inch, while in the later stages the reduction in thickness at each passage through the rolls is less than $\frac{1}{100}$ th of an inch, and finally one or two "spring pinches" are given to the bars by simply passing them through the rolls without altering the adjustment. The testing of the fillets, to ascertain whether they are of the accurate thickness, is effected by the aid of the gauge plate (fig. 4), which consists of two steel bars set at a low angle in relation to each other and graduated to $\frac{1}{100}$ th of an inch. It will be evident that the weight of the finished coin depends upon the thickness of the fillets; and to show how accurately the rolling must be performed it may be pointed out that, in the case of the half-sovereign, a variation of $\frac{1}{1000}$ th of an inch above or below the accurate thickness (or a range of $\frac{1}{1000}$ th of an inch) throws the coin out of "remedy."

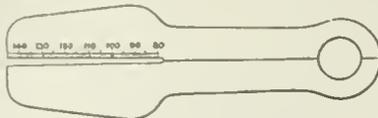

FIG. 4.—Gauge Plate.

The repeated passage through the rolls is attended by a considerable increase of hardness in the metal, and it is therefore in some cases necessary to anneal the fillets repeatedly during the rolling. In the case of fillets for sovereigns the annealing may be entirely dispensed with if the initial thickness of the bars does not exceed $\frac{3}{8}$ th of an inch. Fillets for half-sovereigns have only to be annealed once. In some European mints the fillets are annealed frequently; in one mint the operation is performed after each passage through the rolls. The furnace used for the purpose is generally so arranged as to permit the flame to play over the fillets, which are sometimes freely exposed to its action, but are more often enclosed in cases or tubes. Muffle furnaces are frequently used. The furnace used in the Royal Mint is a simple form of reverberatory furnace. The final rolling is given by a pair of finishing rolls capable of more accurate adjustment than the "breaking-down" rolls.

The fillets of gold or silver are in some cases, though not always, submitted to an appliance known as the drag bench, shown in figs. 5, 6, 7. Its object is to equalize the thickness of the fillets by drawing them between steel cylinders. The ends of the fillets are

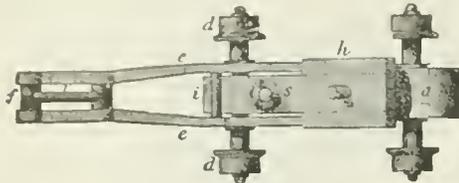

Fig. 5.

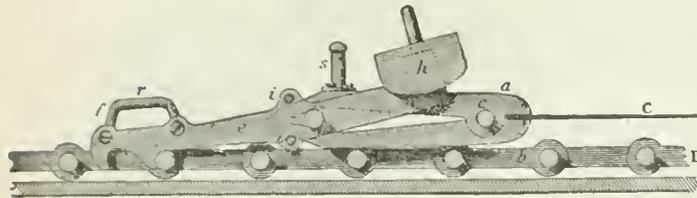

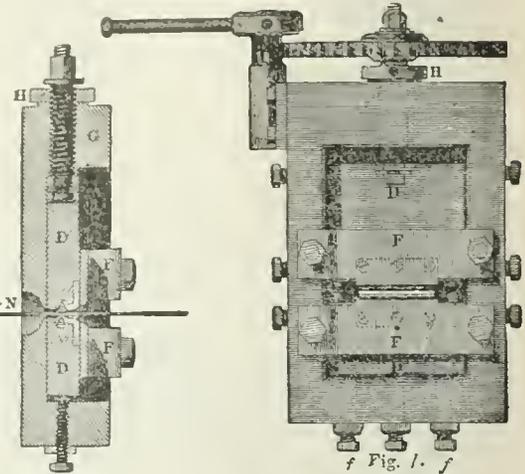

Fig. 6.

f Fig. 7. f

FIGS. 5, 6, 7.—Drag Bench.

first flattened in a little appliance, which need not be described.

The essential feature of the machine now used in the mint consists of two small steel cylinders A, A, which do not revolve, and are held in position in the plates D, D by clamp pieces F, F screwed against them. The portions of metal may be adjusted by the aid of a wheel and screw H (figs. 6, 7), and by small adjusting screws f, f. The part of the machine containing the steel cylinders is fixed at the end of a long bench, and gearing at the other end of this bench drives an endless chain BB (fig. 6), one link or other of which catches the carriage, shown in plan in fig. 5, and drags it along as soon as its end f is depressed by the handle r. The carriage runs on the wheels d, d. The drawing of the fillet C is conducted as follows. Its flattened end is introduced between the steel cylinders, and is grasped by the jaws a. The jaws turn on the pin c, and while the fillet is being dragged through the cylinders the axle of the wheels d, d tends to increase the grip of the jaws by acting on their inclined ends. Directly the strain on the

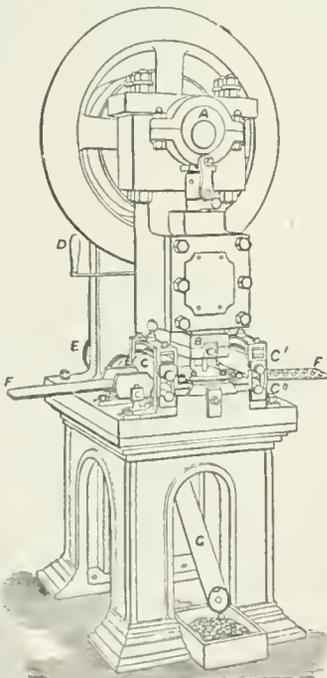

FIG. 8.—Cutting Machine.

fillet is released, the pins i, i and the weight h loosen the jaws and at the same time raise the end of the carriage so as to arrest its further progress along the bench. The carriage is then moved forward by the handle s until the jaws enter the hollowed portion N and grasp another fillet.

Formerly—when fillets were rolled from thick bars—this appliance played a more important part in coining operations than at present. It is now only used for fillets from which sovereigns and half-sovereigns are to be produced. Before fillets are passed on to the next operation—that of cutting from them the disks or blanks destined to form the coin—they are carefully tested by a skilful workman called the "tryer," who cuts one or two blanks from the sides of each fillet by the aid of a cutter worked by hand. These blanks are weighed on a delicate balance against a standard weight, and the experience of the operator enables him to determine whether the variation from the exact weight will justify his sending the fillets forward to the cutting room. In any case he divides the fillets into two or more classes for a reason that will be explained presently.

The cutters employed in the mint until quite recently were of complicated construction, but these have been replaced by a simple machine (fig. 8) which, by the revolution of an eccentric A, causes two short steel cylinders, mounted on a block of iron B suitably guided, to enter two holes firmly fixed in a plate on the bed of the machine. When the fillet FF is interposed between the short cylinders and the holes, the former force disks of metal through the holes, the fillet being advanced at each stroke of the machine by small gripping rolls C, C', C' actuated by a ratchet-wheel E, driven from the shaft which bears the eccentric A. The disks pass down the tube G to a receptacle placed on the floor. In the case of very large silver coins, only one disk is cut in the width of the fillet, and in some few mints disks for gold coin are also cut in this way, but it is far more usual to cut two disks in the width of the fillet, the position of the cutters being so arranged as to remove blanks in the manner shown in fig. 9. In cutting disks for bronze coin extreme precision is not necessary, and it has therefore been found possible to obtain five at each stroke of the machine.

Fig. 9.

Trying.

It will be evident that the rough classification of the fillets according to their thickness, to which reference has already been made, renders it easy to compensate for slight irregularities in thickness caused by rolling, by employing cutters of a slightly larger diameter than the standard size for fillets which are too thin.

The fillets after the removal of the disks present the perforated appearance shown in fig. 9. The residual metal, called "scissel," which amounts to from 25 to 30 per cent. of the metal operated upon, is returned to the melting-house in bundles weighing 180 oz. It may be mentioned here that all attempts to cut disks or blanks for coinage from the ends of rods or cylinders, and thus to avoid the production of scissel, have hitherto failed.

The next operation to which the blanks are submitted varies in different mints. In some, each blank is weighed by hand or by automatic machinery, and each blank that is too heavy is adjusted either to an exact weight or to within the remedy prescribed by law. On the Continent it is very generally the practice to adjust blanks by the aid of a file, or by a machine that removes a fine shaving of metal from the surface of the blank. In mints where mechanical adjustment is adopted there is a tendency to produce "too heavy" blanks in the rolling and cutting departments, as it is impossible to adjust blanks which are too light.¹

In the London mint finished coin alone is weighed, so that the blanks after leaving the cutting room pass directly to an edge-rolling machine, which thickens the edge of each blank so as to form a rim intended to protect the impression on the finished coin. The operation of edge-rolling is called "marking," and the method of conducting it varies considerably in different mints.

In the Royal Mint the blanks are made to pass in quick succession, at the rate of six hundred a minute, between a circular groove in the face of a revolving steel disk and a groove in a fixed block placed parallel to the face of the revolving disk. The groove in the block exactly corresponds to that on the disk; and, as the distance between the block and the disk is slightly less than the diameter of the blank submitted to the operation, the result is that before the blank escapes from the machine its edge has been thickened. The operation may be varied by admitting the blanks between a groove in the periphery of a revolving wheel and a groove in a segmented block, placed at a distance from the wheel rather less than the diameter of the blank. The wheel and block may be either vertical or horizontal.

In some cases the edges of the blanks, at the same time that they are thickened, receive the impression of a legend, or inscription, or an ornamental device. When this is the case the blank is rolled

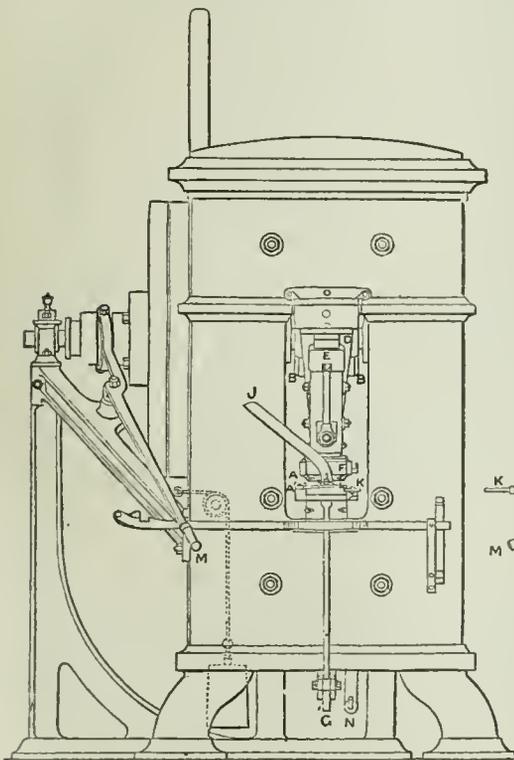

Fig. 10.

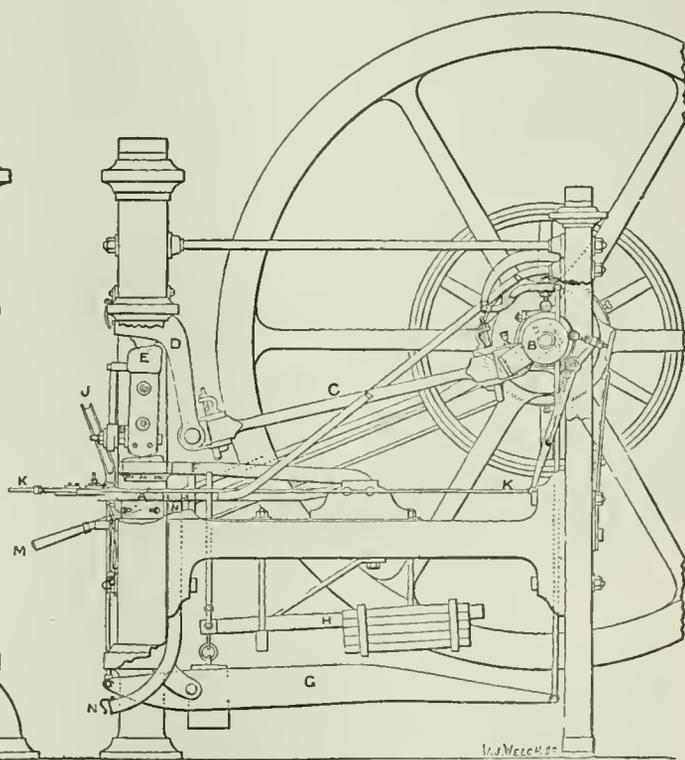

Fig. 11.

between two planes, one of which is fixed and bears the device, while the other has a reciprocating motion imparted to it, or the edge of the blank receives the impression, which may be either raised

¹ A description of a machine used for the adjustment of blanks will be found in *Dingler's Polytechnisches Journal* (1882, ccxlv, pl. 6); and some years ago Mr J. M. Napier devised for the Indian mints a beautiful machine which first ascertains how much it is necessary to cut from each blank in order to reduce it to the standard weight, and then removes the necessary amount of metal and no more. The initial cost of such machinery, however, is considerable. In 1849 M. Doreck, director of the mint in Paris, endeavoured to substitute a chemical for a mechanical treatment by submitting the heavy gold blanks to aqua regia, which it was anticipated would bring them within the prescribed limits of accuracy. The results were not satisfactory, and the attempt was abandoned. In 1870 the present chemist of the mint, Professor W. Chandler Roberts, showed that gold alloyed with copper might be removed from heavy blanks with singular regularity by means of a suitable solvent aided by a battery. The blanks are arranged in a frame of wood and submitted to the action of a solution of cyanide of potassium, the heavy blanks forming the dissolving pole of the battery. The process was not used in the London mint, as it became evident that it could not profitably replace the present system, under which finished coins alone are weighed and the manufacture of good coin only is paid for. It was, however, introduced into the Bombay mint in 1870 by the late Mr L. G. Hines, who extended its usefulness by transferring the metal dissolved from the heavy blanks to blanks which are too light, the latter being by this means raised to the prescribed weight. The process has now fairly taken its place as an ordinary operation of coining, and its importance to the mints where it is used may be gathered from the fact that in the Indian mints no less than 1300 tons of silver were converted into coin in one year (1879), so that the saving effected by its introduction must be considerable.

or sunk, from a collar surrounding the blank in the coining press, as will be afterwards explained.

Before passing to the coining press the blanks either of gold or silver are annealed. In many mints the object of the heating is not only to soften the blanks before they receive the impression, but also to produce a film of oxide of copper on their surface. This is attained in various ways. In England gold blanks are placed in cylindrical crucibles of plumbago and covered with a layer of charcoal, heated in a reverberatory furnace, and when the blanks reach cherry-redness they are cooled by plunging them in water. The thin film of oxide of copper thus formed on the surface of the gold or silver blanks is readily soluble in dilute sulphuric acid, and the removal of a small portion of the alloying metal in this way constitutes "blanching" or "pickling" the coin. The method of conducting the operation varies somewhat in different mints, mainly, however, in the strength of the acid used, which varies from 3° to 5° of the hydrometer of Baumé. The solution is sometimes heated to 96° to 98° C., while in other cases the blanks are introduced into the solution while at a red heat. The latter method is, however, objectionable, as a dense layer of pure metal is found at the surface of the blank which is apt to protect the underlying oxide of copper from the action of the acid. The blanks are afterwards washed in pure water and dried either in sawdust or in copper vessels heated by steam jackets. The object of the process is to

improve the appearance of the finished coin by removing all traces of impurity from the surface of the blank. It has, however, been abandoned in the British mint except in the case of some of the smaller silver coins, mainly because the soft superficial layer of metal wears away with undue rapidity. Certain precautions suggested in 1869 by Mr Hill, the superintendent of the operative department, for avoiding oxidation or tarnishing of the metal during coinage rendered the abolition of the process possible.

The blanks receive the impression which constitutes their coins from engraved dies. Each is placed in the lower of two dies, and the upper die is brought forcibly down upon it. The lateral escape of the metal is prevented by a collar which surrounds the blank while it is being struck. This collar may be either plain or engraved, and if the latter is the case any device or ornament it may bear will be imparted to the edge of the blank.

The coining presses used in various mints may be divided into three types:—(1) the screw press worked by atmospheric pressure, (2) the excentric press, and (3) the lever press. The first of these (see *Ency. Brit.*, 8th ed., vol. vii. p. 92) has now been abandoned. In the excentric press the power is applied to a shaft bearing an excentric which acts by means of a connecting rod upon a vertical slide holding the die which is brought down on the blank. This form of press is used in the mint at Constantinople, where the atmospheric screw press is also still retained. Of the third type, the lever press, there are two modifications, devised respectively by Thonnelier and by Uhlhorn. The details of the Uhlhorn press have been improved by Messrs R. Heaton & Sons of Birmingham; and, their superiority to the old vacuum screw press having been demonstrated by careful experiments, they have been finally adopted in the newly arranged mint, which contains fourteen of them. This press is shown in figs. 10 and 11. It is driven from below the floor of the press-room by bands which pass over fast and loose pulleys on the same shaft that bears the fly-wheel. The loose pulley, however, is only used when it is necessary to stop the machine entirely, as the fly-wheel is permitted to revolve without imparting motion to the shaft so long as a lever M, worked from the front of the machine, does not cause the fly-wheel to be connected with the driving wheel by means of two pins. The dies are placed in the front part of the machine (fig. 10). The lower one is firmly fixed to the bed, while the upper is held at A by the upper of two jaws F and A', or levers, the fulcrum of which are so close together as almost to coincide, the lower jaw A' bearing the collar which encircles the blank while it is being converted into a coin; the upper jaw F, A, governed by the weighted lever H shown below the bed of the machine, has a tendency to rise a sufficient distance to admit the blank between the upper and lower die. A crank B on the shaft bearing the fly-wheel is connected by a rod C with the bent lever D, and this bent lever, acting through the toggle joint and a piece of metal E connected with the jaw that bears the

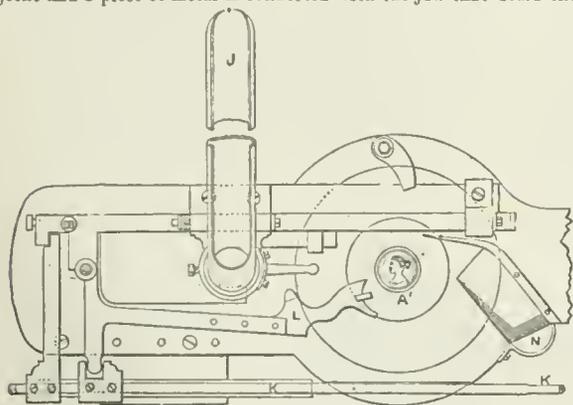

Fig. 12.

upper die, forces it down, and thus squeezes the blank between the upper and lower dies. A cam on the crank shaft acting on the lower of the two levers G shown below the bed of the machine causes the lower jaw A' bearing the collar which surrounded the blank to be depressed sufficiently to leave the finished coin freely resting on the lower die, from whence it is driven down the shoot N by the next blank in succession. Coins are produced at rates varying from 60 to 120 a minute, 90 a minute giving the best results. The blanks to be converted into coins are placed on the slide J, and the advance of each blank in succession is regulated by the rod called the "layer on" K, the backward and forward movement of which is also regulated by an excentric on the crank shaft. The details of this part of the machine are shown in plan, fig. 12.

The last operation before the finished coin is returned to the mint office for issue to the public is the weighing each gold or silver piece separately. This is effected in the American and in most Continental

mints by hand, but in England automatic balances of beautiful construction are employed. They were originally devised for separating worn pieces from those of current weight, but they are now employed to distinguish between "light," "heavy," and "good" pieces, the latter alone being permitted to pass into circulation. In the newly arranged department thirty such machines are provided. Each is driven from overhead shafting by means of gut lines. The driving pulleys derive their motion from a small atmospheric engine, which is found to give more satisfactory results than would be the case if the steam-engine were employed directly. Each balance is worked by a cone pulley A (fig. 13) by a gut line passing round it from the loose pulleys B, the necessary tension being imparted to the line by means of a spring C. The tension of the line is, however, but slight, for if the action of the balance is arrested by accident the cord slides over the cone pulley A without turning it. It will be obvious that the use of the cone pulley enables the machine to be driven with varying degrees of speed. The toothed wheel D is mounted on the spindle which bears the driving pulley A, but it acts only through the intervention of a friction cheek, which is so lightly screwed against the driving wheel that it would cease to act if the machine should be accidentally deranged. The wheel D sets in motion the wheels E, E', E". The cam F, acting on the curved extremity of the rocking frame G, causes the slide H to bring forward one of a series of coins (arranged in the hopper I) until it rests on the plate J of the balance beam, of which beam a portion is shown in an enlarged drawing above the balance, while the plate that receives the coin is also shown in a separate drawing to the left of the machine. Another cam K then comes into play, and enables the forceps, shown at L, to release the rod M to which the balance plate J is attached. The forceps L serves to keep the rod steady while the coin is being placed on the plate J. A rod shown at N is then raised by the cam O, the lower extremity of the rod being kept steady by a pin sliding in a hole in the bottom plate of the balance, and its upper end by a pin which works into the central support of the balance beam. At the base of this rod N, and at right angles to it, there is a metallic bar QQ, the ends of which pass through stirrups in the pendants M and P from the opposite ends of the beam. The elevation of this horizontal rod by the cam O simultaneously releases both ends of the beam, and the coin placed on the beam plate has then, for the first time, a direct influence on the beam. If the coin is "too light" the counterpoise R in the cage at the end of the rod P will raise the coin, and the revolution of the machine then causes part of the cam K to permit a spring to close the forceps L and to hold the pendant M firm. An indicating finger T then falls, and by means of a horizontal lever UV, which fits into one of three inverted steps on the bottom of the shoot V, determines over which of three orifices W, W', W" in the bottom plate of the balance this shoot shall stand. In the meantime the advance of the slide H brings the next piece forward, and displaces the coin which has hitherto occupied the beam plate J, forcing the coin down the shoot V, and thence through the orifice W into a receptacle, external to the balance, destined for the reception of "light coin." If this next piece should be "too heavy" it will not only raise the counterpoise R but will also elevate a little wire S, which would otherwise remain undisturbed on a support. This little wire represents the "working remedy" for the particular denomination of coin in question, which, for safety, is less by $\frac{1}{100}$ th of a grain than the remedy permitted by law. The undue weight of the "heavy coin" will depress the right end of the balance beam and its pendant M to the lowest possible point, and the indicating finger T will, in this case, determine that the rod UV shall occupy the lowest step of the shoot V, which will consequently stand over the orifice W" in the bottom plate of the balance which communicates with the receptacle for the "heavy" coins, and the heavy coin on the beam plate will be driven down the shoot by the next coin in succession. If the coin which is next brought forward by the slide H should be a "good" one, that is, if it is within the working "remedy," its action will be as follows. It may be slightly heavier than the counterpoise, but not sufficiently heavy to lift both the counterpoise and the remedy wire. The balance beam consequently remains approximately horizontal, and the indicating finger T will cause the rod UV to strike the centre step of the shoot V, which will then stand over the central orifice W' in the bed plate which communicates with a receptacle for "good" coins, into which the coin will find its way, as soon as it is driven from the beam plate by the next coin of the series. It will be evident that this excellent appliance both weighs and classifies the coins. About twenty-three coins are passed through it in a minute.

In order to show the importance of extreme accuracy in weighing, it may be pointed out that, although by the Coinage Act of 1870 the "remedy" or allowed variation above or below the standard weight of a sovereign is only $\frac{1}{10}$ th of a grain, yet in a million sterling of sovereigns the difference between the least and the greatest weight the law allows would be no less than £3244.

The manufacture of coin is not the only work which is performed in the Royal Mint. All medals issued to the

army and navy, as well as those given by the Royal Society and the university of London and some others, are struck in the mint, and their preparation forms a considerable part of the work of the die department. Since 1874 the clasps and bars for the medals have also been manufactured in the mint, whence they have been issued completely mounted. Another operation, not connected with the coinage, which is performed in the mint

is the assay of the "diet" or metal scraped from the gold and silver plate manufactured at Sheffield and Birmingham under the direction of the warden of the standard of wrought plate for those towns. By Act of Parliament it is directed that this shall be brought once in each year to the mint to be assayed by the "king's assay master," under the supervision of an officer appointed by the lords of the Treasury.

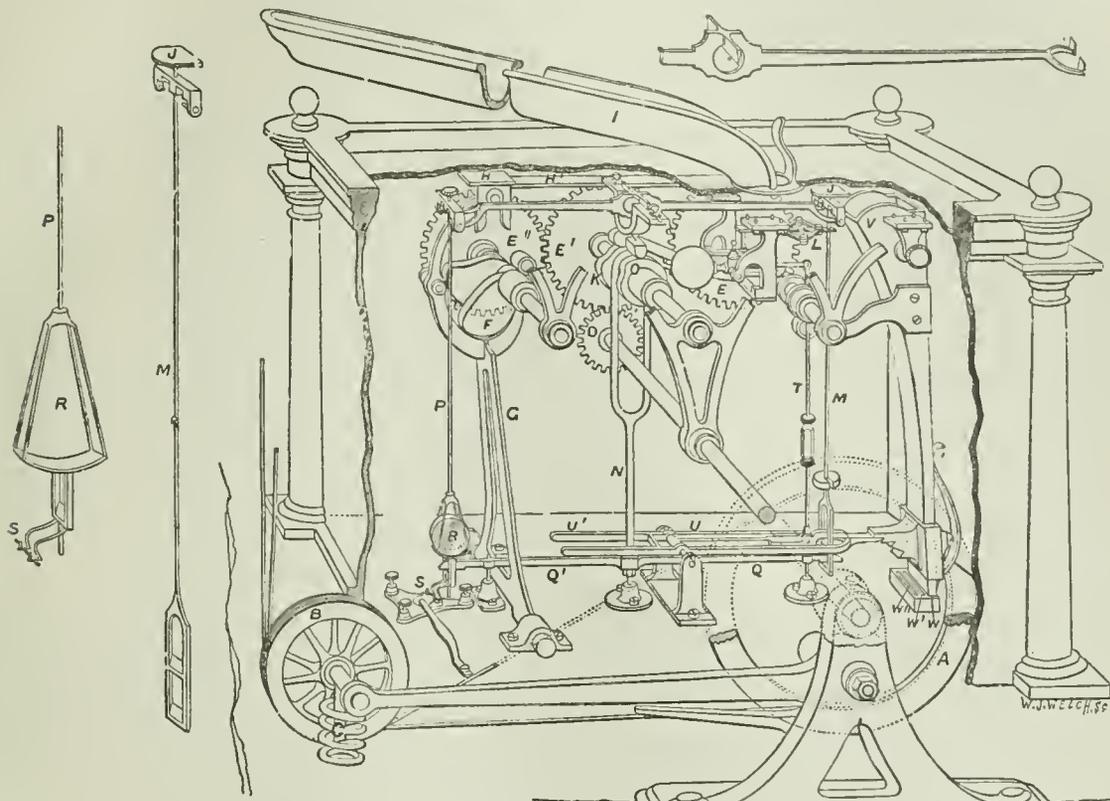

FIG. 13.—Automatic Balance.

The gold coin in circulation in Great Britain is estimated at £100,000,000. It may be well to add the following table, which gives the value of the gold and silver coinages of four of the most important foreign countries, in two recent years:—

	1880.		1881.	
	Gold.	Silver.	Gold.	Silver.
United States	£12,461,655	£5,481,941	£19,370,178	£5,587,840
Germany	1,332,430	...	326,837	...
Austria	493,605	1,674,712	485,999	1,805,734
France	83,646	259,910
	£14,287,690	£7,156,653	£20,266,660	£7,653,484

The value of the gold coinage of the American mints during the fiscal year ending June 1882 amounted to \$89,413,447.50.—being greater than that of any previous year in their history. (W. C. R.—R. A. H.)

MINT, botanically *Mentha*, a genus of labiate plants, comprising about twenty species of perennial herbs, widely distributed throughout the temperate and sub-tropical portions of the globe. All the species are furnished with square stems, opposite, aromatic leaves, and creeping roots. The flowers are arranged in axillary cymes, which either form separate whorls or are crowded together into a terminal spike. The corolla is usually small, and of a pale purple or

pinkish colour; it has four nearly equal lobes, and encloses two long and two short stamens. Great difficulty is experienced by botanists in discriminating the species of this genus by reason of the occurrence of a large number of intermediate forms, nearly three hundred of which have been named and described. Many of these varieties are permanent in consequence of being propagated by stolens.

In Britain nine of the recognized species are indigenous. *Mentha viridis*, L., or Spearmint, grows in marshy meadows, and is the species commonly used for culinary purposes; it is distinguished by its smooth, sessile leaves and lax tapering flower-spikes. *Mentha sylvestris*, L., or Horsemint, chiefly differs from the above in its coarser habit and hairy leaves, which are silky beneath, and in its denser flower-spikes. This plant is supposed to be the mint of Scripture, as it is extensively cultivated in the East, and is much used in cookery; it was one of the bitter herbs with which the paschal lamb was eaten. *M. rotundifolia* resembles the last in size and habit, but is readily distinguished by its rounded wrinkled leaves, which are shaggy beneath, and by its lanceolate bracts. The last two species usually grow on damp waste ground near roadsides. *M. aquatica*, or Capitate Mint, grows in ditches and by the side of streams, and is easily recognized by its rounded flower-spikes and stalked hairy leaves. *M. Piperita*, or Peppermint, has stalked, smooth leaves and an oblong obtuse terminal spike of flowers; it is extensively culti-

vated for its volatile oil. *M. pratensis* belongs to a group of mints which, unlike the foregoing, have the flowers arranged in axillary whorls and never in terminal spikes; it otherwise bears some resemblance in foliage and habit to *M. viridis*. *M. sativa*, the Whorled Hairy Mint, grows by damp roadsides, and *M. arvensis* in cornfields; they are distinguished from *M. pratensis* by their hairy stalked leaves, which in *M. arvensis* are all equally large, but in *M. sativa* are much smaller towards the apex of the stem. *M. Pulegium*, commonly known as Pennyroyal, more rarely as Flea-mint, has small oval obtuse leaves and flowers in axillary whorls, and is remarkable for its creeping habit and peculiar odour. It differs from all the mints above described in the throat of the calyx being closed with hairs. It is met with in damp places on grassy commons, and forms a well-known domestic remedy for female disorders.

All the plants of the genus *Mentha* abound in a volatile oil, which is contained in small receptacles having the appearance of resinous dots in the leaves and stems. The odour of the oil is similar in several species, but is not distinctive, the same odour occurring in varieties of distinct species, while plants which cannot be distinguished by any botanical character possess the same odour. Thus the peppermint flavour is found in *M. Piperita*, in *M. incana*, and in Chinese and Japanese varieties of *M. arvensis*. Other forms of the last-named species growing in Ceylon and Java have the flavour of the common garden mint, *M. viridis*, and the same odour is found to a greater or less degree in *M. sylvestris*, *M. rotundifolia*, and *M. canadensis*. A bergamot scent is met with in a variety of *M. aquatica* and in forms of other species. Most of the mints may be found in blossom in August.

The name mint is also applied to plants of other genera, *Monarda punctata* being called Horsemint, *Pycnanthemum linifolium*, Mountain Mint, and *Nepeta Cataria*, Catmint.

MINTO, SIR GILBERT ELLIOT, FIRST EARL OF (1751–1814), was descended from an old border family, the Elliots of Minto, and was born at Edinburgh, April 23, 1751. His father, Sir Gilbert Elliot, was a member of the administration of Pitt and Grenville, and is spoken of by Horace Walpole as "one of the ablest men in the House of Commons." Young Elliot was educated by a private tutor, with whom at the age of twelve he went to Paris, where David Hume, who was then secretary of the embassy, undertook, from friendship to his father, the special charge of superintending his studies. After spending the winters of 1766 and 1767 at Edinburgh University, Elliot entered Oxford. On quitting the university he became a member of Lincoln's Inn, and was in 1774 called to the bar. He entered parliament in 1776, the year of his father's death. Although he gave a general support to Lord North's administration, he from the beginning occupied an independent position, and in 1782 supported the address of the Commons against an offensive war with America. From this time he became a declared follower of Fox and Burke, with the latter of whom he gradually came to be on terms of great intimacy. He was created Baron Minto in 1797, and after filling several diplomatic posts with great success became in 1807 governor-general of India. The character and events of his rule in India are described in vol. xii. p. 805. He was created Earl of Minto and Viscount Melgund in 1813. He returned to England in 1814, and died on June 21st of that year.

See *Life and Letters of Sir Gilbert Elliot, first Earl of Minto*, from 1751 to 1806, 1874; and *Life and Letters*, 1807–14, 1880. See also MIRABEAU.

MINUCIUS FELIX, MARCUS, one of the earliest, if not the earliest, of the Latin apologists for Christianity. Of his personal history nothing is known, and even the date at which he wrote can be only approximately ascertained.

Jerome (*De Vir. Ill.*, 58) speaks of him as "Romæ insignis causidicus," but in this he is probably only improving on the expression of Lactantius (*Inst. Div.*, v. 1) who speaks of him as "non ignobilis inter causidicos loci." He is now exclusively known by his *Octavius*, a dialogue on Christianity between the pagan Cæcilius Natalis¹ and the Christian Octavius Januarius, a provincial solicitor, the friend and fellow-student of the author. The scene is pleasantly and graphically laid on the beach at Ostia on a holiday afternoon, and the discussion is represented as arising out of the homage paid by Cæcilius, in passing, to the image of Serapis. His arguments for paganism, which proceed partly upon agnostic grounds, partly upon the inexpediency of disturbing long-established religious beliefs, partly upon the known want of culture in Christians, the alleged indecency of their worship, and the inherent absurdity of their doctrines, are taken up seriatim by Octavius, with the result that the assailant is convinced, postponing, however, the discussion of some things necessary for perfect instruction to a future occasion. The form of the dialogue, modelled on the *De Natura Deorum* and *De Divinatione* of Cicero, shows much care and ability, and its style is on the whole both vigorous and elegant if at times not exempt from something of the affectations of the age. If the doctrines of the Divine unity, the resurrection, and future rewards and punishments be left out of account, the work has less the character of an exposition of Christianity than of a philosophical and ethical polemic against the absurdities of crass polytheism. Christology and the other metaphysics of distinctively Christian theology are entirely passed over, and the canonical Scriptures are not quoted, hardly even alluded to.

The *Octavius* is admittedly earlier than Cyprian's *De Idolorum Vanitate*, which borrows from it; how much earlier can be determined only by settling the relation in which it stands to Tertullian's *Apologeticum*. The argument for the priority of Minucius has been most exhaustively set forth by Ebert ("Tertullian's Verhältniss zu Minucius Felix," in vol. v. of the philologico-historical series in *Abhandl. d. Königl. Sächs. Gesellsch. der Wissenschaften*, 1868), who has been followed by Teuffel (*Röm. Lit.*, sec. 368), Keir (*Celsus' Wahres Wort*, 1873), Kuhn, and other scholars. The opposite view is ably maintained by Professor Salmon ("Minucius Felix" in Smith's *Dict. Christ. Biogr.*, 1882). The *Octavius* was first printed (Rome, 1543) as the eighth book of Arnobius *Adv. Gentes*; Balduinus (Heidelberg, 1560) first assigned it to its proper author. There have been numerous subsequent editions, the best being that of Halm in the *Corp. Scriptor. Eccl. Lat.* (Vienna, 1867). See Kuhn's monograph, *Der Octavius des Minucius Felix* (1882).

MINUET (Fr. *Menuet*, from [*pas*] *menus*), a very graceful kind of dance, consisting of a coupee, a high step, and a balance. Its invention is universally ascribed to the inhabitants of Poitou. The melody begins with the down beat, and contains three crotchets in a bar. The music is made up of two strains, which, from being repeated, are called *reprises*, each consisting of eight or more bars, but very rarely of an odd number. Walther speaks of a minuet in Lully's opera of *Roland*, each strain of which contains ten bars, the sectional number being five,—a circumstance which renders it very difficult to be danced; but Lully's system of phrasing was remarkably irregular. Modern instrumental composers have introduced into their symphonies and quartets, &c., minuets of rapid movement and fanciful character, followed by supplementary strains (called trios) in a different style. Some of these compositions bear but very slight resemblance to the older forms; and many of them begin with the third beat in the bar. The finest minuets we possess are those in Handel's *Samson* and Mozart's *Don Giovanni*.

MIRABEAU, HONORÉ GABRIEL RIQUETI, COMTE DE, (1749–1791), one of the greatest statesmen and orators

¹ This name occurs in six inscriptions of the years 211–217 found at Constantine (Cirta), North Africa (*C. I. L.*, vol. viii.).

France has ever produced, was born at Bignon, near Nemours, on March 9, 1749. M. de Loménie has shown that the family of Riquet or Riqueti came originally from the little town of Digne, that they won wealth and municipal honours as merchants at Marseilles, and that in 1570 Jean Riqueti bought the chateau and estate of Mirabeau, which had up to that time belonged to the great Provençal family of Barras, and took the title of esquire a few years later. In 1685 Honoré Riqueti obtained the title of Marquis de Mirabeau, and his son Jean Antoine brought honour to it. He served with distinction through all the later campaigns of the reign of Louis XIV., and especially distinguished himself in 1705 at the battle of Cassano, where he was so severely wounded in the neck that he had ever after to wear a silver stock; yet he never rose above the rank of colonel, owing to his eccentric habit of speaking unpleasant truths to his superiors. On retiring from the service he married Françoise de Castellane, a remarkable woman, who long survived him, and he left at his death, in 1737, three sons—Victor, Marquis de Mirabeau (see next article), Jean Antoine, Bailli de Mirabeau, and Comte Louis Alexandre de Mirabeau. The great Mirabeau was the elder surviving son of the marquis. When but three years old he had a virulent attack of confluent small-pox which left his face for ever disfigured, and contributed not a little to nourish his father's dislike to him. His early education was conducted by Lachabeaussière, father of the better known man of letters, after which, being like his father and grandfather destined for the army, then the only profession open to young men of family, he was entered at a pension militaire at Paris, kept by an Abbé Choquart. Of this school, which had Lagrange for its professor of mathematics, we have an amusing account in the life of Gilbert Elliot, first earl of Minto, who with his brother Hugh, afterwards British minister at Berlin, there made the acquaintance of Mirabeau, an acquaintance which soon ripened into friendship, and to which Mirabeau in later life owed his introduction into good English society. On leaving this school in 1767 he received a commission in the cavalry regiment of the Marquis de Lambert, which his grandfather had commanded years before. He at once began love making, and in spite of his ugliness succeeded in winning the heart of the lady to whom his colonel was attached, which led to such scandal that his father obtained a *lettre de cachet*, and the young scapegrace was imprisoned in the isle of Rhé. The love affairs of Mirabeau form quite a history by themselves, and a well-known history, owing to the celebrity of the letters to Sophie; and the behaviour of the marquis in perpetually imprisoning his son is equally well known, and as widely blamed. Yet it may be asserted that until the more durable and more reputable connexion with Madame de Nehra these love episodes were the most disgraceful blemishes in a life otherwise of a far higher moral character than has been commonly supposed. As to the marquis, his use of *lettres de cachet* is perfectly defensible on the theory of the existence of *lettres de cachet* at all. They were meant to be used (see *LETTRES DE CACHET*) by heads of families for the correction of their families, and Mirabeau, if any son, surely deserved such correction. Further, they did have the effect of sobering the culprit, and the more creditable part of his life did not begin till he left Vincennes. Mirabeau, it may be remarked at once, was not a statesman of the Alcibiades type, and he did not develop his great qualities of mind and character until his youthful excesses were over. These will be passed over as rapidly as possible, for it was not till 1781 that the qualities which made him great began to appear.

On being released from his first imprisonment, the young count, who had always intended to continue his military

career, obtained leave to accompany as a volunteer the French expedition which was to effect the reduction of Corsica. The conquest was one of sheer numerical strength, for the whole population was on the side of Paoli, and Mirabeau, perceiving the value of public opinion, is said to have written a treatise on the oppression the Genoese had formerly exercised over the island, which the Government was ready to publish had not the Marquis de Mirabeau thought fit to destroy it because of its divergence from his own philosophical and economical views. For his services in Corsica Mirabeau was made a captain of dragoons, though not in any particular regiment, and on his return his father endeavoured to make use of the literary ability he had shown for the advancement of his own economical theories. He tried to keep on good terms with his father, though he could not advocate all his ideas, and even went so far in 1772 as to marry a rich heiress, a daughter of the Marquis de Marignane, whose alliance his father had procured for him. He did not live happily with her, and in 1774 was ordered into semi-exile in the country, at his father's request, where he wrote his earliest extant work, the *Essai sur le Despotisme*. His violent disposition now led him to quarrel with a country gentleman who had insulted his sister, and his semi-exile was changed by *lettre de cachet* into imprisonment in the Chateau d'If. In 1775 he was removed to the castle of Joux, to which, however, he was not very closely confined, having full leave to visit in the town of Pontarlier. Here he met Marie Therèse de Monnier, his Sophie as he called her, a married woman, for whom he conceived a violent passion. Of his behaviour nothing too strong can be said: he was introduced into the house as a friend, and betrayed his trust by inducing Madame de Monnier to fall in love with him, and all his excuses about overwhelming passion only make his conduct more despicable. The affair ended by his escaping to Switzerland, where Sophie joined him; they then went to Holland, where he lived by hack-work for the booksellers; meanwhile Mirabeau had been condemned to death at Pontarlier for *rapt et vol*, of which he was certainly not guilty, as Sophie had followed him of her own accord, and in May 1777 he was seized by the French police, and imprisoned by a *lettre de cachet* in the castle of Vincennes. There he remained three years and a half, and with his release ends the first and most disgraceful period of his life. During his imprisonment he seems to have learnt to control his passions from their very exhaustion, for the early part of his confinement is marked by the indecent letters to Sophie (first published in 1793), and the obscene *Erotica Biblion* and *Ma Conversion*, while to the later months belongs his first political work of any value, the *Lettres de Cachet*. The *Essai sur le Despotisme* was an ordinary but at times eloquent declamation, showing in its illustrations a wide miscellaneous knowledge of history, but the *Lettres de Cachet* exhibits a more accurate knowledge of French constitutional history skilfully applied to an attempt to show that an existing actual grievance was not only philosophically unjust but constitutionally illegal. It shows, though still in rather a diffuse and declamatory form, that application of wide historical knowledge, keen philosophical perception, and genuine eloquence to a practical purpose which was the great characteristic of Mirabeau, both as a political thinker and as a statesman.

With his release from Vincennes begins the second period of Mirabeau's life. He found that his Sophie was an idealized version of a rather common and ill-educated woman, and she speedily consoled herself with the affection of a young officer, after whose death she committed suicide. Mirabeau first set to work to get the sentence of death still hanging over him reversed, and by his eloquence not only succeeded but got M. de Monnier condemned in the costs of

the whole law proceedings. From Pontarlier he went to Aix, where he claimed the court's order that his wife should return to him. She naturally objected, but his eloquence would have won his case, even against Portalis, the leader of the Aix bar, had he not in his excitement accused his wife of infidelity, on which the court pronounced a decree of separation. He then with his usual impetuosity intervened in the suit pending between his father and mother before the parlement of Paris, and so violently attacked the ruling powers that he had to leave France and again go to Holland, and try to live by literary work. About this time began his connexion with Madame de Nehra, which sweetened the ensuing years of toil and brought out the better points of his character. She was the daughter of Zwier van Haren, a Dutch statesman and political writer, and was a woman of a far higher type than Sophie, more educated, more refined, and more capable of appreciating Mirabeau's good points and helping him to control his passions. With her the lion became a lamb, and his life was strengthened by the love of his *petite horde*, Madame de Nehra, her baby son, afterwards Lucas de Montigny, and his little dog Chico. After a period of work in Holland he betook himself to England, where his treatise on *Lettres de Cachet* had been much admired, and where he was soon admitted into the best Whig literary and political society of London, through his old schoolfellow Gilbert Elliot, who had now inherited his father's baronetcy and estates, and become a leading Whig member of parliament. Sir Gilbert introduced him freely, but of all his English friends none seem to have been so intimate with him as Lord Lansdowne, and Mr (afterwards Sir Samuel) Romilly. The latter became particularly attached to him, and really understood his character; and it is strange that his remarks upon Mirabeau in the fragment of autobiography which he left, and Mirabeau's letters to him, should have been neglected by French writers. Romilly was introduced to Mirabeau by D'Ivernois, and readily undertook to translate the *Considerations on the Order of Cincinnati*. Romilly writes thus of him in his autobiography:—

"The count was difficult enough to please; he was sufficiently impressed with the beauties of the original. He went over every part of the translation with me, observed on every passage in which justice was not done to the thought or the force of the expression lost, and made many useful criticisms. During this occupation we had occasion to see one another often, and became very intimate; and, as he had read much, had seen a great deal of the world, was acquainted with all the most distinguished persons who at that time adorned either the royal court or the republic of letters in France, had a great knowledge of French and Italian literature, and possessed very good taste, his conversation was extremely interesting and not a little instructive. I had such frequent opportunities of seeing him at this time, and afterwards at a much more important period of his life, that I think his character was well known to me. I doubt whether it has been so well known to the world, and I am convinced that great injustice has been done him. This, indeed, is not surprising, when one considers that, from the first moment of his entering upon the career of an author, he had been altogether indifferent how numerous or how powerful might be the enemies he should provoke. His vanity was certainly excessive; but I have no doubt that, in his public conduct as well as in his writings, he was desirous of doing good, that his ambition was of the noblest kind, and that he proposed to himself the noblest ends. He was, however, like many of his countrymen, who were active in the calamitous Revolution which afterwards took place, not sufficiently scrupulous about the means by which those ends were to be accomplished. He indeed to some degree professed this; and more than once I have heard him say that there were occasions upon which 'la petite morale était ennemie de la grande.' It is not surprising that with such maxims as these in his mouth, unguarded in his expressions, and careless of his reputation, he should have afforded room for the circulation of many stories to his disadvantage. Violent, impetuous, conscious of the superiority of his talents, and the declared enemy and denouncer of every species of tyranny and oppression, he could not fail to shock the prejudices, to oppose the interests, to excite the jealousy, and to wound the pride of many descriptions of persons. A mode of refuting his works, open to the basest and vilest of mankind, was to represent

him as a monster of vice and profligacy. A scandal once set on foot is strengthened and propagated by many, who have no malice against the object of it. They delight to talk of what is extraordinary; and what more extraordinary than a person so admirable for his talents and so contemptible for his conduct, professing in his writings principles so excellent and in all the offices of public and private life putting in practice those which are so detestable? I indeed possessed demonstrative evidence of the falsehood of some of the anecdotes which by men of high character were related to his prejudice."—*Life of Sir S. Romilly*, vol. i. p. 58.

This luminous judgment, the best that is extant on the character of Mirabeau, deserved to be quoted at length; it must be noted that it was written by a man of acknowledged purity of life, who admired Mirabeau in early life, not when he was a statesman, but when he was only a struggling literary man. This close association with Romilly, and his friends Baynes, Trail, and Wilson, does credit to Mirabeau, and must have helped that moral revolution against his passions which was passing within him. He was a warm friend, and first made Romilly acquainted with Lord Lansdowne, and tried to get him a seat in parliament. Lord Lansdowne was himself an extraordinary man, and the first of the new Whigs might well feel sympathy with the statesman of the French Revolution. The *Considérations sur l'ordre de Cincinnati* which Romilly translated was the only important work Mirabeau wrote in the year 1785, and it is a good specimen of his method. He had read a pamphlet published in America attacking the proposed order, which was to form a bond of association between the officers who had fought in the American War of Independence against England; the arguments struck him as true and valuable, so he rearranged them in his own fashion, and rewrote them in his own oratorical style. He soon found such work not sufficiently remunerative to keep his "petite horde" in comfort, and then turned his thoughts to employment from the French foreign office either in writing or in diplomacy. He first sent Madame de Nehra to Paris to make his peace with the authorities, in which she was completely successful, and then returned himself, hoping to get employment through an old literary collaborateur of his, Durival, who was at this time director of the finances of the department of foreign affairs. One of the functions of this official was to subsidize political pamphleteers, and Mirabeau had hoped to be so employed, but he ruined his chances by a series of financial works. On his return to Paris he had become acquainted with Clavières, a Genevese exile, who was minister of finance during the Revolution, and who now introduced him to a banker named Panchaud. From them he heard plenty of abuse of stock-jobbing, and seizing their ideas he began to regard stock-jobbing, or agiotage, as the source of all evil, and to attack in his usual vehement style the Banque de St Charles and the Compagnie des Eaux. This was at least disinterested on his part, for, while his supporters were poor, the bankers he attacked were rich, and would gladly have bought his silence; but Mirabeau, though ever ready to take money for what he wrote, never sold his opinions, or wrote what he did not really believe. The very eloquence of his style rests upon the enthusiastic conviction that he himself was right, and those who differed from him were stupidly and wilfully wrong. This last pamphlet brought him into a controversy with Beaumarchais, who certainly did not get the best of it, but it lost him any chance of literary employment from Government. However, his ability was too great to be neglected by a great minister such as M. de Vergennes undoubtedly was, and after a preliminary tour in the early spring of 1786 he was despatched in June 1786 on a secret mission to the court of Prussia, from which he returned in January 1787, and of which he gave a full account in his *Histoire Secrète de la Cour de Berlin*.

The months he spent at Berlin were important ones in the history of Prussia, for in them Frederick the Great died. The letters just mentioned show clearly what Mirabeau did and what he saw, and equally clearly how unfit he was to be a diplomatist; for, with all his knowledge of men and his influence over them, he thought (and showed he thought) too much of himself ever to be able to surprise their secret thoughts and intentions. He certainly failed to conciliate the new king Frederick William; and thus ended Mirabeau's one attempt at diplomacy. During his journey he had made the acquaintance of a Major Mauvillon, whom he found possessed of a great number of facts and statistics with regard to Prussia; these he made use of in a great work on Prussia published in 1788, as Romilly says, to show that he could write more than a fugitive pamphlet. But, though his *Monarchie Prussienne* gave him a general reputation for historical learning, he had in this same year lost a chance of political employment. He had offered himself as a candidate for the office of secretary to the Assembly of Notables which the king had just convened, and to bring his name before the public published another financial work, the *Denonciation de l'Agiotage*, dedicated to the king and notables, which abounded in such violent diatribes that he not only lost his election, but was obliged to retire to Tongres; and he further injured his prospects by publishing the reports he had sent in during his secret mission at Berlin. But 1789 was at hand; the states-general was summoned; Mirabeau's period of probation was over, and he was at last to have that opportunity of showing his great qualities both as statesman and orator on a worthy arena.

On hearing of the king's determination to summon the states-general, Mirabeau started for Provence, and offered to assist at the preliminary conference of the noblesse of his district. They rejected him; he appealed to the *tiers état*, and was returned both for Aix and for Marseilles. He elected to sit for the former city, and was present at the opening of the states-general on May 4, 1789. From this time the record of Mirabeau's life forms the best history of the first two years of the Constituent Assembly, for at every important crisis his voice is to be heard, though his advice was not always followed. It is impossible here to detail minutely the history of these two eventful years: it will be rather advisable to try and analyse the manner in which Mirabeau regarded passing events, and then show how his policy justifies our analysis.

Mirabeau possessed at the same time great logical acuteness and most passionate enthusiasm: he was therefore both a statesman and an orator, and the interest of the last two years of his life lies mainly in the gradual but decided victory of the statesmanlike and practical over the impulsive and oratorical qualities. From the beginning Mirabeau recognized that government exists in order that the bulk of the population may pursue their daily work in peace and quiet, and that for a Government to be successful it must be strong. In this practical view of the need of a strong executive lies one of Mirabeau's greatest titles to the name of statesman. At the same time he thoroughly comprehended that for a Government to be strong it must be in harmony with the wishes of the majority of the people, and that the political system of Louis XIV. was now falling for lack of this. He had carefully studied the English constitution in England under the guidance of such men as Lord Lansdowne, Sir Gilbert Elliot, and Romilly, and appreciated it with the wise approval of its powers of expansion which characterized the new Whigs, and not with the blind admiration of Burke. He understood the key-notes of the practical success of the English constitution to be the irresponsibility of the king, the solidarity of the ministers, and the selection of the executive from among

the majority of the representatives of the country; and he hoped to establish in France a system similar in principle, but without any slavish imitation of the details of the English constitution.

In the first stage of the history of the states-general Mirabeau's part was very great. He was soon recognized as a leader, to the chagrin of Mounier, because he always knew his own mind, and was prompt at emergencies. To him is to be attributed the successful consolidation of the National Assembly, its continuance in spite of De Brezé and the carpenters, and the address to the king for the withdrawal of the troops assembled by De Broglie. When the taking of the Bastille had assured the success of the Revolution, he was the one man who warned the Assembly of the futility of passing fine-sounding decrees and the necessity for acting. He declared that the famous night of August 4 was but an orgy, giving the people an immense theoretical liberty while not assisting them to practical freedom, and overthrowing the old régime before a new one could be constituted. Still more did he show his foresight when he attacked the dilatory behaviour of the Assembly, which led to the catastrophes of the 5th and 6th October. He implored the Assembly to strike while the iron was hot, and at once solve in a practical manner the difficult problems presented by the abolition of feudalism. But the Assembly consisted of men inexperienced in practical politics, who dreamed of drawing up an ideal constitution preluded by a declaration of rights in imitation of the Americans; and for two months the Assembly discussed in what words the declaration should be expressed, while the country was in a state of anarchy, declaring old laws and customs abolished and having no new ones to obey or follow, disowning the old administrative system and having no new one yet instituted, while Paris was starving and turbulent, and the queen and her friends planning a counter revolution. The result of these two months' theorizing was the march of the women to Versailles, and the transfer of the king to Paris. Mirabeau now saw clearly that his eloquence would not enable him to guide the Assembly by himself, and that he must therefore try to get some support. He wished to establish a strong ministry, which should be responsible like an English ministry, but to an assembly chosen to represent the people of France better than the English House of Commons then represented England. He first thought of becoming a minister at a very early date, if we may believe a story contained in the *Mémoires* of the Duchesse d'Abrantes, to the effect that in May 1789 the queen tried to bribe him, but that he refused to be bribed to silence, and expressed his wish to be a minister. The indignation with which the queen repelled the idea may have been the cause of his thinking of the Duc d'Orleans as a possible constitutional king, because his title would of necessity be parliamentary. But the weakness of Orleans was too palpable, and in a famous remark Mirabeau expressed his utter contempt for him. He also attempted to form an alliance with Lafayette, but the general was as vain and as obstinate as Mirabeau himself, and had his own theories about a new French constitution. Mirabeau tried for a time, too, to act with Necker, and obtained the sanction of the Assembly to Necker's financial scheme, not because it was good, but because, as he said, "no other plan was before them, and something must be done."

Hitherto weight has been laid on the practical side of Mirabeau's political genius; his ideas with regard to the Revolution after the 5th and 6th October must now be examined, and this can be done at length, thanks to the publication of Mirabeau's correspondence with La Marck, a study of which is indispensable for any correct knowledge of the history of the Revolution between 1789 and 1791.

The Comte de la Marck was a Flemish lord of the house of Aremberg, who had been proprietary colonel of a regiment in the service of France; he was a close friend of the queen, and had been elected a member of the states-general. His acquaintance with Mirabeau, commenced in 1788, ripened during the following year into a friendship, which La Marck hoped to turn to the advantage of the court. After the events of the 5th and 6th of October he consulted Mirabeau as to what measures the king ought to take, and Mirabeau, delighted at the opportunity, drew up an admirable state-paper, which was presented to the king by Monsieur, afterwards Louis XVIII. The whole of this *Mémoire* should be read to get an adequate idea of Mirabeau's genius for politics; here it must be merely summarized.

The main position is that the king is not free in Paris; he must therefore leave Paris and appeal to France. "Paris n'en veut que l'argent; les provinces demandent des lois." But where must the king go? "Se retirer à Metz ou sur toute autre frontière serait déclarer la guerre à la nation et abdiquer le trône. Un roi qui est la seule sauvegarde de son peuple ne fuit point devant son peuple; il le prend pour juge de sa conduite et de ses principes." He must then go towards the interior of France to a provincial capital, best of all to Rouen, and there he must appeal to the people and summon a great convention. It would be ruin to appeal to the noblesse, as the queen advised: "un corps de noblesse n'est point une armée, qui puisse combattre." When this great convention met, the king must show himself ready to recognize that great changes have taken place, that feudalism and absolutism have for ever disappeared, and that a new relation between king and people has arisen, which must be loyally observed on both sides for the future. "Il est certain, d'ailleurs, qu'il faut une grande révolution pour sauver le royaume, que la nation a des droits, qu'elle est en chemin de les recouvrer tous, et qu'il faut non seulement les rétablir, mais les consolider." To establish this new constitutional position between king and people would not be difficult, because "l'indivisibilité du monarque et du peuple est dans le cœur de tous les Français: il faut qu'elle existe dans l'action et le pouvoir."

Such was Mirabeau's programme, which he never diverged from, but which was far too statesmanlike to be understood by the poor king, and far too positive as to the altered condition of the monarchy to be palatable to the queen. Mirabeau followed up his *Mémoire* by a scheme of a great ministry to contain all men of mark,—Necker as prime minister, "to render him as powerless as he is incapable, and yet preserve his popularity for the king," the archbishop of Bordeaux, the Duc de Liancourt, the Duc de la Rochefoucauld, La Marck, Talleyrand bishop of Autun at the finances, Mirabeau without portfolio, Target mayor of Paris, Lafayette generalissimo to reform the army, Ségur (foreign affairs), Mounier, and Chapelier. This scheme got noised abroad, and was ruined by a decree of the Assembly of November 7, 1789, that no member of the Assembly could become a minister; this decree destroyed any chance of that necessary harmony between the ministry and the majority of the representatives of the nation existing in England, and so at once overthrew Mirabeau's present hopes and any chance of the permanence of the constitution then being devised. The queen utterly refused to take Mirabeau's counsel, and La Marck left Paris. However, in April 1790 he was suddenly recalled by the Comte de Mercy-Argenteau, the Austrian ambassador at Paris, and the queen's most trusted political adviser, and from this time to Mirabeau's death he became the medium of almost daily communications between the latter and the queen. Mirabeau at first attempted again to make an alliance with Lafayette by a letter in which he says, "Les Barnave, les Dupont, les Lameth ne vous fatiguent plus de leur active inaction; on singe longtemps l'adresse, non pas la force." But it was useless to appeal to Lafayette; he was not a strong man himself, and did not appreciate "la force" in others. From the month of May 1790 to his death in April 1791 Mirabeau remained in close and suspected but not actually proved connexion with the court, and drew

up many admirable state-papers for it. In return the court paid his debts; but it ought never to be said that he was bribed, for the gold of the court never made him swerve from his political principles—never, for instance, made him a royalist. He regarded himself as a minister, though an unawarded one, and believed himself worthy of his hire. Undoubtedly his character would have been more admirable if he had acted without court assistance, but it must be remembered that his services deserved some reward, and that by remaining at Paris as a politician he had been unable to realize his paternal inheritance. Before his influence on foreign policy is discussed, his behaviour on several important points must be noticed. On the great question of the veto he took a practical view, and seeing that the royal power was already sufficiently weakened, declared for the king's absolute veto, and against the compromise of the suspensive veto. He knew from his English experiences that such a veto would be hardly ever used unless the king felt the people were on his side, in which case it would be a useful check on the representatives of the people, and also that if it was used unjustifiably the power of the purse possessed by the representatives and the very constitutional organization of the people would, as in England in 1688, bring about a bloodless revolution, and a change in the person entrusted with the royal dignity. He saw also that much of the inefficiency of the Assembly arose from the inexperience of the members, and their incurable verbosity; so, to establish some system of rules, he got his friend Romilly to draw up a detailed account of the rules and customs of the English House of Commons, which he translated into French, but which the Assembly, puffed up by a belief in its own merits, refused to use. On the great subject of peace and war he supported the king's authority, and with some success. "What was the good of an executive which had no power? Let it be responsible to the representatives of the nation by all means; but if the representatives absorbed all executive power by perpetual interference, there would be six hundred kings of France instead of one, which would hardly be a change for the better. Again Mirabeau almost alone of the Assembly understood the position of the army under a limited monarchy. Contrary to the theorists, he held that the soldier ceased to be a citizen when he became a soldier; he must submit to be deprived of his liberty to think and act, and must recognize that a soldier's first duty is obedience. With such sentiments, it is no wonder that he approved of Bouillé's vigorous conduct at Nancy, which was the more to his credit as Bouillé was the one hope of the court influences opposed to him. Lastly, in matters of finance he showed his wisdom: he attacked Necker's "caisse d'escompte," which was to have the whole control of the taxes, as absorbing the Assembly's power of the purse; and he heartily approved of the system of assignats, but with the important reservation that they should not be issued to the extent of more than one-half the value of the lands to be sold. This restriction was not observed, and it was solely the enormous over-issue of assignats that caused their great depreciation in value.

Of Mirabeau's attitude with regard to foreign affairs it is necessary to speak in more detail. He held it to be just that the French people should conduct their Revolution as they would, and that no foreign nation had any right to interfere with them, so long as they kept themselves strictly to their own affairs. But he knew also that neighbouring nations looked with unquiet eyes on the progress of affairs in France, that they feared the influence of the Revolution on their own peoples, and that foreign monarchs were being prayed by the French emigrés to interfere on behalf of the French monarchy. To prevent this interference, or rather to give no pretext for it was his guiding thought as

to foreign policy. He had been elected a member of the comité diplomatique of the Assembly in July 1790, and became its reporter at once, and in this capacity he was able to prevent the Assembly from doing much harm in regard to foreign affairs. He had long known Montmorin, the foreign secretary, and, as matters became more strained from the complications with the princes and counts of the empire, he entered into daily communication with the minister, advised him on every point, and, while dictating his policy, defended it in the Assembly. Thus in this particular instance of the foreign office, for the few months before Mirabeau's death, a harmony was established between the minister and the Assembly through Mirabeau, which checked for a time the threatened approach of foreign intervention, and maintained the honour of France abroad. Mirabeau's exertions in this respect are not his smallest title to the name of statesman; and how great a work he did is best proved by the confusion which ensued in this department of affairs upon his death.

For indeed in the beginning of 1791 his death was very near; and he knew it to be so. The wild excesses of his youth and their terrible punishment had weakened his strong constitution, and his parliamentary labours completed the work. So surely did he feel its approach that some time before the end he sent all his papers over to his old English friend and schoolfellow Sir Gilbert Elliot, who kept them under seal until claimed by Mirabeau's executors. In March his illness was evidently gaining on him, to his great grief, because he knew how much depended on his life, and felt that he alone could yet save France from the distrust of her monarch and the present reforms, and from the foreign interference, which would assuredly bring about catastrophes unparalleled in the history of the world. On his life hung the future course of the Revolution. Every care that science could afford was given by his friend and physician, the famous chemist Cabanis, to whose brochure on his last illness and death the reader may refer. The people, whose faith in him revived in spite of all suspicions, when they heard that he was on his death-bed, kept the street in which he lay quiet; but medical care, the loving solicitude of friends, and the respect of all the people could not save his life. His vanity appears in its most gigantic proportions in his last utterances during his illness; but many of them have something grand in their sound, as his last reported expression, when he looked upon the sun—"If he is not God, he is at least His cousin-german." When he could speak no more he wrote with a feeble hand the one word "dormir." and on April 2, 1791, he died.

With Mirabeau died, it has been said, the last hope of the monarchy; but, with Marie Antoinette supreme at court, can it be said that there could ever have been any real hope for the monarchy? Had she been but less like her imperious mother, Louis would have made a constitutional monarch, but her will was as strong as Mirabeau's own, and the Bourbon monarchy had to meet its fate. The subsequent events of the Revolution justified Mirabeau's prognostications in his first memoir of October 15, 1789. The royal family fled towards the German frontier, and from that moment there sunk deep into the hearts of the people not only of Paris, but of the provinces, a conviction that the king and queen were traitors to France, which led inevitably to their execution. The noblesse and the foreign aid on which the queen relied proved but a source of weakness. The noblesse, Mirabeau had said, was no army which could fight; and truly the army of the emigrés could do nothing against revolutionary France in arms. The intervention of foreign aid only sealed the king's fate, and forwarded the progress of the Revolution, not in a course of natural development, but to the terrible resource of the Reign of Terror. With regard to the Assembly too, and its constitution, Mirabeau had shown his foresight. The constitution of 1791, excellent as it was on paper, and well adapted to an ideal state, did not deal adequately with the great problems of the time in France, and by its ridiculous weakening of the executive was unsuited to a modern state. Surely if events ever proved a man's political sagacity, the history of the French Revolution proved Mirabeau's.

A few words must be added on Mirabeau's manner of work and his character.

No man ever so thoroughly used other men's work, and yet made it all seem his own. "Je prends mon bien où je le trouve" is as true of him as of Molière. His first literary work, except the bombastic but eloquent *Essai sur le Despotisme*, was a translation of Watson's *Philip II.*, accomplished in Holland with the help of Durival; his *Considérations sur l'ordre de Cincinnatus* was based on an American pamphlet, and the notes to it were contributed by Target; while his financial writings were all suggested by the Genevese exile Clavières. During the Revolution he received yet more help; men were proud to labour for him, and did not murmur because he absorbed all the credit and fame. Dumont, Clavières, Duroveray, Pellenc, Lamourette, and Reybaz were but a few of the most distinguished of his collaborators. Dumont was a Genevese exile, and an old friend of Romilly's, who willingly prepared for him those famous addresses which Mirabeau used to make the Assembly pass by sudden bursts of eloquent declamation; Clavières and Duroveray helped him in finance, and not only worked out his figures, but even wrote his financial discourses. Pellenc was his secretary, and wrote the speeches on the goods of the clergy and the right of making peace, and even the Abbé Lamourette wrote the speeches on the civil constitution of the clergy. Reybaz, whose personality has only been revealed within these last ten years, not only wrote for him his famous speeches on the assignats, the organization of the national guard, &c., which Mirabeau read word for word at the tribune, but even the posthumous speech on succession to estates of intestates, which Talleyrand read in the Assembly as the last work of his dead friend. Yet neither the gold of the court nor another man's conviction would make Mirabeau say what he did not himself believe, or do what he did not himself think right. He took other men's labour as his due, and impressed their words, of which he had suggested the underlying ideas, with the stamp of his own individuality; his collaborators themselves did not complain,—they were but too glad to be of help in the great work of controlling and forwarding the French Revolution through its greatest thinker and orator. True is that remark of Goethe's to Eckermann, after reading Dumont's *Souvenirs*: "At last the wonderful Mirabeau becomes natural to us, while at the same time the hero loses nothing of his greatness. Some French journalists think differently. . . . The French look upon Mirabeau as their Hercules, and they are perfectly right. But they forget that even the Colossus consists of individual parts, and that the Hercules of antiquity is a collective being—a gigantic personification of deeds done by himself and by others."

There was something gigantic about all Mirabeau's thoughts and deeds. The excesses of his youth were beyond all bounds, and severely were they punished; his vanity was immense, but never spoilt his judgment; his talents were enormous, but could yet make use of those of others. As a statesman his wisdom is indubitable, but by no means universally recognized in his own country. Levers of the *ancien régime* abuse its most formidable and logical opponent; believers in the Constituent Assembly cannot be expected to care for the most redoubtable adversary of their favourite theorists, while admirers of the republic of every description agree in calling him from his connexion with the court the traitor Mirabeau. As an orator more justice has been done him; his eloquence has been likened to that of both Bossuet and Vergniaud, but it had neither the polish of the old 17th-century bishop nor the flashes of genius of the young Girardin. It was rather parliamentary oratory in which he excelled, and his true compeers are rather Burke and Fox than any French speakers. Personally he had that which is the truest mark of nobility of mind, a power of attracting love, and winning faithful friends. "I always loved him," writes Sir Gilbert Elliot to his brother Hugh; and Romilly, who was not given to lavish praise, says, "I have no doubt that in his public conduct, as in his writings, he was desirous of doing good, that his ambition was of the noblest kind, and that he proposed to himself the noblest ends." What more favourable judgment could be passed on an ambitious man! What finer epitaph could a statesman desire!

The best edition of Mirabeau's works is that published by Blanchard in 1822, in 10 vols., of which two contain his *Œuvres Oratoires*; from this collection, however, many of his less important works, and the *Monarchie Prussienne*, in 4 vols., 1788, are omitted. For his life consult *Mirabeau: Mémoires sur sa vie littéraire et privée*, 4 vols., 1824, and, what is of most importance, *Mémoires biographiques, littéraires, et politiques de Mirabeau écrits par lui-même, par son père, son oncle, et son fils adoptif*, which was issued by M. Lucas de Montigny in 8 vols., Paris, 1834. See also Dumont, *Souvenirs sur Mirabeau*, 1832; Duval, *Souvenirs sur Mirabeau*, 1832; Victor Hugo, *Étude sur Mirabeau*, 1834; *Mirabeau's Jugendleben*, Breslau, 1832; Schneidewin, *Mirabeau und seine Zeit*, Leipzig, 1831; *Mirabeau, a Life History*, London, 1848. The publication of the *Correspondance entre Mirabeau et le Comte de la Marck*, by Ad. Bacout, 2 vols., 1851, marks an epoch in our exact knowledge of Mirabeau and his career. The most useful modern books are Louis de Loménie, *Les Mirabeau*, 1878, which, however, chiefly treats of his father and uncle; Ph. Plan, *Un Collaborateur de Mirabeau*, 1874, treating of Reybaz, and throwing infinite light on Mirabeau's mode of work; and, lastly, H. Reynald, *Mirabeau et la Constituante*, 1873. On his eloquence and the share his collaborators had in his speeches, see Anlard, *L'Assemblée Constituante*, 1882. For his death see the curious brochure of his physician Cabanis, *Journal de la maladie et de la mort de Mirabeau*, Paris, 1791 (H. M. S.)

MIRABEAU, VICTOR RIQUETI, MARQUIS DE (1715-1789), himself a distinguished author and political economist, but more famous as the father of the great Mirabeau, was born at Pertuis near the old chateau de Mirabeau on October 4, 1715. He was brought up very sternly by his father, and in 1729 joined the army. He took keenly to campaigning, but never rose above the rank of captain, owing to his being unable to get leave at court to buy a regiment. In 1737 he came into the family property on his father's death, and spent some pleasant years till 1743 in literary companionship with his dear friends Vauvenargues and Lefranc de Pompignan, which might have continued had he not suddenly determined to marry—not for money, but for landed estates. The lady whose property he fancied was Marie Geneviève, daughter of a M. de Vassan, a brigadier in the army, and widow of the Marquis de Saulvebœuf, whom he married without previously seeing her on April 21, 1743. While in garrison at Bordeaux, Mirabeau had made the acquaintance of Montesquieu, which may have made him turn his thoughts to political speculations; anyhow it was while at leisure after retiring from the army that he wrote his first work, his *Testament Politique* (1747), which demanded for the prosperity of France a return of the French noblesse to their old position in the Middle Ages. This work, written under the influence of the feudal ideas impressed upon him by his father, was followed in 1750 by a book on the *Utilité des États Provinciaux*, full of really wise considerations for local self-government, which was published anonymously, and had the honour of being attributed to Montesquieu himself. In 1756 Mirabeau made his first appearance as a political economist by the publication of his *Ami des Hommes ou traité de la population*. This work has been often attributed to the influence, and in part even to the pen, of Quesnay, the founder of the economical school of the physiocrats, but was really written before the marquis had made the acquaintance of the physician of Madame de Pompadour. In 1760 he published his *Théorie de l'Impôt*, in which he attacked with all the vehemence of his son the farmers-general of the taxes, who got him imprisoned for eight days at Vincennes, and then exiled to his country estate at Bignon. At Bignon the school of the physiocrats was really established, and the marquis surrounded himself with devotees, and eventually in 1765 bought the *Journal de l'Agriculture, du commerce, et des finances*, which became the organ of the school. He was distinctly recognized as a leader of political thinkers by Prince Leopold of Tuscany, afterwards emperor, and by Gustavus III. of Sweden, who in 1772 sent him the grand cross of the order of Vasa. But the period of his happy literary life was over; and his name was to be mixed up in a long scandalous lawsuit. Naturally his marriage had not been happy; he had separated from his wife by mutual consent in 1762, and had, he believed, secured her safely in the provinces by a lettre de cachet, when in 1772 she suddenly appeared in Paris, and soon after commenced proceedings for a separation. The poor marquis did not know what to do; his sons were a great trouble to him, and it was one of his own daughters who had encouraged his wife to take this step. Yet he was determined to keep the case quiet if possible for the sake of Madame de Pailly, a Swiss lady whom he had loved since 1756. But his wife would not let him rest; her plea was rejected in 1777, but she renewed her suit, and, though the great Mirabeau had pleaded his father's case, was successful in 1781, when a decree of separation was pronounced. This trial had quite broken the health of the marquis, as well as his fortune; he sold his estate at Bignon, and hired a house at Argenteuil, where he lived quietly till his death on July 11, 1789.

For the whole family of Mirabeau, the one book to refer to is Louis de Loménie's *Les Mirabeau*, 2 vols., 1878, and it is greatly to be regretted that the talented author did not live to treat the lives of the great Mirabeau and his brother. See also Lucas de Montigny's *Mémoires de Mirabeau*, and, for the marquis's economical views, De la Vergne's *Économistes français du 18^{me} siècle*.

MIRAGE. See LIGHT, vol. xiv. p. 600.

MIRAMON, MIGUEL, a Mexican soldier of French extraction, was born in the city of Mexico, September 29, 1832, and shot along with the emperor Maximilian at Queretaro, June 19, 1867. While still a student he helped to defend the military academy at Chapultepec against the forces of the United States; and, entering the army in 1852, he rapidly came to the front during the civil wars that disturbed the country. It was largely due to Miramon's support of the ecclesiastical party against Alvarez and Comonfort that Zuloaga was raised to the presidency; and in 1859 he was called to succeed him in that office. Decisively beaten, however, by the Liberals, he fled the country in 1860, and spent some time in Europe earnestly advocating foreign intervention in Mexican affairs; and when he returned it was as a partisan of Maximilian. His ability as a soldier was best shown by his double defence of Puebla in 1856.

MIRANDA, FRANCESCO (1754-1816), was born at Santa Fé in New Granada in 1754. He entered the army, and served against the English in the American War of Independence. The success of that war inspired him with a hope of being the Washington of his own country, and a belief that the independence of Spanish America would increase its material prosperity. With these views he began to scheme a revolution, but his schemes were discovered and he had only just time to escape to the United States. Thence he went to England, where he was introduced to Pitt, but chiefly lived with the leading members of the opposition—Fox, Sheridan, and Romilly. Finding no help in his revolutionary schemes, he travelled over the greater part of Europe, notably through Austria and Turkey, till he arrived at the court of Russia, where he was warmly received, but from which he was dismissed, though with rich presents, at the demand of the Spanish ambassador, backed up by the envoy of France. The news of the dispute between England and Spain about Nootka Sound in 1790 recalled him to England, where he saw a good deal of Pitt, who had determined to make use of him to "insurge" the Spanish colonies, but the peaceful arrangement of the dispute again destroyed his hopes. In April 1792 he went to Paris, with introductions to Pétion and the leading Girondists, hoping that men who were working so hard for their own freedom might help his countrymen in South America. France had too much to do in fighting for its own freedom to help others; but Miranda's friends sent him to the front with the rank of general of brigade. He distinguished himself under Dumouriez, was intrusted in February 1793 with the conduct of the siege of Maestricht, and commanded the left wing of the French army at the disastrous battle of Neerwinden. Although he had given notice of Dumouriez's projected treachery, he was put on his trial for treason on May 12. He was unanimously acquitted, but was soon again thrown into prison, and not released till after the 9th Thermidor. He again mingled in politics, and was sentenced to be deported after the struggle of Vendémiaire. Yet he escaped, and continued in Paris till the *coup d'état* of Fructidor caused him finally to take refuge in England. He now found Pitt and Dundas once more ready to listen to him, and the latter sent a special minute to Colonel Picton, the governor of Trinidad, to assist General Miranda's schemes in every possible way; but, as neither of them would or could give him substantial help, he went to the United States, where President Adams gave him fair words but nothing more. Once more he returned to England,

where Addington might have done something for him but for the signature of the peace of Amiens in 1802. At the peace, though in no way amnestied, he returned to Paris, but was promptly expelled by the First Consul, who was then eager to be on good terms with the court of Spain. Disappointed in further efforts to get assistance from England and the United States, he decided to make an attempt on his own responsibility and at his own expense. Aided by two American citizens, Colonel Smith and Mr Ogden, he equipped a small ship, the "Leander," in 1806, and with the help of the English admiral Sir A. Cochrane made a landing near Carácas, and proclaimed the Colombian republic. He had some success, and would have had more had not a false report of peace between France and England caused the English admiral to withdraw his support. At last in 1810 came his opportunity; the events in Spain which brought about the Peninsular War had divided the authorities in Spanish America, some of whom declared for Joseph Bonaparte, others for Ferdinand VII., while others again held to Charles IV. At this moment Miranda again landed, and had no difficulty in getting a large party together who declared a republic, both in Venezuela and New Granada or Colombia. But Miranda's desire that all the South American colonies should rise, and a federal republic be formed, awoke the selfishness and pride of individual provincial administrations, and thus weakened the cause, which further was believed to be hateful to heaven owing to a great earthquake on March 26, 1812. The count of Monte Verde, the Bourbon governor, had little difficulty in defeating the dispirited forces of Miranda, and on July 26 the general capitulated on condition that he should be deported to the United States. The condition was not observed; Miranda was moved from dungeon to dungeon, and died in 1816 at Cadiz.

There are allusions to Miranda's early life in nearly all memoirs of the time, but they are not generally very accurate. For his trial see Buchez et Roux, *Histoire Parlementaire*, xxvii. 26-70. For his later life see Biggs, *History of Miranda's Attempt in South America*, London, 1809; and Veggasi, *Revolucion de la Columbia*.

MIRANDOLA. See PICO.

MIRKHOND (1433-1498). Mohammed bin Kháwandsáh bin Mahmúd, commonly called Mirkhwánd or Mirkháwánd, more familiar to Europeans under the name of Mirkhond, was born in 1433, the son of a very pious and learned man who, although belonging to an old Bokhara family of Sayyids or direct descendants of the Prophet, lived and died in Balkh. From his early youth he applied himself to historical studies and literature in general. In Herát, where he spent the greater part of his life, he gained the favour of that famous patron of letters, Mir 'Alishír (born 1440), who served his old school-fellow the reigning sultan Husain (who as the last of the Tímúrides in Persia ascended the throne of Herát in 1468), first as keeper of the seal, afterwards as governor of Jurján. At the request of this distinguished statesman and writer¹ Mirkhond began about 1474, in the quiet convent of Khilásyah, which his patron had founded in Herát as a house of retreat for literary men of merit, his great work on universal history, the largest ever written in Persian, and to the present day an inexhaustible mine of information both to Eastern and Western scholars. It is named *Rauzat-ussafá fi sirat-ulanbiá walmulúk walkhulafá* or *Garden of Purity on the Biography of Prophets, Kings, and Caliphs*. That the author has made no attempt at a critical examination of historical traditions can scarcely be called a peculiar fault of his, since almost all Oriental writers are equally deficient in sound criticism; more censurable is his

flowery and often bombastic style, but in spite of this drawback, and although, in our own age, the discovery of older works on Asiatic history has diminished to some extent the value of Mirkhond's *Rauzat*, it still maintains its high position as one of the most marvellous achievements in literature from the pen of one man, and often elucidates, by valuable text-corrections, various readings, and important additions, those sources which have lately come to light. It comprises seven large volumes and a geographical appendix; but internal evidence proves beyond doubt that the seventh volume, the history of the sultan Husain (1438-1505), together with a short account of some later events down to 1523, cannot have been written by Mirkhond himself, who died in 1498. He may have compiled the preface, but the main portion of this volume is probably the work of his grandson, the equally renowned historian Khwándamír (1475-1534), to whom also a part of the appendix must be ascribed.

The following is a summary of the contents of the other six volumes. Vol. i.: Preface on the usefulness of historical studies, history of the creation, the patriarchs, prophets, and rulers of Israel down to Christ, and the Persian kings from the mythical times of the Péshtádians to the Arab conquest and the death of the last Sásánian Yazdajird III. in 30 A. H. (651 A. D.). Vol. ii.: Mohammed, Abúbekr, 'Omar, 'Othmán, and 'Alí. Vol. iii.: The twelve imáms and the Omayyad and 'Abbásid caliphs down to 656 A. H. (1258 A. D.). Vol. iv.: The minor dynasties contemporary with and subsequent to the 'Abbásids, down to 778 A. H. (1376 A. D.), the date of the overthrow of the Kurds by Tímúr. Vol. v.: The Moghuls down to Tímúr's time. Vol. vi.: Tímúr and his successors down to Sultan Husain's accession in 873 A. H. (1468 A. D.). The best accounts of Mirkhond's life are De Sacy's "Notice sur Mirkhond" in his *Mémoires sur diverses antiquités de la Perse*, Paris, 1793; Jourdain's "Notice de l'histoire universelle de Mirkhond" in the *Notices et Extraits*, vol. ix., Paris, 1812 (together with a translation of the preface, the history of the Ismailians, the conclusion of the sixth volume, and a portion of the appendix); Elliot, *History of India*, vol. iv. p. 127 sq.; Morley, *Descriptive Catalogue*, London, 1854, p. 30 sq.; Rieu, *Cal. of Persian MSS. of the Brit. Mus.*, vol. i., London, 1879, p. 87 sq. Mirkhond's patron, Mir 'Alishír, to whom the *Rauzat* is dedicated, died three years after him (1501).

Besides the lithographed editions of the whole work to folio, Bombay, 1853, and Teheran, 1852-56, and a Turkish version, Constantinople, 1842, the following portions of Mirkhond's history have been published by European Orientalists: *Early Kings of Persia*, by D. Shea, London, 1832 (Oriental Translation Fund); *L'Histoire de la dynastie des Sassanides*, by S. de Sacy (in the above-mentioned *Mémoires*); *Histoire des Sassanides (zele Persan)*, by Janbert, Paris, 1843; *Historia priorum regum Persarum*, Pers. and Lat., by Jenish, Vienna, 1782; *Mirkhond historia Taheridarum*, Pers. and Lat., by Mitscherlik, Göttingen, 1814, 2d ed., Berlin, 1819; *Historia Samanidarum*, Pers. and Lat., by Wilken, Göttingen, 1808; *Histoire des Samanides*, translated by Defrémery, Paris, 1845; *Historia Oshanevidarum*, Pers. and Lat., by Wilken, Berlin, 1832; *Geschichte der Sultane aus dem Geschlechte Buyeh*, Pers. and German, by Wilken, Berlin, 1835; followed by Erdmann's *Erläuterung und Ergänzung*, Kazan, 1836; *Historia Seldschuckidarum*, ed. Vullera, Giessen, 1837, and a German translation by the same; *Histoire des Sultans du Khareem*, in Persian, by Defrémery, Paris, 1842; *History of the Atabeks of Syria and Persia*, in Persian, by W. Morley, London, 1848; *Historia Ghuriarum*, Pers. and Lat., by Mitscherlik, Frankfurt, 1818; *Histoire des Sultans Ghurides*, translated into French by Defrémery, Paris, 1844; *Vie de Djenghiz-Khan*, in Persian, by Janbert, Paris, 1841 (see also extracts from the same 6th volume in French translation by Langlès in vol. vi. of *Notices et Extraits*, Paris, 1789, p. 192 sq., and by Hammer in *Sur les origines Russes*, St Petersburg, 1825, p. 62 sq.); "Tímúr's Expedition against Tuktamsh Khán," Persian and French, by Charmyr, in *Mémoires de l'Acad. Impér. de St Petersburg*, 1836, pp. 270-321 and 441-471. (H. E.)

MIROPOLIE, a town of Russia, situated in the government of Kursk, district of Suja, 83 miles south-west of Kursk and 25 miles from the Sumy railway station. It is supposed to have been founded in the 17th century, when it was fortified against the raids of Tartars. The fertility of the soil led to the settlement of large villages close by the fort, and the 10,800 inhabitants of this town are still engaged mostly in agriculture. There is also an extensive manufacture of boots.

MIRROR. It is only since the early part of the 16th century that mirrors have become articles of household furniture and decoration. Previous to that time—from the 12th to the end of the 15th century—pocket mirrors or small hand mirrors carried at the girdle were indispensable adjuncts to ladies' toilets. The pocket mirrors consisted of small circular plaques of polished metal fixed in a shallow circular box, covered with a lid. Mirror cases were chiefly made of ivory, carved with relief representations of love

¹ Mir 'Alishír not only excelled as poet both in Chaghatái, in which his epopees gained him the foremost rank among the classic writers in that language, and in Persian, but composed an excellent *tadhkirah* or biography of contemporary Persian poets.

or domestic scenes, hunting, and games, and sometimes illustrations of popular poetry or romance. Gold and silver, enamels, ebony, and other costly materials were likewise used for mirror cases, on which were lavished the highest decorative efforts of art workmanship and costly jewellery. The mirrors worn at the girdle had no cover, but were furnished with a short handle. In 625 Pope Boniface IV. sent Queen Ethelberga of Northumbria a present of a silver mirror: and there is ample evidence that in early Anglo-Saxon times mirrors were well known in England. It is a remarkable fact that on many of the sculptured stones of Scotland, belonging probably to the 7th, 8th, or 9th century, representations of mirrors, mirror cases, and combs occur.

The method of backing glass with thin sheets of metal for mirrors was well known in the Middle Ages at a time when steel and silver mirrors were almost exclusively employed. Vincent de Beauvais, writing about 1250, says that the mirror of glass and lead is the best of all "quia vitrum propter transparentiam melius recipit radios." It is known that small convex mirrors were commonly made in southern Germany before the beginning of the 16th century, and these continued to be in demand under the name of bull's-eyes (*Ochsen-Augen*) till comparatively modern times. They were made by blowing small globes of glass into which while still hot was passed through the pipe a mixture of tin, antimony, and resin or tar. When the globe was entirely coated with the metallic compound and cooled it was cut into convex lenses, which of course formed small but well-defined images. It appears that attention was drawn to this method of making mirrors in Venice as early as 1317, in which year a "Magister de Alemania," who knew how to work glass for mirrors, broke an agreement he had made to instruct three Venetians, leaving in their hands a large quantity of mixed alum and soot for which they could find no use.

It was, however, in Venice that the making of glass mirrors on a commercial scale was first developed; and that enterprising republic enjoyed a rich and much-prized monopoly of the manufacture for about a century and a half. In 1507 two inhabitants of Murano, representing that they possessed the secret of making perfect mirrors of glass, a knowledge hitherto confined to one German glass-house, obtained an exclusive privilege of manufacturing mirrors for a period of twenty years. In 1564 the mirror-makers of Venice, who enjoyed peculiar privileges, formed themselves into a corporation. The products of the Murano glass-houses quickly supplanted the mirrors of polished metal, and a large and lucrative trade in Venetian glass mirrors sprang up. They were made from blown cylinders of glass which were slit, flattened on a stone, carefully polished, the edges frequently bevelled, and the backs "silvered" by an amalgam. The glass was remarkably pure and uniform, the "silvering" bright, and the sheets sometimes of considerable dimensions. In the inventory of his effects made on the death of the great French minister Colbert is enumerated a Venetian mirror 46 by 26 inches, in a silver frame, valued at 8016 livres, while a picture by Raphael is put down at 3000 livres.

The manufacture of glass mirrors, with the aid of Italian workmen, was practised in England by Sir Robert Mansel early in the 17th century, and about 1670 the duke of Buckingham was concerned in a glass-work at Lambeth where flint glass was made for looking-glasses. These old English mirrors, with bevelled edges in the Venetian fashion, are still well known.

The Venetians guarded with the utmost jealousy the secrets of their varied manufactures, and gave most exceptional privileges to those engaged in such industries. By their statutes any glassmaker carrying his art into a

foreign state was ordered to return on the pain of imprisonment of his nearest relatives, and should he disobey the command emissaries were delegated to slay the contumacious subject. In face of such a statute Colbert attempted in 1664, through the French ambassador in Venice, to get Venetian artists transported to France to develop the two great industries of mirror-making and point-lace working. The ambassador, the bishop of Béziers, pointed out that to attempt to send the required artists was to court the risk of being thrown into the Adriatic, and he further showed that Venice was selling to France mirrors to the value of 100,000 crowns and lace to three or four times that value. Notwithstanding these circumstances, however, twenty Venetian glass-mirror makers were sent to France in 1665, and the manufacture was begun under the fostering care of Colbert in the Faubourg St Antoine, Paris. But previous to this the art of blowing glass for mirrors had been actually practised at Tour-la-Ville, near Cherbourg, by Richard Lucas, Sieur de Nehou, in 1653; and by the subsequent combination of skill of both establishments French mirrors soon excelled in quality those of Venice. The art received a new impulse in France on the introduction of the making of plate glass, which was discovered in 1691. The St Gobain Glass Company attribute the discovery to Louis Lucas of Nehou, and over the door of the chapel of St Gobain they have placed an inscription in memory of "Louis Lucas qui inventa in 1691 le methode de couler les glaces et installa la manufacture en 1695 dans le château de Saint Gobain."

Manufacture.—The term "silvering," as applied to the formation of a metallic coating on glass for giving it the properties of a mirror, was till quite recently a misnomer, seeing that till about 1840 no silver was used in the process. Now, however, a large proportion of mirrors are made by depositing on the glass a coating of pure silver, and the old amalgamation process is comparatively little used.

The process of amalgamation consists in applying a thin amalgam of tin and mercury to the surface of glass, which is done on a perfectly flat and horizontal slab of stone bedded in a heavy, iron-bound wooden frame, with a gutter running round the outer edge. On the surface of this table, which must be perfectly smooth and level, is spread a sheet of thin tin-foil, somewhat larger than the glass to be operated on, and after all folds and creases have been completely removed, by means of stroking and beating with a covered wooden rubber, the process of "quickenening" the foil is commenced. A small quantity of mercury is rubbed lightly and quickly over the whole surface, and the scum of dust, impure tin, and mercury is taken off. Mercury is then poured upon the quickened foil, until there is a body of it sufficient to float the glass to be silvered (about $\frac{1}{4}$ inch deep), and, the edge at one of the sides having been cleared of the scum peculiar to mercury, the glass (scrupulously cleaned simultaneously with the above operations) is slid from that side over the surface of the mercury. Weights are placed over the surface until the greater part of the amalgamated mercury is pressed out, the table is then tilted diagonally, by means of dumb-screws, and all superfluous mercury finds its way to the gutter. The glass is left twenty-four hours under weights; it is then turned over silvered side up, and removed to a drainer with inclining shelves, where by slow degrees, as it dries and hardens, it is brought to a vertical position, which in the case of large sheets may not be arrived at in less than a month. This process yields excellent results, producing a brilliant silver-white metallic lustre which is only subject to alteration by exposure to high temperatures, or by contact with damp surfaces; but the mercurial vapours to which the workmen are exposed give rise to the most distressing and fatal affections.

In 1835 Baron Liebig observed that, on heating aldehyde with an ammoniacal solution of nitrate of silver, in a glass vessel, a brilliant deposit of metallic silver was formed on the surface of the glass. To this observation is due the modern process of silvering glass. In practice the process was introduced about 1840; and it is now carried on, with several modifications, in two distinct ways, called the hot and the cold process respectively. In the former method there is employed a horizontal double-bottomed metallic table, which is heated with steam to from 35° to 40° C. The glass to be silvered is cleaned thoroughly with wet whiting, then washed with distilled water, and prepared for the silver with a sensitizing solution of tin, which is well rinsed off immediately before its removal to the silvering table. The table being raised to the proper temperature, the glass is laid, and the silvering solution at

once poured over it, before the heat of the table has time to dry any part of the surface of the glass. The solution used is prepared as follows:—in half a litre of distilled water 100 grammes of nitrate of silver are dissolved; to this there is added of liquid ammonia (sp. gr. 0·880) 62 grammes; the mixture is filtered, and made up to 8 litres with distilled water, and 7·5 grammes of tartaric acid dissolved in 30 grammes of water are mixed with the solution. About 2·5 litres are poured over the glass for each superficial metre to be silvered. The metal immediately begins to deposit on the glass, which is maintained at about 40° C. (104° F.), and in little more than half an hour a continuous coating of silver is formed. The silvered surface is then cleaned by very cautiously wiping with a very soft chamois rubber, and treated a second time with a solution like the first, but containing a double quantity of tartaric acid. This solution is applied in two portions, and thereafter the glass is once more carefully cleared of all unattached silver and refuse and removed to a side room for backing up.

In silvering by the cold process advantage is taken of the power of inverted sugar to reduce the nitrate of silver. This process has been adopted for the silvering of mirrors for astronomical telescopes, notably for Leverrier's great telescope in the Paris Observatory. For ordinary mirror silvering the following is the process recommended by H. E. Benrath. Two solutions are prepared, the first of which contains the silver salt, and the second the sugar preparation. For the silver solution 800 grammes of nitrate of silver and 1200 grammes of nitrate of ammonium are dissolved in 10 litres of water, and 1·3 kilos of pure caustic soda in 10 litres of water, and of each of these solutions 1 litre is added to 8 litres of water, which is allowed to rest till the sediment forms and then decanted. The second solution—inverted sugar—is prepared by dissolving 150 grammes of loaf sugar with 15 grammes of vinegar in 0·5 litre of water, and boiling the solution for half an hour. After cooling it is made up with water to 4200 cubic centimetres. The silvering is done on horizontal tables in a well-lighted and moderately heated apartment, and the glass is cleaned with scrupulous care. For each square centimetre of glass operated on 15 cubic centimetres of the silver solution above described are measured out, and from 7 to 10 per cent. of the solution of inverted sugar is added, both being quickly stirred together and poured rapidly and evenly over the glass. The reduction immediately begins, and the solution exhibits tints passing through rose, violet, and black, till in about seven minutes it again becomes transparent and the deposit of metal is complete. This first deposit is extremely thin, and allows the transmission of bluish rays. The exhausted solution with floating and unattached dust-like granules of silver is carefully wiped off, the silvered surface washed with distilled water and again treated with the mixed solutions to the extent of half the quantity used in the first application. The finished surface is wiped and washed in the most thorough manner,—for the least trace of caustic soda left would destroy the mirror. The further processes are the same in both methods of silvering.

The deposit of silver on glass is not so adherent and unalterable under the influence of sunlight and sulphurous fumes as the tin-mercury amalgam, and moreover real silvered glass has a slightly yellowish tinge. These defects have been overcome by a process introduced by M. Lenoir, which consists of brushing over the silvered surface with a dilute solution of cyanide of mercury, which instantaneously forming a kind of amalgam renders the deposit at once much whiter and more firmly adherent than before. To protect the thin metallic film from mechanical injury and the chemical action of gases and vapours, it is coated with shellac or copal varnish, over which when dry are applied two coatings of red-lead paint.

Platinum Mirrors.—A cheap process of preparing mirror glass is to some extent prosecuted in France, whereby a thin but very adherent deposit of platinum is formed on the glass. A solution of chloride of platinum with a proportion of litharge and borate of lead dissolved in essential oil of spike is applied with a brush to well-cleaned glass, which is then placed on edge in a muffle furnace, and the platinum is thus burned in, forming an exceedingly thin but brilliant metallic backing having a somewhat grey lustre. It is used only for the lids of cheap boxes, toys, ornamental letters, &c.

Magic Mirrors.—Hand mirrors of metal are still in common use in Oriental countries, and especially in Japan and China they continue to be the prevalent form of looking-glass. In the former country indeed bronze mirrors are articles of the greatest importance in the generally meagre furnishing of houses, and besides possess a religious significance. They have been known and used from the most remote period, mention of them being found in Chinese literature of the 9th century. The (supposed) first made Japanese mirror, preserved at Isé, is an object of the highest veneration in Japan, and an ancient mirror, connected with which is a tradition to the effect that it was given by the sun-goddess at the foundation of the empire, is a principal article of the Japanese regalia. The mirrors of Japan vary in form and size, but in general they consist of thin disks, from 3 to 12 inches in diameter, of speculum metal with handles cast in one piece. The polished face of the mirror is slightly convex in form, so that a reflected image is seen

proportionately reduced in size; the back of the disk is occupied with characteristic Japanese ornamentation and inscriptions in bold relief, and its rim is also raised to the back. Much attention has been attracted to these mirrors by a singular physical peculiarity which in a few cases they are found to possess. These are known as magic mirrors from the fact that when a strong beam of light is reflected from their smooth and polished surface, and thrown on a white screen, an image of the raised ornaments and characters on the back of the mirror is formed with more or less distinctness in the disk of light on the screen. This peculiarity has at no time been specially observed by the Japanese, but in China it attracted attention as early as the 11th century, and mirrors possessed of this property sell among the Chinese at ten or even twenty times the price sought for the ordinary non-sensitive examples. The true explanation of the magic mirror was first suggested by the French physicist Person, who observed that the reflecting surface of the mirrors was not uniformly convex, the portions opposite relief surfaces being plane. Therefore, as he says, "the rays reflected from the convex portion diverge and give but a feebly illuminated image, while, on the contrary, the rays reflected from the plane portions of the mirror preserve their parallelism, and appear on the screen as an image by reason of their contrast with the feebler illumination of the rest of the disk." That such differences of plane in the mirror surface arise is an accidental circumstance due to the manner in which it is prepared, a process explained by Professors Ayrton and Perry, by whom ample details of the history, process of manufacture, and composition of Oriental mirrors have been published. A preliminary operation in polishing the surface consists of scoring the cast disk in every direction with a sharp tool. The thicker portions with relief ornament offer more resistance to the pressure of the tool than the thin flat portions, which tend to yield and form at first a concave surface, but this by the reaction of its elasticity rises afterwards and forms a slightly convex surface while the more rigid thick portions are comparatively little affected. This irregularity of surface is inconspicuous in ordinary light, and does not visibly distort images; but when the mirror reflects a bright light on a screen the unequal radiation renders the minute differences of surface obvious. The ingenious theory of Person has been established by experiments communicated by M. Govi to the academy of Turin in 1864-65, and more recently by investigations of MM. Bertin and Dubosq. See *Annales de Chimie et de Physique* (5th ser., vol. xx.). (J. P. A.)

Ancient Mirrors.

The mirror of classical antiquity (κάτοπτρον, speenlum) was a thin disk of bronze slightly convex on one side and polished, usually provided with a handle, sometimes mounted on a stand in the form of a female figure (see *COSTUME*, vol. vi. p. 453, fig. 1), sometimes fixed inside a circular bronze case. The common size is that of an ordinary hand mirror. Examples large enough to take in the whole figure appear to have been rare. Mirrors of glass are mentioned, and though none of them have been found their existence need not be questioned altogether, since the process of silvering occasionally employed on bronze mirrors suggests that an analogous process may have been applied to glass. But the very large number of mirrors still existing from antiquity shows that bronze was the regular material employed. The alloy known as speenlum, producing a very hard metal with great reflecting power, is comparatively seldom met with. Silver mirrors are mentioned, but none have as yet been found.

The principal feature of ancient mirrors, especially those of Etruria, is the design incised on the back (see *ETRURIA*, vol. viii. p. 643). While twelve incised specimens are all that are as yet known from Greece, the number found in Etruria must be nearly a thousand. As a rule the subjects incised are taken from Greek mythology and legend, the names of the persons represented being frequently added in Etruscan letters and orthography. In most cases the style of drawing, the types of the figures, and the manner of composing the groups are true to the characteristics of Greek art. Some may have been imported from Greece; but the greater number appear to have been more or less faithfully imitated from such designs as occurred on the almost innumerable printed Greek vases which the Etruscans obtained from Greece. Even where distinctly Etruscan figures are introduced, such as the heroes Ælius and Cælius Vibenna on a mirror in the British Museum, Greek models are followed. The characteristics of Greek art here referred to date from a little before 400 B.C., and last for some time after. In this period would fall the majority of the Etruscan mirrors, and to this period also belong the Greek incised mirrors, among which may be mentioned for their beauty one representing Leucas and Corinthus, inscribed with their names (engraved, *Monuments Grecs*, 1873, pl. 3, published by the Association pour l'encouragement des Études Grecques), and another in the British Museum (*Gazette Arch.*, ii. pl. 27), on the back of which is a figure of Eros which has been silvered over. With this last-mentioned mirror was found the bronze case used to contain it

on the back of which is a group of Aphrodite and Eros in repoussée. It was found in Crete. But most of the Greek mirrors and mirror-cases having artistic designs are from Corinth. One bears the name of the artist, Ἀπολλῆς ἐποίησεν (engraved, *Arch. Zeitung*, 1862, pl. 166, fig. 1).

Archaic art (about 500 B.C.) is represented by a mirror in the British Museum from Suniua in Attica. The mirror itself is quite plain, but the stand is composed of a draped female figure, above whose head float two cupids. From Etruria there is a comparatively small number with archaic incised designs. It may be concluded that the luxury of mirrors enriched with incised designs was not freely indulged before 400 B.C. in Etruria and never to any extent in Greece. A special centre of incised mirrors was the Latian town of Preneste (Palestrina), and it is of interest in regard to some of the mirrors found there that they have inscriptions in early Latin. Artistically they have a purely Greek character. Plain mirrors are found wherever Greek and Roman civilization spread, and it may be seen from a specimen found in Cornwall, now in the British Museum, that the Celtic population of England had adopted the form and substance of the mirror from their conquerors. This specimen is enriched with a Celtic pattern incised. The shape of the handle testifies to native originality. Mirrors were used in Greece, perhaps rarely, for divination, as appears, for example, from Pausanias (vii. 21, 5), the method being to let the mirror down into a well by means of a string till it reached close to the surface of the water. When it was pulled up after a little it was expected to show the face of the sick person on whose behalf the ceremony was performed. This was at Patras.

The principal publications on ancient mirrors are Gerhard, *Etruskische Spiegel*, Berlin, 1843-67, 4 vols., containing 430 plates; for the Greek mirrors, Mylonas, Ἑλληνικὰ κάτοπτρα, Athens, 1876, and Dumont, *Bullet. de Corresp. Hellén.*, 1877, p. 103; see also Friederichs, *Kleinere Kunst und Industrie im Alterthum*, Düsseldorf, 1871, p. 13 sq; and Marquardt and Mommsen, *Handbuch der römischen Alterthümer*, vii. pt. 2, p. 670.

MIRZÁPUR, a district in the North-Western Provinces of India, lying between 23° 51' 30" and 25° 31' N. lat., and between 82° 9' 15" and 83° 0' 36" E. long., is bounded on the N. by Jaunpur and Benares, on the E. by Shahábád and Lohárdagá, on the S. by Sargujá state, and on the W. by Allahábád and Rewah state, and has an area of 5217 square miles. It is crossed from east to west by the Vindhya and Káimur ranges. A central jungly plateau connects these, and separates the valley of the Ganges from that of the Son.

The population in 1872 was 1,015,203 (males, 520,496; females, 494,707), of whom 949,644 were Hindus, 64,809 Mohammedans, and 750 Christians. The non-Asiatic population numbered 623. Only three towns had a population exceeding 5000:—Mirzápur, 67,274; Chanár, 10,154; and Ahraura, 9091. Out of a Government-assessed area of 3048 square miles, 1313 are cultivated, 497 cultivable waste, and 1233 uncultivable. The part of Mirzápur which lies north of the Vindhya is very highly cultivated and thickly peopled, but the rest of the district consists largely of ravines and forests, with a very sparse population. Local manufactures comprise carpets of a superior description, brass ware, and shellac. The East Indian Railway traverses the district, along the right bank of the Ganges, for a distance of 32 miles. The climate is slightly warmer and damper than that of districts farther north and east. The mean annual rainfall is 42.7 inches.

MIRZÁPUR, chief town and administrative headquarters of the above district, is situated on the south bank of the Ganges, 56 miles below Allahábád (25° 9' 43" N. lat., 82° 38' 10" E. long.). The population in 1872 was 67,274, of whom 55,917 were Hindus and 11,053 Mohammedans. Up to quite recent years Mirzápur was the largest mart in upper India for grain and cotton; but of late its commercial importance has rapidly decreased, owing to the establishment of through railway communication with Bombay via Jabalpur, and the rise of Cawnpore to the position of a mercantile centre. The river front, lined with stone gháts or flights of stairs, and exhibiting numerous mosques, Hindu temples, and dwelling-houses of the wealthier merchants, with lightly decorated facades and richly carved balconies and door-frames, is handsome; but the interior of the town is mainly composed of mud huts. The manufacture of shellac gives employment to about four thousand persons; brass ware and carpets are also made. The imports consist of grain, sugar, cloth, metals, fruit, spices, tobacco, lac, salt, and cotton; the same articles, with manufactured lac-dye, shellac, and *ghí*, are exported.

MISDEMEANOUR. "The word misdemeanour," says Russell (*On Crimes*, vol. i. chap. iv.), "is applied to all those crimes and offences for which the law has not provided a particular name." Stephen, in his *Digest of the Criminal Law*, adopts the following mode of distinguishing between misdemeanour and other crimes. "Every crime is either treason, felony, or misdemeanour. Every crime which amounts to treason or felony is so denominated in the definitions of crimes hereinafter contained. All crimes not so denominated are misdemeanours." It is customary to speak of misdemeanour as implying a less degree of crime than felony (see FELONY). "Misdemeanours," observes Russell in the passage already cited, "have been sometimes termed *misprisions*; indeed the word *misprision*, in its larger sense, is used to signify every considerable misdemeanour which has not a certain name given to it in the law, and it is said that a *misprision* is contained in every felony whatsoever, so that the offender may be prosecuted for *misprision* at the option of the crown." *Misprision*, in a more restricted sense (or negative *misprision*), is the concealment of an offence. Positive *misprisions* are contempts or misdemeanours of a public character, e.g., mal-administration of high officials, contempt of the sovereign or magistrates, &c. The rule as to punishment, when no express provision has been made by law, is that "every person convicted of a misdemeanour is liable to fine and imprisonment without hard labour (both or either), and to be put under recognizances to keep the peace and be of good behaviour at the discretion of the court" (Stephen's *Digest*, art. 22). By 28 & 29 Vict. c. 67 prisoners convicted of misdemeanour and sentenced to hard labour shall be divided into two divisions, one of which shall be called the first division, and when a person convicted of misdemeanour is sentenced to imprisonment without hard labour the court may order him to be treated as a first-class misdemeanant, who shall not be deemed a "criminal prisoner" within the meaning of that Act. The Prison Act, 1877 (§§ 40, 41), requires prisoners convicted of sedition or seditious libel, or attached for contempt of court, to be treated as misdemeanants of the first class.

In New York and some other States of the American Union the legislature has defined felony as any crime which is or may be punishable with death or imprisonment in a State prison, all other crimes being misdemeanours.

MISHNAH. The *Mishnah*, in the most familiar application of the name, is the great collection of legal decisions by the ancient rabbis which forms in each Talmud the text on which the *Gemara* rests, and so is the fundamental document of the oral law of the Jews. The question What is *Mishnah*? was asked, however, as early as the latter part of the 1st or the early part of the 2d century, though in a somewhat different sense and for a somewhat different purpose.¹ It will be answered in the course of this article in all its bearings.

1. *Name*.—Rabbinic tradition has fixed the pointing *Mishnah* (מִשְׁנָה) by giving its *status constructus* as *Mishnath*. Although the word *Mishnah* is not found in the Bible, it is no doubt a classical Hebrew term, signifying something closely akin to *Mishneh* (which term occurs more than once there), as may be seen on comparing *Mikvah* with *Mikveh*, *Miknah* with *Mikneh*, *Ma'alah* with *Ma'aleh*, and *Mar'ah* with *Mar'eh*, each two of which are, however they may vary in practical application, unquestionably synonymous terms. The practical significations of *Mishnah* are seven in number:—(1) repetition, i.e., tradition;² as such it is the equivalent of the

¹ See T. B., *Kiddushin*, 49a.

² The root *Shanah* (שָׁנָה), from which *Mishnah* is immediately derived, is not merely, as is often thought, to *learn*, to *teach*, but to *repeat*; and it is in reality this last meaning which underlies the two former.

δευτερώσεις of Epiphanius,¹ the *traditiones et δευτερώσεις* of Jerome,² the *δευτερώσεις* of Justinian,³ and the שנייה לְתוֹרָה ("the second to the law") of the *Arukh*⁴; (2) recitation from memory, in contradistinction to reading from a book;⁵ (3) study: as such it is the equivalent of *Midrash* in the former part of its third signification; (4) instruction: as such it is the equivalent of *Midrash* in the latter part of its third signification;⁶ (5) system, style, view, line of study and instruction: as such it is identical with the Talmudical *Shittah*;⁷ (6) a paragraph of the *Mishnah*: it is invariably employed in this sense in the Babylonian Talmud, and is identical with the word *Halakkah*, used for the same purpose, in the Palestinian Talmud; and (7) the collection of the decisions of the whole "oral law," i.e., the *Mishnah* in the concrete sense. The word *Mishnah* has three different plurals:—(1) the traditional *Mishnayoth* for signification (7), formed on the analogy of *Mikvaoth* (not, as some think, on that of *Mikraoth* or *Midrashoth*); (2) the correct, though questioned, *Mishniyyoth* for signification (6), formed on the analogy of *Parshiyoth* from *Parashah* (or *Parshah*), not to speak of that of *Ma'asiyyoth* from *Ma'aseh*; (3), the somewhat inelegant, but correct, *Mishnoth*,⁸ which also serves for signification (6). Significations (1), (2), (3), (4), and (5) have, however inconsistent it may appear when one takes into consideration their respective equivalents, no plural whatever. So much for the Hebrew *Mishnah*. The Aramaic *Mathnitho* will be spoken of later.

2. *Contents and Nature*.—The *Mishnah* consists chiefly of *Halakkah*;⁹ there is, comparatively speaking, little *Agadah*¹⁰ to be found in it. It is not, however, as many think, either a commentary on the Halakic portions of the Pentateuch, or on the ordinances of the *Sopherim*, or on both together. It rather presupposes the knowledge of, and respect for, both the Mosaic and the Sopheric laws, and it only discusses, and finally decides on, the best mode and manner of executing these. The discussions and eventual decisions to be found in the *Mishnah* owe their existence principally to deep meditation on these two kinds of laws, notably on the former, by the rabbis of various ages, but chiefly by those who lived fifty years before and one hundred and fifty years after the rise of Christianity, the names of whom it faithfully gives, along with their respective discussions and decisions. There are but few cases to be found in the *Mishnah* which would critically come under the denomination of an *Halakkah le-Mosheh mis-Sinai*, i.e., an explanation (of a law) as directly

given by God to Moses, and in uninterrupted succession received from him by the rabbis. Several cases given under this name in the *Mishnah* are not *bona fide* cases;¹¹ for the test of such an *Halakkah* is that it must never have been contested by any one.¹²

3. *Method*.—A *Mishnah*, if genuine, never begins with a passage of the Pentateuch, and even comparatively seldom brings direct proof from or gives reference to it. When there is any exception to this rule it will be found, on close examination, either that such a paragraph belongs to a very early age (that of the *Sopherim*), or that it is to be found in another work of the "oral law," and is simply copied in the *Mishnah*, or, what is more likely, that, if independent, it belongs to a very late age, or, finally, that the proof or the reference thus given is only a later addition. One example of the true method of the *Mishnah* will, perhaps, better illustrate the foregoing statement than a sheet full of theorizing on the subject; and this one example will the more surely suffice because of its mixed (Mosaic and Sopheric) character. It is the very first paragraph of the whole *Mishnah*, and runs thus: "From what time (of the day) does (may, should) one read the *Shema* ('the taking upon oneself the yoke of the heavenly kingdom') in the evening?" The *Mishnah* does not begin: One is in duty bound to read the *Shema* in the evening, because it is written (Deut. vi. 7), "And when thou liest down." For, in the first place, the law to read the *Shema* evening and morning is not unquestionably Mosaic, as the words, "And thou shalt talk of them, &c.," do not refer to this passage of the law particularly, but rather to the words of the Pentateuch in general;¹³ and, secondly, it is needless to say that one is in duty bound to recite the *Shema* twice a day, since every Jew readily acknowledges this duty and executes it, although it is not Mosaic. This duty of reading the *Shema*, the grounds on which this duty rests, and how it is best fulfilled, are fully and ably discussed, developed, and finally settled in that part of the Talmud called *Gemara*,¹⁴—the business of which it is to discuss the words of the *Mishnah* and to show the sources of the tradition, and eventually the passage in the Pentateuch (if on such the case rest) from which the respective disputants had derived their views, &c.

4. *Purpose*.—Although it is a book containing Halakic decisions, the *Mishnah* was never intended, as many think, to enable the reader thereof to decide from it immediately. This mistake is old¹⁵ and widely spread,—but a mistake nevertheless. The purpose of the *Mishnah* was and is simply to exhibit the development of the "oral law" and the view taken of this development by the rabbis of various times. For this reason one finds side by side with the opinions of the majority those also of the minority, which latter are very carefully given. But why, since these opinions of the minority can have no decisional effect? The *Mishnah* itself (*Eduyyoth*,¹⁶ i. 5)

¹ *Hæres.*, xv. (κατὰ γραμματέων), in *fine*. Epiphanius was a native of Palestine, even if he was not, as some think, of Jewish parentage. As a Palestinian writer on Jewish and semi-Jewish matters he must have had a more than superficial knowledge of the Jewish traditions (the *Mishnah*, &c.). And indeed, to judge from the account he gives of the various Jewish traditions (although the text of this account is extremely corrupt in every way), he was pretty well informed. For he tells us that the Jews have four kinds of traditions:—such as are ascribed to Moses (by which he no doubt means the *Halakkah le-Mosheh mis-Sinai*); such as are ascribed to the sons of Asmoneus (by which he means the *Takanoth*, &c., of the *Beth Dino shel Hashmonai*; see T. B., *Abodah Zarah*, 36b); such as are ascribed to R. Akibah (the great teacher and martyr); and such as are ascribed to R. Aanan, &c. (Rabbi Yehudah Hanasi).

² *In Isaiam*, cap. viii. 11-15

³ *Nbv.* cxlvi. (Περὶ Ἐβραίων) κεφ. δ, in *medio*.

⁴ Article *שְׁמַע* (first definition).

⁵ Contrast *Shanoh* (שָׁנוּה) with *Ḥaroh* (חָרַו).

⁶ See article *MIDRASH*, p. 285.

⁷ See Schiller-Szinessy, *Catalogue of Hebrew MSS. in the Cambridge University Library*, ii. p. 94.

⁸ See MS. Add. 464 (University Library, Cambridge), leaf 283b.

⁹ This word, derived from the root *Halakh* (חָלַךְ), to go, is synonymous with *Minhag* (custom, practice) and *Mishpat* (rule), &c.

¹⁰ For the meaning of this term and the Agadic parts which are to be found in the *Mishnah*, see *MIDRASH*.

¹¹ See R. Asher b. Yehiel (Harosh), *Hilekthoth Mikvaoth* (coming close after this Rabbi's commentary on *Niddah*, in the printed editions of the Bab. Talmud), i. 1.

¹² There are, however, at least sixteen such *bona fide* cases to be found in the works of the "oral law."

¹³ See T. B., *Berakthoth*, on Deut. xi. 19.

¹⁴ *Gemara*, or *Gemoro*, signifies concretely discussion and final settlement of the contents of the *Mishnah*, from *gemar* (גָּמַר), to study deeply, to come to a final result; which last signification is, to some extent, to be found also in the Hebrew root *gamor* (גָּמַר). Compare T. B., *Bobo Mets'eo*, 33a, and Rashi, in *loca*.

¹⁵ See T. B., *Sotah*, 22a.

¹⁶ The word עֲדוּיָת is variously pointed:—*Aduyyoth*, *Ediyyoth*, and, as in the text, *Eduyyoth*, which last, if the name come from עָדוּת, because of the testimony of the witnesses on which this *Masseketh* chiefly rests, would be the only correct one. But it ought to be remarked that the Babylonian teachers must have spelled it *Idiyyoth* (best things), since its equivalent is given by them as *Behirto* (or *Behirotho*). See T. B., *Berakthoth*, 27a and elsewhere.

answers this question: it is that the teacher or the judge of later ages may be thus enabled, if he have good grounds for taking a view different from that of the majority as given hundreds of years before, to reverse the old decision, by forming, on the strength of the example before him, with others who agree with him (or without them, if only one vote was wanted to reverse the majority) a fresh majority. Thus the Jewish "oral law" can never become ossified like the laws of the Medes and Persians.

5. *Language*.—The *Mishnah* is, on the whole, written in almost pure Hebrew; and even the originally non-Hebrew words (Aramaic, Greek, Latin, &c.) are so skillfully Hebraized that they are a most creditable testimony to the linguistic powers both of many of the disputants mentioned in it, whose very words are in most cases given, and of the editor¹ or editors who revised them.

6. *Age and Authorship*.—R. Yehudah Hannasi (the Prince), the reputed author (in reality only the principal and best among the editors) of the *Mishnah*, was born before the year 140 of the Christian era. His name was in full Yehudah b. Shime'on b. Gamliel b. Shime'on b. Gamliel² b. Shime'on b. Hillel. On account of his holy living he was surnamed Rabbenu Haḳḳadosh, and on account of his great learning and authority he was called simply "Rabbi" ("My Teacher" *par excellence*). Rabbi and his time, however, are no *terminus a quo* for the composition of the *Mishnah*. For, not to speak of many isolated *Mishniyyoth* which can be brought home to R. Meir, to R. 'Akibah, to Hillel,³ to Yose b. Yo'ezer,⁴ and to others, even to the earlier *Sopherim*,⁵ we find that R. Yose b. Halaphta of the 1st century already quotes the beginning and ending of a whole Mishnic treatise (*Kelim*⁶), and that in the same century (or very early in the 2d) another treatise consisting of early testimonies (*Eduyyoth*⁷) was put into order. Moreover, although the phrases *Mishnath R. Eli'ezer b. Ya'aqob*⁸ and *Mishnath R. 'Akibah*⁹ do simply signify the systems, styles, and views of these two eminent teachers, there can be little doubt that they and others besides them, presided over colleges in which the whole Halakhic matter was systematically treated and regularly gone through. Nor are Rabbi and his time for the composition of the *Mishnah* a *terminus ad quem*, for the *Mishnah* was not brought to a close till a very long time afterwards. Not only did R. Hiyya Rabbah, R. Hoshia'yah Rabbah, and Shime'on bar Kappara redact *Mishnayoth*,¹⁰ but in the *Mishnah* before us notices are actually found which reach to the end of the 3d century, if not even later. The statement that Rabbi was the first to write down the

¹ The Hebrew spoken in the house of the principal editor of the *Mishnah* was so correct that rabbis actually learnt the meaning of uncommon words of the Bible from the handmaidens of this house. See T. B., *Rosh Haasshanah*, 26b. As for Rabbi himself, he was not merely a fine Hebrew scholar, but a fine Greek scholar also. He was also a purist; for in T. B., *Sotah*, 49b, he is reported to have exclaimed, "Why should any one speak in Palestine 'Sursi'? Let him speak either Hebrew or Greek!" In using the word "Sursi" for "Suri" (Syriac), he no doubt makes a punning allusion to the mixed (cut-up) character of the language, corrupted from Hebrew, Chaldee, Persian, Greek, and Latin.

² This was the teacher of St Paul.

³ In addition to such well-known Agadic *Mishniyyoth* as those which are distinctly ascribed in *Aboth* to Hillel, see *Mishnah Kidushin*, iv. 1; and contrast it with the language and style of the *Mishnah* in general, and that of *Massekhto Kidushin* in particular.

⁴ *Mishnah Eduyyoth*, viii. 4.

⁵ See *Mishnah Ma'aser Sheni*, v. 7; *Sotah*, v. 1, 2; *Nega'im*, xii. 5, 6, 7, &c.; though it cannot be said that these passages preserve the teaching of the *Sopherim* in their original purity.

⁶ See *Mishnah Kelim*, *in fine*.

⁷ See T. B., *Berakhoth*, 28a: "It is handed down orally (שׁוֹרָר) that *Eduyyoth* was on that day (when R. El'azar b. 'Azaryah was installed as president) gone through," i.e., redacted

⁸ T. B., *Yebameth*, 49b.

⁹ *Mishnah Synhedrin*, iii. 4.

¹⁰ See *Koheleth Rabbah* on ii. 8 *in medio*.

Mishnah is untrue, because the thing is impossible. For the two Talmuds, of which that of Babylonia was not finished before the 6th century (if then), know, certainly, nothing of the writing down of the *Mishnah*. On the contrary, their language throughout presupposes the *Mishnah* in their time to have been what its name indicates, a repetition, i.e., a thing acquired by continual recitation, because, like the other works of the "oral law" (*Torah shebb'e'al peh*), it was to be, and was, handed down orally.¹¹ As for the difficulty of keeping in memory such a stupendous and vast work as the *Mishnah*, it is sometimes forgotten in this controversy that memory was aided by a great variety of mnemotechnic means, such as numbers and names of teachers, and by the existence of other works of the "oral law," which, although they also were not written down, could be easily kept in memory because they rested on letters, words, and verses of the written Pentateuch. Anyhow, there is ample evidence, both negative and positive, that the *Mishnah* as we now have it was not committed to writing in the times of Rabbi or for long afterwards. But it certainly does not follow that no merit is due to Rabbi in connexion with the *Mishnah*. His merit in connexion with it is great in every way. For (1) Rabbi was himself a link in the chain of tradition, since he had "received" from his own father and so on up to his ancestor Hillel and even higher; (2) he gave in the *Mishnah* his own decisions, in most cases in accordance with those of the famous R. Meir, which are thus in a great part secured to us; (3) in giving his own decisions he preserved to us also a good many decisions of the teachers of the 2d century; (4) in collecting all these decisions he anxiously ascertained the genuine formulas of the older *Mishniyyoth*;¹² (5) he did not merely reproduce the formulas which he esteemed the best, but discussed them anew in his own college, which was composed of men of the highest eminence, as is well known; (6) although he gave on the whole the very language of the teachers who preceded him, he gauged it, guarding it against the barbarisms which are so plentiful in the other works of the "oral law"; and (7) he scattered the *Mishnah* broadcast (though only by word of mouth) over all Palestine and Babylonia by means of the disciples who flocked to him from all parts of those countries. If the *Mishnah*, as it now exists, is not entirely his, it certainly belongs to him in a great measure and in a more than one sense.

7. *Value and Appreciation*.—Whatever can be said in favour of the *Agadah* applies with equal if not greater force to the *Mishnah*, as the latter is a canonical and therefore more reliable work of the "oral law." The *Mishnah* is one of the richest mines of archæology which the world possesses. But it waits yet for the master touch to break the spell which holds it bound. Great, however, as the value of the *Mishnah* is, its popularity has never been steady, but has been continually fluctuating, and that for various reasons. Even Rabbi in his time had to appeal for due attention to it. Whilst it was neglected in troublous times by the masses, who ran after the *Agadah*,¹³ which, besides being consoling, needed no particular study, it was, in prosperous times, neglected by the rabbis themselves, through the study of the Bible and the Talmud.¹⁴ And much more was this

¹¹ See particularly T. B., *Bobo Metsi'o*, 33a and b; and compare also Rashi, *in loco*.

¹² See T. Y., *Ma'aser Sheni*, v. 1; and compare the preceding note.

¹³ See MIDRASH, p. 285, note 14.

¹⁴ R. Yohanan said, This *Mishnah* (*Doraitho*), that no study can excel that of *Gemara*, was taught in the time of (and by) Rabbi himself. Then the people went after *Gemara* and neglected the study of the *Mishnah*. Whereupon he again bade them ever run more after *Mishnah* than after *Gemara*. T. B., *Bobo Metsi'o*, 33b, and Rashi, *in loco*.

the case when the Talmud had developed from a mere studious activity to two concrete works of large size.

8. *The Ultimate Writing Down of the Mishnah.*—The troubles of the unhappy Jews had multiplied everywhere. The masses, as already stated, preferred, in consequence of these troubles, the *Agadah*. But the number of the learned also diminished through these troubles day by day; and the comparatively few that remained preferred more and more the Talmud (in Palestine the Palestinian and in Babylonia the Babylonian), which was a better field for the exercise of their ingenuity. The fate of the *Mishnah* would have been sealed had it not been ultimately written down. But the writing down of *Halakhoth en masse* had been prohibited in early times. Two considerations, however, ultimately removed all scruples. (1) It was a time to do something for God, even if by such doings His law was apparently destroyed.¹ Let one (and a minor) law be disregarded, so that many (and higher) laws be preserved. The *Halakhoth* of the *Mishnah* were numerous and the students few; the power of tyranny increased and that of the memory decreased by reason of the persecution. (2) The language of the *Mishnah*, although pure, and indeed purer than the language of several books of the Bible, was so concise and terse that it could not be understood without a commentary; and, therefore, even after being written down, it would virtually retain its oral character.

9. *Recensions.*—The *Mishnah* has three principal recensions:—(1) the *Mishnah* as presented in the work standing by itself; (2) that on which the Palestinian Talmud rests; and (3) that of the Babylonian Talmud. The first-named and the last-named *Mishnayoth* have always been known as complete; the second, however, was supposed for several hundred years to be imperfect, lacking four *Perakim* in *Shabbath*, two entire *Massekhtoth* in the *Seder Nezikin*, the whole of the *Seder Kodoshim*, and by far the greater part of the *Seder Tohoroth*.² But since 1869 this recension also has been known to have been always complete; and it is to be found in its entirety in a MS. purchased in that year for the University Library of Cambridge (Add. 470. 1). Besides these three there are many minor recensions, touching, however, only isolated readings. These last are to be attributed chiefly to copyists. The origin of the difference between the principal recensions is to be sought in the following two facts:—(1) Rabbi had himself gone twice through the *Mishnah* and had himself considerably altered the wording of the text;³ and (2) his successors in early and late times had wilfully altered and corrected the original text.

10. *Divisions and Detailed Contents of the Mishnah.*—The *Mishnah* in all recensions is divided into six *Sedarim* (orders), each of which contains a number of *Massekhtoth* (treatises), which stand in connexion with one another. These are subdivided into *Perakim* (chapters), and these again into *Halakhoth* or *Mishniyyoth* (paragraphs called *Mishnoth*).⁴ The number of the *Sedarim* is six, that of the *Massekhtoth* six,⁵ and that of the *Perakim* 523, or,

¹ This is a somewhat inexact application of Ps. cxix. 126, but it has been more than once acted upon both in ancient and modern times by the Jews. Compare the explanation given in T. B., *Berakhoth*, 63a. and *Menahoth*, 99a.

² *Niddah* is the only *Masseketh* of this *Seder* of which three entire *Perakim* are to be found in the printed editions. Compare Schiller-Szinessy, *Occasional Notices*, &c., i. (Cambridge, 1878, 8vo) p. 8.

³ See T. B., *Bobo Metsi'o*, 44a, and elsewhere.

⁴ Whether the word *Masseketh* comes from *Masokh* (מִסְכָּה), to pour into, to mix, &c.), or from *Nasokh* (נָסַךְ), to pour, to mix, to weave, &c.), it signifies in either case here a mould, a form, a frame. *Masseketh* has three several plurals:—(1) the common *Massekhtoth* (not *Massekhtoth*); (2) the less common *Massekhoth* (see MS. Add. 470. 1, belonging to the University Library of Cambridge, leaf 69a and elsewhere); and (3) *Massekhtliyyoth* (מִסְכְּתֵי), see *Midrash Rabbah* on Canticles vi. 8, 9. The Aramaic *Massekhto* (not *Massikhto*) has in the plural *Massekhtoth*, the use of which is, however, very uncommon.

⁵ Compare above, p. 503.

⁶ Compare *Midrash Rabbah* on Canticles vi. 8, 9.

with a fourth *Perek* to *Bikkurim*, 524.⁷ The following is a scheme of the whole *Mishnah*.⁸

I. ZERA'IM (on Agriculture, preceded by the Treatise on Thanksgivings⁹). (1) *Berakhoth* (blessings), in nine chapters; (2) *Peah* (Lev. xix. 9, &c.), in eight chapters; (3) *Demai* (fruit, grain, &c., doubtful if tithed), in seven chapters; (4) *Kil'ayim* (mixtures of plants, animals, and garments respectively), in nine chapters; (5) *Shebi'ith* (year of release), in ten chapters; (6) *Terumoth* (gifts to the priests), in eleven chapters; (7) *Ma'aser Sheni*¹⁰ (Deut. xiv. 22-27), in five chapters; (8) *Ma'aser Rishon*, otherwise *Ma'asroth* (Levitical tithes), in five chapters; (9) *Hallah* (Num. xv. 19-21), in four chapters; (10) *Oriah* (Lev. xix. 23), in three chapters; and (11) *Bikkurim* (Deut. xxvi. 1-10), in three (commonly four) chapters.

II. MO'ED (on Festival Times). (1) *Shabbath* (Sabbath), in twenty-four chapters; (2) *Erubin* (mixtures, i.e., ideal union of divided spaces), in ten chapters; (3) *Pesah* (commonly *Pesahim*, i.e., Passover), in ten chapters; (4) *Kippurim* (commonly *Yoma*, i.e., "the day" [of atonement]), in eight chapters; (5) *Shekalim* (Exod. xxx. 12-15), in eight chapters; (6) *Sukkah* (Lev. xxiii. 34-43), in five chapters; (7) *Betsah* ("an egg," so called from the beginning of the treatise; also *Yom Tob*, i.e., on work prohibited, or permitted, on festivals), in five chapters; (8) *Rosh Hashsanah* (on the various kinds of new year, as religious or civil, the king's accession and coronation, &c.), in four chapters; (9) *Ta'anuyoth* (fast-days), in four chapters; (10) *Megillah* (reading of the book of Esther, other readings, &c.), in four chapters; (11) *Hagiyah* (festival-offerings), in three chapters; (12) *Mashkin* (so called from the beginning of the treatise, but commonly *Mo'ed Katan*, on work prohibited, or permitted, on the middle holidays of Passover and Tabernacles), in three chapters.

III. NASHIM (Women). (1) *Nashim* (so called from the first distinctive word of the treatise, but commonly *Yebamoth*, on sisters-in-law, the levirate, &c.), in sixteen chapters; (2) *Kethuboth* (marriage-pacts, settlements, &c.), in thirteen chapters; (3) *Nedarim* (vows), in eleven chapters; (4) *Nazir* (Num. vi. 2-21), in nine chapters; (5) *Gittin* (bills of divorce and other bills), in nine chapters; (6) *Kiddushin* (betrothal and marriage), in four chapters; (7) *Sota* (mostly *Sotañ*, Num. v. 12-31), in nine chapters.

IV. NEZIKIM, commonly *Nezikin* (Damages, &c.; see Exod. xxi., xxii., &c.). (1) *Nezikin* (commonly *Bobo Kammo*, the Former Gate, in ten chapters; *Bobo Metsi'o*, the Middle Gate, in ten chapters; and *Bobo Bathro*, the Last Gate, in ten chapters¹¹), in thirty chapters; (2) *Synhedrin* (courts of justice, &c.), in eleven chapters; (3) *Makkoth* ("forty stripes save one," &c.), in three chapters; (4) *Shevi'oth* (oaths, &c.), in eight chapters; (5) *Eduyyoth* (testimonies) or *Idiyyoth* (chiefest or best things¹²), in eight chapters; (6) *Abodah Zarah* (idolatry), in five chapters; (7) *Aboth* (see MIDRASH, p. 286), in five chapters; (8) *Horayoth* (judicial errors, teachings, and decisions), in three chapters.

V. KODOSHIM (Holy Things). (1) *Zebahim*¹³ (sacrifices), in fourteen chapters; (2) *Menahoth* (meat-offerings), in thirteen chapters; (3) *Shehitath Hullin* (slaying animals for common food; commonly *Hullin*, or common food), in twelve chapters; (4) *Bechoroth* (the first-born of beast and man), in nine chapters; (5) *Arakhim*, commonly *Erachin* (on valuations; see Lev. xxvii. 2-33), in nine chapters; (6) *Temurah* (Lev. ix. 10, 33), in seven chapters; (7) *Karethoth*, not *Kerithoth* (sins the punishment of which is excision), in six chapters; (8) *Me'ilah* (Num. v. 6, 7), in six chapters; (9) *Middoth* (description of the temple and its measurements; see MIDRASH, p. 286), in five chapters; (10) *Tamid* (perpetual or daily sacrifice), in six (commonly arranged in seven) chapters; (11) *Kinnim* (sacrifices of birds), in three chapters.

VI. TOHOROTH (Purifications). (1) *Kelim* (impurities of vessels), in thirty chapters; (2) *Oholoth* (Num. xix. 14-16, &c.), in eighteen chapters; (3) *Nega'im* (plague of leprosy in man, house, and garment), in fourteen chapters; (4) *Parah* (Num. xix. 1-19), in twelve chapters; (5) *Tohoroth* (euphemism for impurities), in ten chapters; (6) *Mikvaoth* (religious baths), in ten chapters; (7) *Niddah* (Lev. xv. 19-33), in ten chapters; (8) *Makshirim* (liquids

⁷ Others include, instead of a fourth *Perek* of *Bikkurim*, the *Perek Rabbi Meir*, i.e., the treatise "On the Acquisition of the Law." The original *Mishnah*, however, had neither of these two *Perekim*.

⁸ In this scheme the Cambridge MS. of the *Mishnah* is taken as the groundwork, while the variations in title, &c., are given from the common texts.

⁹ Compare St Paul's words, Eph. v. 20, εὐχαριστοῦντες πάντοτε ὑπὲρ πάντων.

¹⁰ On the apparent anomaly of *Ma'aser Sheni* preceding *Ma'aser Rishon*, see Schiller-Szinessy's *Catalogue of Hebrew MSS. in the Cambridge University Library*, vol. ii. p. 1, note 4.

¹¹ In the Cambridge MS. Add. 470. 1, *Massekhto Nezikin* is given correctly as one, containing thirty chapters. Compare T. B., *Bobo Kammo*, leaf 102a, *Abodah Zarah*, 7a. and *Midrash Shenuel*, v.

¹² See p. 503, note 16.

¹³ Also known under *Shehitath Kodoshim*.

predisposing for the contraction of impurities, Lev. xi. 34), in six chapters; (9) *Zabim* (Lev. xv. 2-33), in five chapters; (10) *Tebul Yom* (Num. xix. 19), in four chapters; (11) *Yalayim* (purification of the hands), in four chapters; (12) *Okotsin* (stalks, peel, &c., of fruit), in three chapters.

11. *Editions*.—The editions of the *Mishnah*, whether as a book by itself or as contained in the Babylonian Talmud, are too numerous to be mentioned here. The *editio princeps* of the *Mishnah*, as a separate book, appeared (with Maimonides' commentary) at Naples in 1492 (see MAIMONIDES), and that as contained in the Babylonian Talmud at Venice in 1520-23, both in folio. As part of the Palestinian Talmud the *Mishnah* came out also at Venice, in 1523-24, folio. This Talmud, however, being defective, its *Mishnah* naturally is incomplete too (see p. 505); and it is, moreover, "corrected" by the scribe of 1288-89 (see Schiller-Szinessy, *Occasional Notices*, &c., i. pp. 8, 11). The syndics of the University Press of Cambridge have therefore laid the learned public under considerable obligations by publishing for the first time the complete original *Mishnah* on which the Palestinian Talmud rests, from the unique MS. preserved in the University Library.¹

12. *Translations*.—There exist translations of the *Mishnah* in Latin, German, and English. (1) There is a Latin translation by the brothers Abendana (R. Ya'akov and R. Yitshak). The former was *Haham* (*Hakham*, i. e., chief rabbi) of the Sephardim in England, and the latter was teacher of Hebrew and Rabbinate at Cambridge and Oxford successively. Both brothers, correspondents in 1660 of Buxtorf, were fine Hebrew and Latin scholars (see Schiller-Szinessy, "The Abendanas," in *Jewish World* of December 5, 1879). This translation is preserved in the Cambridge University Library MS. Mm. 1. 4-8.² (2) The Abendanas' version was before Surenhusius when he compiled, from old and new materials, his Latin translation, which appeared (with the text of the *Mishnah* and the translation also of the commentaries of Maimonides and "Bertinoro") at Amsterdam in 1698-1703, folio. The great indebtedness of Surenhusius to the Abendanas is a fact either unknown to or ignored by the bibliographers.³ (3) A German translation by Rabe came out in German letters at Onolzbach in 1760-63, 4to. (4) The version last-named was in the possession of the anonymous author of the translation, printed in Rabbinic letters, in the Vienna edition of the *Mishnah* with the commentary *Kaph Nahath*, 1817-35, 8vo. This author (or editor) silently "used" the work of his predecessor. (5) Both these translations were surpassed in German diction, as well as in correctness of rendering, by that which came out in Hebrew square letters at Berlin in 1832-34, 4to, and which, no doubt, belongs to J. M. Jost the historian. (6) The English translation which came out at London in 1843, 8vo, by De Sola and Raphael, extends only over eighteen treatises.

13. *Commentaries*.—The commentaries on the *Mishnah* are almost as numerous as the editions, and cannot therefore be specially enumerated here. The principal and the oldest, however, are the following. (1) The two Talmuds themselves, of which, at present,⁴ the Babylonian is the only (and that but comparatively) perfect one, or at all events the more extensive of the two. It ought, however, to be stated, first, that the Palestinian Talmud has *Gemara* on the whole order *Zera'im*, whilst the Babylonian has it on the first "treatise" only of that order (*Erakhoth*), and, secondly, that the *Gemara* *Shekalim* in the Babylonian Talmud is only borrowed from the Palestinian Talmud. (2) The commentaries on *Zera'im*, *Tohoroth*, &c., by Rabbenu Hai Gaon, who was the last, most learned, and in every way noblest of the Geonim.⁵ He flourished in the 10th and 11th centuries. Part of the commentaries (viz., that on *Tohoroth*) has appeared in the collection

Kobets Ma'ase Yede Geonim, &c. (Berlin, 1856, 8vo). (3) The commentary on various treatises of the B. Talmud, and indirectly on the *Mishnah*, by Rabbenu Gershom Meor Haggolah (the "Light of the Diaspora,"⁶ flourished in the 10th and 11th centuries). Fragments of this commentary are incorporated in the ordinary Talmud editions (e.g., *Nedarim*, 22b, &c.), but the greater part lies as yet in manuscript in various libraries. (4) The commentary of Rabbenu Hananel, who lived at Kairawan (in Africa) in the 10th and 11th centuries. His commentary on the Talmud, and thus indirectly on the *Mishnah*, is now being published in the Vilna edition of the Babylonian Talmud.⁷ (5) The commentary of Rashi (*ob.* 1105) in all those parts of the B. Talmud on which that "prince of commentators" wrote. Here ought to be mentioned also the separate *editio princeps* of this commentary as far as the *Mishnah* is concerned, which appeared at Leghorn in 1653-54, 8vo. (6) The supplements and additions to the commentary of Rashi by his son-in-law Rabbenu Yehudah b. Nathan (a.g., T. B., *Makkoth*, 19b, &c.), and by his grandsons Rabbenu Shemuel b. Meir (*vulgo* Rashbam; see *Pesahim*, 99b, and *Bobo Bathro*, 29a, &c.) and Rabbenu Shema'yah b. Simhah of Vitri,⁸ who interpreted the *Masseketh Middoth* before Rashi, his grandfather (see Schiller-Szinessy, *Catalogue of the Hebrew MSS.* preserved in the University Library of Cambridge, ii. p. 89). (7) The commentary on the whole *Mishnah* by MAIMONIDES (q.v.). (8) The commentary by R. Abraham b. David of Posquieres (*vulgo* Rabad) on *Eduyyoth* (see editions of the B. Talmud), *Kinnim* (with two other commentaries by Rabbenu Zerayah Hallevi and R. Asher b. Yehiel, Constantinople, 1751, folio), and on many other *Mishnaiyyoth* of the orders *Zera'im* and *Tohoroth* (in his "strictures" on Maimonides, *Mishneh Torah*, books *Zera'im* and *Tohorah*). (9) The commentary of R. Shimshon of Sens (who, like the foregoing, was a contemporary and opponent of Maimonides) on the orders of *Zera'im* (with supplements taken from the works of the somewhat older R. Yitshak b. Malkitzedek and *Tohoroth*).⁹ (10) The commentary by R. Meir of Rothenburg (the celebrated captive of Rudolph of Hapsburg); see under (13) below. (11) The commentary by R. Asher b. Yehiel (a disciple of the foregoing, who died at Toledo in 1327) on twenty-one treatises of the orders i. and vi. (12) The commentary on the whole *Mishnah*, by Rabbenu 'Obadyah di Bertinoro (flourished in the 15th and 16th centuries), the editions of which are very numerous. (13) The commentary on the whole *Mishnah*, by R. Yomtov Lipmann Heller (flourished in 16th and 17th centuries). This famous teacher, rabbi in some of the greatest congregations of the Jews (Prague, Vladimir, and Cracow), incorporated much of the commentary of R. Meir of Rothenburg; compare under (10).

14. *Works Subsidiary and Auxiliary to the Mishnah*.—These *Math* may be summed up under the word *Mathnitho*. *Mathnitho* is *nitho* ostensibly the Aramaic equivalent of the Hebrew *Mishnah*; in reality, however, it signifies and comprises, not merely everything which is understood under that name, but also *Boraithe* (in full, *Mathnitho Boraithe*), i. e., four other works of the oral law, and many literary notices of Mishnic and pre-Mishnic times besides, which are scattered throughout the Talmuds and other early Rabbinic works.

The first of these is *Tosephto*. As its name indicates, *Tosephto* is "Addition," i. e., to the canonical *Mishnah*. All *Mishnah* teachers from time immemorial, notably R. 'Akibah and R. Yehudah Hannasi, left out, when they taught *Mishnah*, a large mass of kindred and explanatory matter, which they only occasionally and supplementarily mentioned, i. e., when absolutely wanted. The chief collection of this additional matter, not incorporated in the system of the canonical *Mishnah*, is called *Tosephto* in Hebrew and *Tosephto* (or *Tosephta* as some less correctly write it) in Aramaic. The Aramaic singular and the Hebrew plural occur already in the Talmuds and *Midrashim*.¹⁰ *Tosephto* shares with the *Mishnah*, which it enlarges and explains, the number of orders and treatises, but not that of chapters, of which it has only 452. The oldest collection of *Tosephto* matter, even as the oldest collection of Mishnic matter, is due to R. 'Akibah. But, whilst

¹ See Mr W. H. Lowe's able edition of this grand work (*The Mishnah on which the Palestinian Talmud rests*, Cambridge, 1883, 8vo).

² According to Picciotto (*Sketches of Anglo-Jewish History*, London, 1875, 8vo, p. 55), R. Yitshak Abendana translated the *Mishnah* and its commentaries (Maimonides and "Bertinoro") also into Spanish.

³ Surenhusius was also aided in his grand work by the books and notes of Guisius (in *Berakhoth*, *Peah*, *Demai*, *Kil'ayim*, *Shebith*, *Terumoth*, and *Ma'aseroth*, i.-iii. 3), Schmid (in *Shabbath* and *Erubin*), Houting (*Rosh Hasshanah*), Lund (*Taanith*), Otho (*Shekalim*), Wagenseil (*Syrah*), Coceius (*Makkoth*), Engius (*Aboth*), Arnoldi (*Tamid*), L'Empereur (*Middoth*), and Ulmann (*Zebahim* and *Karehoth*). But without the Abendanas Surenhusius could never have commenced, much less executed, the great task he had before him.

⁴ For the probability that the missing parts of the Palestinian Talmud will one day come to light somewhere in the East, see Schiller-Szinessy in the *Academy*, February 23, 1878; *He-Chaluz*, xi.; and Steinschneider, *Handschriften-Verzeichnisse der königlichen Bibliothek zu Berlin*, ii., &c. (1878, 4to), p. 65, where a passage of Palestinian *Gemara* of *Okotsin* is actually quoted.

⁵ He was also a poet of no mean standing. See his *Musar Haskel* or *Hassekhet*), ed. princ. Fano, 1505 (?), 4to.

⁶ In the synod called together by Rabbenu Gershom, among several "ordinances" was also one that no Jew is allowed to marry more than one wife.

⁷ His commentary on *Pesahim* appeared at Paris in 1863, and that on *Makkoth* at Leipsic in 1876, both in 8vo.

⁸ These writers (together with Rabbenu Meir another son-in-law and Rabbenu Ya'akov another grandson of Rashi) are the first of the so-called *Tosaphists*, whose activity continued down to the early part of the 14th century.

⁹ Whether the commentary on *Tamid* printed under his name, together with that of R. Asher b. Yehiel on the same treatise (Prague, 1725, 4to), is really his is still matter of dispute.

¹⁰ See T. Y., *Shabbath*, viii. 1, &c.; T. B., *Synhedrin*, 86a and elsewhere; *Midrash Rabbah* on Ecclesiastes v. 8, &c. There can be little doubt that in some places the word תוספתא ought to be transliterated *Tosephto* (i. e., as plural).

the *Mishnah*, as a work, was first sifted by his disciple R. Meir, *Tosephto*, as a work, was first sifted by another disciple R. Nehemyah; and just as R. Meir's *Mishnah* was sifted again by *Rabbi* and others after him, and was not written down before the 6th century, so *Tosephto* was sifted again by R. Hiyya, R. Hoshayah, and others, and was not written down in its entirety before the 6th century. It is no wonder, then, that it now contains matter of a considerably later age. *Tosephto* is not merely of great help for understanding the *Mishnah*, which is, in a certain sense incomplete without it, but for the precise and exact knowledge of Jewish archaeology and other sciences, and in its Agadic parts, of which there are many, for the Greek Scriptures also. Here ought also to be mentioned *Aloth de-Rabbi Nathan*, which is, no doubt, *Tosephto* to the *Mishnah* of *Aloth*. *Tosephto* used to be printed till within the last forty years¹ as an appendix to the *Riph*, i.e., the *Hilekthoth Rab Alphas* (a compendium of the Talmud by R. Yitshak b. Ya'akob Al-Phesi, or Al-Phasi, i.e., of Fez, ob. 1103), which appeared first with this appendix at Venice, 1521-22, folio. Here, however, it was not edited critically or printed with even ordinary care. But in the Vienna edition of the Babylonian Talmud (1860-72) it came out, for the first time, worthily after a MS. till then uncollected which is preserved in the Court Library. Dr Zuckerman has since published it from the Erfurt and Vienna MSS., with collations.² A Latin translation of *Tosephto* (with the Hebrew text) is to be found, under the name of *Tosapha*, in Blasius Ugolinus's *Thesaurus Antiquitatum Sacrarum* (xvii.-xx.). It comprises, however, only the orders *Zera'im*, *M'ed*, and *Kodoshim*, and came out at Venice in the years 1755-57, folio.

The second of these pieces of literature is *Mekhilto*. This word is the Aramaic equivalent of the Hebrew *Middah* (measure), and hence signifies mould, form, i.e., of Scriptural exegesis, notably of part or parts of the Pentateuch. As such it might, of course, stand for any kind of commentary on any book of the Pentateuch, and have been composed by any one. And we find, indeed, that *Mekhilto* signified at one time a commentary on the books Exodus, Leviticus, Numbers, and Deuteronomy, either by R. Yishma'el or by R. Akibah,³ at another time a commentary on Exodus, by R. Shime'on b. Yohai,⁴ and at another time again a commentary on the last four books of Moses, by (Shime'on) Ben 'Azzai.⁵ *Mekhilto* now, however, means a commentary on the greater part of Exodus, ascribed to R. Yishma'el (flourished in the 1st century); although, in reality, this teacher cannot have been the author of the book, seeing that his name is more than seventy times mentioned in it. The reason why the ancients called the book by his name is, no doubt, because the first words of the real work are *Amar Rabbi Yishma'el*. Like the other works of the "oral law," *Mekhilto* was not written down before the 6th century, a fact which accounts also, in part at least, for the loss of several portions of this commentary, which, at present, only extends from xii. 1 to xxv. 3, with several gaps between. That *Mekhilto* was once fuller than it is now we know, not only from a statement made by Maimonides and others, but from a MS. (Add. 394. I, in the University Library of Cambridge, leaf 40b), where an extract is given by a Franco-German author of the 12th or 13th century. The Talmud knows the name *Mekhilto*, and actually quotes *Boraitoth* (non-canonical *Mishniyyoth*) which are to be found in our book; and yet the existing *Mekhilto* can scarcely have been known to the teachers of the Talmud. *Mekhilto* is by some called *Midrash* and by others *Mishnah*; both names are in a certain sense correct. It is *Midrash* in substance, inasmuch as it contains exegesis, and in form, inasmuch as it is subdivided into *Parshiyoth* and follows the order of the Scriptural verses. But it is *Mishnah* in substance, inasmuch as it not only deals with the groundwork of the *Mishnah*, but consists of *Boraitoth* (non-canonical *Mishniyyoth*), and in form, inasmuch as it is, like the canonical *Mishnah*, divided into *Massekhtoth*. These latter are nine in number, and are called respectively (1) *Dephisha* (with 18 *Parshiyoth* and 1 *Pelhiho* or introduction), (2) *Beshallah* (with 6 *Parshiyoth* and 1 *Pethiho*), (3) *Deshiretha* (with 10 *Parshiyoth*), (4) *Vayyassa* (with 6 *Parshiyoth*), (5) *Amalek* (with 2 *Parshiyoth*), (6) *Yithro* (with 2 *Parshiyoth*), (7) *Bahodesh* (with 11 *Parshiyoth*), (8) *Nezikin* and *Kaspe* (with 20 *Parshiyoth*), and (9) *Shabbetho* (with 2 *Parshiyoth*—1 in the pericope *Ki thissa* and 1 in that of *Vayyakhel*). *Mekhilto* was published first at Constantinople in 1515, under the name of *Sepher Hammekhilto*, and in 1545 at Venice as *Midrash Hammekhilto*. In 1712 it appeared at Amsterdam with a commentary. In 1744 it appeared again at Venice with a Latin translation by Blasius Ugolinus (*Thes. Antiq. Sacr.*, xiv.). In 1801 it appeared at Leghorn with a different commentary. In 1844 it

came out at Vilna with a new commentary. All these are in folio. The best and cheapest editions with commentaries are those by Weiss (1865) and Friedmann (1870), both printed at Vienna, and in 8vo.

The third of these pieces of literature is *Siphro*. Both Leviticus itself, because it is the most difficult of all Mosajic books, and the oldest Rabbinic commentary on it, because it is the most difficult of all commentaries on the Scriptures, have been from time immemorial known under the name of *Siphro* (i.e., the Book).⁶ This book and this commentary are also called *Torath Kohanim*, and the former is spoken of in the Talmud already as *Siphro debe Rub*.⁷ This latter expression has led many great men (among others Maimonides)⁸ to ascribe the authorship of this commentary to Rab (Abba Arikho, a nephew and disciple of R. Hiyya). But such a view is erroneous in the extreme, as the book is, so far as form and substance go, both older and later than Rab, paradoxical as this statement may appear. It is older in its origin and in its matter, for not merely do all the anonymous *Boraitoth* which are to be found in it belong to R. Yehudah b. Il'ai, a teacher of the 1st century, but one of the sons of Rabbi (of the 2d century) had actually taught another rabbi two-thirds of a third, i.e., two-ninths, of this work.⁹ It is later than Rab, for in it are found one "authority" and several "results" of much later date than that of this great Babylonian teacher.¹⁰ The fact is, the word *Rab* in the phrase *Siphro debe Rab* is not a proper name at all, but simply stands for "teacher," and *debe Rab* thus signifies "of a school," a term used for any teacher and any school of any time. Although most of the *Boraitoth* which it contains are as old as the 1st century, this book as such cannot have been written down earlier than the 6th, in accordance with the treatment, in this respect, of all the other Halakhic works of the "oral law." *Siphro*, although it bears on the pericopes and verses of Leviticus, and is on account of this fact by many called a *Midrash*, is in reality *Mishnah*,¹¹ a name borne out by the nature of its contents, which are mostly Mishnic, and sometimes represent actual canonical *Mishniyyoth*. *Siphro* exhibits a curious conglomeration of matter. It opens with the "Rules of the Interpretation of Scripture," ascribed to R. Yishma'el,—a *Boraitoth* which, although important in itself, is not more important for this than for any other commentary on the Pentateuch. And this conglomerate nature shows itself even more strikingly in form; for *Siphro* contains as forms of division *Dibburim*, *Mekhilto*, *Parshiyoth* (some of which mean pericopes, whilst others mean chapters), *Perakim*, and *Pisqoth*. All these points, of course, to various divisions of the book made at various times. Whilst none of these divisions can be later than the 12th century,¹² the earliest is at least as old as the 2d, and belongs perhaps to the 1st.¹³ *Siphro* is chiefly of importance for the understanding of the *Mishnah* of the orders *Kodoshim* and *Tohoroth* (which were, no doubt, the earliest *Mishniyyoth* put into "order"); but, whilst it is a sure help for the *Mishnah*, the *Mishnah* is no sure help for it: *Siphro* is a genuine specimen of the "oral law," inasmuch as it cannot be mastered without a teacher. Owing to the difficulty of understanding it, *Siphro* has not been often studied, and consequently not often printed. The *editio princeps* is of 1545; the second edition with the commentary *Korban Aharon* is of 1609-11, both at Venice. The third edition with the just-named commentary is of 1702, and came out at Dessau. The fourth edition, with a Latin translation, is to be found in Blasius Ugolinus's *Thesaurus Antiquitatum Sacrarum*, &c., Venice, 1744 (vol. xiv.). All these are in folio. The fifth edition, with the commentary *Azarath Kohanim* (vol. i.), appeared at Vilna, 1845, 4to. The sixth edition, with the commentary *Asirith Haephah*, appeared at Lemberg, 1848, folio. The seventh edition, with the commentary *Hatorath Veham-Mitsvah*, appeared at Bucharest, 1860, 4to. The eighth edition, with the commentary of R. Abraham b. David of Posquères, &c., appeared at Vienna, 1862; and the ninth edition, with the commentary by R. Shimshon of Sens, appeared at Warsaw, 1866, both in folio.

The fourth of these pieces of literature is *Siphre*. *Siphre*, or *Siphre debe Rab*, which in earlier times certainly included the oldest Rabbinic commentaries on Exodus, Numbers, and Deuteronomy (and perhaps also that on Leviticus), means now the oldest Rabbinic commentary on the last two books of Moses only.

⁶ See T. B., *Berakthoth*, 18b, and Rashi, *in loco*. The *Siphro* said here to have been studied by Benaiah the son of Jehoiada may well have been our Leviticus, though of course it cannot have been the *Siphro* with which we are here concerned.

⁷ *Ibid.*

⁸ Preface to *Mishneh Torah*.

⁹ See T. B., *Kiddushin*, 33a.

¹⁰ See the pericope *Kedoshim*, vi.

¹¹ Its original founder (R. Yehudah b. Il'ai) identifies *Mishnah* and *Midrash*, T. B., *Kiddushin*, 49a.

¹² They were known to R. Abraham b. David (Rabad).

¹³ T. B., *Kiddushin*, 33a.

¹ That on the order *Zera'im* came out at Vilna in 1799, 4to; but in its entirety it came only out between 1837, 1841, and 1871, folio.

² Issued at Pasewalk and Treves from 1877 to 1882, 8vo.

³ See Maimonides's preface to the *Mishneh Torah*.

⁴ See Nahmanides's commentary on the Pentateuch (on Gen. xlix. 31).

⁵ See *Yuhasin Hasshalem* (ed. Filipowski, London and Edinburgh, 1857, 8vo), p. 30, col. 2.

Both books are divided into *Piskoth* (paragraphs), of which *Siphre* on Numbers has 161, whilst that on Deuteronomy has 357. The ancient division into *Boraitoth* cannot now be accurately traced. The work commences now at Numbers v. 1, and goes to the end of Deuteronomy. The passages anonymously given in *Siphre* are ascribed by the Babylonian Talmud¹ to R. Shime'on b. Yohai, the favourite disciple of R. Akiba, and the reputed author of the *Zohar*. But although he is no doubt the virtual author of *Siphre*, seeing that most *Boraitoth* which are to be found therein are his, he cannot be, technically speaking, its author. For, in the first place, he is not only repeatedly named in the book, but several times actually contradicted by others; and, secondly, there are several passages, anonymously given, in the book, which can only be the result of "Talmudic" study, and must be consequently posterior to the composition of the Talmud. The fact is that *Siphre*, like the other works of the "oral law," was not written down before the 6th century. It ought to be mentioned here that the rabbis of the 11th, 12th, and 13th centuries, and even somewhat later, speak also of another *Siphre* which they variously designate as *Siphre Panim Shenai*, *Siphre shel Panim Shenai*, *Siphre Benid-bar Sinai*, *Siphre Zutta*, and *Siphre* simply. To judge from the extracts which have come down to us, that work must not only have been of much later date, but also of far less value than the work in our hands. *Siphre* appeared for the first time in 1545, and with a Latin translation by Blasius Ugolinus, in his *Thesaurus*, &c. (vol. xv.), in 1744,—both at Venice, and in folio. The third edition appeared at Hamburg in 1789, and the fourth at Sulzbach in 1802, both in 4to. The fifth edition, with the commentary *Zera' Abraham*, appeared in two volumes, of which the first was printed at Dyhernfurt in 1811 and the second at Radawell in 1820, both in folio. The sixth and best edition is that of Friedmann (Vienna, 1854), and the seventh is that of Lemberg, 1866, both in 8vo.

There is also a fifth piece of Mishnic literature known specially by the name *Boraitho*. Besides the *Boraitoth* constituting *Tosepho*, *Mekhilto*, *Siphro*, and *Siphre*, there are hundreds of other *Boraitoth* to be found scattered about in both Talmuds. These are, however, mere fragments of the vast *Mishnayoth* (entire Mishnic works²) composed by Bar Kappara, Rabbi Hiyya, and hundreds of other teachers, which in course of time must have perished. There is, however, enough left of the *Mishnah*, canonical and non-canonical, to prove the correctness of the cabalistic remark that *Mishnah* is the equivalent of *Neshamah* (soul). This is no mere trifling based on the fact that the two words (מִשְׁנָה נִשְׁמָה) accidentally consist of the same letters; it is rather an enunciation of an intrinsic truth: what the soul (*Neshamah*) is to the body, the *Mishnah* is to Mosaism. The soul gives life to the body, and the *Mishnah* gives life to the Pentateuch. For the letter killeth, but the spirit giveth life! (S. M. S.-S.)

MISKOLCZ, capital of the Cis-Tisian county of Borsoda, Hungary (48° 6' N. lat., 20° 49' E. long.), is picturesquely situated in a valley watered by the Szinva, 90 miles north-east from Budapest, with which, as also with Debreczen and Kassa (Kaschau), it is directly connected by railway. Miskolcz is one of the most thriving provincial towns in the kingdom, and has many fine buildings, including Roman Catholic, Greek Catholic, Lutheran, and Calvinist churches and schools, a Minorite convent, synagogue, Hungarian theatre, hospital, royal and circuit courts of law, salt and tax offices, and the administrative bureaux for the county. There are manufactories of snuff, porcelain, boots and shoes, and prepared leather, and both steam and water mills. The trade is chiefly in grain, wheaten flour, wine, fruit, cattle, hides, honey, wax, and the agricultural products of the neighbourhood. The great fairs, held five times a year, are much resorted to by strangers from a distance. Not far from the town are stone quarries and iron mines. At the end of 1880 the (civil) population amounted to 24,343, of whom the majority were Magyars by nationality.

During the 16th and 17th centuries Miskolcz suffered much from the desolating hordes of Ottomans who then ravaged the country, as also from the troops of various Transylvanian princes and leaders, especially those of George Rákóczy and Emeric Tokölyi. In 1781, 1843, and 1847 it was devastated by fire, and on the 30th August 1878 a great portion of the town was laid in ruins by a terrific storm. (See HUNGARY, vol. xii. p. 374.)

MISREPRESENTATION. See FRAUD.

¹ *Synhedrin*, 86a.

² According to T. B., *Maagigah*, 14a, there existed at one time no less than six or seven hundred *Mishnah* orders.

MISSAL,³ the book containing the liturgy, or office of the mass, of the Latin Church. This name (*e.g.*, *Missale Gothicum*, *Francorum*, *Gallicanum Vetus*) began to supersede the older word *Sacramentary* (*Sacramentarium*, *Liber Sacramentorum*) from about the middle of the 8th century. At that period the books so designated contained merely the fixed canon of the mass or consecration prayer (actionem, preceam canonicam, canonem actionis), and the variable collects, secretæ or orationes super oblata, prefaces, and post-communions for each fast, vigil, festival, or feria, of the ecclesiastical year; for a due celebration of the Eucharist they required accordingly to be supplemented by other books, such as the *Antiphonarium*, afterwards called the *Graduale*, containing the proper antiphons (introts), responsories (graduals), tracts, sequences, offertories, communions, and other portions of the communion service designed to be sung by the schola or choir, and the *Lectio-narium* (or *Epistolarium* and *Evangelistarium*) with the proper lessons. Afterwards missals began to be prepared containing more or less fully the antiphons and lessons as well as the prayers proper to the various days, and these were called *missalia plenaria*. All modern missals are of this last description. The *Missale Romanum ex decreto SS. Concilii Tridentini restitutum*, now in almost exclusive use throughout all the churches of the Latin obedience, owes its present form to the council of Trent, which among its other tasks undertook the preparation of a correct and uniform liturgy, and entrusted the work to a committee of its members. This committee had not completed its labours when the council rose, but the pope was instructed to receive its report when ready and to act upon it. The "reformed missal" accordingly was promulgated by Pius V. on July 14, 1570, and its universal use enjoined on all branches of the Catholic Church, the only exceptions allowed being in the case of churches having local and independent liturgies which had been kept in unbroken use for at least two centuries.⁴ It has subsequently undergone slight revisions under Clement VIII. (1604) and Urban VIII. (1634); and various new masses, both obligatory and permissive, universal and local, have been added by the competent authority. Although the Roman is very much larger in bulk than any other liturgy, it need hardly be explained that the communion office to which it relates is not in itself inordinately long. By much the greater part of it is contained in the "ordinary" and "canon" of the mass, usually placed about the middle of the missal, and occupies, though in large type, only a few pages in any printed copy. The work owes its bulk and complexity to two circumstances. On the one hand, in the celebration of the sacrifice of the mass practically nothing is left to the impulse or discretion of the officiating priest; everything—what he is to say, the tone and gestures with which he is to say it, the cut and colour of the robe he is to wear—is carefully prescribed either in the general rubrics prefixed to the text, or in the running rubrics which accompany it.⁵ On the other hand, the Roman, like all the Western liturgies, is distinguished

³ *Missalis* (sc., *liber*), *Missale*, from *Missa*; see vol. viii. p. 652.

⁴ The English missal consequently continued to be used by English Catholics until towards the end of the 17th century, when it was superseded by the Roman through Jesuit influence. The Gallican liturgy held its ground until much more recently, but has now succumbed under the Ultramontanism of the bishops.

⁵ In all the older liturgies the comparative absence of rubrics is conspicuous and sometimes perplexing. It is very noticeable in the Roman *Sacramentaries*, but the want is to some extent supplied by the very detailed directions for a high pontifical mass in the various texts of the *Ordo Romanus* mentioned below. That there was no absolutely fixed set of rubrics in use in France during the 8th century is shown by the fact that each priest was required to write out an account of his own practice ("libellum ordinis") and present it for approbation to the bishop in Lent (see Baluze, *Cap. Reg. Frol.*, i. 824, quoted in Smith's *Dict. of Chr. Antiq.*, ii. 1521).

from those of the Eastern Church by its flexibility. Partly by conscious effort, no doubt, but partly also by happy accident, a well-marked distinctive character has been given in one or all of the above-mentioned respects to the office for each ecclesiastical season, for each fast or festival of the year, almost for each day of the week; and provision has also been made of a suitable communion service for many of the special and extraordinary occasions both of public and of private life. This richness of variety is seen **not only** in the collects but also in the lessons and antiphonal parts of the service, passages of Scripture in the selection and collocation of which an exquisite delicacy of religious and æsthetic instinct has been for the most part strikingly shown.

The different parts of the Roman communion office are not all of the same antiquity. Its essential and characteristic features are most easily caught, and their rationale best understood, by reference to the earliest *Sacramentaries* (particularly the Gregorian, which was avowedly the basis of the labours of the Tridentine committee), to the Gregorian *Antiphonary*, and to the oldest redaction of the *Ordo Romanus*.¹ The account of the mass (qualiter Missa Romana celebratur) as given by the *Sacramentarium Gregorianum* is to the effect that there is in the first place "the *Introit* according to the time, whether for a festival or for a common day; thereafter *Kyrie Eleison*. (In addition to this *Gloria in Excelsis Deo* is said if a bishop be [the celebrant], though only on Sundays and festivals; but a priest is by no means to say it, except only at Eastertide. When there is a litany (quando letania agitur) neither *Gloria in Excelsis* nor *Alleluia* is sung.) Afterwards the *Oratio* is said, whereupon follows the *Apostolus*, also the *Gradual* and *Alleluia*. Afterwards the *Gospel* is read. Then comes the *Offertorium*,² and the *Oratio super oblata* is said." Then follow the *Sursum Corda*, the *Preface*, *Canon*, *Lord's Prayer* and "embolism" (ἐμβόλισμα or insertion, *Libera nos, Domine*), given at full length precisely as they still occur in the Roman missal.

In every liturgy of all the five groups a passage similar to this occurs, beginning with *Sursum Corda*, followed by a *Preface* and the recitation of the *Sanctus* or *Angelic Hymn*. The "canon" or consecration prayer, which in all of them comes immediately after, invariably contains our *Lord's* words of institution, and (except in the Nestorian liturgy) concludes with the *Lord's Prayer* and "embolism." But within this framework there are certain differences of arrangement, furnishing marks by which the various groups of liturgies can be classified (see vol. xiv. p. 709 sq.). Thus it is distinctive of the liturgy of Jerusalem that the "great intercession" for the quick and the dead follows the words of institution and an *Epiklesis* (ἐπίκλησις τοῦ πνεύματος ἁγίου) or petition for the descent of the Holy Spirit upon the gifts; in the Alexandrian the "great intercession" has its place in the *Preface*; in the East Syrian it comes between the words of restitution and the *Epiklesis*; in the Ephesine it comes before the *Preface*; while in the Roman it is divided into two, the commemoration of the living being before, and that of the dead after, the words of institution. Other distinctive features of the Roman liturgy are (1) the position of the "Pax" after the consecration, and not as in all the other liturgies at a very early stage of the service, before the *Preface* even; and (2) the absence of the *Epiklesis* common to all the others.³

¹ For the genealogical relationships of the Roman with other liturgies, the reader is referred to the article *LITURGY* (vol. xiv. 706 sq.), where some account is also given of the three *Sacramentaries*. For the doctrines involved in the "sacrificæ of the mass," see *EUCCHARIST*, vol. viii. p. 650 sq.

² Some editions do not mention the *Offertory* here.

³ This was one of the points discussed at the council of Florence, and Cardinal Bessarion for a time succeeded in persuading the Greeks to give up the *Epiklesis*.

The words of its "canonical prayer" are of unknown antiquity; they are found in the extant manuscripts of the *Sacramentarium Gelasianum*, and were already old and of forgotten authorship in the time of Gregory the Great, who, in a letter to John, bishop of Syracuse (*Registr. Epist.*, vii. 64), speaks of it as "the prayer composed by a 'scholastic'" (precem quam scholasticus composuerat). The same letter is interesting as containing Gregory's defence, on the ground of ancient use, of certain parts of the Roman ritual to which the bishop of Syracuse had taken exception as merely borrowed from Constantinople. Thus we learn that, while at Constantinople the *Kyrie Eleison* was said by all simultaneously, it was the Roman custom for the clergy to repeat the words first and for the people to respond, *Christe Eleison* being also repeated an equal number of times. Again, the *Lord's Prayer* was said immediately after the consecration aloud by all the people among the Greeks, but at Rome by the priest alone.

The somewhat meagre and imperfect liturgical details furnished by the *Sacramentarium Gregorianum* are supplemented in a very full and interesting manner by the successive texts of the *Ordo Romanus*, the first of which dates from about the year 730. The ritual they enjoin is that for a pontifical high mass in Rome itself; but the differences to be observed by a priest "quando in statione facit missas" are comparatively slight. Subjoined is a précis of *Ordo Romanus I*.

It is first of all explained that Rome has seven ecclesiastical regions, each with its proper deacons, subdeacons, and acolytes. Each region has its own day of the week for high ecclesiastical functions, which are celebrated by each in rotation. [This accounts for the Statio ad S. Mariam, Majorem, ad S. Crucem in Jerusalem, ad S. Petrum, &c., prefixed to most of the masses in the *Gregorian Sacramentary*, and still retained in the "Proprium de Tempore" of the Roman missal.] The regulations for the assembling and marshalling of the procession by which the pontiff is met and then escorted to the appointed station are minutely given, as well as for the adjustment of his vestments "ut bene sedeat," when the sacristy has been reached. He does not leave the sacristy until the *Introit* has been begun by the choir in the church. Before the *Gloria* he takes his stand at the altar, and after the *Kyrie Eleison* has been sung (the number of times is left to his discretion) he begins the *Gloria in Excelsis*, which is taken up by the choir. During the singing he faces eastward; at its close he turns round for a moment to say "Pax vobis," and forthwith proceeds to the *Oratio*.⁴ This finished, all seat themselves in order while the subdeacon ascends the ambo and reads [the *Epistle*]. After he has done, the cantor with his book (cantatorio) ascends and gives out the response (*Responsus*) with the *Alleluia* and *Tractus* in addition if the season calls for either. The deacon then silently kisses the feet of the pontiff and receives his blessing in the words "Dominus sit in corde tuo et in labiis tuis." Preceded by acolytes with lighted candles and subdeacons burning incense, he ascends the ambo, where he reads the *Gospel*. At the close, with the words "Pax tibi" and "Dominus vobiscum," the pontiff,⁵ after another *Oratio*, descends to the "senatorium" accompanied by certain of the inferior clergy, and receives in order the oblations of the rulers (oblaciones principum), the archdeacon who follows taking their "amulas" of wine and pouring them into a larger vessel; similar offerings are received from the other ranks and classes present, including the women. This concluded, the pontiff and archdeacon wash their hands, the offerings being meanwhile arranged by the subdeacons on the altar, and water, supplied by the leader of the choir (archiparaphonista), being mingled with the wine. During this ceremony the schola have been engaged in singing the *Offertorium*; when all is ready the pontiff signs to them to stop, and enters upon the *Preface*, the subdeacons giving the responses. At the *Angelic Hymn* (*Sanctus*) all kneel and continue kneeling, except the pontiff, who rises alone and begins the *Canon*. At the words "per quem hæc omnia" the archdeacon lifts the cup with the oblates, and at "Pax Domini sit semper vobiscum" he gives the peace to the clergy in their order, and to the laity. The pontiff then breaks off a particle from the consecrated bread and lays it upon the altar; the rest he places on the paten held by the deacon. It is then distributed while *Agnus Dei* is sung. The pontiff in communicating puts the particle into the cup, saying, "Fiat commixtio et consecratio corporis et sanguinis Domini nostri Jesu Christi accipientibus nobis in vitam æternam." Those present communicate in their order under this species also.

⁴ Quam collectam dicunt, *Ord. Rom. II*.

⁵ After singing "Credo in unum Deum," *Ord. Rom. II*.

As the pontiff descends into the senatorium to give the communion, the schola begins the communion *Antiphon*, and continues singing the *Psalm* until, all the people having communicated, they receive the sign to begin the *Gloria*, after which, the verse having been again repeated, they stop. The celebrant, then, facing eastward, offers the *Oratio ad Complendum*, which being finished the archdeacon says to the people, "Ite, missa est," they responding with "Deo gratias."

To complete our idea of the Roman communion office as it was prior to the end of the 8th century we must now turn to the Gregorian *Antiphonarius sive Gradualis Liber ordinatus per circulum anni*, which as its name implies contains those variable portions of the mass which were intended to be sung by the schola or choir. It gives for each day for which a proper mass is provided—(1) the *Antiphona* (*Antiphona ad Introitum*) and *Psalmus*; (2) the *Responsorium* and *Versus*, with its *Alleluia* and *Versus*; (3) the *Offertorium* and *Versus*; (4) the *Communio* and *Psalmus*. Some explanation of each of these terms is necessary. (1) The word *Antiphon* (*ἀντίφωνον*, Old English *Antefn*, English *Anthem*) in its ecclesiastical use has reference to the very ancient practice of relieving the voices of the singers by dividing the work between alternate choirs. In one of its most usual meanings it has the special signification of a sentence (usually scriptural) constantly sung by one choir between the verses of a psalm or hymn sung by another. According to the Roman liturgiologists it was Pope Celestine who enjoined that the Psalms of David should be sung (in rotation, one presumes) antiphonally before mass; in process of time the antiphon came to be sung at the beginning and end only, and the psalm itself was reduced to a single verse. In the days of Gregory the Great the introit appears to have been sung precisely as at present,—that is to say, after the antiphon (proper and *par excellence*), the *Psalmus* with its *Gloria*, then the antiphon again. (2) The *Responsorium*, like the Greek antiphon, derives its name from the responsive manner of singing. As introduced between the epistle and gospel it was probably at first a comparatively long passage, usually an entire psalm or canticle, originally given out by the cantor from the steps from which the epistle had been read (hence the later name *Graduale*), the response being taken up by the whole choir. (3) The *Offertorium* and *Communio* correspond to the "hymn from the book of Psalms" mentioned by early authorities (see, for example, Augustine, *Retr.*, ii. 11; *Ap. Const.*, viii. 13) as sung before the oblation and also while that which had been offered was being distributed to the people. A very intimate connexion between these four parts of the choral service can generally be observed; thus, taking the first Sunday in the ecclesiastical year, we find both in the *Antiphonary* and in the modern *Missal* that the antiphon is Ps. xxv. 1-3, the psalmus Ps. xxv. 4, the responsorium (*graduale*) and *versus* Ps. xxv. 3 and xxv. 4, the offertorium and *versus* Ps. xxv. 1-3 and Ps. xxv. 5. The communion is Ps. lxxxv. 12, one of the verses of the responsorium being Ps. lxxxv. 7. In the selection of the introits there are also traces of a certain rotation of the psalms in the Psalter having been observed.

The first pages of the modern Roman missal are occupied with the *Calendar* and a variety of explanations relating to the year and its parts, and the manner of determining the movable feasts. The general rubrics (*Rubricæ Generales Missalis*) follow, explaining what are the various kinds of mass which may be celebrated, prescribing the hours of celebration, the kind and colour of vestments to be used, and the ritual to be followed (*ritus celebrandi missam*), and giving directions as to what is to be done in case of various defects or imperfections which may arise. The *Præparatio ad Missam*, which comes next, is a short manual of devotion containing psalms, hymns, and prayers

to be used as opportunity may occur before and after celebration. Next comes the proper of the season (*Proprium Missarum de Tempore*), occupying more than half of the entire volume. It contains the proper introit, collect (one or more), epistle, gradual (tract or sequence), gospel, offertory, secreta (one or more), communion, and post-communion for every Sunday of the year, and also for the festivals and ferias connected with the ecclesiastical seasons, as well as the offices peculiar to the ember days, Holy Week, Easter, and Whitsuntide. Between the office for Holy Saturday and that for Easter Sunday the ordinary of the mass (*Ordo Missæ*), with the solemn and proper prefaces for the year, and the canon of the mass are inserted. The proper of the season is followed by the proper of the saints (*Proprium Sanctorum*), containing what is special to each saint's day in the order of the calendar, and by the *Commune Sanctorum*, containing such offices as the common of one martyr and bishop, the common of one martyr not a bishop, the common of many martyrs in paschal time, the common of many martyrs out of paschal time, and the like. A variety of masses to be used at the feast of the dedication of a church, of masses for the dead, and of votive masses (as for the sick, for persons journeying, for bridegroom and bride) follow, and also certain benedictions. Most missals have an appendix also containing certain local masses of saints to be celebrated "ex indulto apostolico."

Masses fall into two great subdivisions:—(1) ordinary or regular (*secundum ordinem officii*), celebrated according to the regular rotation of fast and feast, vigil and feria, in the calendar; (2) extraordinary or occasional (*extra ordinem officii*), being either "votive" or "for the dead," and from the nature of the case having no definite time prescribed for them. Festival masses are either double, half-double, or simple, an ordinary Sunday mass being a half-double. The difference depends on the number of collects and secreta; on a double only one of each is offered, on a half-double there are two or three, and on a simple there may be as many as five, or even seven, of each. Any mass may be either high (*missa solennis*) or low (*missa privata*). The distinction depends upon the number of officiating clergy, certain differences of practice as to what is pronounced aloud and what inaudibly, the use or absence of incense, certain gestures, and the like. Solitary masses are forbidden; there must be at least an acolyte to give the responses. The vestments prescribed for the priest are the amice, alb, cingulum or girdle, maniple, stole, and chasuble (*planeta*); see *COSTUME*, vol. vi. p. 462. There are certain distinctions of course for a bishop or abbot. The colour of the vestments and of the drapery of the altar varies according to the day, being either white, red, green, violet, or black. This last custom does not go much further back than Innocent III., who explains the symbolism intended.

Subjoined is an account of the manner of celebrating high mass according to the rite at present in force.

1. The priest who is to celebrate, having previously confessed (if necessary) and having finished matins and lauds, is to seek leisure for private prayer (fasting) and to use as he has opportunity the "prayers before mass" already referred to. How the robing in the sacristy is next to be gone about is minutely prescribed, and prayers are given to be used as each article is put on. The sacramental elements having previously been placed on the altar or on a credence table, the celebrant enters the church and takes his stand before the lowest step of the altar, having the deacon on his right and the subdeacon on his left. After invoking the Trinity (in nomine Patris, &c.) he repeats alternately with those who are with him the psalm "Judica me, Deus," which is preceded in the usual way by an antiphon (*Intrebo ad altare Dei*), and followed also by the *Gloria* and *Antiphon*.¹ The versicle "Adjutorium nostrum," with its

¹ This antiphon is not to be confounded with the *Antiphona ad Introitum* further on. This use of the 43d Psalm goes as far back at least as the end of the 11th century, being mentioned by *Micrologus* (1080). It is omitted in masses for the dead and during Holy Week.

response "Qui fecit," is followed by the "Confiteor,"¹ said alternately by the priest and by the attendants, who in turn respond with the prayer for divine forgiveness, "Misereatur." The priest then gives the absolution ("Indulgentiam"), and after the versicles and responses beginning "Deus, tu conversus" he audibly says, "Oremus," and ascending to the altar silently offers two short prayers, one asking for forgiveness and liberty of access through Christ, and another indulgence for himself "through the merits of thy saints whose relics are here." Receiving the thurible from the deacon he incenses the altar, and is thereafter himself incensed by the deacon. He then reads the Introit, which is also sung by the choir; the "Kyrie Eleison" is then said, after which the words "Gloria in Excelsis"² are sung by the celebrant and the rest of the hymn completed by the choir.

2. Kissing the altar, and turning to the people with the formula "Dominus vobiscum," the celebrant proceeds with the collect or collects proper to the season or day, which are read secretly. The epistle for the day is then read by the subdeacon, and is followed by the gradual, tract, alleluia, or sequence, according to the time.³ This finished, the deacon places the book of the gospels on the altar, and the celebrant blesses the incense. The deacon kneels before the altar and offers the prayer "Munda cor meum," afterwards takes the book from the altar, and kneeling before the celebrant asks his blessing, which he receives with the words "Dominus sit in corde tuo." Having kissed the hand of the priest, he goes accompanied by acolytes with incense and lighted candles to the pulpit, and with a "Dominus vobiscum" and minutely prescribed crossings and incensings gives out and reads the gospel for the day, at the close of which "Laus tibi, Christe" is said, and the book is brought to the celebrant and kissed with the words "Per evangelica dicta deleantur nostra delicta." The celebrant then standing at the middle of the altar sings the words "Credo in unum Deum," and the rest of the Nicene creed is sung by the choir.⁴

3. With "Domina vobiscum" and "Oremus" the celebrant proceeds to read the Offertory, which is also sung by the choir. This finished he receives the paten with the host from the deacon, and after offering the host with the prayer beginning "Suscipe, Sancte Pater" places it upon the corporal. The deacon then ministers wine and the subdeacon water, and before the celebrant mixes the water with the wine he blesses it in the prayer "Deus qui humana." He then takes the chalice, and having offered it ("Offerimus tibi, Domine") places it upon the corporal and covers it with the pall. Slightly bowing over the altar, he then offers the prayer "In spiritu humilitatis," and, lifting up his eyes and stretching out his hands, proceeds with "Veni sanctificator." After blessing the incense ("Per intercessionem beati Michaelis archangeli") he takes the thurible from the deacon and incenses the bread and wine and altar, and is afterwards himself incensed as well as the others in their order. Next going to the epistle side of the altar he washes his fingers as he recites the verses of the 26th Psalm beginning "Lavabo." Returning and bowing before the middle of the altar, with joined hands he says, "Suscipe, sancta Trinitas," then turning himself towards the people he raises his voice a little and says, "Orate, fratres" ("that my sacrifice and yours may be acceptable to God the Father Almighty"), the response to which is "Suscipiat Dominus sacrificium de manibus tuis," &c. He then recites the secret prayer or prayers, and at the end says, with an audible voice, "Per omnia secula seculorum" (R. "Amen").

4. Again saluting with a "Dominus vobiscum," he lifts up his hands and goes on to the "Sursum Corda" and the rest of the Preface. A different intonation is given for each of the prefaces.⁵ At the Sanctus the handbell is rung. If there is a choir the Sanctus is sung while the celebrant goes on with the Canon.⁶ After the words of consecration of the wafer, which are said "secretly, distinctly, and attentively," the celebrant kneels and adores the host, rising elevates it, and replacing it on the corporal again

adores it (the bell meanwhile being rung).⁷ The same rite is observed when the chalice is consecrated. Immediately before the Lord's Prayer, at the words "per ipsum et cum ipso et in ipso," the sign of the cross is made three times over the chalice with the host, and towards the close of the "embolism" the fraction of the host takes place. After the words "Pax Domini sit semper vobiscum" the emission of the particle into the cup takes place with the words "Hæc commixtio et consecratio," &c. The celebrant then says the Agnus Dei three times.

5. While the choir sings the Agnus Dei and the Communion, the celebrant proceeds, still "secrete," with the remainder of the office, which though printed as part of the canon is more conveniently called the Communion and Post-communion. After the prayer for the peace and unity of the church ("Domine Jesu Christe, qui dixisti") he salutes the deacon with the kiss of peace, saying, "Pax tecum"; the subdeacon is saluted in like manner, and then conveys the "pax" to the rest of the clergy who may be assisting. The celebrant then communicates under both species with suitable prayers and actions, and afterwards administers the sacrament to the other communicants if there be any. Then while the wine is poured into the cup for the first ablution he says, "Quod ore sumpsimus"; having taken it he says, "Corpus tuum, Domine." After the second ablution he goes to the book and reads the Communion. Then turning to the people with "Dominus vobiscum" he reads the Post-communion (one or more); turning once more to the congregation he uses the old dismissal formula "Dominus vobiscum" (R. Et cum spiritu tuo), and "Ite, missa est" [or "Benedicamus Domino," in those masses from which "Gloria in Excelsis" has been omitted] (R. Deo Gratias). Bowing down before the altar he offers the prayer "Placeat tibi, sancta Trinitas," then turning round he makes the sign of the cross over the congregation with the words of the benediction ("Benedicat").⁸ He then reads the passage from the gospel of John beginning with "In principio erat Verbum," or else the proper gospel of the day.⁹ (J. S. BL.)

MISSIONS. The history of Christian missions may, for practical purposes, be best divided into three chief periods—(1) the primitive, (2) the mediæval, and (3) the modern. None of these periods can be neglected, for they have an intimate connexion with each other, and illustrate the activity respectively of individuals, of the church in her corporate capacity, and of societies.

1. The Primitive Period.

Christian missions had their origin in the example and the command of our Lord Himself (Matt. xxviii. 19); and the unparalleled boldness on the part of the Founder of Christianity, which dared to anticipate for the Christian faith a succession of efforts which should never cease to cause its propagation to be undertaken as "a distinct and direct work," has been justified by the voice of history.¹⁰ Whereas other religions have spread from country to country as component parts of popular opinion, have travelled with migration or conquest, have passed in the train of things and by the usual channels of communication, the first foundations of the church had hardly been laid before individual missionary activity marked the life of each one of the circle of the apostles.

Of the actual details of their labours we have been permitted to know but little. Three only of the immediate followers of the Saviour have any conspicuous place in the apostolic records, and the most illustrious in the whole domain of missionary activity, St Paul, did not belong to the original twelve. His activity took the form of journeys and voyages, chiefly to large towns, where his message found a point of contact either with the Jewish synagogue or the aspirations of the Gentile world. The result of his labours and of those of his successors

¹ A form very similar to the present is given by Hieronymus, and it is foreshadowed even in liturgical literature of the 8th century.

² During Lent and Advent, and in masses for the dead, this is omitted. In low masses it is of course said, not sung (if it is to be said). It may be added that this early position of the *Gloria in Excelsis* is one of the features distinguishing Roman from Ephesine use.

³ The tract is peculiar to certain occasions, especially of a mournful nature, and is sung by a single voice. By a sequence is understood a more or less metrical composition, not in the words of Scripture, having a special bearing on the festival of the day. See, for example, the sequence, "Lauda Sion Salvatorem," on Corpus Christi day.

⁴ On certain days the *Credo* is omitted.

⁵ Now eleven; they were at one time much more numerous.

⁶ The approved usage appears to be in that case that it is sung as far as "Hosanna in Excelsis" before the elevation, and "Benedictus qui venit" is reserved till afterwards. In France it was a very common custom, made general for a time at the request of Louis XII., to sing "O salutaris hostia" at the elevation.

⁷ The history of the practice of elevating the host is somewhat obscure. It seems to have arisen out of the custom of holding up the oblations, as mentioned in the *Ordo Romanus* (see above). The elevation of the host, as at present practised, was first enjoined by Pope Honorius III. The use of the handbell at the elevation is still later, and was first made general by Gregory XI.

⁸ The benediction is omitted in masses for the dead.

⁹ The reading of the passage from John on days which had not proper gospel was first enjoined by Pius V.

¹⁰ Davison, *On Prophecy*, p. 278.

was that towards the middle of the 2d century the church had gradually extended its conquests through Asia Minor, Greece, Italy, southern Gaul, and northern Africa.¹ Ecclesiastical history can tell but little of the church's earliest teachers, and the infancy of many of the primitive congregations is wrapped in hopeless darkness. Whatever was effected was due to the evangelizing labours of individual bishops and clergy, who occupied themselves "in season and out of season," and toiled zealously and effectively in the spread of the church, though leaving no record of their devotion. Amongst the most distinguished representatives of this individual activity in the 4th and 5th centuries may be mentioned Ulfila, the "apostle of the Goths," about 325; Frumentius, a bishop of Abyssinia, about 327; Chrysostom, who founded at Constantinople in 404 A.D. an institution in which Goths might be trained to preach the gospel to their own people;² Valentinus, the "apostle of Noricum," about 440; and Honoratus, who from his monastic home in the islet of Lerins, about 410, sent forth numerous labourers to southern and western Gaul, to become the leading missionaries of their day among the masses of heathendom in the neighbourhood of Arles, Lyons, Troyes, Metz, and Nice.

2. The Mediæval Period.

With the 5th century the church found a very different element proposed to her missionary energies and zeal. Her outposts of civilization had scarcely been planted when she was confronted with numberless hordes which had long been gathering afar off in their native wilds, and which were now precipitated over the entire face of Europe. Having for some time ceased to plead for toleration, and learnt to be aggressive, she not only stood the shock of change but girded herself for the difficult work of calming the agitated elements of society, of teaching the nations a higher faith than a savage form of nature worship, of purifying and refining their recklessness, independence, and uncontrollable love of liberty, and fitting them to become members of an enlightened Christendom.

(a) *The Celtic Missionaries.*—The first pioneers who went forth to engage in this difficult enterprise came from the secluded Celtic churches of Ireland and the Scottish Highlands, which, though almost forgotten amidst the desolating contest which was breaking up the Roman world, were no sooner founded than they sent forth "armies of Scots" to pour back upon the Continent the gifts of civilization and the gospel. Of many who deserve mention in connexion with this period, the most prominent were—Columba, the founder of the famous monastery of Iona, and the evangelizer of the Albanian Scots and northern Picts; Aidan, the apostle of Northumbria; Columbanus, the apostle of the Burgundians of the Vosges; Callich or Gallus, the evangelizer of north-eastern Switzerland and Alemannia; Kilian, the apostle of Thuringia; and Trudpert, the martyr of the Black Forest. The zeal of these singular men at the head of ardent disciples seemed to take the world by storm. Travelling generally in companies, and carrying a simple outfit, these Celtic pioneers flung themselves on the Continent of Europe, and, not content with reproducing at Annegray or Luxeuil the willow or brushwood huts, the chapel and the round tower, which they had left behind in Derry or in the island of Hy, they braved the dangers of the northern seas, and penetrated as far as the Faroes and even far distant Iceland.³

(b) *The English Missionaries.*—Thus they laid the foundations, awing the heathen tribes by their indomitable spirit of self-sacrifice and the sternness of their rule of life.

But, marvellous as it was, their work lacked the element of permanence; and it became clear that if Europe was to be carried through the dissolution of the old society, and missionary operations consolidated, a more practical system must be devised and carried out. The men for this work were now ready. Restored to the commonwealth of nations by the labours of the followers of Augustine of Canterbury and the Celtic missionaries from Iona, the sons of the newly evangelized English churches were ready to go forth to the help of their Teutonic brothers in the German forests. The energy which warriors were accustomed to put forth in their efforts to conquer was now "exhibited in the enterprise of conversion and teaching"⁴ by Wilfrid on the coast of Friesland,⁵ by Willibrord in the neighbourhood of Utrecht,⁶ by the martyr-brothers Ewald or Heward amongst the "old" or continental Saxons,⁷ by Swibert the apostle of the tribes between the Ems and the Yssel, by Adelbert, a prince of the royal house of Northumbria, in the regions north of Holland, by Wursing, a native of Friesland, and one of the disciples of Willibrord, in the same region, and last, not least, by the famous Winfrid or Boniface, the "apostle of Germany," who went forth first to assist Willibrord at Utrecht, then to labour in Thuringia and Upper Hessa, then, with the aid of his kinsmen Wribald and Willibald, their sister Walpurga, and her thirty companions, to consolidate the work of earlier missionaries, and finally to die a martyr on the shore of the Zuyder Zee.

(c) *Scandinavian Missions.*—Devoted, however, as were the labours of Boniface and his disciples, the battle was not yet nearly won. All that he and they and the emperor Charlemagne after them achieved for the fierce untutored world of the 8th century seemed to have been done in vain when, in the 9th, "on the north and north-west the pagan Scandinavians were hanging about every coast, and pouring in at every inlet; when on the east the pagan Hungarians were swarming like locusts and devastating Europe from the Baltic to the Alps; when on the south and south-east the Saracens were pressing on and on with their victorious hosts. It seemed then as if every pore of life were choked, and Christendom must be stifled and smothered in the fatal embrace."⁸ But it was even now that one of the most intrepid of missionary enterprises was undertaken, and the devoted Anskar went forth and proved himself a true apostle of Denmark and Sweden, sought out the Scandinavian viking in his native home and icy fiords, and, after persevering in the face of apparently insurmountable difficulties and hardships, handed on the torch of self-denying zeal to others, who "casting their bread on the waters" saw, after the lapse of many years, the close of the monotonous tale of burning churches and pillaged monasteries, and taught the fierce Northman to lay aside his old habits of piracy, and gradually learn respect for civilized institutions.

(d) *Slavonic Missions.*—Thus the "gospel of the kingdom" was successively proclaimed to the Roman, the Celtic, the Teutonic, and the Scandinavian world. A contest still more stubborn remained with the Slavonic tribes, with their triple and many-headed divinities, their powers of good and powers of evil, who could be approached only with fear and horror, and propitiated only with human sacrifices. Mission work commenced in Bulgaria during the latter part of the 9th century; thence it extended to Moravia, where two Greek missionaries—Cyril and Methodius—provided for the people a Slavonic Bible

and a Slavonic Liturgy; thence to Bohemia, and so onwards to the Scythian wilds and level steppes, where arose the Russian kingdom of Ruric the Northman, and where about the close of the 10th century the Eastern Church "silently and almost unconsciously bore into the world her mightiest offspring."¹ But, though the baptism of Vladimir and the flinging of the triple and many-headed idols into the waters of the Dnieper was a heavy blow to Slavonic idolatry, mission work was carried on with but partial success; and it taxed all the energies of Albrecht, bishop of Bremen, of Vicilin, bishop of Oldenburg, of Bishop Otto of Bamberg the apostle of the Pomeranians, of Adalbert the martyr-apostle of Prussia, to spread the word in that country, in Lithuania, and in the territory of the Wends. It was not till 1168 that the gigantic four-headed image of Swantevit was destroyed at Arcona, the capital of the island of Rügen, and this Mona of Slavonic superstition was included in the advancing circle of Christian civilization. As late as 1230 human sacrifices were still being offered up in Prussia and Lithuania, and, in spite of all the efforts of the Teutonic Knights to expel by force the last remains of heathenism from the face of Europe, idolatrous practices still lingered amongst the people, while in the districts inhabited by the Lapps, though successful missions had been inaugurated as early as 1335, Christianity cannot be said to have become the dominant religion till at least two centuries later.

(e) *Moslem Missions.*—The mention of the order of the Teutonic Knights reminds us how the crusading spirit had affected Christendom, and exchanged the patience of a Boniface or an Anskar for the fiery zeal of the warrior of the cross. Still it is refreshing to notice how even now there was found the famous Raymond Lully to protest against propagandism by the sword, to urge on pope after pope the necessity of missions amongst the Moslems, and to seal his testimony with his blood outside the gates of Bugiah in northern Africa (June 30, 1315). Out of the crusades, however, arose other efforts to bear the banner of the cross into the lands of the East, and to develop the work which Nestorian missionaries from Baghdad, Edessa, and Nisibis had already inaugurated along the Malabar coast, in the island of Ceylon, and in the neighbourhood of the Caspian Sea. In 1245 the Roman pontiff sent two embassies, one to charge the Mongol warriors to desist from their desolating inroads into Europe, the other to attempt to win them over to the Christian faith. The first, a party of four Dominicans, sought the commander-in-chief of the Mongol forces in Persia; the second, consisting of Franciscans, made their way into Tartary, and sought to convert the successor of Oktai-Khan. Their exertions were seconded in 1253 by the labours of another Franciscan whom Louis IX. of France sent forth from Cyprus,² while in 1274 the celebrated traveller Marco Polo, accompanied by two learned Dominicans, visited the court of Kublai-Khan, and at the commencement of the 14th century two Franciscans penetrated as far as Peking, and kept alive a flickering spark of Christianity in the Tartar kingdom, even translating the New Testament and the Psalter into the Tartar language, and training youths for a native ministry.³

(f) *Missions to India and the New World.*—These tentative missions in the East were now to be supplemented by others on a larger scale. In 1486 the Cape of Good Hope was rounded by Dias, and in 1508 the foundations of the

Portuguese Indian empire were laid by Albuquerque. Columbus also in 1492 had landed on San Salvador, and the voyages of the Venetian Cabot along the coast of North America opened up a new world to missionary enterprise. These bold discoverers had secured the countenance of the pope on the condition that wherever they might plant a flag they should be also zealous in promoting the extension of the Christian faith. Thus a grand opportunity was given to the churches of Portugal and Spain. But the zeal of the Portuguese, even when not choked by the rising lust of wealth and territorial power, took too often a one-sided direction, repressing the Syrian Christians on the Malabar coast, and interfering with the Abyssinian Church,⁴ while the fanatic temper of the Spaniard, maddened by his prolonged conflict with the infidel at home, betrayed him into methods of propagating his faith which we cannot contemplate without a shudder, consigning, in Mexico and Peru, multitudes who would not renounce their heathen errors to indiscriminate massacre or abject slavery.⁵ Their only defender for many years was the famous Las Casas, who, having sojourned amongst them till 1516, has drawn a terrible picture of the oppression he strove in vain to prevent.⁶ Some steps indeed were taken for disseminating Christian principles, and the pope in granting territory to the crowns of Spain and Portugal had specially urged this duty, and had been instrumental in inducing a band of missionaries, chiefly of the mendicant orders, to go forth to this new mission field.⁷ But the results were scanty. Only five bishoprics had been established by 1520, and the number of genuine converts was small. In settling, however, his realm the conqueror of Mexico evinced no little solicitude for the spiritual welfare of his charge; and the labours of the devoted men whom he begged the emperor to send out were successful in banishing every vestige of the Aztec worship from the Spanish settlements.⁸

(g) *The Jesuit Missions.*—It was during the period at which we have now arrived that the great organization of the Jesuits came into existence, and one of the first of Loyola's associates, Francis Xavier, was also one of the greatest and most zealous missionaries of his or any other era. Encouraged by the joint co-operation of the pope and of John III. of Portugal, and strongly tinged like Loyola with ideas of chivalry and self-devotion, he disembarked at Goa on the 6th of May 1542, and before his death on the Isle of St John (Hiang-Shang), December 2, 1552, he had roused the European Christians of Goa to a new life, laboured with singular success amongst the Paravars, a fisher caste near Cape Comorin, gathered many converts in the kingdom of Travancore, visited the island of Malacca, made his way to and founded a mission in Japan, thence revisited Goa, and impelled by the quenchless desire to unfurl the banner of the cross in China, had set out thither to fall a victim to malignant fever at the early age of forty-six, within sight of that vast empire whose conversion had been the object of his holy ambition.

The immediate successor of Xavier, Antonio Criminalis, was regarded by the Jesuits as the first martyr of their society (1562). Mattheo Ricci, an Italian by birth, was also an indefatigable missionary in China for twenty-seven years, while the peculiar methods of unholy compromise with Brahmanism in India followed by Robert de' Nobili drew down the condemnatory briefs of pope after pope, and were fatal to the vitality of his own and other missions.

Other representatives of the same order worked with success in evangelizing the Spanish settlement of Paraguay in 1582, while their defeated foes the Huguenots sent forth under a French knight of Malta a body of devoted men to attempt the formation of a Christian colony at Rio Janeiro. By the close of the 16th century the unflagging zeal of the Jesuits led to a more complete development and organization of the missionary system of the Roman Church. To give unity and solidity to the work of missions, a committee of cardinals was appointed under the name of the "Congregatio de propaganda fide," and to it was entrusted the entire management of the mission, conducted under the superintendence of the pope. The scheme originated with Gregory XIII., but was not fully organized till forty years afterwards, when Gregory XV. gave it plenary authority by a bull dated June 2, 1622. Gregory's successor, Urban VIII., supplemented the establishment of the congregation by founding in connexion with it a great missionary college, where Europeans might be trained for foreign labours, and natives might be educated to undertake mission work wherever new colonies were settled. At this college is the missionary printing-press of the Roman Church, and its library contains an unrivalled collection of literary treasures bearing on the particular work. From its walls have gone forth numbers of devoted men, who have proved themselves able to promote in a singular degree the enlargement of the boundaries of the church by means of material as well as spiritual forces.

3. The Modern Period.

This last period of missionary activity is distinguished in a special degree by the exertions of societies for the development of mission work.

As contrasted with the colossal display of power on the part of the Church of Rome, it must be allowed that the churches which in the 16th century broke off from their allegiance to the Latin centre at first presented a great lack of anxiety for the extension of the gospel and the salvation of the heathen. The causes of this, however, are not far to seek. The isolation of the Teutonic churches from the vast system with which they had been bound up, the conflicts and troubles among themselves, the necessity of fixing their own principles and defining their own rights, concentrated their attention upon themselves and their own home work, to the neglect of work abroad.

Still the development of the maritime power of England, which the Portuguese and Spanish monarchies noted with fear and jealousy, was distinguished by a singular anxiety for the spread of the Christian faith. Edward VI. in his instructions to the navigators in Willoughby's fleet, Cabot in those for the direction of the intended voyage to Cathay, good old Hakluyt, who promoted many voyages of discovery in addition to writing their history, agree with Sir Humphrey Gilbert's chronicler that "the sowing of Christianity must be the chief intent of such as shall make any attempt at foreign discovery, or else whatever is builded upon other foundation shall never obtain happy success or continuance." When on the last day of the year 1600 Queen Elizabeth granted a charter to George, earl of Cumberland, and other "adventurers," to be a body-corporate by the name of "The Governor and Company of Merchants of London trading with the East Indies," the expressed recognition of higher duties than those of commerce may by some be deemed a mere matter of form, and, to use the words of Bacon, "what was first in God's providence was but second in man's appetite and intention." Yet a keen sense of missionary duty marks many of the chronicles of English mariners. Notably was this the case with the establishment of the first English colony in America, that of Virginia, by Sir Walter Raleigh. The

philosopher Heriot, one of his colleagues, laboured for the conversion of the natives, amongst whom the first baptism is recorded to have taken place on August 13, 1587.¹ Raleigh himself presented as a parting gift to the Virginian Company the sum of £100 "for the propagation of the Christian religion" in that settlement.² When James I. granted letters patent for the occupation of Virginia it was directed that the "word and service of God be preached, planted, and used as well in the said colonies as also as much as might be among the savages bordering among them"; and the honoured names of Nicolas Ferrar, John Ferrar, Dr Donne, and Sir John Sandys, a pupil of Hooker, are all found on the council by which the home management of the colony was conducted.

In the year 1618 was published *The True Honour of Navigation and Navigators*, by John Wood, D.D., dedicated to Sir Thomas Smith, governor to the East India Company, and much about the same time appeared the well-known treatise of the famous Grotius, *De Veritate Religionis Christianæ*, written for the express use of settlers in distant lands. The wants, moreover, of the North American colonies did not escape the attention of Archbishop Laud during his official connexion with them as bishop of London, and he was developing a plan for promoting a local episcopate there when his troubles began and his scheme was interrupted. During the Protectorate, in 1649, an ordinance was passed for "the promoting and propagating of the gospel of Jesus Christ in New England" by the erection of a corporation, to be called by the name of the **President and Society for the Propagation of the Gospel in New England**, to receive and dispose of moneys for the purpose, and a general collection was ordered to be made in all the parishes of England and Wales; and Cromwell himself desired a scheme for setting up a council for the Protestant religion, which should rival the Roman Propaganda, and consist of seven councillors and four secretaries for different provinces.³ On the restoration of the monarchy, through the influence of Richard Baxter with Lord Chancellor Hyde, the charter already granted by Cromwell was renewed, and its powers were enlarged. For now the corporation was styled "The Propagation of the Gospel in New England and the parts adjacent in America," and its object was defined to be "not only to seek the outward welfare and prosperity of those colonies, but more especially to endeavour the good and salvation of their immortal souls, and the publishing the most glorious gospel of Christ among them." On the list of the corporation the first name is the earl of Clarendon, while the Hon. Robert Boyle was appointed president. Amongst the most eminent of its missionaries was the celebrated John Eliot, who, encouraged by Boyle, and assisted by him with considerable sums of money, brought out the Bible in the Indian language in 1661-64, having revealed at the end of the Indian grammar which he had composed the secret of his success: "prayer and pains, through faith in Jesus Christ, will do anything." Boyle displayed in other ways his zeal for the cause of missions. He contributed to the expense of printing and publishing at Oxford the four Gospels and the Acts of the Apostles in the Malay language, and at his death left £5400 for the propagation of the gospel in heathen lands.

The needs of the colonial church soon excited the attention of others also, and great efforts were made by Bishop Beveridge, Archbishop Wake, Archbishop Sharpe, Bishop Gibson, and afterwards by the philosophic Bishop Berkeley, and Bishop Butler, the famous author of the *Analogy*, to

develop the colonial church and provide for the wants of the Indian tribes. In 1696 Dr Bray, at the request of the governor and assembly of Maryland, was selected by the bishop of London as ecclesiastical commissary; and, having sold his effects, and raised money on credit, he sailed for Maryland in 1699, where he promoted, in various ways, the interests of the church. Returning to England in 1700-1, and supported by all the weight of Archbishop Tenison and Bishop Compton, he was graciously received by William III., and received letters patent under the great seal of England for creating a corporation by the name of the "Society for the Propagation of the Gospel in Foreign Parts" on the 16th of June 1701.

With the establishment of this corporation the era of the activity of societies for carrying out mission work may be said to commence, though the opening of the 18th century saw other movements set on foot for the same object. Thus in 1705 Frederick IV. of Denmark founded a mission on the Coromandel coast, and inaugurated the labours of Ziegenbalg, Schultze, and Schwartz, whose devotion and success told with such remarkable reflex influence on the church at home. Again in 1731 the Moravians illustrated in a signal degree the growing consciousness of obligation towards the heathen. Driven by persecution from Moravia, hunted into mountain-caves and forests, they had scarcely secured a place of refuge in Saxony before, "though a mere handful in numbers, yet with the spirit of men banded for daring and righteous deeds, they formed the heroic design, and vowed the execution of it before God, of bearing the gospel to the savage and perishing tribes of Greenland and the West Indies, of whose condition report had brought a mournful rumour to their ears." And so, literally with "neither bread nor scrip," they went forth on their pilgrimage, and, incredible as it sounds, within ten years they had established missions in the islands of the West Indies, in South America, Surinam, Greenland, among the North American tribes, in Lapland, Tartary, Algiers, Guinea, the Cape of Good Hope, and Ceylon.¹

Such were the preparations for the more general movements during the last hundred years, and the manifestation of missionary zeal on a scale to which it would be difficult to find a parallel in Western Christianity.

The progress that has been made may be best judged of from consideration of the following details :—

(a) At the close of the last century there were only seven missionary societies in existence, properly so called. Of these three only, the Society for the Propagation of the Gospel in Foreign Parts, the Halle-Danish Society, and the Moravians, had been at work for the greater part of the century, whilst four, the Church Missionary Society, the Baptist Missionary Society, the London Missionary Society, and the Dutch Society at Rotterdam, began their work only in its tenth decade. To-day these seven have, in Europe and America alone, increased to upwards of seventy, and to these must be added, not only several independent societies in the colonies, but numerous missionary associations on a smaller scale, the offspring of English and American societies.

(b) The following chronological lists illustrate the growth of missionary societies in Britain and the United States :—

Great Britain and Ireland.

- 1691. Christian Faith Society for the West Indies.
- 1698. Society for Promoting Christian Knowledge.
- 1701. Society for the Propagation of the Gospel in Foreign Parts.
- 1732. Moravian (Episcopal) Missions of the United Brethren.
- 1792. Baptist Missionary Society.
- 1795. London Missionary Society.
- 1796. Scottish Missionary Society.
- 1799. Church Missionary Society.
- 1799. Religious Tract Society.
- 1804. British and Foreign Bible Society.
- 1808. London Society for Promoting Christianity among the Jews.
- 1813. Wesleyan Missionary Society.
- 1817. General Baptist Missionary Society.
- 1823. Colonial and Continental Church Society.
- 1829. Church of Scotland Mission Boards.
- National Bible Society of Scotland.

- 1831. Trinitarian Bible Society.
- 1832. Wesleyan Ladies' Auxiliary for Female Education in Foreign Countries.
- 1834. Society for Promoting Female Education in the East.
- 1835. United Secession (now United Presbyterian) Foreign Missions.
- 1836. Colonial Missionary Society.
- 1840. Foreign Aid Society.
- Coral Missionary Fund.
- 1840. Welsh Calvinistic Methodist Missionary Society.
- 1841. Colonial Bishops Fund.
- 1841. Edinburgh Medical Missionary Society.
- Waldensian Missions Aid Fund.
- 1843. British Society for the Propagation of the Gospel among the Jews.
- 1843. Free Church of Scotland Missions.
- 1843. Primitive Methodist African and Colonial Missions.
- Methodist New Connexion in England Foreign Missions.
- 1844. South American Missionary Society.
- 1849. Evangelical Continental Society.
- 1852. Indian Female Normal School Society.
- 1853. Lebanon Schools.
- 1855. Presbyterian Church in England Foreign Missions.
- 1856. Turkish Missions Aid Society.
- 1856. United Methodist Free Churches Foreign Missions.
- 1858. Christian Vernacular Education Society for India.
- 1860. Central African Mission of the English Universities.
- 1860. British Syrian Schools.
- Melanesian Mission.
- 1865. Ladies' Association for Promoting Female Education among the Heathen.
- 1866. China Inland Mission.
- 1867. Delhi Female Medical Mission.
- 1867. "Friends" Foreign Mission Association.
- 1868. Cape Town Aid Association.
- 1869. "Friends" Mission in Syria and Palestine.
- Irish Presbyterian Missions.
- 1876. Spanish and Portuguese Church Aid Society.
- Columbia Mission.
- Original Secession Church Indian Mission.
- 1877. Cambridge Mission to Delhi.
- 1880. Church of England Zenana Missionary Society.

United States of America.

- 1733. Corporation for the Propagation of the Gospel in New England.
- 1787. Society for Propagating the Gospel among the Indians at Boston.
- 1800. New York Missionary Society.
- Connecticut Missionary Society for Indians.
- 1803. United States Mission to the Cherokees.
- 1806. Western Missionary Society for Indians.
- 1810. Board of Commissioners for Foreign Missions.
- 1814. Baptist Missionary Union.
- 1819. Methodist Episcopal Church Missionary Society.
- 1833. Free-will Baptist Foreign Missionary Society in India.
- 1835. Foreign Missions of the Protestant Episcopal Church.
- 1837. Board of Foreign Missions of the Presbyterian Church.
- 1837. Evangelical Lutheran Foreign Missionary Society.
- 1842. Seventh Day Baptist Missionary Society.
- Strict Baptist Missionary Society.
- 1843. Baptist Free Missionary Society.
- 1845. Methodist Episcopal Church, South.
- 1845. Southern Baptist Convention.
- 1846. American Missionary Association.
- 1857. Board of Foreign Missions of (Dutch) Reformed Church.
- 1859. Board of Foreign Missions of United Presbyterian Church.
- American United Brethren, Moravian.
- United States German Evangelical Missionary Society.
- American Mexican Association.
- Indian Home Missionary Association
- Indian Missionary Association.
- Local Baptist Missionary Society.
- Women's Union Zenana Missionary Society.

(c) At the beginning of the present century the total sum contributed for Protestant missions can hardly be said to have amounted to £50,000; in 1882 the amount raised by British contributions alone to foreign missions amounted to upwards of £1,090,000,² thus divided :—

Church of England Missions.....	£460,935
Joint Societies of Churchmen and Nonconformists.....	153,320
Nonconformist Societies, English and Welsh.....	313,177
Scottish and Irish Societies.....	155,767
Roman Catholic Societies.....	10,910

(d) At the same date it is calculated that there were about 5000 heathen converts under instruction, not counting those belonging to the Roman Catholic missions. At the present day the converts from heathenism may be estimated certainly at no less than 1,800,000, a single year (1878) showing an increase of about 60,000.

(e) When the Society for the Propagation of the Gospel was founded in 1701, there were probably not twenty clergymen of the Church of England in foreign parts. The spiritual condition of the settlers in America and elsewhere was terrible in the extreme, and no effort was then made by the church to win over the heathen to Christ. But now the position which the church holds in the British colonies and dependencies and many parts of heathendom is recognized by all. In those regions where the society labours, and which before it commenced its work were spiritually the "waste places" of the earth, there are, including the American Church (the first fruits of the society's efforts), 138 bishops, more than 5000 clergy, and upwards of 2,000,000 members of the communion.

The above tables sufficiently indicate how varied are the missionary agencies now at work, covering the heathen

¹ Holmes, *Hist. Sketches of the Missions of the United Brethren*, p. 3; Grant, *Bampton Lectures*, p. 190.

world with a network of mission outposts, which within the last century have won nearly two millions of converts to the Christian faith.

The continuity of missionary enthusiasm maintained through the primitive, the mediæval, and the modern periods of the church's history, operating at every critical epoch, and surviving after periods of stagnation and depression, is a very significant fact. It is true that other religions have been called missionary religions, and that one of them occupies the first place in the religious census of mankind.¹ But the missionary activity of Buddhism is a thing of the past, and no characteristic rite distinguishing it has found its way into a second continent; while, as for Mohammedanism, the character of its teaching is too exact a reflexion of the race, time, place, and climate in which it arose to admit of its becoming universal.² These and other religions of the far East may still maintain their hold over millions, but it must be admitted that their prospect of endurance in the presence of advancing Christianity is very small, and it is difficult to trace the slightest probability of their harmonizing with the intellectual, social, and moral progress of the modern world. With all its deficiencies, the Christian church has gained the "nations of the future," and whereas in the 3d century the proportion of Christians to the whole human race was only that of one in a hundred and fifty, this has now been exchanged for one in five,³ and it is indisputable that the progress of the human race at this moment is entirely identified with the spread of the influence of the nations of Christendom.

Side by side with this continuity of missionary zeal, a noticeable feature is the immense influence of individual energy and the subduing force of personal character. Around individuals penetrated with Christian zeal and self-denial has centred not merely the life, but the very existence, of primitive, mediæval, and modern missions. What Ulfla was to the Gothic tribes, what Columba and his disciples were to the early Celtic missions, what Augustine or Aidan was to the British Isles, what Boniface was to the churches of Germany and Anskar to those of Denmark and Sweden, that, on the discovery of a new world of missionary enterprise, was Xavier to India, Hans Egedo to Greenland, Eliot to the Red Indians, Martyn to the church of Cawnpore, Marsden to the Maoris, Carey and Marshman to Burmah, Heber, Wilson, Milman, and Duff to India, Gray, Livingstone, Mackenzie, Steere, Callaway to Africa, Broughton to Australia, Patteson to Melanesia, Mountain and Feild to Newfoundland, Crowther to the Niger Territory, Brett to Guiana. At the most critical epochs such men have ever been raised up, and the reflex influence of their lives and self-denial has told upon the church at home, while apart from their influence the entire history of important portions of the world's surface would have been altered.

If from the agents themselves we turn to the work that has been accomplished it will not be disputed that the success of missions has been marked amongst rude and aboriginal tribes. What was true in the early missions has been found true in these latter times. The rude and barbarous northern peoples seemed to fall like "full ripe fruit before the first breath of the gospel." The Goths and the Vandals who poured down upon the Roman empire were evangelized so silently and rapidly that only a fact here and there relating to their conversion has been preserved. Now this is exactly analogous to modern experience in the South Seas, America, and Africa. We must here content ourselves with a cursory survey

of what missionary enterprise has accomplished in those regions and among the more civilized nations of Eastern Asia.

The South Seas.—That missions have done much in these regions in suppressing cannibalism, human sacrifices, and infanticide, humanizing the laws of war, and elevating the social condition of women, is a fact confirmed by the researches of Meinicke, Waitz, Gerlaud, Oberlander, and even of Darwin.⁴

In Australia work among the aborigines, wherever it has been zealously conducted, has been blessed with signal success. Amongst the Papuans the Moravian stations of Ebenezer in the district of Wimmera, and Ramahyuck in that of Gippsland, can point to their little villages of 125 native Christian inhabitants, their cleanly houses, and their well-ordered churches. In the district of South Adelaide, at Point Macleay, the Scottish Presbyterian Mission has been similarly successful, while in New Zealand the native population was converted almost within a single generation. In the islands north and north-west of Australia the Dutch missionaries have been especially successful in the Minahassa (see CELEBES), of whose 114,000 inhabitants more than 80,000 have been won over to the Christian faith, forming 195 communities with 125 schools; and in southern Borneo, the Rhenish Mission in the south and the Society for the Propagation of the Gospel in the north have been enabled to establish themselves firmly, while the former society has also done a great work among the Battaks in Sumatra. Amongst the dark-coloured races of Polynesia missionary work has made great advances through the labours of the London Missionary Society, the Wesleyans, and the American Board. Making Tahiti its basis of operations, the first-named society has carried on missionary operations in the islands of Australasia, Hervey, Samoa, Tokelan, and Ellice, while the American Board has witnessed equally favourable results in the Sandwich Islands, and in Micronesia (Caroline, Marshall, and Gilbert Islands) the agents of the Hawaiian Association are actively at work under the direction of American missionaries. In Melanesia the Society for the Propagation of the Gospel, the Wesleyans, the London Missionary Society, and the Presbyterians are all actively engaged. The Fiji group stands out as one of the most promising centres of Christian civilization, and the governor, Sir A. Gordon, was enabled to report in 1879 that, out of a population of about 120,000, 102,000 are now regular worshippers in the churches, which number 800, while over 42,000 children are in attendance in 1534 Christian day schools. The Loyalty Islands have been occupied partly by Roman Catholic missions and partly by the London Missionary Society, while in the New Hebrides the missionaries of the Free Church of Scotland and of the Presbyterian churches of Canada, New Zealand, and Australia, in spite of many obstacles, the unhealthiness of the climate, and the variety of the dialects spoken, have upwards of 3000 natives receiving Christian teaching, 800 communicants, and 100 native teachers. On the islands of Banks, Santa Cruz, and Solomon, the English Episcopal Church is achieving no little success, sending native youths for months at a time to Norfolk Island to receive instruction, whence they return again in order to spread the knowledge of truth at home. These islands will ever be famous in connexion with the martyr death of the noble Bishop Patteson.

The Uncivilised Peoples of America.—The quiet humble labours of the Moravians have accomplished much in Greenland and Labrador, whilst among the Indians of Canada and the people of Hudson's Bay the Society for the Propagation of the Gospel has not laboured in vain, nor the Church Missionary Society in the dioceses of Rupertsland, Red River, Saskatchewan, and Moosonee. At Columbia, on the coast of the Pacific, a practical missionary genius named William Duncan has succeeded in civilizing a body of Indians degraded by cannibalism, and at his Metlakahtla mission stands at the head of a community of some thousand persons, which has a larger church than is to be found between there and San Francisco. Testimony to the value of the results achieved was borne in 1876 by Lord Dufferin, then governor-general of Canada, who declared that he could hardly find words to express his astonishment at what he witnessed. Amongst the Indian tribes of the United States work is carried on by the Moravians, the American Board of Missions, the Presbyterians of the North and South, the Baptists, the Episcopal Methodists, and the American Missionary Society; and the result is that 27,000 Indians, divided amongst the 171 communities of different denominations (including the Roman Catholic) are in full membership with the church, and have 219 places of worship, besides 366 schools attended by about 12,222 Indian children. The Cherokees, the Choctaws, the Creeks, the Chickasaws, have their own churches, schools, and academies, and may compare favourably both intellectually and morally with their white neighbours in Missouri, Arkansas, and Texas.⁵ Amongst the negroes in the United States more than 1000 places of worship have been built since the last war, while the American Missionary Association alone has erected 26 academies with about 6000 students, for the purpose of

¹ Max Müller, *Chips*, iv. p. 265.

³ Lightfoot, *Comparative Progress of Ancient and Modern Missions*.

See Christlieb, *Foreign Missions*, p. 88. ⁵ *Ibid.*, pp. 98, 99.

preparing freed slaves to be teachers and missionaries. Amongst the Indians on the Essequibo and Berbice in British Guiana, the missions of the Society for the Propagation of the Gospel have been rapidly extended, and now upwards of half the Indian population are members of Christian churches. In the British West Indies, through the united labours of various missionary societies, out of 1,000,000 inhabitants upwards of 248,000 are returned as regular members of the churches, 85,000 as communicants, while 78,600 children receive instruction in 1123 day schools, of which number about 45,000 belong to Jamaica.

Passing to the southern promontory of South America, we find that the self-denying labours of Allen Gardiner are beginning to justify the devotion that prompted them. The London South American Missionary Society not only carries on its operations in the Falkland Islands, where youths from Tierra del Fuego receive instruction, but has founded stations in Tierra del Fuego itself, has roused the natives of Patagonia from their spiritual deadness, and has extended its labours even to the Indians in Brazil.

Africa.—Here there are three great regions of missionary activity, —on the west coast, in the south, and in some parts of the east.

The largest and most fruitful mission field in West Africa is that of Sierra Leone, where at least seven-eighths of the people are now Christians, though the first mission does not date further back than the present century; and important results have also been obtained in Senegambia (on the Pongas), in Old Calabar, and in the republic of Liberia. On the Gold and Slave Coasts the labours of English Wesleyan missionaries and of the North German missionary societies have been crowned with no small success, while the Basel Society, which celebrated its jubilee in 1878, has extended its sphere of activity to Ashantee, translating the Scriptures into the native languages, and changing primeval marshes into bright-looking Christian villages. In the Yoruba lands the Church Missionary Society has 11 stations, 5994 Christians, and 1657 scholars, while on the Niger we are confronted with the interesting spectacle of negro preachers and teachers labouring under the coloured Bishop Crowther, carrying on a work which within the last few years was consecrated by the blood of martyrs.

South Africa has for some time been a centre of missionary activity. Here thirteen British and Continental associations have proved that all the South African races, Hottentots and Kaffres, Fingoes and Bechuans, Basutos and Zulus, are capable of attaining a considerable degree of Christian civilization, and can not only be instructed in handicraft and agriculture, but trained as ministers and teachers. A single instance of this is afforded in British Kaffraria by the Lovedale Institute of the Free Church of Scotland, where youths from all the above-mentioned tribes are taught along with Europeans, and every Sunday sixty students proclaim the gospel in the neighbouring villages. In the cause of mission work here few ever laboured more zealously than the late Bishop Gray, whose diocese, when first constituted, included the whole colony of the Cape, but whose successor has now for his suffragans the bishops of Grahamstown, Maritzburg, St Helena, Bloemfontein, Zululand, St John's, and Pretoria.

East and East Central Africa, so long neglected, is now being rapidly occupied by missionary enterprise. Here the island of Madagascar has been in great part evangelized, while on the island of Mauritius the Anglican Mission has developed pre-eminent results. On the mainland, the coast of Zanzibar calls for special notice. Here the little island of the same name has long been the seat of the Universities Mission to Central Africa, and the heroic Bishop Steere has not only erected a cathedral on the site of the former slave-market, but translated the New Testament into Sawahili, a language which can be understood by the tribes around the lakes, and even in Uganda.

China.—"O mighty fortress! when shall these impenetrable brazen gates of thine be broken through?" was the mournful exclamation of Valignano, the successor of Xavier, as he gazed in sadness at the mountains of China. The words well express the incredible difficulties which this largest and most thickly peopled heathen land in the world, with its petrified constitution and culture of three thousand years, presents in the way of missionary effort. The country itself, the people, their speech, their manners, their religion, their policy, seemed to unite in opposing an insuperable barrier, but history has to record how efforts have been made by many bodies, and at many times, to break it down. An early Nestorian Church established itself in the empire, but was either uprooted, or died out in course of time. In the 16th century the Jesuits undertook the task, and in spite of the persecutions which they have undergone the missions of the Roman Church, with their numerous foreign clergy and their hosts of natives of different ecclesiastical degrees, have attained no small measure of success. Before the country was really opened to foreigners by the treaty of Tientsin, pioneers proceeded thither from America, and from the London Missionary Society. The labours of Dr Legge in translating and reducing to system the Chinese classics are

well known. At the present day it is estimated that there are upwards of 29 societies at work in the country, with about 250 ordained missionaries and 63 female teachers, and the number is constantly increasing. These societies, of which the largest proportion belong to England, and the next largest to America, support, it is estimated, 20 theological schools, 30 higher boarding schools for boys with 611 scholars, 38 for girls with 777 scholars, 177 day schools for boys with 4000 to 5000 pupils in attendance, 82 for girls with 1307, while 16 missionary hospitals and 24 dispensaries are under the direction of medical missionaries, whose work in China has been recognized almost from the first as the source of the greatest blessing. The mission centres stud the east coast from Hong Kong and Canton to the frontiers of Manchuria in the north; thence they advance little by little every year into the interior, while as yet the western provinces are scarcely touched by missionary effort. The literary labours of the various societies have been carried on with the utmost perseverance; and on the foundations laid by a Morrison and a Milne later toilers have been enabled to raise a superstructure of translations of various portions of the Bible, as well as various Christian books and religions and general periodicals which constitute a means of vast importance towards gradually gaining over this land of culture. At Peking a Russian mission has been labouring for more than one hundred and fifty years. The Society for the Propagation of the Gospel and the Church Missionary Society have lately opened up new centres in this almost limitless country.²

Japan.—Of the missions in Japan it is as yet too early to forecast the future. The signing of the commercial treaties of 1854 and 1858 with America and England was followed in 1859 by efforts on the part of the American churches to extend a knowledge of Christianity, and in these Bishop Williams, an accomplished Japanese scholar, proved himself a valuable leader and guide. Soon afterwards other societies found their way into the country, and in March 1872 the first Japanese congregation, of 11 converts, was constituted in Yokohama. Within the last eight years these 11 have increased to 1200, while the American missions have been supplemented by those of the Church Missionary Society and the Society for the Propagation of the Gospel. Nearly every mission has what may be called a high school for girls, and these institutions are very popular. Thousands of copies also of the Gospels have been circulated in Japanese, and representatives of nearly all the missions are engaged in translating the entire New Testament, while a Russo-Greek mission has established itself in the north, and is advancing steadily, having already made about 3000 converts.³ Thus, when it is considered that in the beginning of the 17th century the Japanese Government drove out the Portuguese and massacred the native Catholic converts, and prohibited all Christians under pain of death from ever setting foot in the country, and when it is borne in mind that many of these old laws against Christianity have not yet been repealed and that the old distrust of strangers is still plainly discernible among the governing classes, it is clear that, while there is much ground for hope, effectual results can only be the work of time.

India.—What is true of China and Japan applies with tenfold force to India. Here the results achieved resemble those which were attained in the conflict between Christianity and the religion of old pagan Rome, with its mass of time-honoured customs interwoven with the literature, institutions, and history of the empire. Against the influence of prestige and settled prejudice the wave of the gospel beat for centuries in vain. Slowly and gradually it was undermining the fabric, but no striking results were immediately visible. So also in India with the Hindu proper Christianity has hitherto made inappreciable progress, while among the rude aboriginal or non-Aryan tribes its success has been remarkable. Independently of Roman Catholic missions upwards of twenty-eight societies are earnestly engaged in the English mission field, and the following figures will give some idea of the progress that has been made during the last twenty or thirty years. In British India, including Burmah and Ceylon, it is estimated that in 1852 there were 22,400 communicants and 128,000 native Christians young and old; in 1862 these had increased to 49,681 communicants and 213,182 native Christians; in 1872 there had been a further increase to 78,494 communicants and 318,363 native Christians, while in 1878 the latter figures rose to 460,000. When we look at the share that each of the societies has had in this increase, we find that the Society for the Propagation of the Gospel and the Church Missionary Society together have since 1850 increased in membership from 61,442 to upwards of 164,000; the London Missionary Society from 20,000 to upwards of 48,000; the Presbyterian missions of Scotland, England, Ireland, and America from 500 to 10,000; the Basel mission in India from 1000 to 6305; the Baptist missionary societies (including the American as well as the English) from 30,000 to 90,000; the five Lutheran societies from 3316 to about 42,000. In some places the progress made has been excep-

² The Roman Catholic Mission had 404,530 converts in China in 1876, with a yearly increase of about 2000.

³ Christlieb, *Foreign Missions*, p. 222.

¹ See Lightfoot, *Ancient and Modern Missions*, p. 10.

tionally rapid. In Cuddapah, e.g., in the Telugu territory, the Society for the Propagation of the Gospel and the London Missionary Society laboured side by side for upwards of thirty years without winning over more than 200 converts. Then on a sudden there sprang up a revival among the non-caste population, and the 200 became nearly 11,000. Among the Kols, after five years' waiting, the Gossner missionaries baptized their first converts in 1850; now in the German and English stations together these amount to about 40,000. Since the famine, however, in 1878-79, the increase of new converts has been still more rapid, and the practical experience of the superiority of Christian pity to heathen selfishness and of the helplessness of their heathen deities, united with the effect produced by persistent missionary labour in past years, brought thousands into the fold of the church. Thus in the Tinnevely district, where the Church Missionary Society carries on its operations, upwards of 11,000 heathens applied in 1878 to Bishop Sargent and his native clergy for instruction preparatory to baptism.¹ In the same district, in connexion with the Society for the Propagation of the Gospel, between July 1877 and the end of June 1878 upwards of 23,564 persons betook themselves to Bishop Caldwell and his fellow-labourers for Christian teaching. Thus the English Church missions in Tinnevely and Ramnad received in little more than a year and a half an increase of 35,000 souls,² and the Propagation Society is now proclaiming the gospel in nearly six hundred and fifty villages in the Tinnevely district, amongst not merely food-seeking "rice Christians" but those who have had the courage to face severe persecution for joining the Christian church. Encouraging progress has also been made among the Santals and the Karens in Burmah and Pegu. Speaking generally, it may be said that the largest proportion of native converts is in the south, in the presidency of Madras; next to southern India the most fruitful field is Burmah, where the American Baptist missions are carrying on a successful work among the Karens, while the Propagation Society has founded many schools on the Irawadi, and penetrated up to Rangoon, and beyond British territory to Mandalay; next in point of numbers stand Bengal and the North-West Provinces. Here the largest contingent is supplied by the missions in Chuti Nagpur, among the aboriginal tribes of the Kols, while the Santal mission also presents many promising features. For the Punjab district and that of Sind, the Church Missionary Society has planted in Lahore a flourishing theological seminary for Christian Hindus, Sikhs, and Mohammedans, and Christianity has advanced thence by way of Peshawar into Afghanistan and Kashmir. It thus appears that by far the greatest measure of success has been obtained amongst the aboriginal races and those who are either of low caste or of no caste at all, while the real strongholds of the Hindu religion and civilization still stand out like strong fortresses and defy the attempts of the besiegers. Still the disintegrating agency of contact with Christianity is working out its slow but sure results. "Statistical facts," writes Sir Bartle Frere, "can in no way convey any adequate idea of the work done in any part of India. The effect is often enormous where there has not been a single avowed conversion. The teaching of Christianity amongst 160 millions of civilized industrious Hindus and Mohammedans in India is effecting changes, moral, social, and political, which for extent and rapidity in effect are far more extraordinary than any that have been witnessed in modern Europe." "The number of actual converts to Christianity in India," says Lord Lawrence, "does not by any means give an adequate result of missionary labours. There are thousands of persons scattered over India who from the knowledge they have acquired either directly or indirectly through dissemination of Christian truth and Christian principles have lost all belief in Hindunism and Mohammedanism, and are in their conduct influenced by higher motives, who yet fear to make an open profession of the change in them lest they should be looked upon as outcasts and lepers by their own people." To some such a negative result may at first sight appear discouraging; but, read by the light of history, it marks a natural, almost a necessary, stage of transition from an ancient historical religion to Christianity. The Brahma Somaj is not the first instance where a system too vague and shadowy and too deficient in the elements of a permanent religion has filled the interval between the abandonment of the old and the acceptance of a new faith. The cultured classes amongst the Greeks and Romans experienced in their day, after the popular mythology had ceased to satisfy, a period of semi-scepticism before Christianity had secured its hold. Meantime in India the indirect agencies which are at work—the results of war and conquest, of European science and European literature, of the telegraph and the railway, the book and the newspaper, the college and the school, the change of laws hallowed by immemorial usage, the disregard of time-honoured prejudices, the very presence of Europeans in all parts of the country—all these various influences are gradually bringing about results analogous to that to which Sir James Mackintosh referred in a conversation with Henry Martyn, when the

Oriental world was made Greek by the successors of Alexander in order to make way for the religion of Christ. But when to these indirect influences we add the effects of direct missionary instruction, of training schools like those of the Free Church of Scotland in Madras, of Bishop Sargent in Tinnevely, of Bishop Cotton in the North-West Provinces, of Zenana missions now carried on on an extensive scale amongst the female population, of the numerous missionary presses at work circulating thousands of copies of the Holy Scriptures and of Christian books, it is obvious that, small and insignificant as these agencies may seem compared with the magnitude of the work required to be done, there has been a great advance made during recent years. The present century of missions may favourably compare with the primitive and mediæval ages of the church, and the continuity of the missionary spirit operating, as we have seen, after long periods of stagnation and depression is the best guarantee of its ultimate and more complete success at the close of the present epoch, during which, to use Karl Ritter's expression, "almost all the rivers of the earth have begun to run in double currents, and nearly all the seas and rivers have become the seas and rivers of civilization." (G. F. M.)

MISSISSIPPI. The territory drained by the Mississippi river and its tributaries includes the greater part of the United States of America lying between the Alleghany Mountains on the east and the Rocky Mountains on the west, and has an area (1,244,000 square miles) considerably larger than all central Europe. The central artery through which the drainage of this region passes is called the Mississippi river for about 1300 miles above its mouth. The name is then usurped by a tributary, while the main

The Mississippi and its Tributaries.

stream becomes known as the Missouri. From its remote sources in the Rocky Mountains to the Gulf of Mexico the total length of the river is about 4200 miles. The other principal tributaries are the Ohio, the Arkansas, and the Red River, but the Yazoo and the St Francis often make dangerous contributions in seasons of flood.

The tables given below exhibit the hydraulic features of the Mississippi and its principal tributaries.

Below the influx of the Ohio the Mississippi traverses alluvial bottom lands liable to overflow in flood seasons. The soil is of inexhaustible fertility, producing large crops of corn in the northern portion, cotton in the middle district, and sugar, rice, and orange groves near the mouth. These bottom lands, averaging about 40 miles in width, extend from north to south for a distance of 500 miles, having a general southern slope of 8 inches to the mile. The river winds through them in a devious course for 1100 miles, occasionally on the east side washing bluffs from 100 to 300 feet in height, but usually confined by banks of its own creation, which, as with all sediment-bearing rivers of like character, are highest near the stream itself. The general lateral slope towards the foot hills is about 6 inches

² Report of the Propagation Society for 1879, p. 31 sq.

in 5000 feet, but the normal fall in the first mile is about 7 feet. Thus apparently following a low ridge through the bottom lands, the tawny sea sweeps onward with great velocity, eroding its banks in the bends and rebuilding them on the points, now forming islands by its deposits, and now removing them as the direction of the flow is modified by the never-ending changes in progress. Chief among such changes is the formation of cut-offs. Two eroding bends gradually approach each other until the water forces a passage across the narrow neck. As the channel distance between these bends may be many miles, a cascade perhaps 5 or 6 feet in height is formed, and the torrent rushes through with a roar audible for miles. The banks dissolve like sugar. In a single day the course of the river is changed, and steamboats pass where a few hours before the plough had been at work. The checking of the current at the upper and lower mouths of the abandoned channel soon obstructs them by deposit, and forms in a few years one of the characteristic crescent lakes which are so marked a feature on the maps.

The total area of the bottom lands is about 32,000 square miles, of which only a narrow strip along the immediate banks of the main river and of its principal bayous and tributaries has even yet been brought under cultivation. A proper system of protection against overflow would throw open 2,500,000 acres of rich sugar land, 7,000,000 acres of the best cotton land in the world, and 1,000,000 acres of corn land of unsurpassed fertility.

The work of embankment began in 1717, when the engineer De la Tour erected a dyke or levee 1 mile long to protect the infant city of New Orleans from overflow. Progress at first was slow. In 1770 the settlements extended only 30 miles above and 20 miles below New Orleans; but by 1828 the levees, although quite insufficient in dimensions, had become continuous nearly to the mouth of Red River. In 1850 a great impulse was given to systematic embankment by the U.S. Government, which gave over to the several States all unsold swamp and overflowed lands within their limits to provide a fund for reclaiming the districts liable to inundation. The action

resulting from this caused alarm in Louisiana, for the great bottom lands above were believed to act as reservoirs to receive the highest flood wave; and it was imagined that if they were closed by levees the lower country would be overwhelmed whenever the river in flood rose above its natural banks. The aid of the Government was invoked, and Congress immediately ordered the necessary investigations and surveys. This work was placed in charge of Captain (now General) Humphreys, and an elaborate report covering the results of ten years of investigation was published just after the outbreak of the civil war in 1861. The second of the tables given above, and indeed most of the physical facts respecting the river, are quoted from this standard authority.

To understand the figures of the table it should be noted that at the mouth of Red River, 316 miles above the passes, the water surface at the lowest stage is only $5\frac{2}{10}$ feet above the level of the Gulf, where the mean tidal oscillation is about $1\frac{2}{10}$ feet. The river channel in this section is therefore a freshwater lake, nearly without islands, 2600 feet wide and 100 feet deep along the deepest line. At the flood stage the surface rises 50 feet at the mouth of Red River, but of course retains its level at the Gulf, thus giving the head necessary to force forward the increased volume of discharge. Above the mouth of Red River the case is essentially different. The width increases and the depth decreases; islands become numerous; the oscillation between high and low water varies but little from 50 feet until the mouth of the Ohio is reached—a distance of about 800 miles. Hence the general slope in long distances is here nearly the same at all stages, and the discharge is regulated by the varying resistances of cross section, and by local changes in slope due to the passage of flood waves contributed by the different tributaries. The effect of these different physical conditions appears in the comparative volumes which pass through the channel. At New Orleans the maximum discharge hardly reaches 1,200,000 cubic feet per second, and a rising river at high stages carries only about 100,000 cubic feet per second more than when falling at the same absolute level; while just below the mouth of the Ohio the maximum flood volume reaches 1,400,000 cubic feet per second, and at some stages a rising river may carry one-third more water than when falling at the same absolute level.

The percentage of sedimentary matter carried in suspension by the water varies greatly at different times, but is certainly not dependent upon the stage above low water. It is chiefly determined by the tributary whence the water proceeds, but is also influenced by the caving of the banks, which is always excessive when the river is rapidly falling after the spring flood. In long periods the sedimentary matter is to the water by weight nearly as 1 to 1500, and by bulk as 1 to 2900. The amount held in suspension and annually contributed to the Gulf constitutes a prism 1 mile square and 263 feet high. In addition to this amount a large volume, estimated at 1 mile square and 27 feet high annually, is pushed by the current along the bottom and thus transported to the Gulf.

The mean annual succession of stages for long periods is quite uniform, but so many exceptions are noted that no definite prediction can safely be made for any particular epoch. The river is usually lowest in October. It rises rapidly until checked by the freezing of the northern tributaries. It begins to rise again in February, and attains its highest point about the 1st of April. After falling a few feet it again rises until, early in June, it attains nearly the same level as before. After this it rapidly recedes to low-water mark. As a rule the river is above mid-stage from January to August inclusive, and below that level for the remainder of the year.

It has been established by measurement and observation that the great bottom lands above Red River before the construction of their levees did not serve as reservoirs to diminish the maximum wave which passed through Louisiana in great flood seasons. They had already become filled by local rains and by water escaping into them from the Mississippi through numerous bayous, so that at the date of highest water the discharge into the river near their southern borders was fully equal to the volume which the wave had lost in passing along their fronts.

In fine, the investigations between 1850 and 1860 established that no diversion of tributaries was possible; that no reservoirs artificially constructed could keep back the spring freshets which caused the floods; that the making of cut-offs, which had sometimes been advocated as a measure of relief, so far from being beneficial, was in the highest degree injurious; that, while outlets within proper limits were theoretically advantageous, they were impracticable from the lack of suitable sites; and, finally, that levees properly constructed and judiciously placed would afford protection to the entire alluvial region.

During the civil war (1861-65) the artificial embankments were neglected; but after its close large sums were expended by the States directly interested in repairing them. The work was done without concert upon defective plans, and a great flood early in 1874 inundated the country, causing terrible suffering and loss. Congress, then in session, passed an Act creating a commission of five engineers to determine and report on the best system for the permanent reclamation of the entire alluvial region. Their report, rendered in 1875, endorsed the conclusions of that of 1861, and advocated a general levee system on each bank. This system comprised—(1) a main embankment raised to specified heights sufficient to restrain the floods; and (2), where reasonable security against caving required considerable areas near the river to be thrown out, exterior levees of such a height as to exclude ordinary high waters but to allow free passage to great floods, which as a rule only occur at intervals of five or six years. The back country would thus be securely protected, and a safe refuge would be provided for the inhabitants and domestic animals living upon the portion subject to occasional overflow. An engineering organization was proposed for constructing and maintaining these levees, and a detailed topographical survey was recommended to determine their precise location. Congress promptly approved and ordered the survey; but strong opposition on constitutional grounds was raised to the construction of the levees by the Government.

In the meantime complaints began to be heard respecting the low-water navigation of the river below the mouth of the Ohio. Forty-three places above the mouth of Red River afforded depths of less than 10 feet, and thirteen places depths less than 5 feet, the aggregate length of such places being about 150 miles. A board of five army engineers, appointed in 1878 to consider a plan of relief, reported that 10 feet could probably be secured by narrowing the wide places to about 3500 feet with hurdle work, brush ropes, or brush dykes designed to cause a deposit of sediment, and by protecting caving banks, when necessary, by such light and cheap mattresses as experience should show to be best suited to the work. Experiments in these methods were soon begun upon the river above Cairo, and have since proved of decided benefit.

In June 1879 Congress created a commission of seven members to mature plans to correct, permanently determine, and deepen the channel, to protect the banks of the river, to improve and give safety to navigation, to prevent destructive floods, and to promote and facilitate commerce. Up to 1882 appropriations amounting to \$1,285,000 were made to execute the plans of this commission, but with proviso that none of the funds were to be expended in repairing or building levees for the protection of land against overflow, although such levees might be constructed if necessary to deepen the channel and improve navigation. Acting under this authority, the commission have allotted considerable sums to repair existing breaks in the levees; but their chief dependence is upon contracting the channel at low water by promoting lateral deposits, and upon protecting the high-water banks against caving by mats of brush, wire, &c., ballasted where necessary with stone,—substantially the plans proposed by the army board of 1878.

The bars at the efflux of the passes at the mouth of the Mississippi have long been recognized as serious impediments to commerce. The river naturally discharges through three principal branches, the south-west pass, the south pass, and the north-east pass, the latter through two channels, the most northern of which is called Pass à l'Outre. The ruling depth on the several bars varies with the discharge over them, which in turn is controlled by the successive advances of the passes. In the natural condition the greatest

depth does not exceed 12 or 13 feet. The first appropriation by Congress to secure increased depth was made in 1837, and was expended in an elaborate survey and in a system of dredging by buckets, but the plan of a ship canal was also discussed. At the next appropriation, made in 1852, a board of officers, appointed by the war department, recommended trying in succession—(1) stirring up the bottom by suitable machinery, (2) dredging by buckets, (3) constructing parallel jetties 5 miles long at the south-west pass, to be extended as found necessary, (4) closing lateral outlets, and (5) constructing a ship canal. A depth of 18 feet was secured by the first plan, and was maintained until the available funds were exhausted. Under the next appropriation (1856) an abortive attempt was made to apply the plan of jetties to the south-west pass. This failed from defects in execution by the contractors, but a depth of 18 feet was finally secured by dredging and scraping. The report of 1861 discussed the subject of bar formation at length. Although it approved the plan of jetties and closure of outlets as correct in theory, the stirring up of the bottom by scrapers during the flood stages of the river (six months annually) was recommended by it as the most economical and least objectionable. After the war this recommendation was carried into effect for several years with improved machinery, giving at a moderate annual cost a depth at times reaching 20 feet at extreme low water, but experience indicated that not much more than 18 feet could be steadily maintained. This depth, entirely satisfactory at first, soon became insufficient to meet the growing demands of commerce, and in 1873 Major Howell, the engineer in charge, revived the project of a ship canal. The subject was discussed carefully by a board of army engineers, the majority approving a ship canal. In 1874 Congress constituted a special board which, after visiting Europe and examining similar works of improvement there, reported in favour of constructing jetties at the south pass, substantially upon the plan used by Mr Caland at the mouth of the Meuse; and in March 1875 Captain J. B. Eads and associates were authorized by Congress to open by contract a broad and deep channel through the south pass upon the general plan proposed by this board. This contract called for "the maintenance of a channel of 30 feet in depth and 350 feet in width for twenty years" by "the construction of thoroughly substantial and permanent works by which said channel may be maintained for all time after their completion." The jetties were to be not less than 700 feet apart. The sum of £1,080,000 was to be paid for obtaining this channel and £412,000 for maintaining it for twenty years. In addition the contractors were authorized to use any materials on the public lands suitable for and needed in the work. The south pass was $12\frac{3}{4}$ miles long. It had an average width of 730 feet and a minimum interior channel depth of 29 feet. The distance from the 30-foot curve inside the pass across the bar to the 30-foot curve outside was 11,900 feet. The minimum depth at average flood tide on the bar was about 8 feet. The discharge at the mouth was about 57,000 cubic feet of water per second, transporting annually about 22 million cubic yards of sediment in suspension to the Gulf. A small island and shoal existed at the head of the pass, the channel there having a minimum depth of 17 feet. The work was begun on June 2, 1875, and has been so far successful that during the year ending June 30, 1882, a channel was maintained having a least depth of 30 feet between the jetties and extending through the bar. Its least width was 20 feet, the average being 105 feet. The 26-foot channel had a least width of 200 feet, except for a few days. In the pass itself the 26-foot channel had a least width of 50 feet. A very powerful dredge-boat was at work between and beyond the jetties 87 days, of which 51 were devoted to the channel in the Gulf. A deepening of 6 feet has occurred in Pass à l'Outre near its head since 1875. Up to the present time the work has proved of great benefit to the commerce of New Orleans.

For further details, see RIVER ENGINEERING. (H. L. A.)

MISSISSIPPI, one of the Southern States of the American Union, derives its name from the river which for more than 500 miles forms its western boundary between the 35th and 31st parallels of north latitude, separating it from Arkansas and Louisiana. The boundary with the latter State is continued along the 31st parallel, for 110 miles, to the Pearl river, and then down the Pearl to its mouth. The Gulf of Mexico, eastward from the mouth of Pearl river, completes the southern boundary. On the north the 35th parallel, from the Mississippi river to the Tennessee, separates the State from Tennessee, and the boundary then follows the latter river to the mouth of Bear Creek, in $34^{\circ} 53'$ N. lat. and $88^{\circ} 15'$ W. long. The eastern boundary of the State, separating it from Alabama, follows a line drawn from the mouth of Bear Creek about seven degrees west of south to what was

"the north-western corner of Washington county on the Tombigbee," and thence due south to the Gulf of Mexico. Ship, Horn, Cat, and Petit Bois Islands, and those nearer the shore, form a part of Mississippi. The extreme length of the State, north and south, is 330 miles, and its maximum breadth is 188 miles. Under the United States surveys, begun in 1803, the State has been divided into townships and sections, except such parts as were at the first owned by individuals. The area of the State is given in the census reports for 1880 as 46,340 square miles.

Topography.—There are no mountains in Mississippi, but a considerable difference of level exists between the continuously low, flat, alluvial region lying along and between the Mississippi and Yazoo rivers, called "the Bottom," and nearly all the remainder of the State, which is classed as upland. The latter part, comprising five-sixths of the whole, is an undulating plateau whose general elevation above the water of the Gulf of Mexico increases to 150 feet within a few miles of the coast, and varies elsewhere from 150 to 500 or 600 feet. Some exceptional ridges are probably 800 feet high. The streams of this region flow in valleys varying in width from a few hundred yards to several miles. The fall of each river is not great, and is quite uniform. Usually a considerable part of the valley of each larger stream is several feet above its present high water mark, and forms the "hommock," or "second bottom" lands. On some of the rivers the lowest part of the valley, subject to overflow, is several miles in width, and bears a resemblance to the Mississippi Bottom.

Ridges or plateaus everywhere in the upland region divide the contiguous basins of creeks and rivers, descending more or less abruptly to their valleys. In the north-eastern part of the State, almost level prairies cover large areas overlying a Cretaceous formation called Rotten Limestone.

A line of abrupt bluffs, extending southward from the north-west corner of the State, divides the upland region from the Bottom, where the general surface lies below the high-water level of the Mississippi river. A few low ridges, running north and south, and embracing about 200,000 acres, are barely above high water. The cultivated lands in the Bottom lie on these, and on the borders of the rivers and the numerous lakes and bayous, where the surface is slightly elevated. Low swamps or marshes, in which flourish large cypress trees (*Taxodium distichum*), lie between the streams, and frequently receive the surface drainage from their banks. Large forest trees and dense cane-brakes (*Arundinaria gigantea*) occupy the drier ground. The Mississippi river is prevented from flooding the Bottom during high water by a system of levees or embankments built by a fund derived partly from taxation on the land and partly from the proceeds of the sale of public lands in the State classed as "swamp lands," which were given over for this purpose by Congress. The only compensation for the injury done when breaks in the levees ("crevasses") occur is the deposit of alluvial matter left by the overflow, which adds to the productiveness of the already wonderfully fertile soil. The present levee system usually protects about one-fourth of the 4,000,000 acres in the Bottom. Many crescent-shaped lakes ("cut-offs") occur in the Bottom. Similar phenomena present themselves in the channels of the other rivers having wide bottoms.

The volume of water in the streams varies greatly during the year, and is usually largest between the months of January and April. During high water all the larger streams are navigable by steamboats. These ply upon the Mississippi, Tennessee, and Yazoo rivers throughout the whole year. The rivers flowing into the Gulf are much obstructed by sand-bars, and are chiefly used for floating logs to the saw-mills on the coast.

The best and only deep harbour on the coast is the well-protected roadstead inside of Ship Island. It has a depth of 27 feet, a firm clay bottom, and is readily accessible to lighters from the shallower harbours along the coast.

Climate.—Near the waters of the Gulf of Mexico the climate is much milder than in the northern parts of the State. On the southern borders the temperature rarely falls to 32° Fahr., or exceeds 95°, the annual mean being about 65°. The orange, lemon, almond, banana, and olive can be grown without protection. In the latitude of Vicksburg the temperature ranges from 98° to 20°, very rarely lower; the annual mean is 65°. The range in the northern part of the State is from 93° to 15°, or rarely 10°, and the annual mean is 61°. The first and last hoar-frosts occur, in the central parts of the State, usually in the latter parts of October and March. The ground is seldom frozen to the depth of 3 inches, and only for a few days at a time. The rainfall on the coast is 60 to 65 inches per annum, and at the northern boundary 50 inches. While about two-thirds of this precipitation occurs in winter and spring, a month seldom passes without several inches of rainfall.

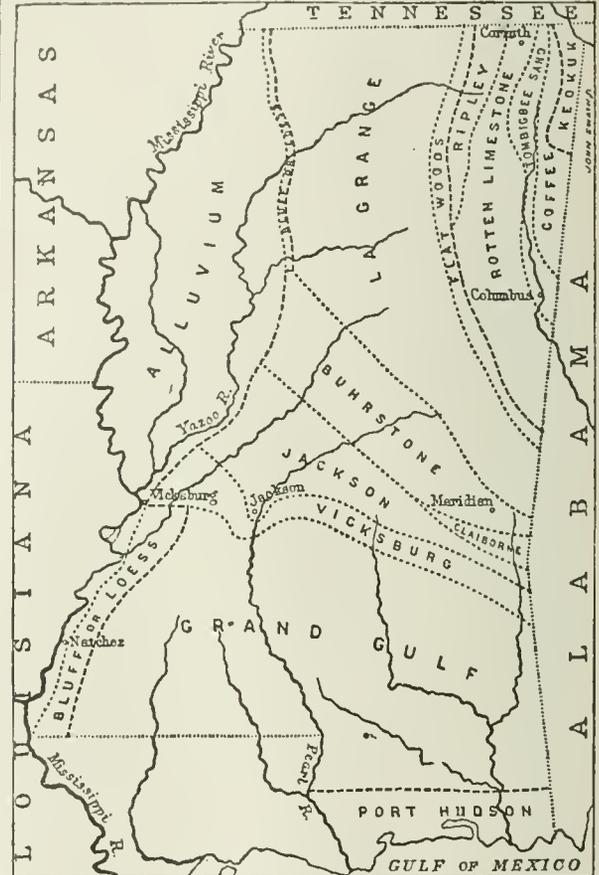

Land and sea breezes in the south, and variable winds elsewhere, make the heat of summer tolerable. In healthfulness Mississippi compares favourably with other States. The average death-rate of thirteen States, variously situated, as given in the census of 1880, is 1.38 per cent.; that of Mississippi is 1.19 per cent. Where the surface is flat and poorly drained malarial fevers are prevalent during the warm season. Yellow fever has become epidemic after importation, but strict quarantine has been successful in preventing it.

Geology.—In accordance with an Act of the legislature passed in 1850, an agricultural and geological survey of the State was begun, which continued, with interruptions, until 1871. Two reports have been published, one in 1854 and another in 1860.

The geological structure of the State is comparatively simple, and closely related to that of the adjacent States. The older formations are nearly all overlaid by deposits of the Quaternary period, which will be described last. In the extreme north-eastern portion are found the oldest rocks in the State,—an extension of the Subcarboniferous formation which underlies the Warrior coal-fields of Alabama. The strata here show some traces of the upheaval which formed the Appalachian mountain chain, whose south-west termination is found in Alabama. When this chain formed the Atlantic mountain-border of the continent, excepting this north-east corner, Mississippi had not emerged from the waters of the ancient Gulf of Mexico. As the shore-line of the Gulf slowly receded southward and westward, the sediment at its bottom gradually came to the surface, and constituted the Cretaceous and Tertiary formations of this and adjacent States. Wherever stratification is observed in these formations in Mississippi, it shows a dip west and south of 20 or 30 feet to the mile. The Cretaceous region includes, with the exception of the Subcarboniferous, all that part of the State eastward of a line cutting the Tennessee boundary in 89° 3' W. long., and drawn southward and eastward through the towns of Ripley, Pontotoc, and Starkville, crossing into Alabama in latitude 32° 45'. Four groups of Cretaceous strata have been determined in Mississippi, defined by lines having the same general direction as the one just described. The oldest, bordering the Subcarboniferous, is the Eutaw or Coffee group, characterized by bluish-black or reddish laminated clays, and yellow or grey sands, containing lignite and fossil resin. Westward and southward to the city of Columbus is the Tombigbee sand group, consisting chiefly of fine-grained micaceous sands of a greenish tint, with many marine fossils. Next in order, westward and southward, is the Rotten Limestone group, made up of a material of great uniformity,—a soft chalky rock, white or pale blue, composed chiefly of tenacious clay, and white carbonate of lime in minute crystals. Borings show the total thickness of this group to be about 1000 feet. Fossils are abundant, but species are few. The latest Cretaceous is the Ripley group, lying west of the northern part of the last-named group, and characterized by hard crystalline white limestones, and dark-coloured, micaceous, glauconitic marls, whose marine fossils are admirably preserved. One hundred and eighty species have been described. The total thickness of the Cretaceous is about 2000 feet. Deposits of the Tertiary period form the basis of more than half the State, extending from the border of the Cretaceous westward nearly or quite to the Yazoo and Mississippi Bottom, and southward to within a few miles of the Gulf coast. Seven groups of the Tertiary strata have been distinguished. Beginning nearest the Cretaceous, the Flatwoods group is characterized by grey or white clays, and a soil which responds poorly to tillage. The Lagrange group, lying to the west of the last, is marked by grey clays and sands, fossil plants, and beds of lignite or brown coal, sometimes 8 feet in thickness. The Buhrstone group, lying south-westward from the last, is characterized by beds of white siliceous clay, and of silicified shells, and sandy strata containing glauconite in valuable quantities. The Claiborne group lies south of the last, and is slightly developed in Mississippi, but well-marked in

Alabama. The Jackson group, south-west of the last two, is made up chiefly of soft yellowish limestones or marls, containing much clay, and sandy strata with glauconite. Zeuglodon bones and other marine fossils are abundant. The Vicksburg group lies next in order south-westward, and is characterized by crystalline limestones and blue and white marls. Marine fossils are very abundant. More than one hundred and thirty species have been determined. The Grand Gulf group, showing a few fossil plants and no marine fossils, extends southward from the last to within a few miles of the coast.

The oldest formation of the Quaternary period is the "orange sand" or "stratified drift," which immediately overlies all the Cretaceous groups except the prairies of the Rotten Limestone, and all the Tertiary except the Flatwoods and Vicksburg groups and parts of the Jackson. Its depth varies from a few feet to over 200 feet, and it forms the body of most of the hills in the State. Its materials are pebbles, clays, and sands of various colours from white to deep red, tinged with peroxide of iron, which sometimes cements the pebbles and sands into compact rocks. The shapes of

Geological Map of Mississippi State.

these ferruginous sandstones are very fantastic,—tubes, hollow spheres, plates, &c., being common. The name stratified drift is used by the geologist of Alabama to indicate its connexion with the northern drift. The fossils are few, and in some cases probably derived from the underlying formations. Well-worn pebbles of amorphous quartz, agate, chalcedony, jasper, &c., are found in the stratified drift along the western side of the Tertiary region of the State, and from Columbus northward. "While this formation is not well understood, it seems tolerably well established that the melting of the great glaciers of the north furnished the water which brought with it fragments of the rocks over which it passed, and flowed into the Gulf with a current which was most rapid where the pebbles were dropped, but overspread the remainder of the State with a gentler flow, leaving sands and clays" (E. A. Smith). The second Quaternary formation is the Port Hudson, occurring within 20 miles of the Gulf coast, and probably outcropping occasionally in the Mississippi Bottom. Clays, gravel, and sands, containing cypress stumps, drift-wood, and mastodon bones, are characteristic. The less or bluff formation lies along the bluffs bordering the Bottom, nearly continuously through the State. Its fine-grained, unstratified silt contains the remains of many terrestrial animals, including fifteen mammals.

The surface and subsoil of nearly all the npland region of Mississippi, the southern part being the exception, is composed of yellow loam or brick-clay containing no fossils, and showing no stratification. The soil of the Rotten Limestone region is similar in its general make up, but is black, and contains more lime and clay. Both are regarded as an independent aqueous deposit, posterior to the stratified drift and bluff formations, and anterior to the alluvium of the present epoch. The "second bottoms," probably, are later than the yellow loam, and belong to the "terrace epoch." The latest formation, alluvium, is strongly marked, and covers a large area in the Yazoo and Mississippi Bottom, and along other streams.

The following are the equivalents of the Mississippi groups in Dana's Geology:—

Quaternary.....	20d 20c 20b 20a	Alluvium.....	Alluvium.
		Loam and loess.....	Loam and loess.
		Port Hudson.....	Fort Hudson.
		Drift.....	Smashed drift.
Tertiary.....	19a	Upper.....	Grand Gulf. Vicksburg.
		Middle.....	Jackson. Claborne.
		Lower.....	Buhrstone, Lagrange. Flatwoods.
Cretaceous.....	18b 18a	Upper.....	Ripley. Rotten Limestone.
		Lower.....	Tombigbee. Coffee.
Subcarboniferous.....			Keokuk.

Minerals.—Metallic ores are not found in Mississippi in paying quantities. The only valuable minerals are sandstones and limestones, marls, sands, lignite or brown coal, and fire-clays. None of these have been extensively brought into market. Potable water is found almost everywhere. Artesian wells furnish it in the Rotten Limestone region, when bored into the underlying Coffee strata.

Fauna.—Mississippi affords perhaps no species which are not found in the neighbouring States. There are thirty or forty species of *Mammalia*, the most remarkable being the American opossum, still quite abundant. The deer (*Cervus virginianus*), black bear (*Ursus americanus*), wolves (*Canis lupus* and *Lupus americanus*), eastmount (*Felis concolor*), and wild-cat (*Lynx rufus*) have much decreased in number, and may, like the buffalo and elk, shortly become extinct. About one hundred and fifty species of birds are found during at least part of the year. Many are seen only *in transitu*, and about twenty species from the north spend the winter here. The mocking bird (*Mimus polyglottus*), the most remarkable songster, is very abundant. The wild turkey (*Meleagris gallinavo*) survives by virtue of its wary and watchful character. Over fifty species of *Reptilia* have been found, prominent among which is the alligator (*A. mississippiensis*), which attains a length of 12 or 15 feet, and is common in the southern river bottoms. The rattlesnake, moccasin, and copperhead, venomous serpents, are occasionally found. About half of the sixty-three species of fish abounding in the fresh and salt waters of the State are valuable for food. The edible oysters and crustaceans of the coast are remarkably fine.

Flora.—Originally nearly the entire State was covered with a growth of forest trees of large size, mostly deciduous. The undergrowth was kept down by annual burnings by the natives, and the ground became carpeted with grasses and herbs. Over 120 species of forest trees are found; many valuable ones are abundant, and their timber constitutes a large item in the resources of the State. Of the 15 species of oak the most valuable are the live-oak (*Q. virens*), found near the coast, and the white-oak (*Q. alba*), widely distributed. The cypress (*Taxodium distichum*) is very abundant in the bottoms. Various species of hickory, the chestnut, black walnut, sweet gum, cucumber tree, cottonwood (*Populus deltoides*), red cedar, elms, holly, magnolias, maples, ash, persimmon, sycamore, tupelo, and many others valuable for their timber, are abundant and of large size. The long-leaved pine (*P. australis*) forms the principal forest growth south of lat. 32° 15'. It attains a diameter of 2 or 3 feet, has a tall and shapely trunk, and its timber is unsurpassed in the variety of its uses. The census reports estimate the merchantable timber of this species now standing in the State at 18,200,000,000 feet, board measure. The amount cut in 1880 was 103,000,000 feet. The short-leaved pine (*P. mitis*), almost as valuable, is found in various parts, the quantity now standing being estimated at 6,775,000,000 feet. The total value of the pine timber of the State is about \$250,000,000.

Agriculture is the leading industry in Mississippi. Over 300,000 of the population are directly engaged in the cultivation of 4,895,000 acres of land. The character of the soil is varied, and all is productive, except that in the Flatwoods region and in the district covered with long-leaved pine, where only the valleys are fertile. At least half the State is exceptionally fertile. Not more than one-fourth of the arable land has been brought into cultivation, and two millions of acres of the best lands in the State, lying in the Bottom, might be made arable by proper drainage.

Cotton is the chief agricultural product; in 1880 Mississippi ranked first among the States in the amount raised. The crop of

1879-80 amounted to 955,808 bales, worth \$43,000,000. There were produced also of cotton seed 23,000,000 bushels, worth \$3,000,000; of Indian corn, 21,340,800 bushels; of oats, 1,959,620 bushels; of wheat, 218,890 bushels; of rice, 1,718,950 lb. Small quantities of rye, barley, molasses, and tobacco, and abundant crops of potatoes, yams, pease, and all garden vegetables, are annually produced.

Fruits of various kinds flourish in many parts of the State, and, with early vegetables, are largely shipped to the northern markets in spring and early summer. The value of the cotton crop is about three times as great as that of all the other products of the soil, which are sometimes insufficient for home consumption. Economically this specialization of agriculture is to be regretted; but successful efforts are being made to diversify it by growing other crops to which the soil and climate are equally well suited.

Manufactures.—The principal articles manufactured are lumber, cotton and woollen goods, cotton seed oil, and agricultural implements.

Population.—The number of inhabitants according to the different census returns from 1850 is given in the following table:—

Census.	Total.	White.	Coloured.	Density per Sq. Mile.
1850	606,528	295,718	310,808	13.09
1860	791,314	353,910	437,404	17.07
1870	829,609	384,549	445,060	17.9
1880	1,131,592	479,371	652,221	24.42

Of the coloured population, mostly freedmen and their descendants, 1738 were Indians or half-breeds in 1880, and about 60,000 mulattoes. The whites own nearly all the farms and other real property. The total property valuation in the State decreased from \$607,324,911 in 1860 to \$209,197,345 in 1870, on account of the losses in war and the liberation of the slaves. There has been, however, a rapid increase in the last decade. The towns in the State have small populations: in 1880 Vicksburg had 11,814 inhabitants, Natchez 7053, and Jackson, the State capital, 5204.

Administration.—The three departments, legislative, executive, and judiciary, are similar to those of other States. The governor and other executive officers are elected for four years. The legislature, which meets biennially, is composed of forty senators, serving four years, and one hundred and twenty representatives, serving two years. These are apportioned to the seventy-four counties according to population, and elected by the people. The judiciary officers, consisting of three justices of the supreme court, twelve circuit judges, and twelve chancellors, are appointed by the governor with the consent of the senate. One attorney-general and twelve district attorneys are elected by the people. The State maintains a public school system, with separate schools for the two races, costing in 1880 \$330,704, besides a State university and other schools of high-grade for each of the races.

History.—Mississippi was first visited by Europeans in 1540, when the adventurous expedition of De Soto reached its northern parts. After the disastrous termination of this expedition no other Europeans visited this region until 1673, when Joliet and Père Marquette descended the Mississippi to lat. 33°. In 1682 La Salle and Tonty descended to the mouth of the river, and claimed the whole region drained by it for the king of France, giving it the name Louisiana. In 1699 the first colonists reached the coast of Mississippi, sent from France under Iberville. Settlements were made on Ship Island and Cat Island, and upon the mainland on the eastern side of Biloxi Bay, at Bay St Louis, and at Mobile. The colony did not prosper, and in 1712 Anthony Crozat obtained by charter from the king all the commercial privileges of the lower Mississippi valley. Under his management the colony languished, and in 1717 the king accepted the surrender of his charter, and granted another with more extended privileges to the "Western Company," or "Mississippi Scheme," with John Law as director-general, and Bienville as governor of the colony. Under this management the rich alluvial lands on the Mississippi river began to be occupied; tobacco, rice, and indigo were cultivated, and African slaves were introduced. Settlements were made near the present city of Natchez in 1720. Two years later, Law's company becoming bankrupt, much embarrassment in the colony followed, and troubles also began with the natives. On November 28, 1729, the Natchez Indians surprised and murdered about 200 of the white male residents, and made captives of about 500 women and children and negroes. A war followed, resulting in the destruction of the Natchez tribe. The representatives of the "Western Company" returned their franchises to the king in 1732, the number of colonists and slaves being then about 7000. After two unsuccessful campaigns against the Chickasaw Indians in the northern part of what is now Mississippi, Bienville was superseded by the Marquis de Vaudreuil in 1740.

By the treaty of Paris, in 1763, France ceded all her possessions east of the Mississippi river to England, excepting the island of New Orleans, ceded to Spain. The British province of West

Florida at first extended eastward from the Mississippi river along the Gulf coasts, with its northern limit at the 31st parallel of north latitude. Soon afterwards the northern boundary was fixed at a line drawn eastward from the point where the Yazoo river unites with the Mississippi.

Under British rule the Natchez country, which had been deserted since the massacre of 1729, and the southern part of the present State of Mississippi, rapidly filled with settlers, many of them emigrants from the Atlantic colonies. Cotton, indigo, and sugar were cultivated, and negro slaves continued to be freely introduced. During the revolutionary war of the Atlantic colonies, West Florida, being far removed, remained undisturbed until 1779. Spain and England being then at war, Calvez, the governor of New Orleans, aided by sympathizers with the revolutionary colonists, took possession of the whole of West Florida for the king of Spain. At the peace of 1783 England acknowledged the 31st parallel as the southern boundary of the United States, and ceded West Florida to Spain. The district between the 31st parallel and the parallel through the mouth of the Yazoo was therefore claimed by the United States and by Spain, the latter being in possession. After tedious negotiations the latter power relinquished the district in March 1798, and Congress at once formed it into "the Mississippi Territory," which extended from the Mississippi river eastward between the two above-mentioned parallels of latitude to the Chattahoochee river.

The State of Georgia claimed as a part of its domain all of the district east of the Mississippi river, and between the 31st and 35th parallels. In 1802 it ceded its claims to the Federal Government for certain considerations, and in 1804 Congress extended the limits of the Mississippi Territory northward to the 35th parallel. Nearly all of the Territory was then owned by the native Indians. The Choctaws occupied the southern part, and the Chickasaws the northern part of what is now the State of Mississippi. In 1812 the United States troops occupied Spanish West Florida, and the district east of Pearl river and south of lat. 31° was added to the Mississippi Territory. The Territory was divided by the present line between Alabama and Mississippi, and the State of Mississippi admitted into the Union in 1817. In 1830-32 the native tribes exchanged their lands for others west of the Mississippi river and were nearly all removed, and a rapid influx of settlers followed. In January 1861 the State seceded from the Federal Union, and, joining the Southern Confederacy, furnished a large number of troops during the civil war. It was the field of many important campaigns, and suffered great losses. Exhausted by the conflict, and harassed by processes of political reconstruction, the State was in a deplorable condition for several years. But within the last decade an era of prosperity commenced, marked by a large increase in population and great activity in agricultural and other pursuits.

MISSOLONGHI, or MESOLONGHI (Μεσολογγίον), a city of Greece, the chief town of the nomarchy of Acarnania and Ætolia, situated on the north side of the Gulf of Patras, about 7 miles from the coast, in the midst of a shallow lagoon, with a population of 6324 in 1879, is notable for the siege of two months which Mavrocordatos with a handful of men sustained in 1821 against a Turkish army 11,000 strong, and for the more famous defence of 1825-26 (see vol. xi. p. 125). Byron died there in 1824, and is commemorated by a cenotaph.

MISSOURI, a Central State of the American Union, lying almost midway between the Atlantic and the Rocky Mountains, British America and the Gulf of Mexico. Its eastern boundary is the Mississippi, separating it from Illinois, Kentucky, and Tennessee. North and south its boundaries with Iowa and Arkansas respectively are mainly coincident with the parallels of 40° 30' and 36° 30' N. lat.; but a small peninsula between the Mississippi and St François rivers stretches 34 miles farther south between Arkansas and Tennessee. The western border, with Nebraska, Kansas, and the Indian Territory, is nearly coincident with the course of the Missouri to the junction of that stream with the Kansas, and then follows the meridian of 17° 40' W. of Washington (94° 43' W. of Greenwich). The area of the State is 65,350 square miles, the extreme length from north to south 282 miles, the extreme width 348 miles. Missouri is divided into

a northern and southern portion by the Missouri river, flowing 400 miles in a generally easterly direction from its junction with the Kansas to the point 12 miles above St Louis where it unites with the Mississippi. Northern Missouri has a surface broken and hilly, but not mountainous. It is mainly prairie land, well watered by streams, and fit for agriculture; but there is a good deal of timber in the eastern parts, especially along the bold bluffs of the two great rivers. Southern Missouri is almost equally divided between timber land in the east and prairie in the west. In its south-western portion rises the table-land of the Ozark hills (highest point 1600 feet above the sea). The Osage, the Gasconade, and other streams flow northward and eastward into the Missouri. The south-eastern lowlands form an undulating country, readily drained after rain, with fertile ridges generally running north and south, occasional abrupt isolated hills, forests of oak, hickory, elm, maple, ash, locust, willow, persimmon, pecan, chestnut, and cherry trees, and in the lowest parts swamps and morasses. High rocky bluffs extend along the banks of the Mississippi from the mouth of the Meramec river to Ste Genevieve, rising sometimes precipitously to the height of 350 feet above the water, and low bottom lands with many lakes and lagoons extend from Ste Genevieve to the Arkansas border. The south-east corner of the State is 275 feet above the sea, the north-east corner 445 feet, and the north-west corner 1000 feet.

Climate.—The climate of Missouri, lying as it does far from the ocean and unprotected by mountain ranges, is one of extremes in heat and cold, moisture and drought. The Ozark range is high enough to influence the climate locally, but not to affect that of the whole State. The mean summer temperature for the ten years 1870-80 ranged from 75° in the north-west of the State to 78°·5 in the south-east; but the thermometer has been known to rise to 104°. The winter temperature averaged 33°·87 for the whole State, varying from 28°·5 in the north-west to 39°·5 in the south-east. In some winters the temperature hardly falls to zero; in others 20° below zero have been registered. The Mississippi at St Louis freezes over once in four or five years; but this is partly caused by the accumulations of floating ice coming down from the north. The river has closed as early as the first week in December, and, again, has remained open until the last week in February. It is in cold seasons sometimes passable for the heaviest teams. The Missouri river is often closed during the whole winter. The mean annual temperature of the State varies from 53° to 58°. The climate is, on the whole, dry; for, in spite of the abundant rains, especially in the spring, evaporation is so rapid that the atmosphere is rarely overloaded with moisture. April is the driest month. The greatest amount of rain falls in the south-eastern part of the State. An unusual amount of fair weather, prevailing clearness of sky, general salubrity of soil and climate, are chief among the natural advantages of this great State.

Geology.—The stratified rocks of Missouri belong to the following divisions:—Quaternary, Tertiary, Carboniferous, Devonian, Silurian, and Archæan. The Quaternary system comprises the drift, 155 feet thick; the bluff, 200 feet above the drift; then the bottom prairie, 35 feet thick; and on the surface the alluvium, 30 feet in thickness. Clays with strata of sands, marls, and humus form the alluvial bottoms of the two great rivers of the State, and make up a soil deep, light, and incomparably rich. Beneath the alluvium is found the bottom prairie, made up also of sands, clays, and vegetable moulds. This formation is found only in the bottom lands of the Missouri and Mississippi rivers, and more abundantly in those of the former. Numerous and well-preserved organic remains are found in the bottom prairie,

including the shells found in great quantities in the bluff and remains of the mastodon and many trees and plants. Below this formation, resting upon the drift, is the bluff. This rests upon the ridges and river bluffs, and thus is topographically higher, although geologically lower, than the bottom prairie. It is composed chiefly of a grey siliceous marl, coloured sometimes to a deep brown or red by the stains of oxide of iron. This formation extends along the bluffs of the Missouri from Fort Union to its mouth, and is found capping those of the Mississippi from Dubuque to the mouth of the Ohio. It is sometimes 200 feet thick; at St Joseph it is 140, at Booneville 100, at St Louis 50, in Marion county only 30 feet. This formation has interesting fossils (*Elephas primigenius*, &c.). The drift, the lowest of the Quaternary system, appears in the altered drift, the boulder formation, made up largely of the igneous and metamorphic rocks, with rocks from the Palæozoic strata upon which the others rest. Large boulders, five or six feet in diameter, are found, usually of granite or metamorphic sandstone; no fossils except a few logs in the altered drift have been found in this formation. The Tertiary formation in Missouri is composed of clays, shales, iron ores, sandstone, and sand, and extends along the bluffs and bottoms of the south-east part of the State. Iron ore is found in this formation in great abundance; sand of the best quality for glass-making and clays for pottery and stoneware also abound. Below the Tertiary bed are found rocks which strongly resemble Cretaceous beds found in other places in the United States. These strata are in such a state of irregularity and disturbance as to indicate the occurrence of some great movements after their deposition and before the formation of the Tertiary strata. The Upper Carboniferous system, or coal measures, made up of sandstone, limestone, marl, coal, and iron ores, covers an area of more than 23,000 square miles in Missouri, occupying the western and northern portions of the State. The supply of bituminous and cannel coals found here would seem to be well-nigh inexhaustible. In the Lower Carboniferous rock are found many varieties of limestone and sandstone. Among these are the Upper Archimedes Limestone, 200 feet; Ferruginous Sandstone, 195 feet; Middle Archimedes Limestone, 50 feet; St Louis Limestone, 250 feet. The Devonian system is represented by limestone in Marion, Ralls, Pike, Callaway, Saline, and Ste Genevieve counties, among which occur the Chouteau Limestone, 85 feet; Lithographic Limestone, 125 feet; Onondaga Limestone, 100 feet. Of the Upper Silurian series are the following formations:—Lower Helderberg, 350 feet; Niagara Group, 200 feet; Cape Girardeau Limestone, 60 feet. Prominent among the Lower Silurian formations are the Trenton Limestone, 360 feet; the Black River and Bird's Eye Limestone; and the Magnesian series. The last-named series is valuable both in a scientific and an economic sense. It covers much of the southern and south-eastern portions of the State, and in it are found vast deposits of lead, zinc, copper, cobalt, iron ores, and marble. The Archaean rocks occur below the Silurian deposits, and contain siliceous and other slates in which no fossils are found. The porphyry rocks of this formation also contain iron ores.

Coal.—The exposed coal in Missouri includes upper, middle, and lower measures. In the first are about 4 feet of coal, and the area of exposure is about 8400 square miles. The middle coal measures contain about 7 feet of coal, and cover an exposed area of about 500 square miles. The lower measures have five workable seams, varying from 18 inches in thickness to 4½ feet, and also some thin seams of only a few inches. In 1880 556,304 bushels of bituminous coal were raised in thirty-five counties of Missouri, the value at the pit mouth being \$1,060,225. \$642,772 were paid in wages to 2599 persons. The Missouri coal mines are easily worked.

Iron.—The iron ores are red hæmatite, red oxide, specular iron, brown hæmatite or limonite, and clay ironstone. Manganiferous and siliceous specular ores occur in the porphyries of the Archaean rocks,

and in the granites. The greatest exposure of specular iron yet discovered is Iron Mountain, the purest mass or body of iron ore known. Analysis shows it to contain from 65 to 69 per cent. of metallic iron. The ore of Shepherd Mountain is not so rich as that of Iron Mountain, but is uniform in character, free from sulphur and phosphoric acid and on the whole superior to any other yet developed in Missouri. Pilot Knob ore gives 53 to 60 per cent. metallic iron, and has few deleterious substances. It is fine-grained, light bluish grey in colour. The ore of the Scotia iron banks and Iron Ridge are much alike in appearance and character, being specular boulders imbedded in soft red hæmatite. In some of these boulders are cavities in which the ore has taken botryoidal form, and upon these peroxide of iron crystallizations are so formed that a gorgeous show of prismatic colours is presented. The above are the chief deposits of iron ores, but limonites are found mostly in the southern parts of the State. The counties of Ste Genevieve, Madison, St François, Cape Girardeau, Bollinger, Wayne, Stoddard, Washington, Reynolds, Shannon, Carter, and Ripley have the greatest exposures of these ores, although they are found in many others. The supply of iron ores is, indeed, practically inexhaustible.

Lead.—Second only to iron among the metals of Missouri is the vast deposit of lead found in the southern parts of the State. The great disseminated lead region occupies about one-half of the northern portion of Madison, and about as much of St François county. It is in the magnesian limestone that the largest quantities have been found. In Franklin county galena is found in abundance in ferruginous clay and coarse gravel. In the great mammoth mine in Washington county is a succession of caves in which millions of pounds of lead were found adhering to the sides and roofs. The central lead district of the State comprises the counties of Cole, Cooper, Moniteau, Morgan, Miller, Benton, Maries, Camden, and Osage; the southern lead region the counties of Pulaski, Laclede, Texas, Wright, Webster, Douglass, Ozark, and Christian. The western lead district includes the counties of Hickory, Dallas, Polk, St Clair, Cedar, and Dade; the south-western the counties of Jasper, Newton, Lawrence, Stone, Barry, and McDonald. The two counties Jasper and Newton produce fully one-half of the pig lead of Missouri. The lead mines of Granby are among the best-known in the State, and millions of pounds of lead have been taken from these lands.

Copper deposits have been found in several counties, chiefly in the south-western part of the State. **Zinc** is found, in the shape of sulphuret and also silicate of zinc, in nearly all the lead mines in south-western Missouri. It has often occurred in such masses as seriously to hinder mining operations, and until very recent years, when railroad facilities have given this ore a market, it was thrown aside as worthless. It is now an important and profitable adjunct of the lead mines of Missouri. **Cobalt** and **nickel** are found at Mine La Motte and in a few other places. **Silver** is found in small quantities in lead mines in Madison county, combined with the lead.

Clays for the manufacture of ordinary brick for building purposes and for fire-brick exist in quantities beyond computation, and kaolin has been found in a few places. **Marble** of various shades and qualities abounds in Missouri, and is an important item in its mineral wealth. **Limestones** and **sandstones** suitable for building purposes are found in many parts of the State.

Agriculture.—Indian corn, wheat, oats, and tobacco are the staple products; but cotton, hemp, and flax are also raised to some extent in the southern counties. The average yield of wheat to the acre is 30 bushels, and that return is often far exceeded. No flour is of a higher quality or more in demand in foreign as well as home markets than that made from Missouri wheat. Indian corn is especially used in fattening live stock. Blue grass, timothy, red-top, and red and white clover grow luxuriantly, and favour stock-raising. In some parts of the State pasturage can be had all the year round, and the cheapness of corn makes the raising of pork, in particular, a very profitable business. All varieties of fruit can be very successfully cultivated. The more tender fruits, such as apricots, nectarines, figs, and many choice kinds of grapes, grow here as well as the more northern fruits—the apple, the pear, the plum, and the cherry. Apples and peaches do well in all parts of the State. Six native varieties of grapes are found in luxuriant growth, and many cultivated varieties have been successfully introduced. No State, not even California, can hope ultimately to rival Missouri in the production of both red and white wines. Sheep-raising has proved remunerative in the southern counties chiefly, where the mild climate, the fine grasses, and the abundance of good water are especially favourable to this branch of agricultural industry. There are in Missouri, in round numbers, 10,000,000 acres of improved and 13,000,000 of unimproved land, including 9,000,000 acres of woodland. The cash value of the farms is estimated at \$90,000,000. In 1880 there were on the farms in the State 667,776 horses, 192,027 mules and asses, 9020 oxen, 661,405 cows, 1,410,507 other cattle, 1,411,298 sheep, and 4,553,123 swine. Missouri is the fourth maize-producing State of the Union; it supplies more wine than any State except California, and is a rival of Kentucky, Virginia, Tennessee, and Maryland in the culture of tobacco, which is a

staple in the rich counties in the northern central part of the State, bordering upon the Missouri river. No State raises so many mules, asses, and hogs. The production of cereals in 1880 was—corn, 202,482,723 bushels; wheat, 24,966,627 bushels; rye, 585,426 bushels; oats, 20,670,958 bushels; barley, 123,031 bushels; buckwheat, 57,640 bushels. The production of tobacco for the same year was 12,015,657 lb from 15,521 acres, valued at \$600,256. Three-fourths of this amount was raised in Chariton, Marion, Randolph, Howard, Callaway, and Saline counties.

Wild Animals.—Red-deer are found in every part of the State, especially in the thinly settled and mountainous districts. Venison, indeed, in its season, is as cheap as good beef in the markets of St Louis. Wild turkeys are numerous in the swampy and mountainous districts, and are found in all parts of the State. Prairie chickens, or pinnated grouse, are found in the prairie portion of Missouri, and are shipped in great numbers to Eastern markets. In all parts of Missouri are found the quail or Virginia partridge, thousands of barrels of which are shipped from the State each season. The rabbit, a species of hare, is so common as to be considered a pest. The grey squirrel and the red fox-squirrel are also found in large numbers all over the State. Black bass, perch, catfish, buffalo fish, suckers, and pike are the leading varieties of native fish.

Manufactures.—In 1880 Missouri had about 20,000 manufacturing establishments, in which a capital of about \$125,000,000 was employed. The products of these establishments were valued at upwards of \$300,000,000. The leading manufacturing counties outside of the city of St Louis are Jackson, Buchanan, St Charles, Marion, Franklin, Greene, Cape Girardeau, Platte, Boone, and Lafayette; but more than three-fourths of the manufactures are produced at St Louis, which is the fourth manufacturing city of the Union. The chief manufacture is that of flour, which employs about 900 mills, and is rapidly increasing. Twenty-four mills made in St Louis, in 1880, 2,142,949 barrels of flour, having a daily output of more than 11,000 barrels. St Louis millers and dealers sent in 1880 to Europe and South America 619,103 barrels of flour; and at the world's fairs at Paris, Vienna, and Philadelphia, Missouri flour received the first award. The iron industry, which stands second in importance, is yet only in its infancy, and St Louis seems destined to be one of the great centres of iron and steel manufacture. The amount of iron made in Missouri in 1880, in twenty-two establishments employing 3139 hands, was 125,758 tons. St Louis made the same year 102,664 tons of pig-iron, steel, and rolled iron and blooms. The yearly values of a number of other industries are estimated as follows:—meat packing, \$20,000,000; lumber, \$10,000,000; bags and bagging, \$7,000,000; saddlery, \$7,000,000; oil, \$6,000,000; printing and publishing, \$5,500,000; furniture, \$5,000,000; carriages and waggons, \$4,500,000; marble and stone, \$4,000,000; tin, copper, and sheet-iron, \$4,000,000; agricultural implements, \$2,000,000. The manufacture of glass and glass-ware is carried on to a considerable extent, especially in St Louis. At Crystal City, on the Mississippi, 30 miles below St Louis, is a very large deposit of sand suitable for the manufacture of plate-glass, and a company has been organized and is now in successful operation, with a capital of \$1,000,000.

Commerce.—The extensive commerce of Missouri centres at St Louis, between which city and the ports on the Mississippi and Missouri rivers steamboats are constantly plying. Railroad transportation has, in recent years, furnished superior and cheaper facilities for much of the trade which formerly depended upon the rivers. The trade in cotton especially has been greatly increased in Missouri since 1870 by the use of railroad transportation, which has made St Louis one of the great cotton centres of the United States. Extensive cotton presses were built in St Louis in that year, and the receipts of cotton from the more southern States has increased rapidly—from 12,264 bales in 1869-70 to 457,563 bales in 1879-80. Railroad connexions have made the interior portions of Arkansas and Texas more accessible to St Louis than to the southern ports of shipment, and the trade with the south-west, with the Indians, and with Mexico is constantly increasing. In 1870 St Louis was made by Act of Congress a port of entry to which foreign merchandise could be brought in bond. The value of the direct imports for the year ending 30th June 1882 was \$1,934,342.

Population.—Missouri is divided into 114 counties. The following table gives the number of inhabitants since 1850:—

Year.	Males.	Females.	Total.	Density per square mile.
1850	357,832	324,212	682,044	14.37
1860	622,201	559,811	1,182,012	18.03
1870	896,347	824,948	1,721,295	26.34
1880	1,127,187	1,041,193	2,168,380	31.55

In 1880 the foreign-born residents numbered 211,578, or 9.7 per cent., of whom 109,974 were Germans and Scandinavians; there were also 145,046 of African descent. The early settlers of the State

were French, and their descendants are still found in St Louis and Ste Genevieve and a few other smaller towns. Many Germans have recently settled in all parts of the State, while English, Irish, Scotch, and Swedes have also made Missouri their home in considerable numbers. The native American population is mostly descended from immigrants from the States of Kentucky, Tennessee, North Carolina, and Virginia. During recent years there has been a large accession to the population from the eastern and north-western States.

St Louis, the chief city of the Mississippi valley, situated upon the Mississippi river about 12 miles below the mouth of the Missouri, has a population of 350,513; Kansas City, a thriving town on the western border, situated on the banks of the Missouri, has 55,785; St Joseph, in the north-west, has 32,431; Hannibal, in the north-east, has 11,074; and Jefferson City (the State capital), in the centre, has 5271.

Education.—Missouri has a public school system of education first adopted in 1839. There are district schools, elementary and ungraded; city schools, graded, with high school courses; four normal schools, and a State university. Free public schools for white and coloured children between the ages of six and twenty years are required by law for every district in the State. Besides these public institutions supported by the State there are many private schools and colleges for both sexes. Chief among these are the St Louis University, an institution managed by the Jesuits; the College of Christian Brothers, also under the control of the Roman Catholics; and Washington University, a non-sectarian endowed school, which has property estimated at \$1,000,000, and more than 1300 students. The Baptists have a college at Liberty called William Jewell College; the Congregationalists one at Springfield called Drury College; and the Methodists and Presbyterians several colleges and seminaries.

Religion.—The early settlers of Missouri were Roman Catholics, and in the river towns may be found to-day a large number of that faith. The Baptists have 88,999 members, with 1385 churches; the Methodists, 96,270 members and 918 churches; the Protestant Episcopal Church, 25,000 members and 65 church buildings; the Presbyterians, with their various branches, 34,628 members and 706 churches.

Administration.—The legislative power is vested in a body consisting of a senate and a house of representatives, which meets once in every two years, on the Wednesday after the first day of January next after the election of the members thereof. Members of the legislature are paid a sum not to exceed \$5 a day for the first seventy days of the session, and after that not to exceed \$1 a day for the remainder of the session. They are also allowed mileage. The executive department consists of a governor, a lieutenant-governor, a secretary of state, a State auditor, State treasurer, an attorney-general, and a superintendent of public instruction; these are all elected by the people. The supreme executive power is vested in the governor, who is chosen for four years, as also are the other members of this department. The governor has a qualified veto upon the acts of the legislature, and such other powers as are common to that officer in the several States. The judicial power of the State is lodged in a supreme court, the St Louis court of appeals, circuit courts, criminal courts, probate courts, and municipal courts. All judicial officers are elected by the people. Judges of the supreme court are elected for ten years, those of the St Louis court of appeals for twelve years, those of the circuit courts for six years. Executive and judicial officers are liable to impeachment by the house of representatives. All impeachment cases are tried by the senate.

Every male citizen of the United States, and every male person of foreign birth who may have declared his intention to become a citizen of the United States, according to law, not less than one year nor more than five years before he offers to vote, who is over the age of twenty-one years, is entitled to vote at all elections by the people, if he has resided in the State one year immediately preceding the election at which he offers to vote, and has resided in the county, city, or town where he shall offer to vote at least sixty days immediately preceding the election.

History.—On the 9th April 1682, the French voyager and discoverer La Salle took possession of the country of Louisiana in the name of the king of France. Its limits were quite indefinite, and included the present territory of Missouri (see LOUISIANA). The first settlements of Missouri were made in Ste Genevieve and at New Bourbon, but uncertainty exists as to the exact date. By some the year is fixed at 1763; by others, and by many traditions, as early as 1735. St Louis was settled by Pierre Laclède Liguist, a native of Franca. The site was chosen in 1763, and in February 1764 Auguste Chouteau went at the order of Liguist to the spot previously selected, and built a small village. For a long time the settlements were confined to the neighbourhood of the river. On the 31st of October 1803 the Congress of the United States passed an Act by which the president was authorized to take possession of the territory according to the treaty of Paris, and the formal transfer of Lower Louisiana was made on 20th December

1803. In 1804 Congress divided the territory into two portions. The northern part, commonly called Upper Louisiana, was taken possession of in March 1804. In June 1812 Missouri was organized as a Territory, with a governor and general assembly. The first governor (1813-1820) was William Clarke. In 1818 Missouri applied for admission to the Union as a State. Two years of bitter controversy followed, which convulsed the country and threatened the dissolution of the Union. This controversy followed a resolution introduced into Congress which had in view an anti-slavery restriction upon the admission of Missouri to the Union. This was at last settled by the adoption of the "Missouri compromise," which forbade slavery in all that portion of the Louisiana purchase lying north of 36° 30' except in Missouri, and on 19th July 1820 Missouri was admitted to the Union. A convention to frame a constitution had already been called, and the constitution then adopted remained without material change until 1865. The first general assembly under the constitution met in St Louis in September 1820, and Alexander M'Nair was chosen governor in August. The seat of government was fixed at St Charles in 1820, and removed to Jefferson City, the present State capital, in 1826. The first census of the State was taken in 1821, when the number of inhabitants was found to be 70,647, of whom 11,254 were slaves. In the Black Hawk war in 1832, the Florida war in 1837, and the Mexican war in 1846 Missouri volunteer troops did their share of the work. In the troubles in Kansas, and the bitter discussion upon the question of slavery, Missouri was deeply involved. A strong feeling in favour of secession showed itself in many parts of the State. Governor Jackson, in his inaugural address on the 4th of January 1861, said that Missouri must stand by the slaveholding States, whatever might be their course. The election of a majority of Union men, however, as delegates to a convention called to consider the affairs of the nation, showed that public sentiment was hostile to secession, and the convention adjourned without committing the State to the secession party. United States troops were soon gathered at St Louis, and forces were also sent to Jefferson City, and to Rolla. Governor Jackson fled from the capital, and summoned all the State troops to meet him at Booneville. General Lyon defeated these troops, 17th June 1861, and soon most of the State was under the control of the United States forces. The State convention was reassembled. This body declared vacant the offices of governor, lieutenant-governor, and secretary of state, and filled them by appointment. The seats of the members of the legislature were also declared vacant. Governor Jackson soon issued a proclamation declaring the State out of the Union, and Confederate forces were assembled in large numbers in the south-western part of the State. General Lyon was killed at the battle of Wilson's Creek near Springfield, and General Fremont, commanding the department of the west, decreed martial law throughout the State. For a year matters were favourable to the Confederates, and at the opening of 1862 their troops held nearly half the State; but in February a Federal force under General Curtis drove General Price into Arkansas. He returned in 1864, and overran a large part of the State, but was finally forced to retreat, and but little further trouble arose in Missouri during the war. Missouri furnished to the United States army during the war 108,773 troops. In 1865 a new constitution was adopted by the people. In 1869 the XV. Amendment to the United States constitution was adopted by a large majority. In 1875 still another State constitution was drawn up by a convention called for that purpose, and ratified by the people, and is now the fundamental law of the State. (M. S. S.)

MISTLETOE¹ (*Viscum album*, L.), a species of *Viscum*, of the family *Loranthaceæ*. The whole genus is parasitical, and seventy-six species have been described; but only the mistletoe proper is a native of Europe. It forms an evergreen bush, about 4 feet in length, thickly crowded with (falsely) dichotomous branches and opposite leaves. The leaves are about 2 inches long, obovate-lanceolate, yellowish green; the dioecious flowers, which are small and nearly of the same colour but yellower, appear in February and March; the fruit, which when ripe is filled with a viscous semitransparent pulp (whence birdlime is derived), is almost always white, but there is said to be a variety with red fruit. The mistletoe is parasitic both on deciduous and evergreen trees and shrubs, and "it would be difficult to

say on what dicotyledonous trees it does not grow" (Loudon). In England it is most abundant on the apple tree, but rarely found on the oak. The fruit is eaten by most frugivorous birds, and through their agency, particularly that of the thrush (hence missel-thrush or mistle-thrush), the plant is propagated. (The Latin proverb has it that "Turdus malum sibi cacat"; but the sowing is really effected by the bird wiping its beak, to which the seeds adhere, against the bark of the tree on which it has alighted.) The growth of the plant is slow, and its durability proportionately great, its death being determined generally by that of the tree on which it has established itself. See Loudon, *Arboretum et Fruticetum Britannicum*, vol. ii. p. 1021 (1838). The mistletoe so extensively used in England at Christmas tide is largely derived from the apple orchards of Normandy.

Pliny (*H. N.*, xvi. 92-95; xxiv. 6) has a good deal to tell about the *viscum*, a deadly parasite, though slower in its action than ivy. He distinguishes three "genera." "On the fir and larch grows what is called *stelis* in Eubœa and *hyphear* in Arcadia." *Viscum*, called *dryos hyphear*, is most plentiful on the esculent oak (*quercus*), but occurs also on the robur, *Prunus sylvestris*, and terebinth. *Hyphear* is useful for fattening cattle if they are hardy enough to withstand the purgative effect it produces at first; *viscum* is medicinally of value as an emollient, and in cases of tumour, ulcers, and the like; and he also notes it "conceptum fœminarum adjuvare si omnino secum habeant." Pliny is also our authority for the reverence in which the mistletoe when found growing on the robur was held by the Druids. The robur, he says, is their sacred tree, and whatever is found growing upon it they regard as sent from heaven and as the mark of a tree chosen by God. Such cases of parasitism are rare, and when they occur attract much attention (*est autem id rarum admodum inventu et reperit magna religione petitur*), particularly on the sixth (day of the) moon, with which their months and years end, after the lapse of thirty years, their "ages" begin. Calling it in their own language "all heal" (*omnia sanantem*), after their sacrifices and banquets have been duly prepared under the tree, they bring near two white bulls whose horns are then for the first time bound. The priest clothed with a white robe ascends the tree, cuts [the mistletoe] with a golden hook; it is caught in a white mantle. They then slay the victims, praying God to prosper His gift to them unto whom He has given it. Prepared as a draught, it is used as a cure for sterility and a remedy for poisons. The mistletoe figures also in Scandinavian legend as having furnished the material of the arrow with which Baldur (the sun-god) was slain by the blind god Höder. Most probably this story had its origin in a particular theory as to the meaning of the word mistletoe.

MITAU (the Lettish Jelgava), a town of Russia, capital of the government of Courland. It is situated 27 miles by rail to the south-west of Riga, on the right bank of the river Aa, in a fertile plain which rises only 12 feet above sea-level, and which probably has given its name to the town (*Mitte in der Aue*). At high water the plain and sometimes also the town are inundated. Mitau is surrounded by a canal occupying the place of former fortifications. Another canal was dug through the town to provide it with water; but this now receives the sewage, and water is brought in cars from a distance of 3 miles. Though so near Riga, Mitau has quite a different character. It has regular broad streets, bordered with the low pretty mansions of the German nobility who reside at the capital of Courland either to enjoy the social amusements for which Mitau is renowned or to provide education to their children. Mitau is well provided with educational institutions. A gymnasium occupies a former palace of the dukes of Courland, and has a rich library; and there are about forty other schools. The town is also the seat of a society of art and literature, of a natural history society, which has a good local museum, and of the Lettish Literary Society. The old castle of the dukes of Courland, which has witnessed so many conflicts, was destroyed by the Duke Biron, who erected in its place a spacious palace, now occupied by the governor and the courts. Mitau has 22,200 inhabitants, mainly Germans, but including also Jews (about 6000), Letts (5000), and Russians. Manufactures are few, those

¹ Greek *ἰξά* or *ἰξός*, hence Latin *viscum*, Italian *vischio* or *visco*, and French *gui*. The English word is the Anglo-Saxon *misteltan*, Icelandic *misteltinn*, in which *tan* or *tinn* means a twig, and *mistel* may be associated either with *mist* in the sense of fog, gloom, because of the prominence of mistletoe in the dark season of the year, or with the same root in the sense of dung (from the character of the berries or the supposed mode of propagation).

of wrought-iron ware and of white-lead being the most important. The river Aa brings Mitau in connexion with the trade of Riga, small vessels carrying goods to the amount of about £150,000 a year.

Mitau is supposed to have been founded in 1266 by the grand-master Conrad Mandern. It has often changed its rulers. In 1345, when it was plundered by Lithuanians, it was already an important town. In 1561 it became the residence of the dukes of Courland. During the 17th century it was thrice taken by the Swedes. Russia annexed it with Courland in 1795. At the beginning of this century it was the residence of the count of Provence (afterwards Louis XVIII.). In 1812 it was taken by Napoleon I.

MITCHEL, ORMSBY M'KNIGHT (1810-1862), American general and writer on astronomy, was born in Union county, Kentucky, August 28, 1810. He began life as a clerk, but, obtaining an appointment to a cadetship at West Point in 1825, he graduated there in 1829, and became assistant professor of mathematics in 1831. Subsequently he was called to the bar, but forsook law to become professor of mathematics and natural philosophy at Cincinnati college. There he established an observatory, of which he became director. From 1859 to 1861, he was director of the Dudley observatory at Albany. He took part in the war as brigadier-general of volunteers, and for his skill and rapidity in seizing certain important strategic points was on April 11, 1862, made major-general. He died of yellow fever at Beaufort, South Carolina, October 30, 1862. Besides making important improvements on several astronomical instruments, Mitchel was the author of several works on astronomy, the principal of which are *The Planetary and Stellar Worlds* (1848) and *The Orbs of Heaven* (1851). See *Memoir* by Headley (1865).

MITCHELL, SIR THOMAS LIVINGSTONE (1792-1855), Australian explorer, was a son of Mitchell of Craigend, Stirlingshire, where he was born, June 16, 1792. From 1808 to the end of the Peninsular War he served in Wellington's army, and for his services received the medal and five clasps, and was raised to the rank of major. He was appointed to survey the battlefields of the Peninsula, and his map of the Lower Pyrenees is still admired. In 1827 he was appointed deputy surveyor-general, and afterwards surveyor-general, of New South Wales. He devoted himself to the exploration of Australia, making four expeditions for that purpose between 1831 and 1846. During these expeditions he discovered the Peel, the Namoi, the Gwyder, and other rivers, traced the course of the Darling and Glenelg, and was the first to penetrate into that portion of the country which he named Australia Felix. His last expedition was mainly devoted to the discovery of a route between Sydney and the Gulf of Carpentaria, and during the journey he explored the Fitzroy Downs, and discovered the Balonne, Victoria, Warrego, and other streams. In 1838, while in England, Mitchell published the narrative of his first three journeys, *Three Expeditions into the Interior of East Australia* (2 vols.). In 1839 he was knighted and made a D.C.L. of Oxford. During this visit he took with him some of the first specimens of gold and the first diamond found in the country. In 1848 the narrative of his second expedition was published in London, *Journal of an Expedition into the Interior of Tropical Australia*. In 1851 he was sent to report on the Bathurst gold-fields, and in 1853 he again visited England and patented his boomerang propeller for steamers. He died at his residence at Darling Point, Sydney, October 5, 1855.

Besides the above works, Mitchell wrote a book on *Geographical and Military Surveying* (1827), an *Australian Geography*, and a translation of the *Lusiad* of Camoens.

MITE. Mites (*Acarina*) are minute creatures which form a large division of the *Arachnida*, distinguished by

the absence of any constriction between the cephalothorax and abdomen. Linnaeus included all in the single genus *Acarus*. They are now divided into several families (mostly containing numerous genera), viz., *Trombidiidæ* (harvest mites), usually scarlet specks seen running on stones, grass, &c., in hot weather; *Tetranychy*, which, although not bright red, are the red spider of our green-houses, and are distinguished by feet with knobbed hairs; *Bdelliidæ*, long-snouted mites with antenniform palpi; *Cheyletidæ* (fig. 1), the so-called book mites,—ferocious, predatory

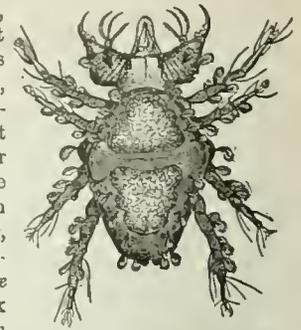

FIG. 1.—*Cheyletus flabellifer*.

little beings, quite unconnected with books; *Hydrachnidæ*, freshwater mites with swimming legs, mostly beautiful creatures of brilliant colours; *Limnocaridæ*, crawling freshwater or mud mites; *Halicaridæ*, chiefly marine; *Gamasidæ*, hard-skinned brown mites often parasitic on insects, and best known by the females, and young of both sexes, found on the common dung beetle (*Geotrupes stercorarius*); *Ixodidæ*, the true ticks, not to be confounded with the sheep-tick, &c., which

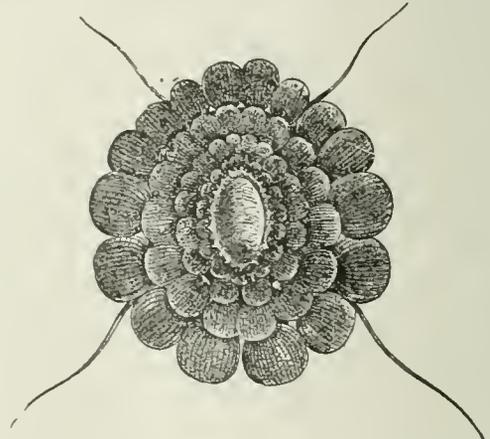

FIG. 2.—*Leiosoma palmicinctum*; nymph.

are wingless flies; *Oribatidæ*, beetle mites, so called from their resemblance to minute beetles (these are never parasitic; they undergo transformations almost as strange as those of insects, many of the immature forms being quaint and beautiful, see fig. 2); *Myobiadæ*, bizarre parasites of the mouse, &c., with peculiar holding claws; *Tyroglyphidæ*, the cheese mites; *Analgidæ*, found on the feathers of birds; *Sarcoptidæ*, the itch mites; *Arcticonidæ*, the water bears; *Demodicidæ*, found in the sebaceous follicles of the human nose, &c.; and *Phytoptidæ*, the gall mites, which attack the leaves of plants, making tiny gall-like excrescences.

The sexes are distinct individuals; the reproduction is oviparous; the larva is almost always hexapod, though the later stages have eight legs; that answering to the pupa of insects is active, and is called the nymph. The breathing in the first-named eleven families is tracheal, the position of the stigmata varying greatly; in the last-named six families it is by the general body surface. No heart or circulation of the blood is known to exist; the alimentary canal is usually somewhat on the insect type, but with caecal prolongations to the stomach, the reproductive organs often more on the crustacean type. There is generally a single very large nerve-ganglion above the oesophagus, sending nerve-branches to the various parts. The legs have ordinarily five to

seven joints, rarely three; the feet are usually terminated by claws or suckers, or both, sometimes by bristles. The mandibles are generally large, oftenest chelate (like a lobster's claw), sometimes style-like piercing organs, and of other forms. The maxillæ vary much: they may be piercing or crushing organs, or may coalesce to form a maxillary lip; there is usually one pair of maxillary palpi, no others. Sometimes there is a lingua, and in the *Gamasidæ* a galea. Antennæ are not found.

Mites are distributed all over the known world. They have been found in Franz-Josef's Land and Spitzbergen and in the hottest tropical regions, as well as the temperate zones. Often very similar species come from all parts. They are numerous in amber of the Tertiary epoch.

The best-known species are probably those which injure man or his works, viz., the itch mite, the cheese mite, the so-called harvest-bug, and the red spider. The dog-tick is also well known.

The itch mite (*Sarcoptes scabiei*, fig. 3) is a minute, almost circular, flattened, colourless creature, with skin covered with wavy wrinkles, and a number of triangular points arising from that of the back; legs short, the two front pairs and the fourth pair in the male terminated by suckers on long stalks, the two hind pairs in the female and third pair in the male having long bristles instead. It is parasitic on human beings; the males and young remain chiefly on the surface of the skin, but are difficult to find; the female burrows under the scarf-skin, causing the intense itching of scabies by the action of her chelate mandibles as she eats her way. A small watery pustule is raised near where the acarus has entered the skin, and others arise; the creature is not found in the pustule, but at the further

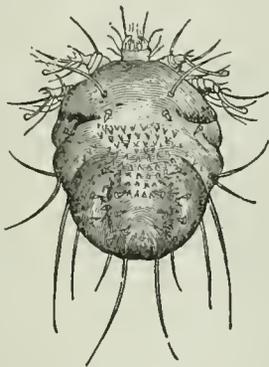

FIG. 3.—The Itch Mite (*Sarcoptes scabiei*); female. After Meguin.

end of a short tunnel which may be half an inch long. The eggs are laid in the tunnel after the acarus has passed; they hatch and multiply rapidly. The disease can be certainly cured; the usual mode is to rub the whole body with sulphur ointment, which is best done after a warm bath, allow it to remain on all night, and wash off in the morning. This treatment should be repeated once or twice at intervals of a day or two. Other applications of sulphur, as sulphurous acid, sulphur vapour baths, &c., are efficacious. All clothes which have touched the skin must be disinfected by heat. The disease is highly contagious. Most mammals have their peculiar varieties of itch mite.

The cheese mite (*Tyroglyphus siro*) is an elliptical, fat-bodied, colourless acarus with smooth skin and very long hairs. It breeds in thousands in old cheese, flour, grain, &c., and does much damage. There are numerous allied species; some belonging to the genus *Glyciphagus* are elegantly ornamented with plumes or leaf-like hairs.

The red-spider (*Tetranychus telarius*) attacks the leaves of plants or trees, and is a great pest in green-houses. It spins a slight web on the surface of the leaves, and lives in companies on the web; it is of a rusty red or brown.

The harvest bugs, thought by some writers to be a species, and by them called *Leptus autumnalis*, are simply the larvæ of several species of *Trombidium*. They are predatory, but will attach themselves temporarily to the human skin, and produce the violent itching felt on the lower parts of the legs after walking through dry grass in autumn. On inspection with a glass the creature may be seen as a

minute scarlet point. A drop of benzine will probably get rid of the intruder.

The dog tick, like the harvest-bug, is not really parasitic on mammals, though it attaches itself temporarily; its ordinary food may probably be vegetable. (A. D. M.)

MITFORD, MARY RUSSELL (1786–1855), born at Alresford, Hampshire, on the 16th of December 1786, retains an honourable place in English literature as the authoress of *Our Village*, a series of sketches of village scenes and characters unsurpassed in their kind, and after half a century of imitations as fresh as if they had been written yesterday. Washington Irving was Miss Mitford's literary model, but her work is thoroughly original and spontaneous, the free outflow of a singularly charming character. The shortest account of her life would be incomplete without a reference to the scapegrace father who was the centre of her affections, and the "only begetter" of all that is most delightful and characteristic in her writing. Dr Mitford first spent his wife's fortune in a few years; then he spent also in a few years the greater part of £20,000 which his daughter drew (in 1797, at the age of ten) as a prize in a lottery; then he lived, for most years of his life, on a small remnant of his fortune and the proceeds of his daughter's literary industry. In the little village of Three Mile Cross, near Reading, in a small cottage which Miss Mitford says was "a fine lesson in condensation," the doctor was the stay, support, and admiration of all the loafers in the neighbourhood, while his daughter, who had called herself his mamma, and treated him as her little boy from the time when she was herself a little girl, found an unflinching charm in his "friskings," and was the loving slave of all his good-humoured exactions. The father kept fresh in his daughter the keen delight in incongruities, the lively sympathy with self-willed vigorous individuality, and the womanly tolerance of its excess which inspire so many of her sketches of character. The woman who lived in close attendance on such an "awful dad," refused all holiday invitations because he could not live without her, and worked incessantly for him, except when she broke off her work to read him the sporting newspapers, evidently wrote from the heart in her bright portraits of such characters as the Talking Lady, the Talking Gentleman, Joel Brent, Jack Rapley, Tom Cordery, Lizzy, Lucy, and Harriet. Her writing has all the charm of perfectly unaffected spontaneous humour, combined with quick wit and exquisite literary skill. She died January 10, 1855.

Miss Mitford's youthful ambition was to be "the greatest English poetess," and her first publications were poems in the manner of Coleridge and Scott (*Miscellaneous Verses*, 1810, of sufficient mark to be reviewed by Scott in the *Quarterly*; *Christine*, a metrical tale, 1811; *Blanche*, 1813). Later on she essayed writing plays (*Julian*, 1823; *The Foscari*, 1826; *Dramatic Scenes*, 1827; *Rienzi*, 1828; *Charles the First*, 1828). But the prose to which she was driven by domestic necessities has rarer qualities than her verse. The first series of *Our Village* sketches appeared in 1824, a second in 1826, a third in 1828, a fourth in 1830, a fifth in 1832, and *Belford Regis*, a novel in which the neighbourhood and society of Reading were idealized, in 1835. Her *Recollections of a Literary Life* (1853) is a series of *causeries* about her favourite books. Five volumes of her *Life and Letters* were published in 1870 and 1872, showing her to have been a delightful letter-writer; two volumes of letters to her appeared in 1882.

MITHRADATES, or, as it is often wrongly spelt, MITHRIDATES (*i.e.*, "given by the god Mithras"), was a favourite name of the Pontic kings in the third and second centuries B.C., and was also common in Persia and the neighbouring countries. The dynasty of Pontus was a Persian family, claiming descent from the Achæmenidæ, and the earliest of them known in history was satrap under the Persian empire. When that empire was destroyed Mithradates II. made himself king of Pontus; and he and his successors gradually spread their power over a great

part of Cappadocia and Paphlagonia. Several of them intermarried with the Seleucids and other Greek royal families, and something of the Hellenic civilization was engrafted on the native non-Hellenic character of the kingdom. The names Mithradates, Pharnaces, and Ariobarzanes, all non-Hellenic, alternate in the family. The province of Phrygia was sold in the most scandalous way by the Roman consul Aquilius to Mithradates V., who died probably in 120 B.C. He was succeeded by his son Mithradates Eupator, sixth of the name, one of those remarkable conquerors that arise from time to time in the East. He was a boy when his father died, and for seven years lived the wandering life of a hunter pursued by assassins. His courage, his wonderful bodily strength and size, his skill in the use of weapons, in riding, and in the chase, his speed of foot, his capacity for eating and drinking, and at the same time his quick and penetrating intellect, his wonderful mastery of twenty-two languages,—all these qualities are celebrated by the ancients to a degree which is almost incredible. With a surface gloss of Greek education, he united the subtlety, the superstition, and the obstinate endurance of an Oriental. He was a virtuoso, and collected curiosities and works of art; he assembled Greek men of letters round him; he gave prizes to the greatest poets and the best eaters. He spent much of his time in practising magic arts, the interpretation of dreams, and other superstitious ceremonies; and it was believed that he had so saturated his body with poisons that none could injure him. He trusted no one; he murdered his nearest relations, his mother, his sons, the sister whom he had married; to prevent his harem from falling a trophy to his enemies he murdered all his concubines, and his most faithful followers were never safe. He once disappeared from his palace, no one knew whither, and returned after some months, having wandered over all Asia Minor in disguise. Except in the pages of romance or the tales of the *Thousand and One Nights* it would be difficult to find anything to rival the account given of Mithradates by the gravest of historians. These qualities fitted him to be the opponent of Roman arms in Asia Minor, to be the champion of the East in its struggle against the destroying and yet civilizing power of the West. He resisted the Romans for eighteen years, yet we can hardly credit him with much real generalship or organizing power. He could collect masses of men and hurl them against the Roman legions; everything that boundless energy and boundless hatred could do he did; but the strength of his opposition to the Romans lay in the fact that all the dislike inspired by Rome in the worst and most cruel time of her rule was arrayed on his side.

No direct collision took place between the Romans and Mithradates for thirty-two years, though the republic took away Phrygia from him in 120 B.C., and several times thwarted his designs in Paphlagonia and Cappadocia. The rupture came about the time of the Social War. Mithradates, prompted, it is said, by envoys from the Italian allies, took advantage of the intestine struggles in Italy. War broke out in 88, on the ostensible cause of disputes about the kingdom of Bithynia; Mithradates rapidly overran Galatia, Phrygia, and Asia, defeated the Roman armies, and made a general massacre of the Romans resident in Asia. He also sent large armies into European Greece, and his generals occupied Athens. But Sulla in Greece and Fimbria in Asia defeated his armies in several battles; the Greek cities were disgusted by his severity, and in 84 B.C. he concluded peace, abandoning all his conquests, surrendering seventy ships, and paying a fine of 2000 talents. Murena invaded Pontus without any good reason in 83, but was defeated in 82. Difficulties constantly arose between the two adversaries, and in 74 a

general war broke out. Mithradates defeated Cotta, one of the Roman consuls, at Chalcidion; but Lucullus worsted him in several engagements, and drove him finally in 72 B.C. to take refuge in Armenia with his son-in-law Tigranes. After two great victories in 69 and 68, Lucullus was disconcerted by mutiny among his troops and the defeat of his lieutenant Fabius (see vol. xv. p. 56). In 66 he was superseded by Pompey, who completely defeated both Mithradates and Tigranes. The former established himself in 64 at Panticapæum, and was planning new campaigns against the Romans when his own troops revolted, and, after vainly trying to poison himself, he ordered a Gallic mercenary to kill him. So perished the greatest enemy that the Romans had to encounter in Asia Minor. His body was sent to Pompey, who buried it in the royal sepulchre at Sinope.

MITHRAS was a Persian god whose worship spread over the Roman world during the 2d and 3d centuries after Christ. His name is found in the oldest records of the East Aryan races. In the Rig-Veda, Mitra, *i.e.*, the friend, and Varuna, *i.e.*, *Ōṛpavos*, are a pair of gods regularly associated: they denote the heaven of day and the heaven of night. Mithras is therefore by origin the god of the bright heaven and of day, closely related in conception to, and yet expressly distinguished from, the sun. In the developed Old Persian religion of Zoroaster Mithras retained a place; he was not one of the greatest gods, but was first of a triad which, while less pure embodiments of the divine nature, were more easy for men to comprehend and to worship. The seventh month, which bears his name, and the sixteenth day of every month were sacred to Mithras; prayers were offered to him at sunrise, at mid-day, and at sunset. When the Persians conquered Assyria and Babylonia their religion was much affected by the worship of these more educated races. The worship of foreign deities was introduced, that of Persian deities was changed in character; and the gods were represented by images. The cultus of Mithras now became far more prominent, he was identified with the sun, and an elaborate ritual with the non-Aryan accompaniment of mysteries was established. This revolution had begun before Herodotus (i. 131) could identify Mithras with the Assyrian goddess Mylitta, and it became more thorough during the 4th century B.C.

It is in this most developed form that we know the cultus of Mithras. The god of light becomes by a ready transition, which is made in the very oldest Aryan records, the god of purity, of moral goodness, of knowledge. There goes on in the world as a whole, and in the life of each man, a continual struggle between the power of good and the power of evil; Mithras is always engaged in this contest, and his religion teaches all men and women alike, to aid in the battle. Victory in this battle can be gained only by sacrifice and probation, and Mithras is conceived as always performing the mystic sacrifice through which the good will triumph. The human soul, which has been separated from the divine nature and has descended to earth, can reascend and attain union with God through a process of fasting and penance which is taught in the mysteries; the sacrifice which is being always offered by Mithras makes this ascent and union possible. Those who were initiated in the mysteries of Mithras had to pass through a long probation, with scourging, fasting, and ordeal by water, and were then admitted as soldiers fighting on behalf of Mithras. This was the lowest terrestrial grade, but there were still two others to attain, the Bull and the Lion, each involving further probation, before the soul could rise above the earth. It then ascended by the grades of Vulture, Ostrich, and Crow through the region of æther; and then it strove to become pure fire through the grades of Gryphon, of Perses, and of the Sun. Finally

the soul attained complete union with the divine nature through the grades of Father Eagle, of Father Falcon, and of Father of Fathers. A holy cave on a hill was the central point in the worship; and the mystic rites involved watching and fasting all night till sunrise brought the triumph of light.

The worship of Mithras became known to the Romans through the Cilician pirates captured by Pompey about 70 B.C. It gained a footing in Rome under Domitian, was regularly established by Trajan about 100 A.D., and by Commodus about 190. Finally the mysteries were prohibited and the holy cave destroyed in 378. Dedicatory inscriptions to *Deo Soli Invicto Mithrae*, and votive reliefs of Roman work, are very common. The usual representation shows Mithras in the mystic cave performing the mystic sacrifice; a young man in Oriental costume kneels with one knee on a prostrate bull, grasping the head and pulling it back with the left hand, while with the right he plunges his sword into its neck. A dog, a snake, and a scorpion drink the blood that flows from the bull; a crow sits on the rock behind Mithras; the figures of the sun and of the moon occupy the two sides of the relief.

See Lajarde, *Recherches sur le Culte de Mithras*.

MITRE. See **COSTUME**, vol. vi. p. 463; and **HERALDY**, vol. xi. p. 711.

MITSCHERLICH, ELHARDT (1794–1863), was born January 7, 1794, at Neuende near Jever, in the grand-duchy of Oldenburg, where his father was pastor. He was educated at the gymnasium of Jever under the historian Schlosser. In 1811 he went to Heidelberg, where he devoted himself to philology, giving special attention to the Persian language. In 1813 he went to Paris, partly for study, partly with the view of obtaining permission to join a French embassy to Persia. The political events of 1814 put an end to this scheme, and Mitscherlich returned to Germany. He then set to work on a history of the Ghurides and Kara-Chitayens, manuscript materials for which he found in the university library of Göttingen, and a portion of which he published in 1815. Still anxious to visit Persia, he resolved to study medicine in order that he might enjoy that freedom of travel usually allowed in the East to physicians. He began at Göttingen with the study of chemistry, and this so completely arrested his attention that he gave up the idea of the journey to Persia and the medical profession. In 1818 he went to Berlin, where he worked in the laboratory of Professor Link. He made analyses of phosphates and phosphites, arseniates and arsenites, confirming the observations of Berzelius as to their composition. In the course of these investigations he observed that corresponding phosphates and arseniates crystallized in the same form.

This was the germ from which grew the theory of isomorphism. In order to follow out his discovery Mitscherlich set to work to learn crystallography. His teacher was a fellow student, Gustav Rose, to whose penetrating mind and profound knowledge of mineralogy have been due some of the most interesting developments and illustrations of the theory of isomorphism. Having measured the inclinations of the faces of a vast number of natural and artificial crystals, he established the principles of isomorphism very much as we now hold them.

It is right that we should remember that Mitscherlich was not the first to notice the fact that two different substances might have the same crystalline form, or that one element could partially replace another without great change of form. Romé de l'Isle in 1772 mentions mixed vitriols containing variable proportions of iron and copper, and Leblanc in 1802 showed that the crystalline form remains the same although the proportions vary both in the case of these mixed vitriols and in that of mixed

alums. Vauquelin had already, in 1797, proved that alum might contain variable quantities of ammonia without any corresponding variation of crystalline form.

The authority of Haüy, who laid down as one of his principles that each compound has its own crystalline form, for a time kept these observations in the background. Further cases were, however, observed. Wollaston (1812) accurately measured the angles of the rhombohedral carbonates, and proved that the forms of these minerals, although nearly the same, are not absolutely identical. He showed that a similar close approximation to identity exists in the case of the vitriols. Fuchs in 1815 brought forward his theory of "vicarious constituents." Gay-Lussac proved that a crystal of common alum continues to grow when placed in a solution of ammonia alum, and cases of crystallized mixtures were pointed out by the French mineralogist Beudant. But notwithstanding these foreshadowings, of which we know, on the evidence of Gustav Rose, that Mitscherlich was wholly ignorant, there was at the time of which we are now speaking no trace of a theory, but merely isolated observations. The theory of isomorphism is the work of Mitscherlich. It was communicated to the Berlin Academy on December 9, 1819.

In that year Berzelius paid a visit to Berlin, and was so struck with Mitscherlich's ability that he suggested him to the minister Altenstein as the most fitting successor to Klaproth in the chair of chemistry in that university. It is not surprising that this idea was not carried out. It was only four years since Mitscherlich had begun to study chemistry; he had never lectured, nor had he published anything on the subject.

Although Altenstein did not at that time carry out the proposal of Berzelius, he was so far impressed by it that he obtained for Mitscherlich a Government grant to enable him to continue his studies under Berzelius.

In 1820 he went to Stockholm, where he worked for a year in Berzelius's laboratory. In 1822 he was appointed extraordinary and in 1825 ordinary professor in Berlin. In the course of an investigation into the slight differences discovered by Wollaston in the angles of the rhombohedra of the carbonates isomorphous with calc-spar, Mitscherlich observed that the angle in the case of calc-spar varied with the temperature. On extending his inquiry to other non-isotropic crystals he observed a similar variation, and was thus led, in 1825, to the discovery that non-isotropic crystals, when heated, expand unequally in the direction of dissimilar axes. In the following year he discovered the change, produced by change of temperature, in the direction of the optic axes of selenite. The discovery (also in 1826) that sulphur can be obtained in two absolutely distinct crystalline forms threw much light on the fact that the two minerals calc-spar and aragonite have the same composition but perfectly different forms. Other cases of this property, to which Mitscherlich gave the name of dimorphism, were arrived at not long after.

In 1833 he made a series of careful determinations of the vapour densities of a large number of volatile substances, and proved that Gay-Lussac's law as to the proportions by volume in which oxygen, nitrogen, hydrogen, and chlorine unite with one another holds generally for volatile elements, and that the simplicity of the relation of the volume of the compound to that of the component gases is also general.

In pure chemistry Mitscherlich's discoveries were mainly connected with isomorphism. Thus he obtained selenic acid in 1827, and showed the isomorphism of its salts with the sulphates, and examined with great care the manganates and permanganates, showing their isomorphism with the sulphates and with the perchlorates respectively. But he did much important work unconnected with this special

subject. We may in particular refer to his discovery of the relation of benzene to benzoic acid, of nitro-benzene, and of a considerable number of the derivatives of benzene.

In 1833 he published his *Lehrbuch der Chemie*, a student's text-book of chemistry of the most thoroughly practical and yet rigidly scientific kind, from the study of which teachers of chemistry may still derive many a valuable hint. His interest in mineralogy led him to the study of the geology of volcanic regions, and he made frequent visits to the Eifel with a view to the discovery of a theory of volcanic action. He did not, however, publish any papers on the subject, but since his death his notes have been arranged and published by Dr Roth in the *Memoirs* of the Berlin Academy (1866). In December 1861 symptoms of heart disease made their appearance, but he was able to carry on his academical work till December 1862. He died at Schöneberg near Berlin on 28th August 1863.

Mitscherlich's published papers are chiefly to be found in the *Abhandlungen* of the Berlin Academy, in *Poggendorff's Annalen*, and in the *Annales de Chimie et de Physique*. The fourth edition of the *Lehrbuch der Chemie* was published in 1844; a fifth was begun in 1855, but was not completed. (A. C. E.)

MITYLENE, or MYTILENE. See LESBOS.

ΜΙΖΠΑΗ (מִצְפָּה) and ΜΙΖΠΕΗ (מִצְפֶּה) are Hebrew words for a "place of prospect," or high commanding point. The cities of Palestine generally occupied such positions; and so in the Old Testament we find several places bearing the name of "The Mizpah" (Mizpeh). Sometimes a determining genitive is added; "The Mizpeh of Gilead" (Judg. xi. 29), "The Mizpeh of Moab" (1 Sam. xxii. 3).

(1) The most famous of these places is that in Gilead, a noted sanctuary (Judg. xi. 11; Hosea v. 1), claiming consecration from the sacrifice of Jacob (Gen. xxxi. 54) and the *masseba* or sacred stone erected by him (ver. 45). The narrative of Gen. xxxi. 45 sq. is somewhat obscure, and not all from one hand. We gather, however, from it that another name of "The Mizpah" was Galeed, i. e., Gilead. Thus Mizpah, Mizpeh Gilead, Gilead (Hos. vi. 8), Ramath Mizpeh (i. e., the height of Mizpeh, Josh. xiii. 26), and Ramoth Gilead (the heights of Gilead), or simply The Ramah (2 Kings viii. 28, 29), are almost universally taken to be one place. With this it agrees that Ramoth Gilead was a city of refuge, which points to an early sanctity. The place is prominent throughout the history. It was the seat of Jephthah (Judg. xi.), the mourning for whose daughter probably gives us a glimpse into the ancient rites of a provincial sanctuary, the residence of one of Solomon's officers (1 Kings iv. 13), and a hotly disputed frontier city in the wars between Syria and the house of Omri, before which Ahab fell (1 Kings xxii.), and in which the military revolt of Jehu was organized (2 Kings ix.). Maspha was still a strong place in the Greek period, and was taken by Judas Maccabæus (1 Mac. v. 35). Eusebius knows Ramoth as a place 15 miles west of Philadelphia or Rabbah of Ammon. It is therefore commonly identified with El-Salt, the modern capital of the Belkâ; but this cannot be said to be made out. (2) The Benjamite Mizpah or Mizpeh, also a sanctuary, is often named in the history of Samuel. It was a border fortress of King Asa (1 Kings xv. 22), and the residence of Gedaliah as governor of Judæa after the fall of Jerusalem (Jer. xl.). Its old sanctity was still remembered in the Maccabean times, and from 1 Mac. iii. 46 we conclude that it commanded a view of Jerusalem. The most probable identification is with the prominent hill-top of Neby Samw'el. There was (3) another Mizpeh in the low country of Judah (Josh. xv. 38), and (4) a land or valley of Mizpeh (Josh. xi. 3, 8) under Mount Hermon.

MNEMONICS, or artificial helps to the memory, have been employed in a more or less systematic form from a very early period. Mnemonics (τὸ μνημονικόν, sc. τέχνημα or παράγγελμα) were much cultivated by Greek sophists and philosophers, and are repeatedly referred to by Plato and Aristotle. In later times the invention was ascribed to the poet Simonides,¹ perhaps for no other reason than that the strength of his memory was famous. Cicero, who attaches considerable importance to the art, but more to the principle of order as the best help to memory, speaks

of Carneades (or perhaps Charmades) of Athens and Metrodorus of Scepsis as distinguished examples of the use of well-ordered images to aid the memory. The latter is said by Pliny to have carried the art so far *ut nihil non eisdem verbis redderet auditum*. The Romans valued such helps as giving facility in public speaking. The method used is described by the author of *Rhet. ad Heren.*, iii. 16-24; see also Quintilian (*Inst. Or.*, x. 1, 2), whose account is, however, somewhat incomplete and obscure. In his time the art had almost ceased to be practised. The Greek and Roman system of mnemonics was founded on the use of mental places and signs or pictures. The thing to be remembered was localized in the imagination, and associated with a symbol which concretely represented what it was desired to retain in the memory, special care being taken that the symbols should be as vivid, pleasing, and impressive as possible. The most usual method was to choose a large house, of which the apartments, walls, windows, statues, furniture, &c., were severally associated with certain names, phrases, events, or ideas, by means of symbolic pictures; and to recall these it was only necessary to search over the apartments of the house, till the particular place was discovered where they had been deposited by the imagination. As the things to be remembered increased, new houses could be built, each set apart to a certain class of ideas or events, and these houses were again constructed into a mnemonic town. In accordance with this system, if it were desired to fix an historic date in the memory, it was localized in an imaginary town divided into a certain number of districts, each with ten houses, each house with ten rooms, and each room with a hundred quadrates or memory-places, partly on the floor, partly on the four walls, partly on the roof. Thus, if it were desired to fix in the memory the date of the invention of printing (1436), an imaginary book, or some other symbol of printing, would be placed in the thirty-sixth quadrate or memory-place of the fourth room of the first house of the historic district of the town. The success of the method depended largely on the power of the imagination to give the different houses, rooms, &c., characteristic varieties of aspect, and we may suppose that it was the effort to frame suitable images and places, giving an adventitious interest to dry details, that constituted the real advantage of the system. Except that the rules of mnemonics are referred to by Martianus Capella, nothing further is known regarding the practice of the art until the 13th century, when the system of the Romans was revived and a good many treatises were published on the subject. Among the voluminous writings of Roger Bacon is a tractate *De Arte Memorativa*, which exists in MS. at Oxford. Raymond Lully devoted special attention to mnemonics in connexion with his *ars generalis*. The first important modification of the method of the Romans was that invented by Conrad Celtes, a German poet, who, in his *Epitoma in utramque Ciceronis rhetoricam cum arte memorativa nova* (1492), instead of places made use of the letters of the alphabet. About the end of the 15th century Petrus de Ravenna awakened such astonishment in Italy by his mnemonic feats that he was believed by many to be a necromancer. His *Phoenix Artis Memorix*, published at Venice in 1491 in four volumes, went through as many as nine editions, the seventh appearing at Cologne in 1608. An impression equally great was produced about the end of the 16th century by Lambert Schenkel, who taught mnemonics in France, Italy, and Germany, and, although he was denounced as a sorcerer by the university of Louvain, published in 1593 his tractate *De Memoria* at Douai with the sanction of that celebrated theological faculty. The most complete account of his system is given in two works by his pupil Martin Sommer, published at Venice in 1619. Giordano Bruno, in connexion

¹ Pliny, *H. N.*, vii. 24. Cicero, *De Or.*, ii. 86, mentions this belief without committing himself to it

with his exposition of the *ars generalis* of Lully, included a *memoria technica* in his treatise *De Umbris Idearum*.

About the middle of the 17th century Winckelmann made known what he called the "1st fertile secret" in mnemonics, namely the use of letters with figures so as to express numbers by words; and the philosopher Leibnitz adopted an alphabet very similar to that of Winckelmann in connexion with his scheme for a form of writing common to all languages. Winckelmann's method was modified and supplemented in regard to many details by Richard Grey, who published a *Memoria Technica* in 1730. The principal part of Grey's method is briefly this: "To remember anything in history, chronology, geography, &c., a word is formed, the beginning whereof being the first syllable or syllables of the thing sought, does, by frequent repetition, of course draw after it the latter part, which is so contrived as to give the answer. Thus, in history, the Deluge happened in the year before Christ two thousand three hundred forty-eight; this is signified by the word *Deletok*, *Del* standing for Deluge and *etok* for 2348." To assist in retaining the mnemonical words in the memory they were formed into memorial lines. The vowel or consonant which Grey connected with a particular figure was chosen arbitrarily; but in 1806 Feinaigle, a monk from Salem near Constance, began in Paris to expound a system of mnemonics, one feature of which was to represent the numerical figures by letters chosen on account of some similarity to the figure to be represented or some accidental connexion with it. This alphabet was supplemented by a complicated system of localities and signs, with the aim of expressing, by a more vivid and impressive symbol, ideas which for want of this are apt to pass from the memory, and of establishing between ideas of the same group an intimate relation, so that the mention of the one would suggest the other. Feinaigle, who published a *Notice sur la mnémonique* at Paris in 1806, came to England in 1811, and in the following year published *The New Art of Memory*. A simplified form of Feinaigle's method was published in 1823 by Aimé Paris, and the use of symbolic pictures was revived in connexion with the latter by a Pole, Jazwinsky, of whose system an account was published by J. Bem, under the title *Exposé Général de la Méthode Mnémonique Polonoise, perfectionnée à Paris*, Paris, 1839. Various other modifications of the systems of Feinaigle and Aimé Paris were advocated by subsequent mnemonists, among them being the Phrenotyping or Brain-Printing method of Beniowsky, the Phreno-Mnemo-techny of Gouraud, and the Mnemotechnik of Carl Otto, a Dane. The more complicated mnemonic systems have fallen almost into complete disuse; but methods founded chiefly on the laws of association have been taught with some success in Germany by, among others, Kothe, who is the author of *Lehrbuch der Mnemonik*, and *Katechismus der Gedächtniskunst*, both of which have gone through several editions; and in England by Dr. Edward Pick, whose *Memory and the Rational Means of Improving it* has also obtained a wide circulation. In certain cases mnemonical devices may be found of considerable service; but all systems which have aimed at completeness have been found rather to puzzle than aid the memory. The fullest history of mnemonics is that given by J. C. F. von Aretin in his *Systematische Anleitung zur Theorie und Praxis der Mnemonik*, 1810.

MOA. See DINORIS.

MOAB. Moab and Ammon (children of Lot) constitute along with Edom and Israel (children of Isaac) that group of four Hebrew peoples which in early antiquity had issued from the Syro-Arabian wilderness, and settled on the border of the cultivated country eastward of the great depression which extends from the Gulf of Elath to the

Dead Sea, and up the valley of the Jordan. According to the book of Genesis, they had come out of Mesopotamia, and so were precursors of the larger wave which followed from the same quarter, forming the most southern outpost of the Aramæan immigration into the lands of Canaan and Heth. Whether the Hebrews were originally Aramæans is questionable, but it is certain that, like the Aramæans, they were distinct from the Canaanites, whose conquerors they were. Such was the relation of the old and new inhabitants, not only in Western Palestine after the Israelite occupation, but also, and from a much earlier period, in Eastern Palestine, where the aborigines were Amorites—that is, Canaanites—and where the Bne Ammon and Moab and the Bne Isaac successively settled in their lands. The old population did not disappear before the conquerors, but continued to subsist among them. In a considerable district—namely, in Gilead—the Amorites even remained unsubdued, and thus formed a gap, only imperfectly filled up by the Bne Ammon, between the Hebrew line of immigration on the south and the Aramæan line more to the north,—a gap which did not begin to close until the historical period. From this district they even endeavoured, and with some success, as will be afterwards seen, to recover the territory which had been taken from them in the south. But where they were the subjects of the Hebrews they constituted the basis of the population, the mainstock of the working and trading classes. The extent of their influence over the conquerors may be judged from the fact that it was their speech which gained the upper hand. The Moabites, and doubtless also the Ammonites and Edomites, spoke the language of Canaan as well as the Israelites. They must have learned it from the Canaanites in the land eastward of Jordan, prior to the period at which Jacob immigrated to and returned from Egypt. Our knowledge is extremely imperfect as regards other departments of the Canaanite influence; but in religion it has left a noticeable trace in the cultus of Baal-Peor, which was carried on in Moabite territory, but was certainly of Canaanite origin.

The assumption that the change of language was first brought about by the Israelites in the land which is called by preference that of Canaan, is rendered untenable by the fact that the Moabites also spoke Canaanitish. It is vain to urge against the identity of Hebrew and Canaanitish the distinction between Phœnician and Hebrew; for doubtless similar distinctions existed between the dialect of the Phœnician coast towns and that of the Hivites, Amorites, and Canaanites generally, whose language the Hebrews borrowed. That the Aramæans of Damascus, who also were compelled to mingle with the Hethites in the country of which they had taken possession, nevertheless retained their original tongue is to be explained by the circumstance that they continued to maintain direct relations with the mother-country of Mesopotamia, and moreover had greater internal cohesion. The designation Amorites, usually given in the Old Testament to the original inhabitants of Eastern Palestine, is substantially synonymous with that of Canaanites, although not quite so comprehensive. The Palestine of the Pre-Israelitic period, which in the Pentateuch is called the Land of Canaan, figures in Amos as the Land of the Amorites. While, however, the former name is bestowed chiefly upon that portion of the earlier population which had remained unconquered, the latter is given to the portion against which the Israelites first directed their attack and in whose territory they settled. This took place in the mountain district, first to the east and afterwards to the west of Jordan. For this reason the Amorites, as contrasted with the Canaanites of the cities of the level country, are a highland race, like the Hebrews themselves, but belong exclusively to the past. In the time of the Biblical narrators, the Canaanites are still living here and there in the land, but the Amorites have once lived where the Israelites now are. This explains the fact that, while in ordinary peaceful circumstances the Canaanites are named as the old inhabitants, the Amorites are immediately substituted for them wherever war and conquest are spoken of. Sihon and Og, with whom Moses does battle, are kings of the Amorites; in like manner it is with the twelve kings of the Amorites that Joshua has to deal westward of the Jordan. The Amorites as an extinct race of course assume a half-mythical character, and are represented as giants, tall as cedars and strong as oaks.

Just as Israel was the people of Jehovah, and Ammon the people of Milcom, Moab was the people of Chemosh (כִּמּוֹשׁ, Num. xxi. 29). The kingship of Chemosh was regarded as thoroughly national and political in its character, but did not on that account exclude the institution of a human king, which existed in Moab much earlier than in Israel; in the time of Moses the Moabites had a king, and the institution was even then an old one. The capitals of the kingdom were Ar Moab and Kir-Moab, south from the Arnon; these were not, however, the constant residences of the kings, who continued to live in their native places, as, for example, Mesha in Dibon. Doubtless there were changes of dynasty, and traces exist of a powerful aristocracy (Arieh Moab; 2 Sam. xxiii. 20).

The land of the Moabites, the Bālkā, is bounded northward and southward by Mount Gilead and Wadi 'l-Aḥsā, westward and eastward by the Dead Sea and the Wilderness; it is divided into two portions by the deep bed of the Arnon, that to the north being the more level (Mishôr), and that to the south being more broken up, and constituting the proper stronghold of the nation. The soil is peculiarly adapted for sheep-farming (2 Kings iii.) and the culture of the vine (Isa. xvi.).¹

The historical importance of the Moabites lies wholly in their contact with Israel, and we have no knowledge of them apart from this. After the Israelites had quitted Egypt and passed a nomadic life for about a generation in the neighbourhood of Kadesh, they migrated thence, still under the leadership of Moses, into northern Moab, dispossessing the Amorites, who had made themselves masters of that district. The interval from Kadesh to the Arnon could be passed only by a good understanding with Edom, Moab, and Ammon,—a proof that the ethnical relationships, which at a later period were expressed only in legend, were at that time still living and practical. In all probability the Moabites called the Israelites to their aid; they were not as yet aware that this little pastoral people was destined one day to become to them a greater danger than the Canaanites by whom they were threatened at the moment.²

As the story of Balaam indicates, the Moabites would willingly have been rid of their cousins after their service had been rendered, but were unable to prevent them from settling in the land of Sihon. The migration of the tribes of Israel into Western Palestine, however, and the dissolution of their warlike confederation soon afterwards made a restoration of the old frontiers possible. If King Eglon took tribute of Benjamin at Jericho, the territory between Arnon and Jordan must also have been subject to him, and

¹ There does not seem to have been any difference in this respect between the northern and southern portions; instead of Heshbon, Sibmah, and Jaazer (Isa. xvi.), the poet Hâtim of Tayyi, a little before Mohammed, names Maâb and Zoar as the chief wine centres (Yâkût, iv. 377, 19).

² The facts as a whole are indubitable; it cannot be an invention that the Israelites settled first in Kadesh, then in northern Moab, and thence passed into Palestine proper. The only doubtful point is whether the song in Num. xxi. 27 *sqq.* is contemporary evidence of these events. It is certainly not a forgery, but it is a question whether it really refers to the destruction of the kingdom of the Amorites at Heshbon. This reference rests entirely upon the words לְמִלְכֵי אֲמֹרִי תִיחֶן, which might very well be omitted as a mere gloss, in which case the song would naturally be understood as directed against the Moabites themselves; it is in this last sense that it is taken by the author of Jer. xlvi. (Comp. E. Meyer in *Stade's Zeitschr. f. A. Tliche Wissensch.*, 1881, p. 129 *sqq.*) As Israel got the better of the Amorites on the plain of Moab, so did Hadad king of the Edomites vanquish the Midianites on the "field" of Moab (Gen. xxxvi. 35); this took place in Gideon's time, as is borne out by the fact that between Hadad and the downfall of the ancient Edomite monarchy, *i.e.* to the period of David, there were four reigning princes. Confused recollections of a former settlement of the Midianites in northern Moab are seen in Num. xxii. 4, 7; xxv. 18.

Reuben must even then have lost his land, or at least his liberty. It would appear that the Moabites next extended their attacks to Mount Gilead, giving their support to the Ammonites, who, during the period of the judges, were its leading assailants. So close was the connexion between Moab and Ammon that the boundary between them vanishes for the narrators (Judges xi.).

Gilead was delivered from the Ammonites by Saul, who at the same time waged a successful war against Moab; the fact is lightly touched upon in 1 Sam. xiv. 47, as if this were a matter of course. The establishment of the monarchy necessarily involved Israel in feuds with its neighbours and kin. The Moabites being the enemies of the Israelite kingdom, David naturally sent his people for shelter thither when he had broken with Saul; the incident is precisely analogous to what happened when he himself at a later period took refuge from Saul's persecution in Philistine territory and needs no explanation from the book of Ruth. As soon as he ceased to be the king's enemy by himself becoming king, his relations with Moab became precisely those of his predecessor. The war in which apparently casual circumstances involved him with Hanun ben Nahash of Ammon really arose out of larger causes, and thus spread to Moab and Edom as well. The end of it was that all the three Hebrew nationalities were incorporated with the kingdom of Israel; the youngest brother eclipsed and subdued his seniors, as Balaam had foreseen. Through the work of Saul and David the political system of Palestine was altogether changed: the smaller peoples were no longer a match for Israel, which established a decisive preponderance, and transformed what had hitherto been jealousy on the part of Moab and Ammon as well as of Edom into bitter hatred; this hatred did not cease even after nothing but a religious shadow remained of what had once been the political supremacy of the people of Jehovah.

The struggle with Ammon which David began ultimately assumed larger dimensions, and brought the Aramæans also into the field against him. He was successful, indeed, against them also, and destroyed their most powerful kingdom; but after his death they recovered themselves, and pressed steadily on from the borders of the wilderness towards the sea; at their head were those kings of Damascus who had established themselves on the ruins of Zoba. In presence of these enemies the already fading distinction between the ruling and the subject nationality within the kingdom of Israel now completely disappeared; and even towards the Canaanites outside the relations of the kings became friendly. It is in one instance expressly stated that the common danger threatening from the East had to do with this (2 Sam. viii. 9 *sqq.*). But, conversely, it was natural that Ammon and Moab should make common cause with the Aramæans; such an attitude was suggested by geographical position and old connexions, but above all by their helpless fury against Israel. Both nationalities must have succeeded in emancipating themselves very soon after David's death, and only now and then was some strong king of Israel able again to impose the yoke for a time, not upon the Ammonites indeed, but upon Moab. The first to do so was Omri, who garrisoned a number of their towns and compelled the king to acknowledge Israel's suzerainty by a yearly tribute of sheep,—a state of matters which continued until the death of Ahab ben Omri. But when that brave king fell in battle with the Aramæans at Ramoth Gilead (about 850 B.C.), Mesha of Dibon, then the ruler of Moab, seized the favourable opportunity to make himself and his people independent. In his famous inscription he tells how, through the wrath of Chemosh, the land had fallen into the enemy's power and endured forty years of slavery, and how by the grace of Chemosh the yoke is now broken and the Israelites ignominiously driven off. **IL**

the Bible we find only the curt statement that Moab rebelled against Israel after the death of Ahab (2 Kings i.); on the other hand, there is a full narrative of a later attempt on the part of Joram ben Ahab to bring Mesha again into subjection—an attempt which promised very well at first, but ultimately failed completely. Joram's invasion took place not from the north but (probably very unexpectedly to the enemy) from the frontier of Edom over the Wadi 'l-Ahsá; he marched through Judah and Edom, and the kings of those countries served as auxiliaries. He defeated a Moabite army on the frontier, penetrated into the country and laid it waste; he laid siege to the fortress of Kir-Moab so closely as to reduce it to great straits. But these straits seem to have filled the besieged with a desperate courage, for the fortunes of war suddenly changed. The Israelites were compelled to retire homeward, a great wrath (of Jehovah) having come upon them, that is, a severe disaster having befallen them, which is not described, but, from the nature of the case, must have been a sudden surprise and defeat by the enemy.¹

As the Moabites owed their liberation from Israelite supremacy to the battle of Ramah—that is, to the Aramæans—we accordingly find them (as well as the Ammonites) afterwards always seconding the Aramæans in continual border warfare against Gilead, in which they took cruel revenge on the Israelites. With what bitterness the latter in consequence were wont to speak of their hostile kinsfolk can be gathered from Gen. xix. 30 *sqq.*—the one trace of open malice in the story of the patriarchs, and all the more striking as it occurs in a narrative of which Lot is the hero and saint, which therefore in its present form is of Moabite origin, although perhaps it has a still older Canaanite nucleus. Of these border wars we learn but little, although from casual notices it can be seen (2 Kings xiii. 20; Amos i. 13; comp. 2 Kings v. 2) that they were long kept up, although not quite uninterruptedly. But when at length the danger from the Aramæans was removed for Israel by the intervention of the Assyrians, the hour of Moab's subjection also came; Jeroboam II. extended his frontier over the eastern territory, as far as to the brook of the willows (Wadi 'l-Ahsá). (Perhaps the song of Num. xxi. 27 *sqq.* has reference to these events.) A vivid picture of the confusion and anguish then prevalent in Moab has been preserved to us in the ancient prophecy of Isa. xv., xvi., which indeed would have greater historical value if we were able to tell precisely what in it depicts the present, and what is prediction of the future.²

This utterance of an older prophet was repeated some

¹ The narrative of Mesha in his inscription has, strange to say, not unfrequently been regarded as parallel with 2 Kings iii., and the conclusion been drawn that the Biblical narrative completely inverts the true state of the case,—it is difficult to see for what motives, for there is no braggadocio in 2 Kings iii. But it is perfectly clear that the narrative of 2 Kings iii. presupposes the revolt of Mesha as an old affair; while, on the other hand, Mesha's story on the stele in the Louvre is a narrative of this very revolt and its immediate consequences; it is accordingly to be regarded as parallel with 2 Kings i. 1. Elisha's miracle in Wadi 'l-Ahsá (2 Kings iii. 16) is explained by the locality; Ahsá means a sandy ground with moist subsoil, where, by digging trenches, water is always obtainable. The (probably compulsory) participation of the king of Edom in Joram's expedition against Moab may perhaps be brought into connexion with the fact that the Moabites burned to lime the bones of a king of Edom (Amos ii. 1).

² In Isa. xv. xvi. it is presupposed that the attack upon Moab has been made from the north, at a time when Judah is a comparatively powerful kingdom, exercising sovereignty over Edom also, and in a position to afford shelter to the fugitive Moabites, thus not being itself at war with them. These marks taken together can only apply to the period of Jeroboam II. and Uzziah. Hitzig will have it that Jonah ben Amittai wrote Isa. xv. xvi.; but according to 2 Kings xiv. 25 that prophet preached prosperity to Jeroboam, and not disaster to the Moabites.

decennia later by the prophet Isaiah, with the addition of a clause adapting it to his time, to the effect that the Assyrians would carry out in all its fulness the hitherto imperfectly-executed threat. The Assyrians actually subjugated the Moabites, as well as the other small peoples of that region; but the blow was apparently not so grave as Isaiah had predicted. They lay more out of the way than their western neighbours, and perhaps their resistance to the scourge of God was not so obstinate as to demand the sharpest measures. What made it all the easier for them to reconcile themselves to the new situation was the fact that the Israelites suffered much more severely than they. From these their deadly enemies they were henceforth for ever free. They did not on that account, however, give up their old hatred, but merely transferred it from Israel to Judah. The political annihilation of the nation only intensified in Jerusalem the belief in its religious prerogative, and against this belief the hostility of neighbours was aroused more keenly than ever. The deepest offence at the religious exclusiveness of the people of Judæa, which then first began to manifest itself, was, as is easily understood, taken by their nearest relatives, Edom and Moab. They gave terrible expression to their feelings when the Chaldeans urged them on like uncaged beasts of prey against the rebellious Jews; and they joined loudly in the general chorus of malignant joy which was raised over the burning of the temple and the ruin of the holy city.³

“Because Moab saith: Behold the house of Judah is like all the other nations, therefore do I open his land to the Bne Kedem,” says the prophet Ezekiel (xxv. 8 *sqq.*). His threat against the Moabites as well as against the Edomites and Ammonites is that they shall fall before the approach of the desert tribes. Probably in his day the tide of Arabian invasion was already slowly rising, and of course it had first to overtake the lands situated on the desert border. At all events the Arab immigration into this quarter began at an earlier date than is usually supposed; it continued for centuries, and was so gradual that the previously-introduced Aramæizing process could quietly go on alongside of it. The Edomites gave way before the pressure of the land-hungry nomads, and settled in the desolate country of Judah; the children of Lot, on the other hand, appear to have amalgamated with them,—the Ammonites maintaining their individuality longer than the Moabites, who soon entirely disappeared.

Israel and Moab had a common origin, and their early history was similar. The people of Jehovah on the one hand, the people of Chemosh on the other, had the same idea of the Godhead as head of the nation, and a like patriotism derived from religious belief,—a patriotism capable of extraordinary efforts, and which has had no parallel in the West either in ancient or in modern times. The mechanism of the theocracy also had much that was common to both nations; in both the king figures as the deity's representative, priests and prophets as the organs through whom he makes his communications. But, with all this similarity, how different were the ultimate fates of the two! The history of the one loses itself obscurely and fruitlessly in the sand; that of the other issues in eternity. One reason for the difference (which, strangely enough, seems to have been felt not by the Israelites alone but by the Moabites also) is obvious. Israel received no gentle treatment at the hands of the world; it had to carry on a continual conflict with foreign influences and hostile

³ Zeph. ii. 8 *sq.*; 2 Kings xxiv. 2, and Jer. xii. 9 *sqq.*; Ezek. xxv. 8 *sqq.* It need hardly be said that the Moabites shared the fate of all the Palestinian peoples when supremacy passed from the Assyrians to the Chaldeans, and that, notwithstanding their hatred of the Jews, they had no difficulty in seeking alliances with them, when occasions arose on which they could be made useful (Jer. xxvii. 3).

powers; and this perpetual struggle with gods and men was not profitless, although the external catastrophe was inevitable. Moab meantime remained settled on his lees, and was not emptied from vessel to vessel (Jer. xlviii. 11), and corruption and decay were the result. This explanation, however, does not carry us far, for other peoples with fortunes as rude as those of Israel have yet failed to attain historical importance, but have simply disappeared. The service the prophets rendered at a critical time, by raising the faith of Israel from the temporal to the eternal sphere, has already been spoken of in the article ISRAEL.

Sources.—The Old Testament (Ruth and Chronicles, however, being of no historical worth in this connexion), and the inscription of Mesha, on the stone of Dibon, discovered in 1868, and now in the Louvre. The Berlin *Moabítica* are valueless.—Schlottmann himself, the unshaken champion of their genuineness, conceding that they are mere scribbling, and do not even form words, much less sentences. The literature of the subject is to be found in the commentaries on the Old Testament books, and in those on the inscription of Mesha. (J. WE.)

MO'ALLAKÁT. *Al-Mo'allakát* is the title of a group of seven longish Arabic poems, which have come down to us from the time before Islam. The name signifies "the suspended" (pl.), the traditional explanation being that these poems were hung up by the Arabs on or in the Ka'ba at Mecca. The oldest passage known to the writer where this is stated occurs in the *Ikd* of the Spanish Arab, Ibn 'Abd-Rabbih (A.D. 861-940), Búlak ed. vol. iii. p. 116 sq. We read there: "The Arabs had such an interest in poetry, and valued it so highly, that they took seven long pieces selected from the ancient poetry, wrote them in gold on rolls (?) of Coptic cloth, and hung them up (*allakát*) on the curtains which covered the Ka'ba. Hence we speak of 'the golden poem of Amraalkais,' 'the golden poem of Zohair.' The number of the golden poems is seven; they are also called 'the suspended' (*al-Mo'allakát*)." Similar statements are frequent in later Arabic works. But against this we have the testimony of a contemporary of Ibn 'Abd-Rabbih, the grammarian Nahhás (*ob.* A.D. 949), who says in his commentary on the *Mo'allakát*: "As for the assertion that they were hung up in [*sic*] the Ka'ba, it is not known to any of those who have handed down ancient poems."¹ This cautious scholar is unquestionably right in rejecting a story so utterly unauthenticated. The customs of the Arabs before Mohammed are pretty accurately known to us; we have also a mass of information about the affairs of Mecca at the time when the Prophet arose; but no trace of this or anything like it is found in really good and ancient authorities. We hear, indeed, of a Meccan hanging up a spoil of battle on the Ka'ba (Ibn Hishám, ed. Wüstenfeld, p. 431). Less credible is the story of an important document being deposited in that sanctuary, for this looks like an instance of later usages being transferred to pre-Islamic times. But at all events this is quite a different thing from the hanging up of poetical manuscripts. To account for the disappearance of the *Mo'allakát* from the Ka'ba we are told, in a passage of late origin (De Sacy, *Chrestom.*, ii. 480), that they were taken down at the capture of Mecca by the Prophet. But in that case we should expect some hint of the occurrence in the circumstantial biographies of the Prophet, and in the works on the history of Mecca; and we find no such thing. That long poems were *written* at all at that remote period is improbable in the extreme. All that we know of the diffusion of Arabic poetry, even up to a time when the art of writing had become far more general than it was before the spread of Islam, points exclusively to *oral* tradition. Moreover, it is quite inconceivable that there should have been either a guild or a private individual of such acknowledged taste,

or of such influence, as to bring about a consensus of opinion in favour of certain poems. Think of the mortal offence which the canonization of one poet must have given to his rivals and their tribes! It was quite another thing for an individual to give his own private estimate of the respective merits of two poets who had appealed to him as umpire; or for a number of poets to appear at large gatherings, such as the fair of 'Okáz, as candidates for the place of honour in the estimation of the throng which listened to their recitations. In short, this legend, so often retailed by later Arabs, and still more frequently by Europeans, must be entirely rejected.² The story is a pure fabrication based on the name "suspended." The word was taken in its literal sense; and as these poems were undoubtedly prized above all others in after times, the same opinion was attributed to "the [ancient] Arabs," who were supposed to have given effect to their verdict in the way already described. A somewhat simpler version, also given by Nahhás in the passage already cited, is as follows: "Most of the Arabs were accustomed to meet at 'Okáz and recite verses; then if the king was pleased with any poem, he said, 'Hang it up, and preserve it among my treasures.'" But, not to mention other difficulties, there was no king of all the Arabs; and it is hardly probable that any Arabian king attended the fair at 'Okáz. The story that the poems were written in gold has evidently originated in the name "the golden poems" (literally "the gilded"), a figurative expression for excellence. We must interpret the designation "suspended" on the same principle. In all probability it means those (poems) which have been raised, on account of their value, to a specially honourable position. Another derivative of the same root is *ilk*, "precious thing."

The selection of these seven poems can scarcely have been the work of the ancient Arabs at all. It is much more likely that we owe it to some connoisseur of a later date. Now Nahhás says expressly in the same passage: "The true view of the matter is this: when Hammád arráwiya (Hammád the Rhapsodist) saw how little men cared for poetry, he collected these seven pieces, urged people to study them, and said to them: 'These are the [poems] of renown.'" And this agrees with all our other information. Hammád (who lived in the first three quarters of the 8th century A.D.) was perhaps of all men the one who knew most Arabic poetry by heart. The recitation of poems was his profession. To such a rhapsodist the task of selection is in every way appropriate; and it may be assumed that he is responsible also for the somewhat fantastic title of "the suspended."

The collection of Hammád appears to have consisted of the same seven poems which are found in our modern editions, composed respectively by Amraalkais, Tarafa, Zohair, Labíd, Antara, 'Amr ibn Kolthúm, and Hárith ibn Hilliza. These are enumerated both by Ibn 'Abd-Rabbih, and, on the authority of the older philologists, by Nahhás; and all subsequent commentators seem to follow them. We have, however, evidence of the existence, at a very early period, of a slightly different arrangement. Two of the foremost authorities in Arabic poetry are Abú 'Obaida and Mofaddal,—men who for care and accuracy in preserving the genuine text were far ahead of their much older contemporary Hammád. Both of these inserted a poem by Nábigha and one by A'shá in place of those of Antara and Hárith;³ and, if our informant has expressed

¹ Ernst Frenkel, *An-Nahhás' Commentar zur Mu'allaga des Inruul-Qais* (Halle, 1876), p. viii.

² Doubts had already been expressed by various scholars, when Hengstenberg—rigid conservative as he was in theology—openly challenged it; and since then it has been controverted at length in Noldeke's *Beiträge zur Kenntniss der Poesie der alten Araber* (Hanover, 1864), p. xvii. sqq. Our highest authority on Arabic poetry, Professor Ahlwardt, concurs in this conclusion; see his *Bemerkungen über die Aechtheit der alten arabischen Gedichte* (1872), p. 25 sq.

³ The passage is cited by Noldeke, *Beiträge*, p. xx. sq.

himself correctly, they also called this modified collection *Mo'allakát*. Mofaddal employs, besides, the names "the seven long [poems]" and "the necklaces." This last became afterwards a common title for the seven poems. The comparison of songs to strings of pearls is a very apt one, from the nature of the Arabic poem, composed as it is of separate loosely-connected parts. Hence it became so popular that even in ordinary prose to speak in rhythmical form is called simply *nazm*, "to string pearls." Mofaddal expressly opposes the view of those who did not acknowledge the pre-eminence of the seven poets selected by him. This appears to be an attack on Hammád for including in his collection the works of two men who for poetic fame could certainly never enter the lists with Nábigha and A'shá. It is *prima facie* more likely that a later writer should have replaced the less famous poets by those who were universally placed in the first rank, than *vice versa*. Perhaps another fact is of some importance here. Hammád, a Persian by descent, was a client of the Arab tribe, Bakr ibn Wáil. In the heathen period this tribe was much at war with the closely-related tribe Taghlib. Now of all Arabic poems none was more famous than that in which 'Amr ibn Kolthúm celebrates in glowing terms the praises of his tribe Taghlib. If, therefore, Hammád's collection embraced this poem, it was very natural for him to gratify his patrons the Bakrites by placing alongside of it that of Hárith—a Bakrite and contemporary of 'Amr—who he extols his own tribe and assails the Taghlibites with bitter scorn. Such considerations did not affect Abú 'Obaida and Mofaddal.

The authority of these men has so far prevailed that the poems of their favourites Nábigha and A'shá often appear in the manuscripts, not indeed instead of those of 'Antara and Hárith, but after the other seven. Thus we sometimes read of *nine* Mo'allakát. The first author in whom the writer has observed this is the great philosophic historian Ibn Khaldún (A.D. 1332-1406); he mentions instead of Hárith the far more celebrated 'Alkama; whether relying on ancient authority, or by an oversight, we cannot tell. In an excellent collection of forty-nine long poems by Abú Zaid al-Korashí (date unknown) Mofaddal's seven poets appear in the first class, "the necklaces;" but Nábigha and A'shá are each represented by a different piece from that usually reckoned among the Mo'allakát. By this editor the name "golden poems," which, as we have seen, sometimes occurs as a synonym of "Mo'allakát," is applied to seven quite distinct songs.¹ This uncertainty as to the selection and the titles may serve as an additional proof that the "suspension," on the Ka'ba or anywhere else, is a fable.

The lives of these seven (or nine) poets were spread over a period of more than a hundred years. The earliest of them, according to the common and probably correct opinion, was AMRAALKAIS (pronounced also Imroolkais, Imraalkais, &c.), regarded by many as the most illustrious of Arabian poets. His exact date cannot be determined; but probably the best part of his career fell within the first half of the 6th century. He was a scion of the royal house of the tribe Kinda, which lost all its power at the death of King Hárith ibn 'Amr in the year 529.² The poet's royal father, Hojr, by some accounts a son of this Hárith, was killed by Bedouins. The son led an adventurous life as a refugee, now with one tribe, now with another, and appears to have died young. The anecdotes related of him—which, however, are very untrustworthy in detail—as well as his poems, imply that the glorious

memory of his house and the hatred it inspired were still comparatively fresh, and therefore recent.

The Mo'allaka of 'AMR hurls defiance against the king of Híra, 'Amr son of Mundhir, who reigned from the summer of 554 till 568 or 569, and was afterwards slain by our poet.³ This prince is also addressed by HÁRITH in his Mo'allaka. Of TARAFÁ, who is said to have attained no great age, a few satirical verses have been preserved, directed against this same king. This agrees with the fact that a grandson of the Kais ibn Khálid, mentioned as a rich and influential man in Tarafa's Mo'allaka (v. 80 or 81), figured at the time of the battle of Dhú Kár, in which the tribe Bakr routed a Persian army. This battle falls between A.D. 604 and 610 (Nöldeke's *Tabari*, p. 311).

The Mo'allaka of 'ANTARA and that of ZOHÁIR contain allusions to the feuds of the kindred tribes 'Abs and Dhobýán. Famous as these contests were, their time cannot be ascertained. But the date of the two poets can be approximately determined from other data. Ka'h, son of Zohair, composed first a satire, and then, in the year 630, a eulogy on the Prophet; another son, Bojair, had begun, somewhat sooner, to celebrate Mohammed. 'Antara killed the grandfather of the Ahnaf ibn Kais who died at an advanced age in A.D. 686 or 687; he outlived 'Abdalláh ibn Simma, whose brother Doraid was a very old man when he fell in battle against the Prophet (early in A.D. 630); and he had communications with Ward, whose son, the poet 'Orwa, may perhaps have survived the flight of Mohammed to Medina. From all these indications we may place the productive period of both poets in the end of the 6th century.⁴ The historical background of 'Antara's Mo'allaka seems to lie somewhat earlier than that of Zohair's.

To the same period appears to belong the poem of 'ALKAMA, which, as we have seen, Ibn Khaldún reckons amongst the Mo'allakát. This too is certainly the date of NÁBIGHA, who was one of the most distinguished of Arabic poets. For in the poem often reckoned as a Mo'allaka, as in many others, he addresses himself to the above-named No'mán, king of Híra, who reigned in the two last decades of the 6th century. The same king is mentioned as a contemporary in one of 'Alkama's poems.

The poem of A'SHÁ, which Mofaddal placed among the Mo'allakát, contains an allusion to the battle of Dhú Kár (under the name "Battle of Hinw," v. 62). This poet, not less famous than Nábigha, lived to compose a poem in honour of Mohammed, and died not long before A.D. 630.

LABÍD is the only one of these poets who embraced Islam. His Mo'allaka, however, like almost all his other poetical works, belongs to the pagan period. He is said to have lived till 661 or even later; certainly it is true of him, what is asserted with less likelihood of several others of these poets, that he lived to a ripe old age.

We have already mentioned that the old Arabic poetry was transmitted not by manuscripts but simply through oral tradition. Many pieces, especially the shorter ones, may have owed their preservation to their hold on the popular memory. But, fortunately, there was a class of men who made it their special business to learn by rote, and repeat, the works either of a single poet or of several. The poets themselves used the services of such rhapsodists (*ráwis*). The last representative of this class is Hammád, the man who formed the collection of Mo'allakát; but he, at the same time, marks the transition from

³ See Nöldeke's *Tabari*, pp. 170, 172.

⁴ This evidence might be supplemented from a poem in Zohair's name, whose author describes himself as a man of ninety years, and in which the downfall of King No'mán of Híra (A.D. 601, see *Tabari*, p. 347) is spoken of as a very recent event. But the genuineness of this poem is more than doubtful (see Ahlwardt, *op. cit.* p. 64, and C. J. Lyall in the *Academy*, March 13, 1880, p. 192).

¹ See Nöldeke, *Beiträge*, p. xxi., and the catalogue of the Arabic codd. in the British Museum, p. 480 *sqq.*

the rhapsodist to the critic and scholar. Now, when we consider that more than a century—in some cases two centuries—elapsd before the poems were fixed by literary men, we must be prepared to find that they have not retained their original form unaltered. The most favourable opinion of the rhapsodists would require us to make allowance for occasional mistakes; expressions would be interchanged, the order of verses disarranged, passages omitted, and probably portions of different poems pieced together. The loose structure of the ancient poems rendered them peculiarly liable to corruptions of this kind. But the fact is that Hammád in particular dealt in the most arbitrary fashion with the enormous quantity of poetry which he professed to know thoroughly. He is even charged with falsifications of all sorts in this department. Of others, again—and notably of the great philologist Khalaf, "the Red"—it is credibly reported that they used their intimate knowledge of the style and language of the ancients to pass off whole poems of their own making as the productions of earlier authors. The worst anticipations are only too completely confirmed by an examination of such pieces as are still preserved, as is shown most conclusively in Ahlwardt's *Bemerkungen*, already cited. The seven Mo'allakát are indeed free from the suspicion of forgery, but even in them verses are frequently transposed; in all there are lacunæ; and probably all contain verses which do not belong to them. Some of them have more than one introduction. This is the case even with the poem of 'Amr, although, as the finest panegyric of his very powerful tribe, it must have had a wide circulation. The true introduction begins at v. 9; before that we find another which certainly does not belong to this poem, and can hardly be the work of the same poet. 'Amr lived in the desert regions near the lower Euphrates, under the Persian dominion; whereas the author of v. 8 boasts of his carousals in several parts of Roman Syria, and in v. 1 he speaks of drinking wine from a place in Northern Syria. It is evident that all attempts to restore the original order, to fill up blanks, or to remove interpolations, can only be carried to a certain degree of probability at the best; there must always be a large subjective element in judgments on points of the kind. Still less can we hope to discover and rectify the minor changes, in single expressions or grammatical forms, which the text may have undergone before it was fixed in writing. It may be remarked in this connexion that where any ancient song has been transmitted through two different grammatical schools it generally appears in two considerably divergent forms, each having been taken down from the lips of a separate ráwí. Of secondary importance are the errors due to later copyists. Considerable as these often are, we are, at least in many cases, better able to correct them.

Even the masters of old Arabian poetry do not exhibit such characteristic differences in their general manner and style as to leave in the mind a clear idea of their individuality. A few distinct poetic types emerge, but the great majority of these poets present a somewhat monotonous aspect to the Western scholar, who indeed can at best have but a very imperfect feeling for *nuances* of style in this field. But if we are thus unable to isolate the various constituent parts of this poetical literature, and pass a critical opinion on each, we do get from this literature, as a whole, what is of far greater importance than an æsthetic estimate of this or that particular poet, viz. a poetic picture of the whole life and activity of that remarkable people which, amid the endless agitation and endless sameness of its existence, and in an extremely inhospitable region, was preparing one of the mightiest revolutions in the history of the world. This collective impression is hardly impaired by the involuntary alterations made by the ráwís; nor is

it greatly distorted by the forgers of the 2d century of Islam, who were thoroughly familiar with the spirit and style of antiquity, and seldom did violence to them.

The critics of the 2d and 3d centuries A.H. unanimously ranked the poets of the heathen period above those of Islam; and in that verdict we must concur. The older Moslem poets were for the most part mere Epigoni, content, for better or worse, to borrow the style of their pagan predecessors. It is only natural, therefore, that the seven best poems should have been selected from the productions of heathenism. But how these particular seven came to be fixed upon, it is difficult to decide. It is remarkable that people who knew thousands of such poems should have agreed as to the superiority of five, and only differed about two. No doubt the selection was greatly influenced by the widely-established reputation of certain poets, like Amraalkáis, Zohair, and Tarafa; while in other cases single poems, such as that of 'Amr, stood in high repute for special reasons. Still, even we, with a much narrower range of selection, should hardly pick out these seven as the finest. In all probability our choice would not light on a single one of them. The truth is, our æsthetic ideal is essentially different from that of those old *litterateurs*. And, while we may certainly consider our own taste, formed on the model of the Greeks and the best of the moderns, to be on the whole purer than theirs, we must not forget that they had the advantage of perfect knowledge of the language and the subject-matter, and could thus perceive a multitude of beautiful and delicate touches, which we either miss entirely or realize with laborious effort. The world of the old Arabian poet lay at an infinite remove from ours. His mental horizon was narrow; but within that horizon every minute detail was seized and designated with precision. Among the nomads, for example, the smallest point of the horse or camel that the eye can see has its importance; the language has precise and generally understood words for them all, where ours has only technical terms. It is the same with all the physical properties of the animal—its paces, etc. Thus, when a poet faithfully described the exterior and the department of his camel, that was to his hearers—and the same is true of later critics—a genuine pleasure, because the description conveyed to them a definite pictorial impression. But we do not understand the details of the picture; or, when at best with all the resources of tradition and natural history we have gained some tolerable comprehension of them, the whole still leaves us indifferent. A camel to us is simply not a poetical object; and even a horse ceases to be æsthetically interesting—except perhaps to a sportsman—when one is asked to go over his points in detail. For this reason we are apt to find a great part of Tarafa's Mo'allaká, and many parts of the poems of Amraalkáis, viewed as poetry, distasteful rather than interesting. More attractive are the descriptions of the life and habits of wild animals in the desert, such as the wild ass and some species of antelope, which the poets are fond of introducing (see, e.g., the Mo'allaká of Labíd). There are also many vivid sketches from nature to be met with,—nature, of course, as seen in the very monotonous Arabian landscape. Monotony, indeed, is a predominant characteristic of this poetry. When one first reads poems where the bard begins by shedding tears over the scarcely perceptible traces of the dwelling of his beloved in years gone by, one's sympathy is aroused. But when poem after poem is found to commence with the same scene, and possibly with almost the same words, the emotion is somewhat damped. No doubt such occurrences must really have been very common in the nomad life; nevertheless the suspicion becomes at last irresistible that for the most part all this is pure fiction. Nor can we be sure that the

poets are always to be taken *au sérieux* when they describe those carousals, and other adventures in peace and war, of which they love to boast. They are probably more serious in the narratives of their love experiences: these are often very highly coloured, and yet are always pervaded by a certain natural refinement, which is too often wanting in the later erotic poetry of the Moslems. But there, too, our enjoyment is frequently marred by minute and even prosy descriptions of the physical charms of the object of affection.

The lyrical and even the more rhetorical passages of the poems make in general a deeper impression upon us than the descriptive portions, to which they owe their distinctive character, and which are often intimately blended with the former. When those old Arabs are really moved by love, or rage, or grief, when personal or tribal vanity vents itself in immoderate boasting, invective, or banter, then they strike chords that thrill our breasts. In those passages where genuine human feeling is stirred, they also display far greater individuality than in the more conventional descriptions. Especially affecting are the numerous passages or complete poems which mourn over the beloved and venerated dead. Their sober practical philosophy too, as it is presented in the Mo'allakā of Zohair and in many of Labīd's poems, is really impressive.

The Mo'allakāt are highly characteristic specimens of this poetry. They exhibit nearly all its merits as well as most of its defects. Amongst its merits we ought, perhaps, to include the unfailing regularity of the verse. That a people living under such extremely simple conditions should have cultivated a purely quantitative metre, so euphonious and so rigorously adhered to, is a fact worthy of our highest admiration. It is one evidence of that sense of measure and fixed form which is, in other directions also, a marked feature in the life and speech of the Arabs. The mere fact that in their verses they give so much attention to elegance of expression deserves commendation. Amongst the defects of this poetry we must emphasize the loose connexion between the separate parts. We require a poem, like any other work of art, to be a compact unity; the Arabs and many other Orientals lay all the stress on the details. In the Mo'allakā of Tarāfa, for instance, after the poet has spoken long enough about his beloved, he starts off in this fashion: "But I banish care when it comes near with a"—she-camel of such and such qualities, and then proceeds to give a description of his riding-camel. Equally abrupt transitions occur in almost all these poems, generally more than once in the same poem. In many cases a sort of unity is preserved by making the different sections represent so many scenes from the life of the poet or from the common life of the Bedouins; but even then there is something unsatisfactory in the want of real connexion. It does not mend matters much when the poet keeps up a merely mechanical transition; as, for example, when he speaks first of his camel, then with the words "it is as swift as a wild ass which," &c., passes to a description of that animal, and again proceeds, "or as swift as an ostrich which," &c., in order to introduce the ostrich.

This loose structure of the poems explains the fact that from a very early period particular pieces were culled from larger works and recited by themselves. For the town-Arabs of later times this procedure was especially convenient. For them the wild ass or oryx-antelope had little attraction; and on the camel they bestowed about as much notice as we do on our dray-horses and waggons. But the love and hate, the pride and scorn, the fierce lust of revenge and the wailing grief, the bravery and the gaiety, which breathed through the old Bedouin songs, had an intense fascination for them. We see that their attitude towards that poetry had in some degree approximated to our own. Hence it is that some anthologies from the old poetry, made by men

of learning and ability, with an eye to contemporary tastes, are on the whole much more pleasing to us than the complete poems themselves. This is eminently true of the excellent collection edited by Abū Tammām, himself a considerable poet (first half of the 9th century), under the title "Ḥamāsa" (Valour). This collection, which, however, embraces many pieces of the Moslem period, is certainly fitted to give a European a rather too favourable idea of ancient Arabic poetry. Whoever wishes really to know that poetry—and without this knowledge it is impossible to understand the Arabs themselves or their language—must betake himself to those which, like the Mo'allakāt and others, have been preserved more or less in their integrity.

The Mo'allakāt have been repeatedly printed, separately and collectively, both in the West and the East, generally with an Arabic commentary. A good commentary by a competent European is a real desideratum. A work of this kind would do more for the understanding of the poems than any poetical translation, which must always fail in rendering these definite concrete expressions of the Arabs for which we possess neither the idea nor the image. A translation must either be a mere paraphrase or else substitute something utterly vague. (TH. N.)

MOBILE, a city and port of entry of the United States, the capital of Mobile county, and, though not the capital, the largest city of Alabama, lies 140 miles east of New Orleans, on a sandy plain on the west bank of Mobile river, one of the arms of the Alabama. The municipal boundary includes an area about 6 miles long by 2 or 3 in breadth; but, excluding the suburban villas scattered about the nearer hills, the portion occupied by the buildings of the city proper is not more than a mile square. In the matter of paving and shade the streets are generally good, and Government Street especially, with its fine oak trees and gardens, forms an attractive promenade. Besides the spacious granite building erected in 1859 to accommodate the Custom-House, the Post Office, and the United States courts, the principal edifices are the Roman Catholic cathedral of the Immaculate Conception (1833), Christ Church (Episcopal) (1837), the City Hospital (1830), the United States Marine Hospital (1836), the Providence Infirmary, the conjoint market-house and municipal buildings, Barton Academy (occupied by the high schools), and the Alabama Medical College (founded in 1859). About 6 miles out, at Spring Hill, is the Jesuit College of St Joseph, established by Bishop Portier in 1832. As a commercial centre Mobile is in some respects very favourably situated. It is the only port of Alabama; the estuary on which it stands is the outlet for several navigable rivers; and it is the seaward terminus of the Mobile and Ohio railroad, the Mobile and Montgomery, and the Grand Trunk. But, on the other hand, it lies 25 miles from the coast; the lagoon-like bay cut off from the Gulf of Mexico by the narrow isthmus of Mobile Point is extremely shallow; and in 1879 no vessel drawing more than 13 feet could load and unload in the harbour with safety. Since 1827, it is true, various works have been undertaken to improve the approaches: the Choctaw Pass and the Dog River Bar, which had formerly a depth of little more than 5 and 8 feet respectively, were deepened to 17 feet by 1882; but Mobile will not take rank as a satisfactory ocean port till the scheme (now in operation) for constructing a wide channel more than 20 feet deep right through the bay has been fully carried out. The cost of the necessary works being beyond the power both of the city and State, Congress has granted \$270,000 for the purpose of widening the channel to 200 feet, and deepening it to 23 feet. A private company, established in 1876, has built a break-water in the bay, and greatly increased the safety of the harbour. For the years between 1855 and 1859 the average value of exports and imports was respectively

\$23,419,266 and \$711,420; the following figures for recent years show a considerable decline on the total:—

Years ending in June	Exports.	Imports.
1877	\$12,784,171	\$648,404
1878	9,493,306	1,148,442
1879	6,219,518	544,628
1880	7,188,740	425,519
1881	6,595,140	671,252
1882	3,258,605	396,573

In cotton, which forms the staple export, the falling off is particularly noticeable, 632,308 bales being the average for 1855 to 1859, and 365,945, 392,319, and 265,040 bales the quantities for 1879, 1880, and 1881. A great deal of what comes to the Mobile market is sent to New Orleans for shipment, partly that it may obtain a higher price as "Orleans" cotton. Lumber shingles, turpentine and rosin, fish and oysters, and coal, are also important items, but do not make in the aggregate so much as half the value of the cotton. Among the local industrial establishments are several spinning-mills, breweries, cooperages, shipbuilding yards, foundries, and sash and door works. The market gardeners of the outskirts produce a large quantity of cabbages, potatoes, water-melons, tomatoes, &c., to supply the cities of the western and northern States (value in 1879, \$112,520; 1880, \$174,483; 1881, \$159,706; 1882, \$367,194; 1883, estimated \$700,000). Though in 1820 it had no more than 2672 inhabitants, Mobile had 31,255 in 1880; the figures for the intermediate decades being 3194 (1830), 12,672 (1840), 20,515 (1850), 29,258 (1860), and 32,034 (1870).

Founded as a fort by Lemoyne d'Iberville (de Bienville) in 1702, Mobile continued to be the capital of the colony of Louisiana till 1723, when this rank was transferred to New Orleans. The site selected by Lemoyne was probably about 20 miles above the present position, which was first occupied after the floods of 1711. By the Treaty of Paris, 1763, Mobile and part of Louisiana were ceded to Britain; but in 1780 the fort (now Fort Charlotte) was captured by the Spanish general Galvez, and in 1783 it was recognized as Spanish along with other British possessions on the Gulf of Mexico. General Wilkinson, ex-governor of Louisiana, recovered the town for Louisiana in 1813, and in 1819, though its population did not exceed 2500, it was incorporated as a city. In 1864-65 Mobile and the neighbourhood was the scene of important military and naval engagements. The Confederates had surrounded the city by three lines of defensive works, but the defeat of their fleet by Admiral Farragut, and the capture of Fort Morgan, Spanish Fort, and Fort Blakelly, led to its immediate evacuation. As a municipal corporation, Mobile had got into such financial difficulties by 1879 that its city charter was repealed, and a board of commissioners established for the liquidation of its debt of \$2,497,856.

MÖBIUS, AUGUST FERDINAND (1790-1868), astronomer and mathematician, was born at Schulpforta, November 17, 1790. At Leipzig, Göttingen, and Halle he studied for four years, ultimately devoting himself to mathematics and astronomy. In 1815 he settled at Leipzig as privat-docent, and the next year became extraordinary professor of astronomy in connexion with the university. Later he was chosen director of the university observatory, which was erected (1818-21) under his superintendence. In 1844 he was elected ordinary professor of higher mechanics and astronomy, a position which he held till his death, September 26, 1868. His doctor's dissertation, *De computandis occultationibus fixarum per planetas* (Leipzig, 1815), established his reputation as a theoretical astronomer. *Die Hauptsätze der Astronomie* (1836), *Die Elemente der Mechanik des Himmels* (1843), may be noted amongst his other purely astronomical publications. Of more general interest, however, are his labours in pure mathematics, which appear for the most part in Crelle's Journal from 1828 to 1858. These papers are chiefly geometrical, many of them being developments and applications of the methods laid down in his great work, *Der Barycentrische Calcul* (Leipzig, 1827), which, as the name implies, is based upon the properties of the mean point or centre of mass. Any point in a plane (or in space) can be represented as the mean point of three (or four) fixed points by giving to these proper weights or coefficients,—an obvious principle which leads in the hands of Möbius to what no doubt is the chief novel feature of the work, a

system of homogeneous coordinates. Besides this, however, the work abounds in suggestions and foreshadowings of some of the most striking discoveries in more recent times—such, for example, as are contained in Grassmann's *Ausdehnungslehre* and Hamilton's *Quaternions*. He must be regarded as one of the leaders in the introduction of the powerful methods of modern geometry that have been developed so extensively of late by Von Standt, Cremona, and others.

MOCHÁ, a town of Yemen on the coast of the Red Sea, in E. long. 43° 20', N. lat. 13° 19'. The point of the coast where Mochá lies appears to have owed early importance to its good anchorage, for the Muza of the *Periplus* (*Geog. Gr. Min.*, i. 273 sqq.), a great seat of the Red Sea trade in antiquity, seems to be identical with the modern Múza' (Yákhút, iv. 680; Niebuhr, *Desc. de l'Arabie*, p. 195), a few miles inland from Mochá. Mochá itself is a modern town, which rose with the coffee trade into short-lived prosperity. The French expedition of 1709 found it a place of some 10,000 inhabitants, and its importance had increased half a century later, when Niebuhr visited it. The chief trade was then with British India. Lord Valencia in 1806 still found the town to present an imposing aspect, with its two castles, minarets, and lofty buildings; but the population had sunk to 5000. The internal disorders of Arabia and the efforts of Mohammed Ali to make the coffee trade again pass through India accelerated its fall, and the place is now a mere village. Mochá never produced coffee, and lies indeed in a quite sterile plain; the European name of Mochá coffee is derived from the shipment of coffee there. The patron saint, Sheikh Shadali, was, according to legend, the founder of the city and father of the coffee trade.

MOCKING-BIRD, or MOCK-BIRD (as Charleton, Ray, and Catesby wrote its name), the *Mimus polyglottus* of modern ornithologists, and the well-known representative of an American group of birds usually placed among the THRUSHES (*q.v.*), *Turdidæ*; though often regarded as forming a distinct section of that Family, differing by having the tarsus scutellate in front, while the typical Thrushes have it covered by a single horny plate. The Mocking-bird inhabits the greater part of the United States, being in the north only a summer-visitant; but, though breeding yearly in New England, is not common there, and migrates to the south in winter, passing that season in the Gulf States and Mexico. It appears to be less numerous on the western side of the Alleghanies, though found in suitable localities across the continent to the Pacific coast, but not farther northward than Wisconsin, and it is said to be common in Kansas. Audubon states that the Mocking-birds which are resident all the year round in Louisiana attack their travelled brethren on the return of the latter from the north in autumn. The names of the species, both English and scientific, have been bestowed from its capacity of successfully imitating the cry of many other birds, to say nothing of other sounds, in addition to uttering notes of its own which possess a varied range and liquid fulness of tone that are unequalled, according to its admirers, even by those of the NIGHTINGALE (*q.v.*). This opinion may perhaps be correct; but, from the nature of the case, a satisfactory judgment can scarcely be pronounced, since a comparison of the voice of the two songsters can only be made from memory, and that is of course affected by associations of ideas which would preclude a fair estimate. To hear either bird at its best it must be at liberty; and the bringing together of captive examples, unless it could be done with so many of each species as to ensure an honest trial, would be of little avail. Plain in plumage, being greyish-brown above and dull white below, while its quills are dingy black, variegated with white, there is little about the Mocking-bird's appear-

(1452 to 1859), ultimately extended from the Po to the Mediterranean, and was bounded N. by Lombardy and the Papal States, E. by the Papal States and Tuscany, S. by Tuscany, Sardinia, and the Mediterranean, and W. by Sardinia and the duchy of Parma. Its greatest length, from Porto-Vecchio, on its northern frontier towards Mantua, to the outlet of the Parmignola torrent, on the Sardinian frontier, was 84½ miles; and its greatest width, from the pass of Calama, on the Papal and Tuscan frontier, to the right bank of the Enza, on the frontier of Parma, was 37 miles. The area was 2371 square miles, of which three-fifths were mountainous. In 1855 the population was 606,159. The duchy had six provinces—Modena, Reggio, Guastalla, Frignano, Garfagnana, Massa-Carrara.

Modena is the ancient Mutina, which was annexed by the Romans along with the rest of the territory of the Boii. In 183 B.C. Mutina became the seat of a Roman colony. During the civil wars Marcus Brutus held out within its walls against Pompeius in 78 B.C., and in 44 B.C. the place was defended by D. Brutus against M. Antony. The 4th century found Mutina in a state of decay; the ravages of Attila and the troubles of the Lombard period left it a ruined city in a wasted land. In the 8th century its exiles founded, at a distance of 4 miles to the north-west, a new city, Città Geminiana (still represented by the village of Cittanova); but about the close of the 9th century Modena was restored and re fortified by its bishop, Laedoinus. When it began to build its cathedral (1099 A.D.) the city was part of the possessions of the countess Matilda of Tuscany; but when, in 1184, the edifice was consecrated by Lucius III., it was a free community. In the wars between Frederick II. and Gregory IX. it sided with the emperor, though ultimately the papal party was strong enough to introduce confusion into its policy. In 1283 Obizzo d'Este was recognized as lord of the city; after the death of his successor, Azzo VIII. (1308), it resumed its communal independence; but by 1336 the Este family was again in power. Constituted a duchy in 1452 in favour of Borso d'Este, and enlarged and strengthened by Hercules II., it became the ducal residence on the incorporation of Ferrara with the States of the Church (1593). Francis I. (1629-1658) erected the citadel and commenced the palace, which was largely embellished by Francis II. Rinaldo (*ob.* 1737) was twice driven from his city by French invasion. To Francis III. (1698-1780) the city was indebted for many of its public buildings. Hercules III. (1727-1803) saw his states transformed by the French into the Cispadine Republic, and, having refused the principality of Breisgau and Ortenau, offered him in compensation by the treaty of Campo Formio, died an exile at Treviso. His only daughter, Maria Beatrice, married Ferdinand of Austria (son of Maria Theresa), and in 1814 their eldest son, Ferdinand, received back the *Stati Estensi*. His rule was subservient to Austria, reactionary, and despotic. On the outbreak of the French Revolution of 1830, Francis IV. seemed for a time disposed to encourage the corresponding movement in Modena; but no sooner had the Austrian army put an end to the insurrection in central Italy than he returned to his previous policy. Francis Ferdinand V., who succeeded in 1846, followed in the main his father's example. Obligated to leave the city in 1848, he was restored by the Austrians in 1849; ten years later, on 20th August 1859, the representatives of the Modenesi, under the direction of Carlo Farini, declared their territory part of the kingdom of Italy, and their decision was confirmed by the plebiscite of 1860.

Natives of Modena are Fallopius the anatomist, Tarquinia Molza, Sadoletius, Sigonius, Tassoni, and Cavdoni the archaeologist; the names of Zaccaria, Tiraboschi, and Muratori are associated with its library. Tiraboschi's *Bibliotheca Modenensis*, 6 vols., contains an account of all the literary personages of the duchy.

See Vedriani, *Storia di Modena*, 1668; Tiraboschi, *Mem. storiche modenese*, 1793; Scharfberg, *Gesch. des Herzogth. Modena*, 1859; Oreste Nagli, *Modena descrittiva*, 1860; Baraldi, *Storia di Modena*; Valdrighi, *Diz. Storico, &c., delle contrade di Modena*, 1879-80; Crespellani, *Guida di Modena*, 1879; Galvani, *Mem. stor. intorno la vita di Francesco IV.*, 4 vols.

MODICA, a city of Italy, in the province of Syracuse in Sicily, 8 miles from the south coast, on the line of railway decreed in 1879 between Syracuse and Licata. It has increased its communal population from 30,547 in 1861 to 41,231 in 1881, and is a well-built and flourishing place. Of note among the public buildings are the old castle on the rock, the mediæval convent of the Franciscans, and the churches of S. Maria del Carmine (1150) and S. Maria di Betlem—this last containing ruins of the ancient temple destroyed by the earthquake of 1693. Modica is the point from which the remarkable prehistoric tomb and dwelling-caves of Val d'Ispica are usually visited. An early dependency of Syracuse Motvea or Mutyca was in Cicero's

days a fairly important municipium. In modern times it was held as a countship by the dukes of Alba. Placido Caraffa has written a prolix history of the city, which may be found in Grævius, *Theat. Ant. et Hist. Ital.*, vol. xii.

MOE, JÖRGEN ENGBRETSSEN (1813-1882), Norwegian poet and comparative mythologist, was born at Hole in Sigdal, Ringerike, Norway, on 22d April 1813, and entered the university of Christiania as a theological student at the age of seventeen. After leaving the university in 1839 he acted as tutor in various schools and families, and in 1845 was appointed professor of theology in the Military School of Norway, which post he held until 1853, when he became resident chaplain in his native parish of Sigdal. In 1863 he received the living of Bragernæs, Drammen; in 1870 that of Vest Aker, near Christiania; and in 1875 the bishopric of Christiansand, where he died on 27th March 1882.

Moe's first publication was a volume of Norse "songs, ballads, and staves," which appeared in 1840; it was followed in 1841 by the *Norske Folke-eventyr* (Norwegian Popular Tales), which he had collected along with his schoolfellow Asbjørnsen. The work excited such interest as a contribution to the study of comparative mythology that in 1847 he was sent by the Government through Thelemark and Sætersdal to increase his collection of stories. The second (enlarged) edition, with a preface by Moe, appeared in 1852. In 1851 his *I Brønden og i Tjernet* (In the Well and in the Tarn), a delightful collection of prose stories for children, appeared, and it was followed in 1859 by a volume of poems entitled *En liden Julegave* (A Little Christmas Present). In 1877 he prepared a collected edition of his works in two volumes, the stories he had published along with Asbjørnsen being excluded. Many of the *Folke-eventyr* (*Popular Tales from the Norse*) were translated by Sir George Dasent in 1859.

MŒSIA (in Greek Mysia, or, to distinguish it from the country of the same name in Asia, Mysia in Europe), in ancient geography the territory immediately to the south of the Danube corresponding in the main to Servia and Bulgaria. It became a Roman province between 27 B.C. and 6 A.D., probably about 16 B.C.¹ In the time of Tiberius and Caius the province was under the same governor with Macedonia and Achaia. It was divided by Domitian into two provinces, Mœsia Superior (Servia) and Mœsia Inferior (Bulgaria); and the same emperor completed the great military road along the line of the Danube, increased the strength of the Roman forces in the country, and, by the conquest of Dacia, saved it from the inroads by which it had been harassed from the time of Tiberius. The Goths invaded Mœsia in 250 A.D., and at last, in 395, a number of them, afterwards known as Mœsogoths, obtained permission to settle in the province. The Slavonians and Bulgarians appear in the 7th century.

The boundary between Upper and Lower Mœsia was not marked, as Ptolemy (iii. 9, 10) states, by the river Cæbrus or Ciâbrus (Cibritza or Zibru), but, as may be inferred from an inscription (6125. *C. Inscr. Lat.*, vol. iii. 2, *additamenta*), lay between Almaus (Lom) and Ratiaria (Archer). Upper Mœsia, or, as it was often called, Mœsia Prima, contained—Singidunum (Belgrade), headquarters of Legio IV. Flavia, and in the 3d century a colonia; Viminacium (Kostolatz), headquarters of Leg. VII. Claud., and designated sometimes municipium Ælium, but more usually colonia (a rank bestowed on it by Gordianus); Bononia (Widin); Ratiaria, which, on the loss of Dacia, became the headquarters of Leg. XIII. gemina, and remained a large town till it was destroyed by Attila; Remesiana (Mustapha Pasha Palanka), which has furnished inscriptions belonging to the unidentified Ulpiana; and Naissus (Nissa or Nish), the birthplace of Constantine the Great. Lower Mœsia (Mœsia Secunda) contained—Oescus (Colonia Ulpia, mod. Gigen), headquarters, after loss of Dacia, of Leg. V. Maced.; Nova (Sistova), at a late date a camp of Leg. I. Ital., and afterwards chief seat of Theodoric king of the Goths; Nicopolis ad Istrum (Nikup), really on the Iatrus or Yantra, a memorial of Trajan's victory over the Dacians; Pristra (Rustehuk), Asamus (Nicopolis on the Osma), Darostorum (Silistria), Odessus (Varna), Tomi (Kustendje), Troesmis (Iglitza).

See Roessler, *Romanische Studien*, 1871; Pfitzner, *Gesch. der Röm. Kaiserlegionen*, 1881, pp. 152-161; Hahn, in *Dkschr. K. Ak. der Wiss.*, Ph. H. Cl., Vienna, 1861, p. 223.

MOFFAT, a health resort of some note in Scotland, is situated in Upper Annandale, Dumfriesshire, occupying an

¹ See A. W. Zumpt, *Commentet. Epigraph.*, ii. 253 sqq.

agreeable position at the base of the Gallow Hill, 63 miles from Edinburgh, and 42 miles from Carlisle by railway. The Spa, which is $1\frac{1}{2}$ miles above the town (525 feet above sea-level), is sulphureous with some saline ingredients, and is used in gout, rheumatism, and dyspepsia. Population (1881) 2161; in the season about 4600.

MOFFAT, ROBERT, D.D. (1795-1883), African missionary, was born at Ormiston, Haddingtonshire, Scotland, on 21st December 1795, of humble parentage. Moffat learned the craft of gardening, but in 1814 offered himself to the London Missionary Society, who, in 1816, sent him out to South Africa. After spending a year in Namaqua Land, with the powerful and dreaded chief Africaner, whom he converted, Moffat returned to Cape Town in 1819, and married Miss Mary Smith, a remarkable woman and most helpful wife. In 1820 Moffat and his wife left the Cape and proceeded to Griqua Town, and ultimately settled at Kuruman, among the Bechuana tribes lying to the west of the Vaal river. Here he worked as a missionary till 1870, when he reluctantly returned finally to his native land. He made frequent journeys into the neighbouring regions, as far north as the Matabele country, to the south of the Zambesi. The results of these journeys he communicated to the Royal Geographical Society (*Jour. R. G. S.*, xxv. xxviii., and *Proc.* ii.), and when in England in 1842 he published his well-known *Missionary Labours and Scenes in South Africa*. Single-handed he translated the whole of the Bible into Bechuana. While solicitous to turn the people to Christian belief and practice, Moffat was perhaps the first to take a broad view of the missionary function, and to realize the importance of inducing the savage to adopt the arts of civilization. He himself was builder, carpenter, smith, gardener, farmer, all in one, and by precept and example he succeeded in turning a horde of bloodthirsty savages into a "people appreciating and cultivating the arts and habits of civilized life, with a written language of their own." Now we find more or less Christianized communities extending from Kuruman to near the Zambesi. Moffat met with incredible discouragement and dangers at first, which he overcame by his strong faith, determination, and genial humour. It was largely due to him that the work of Livingstone, his son-in-law, took the direction which it did. On his return to England, Moffat received a testimonial of about £6000. He died at Leigh, near Tunbridge Wells, 9th Aug. 1883.

See *Scenes and Services in South Africa, the Story of Moffat's Missionary Labours*, London, 1876; and publications of the London Missionary and the B. and F. Bible Societies.

MOGADOR, or SUERAH (Berber *Tasurt*), the most southern seaport town on the Atlantic coast of Morocco, and the capital of the province of Haha, stands from 10 to 20 feet above high water on a projecting ridge of calcareous sandstone in $31^{\circ} 30'$ N. lat. and $10^{\circ} 44'$ W. long. In certain states of wind and sea it is turned almost into an island, and a sea-wall protects the road to Saffi. The streets are regular and, for a Moorish town, broad and clean. Within the walls there are three distinct divisions: the citadels old and new with the government buildings; to the north-west the outer town with its spacious markets in the centre; and at the north-west corner the Mellah, or Jews' quarter. In the citadels the houses are fairly good, and considerable attention is paid to sanitary matters. Water is brought from the Kseb, about $1\frac{1}{2}$ miles to the south, by an aqueduct. The prosperity of Mogador is due to its commerce; only a few gardens break the barrenness of the immediate vicinity. The harbour or roadstead, though apparently protected by the island and quarantine station of Mogador, is extremely dangerous during west and south-west winds. Trade is carried on mainly with Marseilles, London, Gibraltar, and the Canaries,—the prin-

cipal exports being almonds, goat-skins, gums, olive oil, and ostrich feathers, and the principal imports cotton goods (half of the total) and tea. The average value of the exports for the five years 1877-1881 was about £210,000, the imports rather less. Attention has been frequently directed to the value of Mogador as a health resort, especially for consumptive patients. The climate is remarkably steady: mean temperature of the hottest month $71^{\circ} 06'$, of coldest month $58^{\circ} 69'$. The annual rainfall is only 10 or 12 inches, and the rainy days of winter and spring about 28. The sirocco is but rarely felt. The population is about 15,000 (7000 Jews, about 150 foreigners). Jews, Protestants, and Roman Catholics have religious edifices in the town.

A place called Mogador is marked in the 1351 Portulan of the Laurentian Library, and the map in Hondius's *Atlas Minor* shows the island of Mogador *I. Domogador*; but the origin of the present town is much more recent. Mogador was founded by Sultan Mohammed, and completed in 1770. The town received from the Moors the name of Suerah (little picture), while the Portuguese called it after the shrine of Sidi Mogadul, which lies towards the south half-way to the village of Diabat, and forms a striking landmark for seamen. In 1844 the citadel was bombarded by the French.

MOGHILEFF, a north-western government or province of the Russian empire, situated on the upper Dnieper, between the provinces of Vitebsk and Smolensk on the north and east, Tchernigoff and Minsk on the south and west. In the north it is occupied by the watershed which separates the basins of the Dwina and the Dnieper, an undulating tract from 650 to 900 feet above the sea-level, and covered nearly everywhere with forests. This watershed slopes gently to the south, that is, to the valley of the Dnieper, which enters the province from the north-east and flows west and afterwards due south. The southern part of the province is flat and has much in common with the Polyesie of the province of Minsk; it is, however, more habitable, the marshes being less extensive.

The province is covered by the Tertiary formation; Devonian sandstone appears in the north, and Carboniferous limestones in the east. The soil is mostly sand, clay (brick-clay and potter's-clay are not uncommon), and peat-bogs, with a few patches of "black-earth." The climate is rude and wet, the average yearly temperature at the Gorki meteorological observatory being $40^{\circ} 4$ Fahr. ($14^{\circ} 2$ in January, and $63^{\circ} 8$ in July); cold nights in summer are the cause of bad crops. The province has about 1,140,000 inhabitants (947,625 in 1870), mostly White-Russians (78 per cent.), belonging to the Greek Church; Jews are numerous (16 per cent.); Poles, belonging mostly to the nobility, make only 3 per cent. of the population. Agriculture is the chief occupation; nearly one half (46 per cent.) of the surface of the province is under crop; but, except after unusually good harvests, corn is imported, chiefly by the navigable channels of the Dnieper and Sozh. There are many distilleries on the estates of landowners, and wine-spirit is exported. The hemp culture is important; hemp and hemp-seed oil are exported to Riga. The province has one large paper-mill, a few iron and copper works, and minor manufactures.

The province of Moghileff is divided into eleven districts, with the chief towns: Moghileff (40,500 inhabitants), Chausy (4200), Tcherikoff (3900), Gomel (18,030), Gorki, formerly the seat of an agricultural institute (5050), Klimovichi (4000), Mstislavl (6700), Orsha (5350), Rogacheff (7750), Staryi Bykhoff (5200), and Syenno (2550). Of about 80 other municipal towns, we name Shkloff (13,000 inhabitants), Dubrovka (7000), Krichiff (4000).

This province was inhabited in the 10th century by the Krivichi and Radimichi. In the 14th century it became part of Lithuania and afterwards of Poland. Russia annexed it in 1772.

MOGHILEFF ON THE DNEPER, a town of Russia, capital of the province of same name. It is situated on both banks of the Dnieper, 40 miles south of the Orsha station of the railway between Moscow and Warsaw. A railway along the Dnieper will soon bring Moghileff into railway communication with these capitals.

Moghileff is mentioned for the first time in the 14th century as a dependency of the Vitebsk, or of the Mstislavl principality. At the beginning of the 15th century it became the personal property of the Polish kings. But it was continually plundered—either by Russians, who attacked it six times during the 16th century, or by Cossacks, who plundered it three times. In the 17th century its inhabitants who belonged to the Greek Church suffered much from the persecutions of the Union. In 1634

It surrendered to Russia, but in 1661 the Russian garrison was massacred by the inhabitants. In the 18th century it was taken several times by Russians and by Swedes, and in 1708 Peter I. ordered it to be destroyed by fire. It was annexed to Russia in 1772. Of 40,500 inhabitants two-thirds are Jews and the remainder White-Russians, with a few Poles (2500). Its manufactures are without importance; but one branch of trade, namely, the preparation of skins, has maintained itself for many centuries. The commerce is mostly in the hands of Jews: corn, salt, sugar, and fish are brought from the south, whilst skins and manufactured ware imported from Germany (partly by smugglers) are sent to the southern provinces.

MOGHILEFF ON THE DNIESTER (*Mohilow*), a district town of Russia, situated in the province of Podolia, on the left bank of the Dniester, 87 miles east-south-east of Kamenets-Podolsk, and 43 miles from the Zhmerinka railway junction. It has 18,200 inhabitants, nearly one-half of whom are Jews; the remainder are Little Russians, Poles (1500), and a few Armenians. The Little-Russian inhabitants of Moghileff carry on agriculture, gardening, wine, and mulberry culture. The Jews and Armenians are engaged in a brisk trade with Odessa, to which they send corn, wine, spirits, and timber, floated down from Galicia, as well as with the interior, to which they send manufactured wares imported from Austria.

Moghileff, named in honour of the Moldavian hospodar Mohila, was founded by Count Potocki about the end of the 16th century. Owing to its situation on the highway from Moldavia to the Ukraine, at the passage across the Dnieper, it developed rapidly. For more than 150 years it was disputed by the Cossacks, the Poles, and the Turks. It remained in the hands of the Poles, and was annexed to Russia in 1795. The Crown purchased it from Count Potocki in 1806.

MOGILAS, PETRUS (c. 1600-1647), metropolitan of Kieff from 1632, belonged to a noble Wallachian family, and was born about the year 1600. He studied for some time at the university of Paris, and first became a monk in 1625. He was the author of a *Catechism* (Kieff, 1645) and other minor works, but is principally celebrated for the *Orthodox Confession*, drawn up at his instance by the abbot Koslowski of Kieff, approved at a provincial synod in 1640, and accepted by the patriarchs of Constantinople, Jerusalem, Alexandria, and Antioch in 1642-3, and by the synod of Jerusalem in 1672. See GREEK CHURCH, vol. xi. p. 158.

There are numerous editions of the *Confession* in Russian; it has been edited in Greek and Latin by Panagiotis (Amsterdam, 1662), by Hofmann (Leipsic, 1695), and by Kimmel (Jena, 1843), and there is a German translation by Frisch (Frankfort, 1727).

MOGUL, or MUGHAL, *مغول*, the Arabic and Persian form of the word Mongol, usually applied to the Mongol empire in India. See INDIA, vol. xii. p. 793 *sqq.*

MOHÁCS, a market town in the Trans-Danubian county of Baranya, Hungary, stands on the right bank of the west arm of the Danube, 25 miles east-south-east of Pécs (Fünfkirchen), with which it is connected by railway, 45° 58' N. lat., 18° 37' E. long. At Mohács there are several churches and schools belonging both to the Roman Catholics and the Calvinists, also the summer palace of the bishop of Pécs, a monastery, an old castle, and a station for steamers plying on the Danube, by which means a considerable commerce in wine and the agricultural produce of the neighbourhood is carried on with Budapest and Vienna. Not far from Mohács are coal mines, and the town is an important coal dépôt of the Danubian Steam Navigation Company. The population in 1880 was 12,047 (Magyars, Serbs, and Germans).

Two great battles fought in the vicinity of the town mark the commencement and close of the Turkish dominion in Hungary. In the first, 29th August 1526, the Hungarian army under Louis II. was annihilated by the Ottoman forces led by Soliman the Magnificent (see vol. xii. p. 369). In the second, 12th August 1687, the Austrians under Charles of Lorraine gained a great and decisive victory over the Turks, whose power was afterwards still further broken by Prince Eugene of Savoy.

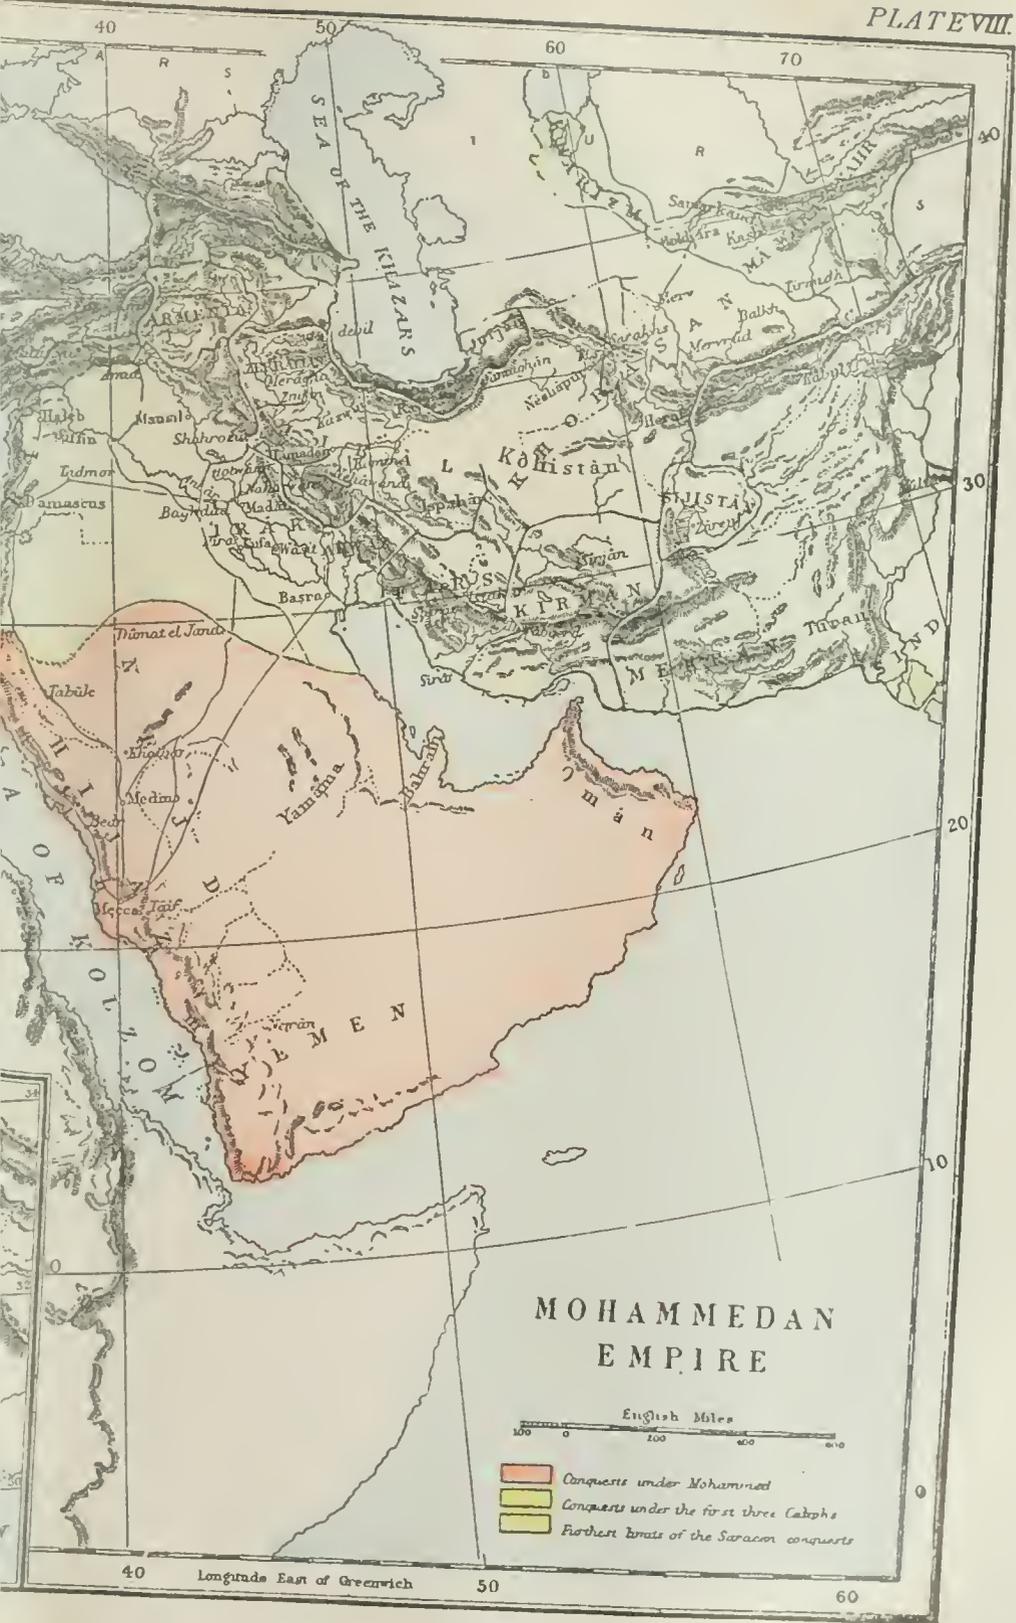

MOHAIR is the woolly hair of a variety of the common or domestic goat inhabiting the regions of Asiatic Turkey, of which Angora is the centre, whence the animal is known as the Angora Goat (see GOAT, vol. x. p. 708). Goat's hair has been known and used as a textile material in the East from the most remote periods; but neither the Angora goat nor its wool was known in Western Europe till, in 1655, the animal was described by the naturalist Tournefort. That textures of mohair were in use in England early in the 18th century is obvious from Pope's allusion:—

"And, when she sees her friend in deep despair,
Observes how much a chintz exceeds mohair."

Owing, however, to the jealous restrictions of the Turkish power, it was not till 1820 that mohair became a regular article of import into the United Kingdom. In that year a few bales came into the market; but so little was the material appreciated that it only realized 10d. per lb. In 1870 average mohair fleece was selling at five times that price. From the small beginning of 1820 the imports gradually waxed, and the trade received a very considerable impetus through the introduction in 1836, by Titus Salt, of the analogous fibre alpaca. The increasing demand for and value of mohair early stimulated endeavours to acclimatize the Angora goat in other regions; but all European attempts have failed, owing to humid and ungenial climates. In 1849 a flock was taken by Dr J. P. Davis to the United States of America, and since that time many fresh drafts have been obtained and distributed to Virginia and various Southern States, and to California and Oregon in the west. In these high and dry regions the goats thrive; and the flocks in the Western States now number many thousands. The Angora goat has also been introduced into the Cape of Good Hope with much success. The first importation of mohair from the Cape, made in 1862, amounted to 1036 lb; and now about one-tenth of the total British supply is received from that source. Mohair has also been received in England from goats reared successfully in Fiji, where they were first introduced in 1874, and there are also thriving flocks in Australia.

The trade in mohair between Asia Minor and western Europe is controlled in Constantinople. There upwards of twenty varieties of fleeces are distinguished according to the localities of their production, the richest and most lustrous qualities being produced in hilly and forest regions, while the fleeces from the open plains are comparatively kempy, coarse, and cottony. From the Lake Van district on the eastern borders of Asiatic Turkey a distinct and inferior variety of wool is obtained. It is known in commerce as Van mohair, and consists, to the extent of about 70 per cent., of white wool slightly streaked with black, with 30 per cent. of coloured red and black wool. At Konieh in the south, also, an inferior mohair known as Pelotons is produced, 80 per cent. of which is black and red, and the remainder white. The average weight of an Angora goat fleece is from 5 to 6 lb. The finest quality of wool is obtained from the first clip, which is made in the second year of the animal. She-goats yield the best wool, after which come wethers, while the rams give the coarsest fleeces. Angora mohair is a brilliant white lustrous fibre, elastic and wiry in character, and devoid of felting properties. It attains the length of four or five inches, but the long fibre is mixed with an undergrowth of shorter wool, which in the spinning process is combed out as 'noils' for separate use. It is a material of enormous durability, and, owing to its remarkable elasticity, it is especially fitted for working into long piled fabrics, such as plush and imitation furs, or for use in braids and bindings, and in boot and other laces. It is largely used for making Utrecht velvet or furniture plush for the upholstery of railway carriages, &c., a trade centred at Amiens. In the making of imitation seal-skins, and imitation beaver, otter, chinchilla, and other furs, and for carriage rugs generally, mohair is extensively employed. Many dress fabrics of mixed mohair and alpaca, cotton, or silk are also manufactured; but with changes in fashion such materials are constantly changing in style, composition, and name. Mohair is also used for making certain qualities of lace, and an imitation of ostrich feathers for use as trimming has been made from the fibre. The imports of mohair into the United Kingdom during 1882 amounted to 16,859,771 lb, valued at £1,433,584, a quantity largely in excess of the imports of any previous year.

M O H A M M E D A N I S M

UNDER this head is given the history of Mohammed and his successors to the fall of the Eastern Caliphate, with a sketch of the institutions and civilization of the Moslem empire and an account of the Koran. The later history

must be sought under the names of individual countries and dynasties. What falls to be said of the social and religious aspects of Islam in modern times will be given under the two great divisions of SUNNITES and SHĪTES.

PART I.—MOHAMMED AND THE FIRST FOUR CALIPHS.

MOHAMMED¹ or MĀHOMET, the founder of Islam, first appears in the full light of history with his Flight to Medina (The Hijra), A.D. 622; and this date, not that of his birth, has been fittingly chosen as the epoch of the Moslem Era. The best-attested tradition² places his first appearance as a prophet in Mecca some twelve years earlier (*circa* 610). He was then forty years old: the forty must be taken as a round number, but as such is doubtless trustworthy. Thus the birth of Mohammed falls about 570 A.D.: it is said to have fallen in the year when Abrahā, the Abyssinian viceroy of Yemen, made the expedition against Mecca, mentioned in the Koran, when the Arabs first saw the elephant and first suffered from smallpox.³

At the time of Mohammed's birth and youth nothing seemed less likely than that the Arabs should presently make their triumphal entrance into the history of the world as victors over the Greeks and Persians. Nowhere in the Peninsula was there an independent state of any considerable power and importance. At the beginning of the 6th century indeed the princes of Kinda had attempted to form a national kingdom, uniting in particular the tribes of central Arabia; but this kingdom was nothing more than an epic prelude to the true history of the Arabs, which begins with Islam. After the fall of the Kindite dynasty, the old anarchy reigned again among the nomads of the Nejd and the Hijáz; in all other quarters Greek or Persian influence predominated, extending from the frontier deep into the interior by the aid of two vassal states—the kingdom of the Ghassanids in the Haurán under Greek suzerainty, and that of the Lakhmids in Hira and Anbár under the Persian empire. The antagonism between Byzantium and Ctesiphon was reflected in the feuds of these Arab lordships; but indeed the rivalry of Greek and Persian exercised its influence even on the distant South of the Peninsula. Urged on by the Greeks, the Abyssinians had overthrown the Christian-hating realm of the Himyarites, the sunken remnant of the ancient might of the Sabæans (A.D. 526), the Persians had helped a native prince again to expel the Christians (*circa* 570), and since then the Persians had retained a footing in the land. Toward the close of the 6th century, their direct and indirect influence

in Arabia greatly surpassed that of the Greeks; and since the Kindites had fallen before the kings of Hira, it extended right through the Nejd into Yemen.⁴

In the Hijáz and western Nejd, the district from which Islam and the Arab empire took their beginning, Greeks and Persians, Ghassanids and Lakhmids, had not much influence; the nomad tribes, and the few urban commonwealths that existed there, lived free from foreign interference, after the manner of their fathers. Mohammed's city was Mecca, where the Banú Kinána had formed a settlement round the Ka'ba, the sanctuary of a number of confederate tribes (Aḥābish) belonging to that district. The feast annually observed in the days before the full moon of the month Dhú'l-Hijja at Mecca and at 'Arafa and Kezah in the vicinity, presented strong attractions for all inhabitants of the Hijáz, and grew into a great fair, at which the Meccans sold to the Bedouins the goods they imported from Syria. Feast and fair gave the city the prosperity which it shared with other cities which, like Mecca, had the advantage of lying near the meeting-place of the two great natural roads to Yemen—that from the north-west along the Red Sea coast, and that from the north-east following the line of the mountains that traverse the Nejd.⁵

By their trading journeys the Korāish⁶ had acquired a knowledge of the world, especially of the Græco-Syrian world: the relative superiority of their culture raised them not only above the Bedouins, but above the agricultural population of such a city as Medina; the art of reading and writing was pretty widely diffused among them. The Korāish within the city were the Banú Ka'b ibn Loay, those in the surrounding country Banú 'Amir ibn Loay; the townsmen proper were again subdivided into Moṭayyabūn and Ahlāf—the latter were the new citizens, who were distinguished from the old settlers by the same name in other Arabian towns, as in Táif and Hira. The community was a mere confederation of neighbouring septs, each occupying its own quarter; there was no magistracy, the town as such had no authority. All political action centred in the several septs and their heads; if they held together against outsiders, this was due to interest and a sense of honour, a voluntary union strengthened by the presence of public opinion. In the time of Mohammed, the most numerous and wealthy sept was that of the Banú Makhzúm; but that of the Banú 'Abdshams was the most distinguished. The Banú Omayya were the most powerful house of 'Abdshams; their head, Abú Sofyán ibn Ḥarb, exercised a decisive influence in the concerns of the whole community. Mohammed himself was of the Banú Hashim; it is affirmed that these had formerly enjoyed and claimed of right the position actually enjoyed by the Banú Omayya, but this assertion seems to have had its origin in the claims to the Caliphate which the Hashimites (the house of 'Alí and the 'Abbāsids) subsequently set up against the Omayyads.⁷

¹ The name Mohammad means in Arabic "the praised," and it has been supposed that this epithet was conferred on the Prophet after his mission to mark him out as the promised Paraclete. This, however, is incorrect (Nöldeke, *Gesch. d. Qorans* [Gott. 1860], p. 6, note 2; Sprenger, *Leben und Lehre des M.*, i. 155 sq.). The name is found, although it was not common, among the heathen Arabs. Renan has shown it to occur on a Greek inscription of the early part of the 2d century of the Christian era (Boeckh, *C. I. G.*, 4500), and Mohammed ibn Maslama of Medina, a contemporary of the Prophet, bore it as his original name, as appears from the fact that his brother was called Mahmúd, it being a favourite practice to give to brothers variations of the same name, as Anas and Múnis, Sahl and Sohail, Monabbih and Nobaih (Sprenger, i. 158, note 2). That Mohammed calls himself Ahmad, in sur. lxi. 6, in order to adapt his name to a supposed prophecy, proves nothing; on the other hand, the men of Mecca, on occasion of a treaty with the Moslems, demanded that the Prophet should not call himself messenger of God; but Mohammed ibn 'Abdalláh, using his old familiar name; see J. Wellhausen, *Ver'di's Kitáb al-Maghazi in verkürzter deutscher Wiedergabe* (Berl. 1882), p. 257.

⁴ On the state of Arabia before Islam see Caussin de Perceval, *Essai sur l'histoire des Arabes*, vol. ii.; Muir, *Life of Mah.*, vol. i.

⁵ Marr al-Zahrán, near Mecca, is accordingly said to have been the point at which the great emigration of tribes from Yemen parted into two streams, moving north-west and north-east respectively.

⁶ The Korāish were the branch of Kinána settled in and about Mecca. They are called also Ghálīb and Fihr, but the last name is particularly applied to those of the Korāish who did not live within the town.

⁷ Sprenger, vol. iii. p. cxx. sq.

Mohammed's father, 'Abdalláh b. 'Abdalmottalib, did not live to see the son's birth, and his mother Ámina died while he was still a child. Mohammed was then cared for first by his grandfather, 'Abdalmottalib, and after his death by his oldest paternal uncle, Abú Tálíb b. 'Abdalmottalib. He was kindly treated, but shared the hardships of a numerous and very poor family; he herded sheep and gathered wild berries in the desert. This is all that we know of his youth (sur. xciii. 6), all else is legend, containing at most an occasional fragment of truth.¹

It was, we are told, in his twenty-fifth year that Mohammed, on the recommendation of his uncle, entered the house and business of a wealthy widow named Khadjá. For her he made commercial journeys, thus learning to know part of Palestine and Syria, and perhaps receiving impressions which fructified in his soul.² By and by he married the widow, who was much his senior; he was a shrewd man, with prepossessing countenance, fair of skin, and black-haired. The marriage was happy, and blessed with several children. The two sons, however, died young; from the elder the father received the surname Abú 'l-Kásim. The most famous of the daughters was Fátima, who married her father's cousin, 'Alí b. Abí Tálíb.

During his married life with Khadjá, Mohammed came in contact with a religious movement which had laid hold on some thoughtful minds in Medina, Mecca, and Táif. In Mecca, as elsewhere, Arabian heathenism was a traditional form of worship, chiefly concentrated in great feasts at the holy places; it was clung to because it had come down from the fathers. The gods were many; their importance was not due to the attributes ascribed to them, but to their connection with special circles in which they were worshipped. They were the patrons of septs³ and tribes, and symbolized, so to speak, the holy unity which united the present and past members of these. Above them all stood Alláh, the highest and universal God.⁴ By him the holiest oaths were sworn; in his name (*Bismika Alláhummi*) treaties and covenants were sealed; the lower gods were not fit to be invoked in such cases, as they belonged to one party instead of standing over both. The enemy was reminded of Alláh to deter him from inhuman outrage; enemy of Alláh ('aduw Alláh, θεοστρυγής) was the name of opprobrium for a villain. But, since Alláh ruled over all

and imposed duties on all, it was not thought that one could enter into special relations with him. In worship he had the last place, those gods being preferred who represented the interests of a specific circle, and fulfilled the private desires of their worshippers.⁵ Neither the fear of Alláh, however, nor reverence for the gods had much influence. The chief practical consequence of the great feasts was the observance of a truce in the holy months, and this in course of time had become mainly an affair of pure practical convenience. In general, the disposition of the heathen Arabs, if it is at all truly reflected in their poetry, was profane in an unusual degree. Wine, the chase, gaming, and love on the one side; vengeance, feuds, robbery, and glory on the other, occupy all the thoughts of the old poets. Their motives to noble deeds are honour and family feeling; they hardly name the gods, much less feel any need of them. The man sets all his trust on himself: he rides alone through the desert, his sword helps him in danger, no God stands by him, he commends his soul to no saint. His reckless egoism may expand to noble self-sacrifice for the family and the tribe; but in this heroism religious impulses have no part, there is nothing mystical in these hard, clear, and yet so passionate natures. The only vein of what can in any sense be called religious feeling appears when the volcano has burned itself out and the storm of life is over; then, it may be, a wail is heard over the vanity of all the restless activity that is now spent.⁶ It is very possible that religion meant more to the sedentary Arabs than to the nomads, to whom almost all the ancient poetry belongs; but the difference cannot have been great. The ancient inhabitants of Mecca practised piety essentially as a trade, just as they do now; their trade depended on the feast, and its fair on the inviolability of the Haram and on the truce of the holy months.⁷

The religion of the Arabs before Mohammed was de-Thcrepit and effete.⁸ Many anecdotes and verses prove that ^{Hanif}indifference and scoffing neglect of the gods was nothing uncommon. The need for a substitute for the lost religion was not very widely felt. But there were individuals who were not content with a negation, and sought a better religion. Such were Omayya b. Abí 'l-Salt in Táif, Zaid b. 'Amr in Mecca, Abú Kais b. Abí Anas, and Abú 'Amir in Medina.⁹ They were called Hanifs, probably meaning

¹ The tradition relates that as an infant Mohammed was entrusted to a Bedouin foster-mother, Halima, who brought him up among her people, the Banú Sa'd b. Laith. Sprenger (i. 162 sq.) will have it that this precise statement is also a fiction; but he is probably wrong. It can hardly be disputed that Bedouin women were accustomed to suckle the children of townfolk for wages, and Mohammed's "milk-kinship" with the Banú Sa'd b. Laith is confirmed by what happened at and after the battle of Hionain. A nephew of Mohammed was also brought up among the Sa'd. Comp. *Vakidi*, *ut supra*, pp. 364, 377 sq., 431, note 1.

² He saw the mute witnesses of divine judgment, the rock-dwellings of Híjr and the Dead Sea; perhaps, too, he was impressed by the figure of some venerable monk (Bahira legends). Comp. Ibn Hishám, p. 115 sq.; Sprenger, i. p. 178 sqq.

³ *Vakidi*, p. 350: Idols were found in every house, and homage was paid to them when men went out or in to gain their blessing. Abú Bajrát made and sold them; there was a lively trade in idols with the Bedouins.

⁴ The particular gods are said to have been regarded as children of Alláh (בני אלהים). From sur. liii. 21, xxxvii. 149, it appears that the Meccans called their goddesses daughters of Alláh; perhaps it was their disputes with Mohammed that forced them to this view. At first, certainly, al-Lát and al-'Ozzá were names of the wife of the supreme god; sexual dualism dominated in the oldest Arab idea of the godhead. It was Mohammed who first reduced the gods to Jinns—i. e. to subordinate demons and kobolds—as he did not deny their existence, but only stripped off their divinity. To say that the oldest Arabs worshipped Jinns is as unreasonable as to say that they worshipped the devil; for Islam degraded the gods to Shaitáns as well as to Jinns. Superstition certainly played its part among the Arabs, but superstition is not religion.

⁵ *Vakidi*, pp. 368, note 1, 370, note 1; Sprenger, iii. 457 sq., 512.

Whether the feast at Mecca was celebrated in honour of Alláh before Mohammed, is very doubtful. It would seem that Hobal was worshipped in the Ka'ba (Ibn Hishám, p. 97 sq.), and Kozah in Mazdalifa (*Vakidi*, p. 428); it is possible, however, that Alláh stood to Hobal among the Arabs as El to Jahwé among the Hebrews. Ritual sacrifices were generally presented to a god who had a proper name; but the trace of a religious rite which still survived in the ordinary killing of beasts for food, possibly consisted even before Mohammed in the invocation of the name of Alláh (Sprenger, ii. 478, note 1; but comp. *Vakidi*, p. 160, note 1, p. 155).

⁶ "We hasten towards an unknown goal, and forget it in eating and drinking. We are sparrows and flies and worms, but more daring than famishing wolves. . . . My roots reach down to the depths of the earth; but this Death spoils me of my youth, and of my soul he spoils me and of my body, and right soon he lays me in the dust. I have urged my camel through every desert, wide-stretching and shimmering with mirage; and I have ridden in the devouring host, reaching after the honours of greedy perils, and I joined in the fray under every sky till I longed for the home-coming instead of booty. But can I, after Harith's death, and after the death of Hojr, the noble host—can I hope for a softer lot from the change of time, which does not forget the hard mountains? I know that I must soon be transfixed by his talon and tooth as befell my father and my grandaie, not to forget him that was slain at Koláb."—Amraalkais, ed. Siane, No. 10, p. 33; ed. Ahlwardt, No. 5.

"penitents", men who strive to free themselves from sin.¹ They did not constitute a regular sect, and had in fact no fixed and organized views. They had, no doubt, intercourse with one another, but were not a close society; they thought more of their own souls than of propaganda; only in Medina they seem to have been more numerous. They rejected polytheism and acknowledged Alláh, but not so much on intellectual grounds as on grounds of conscience. Faith in the one God was with them identical with pious resignation (*Islám*) to his will; their monotheism was most closely allied to the sense of responsibility and of a coming judgment; it stood opposed to the worldly ideas of the idolaters, and was an impulse to upright and sin-avoiding walk. They were not theorists, but ascetics. It was the primitive ideas of Law and Gospel ("the religion of Abraham") that lived again in them. They felt on the whole less attracted towards the developed forms of the religion of revelation; they rather sought after some new form; few of them attached themselves to existing religious communities.

Mohammed, it would appear, came into connexion with these Hanífs through a cousin of his wife, Waraka b. Naufal, who was one of them. Their doctrines found a fruitful soil in his heart; he was seized with a profound sense of dependence on the omnipresent and omnipotent Lord, and of responsibility towards him. Following the example of old Zaid b. 'Amr, he now frequently withdrew for considerable periods to the solitude of the bare and desolate Mount Hírá, and meditated there with prayer and ascetic exercises. For years, perhaps, he went on in these purely individual exercises, without anything to distinguish him essentially from the others who held similar views. But in him the Hanífite ideas lodged themselves in a natural temperament which had a sickly tendency to excitement and vision, and so produced a fermentation that ended in an explosion.² Thus he became a prophet; he felt himself constrained to leave the silent circle of ascetics and make a propaganda for the truth. In this resolve he was unquestionably influenced by what he knew of the example of the Biblical prophets, perhaps also by the circumstance that a longing after a new founder of religion was diffused among the Hanífs, and found support in some dim acquaintance with the Messianic hopes of the Jews.

That Mohammed did not independently produce his own ideas is indisputable; nor is it to be doubted that he derived them from the Hanífs. But what was the ultimate source of these first motions towards Islam? In general they are ascribed to a Jewish source. Jews were very numerous in Hijáz and Yemen, and had perfectly free intercourse with the Arabs, to whom they undoubtedly imparted a quantity of Biblical and religious material. Mohammed in particular was indebted to the Jews for almost all the stories and a great part of the laws of the Koran (laws of marriage, purity, etc.), and the theological language of Islam is full of Jewish words. But the original and productive forces of Islam did not spring from Judaism, least of all the ideas of the Judgment and of the inexorable demands set before the creature by his Creator,

¹ Sprenger (p. 38 sq.) connects Haníf with ٱنڤف, and expounds it per antiphrasin as *lucus a non lucendo*, on the ingenious fashion of A. Geiger. As *tahannuth* = *tahannuf* is the technical name of such solitary ascetic practices as Mohammed himself engaged in before his call, Haníf may be taken to mean a *mutahannif* by profession. The connexion between *hanif* and *tahannuf* is certain, and it seems equally certain that *tahannuf* as an equivalent of *tahannuth* comes not from *hanif* but from *hinif* (for *hinif*), and means not to play the Haníf but to concern oneself with one's sin, to purge oneself of it.

² It is disputed whether Mohammed was epileptic, cataleptic, hysteric, or what not; Sprenger seems to think that the answer to this medical question is the key to the whole problem of Islam. It is certain that he had a tendency to see visions, and suffered from fits which threw him for a time into a swoon, without loss of inner consciousness.

which are so dominant in the older sūras. A distinction must be drawn between the primitive impulses and the material added later; Mohammed did not get his heaven from the Jews, they only supplied him afterwards with meal. Neither in truth can Christianity be viewed as the proper source of Islam—Christianity, that is, in any of its great historical developments. The Arabs knew Greek, Syrian, and Abyssinian-Himyaritic churches; manifold influences from these doubtless reached Islam, but in none of them did the idea of Judgment still stand as the central point of religion; the living sense of divine reality ruling over the life was half extinguished by the developments of theology. But in the Syro-Babylonian desert, off the line of the church's main advance, primitive forms of Christianity, perhaps also of Essenism, still survived, which the course of church history had left untouched. To these belong on the one hand the Sabians ("Baptists," from ٱبٱٱ), on the other the numerous anchorites of these regions. The connection of Islam with the Sabians appears from the fact that in Mecca and Táif its adherents were simply known as Sabians.³ From them, however, were derived, it would seem, for the most part only externals, though the importance of these must on no account be undervalued. The deepest influence exercised on the Hanífs, and through them on the Prophet, appears to have come from the anchorite ascetics. How popular they were with the Arabs, appears from the Bedouin poetry; what power they exercised over the minds even of the heathen, is proved by various episodes in the history of Ghassán and Hírá; how well the Arabs knew the difference between them and the shaven clergy, is seen in the instructions of Abúbekr to the commanders in the Syrian campaigns. It was not their doctrine that proved impressive, but the genuine earnestness of their consecrated life, spent in preparation for the life to come, for the day of judgment, and forming the sharpest contrast to the profanity of heathenism. Asceticism and meditation were the chief points with the Hanífs also, and they are sometimes called by the same name with the Christian monks.⁴ It can hardly be wrong to conclude that these nameless witnesses of the Gospel, unmentioned in church history, scattered the seed from which sprang the germ of Islam.

The tradition gives a telling story of the way in which Mohammed at length came to proclaim openly what had long been living and working within him; in other words, how he became a prophet. Once, in the month of Ramadan, while he repeated his pious exercises and meditations on Mount Hírá, the angel Gabriel came to him by night as he slept, held a silken scroll before him and compelled him, though he could not read, to recite what stood written on it.⁵ This was the first descent of a passage of the heavenly book, the source of revelation from which Moses and Jesus and all prophets had drawn; and so Mohammed was called to be a prophet. The words with which Gabriel had summoned him to read, remained graven on his heart. They were the beginning of sur. xcvi.—

³ Ibn Hishám (p. 835) relates that the Banú Jadhíma announced their conversion to Islam to Khálid in the words, "We are become Sabians." Renan, *Études d'histoire rel.* (1863), p. 257, misunderstands this utterance.

⁴ Abú 'Amir is as often called Ráhib as Haníf. All the accounts indicate that the Hanífs stood nearer to Christianity than to Judaism, not only in Táif but elsewhere. Interesting in the highest degree is a verse ascribed to Sakir al-Ghay in the *Hodhailian Poems*, ed. Kosegarten 18, 11. A thundercloud is there described, the centre of which is an impenetrable mass; only on the outer fringe a restless motion is discernible. "Its fringes on the mountain-ridge (al-Malá) are like Christians celebrating a banquet when they have found a Haníf (and so run to and fro in the restlessness of glad excitement)."

⁵ Of course any one can read in a vision. The question discussed even by Moslems, as to whether the Prophet could read or not, has at least no place in this connexion.

"Read! in the name of thy Lord, who created, created man from a drop. Read! for thy Lord is the Most High who hath taught by the pen, hath taught to man what he knew not. Nay truly man walketh in delusion, when he deems that he suffices for himself; to thy Lord they must all return."

What is here recorded is the commencement, not of Mohammed's knowledge, but of his prophesying. That the latter was due to a vision experienced by him on a night of the month Ramaḍān (sur. xvii. 1, ii. 18F) is certain, and it is at least very possible that the form of the vision was governed by the traditional conception of revelation and prophecy which Mohammed had learned to accept.¹ It is, of course, uncertain whether the words in which the angel called the Prophet are really contained in sur. xvi. Certainly this sūra is very early, and its contents are, indeed, the best expression of the original ideas of Islam. Man lives on content with himself, but he must one day return to his Creator and Lord, and give account to him. This is in a sense the material principle of the oldest faith of Islam; the formal principle is the very prominent doctrine of revelation in writing copied from the heavenly book.

When the angel left him—so the tradition runs on—Mohammed came to Khadija and recounted the occurrence to her in much distress; he thought that he was possessed. She however comforted him, and confirmed him in the belief that he had received a revelation and was called as a messenger of God. Yet his doubts returned, when there ensued a break in the revelation, and they reached a distressing height. He was often on the point of seeking death by casting himself down from Mount Hira'. It is usually assumed that this state of anguish lasted from two to three years. Then the angel is said to have suddenly appeared a second time; he came to Khadija in great excitement and said: "Wrap me up! wrap me up!" This, it must be explained, was done when he fell into one of his swoons; and on this occasion, as often thereafter, the revelation came during an attack. Then was sent down sūra lxxiv. beginning with the address—"O thou enveloped one!" Henceforth there was no interruption and no doubt; the revelations followed without break, and the Prophet was assured of his vocation.

That Mohammed did pass through many doubts and much distress before he reached this assurance, may well be believed (sur. xciii. 3); but the systematic development of the doctrine of the *fatra*, or interval of from two to three years between the first and second revelation, belongs to a later stage of tradition. It appears that it was devised to dispose of the controversy whether Mohammed lived as a prophet in Mecca for ten or for twelve years; perhaps, too, it was desired to solve another difficulty—viz., whether sur. xvii. or sur. lxxiv. was the beginning of the revelation—in a sense that should do some justice to the rival claims of each.² The tradition may also have been influenced by the circumstance that Mohammed, in the first three years of his mission, did not appear as a public preacher,³ but only sought recruits for his own cause and the cause of Allāh in private circles. First, he gained the inmates of his own house,—his wife Khadija, his freed-

man Zaid b. Haritha, his cousin 'Alī (of whose nurture he had relieved Abū Ṭālib, a poor man with many children), and finally his dearest friend Abūbekr b. Abī Ḳoḥāfa. The last named won for him several other adherents: 'Othmān b. 'Affān, Zobair b. al-'Awwām, 'Abd al-Rahmān b. 'Auf, Sa'd b. Abī Waḳḳās, Talha b. 'Obaid Allāh, all names of note in the subsequent history of Islam. Soon there was a little community formed, whose members united in common exercises of prayer.

To the Hānifīs, especially to the family of Zaid b. 'Amr, their relation was friendly; they had the name of Moslem in common, and there was hardly any difference of principle to separate them. The personality of the prophet had given an altogether new impulse to a movement already in existence; that was all. To found a new religion was in no sense Mohammed's intention; what he sought was to secure among his people the recognition of the old and the true. He preached it to the Arabs as Moses had before him preached to the Jews, and Jesus to Christians; it was all one and the same religion as written in the heavenly book. The differences between the several religions of the book were not perceived by him till a much later period.

It is not difficult to understand why Mohammed should in the first instance have turned to those who were most readily accessible to him; but the nature of his mission did not suffer him to rest content with this; it compelled him to make public proclamation of the truth. One of his dependents, Arkam b. Abī Arkam, offered for this purpose his house, which stood close by the sanctuary, and thus the Moslems obtained a convenient meeting-place within the town, instead of, as hitherto, being compelled to resort to ravines and solitary places.⁴ Here Mohammed preached, and here too it was that he received some converts to Islam. But he did not obtain any great results among the Meccans. What he had to say was already in substance familiar to them; all that was new was the enthusiasm with which he proclaimed old truth. But this enthusiasm failed to make any impression on them; they set him aside as a visionary, or as a poet, or simply as one possessed. In their eyes it was a fatal flaw that his supporters were drawn from the slave-class and the lower orders, and the ranks of the young; it would have been quite another matter if one of the rulers or elders had believed in him. This circumstance was a source of annoyance to the prophet himself; in sur. lxxx. we find him rebuked by God for having repulsed in an unkind way a blind beggar who had interrupted him as he was endeavouring to win over a man of influence—an endeavour which proved of no avail.

This indifference of the Meccans embittered the messenger of God, and led him to give to his preaching a polemical character which it had not hitherto possessed. In the oldest sūras we have monotheism in its positive and practical form.⁵ God is the all-powerful Lord and all-knowing Judge of man; he demands loyal self-surrender and unconditional obedience; the service he requires is a serious life, characterized in particular by prayer, almsgiving, and temperance. That the worship of other gods beside Allāh is excluded by these views, goes without saying; still it is

¹ H. Dodwell, "De Tabulis cæli," in Fabricius, *Cod. pseud. V. T.*, 2d ed., ii. 551 sq. Compare, in the Koran, especially sur. lxxvii. 6, "We will cause thee so to read that thou mayest forget nothing save what God will." The following progress is noteworthy:—Isaiah's lips are touched to purge them of sin (Isa. vi. 7); Jeremiah's are touched by the Lord to put His word in his mouth (Jer. i. 9); Ezekiel receives the revelation as a roll of a book which he has to swallow (Ezek. iii. 2).

² See Sprenger in *Z. D. M. G.*, 1859, p. 173 sq.; Noldeke, *op. cit.*, 67 sq. Ewald thinks that the vocatives at the beginning of sur. lxxiv. and lxxiii. mean simply—O long sleeper! This view is worthy of consideration. The Moslem exegetes thoroughly understand the art of giving to general expressions of the Koran specific reference to historical events which they have themselves invented to facilitate exegesis.

³ Ibn Hishām, p. 166.

⁴ It does not appear that Arkam's house was of the nature of an asylum to which Mohammed betook himself for refuge from the ill-treatment to which he was subjected in his own home, nor is there any evidence that he ever lived in it. It was simply the meeting-house of the oldest Islam. Prayer continued to be offered within it until the conversion of 'Omār, who was bold enough to choose the Ka'ba itself, the centre of heathenism, as the Moslem place of prayer. Comp. Muir, ii. p. 117; Sprenger, i. p. 434.

⁵ What is meant by practical monotheism is most easily understood by reference to Matt. vi. 24 sqq., x. 28 sqq., and to Luther's exposition of the first commandment in the catechisms; it is the essence of religion. We do not, of course, mean that this practical monotheism is expressed in the Koran with as much purity and depth as in the Gospel.

noteworthy that the sharp negations of monotheism acquired prominence only by degrees. It was in his indignation against the cold mockery with which he was met that Mohammed first assumed an attitude of hostility towards the worship of polytheism, while at the same time he gave much greater prominence to his own mission, just because it was not acknowledged. He now began to threaten the infidels with the judgment of God for their contempt of His message and His messenger; he related to them the terrible punishments that in other cases had fallen on those who refused to hear the voice of their prophet, applying the old legends to the circumstances of the present with such directness that it was superfluous expressly to add the morals. This could not fail to irritate the Meccans, especially as after all the new religion gained ground. What Mohammed attacked as ungodly and abominable were their holy things; they were jealous for their gods and their fathers. Their attachment to the traditional worship was the greater that the prosperity of their town rested upon it; for they had not yet learned that the Ka'ba was no institution of heathenism. They found, however, no other way to remove the public scandal than to approach Abú Tálib, the Prophet's uncle and the head of his family, asking him to impose silence on the offender, or else to withdraw from him his protection. Abú Tálib was not personally convinced of Mohammed's mission, but he did not choose to impose conditions on the enjoyment of his protection. At length, however, when the Meccans adopted a threatening tone and said that he must either restrain his nephew from his injurious attacks, or openly take side for Mohammed and against them, he sent for his nephew, told him how things stood, and urged him not to involve them both in ruin. Mohammed was deeply moved; he thought his uncle wished to get rid of him; yet he could not and would not withdraw from the divinely-imposed necessity which impelled him to preach his convictions. "Though they gave me the sun in my right hand," he said, "and the moon in my left, to bring me back from my undertaking, yet will I not pause till the Lord carry my cause to victory, or till I die for it." With this he burst into tears, and turned to go away. But Abú Tálib called him back and said: "Go in peace, son of my brother, and say what thou wilt, for, by God, I will on no condition abandon thee."

The protection of his uncle did not relieve Mohammed from all manner of petty insults which he had to endure from his enemies from day to day; but no one ventured to do him serious harm, for the family feud which this would necessarily have produced was not to be lightly incurred. Less fortunate than the Prophet, however, were such of his followers as occupied dependent positions, and had no family support; especially the converted bondmen and bondwomen, who found no consideration, and were often treated with actual cruelty. For some of these Abúbekr purchased freedom. There seem to have been no martyrs, but the situation of many Moslems became so intolerable that they fled to Abyssinia. The Abyssinian Christians were quite looked upon as their religious kinsmen.

A breach with one's people is for the Arab a breach with God and the world; he feels it like a living death. Mohammed, who remained in Mecca, naturally made every effort to heal the breach with his townsmen, and, as naturally, the latter met him half-way. He even went so far as to take the edge from his monotheism. Once, when the heads of the Koraish were assembled at the Ka'ba, Mohammed, we are told, came to them and began to recite before them sur. liii.¹ When he came to the passage,

¹ The authorities for this are Ibn Sa'd, the secretary of Wákidí, to whom we owe the preservation of Wákidí's materials for the Meccan period, and especially Tahari; comp. Muir, ii. 150 *sqq.* The common

"What think ye of al-Lát and al-'Ozzá, and of Manát the third with them?" the devil put words in his mouth which he had long wished to have by revelation from God—viz. "These are the sublime Cranes,² whose intercession may be hoped for." The auditors were surprised and delighted by this recognition of their goddesses, and when Mohammed closed the súra with the words, "So prostrate yourselves before Alláh and do service to him," they all with one accord complied. They then professed their satisfaction with his admissions, and declared themselves ready to recognize him. But the messenger of God went home disquieted. In the evening Gabriel came to him, and Mohammed repeated to him the súra; whereupon the angel said: "What hast thou done? thou hast spoken in the ears of the people words that I never gave to thee." Mohammed now fell into deep distress, fearing to be cast out from the sight of God. But the Lord took him back to His grace and raised him up again. He erased the diabolical verse and revealed the true reading, so that the words now ran— "What think ye of al-Lát and al-'Ozzá, and of Manát the third with them? The male [offspring] for you and the female for God? That were an unjust division!" When the new version reached the ears of the Meccans they compared it with the old, and saw that the Prophet had broken the peace again. So their enmity broke out again with fresh violence.

It is generally and justly suspected that this compromise did not rest on a momentary inspiration of Satan, but was the result of negotiations and protracted consideration. Nor was the breach so instantaneous as is represented; the peace lasted more than one day. There is no doubt as to the fact itself. Every religion must make compromises to gain the masses. But for Mohammed the moment for this had not yet arrived; later on he used the method of compromise with great effect.

The news of the peace between Mohammed and the Meccans had recalled the fugitive Moslems from Abyssinia;³ on their return the actual state of affairs proved very different indeed from what they had been led to expect, and it was not long before a second emigration took place. By degrees as many as a hundred and one Moslems, mostly of the younger men, in little groups, had again migrated to Abyssinia, where they once more met with a friendly reception. Among them were Ja'far, the brother of 'Alí, and the Prophet's daughter Rokayya, along with her husband 'Othmán b. 'Affán.⁴

Mohammed's position was very considerably altered for the worse, both subjectively and in other respects, by his precipitate withdrawal from the compromise almost as soon as it had been made. He himself indeed, although long and salutarily humbled by the remembrance of his fall (sur. xvii. 75 *sqq.*), never abandoned faith in his vocation; his followers also did not permit themselves to be led

tradition ignores the fact itself, but knows its result, the return of the Abyssinian fugitives.

² "*Al-gharáník al-'olá,*" fine-sounding but perhaps meaningless words—

"Herrlich, etwas dunkel zwar,
Doch es klingt recht wunderbar."

Comp. Nöldeke, *op. cit.*, p. 80. Hobal, though the chief god of the Meccans, is not mentioned in the Koran either here or elsewhere. Perhaps as God of the Ka'ba he was already identified with Alláh by the Meccans, or was so identified by Mohammed.

³ The date assigned is the month Rajab of the fifth year of the Call, corresponding to the eighth year before the Flight (A. D. 614-615). The compromise must have been made in the interval. The chronology of this period is of course in the highest degree uncertain, and the order of the events hard to ascertain. Thus it can scarcely be determined whether the above-mentioned scene with Abú Tálib ought to be placed before or after the compromise.

⁴ 'Othmán and Rokayya, however, members of the noble house of Onayya, soon returned, along with many others. The rest remained in exile until the seventh year of the Flight.

away. But the Meccans, from the way in which he had at first given out a verse as God's word and afterwards withdrawn it as a suggestion of Satan, did not hesitate to draw the inference that the whole of his boasted revelation was nothing but a manifest imposture. To their cold and unfeeling logic the Prophet had nothing to oppose save passionate assurances.

Fortunately for the Moslems, precisely at this juncture, when matters were assuming so gloomy an aspect for their little company, two conversions took place, which were well fitted to revive their courage. Mohammed's uncle, Hamza b. 'Abdalmottalib, felt his family pride wounded by the injurious treatment which the former had received from Abú Jahl, head of the great and wealthy family of the Banú Makhzúm, and in order to become publicly his champion, he adopted Islam. Of much more importance still was the conversion in the same year (the sixth of the Call) of 'Omar b. al-Khattáb. 'Omar was then only twenty-six years of age, and neither rich nor noble; but his imposing figure and his unbending strength of will gave him a personal influence, which immediately made itself felt in a very marked manner in favour of Islam. Until now its religious gatherings had taken place privately, especially in the house of Arkam; but 'Omar offered his prayers at the Ka'ba as publicly as possible, and his example was followed by the other Moslems. Their religious exercises were no longer gone about in secret, but ostentatiously and before the eyes of all.

So far as can be gathered, it was at this time that the opposition between Mohammed and his townsmen reached its highest pitch. The feeling that he had somewhat committed himself embittered him; he was determined to atone for his previous concessions to polytheism by uncompromising polemic against it. A personal element, which had lurked from the first in the war of principles, became by degrees increasingly dominant. The idols were less displeasing to Alláh than the idolaters; his own worship was a matter of less concern to him than the recognition of his messenger. With ever-increasing distinctness the prophetic utterances came to be mere words of threatening and rebuke against the Meccans; it was impossible not to recognize in Noah and Moses or Abraham the prophet himself. The coming judgment upon Mecca, and the hour of it, were either in plain words or veiled allusion the continual theme of the "admonisher;" but the oftener and the more urgently it was repeated, the less was the impression it produced. The Meccans did not, on the whole, suffer themselves to be much disturbed by the prospect of the terrible overthrow which was portrayed before them in vivid colours. They were even profane enough to express a desire to see the long-threatened catastrophe arrive at last, and their audacity went so far as to complain of the revelations with which Mohammed sought to stir their feelings as being tedious.¹ They did not in the least believe that the Biblical narratives, which he related with special pride, were known to him by revelation; on the contrary, they pretended to know perfectly well the human source from which he had derived them (sur. xvi. 105; xxv. 5; xlv. 13). It is very interesting to find Mohammed in presence of their unbelief referring to the recognition and approval with which he met among the children of Israel (sur. vi. 114; x. 94; xiii. 36 *sqq.*; xvii. 108; xxviii. 52 *sq.*; xxxiv. 6), and particularly to find him appealing to the testimony of a certain Jew, whom he does not name (sur. xlv. 9 *sqq.*) Manifestly he had relations with Jews at this period, and was under their influence; and from them, of course, it was that the material of his Old Testament and Haggadic narratives was derived. At the

same time it is clear that he himself must have believed these to have come directly to him in a second revelation from above, otherwise he would hardly have taken his stand in the presence of his opponents upon the testimony of the Jews. Such a self-deception seems indeed hardly credible to us, but it is impossible to impute to the Arab prophet too complete an absence of the critical faculty.

The Koraish at last lost all patience. Their heads entered into a solemn compact to break off all intercourse with the Hashimids, as they declined to separate themselves from Mohammed. The Hashimids submitted to the interdict for the sake of their relative, although for the most part they were not believers on him. Along with the Banú 'l-Mottalib they withdrew into the separate quarter of their chief, into the so-called Shi'b Abí Tálib; one only of their number, Abú Lahab, separated himself from them, and made common cause with the Meccans. All buying and selling with the excommunicated persons being forbidden, these found themselves reduced occasionally to outward distress, as well as excluded from all fellowship. This treatment, although apparently never carried out with absolute strictness, did not fail of its effect. The Prophet's more remotely attached adherents fell away from him, and his efforts for the spread of Islam were crippled. All he could do was to encourage those who remained faithful, and to set himself to seek the conversion of his relations.

This state of matters, after continuing for from two to three years, at last became intolerable to the Meccans themselves, who had a variety of relations with the excommunicated family. In the tenth year of the Call (619-620) five of the leading citizens paid a visit to Shi'b Abí Tálib and induced the Banú Háshim and al-Mottalib to come out of their retirement and again appear among their fellow-citizens. The rest of the Koraish were taken by surprise, and did not venture, by setting themselves against the *fait accompli*, to run the risk of what might have become a dangerous breach. The story goes that a lucky accident released them from the solemn oath under which they had laid themselves with reference to the Banú Háshim—the mice had destroyed the document, hung up in the Ka'ba, on which it was recorded.

Mohammed was now free once more; but he no longer thought of carrying on his polemic against the Meccans or of seeking to influence them at all. In his relations to them three stadia can be distinguished, although it is easier to determine their character than their chronology. In the first instance, his endeavour was to propitiate them and win them over to his side; when other methods failed, he even went so far as to make complimentary mention of their goddesses in one of his revelations, and thus to set up a compromise with heathenism. When this compromise failed, he forthwith commenced an embittered assault upon the idolaters, which ended in the outlawry of himself and of his family. And now, the ban having been removed, he gave the Meccans up, abandoning them to their hardness of heart. It had become clear to him that in his native town Islam was to make no progress, and that his position was untenable. His feeling of separation was increased all the more with the death of his faithful Khadija about this time, followed soon afterwards by that of Abú Tálib, his noble protector. He accordingly came to the determination to take his chance in the neighbouring Táif, and set out thither alone. On his arrival he asked the heads of the town whether they would be willing to receive him and protect the free proclamation of his doctrines. He was answered in the negative; the mob drove him out of the town, and pursued him until he found refuge in a vineyard, the property of two noble Meccans. In the deepest dependency he again took the homeward road.

¹ Ibn Hishám, pp. 191, 235 *sq.*

Tradition has it that he found comfort in the fact that at least the Jinns listened to him as by the way he chanted the Koran in the sacred grove of Nakhla.¹ In the present circumstances it was now impossible for him to return into the town, after having openly announced his intention of breaking with it and joining another community. He did not venture to do so until, after lengthened negotiations, he had assured himself of the protection of a leading citizen, Mo'ïm b. 'Adî. Notwithstanding all that had happened, he resolved, two months after the death of Khadija, to enter upon a second marriage with Sauda bint Zam'a, the widow of an Abyssinian emigrant.

Chance soon afterwards brought to pass what forethought (on his journey to Táif) had failed to accomplish. After having given up the Meccans, Mohammed was wont to seek interviews with the Arabs who came to Mecca, Majanna, Dhú'l-Majáz, and 'Okáz, for the purpose of taking part in the feasts and fairs, and to preach to them.² On one such occasion, in the third year before the Flight (A.D. 619-620), he fell in with a small company of citizens of Medina, who to his delight did not ridicule him, as was usually the case, but showed both aptness to understand and willingness to receive his doctrines. For this they had been previously prepared, alike by their daily intercourse with the numerous Jews who lived in confederation with them in their town and neighbourhood, and by the connections which they had with the Nabatæans and Christian Arabs of the north. Hanifitism was remarkably widely diffused among them, and at the same time there were movements of expectation of a new religion, perhaps even of an Arabian Messiah, who should found it. Medina was the proper soil for Mohammed's activity. It is singular that he owed such a discovery to accident. He entered into closer relations with the pilgrims who had come from thence, and asked them to try to find out whether there was any likelihood of his being received in their town. They promised to do so, and to let him hear from them in the following year.

At the pilgrim feast of next year, accordingly, twelve citizens of Medina had a meeting with Mohammed,³ and gave him their pledge to have no god but Alláh, to withhold their hands from what was not their own, to flee fornication, not to kill new-born infants, to shun slander, and to obey God's messenger as far as was fairly to be asked.⁴ This is the so-called First Homage on the 'Akaba.⁵ The twelve men now returned, as propagandists of Islam, to their homes with the injunction to let their master hear of the success of their efforts at the same place on the following year. One of the Meccan Moslems, Mo'sab b. 'Omair, was sent along with or after them, in order to teach the people of Medina to read the Koran, and instruct them in the doctrines and practices of Islam.

Islam spread very quickly on the new soil. It is easy to understand how his joy strengthened the Prophet's spirit to try a higher flight. As a symptom of his exalted frame we might well regard his famous night-journey to Jerusalem (sur. xvii. 1; vi. 2), if we could be sure that it

¹ Sur. xlvi. 23; lxxii. 1. On the impossibility of historically fixing the date of this occurrence see Nöldeke, *op. cit.*, p. 101.

² Muir (ii. 181 sq.) assumes, with good reason, that he had already done so during the time when he was living in the Shi'b Abi Tálib, and assigns to this period the story that Abú Lahab followed him in this in order to counteract his preaching, and sow tares among the wheat.

³ Sprenger (ii. 526) identifies this meeting with the first, which tradition distinguishes from it and places a year earlier. He is probably right.

⁴ Afterwards this was called the women's oath. It is a noteworthy summary of the features by which Islam is distinguished from heathenism.

⁵ On the 'Akaba compare *Vakidi*, pp. 417, 427, 429. It was a station between 'Arafa and Miná.

belonged to this period.⁶ The prophecy also of the final triumph of the Romans over the Persians (contained in sur. xxx. 1 sqq.) might very well pass for an expression of his own assurance of victory, as at that time he still had a feeling of solidarity with the Christians. But the prophecy (the only one contained in the Koran) belongs, it would appear, to a much earlier date.⁷

At the Meccan festival of the last year before the Flight (in March 622) there presented themselves among the pilgrims from Medina seventy-three men and two women who had been converted to Islam. In the night after the day of the sacrifice they again had an interview with the Prophet on the 'Akaba; Al-'Abbás, his uncle, who after Abú Tálib's death had become head of the Banú Háshim, was also present. This is the so-called Second Homage on the 'Akaba, at which Mohammed's emigration to Medina was definitely settled. Al-'Abbás solemnly transferred his nephew from under his own protection to that of the men from Medina, after these had promised a faithful discharge of the duties this involved. They swore to the Prophet to guard him against all that they guarded their wives and children from. He, on the other hand, promised thenceforward to consider himself wholly as one of themselves, and to adhere to their society. According to the tradition this remarkable scene was brought to a close by a sudden noise.

The Meccans soon got wind of the affair, notwithstanding the secrecy with which it had been gone about, but Ibn Obay, the leader of the Medina pilgrim caravan, whom they questioned next morning, was able with good conscience to declare that he knew nothing at all about it, as, being still a heathen, he had not been taken into the confidence of his Moslem comrades, and he had not observed their absence over night. The Meccans did not gain certainty as to what had occurred, until the men of Medina had left. They set out after them, but by this they gained nothing. They next tried, it is said, violently to prevent their own Moslems from migrating. After a considerable pause, they renewed the persecution of the adherents of the Prophet, compelling some to apostasy, and shutting up others in prison. But the measures they adopted were in no case effective, and at best served only to precipitate the crisis. A few days after the homage on the 'Akaba, Mohammed issued to his followers the formal command to emigrate. In the first month of the first year of the Flight (April 622) the emigration began; within two months some 150 persons had reached Medina. Apart from slaves, only a few were kept behind in Mecca.⁸

Mohammed himself remained to the last in Mecca, in the company of Abúbekr and 'Alí. His reason for doing so is as obscure as the cause of his sudden flight. The explanation offered of the latter is a plan laid by the Meccans for his assassination, in consequence of which he secretly withdrew along with Abúbekr. For two or three days the two friends hid themselves in a cave of Mount Thaur, south from Mecca, till the pursuit should have passed over (sur. ix. 40). They then took the northward road and arrived safely in Medina on the 12th of Rabi' of the first year of the Flight.⁹ Meanwhile, 'Alí remained three

⁶ See Muir, ii. 219 sqq.; Sprenger, ii. 527 sqq.; and on the other side, Nöldeke, *Koran*, p. 102. The *mosrá* was afterwards called *mir'áj* (ascension), and, originally represented as a vision, came to be regarded as an objective though instantaneous occurrence.

⁷ See on the one hand Muir (ii. 223 sqq.) and Sprenger (ii. 527 sqq.), and on the other Nöldeke (*Koran*, p. 102; *Tabari*, p. 298). The manner in which Sprenger seeks to make the prophecy a *vaticinium ex eventu* is unfair.

⁸ Ibn Hishám, pp. 315 sq., 319 sq.

⁹ The 12th of Rabi' is, according to tradition, the Prophet's birthday, the day of his arrival in Medina, and the day of his death. It is certain that he died at mid-day on Monday the 12th of Rabi', but

days longer in Mecca, for the purpose, it is alleged, of restoring to its owners all the property which had been entrusted for safe keeping to the Prophet. The Koraiish left him entirely unmolested, and threw no obstacle in the way when at last he also took his departure.

With the Flight to Medina a new period in the life of the Prophet begins; seldom does so great a revolution occur in the circumstances of any man. Had he remained in Mecca he would in the best event have died for his doctrine, and its triumph would not have come until after his death. The Flight brought it about that he, the founder of a new religion, lived also to see its complete victory,—that in his case was united all that in Christendom is separated by the enormous interval between Christ and Constantine. He knew how to utilize Islam as the means of founding the Arabian commonwealth; hence the rapidity of its success. That this was of no advantage for the religion is easily understood. It soon lost the ideality of its beginnings, for almost from the first it became mixed up with the dross of practical considerations. In reaching its goal so soon its capability of development was checked for all time to come; in every essential feature it received from Mohammed the shape which it has ever since retained. It ought not, however, to be overlooked that the want of ideality and spiritual fruitfulness was partly due to its Arabian origin.

Mohammed in the first instance took up his quarters in the outlying village of Kōbā, where several of his most zealous adherents had their homes, and had already built a mosque. It was not until after some days had passed, and he had made himself sure of the best reception, that he removed to the city itself, which at that time bore the name of Yatrib. All were anxious to have him; in order that none might feel themselves slighted, he left the decision to the camel (al-Ḳaṣwa) on which he rode. It knelt down in an open space in the quarter of the Banū Najjār, which he accordingly selected as the site of the mosque and of his own house. At first he took quarters for seven months in the house of Abū Ayyūb; within this interval the mosque was finished, which was to serve at once as the place of religious gatherings and as the common hall. Close to it was the Prophet's private dwelling, consisting of the huts of his wives, in one or other of which he lived. At that time he had only one wife, the Sauda already mentioned; but soon he married, in addition, the youthful 'Āisha, the daughter of his friend Abūbekr, who acquired great influence over him. Some of the leading emigrants built houses in the same neighbourhood, while the rest continued to be quartered with the people of Medina.

Medina is situated on a westward spur of the Arabian tableland, on the Wadi Ḳanāt. It is an oasis amongst barren rocks, mostly of volcanic origin. The inhabitants supported themselves by their date palms and by the field and garden fruits that grew under their shadow; they had their homes partly in the town itself and partly in the suburbs and outlying villages. At one time the oasis had belonged to the Jews, as the similar oases to the north still did—Wadi 'l-Ḳorā, Khaibar, Fadak, Taimā. But some centuries before Mohammed's time, Arabs of Yemen, the Banū Ḳaila, had immigrated and partially driven the Jews away. Many Jews, however, still continued to live there, partly scattered among the Arab tribes and under their protection, partly also in independent communities such as the Ḳaincā, the Naḍir, and the Ḳoraiẓa. For them it was a great advantage that the Arabs were not agreed among themselves. The Banū Ḳaila were divided

into two branches, the Aus and the Khazraj, who were constantly at daggers drawn. The mutual hate which burned within them, from time to time manifested itself in murder and assassination, if by any chance one of the Aus had wandered into a Khazrajite quarter, or *vice versa*. Shortly before the arrival of Mohammed, the battle of Bo'āth had taken place within the liberties of Medina, in which the Aus, with the help of their Jewish allies, had vanquished the Khazraj and broken their preponderance. The Khazraj were the more numerous and powerful, and seem to have been on the point of making their leading man, Ibn Obay, the king of Medina; by the battle of Bo'āth the balance of parties—and anarchy—was preserved in the interests of a third, who came in at the right moment to settle these feeble and exhausting feuds and restore order.

The circumstances were singularly fitted to change the religious influence which Mohammed brought along with him into another of a political character, and from being a prophet to make him the founder of a commonwealth. The Arabs had hitherto been accustomed to lay before their Kāhins, or priestly seers, at the sanctuaries, for decision in God's name, all sorts of disputes and hard questions which ordinary means were inadequate to decide. The religious prestige which Mohammed enjoyed led directly to his being frequently called in as adviser and judge. In Medina quarrels and complications were abundant, and an authority to stand over both parties was much needed. Mohammed met this need in the manner which was most acceptable to the Arabs; the authority he exercised did not rest upon force, but upon such a voluntary recognition of the judgment of God as no one had any need to be ashamed of.¹ In principle, it was the same kind of judicial and public influence as had been possessed by the old Kāhins, but its strength was much greater. This arose not only from the peculiarly favourable circumstances, but above all from Mohammed's own personality. It is impossible to understand the history until one has mastered the fact of his immense spiritual ascendancy over the Arabs. The expedient of giving oneself out for the messenger of God, and one's speech as the speech of God, is of no avail to one who finds no credence; and credence such as Mohammed received is not given for any length of time either to an impostor or a dupe. Even the respect in which he was held as a prophet would have helped him little if his decisions had been foolish and perverse. But they were in accordance with truth and sound understanding; he saw into things and was able to solve their riddle; he was no mere enthusiast, but a thoroughly practical nature as well.

It was not long before he was able to demand as of right that which, in the first instance, had been a voluntary tribute. "Every dispute which ye have one with another ye shall bring before God and Mohammed;" so runs the text in the original constitution for Medina, set up in the first years after the Flight²; and in the Koran a rebuke is given to those who continue to seek the administration of justice at the hands of the false gods, *i.e.* of their priests and seers.³ With incredible rapidity the Prophet as a veritable "hākim biamr Allāh" had come to be the most powerful man in all Medina.

¹ Very significant is it that the Moslems were ready to submit even to punishment with stripes, if awarded by God.

² Ibn Hishām, 342, 17.

³ Ibn Hishām, 360, 8 *sqq.* Jolās b. Sewaid and other hypocrites were summoned before Mohammed by their believing relatives on account of some dispute; but they in their turn summoned the plaintiffs before the Kāhins, who in the days of heathenism had been their judges. It was with reference to this that sur. iv. 63 was revealed—"Hast thou not taken note of those who profess to be believers, yet wish to carry on their suit before the false gods?"

Mohammed thus laid the foundations of his position in a manner precisely similar to that which Moses (Exod. xviii.) is said to have followed; and just as the Torah grew out of the decisions of Moses, so did the Sunna out of those of Mohammed. It was perhaps in judicial and regulative activity, which he continued quietly to carry on to the very end of his life, that his vocation chiefly lay. At all events his work in this direction was extremely beneficial, if only because he was the creator of law and justice where previously there had been nothing but violence, self-help, or at best voluntary arrangement. But the contents of his legislation also (if it can be called by such a name) marked a distinct advance upon what had been the previous use and wont in Arabia. In particular, he made it his special care to set a fence round the rights of property, and to protect and raise the place of woman in marriage. Blood revenge he retained indeed, but completely altered its character by reserving to himself the right of permitting it; in other words, the right of capital sentence. It need not be said that in many ways he availed himself of that which already existed, whether in the form of Arab usage or of Jewish law; he followed the latter, in particular, in his laws relating to marriage.

The new situation of affairs inevitably brought it about that religion was made a mere servant in the work of forming a commonwealth. Never has this service been better performed; never has it been utilized with greater adroitness as a means towards this end. In Mecca, Islam had originally been nothing more than the individual conviction of Mohammed; it was only after severe struggles that he went so far as to preach it, and even his preaching had no other aim than to create individual conviction in others. What he said was of the simplest description—that people ought to believe in God and in judgment to come, that men ought to live their lives seriously and not waste them in follies, that one ought not to be high-minded or covetous, and so on. A community arose, it is true, even in Mecca, and was confirmed by the persecutions. There also religious meetings were held and social prayers. But everything was still in a very fluid and rudimentary stage; religion retained its inward character. It was not until the first two years after the Flight that it gradually lost this, and became, if not exclusively, yet to a very large extent, a mere drill system for the community.¹ No god but the one God (lá iláh illa 'lláh) was the entire sum of their dogmatic, and less importance was attached to belief in it than to profession of it. It was the watchword and battle-cry. The prayers² took the form of military exercises; they were imitated with the greatest precision by the congregation, after the example of the Imám. The mosque was, in fact, the great exercising ground of Islam; it was there that the Moslems acquired the *esprit de corps* and rigid discipline which distinguished their armies.

Next to the monotheistic confession (tauhíd) and to prayer (salát) came almsgiving (zakát, ṣadaqa) as a third important means by which Mohammed awakened and brought into action among his followers the feeling of fellowship. The alms by and by grew to be a sort of tithe, which

¹ This is to be understood as applying to the system as a whole. Of course, there are always individuals who break through system; but the historical power of Islam rests upon the system. To the system also belongs the spiritual jargon which Mohammed introduced. It was no longer permissible to say "Good morning!" (im sabáhan), the phrase now ran, "Peace be with thee!" and on every occasion pious forms of speech were demanded. Characteristic of the puritanism of the system is the prohibition of wine and of gaming, first issued in the years immediately following the Flight, and the contempt for poetry.

² They were five in number—at sunrise, noon, afternoon, sunset, and late evening. Each prayer consisted originally of two, afterwards of four, prostrations. The chief weekly public service (jom'a), with sermon, was held on Friday at mid-day.

afterwards became the basis of the Moslem fiscal system, and so at the same time the material foundation of the Moslem state. Religion received so practical a development that of alms nothing but the name remained, and the convenient fiction that the taxes had to be paid to God.

Just in proportion to the closeness of the union into which Islam brought its followers did its exclusiveness towards them that were without increase. If in Mecca Mohammed in his relations to the other monotheistic religions had observed the principle, "he that is not against me is for me," in Medina his rule was "he that is not for me is against me." As circumstances were, he had to adjust matters chiefly with the Jews. Without any intention on their part, they had helped to prepare the ground for him in Medina; he had great hopes from them, and at first treated them on no different footing from that of the Arab families which recognized him. But as his relations with the Aus and Khazraj consolidated, those which he had with the Jews became less close. The conjunction of religion with political authority, the development of civil polity out of religion, of the kingship from the prophetic function, was precisely what they objected to.³ On the other hand, while the old polity of Medina, broken up and disorganized as it was, had no difficulty in tolerating foreign elements within its limits, the new political system created by Islam changed the situation, and rendered it necessary that these should be either assimilated or expelled.

Mohammed's hostility to the Jews found expression, in the first instance, theoretically more than practically,⁴ and especially in the care with which he now differentiated certain important religious usages which he had taken over from Judaism, so that they became distinguishing marks between Islam and Mosaism. Thus, for example, he altered the direction of prayer (Kibla), which formerly used to be towards Jerusalem, so that it now was towards Mecca; and for the fast on the 10th of Tisri ('Ashúrá) he substituted that of the month of Ramaḍan.⁵ In appointing Friday as the principal day of public worship, he may also possibly have had some polemical reference to the Jewish Sabbath. Of these alterations the greatest in positive importance is the transference of the Kibla to Mecca. It symbolizes the completion of the Arabizing process which went on step by step with the change Islam underwent from being an individual to being a political religion. In substituting the Meccan Ka'ba for the sanctuary at Jerusalem, Mohammed did not merely bid farewell to Judaism and assert his independence of it; what he chiefly did was to make a concession to heathenism, and bring about a nationalization of Islam, for the purpose of welding together the Arab tribes (Kábáil) into one community. Of similar significance was the institution of the feast of sacrifice ('id al-dohá) on the day of the Meccan festival. The Moslems were to observe the latter as much as possible, even if they could not be actually present on the spot.

Thus we have the five chief precepts of Islam—(1) Confession of the unity of God; (2) stated prayer; (3) almsgiving; (4) the fast of Ramaḍan; (5) observance of the festival of Mecca. Capable of having deeper meanings

³ While Islam had the effect of uniting the Arabs politically, uniformity of religion in the case of the Jews had no such effect; on the contrary, the mutual feuds and hatreds in which they indulged conduced greatly to the advantage of the Moslems. The Jews, of course, recognised Mohammed's supremacy as a fact, but they denied any legal title thereto as arising from his prophetic office.

⁴ Compare the well-known second súra, in which a long attack is made on Judaism.

⁵ A connection with the Christian fasts is usually alleged. It is possible that Christian influence may have to do with the long duration of the fasts, but it cannot have anything to do with the selection of Ramaḍan; for in the first years after the Flight, Ramaḍan fell not in Spring but in December.

attached to them, but meritorious also, even in a merely external observance, they were an excellent instrumentality for producing that *esprit de corps*, that obedience to Alláh and his messenger, which constituted the strength of the Moslem system. Up till that time blood-relationship had been the foundation of all political and social relations in Arabia; upon such a foundation it was impossible to raise any enduring edifice, for blood dissociates as much as it unites. But now, religion entered upon the scene as a much more energetic agent in building the social structure; it ruthlessly broke up the old associations, in order to cement the thus disintegrated elements into a new and much more stable system. The very hearts of men were changed; the sanctity of the old relationships faded away in the presence of Alláh; brother would have slain brother, had Mohammed willed it. The best Moslem was he who was the most remorseless in separating from the old and attaching himself to the new; Mohammed gave preference to active natures, even if they occasionally kicked over the traces; contemplative piety received from him only the praise of words. Over the anarchical rule of a multitude of families the sole sovereignty of God came forth triumphant; its subjects were united by the firmest of all bonds. Every Moslem was every Moslem's brother, and, as matter of course, took his part as against every non-Moslem. Outside of Islam there was neither law nor safety; Alláh alone was powerful, and he protected those only who acknowledged his sole sovereignty.

fenders.

The Emigrants (Mohájira), who along with the Prophet had fled from Mecca, were the kernel and the cement of the community. It was made all the easier for them to give effect to the fundamental principle, that citizenship in Medina depended not on family but on faith, because the natives themselves (Ansar, "the Defenders"), consisting of Aus and Khazraj, neutralized one another by their mutual enmity. Mohammed seems at first to have cherished the design not only of entirely disowning relationship with non-Moslems, but also of obliterating as much as possible, within Islam, the distinctions of blood, by means of the common faith. He established between emigrants and individual citizens of Medina relationships of brotherhood, which also involved heirship. But he soon abandoned this line, and expressly recognized the validity and sacredness, *within Islam*, of the old rights of family and inheritance (sur. viii. 76). Thus he refrained from carrying out to its full logical consequence the theoretical principle of equalization, but on practical grounds permitted the old order of society to continue. At a subsequent period, he even conceded to relationship and the ties of blood far larger rights than were compatible with Islam, and thus himself laid the foundations of the violent quarrel which rent the community, more particularly in the time of the Omayyads. Similarly it might be said that communism was originally involved in the principles of Islam; but it is characteristic that from the first the alms were less employed for the equalization of society, than for strengthening the hands of the ruling power. It frequently happens that a religious revolution finds expression also in the region of social polity; but it is remarkable to observe how Islam utilized the religious leaven from the first for a positive reorganization of society, and neutralized the destructive tendency which that leaven is wont to show in political affairs. It did not indeed succeed in totally destroying the radical tendency, as the history of the caliphate shows. But, on the whole, the equality before God which Islam teaches interfered hardly at all with the subordination of men to their human leaders; both were demanded by religion, both were taken sincerely, and each was found, in practice, reconcilable with the other.

That this new and drastic principle, thrown into the

chaos of existing relations, must have exercised a mighty power both of attraction and repulsion is obvious. More than one naive expression bears witness to the astonishment with which the Arabs regarded the strange spirit which animated the community of the Moslems—the firmness with which they held together, the absolute and willing obedience which they gave to their leaders, the recklessness with which they disregarded everything that before Islam, or outside of it, was looked upon as holy. Some natures felt themselves attracted by these peculiarities, especially if on other grounds they felt little difficulty in severing themselves from their old connexions; but, on the whole, feelings of antipathy prevailed. Even in Medina itself this antipathy was widespread. The so-called hypocrites (*monáfikún*) were either only half-attached to the Prophet or in their inmost hearts unfavourably disposed; they were kept from overt action partly by the absence of a decided opinion, partly by the terrorism which the convinced Moslems exercised. The reproach of hypocrisy brought against them means chiefly that they did not manifest a full acceptance of the new political relations. They could not reconcile themselves to the position of having never a word to say in their own town, and of being compelled to obey the Prophet from Mecca and those who had come with him. For a time the danger was imminent that all Medina (the Emigrants of course excepted) might be infected with hypocrisy, if one may call it hypocrisy when for a moment nature and blood asserted themselves against religious discipline and burst its bonds. The younger portion of the community, however, was on the whole enthusiastic for Mohammed; the hypocrites were for the most part older men, especially heads of families, who found it difficult to put up with the loss of political influence which they were suffering. As chief of their number Ibn Obay is always named, the foremost man of Medina, whom the Khazraj had thought of crowning as king, before matters were so fundamentally changed by Islam. Mohammed's attitude towards him and the hypocrites in general was that of connivance,—thoroughly appropriate here, where political rather than religious affairs were involved, and the question was one less of principle than of power.

The founding of the state upon the feeling of fellowship, generated by religion, was without question the Prophet's greatest achievement: the community of Medina was the tool, its heroic faith the force, by means of which Islam attained the results which figure so largely in the history of the world.¹ Moslem tradition, however, does not stop to inquire what it was that constituted the inward strength of Islam, but goes on at once to relate what were its outward manifestations. Its information on the subject of the period of Mohammed's sojourn in Medina is given under the title of "the campaigns (*magházi*) of the apostle of God." With a few of the smaller tribes in the neighbourhood of Medina (*Johaina*, *Mozaina*, *Ghifár*, *Aslam*), and with the *Khodz'a*, Mohammed maintained relations of peace and amity; benevolent neutrality gradually grew into alliance, and finally union with the commonwealth of Medina. But towards all the rest of Arabia his very principles placed him in an attitude of war. Ever since Islam from being a religion had become a kingdom, he was compelled to vindicate, by means of war against unbelievers, its claims to supremacy; the conflict of principles had to be settled by the sword, the sole sovereignty of Alláh demonstrated

¹ The credit of being the founder of the Moslem state cannot be transferred to 'Omar, but must be left with Mohammed. It was not 'Omar who created that feeling of oneness which enabled him, for example, suddenly to recall a general like Khálid from his career of victory without eliciting a murmur. The miracle is the "primitive cell" of Medina, not the fact that in course of time success gave it the force of an avalanche.

by force to the rebels who showed unwillingness to accept it. More literally than Christ could Mohammed say of himself that he was come not to bring peace but a sword. Islam was a standing declaration of war against idolaters.

The nearest object against which to direct the holy war (jihád) was presented by the Meccans. Against them first did Mohammed bring into operation the new principle, that it is faith and not blood that separates and unites. According to Arab notions it was a kind of high treason on his part to leave his native town in order to join a foreign society; on the part of the people of Medina it was an act of hostility to Mecca to receive him among them. The Meccans would have been fully justified on their side in taking arms against the Moslems, but they refrained, being too much at their ease, and shrinking besides from fratricidal war. It was the Moslems who took the initiative; aggressiveness was in their blood. Mohammed began with utilizing the favourable position of Medina, on a mountain spur near the great highway from Yemen to Syria, to intercept the Meccan caravans. Originally he sent forth only the Emigrants to take part in the expeditions, as the people of Medina had pledged themselves to defend him only in the event of his being attacked; soon, however, they also joined him. What first induced them to do so was the prospect of booty; afterwards it was impossible to separate themselves, so great was the fusion of elements which had been quietly going on within the crucible of Islam.

The first plunder was taken in the month Rajab, A.H. 2 (Autumn 623), in which circumstance was at once seen the advantage arising from the change of conscience brought about by the new religion; for in Rajab feuds and plundering raids were held to be unlawful. Relying upon the sacredness of this month a caravan of Koraish was returning from Táif laden with leather, wine, and raisins. But this did not prevent Mohammed from sending out a band of Emigrants to surprise the caravan at Nakhla, between Táif and Mecca; his orders to this effect were given in a document which was not to be unsealed until two days after the departure of the expedition. The plan was carried out, and the surprise was all the more successful, because the robbers gave themselves the outward semblance of pilgrims; one Meccan was killed in the struggle. But the perfidy with which in this instance Mohammed's advanced religious views enabled him to utilize for his own advantage the pious custom of the heathen roused in Medina itself such a storm of disapproval, that he found himself compelled to disavow his own tools. In Mohammedan tradition, the contents of the unambiguous document in which he ordered the surprise are usually falsified.

The Koraish still remained quiet; another outrage had yet to come. In Ramađan A.H. 2 (December 623), the return of their great Syrian caravan was expected, and Mohammed resolved to lie in wait for it at Bedr, a favourite watering-place and camping-ground, northward from Medina. For this purpose he set out thither in person along with 308 men; but the leader of the caravan, the Omayyad Abú Sofyán, got word of the plan and sent a messenger to Mecca with a request for speedy help. Concern about their money and goods at last drove the Koraish to arms; a very short interval found them, 900 strong, on the road to Bedr. By the way they received intelligence that the caravan had made a circuit to the west of Bedr, and was already in safety. Nevertheless they resolved, at the instance of the Makhzumit Abú Jahl, for the sake of their honour, to continue their march. When the Moslems first got touch of them at Bedr, they took them for the caravan; their surprise on discovering the truth may be imagined. But, kept firm by the courage of their leader, they resolved to face the superior numbers of the enemy.

On the morning of Friday, the 17th of Ramađan, the encounter took place. A number of duels were fought in the front, which were mostly decided in favour of the Moslems. The Meccans at last gave up the fight, strictly speaking for no other cause than that they did not see any reason for carrying it on. They were reluctant to shed the blood of their kinsmen; they were awestruck in presence of the gloomy determination of their adversaries, who did know what they were fighting for, and were absolutely reckless of consequences. After a number of the noblest and oldest of the Koraish, including at last Abú Jahl, had fallen, those who remained took to flight. The number of the dead is said to have been as great as that of the prisoners. Two of the latter, whom he personally hated, Mohammed caused to be put to death—'Okba b. Abí Mo'ait and al-Nadr b. al-Háarith. When the last named had perceived, from the Prophet's malignant glance, the danger in which he stood, he implored an old friend of his among the Moslems for his intercession. This request being refused, al-Nadr said: "Had the Koraish taken thee prisoner, thou hadst not been put to death as long as I had lived;" to which the apologetic reply was: "I do not doubt it, but I am differently placed from thee, for Islam has made an end of the old relations." To the remaining prisoners life was spared on payment by their kinsmen of a heavy ransom; but Mohammed is said to have afterwards reproached himself for having allowed considerations of earthly gain to keep him back from sending them all to hell as they deserved.

The battle of Bedr is not only the most celebrated of battles in the memory of Moslems; it was really also of great historical importance. It helped immensely to strengthen Mohammed's position. Thenceforward open opposition to him in Medina was impossible; families which had hitherto withdrawn themselves from his influence were so thoroughly cowed by some atrocious murders carried out in obedience to his orders, that they went over to Islam. He was now in a position to proceed to break up the autonomy of the Jews. In the first instance, he addressed himself to the weak Banú Kainoká, demanding their acceptance of Islam: on their refusal, he took the earliest opportunity that offered itself to declare war against them. After a short siege they were compelled to surrender; and they might congratulate themselves that their old ally, Ibn Obay, was able to concuss the Prophet into sparing their lives, and contenting himself with their banishment from Medina. Soon afterwards other blows were struck, in the shape of assassinations, by means of which Mohammed put out of the way several of the Jews whom he hated most, such as Ka'b b. al-Ashraf and Ibn Sonaina.¹ The state of fear to which the rest were reduced may readily be imagined; they came to the Prophet and begged him to be propitious. If in other days their dislike had found somewhat public expression in all sorts of witticisms and scornful sayings, they were now at least modest and quiet, and kept their hatred to themselves.

The Meccans also were very deeply impressed by the defeat inflicted on them by the Moslems. They saw clearly that the blow must be avenged, and they took comprehensive measures for their campaign. After a year's delay, their preparations being now complete, and their allies

¹ The murderer of Ibn Sonaina was Mohayyisa b. Mas'úd, of whose elder brother, Howaisa, he had been a sworn ally. Howaisa struck the murderer in consequence, and reproached him with his treacherous ingratitude, saying that much of the fat in his body had come from the estate of the Jew. Mohayyisa's reply was: "If he who bade me kill him were also to bid me kill thee, I should obey." The brother, amazed, asked him if he was serious, and when the other assured him that he was, Howaisa exclaimed: "By God, a religion which brings it to this is a stupendous one," and forthwith became a convert. The story (*Vakidi*, p. 98) is too characteristic to be passed over.

Effect
of the
battle

(Ahabīsh) assembled, they set out under the command of Abū Sofyān, and without any check reached Medina, where they pitched their camp to the north-east of the city, in the green corn-fields by Mount Oḥod. In Medina the elders were for awaiting the attack on the town and defending themselves within it, but the young men hurried the Prophet into the determination to meet the enemy without the gates; this resolution once come to he persevered in, even after those who had urged him to it had changed their minds. On the morning of Saturday, the 7th of Shawwal, A. H. 3 (Jan. Feb. 625), the armies met. At first the battle seemed to be going once more in favour of the Moslems; one after another the standard-bearers and champions of the enemy fell, the whole host wavered, and even the camp was gained. But here their lust for plunder did them an evil turn. Mohammed had covered his left flank against the Meccan horsemen by a number of bowmen, whom he had ordered on no account to leave their post. But as soon as they saw that the enemy's camp was taken, they threw off all discipline, and determined to have their share of what was going. It thus became possible for the Meccan cavalry to fall upon the Moslem rear, and snatch back the victory that had already been won. In the confusion which now ensued Mohammed himself was wounded in the face, and for some time lay for dead on the ground. Among the slain was found his uncle, Ḥamza b. 'Abdalmottalib, "the lion of God;" his liver was cut out and carried to Abū Sofyān's wife, Hind bint 'Otba, whose father had been killed by Ḥamza at Bedr. But the Meccans did not know how to follow up their triumph. Instead of at once attacking Medina—where, to be sure, a second struggle with Ibn Obay, who with his following had not taken part in the battle at Oḥod, would have been necessary—they contented themselves with the honour of their victory, and took the road home, after having summoned the Moslems to a repetition in the following year of the duel at Bedr. Mohammed even pursued them for a short distance on the following day (as far as to Hamrá al-Asad), of course only for the sake of appearances, that the Arabs might not suppose him to have been daunted by his defeat.

Nothing came of the proposed meeting at Bedr, the Meccans failing to put in an appearance. The principal event of A. H. 4 was the expulsion of the Banú Naḍir, the most distinguished and powerful Jewish family in Medina (Summer 625). Mohammed, under some pretext, suddenly broke with them and ordered their departure within ten days, on pain of death. Relying upon the support of Ibn Obay, they resolved to resist, and sustained a siege within their walls; but the ally they had counted on proved a broken reed,¹ and they were soon compelled to surrender. They were permitted to withdraw, taking along with them all their movable property except their arms. With music and roll of drum, the women in gala dress, they marched through the streets of Medina, on their way to Khaibar, where they had property. Their land the Prophet appropriated to himself (sur. lix. 7); the income derived from it could be employed to meet the numerous claims that were made upon him. He seems also to have handed over some of it to the Emigrants, who until then had acquired no property in land in Medina.

Meanwhile, the Banú Naḍir were not idle in Khaibar, but left no stone unturned to annihilate their mortal enemy. They succeeded in bringing about an alliance of the Koraish and the great Bedouin tribes of Solaim and Ghatafán, for the suppression of Islam. In the month

Dhū 'l-ka'da, A. H. 5* (March 627), the three armies set out, 10,000 strong, under the command of Abū Sofyān. Mohammed received word of this through the Khozá'a, who secretly played into his hands, and on this occasion he resolved, not as formerly to offer battle on the open field, but to make preparation for a siege. For the most part the houses of the town were built so close to one another as to make a continuous wall; at the north-west corner only was there a wide open space, through which an enemy could easily effect an entrance. Here Mohammed, with the advice and direction of the Persian freedman Salmán, drew a ditch, behind which he entrenched himself with the Moslems, the hill of Sal'² protecting their rear. This fosse, which has become famous, and has even given its name to the entire campaign (the War of the Fosse), fully served its purpose. The enemy with their cavalry perseveringly directed their attack on this spot, but were constantly repelled by the vigilant and courageous defence of the fosse. They at last gave up all hope of reaching their end in this way, unless a simultaneous attack were to succeed in another quarter. To assist them in this, they endeavoured to stir up the Koraiza, the last autonomous family of Jews still remaining in Medina, having their settlements in the south-east of the town. The Naḍirite Ḥoyay b. Akḥtab, the most zealous promoter of the alliance against Mohammed, undertook charge of the negotiations, and succeeded at last in persuading their prince, Ka'b b. Asad, to break his pact of neutrality with the Moslems. But nothing came of it. The Jews doubted the perseverance of the Koraish and their allies—they had their fears lest, if the struggle proved a protracted one, the besiegers might withdraw and leave them to their fate. They accordingly demanded hostages in security against such an event, being otherwise determined not to break up all hope of reconciliation with Mohammed by entering the contest. This attitude, in turn, aroused suspicion on the part of the besiegers, whom it was not difficult to convince that the Jews were demanding hostages of them for the purpose of handing them over to Mohammed, and so making their peace with him. All this crippled their activities still more than did the failure of their own attacks upon the fosse. The season also was against them; the weather was windy, the nights extremely cold, and, worst of all, the fields yielded nothing. From this cause the chief sufferers were the Bedouins, who had brought no forage for their camels and horses. Mohammed, who appears to have been kept well informed of their mood, judged it expedient to open negotiations with them. These were soon broken off indeed, but the mere fact that the Ghatafán had ever entered upon them was enough to create mutual suspicion amongst the allies. One stormy night the Meccans suddenly raised the siege, after it had lasted fourteen days, and returned home; they were followed by the Ghatafán and Solaim. It was with no small joy that the Moslems on the following morning discovered the departure of the enemy; it would have been impossible for them to have held out much longer, exhausted as they were, not less by cold and hunger, than by the fatigues of constantly mounting guard. As soon as Mohammed had given them permission to leave the camp beside the hill of Sal', they dispersed with the greatest alacrity to their homes.

Mohammed, however, did not allow them much time to recruit. Hardly had they reached their abodes, when he again called them to arms against the treacherous Koraiza. The unlucky Jews had been given over to the sword by the withdrawal of the allies; a siege of fourteen days compelled them to surrender unconditionally. The men

¹ The sympathy shown by many scholars for Ibn Obay, whose weakness degenerated into faithlessness, is unjustified.

² Now the citadel; it would seem.

were driven in chains to the house of Osáma b. Zaid, whence on the following morning Mohammed caused them to be brought one by one to the market-place of Medina, and there executed. This continued till late in the evening. They were six or seven hundred in number, and among them was the Nadirite Hoyay b. Akhtab, the author of the War of the Fosse, who had left the Meccans to join his fortunes with those of the Koraiza. By accepting Islam these men could have saved their lives, but they preferred death. No more magnificent martyrdom is known to history. The women and children were sold into slavery; one young woman only, Banána, suffered the penalty of death for having broken the head of a Moslem with a millstone during the siege. With joyous heart and smiling face she went to meet her death, never forgotten by 'Aisha, with whom she was when her name was called. The Prophet selected for himself the fair Raihána, and married her, after having caused her to become a convert to Islara.

The War of the Fosse was the last attack made by the Koraish upon Medina; Mohammed now began to take the offensive towards Mecca. This he at first set about with extreme diplomacy, utilizing the festival, and the truce of God subsisting at the time of the festival, for the purpose of paying a visit to his native town. Although unsuccessful in winning to his side the neighbouring tribes of Bedouins, it was nevertheless with a considerable following (1500 men) that in Dhú 'l-ka'da A.H. 6 (March 628),¹ he set out on his journey. In a dream he had had the key of the Ka'ba delivered to him; on the strength of this his followers believed firmly in the success of the expedition. But the Koraish were determined that the pretext of pilgrimage should not avail their adversary; they summoned their allies and formed a camp to the north of their town for the purpose of preventing the entrance of the Moslems. Mohammed was forced to halt at Hodaibiya on the borders of the sacred territory, and it was in vain that by fair speeches he sought to obtain permission to make the circuit of the Ka'ba. He felt himself too weak to force his way, and accordingly preferred to treat. While the envoys were passing to and fro, there suddenly arose an alarm in the Moslem camp; they apprehended a sudden act of treachery on the part of the Meccans. It was on this occasion that the famous Homage under the Tree took place, when Mohammed pledged his followers by striking hands that they would stand by him and go to death for his sake. Some of the Koraish agents witnessed the scene, and were immensely impressed by it; such an enthusiastic obedience as Mohammed received, such an ascendancy over the minds of men as he exercised, they had never before conceived to be possible, and on their return they urged their people in the strongest way not to permit matters to come to extremities. The Koraish accordingly judged it best to offer a bargain with Mohammed, the terms being that for this year he was to withdraw, so that the Arabs might not say that he had forced an entrance, but that on the following year he was to return and be permitted to remain three days within the sacred territory for the purpose of sacrifice. After some discussion Mohammed accepted this proposal, although zealous Moslems detected a discreditable shortcoming in matters of faith, in so far as it involved turning back within sight of the Ka'ba without being allowed to accomplish the sacred circuit. When the agreement was to be committed to writing, Mohammed dictated the words: "In the name of Alláh, the merciful Rahmán";² but the Meccan plenipotentiary, Sohail b. 'Amr, declared that he knew nothing about Rahmán, and

insisted upon the customary formula—"In thy name, Alláh-homma!" The Moslems murmured, but Mohammed yielded. He then went on to dictate: "This is the treaty of peace between the apostle of God." . . . Sohail anew protested; to acknowledge Mohammed as the apostle of God, would be to declare himself his follower; the designation ought to be simply Mohammed b. 'Abdalláh. The Moslems murmured louder than before, and refused to consent to the change. The heads of the two tribes of Medina, Osaíd b. Ḥoḍair and Sa'd b. 'Obáda, held the hand of the scribe and declared that "Mohammed the apostle of God" must be written, or the sword must decide. The Meccan representatives whispered to one another words of amazement at the spirit displayed by these men. But Mohammed made a sign to the zealots to hold their peace, and again gave way (sur. xvii. 110). The writing which now took shape ran as follows:—

"In thy name, O God! This is the treaty of peace concluded The by Mohammed b. 'Abdalláh and Sohail b. 'Amr. They have agreed treat to allow their arms to rest for ten years. During this time each party shall be secure, and neither shall injure the other; no secret damage shall be inflicted, but uprightness and honour prevail betwixt us. Whosoever wishes to enter into treaty and covenant with Mohammed can do so, and whosoever wishes to enter into treaty and covenant with the Koraish can do so. But if a Koraishite comes without permission of his guardian (Walí) to Mohammed, he shall be delivered up; but if, on the other hand, one of Mohammed's people comes to the Koraish he shall not be delivered up. This year Mohammed with his companions must withdraw from us,³ but next year he may come amongst us and remain for three days, yet without other weapons than those of a traveller, the swords remaining in their sheaths."

The first result of the treaty was that the Khozá'a declared for alliance with Mohammed; while, on the other hand, the Bekr b. Kinána joined themselves to the Koraish.

To compensate his followers for the apparent resultless- War w' Khaiba
ness of this expedition, Mohammed immediately after their return led them out against the rich Jews of Khaibar (northwards from Medina), whither the Banú Naḍir had migrated, and from which place they had uncasing⁴ stirred up opposition against the Prophet. Hitherto he had contented himself with putting out of the way, by means of assassination, some of their leading men who seemed to him to be particularly dangerous, such as Abi Ráfi' and Yosair b. Rázim,⁴ but now he resorted to wholesale measures. In Moharram, A.H. 7 (May 628), he made his appearance before Khaibar with a powerful army; in the plunder only those who had taken part in the expedition of Hodaibiya were to share, but many others besides accompanied them. The Jews, although aware of the hostility of Mohammed's intentions, were nevertheless taken completely by surprise when one morning they saw him and his troops encamp before their strongholds. One of their leaders had given them the excellent advice not to shut themselves up by families in their quarters, but to construct a common camp in the fields, otherwise they were likely to share the fate of their coreligionists in Medina. But they replied that their strongholds were of a different sort, perched on impregnable summits, and they remained shut up within them. They had neither discipline nor order, courage nor devotion. As they were wanting in community of feeling, so also were they lacking in leaders. Their best man, Salám b. Mishkám, lay on a sick-bed; his place was by no means supplied by Kinána b. b. Abi 'l-Hokaik. When they suddenly became aware that they had been completely abandoned by their Arab allies, the Ghaṭafán, their heart utterly failed them. When besieged in any of their citadels, they hardly ever waited

to be stormed, but after one or two sorties evacuated it and withdrew to another, where the same story was repeated. Thus citadel after citadel fell into the hands of the Moslems; treachery, which had something to do with the surrender, was well-nigh superfluous. From Al-Naṭāt the Jews were driven to Al-Shiḳḳ, and at last nothing was left to them but Al-Kaṭiḳa (with Al-Waṭṭi and Solālim).¹ There they remained shut up and filled with fear, without even risking, as formerly, single combats and skirmishes before their citadels. After some time they asked for peace, and obtained it on the footing that they retained their lives, wives and children, and one garment each, but gave up all their property, the penalty of concealing anything being death. Kinana b. b. Abī 'l-Ḥoḳaḳi was cruelly tortured, and at last put to death because he had buried the renowned jewels of his family; thus at the same time his handsome wife Safiya bint Ḥoyay was left free for Mohammed.

His marriage with "the daughter of the king" wound up the prosperous campaign. Safiya felt no repulsion towards the man who had caused the death of her father Ḥoyay, and of her husband Kināna; she gracefully accommodated herself to the situation. More worthy was the demeanour of another Jewess, Zainab, who made the attempt to poison the executioner of her people, and atoned for this offence by her death. The attempt was unsuccessful, but Mohammed believed that even in his last illness he could trace the effects of the poison.

Simultaneously with Khaibar, Fadak also fell into his hands, and shortly afterwards Wadi 'l-Korā, where also there were settlements of Jews. The plunder was very considerable. So far as it consisted of movables, it was gathered together into a heap, and put up to auction; the proceeds were then divided. Mohammed insisted very strictly that no one should be permitted to plunder for his own hand. The property in land, palm plantations, vegetable gardens, were allowed for the time being to remain at a rent in the hands of the Jews; half of the produce had to be paid to the new owners. The lion's share of the spoil fell to the lot of God, *i.e.* of the Prophet—a fifth of the movables, of the real estate a larger proportion. He consequently had at his command considerable material resources, and he well knew how to employ them, not only for the enrichment of his family, but also for gaining over to his side such individuals as were more accessible to payment than to principles.

The peace of Ḥodaibiya, with the subsequent conquest of Khaibar, closes the first period of Mohammed's life at Medina; strictly speaking, indeed, it merely confirmed the status which in point of fact the War of the Fosse had already given him. If at first it seemed as if Mohammed had shamefully given way, it soon became apparent, nevertheless, that the advantage lay with him. "No victory of Islam," Abūbekr was wont to say, "has more importance than the treaty of Ḥodaibiya; men are always for hurrying things on, but God lets them ripen." "Previously there had subsisted a wall of partition between the Moslems and the rest of men; they never spoke to each other; wherever they met, they began to fight. Subsequently hostility died down; security and mutual confidence took its place. Every man of even moderate intelligence who heard of Islam joined it; in the twenty-two months during which the truce subsisted, the number of conversions was greater than throughout the whole of the previous period; the faith diffused itself in all directions among the Arabs."

As a religion Islam did not attract the Arabs; they had

no inclination to pray, read the Koran, and give alms. Of this they had given sufficient evidence by their perennial feuds with Mohammed, and by the murder of divers of his missionaries who were sent to teach them the faith.² We can hardly believe that a new spirit now suddenly possessed them. Their change of attitude was merely due to the imposing effect of the rising might of Islam. They began to respect the Moslems, who, in spite of their small numbers, could defy a whole world, because they were of one mind, and did not ask what the world thought. They saw that, in the great conflict between Mecca and Medina, in which as actors or as spectators they had all participated, the victory inclined more and more to the side of Medina, that force could accomplish nothing against faith. The prestige of Mecca was shaken by the War of the Fosse, and was not restored by the treaty of Ḥodaibiya, in which the Koraiḥ waved Mohammed off with the open hand, and at the same time permitted him to return next year. Islam had "stretched out its neck"—had consolidated itself into indestructible existence—it now fought for victory. There was, moreover, another argument in favour of the new religion, to which the Arabs were very sensible—the rich booty, to wit, which the Moslems acquired by their continual forays. There is no question that the material success of Islam was the chief force that attracted new adherents.

The treaty of Ḥodaibiya gave a breathing space to the two combatants, and of this the prophet reaped the whole advantage. The truce, which lasted for almost two years, brought to the Meccans an almost unbroken series of humiliations and losses. Contrary to all expectation, the provision made in their favour, by which Mohammed bound himself to send back such of their sons as deserted to him before their majority, turned to their hurt, so that they had to ask Mohammed to have it changed.³ Still more serious for them was the desertion of three eminent men, Khālid b. al-Walīd, 'Amr b. al-'As, and 'Othmān b. Ṭalḥa, whom the Prophet received with open arms. Next year they looked on with shame and concealed indignation when the Prophet, availing himself of his stipulated right, entered the city with 2000 men, and performed the sacred ceremonies ('Omrāt al-Ḳaḍā, March 629). Still they were afraid to break with him again, and did not even venture to rid themselves of his spies, the Khozā'a, who lived in their midst. "When they put one foot forward they draw the other back; they are convinced that Mohammed will win"—such was the impression the Koraiḥ made on the Bedouins, who have a very keen instinct in matters of this sort. They had lost confidence in themselves; they knew that the fight was not fought out, but they dared not seek to bring it to a decision.

Against their will the decision came. The Banū Bekr fell upon Mohammed's friends, the Khozā'a, and were supported by some of their Koraiḥite allies. The Khozā'

² See *Vakīdī*, pp. 153-157 (Bir Ma'ūna and al-Rajī'), and the general view of these feuds, *ibid.* p. 29 *sqq.*

³ Abū Basīr had fled to Mohammed to Medina; the Meccans demanded his surrender. He was given up, in spite of his passionate remonstrances, to the two messengers sent to fetch him. But on the road he fell on one of them and slew him with his own sword: the other hastened back to Medina in horror. Abū Basīr followed, thinking Mohammed had now done enough to satisfy the Meccans. Only, however, when the messenger refused the charge of so dangerous a prisoner, did Mohammed permit the latter to go off where he pleased, refusing to allow him to stay with the Moslems. Accordingly Abū Basīr made for the coast-road of the Syrian caravans, and became the leader of other Moslem fugitives from Mecca, who quickly gathered round him. They intercepted all caravans, divided the prey, and slew the men. Abū Basīr's robberies at length induced the Meccans to ask Mohammed by letter to allow him to join his community, and so put an end to the mischief.—*Vakīdī*, p. 261; Ibn Hishām, p. 757 *sqq.*

¹ Such were the names of the three separate quarters of Khaibar, each one made up of a complex of houses and citadels.

with
Mecca

ites complained to the Prophet, who eagerly seized the pretext for war. In vain did the Meccans send Abú Sofyán to Medina to renew the truce; they could not move the Prophet from his purpose. In Ramađan, A.H. 8 (January 630), he moved against Mecca with an army of 10,000 men. With the Emigrants and the Defenders were mustered the Aslam, Ghifár, Mozaina, Jobaina, and Ashja'; the Solaim and the Khozá'a joined them on the way. The Bedouins were drawn by the hope of booty; the Fazárite 'Oyaina was sorely vexed that he had left his Ghatafán at home, not knowing what was in view, for Mohammed at first kept the aim of his expedition a secret. Some of the Meccan nobles must, however, have known it; Makhrama b. Naufal, for example, and the Prophet's uncle, 'Abbás, did not await the capture of their city, but deserted to the enemy while he was still distant. Abú Sofyán, in particular, must have been in the secret; it appears that at Medina he received the promise that the holy city should be spared if it yielded pacifically, and that he pledged himself to do his best to play into the hands of the Prophet.¹ But before the populace it was necessary to keep up the appearance of a sudden surprise, an inevitable submission to an unforeseen display of force. The same comedy was repeated afterwards at Táif; the headmen treated with the Prophet without consulting the Thakáfités, and then contrived that the result of their policy should appear to be forced by the course of events. The Moslems were on the border of the holy land before the Meccans suspected their approach; then suddenly one night 10,000 fires were seen rising to heaven to the north-west of the holy city. In well-feigned surprise Abú Sofyán hastened to the hostile camp; he returned with the news that the Moslems were at the gates, that an improvised resistance could effect nothing against their force; the only wise course was a surrender—Mohammed had promised security to those who remained in their houses or threw away their weapons. The terrified Meccans had hardly any other course open to them than to follow this advice. And now the Moslems entered the city from several sides at once, meeting only at one point with an easily quelled resistance. Mohammed insisted that there should be no violence; he pledged the captains to avoid all bloodshed. Ten persons only were put to the ban, and of these one half were subsequently pardoned. He took all pains to preserve the sanctity of Mecca unimpaired, confirmed the rights and privileges therewith connected, and made it plain that the old cultus should not be less flourishing under Islam. The ceremonies were retained, save only that he abolished all idols, both the domestic gods found in every house and the images in and round the Ka'ba. But every sanctuary outside of Mecca was destroyed, except such as had a part in the celebration of the Feast, and so stood in connexion with the Ka'ba itself. Thus the Meccan worship gained a new and unique importance. Mohammed's reform did for Mecca what Josiah's did for Jerusalem.²

The last step towards that identification of the Ka'ba with Islam, which made it the religious centre of the Moslem world, was not taken till the following year, when the famous Renunciation (Bará'a) of sur. ix. forbade the heathen to share in the Feast, which was henceforth to be a strictly Moslem ordinance, and at the same time abrogated the peace of the holy months. A year later (Dhú'l-Hijja, A.H. 10, March 532) he himself celebrated the Feast for the first time in the orthodox fashion, introducing certain modifications on the traditional practice and

reducing certain varieties of use to uniform rule. In all this he professed to re-establish the true ancient use, purged of heretical deviations from the example of Abraham. At the same time he remodelled the Calendar, forbidding the occasional interpolation of a month as an arbitrary and human invention, and establishing the true lunar year of twelve lunations.

We return to the capture of Mecca. The submission of the Koraish was followed by that of their nomad brethren and allies. But the neighbouring Hawázin, to whom belonged also the Thakáfité inhabitants of Táif, assembled for battle with the Moslems. They camped in Auás between Táif and Mecca. Mohammed advanced against them, and battle was joined in the valley of Honain. The Moslems were broken by the first charge of the foe; for a moment the Prophet himself was in danger, till the Khazraj rallied round him, checked the onset of the Hawázin, and at length turned them to flight. A vast booty rewarded the victors; for the Hawázin had brought all their herds and non-combatants with them and placed them in the rear, that they might feel what they were fighting for.³ Mohammed caused the prey to be conveyed to the glen of Jírána, outside the north-west border of the Haram, a little way off the great valley that descends from Táif; he himself pressed on to Táif itself. Here, however, he failed in his object; in a dream he saw a cock peck a hole in a bowl of cream that was set before him, so that the contents ran out. After fourteen days he gave up the siege and marched to Jírána to deal with the booty. He had deferred this task in the hope that the Hawázin would be tempted to embrace Islam in order to recover their families and cattle. But as they still sent no ambassadors, he had to yield to the pressure of the Bedouins and divide the spoil. When it was too late, the messengers of the Hawázin appeared to announce their conversion; they had now to give up their herds, and content themselves that their wives and children were restored to them, through the mediation of the Prophet with their new masters. The Bedouins received compensation for what they gave up; the Emigrants and Defenders gave up their captives freely. Altogether the men of Medina fared worst in the distribution of booty, though they had borne the brunt of the conflict; those who fared best were the nobles of Mecca, who had no share in the fight, but whom Mohammed desired to conciliate by gifts (sur. ix. 60).

The fall of Mecca reacted powerfully on the future development of Islam. Again the saying came true: *victa victores cepit*; the victory of the Moslems over the Koraish shaped itself into a domination of the Koraish over the Moslems. For this the Prophet himself was to blame. In making Mecca the Jerusalem of Islam, he was ostensibly moved by religious motives; but in reality Mohammed's religion had nothing to do with the heathenish usages at the Ka'ba and the Great Feast. To represent Abraham as the founder of the ritual was merely a pious fraud. What Mohammed actually sought, was to recommend Islam to Arabic prejudices by incorporating this fragment of heathenism, and at the same time he was influenced by his local patriotism. Henceforth these local feelings became quite the mainspring of his conduct; his attitude to the Koraish was determined entirely by the spirit of clannishness. Hence the extraordinary value he set on the conciliation of their chiefs; one gains the impression that he cared more for this than for the conversion of all the rest of the world. He left to them all that they already had; he gave them in addition whatever they asked, if only they would be his good friends. Abú Sofyán was a great man already, but Mohammed hastened

¹ The tradition indeed is silent, but Muir (iv. 120) is justified in drawing this inference from the course of events.

² Snouck-Hurgronje, *Het Mekkaansche Feest*, Leyden, 1880.

³ Among them were relatives of the Prophet's foster-mother, Halima.

to raise his power by giving him rule over a broad tract southward from Mecca. He used every means to make their conversion easy to the Kōraish, and to convince them that they were losing little and gaining much. They had the sense to understand this and act accordingly; they were soon the best of Moslems, and that for the best practical reasons.

The men of Medina, as was natural, felt themselves slighted in a special degree by this petting of the Kōraish. They had done all and sacrificed all for the Prophet; were others now to reap the fruit of their labours? Had they by years of struggle made Mohammed Lord of Mecca, only that they might surrender in favour of Mecca the place they had hitherto held? Did he indeed esteem kinship so much more than tried service to the Faith? The Defenders had good ground for discontent, but Mohammed appeased them easily enough. He reminded them of their fellowship together in the great days of the past, of all that he had done for them, and they for him; he promised that their town should still be his residence, and so the political capital of Islam (Madinat al-Islām). Then all the men wept till their beards were wet, and said: "O apostle of God, we are content with our share and lot!"

The Defenders murmured at the preference shown to the Kōraish, because they desired preference for themselves. But already there were movements of an opposition from principle which deemed it a falling away from Islam to give any heed to kinship instead of to faith. It is related that the beginnings of the Khārijites (Dissenters) go back to the distribution of booty in W. Jirāna.¹ Certain it is that a worldly bias, which had indeed been introduced into Islam long before, then first became visible to every eye. Certain it is that Mohammed then sowed the seeds of the deep dissensions that rent his following after his death—of the struggle between religious democracy, such as Islam demanded, and the national aristocracy, which alone was really fit to hold rule in Arabia. It was Mohammed who placed the helm in the hands of the Kōraish and opened the way to sovereignty for Abū Sofyān and his house, the Omayyads. If the Khārijite Dhū 'l-khowaisira spoke out against the Prophet himself at Jirāna, the feeling that moved him was quite sound.

The last years of the Prophet were like the ingathering of a harvest laboriously reaped. The conquest of Mecca, so great was the impression it produced, was called "*the Conquest*," as if it contained in itself all others. From every side, in the next two years, the sheikhs streamed to Medina to open negotiations for the acceptance of Islam by their tribes; if they did not come spontaneously, Mohammed sent to them. A change of heart on the part of the Arabs had no more share in these than in former conversions. It cost them no struggle to cast away their idols, the images and the sanctuaries fell quietly enough. Heatherism was a dead thing; superstitions could be transplanted into Islam. The unique sovereignty of Allāh was clearly evidenced in the fact that no might could withstand his. It is safe to affirm that the accessions to Islam were due to political more than religious impulses, and meant adherence to the state of Medina rather than to monotheism. The power to which that city had grown, acted as a force of attraction upon the Arabs; and their subjection was not the mere effect of fear, but expressed also that sense of the necessity for peace and order, which had led to the founding of states in the two previous centuries. Thus it becomes intelligible that from every side, by a sort of natural necessity, the

masses of Arabian society were drawn towards the centre of attraction at Medina, and that the Prophet received the homage of distant tribes which he could not have influenced directly. The Christian tribes were not behind the rest, they were Arabs first and Christians after. Only the Christians of Najrān remained true to their faith; so did the Jews in all parts, and the Magians in the province of Bahrain.² The last named, as idolaters, ought not in strictness to have been tolerated in the Moslem state; but practical considerations broke through theory, and the men of system had to accept the inconsistency with the best grace they could.

The signs of submission were—(1) the performance of the five daily prayers, or at least the proclamation of the times of prayer by the Muedhdhin; (2) the payment of the alms-tax;³ (3) the acceptance of the Moslem Law, which was introduced by qualified delegates from Medina. Otherwise things remained as they were; Mohammed was careful not to meddle with tribal affairs, and strengthened the existing aristocracies wherever he could do so. The change of faith was effected by treaty; the populace was not consulted, and the whole negotiations were directed by the Elders and Chiefs. For, in fact, purely political interests were involved.

A single case, about which our information is exceptionally full, will suffice in illustration. The Hawāzin had joined Mohammed after the battle of Honain, and now preached the duty of holy warfare against their kinsmen, the Thaqafites of Tāif, who were still heathens. They made raids on the cattle pastured without the city, and made captives of those who ventured abroad. The Thaqafites were exposed, alone and helpless, to the advances of Islam; they dared not stir a foot beyond their walls. The heads of the city found the situation untenable, and resolved to do homage to the Prophet for the sake of peace. Ten ambassadors proceeded to Medina, and negotiations began as to the conditions of the conversion of the Thaqif. The envoys desired that fornication, usury, and wine-drinking should be permitted to them; this Mohammed refused (sur. xvii. 234; ii. 278; v. 92); and they consented to yield the point when it was explained that, indispensable as these three practices might seem, the other Moslems had learned to give them up. There was more difficulty about the Rabba or Goddess of Tāif (al-Lāt). The ambassadors begged that, as a concession to the foolish multitude, they might retain her for three years. When they found Mohammed resolute, they came down successively to two years, one year, and a month. Even this was refused; Mohammed's sole concession was that they should not be obliged to destroy their goddess with their own hands. The deputation returned, and had nearly reached Tāif, when 'Abdyalil counselled the others to make as if they had broken off the negotiation, and not to confess the conclusion of the pact till the Thaqif showed no stomach for battle with Mohammed. With faces covered, like men who have no good news, they rode into the town, and first paid the customary visit to the temple of the Rabba. Then they told their tribesmen the conditions of treaty, declared them intolerable, and reviled Mohammed as a hard and arrogant man. "And so," they concluded, "prepare for war, lay in provisions for two years; Mohammed will surely not maintain the siege longer; dig a fosse to protect your stronghold, and lose no time." The Thaqafites at first agreed to this; but in a few days they lost courage, and bade the negotiators return and accept the conditions. These then confessed the truth,

² Non-Moslem subjects were made to pay an arbitrary capitation or income tax.

³ The expenditure of this tax was regulated in the case of some tribes by special treaty.

¹ *Vakidi*, p. 377. *Ibn Hishām*, p. 834.

and added that Mohammed's emissaries would presently appear to destroy the Rabba. The destruction took place accordingly, to the terror of the women and children, but without a single man raising his hand.

The pilgrimage undertaken by Mohammed in the year 10 (March 632) was like a very triumph. All Arabia, apart from the vassals of Persia and Greece, lay at his feet. The greatest success of his life had been effected by sheer moral force without a stroke of the sword. But Arabia no longer sufficed him; he had wider aims. In his last years he began to extend the holy war against the Greeks. Even on his return from Hodaibiya, he began to direct envoys to several foreign potentates, with letters demanding their adhesion to Islam. One of these envoys was seized and beheaded in the Belka (the ancient Moab). Hence sprang the first campaign against the Greeks, i.e. the Arabs who were subject to the Greek empire. The army directed against them was, however, entirely defeated at Mu'ta (Autumn 629); Khâlid succeeded with difficulty in rallying and leading back the broken remnant of the host. Next summer the Nabataeans who visited the market of Medina spread a rumour that the Emperor Heraclius was collecting a vast force to attack the Moslems; and Mohammed set forth to meet him at the head of 30,000 men, but got no farther than Tabuk, on the southern borders of ancient Edom, when the rumour was found to be false. The expedition, however, was not altogether fruitless, as it led to the submission of several small Jewish and Christian communities in the north of the Peninsula. Mohammed equipped a new expedition against the Greeks on his return from his "farewell pilgrimage," and it was just ready to start when he died, on Monday, 8th June 632.

In forming an estimate of one who has exercised so unexampled an influence on the history of the world, we shall do well to bear in mind the hint of Gibbon, that "some reverence is surely due to the fame of heroes and the religion of nations." The grounds on which Mohammed may be condemned are partly found in his private life. Although on the whole, even after he had become ruler of all Arabia, he maintained the original poverty and simplicity of his establishment, never set store by money and estate, eating and drinking and soft clothing, strictly continued to fast and watch and pray after his first fashion, and that, too, plainly out of a heartfelt need and without any ostentation, he nevertheless in one point at least used his supreme authority as prophet to make provision for the flesh. He claimed to be personally exempt from those restrictions in regard to the female sex which lay upon all other Moslems, and, as is well known, he made very extensive application of this fundamental principle. This fact is quite rightly urged against him as a reproach; even pious Moslems have been scandalised by it. At the same time, it is unnecessary to judge him on this account more harshly than we do Charlemagne, the most Christian king of the Franks; in any case we must not apply the standards of the present day to the circumstances of old Arabia. Of much weightier and indeed of crushing character is the accusation, that he did not really believe himself to be a prophet, but merely of set purpose played the part of one. For the first years of his activity indeed this charge is not now any longer maintained; it is universally granted that at that period his enthusiasm was genuine and real. But in Medina, we are told, he used his prophetic character simply as a pretext for the establishment of his power. It seems to the present writer that into this opinion there enter modern notions as to the separation between religion and the civil magistracy, which ought to be carefully kept out of sight. By any other instrumentality than that of a prophet it would hardly have been possible to found the state of Medina;

religion was the soul of the community. The founding of a religion and the forming of a state were not connected in so merely external a way as is usually supposed; on the contrary, the one was the natural and necessary consequence of the other. This must certainly be conceded, that, if we are to make any distinctions at all, Islam was far less rich in religious meaning than in social forces. The Koran is Mohammed's weakest performance; the weight of his historical importance lies in his work at Medina and not in that at Mecca. And it is a fact that the politician in him outgrew the prophet more and more, and that in many cases where he assigned spiritual motives he merely did so to give a fair appearance to acts that emanated from secular regards. In this respect it appears to us particularly objectionable that he gave out as revelations of God and placed in the Koran all sorts of regulations and orders of the day, which proceeded simply from his own deliberations or even in part were suggested to him by advisers from outside. At the same time the element of self-deception is not excluded even here; he took for a message sent down from heaven everything which in his cataleptic fits passed through his mind, however close might be its agreement with his own previously cherished thoughts. It was pardonable that he went on with the idea after he had once grasped it, that he blew upon the coals when the flame threatened to die out. It is less easy to free him from the reproach of perfidy and cruel vindictiveness. The surprise of Nakhla in the month Rajab (ordered by him, though he afterwards repudiated it), the numerous assassinations which he instigated, the execution of the 600 Jews at the close of the War of the Fosse, burden the Prophet heavily, and sufficiently explain the widespread antipathy in which he is held. Yet even in this respect it is well not to forget the instance, already cited, of Charlemagne. It is precisely the man of vast aims who finds it most difficult to keep the beaten path.

After the death of Mohammed arose the question who was to be his "representative" (Khalifa, Caliph). The choice lay with the community of Medina; so much was understood; but whom were they to choose? The natives of Medina believed themselves to be now once more masters in their own house, and wished to promote one of themselves. But the Emigrants asserted their opposing claims, and with success, having brought into the town a considerable number of outside Moslems,¹ so as to terrorize the men of Medina, who besides were still divided into two parties. The Emigrants' leading spirit was 'Omar; he did not, however, cause homage to be paid to himself but to Abûbekr, the friend and father-in-law of the Prophet.

Abûbekr
Caliph.

The affair would not have gone on so smoothly, had not the opportune defection of the Arabians put a stop to the inward schism which threatened. Islam suddenly found itself once more limited to the community of Medina; only Mecca and Taif remained true. The Bedouins were willing enough to pray, indeed, but less willing to pay taxes; their defection, as might have been expected, was a political movement.² None the less was it a revolt from Islam, for here the political society and the religious are identical. A peculiar compliment to Mohammed was involved in the fact that the leaders of the rebellion in the various districts did not pose as princes and kings, but as prophets; in this the secret of Islam's success appeared to lie.

Revolt
of the
Arabs.

Abûbekr proved himself quite equal to the perilous situation. In the first place, he allowed the expedition against the Greeks, already arranged by Mohammed, quietly to set out, limiting himself for the time to the defence of Medina. On the return of the army he proceeded to

¹ Compare Muir, iv. 263.

² See Nûldeke, *Beiträge zur Kenntniss der Poesie der alten Araber* (1864), p. 89 sq.

attack the rebels. The holy spirit of Islam kept the men of Medina together, and inflamed them to a death-defying zeal for the faith; while, on the other side, the Arabs as a whole had no other bond of union and no better source of inspiration than universal egoism. As was to be expected, they were worsted; eleven small flying columns of the Moslems, sent out in various directions, sufficed to quell the revolt. Those who submitted were forthwith received back into favour; those who persevered in rebellion were punished with death. The majority accordingly converted, the obstinate were extirpated. In Yamâma only was there a severe struggle; the Banû Hanîfa under their prophet Mosailima fought bravely, but here also Islam triumphed.

The internal consolidation of Islam in Arabia was, strange to say, brought about by its diffusion abroad. The holy war against the border countries which Mohammed had already inaugurated, was the best means for making the new religion popular among the Arabs; for, in spreading by means of the sword the worship of Allâh, opportunity was at the same time afforded for gaining rich booty. This vast movement was organized by Islam, but the masses were induced to join it by quite other than religious motives. Nor was this by any means the first occasion on which the Arabian caldron had overflowed; once and again in former times emigrant swarms of Bedouins had settled on the borders of the wilderness. This had last happened in consequence of the events which destroyed the prosperity of the old Sabæan kingdom. At that time the small Arabian kingdoms of Ghassân and Hîra had arisen in the western and eastern borderlands of cultivation; these now presented to Moslem conquest its nearest and natural goal. But inasmuch as Hîra was subject to the Persians, and Eastern Palestine to the Greeks, the annexation of the Arabians involved the extension of the war beyond the limits of Arabia to a struggle with the two great powers.

Khâlid
of Syria. After the subjugation of Middle and North-Eastern Arabia, Khâlid b. al-Walîd proceeded by order of the Caliph to the conquest of the districts on the lower Euphrates. Thence he was summoned to Syria, where hostilities had also broken out. Damascus fell late in the summer of 635, and on 20th August 636 the great decisive battle on the Hieromax (Yarmûk) was fought, which caused the Emperor Heraclius finally to abandon Syria.¹ Left to themselves, the Christians henceforward defended themselves only in isolated cases in the fortified cities; for the most part they witnessed the disappearance of the Byzantine power without regret. Meanwhile the war was also carried on against the Persians in Irâk, unsuccessfully at first, until the tide turned at the battle of Kâdisiya (end of 637). In consequence of the defeat which they here sustained, the Persians were forced to abandon the western portion of their empire and limit themselves to Eran proper. The Moslems made themselves masters of Ctesiphon (Madâin), the residence of the Sasanides on the Tigris; and conquered in the immediately following years the country of the two rivers. In 639 the armies of Syria and Irâk were face to face in Mesopotamia. In a short time they had taken from the Aryans all the principal old Semitic lands,—Palestine, Syria, Mesopotamia, Assyria, and Babylonia. To these was soon added Egypt, which Amr b. al-Âs, aided by the national and confessional antipathies of the Copts towards the Greeks, overran with little trouble in 641.² This completed the circle of the lands bordering on the wilderness of Arabia; within

Battle
of Kâ-
disiya.

these limits annexation was practicable and natural, a repetition indeed of what had often previously occurred. The kingdoms of Ghassân and Hîra, advanced posts hitherto, now became the headquarters of the Arabs; the new empire had its centres on the one hand at Damascus, on the other hand at Cufa and Basra, the two newly-founded cities in the region of old Babylonia. The capital of Islam continued indeed for a while to be Medina, but soon the Hijâz and the whole of Arabia proper lay quite on the outskirts of affairs.

It is striking to notice how easily the native populations of the conquered districts, exclusively or prevalingly Christian, adapted themselves to the new rule. Their nationality had been broken long ago, but intrinsically it was more closely allied to the Arabian than to the Greek or Persian. Their religious sympathy with the West was seriously impaired by dogmatic controversies; from Islam they might at any rate hope for toleration, even though their views were not in accordance with the theology of the Emperor of the day. The lapse of the masses from Christendom to Islam, however, which took place during the first century after the conquest, is only to be accounted for by the fact that in reality they had no inward relation to the gospel at all. They changed their creed in order to acquire the rights and privileges of Moslem citizens. In no case were they compelled to do so; on the contrary, the Omayyad Caliphs saw with displeasure the diminishing proceeds of the poll-tax derived from their Christian subjects.

It would have been a great advantage for the solidity of the Arabian empire if it had confined itself within the limits of those old Semitic lands, with perhaps the addition of Egypt. But the Persians were not so ready as the **Conquest of Eran** Greeks to give up the contest; they did not rest until the Moslems had subjugated the whole of the Sasanid empire. The most important event in the protracted war which led to the conquest of Eran, was the battle of Nehâwend in 641;³ the most obstinate resistance was offered by Persis proper, and especially by the capital, Istakhr (Persepolis). In the end, all the numerous and somewhat autonomous provinces of the Sasanid empire fell, one after the other, into the hands of the Moslems, and the young Shahanshah, Yazdegerd, was compelled to retire to the farthest corner of his realm, where he came to a miserable end.⁴ But in more than one case the work of conquest had to be done over again: it was long before the Eranians learned to accept the situation. Unlike the Christians of Western Asia, they had a vigorous feeling of national pride, based upon glorious memories and especially upon a church having a connexion of the closest kind with the state. Internal disturbances of a religious and political character and external disasters had long ago shattered the empire of the Sasanids indeed, but the Eranians had not yet lost their patriotism. They were fighting, in fact, against the despised and hated Arabs, in defence of their holiest possessions, their nationality, and their faith. They were subjugated, but their subjection was only outward. The commonwealth of Islam never succeeded in assimilating them as the Syrian Christians were assimilated. Even when in process of time they did accept the religion of the Prophet, they leavened it thoroughly with their own peculiar leaven, and, especially, deprived it of the practical political and national character which it had assumed after the Flight to Medina. To the Arabian state they were always a thorn in the flesh, it was they who helped most largely to break up its internal order, and it was from them also that it at last received its outward deathblow.

¹ De Goeje, *Mémoires d'Hist. et de Géog. Orient.*, No. 3. Leyden, 1864; Noldeke, *D. M. Z.*, 1875, p. 76 sqq.; Beladhori, 137.

² See H. Zotenberg in *Journ. as.*, 1879 (xiii. 291-386). The date perhaps some years too late.

³ The accounts differ: see Beladhori, 305. The chronology of the conquests, as is well known, is in many points uncertain.

⁴ Beladh., 315 sq.; Tabarî, i. 1068.

The fall of the Omayyads was their work, and with the Omayyads fell the Arabian empire. The course of Islam's political history during its first centuries is denoted by the removal of the capital from Damascus to Cufa, and from Cufa to Baghdád, the latter occupying, approximately, the site of the ancient Ctesiphon.

But we must return to the period of Abúbekr. He died after a short reign, on 22d August 634, and as matter of course was succeeded by Omar. To 'Omar's ten years' Caliphate belong for the most part the great conquests. He himself did not take the field, but remained in Medina; he never, however, suffered the reins to slip from his grasp, so powerful was the influence of his personality and the Moslem community of feeling. His political insight is shown by the circumstance that he endeavoured to limit the indefinite extension of Moslem conquest, and to maintain and strengthen the national Arabian character of the commonwealth of Islam;¹ also by his making it his foremost task to promote law and order in its internal affairs. The saying with which he began his reign will never grow antiquated: "By God, he that is weakest among you shall be in my sight the strongest, until I have vindicated for him his rights; but him that is strongest will I treat as the weakest, until he complies with the laws." It would be impossible to give a better general definition of the function of the State. After the administration of justice he directed his organizing activity, as the circumstances demanded, chiefly towards financial questions—the incidence of taxation in the conquered territories,² and the application of the vast resources which poured into the treasury at Medina. It must not be brought against him as a personal reproach, that in dealing with these he acted on the principle that the Moslems were the chartered plunderers of all the rest of the world. But he had to atone by his death for the fault of his system; a workman at Cufa, driven to desperation by absurd fiscal oppressions, stabbed him in the mosque at Medina. He died in the beginning of November 644.

Before his death 'Omar had nominated six of the leading Emigrants who should choose the Caliph from among themselves—'Othmán, 'Alí, Zobair, Talha, Sa'd b. Abí Waqqás, and 'Abd al-Rahmán b. 'Auf. The last named declined to be candidate, and decided the election in favour of 'Othmán b. 'Affán. Under this weak sovereign the government of Islam fell entirely into the hands of the Koraish nobility. We have already seen that Mohammed himself prepared the way for this transference; Abúbekr and 'Omar likewise helped it; the Emigrants were unanimous among themselves in thinking that the precedence and leadership belonged to them as of right. Thanks to the energy of Omar, they were successful in appropriating to themselves the succession to the Prophet. They indeed rested the claims they put forward in the undeniable priority of their services to the faith, but they also appealed to their blood relationship with the Prophet, as a legitimation of their right to the inheritance; and the ties of blood connected them with the Koraish in general. In point of fact they felt a greater solidarity with these than, for example, with the natives of Medina; nature had not been expelled by faith.³ The supremacy of the Emigrants naturally furnished the means of transition to the supremacy of the

Meccan aristocracy. 'Othmán did all in his power to press forward this development of affairs. He belonged to the foremost family of Mecca, the Omayyads, and that he should favour his relations and the Koraish as a whole, in every possible way, seemed to him a matter of course. Every position of influence and emolument was assigned to them; they themselves boastfully called the important province of 'Irák the garden of Koraish. In truth, the entire empire had become that garden. Nor was it unreasonable that from the secularization of Islam the chief advantage should be reaped by those who best knew the world. Such were beyond all doubt the patricians of Mecca, and after them those of Táif, people like Khálid b. al-Walid, 'Amr b. al-'Ás, 'Abdalláh b. Abí Sarh, Moghira b. Sho'ba, and, above all, old Abú Sofyán with his son Mo'áwiya, the governor of Syria.

Against the rising tide of worldliness an opposition, however, now began to appear. It was led by what may be called the spiritual noblesse of Islam, which, as distinguished from the hereditary nobility of Mecca, might also be designated as the nobility of merit, consisting of the "Defenders," and especially of the Emigrants who had lent themselves to the elevation of the Koraish, but by no means with the intention of allowing themselves to be thereby effaced. The opposition was headed by 'Alí, Zobair, Talha, both as leading men among the Emigrants and as disappointed candidates for the Caliphate, who therefore were jealous of 'Othmán. Their motives were purely selfish; not God's cause but their own, not religion but power and preferment, were what they sought.* Their party was a mixed one. To it belonged the men of real piety, who saw with displeasure the promotion to the first places in the commonwealth of the great lords who had actually done nothing for Islam, and had joined themselves to it only at the twelfth hour, while those who had borne the burden and heat of the day were passed by. But the majority were merely a band of men without views, whose aim was not a change of system but of persons, that they themselves might fatten in the vacant places. Everywhere in the provinces there was agitation against the Caliph and his governors, except in Syria, where 'Othmán's cousin, Mo'áwiya b. Abí Sofyán, carried on a wise and strong administration. The movement was most energetic in 'Irák and in Egypt. Its ultimate aim was the deposition of 'Othmán in favour of 'Alí, whose own services as well as his close relationship to the Prophet seemed to give him the best claim to the Caliphate. Even then there were enthusiasts who held him to be a sort of Messiah.

The malcontents sought to gain their end by force. In bands they came from the provinces to Medina to concuss 'Othmán into concession of their demands. From the Indus and Oxus to the Atlantic the world was trembling before the armies of the Caliph, but in Medina he had no troops at hand. He propitiated the mutineers by concessions, but as soon as they had gone, he let matters resume their old course. Thus things went on from worse to worse. In the following year (656) the leaders of the rebels came once more from Egypt and 'Irák to Medina with a more numerous following; and the Caliph again tried his former plan of making promises which he did not intend to keep. But the rebels caught him in a flagrant breach of his word, and now demanded his abdication, besieging him in his own house, where he was

¹ He sought to make the whole nation a great host of God; the Arabs were to be soldiers and nothing else. They were forbidden to acquire landed estates in the conquered countries; all land was either made state property or was restored to the old owners subject to a perpetual tribute which provided pay on a splendid scale for the army.

² Noldeke, *Tabari*, 246. To 'Omar also is due the establishment of the Era of the Flight.

³ Even in the list of the slain at the battle of Honain the Emigrants are enumerated along with the Meccans and Koraish, and distinguished from the men of Medina.

* It was the same opposition of the spiritual to the secular nobility that afterwards showed itself in the revolt of the sacred cities against the Omayyads. The movement triumphed with the elevation of the 'Abbásids to the throne. But, that the spiritual nobility was fighting not for principle but for personal advantage was as apparent in 'Alí's hostilities against Zobair and Talha as in that of the 'Abbásids against the followers of 'Alí.

Omar
Caliph.Othmán
Caliph.

defended by a few faithful subjects. As he would not yield, they at last took the building by storm and put him to death, an old man of eighty. His death in the act of maintaining his rights was of the greatest service to his house and of corresponding disadvantage to the enemy.

Controversy now arose among the leaders of the opposition as to the inheritance. The mass of the mutineers summoned 'Alī to the Caliphate, and compelled even Ṭalḥa and Zobair to do him homage. But soon these two, along with 'Aīsha, the mother of the faithful, who had an old grudge against 'Alī, succeeded in making their escapé to 'Irāk, where at Basra they raised the standard of rebellion. 'Alī in point of fact had no real right to the succession, and moreover was actuated not by piety but by ambition and the desire of power, so that men of penetration, even although they condemned 'Othmān's method of government, yet refused to recognize his successor. The new Caliph, however, found means of disposing of their opposition, and at the battle of the Camel, fought at Basra in November 656, Ṭalḥa and Zobair were slain, and 'Aīsha was taken prisoner.

Mo'awiya.

But even so 'Alī had not secured peace. With the murder of 'Othmān the dynastic principle gained the twofold advantage of a legitimate cry—that of vengeance for the blood of the gray-haired Caliph, and of a distinguished champion, the Syrian governor Mo'awiya. Mo'awiya was not inclined to recognize 'Alī, and the latter did not venture to depose him. To have done so would have been useless, for Mo'awiya's position in Syria was impregnable. The kernel of his subjects consisted of genuine Arabs, not only recent immigrants along with Islam, but also old settlers who, through contact with the Roman empire and the Christian church, had taken on a measure of civilization. Through the Ghassānids these latter had become habituated to monarchical government and loyal obedience, and for a long time much better order had prevailed amongst them than elsewhere in Arabia. Syria was the proper soil for the rise of an Arabian kingdom, and Mo'awiya was just the man to make use of the situation. He exhibited 'Othmān's blood-stained garment in the mosque at Damascus, and incited his Syrians to vengeance.

'Alī's position in Cufa was much less advantageous. The population of 'Irāk was already mixed up with Persian elements; it fluctuated greatly, and was largely composed of fresh immigrants. Islam had its headquarters here; Cufa and Basra were the home of the pious and of the adventurer, the centres of religious and political movement. This movement it was that had raised 'Alī to the Caliphate, but yet it did not really take any personal interest in him. Religion proved for him a much less trustworthy and more dangerous support than did the conservative and secular feeling of Syria for the Omayyads. Mo'awiya could either act or refrain from acting as he chose, secure in either case of the obedience of his subjects. 'Alī, on the other hand, was unable to convert enthusiasm for the principle inscribed on his banner into enthusiasm for his person. It was necessary that he should accommodate himself to the wishes of his supporters, and at the same time it was impossible, for these wishes were inconsistent. They compelled him suddenly to break off the battle of Siffin, which he was on the point of gaining over Mo'awiya, because the Syrians fastened copies of the Koran to their lances to denote that not the sword, but the word of God should decide the contest (end of July 657). But in yielding to the will of the majority he excited the displeasure of the minority, the genuine zealots, who in Mo'awiya were opposing the enemy of Islam, and who regarded 'Alī's entering into negotiations with him as a denial of the

faith. When the negotiations failed and war was resumed, the Khārijites refused to follow 'Alī's army, and he had to turn his arms in the first instance against them. He succeeded in disposing of them without difficulty, but in his success he lost the soul of his following. For they were the true champions of the theocratic principle; through their elimination it became clear that the struggle had in no sense anything to do with the cause of God. 'Alī's defeat was a foregone conclusion, once religious enthusiasm had failed him; the secular resources at the disposal of his adversaries were far superior. Fortunately for him he was murdered (end of January 661), thereby posthumously attaining an importance in the eyes of a large part of the Mohammedan world (Shī'a) which he had never possessed during his life. His son Hasan made peace with Mo'awiya.

The Khārijites are the most interesting feature of the then phase of Islām. In the name of religion they raised their protest against allowing the whole great spiritual movement to issue in a secular and political result, in the establishment within the conquered territories of an Arabian kingdom, a kingdom which diametrically contradicted the theocratic ideal. Islam was then on the point of making its peace with the world, not without a certain apostasy from its original principles, for which Mohammed himself had paved the way. Life was no more dominated by religion, but came to terms with it and parted company. This development was favoured by the government, which desired before all things to have peace. Orthodoxy arose, and thereby religion was tamed and divested of every dangerous element; strictly speaking, it became a compromise, according to which the letter of the precept was correctly followed, in order that, in everything besides, a man might obey his own inclinations. The conditions under which any one might make sure of heaven were—on the one hand, the performance of "good works," i.e. of such *opera operanda* as had a special churchly merit assigned to them; on the other hand, faith in the absolute sovereignty of God even over the wills of men. About morals God showed little concern—the usual view of orthodox shamanism. This was by no means the original standpoint of Islam, although the transition to it was made at an early stage, and by the Prophet himself. Originally Islam—i.e. religious resignation—was only the complement of pious effort; a man set himself about even the hardest and apparently purposeless tasks, because he believed the issue to lie entirely in the hand of God. But now all this was reversed; a man acted according to his humour, because his destiny had nothing to do with his inherent qualities, but was dependent entirely on Allāh's caprice. The Khārijites protested not merely against the dynastic principle and the rule of the Omayyads, but also against orthodoxy; they disputed the doctrine of predestination and the proposition that a great sinner could yet be a good Moslem, because they did not understand how to divorce religion from practice. To some degree they call to mind the Montanists, but their opposition was much more energetic in its expression.¹

Sources.—For the history of Mohammed these are—(1) the Koran; (2) the theologico-historical tradition or Hadīth. The latter is chronologically arranged in the biographies, of which those of Ibn Ishāq and of Wākidi are the oldest and most important. Ibn Ishāq's work in its complete form is now to be found only in Ibn Hishām's revision (ed. Wüstenfeld), but large and numerous fragments of the original are given by Tabarī (ed. De Jong). Of Wākidi the *Kitāb al-Maghāzī*, i.e. the history of Mohammed in Medina, is still extant (abridged German translation by Wellhausen, 1882); his collections for the earlier period are known to us through the work of Ibn Sa'd his secretary (*Tabaqāt*).

¹ On the further development of Islam compare Houtsma, *De Strijd over het Dogma*, Leyden, 1875.

imedit). The Hadith is set forth more systematically, according to subjects, in the great collections of tradition by Málík b. Anas, Bokhari, Moslim, etc. (Bulák editions). A subsidiary authority is the humanistic tradition of the Odábá, with which the poetry may be reckoned. The principal collections of this class are the *Kitáb al-Agháni* (Bulák edition) and the *Kámil* (ed. Wright). For the period after Mohammed the most important work is the *Chronicle of Tabari* (Leyden edition); the history of the conquest is treated briefly after the best authorities by Beládhorí (ed. De Goeje, 1866).

Literature.—The genuine tradition of the Arabs with reference to their prophet was first introduced into Europe by the French, beginning with Gagnier and ending with the valuable work of Caussin de Perceval. Weil and, after him, Nöldeke especially, have

the merit of having shown how to use the Koran in conjunction with the Arab tradition as a main source. Of modern biographies the most important are those of Muir and Sprenger; research has not yet got beyond them, although there is room for this. For the history of the Caliphs, the standard book is still the well-known work of Weil, although since it was published considerable additions have been made to our knowledge of the sources, thanks specially to the labours of Dozy, De Goeje, and other Dutchmen. Hitherto the main object has been to bring together the materials in this department of research, and a comprehensive treatment of the entire subject has not as yet been accomplished: still reference may be made in this connection to Dozy (*Histoire de l'Islamisme*), and A. von Kremer (*Gesch. der herrschenden Ideen d. Islam. and Kulturgeschichte d. Orients unter den Khalifen*). (J. WE.)

PART II.—THE EASTERN CALIPHATE.

SECT. I.—THE OMAYYADS.

I. IN commencing the history of the Omayyad dynasty we must first recur to the causes which brought about the triumph of this family, and which led its chief to substitute Damascus for Medina as the seat of the Caliphate, an event which led to profound changes in the Moslem empire, and exercised a considerable influence on its development. In the same way, at a later date, the transfer of the Caliphate from Damascus to Baghdád marked the accession of a new family to the supreme power, and gave Islam a new direction.

In the time of Mohammed, the Arabs were divided into an infinite number of tribes, some settled, others nomadic, which were constantly at war with each other. The Prophet united them into one body, but he could not entirely eradicate the hatred which had existed for ages between tribe and tribe. Thus the people of Mecca and those of Medina hated each other, because the former were a branch of the race of Ma'add, the great ancestor of the tribes of the North;¹ while the latter belonged to the Yemenite race, or that of the South. The conquest of Mecca by Mohammed and his allies of Medina only exasperated this hatred, and the nobles of the Koraish swore to take revenge on the Yemenites, as soon as they should be able to do so. One of the most violent opponents of the Prophet had been, as we have seen, the father of that very Mo'awiya who founded the Omayyad dynasty, Abú Sofyán, grandson of Omayya, the leader of the Meccans in the battle at Ohod; and it is related that his wife Hind, having found Hamza, Mohammed's uncle, among the dead, cut open his body, and tore out and devoured his liver. We have also seen how Abú Sofyán ultimately made his submission and embraced Islam, but only under compulsion. His son Mo'awiya became, it is true, one of Mohammed's secretaries; but we know that his faith was never very strong, and that he always made his religion subordinate to the interests of his family. Even in his youth, he had conceived the project of recovering the supreme power for his own race, and it has been related above how the inner conflicts of Islam under the Caliphates of 'Othmán and 'Alí carried him forwards towards this goal.

Mo'awiya might, no doubt, have marched to the help of 'Othmán with an army of Syrians; but the preservation of the Caliph, his relative, would not have served the purposes of his burning ambition, and we may say without hesitation that it was with secret joy that the prefect of Damascus heard of the fatal result of the plot against 'Othmán. The Syrians were entirely devoted to Mo'awiya. Polite, amiable, and generous, he had gained the goodwill of all the Arabs of Syria, for whom Islam had remained a dead letter, and who, continuing Bedouins at heart, shared the feelings of their chief against the new

aristocracy of Medina. Consequently, when 'Alí, 'Othmán's successor, summoned Mo'awiya for the last time to acknowledge him, and when Mo'awiya, assembling his partisans in the mosque of Damascus, asked their advice, they replied that it was his part to command, and theirs to obey and to act. The enthusiasm of the Syrians was great; and Mo'awiya having ordered a levy *en masse*, within three days every able-bodied man had joined his standard. Syria alone supplied Mo'awiya with more troops than all the rest of the provinces put together furnished to 'Alí, who is said to have addressed his soldiers with these bitter words: "I would gladly exchange ten of you for one of Mo'awiya's soldiers." Then he added—in allusion to the savage action of Hind, Mo'awiya's mother, on the field of battle at Ohod—"By God! he will gain the victory, this son of the liver-eater!"

'Alí's gloomy anticipations were fulfilled; but it was by stratagem that Mo'awiya gained his victory. The battle of Šiffin, the abortive negotiations that followed, and the withdrawal of the Khárijites, have been already spoken of. The negotiations ended in the conference of Dúmat al-Jandal, a small place situated between Syria and 'Irák, about seven days' journey from Damascus and thirteen from Medina. Here in Ramádan, A.H. 37 (A.D. 657-658), Abú Músá and 'Amr b. al-'Áš (the famous conqueror of Egypt) appeared as arbitrators for 'Alí and Mo'awiya respectively, and the cunning of the latter induced Abú Músá to pronounce both pretendants deprived of whatever rights either might have to the Caliphate, and to say that it now rested with the Moslems to make a new choice. 'Amr, who was only waiting for this declaration, rose in his turn, and said to the Arabs who were crowding round the platform: "O people, ye hear what Abú Músá says. He himself renounces the claims of his master. I also agree to the deprivation of 'Alí, but I proclaim my master Mo'awiya Mo'á-Caliph." Abú Músá cried out against this treachery, but Mo'awiya L no one would listen to him, and he fled for refuge to Mecca, where he ultimately recognised the claims of Mo'awiya, even in 'Alí's lifetime. This event marks the commencement of the Omayyad dynasty. 'Amr went in triumph to Damascus, where the Syrians took the oath of fidelity to Mo'awiya.

In 'Irák, on the other hand, with the exception of the Khárijites, all the people remained faithful to the cause of 'Alí, who, mounting the pulpit at Cufa, summoned his army to the field, and fixed their rendezvous at Nokhaila, a small place not far from the city. The Khárijites had taken refuge at Nahrowán, and 'Alí found it necessary to attack them there, before marching against the Syrians. At his arrival most of the rebels dispersed, except from fifteen to eighteen hundred fanatics, who remained at their post and allowed themselves to be slaughtered to the last man. Thus rid of the Khárijites, 'Alí meant to direct his march towards Syria, but his soldiers refused to move, and declared their intention of first taking some

¹ The Ma'addites are also often called Mođarites and Káisites, after their ancestors Mođar and Káis.

rest at Cufa. Compelled to inaction, 'Alī returned to Cufa, while Mo'āwiya gave his attention to securing the possession of the provinces. At the beginning of A. N. 38 (A. D. 658-659), Egypt was lost to 'Alī. 'Amr b. al-'Āṣ was sent thither by Mo'āwiya, and marched without delay, at the head of five thousand men, against 'Alī's vicegerent, Mohammed, son of the late Caliph, Abūbakr. The brave general Ashtar, whom 'Alī sent to the help of Mohammed, was poisoned at Kolzom by the prefect of that place, acting under secret orders from Mo'āwiya, and 'Alī's troops retraced their steps. Meanwhile, in Egypt itself, a partisan of the Omayyads, Mo'āwiya b. Hodajj, who was at the head of six thousand fighting men, had declared against Mohammed, and driven him from Fostat. On his arrival in Egypt, 'Amr effected a junction with Mo'āwiya b. Hodajj, and the unfortunate Mohammed, beaten by his adversaries, fell into the hands of Ibn Hodajj, who put him to death.

While Egypt was thus being lost to 'Alī, commotions were excited at Basra itself by a partisan of the Omayyads. These were, however, put down by the governor of that city, Ziyād. This man was Mo'āwiya's own brother, but illegitimate, and not having been acknowledged by his father, Abū Sofyān, he had revenged himself by embracing the party of 'Alī. Ziyād was renowned among the Arabs for his eloquence, his resolution, and his courage. At a later period, Mo'āwiya gained him over to his cause by publicly acknowledging him as his brother. At the time we speak of, he was a faithful servant of 'Alī, and as soon as the revolt of Basra was put down, he marched into Fārsistān, where he maintained peace and kept the inhabitants in their allegiance. Meanwhile, however, the other provinces were falling one after the other under the power of Mo'āwiya. His generals penetrated into the heart of Chaldæa; and even in Arabia, where 'Alī's generals had at first gained some advantages, Bosr¹ b. Artah obtained possession of Medina A. H. 40 (A. D. 660-661), and compelled its inhabitants to acknowledge Mo'āwiya. After this he marched upon Mecca, expelled Kotham, 'Alī's governor, and there also exacted an oath of obedience to his master. Following up his successes, Bosr did not hesitate to press southward, and soon gained possession of Yemen. 'Alī was now no longer master of anything but 'Irāk and a part of Persia, and even of these provinces the former was menaced by the Syrians, as we have seen. Taking advantage of some partial successes gained by his forces in Arabia and in Syria, 'Alī made overtures for peace, but they were rejected. Mo'āwiya believed himself too sure of ultimate success to be willing to share the empire.

It was then that three men of the Khārijites conceived the project of delivering Islam from those who were desolating it with fire and blood. 'Abd al-Rahmān b. Moljam, Boraik b. 'Abdallāh, and 'Amr b. Bekr agreed that on the very same day the first should kill 'Alī at Cufa, the second Mo'āwiya at Damascus, and the third 'Amr b. al-'Āṣ at Fostat. They fixed on Friday the 15th of Ramaḍān, A. N. 40, when they were sure of finding their victims at the mosque. The plot was put in execution, but 'Alī alone fell. On the appointed day, Boraik made his way into the mosque of Damascus, and stabbed Mo'āwiya in the back with his sword. Before he could repeat the blow he was seized, and Mo'āwiya recovered from his wound. As for 'Amr, he had been kept at home by illness; his place at the mosque was taken by Khārijā, the chief of his guards; and it was he who fell beneath the blows of 'Amr b. Bekr. 'Abd al-Rahmān was more

successful. As 'Alī was entering the mosque, he dealt him a blow on the head with his sword, and stretched him on the ground mortally wounded. Two days later 'Alī died, and the assassin was put to death with horrible torments.

'Alī left two sons, Hasan and Ḥosain. The people of 'Irāk chose Hasan Caliph. But he, not having his father's energy, recoiled before the prospect of a war with Mo'āwiya. Though he had an army of forty thousand men at his disposal, he preferred to renounce the Caliphate. Besides, one of his generals, Kais b. Sa'd, who had urged him to continue the struggle, and had himself tried the chance of arms, had just been beaten by the Syrians. In consequence of this defeat a mutiny had broken out in Hasan's army. He abdicated, and only demanded, in exchange for the power which he resigned, pardon for his relatives and a yearly pension of five millions of dirhems,² together with the revenues of the Persian city of Dārāb-gird. A treaty to this effect was concluded between Mo'āwiya and Hasan, in spite of the opposition of Ḥosain, who exhorted his brother to continue the struggle; and Mo'āwiya entered Cufa at the head of his army, according to some authorities towards the end of the month of Rabī' I., A. H. 41 (July, A. D. 661), according to others a month or two later. Hasan retired to Medina, where he died eight or nine years afterwards, poisoned, it is said, by order of the Caliph.

Mo'āwiya, who now remained sole master of the Moslem empire, was, however, not yet universally acknowledged. Five thousand Khārijites made head against him in the province of Ahwāz, the ancient Susiana, and a revolt broke out at Basra. Ziyād himself, Mo'āwiya's brother, refused to take the oath to him, and fortified himself at Istakhr, the ancient Persepolis. The revolt at Basra was put down by Bosr b. Artāh, and Moghira b. Sho'ba, whom Mo'āwiya had named prefect of Cufa, accepted the task of bringing about a reconciliation with Ziyād. Ziyād refused to take the oath of allegiance only because he feared being called to account for certain sums of money which were missing from the public treasury of Persia. Mo'āwiya promised to shut his eyes to these irregularities; and Ziyād came to Damascus and was very well received by the Caliph, who hastened to adopt the bastard as his brother, to the great scandal of all pious Moslems.³ After acknowledging Ziyād, who thus became Ziyād son of Abū Sofyān, Mo'āwiya entrusted him with the government of Basra and of Persia, and afterwards with that of Cufa, when Moghira b. Sho'ba died. Ziyād governed 'Irāk with the greatest vigour, to the full satisfaction of Mo'āwiya, who further placed the whole of Arabia under his authority; but in that same year, A. H. 53 (A. D. 672-673), Ziyād died. It seems that Mo'āwiya had thought of him as his successor in the Caliphate. After Ziyād's death, the Caliph wished to secure the throne for his own son Yazid. This was a new violation of the customary rights of Islam; for Mohammed, whose actions served as a rule, had not in his lifetime appointed any one as his successor. Mo'āwiya, who was a statesman above everything, and who held religion very cheap when it interfered with his objects, did not hesitate to create a precedent. He met, however, at first with vigorous opposition, and it was not till some years later that he ventured to have his intentions publicly announced from the pulpit. In Syria the people took the oath of allegiance to Yazid; in Arabia and 'Irāk public opinion declared itself against the step which Mo'āwiya had taken.

² The dirhem is a silver coin worth about a franc.

³ At a later period, the Abbāsid Caliph Mahdī thought it right to have the names of Ziyād and his descendants struck off the rolls of the Korāish; but after his death, the persons concerned gained over the chief of the roll-office, and got their names replaced on the lists. See Tabari, iii. 479.

¹ Not Bishr, as some historians call him. Bosr gave his name to a fortress near Kairawān. Belādhorī calls him Bosr b. Abī Artāh.

The Caliph was not moved; threats prevailed over the obstinacy of the people of 'Irāk, and Mo'āwiya repaired to Arabia in person, at the head of an army, to intimidate the inhabitants of Mecca and Medina. As may be supposed, the principal fomenters of the resistance in Arabia were the sons of the first Caliphs, 'Abd al-Rahmān the son of Abūbekr, 'Abdallāh the son of 'Omar, and Ḥosain the son of 'Alī; for, by submitting, they would have renounced all hope of being themselves chosen by the people. Another 'Abdallāh, son of that Zobair who had been among the six candidates nominated at the death of 'Omar for the choice of the Moslems, was also one of the warmest opponents of the pretensions of Mo'āwiya. All the efforts of the Caliph to win over these personages to his side having proved vain, he ordered them to be brought into the mosque at Mecca, each between two soldiers; then, having mounted the pulpit, he called on the bystanders to take the oath of allegiance to his son, adding that 'Abd al-Rahmān, Ḥosain, and the two 'Abdallāhs would raise no objection. They, in their terror, did not utter a word, and the assembly took the oath. Then Mo'āwiya, without concerning himself further about the malcontents, returned to Damascus.

While thus occupied at home, Mo'āwiya did not neglect foreign affairs. 'Amr b. al-'Ās, governor of Egypt, died A.H. 43 (A.D. 663-664), and was followed by several prefects in succession, under one of whom the general Mo'āwiya b. Hodajj undertook several expeditions into the province of Africa. In the year 50 (A.D. 670) he advanced as far as Camunia, now Sūsa, near which city he laid the foundations of the celebrated Kairawān, and even went on to Sabaratha, a town situated near the seashore, and opposite to the island of C'rina. The emperor, Constantine IV., had sent thither thirty thousand Greeks, who were beaten and compelled to re-embark in haste. Mo'āwiya b. Hodajj returned to Egypt after his victory, and the Caliph now considered the position of the Moslems in Africa so strong, that he separated that province from Egypt, and appointed as governor of Africa 'Okba b. Nāfi, who permanently established Kairawān, in a plain situated at a little distance from the first encampment of Mo'āwiya b. Hodajj. According to some historians, the new city was completed A.H. 55 (A.D. 674-675).

In the East the successes of the Moslems were still more brilliant. Ziyād, brother of Mo'āwiya, as soon as he was appointed governor of 'Irāk and Persia, sent an army into Khorāsān. It advanced as far as the Oxus, crossed that river, and returned loaded with booty taken from the wandering Turkish tribes of Transoxiana. Bokhārā was occupied by a son of Ziyād, and Sa'd, son of the Caliph 'Othmān, whom Mo'āwiya had made governor of Khorāsān, marched against Samarkand, A.H. 56 (A.D. 675-676). Other generals penetrated as far as the Indus, and overran and conquered Mūltān, Kābūlistān, Mokrán, and Sijistān.

In the North the Moslems were not less fortunate in their attacks on the Byzantine empire. Mo'āwiya, while still only governor of Syria, had gained possession of Armenia, and had sent a fleet against Cyprus, which, in conjunction with that of the governor of Egypt, had effected the conquest of that island. Encouraged by the result of this expedition, he gave the order for new incursions in the Mediterranean. His fleet of twelve hundred vessels invested the islands of Cos, Crete, and Rhodes. The famous Colossus of Rhodes was broken to pieces, and it is said that the bronze of which it was made was bought by a Jew of Emesa, and formed a load for nine hundred and eighty camels. The Arabs even dared to threaten Constantinople, which owed its safety only to the Greek fire. Yazīd, the son of Mo'āwiya, took part in these

expeditions, but with no great ardour, and in the year 58 (A.D. 677-678) Mo'āwiya concluded a thirty years' peace with Constantine IV. Two years later, he died at Damascus, after a reign of nearly twenty years. He had been governor of Syria for the same length of time. Before his death, he sent for his son Yazīd, and having pointed out how he had smoothed down all difficulties for him, he advised him to spare no effort to preserve the attachment of the Syrians. He urged him also to keep a close watch on the actions of Ḥosain b. 'Alī, and of the other pretenders who had refused to take the oath of allegiance to him; but he added that, should they rebel, Yazīd ought to treat them with clemency, and not to forget their illustrious origin. By failing to act upon this wise advice, Yazīd rendered irreconcilable that formidable schism which, even at the present day, still divides the Moslem world, and which, at all periods has been a source of calamity to Islam.

2. Yazīd had not his father's genius. Passionately Yazīd fond of pleasure, and careless about religion, he bestowed more care on turning a pretty couplet than on consolidating the strength of his empire. During his short reign he committed three actions for which Moslems never pardoned his memory: the murder of Ḥosain, son of 'Alī and grandson of the Prophet; the pillage of Medina, and the taking of the Ka'ba, the venerated temple of Mecca, crimes which were not redeemed in the eyes of the people by a few fortunate expeditions on the part of his generals.¹

Immediately on ascending the throne, in the month Rajab A.H. 60 (April, A.D. 680), Yazīd sent a circular to all his prefects, with an official announcement of his father's death, and an order to administer the oath of allegiance to their respective subjects. In particular, he charged the new prefect whom he appointed to Medina, his own cousin Walīd b. 'Otba, to strike off the heads of Ḥosain son of 'Alī, 'Abd al-Rahmān son of Abūbekr 'Abdallāh son of 'Omar, and 'Abdallāh son of Zobair, if they again refused to acknowledge him. Terrified at such a commission, Walīd did not dare to act with rigour against Ḥosain and 'Abdallāh b. Zobair, both of whom refused to take the oath, but allowed them to escape to Mecca. Yazīd immediately deprived him of his office, and appointed in his place 'Amr b. Sa'īd, already governor of Mecca. Once in the Holy City, 'Abdallāh b. Zobair thought himself in such perfect safety that he began to intrigue with the Meccans to have himself proclaimed Caliph in Arabia. At Cufa the news of the flight of Ḥosain produced great agitation among the partisans of the family of 'Alī, who were numerous there, and they sent several addresses to the grandson of the Prophet, inviting him to take refuge with them, and promising to have him proclaimed Caliph in 'Irāk. Ḥosain, who knew the fickleness of the people of 'Irāk, hesitated to yield to their entreaties, but Ibn Zobair, who was desirous to get rid at all costs of so formidable a rival, persuaded him that he ought to go and put himself at the head of the people of 'Irāk, and enter on an open struggle with Yazīd. Ḥosain began by sending his cousin Moslim b. 'Aḳīl to Cufa, and from him he learned that many of the inhabitants of that city appeared really decided to support him. The prefect of Cufa, No'mān b. Bashīr, though apprised of these proceedings, did not choose to make them known to Yazīd, as he was reluctant to act with severity against a descendant of the Prophet. Information, however, reached the Caliph, who deprived No'mān of his office, and ordered

¹ Salām b. Ziyād invaded Sogdiana, and brought back immense booty to Merv. In Africa 'Okba b. Nāfi' invaded the whole coast of the Mediterranean as far as Morocco. On his return, however, he fell into an ambuscade laid by the Berbers, who killed him and took Kairawān.

'Obaid Allāh, son of the famous Ziyād, and then governor of Basra, to give up his post there to his brother 'Othmān, and to repair in person to Cufa, in order to watch the partisans of 'Alī in that city. 'Obaid Allāh obeyed, entered Cufa, and, ascending the pulpit the very day after his arrival, publicly announced his firm intention of putting to death any one who should rebel. Moslim b. 'Aqil was given up by a traitor and executed. Meanwhile Ḥosain, on receiving his cousin's despatches, had already set out from Mecca with all his family, and had reached Kādisiya (a place situated only fifteen parasangs¹ from Cufa, and noted for the defeat sustained there by the Persians during the Caliphate of 'Omar), when he received the news of these vexatious occurrences. He wished to retrace his steps immediately, but the friends of Moslim dissuaded him from doing so, crying out for revenge, and representing to him that doubtless he had only to show himself under the walls of Cufa to be received with enthusiasm by its inhabitants. Ḥosain accordingly pursued his journey towards Cufa. But 'Obaid Allāh, who was watching all his movements, sent four thousand horsemen, devoted to the Omayyad cause, to meet him, with orders to bring Ḥosain before him either alive or dead. The commander of these horsemen was 'Omar b. Sa'd,² to whom 'Obaid Allāh had promised the government of Media as a reward, if his expedition should succeed. The Omayyads met Ḥosain in the plain of Kerbelā, opposite to Cufa, before he had reached the Euphrates, and surrounded him. 'Omar b. Sa'd himself sought out Ḥosain and summoned him to surrender. Ḥosain declared himself ready to renounce his pretensions, provided he were allowed to return to Mecca with his followers, or were even sent to Damascus. When 'Obaid Allāh was informed of this proposal, he simply repeated his former order to bring Ḥosain to Cufa, dead or alive; and, fearing the defection of 'Omar b. Sa'd, he sent out another troop of horsemen under the orders of a certain Shimr. On the 9th of Moharram in the year 61 (9th October A.D. 680), Shimr reached Kerbelā, and summoned Ḥosain afresh to surrender at discretion. Ḥosain preferred to die sword in hand, and on the following day, after a desperate struggle, he was cut down with all his followers. His head was cut off and carried to Cufa, and then sent to Damascus. His body was not buried till the following day. Only the women of his family were spared, and one of his sons; these were taken by Yazid's order to Medina, where the sight of their mourning and the tale of their sufferings caused a profound sensation. The horror and grief of the partisans of 'Alī's family were great. Hence the names of Yazid, 'Obaid Allāh, and Shimr, have been held accursed ever since by the Shi'ites.³ They observe the 10th of Moharram as a day of public mourning. Among the Persians, stages are erected in public places on that day, and plays are acted, representing the misfortunes of the family of 'Alī.⁴ The Omayyads themselves were loud in their reprobation of this impious massacre, and all Moslems, without distinction of party, considered it a monstrous act.

At Mecca the news was received with a degree of indignation of which 'Abdallāh b. Zobair took advantage to assume the title of Caliph. As early as A.H. 60, the new prefect of Medina had tried to secure his person. He had sent against him a force of two thousand men, at whose

head was placed a brother of the pseudo-Caliph himself, called 'Amr, who, having been accused by 'Abdallāh of maintaining a guilty intercourse with one of his wives, had become his bitter enemy. 'Abdallāh collected an army, and placed it under the orders of 'Abdallāh b. Šafwān, who completely defeated the Omayyad troops. The brother of the pseudo-Caliph was taken and put to death. At the news of this defeat, Yazid swore that Ibn Zobair should never appear before him but as a prisoner in chains. He dismissed the new prefect of Medina, and reinstated Walid b. 'Otba, who, in the year 61, went to Mecca to try to seize 'Abdallāh b. Zobair. The latter, in derision, wrote to Yazid: "Walid is a madman, who will ruin everything by his folly; send in his place another governor to repair the wrongs he has done." Yazid thought that 'Abdallāh meant these words as a step towards reconciliation; hastened to deprive Walid of his office; appointed 'Othmān b. Mohammed in his place; and even sent envoys to Ibn Zobair. He, however, would not listen to them; he thought he could reckon upon the devotion of the people of Mecca, and further hoped that Medina itself would declare against Yazid. This, in fact, took place in the year 63 (A.D. 682-683). The people of Medina, stirred up by a certain 'Abdallāh b. Hanzala, who had had a near view of Yazid at the court of Damascus, and had been scandalized by the profligacy of his life, revolted, drove the governor and all the Omayyads out of Medina, and proclaimed the dethronement of Yazid. The Caliphate was even offered by some to 'Alī, that one of the sons of Ḥosain who had escaped the massacre of Kerbelā; but 'Alī wisely refused it. At the news of this revolt, Yazid first sent an ambassador to Medina. This step proving fruitless, he next collected an army of from ten to twelve thousand Syrians, and entrusted their command to Moslim b. 'Oqba, who passed, and with good reason, for a man who would recoil from nothing. This general, though weighed down by age and sickness, marched against Medina, took it, after a battle known as the day of Harra⁵ (26th Dhū 'l-Hijja 63, 26th August 683), and gave up the city for three days to massacre and pillage. Torrents of blood flowed, and hence Moslim b. 'Oqba received the surname of *Mosrif* (the Prodigal). On the fourth day, Moslim repaired to the mosque, and received the oath of allegiance from all those of the citizens of Medina who had not been able to make their escape. The news reached Mecca a few days later, and fell like a thunder-stroke on Ibn Zobair and his adherents, who prepared for war, expecting from day to day to see Moslim appear before the walls of their city. He had, in fact, started for Mecca immediately after the conquest of Medina; but he died on the road, and the command was taken by Ḥosain b. Nomair. The Omayyad army arrived before Mecca a month after the capture of Medina, and found Ibn Zobair ready to defend it. A number of the citizens of Medina had come to the aid of the Holy City, as well as many Khārijites and Shi'ites, at the head of whom was a certain Mokhtār b. Abi 'Obaid, who subsequently played a very important part in 'Irāk. In spite of the sorties of the Meccans, the Syrian army invested the city. Ḥosain b. Nomair had caused balistas to be placed on the neighbouring heights; and these, under the management of an Abyssinian soldier, hurled against the Ka'ba enormous stones and vessels full of blazing bitumen, with such effect that the temple took fire and was consumed. After a siege of two months, Ibn Zobair was beginning to despair, when he received, through an Arab of the desert, news of the death of Yazid. The Caliph had in fact died on the 15th of Rabī' I. (11th November 683).

Capture and pillage of Medina.

¹ The parasang is nearly equivalent to an English mile.

² Son of the famous Sa'd b. Abi Waqqās, conqueror of Persia under 'Omar, and founder of Cufa.

³ Shi'ites comes from *Shi'a*, a word which in Arabic signifies "sectary." It is the name given to the partisans of the family of 'Alī, who acknowledge no legitimate Caliphate outside of that family. Shi'ism is the religion of Persia.

⁴ See Chodzko, *Théâtre persan*. Paris, 1878.

⁵ Harra is the volcanic district outside of Medina. One of the gates of the city is called the Gate of Harra.

Hosain b. Nômair immediately offered the Caliphate to Ibn Zobair, on condition that he should grant a complete amnesty to all those who had taken part in the battle of Harra and in the siege of Mecca. 'Abdallâh had the folly to refuse, and Hosain then returned to Damascus.

Thus rid of his enemy, 'Abdallâh caused the title of Prince of the True Believers (Amîr al-mo'minin) to be conferred on him—a title which 'Omar had already received, and which was afterwards adopted by all the Caliphs. He sent one of his brothers, 'Obaid Allâh, to Medina, and chose as governor of Egypt 'Abd al-Rahmân b. Jahdam, who repaired to that province, and caused the authority of Ibn Zobair to be acknowledged there. At Basra and at Cufa, many of the inhabitants did not hesitate to acknowledge him, and received a Zobairite governor, while the Khârijites and the Shî'ites rose in revolt—the former at Basra under the leadership of Nâfi' b. Azrak, the latter at Cufa under that of Solaimân b. Šorad—and expelled the Omayyad governor, 'Obaid Allâh b. Ziyâd, who took refuge at Damascus. Mesopotamia soon followed the example of 'Irâk. Even in Syria, the population seemed disposed to forsake the cause of the Omayyads. The Khârijites and Mokhtâr b. Abi 'Obaid, who had supported Ibn Zobair, now repented of having laboured for the elevation of this pretender, and quitted Mecca. The son of Zobair, remaining thenceforth sole master of Mecca, occupied himself tranquilly in rebuilding the Ka'ba, which he restored on its ancient foundations.

3. It was in the midst of this break-up of his party that, immediately after the death of Yazîd, his eldest son, Mo'âwiya II., was elected Caliph at Damascus at the age of only seventeen or twenty. He was a young man of weak character, and imbued, it is said, with Shî'ite opinions. He felt himself incapable of ruling, and was contemplating abdication, when he died, after a reign of but forty days, by poison, as some say; of the plague, as others assert. The Caliphate was immediately offered to 'Othmân b. 'Otba b. Abi Sofyân, cousin of Mo'âwiya II.; for Khalid, the second son of Yazîd, was only sixteen years old. 'Othmân b. 'Otba, however, having made it a condition of his election that he should not be compelled to enter on any war, or to condemn any one to death, the choice fell at Damascus on Merwân b. al-Hakam, a descendant of Omayya through his grandfather Abû 'l-'Âs, but on condition that he should marry Maisûn, the widow of Yazîd, and should appoint Khâlid, her son, as his successor.

4. Merwân b. al-Hakam had been secretary to the Caliph 'Othmân, and governor of Medina under Mo'âwiya I. Yazîd, on his accession to power, had dismissed him and put Walîd b. 'Otba in his place; but Merwan had continued to live at Medina, and had been driven from it during the revolt of the year 63, and again in the following year, when 'Obaid Allâh b. Zobair had taken possession of that city in the name of his brother. It might have been thought that Merwân would cherish a deep hatred of 'Abdallâh Ibn Zobair; but he was an old man of sixty-two at the time of his election, and, dreading an unequal struggle, he was on the point of making his submission to the Meccan Caliph. The drooping courage of Merwan was revived by his son 'Abd al-Melik and by 'Obaid Allâh b. Ziyâd, and he resolved to try the chances of war.

Dahhâk b. Kaïs, governor of Damascus, had declared himself on the side of Ibn Zobair, and had raised an army, principally from among the tribe of Kaïs. This tribe had taken offence because Mo'âwiya I. and Yazîd had chosen their wives from the Yemenite tribe of Kalb, and, continuing to resent their conduct, now refused to acknowledge Khâlid as the heir-presumptive of Merwân. It was therefore on the Yemenites that Merwan had to depend for the suppression of Dahhâk's rebellion. The latter had an

army of nearly sixty thousand horsemen, while Merwân could bring together only thirteen thousand infantry. The two armies met at Marj Râhit, a few miles from Damascus, and, after a series of combats which lasted for twenty days, Merwân's troops gained a complete victory, and Dahhâk was among the killed. The Syrian provinces hastened to acknowledge the conqueror, and Merwân was able to turn his attention to Egypt, which, as will be remembered, had submitted to the Meccan. 'Abd al-'Aziz, a son of Merwân, had already marched to Aila on the Red Sea, and was preparing to enter Egypt; Merwân joined him, and the Zobairite governor of Egypt, beaten by their united forces, was obliged to seek safety in flight. Merwan made 'Abd al-'Aziz governor of the province. At the beginning of the year 65 (A.D. 684-685) Merwân returned in haste to Syria; for, during his absence, a brother of Ibn Zobair, named Moš'ab, had invaded that province. Merwân triumphed over Moš'ab; but an army of four thousand men, which he had sent to the Hijâz, and in which was Hâjjâj b. Yûsuf—then quite a young man, but who afterwards played so important a part under 'Abd al-Melik—was cut to pieces. This defeat was redeemed by a victory gained by his generals, 'Obaid Allâh b. Ziyâd and Hosain b. Nômair, at 'Ain al-Warda over a small army of Shî'ites led by Solaimân b. Šorad. But while the battle was being fought in Ramađan 65 (April-May 685), Merwân died; suffocated, it is said, by his wife Maisûn, because he had insulted her son Khâlid, and had broken his word by nominating his own son 'Abd al-Melik as his successor. The accession of 'Abd al-Melik was attended with no difficulty, as he was acknowledged by the whole of Syria and Egypt. The Kaïsîtes naturally rallied round him, because he had not a drop of Yemenite blood in his veins.

5. When 'Abd al-Melik ascended the throne, there still remained much to be done before the unity of the empire could be re-established. Ibn Zobair was still master of Arabia and of 'Irâk, though in the latter province his authority was very much shaken by the permanent rebellion of the Shî'ites at Cufa, and of the Khârijites at Basra. The Zobairite general Mohallab had, it is true, succeeded in forcing back the Khârijites into Susiana and Persia; but at Cufa the Shî'ites, at the instigation of Mokhtâr, continued their agitation. Mokhtâr, as we have seen, had withdrawn from Mecca after the raising of the siege by Hosain b. Nômair. He returned to Cufa, and there fomented serious disturbances. Many of the inhabitants of that city repented bitterly of having allowed Hosain, the grandson of the Prophet, to be massacred. Amid the general disorder of the Moslem empire, Mokhtâr hoped to make his own authority acknowledged in 'Irâk and Mesopotamia. He put himself forward as the avenger of the family of 'Alî, and pretended to have been commissioned by a son of 'Alî, Mohammed b. Hanafiya,¹ who was living at Medina, to give effect to his rights to the Caliphate. Many Shî'ites believed him, and, detesting their chief Solaimân b. Šorad, joined Mokhtâr. On learning these intrigues, the Zobairite governor threw him into prison. Soon after the defeat of Solaimân at 'Ain al-Warda, at the request of Mokhtâr's brother-in-law, who was no other than 'Abdallâh the son of 'Omar, the governor consented to set him at liberty, on his swearing to make no further attempts against him. As Solaimân had fallen on the

¹ That is to say, the son of the Hanafite woman. The mother of Mohammed was of the tribe of Hanifa. Even before Mokhtâr, Mohammed had partisans who looked on him as destined to be Caliph. These sectaries received the name of Kaïsânites, from a freedman of 'Alî, called, Kaïsân, who was the most ardent advocate of Mohammed's pretensions. After Mokhtâr had declared in favour of Mohammed, his supporters received the name of Mokhtârîtes.

field of battle at 'Am al-Warda, all the Sh'fites now acknowledged Mokhtár as their chief. He, however, considering himself bound by his oath, remained inactive until the governor who had imposed it was replaced by 'Abdalláh b. Motí. The now Zobairite governor, suspecting with reason that Mokhtár was about to recommence his intrigues, thought it advisable to invite him to his house, with the intention of having him arrested. Mokhtár called his partisans together, and plotted with them to take Ibn Motí by surprise. As, however, Sa'd, one of the Sh'fite chiefs, asked for a delay of a week, for the purpose of collecting troops, Mokhtár was obliged to feign illness in order to evade the governor's invitation, and took care to surround himself with a numerous body of guards. Meanwhile Sa'd, who had only demanded this delay in order to ascertain the real wishes of Mohammed b. Hanafiya, sent off four confidential messengers to Medina, to ask Mohammed whether he had really confided the care of his interests to Mokhtár. Mohammed contented himself with replying vaguely that it was the bounden duty of every good Moslem to take part with the family of the Prophet. These words were interpreted in favour of Mokhtár, and thenceforward all the Sh'fites followed him blindly as their chief. Mokhtár fixed the middle of the month Rabí I., A.H. 66, for the commencement of hostilities. During the night of the 13th to the 14th, the conspirators intended to gain possession of the city by a *coup de main*; but the governor was on his guard, and Mokhtár and his Sh'fites took the course of leaving Cufa. They numbered sixteen thousand resolute men. All the armies which Abdalláh b. Motí sent against them were successively beaten, and Mokhtár soon re-entered Cufa in triumph, compelling the Zobairite governor to flee to Basra. Once master of Cufa, Mokhtár thought himself already in possession of the empire. He sent emissaries to Medina, to Mosul, to Madáin, and even into Azerbaiján, with orders to induce the people to take the oath of allegiance to him. He then sent his generals, Yazíd b. Anas and Zofar, against the Omayyad army, which had entered Mesopotamia after the battle of 'Ain al-Warda, and these prevented the advance of the Syrians into 'Irák. Another of Mokhtár's generals, Ibráhm b. Málik, inflicted a serious defeat on the Syrians near Mosul, and 'Obaid Alláh b. Ziyád, who commanded them, fell in the battle. Ibráhm was rewarded by Mokhtár with the government of Mosul. Mokhtár himself next took the title of "lieutenant of the Mahdí"¹ and inserted in the *Khotba*, on Friday's preaching, a prayer on behalf of Mohammed b. Hanafiya; which was equivalent to declaring him Caliph. After this, urged on by his adherents, he caused all those who had taken part in the massacre of Hosain, the grandson of the Prophet, like 'Omar b. Sa'd and Shimir, to be sought out and put to death.

While these events were occurring, the Caliph at Damascus, 'Abd al-Melik, sent an army of observation to the frontiers of Arabia. Mokhtár, having been informed of this, feigned an intention to help Ibn Zobair, and despatched a body of three thousand men from Cufa, under the command of a certain Sharáhlí. His real object was to concentrate forces at Medina, with a view to attacking Ibn Zobair. But the latter penetrated his design, and two thousand Meccans marched by his orders to meet Sharáhlí, who was defeated.

In the same year (A.H. 66) Mohammed b. Hanafiya had gone to Mecca to perform the ceremonies of the pilgrimage.

¹ Mahdí, or "the well-guided," is the name given by the Sh'fites to that member of the family of 'Alí who, according to their belief, is one day to gain possession of the whole world, and set up the reign of righteousness in it. In Mokhtár's time, Mohammed b. Hanafiya was looked upon as the Mahdí.

Ibn Zobair took advantage of this to seize his person, and confined him in a small house adjoining the well of Zamzam, within the precincts of the Ka'ba. Mohammed succeeded in conveying intelligence of his detention to Mokhtár; and he, delighted to find his aid implored by the very man whose follower he called himself, swore to effect his rescue. He despatched a thousand chosen horsemen, who managed to conceal their march so well, that they were under the walls of Mecca before the son of Zobair had been able to make the slightest preparations for defence. They made their way into the Holy City; but, being unwilling to draw the sword on that sacred ground, they armed themselves with sticks, broke in the doors of the house in which Mohammed b. Hanafiya was imprisoned, rescued him, and escorted him out of the city. A son of Mohammed, called 'Alí, who had also been thrown into prison, likewise succeeded in escaping, and rejoined his father at some distance from Mecca.

In the following year, Ibn Zobair, who was determined to get rid, at all costs, of so dangerous an adversary as Mokhtár, ordered his brother Mos'ab to effect a junction with Mohallab, the conqueror of the Khárijites, and to march against Cufa. Mos'ab and Mohallab invested that city, and Mokhtár, making a sortie against them, was beaten, taken prisoner, and beheaded. 'Irák thus, for the second time, fell under the rule of Ibn Zobair. Ibráhm b. Málik, who held Mosul in the name of Mokhtár, submitted to the conquerors, on condition of retaining his government; but Mos'ab deprived him of his office, and put Mohallab in his place. He himself was appointed governor of 'Irák by his brother, and, having installed himself at Basra, placed Cufa under the orders of his lieutenant Háriith. The year after, the Khárijites of Susiana raised a fresh insurrection, and invaded 'Irák. Mohallab had to be recalled from Mosul, and during his absence it was Ibráhm b. Málik whom Mos'ab chose to supply his place. The period of the pilgrimage caused a momentary truce to all these struggles, and in that year was seen the curious spectacle of four different standards planted near Mecca, belonging respectively to four party chiefs, each of whom was a pretender to the empire: the standard of 'Abdalláh b. Zobair, Caliph of Mecca; that of the Caliph of Damascus, 'Abd al-Melik; that of the son of 'Alí, Mohammed b. Hanafiya; and that of the Khárijites, who were at that time under the command of Najda b. 'Ámir. Such, however, was the respect inspired by the holy places, that no disorders resulted from the presence of so many inveterate rivals.

The Omayyad Caliph, whose troops had been beaten in Mesopotamia, and who had been hitherto content to watch the frontiers of Arabia, was again prevented from pushing on military operations more actively by the breaking out of troubles in Syria. At the beginning of A.H. 69 (A.D. 688-689), 'Abd al-Melik having left Damascus at the head of a numerous army, with the purpose of marching against 'Irák, the Omayyad 'Amr b. Sa'id, whom he had appointed governor of Damascus, took advantage of his absence to lay claim to the supreme power, and to have himself proclaimed Caliph by his partisans. 'Abd al-Melik was obliged to retrace his steps, and to lay siege to his own capital. The garrison of Damascus took fright, and deserted their posts; so that 'Amr b. Sa'id, abandoned by his followers, was compelled to surrender at discretion. 'Abd al-Melik at first meant to spare him, but he afterwards changed his mind, and struck off his head with his own hand. Scarcely had he suppressed this revolt, when the Emperor of Constantinople, Justinian II., in violation of the thirty years' truce formerly concluded between Mo'áwiya I. and Constantine IV., sent a Greek army to invade Syria. 'Abd al-Melik was obliged to buy peace

for the time, for he required all his forces to dispute the empire with the son of Zobair. He consented, it is asserted, to pay the Greeks an indemnity of one thousand pieces of gold weekly. He then gave his attention to the renewal of the projected expedition against 'Irāk. Moš'ab the Zobairite had rendered himself odious to the inhabitants of Basra and Cufa by his exactions, and a party favourable to 'Abd al-Melik was already forming in those cities. The Omayyad Caliph marched forth at the head of an army composed of Syrians and Egyptians, and encamped three parasangs from the plain of Dair al-Játhalk, not far from the site of Baghdád, where Moš'ab had established his army. Before joining battle, 'Abd al-Melik had written secretly to all the chiefs of Moš'ab's army, making them the most seductive promises if they would agree to desert the cause of Moš'ab. This step was crowned with success, and on the eve of the battle, which took place on the 13th Jomádí II., A.H. 71 (23d November 690), several of these generals passed into the camp of 'Abd al-Melik with arms and baggage. Moš'ab nevertheless attacked his enemy, but during the battle he found himself deserted by his troops, and, not choosing to survive his defeat, he caused himself to be slain. This victory opened the gates of Cufa to 'Abd al-Melik, and all 'Irāk received him with acclamations. He remained forty days at Cufa, and then, having given the government to his brother Bishr, while Khálid b. 'Abdalláh received that of Basra, he returned in triumph to Damascus. Soon after, the Omayyad arms having sustained a check from the Khárijites in Fársistán, the Caliph gave Khálid orders to march against those sectaries with the support of Mohallab, who was their terror, and of the governor of Rey. Khálid succeeded completely in this expedition, and drove the Khárijites out of Ahwáz, Fársistán, and Kirmán. On his side, the Omayyad Caliph stirred up a revolt in Khorásán, a province which still remained faithful to the Zobairite cause. Its governor was treacherously assassinated by his lieutenant Bokair, who received, as the price of this service, the governorship of the province.

Only Arabia now remained to Ibn Zobair. In A.H. 72 'Abd al-Melik made preparations for depriving him of it. Accordingly he raised an army; but when his generals found that another siege of Mecca was in contemplation, not one of them was willing to accept such a mission. An obscure officer, Hajjáj b. Yúsuf, boldly offered to lead the expedition. 'Abd al-Melik had little confidence in him, and therefore at first placed only two or three thousand horsemen under his command. Hajjáj set out, traversed the Hijáz without resistance, and pitched his camp at Táif, not far from Mecca. Ibn Zobair tried to dislodge him; but in the frequent encounters between his troops and those of Hajjáj, the latter always had the advantage. 'Abd al-Melik then decided on sending him a reinforcement of five thousand men, on receiving which Hajjáj invested Mecca. The blockade lasted several months, during which the city was a prey to all the horrors of siege and famine. Hajjáj had set up balistas on the neighbouring heights, and poured a hail of stones on the city and the Ka'ba. Famine at length triumphed over the last adherents of the son of Zobair. Ten thousand fighting men, and even several of the sons of the pretender, left the city and surrendered. Mecca being thus left without defenders, Hajjáj took possession of it and invested the Ka'ba. Then the son of Zobair, seeing that ruin was inevitable, went to his mother Asmá, who had reached the age of a hundred, and asked her counsel. She answered that he must die sword in hand; and when, in embracing him for the last time, she felt the cuirass which he wore, she exclaimed that such a precaution was unworthy of a man resolved to perish. 'Abdalláh took off his cuirass, and taking refuge in

the Ka'ba, passed the night there in prayer. At daybreak of the 14th of Jomádí I. in the year '73 (1st October 692), the Omayyad troops made their way into the mosque. 'Abdalláh attacked them furiously, notwithstanding his advanced age, but at last fell, overwhelmed by numbers. His head was cut off, carried to Hajjáj, and sent by the victorious general to Damascus.¹

With Ibn Zobair perished the influence which the early companions of Mohammed had hitherto exercised over Islam. Medina and Mecca, though they continued to be the Holy Cities, had no longer the political importance which had enabled them to maintain a struggle with Damascus. Temporal interests, represented by Damascus, will henceforth have precedence over those of religion; policy will outweigh fanaticism;² and the centre of Islam, now permanently removed beyond the limits of Arabia, will be more easily affected by foreign influences, and assimilate more readily their civilizing elements. Damascus, Cufa, and Basra will attract the flower of all the Moslem provinces; and thus that great intellectual, literary, and scientific movement which is to reach its apogee under the 'Abbásid Caliphs at Baghdád, will become daily more marked.

By the death of the son of Zobair, 'Abd al-Melik remained sole Caliph; for Mohammed b. Hanafyya reckoned for nothing since the death of Mokhtár, whose creature he had been. The only remaining danger was from the Khárijites, who, though incessantly repulsed, as incessantly returned to the charge. Hajjáj had remained after his victory at Mecca, where he was occupied in rebuilding the Ka'ba, ruined for the second time by his engines of war. In the year 75, 'Abd al-Melik, alarmed at the news which reached him from Persia and 'Irāk, named Hajjáj governor of that province, and gave him the most extensive powers for the re-establishment of order. The troops of 'Irāk, who accompanied Mohallab in an expedition against the Khárijites, had abandoned their general and dispersed to their homes, and nothing could induce them to return to their duty. Hajjáj, arriving unexpectedly at Cufa, ascended the pulpit at the moment when the people were assembled for morning prayers, and delivered an energetic address to them, which depicts his character so well, that some passages from it may be cited:—

"Men of Cufa, I see before me heads ripe for the harvest, and the reaper—I am he! I seem to myself already to see blood between turbans and shoulders. I am not one of those who can be frightened by an inflated bag of skin, nor need any one think to squeeze me like dried figs. I have been chosen on good grounds; and it is because I have been seen at work that I have been picked out from among others. The Prince of the Believers has spread before him the arrows of his quiver, and has tried every one of them by biting its wood. It is my wood that he has found the hardest and the bitterest, and I am the arrow which he shoots against you."

Thereupon Hajjáj ordered that every man capable of bearing arms should immediately join Mohallab in Susiana, and swore that all who made any delay should have their heads struck off. This threat produced its effect, and Hajjáj proceeded to Basra, where his presence was followed by the same result. Mohallab, reinforced by the army of 'Irāk, at last succeeded, after a struggle of eighteen months, in subjugating the Khárijites, and was able, at the beginning of A.H. 78, to return to Hajjáj at Basra. The latter loaded him with honours and made him

¹ On these events, see Quستمère, *Mémoire historique sur la vie d'Abd-Allah b. Zobair*. Paris, 1832.

² It is said that the Caliph 'Abd al-Melik affected great piety before his elevation. At the moment when he was first saluted with the title of Caliph, he closed a copy of the Koran which was in his hands, saying: "We must now part."

governor of Khorásán,¹ whence he directed several expeditions against Transoxiana.

While Mohallab was fighting against the Khárijites in Persia, Hajjáj himself had had to struggle against rebellion. Three Khárijites, Šalih, Šabīb, and Moťarrif, had succeeded in creating a party in Mesopotamia and 'Irák. The second had even pushed his audacity so far as to march upon Cufa, and for a moment had occupied that city. Hajjáj overcame the rebels; and through his vigilance, Kaťarī b. al-Foťá'a, another Khárijite chief, after being pursued as far as Ťabaristán, on the Caspian Sea, was taken and killed by two Omayyad generals.

Ibn al-Ash'ath.

When he gave the government of Khorásán to Mohallab, Hajjáj had committed that of Sijistán to 'Obaid Alláh b. Abí Bakra. At the beginning of A.H. 79, 'Obaid Alláh's troops were beaten by the king of Kábúl. Hajjáj thought it advisable to remove 'Obaid Alláh and to replace him by the captain of his guards, 'Abd al-Rahmán b. al-Ash'ath. This was a bad choice, for Ibn al-Ash'ath had often given proofs of an insubordinate temper, and Hajjáj soon had occasion to repent of it. In fact, soon after his arrival in Sijistán, 'Abd al-Rahmán, whose army was composed of contingents from Cufa and Bašra, always ready for revolt, conceived the design of an insurrection against the authority of Hajjáj. Popular movements often go beyond the object first proposed; and not only did the troops welcome joyfully the idea of marching against the hated governor of 'Irák, but they even proclaimed the dethronement of 'Abd al-Melik, and saluted Ibn al-Ash'ath as Caliph. The new pretender entered Fársistán and Ahwáz, and it was in this last province, near Shuster, that Hajjáj came up with him, after receiving from Syria the reinforcements which he had demanded in all haste from the Caliph. Hajjáj was beaten and obliged to retreat. Ibn al-Ash'ath pursued him as far as Bašra, which opened its gates to him; but fortune soon changed, and he was again driven out by his adversary. Ibn al-Ash'ath then turned his arms against Cufa, and with aid from within, obtained possession of it; thus cutting the communications of Hajjáj with Syria. The latter, thus compelled to leave Bašra, took the field, and pitched his camp at Dair al-Jamájim, two days' journey from Bašra. Ibn al-Ash'ath marched against him at the head of his army. The condition of 'Irák caused the greatest uneasiness at Damascus, and 'Abd al-Melik hoped to stifle the revolt by proposing to the insurgents the dismissal of Hajjáj from his post. The insurgents rejected this offer, and hostilities recommenced. At the end of three months, in Jomádí II., A.H. 83 (July 702), a decisive action took place. Victory declared for Hajjáj. Ibn al-Ash'ath fled to Bašra, where he managed to collect fresh troops; but, having been again beaten, he took refuge in Susiana, from which he was driven by a son of Hajjáj. The rebel then retired into Sijistán, and afterwards sought an asylum with the king of Kábúl. As soon as his partisans had rejoined him, he penetrated into Khorásán, in order to raise an insurrection there. The governor of this province was at that time Yazíd, son of the celebrated Mohallab, who had died in the year 82. Yazíd marched against Ibn al-Ash'ath, and cut his army to pieces. From that time the pretender disappeared; and it is thought that, having again taken refuge with the king of Kábúl, he was betrayed by him and put to death.² It was during

this long struggle that, in the year 82, Hajjáj laid the foundations of the city of Wásit (the Intermediate); so called because it is situated midway between Cufa and Bašra. Some time after the suppression of this revolt, in the year 84, Hajjáj deprived Yazíd b. Mohallab of the government of Khorásán, accusing him of partiality towards the rebels, and appointed in his stead first his brother Mofáđdal b. Mohallab, and nine months after Kotaiba b. Moslim, who was destined at a later period to extend the sway of the Moslems in the East as far as China.

While these events were taking place, 'Abd al-Melik was engaged in the West in a struggle against the Greeks. We have seen that in the year 69 the Caliph, compelled as he then was to direct all his efforts towards 'Irák and Arabia, had concluded a disgraceful peace with Justinian II. It was not till A.H. 73 (A.D. 692-693) that he resumed hostilities in Armenia, Asia Minor, and Africa. The operations in Asia Minor and in Armenia were entrusted to Mohammed b. Merwán, brother of the Caliph, and to 'Othmán b. Walid. They beat the Greeks at first; but, in consequence of subsequent reverses, the Moslems were compelled to accept peace, which was broken anew by the Greeks about the year 75 or 76, the Caliph in one of his letters to Justinian II. having used expressions which displeased the Christian monarch. In retaliation, Justinian threatened to have legends offensive to Islam struck on his coins. As, up to that time, the Moslems had no special coinage of their own, and principally used Byzantine and Persian money, this menace led 'Abd al-Melik to institute a purely Arabic coinage. It was a Jew of Taimá, named Somair, who commenced its fabrication. Justinian II. refused to receive these coins in payment of the tribute, and declared the treaty at an end. The incensed Moslems fought valiantly, and succeeded in extending their frontiers to Mar'ash, on the side of Asia Minor, and to Ámid, on the side of Armenia. From this time forth the Moslems made yearly expeditions against the Greeks; but they were only razzias, for which the Greeks often avenged themselves by incursions into the territory of Islam.

First Arabic coinage.

In Africa we have seen that 'Okba b. Náfí had been slain by the Berbers, who had taken Kaírawán. In the year 73 'Abd al-Melik sent Hassán b. Nómán into Africa, at the head of a numerous army. He retook Kaírawán, swept the coast as far as Carthage, expelling the Greek garrisons from all the fortified places, and then, turning his arms against the Berbers, beat them so completely that they submitted for a long time to the tribute and the conscription. But when Hassán left Africa, the Greeks, under the successor of Justinian, retook the coast-line. Hassán prepared to return to Africa, but he previously demanded from the governor of Egypt, 'Abd al-'Azíz, the recall of a freedman, whom he had appointed governor of a part of the province of Africa. 'Abd al-'Azíz refused, and Hassán went to Damascus to complain to the Caliph. Soon after his arrival at the capital he died, and the governor of Egypt placed Músá b. Nošair at the head of the expedition. This general reconquered the seaboard as far as Carthage, and drove the Greeks permanently from it. The daring Músá continued his triumphant march, and took possession of the whole of the coast to Tlemcen. One of his lieutenants, in the year 82, carried a reconnaissance by sea as far as Sicily. The Moslem fleet having been destroyed by a storm, Músá equipped another, and entrusted its command to his brother 'Abdalláh, who returned to Sicily and effected a

¹ In A.H. 78, 'Abd al-Melik had made Khorásán and Sijistán dependent on the governor of 'Irák, so that Hajjáj had the right of directly nominating the governors of those provinces.

² This king of Kábúl is called Ratbil or Rotbil by some historians, and Zenbil by others. See Weil, *Geschichte der Chalifen*, i. 449; Tabari, transl. by Zotenberg, iv. 127; and Mas'údi, transl. by Barbier de Meynard, index, s. v. Rotbil. According to Abulfeda's *Geography*,

p. 343, Ibn al-Ash'ath was killed in the province of Arrokhaj (Arrokhsia), and his head was sent to Damascus and Egypt.

razzia there. Merwán, the father of 'Abd al-Melik, had designated as successor to the latter his other son, 'Abd al-'Azíz, governor of Egypt. 'Abd al-'Azíz having died in the year 84, 'Abd al-Melik chose as heirs of the empire, first his son Walíd, and after him his second son Solaimán.¹ He himself survived 'Abd al-'Azíz only two years, and died 14th Shawwál 86 (8th October 705), at the age of about sixty. His reign was one of the most unquiet in the annals of Islam, but also one of the most glorious. 'Abd al-Melik not only brought triumph to the cause of the Omayyads, but extended and strengthened the Moslem power externally. Amid so many grave anxieties, he yet found time for his pleasures. He was passionately fond of poetry, and his court was crowded with poets, whom he loaded with favours, even if they were Christians, like Akhtal. In his reign flourished also the two celebrated rivals of Akhtal, Jarír and Farazdaq.²

6. Immediately on his accession Walíd confirmed Hajjáj in the government of 'Irák, and appointed as governor of Medina his cousin 'Omar b. 'Abd al-'Azíz, who was received there with joy, his piety and gentle character being well known. Under his government important works were undertaken at Medina and Mecca by order of Walíd, who, having no rivals to struggle against, was able to give his attention to pacific occupations. The mosque of Medina was enlarged, wells were sunk, the streets widened, and hospitals established. At Mecca many improvements were introduced. The reputation of 'Omar attracted to the two Holy Cities a great number of the inhabitants of 'Irák, who were groaning under the iron hand of Hajjáj. The latter, who was not a man to let his prey escape from his grasp, was so urged with Walíd that he obtained the dismissal of 'Omar b. 'Abd al-'Azíz in the year 93, and the appointment of 'Othmán b. Hayyán at Medina, and of Khálid b. 'Abdalláh at Mecca. These two prefects compelled the refugees at Mecca and Medina to return to 'Irák, where many of them were cruelly treated and even put to death by Hajjáj. It was probably his cruelty which drove so many men of 'Irák to enlist in the armies of the East and the South; and this may in some degree account for the unheard-of successes of Kotaiba b. Moslim in Transoxiana, and of Mohammed b. Kásim in India. They may also be explained by the ambition of Hajjáj, who, it is said, cherished the project of creating a vast empire for himself to the east and south of the Moslem realm, and had secretly promised the government of China to the first of his generals who should reach that country. Be this as it may, in the course of a very few years Kotaiba conquered the whole of Bokharia, Khárizm, and Transoxiana or Má wará-annah, as far as the frontiers of China. Meanwhile Mohammed b. Kásim invaded Mokrán, Sind, and Múltán, carried off an immense booty, and reduced the women and children to slavery. In Armenia and Asia Minor, Maslama, brother of the Caliph Walíd, and his lieutenants, also obtained numerous successes against the Greeks. In Armenia, Maslama even advanced as far as the Caucasus.

The most important achievement, however, of Walíd's reign was the conquest of Spain. The narrative of this conquest belongs specially to the history of Spain; and we shall therefore only touch briefly on it here. We have seen that, even in the Caliphate of 'Abd al-Melik, Músá b. Nosair had penetrated as far as Tlemcen in Africa. Under Walíd, Músá, who had been appointed governor of Africa, entered Morocco, occupied Fez and Tangier, and then

returned to Kairawán, having made his lieutenant Tárík governor of Tangier and of all the West of Africa. The town of Ceuta still held out under its governor Julian, who held it in the name of Witiza, King of Spain. Witiza having been dethroned by Roderic, Julian thought he might find the Arabs useful allies in the struggle which he proposed to carry on against the usurper³ and entered into negotiations with Tárík. The latter, foreseeing the possibility of conquering for the advantage of the Arabs a country which had been represented to him as a paradise, requested instructions from Músá, who referred the matter to the Caliph. Walíd gave Músá *carte blanche*, and Tárík hastened to make alliance with Julian. He first, however, sent four ships, with five hundred men under the command of Tarif, to reconnoitre the country. This expedition was successful, and Tárík, now certain of meeting no serious opposition to his landing, passed into Spain himself, at the head of twelve thousand men, in the year 92 (A.D. 710-711), and landed at the spot which thence received the name of Jabal-Tárík, or "Mountain of Tárík," a name which was afterwards corrupted by the Westerns into Gibraltar. At the news of this invasion, Roderic led a numerous army against the Arabs, but was completely routed near Cadiz, and perished in the conflict. Músá, jealous of the success of his lieutenant, hastened to Spain with eighteen thousand men, and his first step on arriving was to send Tárík orders to suspend his march. But Tárík, far from obeying, divided his little army into three corps, and obtained possession successively of Ecija, Malaga, Elvira, Cordova, and Toledo. Músá, hopeless of arresting the victorious march of Tárík, determined to play the part of a conqueror himself, and took Seville, Carmona, and Merida. On rejoining Tárík at Toledo, the first step he took was to throw him into prison. The Caliph, however, gave orders that he should be set at liberty and restored to his command. The two conquerors then shared the country between them, and, in less than three years, all Spain was subdued, to the very foot of the Pyrenees. Meanwhile Walíd, fearing to see Músá declare his independence, recalled him to Damascus. He obeyed after appointing his son 'Abd al-'Azíz governor of Spain, and assigning Seville as his residence. Músá left Spain in the month of Safar, A.H. 95 (October-November 713), in company with Tárík, bringing an immense booty to Damascus, and leading in his train a great number of prisoners. His journey from Ceuta to Damascus was one long triumph. He reached Egypt in the month of Rab' I. in the following year (Nov.-Dec. 714), and then moved on by short marches towards Damascus, where he did not arrive till two months and a half later, at the very moment when Walíd had just breathed his last, and his brother Solaimán had been saluted as Caliph. The renowned Hajjáj had preceded his sovereign, and had expired five days before the end of Ramadan, A.H. 95. Músá did not receive the reward due to his distinguished services. Accused of peculation by the new Caliph, he was beaten with rods, and condemned to a fine of 100,000 pieces of gold; and all his goods were confiscated. Solaimán did not stop here: he caused 'Abd al-'Azíz, the son of Músá, to be put to death in Spain, and carried his cruelty so far as to show his severed head to Músá, asking him whether he recognised it. He replied that it was the head of a man a thousand times superior to him who had ordered his death. Músá died soon after. As for Tárík, there is no further mention of him after the beginning of the reign of Solaimán, and we must therefore suppose that he retired into private life.

¹ 'Abd al-Melik had several other sons, two of whom, Yazíd and Hishám, also reigned.

² See Caussin de Perceval, *Journal asiatique*, 2^e série, vols. xiii. and xv.

³ According to Eastern chronicles, Julian's hatred of Roderic arose from the latter's having dishonoured his daughter.

7. Solaimán had nearly missed the throne. Walíd, in the very year of his death, wished to have his son 'Abd al-'Azíz b. Walíd chosen as his successor, and had offered Solaimán a great sum of money to induce him to surrender his rights to the Caliphate; but Solaimán obstinately refused to do so. Walíd went still further, and sent letters to the governors of all the provinces, calling on them to make the people take the oath of allegiance to his son. None except Hájáj and Kotaiba b. Moslim consented thus to set at nought the order of succession established by 'Abd al-Melik; and Solaimán succeeded without difficulty at the death of his brother. We can easily conceive the hatred felt by Solaimán for Hájáj, and for all that belonged to him, far or near. Hájáj himself escaped by death; but Solaimán poured out his wrath on his family, and strove to undo all that he had done. First of all, Mohammed b. Kásim, the conqueror of India, who was cousin to Hájáj, was dismissed from his post and outlawed. Hájáj had deprived Yazíd b. Mohallab of the government of Khorásán; Solaimán conferred on him that of 'Irák. Kotaiba b. Moslim, on learning the accession of Solaimán, knew that his own ruin was certain, and therefore anticipated the Caliph by a revolt. But Solaimán induced Kotaiba's troops to desert by authorising them to return to their homes; and when the illustrious general sought to carry his army with him, a conspiracy was formed against him which ended in his murder. Yazíd b. Mohallab, who preferred Khorásán to 'Irák, obtained permission to exchange. Immediately on his return to Khorásán he set on foot a series of new expeditions against Jorján and Tabaristán. But the inhabitants of Khorásán, which he governed oppressively, made complaints against him to the Caliph, accusing him of practising extortions in order to obtain such a sum of money as would enable him to rebel against his sovereign. From that day Solaimán determined to get rid of Yazíd. As, however, he was then dreaming of the conquest of Constantinople, he thought it prudent to dissemble his dissatisfaction for some time.

The Byzantine empire was disturbed by internal troubles during the years A.D. 715-717. Solaimán resolved to take advantage of these in order to rid himself for ever of the hereditary enemy of Islam, and prepared a formidable expedition. A fleet of eighteen hundred vessels, equipped at Alexandria, sailed to the coasts of Asia Minor, took on board the Moslem army, commanded by Maslama, and transported it to Europe. This army appeared under the walls of Constantinople, 15th August 717, five months after Leo III., the Isaurian, had ascended the throne. Once more the Greek fire prevailed against the Moslems. Their fleet was destroyed by this terrible engine of war; the army could obtain no fresh supply of provisions, and suffered all the horrors of famine. Meanwhile the Caliph, who desired to be present in person at the taking of Constantinople, had set out to join the army. He fell ill at Dábiq, not far from Aleppo, and died there on the 22d of September in the same year, after having nominated as his own successor his cousin, 'Omar b. 'Abd al-'Azíz, and as successor to the latter, Yazíd b. 'Abd al-Melik, his own brother. In vain did the new Caliph despatch from Egypt a fleet of four hundred ships to carry arms and provisions to the army before Constantinople; this fleet also was destroyed by the Greeks, and the Moslem army was decimated by famine, and soon by the plague as well. A hundred thousand men perished miserably under the walls of Constantinople, and Maslama brought back to Asia Minor a mere handful of soldiers, and that with great difficulty.

8. 'Omar b. 'Abd al-'Azíz, incensed at this disaster, took his revenge on the Christians of his own states by

excluding them from all public employments, in spite of the great services they rendered there, and by loading them with imposts to such an extent that one public functionary wrote thus to the Caliph: "If things continue to go on in Egypt as at present, all the Christians will become Moslems to escape taxation, and the State will lose its revenue." To this the pious 'Omar replied: "I should look on the conversion of all the Christians as a great piece of good-fortune; for God sent his prophet to act the part of an apostle, and not of a tax-gatherer." By his religious intolerance, by the simplicity of his life, and by his vigour in observing the precepts of his religion and enforcing their observance, 'Omar has acquired in Moslem history the reputation of a saint. But the sanctity of a prince does not ensure the greatness of a State; and the reign of 'Omar, as we shall see, was injurious rather than advantageous to Islam. He alienated the provincial governors by his severity; and the family of 'Abbás took advantage of the general discontent to stir up the people secretly, and thus to prepare the way for the fall of the dynasty.

It will be remembered that Solaimán died before carrying out his purpose of deposing Yazíd b. Mohallab, the governor of Khorásán. 'Omar II. took it on himself to fulfil this design. He summoned Yazíd to his presence, and on his arrival at Damascus, threw him into prison, and demanded the restitution of the money which he believed him to have misappropriated. As Yazíd alleged that he could render no account of it, the Caliph banished him to Dahlak, a small island in the Red Sea, but soon brought him back, and placed him in close confinement. It was not till A.H. 101, when 'Omar II. was dying, that Yazíd succeeded in escaping and took refuge in 'Irák. Mokhallad, the son of Yazíd, whom his father, on quitting Khorásán, had left there as his lieutenant, was also summoned to Damascus, and the Caliph at first appointed Jarráh b. 'Abdalláh governor of that province, but soon after, on receiving complaints against him, replaced him by 'Abd al-Rahmán al-Koshairi, whom he desired to use every effort for the conversion of the unbelievers, rather than to think of extending the Moslem power by force of arms. With so pacific a disposition, it is easy to understand that the Caliph did not signalize his reign by any conquest; except a revolt of the Khárijites in 'Irák, which was suppressed by Maslama, his caliphate was not distinguished by any warlike event. Its most noticeable occurrence, as we have said above, was the commencement of the 'Abbásid movement.

The 'Abbásid family derived its name from 'Abbás, who was Mohammed's uncle on the father's side, and who, during the Prophet's life, had enjoyed universal consideration among the Moslems. It was he who, at the death of the Prophet, had the charge of washing the corpse. The first Caliphs, Abúbekr, 'Omar, 'Othmán, and 'Alí, showed the utmost deference to 'Abbás; and his eldest son 'Abdalláh had been united in the closest friendship with Hosain, the unfortunate son of 'Alí. After the assassination of 'Alí, and the slaughter of Hosain, 'Abdalláh had retired to Mecca, and there brought up his numerous family in hatred of the Omayyads. It was from his youngest son 'Alí, born A.H. 40, that the 'Abbásid dynasty sprung. Under the Caliph 'Abd al-Melik, this 'Alí was living at Damascus; but, on his marrying Labhába, the divorced wife of 'Abd al-Melik, the Caliph conceived a great aversion for 'Alí. Walíd, the son and successor of 'Abd al-Melik, inherited his father's prejudices, subjected 'Alí to every kind of insult, and drove him from his court. Walíd's successor, Solaimán, gave him leave to return to Damascus, but 'Alí, instead of availing himself of this permission, preferred to retire to Homaima, a town situ-

ated in the south of Syria, on the confines of Arabia. It was in this retirement that his son Mohammed conceived the design of supplanting the Omayyad dynasty. We have said that the first 'Abbásids were closely united with the family of 'Alī. Mohammed b. 'Alī, the 'Abbásid, saw clearly that it was only among the followers of 'Alī that he was likely to be able to form a party. To attain this object, he formed the plan of making it believed that a descendant of the Prophet's son-in-law had transmitted to him his rights to the Caliphate. It will be remembered that Mohammed b. Hanafīya had come forward as a pretender to the throne at the troublous period when Ibn Zobair and 'Abd al-Melik were disputing the Caliphate. According to the story of the 'Abbásids, Abū Hāshim 'Abdallāh, the son of Ibn Hanafīya, had gone to Homaima, to the house of Mohammed b. 'Alī, and had made on his deathbed a legal transfer of his rights to Mohammed, by appointing him his heir. Whatever may be the truth respecting this transfer,¹ Mohammed the 'Abbásid spread abroad the report of it, and chose especially for its propagation the provinces in which the family of 'Alī had the greatest number of adherents, 'Irāk and Khorāsān. Emissaries sent by him into these two provinces, under the caliphate of 'Omar II., began to stir up the people in secret against the reigning house. 'Omar was probably acquainted with these intrigues, but he had not time to repress them, for he died on the 20th or 25th of Rajab, A.H. 101 (5th or 10th February 720), after a reign of about two years and a half.

9. Yazīd, the son of 'Abd al-Melik, ascended the throne without resistance. His first care was to pursue Yazīd b. Mohallab, who had escaped from his prison and taken refuge in 'Irāk. Besides reasons of state, Yazīd II. had personal reasons for ill-will to Yazīd b. Mohallab. One of the wives of the new Caliph, the same who gave birth to that son of Yazīd II. who afterwards reigned under the name of Walīd II., was niece to the celebrated Hajjāj, who, as it will be remembered, had hated and persecuted Yazīd b. Mohallab. Aware of the alliance of the new Caliph with the family of Hajjāj, the son of Mohallab had made every effort to escape as soon as he was informed of the illness of 'Omar II.; for he well knew that Yazīd II. would spare neither him nor his family. In fact, the Caliph sent express orders to the prefect of 'Irāk to arrest all the brothers and other members of the family of Mohallab who were to be found at Basra; and this order was immediately carried out. But Yazīd b. Mohallab had many partisans in 'Irāk. He collected a small army, and fought with such valour that in a short time he succeeded in making himself master of Basra, where he had himself proclaimed Caliph. The public treasury fell into his hands, and he employed it in paying his troops and in raising fresh ones, whom he sent on expeditions into Khūzistān or Ahwāz, Fārsistān, Mokrán, and Sind. As this revolt threatened to spread far and wide, Yazīd II. was obliged to have recourse for its suppression to the celebrated Maslama. Early in A.H. 102, this illustrious general took the field, and completely defeated Ibn Mohallab near Basra. Yazīd fell in the battle, and his brothers fled beyond the Indus, but were pursued and slain by the lieutenants of Maslama.

This revolt suppressed, Yazīd II. was able to give his thoughts to the extension of the empire, an object which had been so much neglected by his predecessor. Several expeditions were directed against Farghāna in Transoxiana, against the Khazars in Armenia, and against the Greeks in Asia Minor, but without any very decided results. In

¹ The 'Abbásid Caliph Ma'mūn certainly did not believe in it, for he thought it his duty to restore the Caliphate to the family of 'Alī, by appointing as his successor 'Alī Ridā, a descendant of the Caliph 'Alī.

Africa, serious troubles had been caused by the appointment as governor of a certain Yazīd b. Abī Moslim, who had been secretary to Hajjāj, and who followed the example of his master's implacable harshness. The Berbers rose in insurrection, slaughtered the unfortunate governor, and chose in his place Mohammed b. Aus. The Caliph at first ratified this choice, but soon after dismissed Mohammed from his post, and replaced him by Bishr b. Šafwān, who sent out an expedition against Sicily.

In Europe, the Arabs obtained at first some degree of success. Under the orders of Samah, then governor of Spain, they crossed the Pyrenees, and took possession of Narbonne; but, having been beaten at Toulouse, they had to retrace their steps. It was the celebrated Abderame ('Abd al-Rahmān) who effected their retreat.

Yazīd II. died three years later of a lingering illness, caused, it is said, by his grief for the death of a favourite slave-girl. At his accession, Yazīd had designated as his successors, in the first place his son Hishām, and in the second his son Walīd. Hishām ascended the throne without opposition.

10. Hishām was a pious prince and an enemy of luxury; as rigid in his religion as 'Omar II. To this severity may in part be attributed the disturbances which broke out in the provinces during his reign. The governors were accustomed to remain loyal to the Caliph only when the latter did not exact from them too rigorous an account. Hishām was, besides, very avaricious, a fault highly calculated to make him odious to those about him. Lastly, he favoured the Yemenites, and this alienated from him the powerful party of the Kaīsites. All these circumstances emboldened the 'Abbásids to carry on actively their propaganda in 'Irāk and Khorāsān, and it succeeded beyond their hopes. The Kaīsite tribes, offended at seeing the Caliph bestow the best posts on Yemenites, were ready to espouse with enthusiasm the cause of any one whose aim was the overthrow of the Omayyads. Rebellion had been smouldering in the provinces for thirteen years; it broke out at last at Cufa and in the whole of 'Irāk, under chiefs called Mughāra and Bahlūl; and when these insurgents had been chastised, others sprung up in their place, 'Amr al-Yashkūrī, Al-'Anazī, and Al-Sakhtayānī. The prefect of 'Irāk, Khālid b. 'Abdallāh, was accused of favouring this revolt, was degraded, and replaced by Yūsuf b. 'Omar, who threw him into prison, where he remained for eighteen months. This measure increased the discontent of the people of 'Irāk, and a member of the family of 'Alī, Zaid b. 'Alī, collected round him a small body of partisans, and had himself proclaimed Caliph, A.H. 122 (A.D. 739-740). Unfortunately for Zaid, he had to do with the same Cufans whose fickleness had already been fatal to his family. In the moment of danger he was deserted by his troops, slain in an unequal conflict, and his head sent to Damascus. In Khorāsān also there were very serious disturbances. In the year 106 (A.D. 724-725) there had already been a revolt at Balkh, excited by the emissaries of the 'Abbásids. The following years brought with them fresh troubles, which led to the dismissal of the governor of Khorāsān, Asad, the brother of Khālid b. 'Abdallāh, who had been prefect of 'Irāk. Under the successors of Asad, who were successively Ashras b. 'Abdallāh, Jonaid b. 'Abd al-Rahmān, and 'Asim b. 'Abdallāh, seditions broke out in Transoxiana, which were repressed with great difficulty; and it was not until the year 120 that, by the appointment of the brave and prudent Naṣr b. Sayyār as governor of Khorāsān, peace was for a time restored to that region. The 'Abbásid emissaries, nevertheless, secretly continued their propaganda.

In India, several provinces had been converted

to Islam under the Caliphate of 'Omar II. declared themselves independent; and this led to the founding of several strong cities for the purpose of controlling those provinces. It was thus that the cities of Mahlúza and Mansúra had their origin.

In the north and north-west of the empire there were no internal disorders, but the Moslems had much to do to maintain themselves there against the Alans, the Turkomans, and the Khazars. The illustrious Maslama lost his life in battle, and Merwán b. Mohammed, afterwards Caliph, took his place as prefect of Armenia and Azerbaijan. He succeeded in imposing peace on the petty princes of the Eastern Caucasus, and in consolidating the Arab power in that quarter. The war against the Byzantines lasted during the whole of Hishám's reign. In Asia Minor, the Moslems reoccupied Cæsarea, and laid siege to Nicæa. Arab writers even declare that Constantine, afterwards Emperor of Constantinople, was made prisoner in the year 114 (A.D. 732-733), but the Byzantine authorities make no mention of this fact. On the other hand, they notice an important defeat of the Moslem arms in A.D. 739. This defeat, which is acknowledged by the Arab writers, cost the life of their general, 'Abdalláh, surnamed al-Battál—"the hero"—whose prowess still lives in the memory of the people of Asia Minor.

In Africa, several successive prefects were fully occupied in repressing the constant insurrections of the Berbers. In Spain, the attention of the Moslems was principally turned to avenging their defeats beyond the Pyrenees. As early as the second year of the reign of Hishám, 'Anbasa, governor of Spain, crossed the Pyrenees, and pushed on military operations vigorously. Carcassonne and Nîmes were taken. The death of 'Anbasa, in A.H. 107 (A.D. 725-726), put a stop to hostilities; but they recommenced still more vigorously six years later. 'Abd al-Rahmán (Abderame), the same who, under Yazíd II., had led back to Spain the remnants of the Moslem army, crossed the mountains anew, and penetrated into Gascony by the passage of Roncervaux. The Moslems beat the Duke Eudes, gained possession of Bordeaux, and overran the whole of Southern Gaul as far as the Loire. But in A.H. 114 (A.D. 732) Charles Martel, whose aid the Duke of Aquitaine had implored, succeeded in inflicting on 'Abd al-Rahmán so severe a defeat, near Poitiers, that the Moslems were obliged to effect a hasty retreat, and to return to Spain. Two years later the new governor of Spain, 'Oqba b. al-Hajjáj, re-entered Gaul, and pushed forward expeditions as far as Burgundy and Dauphiné. Charles Martel, with the help of the Lombards, again drove back the Arabs as far as Narbonne. Thenceforth the continual revolts of the Berbers in Africa on the one side, and on the other the internal troubles which disturbed Spain, and which led at a later period to its independence, offered insurmountable obstacles to the ambition of the Moslems, and prevented their resuming the offensive.

Such was the state of the empire when Hishám died on the 6th of Rabí' II. A.H. 125 (6th Feb. A.D. 743), after a reign of twenty years. He had not been wanting in energy and ability. Yet under his reign the Moslem power declined rather than advanced, and signs of the decay of the Omayyad dynasty began to show themselves. The history of his four successors, Walíd II., Yazíd III., Ibráhím, and Merwán II., is but the history of the fall of the Omayyads.

11. Walíd II., the son of Yazíd II., ascended the throne without opposition at the death of Hishám; but he soon made himself so much hated and despised by his debaucheries and his irreligion that even the sons of Hishám and of Walíd I. plotted with the enemies of the Omayyads. Yazíd, one of the sons of Walíd I., went so far as to take

openly the title of Caliph, and to march against Damascus, which Walíd II. had quitted for fear of a pestilence which was then raging there. This step was fatal to the Caliph. The inhabitants of Damascus opened their gates to Yazíd, who took possession of the arsenals, and used the arms they contained to equip new troops. Walíd II., on his side, collected his adherents and marched against his rival. The two armies met at a place called Bakhrá, on the confines of Syria and Arabia. Yazíd had no difficulty in overcoming his opponent, who was abandoned by his own soldiers. Walíd II. died fighting, having reigned little more than a year, and his head was taken to Damascus, and carried about the city at the end of a spear. (Jomádí II., A.H. 126, March-April 744.)

12. The death of Walíd II., far from appeasing the troubles of the State, put its unity in greater jeopardy than ever. The distant provinces escaped from the power of the new Caliph. In Africa, 'Abd al-Rahmán b. Habíb declared himself independent. In Spain, every enir aspired to free himself from a suzerainty which appeared to him only nominal. In Khorásán the 'Abbásid emissaries were more and more busy, acting in the name of Ibráhím b. Mohammed, who had become the head of the family by the death of his father, Mohammed b. 'Alí. Even in Syria Yazíd III. saw his authority disputed. Himself belonging to the sect of Mo'tazilites, who rejected the doctrine of predestination—a sect to which we shall have occasion to recur in treating of the religious history of Islam—he aroused all the orthodox against him. Besides this, many of the Syrians, from a sudden change of feeling, now desired to avenge the death of Walíd II. The inhabitants of Emesa revolted, and marched against Damascus. They were beaten at a place called Thaníyat al-'Okáb, or The Eagle's Pass, twelve miles from the capital. Palestine rose in its turn, and chose as its Caliph another Yazíd, cousin of the reigning prince. This revolt also was suppressed. But a greater danger menaced Yazíd III. The Omayyad Merwán b. Mohammed, who was, as we have said, governor of Armenia and of Azerbaijan, also prepared to dispute the supreme power with the Caliph of Damascus, and invaded Mesopotamia. Yazíd III., in his alarm, offered him the government of this last province as the price of peace. Merwán accepted these conditions, but he would probably not have left his rival long at rest, had not the latter died after a reign of only six months.

13. Yazíd III. left his brother Ibráhím as his successor. At the news of Yazíd's death, Merwán collected a powerful army and entered Syria. Having beaten Ibráhím's generals one after the other and taken Emesa, he advanced rapidly towards Damascus. Solaimán b. Hishám tried to oppose his march, but he was defeated at 'Ain al-Jarr, between Baalbec and Damascus, and the Caliph Ibráhím took flight; while Solaimán, the son of Hishám, laid hands on the public treasure, and then fled in turn. Merwán entered Damascus, and caused himself to be proclaimed Caliph. The reign of Ibráhím had lasted only two months. Ibráhím himself soon acknowledged the new Caliph, and submitted to his authority.

14. Merwán II. was a man of energy, and might have revived the strength of his dynasty, if the ferment in the east of the empire had been less strong. Unfortunately for him, the 'Abbásid movement had never ceased to gain ground in Khorásán, and the chief adherent of the family of 'Abbás, Abú Moslim, was in no degree inferior to the Caliph in energy and ability. This Abú Moslim, whose origin is obscure and disputed, had been distinguished by the 'Abbásid Mohammed b. 'Alí, the same who alleged that he had been appointed heir to the claims of the family of 'Alí to the supreme power. If we may believe the legend

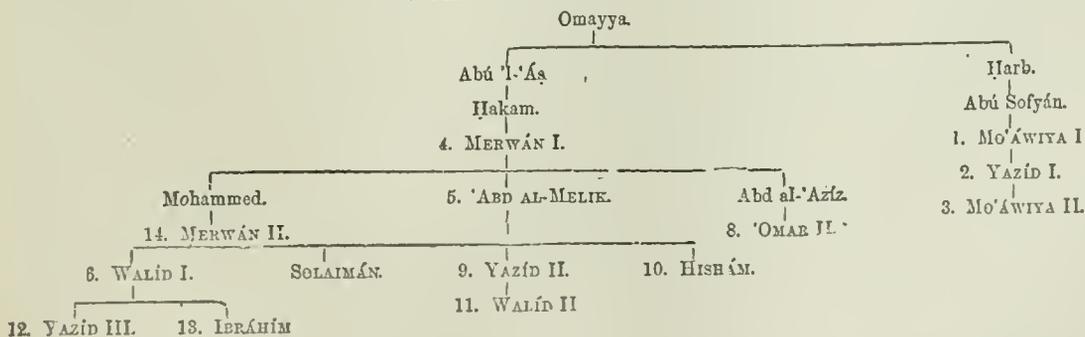

Mohammed had even foretold that the accession of his family would take place *in the year of the ass*,¹ through the efforts of Abú Moslim, and that one of his three sons would ascend the throne. These three sons were: Ibráhm, 'Abdalláh, called Abú 'l-'Abbás, and 'Abdalláh, called Abú Ja'far. Whatever we may think of this prediction, it is certain that under Merwán II. Abú Moslim was the principal emissary of the 'Abbásid Ibráhm, and had been able to form a vast conspiracy in Khorásán, which broke out in A.H. 128, at the very moment when it had been discovered by Naṣr b. Sayyár, the Omayyad governor of the province. Even before this, Merwán II. had had to repress disorders which had broken out in Syria, Palestine, and 'Irák; and the Caliph could now rely so little on Syria that he had thought it necessary to quit Damascus, and to fix his abode at Ḥarrán, in Mesopotamia. On learning the revolt of Abú Moslim, Merwán II. wrote to Naṣr b. Sayyár, directing him to act with vigour against the fomenters of sedition. It was easier to give such an order than to execute it, for Abú Moslim was at the head of a numerous army, absolutely devoted to the 'Abbásids. Merwán II. thought it necessary at the same time to secure the person of the 'Abbásid pretender Ibráhm, who was still living at Ḥomaima. Ibráhm was therefore arrested, conveyed to Ḥarrán, and thrown into prison. He found means, however, of communicating with his lieutenant Abú Moṣlim, and the latter, who had received the most extensive powers from his chief, marched direct upon Merv, the capital of Khorásán, and drove out the governor Naṣr. At the news of this the Caliph, no longer able to restrain his anger, had his captive Ibráhm put to death; an execution which, at a later period, brought upon the Omayyads the most terrible reprisals. The brother of Ibráhm, Abú 'l-'Abbás, surnamed Saḡfáh, "The Sanguinary," on account of his cruelties, having by Ibráhm's death become chief of the 'Abbásids, immediately quitted Ḥomaima with all the members of his family, and took refuge in Khorásán, that his presence there might sanction and encourage the insurrection. Abú Moslim, now master of Khorásán by the capture of Merv, had meanwhile sent an army against 'Irák, under the orders of Kaḡtaba b. Shabf, who had beaten the Omayyad army, commanded by Yazíd b. Hobaira, governor of that province. In A.H. 132 Abú 'l-'Abbás arrived at Merv. After remaining there some time, waiting for a favourable moment, he decided on openly assuming the title of 'Caliph. He installed himself in the governor's palace, and thence went in state to the mosque, where he mounted the pulpit, and officiated

in the capacity of successor of the Prophet. All those present took the oath of allegiance to him, and Abú 'l-'Abbás returned to the palace, over which the black flag was flying, black being the distinctive colour of the 'Abbásids.² But he did not remain long at Merv. Committing the government of that city to his uncle Dáwúd, he went to review his army, and divided it into several corps, which he directed against different points. After this he went to Chaldaea, and there established himself in a spot not far from Cufa, to which he gave the name of Háshimiya, or the city of Háshim, the ancestor of his own family and of that of the Prophet. Another of his uncles, 'Abdalláh b. 'Alí, whom he had sent on an expedition against the city of Shahrozúr, took possession of that place, and leaving Abú 'Aun 'Abd al-Melik b. Yazíd there as governor, rejoined his nephew and sovereign at Háshimiya. Meanwhile the Omayyad Caliph had marched against Shahrozúr. Abú 'Aun went out to meet him, and was joined by a strong reinforcement of cavalry under 'Abdalláh b. 'Alí. The 'Abbásids only numbered forty-five thousand soldiers, but these were experienced and resolute warriors. The Omayyad army, though much more numerous, was ill commanded and devoid of spirit. A battle ensued, and fortune favoured the rebels. In vain did Merwán show himself everywhere; his soldiers gave way and repassed the Zab in disorder, hurrying away in their flight the unfortunate Merwán. (Jomádí II. 11, A.H. 132, 25th January 750.) This victory cost the Omayyads their empire. Merwán attempted at first to take refuge at Mosul; but the inhabitants of that city having declared for the enemy, the prince went to his capital Ḥarrán, whence he was soon driven by the army of 'Abdalláh b. 'Alí. From Ḥarrán Merwán fled successively to Emesa, to Damascus, to Palestine, and finally to Egypt. He was pursued without intermission by Šálih, brother of 'Abdalláh b. 'Alí, who at last came up with him at Búšír, on the frontiers of the Delta. Merwán took refuge in a Coptic church, but the 'Abbásids pursued him into the building, and slew him at the foot of the altar. His head was cut off and sent to Cufa, where the new Caliph then was.

Thus perished in the East the dynasty of the house of Omayya, which, having been founded by usurpation, had only maintained itself by shedding torrents of blood, and was destined to perish in blood. We now enter upon the history of the new dynasty, whose origin we have described, and under which the power and glory of Islam reached their highest point.

Here we give the

GENEALOGICAL TABLE OF THE OMAYYADS.

¹ To understand this allusion we must know that Merwán II. had received the nickname of *Himár*, "the ass," on account of his temperance and the strength of his constitution.

² Historians are divided as to the date at which black became the 'Abbásid colour. According to some, the first 'Abbásids wore a robe

of black silk as early as at the battle called that of the Camel. According to others, it was only after the murder of Ibráhm by Merwán that the 'Abbásids adopted black as a sign of mourning. See Quatremère, *Mémoires historiques sur la dynastie des Khalifes Abbásides*. Paris. 1827.

Triumph of the 'Abbásids.

Al-Saḡfáh assumes the title of Caliph.

SECT. II.—THE 'ABBÁSIDS.

1. From the death of Merwán may be reckoned the real accession of the 'Abbásid dynasty to the Caliphate, which thus returned to the hands of the grand-nephews of the Prophet. Abú 'l-'Abbás, whose proper name was 'Abdalláh, and who afterwards received the surname of Saffáh, was, as has been said above, a man of energetic will, who hesitated at nothing to ensure the triumph of his dynasty. When he caused himself to be proclaimed Caliph at Cufa, one of his partisans, Abú Salama, who had till then believed that Abú 'l-'Abbás was working to restore the posterity of 'Alí to the throne, and not to gain possession of the empire for himself, hesitated to take the oath of obedience to the new Caliph. Abú 'l-'Abbás immediately resolved on his destruction, but fearing that Abú Salama might have a secret understanding with the conqueror of Khorásán, he began by sending his own brother Abú Ja'far into that province to sound Abú Moslim. The latter loudly disclaimed any alliance with Abú Salama, and, that no suspicion might rest upon him, he sent a confidential agent to Cufa, and had Abú Salama assassinated. Still further to prove his zeal for the house of 'Abbás, Abú Moslim also got rid of Solaimán b. Kathír, another 'Abbásid emissary, whom he suspected of partiality towards the family of 'Alí. On his side, Abú 'l-'Abbás caused 'Abdalláh b. Mo'áwiya, an adherent of 'Alí's family, to be treacherously slain, though he had distinguished himself in the wars against Merwán. As for the Omayyads, they were systematically followed up and put to death. The new Caliph desired to exterminate that family, not only for the sake of revenge, but also that he might deprive the Syrians of any pretext for fresh insurrections. In fact, hardly had Abú 'l-'Abbás been proclaimed Caliph at Cufa, when the Omayyad governor of Kinnésrin, Abú 'l-Ward b. Kauthar, notwithstanding that he had taken the oath to the new sovereign, gave the signal for revolt in the name of the Omayyads. Abú 'l-'Abbás immediately ordered his uncle 'Abdalláh b. 'Alí, who had been made governor of Palestine, to act with the utmost rigour against all members of the Omayyad family on whom he could lay his hands. That he might let none of them escape, 'Abdalláh pretended to grant an amnesty to all Omayyads who should come in and acknowledge the new Caliph, and even promised them the restitution of all their property. Ninety members of that unfortunate family allowed themselves to be entrapped by these specious promises, and 'Abdalláh, on pretence of sealing the reconciliation of the two parties, invited them to a banquet. But when they were all collected, a body of executioners rushed into the hall, and slew the Omayyads with blows from whips and rods. A grandson of Hishám, 'Abd al-Rahmán b. Mo'áwiya, who had taken refuge in Africa, alone escaped this massacre. It was he who, at a later date, founded in Spain the Omayyad dynasty of Cordova. The cruelty of the 'Abbásids excited a feeling of horror in the whole of Syria, and the revolt soon became general. Abú 'l-Ward b. Kauthar found himself at the head of forty thousand men, and pitched his camp at Marj al-Akhram, a plain near Kinnésrin. The revolt spread even to Mesopotamia and 'Irák. One of Merwán's former generals, Ishák b. Moslim, laid siege to Harrán, while Yazíd b. Hobaira, formerly governor of 'Irák, raised an insurrection at Wásit. In Khorásán also, as many as thirty thousand malcontents took up arms against Abú Moslim. Notwithstanding this formidable display of force, the 'Abbásids remained conquerors. In Syria, 'Abdalláh b. 'Alí beat Abú 'l-Ward at Marj al-Akhram. Abú Ja'far, brother of the Caliph, compelled Ishák b. Moslim and Yazíd b. Hobaira in succession to

submit. Lastly, Abú Moslim quieted the rising in Khorásán. Mosul also attempted an insurrection, but Yahyá, a brother of the Caliph, quenched the revolt in streams of blood. All the provinces being thus reduced to peace, the new Caliph distributed them among the principal members of his family and his best generals. To his brother Abú Ja'far he gave a part of Mesopotamia, Azerbaijan, and Armenia; to his uncle 'Abdalláh b. 'Alí, Syria; to his uncle Dáwúd, Arabia, Hijáz, Yamáma, and Yemen; to his cousin 'Isá b. Músá, the province of Cufa. Abú Moslim continued in possession of the government of Khorásán, Transoxiana, and a part of Farsistán. Egypt was entrusted to Abú 'Ann. Another uncle of the Caliph, Solaimán b. 'Alí, received the government of Basra, with Bahrain and 'Omán. Lastly, the province of Mosul was taken from the cruel Yahya, and granted to one of the uncles of Abú 'l-'Abbás, Ismá'il b. 'Alí, who received besides the government of Ahwáz. In Sind, the Omayyad governor had succeeded in maintaining himself, but was defeated by an army sent against him under Músá b. Ka'b, and the black standard of the 'Abbásids was raised over the city of Mansúra. If we omit Africa and Spain in describing this division of the provinces of the empire, it is because the 'Abbásids never gained any real footing in Spain, while Africa remained in only nominal subjection to the new dynasty.

Abú 'l-'Abbás, after having definitely established his power, left the town of Hášumíya and fixed his residence at Anbár, where he died on the 13th of Dhú 'l-Hijja, A.H. 136 (9th June 754).

2. Abú 'l-'Abbás had designated as his successors, first Abú Ja'far, and after him his cousin 'Isá b. Músá. At the moment of the death of Abú 'l-'Abbás, Abú Ja'far, who then assumed the title of Al-Mansúr, "the Victorious," was not in 'Irák. He had undertaken the leadership of the pilgrims who had started on the journey to Mecca, and among whom figured the celebrated Abú Moslim. 'Abdalláh b. 'Alí, uncle of Abú 'l-'Abbás, dissatisfied at having been excluded from the succession, took advantage of this absence to revolt. Having raised an army and proclaimed himself Caliph, he marched against Harrán and laid siege to it. On receiving this news, Abú Ja'far hastened to return to Anbár in company with Abú Moslim, whom he placed at the head of his troops, and sent against the rebel. At the approach of Abú Moslim, 'Abdalláh, who had among his troops a body of seventeen thousand men of Khorásán, fearing that they might declare for Abú Moslim, had them all slaughtered, as the historians assert, by his Syrians, and then hastened to meet his enemy. The two armies met at Nisibis, and, after a number of skirmishes, a decisive engagement took place on the 7th of Jomádi II, A.H. 137 (28th November 754). 'Abdalláh was defeated and compelled to submit to Al-Mansúr, who spared his life. The new and brilliant service thus rendered by Abú Moslim to his sovereign ought to have placed him even higher in the favour of Mansúr than he already stood. On the contrary, it was the cause of his ruin. The Caliph wished to commit the task of maintaining order in Syria to Abú Moslim; but the latter refused to give up his government of Khorásán, where he enjoyed an extraordinary reputation, and possessed numerous adherents, and, instead of obeying the order of the Caliph, directed his march towards the East. Thenceforth Mansúr looked on him only as a dangerous rebel, and sought for means of getting rid of him. On pretence of conferring with him on business of state, he induced him to come to Madáin (the ancient Ctesiphon), caused him to be put to death by his guards, and ordered his body to be thrown into the Tigris. Thus miserably perished the real founder of the 'Abbásid

dynasty, after having accomplished his work, which, as the historians assert, cost the lives of more than 600,000 men. Notwithstanding the defeat of 'Abdalláh b 'Alí and the murder of Abú Moslim, the spirit of rebellion was not yet broken. Risings took place in Mesopotamia and to a still greater extent in Khorásán; and the Calph's troops were repeatedly beaten by the rebels; but order was at last re-established by Mansúr's generals, by Kházim b. Khozaima in Mesopotamia, and by Mohammed b. al-Ash'ath in Khorásán.

About the same time Africa and Spain escaped from the dominion of the Eastern Caliphate; the former for a season, the latter permanently. The cause of the revolt of Africa was as follows: As soon as Mansúr ascended the throne, he wrote to 'Abd al-Rahmán, announcing the death of Abú 'l-'Abbás, and requiring him to take the oath of allegiance. 'Abd al-Rahmán sent in his adhesion to the new Caliph, and added a few presents of little value. The Caliph was so much dissatisfied that he replied by a threatening letter which excited the anger of 'Abd al-Rahmán. He called the people together at the hour of prayer, mounted the pulpit, publicly cursed Mansúr, and then declared his deposition from the Caliphate. He next caused a circular letter to be written, commanding all Maghrebins to refuse obedience to the Caliph, and this letter was circulated and read from the pulpit throughout the whole extent of the Maghrib (the West). A brother of 'Abd al-Rahmán, Ilyás, saw in this revolt an opportunity of obtaining the government of Africa for himself. Seconded by many of the inhabitants of Kairawán, who had remained faithful to the cause of the 'Abbásids, he attacked his brother, slew him, and proclaimed himself governor in his stead. This revolution in favour of the 'Abbásids was, however, of no long duration. Hábíb, the eldest son of 'Abd al-Rahmán, had fled on the night of his father's murder, and Ilyás caused him to be pursued, with the object of transporting him to Andalusia. Hábíb was captured, but the vessel which was to convey him to Spain having been detained in port by stress of weather, the partisans of independence took arms, rescued Hábíb, and prepared to resist Ilyás, who was marching against them at the head of an army. Under these circumstances a fortunate idea occurred to Hábíb. He challenged his uncle Ilyás to single combat. Ilyás hesitated, but his own soldiers compelled him to accept the challenge. He measured arms with Hábíb, and was laid prostrate by him with a thrust of his lance. The party of independence thus triumphed, and several years elapsed before the 'Abbásid general, Al-Aghlab, was able to enter Kairawán, and regain possession of Africa in the name of the Eastern Caliph. From this time forward, it must be added, Africa only nominally belonged to the 'Abbásids; for, under the Caliphate of Hárún al-Rashíd, Ibráhím, the son of Al-Aghlab, who was invested with the government of Africa, founded in that province a distinct dynasty, that of the Aghlabites.

the Aghlabites in Africa.

Coincidentally with the revolt in Africa, the independent Caliphate of the Western Omayyads was founded in Spain. The long dissensions which had preceded the fall of that dynasty in the East, had already prepared the way for the independence of a province so distant from the centre of the empire. Every petty emir there tried to seize sovereign power for himself, and the people groaned under the consequent anarchy. Weary of these commotions, the Arabs of Spain at last came to an understanding among themselves for the election of a Caliph, and their choice fell upon the last survivor of the Omayyads, 'Abd al-Rahmán b. Mo'áwiya, grandson of the Caliph Hishám. This prince was wandering in the deserts of Africa, pursued by his implacable enemies, but everywhere protected and

concealed by the desert tribes, who pitied his misfortunes and respected his illustrious origin. A deputation from Andalusia sought him out in Africa, and offered him the Caliphate of Spain, which he accepted with joy. On 25th September, A.D. 755, 'Abd al-Rahmán landed in the Iberian Peninsula, where he was universally welcomed, and speedily founded at Cordova the Western Omayyad Caliphate, with which this history has no further concern.

While Mansúr was thus losing Africa and Spain, he was trying to take from the Greeks the city of Malatiya, which, from the importance of its situation, was looked on as the key of Asia Minor. In A.H. 139-140 (A.D. 756-757), a Moslem army of 70,000 men invested the place, and, after a vigorous siege, Malatiya was taken by assault. After this success the Moslems marched through Cilicia, entered Pamphylia, and cut to pieces a Greek army on the banks of the Melas. The Greeks asked and obtained a seven years' truce, which Mansúr was the more disposed to grant because new and very serious troubles had been stirred up in his empire by certain sectaries of Khorásán, called Ráwandís. These Ráwandís, like many other Persian sectaries, admitted a number of dogmas completely foreign to Islam, such as the transmigration of souls and the incarnation of the Deity as a man. They believed, for instance, as historians assure us, that divine honours ought to be paid to the Caliph Mansúr. They had their name from Ráwand, a city near Isfahán, where the sect originated. A great number of these sectaries had repaired to Háshimíya, the residence of the Caliph, and there persisted in marching in procession round his palace, as if it had been the Ka'ba. Mansúr, refusing to receive this impious homage, caused the principal chiefs of the sect to be seized and thrown into prison. The Ráwandís immediately rose in revolt, broke open the prison doors, rescued their chiefs, and pushed their audacity so far as to besiege the Caliph in his own palace. Very fortunately for Mansúr, the populace declared against the Ráwandís and massacred them; but from that time forward he took a dislike to the city of Háshimíya, and resolved to choose another residence. He had at first thought of fixing his place of abode at Cufa; but he remembered the fickle character of the inhabitants, and decided on founding an entirely new city on the banks of the Tigris. His choice fell upon a spot near the ancient Ctesiphon, the capital of the Sassanids, called Baghdád. There he himself laid the first stone of the city which was to be the centre of the civilised world as long as the Caliphate lasted. A revolt, however, of some importance soon called Mansúr's attention from the building of Baghdád. The descendants of 'Alí, who had had reason to think that the 'Abbásids were labouring for their advancement, were now cruelly undeceived. In A.H. 145 (A.D. 762-763), Mohammed Mahdí, great-grandson of Hosain, and surnamed Al-Nafs al-Zakiya ("the pure soul"), collected a large number of adherents at Medina, and had himself proclaimed Caliph. The governor of Cufa, 'Isá b. Músá, received orders to march against him, and entered Arabia. The partisans of 'Alí were defeated, and Mohammed Mahdí fell in battle. But meanwhile his brother Ibráhím had gone to Basra, and had there succeeded in exciting a revolt, in presence of which the 'Abbásid governor had been obliged to capitulate. The adherents of 'Alí, emboldened by this success, spread themselves over 'Irák, and obtained possession of several places, among which was the city of Wásit. Ibráhím was already advancing towards Cufa, at the head of a strong army, when 'Isá b. Músá, who had been hastily recalled from Arabia, threw himself in his way. A terrible conflict took place. At last Ibráhím fell, pierced by an arrow, and, in spite of the desperate efforts

Founda-
tion of
Baghdád

of his followers, his body remained in the hands of the enemy. The partisans of 'Alī then dispersed, and never again ventured to have recourse to arms.

The Caliph was highly delighted when he heard of the decisive victory gained by 'Isā, but, far from rewarding his valiant cousin, he tried to compel him to renounce his right of succession to the Caliphate, with the view of substituting as heir-presumptive his own son Mohammed. 'Isā at first energetically refused to abandon his rights; but Manṣūr did not hesitate at a shameless deception, and produced false witnesses, who swore that 'Isā had waived his claim in favour of Mohammed b. Manṣūr. However unwillingly, 'Isā was obliged to yield his priority to Mohammed, but it was understood that, in case of the death of the latter, the succession should return to 'Isā. One of the false witnesses was, it is asserted, Khālid b. Barmak, the head of that celebrated Persian family the Barmecides, which played so important a part in the reign of 'Irārūn al-Rashīd. To this Khālid, Manṣūr had entrusted the elevated post of minister of finance.

In A.H. 158 (A.D. 774-775), Manṣūr, feeling the decline of his powers, resolved to undertake for the last time the pilgrimage to Mecca. At the last station on the route he had a fall from his horse, and died at the gate of the Holy City. He was nearly seventy years of age, and had reigned for twenty-two years. He was buried at Mecca.

3. Mohammed b. Manṣūr was at Baghdād when he received the news of his father's death, and hastened to have himself proclaimed Caliph. He then took the title of Mahdī ("the well-directed"). To make his accession welcome to his subjects, he began by granting an amnesty to a great number of persons who had incurred the anger of Manṣūr, and had been thrown into prison. Among these was a certain Dāwūd b. Yaḳūb, whom Mahdī afterwards made his prime minister. But, on the other hand, Mahdī did not choose to confirm in their posts the provincial governors in whom his father had placed confidence; he supplied their places by creatures of his own. These changes displeased the people of Khorāsān, who revolted under the leadership of a certain Yūsuf b. Ibrāhīm, surnamed Al-Barm. Mahdī sent against him his general Yazīd b. Mazyad, who, after a desperate struggle, defeated Yūsuf, took him prisoner, and brought him in triumph to Baghdād, where he was put to the torture and crucified. Mahdī had been scarcely a year on the throne, when he resolved to accomplish the pilgrimage to Mecca, and at the same time to visit the tomb of his father. Leaving his eldest son Mūsā as governor of Baghdād, he set off, accompanied by his second son Hārūn and a numerous suite. The chroniclers relate that the Caliph had ordered a great number of camels to be laden with snow, and that he reached Mecca without having exhausted this store. Immediately on his arrival in the Holy City, he applied himself, at the request of the inhabitants, to the renewal of the veils which covered the exterior walls of the Ka'ba. For a very long time these veils had been placed one over another, no care having been taken to remove the old covering when a new one was put on; so that the accumulated weight caused uneasiness respecting the stability of the walls. Mahdī caused the temple to be entirely stripped, and covered the walls again with a single veil of great richness. On this occasion he distributed considerable largesses among the Meccans. From Mecca, Mahdī went to Medina, where he caused the mosque to be enlarged. During his stay in that city he formed himself a guard of honour, composed of five hundred descendants of the Anṣār,¹ to whom he assigned lands in 'Irāq to be held in

ief. Struck by the difficulties of every kind which had to be encountered by poor pilgrims who desired to repair to Mecca from Baghdād and its neighbourhood, he resolved to come to their help. His first care was to have the road from Baghdād to Mecca laid out, and its divisions marked by milestones. He next ordered the construction at every stage of a kind of inn, where the poorer travellers might find shelter and food. He also saw to having new wells dug and cisterns built along the whole route.

Whilst he was devoting himself to these pious labours, he was menaced by a dangerous revolt in Khorāsān. Its leader was a sectary called Ḥakīm, surnamed Al-Moḳanna' or the Veiled One, because he never appeared in public without having his face covered with a mask. Al-Moḳanna' hoped to gather a great number of adherents around him, and to govern the province as absolutely as Abū Moslim had formerly done. His religious teaching consisted in the assertion that God had several times become incarnate among men, and that his last incarnation was Moḳanna' himself. Many Persians were seduced by his words, and still more by the hope of plundering the property of the Moslems, which Moḳanna' promised to give up to them. The governor of Khorāsān and several other generals who marched against these sectaries were defeated; but at last the Caliph charged a skilful captain, Sa'īd al-Ḥarashī, with the direction of operations, and Sa'īd, having compelled the impostor to throw himself into the city of Kash, soon reduced him to a choice between surrender and death. Moḳanna' preferred the latter alternative, and took poison.

These disturbances did not suffice to turn Mahdī's thoughts from the hereditary enemy of the Caliphate. Every summer he sent expeditions into Asia Minor against the Greeks; but these were not successful, and the Caliph decided on leading his army in person. Having levied in Khorāsān a large number of those mountaineers who had always distinguished themselves by their valour, he assembled his army in the plains of Baradān, on the banks of the Tigris, and commenced his march A.H. 163, taking with him his second son Hārūn, and leaving his eldest son Mūsā as governor of Baghdād. The latter was also designated as his successor in the Caliphate, 'Isā b. Mūsā having definitively renounced the throne. Mahdī traversed Mesopotamia and Syria, entered Cilicia, and established himself on the banks of the Jaiḥān (Pyramus). Thence he despatched an expeditionary force, at the head of which his son Hārūn was nominally placed. In reality, that prince being too young to direct military operations, the chief command was exercised by his tutor, the Barmecide Yahyá b. Khālid. Hārūn took the fortress of Samálú after a siege of thirty-eight days. In consequence of this feat of arms, Mahdī made Hārūn governor of Azerbaijan and Armenia. Two years later war broke out afresh between the Moslems and the Greeks. Leo IV., Emperor of Constantinople, had recently died leaving the crown to Constantine Porphyrogenitus. This prince was then only ten years old, and would have been incapable of governing. His mother Irene took the regency on herself. By her orders an army of 90,000 men, under the command of Michael Lachonodracon, entered Asia Minor. The Moslems, on their side, invaded Cilicia under the orders of 'Abd al-Kabīr, but were defeated by the Greeks. Mahdī then recalled his son Hārūn, and enjoined on him to avenge the failure of the arms of Islam. Hārūn assembled an army of nearly 100,000 men, and conceived the project of carrying the war to the very gates of Constantinople. The patrician Nicetas, who sought to oppose his march, was defeated by Hārūn's general, Yazīd b. Mazyad, and forced to take refuge at Nicomedia. Hārūn marched through Asia Minor, and

¹ The first citizens of Medina who embraced Islam were called Anṣār; see above, p. 554.

pitched his camp on the shores of the Bosphorus. Irene took alarm, sued for peace, and obtained it, but on humiliating conditions. This brilliant success increased Mahdí's affection for Hárún to such an extent that he resolved, a few years later, to declare him his successor instead of Músá. It was necessary first to obtain from Músá a renunciation of his rights; and for this purpose his father recalled him from Jorján, where he was then engaged on an expedition against the rebels of Tabaristán. Músá, who had had information of his father's intentions, refused to obey this order. Mahdí determined to march in person against his rebellious son (A.H. 169), and set out, accompanied by Hárún. But, after his arrival at Mäsabadhán, a place in Persian 'Irák or Jabal, the Caliph died suddenly, at the age of only forty-three. There are two versions of the cause of his death: some attribute it to an accident met with in hunting; others believe him to have been poisoned. If this was really the case, although we have no proofs against Músá, we may reasonably suspect him of having been privy to the sudden death of his father.

4. Mahdí having died before he could carry out his plan for assuring the throne to Hárún, the succession naturally fell to Músá, and he was proclaimed Caliph at Baghdád in the year of his father's death. He took the title of Hádí (He who directs). Hárún made no opposition to the accession of his brother, and the army which had accompanied Mahdí returned peacefully from Jabal to Baghdád.

The accession of a new Caliph doubtless appeared to the partisans of the house of 'Alí a favourable opportunity for a rising. Hosain b. 'Alí, a descendant of that Hasan who had formerly renounced his pretensions to the Caliphate through fear of Mo'áwiya I., raised an insurrection at Medina with the support of numerous adherents, and had himself proclaimed Caliph. But having unfortunately conceived the idea of going on pilgrimage to Mecca, he was attacked at Fakh by a party of 'Abbásids, and perished in the combat. His cousin Idrís b. 'Abdalláh succeeded in escaping and fled to Egypt, whence he passed into Morocco; and there, at a later period, his son founded the Idrísite dynasty.

Hádí, as may be supposed, had never been able to forget that he had narrowly escaped being supplanted by his brother. He formed a plan for excluding Hárún from the Caliphate, and transmitting the succession to his own son Ja'far. He neglected no possible means of attaining this object, and obtained the assent of his ministers, and of the principal chiefs of his army, who took the oath of allegiance to Ja'far. Only Yahyá b. Khálid the Barmecide, Hárún's former tutor, absolutely refused to betray the interests of his pupil. In a discussion which took place between him and the Caliph on this subject, Yahyá showed such firmness and boldness that Hádí resolved on his death, and Harthama b. A'yan, one of the bravest generals of the empire, had already received the order to go and take his head, when the Caliph died suddenly. One of those terrible domestic dramas had been acted of which so many were afterwards seen in the palace of the Caliphs. The mother of Hádí and Hárún was Khaizorán, a haughty and intriguing woman, whose aim it was to get the direction of affairs into her own hands, leaving Hádí only the shadow of power. Her influence over all matters of government was so well understood that her door was beset all day by a crowd of petitioners, who neglected the Caliph and preferred to address their requests to her. Hádí soon became indignant at the subordinate part which his mother wished him to play, and after a dispute on the matter, he attempted to poison her. Khaizorán, hoping to find a more submissive instrument of her will in her second son, and wishing to protect herself against fresh

attempts at murder, caused Hádí to be taken unawares and smothered with cushions by two young slaves whom she had presented to him. (Rabí I., A.H. 170. Sept. A.D. 786.)

5. We have now reached the most celebrated name among the Arabian Caliphs, celebrated not only in the East, but in the West as well, where the stories of the Thousand and One Nights have made us familiar with that world which the narrators have been pleased to represent to us in such brilliant colours.

On the unexpected death of Hádí, the generals and ministers who had declared against Hárún, perceiving that popular favour did not incline to the son of the late Caliph, hastened to rally round the son of Khaizorán and Hárún, surnamed Al-Rashíd (The Upright), ascended the throne without opposition. His first act was to choose as prime minister his former tutor, the faithful Yahyá b. Khálid, and to confide important posts to the two sons of Yahyá, Faql and Ja'far, the former of whom was also his own foster-brother. The Barmecide family were endued in the highest degree with those qualities of generosity and liberality which the Arabs prized so highly. Thus the chroniclers are never wearied in their praises of the Barmecides. Loaded with all the burdens of government, Yahyá brought the most distinguished abilities to the exercise of his office. He put the frontiers in a state of defence, and supplied all that was wanting for their security. He filled the public treasury, and carried the splendour of the throne to the highest point. The following anecdote will show what an amount of earnest affection the Barmecide family succeeded in winning:—

After Hárún, as we shall relate farther on, had ruined the Barmecides of whose influence he was jealous, he forbade the poets to compose elegies on the disgrace of the family, and commanded that all who disobeyed this order should be punished. One day, as one of the soldiers of the Caliph's guard was passing near a ruined building, he perceived a man holding a paper in his hand, and reeiting aloud, and with many tears, a lament over the ruin of the palace of the Barmecides. The soldier arrested the man and led him to the palace of the Caliph, who ordered the culprit to be brought before him, and asked him why he had infringed his orders. "Prince," replied the man, "let me relate my history to thee; when thou hast heard it, do with me as thou wilt. I was an inferior clerk under Yahyá b. Khálid. He said to me one day: 'Thou must invite me to thy house.' 'My lord,' I replied, 'I am quite unworthy of such an honour, and my house is not fit to receive thee.' 'No,' said Yahyá, 'thou must absolutely do what I require of thee.' 'In that case,' answered I, 'grant me some little delay that I may make suitable arrangements.' Yahyá granted me some months. As soon as I informed him that I was ready, he repaired to my abode, accompanied by his two sons, Faql and Ja'far, and by some of his most intimate friends. Scarcely had he dismounted from his horse when he begged me to give him something to eat. I offered him some roasted chickens. When he had eaten his fill, he went over the whole of my house, and having seen it all, he asked me to show him the buildings attached to it. 'My lord,' said I, 'thou hast seen everything.' 'No,' said he, 'thou hast another house.' In vain I assured him that I had but one; he persisted in his assertion, and, sending for a mason, ordered him to make an opening in the wall. 'My lord,' said I, 'may I venture thus to make my way into my neighbour's house?' 'It matters not,' replied he. When a doorway had been opened, he passed through it, followed by his two sons, and I went after him. We entered a delightful garden, well planted and watered by fountains. In this garden stood a beautiful house with pavilions adorned with furniture and carpets, and filled with slaves of both sexes, all of perfect beauty. 'All this is thine,' said Yahyá to me. I kissed his hands and poured out my thanks to him; and then I learned that on the very day when he had spoken to me of inviting him he had bought the land adjoining to my house, and had had it laid out for me without my ever suspecting it. I had certainly noticed that building was going on, but I was far from imagining that all this was intended for me. Yahyá next addressed himself to Ja'far and said: 'Here are certainly a house and servants, but who will provide for their support?' 'I,' replied Ja'far, 'will give him a farm and its dependencies, and will send him the deed of gift.' 'Very well,' continued Yahyá; 'but how is he to live until he shall receive the revenue of his property?' 'I owe him a thousand pieces of gold,' said Faql, 'and I will send them to his

house.' Thanks to these magnificent gifts, I afterwards gained great wealth,—wealth which I still enjoy. Since that day, I have never lost any opportunity of singing the praises of that noble family. And now, Prince, slay me if thou wilt; I am ready to die." Hárún, affected by this tale, let the man depart, and in future forbade no man to weep for the tragical end of the sons of Barmak. (*El-Fachri*, ed. Ahlwardt, p. 237.)

Although the administration of Hárún's states was committed to skillful hands, yet the first years of his long reign were not free from troubles. Towards the year 176 (A.D. 792-793), a member of the house of 'Alí, named Yahyá b. 'Abdalláh, who had taken refuge at Dáim on the shores of the Caspian Sea, succeeded in forming a powerful party, and publicly announced his pretensions to the Caliphate. Hárún immediately sent an army of 50,000 men against the rebel, under the command of Fadl. Reluctant, however, to fight against a descendant of the Prophet, Fadl first attempted to induce him to submit, by promising him safety for his life and a brilliant position at the court of Baghdád. Yahyá accepted these conditions, but he required that the Caliph should send him letters of pardon countersigned by the highest legal authorities and the principal personages of the empire. Hárún consented to do so, and Yahyá, furnished with the Caliph's safe-conduct, repaired to Baghdád, where he met with a splendid reception. At the end of some months, however, he was calumniously accused of conspiracy, and the Caliph, seizing this opportunity of ridding himself of a rival who might prove dangerous, threw him into prison, where he was soon after put to death. Dreading fresh insurrections, Hárún thought it well to secure the person of another descendant of 'Alí, Músá b. Ja'far, who was resident at Medina, where he enjoyed the highest consideration. The unfortunate man was sent to Baghdád, and there died by poison.

Meanwhile Hárún did not forget the hereditary enemy against whom he had already fought. Under his reign all the strong places of Syria were formed into a special province, which received the name of 'Awásim. The charge of fortifying the city of Tarsus was committed to Faraj, the chief of the Turkish soldiers, whom the Caliphs were beginning to employ, and who were at a later period to become their masters. The ancient Anazarbus was rebuilt, and garrisoned with a military colony from Khorásán. Thanks to these measures, the Moslem armies were able to advance boldly into Asia Minor. Ishák b. Solaimán entered Phrygia and defeated the Greek governor of that province. A Moslem fleet destroyed that of the Greeks in the Gulf of Satalia. Hárún invaded Asia Minor in the year 181 (A.D. 797-798), and during the following years his generals gained continual victories over the Byzantines, so that Irene was compelled to sue for peace. An attack by the Khazars called the Caliph's attention from his successes in Asia Minor. That people had made an irruption into Armenia, and their attack had been so sudden that the Moslems were unable to defend themselves, and a hundred thousand of them had been reduced to captivity. Two valiant generals, Khozaima b. Kházim and Yazíd b. Mazyad, marched against the Khazars and drove them out of Armenia.

In the midst of the cares of war, Hárún did not forget his religious duties, and few years passed without his making the pilgrimage. In one of these pilgrimages, A.H. 186 (A.D. 802), he was accompanied by his two eldest sons, Mohammed and 'Abdalláh, and having determined to fix the order of succession in so formal a manner as to take away all pretext for future contentions, he executed a deed by which he appointed Mohammed his immediate heir; after him 'Abdalláh, and after 'Abdalláh a third of his sons, named Kásim. Mohammed received the surname of Al-Amin (The Sure), 'Abdalláh that of Al-Ma'mún (He

in whom men trust), and Kásim that of Mo'tamin billáh (He who trusts in God). Hárún further stipulated that Ma'nún should have as his share, during the lifetime of his brother, the government of the eastern part of the empire. Each of the parties concerned swore to observe faithfully every part of this deed, which the Caliph caused to be hung up in the Ka'ba, imagining that it would be thus guaranteed against all violation on the part of men. These precautions were to be rendered vain by the perfidy of Amin. We shall see hereafter how he kept his oath, and how he expiated his treachery by death.

It was in the following year, at the very moment when the Barmecides thought their position most secure, that Hárún brought sudden ruin upon them. The causes of their disgrace have been differently stated by the annalists. Some relate that the Caliph, preferring to all other society that of his sister 'Abbása and of Ja'far b. Yahyá, resolved to unite them in marriage, in order to be able to bring them together in his presence without a breach of etiquette. He meant, however, that Ja'far should continue to be only the nominal husband of his sister. Ja'far accepted this condition, but it was not long before he forgot it, and the Caliph learned that his sister had given birth to a son. This, it is said, was the cause of Ja'far's disgrace, which involved his father and his brother. This story may be true; but the principal cause of the fall of the Barmecides appears to have consisted in the abuses of power of which they had been guilty, and in the sovereign influence which they exercised on those around them. The Barmecides lived in a magnificent palæe opposite to that of the Caliph. Seeing one day an extraordinary crowd around the dwelling of his first minister, Hárún was moved to say: "Verily Yahyá has taken all business into his own hands; he it is who really exercises supreme power; as for me, I am Caliph only in name." This secret dissatisfaction was increased by a new act of disobedience on the part of Ja'far. Hárún had ordered him to put to death secretly a member of the house of 'Alí, whose intrigues he dreaded. Ja'far allowed the victim to escape, and afterwards swore to the Caliph that his orders had been executed. Soon after, however, information against him was given to Hárún, who, after compelling Ja'far to acknowledge the truth, had his head struck off and brought to him by Masrúr, the chief of his eunuchs. On the very next day Yahyá, his son Fadl, and all the other Barmecides, were arrested and imprisoned; all their property was confiscated; and Hárún chose as his prime minister Fadl b. Rabí, who had been his chamberlain.

In the same year, a revolution broke out at Constantinople, which overthrew the Empress Irene, and raised Nicephorus to power. The new emperor had scarcely ascended the throne, when he thought himself strong enough to refuse the payment of tribute, and wrote an insulting letter to Hárún, who contented himself with replying: "Thou shalt not hear; but see, my answer." He then assembled an army, entered Asia Minor, and took Heraclea, plundering and burning along his whole line of march, till Nicephorus, in his alarm, sued for peace. Scarcely had the Caliph returned into winter quarters, when Nicephorus broke the treaty. Notwithstanding the rigour of the season, Hárún retraced his steps, and this time Nicephorus was compelled to observe his engagements. The year after, A.H. 189 (A.D. 804-805), disturbances arose in Khorásán. They were caused by the malversations of the governor of that province, 'Alí b. 'Isá, and the Caliph went in person to Merv to judge of the reality of the complaints which had reached him. 'Alí b. 'Isá hastened to meet the Caliph on his arrival at Ray. He brought with him a great quantity of presents, which he distributed with such profusion

among the courtiers that every one found a thousand reasons for excusing his conduct. Hárún confirmed him in his post and returned to Baghdád, through which, however, he only passed, and went on to Rakka on the Euphrates, a city which became his habitual residence. He did not long enjoy the repose which he went there to seek, for Nicephorus again broke the treaty of peace, and the Caliph was obliged to take the field anew. Once more Nicephorus was beaten, and so completely that he was obliged to submit to the very harsh conditions which the victor imposed on him.

Two years later, new disturbances broke out in Khorásán, where a certain Ráfi' b. Laith had revolted. Hárún set out again for that province, accompanied by his son Ma'mún. It was to be his last journey. He was attacked by a tumour in the abdomen, and struggled in vain against this malady, which carried him off a year after his departure, A.H. 193 (A.D. 808-809), just on his arrival at the city of Tús, the birthplace of the great epic poet of Persia, Firdausi. Hárún was only forty-seven years of age.

6. On the death of Hárún, his minister Fadl b. Rabf hastened to call together all the troops of the late Caliph, and to lead them back to Baghdád, in order to place them in the hands of the new sovereign, Amín. He even led back the corps which was intended to occupy Khorásán, and which ought to have fallen to the share of Ma'mún, according to the testament of Hárún. Fadl v. Rabf thus committed a serious violation of the rights of Ma'mún; but he cared little for this, being chiefly desirous of winning the confidence of the new Caliph. He was quite aware, however, that in thus acting he was making Ma'mún his irreconcilable enemy; and he therefore purposed to use every endeavour to arouse against him the enmity of his brother Amín. He advised him to exclude Ma'mún from the succession, and the Caliph was weak enough to listen to him. Receiving the order to resign his government of Khorásán and to repair to Baghdád, Ma'mún was greatly perplexed; but his tutor and vizier, Fadl b. Sahl, reanimated his courage, and pointed out to him that, if he obeyed the orders of the Caliph, certain death awaited him at Baghdád. Ma'mún resolved to hold out against Amín, and found pretexts for eluding the orders of his brother and remaining in Khorásán. Amín, in his anger, caused the testament of his father, which, as we have seen, was preserved in the Ka'ba, to be destroyed, declared, on his own authority, the rights of Ma'mún to the Caliphate to be forfeited, and caused the army to swear allegiance to his own son Músá, a child five years of age, on whom he bestowed the title of Nátik bil-Hakik, "He who speaks according to truth" (A.H. 194, A.D. 809-810). On hearing the news, Ma'mún, strong in the rightfulness of his claim, retaliated by suppressing the Caliph's name in all public acts. Amín immediately despatched to Khorásán an army of fifty thousand men, under the command of 'Alí b. 'Isá. Ma'mún, on his side, raised troops among his faithful people of Khorásán, and entrusted their command to Táhir b. Hosain, who displayed remarkable abilities in the war that ensued. In the following year, the two armies met under the walls of Ray, and victory declared for Táhir. Ma'mún now no longer hesitated to take the title of Caliph. The year after, Amín placed in the field two new armies, commanded respectively by Ahmed b. Mazyad and 'Abd-alláh b. Homaid b. Kahtaba. The skilful Táhir b. Hosain succeeded in creating divisions among the troops of his adversaries, and obtained possession, without striking a blow, of the city of Holwán, an advantage which placed him at the very gates of Baghdád. Ma'mún immediately sent Táhir reinforcements under the orders of Harthama b. A'yan, which enabled him to maintain a firm hold on all the conquered territory, and to continue his victorious

march to the capital. Reverses naturally lead to fresh reverses. One after the other the provinces fell away from Amín, and he soon found himself in possession of Baghdád alone, which was speedily invested by the troops of Táhir and Harthama. That unfortunate capital, though blockaded on every side, made a desperate defence for two years. Ultimately the eastern part of the city fell into the hands of Táhir, and Amín, deserted by his followers, was compelled to surrender. He resolved to treat with Harthama, as he hated Táhir; but this step caused his ruin. Táhir learned by his spies that Harthama was to receive the Caliph in person, and gave orders to a body of horsemen to arrest Amín as he issued from Baghdád under cover of the night. On the banks of the Tigris, Harthama awaited Amín with a boat, but scarcely had the Caliph set foot in it, when the agents of Táhir poured on it a storm of arrows and stones. The boat sank, and the Caliph had to make his escape by swimming. But he was closely followed up, and had scarcely left the river when he fell into the hands of his enemies, who shut him up in a hut and went to inform Táhir of the capture. The victorious general immediately ordered him to be put to death, and the order was carried out. The head of the unfortunate Amín was cut off and sent to Ma'mún, A.H. 198. It was presented to him by his vizier, Fadl b. Sahl, surnamed Dhú 'l-Riyásatain, or "the man with two governments," because his master had committed to him both the ministry of war and the general administration. Ma'mún, on seeing the head, hid his joy beneath a feigned display of sorrow.

7. On the day following that on which Amín had Ma'mún. perished so miserably, Táhir caused Ma'mún to be proclaimed at Baghdád. The accession of this prince appeared likely to put an end to the evils of civil war, and to restore to the empire the order necessary for its prosperity. It was not so, however. The reign of Ma'mún—that reign on which art, science, and letters, under the patronage of the Caliph, threw so brilliant a lustre—had a very stormy beginning. Ma'mún was in no haste to remove to Baghdád, but continued to make Merv his temporary residence. In his gratitude to the two men to whom he owed his throne, he conferred on Táhir the government of Mesopotamia and Syria, and chose as prime minister of the empire Fadl b. Sahl, who had been already his vizier in the government of Khorásán. The adherents of 'Alí seized on the elevation of Ma'mún to power as a pretext for fresh revolts at Mecca, at Medina, and in 'Irák. At Cufa a certain Ibn Tabátábá also broke out into open rebellion, and placed an army in the field under one of his partisans, Abú 'l-Saráyá. Hasan b. Sahl, brother of Ma'mún's prime minister, who had been made governor of all the provinces conquered by Táhir, immediately sent troops against Cufa. They were defeated, and Abú 'l-Saráyá, encouraged by this first success, and no longer finding a secondary part sufficient for his ambition, poisoned his chief Ibn Tabátábá, and put in his place another of the family of 'Alí, Mohammed b. Mohammed, whom, on account of his extreme youth, he hoped to govern at his will. Fresh troops sent against Abú 'l-Saráyá fared no better than the first, and several cities of 'Irák, as Basra, Wásit, and Madáin, fell into the hands of the rebels. Abú 'l-Saráyá was already marching against Baghdád, when Hasan b. Sahl, in great alarm, hastily recalled Harthama b. A'yan, one of the heroes of the civil war, who was already on his way back to Merv. As soon as this general had returned from Khorásán, the face of affairs changed. The adherents of 'Alí were everywhere driven back, and the whole of 'Irák fell again into the hands of the 'Abbásids. Cufa was taken by assault, and both Abú 'l-Saráyá and Mohammed b. Mohammed were

made prisoners. The former had his head struck off; the latter was sent to Khorásán. The revolt in Arabia was also quickly stifled, and it might have been supposed that peace was about to be re-established. This, however, was by no means the case. The civil war had caused a swarm of vagabonds to spring, as it were, from underground at Baghdád. They proceeded to treat the capital as a conquered city; and such was their audacity that they plundered houses and carried off women and children at mid-day. It became necessary for all good citizens to organize themselves into a regular militia, in order to master these ruffians. Meanwhile, at Merv, Ma'mún was adopting a decision which fell like a thunderbolt on the 'Abbásids. In A.H. 201 (A.D. 816-817), under pretence of putting an end to the continual revolts of the partisans of 'Alí, and acting on the advice of his prime minister, Faḍl, he publicly designated as his successor in the Caliphate 'Alí b. Músá, a direct descendant of Hosain the son of 'Alí, and proscribed black, the colour of the 'Abbásids, in favour of that of the house of 'Alí, green. This step was well calculated to delight the followers of 'Alí, but it naturally could not fail to exasperate the 'Abbásids and their partisans. The people of Baghdád refused to take the oath to 'Alí b. Músá as heir-presumptive, declared Ma'mún deposed, and elected his uncle Ibráhím, son of Mahdí, to the Caliphate.¹ The news reached the Caliph only indirectly, for his minister Faḍl, desiring to leave Ma'mún only the shadow of power, kept all important events carefully from his knowledge. The eyes of the Caliph were opened, and he now perceived that Faḍl had been treating him as a puppet. His anger knew no bounds. Faḍl was one day found murdered, and 'Alí b. Músá died suddenly. The historians bring no open accusation against Ma'mún of having got rid of these two personages; but it seems clear that it was not chance that did him such a seasonable service. Ma'mún of course affected the profoundest grief, and, in order to disarm suspicion, appointed as his prime minister the brother of Faḍl, Ḥasan b. Sahl, whose daughter Búrán he also afterwards married. But on the other hand, in order to quiet the people of Baghdád, he wrote to them: "The cause of your dissatisfaction in the business of 'Alí b. Músá no longer exists; since he who was the object of your resentment has just died." From that moment the pseudo-caliph Ibráhím found himself deserted, and was obliged to seek safety in concealment. His precarious reign had, however, lasted nearly two years. Ma'mún now decided on making a public entry into Baghdád, but to show that he came as a master, he still displayed for several days the green flag of the house of 'Alí, though at last, at the entreaty of his courtiers, he consented to resume the black. From this time the real reign of Ma'mún began, freed as he now was from the guardianship of Faḍl. His general Táhir alone continued to excite his suspicions. Under the pretence that he could no longer endure the sight of the murderer of his brother, he removed Táhir to a distance by appointing him governor of Khorásán. Like most of the great Moslem generals, Táhir, it is said, conceived the project of creating an independent kingdom for himself. His death, A.H. 207, prevented its realization; but as his descendants succeeded him one after the other in the post of governor, he may be said to have really founded a dynasty in Khorásán. When, two years later, the impostor Bábak set up a communistic sect in Armenia and Azerbaijan, it was a son of Táhir, 'Abdalláh, who was commissioned by Ma'mún to put him down. Notwithstanding his ability, 'Abdalláh could not accomplish the task, and it

was only under Ma'mún's successor that Bábak was taken and put to death.

Ever since Ma'mún's entry into Baghdád, the pseudo-caliph Ibráhím had led a wandering life. He was arrested one night in Baghdád, under the disguise of a woman, and brought before Ma'mún. The latter generously pardoned him, and also granted an amnesty to the former minister of Amín, Faḍl b. Rabf, although he had been the chief promoter of the terrible civil war which had so lately shaken the empire. After that time, Ibráhím the son of Mahdí lived peacefully at the court, cultivating the arts of singing and music, in which he excelled.

Tranquillity being now everywhere re-established, Ma'mún gave himself up, without hindrance, to his scientific and literary tastes. He caused works on mathematics, astronomy, medicine, and philosophy, to be translated from the Greek. It was also by his orders that two learned mathematicians undertook the measurement of a degree of the earth's circumference. Ma'mún interested himself, too, in questions of religious dogma. Shocked at the opinion which had spread among the Moslem doctors, that the Koran was the fincreated word of God, he published an edict commanding them to renounce this error. Several distinguished doctors, and, among others, the celebrated Ibn Ḥanbal, founder of one of the four orthodox Moslem sects, were obliged to appear before an inquisitorial tribunal; and as they persisted in their belief respecting the Koran, they were thrown into prison. Meanwhile, war having broken out between the Greeks and the Moslems, Ma'mún set out for Asia Minor, to put himself at the head of his army. On his arrival at Tarsus, he received from the governor of Baghdád the report of the tribunal of inquisition, and ordered that the culprits should be sent off to him. Happily for these unfortunate doctors, they had scarcely started on the road to the frontiers, when news of the Caliph's death reached Baghdád. Ma'mún having bathed in the Podendon, a burning fever was the result, which brought him to the grave in A.H. 218 (A.D. 833). Before his death, he designated as his successor his brother Mo'tasim billáh, (He who seeks defence in God), whom he had for a long time preferred to Mo'tamin.

8. The accession of the new Caliph Mo'tasim met at first with active opposition in the army, where a powerful party had been formed in favour of 'Abbás, the son of Ma'mún. Thanks, however, to the disinterested conduct of that prince, civil war was averted. 'Abbás publicly renounced all pretension to the Caliphate, and took the oath of allegiance to his uncle. Mo'tamin, the son of Ḥárún, imitated the conduct of 'Abbás, and the whole army accepted Mo'tasim, who made his public entry into Baghdád in the month of Ramadan 218.

The new Caliph, far from putting a stop to the persecution which had been directed against the orthodox doctors, took up and carried out the views of Ma'mún. The doctor Ibn Ḥanbal was beaten with rods and thrown into prison, together with several of his companions, and was not restored to liberty till the Caliphate of Motawakkil. This persecution had already prejudiced the people against Mo'tasim, and their discontent became more marked when the Caliph created a new body of troops, specially intended to watch over his person. This new guard was composed of Turks, an unbridled and undisciplined body of soldiery, who, moreover, held in open contempt the religious precepts of Islam. Tired of the excesses of every kind committed by the Turks, the people of Baghdád rose in insurrection, and Mo'tasim, not daring to act with severity either against his guard or the citizens, took the course of quitting the city. Leaving the government of the capital in the hands of his son Wáthik billáh (He who trusts in

Ibráhím
b. al-
Mahdí
elected at
Baghdád.

¹ On this event, see a remarkable essay by Barbier de Meynard, in the *Journal asiatique* for March-April, 1869.

God), he established himself with his guard at Sámarra, a small place situated a few leagues above Baghdád, and changed its name to Sorra-man-ra'a (He rejoices who sees it). This resolution of Mo'tasim was destined to prove fatal to his dynasty; for it placed the Caliphs at the mercy of their Prætorians. In fact, from the time of Mo'tasim, the Caliphate became the plaything of the Turkish guard, and its decline was continuous. Some glorious feats of arms, however, were still performed under Mo'tasim. The sectary Bábak was at last taken by Afshín, a Turkish general of the Caliph, in the year 223 (A.D. 837-838). Bábak was carried to Baghdád, led through the city on the back of an elephant, and then delivered to the executioners, who cut off his arms and his legs. Afshín, however, was very ill rewarded for his services, for shortly afterwards the Caliph had him put to death on a charge of heresy.

The death of Ma'mún had for the moment suspended hostilities with Constantinople; under Mo'tasim the war was rekindled. A valiant Greek general, Manuel, who had incurred the displeasure of the Emperor Theophilus, took refuge with the Caliph, who eagerly welcomed him and gave him a command. Manuel began by reducing Khorásán, which had risen in revolt, and Mo'tasim was so well satisfied with him that he thought of employing him against his own countrymen. This was precisely what Theophilus dreaded, and he took measures accordingly to bring back the banished general to his side. He sent an ambassador to Mo'tasim, under pretence of ransoming some Greek prisoners; but the real object of his mission, which he contrived to communicate to Manuel, was the recall of that general. Manuel, feigning great animosity against his country, himself asked to be allowed to lead a Moslem army into Cappadocia. The Caliph granted his request, and sent with him his own son Wáthík billáh. But, as soon as they reached the frontiers of Cappadocia, Manuel confessed to the young prince that his intention was to return to Constantinople, and quitted the army. Theophilus, taking advantage of the confusion into which the departure of Manuel had thrown the Moslems, made an incursion into Syria, laid waste that province as far as Zaba'tra, and returned loaded with booty. At the news of this disaster, Mo'tasim assembled a formidable army, estimated at more than two hundred thousand men, penetrated into Asia Minor, beat the Greeks, and took the city of Amorium, which he ordered to be razed to the ground. A revolt which broke out at Baghdád in favour of his nephew 'Abbás, the son of Ma'mún, compelled the Caliph to turn back. Mo'tasim had the unfortunate 'Abbás arrested, and he was soon after found dead in his prison. Mo'tasim survived him only four years. He died at Sorra-man-ra'a, in A.H. 227 (A.D. 841-842).

9. His son Wáthík, who succeeded him, showed himself no less intolerant on the doctrinal question of the uncreated Koran. He carried his zeal to such a point that, on the occasion of an exchange of Greek against Moslem prisoners, in the year 231 (A.D. 845-846), he ordered that all the Moslem captives who would not declare their belief that the Koran was a human work, should be left in the hands of the enemy. The reign of Wáthík billáh was not otherwise marked by any very striking events. He died in 232 (A.D. 846-847), after a reign of five years. As he had appointed no successor before his death, the principal personages of the state at first cast their eyes on his son Mohammed; but they had scarcely saluted him with the title of Caliph, when they changed their purpose, and offered the supreme power to Motawakkil 'ala 'Iláh (He who trusts to God), brother of Wáthík. This prince was therefore elected in the same year in which Wáthík died.

10. The first act of Motawakkil was an atrocious cruelty. He seized Mohammed b. 'Abd al-Melik, his brother's vizier, who had always been his enemy, and ordered him to be placed in a furnace bristling within with iron points, which was then raised to a red heat. The Caliph looked on at the agonies of his victim, incessantly repeating: "Pity is a weakness." This had been the favourite maxim of the unfortunate vizier. An impostor named Mohammed b. Faraj had set himself up as a prophet, giving out that he was Moses risen from the dead. By means of this gross fabrication, he had contrived to attract twenty-seven followers. The Caliph had him seized, and condemned him to perpetual imprisonment; but first he compelled each of the followers of Mohammed to give the pretended prophet ten blows on the head with his fist; and the poor wretch expired under the hands of his own disciples. (A.H. 235, A.D. 849-850.)

In the year of his elevation to the Caliphate, Motawakkil had regulated the succession to the empire in his own family, by designating as future Caliphs his three sons, Montasir billáh (He who seeks help in God), Mo'tazz billáh (Strong through God), and Mowayyad billáh (Assisted by God). In acting thus, his object was to protect against the tendency of his predecessors to favour the house of 'Alí, and to guard against the attainment of the Caliphate by any member of that house. Motawakkil displayed the most extreme hatred for the descendants of the Prophet. He even went so far as to destroy the chapel erected over the tomb of Hosain at Kerbelá, and forbade the Shi'ites to visit the spot. Not content with attacking the liberty and the property of the descendants of 'Alí, he insulted their belief, by taking buffoons into his pay, whose business it was to turn the person of 'Alí into mockery. He also persecuted the Christians and the Jews; excluding them from all public employments, and obliging them to send their children to Moslem schools. In the year 237, a revolt broke out in Armenia. The Caliph sent the Turk Bugha against the rebels; but they met him with a vigorous resistance, and it was four years before peace was restored to the province. During that time the Greeks effected a descent on Egypt, and Damietta was taken and burned. Motawakkil caused Damietta to be fortified, and transferred his own residence to Damascus, doubtless that he might be able to keep a closer watch on the proceedings of the Byzantines. He soon thought himself strong enough to take the offensive, and poured his Turkish soldiery into Asia Minor, where they encountered the same Manuel who had been formerly received at the court of Mo'tasim. After an alternation of successes and reverses, both Moslems and Greeks retired from the conflict. Motawakkil then returned to his residence at Sorra-man-ra'a, and there caused a magnificent quarter to be built, which he called Ja'fariyya.¹ There he gave himself up to debaucheries; till at last, during one of his orgies, he was murdered by a Turkish soldier named Wasf, who had been bribed to the deed by his own son Montasir billáh (A.H. 247, A.D. 861-862).

11. On the very night of his father's assassination Montasir had himself proclaimed Caliph. The conspirators among the Turkish soldiery compelled him to deprive his two brothers, Mo'tazz and Mowayyad, who were not agreeable to them, of their rights of succession. Montasir did not long enjoy the fruits of his crime. He died five months after, by poison, it is said.

12. The Turkish soldiery, which now arrogated to itself the mastery over the Caliphate, chose in succession to Montasir his cousin Ahmed, who took the title of Mosta'in

¹ That is, "City of Ja'far." Ja'far was Motawakkil's own proper name

billáh (He who looks to help to God). Under the reign of this feeble prince, the Greeks inflicted serious losses on the Moslems in Asia Minor. The Turkish soldiery, instead of attempting to repair these losses, revolted against the Caliph whom they had themselves chosen, and plundered the city of Sorra-man-ra'a. Taking advantage of these disorders, a descendant of 'Alí, named Hasan, gained possession of Tabaristán and Jorján, and permanently deprived the Eastern Caliphate of those provinces. At the same time, insurrections sprang up in every part of the empire. Next, the chiefs of the Turkish soldiery, in their mutual jealousies, began to tear each other to pieces. The infatuated Caliph fled from Sorra-man-ra'a, and took refuge at Baghdád. The Turks now resolved on his destruction, and forgetting that they themselves had deprived Mo'tazz billáh, brother of Montasir, of his legitimate rights, chose him as their Caliph. They next placed at their head a brother of Mo'tazz, named Mowaffak billáh, and besieged Mosta'in at Baghdád. At the end of one month (A.H. 252, A.D. 866), Mosta'in surrendered, and was put to death.

13. Mo'tazz billáh, thus called to the throne by the very men who had previously sought to exclude him from it, resolved to free himself from the yoke of the formidable Turkish soldiery which thus made and unmade Caliphs. But to maintain a struggle against such terrible adversaries, the new sovereign would have needed an ability and energy which he did not possess. He made, indeed, a very impolitic beginning in getting rid of his brothers Mowayyad and Mowaffak, of whom he put the former to death, and drove the latter into exile. Some time after, it is true, he had the satisfaction of seeing Wasif, one of the chiefs of the Turkish soldiery, lose his life in a mutiny of his own troops; and that of defeating in person another chief, Bugha, whom he afterwards caused to be beheaded. But in the following year (A.H. 254), the Turks chose as their leaders the sons of Wasif and Bugha, Sâlih and Mohammed, who avenged their fathers by plundering the palace of the prime minister and besieging that of the Caliph, whom they seized and threw into close confinement, where he died of hunger and thirst, A.H. 255.

Moht. 14. Immediately after the fall of Mo'tazz, the Turks brought from Baghdád one of the sons of Wâthik billáh, and proclaimed him Caliph, with the title of Mohtadi billáh (Guided by God). Mohtadi, a man of noble and generous spirit, exerted himself, but in vain, to release his predecessor from prison. Having failed in this, he kept the precarious measure of power which his masters left him, and applied it to the regeneration of Moslem society, the decay of which appeared to him imminent. He forbade wine and games of chance; he devoted himself to the administration of justice; he examined in person every sentence passed by the judges, and gave public audience to the people twice a week for the redress of their grievances. The farmers of the revenue were subjected to strict control, and the taxes were considerably lightened. It seemed as if these reforms were likely to re-establish order and prosperity in the empire. But Mohtadi came too late, and the Turks did not leave him time to finish his work. Sâlih, one of the chiefs of the Turkish soldiery, having been assassinated by a rival, Mohtadi punished the guilty person with rigour. The Turks, in their rage, beset the palace and slaughtered the unfortunate Caliph (A.H. 256, A.D. 870).

15. Whether from weariness, or from repentance, the Turkish soldiery discontinued for a time their hateful excesses. A son of Motawakkil was brought out of prison to succeed his cousin, and reigned for twenty-two years under the name of Mo'tamid 'ala'lláh (He whose support is God). During his reign two great events took place,

tokens and precursors of the dissolution of the Caliphate. Eastern Persia and Egypt separated themselves by force from the empire, and two new dynasties established themselves in these countries, those respectively of the Saffarids and the Túlunids. The founder of the former, Ya'kúb b. Laith, was the son of a coppersmith (Saffar). At the head of a band of resolute men, he invaded successively Khorásán, Kirmán, and Sijistán, and at last the Caliph Mo'tamid, powerless to arrest his progress, was obliged to give an official recognition to accomplished facts. But Ya'kúb was not satisfied with this; he soon possessed himself of Tabaristán, Fârsistán, and Ahwáz, and thence marched against Baghdád. Fortune, however, deserted him; he was beaten in the neighbourhood of Wásif (A.H. 262), and compelled to return to Persia in order to levy a new army there. In 265 he resumed his march against Baghdád, but was obliged by sickness to halt at Jondisábúr, where he died; not, however, till he had obtained from the Caliph a formal investiture of all the provinces he had conquered. He was succeeded by his brother 'Amr. On the other side, a certain Ahmed b. Túlún, the son of a freedman, who had obtained from the Caliph the post of governor of Egypt, planned the creation for himself of an independent kingdom. Under Mo'tamid he even invaded Syria, and perhaps would have pushed his conquests still farther, had not death overtaken him in A.H. 270 (A.D. 883-884). His son Khomaríya succeeded him in Egypt, and though, at a later period, he submitted to pay tribute to Mo'tadid, nevertheless a dynasty had been founded in that country which lasted for twenty-one year longer. Mo'tamid died eight years after Ahmed b. Túlún.

16. The reign of Mo'tadid billáh (He who seeks his support in God), who succeeded his uncle Mo'tamid, is principally remarkable for the rise of the celebrated sect of the Carmathians (Karmaita), who for two centuries laid waste the Moslem empire, as if for the extinction of the Saffarid dynasty in Persia, where it was replaced by that of the Sámánids. Some details respecting the origin and the creed of the Carmathians will be found in the third section of this article. We shall content ourselves here with stating the fact that these sectaries, who were numerous in 'Irák, Syria, and Eastern Arabia, kept in check all the armies which were sent against them. Under the reign of Mo'tadid they invaded Mecca and committed great ravages there. In A.H. 281, Mo'tadid repaired the disasters which they had caused there, and raised important works about the Ka'ba. Mo'tadid died in 289 (A.D. 902), leaving the throne to his son Moktafi billáh.

17. Moktafi billáh (He who sufficeth himself in God) reigned for six years, during which he had constantly to struggle against the Carmathians. One of his generals, indeed, gained a signal victory over these sectaries; but, to avenge their defeat, they lay in wait for a caravan which was on its return from Mecca, and massacred twenty thousand pilgrims. This horrible crime raised the whole of Arabia against them. The Carmathians were beaten again, and Dhikríya, one of their ablest generals, was taken and put to death. The sectaries remained quiet for some time, and the Caliph took advantage of this respite to take Egypt from the house of Túlún, and to confer its government on the Ikshídites. Moktafi died A.H. 295 (A.D. 907-908). His activity and energy revived for a moment the prestige of the Caliphate; but this fleeting renewal of its greatness was soon to disappear, and decay resumed its course.

18. The new Caliph, Moktadir billáh (Powerful through God), was only thirteen years of age when he ascended the throne. His extreme youth prejudiced the people of Baghdád against him; they rebelled, and swore allegiance to 'Abdalláh, son of the former Caliph Mo'tazz; but the

party of Muktadir prevailed, and his rival was put to death. Muktadir, however, was too young to exercise any real power; he was governed by his eunuchs. He was, besides, a man of feeble character, and looked on helplessly at the death-struggle of the empire, upon which calamities of every kind now poured in. The Greeks invaded Mesopotamia. A truce was concluded with them; but the Carmathians then recommenced their disorders in Syria. The indolence of the Caliph, and his inaction in the face of this danger, alienated all hearts from him; and the eunuch Múnis, the principal chief of his party, took the lead in deposing him and proclaiming in his stead his brother Káhir billáh (Victorious through God), in the year 317 (A.D. 929-930). Káhir, however, having refused to distribute a donative to the army on the occasion of his accession, a counter-revolution took place, and Muktadir, who had been imprisoned, was taken from his dungeon and replaced on the throne, only three days after his deposition. Favoured by these disturbances, the governor of Mosul, Násir al-Daula, declared himself independent, and founded definitively the dynasty of the Hamdánites; thus causing an additional dismemberment of the empire. The Carmathians in their turn, under the guidance of a new chief, Abú Táhír, obtained possession of Mecca, and carried off the celebrated black stone of the Ka'ba, which they did not restore till very long afterwards. Meanwhile the eunuch Múnis had been disgraced. He withdrew at first to Mosul, to the court of Násir al-Daula; but it was to raise an army and march upon Baghdád, where the Caliph had again fixed his abode. The object of Múnis was not to attack the Caliph, but only to take vengeance on his personal enemies. Muktadir was induced by evil counsellors to make a sally against Múnis. His troops were put to the rout, and he himself fell on the field of battle, in the year 320 (A.D. 932).

With the reign of Muktadir is connected one of the greatest events in the history of the Caliphate, the foundation of the Fátimite dynasty, which reigned, first in the Maghrib and then in Egypt, for nearly three centuries. The first of this family who put forward any pretensions to the Caliphate was 'Obaid Alláh, surnamed the Mahdí, or Messiah of the followers of 'Alí, who gave himself out as a direct descendant of 'Alí, through his wife Fátima, the daughter of Mohammed, whence the name of Fátimite. It seems to be proved that 'Obaid Alláh was really descended from a certain 'Abdalláh b. Maimún el-Kaddáh, the founder of the Ismailian sect, of which the Carmathians were only a branch. This 'Obaid Alláh had himself become pontiff of the Ismailians. As early as the Caliphate of Mottakí, one of 'Obaid Alláh's missionaries, named Abú 'Abdalláh, had succeeded in gaining numerous partisans in the province of Africa, then subject to the Aghlabites, and the victories of this missionary had wrested Eastern Africa from the family of Aghlab when Muktadir ascended the throne. 'Obaid Alláh then repaired to his new realm (A.H. 303), and founded the city of Mahdiya, which he made his capital. He tried also, but without success, to seize Egypt; the conquest of that country was reserved for one of his successors, Mo'izz li-dín-illáh. 'Obaid Alláh died two years after Muktadir, leaving to his son Káim an empire already sufficiently powerful to cause uneasiness to the 'Abbásids, to the Omayyads of Spain, and to all the Christian princes whose states bordered on the Mediterranean.

19. Káhir billáh, on being raised anew to the throne after the death of his brother Muktadir, still bore ill-will to his patrons, and tried to free himself from their guardianship. The emirs of his court dethroned him a second time and put out his eyes. One of his nephews was then proclaimed Caliph under the name of Rádí

(Content through God). This prince, who was entirely governed by those about his person, created, in favour of a certain Abúbekr Mohammed b. Ráik, the office of Amír al-Omará, or Emir of the Emirs, which nearly corresponds to that of Mayor of the Palace among the Franks.¹ The Amír al-Omará was charged with the administration of civil and military affairs. He also acted as the Caliph's deputy in sacerdotal functions, and was named next after him in the public prayers. Thenceforth the Caliphate was no longer anything but an empty shadow. During the reigns of Káhir and Rádí, the Carmathians became more audacious than ever. The Amír al-Omará was obliged to purchase from them the freedom of pilgrimage to Mecca at the price of a disgraceful treaty. Thus the Caliphate found itself almost reduced to the province of Baghdád. Khorásán, Transoxiana, Kirmán, and Persia were in the hands of independent sovereigns, the Sámánids, the Búyids, and a prince named Washingfr. The Hamdánites possessed Mesopotamia, the Sájites, Armenia; Egypt was under the rule of the Ikhshídites; Arabia was held by the Carmathians; Africa, as we have seen, had become the prey of the Fátimites. The single transient success obtained by Rádí was the capture of Mosul in A.H. 328 (A.D. 939-40); and even this success he owed to the Turk Bejkem, who had succeeded Mohammed b. Ráik as Amír al-Omará.

Rádí died in the following year, and was succeeded by Mottakí billáh (He who fears God). From his very accession, this prince saw himself exposed to the attacks of a certain Al-Barídí, who had carved out for himself a principality in Chaldæa, and who now laid siege to Baghdád. Násir al-Daula, prince of Mosul, who had been reinstated in his government, offered an asylum to Mottakí; put his troops at his disposal, and succeeded in repelling Al-Barídí. In return he obtained the office of Amír al-Omará. But there were other competitors for that post. Turun, a former lieutenant of Bejkem, protested sword in hand against the choice of the Caliph, and threatened Baghdád. Ikhshíd, sovereign of Egypt, offered Mottakí a refuge in his states; but Turun, fearing to see the Caliph obtain such powerful support, found means to entice him to his tent, and had his eyes put out, A.H. 333 (A.D. 944-945).

As successor to Mottakí, Turun chose Mostakí billáh (He Mostakí who places his whole trust in God). This prince, like his predecessors, was a mere puppet in the hands of his ministers. A new Amír al-Omará, Zírak b. Shírzád, made himself so hateful to the people of Baghdád by his deeds of violence and rapacity that they besought the help of the Búyids. Ahmed, the third prince of that dynasty, entered Baghdád, overthrew Zírak, and took his place under the title of Mo'izz al-Daula. Mostakí soon had enough of this new master, and ventured to conspire against him. The plot was discovered, and Mo'izz al-Daula had the eyes of the Caliph put out. There were now at Baghdád three Caliphs who had been dethroned and blinded—Káhir, Mottakí, and Mostakí. Mo'izz al-Daula thought for a moment of restoring the illusory title of Caliph to the descendants of 'Alí. He feared, however, lest this should lead to the recovery by the Caliphs of their former supremacy, and his choice fell on a son of Muktadir under the name of Motí' billáh (He who obeys God). Reserving to himself all the powers and revenues of the Caliph, he allowed Motí' merely a secretary and a moderate pension. The prince of Mosul, who began to think his possessions threatened by the neighbourhood of Mo'izz, entered on a struggle with him and tried to wrest Baghdád from him; but he failed, and was obliged to

¹ See Defrémery, *Mémoire sur les Emirs al-Omará*. Paris, 1848.

submit to the payment of tribute. We have said above that Mo'izz al-Daula professed a great veneration for the house of 'Alī. His preference showed itself in public acts. He caused the most terrible imprecations against the Omayyads to be posted up at the doors of the mosques. This step irritated men's minds; and a general insurrection was imminent at Baghdád, when Mo'izz died (A.H. 356), leaving his power to his son 'Izz al-Daula.

While the 'Abbasid family was thus dying out in shame and degradation, the Fātimites, in the person of Mo'izz li-dīn-illāh, were reaching the highest degree of power and glory (see EGYPT, vol. vii. p. 750 *sqq.*) Jauhar, a general of Mo'izz li-dīn-illāh, conquered Egypt for his master, and Arabia acknowledged the sovereignty of the Fātimites. The Carmathians, who had so long contended against the 'Abbāsids, now came to better terms with Motīf, and their general made the Caliph the offer of driving back the Fātimites, on condition of his granting him the government of Egypt. Motīf preferred to stand neutral in the struggle; and the Carmathian general, who with the support of Motīf might perhaps have triumphed over Mo'izz, was beaten by his powerful rival. Motīf, having been struck by paralysis, was obliged to abdicate in the year 363 (A.D. 973-974), and left the empty title of Caliph to his son Tāi' li-amr-illāh (Obedient to the command of God). The new Caliph lived at first in peace, for it was now the office of Amīr al-Omará which provoked ill-will. Under the reign of Tāi' the Būyid princes contended furiously with one another for the office of Emir, and one of them, 'Adod al-Daula, having conquered 'Izz al-Daula, took the title, never before employed, of Shāhīnshāh, or king of kings. On his death he transmitted his office to his three sons, who held it successively, under the names of Shams al-Daula, Sharaf al-Daula, and Bahá al-Daula. The last, who was as avaricious as he was ambitious, took offence at the Caliph Tāi' for having disposed of certain sums of money, of which he wished to reserve the management to himself, compelled him to abdicate in A.H. 381, and replaced him by a grandson of Moqtadir, who took the name of Kādir billāh (Powerful through God), and reigned forty one years under the tutelage of the Būyids. Meanwhile events were preparing the fall of the Būyids. In Persia, Mahmūd of Ghazni was founding the powerful empire of the Ghaznevīds, which extended to the Indus, and the Seljūk Turks were already invading Khorásán. It was under the successor of Kādir billāh that that sanguinary revolution took place, which was to give over the government of Baghdád to the Seljūks.

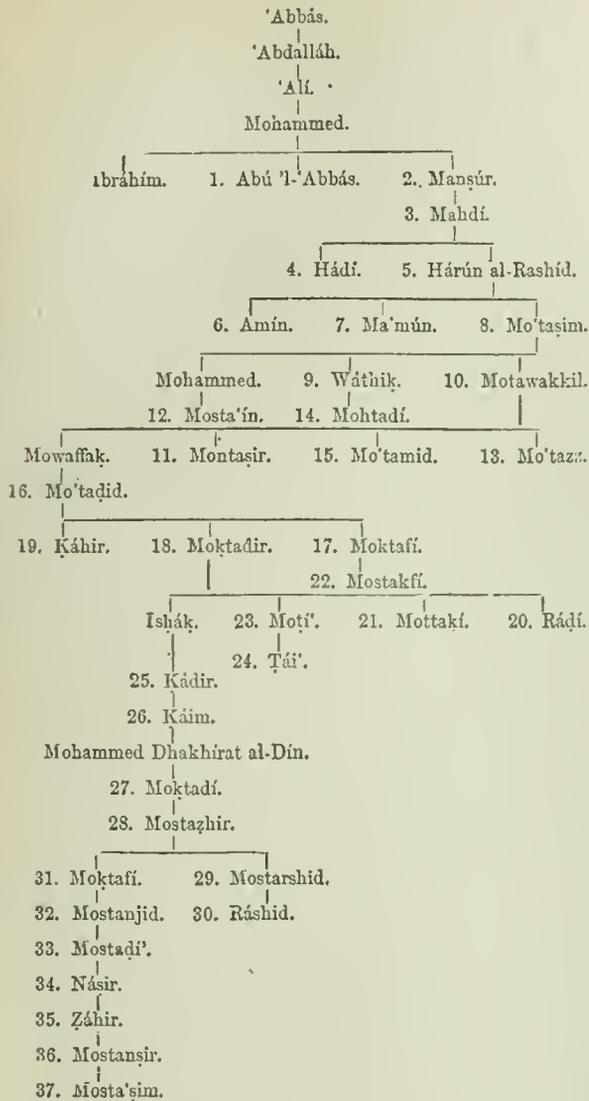

Kāim. Kādir billāh died in A.H. 422 (A.D. 1030-31), and was succeeded by Kāim bi-amr-illāh (He who is charged with the business of God). The new Caliph, groaning under the iron hand of his Amīr al-Omará, called to his aid the Seljūk Toghril Beg, who entered Baghdád in the month of Ramaḍan in the year 447 (A.D. 1055-1056), overthrew the Būyids, and took their place. Some years later, Toghril married the daughter of the Caliph. At his death, Toghril left to his nephew Alp Arslán the title of Sultan, a flourishing empire, and uncontrolled power. As for Kāim, he enjoyed the Caliphate in peace under the tutelage of Alp Arslán and of his successor Malik Sháh, till his death in A.H. 467. His grandson, Moqtadī bi-amr-illāh (He who obeys the orders of God), who succeeded him, owed to the power of Malik Sháh the honour of recovering his supremacy in Arabia. At Medina and Mecca his name was substituted in the public prayers for those of the Fātimite Caliphs. This was, after all, a mere gratification to his vanity, for Malik Sháh was the real sovereign, and the Caliph thought himself highly honoured in marrying the daughter of his

powerful patron. This union, however, far from drawing closer the bonds of friendship between Malik Sháh and Moqtadī, became on the contrary a cause of strife. The Caliph having put away his wife, who had wearied him by her peevish humours, was compelled by Malik Sháh to appoint the child whom he had had by her as his successor, to the prejudice of his eldest son. Malik Sháh also exiled his son-in-law to Basra. Just, however, as this order was about to be carried out, Malik Sháh died. Moqtadī survived him only a few months. It was during the reign of his successor Mostaẓhir billāh (A.H. 487-512) that the first crusade took place. We need not here enter into the details of those wars. It is sufficient to say that from the date of the first crusade Baghdád ceases, so to speak, to have any special history. The successors of Mostaẓhir billāh (He who seeks to triumph through God) were—Mostarshid billāh (He who asks guidance from God), A.H. 512-529; Rāshid billāh (Just through God), A.H. 529-530; Moqtadī li-amr-illāh (He who follows the orders of God), A.H. 530-555; Mostanjid billāh (He who invokes help from God), A.H. 555-566; and Mostadīf bi-amr-illāh (He who seeks enlightenment in the orders of God), A.H. 566-575. Under this last, the Fātimite dynasty was at length destroyed, and Egypt fell again under the spiritual authority of the Caliphs of Baghdád. It was one of the generals of the Emir Nūr al-dīn, the celebrated Salāh al-dīn (Saladin), who made this important conquest in A.H. 567 (A.D. 1171-1172). He maintained himself in Egypt as Sultan, founded a new dynasty, that of the Ayyubites, and in some sort compelled Nāṣir li-dīn-illāh (He who helps the religion of God), the successor of Mostadīf (A.H. 575-622), to acknowledge his title and to ratify his usurpation.

A still more formidable danger was now threatening Baghdád. The terrible Jīnghīz Khán was issuing from the depths of Asia at the head of his Mongols, and was beginning to invade Transoxiana. Under Nāṣir li-dīn-illāh's successors, Zāhir billāh (Victorious through God), A.H. 622-623, and Mostanṣir billāh (He who asks help from God), A.H. 623-640, the Mongol invasion advanced with immense strides; and when, after them, Mosta'ṣim billāh (He who seeks his defence in God) was named Caliph in the year 640 (A.D. 1242-1243), the last days of the Caliphate had arrived. Hulāgu, who was then sovereign of the Mongols, determined to make himself master of the whole of Western Asia. He placed himself at the head of his immense hordes, swept everything before him on his march, and arrived under the walls of Baghdád. In vain did Mosta'ṣim sue for peace. The siege was actively pursued, and on the 29th of Moḥarram 656 (5th February 1258), the Mongols forced their way into Baghdád and planted the standard of Hulāgu on the highest of its towers. The city was given up to fire and slaughter; Mosta'ṣim was thrown into prison, and died there a few days after; and with him expired the Eastern Caliphate, which had lasted 626 years, from the death of Mohammed.

In vain, three years later, did a scion of the race of the 'Abbāsids, who had taken refuge in Egypt, make an effort to restore a dynasty which was now for ever extinct. At the head of a few followers, he marched against Baghdád, but was repulsed by the governor of that city, and died fighting. At a later period, another descendant of the 'Abbāsids also sought an asylum in Egypt. The Sultan Baibars, after a judicial investigation of his origin, proclaimed him Caliph under the name of Hākim bi-amr-illāh. His sons inherited this empty title, but, like their father, remained in Egypt, without power or influence. This shadow of sovereignty continued to exist till the conquest of Egypt by the Turks.

GENEALOGICAL TABLE OF THE ABBASID CALIPHS DOWN TO THE FALL OF BAGHDAD.

SECT. III.—SKETCH OF THE INSTITUTIONS AND CIVILIZATION OF THE EASTERN CALIPHATE.

Mohammed had begun to bestow political unity on Arabia ; but he had done still more : he had given her the Koran, as the starting-point and base of the future civilization of Islam. It was for the preservation and the better understanding of the sacred text that the first believers were led to create grammar and lexicography, and to make collections of the poems of their own and former times, those "witnesses of the meaning of words," as the Arabs call them. To elucidate questions of dogma they created theology. Jurisprudence, in like manner, issued from the Koran, and the historical sciences at first gathered around it. As early as the first century of the Flight, schools were founded in Irák, at Basra and at Cufa, in which all the questions to which the study of the Koran gave rise were stated, and answered in different ways. Natural science and mathematics were less directly concerned with the sacred book, and were consequently neglected during the whole period of the Omayyad dynasty. They only began to be cultivated when, under the Abbásids, the

study of philosophy led to the use of translations from the Greek. The institutions of Islam were developed, no doubt, as new wants made themselves felt, in proportion to the extension of the empire ; but they were nevertheless founded on the first arrangements made by the Prophet, and handed down by him in the Koran.

Under the first four Caliphs these institutions continued in a rudimentary state. The Caliph (*Khalifa*, substitute or successor) was elected by the Moslem community ; and, after receiving from all its members the oath of fidelity (*Bai'a*) which they were bound to take, united the temporal and spiritual powers in his own hands. He was at the same time high priest, ruler, and judge. He was compelled, however, by the very extent of the empire to delegate his powers to those agents (*Amil*, plural *Ommál*) whom he commissioned to represent him in the provinces. The State revenues, which entered the public treasury (*Bait al-mál*), were composed—(1) of the tithe, or tax for the poor (*Zakát*), which every Moslem was bound to pay ; (2) of the fifth, raised on all booty taken in war, the rest being divided among the warriors ; (3) of the poll-tax (*Jizya*) and the land-tax (*Kharáj*), which only affected non-Moslem subjects. The Caliph administered the revenues of the State at his own pleasure, applying them to the necessities of war, to public works, to the payment of officials, to the support of the poor, and to the distribution of the annual pensions, in which every Moslem had originally a right to share. The State could possess landed property. Under 'Omar I. we find that the pasture land belonging to the State supported not less than forty thousand camels and horses. To 'Omar I. was due the regulation of the poll-tax by a fixed scale. The rich, whether Christians or Jews, paid four *dínars* (about thirty-two shillings) yearly ; people of the middle class, two *dínars* ; the poor, one *dínar*. Besides this payment in money, the subject-races had to make contributions in kind, intended for the support of the troops. The land-tax consisted of a general rent in proportion to the extent, character, and fertility of the lands possessed by the conquered.

As the sums produced by these different imposts were often very considerable, it became necessary, as early as the Caliphate of 'Omar I., to create a special office, charged with the accounts of their expenditure. Its organization was borrowed by 'Omar from the Persians, and it retained its Persian name of *Diwán*, a term afterwards applied to all government offices. The Arabs at that time being too illiterate for such employment, the task of keeping the registers of the *Diwán* was entrusted to Greeks, Copts, and Persians. 'Omar also gave his attention to the apportionment of the individual pensions of the Faithful. Every one received a larger or smaller sum according to the greater or less nearness of his connexion with the family, or the tribe, of the Prophet. Thus 'Áisha, who had been the favourite wife of Mohammed, received a yearly pension of twelve thousand dirhems ;¹ the other widows of the Prophet only received ten thousand. The Hášhimites and Mo'talibites, that is, the members of the Prophet's family, also received ten thousand dirhems. The Emigrants and the Defenders, or those citizens of Mecca and Medina who had been the first to embrace Islam, had five thousand dirhems ; and that was the sum which 'Omar I. allotted to himself.² For every other Moslem of full age, the pension varied from 4000 to 300 dirhems. We can easily understand what an influence the hope of this pension must have exerted on the conquered races, and how much it must

¹ The dirhem was equivalent to one franc.

² His moderation was not imitated by his successor 'Othmán, who made it his principal object to enrich all the members of his own family at the expense of the rest of the Moslems.

have contributed to their conversion. On accepting Islam they acquired a right to the pension, besides ceasing to pay the land-tax and the poll-tax.

Even in the earliest days of Islam the Arabs were not entirely devoid of military skill. Many of their tribes had been brought into relations with the Greeks and Persians, and had acquired from them some ideas of the art of war. Thus, in the time of Mohammed, the division of an army into a centre, right and left wings, vanguard and rearguard, was understood, and the art of defending a camp or a city by entrenchments was also known. The Arabs fought on foot, on horseback, and mounted on camels. The arms of the infantry consisted of a spear, a sword, and a shield, and sometimes also of a bow and arrows. The horsemen fought chiefly with the lance. For defensive arms, besides the shield, the Arabs were acquainted with the helmet, the coat of mail, and the cuirass of leather covered with plates of iron. It was not till the period of the Omayyads that they began to employ military engines, such as the balista. The army was divided by tribes; and each tribe had its flag, which consisted of a piece of cloth fastened to a lance. As regards the recruitment of their armies, every man able to carry arms was originally bound to render military service. 'Omar I., to whom Islam owes so many of its institutions, was the first to divide his armies into distinct corps, and to assign to each corps a fixed station. These stations were the province of Cufa, that of Basra, and afterwards the provinces of Emesa, of the Jordan, and of Palestine. These provinces afterwards became military colonies, all the inhabitants of which were bound to render military service, as distinguished from the other provinces, where service was optional, or at all events regulated by the necessities of the moment.

Ceremo-
nial.

With the accession of Mo'awiya I. to the supreme power, the mechanism of the State was modified and became more complicated. Mo'awiya endeavoured to copy the ceremonial of foreign courts. He built himself a palace at Damascus, and set up a throne in the audience-chamber, the door of which was kept by a chamberlain (*Hajib*). When he attended the service at the mosque, he occupied a close pew with a grating in front (*Maḥṣūra*). When he left his palace, he was surrounded by a bodyguard (*Shorta*), commanded by a provost (*Sahib al-Shorta*). Lastly, in his own lifetime, he caused his son Yazid to be acknowledged as his heir-presumptive, and thus established the principle of hereditary succession, which was opposed to the spirit of Islam, and was the source of every kind of calamity. As regards the administration of the State, Mo'awiya acted at his own will and pleasure. Thus, in order to secure the services of 'Amr b. al-'As, the conqueror of Egypt, he gave up to him the revenues of that province, a part of which ought to have gone to the State. He also took an important step with regard to the annual pensions of the Faithful, which he reduced by about two and a half per cent. The administration of the public funds in the different provinces was left to their Prefects, who were expected to pay into the public treasury only the surplus of their respective revenues. The empire had been at first divided into ten provinces—1. Syria (subdivided into four *Jond*, or military districts); 2. Cufa, with Arabian 'Irak and Persian 'Irak; 3. Basra, with Persia, Sijistan, Khorasan, Bahrain, and 'Oman; 4. Armenia; 5. Mecca; 6. Medina; 7. The Indian Marches; 8. Africa; 9. Egypt; 10. Yemen. Mo'awiya, however, subsequently thought proper to make Khorasan a separate province. Under his successors, and according to the necessities of the moment, it was sometimes reunited to the government of 'Irak. In 'Irak itself, Mo'awiya joined Basra and its dependencies to Cufa.

Under Mo'awiya the Prefects had the most extensive

civil and military powers. They had even the right of the direct appointment of their Sub-Prefects. Mo'awiya, notwithstanding, thought it advisable to disconnect from their powers the offices of Judge (*Kadi*) and of Religious Official (*Imam*), which were entrusted to special functionaries named directly by the Caliph. The Caliph was, however, always at liberty to modify these arrangements at his own pleasure. Under the successors of Mo'awiya, we find certain Prefects invested at the same time with the dignities of Cadi and Imam.

It was also to Mo'awiya that the State owed the creation of a Chancery (*Diwan al-akhtam*, or Seals-office), in which all decrees proceeding from the Caliph were registered; so that, when once issued, these decrees could not be falsified. Mo'awiya also exerted himself to ensure rapidity of communication throughout the empire, by instituting the courier-post (*Barid*), in imitation of the post of the Persians and Byzantines.

After Mo'awiya we must come down to the time of 'Abd al-Melik to meet with any important innovations in Moslem institutions. Before the reign of that Caliph the books of the public offices were kept by Christians and Persians, and drawn up in Greek and Persian. 'Abd al-Melik ordered the exclusive employment of the Arabic language, and substituted Moslems for all the Christian and Persian clerks in the government offices. It was this same Caliph who founded the monetary system of Islam, Money and who was the first to strike dinars (pieces of gold worth about ten francs), and dirhems (pieces of silver worth about a franc), with legends in Arabic. The postal system was also very much improved and developed under this prince. 'Abd al-Melik was powerfully seconded by the famous Hajjaj, who was able to re-establish in 'Irak the disputed principle of obligatory military service, and who also succeeded, by skilful management, in raising the condition of agriculture in that province. Walid, the successor of 'Abd al-Melik, especially distinguished himself by the foundation of religious institutions. In his reign the mosque of Damascus, half of which had hitherto remained in the hands of the Christians, was appropriated exclusively to the Moslems, and considerably embellished. Hospitals were also established for lepers, the poor, the blind, and the sick. The pious 'Omar II. devoted all his efforts to the embellishment of the mosque of Damascus. An edict of 'Omar I. had forbidden Moslems to acquire landed property, agriculture being considered an occupation unworthy of a free man. This law had fallen into disuse; but 'Omar II. put it in force again, and declared null and void every purchase of land made by a Moslem subsequently to A.H. 100. The effects of this law might have been fatal to the empire; but it again became obsolete under the Caliphate of Hisham.

At the accession of the 'Abbásids the centre of the empire was displaced. Damascus fell from the rank of its capital to that of a provincial town; while Baghdad, a small and unknown village, became the mistress of the world. Under the first 'Abbásid the empire—not including the province of Baghdad—was divided as follows:—1. The province of Cufa; 2. The province of Basra, with the district of the Tigris, Bahrain and 'Oman; 3. Hijaz and Yamama; 4. Yemen; 5. Ahwaz; 6. Farsistan; 7. Khorasan; 8. The province of Mosul; 9. Mesopotamia, with Armenia and Azerbaijan; 10. Syria; 11. Egypt and the province of Africa (Spain being a dependency of Africa); 12. Sind. Al-Saffah afterwards made Palestine a distinct province, and separated Armenia and Azerbaijan from Mesopotamia. Still later, Harun al-Rashid created a new province to the north of Syria, which received the name of 'Awásim. Each newly-conquered province was always united to that one of the older provinces to which it was nearest.

tary suc-
cession.

Religious
founda-
tions.

Simultaneously with the accession of the 'Abbásids, Persian influence began to preponderate. The Persian, Khálid b. Barmak, was entrusted with the administration of the finances (*Diwán al-Kharáj*) by As-Saffáh, who was also the first Caliph who transferred the burden of public affairs from himself to a Prime Minister (*Wazír*, whence, in European languages, the term *Vizier*). The title of Wazír was unknown to the Omayyads. The office of Prime Minister was of Persian origin. It existed till the time of the Caliph Rádi, when that of Amír al-Omará was substituted for it. When the Caliphs had fallen under the tutelage of the Báýids, it was the latter who chose Viziers, leaving to the Caliphs only Secretaries (*Rayis al-Ruwásá*). Under the Seljúk Sultans the Caliphs were again permitted to choose their own Viziers.

The institution of the office of Vizier was not the least among the causes of the decadence of the Eastern Caliphate. The 'Abbásids gradually became unaccustomed to the exercise of power and the management of affairs, and thus lost all direct influence over their subjects. Besides the Minister of Finance and the Vizier, the 'Abbásids created another important office, that of Postmaster-General (*Sáhib al-Barid*), whose duty it was to collect at a central office all the information which arrived from the provinces, and to transmit it to the Prime Minister. Thus the administrative services were greatly extended under the 'Abbásids. They were subdivided as follows:—1. *Diwán al-Kharáj*, or Ministry of Finance; 2. *Diwán al-Diyá*, or Bureau of State property; 3. *Diwán al-Zimám*, Registry Office or Exchequer Office; 4. *Diwán al-Jond*, or Ministry of War; 5. *Nazar al-Mazálim*, or Court of Appeal; 6. *Diwán al-Mawáli wal-Ghilmán*, or Bureau of the freedmen and slaves of the Caliphs; 7. *Diwán Zimám al-Nafakát*, or Office of Expenditure; 8. *Diwán al-Barid*, or Office of the Posts; 9. *Diwán al-Rasáil*, or Office of Correspondence; 10. *Diwán al-Taukíf*, or Office of the Imperial Seal, and of the registration of official documents. There were also offices for the despatch and reception of official documents, and for the inspection of weights and measures.

We cannot better conclude this brief summary of the institutions of the Caliphate than by giving a sketch of the organization of the State, according to the Moslem authors themselves.

The supreme chief received the title of Caliph, or of Commander of the Faithful (Amír al-Mo'minin). He united in his own person all the powers of the State; his Ministers and all public functionaries acted only by virtue of a commission from him. They, like all other Moslems, were at the mercy of the Caliph, who had power of life and death over them. As spiritual chief, the Caliph was also the supreme judge in questions of dogma. In theory he held his powers by the free choice of the majority of Moslems; but, when he had once received their oath of allegiance, he became their absolute master. The first condition of eligibility to the Caliphate was to belong to the tribe of Koraish. In Moslem belief, the subjects of the Caliph owed him obedience and aid so long as he should fulfil his duties with exactness. These consisted in maintaining the principles of religion, in administering justice scrupulously, in defending the territory and assuring its safety, in carrying on war for the subjugation of the infidels, and in spending the public revenue in conformity to the law. If the Caliph failed in the performance of his duty, rebellion against him became lawful.

The Ministers might be absolute or dependent. If dependent, they simply executed the orders of their sovereign. If absolute, they took his place, and exercised all the powers of a Caliph except that they could not, at least in theory, designate any successor to the reigning

Caliph. It was only to the Caliph himself that they were responsible for their actions.

The Prefects, when once appointed, whether by the Caliph or the Vizier, became so many petty sovereigns, and, legally, owed an account of their actions only to the Caliph, or to his Prime Minister, when the latter was absolute.

The Generals were appointed either by the Caliph or by the Vizier, or lastly by the Prefect, when only a local war was in question. They were sometimes invested with very extensive powers, such as those of concluding treaties of peace, of administering justice, and of dividing the booty. The General, in his turn, appointed the officers (*Nakíbs*) and under-officers (*Arifs*). It was a general order that infidels, before hostilities against them were opened, should be summoned to embrace the faith, or to submit by capitulation. The conversion of infidels was valid, even when effected sword in hand, on the field of battle, and the new convert became inviolable in person and property. On the other hand, every infidel taken prisoner was sold as a slave, with his wife and children. He might even be put to death. Apostates were never to be spared; they were put to death, and their property confiscated.

Justice was administered by Cadis, appointed either by the Caliph, by the Vizier, or by the Prefect. To be eligible as a Cadi (*Káfi*), it was requisite that a man should be—1. A male and of respectable age; 2. In full possession of his mental and physical faculties; 3. A free man; 4. A Moslem; 5. Of good moral character; 6. Acquainted with the principles of the law and their application. The duties of the Cadi were to examine into the disputes and lawsuits brought before him; to enforce the execution of his judgments; to name judicial councils for the administration of the goods of minors, madmen, etc.; to administer the mortmain property of mosques and schools (*wakf*, plural *wokúf*); to watch over the execution of wills; to inflict due legal penalties on those guilty of crimes or misdemeanours;¹ and to inspect the highways and public buildings. When any locality possessed no Imám, or public officiator at the mosque, it was the Cadi who performed this duty. The assistants of the Cadi were Notaries (*Shohúd*), Secretaries (*Omaná*), and Deputies (*Náýibín*). If the Cadi died, his subordinates lost their offices *ipso facto*. On the other hand, the death of a Caliph did not nullify the powers of the Cadi; but it was necessary that he should be confirmed by the new sovereign.

The Court of Appeal (*Nazar al-Mazálim*) was instituted to take cognizance of those causes in which the parties concerned appealed from the judgment of the Cadi. The sittings of this court were presided over by the Caliph in person. It was established by the Omayyad 'Abd al-Melik. The last Caliph who sat in public to examine appeal cases was Mohtadí. After him a special judge was appointed to the function of president of the Court of Appeal.

Besides the Judges there were Inspectors (*Mohtasib*), charged with the police of the markets and the care of morals. The Mohtasib's duty was to take care that weights and measures were not falsified, and that buyers were not deceived as to the quality of the goods sold. He had the power of inflicting summary punishment on delinquents, but only in the case of flagrant offences. If the person charged denied the facts, he was to be brought before the Cadi. As regards morals, the Mohtasib took care that widows and divorced women should not remarry before the expiration of the legal period prescribed by the

¹ The principal offences were—apostasy, neglect of religious duties, refusal to pay taxes, theft, adultery, outrages, and murder. The penalties were imprisonment, fines, corporal punishment, and death.

Koran. Slaves and beasts of burden were placed under his guardianship, and he protected them from ill-treatment on the part of their masters. The Mohtasib was also commissioned to prevent public scandals, such as the sale of wine; to forbid Christians and Jews from building houses higher than those of the Faithful; and to enforce their wearing on their dress a distinctive mark (*Ghiyār*).

Besides the offices already described, there existed three others which require mention—those of the Marshals of the Nobility (*Nikābat al-Ashraf*), of the Imāms, and of the Emirs of the Pilgrimage.

The Marshals of the Nobility were appointed in the different provinces either by the Caliph, by his representatives, or by the Grand Marshal. Their functions were to superintend the descendants of the family of the Prophet, who formed the nobility of Islam, and to keep a register of all the births and deaths which occurred in the families of the members of this nobility. In every province there were two Marshals, one for the family of 'Alī, the other for the 'Abbāsids.

Imām. The duty of the Imām was to recite the public prayers in the mosque. He was appointed by the Caliph or his representatives, and chose in his turn his *Mo'edhdhins*, who called the Faithful to prayer from the tops of the minarets. In the Friday prayers it was the duty of the Imām to invoke publicly the blessings of Heaven on the reigning Caliph.

Leader of The leadership of the yearly pilgrimage to the temple of Mecca was considered a great honour. It was almost always the Caliph himself or one of his near relatives who assumed the function of Amīr al-Hajj. The duties of this leader of the pilgrimage were—1. To escort the pilgrims in safety on their journeys to Mecca and back; 2. To direct the religious ceremonies during the sojourn of the pilgrims at the Holy City.

Such, briefly stated, was the organization of the Moslem State. Let us now say a few words on its religion.

Religion. We need not now recur to the subject of the doctrines of Mohammed, which are treated of in their own place; but it is important to show what they became after the time of the Prophet, and what movements they aroused in Islam. The diversity of the conquered races was of itself sufficient to introduce, in the course of ages, serious modifications of the earlier religion.

But, from the very first, the Koran contained within itself the germs of discord. As long as men were content to adopt its teachings without discussion, orthodoxy might boast of maintaining itself unbroken. But as soon as they sought to examine deeply into its meaning, difficulties arose, which necessarily led the strongest minds into doubt and uncertainty. In particular, the conception of God, predestination, and free-will, as presented by the Koran, could not bear examination. As early as the first century of the Flight a theological school was founded at Basra, the most renowned master of which, Ḥasan al-Basrī, introduced the critical study of dogmas. His disciples, who were for the most part Persians, could not fail soon to discover that the Koran often contradicted itself, and especially that it left many dogmatic difficulties unresolved. One of the disciples of Ḥasan, Wāsil b. 'Atā, set forth his scruples publicly, departing on three points from the orthodox doctrine. The Koran affirms the attributes of God; Wāsil b. 'Atā denied them; because, he says, if the attributes of God are eternal, they constitute in some sort so many deities. We ought not therefore to affirm the existence of an attribute—that of justice, for example—but simply to affirm that God is essentially just. The Koran admits the doctrine of predestination; Wāsil rejected it, as incompatible with the theory of rewards and punishments in another life, which presumes absolute

free-will in man. The Koran speaks only of paradise and hell; Wāsil admitted a purgatory. The sect founded by Wāsil received the name of Mo'tazilite (dissident), or Mo'tazilite, that is to say, which recognizes in man a power (*Kadar*) over his own actions. Another sect, that of the Jabarites (Partisans of *constraint*) agreed with the Mo'tazilites on the question of the attributes, but were diametrically opposed to them on that of free-will. The Jabarites denied to man the slightest share in his own actions, and believed the very smallest actions of men to be the effect of predestination. The Koran, not concerning itself with the contradictions involved, admits at the same time the responsibility of man and the absolute predestination of his actions. The Jabarites rejected all responsibility, and believed that man is predestined from all eternity to paradise or to hell, for no other reason than that God has so willed it. A third sect, that of the Šifatites (Partisans of the *Attributes*), contended energetically against the two former. Keeping to the text of the sacred book, they alleged, for example, that when it is said in the Koran that God is seated on his throne, the expression must be taken literally. They thus fell into the grossest anthropomorphism, a doctrine which was very far from the ideas of Mohammed. In the face of these heterodox sects, the orthodox made but a poor figure. Rejecting, in their commentaries on the Koran, the explanations alike of the Mo'tazilites, of the Jabarites, and of the Šifatites, but acknowledging their inability to refute them systematically, they merely opposed to them a declaration that the Koran was neither to be explained allegorically nor always taken literally; and they concluded that, where two contradictory expressions could not be reconciled, a mystery must be admitted to exist, which it would be vain to attempt to fathom. But they did not always keep within the limits of discussion. Under the reign of 'Abd al-Melik they succeeded in bringing about a persecution of the sectaries.

The Mo'tazilites, the Jabarites, and the Šifatites were dangerous only to the Church. Other sects arose, which put the State itself in peril. It will be remembered that, at the time of the dispute between 'Alī and Mo'āwiya, twelve thousand of the partisans of the former deserted him. These revolvers, or Khārijites, originated one of the most formidable sects which ever existed in Islam. The Khārijites rejected in principle the Caliphate and the Imāmate. At all events, they did not acknowledge the exclusive right of the Korāish to the Caliphate, but declared that, if it was absolutely necessary to elect a Caliph, his origin was of little consequence, provided he fulfilled his duties conscientiously and exactly. We have seen for what a length of time they kept the Omayyads in check. When they had been put down in Asia, they passed into Africa, and there made numerous proselytes among the Berbers, disposed as these were, by their independent character, to adopt with enthusiasm the principle of anarchy. The most terrible, however, of the militant sects which were formed in the bosom of Islam was that of the Shī'ites. Originally the Shī'ites were simply the partisans of 'Alī and of his descendants. In the course of time, when the whole of Persia had adopted the cause of the family of 'Alī, Shī'ism became the receptacle of all the religious ideas of the Persians, and Dualism, Gnosticism, and Manicheism, were to be seen reflected in it. Even in the lifetime of 'Alī, a converted Jew, named 'Abdallāh b. Sabā, had striven to introduce foreign elements into Islam. Thus, he alleged that 'Alī was to be adored as an incarnation of the Deity. These ideas, though rejected with horror by 'Alī himself, and by the greater part of the first Shī'ites, gradually made way; and all the direct descendants of 'Alī became veritable deities in

the eyes of their respective partisans. A further distinction between the Shīfites and other sects is, that they introduced the practice of giving the Koran an allegorical interpretation. This system permitted them to see in the sacred book whatever meaning they chose, and was carried out at a later date, as we shall see, by the founder of the Ismailian sect.

Under the 'Abbāsids it seemed for a moment that the Shīfite doctrines were about to triumph. We know, in fact, that the founder of that dynasty gave himself out as the heir of the house of 'Alī. But reasons of State prevailed, and the 'Abbāsids, false to their first professions, on the whole supported orthodoxy. Under their reign were established the four orthodox sects—Mālikite, Hanafite, Shāfi'ite, and Ḥanbalite, which even at this day divide between them the whole Moslem world. They are named after their founders—Mālik, Abū Ḥanifa, Shāfi', and Ibn Ḥanbal. These sects only differ from each other on a few points of civil and religious jurisprudence. They agree on questions of dogma. It was not, however, without difficulty that orthodoxy succeeded in obtaining the victory. Under Ma'mūn and other Caliphs several doctors, as we have seen, were persecuted for believing that the Koran was the uncreated word of God. From the time of Motawakkil, however, orthodoxy regained the upper hand. Still, this reaction would not have lasted long, in face of the advance in science which marked the accession of Ma'mūn to power, if the orthodox had had no other defensive weapons than material force and the assent of the majority. As philosophy made its way in Islam, thanks to the translations from Greek authors, which were made principally during the Caliphate of Ma'mūn, it called forth in men's minds a movement of scientific curiosity which might have been fatal to orthodoxy. In the tenth century of our era a society of encyclopedists was formed at Basra, who, under the name of Ikhwān al-Safā, or Brothers of Purity, put forth a number of very curious treatises, in which all sorts of physical and metaphysical questions were discussed and resolved in a scientific manner.¹ There is no doubt that these lucid and attractive writings would have led to a great religious revolution, if the orthodox had not understood the danger of their position, and applied themselves also to the study of philosophy, for the purpose of employing it in the service of the faith. It was thus that, towards the middle of the tenth century, a certain Abū 'l-Ḥasan al-Ash'ari, a descendant of that Abū Mūsā al-Ash'ari who had formerly acted the part of arbitrator in the dispute between Mo'awiya and 'Alī, struck out a system in which religion appeared to be reconciled with philosophy; a system which was naturally sure to attract all commonplace minds—that is to say, the greater number. Ash'arism, or philosophic theology (Kalām), was adopted with enthusiasm by the triumphant orthodox doctors, and thenceforth pure philosophy and the heterodox sects ceased to extend their influence.²

The creation, however, of this philosophical theology had not done away with all dangers for orthodoxy. We have seen above that the Shīf'a were divided into several sects, each holding for one of the direct descendants of 'Alī, and paying him the reverence due to a deity. One of these sects, called the Ismailian, because it acknowledged Ismā'īl, the seventh Imām or Pontiff of the posterity of 'Alī, as its chief, was the source of the greatest disorders in the Moslem empire, and was not far from being triumphant in Asia, as it was for a long time in Egypt. The Ismailians, like all the other Shīfites, believed in the

coming of a Messiah, whom they called the Mahdī, and who, according to them, was one day to appear on earth, in order to establish the reign of justice and equity, and to take vengeance on the oppressors of the family of 'Alī. They also believed in a God of far more elevated character than the God of the Koran, one who was unapproachable by human reason, and who had created the universe, not directly, but by the intermediate action of a sublime being, the Universal Reason, produced by an act of God's will. The Universal Reason, in its turn, had produced the Universal Soul, which, on its part, had given birth to primitive Matter, to Space, and to Time. These five principles were the causes of the universe. Man, emanating from them, had a tendency to reascend towards his source. The chief end of his being was to attain to perfect union with the Universal Reason.³ But, left to himself, man would have been powerless to attain this end. The Universal Reason and the Universal Soul therefore became incarnate among men, in order to guide them towards the light. These incarnations were no other than the prophets in all ages, and, in the last period, the Imāms of the posterity of 'Alī. In the second half of the ninth century, a Persian, born in Susiana and named 'Abdallāh b. Maimūn al-Kaddāh, nourished the dream of destroying Islam, and thought these doctrines, suitably modified, likely to be highly useful in carrying out his purpose. He devised a system at once religious, philosophical, political, and social, in which, as he thought, all beliefs were to meet and mingle, but—and in this consisted its originality—a system so graduated to suit different degrees of intelligence, that the whole world should become one vast Masonic association. The chief of the Ismailians, the Imām Ismā'īl, having died, 'Abdallāh asserted that his son Mohammed b. Ismā'īl was to succeed him as the founder of this new religion, which it was 'Abdallāh's mission to announce to the world. Since the creation of the world, as 'Abdallāh asserted, there had been six religious periods, each marked by an incarnation of the Universal Reason in the person of a prophet. Adam, Noah, Abraham, Moses, Jesus, and Mohammed had been the prophets of these periods. Their mission had been to invite men to accept more and more perfect forms of religion. The seventh and last religion, and the most perfect of all, was that of Mohammed b. Ismā'īl, the true Messiah. The Ismailians, as may be imagined, readily embraced the theories of 'Abdallāh. In addressing other sects and religions, 'Abdallāh used special arguments with each. With the philosophers he dwelt on the philosophical principles of his doctrine. The conversion of Christians, Moslems, or Jews, was a more difficult task. 'Abdallāh had established several degrees of initiation, and it was only by slow degrees, and with the most minute precautions, that he gained a mastery over the mind of the future proselyte. His curiosity was first aroused by allegorical interpretations of the Old Testament, the Gospels, and the Koran, and by proposing to him religious problems which could not be solved by any of the existing religions. The solution of these problems was not to be given to him till he should have signed a compact, and sworn never to reveal the mysteries with which he was made acquainted. If he took this pledge, he thenceforward belonged, body and soul, to the sect; and woe to him if he made any attempt to withdraw himself from the authority of his chiefs! The compact signed, the newly-initiated disciple had to make a certain payment, which went to swell the treasury of the sect. The secret society

² See Houtsma, *De Strijd over het dogma in den Islam tot op el-Ash'ari*; and Spitta, *Zur Geschichte Abu 'l-Hasan al-Ash'ari*.

³ It need hardly be said that all these doctrines were borrowed from Gnosticism and from Neo-Platonism. See on the Ismailian sect Guyard, *Fragments relatifs à la doctrine des Ismailiens*, and *Un grand-maitre des Assassins au temps de Saladin*.

founded by 'Abdalláh soon had a great number of members, and its missionaries spread themselves over the Moslem world. Towards 887 A.D. an Ismailian, Hamdán, surnamed Karmat, founded the branch sect of the Carmathians, whose exploits have been recorded above. The Ismailian preachers also made numerous proselytes in Africa and in Egypt; and in A.D. 909, 'Obaid Alláh, a descendant of the founder of the sect, but who passed as a member of the family of 'Alí, founded the Fátimite dynasty. Under the Fátimite Caliph Hákim, a new religion sprang out of Ismailism, that of the Druses, so called from its inventor, a certain Darází or Dorzí. This religion differs little from Ismailism, except that it introduces the dogma of the incarnation of God himself on earth, under the form of the Caliph Hákim. This heresy did not survive the reign of Hákim in Egypt. When the Fátimite Caliph Mostansir ascended the throne, he re-established the Ismailian belief; and the Druses, driven from Egypt, took refuge in the Lebanon, where they still exist. As for the Egyptian Ismailians, they disappeared at the time of the conquest of that province by the pious and orthodox Ayyúbite Saladin. This, however, was not a final deliverance of Islam from that formidable heresy. A hundred years before the return of Egypt to orthodoxy, a Persian named Hasan Šabbáh, who had been initiated into Ismailism at Cairo, in the household of the Caliph Mostansir, had founded at Alamút, on the southern shores of the Caspian Sea, that Persian branch of the Ismailians known to all the world under the name of the Assassins,¹ who held in check the most powerful princes of Islam, till they were destroyed by the Mongol invasion. From Persia, Hasan Šabbáh succeeded in filling Syria with his Assassins, and every one knows the part they played during the Crusades. The Assassins of Syria have never entirely disappeared. Even at this day some are to be found in the Lebanon. There are also some representatives of the sect in Persia, in India, and even in Zanzibar; but since the 13th century they have become completely inoffensive.

To conclude this sketch of the development of religious beliefs, it remains to say a few words on one of the most remarkable manifestations of Islam—its mysticism, or Šúfism. In principle, mysticism is rather a mode of practising religion than a distinct religion; it depends on the character of the believer's mind, and adapts itself to all dogmas.² It is the especial tendency of tender and dreamy spirits. Thus among the Moslems it is a woman who is considered to have founded mysticism. This woman, named Rab'ía, lived in the first century of the Hijra, and was buried at Jerusalem. Her doctrine was simply the theory of Divine love. She taught that God must be loved above all things, because he alone is worthy of love; and that everything here below must be sacrificed in the hope of one day attaining to union with God. These views were too similar to the Neo-Platonic ideas respecting the union of the human intellect with the Universal Reason not to have an attraction for the Gnostics, who abounded in the Šhí'ite sects. Mysticism therefore made great progress in Persia, and assumed the character of a sect towards the year 200 of the Flight. A certain Abú Sa'íd b. Abí 'l-Khair was the first who advised his disciples to forsake the world and embrace a monastic life, in order to devote themselves exclusively to meditation and contemplation; a practice which may very probably have been borrowed from India. The disciples of Abú Sa'íd wore a garment of wool (*Šúf*), whence they received the name of Šúfis. Šúfism spread more and more in Persia, and was enthusi-

astically embraced by those who wished to give themselves up undisturbed to philosophical speculation. Thus, under the colour of Šúfism, opinions entirely subversive of the faith of Islam were professed. In its first form Šúfism was quite compatible with Moslem dogma. It was satisfied to profess a contempt for life, and an exclusive love of God, and to extol ascetic practices, as the fittest means of procuring those states of ecstasy during which the soul was supposed to contemplate the Supreme Being face to face. But by degrees, thanks to the adepts whom it drew from the ranks of heterodoxy, Šúfism departed from its original purpose, and entered on discussions respecting the Divine nature, which in some cases finally led to Pantheism. The principal argument of these Pantheistic Šúfis was that God being one, the creation must make a part of his being; since otherwise it would exist externally to him, and would form a principle distinct from him; which would be equivalent to looking on the universe as a deity opposed to God. In the reign of Moktadir, a Persian Šúfi named Halláj, who taught publicly that every man is God, was tortured and put to death. After this the Šúfis showed more caution, and veiled their teachings under oratorical phrases. Moreover, it was not all the Šúfis who pushed logical results so far as to assert that man is God. They maintained that God is all, but not that all is God. Šúfism exists in Persia even in our own day.

It has been explained that, under the 'Abbásids, four orthodox sects were established, and that these sects differed among themselves principally with regard to jurisprudence. The law of Islam is one of its most original creations, and can only be compared in history with the development of Roman law. The laws laid down by Mohammed in the Koran might suffice for the Arabs as long as they were confined within the bounds of their peninsula. When their empire was extended beyond these limits, it was inevitable that this first code should become insufficient for their wants. As early as the time of the first four Caliphs it was necessary, in giving judgment on the new cases which presented themselves, to have recourse to analogy, and to draw inspiration from decisions given by Mohammed, but not recorded in the Koran. The first fountain, therefore, of law were, besides the sacred book, the traditions of Mohammed, or *Hadith*, the collective body of which constitutes the *Sunna*, or custom. These traditions were for a long time preserved only in the memory of the companions of Mohammed, and of those to whom they had been orally communicated. But at the beginning of the second century of the Flight the need was felt of fixing tradition in writing; and it was at Medina that the first collection of them was made. It was due to the juriconsult Málik b. Anas. He rejected from his collection with the greatest care all traditions which appeared doubtful, and only preserved about seventeen hundred, which he arranged in the order of their subjects. To this collection he gave the name of *Mowatta*, or Beaten Path.³ After him came the celebrated Bokhári, the compiler of the *Šahih*,⁴ in which he brought together about seven thousand traditions, carefully chosen. The *Šahih* has continued to be the standard work on the subject of tradition.

The traditions did not always supply the means of deciding difficult cases. The first four Caliphs were often obliged to have recourse to their own judgment in the administration of justice. Their decisions (*Athár*) were also collected at Medina, and helped to swell the store of juridical matter.

³ Published at Tunis, in India, and at Cairo, A.H. 1250, with the commentary of Zarkán.

⁴ Krehl's edition (Leyden) is still unfinished. An edition, fully vocalised, in 8 vols., appeared at Búláq, A.H. 1296.

In 'Irāk another school of law was formed, which is distinguished from that of Medina by a greater degree of independence. While the lawyers of Medina held strictly to the Koran, the traditions of the Prophet, and the 'Áthár, those of 'Irāk admitted, in addition to these, the deductive or analogical method (*Kiyás*), according to which it was lawful to create precedents, provided there was no departure from the spirit of the sacred book, from the traditions of the Prophet, or from the corresponding decisions of the first four Caliphs. Ibn Abí Laila, who filled the office of judge in 'Irāk under the caliphate of Mansúr, was one of the first to apply this system. His renown, however, was eclipsed by that of his contemporary Abú Hanífa, who worked out a complete system of jurisprudence, with which his name has continued to be connected (Hanífite law). Fifty years after the death of Abú Hanífa, Sháfí'í, a pupil of Málík, appeared at Baghdád, and founded in his turn an intermediate system, in which he endeavoured to hold an equal balance between the purely traditional and the deductive methods. The fourth system reputed orthodox is that of Ibn Hanbal, a pupil of Sháfí'í. Ibn Hanbal strove above all things to bring back religious observances to their primitive purity. His doctrine was a kind of puritanism. As may be supposed, each of these systems has been subsequently developed and commented on in a multitude of works, even the names of which it is impossible to enumerate. In order, however, to give some idea of what a Moslem treatise on jurisprudence is, we shall point out the principal subjects contained in it. It treats successively—1. Of Purification (ablutions commanded by the law, purification of women, circumcision, etc.); 2. Of Prayer as commanded by the law; 3. Of Funerals; 4. Of Tithe and Almsgiving; 5. Of the legal Fast; 6. Of the Pilgrimage to Mecca; 7. Of Commercial and other transactions; 8. Of Inheritance; 9. Of Marriage and Divorce; 10. Of the Faith; 11. Of Crimes and Misdemeanours; 12. Of Justice; 13. Of the Imámate or spiritual power, and of the Caliphate or temporal power. It is thus a complete code, religious, civil, penal, and governmental, that Moslem treatises on jurisprudence set before us; a code which embraces and foresees all the circumstances both of public and private life.

The development of science and literature runs parallel with the development of law. Before the time of Mohammed the Arabs had been distinguished only by a rare poetical talent. Islam was the signal for the springing up of all the sciences and of literature. While the study of the dogmas and ordinances of the Koran was producing theology and jurisprudence, the necessity of preserving the exact text of the sacred book, and of teaching the new converts the language of the Prophet, was giving birth to grammar and lexicography. The first school of grammar was established at Basra. The first attempts at grammar are generally attributed to a certain Abú 'l-Aswad al-Do'alf, who was tutor to the children of Ziyád, the brother of Mo'áwiya. According, however, to some authors, the honour of having discovered the first elements of grammar ought to be attributed to a Persian, named 'Abd al-Rahmán b. Hormúz. Be this as it may, a foreign influence must be recognized at the very commencement of this science. The vowel marks, for instance, were imitated from those of the Syriac. The division of the parts of speech into nouns, verbs, and particles was indirectly borrowed from Greek grammar. Yet the Moslems, once in possession of the principles of grammar, knew how to develop and apply them in an admirable manner. A perfect galaxy of grammarians arose in the track of Abú 'l-Aswad; a rival school to that of Basra was established at Cufa, and grammar attained its highest degree of perfection under the first 'Abbásids;

as is shown by the voluminous treatise of Sibawaihi, known under the name of *Kitáb*,¹ or the Book *par excellence*.

In lexicography, the Arabs were at first content to explain the rarer words of the Koran, of the traditions, and of the ancient poems; and to collect lists of terms applying to the same object, as the camel, the horse, the sword, etc. Thus small collections were formed, which served afterwards for the composition of dictionaries. The first dictionary properly so called, composed in Arabic, appears to have been the *Kitáb al-'Ain* of Khalíl b. Ahmed al-Faráhidí, a contemporary of Hárún al-Rashíd. After him came Jauharí, whose *Saháh* may still be consulted with profit. The celebrated Zamakhsharí composed a dictionary of metaphors under the title of *Asás al-Balágha*. Lastly, Tha'álibí, in the 11th century of our era, drew up his *Fíkh al-Logha*,² a work specially devoted to synonyms. The accessory branches of philology gave occasion to some important works. The ancient poems and proverbs were collected and commented on. Thus Abú Tammáz formed his Anthology, called *HAMÁSA* (*q.v.*), and Maidání his collection of proverbs (*Kitáb amthál al-'Arab*).³ The study of poetry, with special regard to its rhythm, led Khalíl b. Ahmed, already mentioned as a grammarian and lexicographer, to the conception of prosody. He wrote the first treatise on that science, which served as a model to all subsequent writers on metre.⁴ Pure literature remained confined to poetry. It was not that the Arabs were without any conception of the romance, the tale, or the novel. The adventures of Antar, the romances of Dhú 'l-Himma and of Saíf al-Yazan, the Thousand and one Nights, and various collections of stories and novels, such as the *Faraj ba'da 'l-Shidda* and the compilation of Biqá'í, well known by the extracts which Kosegarten has given in his *Chrestomathy*;—all these show clearly that the Arabs were not devoid of imagination, at least if, as we believe, these tales and romances were not pure and simple imitations from the Persian. It must be acknowledged, however, that these few productions do not, any more than the *Maqámát* of Hamadhání and of Harírí, constitute a very important literature. The drama, the epic, the romance of character, were absolutely unknown to the Arabs. Poetry, on the other hand, an endowment of the ancient Arabs, continued to live and flourish as long as the Eastern Caliphate lasted. We may count poets by the hundred, eminent in every department of that art: in descriptive, erotic, martial, and philosophic poetry; in odes, in satires, etc. The great collection entitled *Kitáb al-Aghání*,⁵ compiled by Isfahání, contains a choice of the finest poems, accompanied by very instructive notices of the poets, and of the circumstances under which they composed such and such pieces. Besides this, many *Díwáns*, or complete editions of the works of poets, have come down to us. They bear the celebrated names of Nábigha, of 'Antara, of Tarafa, of Zohair, of 'Alkama, of Amraalkais, of Shanfara, of Labíd, in the pre-Islamic period (see *MO'ALLAKÁT*); of Jarir, Akhtal, and Farazdak,⁶ in the Omayyad period; and of Abú Nowás,⁷ Abú 'l-Atáhiya, Moslim,⁸ *MOTANABBI* (*q.v.*), and Abú 'l-'Alá,⁹ in the period of the 'Abbásids. And this list contains only the most illustrious names.

With the accession of the 'Abbāsids to power, Moslem culture entered on a path fruitful in scientific progress. The second Caliph of that family, Mansūr, was surrounded by Syrian Christians of great learning, and equally well acquainted with the Greek, Syriac, and Arabic languages, and took advantage of their abilities to have a number of foreign books translated into Arabic. Thanks to him, the writings of Aristotle, Ptolemy, and Euclid spread a taste for science among the Moslems. The Caliph Ma'mūn was one of those who most encouraged translations from the Greek. In this way the Moslems became acquainted with the most important productions of the ancient world. Plato, the works of the Alexandrian school, those of Hippocrates, Dioscorides, and Galen, were familiar to them. Through the Persians many Indian writings also became accessible to them, such as the fables of Bidpai,¹ and certain treatises on astronomy and algebra. The study of philosophy in all its branches was at one time in fashion, and, to appreciate the success with which it was cultivated in Islam, we need only recall the great names of Al-Kindī, Al-Fārābī, Ibn Sīnā (Avicenna), Ibn Bājā (Avenpace), and Ibn Roshd (Averroes), whose scientific teaching swayed the Middle Ages, and led to the revival of learning in the West.

In history and geography the Moslems distinguished themselves. The taste for history had been developed among them by the necessity of collecting all traditions relating to the Prophet, and by that of preserving their own genealogies. The study of geography was a result of their conquests. One of their most ancient historical productions was the biography of Mohammed, composed by Mohammed b. Ishāq under the caliphate of Mansūr. Wākidi, another author of the 8th century of our era, compiled a history of the first Moslem conquests. At a later period, Balādhori wrote on the same subject his *Kitāb Fotūh al-Boldān*.² General history also soon became a subject of study, and, in the 9th century after Christ, Ibn Kōtaiba compiled his *Kitāb al-Ma'ārif*,³ a treatise on universal history. In the 10th century two great historians flourished, Ṭabarī and Mas'ūdi, by the first of whom we have a very extensive chronicle,⁴ and by the second a general history, entitled *Morūj al-Dhahab* (see MAS'ŪDI). After them came a perfect galaxy of well-known historians and biographers, such as Hamza of Isfahān, Ibn al-Tiqtāqā, Nowairī, Makrīzī, Abū 'l-Fidā, Abū 'l-Faraj, Al-Makin, Ibn al-Athir, Soyūtī, and Ibn Khaldūn,⁵ not to speak of many others who compiled local chronicles and histories, such as those of Mecca, Medina, Damascus, and Baghdād. As biographers, Nawawī and Ibn Khallikān⁶ are celebrated. The history of physicians and philosophers, by Ibn Abī Osaibīya, deserves to be placed in the first rank, side by side with the history of religions and sects by Shahrastānī.⁷

The Moslems were not less active in the study of geography. In the 9th century, Ya'kūbī wrote his *Kitāb al-Boldān*, or Book of Countries, in which he described the principal cities of the Moslem empire.⁸ After him, Ibn Khordādhbeh composed his *Kitāb al-Masālik wal-*

Mamālik, or Book of Roads and Provinces, in which his principal object is to point out the different routes, and to give an account of the revenues derived from every province.⁹ His contemporary Kōdāma soon after published his treatise on the work of clerks, in which, after a notice of the various government offices, he gives a description of the provinces of the empire with an account of the post-routes, their stages and distances, and of the revenues of each province. Ahmed b. Abī Ya'kūb al-Ya'kūbī wrote a description of Asia Minor and Ifrīkiya. Several of the writings of the historian Mas'ūdi also afford highly valuable information on geography. To Yāqūt we owe a great geographical dictionary under the title of *Mojam al-Boldān*.¹⁰ Lastly, Ištakhri, Ibn Haukal, Mo'kaddasī, Bērūnī, Bakrī, Zamakhsharī, Edrīsī, and Abū 'l-Fidā have left us important treatises, narratives of travels, and geographical dictionaries.¹¹ Among the literature of voyages and travels we must also mention the curious *Chain of Histories* associated with the name of the merchant Solaimān and the narratives of Nāsiri Khosrū,¹² of Ibn Johair,¹³ and of IBN BARŪTA (*q.v.*).

The sciences connected with geography, such as astronomy and cosmography, were also cultivated by the Moslems. As early as the reign of Mansūr, the Sanscrit treatise on astronomy entitled *Siddhanta* had been translated into Arabic. Under Ma'mūn, two observatories were founded, one at Baghdād, the other at Damascus, and two degrees of the terrestrial meridian were measured by order of that Caliph. Al-Khārizmī, librarian to Ma'mūn, composed his *Rasm al-Ard*, or configuration of the earth, in which the name of every place was accompanied by its latitude and longitude. Astronomical tables were drawn up by Yahya, Habash, Abū Ma'shar (Abumazar), and Al-Battānī (Albategni). Treatises on astronomy were composed by Al-Farghānī and Al-Kindī. Al-Battānī, of whom we have just spoken, was the author of important works on the obliquity of the ecliptic and on the precession of the equinoxes. We may mention in the last place the curious writings of Dimashkī and Kāzwīnī on general cosmography, embracing several physical sciences.¹⁴

The study of mathematics was carried very far. The Moslems not only received arithmetic, geometry, trigonometry, and algebra from the Greeks and Hindus, but themselves gave a further development to those sciences. The works of Al-Khārizmī served as guides to those learned men in Europe who first turned their attention to algebra in the 16th century.

The sciences of physics and chemistry, on the other hand, remained in their infancy. In physical science we can only mention a few works on Optics. As for Music, its study was limited to the practical, and though we may name the important treatise of Al-Fārābī on the theory of Music—a treatise itself drawn entirely from Greek sources—we must acknowledge that Acoustics, properly so called, are not at all taken into consideration by him. Chemistry, considered as an exact science, continued unknown to the Moslems; yet they cultivated Alchemy with eagerness, in their search after the transmutation of metals, and Alchemy is the mother of Chemistry. Medicine, in the hands of the Arabs, remained such as they had borrowed it from the Greeks. As their religion forbade dissection, the Moslems were never able to rise above a rude empiricism. They contented themselves with adding to their

own prescriptions, which they pretended to have received from the Prophet, those of the Greek physicians. The works of Avicenna prove this; and Ibn al-Baitár's treatise on the pharmacopœia also shows how small a part observation played in Arabian medicine.¹ Zoology, botany, and mineralogy made no greater progress; but they were at least among the subjects which attracted the attention of learned Moslems. The great treatise by Damíri, entitled *Hayât al-Haiwân*, or *Life of Animals*, is of interest mainly from the legends it contains;² and the treatise on mineralogy by Taifashí interests us principally by the details it gives on the origin of precious stones and the art of cutting them. It would be unjust to conclude this sketch without adding that the Moslems possess also a great number of technical treatises on the art of war, on military engines, and the Greek fire, on falconry and hunting, and on certain industries, such as those of glass, pottery, and metals. They have also written on magic, on the interpretation of dreams, and on sleight of hand. These works have as yet been very little investigated. We shall no doubt find in them interesting revelations on the history of the industrial arts, and on the history of superstitions.

With an empire so vast as that of the Moslems, we may easily conceive how extensive their commerce and industry must have been. Commerce had at all times been held in honour by the Arabs. Long before the days of Mohammed, the Koráish annually sent caravans, laden with all the products of Yemen, into Syria. Maritime commerce also was already flourishing in Chaldæa in the 5th century of our era. The city of Híra was frequented by ships coming from the Red Sea, from India, and even from China. Obolla was the emporium for the merchandise of India. It was principally thither that teakwood was brought, which served for the construction of ships and houses. Thus the Arabs, when they conquered Chaldæa, found maritime commerce in full activity there, and took advantage of it. Under the Abbásids, Basra supplanted Híra and Obolla, and became the principal port. The history of Sindibád (Sinbad the Sailor) shows how active foreign commerce was under the Abbásids, and with what courage the Arab sailors confronted danger. Moslem colonies were established all along the coasts of Persia and India, and Moslem voyagers did not fear to venture as far as the China Seas. On the West, the commercial movement was not less active. Caravans laden with the products of Spain left Tangier, traversed the whole of Northern Africa, and reached Syria, Arabia, and Mesopotamia. Others passed through Asia Minor, Armenia, Persia, Khorásán, and Turkestan, as far as the frontiers of China, while the route of others again was along the eastern coast of Africa, whence they brought back ivory and black slaves. Thus the silks of China, and the spices, camphor, steel, and

precious woods of India, were poured into the empire, while the Moslems exported their glass, their dates, their cotton stuffs, their refined sugar, and their wrought tools, to those countries. The manufacture of glass was an industry of old standing among them. The glass of Syria was celebrated, and we know that flint-glass and enamels were also made at Baghdád. Dates were cultivated principally in the neighbourhood of Basra, and also in Persia and Khúzistán. Refined sugar also came from the coast of Persia. As regards steel, the manufacture of armour and weapons was the speciality of the people of 'Irák, of Bahrain, of 'Oman, and of Yemen. The Syrians had the credit of forging excellent sword-blades. In Syria too were made mirrors of polished steel. The weaving of various stuffs formed an important branch of industry. The striped stuffs of Yemen, and the tissues of Baghdád, Herát, Tawwaj, and Fasá, enjoyed a high repute. Damascus was renowned for the silk fabrics which have taken their name from that city. The silks of Yemen, of Egypt, and of Cufa, had also a high reputation. Tunis produced gauze, and muslin figured with gold. Egypt manufactured brocade, Armenia supplied satin. The carpet manufacture under the Caliphs had already reached the excellence which it has maintained to our own days. At that time the carpets most valued came from Fársistán and Tabaristán. Jewellery and trinkets found numerous outlets, as may be supposed. This traffic was principally carried on in the East by the Jews.

We know that the religion of the Prophet forbade any representation of the human figure. This prohibition does not appear to have been long observed, for we find that the walls of palaces and of the houses of the rich were covered with paintings. There was a school of painting at Basra, and a historian gives us the names of two painters of high celebrity in their art—Ibn 'Azíz and Koşair.

The manufacture of paper was carried on very extensively, a fact which is easily explained when we think of the literary activity of the Moslems. The Arabs originally used parchment. For this, after the conquest of Egypt, they substituted papyrus, which was itself supplanted by paper, when the Arabs had opened communications with China. Paper mills were established in several of the provinces, and at Baghdád itself. Simultaneously with the appearance of this precious substance, the art of binding became one of the most flourishing industries, as did also the trades of the shoemaker, the saddler, and the dyer, etc. etc. Retail commerce, lastly, undertook the distribution of the products of agriculture and industry. In almost all the cities of the empire markets were held, where the fruiterer and grocer (*Bakkál*), the butcher (*Jazzár*), the armourer (*Saikal*), the bookseller (*Warrák*), and the druggist and perfumer (*Attár*), offered their wares for sale.³ (ST. G.)

PART III.—THE KORAN

THE Koran (Ko'rán) is the foundation of Islam. It is the sacred book of more than a hundred millions of men, some of them nations of immemorial civilization, by all whom it is regarded as the immediate word of God. And since the use of the Koran in public worship, in schools and otherwise, is much more extensive than, for example, the reading of the Bible in most Christian countries, it has been truly described as the most widely-read book in existence. This circumstance alone is sufficient to give it an urgent claim on our attention, whether it suit our taste and fall in with our religious and philosophical views or not. Besides, it is the work of Mohammed, and as such is fitted to afford

a clue to the spiritual development of that most successful of all prophets and religious personalities. It must be owned that the first perusal leaves on a European an impression of chaotic confusion,—not that the book is so very extensive, for it is not quite so large as the New Testament. This impression can in some degree be modified only by the application of a critical analysis with the assistance of Arabian tradition.

To the faith of the Moslems, as has been said, the Koran is the word of God, and such also is the claim which the book itself advances. For except in sur. i.—which is

¹ The treatise has been translated into French by Dr. Leclerc.

a prayer for men—and some few passages where Mohammed (vi. 104, 114; xxvii. 93; xlii. 8), or the angels (xix. 65; xxxvii. 164 *seqq.*), speak in the first person without the intervention of the usual imperative “say” (sing. or pl.), the speaker throughout is God, either in the first person singular, or more commonly the plural of majesty “we.” The same mode of address is familiar to us from the prophets of the Old Testament; the human personality disappears, in the moment of inspiration, behind the God by whom it is filled. But all the greatest of the Hebrew prophets fall back speedily upon the unassuming human “I”; while in the Koran the divine “I” is the stereotyped form of address. Mohammed, however, really felt himself to be the instrument of God; this consciousness was no doubt brighter at his first appearance than it afterwards became, but it never entirely forsook him. We might therefore readily pardon him for giving out, not only the results of imaginative and emotional excitement, but also many expositions or decrees which were the outcome of cool calculation, as the word of God, if he had only attained the pure moral altitude which in an Isaiah or a Jeremiah fills us with admiration after the lapse of ages.

The rationale of revelation is explained in the Koran itself as follows:—In heaven is the original text (“the mother of the book,” xliiii. 3; “a concealed book,” lv. 77; “a well-guarded tablet,” lxxxv. 22). By a process of “sending down” (*tanzil*), one piece after another was communicated to the Prophet. The mediator was an angel, who is called sometimes the “Spirit” (xxvi. 193), sometimes the “holy Spirit” (xvi. 104), and at a later time “Gabriel” (ii. 91). This angel dictates the revelation to the Prophet, who repeats it after him, and afterwards proclaims it to the world (lxxxvii. 6, etc.). It is plain that we have here a somewhat crude attempt of the Prophet to represent to himself the more or less unconscious process by which his ideas arose and gradually took shape in his mind. It is no wonder if in such confused imagery the details are not always self-consistent. When, for example, this heavenly archetype is said to be in the hands of an exalted “scribe” (lxxx. 13 *seqq.*), this seems a transition to a quite different set of ideas, namely, the books of fate, or the record of all human actions—conceptions which are actually found in the Koran. It is to be observed, at all events, that Mohammed’s transcendental idea of God, as a Being exalted altogether above the world, excludes the thought of direct intercourse between the Prophet and God.

It is an explicit statement of the Koran that the sacred book was revealed (“sent down”) by God, not all at once, but piecemeal and gradually (xxv. 34). This is evident from the actual composition of the book, and is confirmed by Moslem tradition. That is to say, Mohammed issued his revelations in fly-leaves of greater or less extent. A single piece of this kind was called either, like the entire collection, *ko’rân*, i.e. “recitation” or “reading;” or *kitâb*, “writing;” or *sûra*, which is the late-Hebrew *shûrâ*, and means literally “series.” The last became, in the lifetime of Mohammed, the regular designation of the individual sections as distinguished from the whole collection; and accordingly it is the name given to the separate chapters of the existing Koran. These chapters are of very unequal length. Since many of the shorter ones are undoubtedly complete in themselves, it is natural to assume that the longer, which are sometimes very comprehensive, have arisen from the amalgamation of various originally distinct revelations. This supposition is favoured by the numerous traditions which give us the circumstances under which this or that short piece, now incorporated in a larger section, was revealed; and also by the fact that the connection of thought in the present *sûras* often seems to be interrupted. And in reality many pieces of the long

sûras have to be severed out as originally independent; even in the short ones parts are often found which cannot have been there at first. At the same time we must beware of carrying this sifting operation too far,—as Nöldeke now believes himself to have done in his earlier works, and as Sprenger also sometimes seems to do. That some *sûras* were of considerable length from the first is seen, for example, from xii., which contains a short introduction, then the history of Joseph, and then a few concluding observations, and is therefore perfectly homogeneous. In like manner, xx., which is mainly occupied with the history of Moses, forms a complete whole. The same is true of xviii., which at first sight seems to fall into several pieces; the history of the seven sleepers, the grotesque narrative about Moses, and that about Alexander “the Horned,” are all connected together, and the same rhyme runs through the whole *sûra*. Even in the separate narrations we may observe how readily the Koran passes from one subject to another, how little care is taken to express all the transitions of thought, and how frequently clauses are omitted, which are almost indispensable. We are not at liberty, therefore, in every case where the connection in the Koran is obscure, to say that it is really broken, and set it down as the clumsy patchwork of a later hand. Even in the old Arabic poetry such abrupt transitions are of very frequent occurrence. It is not uncommon for the Koran, after a new subject has been entered on, to return gradually or suddenly to the former theme,—a proof that there at least separation is not to be thought of. In short, however imperfectly the Koran may have been redacted, in the majority of cases the present *sûras* are identical with the originals.

How these revelations actually arose in Mohammed’s mind is a question which it is almost as idle to discuss as it would be to analyse the workings of the mind of a poet. In his early career, sometimes perhaps in its later stages also, many revelations must have burst from him in uncontrollable excitement, so that he could not possibly regard them otherwise than as divine inspirations. We must bear in mind that he was no cold systematic thinker, but an Oriental visionary, brought up in crass superstition, and without intellectual discipline; a man whose nervous temperament had been powerfully worked on by ascetic austerities, and who was all the more irritated by the opposition he encountered, because he had little of the heroic in his nature. Filled with his religious ideas and visions, he might well fancy he heard the angel bidding him recite what was said to him. There may have been many a revelation of this kind which no one ever heard but himself, as he repeated it to himself in the silence of the night (lxxiii. 4). Indeed the Koran itself admits that he forgot some revelations (lxxxvii. 7). But by far the greatest part of the book is undoubtedly the result of deliberation, touched more or less with emotion, and animated by a certain rhetorical rather than poetical glow. Many passages are based upon purely intellectual reflection. It is said that Mohammed occasionally uttered such a passage immediately after one of those epileptic fits which not only his followers, but (for a time at least) he himself also, regarded as tokens of intercourse with the higher powers. If that is the case, it is impossible to say whether the trick was in the utterance of the revelation or in the fit itself.

How the various pieces of the Koran took literary form is uncertain. Mohammed himself, so far as we can discover, never wrote down anything. The question whether he could read and write has been much debated among Moslems, unfortunately more with dogmatic arguments and spurious traditions than authentic proofs. At present, one is inclined to say that he was not altogether ignorant of these arts, but that from want of practice he found it

convenient to employ some one else whenever he had anything to write. After the flight to Medina (A.D. 622) we are told that short pieces—chiefly legal decisions—were taken down immediately after they were revealed, by an adherent whom he summoned for the purpose; so that nothing stood in the way of their publication. Hence it is probable that in Mecca, where the art of writing was commoner than in Medina, he had already begun to have his oracles committed to writing. That even long portions of the Koran existed in written form from an early date may be pretty safely inferred from various indications; especially from the fact that in Mecca the Prophet had caused insertions to be made, and pieces to be erased in his previous revelations. For we cannot suppose that he knew the longer sūras by heart so perfectly that he was able after a time to lay his finger upon any particular passage. In some instances, indeed, he may have relied too much on his memory. For example, he seems to have occasionally dictated the same sūra to different persons in slightly different terms. In such cases, no doubt, he may have partly intended to introduce improvements; and so long as the difference was merely in expression, without affecting the sense, it could occasion no perplexity to his followers. None of them had literary pedantry enough to question the consistency of the divine revelation on that ground. In particular instances, however, the difference of reading was too important to be overlooked. Thus the Koran itself confesses that the unbelievers cast it up as a reproach to the Prophet that God sometimes substituted one verse for another (xvi. 103). On one occasion, when a dispute arose between two of his own followers as to the true reading of a passage which both had received from the Prophet himself, Mohammed is said to have explained that the Koran was revealed in seven forms. In this apparently genuine dictum seven stands, of course, as in many other cases, for an indefinite but limited number. But one may imagine what a world of trouble it has cost the Moslem theologians to explain the saying in accordance with their dogmatic beliefs. A great number of explanations are current, some of which claim the authority of the Prophet himself; as, indeed, fictitious utterances of Mohammed play throughout a conspicuous part in the exegesis of the Koran. One very favourite, but utterly untenable interpretation is that the "seven forms" are seven different Arabic dialects.

When such discrepancies came to the cognisance of Mohammed it was doubtless his desire that only one of the conflicting texts should be considered authentic; only he never gave himself much trouble to have his wish carried into effect. Although in theory he was an upholder of verbal inspiration, he did not push the doctrine to its extreme consequences; his practical good sense did not take these things so strictly as the theologians of later centuries. Sometimes, however, he did suppress whole sections or verses, enjoining his followers to efface or forget them, and declaring them to be "abrogated." A very remarkable case is that of the two verses in liii., when he had recognised three heathen goddesses as exalted beings, possessing influence with God. (*Supra*, p. 549.)

So much for abrogated readings; the case is somewhat different when we come to the abrogation of laws and directions to the Moslems, which often occurs in the Koran. There is nothing in this at variance with Mohammed's idea of God. God is to him an absolute despot, who declares a thing right or wrong from no inherent necessity but by his arbitrary fiat. This God varies his commands at pleasure, prescribes one law for the Christians, another for the Jews, and a third for the Moslems; nay, he even changes his instructions to the

Moslems when it pleases him. Thus, for example, the Koran contains very different directions, suited to varying circumstances, as to the treatment which idolaters are to receive at the hands of believers. But Mohammed showed no anxiety to have these superseded enactments destroyed. Believers could be in no uncertainty as to which of two contradictory passages remained in force; and they might still find edification in that which had become obsolete. That later generations might not so easily distinguish the "abrogated" from the "abrogating" did not occur to Mohammed, whose vision, naturally enough, seldom extended to the future of his religious community. Current events were invariably kept in view in the revelations. In Medina it called forth the admiration of the Faithful to observe how often God gave them the answer to a question whose settlement was urgently required at the moment. The same naïveté appears in a remark of the Caliph 'Othmán about a doubtful case: 'If the Apostle of God were still alive, methinks there had been a Koran passage revealed on this point.' Not unfrequently the divine word was found to coincide with the advice which Mohammed had received from his most intimate disciples. "Omar was many a time of a certain opinion," says one tradition, "and the Koran was then revealed accordingly."

The contents of the different parts of the Koran are extremely varied. Many passages consist of the theological or moral reflections. We are reminded of the greatness, the goodness, the righteousness of God as manifested in Nature, in history, and in revelation through the prophets, especially through Mohammed. God is magnified as the One, the All-powerful. Idolatry and all deification of created beings, such as the worship of Christ as the Son of God, are unsparingly condemned. The joys of heaven and the pains of hell are depicted in vivid sensuous imagery, as is also the terror of the whole creation at the advent of the last day and the judgment of the world. Believers receive general moral instruction, as well as directions for special circumstances. The lukewarm are rebuked, the enemies threatened with terrible punishment, both temporal and eternal. To the sceptical the truth of Islam is held forth; and a certain, not very cogent, method of demonstration predominates. In many passages the sacred book falls into a diffuse preaching style, others seem more like proclamations or general orders. A great number contain ceremonial or civil laws, or even special commands to individuals down to such matters as the regulation of Mohammed's harem. In not a few, definite questions are answered which had actually been propounded to the Prophet by believers or infidels. Mohammed himself, too, repeatedly receives direct injunctions, and does not escape an occasional rebuke. One sūra (i.) is a prayer, two (cxiii., cxiv.) are magical formulas. Many sūras treat of a single topic, others embrace several.

From the mass of material comprised in the Koran—and the account we have given is far from exhaustive—we should select the histories of the ancient prophets and saints as possessing a peculiar interest. The purpose of Mohammed is to show from these histories how God in former times had rewarded the righteous, and punished their enemies. For the most part the old prophets only serve to introduce a little variety in point of form, for they are almost in every case facsimiles of Mohammed himself. They preach exactly like him, they have to bring the very same charges against their opponents, who on their part behave exactly as the unbelieving inhabitants of Mecca. The Koran even goes so far as to make Noah contend against the worship of certain false gods, mentioned by name, who were worshipped by the Arabs of Mohammed's time. In an address which is put in the mouth of Abraham (xxvi. 75 *sqq.*) the reader quite forgets that it is Abraham, and not Mohammed (or God himself) who is

speaking. Other narratives are intended rather for amusement, although they are always well seasoned with edifying phrases. It is no wonder that the godless Koraisites thought these stories of the Koran not nearly so entertaining as those of Rostam and Ispandîâr related by Nadr the son of Hârith, who had learned on the Euphrates the heroic mythology of the Persians. But the Prophet was so exasperated by this rivalry that when Nadr fell into his power after the battle of Badr, he caused him to be executed; although in all other cases he readily pardoned his fellow-countrymen.

These histories are chiefly about Scripture characters, especially those of the Old Testament. But the deviations from the Biblical narratives are very marked. Many of the alterations are found in the legendary anecdotes of the Jewish Haggada and the New Testament Apocrypha; but many more are due to misconceptions such as only a listener (not the reader of a book) could fall into. The most ignorant Jew could never have mistaken Haman (the minister of Ahasuerus) for the minister of Pharaoh, or identified Miriam the sister of Moses with Mary (= Miriam) the mother of Christ. In addition to such misconceptions there are sundry capricious alterations, some of them very grotesque, due to Mohammed himself. For instance, in his ignorance of everything out of Arabia, he makes the fertility of Egypt—where rain is almost never seen and never missed—depend on rain instead of the inundations of the Nile (xii. 49). It was through the Jews also that he borrowed his account of Alexander "the Horned"; an epithet which is to be explained, after old Hottinger, from the great multitude of coins where Alexander is represented with the ram's-horn of Ammon. Besides Jewish and Christian histories there are a few about old Arabian prophets. In these he seems to have handled his materials even more freely than in the others.

The opinion has already been expressed that Mohammed did not make use of written sources. Coincidences and divergences alike can always be accounted for by oral communications from Jews who knew a little and Christians who knew next to nothing. Even in the rare passages where we can trace direct resemblances to the text of the Old Testament (comp. xxi. 105 with Ps. xxxvii. 29; i. 5 with Ps. xxvii. 11) or the New (comp. vii. 48 with Luke xvi. 24; xli. 19 with Luke xvi. 25), there is nothing more than might readily have been picked up in conversation with any Jew or Christian. In Medina, where he had the opportunity of becoming acquainted with Jews of some culture, he learned some things out of the Mishna, e.g. v. 35 corresponds almost word for word with Mishna *Sanh.* iv. 5; compare also ii. 183 with Mishna *Ber.* i. 2. That these are only cases of oral communication will be admitted by any one with the slightest knowledge of the circumstances. Otherwise we might even conclude that Mohammed had studied the Talmud; e.g. the regulation as to ablution by rubbing with sand, where water cannot be obtained (iv. 46), corresponds to a talmudic ordinance (*Ber.* 15 a). Of Christianity he can have been able to learn very little even in Medina; as may be seen from the absurd travesty of the institution of the Eucharist in v. 112 *sqq.* For the rest, it is highly improbable that before the Koran any real literary production—anything that could be strictly called a book—existed in the Arabic language.

In point of style and artistic effect, the different parts of the Koran are of very unequal value. An unprejudiced and critical reader will certainly find very few passages where his æsthetic susceptibilities are thoroughly satisfied. But he will often be struck, especially in the older pieces, by a wild force of passion, and a vigorous, if not rich, imagination. Descriptions of heaven and hell, and allusions to God's working in Nature, not unfrequently show

a certain amount of poetic power. In other places also the style is sometimes lively and impressive; though it is rarely indeed that we come across such strains of touching simplicity as in the middle of xciii. The greater part of the Koran is decidedly prosaic; much of it indeed is stiff in style. Of course, with such a variety of material, we cannot expect every part to be equally vivacious, or imaginative, or poetic. A decree about the right of inheritance, or a point of ritual, must necessarily be expressed in prose, if it is to be intelligible. No one complains of the civil laws in Exodus or the sacrificial ritual in Leviticus, because they want the fire of Isaiah or the tenderness of Deuteronomy. But Mohammed's mistake consists in persistent and slavish adherence to the semi-poetic form which he had at first adopted in accordance with his own taste and that of his hearers. For instance, he employs rhyme in dealing with the most prosaic subjects, and thus produces the disagreeable effect of incongruity between style and matter. It has to be considered, however, that many of those sermonizing pieces which are so tedious to us, especially when we read two or three in succession (perhaps in a very inadequate translation), must have had a quite different effect when recited under the burning sky and on the barren soil of Mecca. There, thoughts about God's greatness and man's duty, which are familiar to us from childhood, were all new to the hearers—it is hearers we have to think of in the first instance, not readers—to whom, at the same time, every allusion had a meaning which often escapes our notice. When Mohammed spoke of the goodness of the Lord in creating the clouds, and bringing them across the cheerless desert, and pouring them out on the earth to restore its rich vegetation, that must have been a picture of thrilling interest to the Arabs, who are accustomed to see from three to five years elapse before a copious shower comes to clothe the wilderness once more with luxuriant pastures. It requires an effort for us, under our clouded skies, to realize in some degree the intensity of that impression.

The fact that scraps of poetical phraseology are especially numerous in the earlier sûras, enables us to understand why the prosaic mercantile community of Mecca regarded their eccentric townsman as a "poet," or even a "possessed poet." Mohammed himself had to disclaim such titles, because he felt himself to be a divinely-inspired prophet; but we too, from our standpoint, shall fully acquit him of poetic genius. Like many other predominantly religious characters, he had no appreciation of poetic beauty; and if we may believe one anecdote related of him, at a time when every one made verses he affected ignorance of the most elementary rules of prosody. Hence the style of the Koran is not poetical but rhetorical; and the powerful effect which some portions produce on us is gained by rhetorical means. Accordingly the sacred book has not even the artistic form of poetry; which, among the Arabs, includes a stringent metre, as well as rhyme. The Koran is never metrical, and only a few exceptionally eloquent portions fall into a sort of spontaneous rhythm. On the other hand, the rhyme is regularly maintained; although, especially in the later pieces, after a very slovenly fashion. Rhymed prose was a favourite form of composition among the Arabs of that day, and Mohammed adopted it; but if it imparts a certain sprightliness to some passages, it proves on the whole a burdensome yoke. The Moslems themselves have observed that the tyranny of the rhyme often makes itself apparent in derangement of the order of words, and in the choice of verbal forms which would not otherwise have been employed; e.g. an imperfect instead of a perfect. In one place, to save the rhyme, he calls Mount Sinai *Sînîn* (xcv. 2) instead of *Sînâ* (xxiii. 20); in another Elijah is called *Ilyâsîn* (xxxvii. 130) instead of

Rhetorical forms and rhyme.

Pyás (vi. 85; xxxvii. 123). The substance even is modified to suit exigencies of rhyme. Thus the Prophet would scarcely have fixed on the unusual number of *eight* angels round the throne of God (lxix. 17) if the word *thamáníyah*, "eight," had not happened to fall in so well with the rhyme. And when lv. speaks of *two* heavenly gardens, each with *two* fountains and *two* kinds of fruit, and again of *two* similar gardens, all this is simply because the dual termination (*án*) corresponds to the syllable that controls the rhyme in that whole *súra*. In the later pieces, Mohammed often inserts edifying remarks, entirely out of keeping with the context, merely to complete his rhyme. In Arabic it is such an easy thing to accumulate masses of words with the same termination, that the gross negligence of the rhyme in the Koran is doubly remarkable. One may say that this is another mark of the Prophet's want of mental training, and incapacity for introspective criticism.

Syllabic
weak-
nesses.

On the whole, while many parts of the Koran undoubtedly have considerable rhetorical power, even over an unbelieving reader, the book, æsthetically considered, is by no means a first-rate performance. To begin with what we are most competent to criticize, let us look at some of the more extended narratives. It has already been noticed how vehement and abrupt they are where they ought to be characterized by epic repose. Indispensable links, both in expression and in the sequence of events, are often omitted, so that to understand these histories is sometimes far easier for us than for those who heard them first, because we know most of them from better sources. Along with this, there is a great deal of superfluous verbiage; and nowhere do we find a steady advance in the narration. Contrast in these respects the history of Joseph (xii.) and its glaring improprieties, with the admirably-conceived and admirably-executed story in Genesis. Similar faults are found in the non-narrative portions of the Koran. The connexion of ideas is extremely loose, and even the syntax betrays great awkwardness. Anacolutha are of frequent occurrence, and cannot be explained as conscious literary devices. Many sentences begin with a "when" or "on the day when" which seems to hover in the air, so that the commentators are driven to supply a "think of this" or some such ellipsis. Again, there is no great literary skill evinced in the frequent and needless harping on the same words and phrases; in xviii., for example, "till that" (*hattá idhá*) occurs no fewer than eight times. Mohammed, in short, is not in any sense a master of style. This opinion will be endorsed by any European who reads through the book with an impartial spirit and some knowledge of the language, without taking into account the tiresome effect of its endless iterations. But in the ears of every pious Moslem such a judgment will sound almost as shocking as downright atheism or polytheism. Among the Moslems, the Koran has always been looked on as the most perfect model of style and language. This feature of it is in their dogmatic the greatest of all miracles, the incontestable proof of its divine origin. Such a view on the part of men who knew Arabic infinitely better than the most accomplished European Arabist will ever do, may well startle us. In fact, the Koran boldly challenged its opponents to produce ten *súras*, or even a single one, like those of the sacred book, and they never did so. That, to be sure, on calm reflexion, is not so very surprising. Revelations of the kind which Mohammed uttered, no unbeliever could produce without making himself a laughing-stock. However little real originality there is in Mohammed's doctrines, as against his own countrymen he was thoroughly original, even in the form of his oracles. To compose such revelations at will was beyond the power

of the most expert literary artist; it would have required either a prophet, or a shameless impostor. And if such a character appeared *after* Mohammed, still he could never be anything but an imitator, like the false prophets who arose about the time of his death and afterwards. That the adversaries should produce any sample whatsoever of poetry or rhetoric equal to the Koran is not at all what the Prophet demands. In that case he would have been put to shame, even in the eyes of many of his own followers, by the first poem that came to hand. Nevertheless, it is on a false interpretation of this challenge that the dogma of the incomparable excellence of the style and diction of the Koran is based. The rest has been accomplished by dogmatic prejudice, which is quite capable of working other miracles besides turning a defective literary production into an unrivalled masterpiece in the eyes of believers. This view once accepted, the next step was to find everywhere evidence of the perfection of the style and language. And if here and there, as one can scarcely doubt, there was among the old Moslems a lover of poetry who had his difficulties about this dogma, he had to beware of uttering an opinion which might have cost him his head. We know of at least one rationalistic theologian who defined the dogma in such a way that we can see he did not believe it (Shahrastáni, p. 39). The truth is, it would have been a miracle indeed if the style of the Koran had been perfect. For although there was at that time a recognized poetical style, already degenerating to mannerism, a prose style did not exist. All beginnings are difficult; and it can never be esteemed a serious charge against Mohammed that his book, the first prose work of a high order in the language, testifies to the awkwardness of the beginner. And further, we must always remember that entertainment and æsthetic effect were at most subsidiary objects. The great aim was persuasion and conversion; and, say what we will, that aim has been realized on the most imposing scale.

Mohammed repeatedly calls attention to the fact that the Koran is not written, like other sacred books, in a strange language, but in Arabic, and therefore is intelligible to all. At that time, along with foreign ideas, many foreign words had crept into the language; especially Aramaic terms for religious conceptions of Jewish or Christian origin. Some of these had already passed into general use, while others were confined to a more limited circle. Mohammed, who could not fully express his new ideas in the common language of his countrymen, but had frequently to find out new terms for himself, made free use of such Jewish and Christian words, as was done, though perhaps to a smaller extent, by certain thinkers and poets of that age who had more or less risen above the level of heathenism. In Mohammed's case this is the less wonderful, because he was indebted to the instruction of Jews and Christians whose Arabic—as the Koran pretty clearly intimates with *regarā* to one of them—was very defective. Nor is it very surprising to find that his use of these words is sometimes as much at fault as his comprehension of the histories which he learned from the same people—that he applies Aramaic expressions as incorrectly as many uneducated persons now employ words derived from the French. Thus, *forqán* means really "redemption," but Mohammed (misled by the Arabic meaning of the root *فرق* "sever," "decide") uses it for "revelation." *Milla* is properly "Word," but in the Koran "religion." *Illiyún* (lxxxiii. 18, 19) is apparently the Hebrew name of God, *Elyón*, "the Most High"; Mohammed uses it of a heavenly book (see S. Fraenkel, *De vocabulis in antiquis Arabum carminibus et in Corano peregrinis*, Leyden, 1880, p. 23). So again the word *mathání* is, as Geiger has conjectured, the

regular plural of the Aramaic *mathnithá*, which is the same as the Hebrew *Mishna*, and denotes, in Jewish usage, a legal decision of some of the ancient Rabbins. But in the Koran "the seven *Mathání*" (xv. 87) are probably the seven verses of sūra i., so that Mohammed appears to have understood it in the sense of "saying," or "sentence" (comp. xxxix. 24). Words of Christian origin are less frequent in the Koran. It is an interesting fact that of these a few have come over from the Abyssinian; such as *hawáriyún*, "apostles," *máida*, "table," and two or three others; these all make their first appearance in súras of the Medina period. The word *shaitán*, "Satan," which was likewise borrowed, at least in the first instance, from the Abyssinian, had probably been already introduced into the language. Sprenger has rightly observed that Mohammed makes a certain parade of these foreign terms, as of other peculiarly constructed expressions; in this he followed a favourite practice of contemporary poets. It is the tendency of the imperfectly educated to delight in out-of-the-way expressions, and on such minds they readily produce a remarkably solemn and mysterious impression. This was exactly the kind of effect that Mohammed desired, and to secure it he seems even to have invented a few odd vocables, as *ghislín* (lxix. 36), *sijín* (lxxxiii. 7, 8), *tasnim* (lxxxiii. 27), and *salsabíl* (lxxvi. 18). But, of course, the necessity of enabling his hearers to understand ideas which they must have found sufficiently novel in themselves, imposed tolerably narrow limits on such eccentricities.

The constituents of our present Koran belong partly to the Mecca period (before 622 A.D.), partly to the period commencing with the flight to Medina (from the autumn of 622 to 8th June 632). Mohammed's position in Medina was entirely different from that which he had occupied in his native town. In the former he was from the first the leader of a powerful party, and gradually became the autocratic ruler of Arabia; in the latter he was only the despised preacher of a small congregation. This difference, as was to be expected, appears in the Koran. The Medina pieces, whether entire súras or isolated passages interpolated in Meccan súras, are accordingly pretty broadly distinct, as to their contents, from those issued in Mecca. In the great majority of cases there can be no doubt whatever whether a piece first saw the light in Mecca or in Medina; and for the most part the internal evidence is borne out by Moslem tradition. And since the revelations given in Medina frequently take notice of events about which we have pretty accurate information, and whose dates are at least approximately known, we are often in a position to fix their date with at any rate considerable certainty; here again tradition renders valuable assistance. Even with regard to the Medina passages, however, a great deal remains uncertain, partly because the allusions to historical events and circumstances are generally rather obscure, partly because traditions about the occasion of the revelation of the various pieces are often fluctuating, and often rest on misunderstanding or arbitrary conjecture. But at all events it is far easier to arrange in some sort of chronological order the Medina súras than those composed in Mecca. There is, indeed, one tradition which professes to furnish a chronological list of all the súras. But not to mention that it occurs in several divergent forms, and that it takes no account of the fact that our present súras are partly composed of pieces of different dates, it contains so many suspicious or undoubtedly false statements, that it is impossible to attach any great importance to it. Besides, it is *a priori* unlikely that a contemporary of Mohammed should have drawn up such a list; and if any one had made the attempt, he would have found it almost impossible to obtain reliable information as to the order of the

earlier Meccan súras. We have in this list no genuine tradition, but rather the lucubrations of an undoubtedly conscientious Moslem critic, who may have lived about a century after the Flight.

Among the revelations put forth in Mecca there is a considerable number of (for the most part) short súras which strike every attentive reader as being the oldest. They are in an altogether different strain from many others, and in their whole composition they show least resemblance to the Medina pieces. It is no doubt conceivable—as Sprenger supposes—that Mohammed might have returned at intervals to his earlier manner; but since this group possesses a remarkable similarity of style, and since the gradual formation of a different style is on the whole an unmistakable fact, the assumption has little probability; and we shall therefore abide by the opinion that these form a distinct group. At the opposite extreme from them stands another cluster, showing quite obvious affinities with the style of the Medina súras, which must therefore be assigned to the later part of the Prophet's work in Mecca. Between these two groups stand a number of other Meccan súras, which in every respect mark the transition from the first period to the third. It need hardly be said that the three periods—which were first distinguished by Professor Weil—are not separated by sharp lines of division. With regard to some súras, it may be doubtful whether they ought to be reckoned amongst the middle group, or with one or other of the extremes. And it is altogether impossible, within these groups, to establish even a probable chronological arrangement of the individual revelations. In default of clear allusions to well-known events, or events whose date can be determined, we might indeed endeavour to trace the psychological development of the Prophet by means of the Koran, and arrange its parts accordingly. But in such an undertaking one is always apt to take subjective assumptions or mere fancies for established data. Good traditions about the origin of the Meccan revelations are not very numerous. In fact the whole history of Mohammed previous to the Flight is so imperfectly related that we are not even sure in what year he appeared as a prophet. Probably it was in A.D. 610; it may have been somewhat earlier, but scarcely later. If, as one tradition says, xxx. 1 *sq.* ("The Romans are overcome in the nearest neighbouring land") refers to the defeat of the Byzantines by the Persians, not far from Damascus, about the spring of 614, it would follow that the third group, to which this passage belongs, covers the greater part of the Meccan period. And it is not in itself unlikely that the passionate vehemence which characterizes the first group was of short duration. Nor is the assumption contradicted by the tolerably well-attested, though far from incontestable statement, that when 'Omar was converted (A.D. 615 or 616), xx., which belongs to the second group, already existed in writing. But the reference of xxx. 1 *sq.* to this particular battle is by no means so certain that positive conclusions can be drawn from it. It is the same with other allusions in the Meccan súras to occurrences whose chronology can be partially ascertained. It is better, therefore, to rest satisfied with a merely relative determination of the order of even the three great clusters of Meccan revelations.

In the pieces of the first period the convulsive excitement of the Prophet often expresses itself with the utmost vehemence. He is so carried away by his emotion that he cannot choose his words; they seem rather to burst from him. Many of these pieces remind us of the oracles of the old heathen soothsayers, whose style is known to us from imitations, although we have perhaps not a single genuine specimen. Like those other oracles, the súras of this period, which are never very long, are composed of

short sentences with tolerably pure but rapidly-changing rhymes. The oaths, too, with which many of them begin, were largely used by the soothsayers. Some of these oaths are very uncouth and hard to understand, some of them perhaps were not meant to be understood, for indeed all sorts of strange things are met with in these chapters. Here and there Mohammed speaks of visions, and appears even to see angels before him in bodily form. There are some intensely vivid descriptions of the resurrection and the last day which must have exercised a demonic power over men who were quite unfamiliar with such pictures. Other pieces paint in glowing colours the joys of heaven and the pains of hell. However, the sūras of this period are not all so wild as these; and those which are conceived in a calmer mood appear to be the oldest. Yet, one must repeat, it is exceedingly difficult to make out any strict chronological sequence. For instance, it is by no means certain whether the beginning of xcvi. is really, what a widely-circulated tradition calls it, the oldest part of the whole Koran. That tradition goes back to the Prophet's favourite wife 'Āisha; but as she was not born at the time when the revelation is said to have been made, it can only contain at the best what Mohammed told her years afterwards, from his own not very clear recollection, with or without fictitious additions. And, moreover, there are other pieces mentioned by others as the oldest. In any case xcvi. 1 *sqq.* is certainly very early. According to the traditional view, which appears to be correct, it treats of a vision in which the Prophet receives an injunction to recite a revelation conveyed to him by the angel. It is interesting to observe that here already two things are brought forward as proofs of the omnipotence and care of God: one is the creation of man out of a seminal drop—an idea to which Mohammed often recurs; the other is the then recently introduced art of writing, which the Prophet instinctively seizes on as a means of propagating his doctrines. It was only after Mohammed encountered obstinate resistance that the tone of the revelations became thoroughly passionate. In such cases he was not slow to utter terrible threats against those who ridiculed the preaching of the unity of God, of the resurrection, and of the judgment. His own uncle Abū Lahab had rudely repelled him, and in a brief special sūra (cxi.) he and his wife are consigned to hell. The sūras of this period form almost exclusively the concluding portions of the present text. One is disposed to assume, however, that they were at one time more numerous, and that many of them were lost at an early period.

Since Mohammed's strength lay in his enthusiastic and fiery imagination rather than in the wealth of ideas and clearness of abstract thought on which exact reasoning depends, it follows that the older sūras, in which the former qualities have free scope, must be more attractive to us than the later. In the sūras of the second period the imaginative glow perceptibly diminishes; there is still fire and animation, but the tone becomes gradually more prosaic. As the feverish restlessness subsides, the periods are drawn out, and the revelations as a whole become longer. The truth of the new doctrine is proved by accumulated instances of God's working in nature and in history; the objections of opponents, whether advanced in good faith or in jest, are controverted by arguments; but the demonstration is often confused or even weak. The histories of the earlier prophets, which had occasionally been briefly touched on in the first period, are now related, sometimes at great length. On the whole, the charm of the style is passing away.

There is one piece of the Koran, belonging to the beginning of this period, if not to the close of the former, which claims particular notice. This is i., the Lord's Prayer of

the Moslems, and beyond dispute the gem of the Koran. The words of this sūra, which is known as *al-fātiḥa* ("the opening one") are as follows:—

(1) In the name of God, the compassionate compassioneer. (2) Praise be [literally "is"] to God, the Lord of the worlds, (3) the compassionate compassioneer, (4) the Sovereign of the day of judgment. (5) Thee do we worship and of Thee do we beg assistance. (6) Direct us in the right way; (7) in the way of those to whom Thou hast been gracious, on whom there is no wrath, and who go not astray.

The thoughts are so simple as to need no explanation; and yet the prayer is full of meaning. It is true that there is not a single original idea of Mohammed's in it. Several words and turns of expression are borrowed directly from the Jews, in particular the designation of God as the "Compassioneer," *Rahmán*. This is simply the Jewish *Rahmáná*, which was a favourite name for God in the Talmudic period. Mohammed seems for a while to have entertained the thought of adopting *al-Rahmán* as a proper name of God, in place of *Alláh*, which was already used by the heathens.¹ This purpose he ultimately relinquished, but it is just in the sūras of the second period that the use of *Rahmán* is specially frequent. It was probably in the first sūra also that Mohammed first introduced the formula, "In the name of God," etc. It is to be regretted that this prayer must lose its effect through too frequent use, for every Moslem who says his five prayers regularly—as the most of them do—repeats it not less than twenty times a day.

The sūras of the third Meccan period, which form a Latest Meccan sūras. pretty large part of our present Koran, are almost entirely prosaic. Some of the revelations are of considerable extent, and the single verses also are much longer than in the older sūras. Only now and then a gleam of poetic power flashes out. A sermonizing tone predominates. The sūras are very edifying for one who is already reconciled to their import, but to us at least they do not seem very well fitted to carry conviction to the minds of unbelievers. That impression, however, is not correct, for in reality the demonstrations of these longer Meccan sūras appear to have been peculiarly influential for the propagation of Islam. Mohammed's mission was not to Europeans, but to a people who, though quick-witted and receptive, were not accustomed to logical thinking, while they had outgrown their ancient religion.

When we reach the Medina period it becomes, as has Medinan sūras. been indicated, much easier to understand the revelations in their historical relations, since our knowledge of the history of Mohammed in Medina is tolerably complete. In many cases the historical occasion is perfectly clear, in others we can at least recognize the general situation from which they arose, and thus approximately fix their time. There still remains, however, a remnant, of which we can only say that it belongs to Medina.

The style of this period bears a pretty close resemblance to that of the latest Meccan period. It is for the most part pure prose, enriched by occasional rhetorical embellishments. Yet even here there are many bright and impressive passages, especially in those sections which may be regarded as proclamations to the army of the faithful. For the Moslems, Mohammed has many different messages. At one time it is a summons to do battle for the faith; at another, a series of reflexions on recently experienced success or misfortune, or a rebuke for their weak faith; or an exhortation to virtue, and so on. He often addresses himself to the "doubters," some of whom vacillate between faith and unbelief, others make a pretence of faith, while others

¹ Since in Arabic also the root *رحم* signifies "to have pity," the Arabs must have at once perceived the force of the new name

scarcely take the trouble even to do that. They are no consolidated party, but to Mohammed they are all equally vexatious, because, as soon as danger has to be encountered, or a contribution is levied, they all alike fall away. There are frequent outbursts, ever increasing in bitterness, against the Jews, who were very numerous in Medina and its neighbourhood when Mohammed arrived. He has much less to say against the Christians, with whom he never came closely in contact; and as for the idolaters, there was little occasion in Medina to have many words with them. A part of the Medina pieces consists of formal laws belonging to the ceremonial, civil, and criminal codes; or directions about certain temporary complications. The most objectionable parts of the whole Koran are those which treat of Mohammed's relations with women. The laws and regulations were generally very concise revelations, but most of them have been amalgamated with other pieces of similar or dissimilar import, and are now found in very long sūras.

Such is an imperfect sketch of the composition and the internal history of the Koran, but it is probably sufficient to show that the book is a very heterogeneous collection. If only those passages had been preserved which had a permanent value for the theology, the ethics, or the jurisprudence of the Moslems, a few fragments would have been amply sufficient. Fortunately for knowledge, respect for the sacredness of the letter has led to the collection of all the revelations that could possibly be collected,—the “abrogating” along with the “abrogated,” passages referring to passing circumstances as well as those of lasting importance. Every one who takes up the book in the proper religious frame of mind, like most of the Moslems, reads pieces directed against long-obsolete absurd customs of Mecca just as devoutly as the weightiest moral precepts,—perhaps even more devoutly, because he does not understand them so well.

At the head of twenty-nine of the sūras stand certain initial letters, from which no clear sense can be obtained. Thus, before ii. iii. xxxi. xxxii. we find ا ل م ي (*Alif-Lām Mim*), before xl. xlv.

(*Hā Mim*). Noldeke at one time suggested that these initials did not belong to Mohammed's text, but might be the monograms of possessors of codices, which, through negligence on the part of the editors, were incorporated in the final form of the Koran; he now deems it more probable that they are to be traced to the Prophet himself, as Sprenger, Loth, and others suppose. One cannot indeed admit the truth of Loth's statement that in the proper opening words of these sūras we may generally find an allusion to the accompanying initials; but it can scarcely be accidental that the first verse of the great majority of them (in iii. it is the second verse) contains the word “book,” “revelation,” or some equivalent. They usually begin with: “This is the book,” or “Revelation (‘down sending’) of the book,” or something similar. Of sūras which commence in this way only a few (xviii. xxv. xxv. xxxix.) want the initials, while only xxix. and xxx. have the initials and begin differently. These few exceptions may easily have proceeded from ancient corruptions; at all events they cannot neutralize the evidence of the greater number. Mohammed seems to have meant these letters for a mystic reference to the archetypal text in heaven. To a man who regarded the art of writing, of which at the best he had but a slight knowledge, as something supernatural, and who lived amongst illiterate people, an A B C may well have seemed more significant than to us who have been initiated into the mysteries of this art from our childhood. The Prophet himself can hardly have attached any particular meaning to these symbols: they served their purpose if they conveyed an impression of solemnity and enigmatical obscurity. In fact, the Koran admits that it contains many things which neither can be, nor were intended to be, understood (iii. 5). To regard these letters as ciphers is a precarious hypothesis, for the simple reason that cryptography is not to be looked for in the very infancy of Arabic writing. If they are actually ciphers, the multiplicity of possible explanations at once precludes the hope of a plausible interpretation. None of the efforts in this direction, whether by Moslem scholars or by Europeans, have led to convincing results. This remark applies even to the ingenious conjecture of Sprenger, that the letters ك ت ه ي ع س م (*Kāf Hā Yā 'Ain Sād*) before xix. (which treats of John and Jesus, and, according to tradition, was sent to the Christian king of Abyssinia) stand for *Jesus Nazareus*

Rex Judæorum. Sprenger arrives at this explanation by a very artificial method; and besides, Mohammed was not so simple as the Moslem traditionalists, who imagined that the Abyssinians could read a piece of the Arabic Koran. It need hardly be said that the Moslems have from of old applied themselves with great assiduity to the decipherment of these initials, and have sometimes found the deepest mysteries in them. Generally, however, they are content with the prudent conclusion, that God alone knows the meaning of these letters.

When Mohammed died, the separate pieces of the Koran, notwithstanding their theoretical sacredness, existed only in scattered copies; they were consequently in great danger of being partially or entirely destroyed. Many Moslems knew large portions by heart, but certainly no one knew the whole; and a merely oral propagation would have left the door open to all kinds of deliberate and inadvertent alterations. Mohammed himself had never thought of an authentic collection of his revelations; he was usually concerned only with the object of the moment, and the idea that the revelations would be destroyed unless he made provision for their safe preservation, did not enter his mind. A man destitute of literary culture has some difficulty in anticipating the fate of intellectual products. But now, after the death of the Prophet, most of the Arabs revolted against his successor, and had to be reduced to submission by force. Especially sanguinary was the contest against the prophet Maslama (Mubarrad, *Kāmil* 443, 5), an imitator of Mohammed, commonly known by the derisive diminutive Mosailma. At that time (A.D. 633) many of the most devoted Moslems fell; the very men who knew most Koran pieces by heart. 'Omar then began to fear that the Koran might be entirely forgotten, and he induced the Caliph Abūbekr to undertake the collection of all its parts. The Caliph laid the duty on Zaid, the son of Zaid's first Koran. Thābit, a native of Medina, then about twenty-two years of age, who had often acted as amanuensis to the Prophet, in whose service he is even said to have learned the Jewish letters. The account of this collection of the Koran has reached us in several substantially identical forms, and goes back to Zaid himself. According to it, he collected the revelations from copies written on flat stones, pieces of leather, ribs of palm-leaves (not palm-leaves themselves), and such-like material, but chiefly “from the breasts of men,” i.e. from their memory. From these he wrote a fair copy, which he gave to Abūbekr, from whom it came to his successor 'Omar, who again bequeathed it to his daughter Hāfisa, one of the widows of the Prophet. This redaction, commonly called *al-ṣoḥof* (“the leaves”), had from the first no canonical authority; and its internal arrangement can only be conjectured.

The Moslems were as far as ever from possessing a uniform text of the Koran. The bravest of their warriors sometimes knew deplorably little about it; distinction on that field they cheerfully accorded to pious men like Ibn Mas'ūd. It was inevitable, however, that discrepancies should emerge between the texts of professed scholars, and as these men in their several localities were authorities on the reading of the Koran, quarrels began to break out between the levies from different districts about the true form of the sacred book. During a campaign in A.H. 30 (A.D. 650-1), Hodaifa, the victor in the great and decisive battle of Nehāwand—which was to the empire of the Sāsānids what Gaugamela was to that of the Achæmenidæ—perceived that such disputes might become dangerous, and therefore urged on the Caliph 'Othmān the necessity for a universally binding text. The matter was entrusted to Zaid, who had made the former collection, with three leading Koraishites. These brought together as many copies as they could lay their hands on, and prepared an edition which was to be canonical for all Moslems. To prevent any further disputes, they burned all the other codices except that of

Hafsa, which, however, was soon afterwards destroyed by Merwán, the governor of Medina. The destruction of the earlier codices was an irreparable loss to criticism; but, for the essentially political object of putting an end to controversies by admitting only one form of the common book of religion and of law, this measure was necessary.

The result of these labours is in our hands; as to how they were conducted we have no trustworthy information, tradition being here too much under the influence of dogmatic presuppositions. The critical methods of a modern scientific commission will not be expected of an age when the highest literary education for an Arab consisted in ability to read and write. It now seems to me highly probable that this second redaction took this simple form: Zaid read off from the codex which he had previously written, and his associates, simultaneously or successively, wrote one copy each to his dictation. It certainly cannot have been by chance that, according to sure tradition, they wrote exactly four copies. Be that as it may, it is impossible now to distinguish in the present form of the book what belongs to the first redaction from what is due to the second.

In the arrangement of the separate sections, a classification according to contents was impracticable because of the variety of subjects often dealt with in one sūra. A chronological arrangement was out of the question, because the chronology of the older pieces must have been imperfectly known, and because in some cases passages of different dates had been joined together. Indeed, systematic principles of this kind were altogether disregarded at that period. The pieces were accordingly arranged in indiscriminate order, the only rule observed being to place the long sūras first and the shorter towards the end, and even that was far from strictly adhered to. The short opening sūra is so placed on account of its superiority to the rest, and two magical formulæ are kept for a sort of protection at the end; these are the only special traces of design. The combination of pieces of different origin may proceed partly from the possessors of the codices from which Zaid compiled his first complete copy, partly from Zaid himself. The individual sūras are separated simply by the superscription—"In the name of God, the compassionate Compassioner," which is wanting only in the ninth. The additional headings found in our texts (the name of the sūra, the number of verses, etc.) were not in the original codices, and form no integral part of the Koran.

It is said that 'Othmán directed Zaid and his associates, in cases of disagreement, to follow the Koraish dialect; but, though well attended, this account can scarcely be correct. The extremely primitive writing of those days was quite incapable of rendering such minute differences as can have existed between the pronunciation of Mecca and that of Medina.

'Othmán's Koran was not complete. Some passages are evidently fragmentary; and a few detached pieces are still extant which were originally parts of the Koran, although they have been omitted by Zaid. Amongst these are some which there is no reason to suppose Mohammed desired to suppress. Zaid may easily have overlooked a few stray fragments, but that he purposely omitted anything which he believed to belong to the Koran is very unlikely. It has been conjectured that in deference to his superiors he kept out of the book the names of Mohammed's enemies, if they or their families came afterwards to be respected. But it must be remembered that it was never Mohammed's practice to refer explicitly to contemporary persons and affairs in the Koran. Only a single friend, his adopted son Zaid (xxxiii. 37), and a single enemy, his uncle Abū Lahab (cxi.)—and these for very special reasons—are mentioned by name; and the name of the latter has been left

in the Koran with a fearful curse annexed to it, although his son had embraced Islam before the death of Mohammed. So, on the other hand, there is no single verse or clause which can be plausibly made out to be an interpolation by Zaid at the instance of Abūbekr, 'Omar, or 'Othmán. Slight clerical errors there may have been, but the Koran of 'Othmán contains none but genuine elements,—though sometimes in very strange order.

Of the four exemplars of 'Othmán's Koran, one was kept in Medina, and one was sent to each of the three metropolitan cities, Cufa, Basra, and Damascus. It can still be pretty clearly shown in detail that these four codices deviated from one another in points of orthography, in the insertion or omission of a *wa* ("and"), and such-like minutæ; but these variations nowhere affect the sense. All later manuscripts are derived from these four originals.

At the same time, the other forms of the Koran did not at once become extinct. In particular we have some information about the codex of Obay. If the list which gives the order of its sūras is correct, it must have contained substantially the same materials as our text; in that case Obay must have used the original collection of Zaid. The same is true of the codex of Ibn Mas'ūd, of which we have also a catalogue. It appears that the principle of putting the longer sūras before the shorter was more consistently carried out by him than by Zaid. He omits i. and the magical formulæ of cxiii. cxiv. Obay, on the other hand, had embodied two additional short prayers, which we may regard as Mohammed's. One can easily understand that differences of opinion may have existed as to whether and how far formularies of this kind belonged to the Koran. Some of the divergent readings of both these texts have been preserved, as well as a considerable number of other ancient variants. Most of them are decidedly inferior to the received readings, but some are quite as good, and a few deserve preference.

The only man who appears to have seriously opposed the general introduction of 'Othmán's text is Ibn Mas'ūd. He was one of the oldest disciples of the Prophet, and had often rendered him personal service; but he was a man of contracted views, although he is one of the pillars of Moslem theology. His opposition had no effect. Now when we consider that at that time there were many Moslems who had heard the Koran from the mouth of the Prophet, that other measures of the imbecile 'Othmán met with the most vehement resistance on the part of the bigoted champions of the faith, that these were still further incited against him by some of his ambitious old comrades until at last they murdered him, and finally that in the civil wars after his death the several parties were glad of any pretext for branding their opponents as infidels;—when we consider all this, we must regard it as a strong testimony in favour of 'Othmán's Koran that no party, not even that of 'Alī, found fault with his conduct in this matter, or repudiated the text formed by Zaid, who was one of the most devoted adherents of 'Othmán and his family.

But this redaction is not the close of the textual history of the Koran. The ancient Arabic alphabet was very imperfect; it not only wanted marks for the short, and in part even for the long vowels, but it often expressed several consonants by the same sign. Hence there were many words which could be read in very different ways. This variety of possible readings was at first very great, and many readers seem to have actually made it their object to discover pronunciations which were new, provided they were at all appropriate to the ambiguous text. There was also a dialectic license in grammatical forms, which had not as yet been greatly restricted. An effort was made by many to establish a more refined pronunciation for the Koran than was usual in common life or in secular literature. The various schools of "readers" differed very widely from one another; although for the most part there was no important divergence as to the sense of words. A few of them gradu-

ally rose to special authority, and the rest disappeared. Seven readers are generally reckoned chief authorities, but for practical purposes this number was continually reduced in process of time; so that at present only two "reading-styles" are in actual use,—the common style of Hafs, and that of Nâfi, which prevails in Africa to the west of Egypt. There is, however, a very comprehensive massoretic literature in which a number of other styles are indicated. The invention of vowel-signs, of diacritic points to distinguish similarly formed consonants, and of other orthographic signs, soon put a stop to arbitrary conjectures on the part of the readers. Many zealots objected to the introduction of these innovations in the sacred text, but theological consistency had to yield to practical necessity. In accurate codices, indeed, all such additions, as well as the titles of the sûra, etc., are written in coloured ink, while the black characters profess to represent exactly the original of 'Othmân. But there is probably no copy quite faithful in this respect.

In European libraries, besides innumerable modern manuscripts of the Koran, there are also codices, or fragments, of high antiquity, some of them probably dating from the 1st century of the Flight. For the restoration of the text, however, the works of ancient scholars on its readings and modes of writing are more important than the manuscripts; which, however elegantly they may be written and ornamented, proceed from irresponsible copyists. The original, written by 'Othmân himself, has indeed been exhibited in various parts of the Mohammedan world. The library of the India Office contains one such manuscript, bearing the subscription: "Written by 'Othmân the son of 'Affân." These, of course, are barefaced forgeries, although of very ancient date; so are those which profess to be from the hand of 'Ali, one of which is preserved in the same library. In recent times the Koran has been often printed and lithographed, both in the East and the West.

Shortly after Mohammed's death certain individuals applied themselves to the exposition of the Koran. Much of it was obscure from the beginning, other sections were unintelligible apart from a knowledge of the circumstances of their origin. Unfortunately, those who took possession of this field were not very honourable. Ibn 'Abbâs, a cousin of Mohammed's, and the chief source of the traditional exegesis of the Koran, has, on theological and other grounds, given currency to a number of falsehoods; and at least some of his pupils have emulated his example. These earliest expositions dealt more with the sense and connexion of whole verses than with the separate words. Afterwards, as the knowledge of the old language declined, and the study of philology arose, more attention began to be paid to the explanation of vocables. A good many fragments of this older theological and philological exegesis have survived from the first two centuries of the Flight, although we have no complete commentary of this period. Most of the expository material will perhaps be found in the very large commentary of the celebrated Tabarî (A. D. 839-923), of which an almost complete copy is in the Viceregal library at Cairo. Another very famous commentary is that of Zamakhsharî (A. D. 1075-1144), edited by Nassau-Leech, Calcutta, 1859; but this scholar, with his great insight and still greater subtlety, is too

apt to read his own scholastic ideas into the Koran. The favourite commentary of Baidâwî (ob. A. D. 1286), edited by Fleischer, Leipzig, 1846-1848, is little more than an abridgment of Zamakhsharî's. Thousands of commentaries on the Koran, some of them of prodigious size, have been written by Moslems; and even the number of those still extant in manuscript is by no means small. Although these works all contain much that is useless or false, yet they are invaluable aids to our understanding of the sacred book. An unbiassed European can, no doubt, see many things at a glance more clearly than a good Moslem who is under the influence of religious prejudice; but we should still be helpless without the exegetical literature of the Mohammedans. Nevertheless, a great deal remains to be accomplished by European scholarship for the correct interpretation of the Koran. We want, for example, an exhaustive classification and discussion of all the Jewish elements in the Koran; a praiseworthy beginning has already been made in Geiger's youthful essay: *Was hat Mahomet aus dem Judenthume aufgenommen?* (Bonn, 1833). We want especially a thorough commentary, executed with the methods and resources of modern science. No European language, it would seem, can even boast of a translation which completely satisfies modern requirements. The best are in English; where we have the extremely paraphrastic, but for its time admirable translation of Sale (repeatedly printed), that of Rodwell (1861), which seeks to give the pieces in chronological order, and that of Palmer (1880), who wisely follows the traditional arrangements. The introduction which accompanies Palmer's translation is not in all respects abreast of the most recent scholarship. Considerable extracts from the Koran are well translated in E. W. Lane's *Selections from the Kur-ân*.

Besides commentaries on the whole Koran, or on special parts and topics, the Moslems possess a whole literature bearing on their sacred book. There are works on the spelling and right pronunciation of the Koran, works on the beauty of its language, on the number of its verses, words and letters, etc.; nay, there are even works which would nowadays be called "historical and critical introductions." Moreover, the origin of Arabic philology is intimately connected with the recitation and exegesis of the Koran. To exhibit the importance of the sacred book for the whole mental life of the Moslems would be simply to write the history of that life itself; for there is no department in which its all-pervading, but unfortunately not always salutary influence has not been felt.

The unbounded reverence of the Moslems for the Koran reaches Eternity, its climax in the dogma that this book, as the divine word, i. e. of the thought, is immanent in God, and consequently eternal and uncreated. That dogma has been accepted by almost all Mohammedans since the beginning of the 3d century. Some theologians did indeed protest against it with great energy; it was in fact too preposterous to declare that a book composed of unstable words and letters, and full of variants, was absolutely divine. But what were the distinctions and sophisms of the theologians for, if they could not remove such contradictions, and convict their opponents of heresy?

The following works may be specially consulted: Weil, *Einleitung in den Koran*, 2d ed., 1878; Th. Noldeke, *Geschichte des Qorân's* (Göttingen, 1860); and the Lives of Mohammed by Muir and Sprenger. (Th. N.)

Note.—Arabic has only three short vowels, ranging between the short sounds of a and z, e and i, o and u respectively. In the transcription adopted these are given by a or e, i and o respectively. The corresponding long vowels are â, ê, î. The latter two have the sound of English z and ee, and are so written by some English scholars. In the transcription of consonants th is as the ð in ðin, dh the ðh in the; dots are put under hard letters which have no exact English equivalent; kh (often written ch) is nearly the Scottish or German ch; ' is a deep breathing, seldom pronounced by Europeans; gh a guttural something like modern Greek y or the Northumberland burr. In a few names the conventional spelling is used. In proper names b. stands for bin, "son of."

MOHL, JULES (1800-1876), Orientalist, was born at Stuttgart 25th October 1800, and educated for the Lutheran Church at Tübingen; but his inclinations carried him from theology through Hebrew to Oriental studies, and in 1823 he betook himself to Paris, at that time under De Sacy the great European school of Eastern letters. He soon acquired reputation, and from 1826 to 1833 was nominally professor at Tübingen, with permission to continue his studies in France, but he never entered on the duties of this office, Paris having become his second home. In 1826 he was charged by the French Government with the preparation of an edition of the *Sháh Námeb*, the first volume of which appeared in 1838, while the seventh and last was left unfinished at his death; in 1844 he was nominated to the Institut, and in 1847 he became professor of Persian at the Collège de France. But his knowledge and interest extended to all departments of Oriental learning, and this catholicity of taste, united to a singular impartiality of judgment and breadth of view, gave him a quite remarkable personal influence on the course of Eastern learning in France. The chief sphere of this influence was the Société Asiatique, which he served for many years as secretary-adjunct, as secretary, and finally as president. His annual reports on Oriental science, presented to the society from 1840 to 1867, and collected after his death (4th January 1876, at Paris) under the title *Vingt-sept Ans des Etudes Orientales* (Paris, 1879), are an admirable history of the progress of Eastern learning during these years, and justify the high esteem in which he was held by scholars.

MÖHLER, JOHANN ADAM (1796-1838), Roman Catholic theologian, was born at the village of Igersheim in Württemberg on 6th May 1796, and, after studying philosophy and theology in the Lyceum at Ellwangen, entered the Wilhelmstift in the university of Tübingen in 1817. Ordained to the priesthood in 1819, he was appointed to a curacy at Riedlingen, but speedily returned as "repent" to Tübingen, where he became privat-docent in 1822, extraordinary professor of theology in 1826, and ordinary in 1828. The controversies excited by his *Symbolik* (1832) proved so unpleasant that in 1835 he accepted a call to the university of Munich. In 1838 he was appointed to the deanery of Würzburg, but died shortly afterwards (12th April 1838).

Mohler wrote *Die Einheit in der Kirche* (Tübingen, 1825); *Athanasius der Grosse u. d. Kirche seiner Zeit im Kampfe m. d. Arianismus* (2 vols., Mainz, 1827); *Symbolik, oder Darstellung der dogmatischen Gegensätze der Katholiken u. Protestanten nach ihren öffentlichen Bekenntnisschriften* (Mainz, 1832; 8th ed., 1871-72; Eng. transl. by J. B. Robertson, 1843); and *Neue Untersuchungen der Lehrgegensätze zwischen den Katholiken u. Protestanten* (1834). His *Gesammelte Schriften u. Aufsätze* were edited by Dollinger in 1839; his *Patrologie* by Reithmayr, also in 1839; and a *Biographie* by Wörner was published at Ratisbon in 1866. It is with the *Symbolik* that his name is chiefly associated; the interest excited by it in Protestant circles is shown by the fact that within two years of its appearance it had elicited three replies of considerable importance, those namely of Baur, Marheineke, and Nitzsch. But, although characterized by abundant learning and acuteness, as well as by considerable breadth of spiritual sympathy, and thus a stimulative and suggestive work, it cannot be said to have been accepted by Catholics themselves as embodying an accurate objective view of the actual doctrine of their church. The liberal school of thought of which Mohler was a prominent exponent was discouraged in official circles, while Protestants, on the other hand, complain that the author has failed to grasp the vast significance of the Reformation as a great movement in the spiritual history of mankind, while expending needless pains on an exposition of the doctrinal shortcomings, inconsistencies, and contradictions of the individuals who were its leaders.

MOHR, KARL FRIEDRICH (1806-1879), a philosopher whose greatest claims to scientific distinction are as yet, though indubitable, only partially admitted, was the son of a well-to-do druggist in Coblenz, and was born 4th November 1806. Being a delicate child, he received much of his early education at home, in great part in his father's

laboratory. To this may be traced much of the skill he showed in devising instruments and methods of analysis which are still in common use in chemical and pharmaceutical laboratories. At the age of 21 he studied chemistry under Gmelin, and, after five years spent in Heidelberg, Berlin, and Bonn, returned with the degree of Ph.D. to join his father's establishment. On the death of his father in 1840 he succeeded to the business, retiring from it for scientific leisure in 1857. Serious pecuniary losses led him at the age of 57 to become a privat-docent in Bonn, where he was soon after appointed, by the direct influence of the emperor, extraordinary professor of pharmacy. In private and domestic life he was a man of singularly winning manners, intensely fond of music and poetry, for the latter of which he showed wonderful memory. But his uncompromising spirit—perhaps we might even in some cases say his wrongheadedness—in matters of scientific and theological authority had raised such a host of enemies that even royal influence could not secure his further advancement. Although he stood at the very head of the scientific pharmacists of Germany, his name was deliberately omitted from the list of the commission entrusted with the preparation of the *Pharmacopœia Germanica*. Yet in that work many of his ideas and processes were incorporated by the very men who had previously denounced them. He died in October 1879.

Mohr's best-known work is his *Lehrbuch der chemisch-analytischen Titrimethode* (1855), which has already run through many editions, and which was specially commended by Liebig. His improvements in methods of chemical analysis occupy a long series of papers extending over some fifty years. He also published a number of physical papers on subjects such as Hail, St. Elmo's Fire, Ground-ice, &c., and a curious notice of the earliest mention of Ozone. He shows that Homer, on four different occasions, mentions the sulphurous smell produced by lightning, and employs the very word from which the name of Ozone was long afterwards coined. In 1866 appeared his *Geschichte der Erde, eine Geologie auf neuer Grundlage*, which has obtained a wide circulation.

But he will be remembered in future times mainly on account of a paper, *Ueber die Natur der Wärme*, published in 1837, which unfortunately has not yet appeared in full in an English translation. The history of this paper is remarkable. It was refused admission into *Poggendorff's Annalen*, and was then sent to Baumgartner of Vienna, in whose *Zeitschrift für Physik, &c.*, it was at once published. As no proof-sheets reached Mohr, he concluded that his paper had been lost or rejected, and contented himself with publishing a short analysis in the *Annalen der Pharmacie*, of which he was an editor. This analysis, it is only fair to say, though probably prepared by the author himself, gives a very inadequate idea of the scope and merit of the paper. In 1864 Dr. Akin unearthed the paper from the forgotten pages of the *Zeitschrift*, and the author was enabled to reprint it, with notes, while the recent discussions as to the history of Conservation of Energy were still being carried on. Along with it he issued a number of other papers of greatly inferior merit.

Unless some still earlier author should be discovered, there can be no doubt that Mohr is to be recognized as the first to enunciate, in its generality what we now call "conservation of energy." The thesis of his paper must be stated in his own words,—“Besides the 54 known chemical elements, there is in the physical world one agent only, and this is called Kraft (energy).”¹ It may appear, according to circumstances, as motion, chemical affinity, cohesion, electricity, light, and magnetism; and from any one of these forms it can be transformed into any of the others.” Even now, after nearly half a century of rapid advance in science, it would be difficult to improve this statement except by inserting, as regards transformation of energy, some such guarding expression as “in whole or in part.” But if Mohr had inserted this, he might have had claims to the “dissipation of energy” also. Mohr's starting-point appears to have been the discovery (by Forbes) of the polarization of radiant heat. He goes through the whole of the then range of physics, pointing out the explanation of each experimental result as a transformation of energy, mentioning even the electric currents produced by electro-magnetic induction as a transformation of the energy required to draw the coil from the magnet—one of the earlier methods used by Joule for quantitative determinations. His numerical results, based on data quoted from various books, are, it is

¹ It is to be remembered that even the most accurate authorities in Germany—as, for instance, Von Helmholtz in his *Essay of 1847*—used till quite recently the word Kraft in the sense of Energy.

true; very inaccurate; the correct experimental determinations we owe to Joule. But it must be remembered that these speculations, daring as they were and accurate (on the whole) as they have been found to be, required the confirmation which they received from the experimental work of Colding and Joule, or from the *Essay* of von Helmholtz, whose basis also is wholly experimental, being the fact that "perpetual motion" is recognized as unattainable.

MOIR, DAVID MACBETH (1798-1851), the "Delta" of *Blackwood's Magazine*, one of its most popular contributors in its early days, was born at Musselburgh 5th January 1798, and was a physician in active practice there from his manhood to his death (6th July 1851). He seems to have been a man of winning manners and noble integrity of character, and the intrinsic value of his poetry has been in consequence somewhat over-estimated by critics of repute who enjoyed his personal acquaintance. He had no independent vein as a writer of serious verse, and his technical qualities as a poet do not bear examination. But his verses were undoubtedly popular with the readers of the magazine at the time. A collection of them was edited by Thomas Aird in 1852. As a kindly humourist "Delta" had a more original turn. His *Autobiography of Mansie Wauch*, published separately in 1828, is a Scotch classic. And some of his satirical squibs on passing events were written with great freshness and spirit. His *Outlines of the Ancient History of Medicine* (1831) evidence his industry and versatility of talent. His *Sketch of the poetical literature of the past Half Century* (1851) is more remarkable for the grace of its rhetorical ornaments than for depth or freshness of insight.

MOIR, GEORGE (1800-1870), author of the tréatíses on "Poetry" and "Romance" in the seventh edition of the *Encyclopædia Britannica*, and born at Aberdeen in 1800, was an Edinburgh lawyer of very varied accomplishments. He was appointed professor of rhetoric in 1835, professor of Scots law in 1864; he had a considerable success at the Scottish Bar, was successively sheriff of Ross and sheriff of Stirling, and was a frequent contributor to *Blackwood's Magazine*. Moir honourably maintained the literary traditions of Edinburgh law. He was a man of very wide reading, catholic sympathy, and fastidious taste, alive to very various degrees and kinds of excellence in literature, but too critical and hard to please to do justice to his own wealth of ideas. He died in 1870.

MOISSAC, chief town of an arrondissement in the department of Tarn-et-Garonne, France, is situated on the right bank of the Tarn, and on the railway line from Bordeaux to Cette, 17 miles west-north-west of Montauban. The church of St Peter, belonging to the 15th century, has a doorway of the 12th century, remarkable for its elaborate and beautiful sculpture, representing Scriptural scenes. Connected with the choir of the church is a cloister dating from the beginning of the 12th century, and one of the finest specimens of this kind of building in France; the pointed arches are supported by small columns with sculptured capitals. The town has a large trade in corn and flour, and the mills afford employment to a considerable number of persons. The population in 1881 was 9202.

The town owes its origin to an abbey founded between 630 and 640 by St Amand, the friend of Dagobert. After being devastated by the Saracens, the abbey was restored by Louis of Aquitaine, son of Charlemagne. Subsequently it was made dependent on Cluny, but in 1618 it was secularized by Pope Paul V., and replaced by a house of Augustinian monks, which was suppressed at the Revolution. The town, which was erected into a commune in the 15th century, was taken by Richard Cœur de Lion, and by Simon de Montfort.

MOKADDASI. Shams al-Dīn Abū Abdallāh Mohammed ibn Ahmad al-Mokaddasi, i.e., of Jerusalem, also called al-Bashsharī, was the author of a famous description of the lands of Islam, which much surpasses the earlier works of the same kind. His paternal grandfather was an architect of eminence, who constructed many public works in Pales-

tine, and his mother's family was opulent. He was himself a well-educated and talented man, with an exorbitant idea of his own qualities, and some curious affectations, such as that of imitating for each region the dialect of its inhabitants. His descriptions rest on very extensive travels continued through a long series of years. His first pilgrimage was made at the age of twenty, but his book was not published till A.H. 375 (985-6 A.D.), when he was forty years old. The two MSS. (at Berlin and Constantinople) represent a later recension (A.H. 378). The book became known in Europe through the copy brought from India by Sprenger, and was edited by De Goeje in 1877 as the third part of his *Biblioth. Geographorum Arabicorum*.

MOKANNA (*Al-Mokanna*, "the veiled") was, as explained above, p. 580, the surname given to Hakim, or 'Ata, a man of unknown parentage, originally a fuller in Merv, who posed as an incarnation of Deity, and headed a revolt in Khorasan against the caliph Mahdi. Much is related of his magical arts, especially of a moonlike light visible for an enormous distance which he made to rise from a pit near Nakhshab. He died by poison in A.H. 163 (779-80 A.D.).

MOKSHAN, a town of Russia, situated in the government of Penza, 27 miles to the north-west of the capital of the province, and 18 miles from the Ranzay railway station. It has 14,500 inhabitants, who are engaged in agriculture, or work in flour-mills, oil-works, tanneries, and potash-works. A few merchants export corn and flour. Mokshan, which was built in 1535 as a fort to protect the country from the raids of the Tatars and Kalmuks, is supposed to occupy the site of the town of Mescheryaks, Murundza, mentioned as early as the 9th century. It has begun rapidly to increase since the railway between Moscow and Penza was made.

MOLA, or MOLA DI BARI, a seaport town of Italy, in the province of Bari, 13 miles from Bari on the railway to Brindisi. It is an old-fashioned place with irregular streets, but outside of the walls several new districts have grown up. The foreign, and to some extent also the coasting, trade has considerably declined since 1863, and the communal population has decreased from 12,574 in 1861 to 12,435 in 1881. Little is known about the early history of Mola; it was sold by Alphonso I. to Landolfo Maramoldo in 1436, and ten years afterwards to Niccolo Tovaldo.

MOLASSES. See SUGAR.

MOLAY, JACQUES DE, a native of Burgundy, became grand-master of the order of the Temple in 1298, and was the last who held that dignity. He was burned at the stake in 1314. See TEMPLARS.

MOLDAVIA. See ROUMANIA.

MOLE. (contracted form of mould-warp, i.e., mould-caster), a term restricted in England to the common mole (*Talpa europæa*), a small, soft-furred, burrowing mammal, with minute eyes, and broad fossorial fore feet, belonging to the order *Insectivora* and family *Talpidae*, but generally applied elsewhere to any underground burrowing animal of the class Mammalia. Thus, in North America we find, representing the same family, the star-nosed moles (*Condylura*), and the shrew moles (*Scalops* and *Scapanus*); in South Africa, the golden moles of the far-removed family *Chrysochloridae*; and in South-East Europe, Asia, and South Africa, the rhizophagous rodent moles of the order *Rodentia* and families *Spalacidae* and *Muridae* (see MAMMALIA, vol. xv. pp. 405, 419, figs. 64 and 96).

Talpa europæa, the Common Mole, type of the genus *Talpa*,¹ is about six inches in length, of which the tail measures somewhat more than an inch; the body is long

¹ Eight species may be recognized, and arranged, according to their dentition, as follows:—

and cylindrical, and, owing to the very anterior position of the forelimbs, the head appears to rest between the shoulders; the muzzle is long and obtusely pointed, terminated by the nostrils, which are close together in front; the minute eye is almost hidden by the fur; the ear is without a conch, opening on a level with the surrounding integument; the forelimbs are rather short and very muscular, terminating in broad, naked, shovel-shaped feet, the palms normally directed outwards, each with five subequal digits armed with strong flattened claws; the hind-feet, on the contrary, are long and narrow, and the toes are provided with slender claws. The body is densely covered with soft, erect, velvety fur,—the hairs uniform in length and thickness, except on the muzzle and short tail, the former having some straight vibrissæ on its sides, whilst the latter is clothed with longer and coarser hairs. The fur is generally black, with a more or less greyish tinge, or brownish-black, but various paler shades up to pure white have been observed.

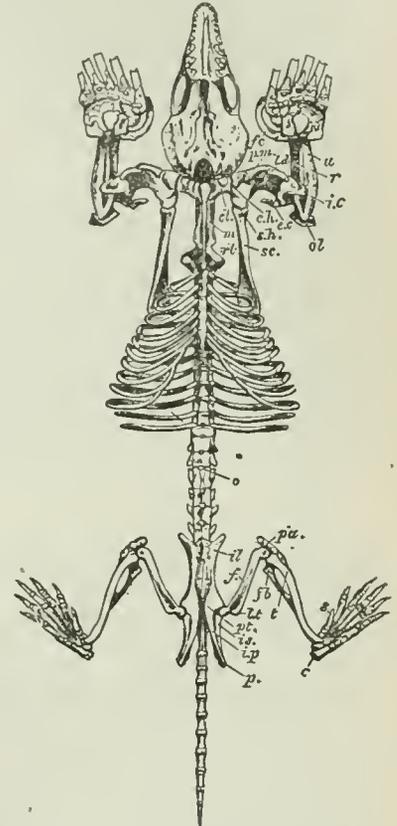

The food of the mole consists chiefly of the common earth-worm, in pursuit of which it forms its well-known underground excavations. Its habits, so difficult to observe, were many years ago most patiently studied and described by M. Henri le Court. Like many other mammals the mole has a lair or fortress to which it may retire for security. This is constructed with much ingenuity. It consists of a central nest formed under a hillock which is placed in some protected situation, as under a bank, or between the roots of trees. The nest, which is lined with dried grass or leaves, communicates with the main-run by four passages, one of which only joins it directly, leading downwards for a short distance and then ascending again; the other three are directed upwards and communicate at regular intervals with a circular gallery constructed in the upper part of the hillock, which in turn communicates by five passages leading downwards and outwards with another much larger gallery placed lower down on a level with the central nest, from which passages proceed outwards in different directions, one only communicating directly with the main-run, while the others, curving round, soon join, or end in culs-de-sac. The main-run is somewhat wider than the animal's body, its walls are smooth, and formed of closely compressed earth, its depth varying according to the nature of the soil, but ordinarily from four- to six inches. Along this tunnel the animal passes backwards and forwards several times daily, and here traps are laid by mole-catchers for its capture. From the main-run numerous passages are formed on each side, along which the animal hunts its prey, throwing out the soil in the form of mole-hills. The mole is the most voracious of mammals, and, if deprived of food, is said to succumb in from ten to twelve hours. Almost any kind of flesh is eagerly devoured by captive moles, which have been seen by various observers, as if maddened by hunger, to attack animals nearly as large as themselves, such as birds, lizards, frogs, and even snakes; toads, however, they will not touch, and no form of vegetable food attracts their notice. If two moles be confined together without food, the weaker is invariably devoured by the stronger. They take readily to the water—in this respect, as well as in external form, resembling their

representatives on the North American continent. Bruce, writing in 1793, remarks that he saw a mole paddling towards a small island in the Loch of Clunie, 180 yards from land, on which he noticed molehills.

The sexes come together about the second week in March, and the young—generally from four to six in number—which are brought forth in about six weeks, quickly attain their full size.

The mole exhibits in its whole organization the most perfect adaptation to its peculiar mode of life. In the structure of the

skeleton very striking departures from the typical mammalian forms are noticeable. The first sternal bone is so much produced anteriorly as to extend forward as far as a vertical line let down from the second cervical vertebra, carrying with it the very short almost quadrate clavicles, which are articulated with its anterior extremity and distally with the humeri, being also connected ligamentously with the scapulae. The forelimbs are thus brought opposite the sides of the neck, and from this position a threefold advantage is derived:—in the first place, as this is the narrowest part of the body, they add but little to the general width, which, if increased, would lessen the power of movement in a confined space; secondly, this position allows of a longer forelimb than would otherwise be possible, and so increases its lever power; and, thirdly, although the entire limb is relatively very short, its anterior position enables the animal, when burrowing, to thrust the claws so far forward as to be in a line with the end of the muzzle, the importance of which is evident.¹ Posteriorly, we find the hind limbs similarly removed out of the way by approximation of the hip-joints to the centre line of the body. This is effected by inward curvature of the innominate bones at the acetabula to such an extent that they almost meet in the centre, while the pubic bones are widely separated behind.² The shortness of the

Skeleton of Mole $\times \frac{3}{4}$ (lower jaw removed to show base of skull).

c, calcaneum; c.h., clavicular articulation of the humerus; cl., clavicle; c.c., external condyle of humerus; f., femur; fb., fibula; fc., falciform bone (radial sesamoid); h., humerus; i.c., internal condyle of humerus; il., left iliac bone; i.p., ramus of the ilium and pubis; is., ischium; l.d., ridge of insertion of latissimus dorsi muscle; l.t., lesser trochanter; n., manubrium sterni; o., fourth hypapophysial sesamoid ossicle; ol., olecranon; p., pubic bone widely separated from that of the opposite side; pa., patella; p.m., ridge for insertion of pectoralis major muscle; pt., pectineal eminence; r., radius; rb., first rib; s., plantar sesamoid ossicle corresponding to the radial sesamoid (os falciform) in the manus; sc., scapula; s.h., scapular articulation of the humerus; t., tibia; u., ulna.

of the body and limbs fitting them for fossorial action and underground progression have been brought about in a totally different manner. In them the manubrium sterni is not anteriorly elongated, neither are the clavicles shortened; but this is made up for by a deep hollowing out of the antero-lateral walls of the thorax, the ribs in these parts and the sternum being convex inwards, the long clavicles have their distal extremities pushed forward, and the concavities on the sides and inferior surface of the thorax lodge the thick muscular arms.

¹ It is most interesting to observe how, in the golden moles (*Chrysochloridæ*) of South Africa, the necessary modifications of the corresponding parts of the body and limbs fitting them for fossorial action and underground progression have been brought about in a totally different manner. In them the manubrium sterni is not anteriorly elongated, neither are the clavicles shortened; but this is made up for by a deep hollowing out of the antero-lateral walls of the thorax, the ribs in these parts and the sternum being convex inwards, the long clavicles have their distal extremities pushed forward, and the concavities on the sides and inferior surface of the thorax lodge the thick muscular arms.

² In Jacobs's *Tafel Europæ Anatomie* (Jena, 1816) this part of the pelvic wall (marked *pt* in the fig.) was identified with the symphysis

(A.) i. $\frac{3}{8}$, c. $\frac{1}{4}$, prm. $\frac{3}{8}$, m. $\frac{3}{8} \times 2$ (*T. wogura*).

(B.) i. $\frac{3}{8}$, c. $\frac{1}{4}$, prm. $\frac{3}{8}$, m. $\frac{3}{8} \times 2$ (*T. europæa, cæca, longirostris, micrura*).

(C.) i. $\frac{3}{8}$, c. $\frac{1}{4}$, prm. $\frac{3}{8}$, m. $\frac{3}{8} \times 2$ (*T. leucurura, leptura*).

(D.) i. $\frac{3}{8}$, c. $\frac{1}{4}$, prm. $\frac{3}{8}$, m. $\frac{3}{8} \times 2$ (*T. moschata*).

Except in *T. europæa*, the eyes are covered by a membrane. In *T. micrura* the short tail is concealed by the fur. *T. europæa* extends from England to Japan. *T. cæca* is found south of the Alps, the remaining species are all Asiatic, and of them two only—*T. micrura* and *T. leucurura*—occur south of the Himalayas. (See Dobson, *Monograph of the Insectivora*, Part ii., 1833.)

forelimb is due to the humerus, which, like the clavicle, is so much reduced in length as to present the appearance of a flattened X-shaped bone, with prominent ridges and deep depressions for the attachments and origins of the powerful muscles connected with it. Its proximal extremity presents two rounded prominences: the smaller, the true head of the bone, articulates as usual with the scapula; the larger, which is really the external tuberosity rounded off, forms a separate synovial joint with the end of the clavicle. This double articulation gives to a naturally loose joint the rigidity necessary to support the great lateral pressure sustained by the forelimb in excavating. The forearm bones are normal, but those of the forefeet are much flattened and laterally expanded. The great width of the forefoot is also partly due to the presence of a peculiar falciform bone, lying on the inner side of the palm and articulating by its proximal extremity with the wrist. Into the radial side and under surface of this bone is inserted a tendon derived from that of the palmaris longus muscle, which, acting upon it as an abductor, separates it from the side of the palm, and so increases the width of the latter, at the same time rendering the palmar integument tense.

The muscles acting on these remarkably modified limbs are all homologous with those of the cursorial insectivora, differing only in their relative development. The tendon of the biceps traverses a long osseous tunnel, formed by the great expansion of the margin of the bicipital groove for the insertion of the large pectoralis major muscle; the anterior division of the latter muscle is unconnected with the sternum, extending across as a muscular band between the humeri, and co-ordinating the motions of the forelimbs. The teres major and latissimus dorsi muscles are of immense size, probably relatively larger than in any other mammal, and are inserted together into the prominent ridge below the pectoral attachment; they are the principal agents in the excavating action of the limb. The cervical muscles connecting the slender scapulae, and through them the forelimbs, with the centre line of the neck and with the occiput are large, and the ligamentum nuchæ between them is ossified (as in all true moles); the latter condition appears to be

due to the prolongation forwards of the sternum (described above), preventing all flexion of the head downwards; and, accordingly, the normal office of the ligament being lost, it ossifies, and so affords a more fixed point for the origines of the superficial cervical muscles. †

The skull is long, with slender zygomatic arches; the nasal bones are strong and early become united, and in front of them the nostrils are continued forwards in tubes formed of thick cartilage, the septum between which becomes partially or wholly ossified beneath. There are 7 cervical, 13 dorsal, 6 lumbar, 6 sacral, and 10-12 caudal vertebrae; of the dorsal and lumbar there may be one vertebra more or less. The sacral vertebrae are united by their greatly expanded and laterally compressed spinous processes, and all the others, with the exception of the cervical, are very closely and solidly articulated together, so as to support the powerful propulsive and fossorial actions of the limbs. Dentition: i. $\frac{3}{3}$, c. $\frac{1}{1}$, pm. $\frac{4}{4}$, m. $\frac{3}{3}$, $\times 2 = 44$ teeth. The upper incisors are simple chisel-edged teeth; the canine is long and two-rooted; then follow three subequal conical premolars, and a fourth, much larger, and like a canine; these are succeeded by three molars with W-shaped cusps. In the lower jaw the three incisors on each side are slightly smaller, and slant more forwards; close behind them is a tooth which, though quite like them, must, from its position in front of the upper canines when the jaws are closed, be considered as the canine; behind it, but separated by an interval, is a large double-rooted conical tooth, the first premolar; the three following premolars are like the corresponding teeth above, but smaller, and are succeeded, as above, by three molars.

The geographical distribution of the common mole may be said to exceed that of all the other known species of the genus to which it belongs taken together. It extends from England to Japan, and from the Dovre-Fjeld Mountains in Scandinavia and the Middle Dwina region in Russia to southern Europe and the southern slopes of the Himalayas, where it occurs at an elevation of 10,000 feet. In Great Britain it is found as far north as Caithness, but in Ireland and in the Western Isles of Scotland (except Mull) it is altogether unknown. (G. E. D.)

M O L E C U L E

IN the conception of the atomic as opposed to the continuous and infinitely divisible constitution of matter, it is supposed that portions of matter called *atoms* exist, which are separated, or are capable of being separated, from each other by empty space. (See *ATOM*). It may be the case that each atom has unchangeable shape and volume as well as unchangeable mass, but such a conception of an atom is not essential to the hypothesis. It is not even necessary, as explained in the article *ATOM* (vol. iii., pp. 37, 38), to maintain that no part of space can be in two atoms at the same time. But one attribute of the atom upon which its permanence, or, so to speak, its personal identity, depends, is its constituent mass, and this remains the same, unchanged and unchangeable, through all time.

Boscovich, indeed, goes so far as to regard the atom as a mere centre of force, the result of whose existence is that no two atoms or centres can approach each other within a certain distance, while other physicists regard the atomic volume as a distinct portion of space occupied by that atom to the exclusion of every other, and comprising within it matter ideally infinitely divisible, but the parts of which in fact never have been, and never can be, separated from each other. In this latter mode of viewing the subject, all the conclusions of mechanics which are based on the conception of the continuity and infinite divisibility of matter may be applied to the equilibrium or motion of each individual atom, the atomic theory merely introducing the additional hypothesis that, in fact, these persistent entities called atoms do exist, and that out of them all substances which affect our senses are constructed. The theory of universal gravitation requires us to believe in the existence of forces or actions between every portion

of matter and every other portion, determinate in magnitude and direction, and such that, when on the infinitely divisible hypothesis the volumes of these portions are indefinitely diminished, these mutual forces are inversely proportional to the square of the distance between the portions (the distance between any two points, one in the volume of each portion, being in this case taken as the distance between the portions), and directly proportional to the products of the masses, or quantities of the two portions of matter,—such forces being regarded provisionally as ultimate facts, while inviting further analysis and explanation. Chemical and chemico-physical investigations indicate the existence of other actions between portions of matter, following other and for the most part unknown laws, and rapidly becoming inappreciable as the distance between the reacting portions is increased. All these hypotheses are to be retained on the hypothesis of discrete atoms as above enunciated, the mutual actions between atoms being the resultant of the actions between the various portions of their constituent matter. The volumes of the atoms are so small that, for any sensible distances apart, the line of the resultant mutual action between them may be taken as coincident with the line joining any point in the volume of one to any point in the volume of the other, but, for distances or parts comparable with the linear dimensions of the atoms, the size and shape of their bounding surfaces must be taken into consideration, and perhaps also the law of distribution of their constituent matter within that surface. In all respects, unless we accept the Boscovichian hypothesis, we simply regard the atom as made up, so to speak, of infinitely divisible matter, while substances, as we know them, are built up of indestructible and unchangeable atoms.

With this conception of an atom, as thus explained, we might be content to rest, confessing our total ignorance of the mode in which such atoms are built up into actual substances, being satisfied to regard such substances as

pubis, whereas the true pubic bones are widely separated (as shown at p). In this mistake he has been followed by most comparative anatomists; and hence the mole is generally believed to present the unique peculiarity that the outlets of the urinary, generative, and digestive organs do not pass through the arch of the pelvis.

composed of these distinct portions of matter separated, or capable of being separated, by empty space from other portions. But the *molecular hypothesis* of the constitution of different kinds of substances aims at analysing this process by which such substances are built up out of their constituent atoms. The *molecule* of any substance is, by some chemists, defined as being the smallest portion of that substance to which can be attributed all the chemical properties of the substance; by others, as the smallest portion which, so long as the substance is chemically unchanged, keeps together without complete separation of its parts. In the language of Clausius's theorem, if the parts of the molecule have internal motion, the kinetic energy of such internal motion is equal to the virial of the mutual attractive forces of the parts. Thus the formation of the molecule of each particular substance is viewed as an essential step in the process of building up that substance out of its constituent atoms. The molecule is first built up out of atoms arranged in its formation according to a definite type, and then the substance itself is constituted of these molecules. Of course molecules may be, and in fact in many particular substances are, supposed to be monatomic; that is to say, the intermediate step of building up the molecule out of the atoms has, in these particular substances, been omitted, the atoms and molecules becoming then identical. The particular arrangement of the formed molecules in the building up of the substance determines the physical state of that substance,—that is, its fluid, solid, gaseous, crystalline, or amorphous state; but the chemical properties of the substance depend upon the constitution of the molecule. As the investigations and theories of chemistry appear to indicate irresistibly the existence of permanent atoms, so do they also lead almost as necessarily to the conception of the molecule as an entity which bears the same relation to special substances that the atoms bear to matter generally. So long as the molecule endures, the substance of which it is the molecule retains its chemical properties; with the dissolution of the molecule, the substance, as that special substance, perishes; the atoms alone continue, and are free to enter into other combinations. The permanence of the molecule is relative, that of the atom absolute. This conception of the molecular constitution of substances suggests physical questions of great interest, such as the shape, volume, and mass of the constituent molecules, and the relative motions of which their parts are susceptible; and the answers to these questions cannot fail to be of great value in chemical and chemico-physical investigations, as well as in the theories of light and electricity.

Now, whatever differences may exist between the properties of different substances in the solid and liquid states, there are certain properties which, in the gaseous state, manifest themselves with no variation whatever in all substances alike. Hence the explanation of these common properties—or gaseous laws, as they are called—has long possessed a peculiar fascination for physicists. The tendency to expand or fill all accessible space, manifested by all gases, proves that on the molecular hypothesis their compound atoms or molecules must be continually tending to fly apart. We must conceive gases as constituted of molecules, not only separable but actually separated by space void of the matter of which these gases consist; and it may be most reasonably expected, therefore, that any general laws to which substances in this state conform may afford us a valuable insight into the constitution of these separate molecules.

Now the general laws to which all gases conform are: (1) *Boyle's law*—that, in a given mass of any gas kept at constant temperature, the pressure per unit of area upon the containing surface increases in the same proportion as

the volume occupied by the gas is diminished, or at least with very slight deviation from exact proportionality; (2) *Charles's law*—that, if the temperature be varied while the pressure upon the gas remains the same, the gas increases by $\frac{1}{273}$ of its volume at zero centigrade for every degree of centigrade added to the temperature, or, which in combination with Boyle's law is the same thing, that if the density be constant, the pressure is directly proportional to the temperature measured from the point -273° centigrade, this point being called the zero of absolute temperature; (3) *Avogadro's law*—which asserts that all gases at the same temperature and pressure contain the same number of molecules in the same volume; and (4) *Dalton's law*—that in a mixture of different gases, when there is equilibrium, each gas behaves as a vacuum to all the rest.

It was at one time considered that these phenomena might be explained on the hypothesis of mutual repulsive forces between the parts of which the gas is composed, whether they were regarded as constituted of molecules or of infinitely divisible continuous matter,¹ but it has been shown in the article ATOM (vol. iii. p. 39 sq.) that there are at least two absolutely conclusive reasons why this explanation cannot be accepted. These objections, together with the experimental fact proved by Joule that gases, or at any rate atmospheric air, expand into vacuum with scarcely any appreciable change of temperature, must be considered fatal to any mutual-force theory of gaseous action, and, accordingly, physicists have been driven to seek for other methods of explaining these laws. The explanation which has been more developed than any other is that known as the kinetic theory of gases, which regards the intrinsic energy of a gaseous mass as residing, not in the potential energy of intermolecular forces, but mainly in the kinetic energy of the molecules themselves, which are assumed to be in a state of continual relative velocity, admitting at the same time a possible small intermolecular potential energy, and it may be also an interatomic energy, between the atoms of the individual molecules. That some such persistent relative motion does exist in every gaseous mass is evident from the rapidity with which odours penetrate the stillest air where no breath of wind—that is, of absolute motion of translation of the mass as a whole or any portion of finite size—is perceptible. It becomes an interesting question whether the laws of mechanics admit of a mass thus constituted ever arriving at a state of permanence; that is to say, whether, consistently with the hypothesis of infinite irregularities in the directions and magnitudes of velocities of individual molecules, there may be found any properties of the mass in the aggregate which remain

¹ An argument in favour of the molecular constitution of gases, to which attention was first called by Professor Osborne Reynolds (Memoir "On some Dimensional Properties of Matter in the Gaseous State," *Phil. Trans.*, 1879), is derived from certain phenomena observed in highly-rarefied gases, and in the transpiration of gases through porous plates. If, according to this argument, we had in a gas to do with a continuous plenum, such that every portion must possess the same properties, then these properties must exist independently of the amount of gas contained in any space, although their sensible effects might be increased or diminished by a variation in that amount. If, then, we can find properties of a gas depending on the size of the space in which it is enclosed, and on the quantity of gas enclosed in this space, we have proof that gas is not continuous—in other words, possesses dimensional structure. Such properties we do find in highly-rarefied gases, as, for instance, in the phenomena of Crooke's radiometer. The motion of the vanes when one side is heated by incident rays appears to depend on the distance between the vane and the containing walls of the vessel bearing some not very high ratio to the distance between the particles or molecules of the gas. At least no satisfactory explanation of the phenomena consistent with the gas being continuous has yet been suggested.

Again, Professor O. Reynolds, from his experiments on the transpiration of gases through a porous plate, finds a relation between the gas and the coarseness or fineness of the plate, which would not exist were the gas continuous.

constant, and in agreement with the accepted laws common to all gases. Now the physical theory of heat compels us to regard the intrinsic energy of any gaseous mass as dependent entirely or almost entirely upon the temperature. If, therefore, this intrinsic energy is to be sought for in the kinetic energy of the moving molecules, it follows that the average value of the kinetic energy of the molecules taken throughout the mass must be also a function of the temperature.

We will proceed to investigate the condition of permanence of a number of molecules moving about irregularly in any bounded space; and, for simplicity's sake, we shall first of all restrict ourselves to the case of monatomic molecules.

We know nothing of the size or shape of these atoms, except that the volume of each one must be incomparably smaller than that of the containing region. In shape we shall, as the simplest hypothesis, regard them as spherical. We shall suppose that there are no intermolecular forces between any two such atoms, except of such a nature as to be practically insensible when the atoms are not geometrically in contact, and similarly as regards the forces between the atoms and the material bounding surface, such forces being of the nature called "conservative." So that in point of fact we are investigating the mechanical properties of an infinitely large number of infinitely small and perfectly elastic spheres moving about in a given region and subject to frequent collisions.

PROBLEM.—*A very large number of smooth elastic spheres, equal in every respect, are in motion within a region of space of given volume, and therefore occasionally impinge upon each other with various degrees of relative velocity and in various relative directions; required to find the law of distribution of velocities in order that such distribution may be permanent.*

Let N be the total number of spheres, and let

$$\chi(u, v, w) du dv dw$$

be the number of spheres whose component velocities, parallel to the axes, are intermediate between u and $u + du$, v and $v + dv$, w and $w + dw$ respectively.

If c be the resultant velocity of any of these last-mentioned spheres, and if θ be the inclination of c to the axis of z , and ϕ that of the plane cx to the plane xy , the last-mentioned expression will become, by changes of the independent variables from x, y, z to θ, ϕ, c ,

$$\chi(u, v, w) c^2 \sin \theta d\theta d\phi dc.$$

Let a spherical surface of radius unity be described about any origin as centre, and let $d\sigma$ be written for the element $\sin \theta d\theta d\phi$ on this surface, then the last-written expression becomes

$$\chi(u, v, w) c^2 dc d\sigma.$$

Since for the same magnitude of the resultant velocities all directions of motion must be equally probable, it follows that the coefficient of $dc d\sigma$ in the last-written expression must be a function of c only, and therefore the number of spheres having component velocities between u and $u + du$, v and $v + dv$, w and $w + dw$, must be

$$\psi(c) du dv dw.$$

It is required to find the form of ψ in order that the value of this expression may be unaffected by collisions. The solution is, that the number of spheres with component velocities between the limits u and $u + du$, v and $v + dv$, w and $w + dw$ must be

$$Ae^{-hc^2} du dv dw;$$

or

$$Ae^{-hc^2} c^2 dc d\sigma,$$

employing the notation already used.

Integrating with respect to $d\sigma$ from 0 to 4π , we find for the number of spheres with velocities between c and $c + dc$ the expression

$$4\pi Ae^{-hc^2} dc.$$

Again, since the number with component velocities between u and $u + du$, v and $v + dv$, w and $w + dw$ is

$$A_1 e^{-h(u^2 + v^2 + w^2)} du dv dw,$$

or $(\sqrt[3]{A_1 e^{-hu^2}} du) (\sqrt[3]{A_1 e^{-hv^2}} dv) (\sqrt[3]{A_1 e^{-hw^2}} dw)$,

it follows that the number of spheres having velocities intermediate between u and $u + du$ parallel to the x axis is

$$Ae^{-hu^2} du \int_0^\infty e^{-hv^2} dv \int_0^\infty e^{-hw^2} dw;$$

that is,

$$\frac{\pi}{h} Ae^{-hu^2} du,$$

where A is to be determined by the equations

$$\frac{\pi}{h} A \int_0^\infty e^{-hu^2} du = N,$$

or

$$A \frac{\pi^{\frac{1}{2}}}{h^{\frac{1}{2}}} = N;$$

therefore

$$A = \frac{N h^{\frac{1}{2}}}{\pi^{\frac{1}{2}}};$$

that is to say, the number of spheres having velocities between c and $c + dc$ is

$$\frac{4h^{\frac{1}{2}}}{\sqrt{\pi}} N e^{-hc^2} dc.$$

Multiplying this expression by c , and integrating the product with regard to c from 0 to ∞ , and dividing by N , the mean velocity for all the spheres becomes

$$\frac{2}{\sqrt{\pi h}};$$

and multiplying by c^2 instead of by c , we find the mean square of all the velocities to be

$$\frac{3}{2h}.$$

In the preceding investigation no account has been taken of collisions between the spheres and the enclosing boundary of the region in which they are contained, because in every such collision the magnitude of the velocity of each sphere is unaltered and its direction is changed according to the ordinary law of reflexion, whence it is evident that the distribution is unaffected by such collisions. Also, the investigation has been confined to the cases of spheres colliding in pairs, but since there need be no limit to the smallness of the interval between any pair of collisions the result really embraces the cases of simultaneous collisions between three or more spheres; for if a sphere A collides with another B , and immediately afterwards with a third C , the resultant velocity of A after this second collision must be the same as if it had collided with B and C simultaneously.

The foregoing investigation has been given in some detail because the principles upon which it proceeds are essentially the same as those by which all questions of the distribution of energy among a great number of moving bodies are determined, although it may be found, as well as the detailed investigations of the results immediately following, in published memoirs and systematic treatises on the kinetic theory of gases.

If the spheres be not all of equal mass, but if there be within the region N' spheres of mass m , N'' of mass m' , and so on, then it may be proved, by reasoning exactly similar to the foregoing, that when the permanent or stable state of motion has been attained the number of spheres of the N' set with component velocities between u and $u + du$, v and $v + dv$, w and $w + dw$ is

$$Ae^{-\frac{hmc^2}{2}} du dv dw,$$

and the number of the N'' set having component velocities between u' and $u' + du'$, v' and $v' + dv'$, w' and $w' + dw'$, is

$$A'e^{-\frac{hm'c'^2}{2}} du' dv' dw',$$

where $c^2 = u^2 + v^2 + w^2$, $c'^2 = u'^2 + v'^2 + w'^2$, h is a constant the same for both sets, and

$$A = \frac{N}{\pi^{\frac{3}{2}}} \cdot \left(\frac{mh}{2}\right)^{\frac{3}{2}}, \quad A' = \frac{N'}{\pi^{\frac{3}{2}}} \cdot \left(\frac{m'h}{2}\right)^{\frac{3}{2}},$$

and so on if there be any other sets.

The mean velocity and mean square velocity of each sphere of the N' set are

$$\frac{2}{\sqrt{\pi}} \sqrt{\frac{2}{mh}} \text{ and } \frac{3}{mh} \text{ respectively,}$$

and the mean kinetic energy of each of such spheres is

$$\frac{3}{2h'}$$

the last result being common to all the sets.

If the spheres in the given region be acted on by any given forces tending to fixed centres, and functions of the distances of the centres of the spheres from the centres of force, we may not in such case assume, *a priori*, that the chances of velocities in all directions are the same; but we may assume that the number of spheres of any set (N) with coordinates of their centres intermediate between

x and $x+dx$, y and $y+dy$, z and $z+dz$, and component velocities intermediate between u and $u+du$, v and $v+dv$, w and $w+dw$, is

$$\psi(x, y, z, u, v, w) dx dy dz du dv dw.$$

In the state of permanence the form of ψ must be independent of the time (t), so long as the sphere is moving free from collisions with any other.

From the last-mentioned condition it must follow that, if $\phi_1 = a_1$, $\phi_2 = a_2$, &c., be any equations among the variables determining the position and motion of any sphere obtained by the elimination of t from the equations of motion of that sphere, then ψ must be of the form $\psi(\phi_1, \phi_2, \text{&c.})$. With the assumption, then, that the number of spheres of the given set with variables between the above-mentioned limits is

$$\psi(\phi_1, \phi_2, \dots) dx \dots dw,$$

we find for the form of ψ , by reasoning like the foregoing, $Ae^{-h(\chi + \frac{mc^2}{2})}$, where χ is the potential energy of the sphere in the position x, y, z , and $c^2 = u^2 + v^2 + w^2$, and h is a constant, the same for all the sets.

If we integrate the expression $Ae^{-h(\chi + \frac{mc^2}{2})} dx dy dz du dv dw$ for all values of x, y, z within the given region, we find for the number of spheres of any set with component velocities between u and $u+du$, v and $v+dv$, w and $w+dw$,

$$Be^{-\frac{hm c^2}{2}} du dv dw,$$

whence we easily see that the chances of velocities in all directions are the same, and that the mean velocity and mean square velocity of any sphere of this set are $\frac{2\sqrt{2\pi}}{\sqrt{mh}}$ and $\frac{3}{mh}$ respectively, and the mean

kinetic energy of any such sphere is $\frac{3}{2h}$, and therefore the same for all the sets.

Furthermore, if we integrate the expression

$$Ae^{-h(\chi + \frac{mc^2}{2})} dx dy dz du dv dw$$

for all values of u, v , and w from $-\infty$ to $+\infty$ respectively, we obtain a result of the form $Ce^{-h\chi} dx dy dz$, and therefore the number of spheres of the set in question with centres within the elementary volume $dx dy dz$, or, what is the same thing with the exception of a constant factor, the chance of the centre of any sphere of that set being within that elementary volume, is $Ce^{-h\chi} dx dy dz$, so that the density of the N set of matter in the neighbourhood of the point x, y, z is $mCe^{-h\chi}$.

We are now in a position to compare the physical properties of a medium composed of monatomic molecules in motion, and free from any intermolecular or interatomic forces with those of ordinary gases, so long at least as the atoms are spherical.

Consider two contiguous portions of such a medium separated by any plane parallel to that of yz , and, since the distribution and motion of each set of spheres is independent of all the other sets, let us confine our attention to the spheres of the N set. Suppose that there are N such spheres per unit volume in the neighbourhood of the point x, y, z , whose component velocities parallel to the axis of x are between u and $u+du$. The number of these spheres which cross the elementary area $dy dz$ in time dt will be the same as the number of the N spheres whose centres are situated within the elementary parallelepiped $dx dy dz$, in which dx is equal to udt , and this number is

$$Nu dy dz dt.$$

Each of these spheres carries across with it a momentum parallel to x equal to mu ; the total momentum parallel to x transferred across $dy dz$ in time dt is therefore

$$mNu^2 dy dz dt.$$

If u be positive, this is positive momentum transferred from the negative to the positive side of the plane yz ; and if u be negative, this is negative momentum similarly transferred from the positive to the negative side of that plane. In either case it follows that by the mere motion of these spheres across the area $dy dz$ the positive momentum parallel to the axis of x is diminished by the quantity $mNu^2 dy dz dt$ on the negative side of the plane yz , and increased by the same quantity on the positive side of that plane in the time dt ; m being, as before, the mass of each sphere. Hence, on the whole, there is a transference of positive x momentum in the time dt across the area $dy dz$ equal to $m dy dz dt \sum_{-\infty}^{\infty} u^2 N$; that is, equal to

$$\rho dy dz dt \bar{u}^2,$$

where ρ is the density of the N matter at the point x, y, z , and \bar{u}^2 is the mean square of the x velocities.

But either by integration or general reasoning it is easily seen

that $\bar{u}^2 = \frac{\bar{v}^2}{3}$, where \bar{v}^2 is the mean square of the resultant velocities of the N spheres, and is equal, as we have proved, to

$$\frac{3}{mh}.$$

Therefore, there is a transference of positive momentum from the negative to the positive side of the plane yz across the area $dy dz$ in time dt equal to

$$\frac{\rho dy dz dt}{mh}.$$

Each separate sphere whose component velocities are u, v , and w carries across the same area y and z momenta equal to mv and mw respectively, so that in the time dt there are carried across the area $dy dz$ y and z momenta equal to $\sum muv dy dz dt$ and $\sum muw dy dz dt$, respectively. By symmetry it is clear that $\sum muv$ and $\sum muw$ are separately zero. Therefore, the resultant mutual actions of the two portions of the medium under consideration in the time dt is the transference across the elementary area $dy dz$ of a quantity of x

momentum equal to $\rho dy dz dt \frac{\bar{v}^2}{3}$ from the negative to the positive side of the bounding plane. If this mutual action, or, as it is generally called, "pressure" when referred to unit of surface, be denoted by the symbol p , we get the equation

$$p dy dz dt = \rho dy dz dt \frac{\bar{v}^2}{3},$$

or

$$p = \rho \frac{\bar{v}^2}{3} = \frac{\rho}{mh}.$$

Since the momenta parallel to y and z remain unaltered, it follows that the mutual action or pressure between contiguous portions of the medium in the neighbourhood of any point is normal to the bounding surface at that point. Since also the expression for p or $\frac{\rho}{mh}$ is independent of the direction of the x axis, it follows that the pressure at any point of the medium is the same in all directions.

If the contiguous portions of the medium be separated by a material instead of an ideal plane, it will be necessary for the maintenance of equilibrium that there should be an action between this plane and the adjacent medium, equivalent to the transference of momentum estimated above; but action measured by the rate per unit of time at which momentum is generated constitutes moving force or statical pressure. Hence the force or pressure between the plane and medium is normal to the plane, independent of the direction of the plane through the point, and equal to the value of

$\frac{\rho}{mh}$ at the point.

When several sets of spheres are present together in the region under consideration, the distribution of the centres and of the velocities of each set is, as we have seen, independent of the co-existence of the other sets. If therefore $\rho_1, \rho_2, \text{&c.}$ be the densities of the matter of the different sets in the neighbourhood of the point x, y, z , and if $p_1, p_2, \text{&c.}$ be the pressures at that point defined as above, and if $m_1, m_2, \text{&c.}$ be the masses of the spheres of each of the sets, and p the total pressure, we get

$$p = p_1 + p_2 + \text{&c.} \\ = \frac{\rho_1}{m_1 h} + \frac{\rho_2}{m_2 h} + \text{&c.}$$

Hence we arrive at the following conclusions:—(1) there is one physical quantity having the same value for every set of spheres—namely, the mean kinetic energy of each sphere, or $\frac{3}{2h}$; let this

quantity be called τ ; (2) the distribution of the positions and velocities of the spheres of each set is independent of the co-existence of the remaining sets, and is in all respects the same as if that particular set existed alone in the region considered; (3) the pressure at any point referred to unit of surface at any point of the medium arising from the action of any one of the sets is $\frac{2}{3m} \rho \tau$,

where ρ is the density of that particular set at the point in question, and τ is the physical quantity above referred to as common to all the sets.

This third inference may be expanded into the following three laws:—(a) if τ be kept constant, then the pressure arising from each set varies as the density of that set; (b) if ρ be kept constant, then the pressure from each set varies as τ ; (c) if the pressures for all the sets be the same, then $\frac{\rho}{m}$ is also the same, or the number of spheres per unit volume is the same.

Now suppose there is a mixture of any number of gases in any region; when there is equilibrium there is one physical quantity, namely, temperature, which is the same for all; the intrinsic

energy of this mixture depends, as we know, upon its temperature, and the energy of these moving spheres is entirely kinetic, and may be conceived, therefore, to be a function of the mean *vis viva*. Let us then assume that in this medium of moving spheres we have a representation of a mass of gases, and that what is called the temperature of the gaseous mass is nothing else than the τ or mean kinetic energy of each moving sphere. Then, with this assumption, the three parts (α, β, γ) of inference (3) above correspond to the gaseous laws connected with the names of Boyle, Charles, and Avogadro respectively, and inference (2) corresponds with the law of Dalton concerning gaseous mixtures.

We may also deduce the ordinary hydrostatical equations of equilibrium from the formulae which we have obtained.

For, since these equations give us

$$p = \frac{\rho}{mh}, \text{ and } \rho = mEe^{-hX},$$

we get

$$\frac{dp}{dx} = -\rho \frac{dX}{dx} = \rho X, \text{ and } \frac{dX}{dx} = -\tau X,$$

and similarly

$$\frac{dp}{dy} = \rho Y, \quad \frac{dp}{dz} = \rho Z,$$

where $X, Y,$ and Z are the component impressed forces, or the negatives of the space variations of χ along the coordinate axes.

So far, therefore, the physical properties of a perfect gas or mixture of such gases correspond, in all respects, with the physical properties of a medium consisting of a set of elastic spheres, or of a mixture of sets of such spheres, with the sole assumption that the physical property termed temperature, in the case of the gas, corresponds to, or is represented by, the mean kinetic energy of each of the spheres, and that each sphere represents the chemical atom.

There are, however, physical properties of gases which this theory fails to explain. The most important of these is the ratio of the specific heats at constant volume and constant temperature respectively. The specific heat of gas expanding while being heated under a constant pressure is greater than that of gas heated with a constant volume, as when it is contained in a rigid vessel, for the obvious physical reason that in the former case a portion of the heat is converted into mechanical work, namely, that performed by the expansion under the constant pressure. This ratio of the specific heat of gas under constant pressure to the specific heat with constant volume has been determined for many gases with great accuracy, chiefly from observations of the velocity of sound in such gases, in which velocity the value of this ratio bears a very important part.

Now, on the assumption of the gas being constituted of a number of elastic spheres in rapid but irregular motion among each other, and the physical property of temperature being represented or measured by the mean *vis viva* of each sphere, the ratio of these specific heats must be exactly 1½.

For, if v be the volume occupied by a unit of mass of this moving sphere medium, and τ the number of spheres to the unit mass, and if ρ be the density, it follows that

$$\tau m = \rho v = 1.$$

Also we know that p , the pressure referred to unit surface, is given by the equation

$$pv = \frac{2}{3} \tau \tau,$$

where τ is the mean *vis viva*. If now τ increase from τ to $\tau + \delta\tau$, while v remains constant, the increase of intrinsic energy must be, from definition, $\tau\delta\tau$. Also if there be a similar change in τ without the restriction of v being constant, but supposing p to be constant, there is external mechanical work performed equal to $p\delta v$, where δv is the increase of volume. Also

$$p\delta v = \frac{2}{3} \tau\delta\tau;$$

and therefore the whole energy required to be supplied from without must be in this case

$$\tau\delta\tau + \frac{2}{3} \tau\delta\tau$$

Or the ratio of the energies to be supplied from without, in order that the mean *vis viva* of the moving sphere medium should be increased by the same amount in the two cases respectively, becomes

$$\frac{\tau + \frac{2}{3} \tau}{\tau}, \text{ or } 1\frac{1}{2}.$$

If therefore the gaseous mass be adequately represented by the moving sphere medium, the ratio of the specific heats must be 1½.

Mercury vapour is the only gas for which the ratio has so large a value as this. Several of the more permanent gases have the ratio equal to 1.408, while in others it falls as low as 1.26. The value for mercury vapour, as determined by Kundt and Warburg

(Poggendorff, clvii. 353), is between 1.695 and 1.631, the mean of all the observations being somewhat under 1.6. If any value above 1.6 be insisted on it will be impossible to retain the theory as above enunciated. In point of fact we may say, in anticipation of what has yet to come, that there is no modification of the kinetic theory as hitherto treated which could give a higher value for the ratio in question than 1½.

It follows from what has been proved that either all known gases and vapours, except the vapour of mercury, and perhaps cadmium, must be polyatomic, or else that the attempts to explain the constitution of gases by the kinetic theory must be abandoned. We must therefore proceed further to investigate the physical properties of a medium consisting of compound atoms or molecules built up of atoms in any definite arrangement, such molecules being in a condition of irregular motion among themselves, such as we have supposed in the cases of the spherical atoms hitherto considered.

It will be observed, on reference to the cases of the spheres hitherto investigated, that, whether there be forces to fixed centres in action on the medium or not, the chance of any sphere having the coordinates of its centre and its component velocities between x and $x + dx$, y and $y + dy$, z and $z + dz$, u and $u + du$, v and $v + dv$, w and $w + dw$, is proportional to $e^{-hE} dx dy dz du dv dw$, where E is the total energy, kinetic and potential, of the sphere in the state of position and motion defined by x, y, z, u, v, w .

We may generalize this proposition, and prove that when the sphere is replaced by a molecule of any shape and constitution, so as to be defined as to position and motion by r generalized coordinates $q_1 \dots q_r$ with their corresponding momenta $p_1 \dots p_r$, the chances of the molecule having its defining variables between the limits q_1 and $q_1 + dq_1 \dots p_r$ and $p_r + dp_r$, or, what is the same thing, the number of such molecules at any time with variables thus limited, whether there be forces to fixed centres or not, and whether interatomic forces or intermolecular forces are or are not in action on the molecular aggregate, is proportional to

$$e^{-hE_r} dq_1 \dots dp_r,$$

where h is a constant, the same for all molecules, and E_r is the total energy, kinetic and potential, of the molecule in the free state as to position and motion, the potential energy being that of the fixed centre forces on the molecule, together with that of its interatomic forces, in the given position.

The problem before us may be stated thus:—

A number of similar molecules possessing in the whole n degrees of freedom, where n is very large, are in motion in a region of space bounded by a material envelope, under the action either of forces to fixed centres (called external forces) or of forces between different molecules and different parts of the same molecule, as well as by forces between the fixed boundary and the contained molecules, all of them conservative, so that the total energy, kinetic and potential, of the aggregate remains always the same; it is required to find the chance of a group of any one or more molecules possessing in the whole r degrees of freedom, defined by the coordinates $q_1 \dots q_r$ and momenta $p_1 \dots p_r$, where r is small compared with n , having its variables between the limits q_1 and $q_1 + dq_1 \dots p_r$ and $p_r + dp_r$.

We might start with the assumption made above in the case of the spheres under central forces, that this chance must be of the form

$$\psi(\phi_1, \phi_2 \text{ \&c.}) dq_1 \dots dp_r$$

where $\phi_1 = a_1, \phi_2 = a_2, \text{ \&c.}$, are obtained by the elimination of t between the equations of motion of the r group under the fixed centre and boundary forces and those between its component atoms, because there is nothing in the conception of a molecule beyond that of a system with a number of degrees of freedom, and under internal forces; and in this case, considering the generality of the assumption as to the external forces, it would be impossible to conceive the existence of any general equation, independent of the time, between the variables, except that of the conservation of energy, so that the chance in question becomes

$$\psi(E_r) dq_1 \dots dp_r$$

where E_r is above defined, and it remains to determine the form of ψ .

If we considered a second group of one or more molecules containing s degrees of freedom (where s may or may not be equal to r , but, like r , is much smaller than n), and defined by the coordinates and momenta $q_{r+1} \dots q_{r+s}, p_{r+1} \dots p_{r+s}$, then the two groups together contain $r+s$ degrees of freedom defined by the variables $q_1 \dots p_{r+s}$ and since $r+s$ is small compared with n , the chance of this group having its variables between q_1 and $q_1 + dq_1 \dots p_{r+s}$ and $p_{r+s} + dp_{r+s}$ must be

$$\psi(E_{r+s}) dq_1 \dots dp_{r+s}$$

But this chance must be equal to the chance of the r group being fixed in the state $q_1, q_1 + dq_1 \dots p_r, p_r + dp_r$, multiplied by the chance of the remaining s group being in the state $q_{r+1}, q_{r+1} + dq_{r+1} \dots p_{r+s}, p_{r+s} + dp_{r+s}$ where the r group are so fixed.

Now to find this latter chance we observe that it is the chance of the *s* group being in their required limits of position and motion, when the internal forces between the *r* and *s* group become forces between the *s* group and fixed centres.

If the total kinetic energy of the *r* group in their given state be T_r , and that of the *r* + *s* group be T_{r+s} the total kinetic energy of the *s* group must be $T_{r+s} - T_r$.

Also if the total potential energy of the *r* + *s* group under the influence of all forces be χ_{r+s} this is made up of—

- (1) χ_r , the potential energy of the *r* group to fixed centres, and of its internal forces;
- (2) χ_s , similarly taken for the *s* group; and
- (3) χ_{rs} , the potential energy of the *r* and *s* group forces.

And when the *r* group is fixed the potential energy of the *s* group is reduced to (2) and (3), or is $\chi_{r+s} - \chi_r$.

Therefore the chance of the *s* group having its variables within the required limits when the *r* group is fixed must be

$$\psi(E_{r+s} - E_r) dq_{r+1} \dots dp_{r+s}$$

Therefore

$$\psi(E_r) \psi(E_{r+s} - E_r) dq_1 \dots dp_{r+s} = \psi(E_{r+s}) dq_1 \dots dp_{r+s}$$

or

$$\psi(E_r) \psi(E_{r+s} - E_r) = \psi(E_{r+s}).$$

Therefore

$$\psi(x) = e^{Cx} = e^{-hx} \text{ suppose.}$$

And the chances of the *r* group having its variables between the limits q_1 and $q_1 + dq_1 \dots p_r$ and $p_r + dp_r$ must, in the state of permanent or stable motion, be proportional to

$$e^{-hE_r} dq_1 \dots dp_r,$$

which was to be proved.

Supposing now that the aggregate of molecules under consideration consists of a number of sets of similar molecules, the number of molecules in one of these sets being *N*, where *N* is very large, and suppose that each of these *N* molecules possesses σ degrees of freedom defined by the coordinates $q_1 \dots q_\sigma$ with the momenta $p_1 \dots p_\sigma$, and that its mass is *m*. Three of these coordinates may be taken as the rectangular coordinates of its centre of mass, in which case the corresponding momenta will be $mu, m\dot{v}, m\dot{w}$, where *u, v, w* are the component velocities of translation of that centre of mass. Then in this case, if $q_4 \dots q_\sigma, p_4 \dots p_\sigma$ be the remaining coordinates and momenta of the molecule, the chance of the molecule's variables being within the limits *x* and $x + dx \dots p_\sigma$ and $p_\sigma + dp_\sigma$ will be proportional to

$$e^{-h(\chi+T)} dx dy dz dq_4 \dots dp_4 e^{-\frac{h}{2}(u^2+v^2+w^2)} du dv dw \dots (I),$$

where *T*, the kinetic energy of the molecule, is equal to

$$\frac{m}{2}(u^2+v^2+w^2) + f,$$

where *f* is a quadratic function of the *p*'s, having as coefficients known functions of the *q*'s.

If we integrate the expression (I) for all possible values of *x, y, z, q_4 \dots q_\sigma, p_4 \dots p_\sigma, we obtain an expression of the form*

$$Be^{-\frac{h}{2}c^2} du dv dw \dots (II),$$

where *B* is independent of *u, v, w*, and $c^2 = u^2 + v^2 + w^2$. From the form of (II) it follows, exactly as in the cases of the elastic spheres, that the chances of all directions of the velocity of translation of a molecule are equal, that the mean velocity and mean square velocity of translation of each molecule are

$$\frac{2^{\frac{1}{2}} \sqrt{\pi}}{\sqrt{mh}} \text{ and } \frac{3}{mh}$$

respectively, and that the mean kinetic energy of translation is $\frac{3}{2h}$,

and the same for a molecule of any set.

Again, if \bar{T} be the mean total kinetic energy of the molecule, then

$$\bar{T} = \frac{\int \dots \int T \cdot e^{-h(\chi+T)} dx \dots dp_\sigma}{\int \dots \int e^{-h(\chi+T)} dx \dots dp_\sigma} \dots (III);$$

and if we evaluate this expression, paying attention to the form of *T* as a quadratic function of the *p*'s mentioned above, we shall find for (III) the expression $\frac{\sigma}{2h}$.

It follows from this result that each additional degree of freedom of the molecule increases the mean total kinetic energy of the molecule by the quantity $\frac{1}{2h}$, which is the mean kinetic energy of translation parallel to any one of the axes, and that the total kinetic energy is proportional to the number of such degrees of freedom.

If, again, we integrate the expression (I) for all values of the momenta, we obtain an expression of the form

$$Ce^{-h\chi} dx dy dz dq_4 \dots dq_\sigma \dots (IV),$$

where χ is the potential energy of the molecule due to fixed centre

and to interatomic forces in the position defined by *x, y, z, q_4 \dots q_\sigma. The dimensions of the molecule are so small that we may regard forces from each fixed centre on different parts of the molecule as parallel and equal and functions of the distance of the centre of mass from that fixed centre, so that, if the part of χ arising from these fixed centre forces be called χ_1, χ_2 will be a function of *x, y, z*, and of these variables only, the remaining part of χ (arising from interatomic forces), which may be called χ_3 , will be a function of the $\sigma - 3$ variables $q_4 \dots q_\sigma$.*

If in (IV) we write $\chi_1 + \chi_2$ for χ , and then integrate for all values of $q_4 \dots q_\sigma$, we obtain an expression of the form

$$De^{-h\chi_1} dx dy dz \dots (V),$$

where *D* is independent of *x, y, z*, and therefore ρ the density of the *N* molecule matter in the neighbourhood of the point *x, y, z*, is

$$mDe^{-h\chi_1}.$$

From these results all the propositions proved above with reference to the aggregate of elastic spheres or monatomic molecules, as to the correspondence of the physical properties of such an aggregate with those of gases as indicated by the gaseous laws, may be deduced also for this aggregate of polyatomic molecules. So that if \bar{T} be equal to $\frac{3}{2h}$, or the mean kinetic energy of agitation of any one of the aggregate of moving molecules, if *v* be the volume occupied by unit of mass, τ the number of molecules in unit of volume, and *m* the mass of each molecule, we have, exactly as in the case referred to,

$$m\tau = 1, \rho v = 1,$$

and

$$\rho v = \frac{2}{3} \tau \bar{T}.$$

We also get the ordinary hydrostatical equations

$$\frac{dp}{dx} = \rho X, \quad \frac{dp}{dy} = \rho Y, \quad \frac{dp}{dz} = \rho Z$$

from this expression for *p* combined with the equation

$$\rho = mDe^{-h\chi_1},$$

remembering that

$$\frac{d\chi_1}{dx} = -mX, \quad \frac{d\chi_1}{dy} = -mY, \quad \frac{d\chi_1}{dz} = -mZ,$$

whence the coincidence of the physical properties of this aggregate of polyatomic moving molecules with those of a gas, on the assumption that the temperature represents the mean kinetic energy of agitation, is at once apparent.

It can be shown also that the aggregate of moving molecules, such as we conceive a gas to be, possesses another very important physical property which, by its analogy to the second law of thermodynamics, affords additional evidence of the relation between the phenomena of heat and those of aggregates in some kind of motion,—the property in question being that, if in any aggregate of moving molecules the mean kinetic energy of any one of them be called τ , and if δQ be an increment of energy imparted to the aggregate

from without, then $\frac{\delta Q}{\tau}$ is a perfect differential.

If to this aggregate we apply a certain small quantity δQ of heat or energy from without, and if δr be the increase of the mean kinetic energy of agitation when the volume is unaltered, then this constancy of volume prevents any of the energy δQ from being absorbed in doing external work; but it is conceivable that the increase of τ may cause such a change in the average state of the molecule as to produce a variation $\delta\chi$ in the mean potential energy of the molecule, $\delta\chi$ being proportional to δr .

Therefore

$$\delta Q = r \left\{ \frac{d\bar{T}}{dr} + \frac{d\chi}{dr} \right\} \delta r.$$

But

$$\bar{T} = \frac{\sigma}{2h} = \frac{\sigma}{3} \cdot \frac{3}{2h} = \frac{\sigma}{3} \tau;$$

therefore

$$\delta Q = r \left\{ \frac{\sigma}{3} + \frac{d\chi}{dr} \right\} \delta r.$$

If the volume vary by δv , the pressure being constant, then we must add external work, or $p\delta v$, to the energy absorbed, so that if the whole external energy now applied be $\delta'Q$, and the increase of temperature δr be the same in both cases, we have

$$\frac{\delta'Q}{\delta Q} = \frac{r \left(\frac{\sigma}{3} + \frac{d\chi}{dr} \right) \delta r + p\delta v}{r \left(\frac{\sigma}{3} + \frac{d\chi}{dr} \right) \delta r}.$$

But if *p* be constant, then as before

$$p\delta v = 2 \frac{\tau}{3} \delta r,$$

and therefore the ratio of $\delta'Q$ to δQ , or of the two specific heats at constant pressure and constant volume respectively, becomes

$$\frac{\sigma + 3 \frac{dX}{d\tau} + 2}{\sigma + 3 \frac{dX}{d\tau}}$$

$\frac{dX}{d\tau}$ is unknown in all respects except that it must be positive; also we know that σ must be integral and not less than 3; if we denote $3 \frac{dX}{d\tau}$ by c we have for the ratio

$$\frac{\sigma + 2 + c}{\sigma + c}$$

or

$$1 + \frac{2}{\sigma + c},$$

which, with the necessary limitations of σ and c , cannot be greater than $1\frac{1}{3}$ or 1.6 , and in this limiting case the gas must be monatomic.

If, therefore, any value above 1.6 of the ratio for mercury vapour be insisted upon, the theory must be abandoned so far as present investigations are concerned. If, however, the difference between 1.6 and any higher value given by the observations be regarded as within reasonable limits of experimental error, this value for mercury vapour, a gas which on chemical grounds is regarded as monatomic, may be viewed as confirming the theory, at least *pro tanto*.

If two spherical atoms were united by a rigid rod to form a molecule, such a molecule would have five degrees of freedom and the specific heat ratio would in this case be $1\frac{1}{2}$, for c would then be zero. This value has a plausible approximation to the observed value 1.408 of the ratio in a great number of two-atom gases, such as hydrogen, nitrogen, oxygen, and others, but all observations agree so completely in the ratio 1.408 , or from 1.405 to 1.408 , that it hardly seems reasonable to regard the difference $.008$ as within the limits of experimental error, unless, indeed, we had grounds for suspecting a tendency to excess in all the methods employed for the determination of the ratio. But there are other difficulties more formidable still, arising from the spectroscopic properties of heated gases. The light emitted by such gases, so long as they are of no great density, never presents a continuous spectrum, but a spectrum consisting of bright lines with intervening dark spaces. Thus the spectrum of hydrogen gives thirty-two bright lines, that of mercury vapour six lines, that of nitrogen eighteen, and so on. So long as light is regarded as an energy intercommunicable with heat, and light of definite refrangibility is referred to vibrations of given period, we must regard these discontinuous spectra as connected with, and arising from, vibrations of determinate periods in the molecule of the heated gas. And if a gas such as hydrogen or nitrogen be constituted, as we are supposing, of an indefinite repetition of similar molecules, it must follow that such molecules must be capable, at any rate when not too closely packed together, of as many independent vibrations as there are bright lines in the spectrum; that is to say, in addition to the three degrees of freedom arising from motion of translation in solid space, each molecule must possess as many additional degrees of freedom or possible relative motion of its parts as are indicated by the number of spectrum lines. The degrees of freedom corresponding to motion of translation cannot well contribute anything to these luminous vibrations owing to their assumed irregularity and independence of any law; but it is otherwise with the internal or relative degrees of freedom of each molecule, for, unless the gas be very dense, we may easily conceive a sufficient interval of time between one encounter and the next of any molecule with another for very many vibrations, each according to its own law, to take place in the relative positions of different parts of the molecule. At each encounter the whole molecule would be roughly shaken, and when the encounters increased in frequency the vibrations would become irregular and the spectrum would degenerate into a general diffused light of no definite refrangibility, just as music degenerates into ordinary noise. And this is exactly what occurs in the spectra of dense gases.

To bring the theory, therefore, into agreement with observed phenomena, we require very many more degrees of freedom in each molecule than could possibly be assigned to it in accordance with the observed value of the ratios of the specific heats,—mercury vapour, for example, admitting with difficulty the minimum number of three such degrees, as we have just now seen, while its spectrum would require at least nine. And the difficulty increases as we pass to hydrogen and other gases.

We might perhaps conceive, with the view of possibly explaining this difficulty, that there were in all gases a number of composite molecules with many degrees of freedom mixed up with the other molecules with three or five such degrees, but in so small a proportion to those molecules that their presence produces no appreciable effect upon the specific heats; or, since we have no experimental determination of the specific heats of gases at light-giving temperature,

we might, at least until such experimental determination has been arrived at, conceive that our atoms may change their constitution under increased temperature, and become themselves capable of vibration. There is nothing in the conception of an atom as we are considering it which is really inconsistent with such an hypothesis.

Certain observed phenomena accompanying dissociation and combination give rise to other difficulties in the way of the acceptance of the kinetic theory in addition to those arising from the equal distribution of mean kinetic energy just now discussed. For when nitrogen and hydrogen, for example, are mixed in proportion to form ammonia it is observed (1) that at ordinary temperatures they do not exhibit the slightest tendency to combine directly with each other, while, on the other hand, (2) ammonia at ordinary temperatures does not exhibit the slightest tendency to decompose into nitrogen or hydrogen. But ammonia when subjected to certain very high temperatures becomes partially decomposed—that is, becomes a mixture of so many parts of ammonia and of so many other parts of nitrogen and hydrogen in the proportions to form ammonia; and if the temperature be high enough the decomposition may be complete. But, in accordance with the kinetic theory, the conditions, whatever they may be, which at high temperature cause the ammonia to decompose, must sometimes occur to individual molecules at ordinary temperature, because temperature, as we understand it, merely indicates a certain quantity of kinetic energy, and therefore in a gas, however cold, there will be always some molecules in a state for dissociation; and this dissociation having taken place can by (1) never be compensated by recombination; therefore dissociation should be going on in ammonia at all temperatures, and this result is contrary to the observed phenomena (2). It might possibly be conceived, as a way of meeting this last-mentioned difficulty, that the dissociation attendant upon high temperature—that is, upon an average large molecular velocity of translation—requires that there should be a fairly rapid repetition of encounters among molecules moving with dissociation velocity to ensure the production of dissociation, and that in the case of a gas at low temperature, or small average velocity, the chance of two molecules encountering one another at high velocities is small, and the chance of any molecule meeting with any rapid succession of such encounters is practically insensible, and therefore that the dissociation spoken of really never takes place.

As above stated, we conceive that in any gas at ordinary pressure and temperature the intermolecular forces are very small in the aggregate—that is, in Clausius's language, have a very small virial,—by which is understood, not that the forces themselves, where acting, are small, but that, considering the whole aggregate of molecules at any instant, there are very few pairs near enough to each other to exert any appreciable force on each other. Or, if we could watch any individual molecule for any time, we should find that during by far the greater portion of the time it was sensibly free from any action by surrounding molecules. The distance traversed by the type molecule between the instant when it passes out of the sphere of action of one molecule and the instant when it passes into the sphere of action of the next—that is, from one encounter to another—is called its *free path*.

We may find the chance that a molecule starting from any point with velocity ω in a uniform gas shall have free path between x and $x + dx$ from that point.

If a be the chance for such a molecule of free path at least unity, then a^2 is the chance of a free path at least 2. Hence the chance of free path at least x must be of the form a^x .

Following the method employed by O. E. Meyer,¹ let us write this in the form

$$e^{-\frac{x}{l}},$$

where therefore

$$l = -\frac{1}{\log a};$$

then the chance of free path $x + dx$ is

$$e^{-\frac{x+dx}{l}}.$$

The chance that such a molecule shall have its first encounter between x and $x + dx$ is the difference of these two expressions; that is,

$$-\frac{x}{l} \frac{dx}{l}.$$

This is the chance of a free path between x and $x + dx$.

The mean free path for such a molecule must then be

$$\int_0^{\infty} e^{-\frac{x}{l}} \frac{x}{l} dx \div \int_0^{\infty} e^{-\frac{x}{l}} \frac{1}{l} dx = l.$$

This is the meaning of the constant l in $e^{-\frac{x}{l}}$. But if we denote by B the number of encounters which a molecule moving through space with velocity ω experiences on the average per unit of time,

¹ *Kinetische Theorie der Gase*, Breslau, 1877.

$$B = \frac{\omega}{l}; \text{ or } \frac{1}{l} = \frac{B}{\omega}.$$

Hence the chance for such a molecule of free path between x and $x + dx$ is

$$\frac{B}{\omega} e^{-\frac{Ex}{\omega}}$$

with the above definition of B .

The chance of a molecule whose velocity is ω having free path x is of course the same as the chance of its free path having the duration $\frac{x}{\omega}$. If $t = \frac{x}{\omega}$, the chance of duration between t and $t + dt$ is thus

$$\frac{B}{\omega} e^{-Bt} \omega dt : \text{ or } B e^{-Bt} dt.$$

Meyer determines the value of B , if the molecules be spheres, in the form

$$B = N\pi s^2 \Omega \left\{ 1 + \frac{1}{1} \frac{1}{1.3} \omega^2 h - \frac{1}{1.2} \cdot \frac{1}{3.5} \omega^4 h^2 + \right. \\ \left. (-)^{n-1} \frac{1}{n} \frac{1}{2n-1} \cdot \frac{1}{2n+1} (\omega^2 h)^n \dots \right\},$$

where $\Omega = \frac{2}{\sqrt{\pi} h}$, and s is the sum of the radii of two molecules.

It will be observed that the series converges very rapidly if $\omega^2 h$ is less than unity, the successive coefficients being

$$\frac{1}{3}, -\frac{1}{30}, +\frac{1}{210}, -\frac{1}{1512}, +\frac{1}{11880}, \&c.$$

Having found B for the number of encounters experienced per unit of time by a molecule having velocity ω , we have for the average number of encounters experienced by any molecule per unit of time, which we denote by C ,

$$C = \frac{4}{\sqrt{\pi}} h^{\frac{3}{2}} \int_0^{\infty} e^{-h\omega^2} \omega^2 B d\omega.$$

From which Meyer deduces

$$C = 2 \frac{\sqrt{2\pi}}{h} N s^2 \\ = \Omega \sqrt{2} N \pi s^2.$$

Hence the mean value of the free path for all molecules. irrespective of velocity, is $L = \frac{\Omega}{C} = \frac{1}{\pi \sqrt{2} N s^2}$

Thus the kinetic theory of gases presents to us the conception of apparently perfect rest, as the result of motion irregular in detail but permanent and stable on the average. Whatever difficulty may be felt at first sight in the acceptance of this theory in the case of a medium at rest is greatly enhanced when we pass to the contemplation of a disturbed medium like a mass of gas through which a wave of sound is passing. In our ordinary investigations of such a disturbance the gas is treated as a continuous body, subjected to small relative motions of its parts, accompanied by corresponding variations of internal pressure. When a disturbance or a local condensation or rarefaction is set up in any portion of this gas we calculate the resulting effects by the well-known equations of sound motion. But on this kinetic theory the medium is supposed to consist of a number of discrete masses—elastic spheres or the like—which preserve the physical properties of the medium merely by the recurrence of their mutual collisions, such collisions obeying no law in individual cases, but preserving a certain average uniformity in the motion of the whole aggregate; and we need some further investigation to assure ourselves of the applicability of the ordinary treatment of wave motion to such a medium.

Now we observe that the physical properties of our medium, so far as the relation between pressure, density, and temperature is concerned, merely require that the temperature be measured by the mean total kinetic energy of translation, and that the mean kinetic energy of translation parallel to any fixed line be equal to one-third of the mean total energy of translation. If the molecules constituting any portion of this medium were animated by a common velocity or acceleration, the physical properties of this portion would be similarly determined by the velocities and kinetic energies relative to the common motion. When the distribution of such relative velocities is stable or permanent, the average relative kinetic energy in any fixed direction is one-third of the average relative total kinetic energy, such property constituting normal distribution.

Suppose that in any portion of a medium, consisting of equal elastic spheres, this distribution has been disturbed—that is, Σmu^2 , Σmv^2 , and Σmw^2 are unequal. If V were the relative velocity of any pair of spheres after such disturbance and before they collide, and θ the angle between V and the common normal at the point of impact, then the normal and tangential relative velocities

before impact are $V \cos \theta$ and $V \sin \theta$, and after impact they become $-V \cos \theta$ and $V \sin \theta$ respectively. The relative velocity after impact, resolved in the direction of relative velocity before impact, is therefore

$$-V \cos^2 \theta + V \sin^2 \theta,$$

or $-V \cos 2\theta$; and the chance of θ being between θ and $\theta + d\theta$ is $\sin 2\theta d\theta$.

Therefore the average square relative velocity resolved in the original direction becomes after impact

$$\bar{V}^2 = \int_0^{\frac{\pi}{2}} \cos^2 2\theta \sin 2\theta d\theta, \text{ or } \frac{\bar{V}^2}{3}.$$

The relative velocity after impact in the plane of V , and the normal perpendicular to the direction of V before impact is

$$V \sin \theta \cos \theta + V \sin \theta \cos \theta, \text{ or } V \sin 2\theta.$$

And, if a fixed line be taken in the plane perpendicular to V , the average value of the square of the relative velocity after impact, resolved parallel to this line, is

$$\frac{\bar{V}^2}{2\pi} \int_0^{2\pi} \int_0^{\frac{\pi}{2}} \sin^2 2\theta \cos^2 \phi d\theta d\phi, \text{ or } \frac{\bar{V}^2}{3} \text{ as before.}$$

Hence we conclude that, in whatever manner the distribution is disturbed in any portion of the medium at any instant, it will, for all those pairs of spheres which within any given interval encounter each other, have assumed the normal distribution after that interval.

If τ denote the average time between two collisions for any given sphere, the chance that this sphere shall continue for any time t

free from collisions is, as we have seen, $e^{-\frac{t}{\tau}}$.

If, therefore, D be the number of spheres within any region whose total relative velocity is between w and $w + dw$, but so distributed that the mean square of their relative velocities along any fixed line is not $\frac{w^2}{3}$, then after a time t considerably greater than τ , say ten times τ , the number of the D spheres which have escaped collision will be utterly inconsiderable, and the distribution will have become normal throughout the region.

Suppose, for instance, that a sound wave is passing along a tube filled with air.

the air in the tube is, at any instant, in a state of alternate compression and rarefaction, as at C, R, C, R above.

If the note sounded be (say) 500 vibrations per second, the length of the wave CR is about $\frac{1}{1000}$ feet, and the time taken by the wave in traversing that distance is about $\frac{1}{1000}$ th of a second.

The air in any section of the tube near P has alternately a small positive momentum and an equal small negative momentum; the reversal taking place in every $\frac{1}{1000}$ th of a second; also the same cause which produces the average momentum in either case disturbs the distribution of energy among the $x, y,$ and z directions, *i.e.*, it is always producing an excess or defect in mu^2 above or below that of mv^2 and mw^2 . By what has been proved above, this abnormal distribution of energy becomes inappreciable, owing to molecular collisions in a time considerably less than $\frac{1}{1000}$ th of a second—in fact, in about $\frac{1}{1000000}$ th of a second, when the value of T for atmospheric air is considered. It is therefore legitimate, in calculating the velocity of sound in air (at least on the elastic sphere hypothesis), to regard the distribution as always normal in any section of the tube, the air in that section or in any elementary portion of it possessing, as a whole, any given velocity or acceleration, estimated as if we were dealing with a continuous mass.

DIFFUSION OF GASES.

If any further light is to be thrown on the physical nature of a molecule from investigations, experimental or analytical, concerning gases, it will most probably be by means of experiments on the diffusion of gases, or else on the internal friction or viscosity of gases, and the comparison of these results with those obtained analytically by the methods of the kinetic theory. Such investigations have been undertaken experimentally by Graham, Loschmidt, Maxwell, O. E. Meyer, and others. An account of them will be found in O. E. Meyer's work above referred to. The same problems have also been discussed analytically by Maxwell,¹ and by Stefan, O. E. Meyer, and Boltzmann in the treatises referred to below. We proceed to give a short account of Meyer's results.

¹ *Phil. Mag.*, July 1860, and Feb. and March 1863.

The term "diffusion" has sometimes been applied to the process by which a gas passes through a porous diaphragm. This, however, is now generally denominated *transpiration*. It has also been applied to the expansion of a gas into vacuum, as on the removal of a diaphragm separating the gas from an exhausted receiver. This is now generally denominated *free expansion*. We shall understand, as is now usual, by the term diffusion the process by which, when two or more gases are mixed throughout any space in different proportions at different points, but so that if all molecules were of the same gas the whole would be in equilibrium, the different gases pass through each other and tend to equalize the proportions at all points in the space.

Suppose, for instance, a tube containing a mixture of two gases, *A* and *B*, at constant temperature and constant pressure of the combined gases throughout the tube and subject to no forces, but the density of gas *A* increasing and that of *B* diminishing from one end of the tube to the other. Let the axis of the tube be taken for the axis of *x*. If N_a be the number of molecules of gas *A*, and N_b the number of molecules of gas *B* in unit volume, we have, owing to the constant pressure and temperature at all points of the tube, $N_a + N_b = N$, a constant. But at a given instant N_a and N_b at any point are severally functions of *x*. It will be found that under these circumstances more molecules of gas *A* pass through any section of the tube, which may be in the plane of *yz*, in one direction, say from left to right, than in the opposite direction. On the other hand, more molecules of gas *B* pass from right to left than from left to right. And this will go on till the mixture becomes uniform throughout the tube.

The investigation of the rate at which the unequal distribution tends to equalize itself in this simple case—that is, the excess of the number of molecules of gas *A* which cross a section of the tube from left to right over the number crossing in the same time from right to left—is the problem of diffusion. We give the results obtained by O. E. Meyer as follows:—if the molecules of the two gases had the same mass and dimensions (to put an ideal case), then the excess of molecules of either gas passing through the section in one direction—that is, the stream velocity—would be $\frac{1}{3} \frac{dN_a}{dx} \bar{\omega} l$, where *l* denotes

the mean free path for a molecule having velocity ω , and $\bar{\omega} l$ is the average value of that function for all molecules of the gas.

When we come to deal with two gases, the molecules of one not being of the same size and dimensions with those of the other, we shall find that, in the absence of any common velocity of the two gases at the plane of *yz*, more, or fewer, molecules of gas *A* would cross the plane per unit of time from left to right than of gas *B* from right to left, because, assuming constant pressure and temperature of the mixture at every point in the tube, the number of molecules of the two gases combined must be the same at every point—that is, $N_a + N_b = N$, where *N* is constant. Hence

$$\frac{dN_a}{dx} = - \frac{dN_b}{dx}$$

Now the excess of molecules of gas *A* coming from left to right per unit of time is $\frac{1}{3} \frac{dN_a}{dx} \bar{\omega} l_a$, and similarly the excess of molecules of gas *B* crossing from right to left per unit of time is $\frac{1}{3} \frac{dN_b}{dx} \bar{\omega} l_b$, if we now distinguish by suffixes *a* and *b* quantities relating to the two gases respectively. Here l_a and l_b are mean free paths for velocity ω of the two kinds of molecules through the mixed gases, and $\bar{\omega} l_a$ is not generally equal to $\bar{\omega} l_b$. Hence the total number of molecules crossing the plane from left to right exceeds the number crossing from right to left by $\frac{1}{3} \frac{dN}{dx} (\bar{\omega} l_a - \bar{\omega} l_b)$.

Meyer here assumes that the combined gases have a common velocity $-\frac{1}{3} \frac{dN}{dx} (\bar{\omega} l_a - \bar{\omega} l_b)$, and that such common velocity will not affect the relative motion of the molecules. On that hypothesis the rate of diffusion can be calculated as follows. The proportion of the stream of the combined gases which consists of molecules of gas *A* is

$$\frac{N_a}{N_a + N_b} \frac{1}{3} \frac{dN_a}{dx} \{\bar{\omega} l_a - \bar{\omega} l_b\}.$$

Hence the total surplus number of molecules of gas *A* passing through the area of the plane per unit of time is

$$\begin{aligned} &= \frac{1}{3} \frac{dN_a}{dx} \left\{ \frac{N_a}{N_a + N_b} (\bar{\omega} l_a - \bar{\omega} l_b) + \bar{\omega} l_a \right\} \\ &= \frac{1}{3} \frac{dN_a}{(N_a + N_b) dx} \{N_b \bar{\omega} l_a + N_a \bar{\omega} l_b\}, \end{aligned}$$

$$\text{or} \quad \frac{1}{3N} \frac{dN_a}{dx} \{N_b \bar{\omega} l_a + N_a \bar{\omega} l_b\}.$$

The expression

$$\frac{1}{3N} \{N_b \bar{\omega} l_a + N_a \bar{\omega} l_b\}$$

is defined to be the "coefficient of diffusion" of gas *A* into gas *B*. It is evidently the same as that of gas *B* into gas *A*.

The Relation of the Coefficient of Diffusion to Density.—It can be shown that $l_a \omega$, the mean free path for a molecule having velocity ω , is for any single gas inversely proportional to the density, and for any mixture of gases inversely proportional to λ , the aggregate volume occupied by matter in unit space. Hence, in the expression $\frac{1}{3} \bar{\omega} l \frac{dN}{dx}$, $\bar{\omega} l$ is inversely proportional to the density, or to λ , as the case may be.

Now the rate of diffusion on this theory depends upon $\frac{1}{3} \frac{dN}{dx} \bar{\omega} l$.

Hence, given the absolute increase of density of a gas per unit of length, that is, given $\frac{dN}{dx}$, the rate of diffusion ought to vary inversely as the density of the combined gases. On the other hand, given the proportional increase of the density, or $\frac{1}{N} \frac{dN}{dx}$, the rate of diffusion ought to be independent of the density, because in that case $\frac{dN}{dx}$ varies directly, and $\bar{\omega} l$ inversely, as *N*. The analytical result, that at given temperatures, and given the absolute value of $\frac{dN}{dx}$, the rate of diffusion is inversely proportional to the density of the gases agrees with the experimental results obtained by Loschmidt for carbonic acid gas and air, carbonic acid gas and hydrogen, hydrogen and oxygen.¹

Relation of the Coefficient of Diffusion to Temperature.—The coefficient of diffusion varies directly as the square root of the absolute temperature, for

$$\bar{\omega} l = \frac{\omega^2}{B},$$

and

$$B = 2N\sigma^2 \frac{\sqrt{\pi}}{\sqrt{h}} \left\{ e^{-h\omega^2} + \frac{2h\omega^2 + 1}{\omega\sqrt{h}} \int_0^{\omega\sqrt{h}} d\mu e^{-\mu^2} \right\};^2$$

or, if $\omega\sqrt{h} = y$,

$$B = 2N\sigma^2 \frac{\sqrt{\pi}}{\sqrt{h}} \left\{ e^{-y^2} + \frac{2y^2 + 1}{y} \int_0^y e^{-\mu^2} d\mu \right\}$$

Hence

$$\frac{1}{B} = \frac{\sqrt{h}}{\sqrt{\pi} N \sigma^2} \psi(y),$$

where ψ denotes a certain function, and

$$\begin{aligned} \left(\frac{\omega^2}{B}\right) &\approx h^{\frac{3}{2}} \int_0^{\omega\sqrt{h}} d\omega e^{-h\omega^2} \frac{\omega^4}{B} \\ &\approx h \int_0^{\omega\sqrt{h}} dy e^{-y^2} \frac{y^4}{h^{\frac{3}{2}}} \frac{1}{B} \approx \frac{1}{\sqrt{h}} \int_0^{\omega\sqrt{h}} dy e^{-y^2} y^2 \psi y \approx \frac{1}{\sqrt{h}}. \end{aligned}$$

This analytical result also agrees fairly with Loschmidt's experiments above referred to.

FRICION OR VISCOSITY OF GASES.

Suppose two layers of gas separated by an imaginary plane, similar in all respects except that the molecules of one have a small common momentum in a certain direction parallel to the plane. We may take the imaginary plane for that of *yz*, and the average direction of motion of the molecules on one side of the plane, e.g., the left-hand side, for the axis of *y*, the molecules on the right-hand side of the plane having no average momentum. Then the molecules crossing from the left to the right side carry with them an average momentum in the direction *y*, and so tend to impress the right-hand stratum of gas with that momentum. On the other hand, the molecules of the right-hand stratum crossing the plane into the left-hand one have, relatively to the molecules in the latter, an average momentum in the opposite direction, and therefore tend to diminish the average momentum of the left-hand stratum.

¹ *Sitzungsberichte*, 1870, Bd. lxi. S. 350.

² See Meyer's *Ktn. Theorie*, p. 295.

Hence, if we attempt to cause one stratum of gas to pass over another in parallel planes, we experience a resistance due to the interchange of molecules between the portions of gas separated by the plane. This is in some respects analogous to sliding friction between solid bodies, and is called by German writers the "friction" (*Reibung*), by Maxwell and others the "viscosity," of the gas. Meyer¹ investigates this effect of friction in a manner somewhat similar to that employed in case of diffusion, and obtains for the coefficient of viscosity $\frac{1}{3} mN\bar{\omega}l$.

Relation of the Coefficient of Viscosity to Density and Temperature.—The viscosity of a gas is independent of the density, being, according to O. E. Meyer, $\frac{mN}{3} \bar{\omega}l$. Now, for any one gas, $l\omega$ is, as we have seen, inversely proportional to the density, and therefore $\bar{\omega}l$ is inversely proportional to the density. On the other hand, N is directly proportional to the density. Hence the viscosity is independent of the density. This agrees with the result obtained by Maxwell from the kinetic theory in 1860, and with the results of experiments by Maxwell² and O. E. Meyer.³ Also, experiments by O. E. Meyer and Springmühl⁴ on the *transpiration of gases* show that the times in which two different gases under similar circumstances flow through a tube maintain the same constant ratio to one another. As in the case of the coefficient of diffusion, $\bar{\omega}l$ is inversely proportional to the square root of the absolute temperature. As both the coefficient of diffusion and that of viscosity depend on the same function $\bar{\omega}l$, it should be possible from experiments on viscosity to determine the rate of diffusion. Experiments with this object have been conducted by Stefan⁵ with very satisfactory results, his calculated values for the coefficient of diffusion agreeing very closely with those determined by Loschmidt's direct experiment.⁶ We have given the above results for the coefficients of diffusion and viscosity from O. E. Meyer's work, because his method has met with very general acceptance. It has been shown, however, by Boltzmann,⁷ that the method is incomplete. Meyer's results can only be obtained on the assumption that the molecules of a gas undergoing diffusion or internal friction, which have any given velocity, as w , are moving with that velocity in all directions indifferently. We may calculate the number of molecules having velocity w that pass through a given plane during a short time dt , starting from encounters at any given distance from the plane. If we assume that the molecules, issuing from such encounters with velocity w , move indifferently in all directions, we obtain Meyer's result. This assumption is true only of a gas at rest—that is, having no velocity of translation—so that our result so obtained would express, in case of diffusion, the rate at which two gases begin to diffuse, if given at any instant both at rest—that is, with no stream velocity—but mixed in unequal proportions in different parts of space. In any actual case of diffusion, either of the two diffusing gases acquires a small velocity of translation. If we take this velocity into account in calculating the number of molecules of the gas passing through a plane, according to Meyer's method, we shall find that it introduces two new terms, one of which, when the motion becomes steady, is equal and opposite to the result obtained by Meyer. This is proved by Boltzmann in the case of viscosity in the treatise above referred to. The same proof is easily applied in the case of diffusion.

Stefan's Method.—Stefan⁸ regards the two diffusing gases as having small velocities of translation, or stream velocities, u_1 and u_2 , in opposite directions, so that the molecules of one gas, of mass m_1 , have an average momentum m_1u_1 in direction from left to right, and those of the other gas, of mass m_2 , an average momentum m_2u_2 from right to left. By virtue of encounters between the two sets of molecules, each gas is always imparting to the other a portion of its own average momentum, and receiving from the other a corresponding momentum in the opposite direction. The momentum so transferred or interchanged is what Stefan calls the *resistance* which one gas offers to the other's diffusion. In this investigation Stefan assumes that all classes of molecules of one gas, whatever their molecular velocity in space, have the same average velocity in the direction of diffusion—that is, the same stream velocity—so that the motion of the molecules of a diffusing gas would be exactly represented by considering the molecules of a gas at rest—that is, with only its molecular velocity—at the same

temperature and pressure, and then giving to each molecule the additional common velocity u in the direction of diffusion. Boltzmann, however, shows that, in order correctly to represent the motion of the diffusing gas, we must impart to molecules having different molecular velocities independent of direction different common velocities in the direction of diffusion. And it will be found that the resistance of the gases is sensibly modified by this property.⁹

The complete solution of the problem,—that is, the determination of u as a function of w , on the hypothesis that the molecules are elastic spheres,—is difficult.

If we assume molecules to be centres of force varying inversely as the n th power of the distance, so that the force at distance r is $\frac{\mu}{r^n}$, where μ is constant, we obtain the following result. We assume the molecules of gas A whose absolute velocities are between w and $w+dw$ to have an average stream velocity u in direction of the tube, where u is a function of w . Then, if the terminal condition at the ends of the tube be maintained constant, we obtain an equation of the form

$$\frac{p}{N} \frac{dN_b}{dx} = \frac{4n-8}{3n-3} C \cdot \frac{m_1m_2}{m_1+m_2} \frac{\pi N_a N_b}{\text{unit volume}}$$

multiplied by the average value for all molecules of gas A of $\frac{u}{V^{n-1}}$, where V is the relative velocity of two molecules, one taken from each gas, and C is a constant, and m_1, m_2 the masses of the molecules of gas A and gas B respectively.

By making n infinite we obtain the result for elastic spheres: in that case $\frac{u}{V^{n-1}} = V$, and the problem is to find the average value of u .

Since p varies as the absolute temperature, and the average value of V varies as the square root of the absolute temperature, we may infer that the average value of u —that is, the stream velocity—will vary approximately as the square root of the temperature, as it appears to do from experimental evidence. If, on the other hand, $n=5$, V disappears, and $\frac{4n-8}{3n-3} = 1$. In this case the analytical determination of u presents no difficulty; but in the result the stream velocity varies as the absolute temperature, which accords less satisfactorily with experiments.

ON MOLECULAR DIMENSIONS.

Many attempts have been made in recent years to form an estimate or conjecture, more or less accurate, of the numerical value of the dimensions of a molecule and the absolute force between molecules.¹⁰

In accordance with the view of the subject considered in this article, we are here concerned with such speculations only in so far as they are founded upon the kinetic theory of gases, or supported by it. The phenomena of diffusion and viscosity especially have afforded grounds for estimates of molecular dimensions.

It is first necessary to define what is meant by the dimensions of a molecule. Regarded as an elastic sphere, it has dimensions with the conception of which we are familiar. It is not, of course, seriously contended by any physicists that the molecules of a gas are actually hard elastic spheres, exerting no force on each other at any distance greater than that of actual contact, and then an infinite force. It is necessary to conceive the forces as finite, although they may diminish so rapidly with the distance as that the motions of molecules in the aggregate differ little from what they would be if the molecules were ideal elastic spheres. Nevertheless, they must be finite forces; and, that being the case, it is difficult, if not impossible, to frame a definition of the boundary of a molecule, except as a certain surface at which the forces acting between the molecule in question and other molecules attain a certain value.

If, for instance, we were to regard a molecule as a centre of force,

⁹ For Boltzmann's own treatment of the subject we cannot, within the limits of this article, do more than refer the reader to the memoir above mentioned, "Zur Gas-Reibung," and another as yet unfinished memoir "On Diffusion," in the *Sitzungsber. d. k.-k. Akad.*, 1882.

¹⁰ An account of these will be found in O. E. Meyer's *Kin. Theorie d. Gase*, in Professor Tai's *Recent Advances in Physical Science*, lect. xii., and in the following memoirs:—*Phil. Mag.*, July 1879, "On the Size of Molecules," by N. D. C. Hodges; *Phil. Mag.*, March 1880, "On the Mean Free Path of Molecules," by the same author. See also, lecture delivered by Sir W. Thomson at the Royal Institution, 2d Feb. 1883.

⁸ Memoir "On the Dynamical Theory of Diffusion" (*Sitzungsber. d. k.-k. Akad.*, lxx.)

exerting an attractive force $\frac{\mu'}{r^4}$ and a repulsive force $\frac{\mu''}{r^7}$, we might define the molecule to be a sphere of radius a , such that $\frac{\mu}{a^4} = \frac{\mu'}{a^7}$.

In like manner, regarding a molecule as a centre of force, repelling according to the law of the inverse fifth power of the distance, we might define the magnitude of a molecule as a sphere of radius equal to the least distance to which two molecules, whose relative velocity is equal to the mean velocity of the centres of force, approach each other in a direct encounter.

If on any hypothesis concerning the nature of a molecule, or the law of force which acts during encounters, we can calculate the coefficient of viscosity or diffusion analytically, a comparison of the analytical result with results obtained by experiment may afford the means of determining the absolute numerical value of the constants used in the analysis. For example, if we consider the molecules as elastic spheres, and if we consider for a moment Meyer's results as correct, or approximately correct, the coefficient of viscosity for any single gas can be put in the form $\frac{Nm}{3} \bar{\omega} \omega$, where N is the number of molecules in unit of volume, m the mass of a molecule. Now, for every value of $\bar{\omega} \omega$, the mean free path

of a molecule with that velocity is equal to $\sqrt{h} \frac{1}{N\pi s^2}$, where s is twice the radius of a molecule multiplied by a numerical factor which can be determined to any required degree of accuracy. Also at given temperature and pressure the numerical value of \sqrt{h} is known. It follows that we can calculate the numerical value of the coefficient of viscosity by analytical methods in terms of $N\pi s^2$

to any required degree of accuracy. Let it be $\frac{C}{N\pi s^2}$. If by experiments on viscosity we can determine the numerical value of the same coefficient in the form C_1 , when C_1 is a mere numerical quantity, we have immediately the equation $C_1 = \frac{C}{N\pi s^2}$, or $N\pi s^2 = \frac{C}{C_1}$.

This gives in absolute numerical measure the value of $N\pi s^2$, or four times the sum of the great circle areas of all the molecules in unit of volume, supposing them to be spherical. If we attempt to use the coefficient of diffusion instead of viscosity in this method, we are met by the difficulty that the analytical result contains now two unknown quantities instead of one—namely, the radii of the respective molecules of the two gases in question. If this difficulty be got over by a comparison of results obtained in different experiments, the greater certainty attending the observations on diffusion might perhaps compensate for the additional mathematical difficulty, and render diffusion at least equally trustworthy with viscosity as a method for estimating molecular dimensions. Again, on the hypothesis of repulsion between molecules according to the law of the inverse fifth power of the distance, we can calculate analytically the rate of diffusion between two reservoirs connected by a tube as above described, the result containing only one unknown constant, viz., μ , the constant of absolute force. Comparing the analytical result with the results of experiments on diffusion through such a tube as above described, if we find them capable of being harmonized by attributing any numerical value to μ , we should have good reason for concluding that the law of force assumed is to a certain extent at least the true law, and that the particular value of μ is that which harmonizes the analytical with the experimental results. And the determination of μ , the absolute force, corresponds to, or indeed is, the determination of the size of the molecule.

Until all the mathematical hypotheses have been fully developed, no very great reliance can be placed on the results of such comparisons, even assuming that the experimental results themselves are to be depended upon. However valuable the experiments may be for other purposes, they are not valuable for the purpose of determining molecular dimensions until our mathematical analysis is sufficiently advanced to enable us to interpret the experiment. At present it is perhaps impossible to deduce from the experiments any other result bearing on this question than that the coefficients of diffusion and viscosity increase with increasing temperature, and probably contain an important term proportional to the square root of the absolute temperature. If, indeed, it can be shown that that is the only term, and if it can be also shown that the density of one of two diffusing gases in a tube through which steady diffusion is going on tends to vary in geometrical progression, then the analysis will lead us to the conclusion that molecules of gases behave in their physical relations to each other as if they were elastic spheres.

The following method has also been suggested for estimating the magnitude of molecules of mercury. Mercury is regarded by most chemists as monatomic. Let us assume that its molecules are conducting spheres; on that assumption we may calculate the *specific inductive capacity* of mercury vapour on Faraday's hypothesis to be $\frac{1+2\lambda}{1-\lambda}$, where λ is the ratio which the aggregate volume of all the

spherical molecules in unit volume bears to unit volume. If now K , the specific inductive capacity of mercury vapour, can be determined experimentally, the equation $K = \frac{1+2\lambda}{1-\lambda}$ affords a ground for estimating the value of λ ,—that is, the aggregate volume of the molecules.

Another method, originally proposed by Van der Waals, is founded on the small deviations from Boyle's law observed in all gases. Suppose a vessel of volume V containing a number N_1 of elastic spheres, each of mass m , moving with a certain average kinetic energy. Let p_1 be the pressure. Let a second class of elastic spheres, in number N_2 , each of the same mass m as the former class and having the same average kinetic energy, be introduced into the vessel. If the second class of spheres could freely penetrate the first, and *vice versa*, so that there should be no restrictions on a sphere of the first class and a sphere of the second being in the same place at the same time, then the pressure on the walls of the vessel would be increased in the exact proportion $\frac{N_1+N_2}{N_1}$. Boyle's law would be exactly fulfilled. But if the spheres cannot penetrate each other, the volume occupied by the second class of spheres is not V , but $V - \frac{4}{3} N_2 \pi r^3$, if r be the radius of a sphere of the first class. Consequently, the pressure due to the second class of spheres is rather greater than it should be, and there is a small deviation from Boyle's law. Van der Waals treats the pressure as proportional to the number of encounters, and therefore inversely proportional to the mean free path, which is evidently diminished by any increase in the magnitude of the spheres, and diminished more than in proportion to any increase in the number.

(H. W. W.—S. H. B.)

CHEMICAL ASPECT.

The word *Moléculé* is used by chemists to express the unit of a pure substance, that quantity of it which its formula ought to represent. What this quantity is, in any particular case, must be ascertained by studying the chemical actions by which the substance is produced and the chemical changes which it undergoes. We may give one or two illustrations to show how this can be done, as well as to indicate the limits within which these methods can be applied.

The formula usually assigned to acetic acid is $C_2H_4O_2$. This agrees with almost all the chemical actions in which it takes part. Thus, one quarter of the hydrogen is replaceable by other metals, as in $C_2H_3KO_2$, &c.; and one, two, or three quarters of the hydrogen can be replaced by chlorine. There must, therefore, be four (or a multiple of four) atoms of hydrogen in the molecule. Similarly, half of the oxygen can be replaced by sulphur, and one-half of the oxygen along with one-quarter of the hydrogen can be replaced by chlorine. There must, therefore, be two (or a multiple of two) atoms of oxygen in the molecule. Again, the formation of marsh gas and carbonate of soda, when acetate of soda is heated with caustic soda, and the formation of aceto-nitrile from cyanide of potassium and iodide of methyl, show that the carbon in acetic acid is divisible by two, or that the molecule contains two (or a multiple of two) atoms of carbon. $C_2H_4O_2$ is the simplest formula which fulfils these conditions, but the existence of an acid acetate of potash and an acid acetate of ammonia, the formulæ of which are usually written $C_2H_3KO_2$, $C_2H_4O_2$ and $C_2H_5(NH_4)O_2$, $C_2H_4O_2$, as if these were compounds derived from two molecules of acetic acid, might lead us to $C_4H_8O_4$, as this shows that the hydrogen is divisible by eight. In the same way, we can easily satisfy ourselves that $C_6H_{10}O_5$, or some multiple of it, is the formula of starch; that C_8H_5NO , or some multiple of it, is the formula of indigo blue, and so on. But it is not easy to determine by purely chemical methods whether these formulæ themselves, or multiples of them, really represent the molecule. A simple formula may suffice for a great many of the reactions of a substance, and may enable us to represent a great many of its derivatives, and yet reactions and derivatives may be discovered which require a multiple of that simple formula. This has already been indicated in reference to acetic acid, and a very striking

illustration is supplied, by mellitic acid. For a long time the formula $C_4H_2O_4$ was used for this acid, and by means of it all the then known derivatives were represented. But later investigations by Baeyer proved that this formula must be multiplied by three, the new derivatives obtained by him not being capable of representation with any formula simpler than $C_{12}H_6O_{12}$. Very many examples of the same kind might be adduced, but those given may serve to show the nature of the difficulty of settling the formula and with it the molecular weight of a substance. It need scarcely be said that the multiple formula represents everything which the simple formula represents and something more, and that chemists as a rule take the simplest formula which will answer the purpose. These chemical methods of determining the formula and molecular weight apply equally to all pure substances, but they do not give us absolute values, only numbers to which the molecular weights are proportional. And for purely chemical purposes these are all that we require. Thus, when a chemist speaks of acting on a molecule of succinic acid with two molecules of pentachloride of phosphorus, he means that he mixes them in the proportion of 118 parts of the former to 2×177.5 of the latter. For the sake of precision we sometimes speak of a molecule of water (or other substance) in grammes, or even of a *gramme-molecule*, a *grain-molecule*, &c. Thus, in the case just mentioned a gramme-molecule of succinic acid means 118 grammes of succinic acid, &c.

But, while for practical purposes these proportional numbers are quite sufficient, we cannot leave out of view their relation to the actual constitution of matter. There is good reason to believe that matter consists of discrete particles, and that every pure substance is made up of small portions of matter, all alike, so that one of them, if we could examine it, would give us a complete idea of the chemical composition, constitution, and character of the substance. These small portions, of which the smallest quantity of the substance which we can examine contains many millions, we may call *molecules*. From the character which we have supposed this molecule to possess—viz., that it fully represents all the chemical properties of the substance—it will be seen that these *real, ultimate* molecules must be proportional to the molecular weights ascertained by chemical means; so that, while for practical laboratory or manufacturing purposes we use the gramme, the pound, or the ton as our unit, and speak of 18 grammes, pounds, or tons, as the case may be, of water, as a molecule (or gramme-molecule, ton-molecule, &c.), in dealing with the actual constitution of matter we should use as our unit the mass of a single atom of hydrogen, and our gramme-molecule would then be a definite, very large, but not yet accurately ascertained, number of real molecules.

It has been already shown above that, on the kinetic theory of gas, a gas consists of a number of particles moving about in straight lines in all directions, and that in a homogeneous gas which follows Boyle's and Charles's laws these particles are all alike. The masses of the particles of different gases are therefore to one another in the same proportion as the densities of the gases, temperature and pressure being the same. Thus, in gases, the independently moving particles of the kinetic theory are the molecules of which the chemist is in search, and it becomes important that we should compare our chemically found molecular weights with the densities. Theoretically accurate results could be obtained only in the case of a perfect gas; but small deviations from Boyle's and Charles's laws do not interfere with the application of this method. Chemical methods, as we have already seen, lead us to a particular number, or a *multiple of it*, so that our choice is as a rule limited to two or three numbers widely differing

from one another. We find that if we do not exceed the limits of chemical stability a gas approaches the state of a perfect gas as the temperature increases, or as the pressure diminishes. Now if one of the numbers rendered probable by chemical evidence *nearly* coincides with that given by comparison of gas densities, under conditions where the substance sensibly deviates from Boyle's and Charles's laws, we find that by diminishing the pressure or increasing the temperature within the limits of chemical stability, and thus bringing the substance nearer the state of a perfect gas, the correspondence between these two numbers becomes closer. This has already been pointed out and illustrated in the article CHEMISTRY, vol. v. p. 469.

We can now compare the results, in the case of gases, of the chemical and of the physical determination of molecular weight, by giving some examples, placing side by side the formula and molecular weight adopted by chemists, and the mass, in grammes, of the gas occupying the volume of $22.33 \times 760/p \times (273+t)/273$ litres. This volume is that which one gramme of an ideal gas having the molecular weight 1, and perfectly following Boyle's and Charles's laws, would occupy at pressure p millimetres of mercury and temperature $t^\circ C$. If, then, w be the molecular weight of any gas, w grammes of it should occupy this volume, and slight deviation from this would indicate slight deviation from Boyle's and Charles's laws. In the annexed table w is the molecular weight and m the mass contained in $22.33 \times 760/p \times (273+t)/273$ litres. Where the temperature is not specially stated, the determinations were made under the usual atmospheric conditions.

Name.	Formula.	w.	m.	
Sulphuretted hydrogen ...	H ₂ S	34	34.04	
Nitrous oxide	N ₂ O	44	44.08	
Ammonia	NH ₃	17	17.12	
Carbonic acid	CO ₂	44	44.14	
Marsh gas	CH ₄	16	16.13	
Olefiant gas	C ₂ H ₄	28	28.44	
Hydrogen	H ₂	2	2	
Oxygen	O ₂	32	32	
Chlorine	Cl ₂	71	71.27	at 100° C.
Phosphorus	P ₄	124	125.9	„ 500° C.
Arsenic	As ₄	300	294.5	„ 860° C.
Sulphur	S ₈	192	194	„ 500° C.
	S ₂	64	63.5	„ 1000° C.
Bromide of aluminium ...	Al ₂ Br ₆	534	537.5	„ 440° C.
Ferric chloride	Fe ₂ Cl ₆	325	328.8	„ 440° C.
Sal-ammoniac	NH ₄ Cl	53.5	29.6	at 350° C.
Oil of vitriol	H ₂ SO ₄	98	50.24	„ 440° C.
Pentachloride of phosphorus	PCl ₅	203.5	140	„ 200° C.
			105.4	„ 300° C.
Sulphide of ammonium ...	(NH ₄) ₂ S	68	22.76	„ 80° C.

A comparison of the values of w and m leads to the following conclusions:—

(1) In the case of a very great number of substances, of which only a few specimens are given in the table, the two determinations agree, the slight differences often observed being evidently due to deviation of the substance from the state of a perfect gas. (2) In a considerable number of substances, physical evidence leads to a multiple of the simplest number satisfying the chemical conditions. This cannot be looked upon as a disagreement between the methods, because, if a particular formula satisfies the chemical conditions, any multiple of it will necessarily do so; and indeed, in many of the cases we are now considering, it is possible from chemical considerations to justify the higher molecular weight after it has been suggested, although such chemical considerations might not in all cases have warranted its adoption without external support. Thus, we are not without chemical evidence in

favour of the formulæ H_2 , Cl_2 , O_2 , or even Al_2Br_6 and Fe_2Cl_6 , although chemists would probably have contented themselves with H , Cl , O , AlBr_3 , and FeCl_3 , had it not been for the evidence of gas and vapour density, and certainly without the latter no one would have thought of P_4 , As_4 , or S_8 .¹ (3) There are a number of substances in the case of which there is an apparent disagreement between the results of the two ways of determining molecular weight. Such substances are said to have an anomalous gas or vapour density. The expression anomalous vapour density is sometimes applied to the case of such substances as phosphorus and arsenic, but not very accurately. It would be better to say that these substances have an *unexpected* vapour density, because their complex molecular formulæ, while not clearly indicated by their chemical character, are not at variance with any established law.

We shall therefore reserve the term "anomalous vapour density" for those substances the molecular weight of which as given by their vapour density is not reconcilable with any formula which is chemically admissible. In the case of some substances, such as the oxides of chlorine, it has been shown that the discrepancy was due to errors of observation, impure specimens having been used in the experiments; but there still remain many substances having, in the sense above indicated, an anomalous vapour density. These substances have therefore been examined with special care, with the result of completely vindicating the kinetic theory, and of disclosing a very interesting and theoretically important kind of chemical change. We shall take, as instances of such anomalous vapour densities, the substances in the last division of the table, and show how the anomaly has in these cases been explained.

Sal-ammoniac has the composition represented by the formula NH_4Cl . This formula agrees with all the chemical actions of the substance and of all the substances in any way related to it, but it does not agree with the results of vapour density determinations. When sal-ammoniac is heated it is converted into vapour or gas, and this vapour or gas is reconverted into solid sal-ammoniac when it is cooled. This looks exactly like the process of sublimation, and it was universally supposed that the vapour given off when sal-ammoniac is heated was really sal-ammoniac vapour. But its vapour density corresponds, not to the formula NH_4Cl and the molecular weight 53.5, but to the half of this. Now this formula does not admit of division, and the explanation at once suggests itself, that the vapour examined was not really the vapour of sal-ammoniac, but of hydrochloric acid and ammonia gases, the products of the decomposition of sal-ammoniac.

This would of course completely explain the apparent anomaly; each molecule NH_4Cl dividing into two molecules NH_3 and HCl , the gas from a given weight of sal-ammoniac would of course contain twice as many molecules and occupy twice the space which it would do if no such decomposition had occurred. On this supposition the mixed gases would remain uncombined as long as the temperature was above the decomposing point of sal-ammoniac; if the temperature fell below this point they

¹ It is important as a matter of scientific history to note that this agreement of gas density and chemical molecular weight was first indicated by Gay-Lussac, who showed that the ratio of the densities of two gases stood in a very simple arithmetical relation to the ratio of their chemical equivalents. Avogadro in 1811 brought forward his famous hypothesis, that the number of molecules in a given volume of gas is independent of the nature of the gas, or that the densities of gases (temperature and pressure being the same) are to one another as the masses of their molecules. This hypothesis is now shown to be in accordance with the kinetic theory of gas, and is known as "Avogadro's law." See *ATOM*, vol. iii. p. 40, where a slight confusion has been caused by using the word "equivalent" instead of "molecule," and by not sufficiently distinguishing between the discovery of Gay-Lussac and the hypothesis of Avogadro.

would unite and reproduce sal-ammoniac. It was necessary, however, to prove that this decomposition occurs.

As has been shown above (p. 618), the rate of diffusion of a gas depends upon its density. In this case the two gases into which the substance may be supposed to break up at the moment of volatilization differ considerably in density; we ought, therefore, to be able to effect partial separation by means of diffusion, and it has been shown that such partial separation actually does occur. Thus, if we have hydrogen gas on one side of a porous diaphragm and volatilized sal-ammoniac on the other side, we find after a time that, mixed with the hydrogen on the one side, we have what we may for shortness call sal-ammoniac vapour—that is, a vapour which when cooled forms solid sal-ammoniac—with an excess of ammonia, which, being less dense than hydrochloric acid gas, has diffused faster; while on the other side, also mixed with hydrogen which has diffused through the diaphragm, we have sal-ammoniac vapour with excess of hydrochloric acid, the denser and more slowly diffusing gas. This of course proves that the decomposition has occurred, but it does not prove that the vapour of sal-ammoniac consists *entirely* of hydrochloric acid and ammonia *mixed* with one another. That this in fact is not the case has been shown by an ingenious experiment. The two gases were separately raised to a temperature higher than that at which sal-ammoniac volatilizes, and were then allowed to mix in a vessel kept at the same temperature as the two gases. In this vessel a delicate thermometer was placed, and it was found that the mixing of the two gases was accompanied by a small but very decided evolution of heat. This proves that some chemical combination takes place, and that the mixed gases must contain some vapour of NH_4Cl . Moreover, careful determinations of the vapour density of sal-ammoniac prove that it is a little more than the mean of the densities of ammonia and hydrochloric acid (as compared with air at the same temperature and pressure, 1.01 instead of 0.9255 at 350°C.); and this increase of density on mixing the hot gases is easily explained by supposing that a small proportion is in the condition of NH_4Cl , while the most of the gas consists of separate NH_3 and HCl molecules.

In a similar way it has been shown that the vapour of oil of vitriol is a mixture of two vapours,—that of water, H_2O , and that of sulphuric anhydride, SO_3 ; and that sulphide of ammonium when volatilized breaks up into two volumes of ammonia and one of sulphuretted hydrogen, $(\text{NH}_4)_2\text{S} = 2\text{NH}_3 + \text{H}_2\text{S}$. We find, therefore, that in the former case, as in that of sal-ammoniac, $w = 2m$, and in the latter, $w = 3m$.

This peculiar kind of decomposition is now known by the name "dissociation." (See vol. v. pp. 475, 476.) In the cases we have mentioned the substances undergo nearly complete dissociation at the temperature at which they volatilize, and recombination takes place when they are cooled and again assume the solid, or, as in the case of oil of vitriol, the liquid state. These substances are therefore not suited for the illustration of the whole course of dissociation. This has been carefully studied in the case of some compounds, in which the dissociation is far from complete, at the boiling point of the substance, with the result that, if AB be the compound dissociating into the separate molecules A and B , we may represent the amount of dissociation as the ratio of the number of pairs of separate A and B molecules to the total number of pairs of A and B , both separate and combined. This ratio we may call R , so that when dissociation is complete $R=1$.

(1) R increases as the temperature rises. (2) dR/dt (where t is temperature) is a maximum when $R=\frac{1}{2}$. (3) The presence of excess of either A or B diminishes the value of R . For instance, PCl_5 is nearly completely dissociated into PCl_3 and Cl_2 at 300°C.; but if a large excess of PCl_3 is mixed with the vapour it is found to contain scarcely any Cl_2 , so that dissociation is greatly diminished by the presence of excess of PCl_3 . These experimental results are capable of explanation on the kinetic theory of gas, if we adopt Pfaunder's hypothesis. This is, that for each case of dissociation there is a

limiting value for the internal kinetic energy¹ of a molecule of AB . If a molecule of AB , by encounter with other molecules or with the wall of the vessel containing the gas, acquires a greater amount of internal kinetic energy than this limit, it at once breaks up into A and B , so that in the gaseous mixture there are no molecules of AB having more internal kinetic energy than the limit. Further, if two molecules, one of A and one of B , meet one another with such a velocity and with such an amount of internal kinetic energy that together the internal kinetic energy is less than the limit, they will unite to form a molecule of AB . Thus the molecules with great internal kinetic energy will be separate molecules of A and B ; those with small internal kinetic energy will mostly be united as AB . This hypothesis has been to a considerable extent worked out and applied by Pfaundler and by Naumann, and the deductions from it agree fairly well with the results of experiment; but in some points the theory has not been fully developed, and in some it does not seem altogether to accord with observed facts. Some of these difficulties have been mentioned above. We know enough of the nature of dissociation to see that it belongs to the class of *balanced chemical actions*, in which a chemical change is reversible, and equilibrium is kept up, with constant external conditions, by the two opposite chemical changes taking place to an equal extent in a given time. We can see that all such cases are explicable by the statistical method, but we cannot apply this method mathematically until we know more of the intimate nature of the molecules and of the way in which they act upon one another. In this discussion of dissociation we have looked specially at the cases in which A , B , and AB are all gaseous, because it was the question of anomalous vapour densities which led us to treat of the subject. Dissociation also occurs where one or two of the substances are solid or liquid.

We now see with what restrictions the method of vapour density is applicable to the determination of molecular weight, and we can understand more fully the example given in the article CHEMISTRY, vol. v. p. 469. It is there shown that acetic acid vapour does not conform to the laws of Boyle and Charles until the temperature is raised to about 250°, at the ordinary barometric pressure. At and above that temperature the vapour density corresponds to the formula $C_2H_4O_2$. At lower temperatures the density corresponds to a higher molecular weight. Now Playfair and Wanklyn determined the vapour density at much lower temperatures than the ordinary boiling point of acetic acid, by greatly diminishing the pressure of the

acetic acid vapour. This they accomplished by mixing it with a large quantity of hydrogen, so that the pressure due to acetic acid vapour formed only a small fraction of the total pressure. The vapour density of acetic acid at the low temperatures at which they worked was found to correspond very nearly with the formula $C_4H_8O_4$, and, by comparing this result with what has been said (p. 620) of the chemical evidence as to the molecular weight of acetic acid, we may reasonably conclude that the molecule of acetic acid at low temperatures is $C_4H_8O_4$, and that as the temperature is raised it undergoes dissociation, each molecule dividing into two of $C_2H_4O_2$. This is then a case where A and B are equal, and AA divides into $A+A$. Another instance of the same kind is probably to be found in peroxide of nitrogen (CHEMISTRY, p. 513), where N_2O_4 divides into NO_2+NO_2 . Similarly, sulphur vapour has, at temperatures below 500° C., a density corresponding to the formula S_8 . This dissociates as the temperature rises until, about 1000° C., the density corresponds to the formula S_2 (CHEMISTRY, p. 498).

We have now seen that chemistry receives great assistance in the determination of molecular weight from physics, but this assistance is almost entirely confined to the case of gases, or of substances which can be volatilized. The phenomena of the diffusion of liquids show us that there also there are independently moving particles; but the laws of liquid-diffusion have not been sufficiently generalized to give us much help in the determination of the relative masses of these particles. In liquids it is probable that the particles are very near each other, and that their shape and their mutual action, as well as their mass and the temperature, determine their rate of motion.

In solids we have no independently travelling particles, and it is perhaps scarcely correct to speak of a molecular structure of solids at all. Solids are no doubt composed of atoms, and these atoms are evidently arranged in what may be called a tactical order. When the solid is fused or dissolved or volatilized, it breaks into molecules, each repetition of the pattern, if we may use the expression, being ready to become an independent thing under favourable circumstances. But, while these potential molecules of solids cannot perhaps be properly called molecules in a physical sense,² for chemical purposes we may call them so, for they are the smallest portions of the substance which fully represent it chemically, and, as we have seen, this is the chemical molecule, the quantity which should be represented by the formula. (A. C. B.)

MOLESKIN is a stout heavy cotton fabric of leathery consistence woven as a satin twill on a strong warp. It is finished generally either as a bleached white or as a slaty drab colour, but occasionally it is printed in imitation of tweed patterns. Being an exceedingly durable and economical texture, it was formerly much more worn by workmen, especially outdoor labourers, than is now the case. It is also used for gun-cases, carriage-covers, and several purposes in which a fabric capable of resisting rough usage is desirable.

MOLESWORTH, SIR WILLIAM (1810-1855), the eighth baronet, was born in London, 23d May 1810, and succeeded to the extensive family estates in Devon and Cornwall in 1823. On the passing of the Reform Act of 1832 he was returned to parliament, though only twenty-two years old, for the eastern division of the county of Cornwall, to support the ministry of Lord Grey. For some time he took little part in the debates of the House of Commons; but in April 1835 he founded, in conjunction with Mr. Roebuck, the *London Review*, as an organ of the politicians known to the world as "Philosophic Radicals." After the publication of two volumes he purchased the *Westminster Review*, and for some time the united magazines were edited by him and J. S. Mill. From 1837 to 1841 Sir William Molesworth sat for the borough of Leeds, and during those years acquired considerable influence in the House of Commons by his speeches and by his tact in presiding over the select committee on Transportation. From 1841 to 1845 he remained in private life, occupying his leisure time in editing the works in Latin and English of Thomas Hobbes of Malmesbury, a recreation which cost him no less than £6000. In the latter year he

was returned for the borough of Southwark, and retained that seat until his death. On his return to parliament he devoted special attention to the condition of the colonies, and delivered many speeches in favour of a reduction in colonial expenditure and on their better administration. His arguments on these questions changed the opinions of the members of the House of Commons; and the criticisms of the daily press, aided by the printing of his speeches, led to the gradual acceptance of his views by the electors at large. It was not, however, until many years afterwards that he was allowed full opportunity for working out the difficult problems connected with the government of Great Britain. Office was conferred upon him in December 1852 by Lord Aberdeen, but it was the minor post of directing the public improvements and crown lands of his own country, and the chief work by which his name was brought into prominence at this time was the construction of the new Westminster Bridge. At last, in July 1855, he was called to preside over the Colonial Office, but unfortunately its duties were no sooner entrusted to his care than he was cut off by death (22d October 1855), to the universal regret of his countrymen, for he had lived down the animosities of his youth, and had attracted to himself the sympathies of all thoughtful men. The influence which his views had acquired, and still retain, may be judged from the fact that in 1878 the delegates of the Transvaal Government put forward, as the chief argument for the withdrawal of the English from the Transvaal, the substance of his speech on the abandonment of the Orange River Territory in 1854.

A full pedigree of the Molesworth family is printed in Sir John Maclean's *Trigg Minor*, vol. i.; the titles of his speeches and works

¹ By internal kinetic energy is meant the kinetic energy of motion of the parts of the molecule relatively to one another, in contradistinction to the kinetic energy of motion of the molecule as a whole.

² It may be urged that the cleavage of crystals indicates that they possess a molecular structure, but a tactical or pattern-like arrangement of atoms may easily be supposed to present planes of easier separation, without the assumption of really independent molecules.

may be found in the *Edm. Cornubiensis*, vols. I. and III. The name of Sir William Moleworth is frequently mentioned in the biographies of Moll, Coblen, Carlyle, Grose, and Panizzi.

MOLFETTA, a city and seaport of Italy, in the province of Bari, 16 miles by rail north-north-west of Bari. From the sea it presents a fine appearance with its white stone houses and the remains of its turreted walls; and there are several buildings of considerable pretensions. The castle was in the 14th century the prison of Otho, duke of Brunswick. The cathedral is dedicated to St Conrad. Molfetta has well-frequented markets, a small foreign trade (6000 tons in 1871), and such industries as cotton and net weaving, soap-boiling, and rope-spinning. The population was 26,516 in 1871.

Molfetta (Melfetta or Malfitum) was given by Charles V. to the duke of Termoli in 1522, and during his lordship it was grievously sacked by the French under Lautrec. In 1631 Cesare Gonzaga took the title of duke of Guastalla and prince of Molfetta; but in 1649 the fief was sold to the Spinola family, and in 1798 incorporated with the royal domain. The bishopric holds directly of the papal see.

MOLIÈRE (1622-1673), to give Jean Baptiste Poquelin the stage name which he chose, for some undiscovered reason, to assume, was born in Paris, probably in January 1622. The baptismal certificate which is usually, and almost with absolute certainty, accepted as his is dated 15th January 1622, but it is not possible to infer that he was born on the day of his christening. The exact place of his birth is also disputed, but it seems tolerably certain that he saw the light in a house of the Rue St Honoré. His father was Jean Poquelin, an upholsterer, who, in 1631, succeeded his own uncle as "valet tapissier de chambre du roi." The family of Poquelin came from Beauvais, where for some centuries they had been prosperous tradesmen. The legend of their Scotch descent seems to have been finally disproved by the researches of M. E. Révérend du Mesnil. The mother of Molière was Marie Cressé; and on his father's side he was connected with the family of Mazuel, musicians attached to the court of France. In 1632 Molière lost his mother; his father married again in 1633. The father possessed certain shops in the covered Halle de la Foire, Saint Germain des Prés, and the biographers have imagined that Molière might have received his first bent towards the stage from the spectacles offered to the holiday people at the fair. Of his early education little is known; but it is certain that his mother possessed a Bible and Plutarch's *Lives*, books which an intelligent child would not fail to study. In spite of a persistent tradition, there is no reason to believe that the later education of Molière was neglected. "Il fit ses humanitez au Collège de Clermont," says the brief life of the comedian published by his friend and fellow-actor, La Grange, in the edition of his works printed in 1682. La Grange adds that Molière "eut l'avantage de suivre M. le Prince de Conti dans toutes ses classes." As Conti was seven years younger than Molière, it is not easy to understand how Molière came to be the school contemporary of the prince. Among more serious studies the Jesuit fathers encouraged their pupils to take part in *ballets*, and in later life Molière was a distinguished master of this sort of entertainment. According to Grimarest, the first writer who published a life of Molière in any detail (1705), he not only acquired "his humanities," but finished his "philosophy" in five years. He left the Collège de Clermont in 1641, the year when Gassendi, a great contemner of Aristotle, arrived in Paris. The *Logic* and *Ethics* of Aristotle, with his *Physics* and *Metaphysics*, were the chief philosophical text-books at the Collège de Clermont. But when he became the pupil of Gassendi (in company with Cyrano de Bergerac, Chapelle, and Hesnaut), Molière was taught to appreciate the atomic philosophy as taught by Lucretius. There seems no doubt that Molière began, and almost or

quite finished, a translation of the *De Natura Rerum*. According to a manuscript note of Trallage, published by M. Paul Lacroix, the manuscript was sold by Molière's widow to a bookseller. His philosophic studies left a deep mark on the genius of Molière. In the *Jugement de Pluton sur les deux Parties des Nouveaux Dialogues des Morts* (1684), the verdict is "que Molière ne parleroit point de Philosophie." To "talk philosophy" was a favourite exercise of his during his life, and his ideas are indicated with sufficient clearness in several of his plays. There seems no connexion between them and the opinions of "Molière le Critique" in a dialogue of that name, published in Holland in 1709. From his study of philosophy, too, he gained his knowledge of the ways of contemporary pedants,—of Panrace the Aristotelian, of Marphorius the Cartesian, of Trissotin, "qui s'attache pour l'ordre au Péripatétisme", of Philaminte, who loves Platonism, of Bélise, who relishes "les petits corps," and Armande, who loves "les tourbillons." Grimarest has an amusing anecdote of a controversy in which Molière, defending Descartes, chose a lay-brother of a begging order for umpire, while Chapelle appealed to the same expert in favour of Gassendi. His college education over, Molière studied law, and there is even evidence—that of tradition in Grimarest, and of Le Boulanger de Chalussay, the libellous author of a play called *Étomire Hypochondre*—to prove that he was actually called to the bar. More trustworthy is the passing remark in La Grange's short biography (1682), "*au sortir des écoles de droit, il choisit la profession de comédien.*" Before joining a troop of half-amateur comedians, however, Molière had some experience in his father's business. In 1637 his father had obtained for him the right to succeed to his own office as "valet tapissier de chambre du roi." The document is mentioned in the inventory of Molière's effects, taken after his death. When the king travelled the valet tapissier accompanied him to arrange the furniture of the royal quarters. There is very good reason to believe (Loiseleur, *Points Obscurs*, p. 94) that Molière accompanied Louis XIII. as his valet tapissier to Provence in 1642. It is even not impossible that Molière was the young valet de chambre who concealed Cinq Mars just before his arrest at Narbonne, 13th June 1642. But this is part of the romance rather than of the history of Molière. Our next glimpse of the comedian we get in a document of 6th January 1643. Molière acknowledges the receipt of money due to him from his deceased mother's estate, and gives up his claim to succeed his father as "valet de chambre du roi." On 28th December of the same year we learn, again from documentary evidence, that Jean Baptiste Poquelin, with Joseph Bédard, Madeleine Bédard, Geneviève Bédard, and others, have hired a tennis-court, and fitted it up as a stage for dramatic performances. The company called themselves *L'illustre Théâtre*, *illustre* being then almost a slang word, very freely employed by the writers of the period.

We now reach a very important point in the private history of Molière, which it is necessary to discuss at some length in defence of the much maligned character of a great writer and a good man. Molière's connection with the family of Bédard brought him much unhappiness. The father of this family, Joseph Bédard the elder, was a needy man with eleven children at least. His wife's name was Marie Hervé. The most noted of his children, companions of Molière, were Joseph, Madeleine, Geneviève, and Armande. Of these, Madeleine was a woman of great talent as an actress, and Molière's friend, or perhaps mistress, through all the years of his wanderings. Now, on 14th February 1662 (for we must here leave the chronological order of events), Molière married Armande Claire Elisabeth Grésinde Bédard. His enemies at that time,

and a number of his biographers in our own day, have attempted to prove that Armande Béjard was not the sister, but the daughter of Madeleine, and even that Molière's wife may have been his own daughter by Madeleine Béjard. The arguments of M. Arsène Housseye in support of this abominable theory are based on reckless and ignorant confusions, and do not deserve criticism. But the system of M. Loiseleur is more serious, and he goes no further than the idea that Madeleine was the mother of Armande. This, certainly, was the opinion of tradition, an opinion based on the slanders of Montfleury, a rival of Molière's, on the authority of the spiteful and anonymous author of *La Fameuse Comédienne* (1688), and on the no less libellous play, *Élomire Hypochondre*. In 1821 tradition received a shock, for Bèffara then discovered Molière's "acte de mariage," in which Armande, the bride, is spoken of as the sister of Madeleine Béjard, by the same father and mother. The old scandal, or part of it, was revived by M. Fournier and M. Bazin, but received another blow in 1863. M. Soulié then discovered a legal document of 10th March 1643, in which the widow of Joseph Béjard renounced, in the name of herself and her children, his inheritance, chiefly a collection of unpaid bills. Now in this document all the children are described as minors, and among them is "*une petite non encore baptisée.*" This little girl, still not christened in March 1643, is universally recognized as the Armande Béjard afterwards married by Molière. We reach this point, then, that when Armande was an infant she was acknowledged as the sister, not as the daughter, of Madeleine Béjard. M. Loiseleur refuses, however, to accept this evidence. Madeleine, says he, had already become the mother, in 1638, of a daughter by Esprit Raymond de Moiroron, comte de Modène, and chamberlain of Gaston duc d'Orléans, brother of Louis XIII. In 1642 Modène, who had been exiled for political reasons, "was certain to return, for Richelieu had just died, and Louis XIII. was likely to follow him." Now Madeleine was again—this is M. Loiseleur's hypothesis—about to become a mother, and if Modène returned, and learned this fact, he would not continue the *liaison*, still less would he marry her,—which, by the way, he could not do, as his wife was still alive. Madeleine, therefore, induced her mother to acknowledge the little girl as her own child. In the first place, all this is pure unsupported hypothesis. In the second place, it has always been denied that Béjard's wife could have been a mother in 1643, owing to her advanced age, probably fifty-three. But M. Loiseleur himself says that Marie Hervé was young enough to make the story "sufficiently probable." If it was probable, much more was it possible. M. Loiseleur supports his contention by pointing out that two of the other children, described as legally minors, were over twenty-five, and that their age was understated to make the account of Armande's birth more probable. Nothing is less likely than that Modène would have consulted this document to ascertain the truth about the parentage of Armande, yet M. Loiseleur's whole theory rests on that extreme improbability. It must also be observed that the date of the birth of Joseph Béjard is unknown, and he may have been, and according to M. Jal (*Dictionnaire Critique*, p. 178) must have been, a minor when he was so described in the document of 10th March 1643, while Madeleine had only passed her twenty-fifth birthday, her legal majority, by two months. This view of Joseph's age is supported by Bouquet (*Molière à Rouen*, p. 77). M. Loiseleur's only other proof is that Marie Hervé gave Armande a respectable dowry, and that, as we do not know whence the money came, it must have come from Madeleine. The tradition in Grimarest, which makes Madeleine behave *en femme furieuse*, when she heard of the marriage, is based on a juster appreciation of the

character of women. It will be admitted, probably, that the reasons for supposing that Molière espoused the daughter of a woman who had been his mistress (if she had been his mistress) are flimsy and inadequate. The affair of the dowry is insisted on by M. Livet: (*La Fameuse Comédienne*, reprint of 1877, p. 143). But M. Livet explains the dowry by the hypothesis that Armande was the daughter of Madeleine and the comte de Modène, which exactly contradicts the theory of M. Loiseleur, and is itself contradicted by dates, at least as understood by M. Loiseleur. Such are the conjectures by which the foul calumnies of Molière's enemies are supported in the essays of modern French critics.

To return to the order of events, Molière passed the year 1643 in playing with, and helping to manage, the Théâtre Illustre. The company acted in various tennis-courts, with very little success. Molière was actually arrested by the tradesman who supplied candles, and the company had to borrow money from one Aubrey to release their leader from the Grand Châtelet (13th August 1645). The process of turning a tennis-court into a theatre was somewhat expensive, even though no seats were provided in the pit. The troupe was for a short time under the protection of the duc d'Orléans, but his favours were not lucrative. The duc de Guise, according to some verses printed in 1646, made Molière a present of his cast-off wardrobe. But costume was not enough to draw the public to the tennis-court theatre of the Croix Noire, and empty houses at last obliged the Théâtre Illustre to leave Paris at the end of 1646.

"Nul animal vivant n'entra dans nôtre salle," says the author of the scurrilous play on Molière, *Élomire Hypochondre*. But at that time some dozen travelling companies found means to exist in the provinces, and Molière determined to play among the rural towns. The career of a strolling player is much the same at all times and in all countries. The *Roman Comique* of Scarron gives a vivid picture of the adventures and misadventures, the difficulty of transport, the queer cavalcade of horses, mules, and lumbering carts that drag the wardrobe and properties, the sudden metamorphosis of the tennis-court, where the balls have just been rattling, into a stage, the quarrels with local squires, the disturbed nights in crowded country inns, all the loves and wars of a troupe on the march. Perrault tells us what the arrangements of the theatre were in Molière's early time. Tapestries were hung round the stage, and entrances and exits were made by struggling through the heavy curtains, which often knocked off the hat of the comedian, or gave a strange cock to the helmet of a warrior or a god. The lights were candles stuck in tin sconces at the back and sides, but luxury sometimes went so far that a chandelier of four candles was suspended from the roof. At intervals the candles were let down by a rope and pulley, and any one within easy reach snuffed them with his fingers. A flute and tambour, or two fiddlers, supplied the music. The highest prices were paid for seats in the *dedans* (cost of admission fivepence); for the privilege of standing up in the pit twopence-halfpenny was the charge. The doors were opened at one o'clock, the curtain rose at two.

The nominal director of the Théâtre Illustre in the provinces was Du Fresne; the most noted actors were Molière, the Béjards, and Du Parc, called Gros René. It is extremely difficult to follow exactly the line of march of the company. They played at Bordeaux, for example, but the date of this performance, when Molière (according to Montesquieu) failed in tragedy and was pelted, is variously given as 1644-45 (Trallage), 1647 (Loiseleur), 1648-58 (Lacroix). Perhaps the theatre prospered better elsewhere than in Paris, where the streets were barricaded in

these early days of the war of the Fronde. We find Molière at Nantes in 1648, at Fontenay-le-Compte, and in the spring of 1649 at Agen, Toulouse, and probably at Angoulême and Limoges. In January 1650 they played at Narbonne, and between 1650 and 1653 Lyons was the headquarters of the troupe. In January 1653, or perhaps 1655, Molière gave *L'Étourdi* at Lyons, the first of his finished pieces, as contrasted with the slight farces with which he generally diverted a country audience. It would be interesting to have the precise date of this piece, but La Grange (1682) says that "in 1653 Molière went to Lyons, where he gave his first comedy, *L'Étourdi*," while in his *Registre* La Grange enters the year as 1655. At Lyons De Brie and his wife, the famous Mlle. de Brie, entered the troupe, and Du Parc married marquise de Gorla, better known as Mlle. du Parc. The libellous author of *La Fameuse Comédienne* reports that Molière's heart was the shuttlecock of the beautiful Du Parc and De Brie, and the tradition has a persistent life. Molière's own opinion of the ladies and men of his company may be read between the lines of his *Imprévu de Versailles*. In 1653 Prince de Conti, after many political adventures, was residing at La Grange, near Pézénas, in Languedoc, and chance brought him into relations with his old schoolfellow Molière. Conti had for first gentleman of his bed-chamber the abbé Daniel de Cosnac, whose memoirs now throw light for a moment on the fortunes of the wandering troupe. Cosnac engaged the company "of Molière and of La Béjart;" but another company, that of Cormier, nearly intercepted the favour of the prince. Thanks to the resolution of Cosnac, Molière was given one chance of appearing on the private theatre of La Grange. The excellence of his acting, the splendour of the costumes, and the insistence of Cosnac, and of Sarrasin, Conti's secretary, gained the day for Molière, and a pension was assigned to his company (Cosnac, *Mémoires*, i. 128, Paris, 1852). As Cosnac proposed to pay Molière a thousand crowns of his own money to recompense him in case he was supplanted by Cormier, it is obvious that his profession had become sufficiently lucrative. In 1654, during the session of the estates of Languedoc, Molière and his company played at Montpellier. Here Molière danced in a ballet (*Le Ballet des Incompatibles*) in which a number of men of rank took part, according to the fashion of the time. Molière's own rôles were those of the Poet and the Fishwife. The sport of the little piece is to introduce opposite characters, dancing and singing together. Silence dances with six women, Truth with four courtiers, Money with a poet, and so forth. Whether the ballet, or any parts of it, are by Molière, is still disputed (*La Jeunesse de Molière, suivie du Ballet des Incompatibles*, P. L. Jacob, Paris, 1858). In April 1655 it is certain that the troupe was at Lyons, where they met and hospitably entertained a profligate buffoon, Charles d'Assouey, who informs the ages that Molière kept open house, and "*une table bien garnie*." November 1655 found Molière at Pézénas, where the estates of Languedoc were convened, and where local tradition points out the barber's chair in which the poet used to sit and study character. The longest of Molière's extant autographs is a receipt, dated at Pézénas, 4th February 1656, for 6000 livres, granted by the estates of Languedoc. This year was notable for the earliest representation, at Béziers, of Molière's second finished comedy, the *Dépit Amoureux*. Conti now withdrew to Paris, and began to "make his soul," as the Irish say. Almost his first act of penitence was to discard Molière's troupe (1657), which consequently found that the liberality of the estates of Languedoc was dried up for ever. Conti's relations with Molière must have definitively closed long before 1666, when the now pious prince wrote a treatise against the

stage, and especially charged his old schoolfellow with keeping a new school, a school of atheism (*Traité de la Comédie*, p. 24, Paris, 1666). Molière was now (1657) independent of princes and their favour. He went on a new circuit to Nismes, Orange, and Avignon, where he met another old class-mate, Chapelle, and also encountered the friend of his later life, the painter Mignard. After a later stay at Lyons, ending with a piece given for the benefit of the poor on 27th February 1658, Molière passed to Grenoble, returned to Lyons, and is next found in Rouen, where, we should have said, the Théâtre Illustre had played in 1643 (F. Bouquet, *La Troupe de Molière à Rouen*, p. 90, Paris, 1880). At Rouen Molière must have made or renewed the acquaintance of Pierre and Thomas Corneille. His company had played pieces by Corneille at Lyons and elsewhere. The real business of the comedian in Rouen was to prepare his return to Paris. "After several secret journeys thither he was fortunate enough to secure the patronage of Monsieur, the king's only brother, who granted him his protection, and permitted the company to take his name, presenting them as his servants to the king and the queen-mother" (Preface to La Grange's edition of 1682). The troupe appeared for the first time before Louis XIV. in a theatre arranged in the old Louvre (24th October 1658).

Molière was now thirty-six years of age. He had gained all the experience that fifteen years of practice could give. He had seen men and cities, and noted all the humours of rural and civic France. He was at the head of a company which, as La Grange, his friend and comrade, says, "sincerely loved him." He had the un lucrative patronage of a great prince to back him, and the jealousy of all playwrights, and of the old theatres of the Hôtel de Bourgogne and the Marais, to contend against. In this struggle we can follow him by aid of the *Registre* of La Grange (a brief diary of receipts and payments), and by the help of notices in the rhymed chronicles of Loret.

The first appearance of Molière before the king was all but a failure. *Nicomède*, by the elder Corneille, was the piece, and we may believe that the actors of the Hôtel de Bourgogne, who were present, found much to criticize. When the play was over, Molière came forward and asked the king's permission to act "one of the little pieces with which he had been used to regale the provinces." The *Docteur Amoureux*, one of several slight comedies admitting of much "gag," was then performed, and "diverted as much as it surprised the audience." The king commanded that the troupe should establish itself in Paris (Preface, ed. 1682). The theatre assigned to the company was a *salle* in the Petit Bourbon, in a line with the present Rue du Louvre. Some Italian players already occupied the house on Tuesdays, Fridays, and Sundays; the company of Molière played on the other days. The first piece played in the new house (3d Nov. 1658) was *L'Étourdi*. La Grange says the comedy had a great success, producing seventy pistoles for each actor. The success is admitted even by the spiteful author of *Élomire Hypochondre* (Paris, 1670)— "Je jouai l'Étourdi, qui fut une merveille."

The success, however, is attributed to the farcical element in the play and the acting—the cuckoo cry of Molière's detractors. The original of *L'Étourdi* is the Italian comedy (1629) *L'Inavvertito*, by Nicolò Barbieri detto Beltrame; Molière pushed rather far his right to "take his own wherever he found it." Had he written nothing more original, the contemporary critic of the *Festin de Pierre* might have said, not untruly, that he only excelled in stealing pieces from the Italians. The piece is conventional: the stock characters of the prodigal son, the impudent valet, the old father occupy the stage. But the dialogue

has amazing rapidity, and the vivacity of M. Coquelin in Mascarille still makes *L'Étourdi* a favourite on the stage, though it cannot be read with very much pleasure. The next piece, new in Paris, though not in the provinces, was the *Dépit Amoureux* (first acted at Béziers, 1656). The play was not less successful than *L'Étourdi*. It has two parts, one an Italian *imbroglio*; the other, which alone keeps the stage, is the original work of Molière, though, of course, the idea of *amantium ira* is as old as literature. "Nothing so good," says Mr. Saintsbury, "had yet been seen on the French stage, as the quarrels and reconciliations of the quartette of master, mistress, valet, and soubrette." Even the hostile Le Boulanger de Chalussay (*Élomire Hypochondre*) admits that the audience was much of this opinion—

"Et de tous les côtés chacun cria tout haut,
'C'est la faire et jouer les pièces comme il faut.'"

The same praise was given, perhaps even more deservedly, to *Les Précieuses Ridicules* (18th November 1659). Doubts have been raised as to whether this famous piece, the first true comic satire of contemporary foibles on the French stage, was a new play. La Grange calls it *pièce nouvelle* in his *Registre*, but, as he enters it as the third *pièce nouvelle*, he may only mean that, like *L'Étourdi*, it was new to Paris. The short life of 1682, produced under La Grange's care, and probably written by Marcel the actor, says the *Précieuses* was "made" in 1659. There is another controversy as to whether the ladies of the Hôtel Rambouillet, or merely their *bourgeoises* and rustic imitators, were laughed at. Ménage, in later years at least, professed to recognize an attack on the over-refinement and affectation of the original and, in most ways, honourable *précieuses* of the Hôtel Rambouillet. But Chappelle and Bachaumont had discovered provincial *précieuses*, hyper-æsthetic literary ladies, at Montpellier before Molière's return to Paris; and Furetière, in the *Roman Bourgeois* (1666), found Paris full of middle-class *précieuses*, who had survived, or, like their modern counterparts, had thriven on ridicule. Another question is—Did Molière copy from the earlier *Précieuses* of the abbé de Pure? This charge of plagiarism is brought by Somaize, in the preface to his *Véritables Précieuses*. De Pure's work was a novel (1656), from which the Italian actors had put together an acting piece in their manner, that is, a thing of "gag," and improvised speeches. The reproach is interesting only because it proves how early Molière found enemies who, like Thomas Corneille in 1659, accused him of being skilled only in farce, or, like Somaize, charged him with literary larceny. These were the stock criticisms of Molière's opponents as long as he lived. The success of the *Précieuses Ridicules* was immense; on one famous occasion the king was a spectator, leaning against the great chair of the dying Cardinal Mazarin. The play can never cease to please while literary affectation exists, and it has a comic force of deathless energy. Yet a modern reader may spare some sympathy for the poor heroines, who do not wish, in courtship, to "begin with marriage," but prefer first to have some less formidable acquaintance with their wooers. Molière's next piece was less important, and more purely farcical, *Sganarelle; ou le Cocu Imaginaire* (28th May 1660). The public taste preferred a work of this light nature, and *Sganarelle* was played every year as long as Molière lived. The play was pirated by a man who pretended to have retained all the words in his memory. The counterfeit copy was published by Ribou, a double injury to Molière, as, once printed, any company might act the play. With his habitual good-nature, Molière not only allowed Ribou to publish later works of his, but actually lent money to that knave (Soulié, *Recherches*, p. 287).

On 11th October 1660 the Théâtre du Petit Bourbon was demolished by the superintendent of works, without

notice given to the company. The king gave Molière the Salle du Palais Royal, but the machinery of the old theatre was maliciously destroyed. Meanwhile the older companies of the Marais and the Hôtel de Bourgogne attempted to lure away Molière's troupe, but, as La Grange declares (*Registre*, p. 26), "all the actors loved their chief, who united to extraordinary genius an honourable character and charming manner, which compelled them all to protest that they would never leave him, but always share his fortunes." While the new theatre was being put in order, the company played in the houses of the great, and before the king at the Louvre. In their new house (originally built by Richelieu) Molière began to play on 20th January 1661. Molière now gratified his rivals by a failure. *Don Garcie de Navarre*, a heavy tragi-comedy, which had long lain among his papers, was first represented on 4th February 1661. Either Molière was a poor actor outside comedy, or his manner was not sufficiently "stagy," and, as he says, "demoniac," for the taste of the day. His opponents were determined that he could not act in tragi-comedy, and he, in turn, burlesqued their pretensions and exaggerated manner in a later piece. In the *Précieuses* (sc. ix.) Molière had already rallied "les grands comédiens" of the Hôtel Bourgogne. "Les autres," he makes Mascarille say about his own troupe, "sont des ignorants qui récitent comme l'on parle, ils ne savent pas faire ronfler les vers." All this was likely to irritate the *grands comédiens*, and their friends, who avenged themselves on that unfortunate jealous prince, Don Garcie de Navarre. The subject of this unsuccessful drama is one of many examples which show how Molière's mind was engaged with the serious or comic aspects of jealousy, a passion which he had soon cause to know most intimately. Meantime the everyday life of the stage went on, and the doorkeeper of the Théâtre St. Germain was wounded by some revellers who tried to force their way into the house (La Grange, *Registre*). A year later, an Italian actor was stabbed in front of Molière's house, where he had sought to take shelter (Campardon, *Nouvelles Pièces*, p. 20). To these dangers actors were peculiarly subject: Molière himself was frequently threatened by the marquises and others whose class he ridiculed on the stage, and there seems even reason to believe that there is some truth in the story of the angry marquis who rubbed the poet's head against his buttons, thereby cutting his face severely. The story comes late (1725) into his biography, but is supported by a passage in the contemporary play, *Zélinde* (Paris, 1663, scene viii.). Before Easter, Molière asked for two shares in the profits of his company, one for himself, and one for his wife, if he married. That fatal step was already contemplated (La Grange). On 24th June he brought out for the first time *L'École des Maris*. The general idea of the piece is as old as Menander, and Molière was promptly accused of pilfering from the *Adelphi* of Terence. One of the *ficelles* of the comedy is borrowed from a story as old, at least, as Boccaccio, and still amusing in a novel by Charles de Bernard. It is significant of Molière's talent that the grotesque and baffled paternal wooer, Sganarelle, like several other butts in Molière's comedy, does to a certain extent win our sympathy and pity as well as our laughter. The next new piece was *Les Fâcheux*, a *comédie-ballet*, the Comedy of Bores, played before the king at Fouquet's house at Vaux le Vicomte (August 15-20, 1661). The comedians, without knowing it, were perhaps the real "fâcheux" on this occasion, for Fouquet was absorbed in the schemes of his insatiable ambition (*Quo non ascendam?* says his motto), and the king was organizing the arrest and fall of Fouquet, his rival in the affections of La Vallière. The author of the prologue to *Les Fâcheux*, Pellisson, a friend of Fouquet's, was arrested along with the superintendent of finance. Pellisson's prologue and

name were retained in later editions. In the dedication to the king Molière says that Louis suggested one scene (that of the Sportsman), and in another place he mentions that the piece was written, rehearsed, and played in a fortnight. The fundamental idea of the play, the interruptions by bores, is suggested by a satire of Régnier's, and that by a satire of Horace. Perhaps it may have been the acknowledged suggestions of the king which made gossips declare that Molière habitually worked up hints and *mémories* given him by persons of quality (*Nouvelles Nouvelles*, 1663).

In February 1662 Molière married Armande Béjard. The date is given thus in the *Registre de La Grange*: "Mardy 14, Les Visionnaires, L'Écol des M."

Part. Visite chez M^e d'Equilly."

And on the margin he has painted a blue circle, his way of recording a happy event, with the words, "mariage de M. de Molière au sortir de la Visite." M. Loiseau gives the date in one passage as 29th February, in another as 20th February. But La Grange elsewhere mentions the date as "Shrove Tuesday," which was, it seems, 14th February. Elsewhere M. Loiseau makes the date of the marriage a vague day "in January." The truth is that the marriage contract is dated 23d January 1662 (Soulié, *Documents*, p. 203). Where it is so difficult to establish the date of the marriage, a simple fact, it must be infinitely harder to discover the truth as to the conduct of Madame Molière. The abominable assertions of the anonymous libel, *Les Intrigues de Molière et celles de sa Femme; ou la Fameuse Comédienne* (1688), have found their way into tradition, and are accepted by many biographers. But M. Livet and M. Bazin have proved that the alleged lovers of Madame Molière were actually absent from France, or from the court, at the time when they are reported, in the libel, to have conquered her heart. A conversation between Chapelle and Molière, in which the comedian is made to tell the story of his wrongs, is plainly a mere fiction, and is answered in Grimarest by another dialogue between Molière and Rohault, in which Molière only complains of a jealousy which he knows to be unfounded. It is noticed, too, that the contemporary assailants of Molière counted him among jealous, but not among deceived, husbands. The hideous accusation brought by the actor Montfleury, that Molière had married his own daughter, Louis XIV. answered by becoming the godfather of Molière's child. The king, indeed, was a firm friend of the actor, and, when Molière was accused of impiety on the production of *Don Juan* (1665), Louis gave him a pension. We need not try to make Madame Molière a *vertu*, as French ladies of the theatre say, but it is certain that the charges against her are unsubstantiated. It is generally thought that Molière drew her portrait in *Le Bourgeois Gentilhomme*, acte iii. sc. ix., "elle est capricieuse, mais on souffre tout des Belles."

From 1662 onwards Molière suffered the increasing hatred of his rival actors. La Grange mentions the visit of Floridor and Montfleury to the queen-mother, and their attempt to obtain equal favour, "la troupe de Molière leur donnant beaucoup de jalousie" (12th August 1662). On 26th December was played for the first time the admirable *École des Femmes*, which provoked a literary war, and caused a shower of "paper bullets of the brain." The innocence of Agnes was called indecency; the sermon of Arnolphe was a deliberate attack on Christian mysteries. We have not the space to discuss the religious ideas of Molière; but both in *L'École des Femmes* and in *Don Juan* he does display a bold contempt for the creed of "boiling cauldrons" and of a physical hell. A brief list of the plays and pamphlets provoked by *L'École des Femmes* is all we can offer in this place.

December 26, 1662.—*École des Femmes*.

February 9, 1663.—*Nouvelles Nouvelles*, by De Visé. Molière is accused of pilfering from Straparola.

June 1, 1663.—Molière's own piece, *Critique de l'École des Femmes*. In this play Molière retorts on the critics, and especially on his favourite butt, the critical marquis.

August 1663.—*Zélinde*, a play by De Visé, is printed. The scene is in the shop of a seller of lace, where persons of quality meet, and attack the reputation of "Élomire," that is, Molière. He steals from the Italian, the Spanish, from Furetière's *Francion*, "il lit tous les vieux bouquins," he insults the noblesse, he insults Christianity, and so forth.

November 17, 1663.—*Portrait du Peintre* is printed,—an attack on Molière by Boursault. This piece is a detailed criticism, by several persons, of *L'École des Femmes*. It is pronounced dull, vulgar, farcical, obscene, and (what chiefly vexed Molière, who knew the danger of the accusation) impious. Perhaps the only biographical matter we gain from Boursault's play is the interesting fact that Molière was a tennis-player. On 4th November 1663 Molière replied with *L'Impromptu de Versailles*, a witty and merciless attack on his critics, in which Boursault was mentioned by name. The actors of the Hôtel de Bourgogne were parodied on the stage, and their art was ridiculed.

The next scenes in this comedy of comedians were:—

November 30.—The *Panegyrique de l'École des Femmes*, by Robinet.

December 7.—*Réponse à l'Impromptu; ou la Vengeance des Marquis*, by De Visé.

January 19, 1664.—*L'Impromptu de l'Hôtel de Condé*. It is a reply by a son of Montfleury.

March 17, 1664.—*La Guerre Comique; ou Défense de l'École des Femmes*.

1664.—*Lettre sur les Affaires du Théâtre*, published in *Diversités Galantes*, by the author of *Zélinde*.

In all those quarrels the influence of Corneille was opposed to Molière, while his cause was espoused by Boileau, a useful ally, when "les comédiens et les auteurs, depuis le cèdre [Corneille ?] jusqu'à l'hysope, sont diablement animés contre lui" (*Impromptu de Versailles*, scène v.).

Molière's next piece was *Le Mariage Forcé* (15th February 1664), a farce with a ballet. The comic character of the reluctant bridegroom excites contemptuous pity, as well as laughter. From the end of April till 22d May the troupe was at Versailles, acting among the picturesque pleasures of that great festival of the king's. The *Princesse d'Élide* was acted for the first time, and the three first acts of *Tartuffe* were given. Molière's natural hatred of hypocrisy had not been diminished by the charges of blasphemy which were showered on him after the *École des Femmes*. *Tartuffe* made enemies everywhere. Jansenists and Jesuits, like the two marquises in *L'Impromptu de Versailles*, each thought the others were aimed at. Five years passed before Molière got permission to play the whole piece in public. In the interval it was acted before Madame, Condé, the legate, and was frequently read by Molière in private houses. The *Gazette* of 17th May 1664 (a paper hostile to Molière) says that the king thought the piece inimical to religion. Louis was not at that time on good terms with the *dévots*, whom his amours scandalized; but, not impossibly, the queen-mother (then suffering from her fatal malady) disliked the play. A most violent attack on Molière, "that demon clad in human flesh," was written by one Pierre Roullé (*Le Roy Glorieux au Monde*, Paris, 1664). This fierce pamphlet was suppressed, but the king's own copy, in red morocco with the royal arms, remains to testify to the bigotry of the author, who was curé of Saint Barthélemy. According to Roullé, Molière deserved to be sent through earthly to eternal fires. The play was prohibited, as we have seen, but in August 1665 the king adopted Molière's troupe as his servants, and gave them the title of "troupe du roy." This, however, did not cause Molière to relax his efforts to obtain permission for *Tartuffe* (or *Tartufe*, or *Tartufle*, as it was variously spelled), and his perseverance was at length successful. That his thoughts were busy with contemporary hypocrisy is proved by certain scenes in one of his greatest pieces, the *Festin de Pierre*, or *Don Juan* (15th February 1665). The legend of *Don Juan* was familiar already on the Spanish, Italian,

and French stages. Molière made it a new thing: terrible and romantic in its portrait of *un grand seigneur mauvais homme*, modern in its suggested substitution of *la humanité* for religion, comic, even among his comedies, by the mirthful character of Sganarelle. The piece filled the theatre, but was stopped, probably by authority, after Easter. It was not printed by Molière, and even in 1682 the publication of the full text was not permitted. Happily the copy of De la Regnie, the chief of the police, escaped obliterations, and gave us the full scene of Don Juan and the Beggar. The piece provoked a virulent criticism (*Observations sur le Festin de Pierre*, 1665). It is allowed that Molière has some farcical talent, and is not unskilled as a plagiarist, but he "attacks the interests of Heaven," "keeps a school of infidelity," "insults the king," "corrupts virtue," "offends the queen-mother," and so forth. Two replies were published, one of which is by some critics believed to show traces of the hand of Molière. The king's reply, as has been shown, was to adopt Molière's company as his servants, and to pension them. *L'Amour Médecin*, a light comedy, appeared 22d September 1665. In this piece Molière, for the second time, attacked physicians. In December there was a quarrel with Racine about his play of *Alexandre*, which he treacherously transferred to the Hôtel de Bourgogne. June 4, 1666 saw the first representation of that famous play, *Le Misanthrope (ou L'Atrabilaire Amoureux*, as the original second title ran). This piece, perhaps the masterpiece of Molière, was more successful with the critics, with the court, and with posterity than with the public. The rival comedians called it "a new style of comedy," and so it was. The eternal passions and sentiments of human nature, modified by the influence of the utmost refinement of civilization, were the matter of the piece. The school for scandal kept by Célimène, with its hasty judgments on all characters, gave the artist a wide canvas. The perpetual strife between the sensible optimism of a kindly man of the world (Philinte) and the *sæva indignatio* of a noble nature soured (Alceste) supplies the intellectual action. The humours of the joyously severe Célimène and of her court, especially of that deathless minor poet Oronte, supply the lighter comedy. Boileau, Lessing, Goethe have combined to give this piece the highest rank even among the comedies of Molière. As to the "keys" to the characters, and the guesses about the original from whom Alceste was drawn, they are as valueless as other contemporary tattle.

A briefer summary must be given of the remaining years of the life of Molière. The attractions of *Le Misanthrope* were reinforced (6th August) by those of the *Médecin Malgré Lui*, an amusing farce founded on an old *fabliau*. In December the court and the comedians went to Saint Germain, where, among other diversions, the pieces called *Mélicerte*, *La Pastorale Comique* (of which Molière is said to have destroyed the MS.), and the charming little piece *Le Sicilien*, were performed. A cold and fatigue seem to have injured the health of Molière, and we now hear of the consumptive tendency which was cruelly ridiculed in *Elomire Hypochondre*. Molière was doubtless obliged to see too much of the distracted or pedantic physicians of an age when medicine was the battlefield of tradition, superstition, and nascent chemical science. On 17th April 1667 Robinet, the rhyming gazetteer, says that the life of Molière was thought to be in danger. On the 10th of June, however, he played in *Le Sicilien* before the town. In the earlier months of 1667 Louis XIV. was with the army in Flanders. There were embassies sent from the comedy to the camp, and on 5th August it was apparent that Molière had overcome the royal scruples. *Tartuffe* was played, but Lamoignon stopped it after the first night. La Grange and La Torillière hastened to the camp, and

got the king's promise that he would reconsider the matter on his return. Molière's next piece (13th January 1668) was *Amphitryon*, a free—a very free—adaptation from Plautus, who then seems to have engaged his attention, for not long afterwards he again borrowed from the ancient writer in *L'Avare*. There is a controversy as to whether *Amphitryon* was meant to ridicule M. de Montespan, the husband of the new mistress of Louis XIV. Michelet has a kind of romance based on this probably groundless hypothesis. The king still saw the piece occasionally, after he had purged himself and forsworn sack under Madame de Maintenon, and probably neither he nor that devout lady detected any personal references in the coarse and witty comedy. As usual, Molière was accused of plagiarizing, this time from Rotrou, who had also imitated Plautus. The next play was the immortal *George Dandin* (10th July), first played at a festival at Versailles. Probably the piece was a rapid palimpsest on the ground of one of his old farces, but the addition of these typical members of a county family, the De Sotenville, raises the work from farce to satiric comedy. The story is borrowed from Boccaccio, but is of unknown age, and always new,—Adolphus Crosbie in *The Small House at Allington* being a kind of modern George Dandin. Though the sad fortunes of this peasant with social ambition do not fail to make us pity him somewhat, it is being too refined to regard *George Dandin* as a comedy with a concealed tragic intention. Molière must have been at work on *L'Avare* before *George Dandin* appeared, for the new comedy after Plautus was first acted on 9th September. There is a tradition that the piece almost failed; but, if unpopular in the first year of its production, it certainly gained favour before the death of its author. *M. de Pourceaugnac* (17th September 1669) was first acted at Chambord, for the amusement of the king. It is a rattling farce. The physicians, as usual, bore the brunt of Molière's raillery, some of which is still applicable: Earlier in 1669 (5th February) *Tartuffe* was played at last, with extraordinary success. *Les Amants Magnifiques*, a comedy-ballet, was acted first at Saint Germain (10th February 1670). The king might have been expected to dance in the ballet, but from Racine's *Britannicus* (13th December 1669) the majestic monarch learned that Nero was blamed for exhibitions of this kind, and he did not wish to out-Nero Nero. Astrology this time took the place of medicine as a butt, but the satire has become obsolete, except, perhaps, in Turkey, where astrology is still a power. The *Bourgeois Gentilhomme*, too familiar to require analysis, was first played on 23d October 1770. The lively *Fourberies de Scapin* "saw the footlights" (if footlights there were) on 24th May 1671, and on 7th May we read in La Grange, "les Repetitions de Spsyche ont commencé." La Grange says the theatre was newly decorated and fitted with machines. A "concert of twelve violins" was also provided, the company being resolute to have everything handsome about them. New singers were introduced, who did not refuse to sing unmasked on the stage. Quinault composed the words for the music, which was by Lulli; Molière and Pierre Corneille collaborated in the dialogue of this magnificent opera, the name of which (*Psyche*) La Grange eventually learned how to spell. The *Comtesse d'Escarbagnas* (2d February 1672) was another piece for the amusement of the court, and made part of an entertainment called *Le Ballet des Ballets*. In this play, a study of provincial manners, Molière attacked the financiers of the time in the person of M. Harpin. The comedy has little importance compared with *Les Femmes Savantes* (11th February), a severer *Précieuses*, in which are satirized the vanity and affectation of sciolists, pedants, and the women who admire them. The satire is never out of date, and finds its modern form in

Le Monde où l'on s'ennuie, by M. Pailleron. On the 17th February Madeleine Béjard died, and was buried at St Paul. She did not go long before her old friend or lover, Molière. His *Mariage Forcé*, founded, perhaps, on a famous anecdote of De Gramont, was played on 8th July. On 7th August La Grange notes that Molière was indisposed, and there was no comedy. Molière's son died on the 11th October. On 22d November the preparations for the *Malade Imaginaire* were begun. On 10th February 1673 the piece was acted for the first time. What occurred on 17th February we translate from the *Registre* of La Grange:—

"This same day, about ten o'clock at night, after the comedy, Monsieur de Molière died in his house, Rue de Richelieu. He had played the part of the said Malade, suffering much from cold and inflammation, which caused a violent cough. In the violence of the cough he burst a vessel in his body, and did not live more than half an hour or three-quarters after the bursting of the vessel. His body is buried at St Joseph's, parish of St Eustache. There is a gravestone raised about a foot above the ground."

Molière's funeral is thus described in a letter, said to be by an eye-witness, discovered by M. Benjamin Fillon:—

"Tuesday, 21st February, about nine in the evening, was buried Jean Baptiste Poquelin Molière, *lapissier valet du chambre*, and a famous actor. There was no procession, except three ecclesiastics; four priests bore the body in a wooden bier covered with a pall, six children in blue carried candles in silver holders, and there were lackeys with burning torches of wax. The body . . . was taken to St Joseph's churchyard, and buried at the foot of the cross. There was a great crowd, and some twelve hundred livres were distributed among the poor. The archbishop had given orders that Molière should be interred without any ceremony, and had even forbidden the clergy of the diocese to do any service for him. Nevertheless a number of masses were commanded to be said for the deceased."

When an attempt was made to exhume the body of Molière in 1792, the wrong tomb appears to have been opened. Unknown is the grave of Molière.

Molière, according to Mlle. Poisson, who had seen him in her extreme youth, was "neither too stout nor too thin, tall rather than short; he had a noble carriage, a good leg, walked slowly, and had a very serious expression. His nose was thick, his mouth large with thick lips, his complexion brown, his eyebrows black and strongly marked, and it was his way of moving these that gave him his comic expression on the stage." "His eyes seemed to search the deeps of men's hearts," says the author of *Zélinde*. The inventories printed by M. Soulié prove that Molière was fond of rich dress, splendid furniture, and old books. The charm of his conversation is attested by the names of his friends, who were all the wits of the age, and the greater their genius the greater their love of Molière. As an actor, friends and enemies agreed in recognizing him as most successful in comedy. His ideas of tragic declamation were in advance of his time, for he set his face against the prevalent habit of ranting. His private character was remarkable for gentleness, probity, generosity, and delicacy, qualities attested not only by anecdotes but by the evidence of documents. He is probably (as Menander is lost) the greatest of all comic writers within the limits of social and refined as distinguished from romantic comedy, like that of Shakespeare, and of political comedy, like that of Aristophanes. He has the humour which is but a sense of the true value of life, and now takes the form of the most vivacious wit and the keenest observation, now of melancholy, and pity, and wonder at the fortunes of mortal men. In the literature of France his is the greatest name, and in the literature of the modern drama the greatest after that of Shakespeare. Besides his contemplative genius he possessed an unerring knowledge of the theatre, the knowledge of a great actor and a great manager, and hence his plays can never cease to hold the stage, and to

charm, if possible, even more in the performance than in the reading.

There is no biography of Molière on a level with the latest researches into his life. The best is probably that of M. Taschereau, prefixed to an edition of his works (*Œuvres Complètes*, Paris, 1863). To this may be added Jules Loiseleur's *Les Points Obscurs de la Vie de Molière*, Paris, 1877. We have seen that M. Loiseleur is not always accurate, but he is laborious. For other books it is enough to recommend the excellent *Bibliographie Moliéresque* of M. Paul Lacroix (1875), which is an all but faultless guide. The best edition of Molière's works for the purposes of the student is that published in *Les Grands Écrivains de la France* (Hachette, Paris, 1874-1882). The edition is still incomplete. It contains reprints of many contemporary tracts, and, with the *Registre* of La Grange, and the *Collection Moliéresque* of M. Lacroix, is the chief source of the facts stated in this notice, in cases where the rarity of documents has prevented the writer from studying them in the original texts. Another valuable authority is the *Recherches sur Molière et sur sa Famille* of Ed. Soulié (1863). Lotheisen's *Molière, sein Leben und seine Werke* (Frankfurt, 1880), is a respectable German compilation. *Le Moliériste* (Tresse, Paris, edited by M. Georges Monval) is a monthly serial, containing notes on Molière and his plays, by a number of contributors. The essays, biographies, plays, and poems on Molière are extremely numerous. The best guide to these is the indispensable *Bibliographie* of M. Lacroix. The English biographies are few and as a rule absolutely untrustworthy. (A. L.)

MOLINA, LUIS (1535-1600), a Spanish Jesuit, when Pascal's *Lettres d'un Provincial* have rendered immortal, was born at Cuenca in 1535. Having at the age of eighteen become a member of the Company of Jesus, he studied theology at Coimbra, and afterwards became professor in the university of Evora, Portugal. From this post he was called, at the end of twenty years, to the chair of moral theology in Madrid, where he died on 12th October 1600. Besides other works he wrote *Liberi arbitrii cum gratia donis, divini præscientia, providentia, prædestinatione et reprobatione, concordia* (4to, Lisbon, 1588); a commentary on the first part of the *Summa* of Thomas Aquinas (2 vols., fol., Cuenca, 1593); and a treatise *De Justitia et Jure* (6 vols., 1593-1609). It is to the first of these that his fame is principally due. It was an attempt to reconcile, in words at least, the Augustinian doctrines of predestination and grace with the Semipelagianism which, as shown by the recent condemnation of BAJUS (*q.v.*), had become prevalent in the Roman Catholic Church. Assuming that man is free to perform or not to perform any act whatever, Molina maintains that this circumstance renders the grace of God neither unnecessary nor impossible:—not impossible, for God never fails to bestow grace upon those who ask it with sincerity; and not unnecessary, for grace, although not an efficient, is still a sufficient cause of salvation. Nor, in Molina's view, does his doctrine of free-will exclude predestination. The omniscient God, by means of His "scientia media" (the phrase is Molina's invention, though the idea is also to be found in his older contemporary Fonseca), or power of knowing future contingent events, foresees how we shall employ our own free-will and treat His proffered grace, and upon this foreknowledge He can found His predestinating decrees. These doctrines, although in harmony with the prevailing feeling of the Roman Catholic Church of the period, and further recommended by their marked opposition to the teachings of Luther and Calvin, excited violent controversy in some quarters, especially on the part of the Dominicans, and at last rendered it necessary for the pope (Clement VIII.) to interfere. At first (1594) he simply enjoined silence on both parties so far as Spain was concerned; but ultimately, in 1598, he appointed the "Congregatio de Auxiliis Gratia" for the settlement of the dispute, which became more and more a party one. After holding very numerous sessions, the "congregation" was able to decide nothing, and in 1607 its meetings were suspended by Paul V., who announced his intention of himself pronouncing judgment in due time. He contented himself, however in 1611,

with prohibiting all further discussion of the question "de auxiliis," and studious efforts were made to control the publication even of commentaries on Aquinas. The Molinist subsequently passed into the Jansenist controversy, and it is as a champion of Jansenism that Pascal in the *Provincial Letters* attacks Molina and the *scientia media* (see JANSENISM).

MOLINE, a city of the United States, in Rock Island county, Illinois, is situated in a picturesque district on the left bank of the Mississippi, opposite the upper end of Rock Island. First settled in 1832, the town was organized as a city in 1872. It is noted for its water-power, developed and maintained by the Government, and for the number and importance of its manufacturing establishments. By means of a dam nearly a mile in length, from the Illinois shore to the island, an almost uniform head of 7 feet of water is obtained, which is used in driving the machinery of the Government arsenal on the island, and in supplying power to several factories. Beds of bituminous coal are mined in the neighbourhood, and three lines of railway pass through the city, affording with the river ample means of communication. The most prominent manufactures are agricultural implements and machinery generally, waggons, organs, paper, and stoves. Moline has nine churches, a complete system of graded free schools, including a high school, and a free library. The population increased from 4066 in 1870 to 7805 in 1880, and with the suburbs the number is now estimated at 12,000.

MOLINOS, MIGUEL DE (1627-c. 1696), a Spanish priest whose name is intimately associated with that type of religion known in Italy and Spain during the latter half of the 17th century as Quietism, was born of good family in the diocese of Saragossa, on 21st December 1627. Having entered the priesthood, he settled about his fortieth year in Rome, where he speedily rose to high repute as a father confessor, and gained many distinguished friends, among whom were several cardinals, including Odescalchi (afterwards Innocent XI., 1676). In 1675 he published at Rome a small duodecimo volume entitled *Guida spirituale che disinvolve l'anima e la conduce per l'interior cammino all'acquisto della perfetta contemplazione e del ricco tesoro della pace interiore*, which was soon afterwards followed by the *Breve trattato della quotidiana comunione*, usually bound up with it in later editions. The work, which breathes a spirit of simple and earnest piety, is designed to show how inward peace may be found by what may be called contemplative or passive prayer, by obedience, by frequent communion, and by inward mortification; it was widely circulated, and greatly increased the popularity of its author, whom Innocent XI. after his elevation provided with rooms in the Vatican, and is said to have also taken as his spiritual director. Its doctrine of the passivity of the highest contemplation and purest prayer does not appear to have raised the slightest discussion until after the publication, in 1681, of the *Concordia tra la fatica e la quiete nell'orazione*, by the Jesuit preacher, Paolo Segneri. Although scrupulously refraining from any mention of the name of Molinos, and indeed displaying considerable moderation as a controversialist, Segneri by this tract and by another with which he followed it up brought upon himself much unpopularity; and so great did the excitement become that a committee was at last appointed by the Inquisition to investigate his own views as well as to examine the writings of Molinos and of his friend Petrucci (author of *La contemplazione mistica acquistata*). The report (1682) was entirely favourable to the doctrines of the *Guida Spirituale*, the writings of Segneri being censured as scandalous and heretical; but in 1685, in consequence of representations made to the pope by Louis XIV., under the Jesuit influence of Père La Chaise, both Petrucci and

Molinos were laid under arrest, and the papers of the latter, including a voluminous correspondence, seized. Petrucci was soon afterwards liberated, and relieved from further persecution by the gift of a cardinal's hat; but, after Molinos had languished in confinement for two years, suddenly 200 persons, many of them of high rank, were also apprehended by order of the Inquisition for what were then for the first time called "Quietist" opinions. In 1687 the pope signified his approval of the condemnation pronounced by the Inquisition on sixty-eight doctrines imputed to Molinos. The "heretic" forthwith "abjured" these, and thus escaped the flames indeed, but did not regain his liberty. Of his later years nothing is known; according to the most probable accounts he languished in imprisonment until 25th December 1696.

The evidence on which certain charges of immorality against Molinos were based is unknown, and the degree of his responsibility for certain of the condemned propositions is obscure; but a perusal of the *Guida Spirituale* at least does not disclose to the candid reader any reason wherefore Molinos should not have been tolerated within a church which has canonized St Theresa. The explanation of the treatment to which he was subjected is most probably to be sought rather in the negative than in the positive aspects of his teaching, and still more in the passing exigencies of party politics. As Tholuck remarks, it was hardly to be expected that the Society of Jesus should regard as otherwise than highly dangerous a man who "declared confession and outward mortification to be work only for beginners, who himself abstained from confessing for twelve years on end, by whose advice countless monks and nuns had thrown aside chaplets, images, and reliques, that they might worship God in the spirit, and who, moreover, stood well with the fashionable world and with the pope himself." The *Guida Spirituale* was published in Spanish at Madrid in 1676, and frequently afterwards; it was also translated into Latin (*Manuductio Spirituales*, Leipsic, 1687) by A. H. Francke, the well-known German pietist and philanthropist, and an English version (*The spiritual guide, which disentangles the soul and brings it by the inward way to the getting of perfect contemplation and the rich treasure of eternal peace: with a brief treatise concerning daily communion*) appeared in 1688. The materials for a history of the Quietist controversy are very fully given in the third volume of Gottfried Arnold's *Kirchen-und Ketzerhistorie*. See also Heppel, *Geschichte der quietistischen Mystik in der Katholischen Kirche* (Berlin, 1875); Tholuck's article on "Molinos" in Herzog's *Realencyklopädie*; and Bigelow, *Molinos the Quietist*, New York, 1882.

MOLISE, now CAMPOBASSO, a province of Italy, stretching twenty miles along the coast of the Adriatic, and bounded by the Abruzzi (Chieti and Aquila), Terra di Lavoro (Caserta), Benevento, and Capitanata (Foggia). Most of it lies on the north-eastern side of the Apennines, and is watered by the Biferno, the Forlone, and the Trigno; but it also includes the country on the other side which contains the head streams of the Volturno. About five-sixths of the surface may be described as mountainous or hilly, the loftiest range being the Matese on the borders towards Benevento, with its highest point in Monte Miletto, 6750 feet. The population, which increased from 346,007 in 1861 to 365,434 in 1881, is mainly dependent on pastoral and agricultural pursuits, neither manufactures nor trade being highly developed. According to the census of 1871, there were six places with more than 5000 inhabitants—Campobasso, 12,890; Riccia, 8123; Isernia, 7715; Agnone, 7147; Casalende, 6217; and Larino, 5357; according to the census of 1881, 21 of the 133 communes had a population exceeding 4000.

The Molise territory was in ancient times part of the country of the Sabines and Samnites. Under the Lombards it was included in the duchy of Benevento; but the districts of Sepino, Boiano, and Isernia were cut off to form a domain for the Bulgarians who had come to assist King Grimoald. About two centuries later this became the countship of Boiano, and the name was soon after changed to countship of Molise, probably because the lordship was held by Ugone di Molisio, or Molise. Attached under Frederick II. to the Terra di Lavoro, and at a later date incorporated with Capitanata, the district did not again become an independent province till 1811. In 1861 it surrendered fifteen communes to Benevento, and received thirteen from Terra di Lavoro.

MOLLUSCA

THE Mollusca form one of the great "phyla," or sub-kingdoms of the Animal Pedigree or Kingdom.

Literary History of the Group.—The shell-bearing forms belonging to this group which were known to Linnæus were placed by him (in 1748) in the third order of his class Vermes under the name "Testacea," whilst the Echinoderms, Hydroids, and Annelids, with the naked Molluscs, formed his second order, termed "Zoophyta." Ten years later he replaced the name "Zoophyta" by "Mollusca," which was thus in the first instance applied, not to the Mollusca at present so termed, but to a group consisting chiefly of other organisms. Gradually, however, the term Mollusca became used to include those Mollusca formerly placed among the "Testacea," as well as the naked Mollusca.

It is important to observe that the term *μαλάκια*, of which Mollusca is merely a Latinized form, was used by Aristotle to indicate a group consisting of the Cuttle-fishes only.

The definite erection of the Mollusca into the position of one of the great primary groups of the animal kingdom is due to George Cuvier (1788-1800), who largely occupied himself with the dissection of representatives of this type (1).¹ An independent anatomical investigation of the Mollusca had been carried on by the remarkable Neapolitan naturalist Poli (1791), whose researches (2) were not published until after his death (1817), and were followed by the beautiful works of another Neapolitan zoologist, the illustrious Delle Chiaje (3).

The "embranchement" or sub-kingdom Mollusca, as defined by Cuvier, included the following classes of shell-fish:—1, the cuttles or poulps, under the name CEPHALOPODA; 2, the snails, whelks, and slugs, both terrestrial and marine, under the name GASTROPODA; 3, the sea-butterflies or winged-snails, under the name PTEROPODA; 4, the clams, mussels, and oysters, under the name ACEPHALA; 5, the lamp-shells, under the name BRACHIOPODA; 6, the sea-squirts or ascidians, under the name NUDA; and 7, the barnacles and sea-acorns, under the name CIRRHOPODA.

The main limitations of the sub-kingdom or phylum Mollusca, as laid down by Cuvier, and the chief divisions thus recognized within its limits by him, hold good to the present day. At the same time, three of the classes considered by him as Mollusca have been one by one removed from that association in consequence of improved knowledge, and one additional class, incorporated since his day with the Mollusca with general approval, has, after more than forty years, been again detached and assigned an independent position owing to newly-acquired knowledge.

The first of Cuvier's classes to be removed from the Mollusca was that of the Cirrhopoda. Their affinities with the lower Crustacea were recognized by Cuvier and his contemporaries, but it was one of the brilliant discoveries of that remarkable and too-little-honoured naturalist, J. Vaughan Thompson of Cork, which decided their position as Crustacea. The metamorphoses of the Cirrhopoda were described and figured by him in 1830 in a very complete manner, and the legitimate conclusion as to their affinities was formulated by him (4). Thus it is to Thompson (1830), and not to Burmeister (1834), as erroneously stated by Kefenstein, that the merit of this discovery belongs. The next class to be removed from Cuvier's Mollusca was that of the Nuda, better known as Tunicata. In 1806 the Russian embryologist Kowalewsky startled the zoological world with a minute account of the developmental changes of Ascidia, one of the Tunicata (5), and it became evident that the

affinities of that class were with the Vertebrata, whilst their structural agreements with Mollusca were only superficial. The last class which has been removed from the Cuvierian Mollusca is that of the Lamp-shells or Brachiopoda. The history of its dissociation is connected with that of the class, viz., the Polyzoa or Bryozoa, which has been both added to and again removed from the Mollusca between Cuvier's date and the present day. The name of J. Vaughan Thompson is again that which is primarily connected with the history of a Molluscan class. In 1830 he pointed out that among the numerous kinds of "polyps" at that time associated by naturalists with the Hydroids, there were many which had a peculiar and more elaborate type of organization, and for these he proposed the name Polyzoa (6). Subsequently (7) they were termed Bryozoa by Ehrenberg (1831).

Henri Milne-Edwards in 1844 demonstrated (8) the affinities of the Polyzoa with the Molluscan class Brachiopoda, and proposed to associate the three classes Brachiopoda, Polyzoa, and Tunicata in a large group "Molluscoidea," coordinate with the remaining classes of Cuvier's Mollusca, which formed a group retaining the name Mollusca. By subsequent writers the Polyzoa have in some cases been kept apart from the Mollusca and classed with the "Vermes;" whilst by others (including the present writer) they have, together with the Brachiopoda, been regarded as true Mollusca. The recent investigation by Mr. Caldwell (1882) of the developmental history of Phoronis (9), together with other increase of knowledge, has now, however, established the conclusion that the agreement of structure supposed to obtain between Polyzoa and true Mollusca is delusive; and accordingly they, together with the Brachiopoda, have to be removed from the Molluscan phylum. Further details in regard to this, the last revolution in Molluscan classification, will be found in the article POLYZOA.

As thus finally purified by successive advances of embryological research, the Mollusca are reduced to the Cuvierian classes of Cephalopoda, Pteropoda, Gastropoda, and Acephala. Certain modifications in the disposition of these classes are naturally enough rendered necessary by the vast accumulation of knowledge as to the anatomy and embryology of the forms comprised in them during fifty years. Foremost amongst those who have within that period laboured in this group are the French zoologists Henri Milne-Edwards (20) and Lacaze Duthiers (21), to the latter of whom we owe the most accurate dissections and beautiful illustrations of a number of different types. To Kölliker (22), Gegenbaur (23), and more recently Spengel (24), amongst German anatomists, we are indebted for epoch-making researches of the same kind. In England, Owen's anatomy of the Pearly Nautilus (10), Huxley's discussion of the general morphology of the Mollusca (11), and Lankester's embryological investigations (12), have aided in advancing our knowledge of the group. Two remarkable works of a systematic character dealing with the Mollusca deserve mention here—the *Manual of the Mollusca* by the late Dr. S. P. Woodward, a model of clear systematic exposition, and the exhaustive treatise on the Malacozoa or Weichthiere by the late Professor Kefenstein of Göttingen, published as part of Bronn's *Classen und Ordnungen des Thier-Reichs*. The latter work is the most completely illustrated and most exhaustive survey of existing knowledge of a large division of the animal kingdom which has ever been produced, and, whilst forming a monument to its lamented author, places the student of Molluscan morphology in a peculiarly favourable position.

¹ These figures refer to the bibliography at the end of the article, p. 635

Classes of the Mollusca.—The classes of the Mollusca which we recognize are as follows:—

Phylum MOLLUSCA.

BRANCH A.—Glossophora.

BRANCH B.—Lipocephala
(= Acephala, *Cuvier*).

Class 1.—GASTROPODA.

Br. a.—*Isopleura*.

Examples—Chiton, Neomenia.

Br. b.—*Anisopleura*.

Examples—Limpet, Whelk, Snail, Slug.

Class 2.—SCAPHOPODA.

Example—Tooth-shell.

Class 3.—CEPHALOPODA.

Br. a.—*Pteropoda*.

Examples—Hyalæa, Pneumoderm.

Br. b.—*Siphonopoda*.

Examples—Nutilus, Cuttles, Poulp.

Class 1.—LAMELLIBRANCHIA

(Syn. *Conchifera*).

Examples—Oyster, Mussel, Clam, Cockle.

General Characters of the Mollusca.—The forms comprised in the above groups, whilst exhibiting an extreme range of variety in shape, as may be seen on comparing an Oyster, a Cuttle-fish, and a Sea-slug such as *Doris*; whilst adapted, some to life on dry land, others to the depths of the sea, others to rushing streams; whilst capable, some of swimming, others of burrowing, crawling, or jumping, some, on the other hand, fixed and immobile; some amongst the most formidable of carnivores, others feeding on vegetable mud, or on the minutest of microscopic organisms—yet all agree in possessing in common a very considerable number of structural details which are not possessed in common by any other animals.

The structural features which the Mollusca do possess in common with other animals belonging to other great phyla of the animal kingdom are those characteristic of the Cœlomata, one of the two great grades (the other and lower being that of the Cœlentera) into which the higher animals, or Enterozoa as distinguished from the Protozoa, are divided (13). The Enterozoa all commence their individual existence as a single cell or plastid, which multiplies itself by transverse division. Unlike the cells of the Protozoa, these embryonic cells of the Enterozoa do not remain each like its neighbour and capable of independent life, but proceed to arrange themselves in two layers, taking the form of a sac. The cavity of the two-cell-layered sac or Diblastula thus formed is the primitive gut or ARCH-ENTERON. In the Cœlentera, whatever subsequent changes of shape the little sac may undergo as it grows up to be Polyp or Jelly-fish, the original arch-enteron remains as the one cavity pervading all regions of the body. In the Cœlomata the arch-enteron becomes in the course of development divided into two totally distinct cavities shut off from one another—an axial cavity, the MET-ENTERON, which retains the function of a digestive gut; and a peri-axial cavity, the CŒLOM or body-cavity, which is essentially the blood-space, and receives the nutritive products of digestion and the waste products of tissue-change by osmosis. The Mollusca agree in being Cœlomate with the phyla Vertebrata, Platyhelma (Flat-worms), Echinodermata, Appendiculata (Insects, Rugged-worms, &c.), and others,—in fact, with all the Enterozoa except the Sponges, Corals, Polyps, and Medusæ.

In common with all other Cœlomata, the Mollusca are at one period of life possessed of a PROSTOMIUM or region in front of the mouth, which is the essential portion of the "head," and is connected with the property of forward locomotion in a definite direction and the steady carriage of the body (as opposed to rotation of the body on its long axis). As a result, the Cœlomata, and with them the Mollusca, present (in the first instance) the general

condition of body known as BILATERAL SYMMETRY; the dorsal is differentiated from the ventral surface, whilst a right and a left side similar to, or rather the complements of, one another are permanently established. In common with all other Cœlomata, the Mollusca have the mouth and first part of the alimentary canal which leads into the met-enteron formed by a special invagination of the outer layer of the primitive body-wall, not to be confounded with that which often, but not always, accompanies the antecedent formation of the arch-enteron; this invagination is termed the STOMODŒUM; an anal aperture is formed in connexion with a special invagination which meets the hinder part of the met-enteron, and is termed the PROCTODŒUM.

In common with many (if not all) Cœlomata, the Mollusca are provided with at least one pair of tube-like organs, which open each by one end into the cœlom or body cavity, and by the other end to the exterior, usually in the neighbourhood of the anus. These are the NEPHRIDIA.

Like all other Cœlomata, the Mollusca are also provided with special groups of cells forming usually paired or median growths upon the walls of the cœlomic cavity, the cells being specially possessed of reproductive power, and differentiated as egg-cells and sperm-cells. These are the GONADS. As in other Cœlomata, the cells of the gonads may escape to the exterior in one of two ways—either through the nephridia, or, on the other hand, by special apertures.

As in all other Cœlomata, the cells, which build up respectively the primary outer layer of the body, the lining layer of the met-enteron, and the lining layer of the cœlom, are multiplied and differentiated in a variety of ways in the course of growth from the early embryonic condition. TISSUES are formed by the adhesion of a number of similarly modified cells in definite tracts. As in all Cœlomata, there is a considerable variety of tissues characterized by, and differentiated in relation to, particular physiological activities of the organism. Not only the Cœlomata but also many Cœlentera show, in addition to the EPITHELIA (the name given to tissue which bounds a free surface, whether it be that of the outer body-wall, of the gut, or of a blood-space), also deeper lying tissues, of which the first to appear is MUSCULAR tissue, and the second NERVOUS tissue.

The epithelia are active in throwing off their constituent cells (blood-corpuscles from the wall of the cœlom), or in producing secretions (glands of body-wall and of gut), or in forming horny or calcareous plates, spines, and processes, known as CUTICULAR PRODUCTS (shells and bristles of the body-wall, teeth of the tongue, gizzard, &c.).

In the Mollusca, as in all other Cœlomata, in correspondence with the primary bilateral symmetry and in relation to the special mechanical conditions of the prostomium, the nervous tissue which is in Cœlentera, and even in Flat-worms, diffused over the whole body in networks, tends to concentrate in paired lateral tracts, having a special enlargement in the prostomium. The earlier plexiform arrangement is retained in the nervous tissue of the walls of the alimentary canal of many Cœlomata, whilst a concentration to form large nerve-masses (GANGLIA), to which numerous afferent and efferent fibres are attached, affects the nervous tissue of the body-wall.

In all Cœlomata, including Mollusca, muscular tissue is developed in two chief layers, one subjacent to the deric or outer epithelium (SOMATIC MUSCULATURE), and a second surrounding the alimentary canal (SPIRANCHNIC MUSCULATURE). Thus, primarily, in Cœlomata the body has the character of two muscular sacs or tubes, placed one within the other and separated from one another by the cœlomic space. The somatic musculature is the more copious and develops

very generally an outer circular layer (*i.e.*, a layer in which the muscular fibres run in a direction transverse to the long axis of the body) and a deeper longitudinal layer; to these oblique and radiating fibres may be added. The splanchnic musculature, though more delicate, exhibits a circular layer nearer the enteric epithelium, and a longitudinal layer nearer the cœlomic surface.

In Cœlomata and in many Cœlentera there are found distributed between the tracts of muscular tissue, bounding them and giving strength and consistency also to the walls of the body, of the alimentary canal, of the cœlom, and of the various organs and tissue-masses (such as nerve-centres, gonads, &c.) connected with these, tracts of tissue the function of which is skeletal. The SKELETAL TISSUE of Mollusca, in common with that of other Cœlomata, exhibits a wide range of minute structure, and is of differing density in various parts; it may be fibrous, membranous, or cartilaginous. The Mollusca, in common with the other Cœlomata, exhibit a remarkable kind of association between the various forms of skeletal tissue and the epithelium which lines the cœlomic cavity. The cœlomic cavity contains a liquid which is albuminous in chemical composition (BLOOD-LYMPH or HÆMOLYMPH), and into this liquid cells are shed from the cœlomic epithelium. They float therein and are known as BLOOD CORPUSCLES or LYMPH CORPUSCLES. The cœlomic space with its contained hæmolymph is not usually in Cœlomata, and is not in Mollusca, a simple even-walled cavity, but is broken up into numerous passages and recesses by the outgrowths, both of the alimentary canal and of its own walls. By the adhesion of its opposite walls, and by an irregularity in the process of increase of its area during growth, the cœlom becomes to a very large extent a spongy system of intercommunicating LACUNÆ or irregular spaces, filled with the cœlomic fluid. At the same time, the cœlomic space has a tendency to push its way in the form of narrow canals and sinuses between the layers of skeletal tissue, and thus to permeate together with the skeletal tissue in the form of a spongy, or it may be a tubular, network all the apparently solid portions of the animal body. This association of the nutritive and skeletal functions is accompanied by a complete identity of the tissues concerned in these functions. Not only is there complete gradation from one variety of skeletal tissue to another (*e.g.*, from membranous to fibrous, and from fibrous to cartilaginous) even in respect of the form of the cells and their intercellular substance, but the cœlomic epithelium, and consequently the hæmolymph with its floating corpuscles derived from that epithelium, is brought into the same continuity. The skeletal and blood-containing and -producing tissues in fact form one widely-varying but continuous whole, which may be called the SKELETO-TROPHIC SYSTEM OF TISSUES.

In many Cœlomata not only do the skeletal tissues allow the cœlomic space with its fluid and corpuscles to penetrate between their layers, but a special mode of extension of that space is found, which consists in the hollowing out of the solid substance of elongated cells having the form of fibres, which thus become tubular, and, admitting the nutritive fluid, serve as channels for its distribution. These are "capillary vessels," and it has yet to be shown that such are formed in the Mollusca. Larger vessels, however, concerned in guiding the movement of the cœlomic fluid in special directions are very usually developed in the Mollusca, as in other Cœlomata, by the growth of skeletal tissue around what are at first ill-defined extensions of the cœlomic space. In this way a portion of the cœlomic space becomes converted into vessels, whilst a large part remains with irregular walls extending in every direction between the skeletal tissues and freely communicating with the system of vessels. As in many other Cœlomata, muscular tissue grows around

the largest vessel formed from the primitive cœlom, which thus becomes a contractile organ for propelling the blood-lymph fluid. This "HEART" has in Mollusca, as in most other Cœlomata in which it is developed, a dorsal position. A communication of the blood-lymph space with the exterior by means of a pore situated in the foot or elsewhere, has been very generally asserted to be characteristic of Mollusca. It has been maintained that water is introduced by such a pore into the blood, or admitted into a special series of water-vessels. It has also been asserted that the blood-fluid is expelled by the Mollusca from these same pores. Recent investigation (14) has, however, made it probable that the pores are the pores of secreting glands, and do not lead into the vascular system. There is, it therefore appears, no admission or expulsion of water through such pores in connexion with the blood, although in some other Cœlomata it is established that water is taken into the cœlomic space through a pore (Echinoderms), whilst in some others there is no doubt that the cœlomic hæmolymph is occasionally discharged in quantity through pores of definite size and character (Earthworm, &c.).

We have thus seen that the Mollusca possess, in common with the other Cœlomata,—1, a body composed of a vast number of cells or plastids, arranged so as to form a sac-like body-wall, and within that a second sac, the *met-enteron*, the wall of which is separated from the first by a *cœlom* or blood-lymph space; 2, a *stomodæum* and a *proctodæum*; 3, a *prostomium*, together with a differentiated dorsal and ventral surface, and consequently right and left sides, *i.e.*, bilateral symmetry; 4, a pair of *nephridia*; 5, *gonads* developed on the wall of the cœlom; 6, *deric* epithelium (producing horny and calcareous deposits on its surface), *enteric* epithelium, and *cœlomic* epithelium; 7, laterally paired masses of *nerve-tissue*, especially large in the prostomial region (nerve-centres or *ganglia*); 8, *muscular tissue*, forming a *somatic tunic* and a *splanchnic tunic*; 9, *skeleto-trophic tissues*, consisting of membranous, fibrous, and cartilaginous *supporting tissues*, and of *blood-vessels* and the walls of *blood-spaces*, the *cœlomic epithelium*, and the liquid tissue known as *hæmolymph* (commonly blood).

Schematic Mollusc.—Starting from this basis of structural features common to them and the rest of the Cœlomata, we may now point out what are the peculiar developments of structure which characterize the Mollusca and lead to the inference that they are members of one peculiar branch or phylum of the animal pedigree. In attempting thus to set forth the dominating structural attributes of a great group of organisms it is not possible to make use of arbitrary definitions. Of Mollusca, as of other great phyla, it is not possible categorically to enunciate a series of structural peculiarities which will be found to be true in reference to every member of the group. We have to remember that the process of adaptation in the course of long ages of development has removed in some cases one, in other cases another, of the original features characteristic of the ancestors from which the whole group may be supposed to have taken origin, and that it is possible (and actually is realized in fact) that some organisms may have lost all the *primary* characteristics of Molluscan organization, and yet be beyond all doubt definitely stamped as Mollusca by the retention of some *secondary* characteristic which is so peculiar as to prove their relationship with other Mollusca. An example in point is found in the curious fish-like form *Phyllirhoë* (fig. 58), which has none of the primary characteristics of a Mollusc, and yet is indisputably proved to belong to the Molluscan phylum by possessing the peculiar and elaborate lingual apparatus present in one branch of the phylum, the *Glossophora*.

In order to exhibit concisely the peculiarities of organization which characterize the Mollusca, we find it most

convenient to construct a schematic Mollusc, which shall possess in an unexaggerated form the various structural arrangements which are more or less specialized, exaggerated, or even suppressed in particular members of the group. Such a schematic Mollusc is not to be regarded as an arche-

Mollusc the representation of the actual Molluscan ancestor from which the various living forms have sprung. To definitely claim for our schematic form any such significance in the present state of knowledge would be premature, but it may be taken as more or less coinciding with what we are justified, under present conditions, in picturing to ourselves as the original Mollusc or archi-Mollusc (more correctly Archimalakion). After describing this schematic form, we shall proceed to show how far it is realized or justified in each class and order of Mollusca successively.

The schematic Mollusc (fig. 1, A to E) is oblong in shape, bilaterally symmetrical, with strongly differentiated dorsal and ventral surface, and has a well-marked HEAD, consisting of the prostomium (*b*) and the region immediately behind the mouth. Upon the head we place a pair of short CEPHALIC TENTACLES (*a*). The *mour* is placed in the median line anteriorly, and is overhung by the prostomium (B, *o*); the *anus* is placed in the median line posteriorly, well raised on the dorsal surface (A, *m*). The apertures of a pair of NEPHRIDIA are seen in the neighbourhood of the anus right and left (A, *l*). Near the nephridial apertures, and in front of them, right and left, are the pair of apertures (*k*) appropriate to the ducts of the GONADS (generative pores).

The most permanent and distinctive Molluscan organ is the foot (Podium). This is formed by an excessive development of the somatic musculature along the ventral surface, distinctly ceasing at the region of the head, below which it suddenly projects as a powerful muscular mass (B, *p*; E, *p*). It may be compared, and is probably genetically identical, with the muscular ventral surface of the Planarians and with the suckers of Trematoda, but is more extensively developed than are those corresponding structures. The muscular tissue of the foot, and of all other parts of the body of all Mollusca, is cellular and unstriated, as distinguished from the composite muscular fibre (consisting of cell-fusions instead of separable cells) which occurs in Arthropoda and in Vertebrata, and which has the further distinction of being composed of alternating bands of substance of differing refractive power (hence "striated"). The appearance of cross striation seen in the muscular cells of some Molluscs (odontophore of *Haliotis*, *Patella*, &c.) requires further investigation. It is by no means altogether the same thing as the marking characteristic of striated muscular fibre.

Contrasting with the ventral foot is the thin-walled dorsal region of the body, which may be termed the antipodial region. This thin-walled region is formed by soft viscera covered in by the comparatively delicate and non-muscular body-wall (fig. 1, E). As the ventral foot is clearly separate from the projecting head, so is this dorsal region, and it is conveniently spoken of as the VISCERAL HUMP or "dome" (cupola). Protecting the visceral dome is a SHELL (conchylium) consisting of a horny basis impregnated with carbonate of lime,¹ and secreted by the deric epithelium of this region of the body (*g*). The shell in our schematic Mollusc is single, cap-shaped, and symmetrical. It does not lie entirely naked upon the surface of the visceral dome, but is embedded all round its margin, to a large extent in the body-wall. In fact, the integument of the visceral dome forms an open flattened sac in which the shell lies. This is the PRIMARY SHELL-SAC, or FOLLICLE (A and E, *f*). The wall of the body projects all round the visceral dome in the form of a flap or skirt, so as to overhang and conceal to some extent the head and the sides of the foot. This skirt, really an out-

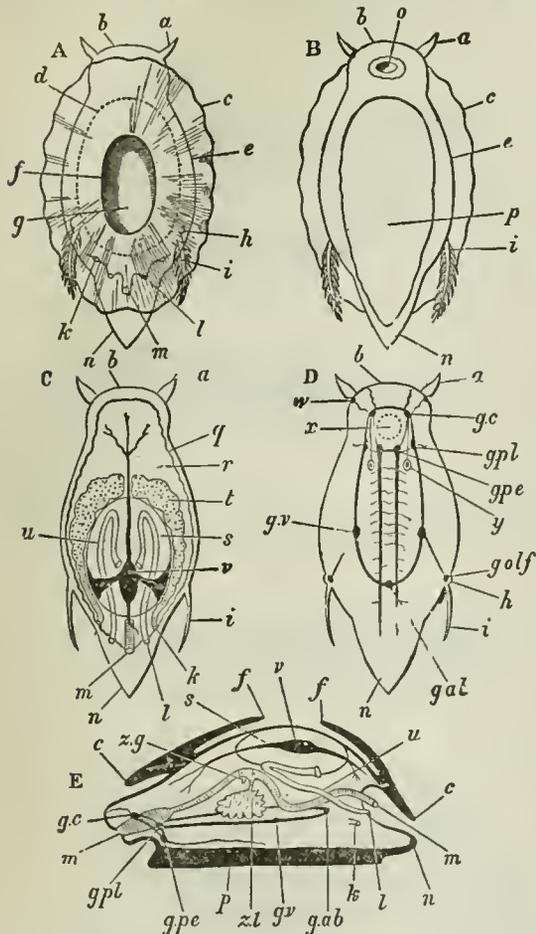

FIG. 1.—Schematic Mollusc. A. Dorsal aspect. B. Ventral aspect. C. The heart, pericardium, gonads, and nephridia shown in position. D. The nervous system; the reader is requested to note that the cord passing backwards from *g.pe* lies beneath, and does not in any way unite with the cord which passes from *g.ab* to *g.pl*. E. Diagram in which the body-wall is represented as cut in the median antero-posterior plane, so as to show organs in position, —the shell-sac is seen in section, but the shell is omitted.

Letters in all the figures as follows:—*a*, cephalic tentacle; *b*, head; *c*, edge of the mantle-skirt or limbus pallialis; *d*, dotted line indicating the line of origin of the free mantle-skirt from the sides of the visceral hump; *e*, outline of the foot seen through the mantle-skirt in A, which is supposed to be transparent, allowing the position of this and of the various parts *h*, *i*, *k*, *l*, *m*, to be seen through its substance; *f*, edge of the shell-follicle; *g*, the shell; *h*, the osphradium, paired (Spengel's olfactory organ); *i*, the ctenidium, paired (gill-plume); *k*, aperture of the gonad, paired; *l*, aperture of one of the two nephridia; *m*, anus; *n*, posterior region of the foot reaching farther back than the mass of viscera (dorsal hump) which it carries; *o*, mouth; *p*, plastral surface of the foot; *q*, cut edge of the body-wall of the dorsal region; *r*, coelomic space (blood-lymph space or body-cavity), mostly occupied by liver, but to some extent retained as blood-channels and lacunae; *s*, pericardial cavity; *t*, gonad (ovary or spermary), paired; *v*, nephridium, paired; *w*, ventricle of the heart receiving the right and the left auricles at its sides, and sending off anteriorly a large vessel, posteriorly a small one; *x*, the cephalic eye, paired; *y*, the otcyst, paired; *z*, dotted ring to show the position occupied by the oesophagus in relation to the nerve ganglia and cords; *z.g*, the otcyst, paired; *z.l*, the digestive gland (so-called "liver") of the left side; *z.g*, duct of the digestive gland of the right side; *g.c*, cerebral ganglion united by the cerebral commissure to its fellow; *g.pl*, pleural ganglion united by the cerebro-pleural connective to the cerebral ganglion, and by the pleuro-pedal connective to the pedal ganglion; *g.pe*, the pedal ganglion united to its fellow by the pedal commissure—the two sending off posteriorly the long ladder-like pair of pedal nerves; *g.v*, the visceral ganglion (of the left side) united by the visceral loop or commissure to the similar ganglion on the right side, and by the visceropleural connective to the pleural ganglion; *g.ab*, abdominal ganglion developed on the course of the visceral loop; *g.olf*, olfactory ganglion placed near the osphradium on a nerve taking its origin from the visceral ganglion.

type, in the sense which has been attributed to that word, nor as the embodiment of an idea present to a creating mind, nor even as an epitome of developmental laws. Were knowledge sufficient, we should wish to make this schematic

¹ As to the minute structure of the shell in various classes, see Carpenter's article "Shell" in the *Cyclop. of Anat. and Physiol.* The limits of our space do not permit us to deal with this or other histological topics.

growth of the dorsal body-wall, is called the MANTLE-FLAP (limbus pallialis), or more shortly the MANTLE or PALLIUM (c). The space between the overhanging mantle-flap and the sides and neck of the animal which it overhangs is called the SUB-PALLIAL SPACE or CHAMBER. Posteriorly in this space are placed the anus and the pair of nephridial apertures (see fig. 1, E).

The development of the mantle-skirt and its sub-pallial space appears to have a causal relation, in the way of protection, to a pair of processes of the body-wall which spring, one on the right and one on the left, from the sides of the body, nearer the anus than the mouth, and are concealed by the mantle-flap to some extent (A, B, i). These processes have an axis in which are two blood-vessels, and are beset with two rows of flattened filaments, like the teeth of a comb in double series. These are the CTENIDIA or gill-combs. Usually, as will be seen in the sequel, they play the part of gills, but since in many Molluscs (Lamelli-branches) their function is not mainly respiratory, and since also other completely-formed gills are developed as special organs in some Molluscs to the exclusion of these processes, it is well not to speak of them simply as "gills" or "branchiæ," but to give them a non-physiological name such as that here proposed. Near the base of the stem of each ctenidium is a patch of the epithelium of the body-wall, peculiarly modified and supplied with a special nerve and ganglion. This is Spengel's olfactory organ, which tests the respiratory fluid, and is persistent in its position and nerve-supply throughout the group Mollusca. We propose to call it the OSPHRADIUM.

Passing now to the internal organs, our schematic Mollusc is found to possess an ALIMENTARY CANAL, which passes from mouth to anus in the middle line, leaving between it and the muscular body-wall a more or less spongy, in parts a spacious, CÆLOM. The *stomodæum* is large and muscular, the *proctodæum* short; the bulk of the alimentary canal is therefore developed from the met-enteron or remnant of the arch-enteron after the cœlom has been pinched off from it. A paired outgrowth of the met-enteron forms the glandular diverticulum known as the digestive gland or (commonly) liver (E, 2g, 2l).

Dorsally to the alimentary tract the cœlom is spacious. The space (C, E, s) is termed the PERICARDIUM, since it is traversed by a vessel running fore and aft in the median line, which has contractile muscular walls and serves as a heart to propel the cœlomic blood-fluid. This pericardial space, although apparently derived from the original cœlom, is not in communication with the other spaces and blood-vessels derived from the cœlom; it never (or perhaps in a very few instances) contains in the adult the Molluscan blood or hæmolymp, and is always in free communication with the exterior through the tubes called *nephridia* (renal organs). The HEART receives symmetrically on each side, right and left a dilated vessel bringing aerated blood from the ctenidia. These dilated vessels are termed the *auricles of the heart*, whilst the median portion itself, at the point where these vessels join it, is termed the *ventricle of the heart* (C, v). The vessel passing fore and aft from the ventricle gives off a few trunks which open into spaces of the cœlom, the so-called lacunæ; these are excavated in every direction between the viscera and the various bundles of fibrous and muscular tissue, and may assume more or less the character of tube-like vessels with definite walls. Right and left opening into the pericardial cœlom is a coiled tube, the farther extremity of which opens to the exterior by the side of the anus. These two tubes (C, u) are the symmetrically disposed NEPHRIDIA (renal organs).

The GONADS (ovaries or spermaries) are placed in the mid-dorsal region of the cœlom (C, t), and have their own apertures in the immediate neighbourhood of those of the

nephridia. The apertures are paired right and left, and so are the ducts into which they lead; but at present we have no ground for determining whether the gonad itself was primarily in Molluscs a paired organ or a median organ, nor have we any well-founded conception as to the nature of the ducts when present, and their original relationship

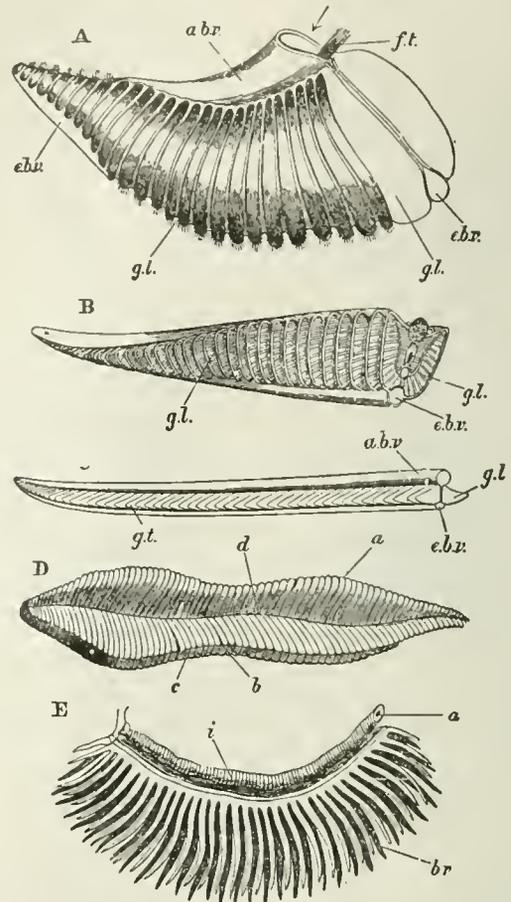

FIG. 2.—Ctenidia of various Mollusca (original). A. Of Chiton; *ft.*, fibrous tissue; *a.b.v.*, afferent blood-vessel; *e.b.v.*, efferent blood-vessel; *g.l.*, laterally paired lamellæ. B. to the gonads. The genital ducts of some organisms are modified nephridia, but the nature of those of Mollusca, of Arthropoda, of Echinoderma, of Nematoidea, and of some Vertebrata has yet to be elucidated.

The disposition of the nerve-centres is highly characteristic. There are four long cords composed of both nerve-fibres and nerve-cells which are disposed in pairs, two right and left of the pedal area or foot, two more dorsally and tending to a deeper position than that occupied by the pedal cords, so as to lie freely within the cœlomic space unattached to the body-wall. These are respectively the PEDAL NERVE-CORDS and the VISCERAL NERVE-CORDS. The latter meet and join one another posteriorly. A right and left (D, *g.v.*) and a median abdominal (*g.ab.*) ganglion are placed on these cords, and from them are given off the osphradial nerves which have special ganglia (*g.olf.*). In the region of the prostomium the pedal nerve-cords are enlarged behind the mouth, forming the *pedal ganglia* (*g.pe.*), and are united by nerve-fibres to one another. From this spot they are continued forward into the prostomium, where they enlarge to form the right and left *cerebral ganglia* (*g.c.*), which are united to one another by nerve-fibres in front of

the mouth, just as the pedal ganglia are behind it. The right and left pedal ganglia are joined by transverse cords to the right and left visceral cords respectively, the point of union being marked on either side by a swelling (*g.pl*) known as the pleural ganglion. The visceral nerve-cord can also be traced up on each side beyond the pleural ganglion to the cerebral ganglion. Thus we have a nearly complete double nerve-ring formed around the oesophagus by the two pairs of nerve-cords which are in this region drawn, as it were, towards each other and away from their lateral position both behind and before the stomodæal invagination. Whilst the swollen parts of the nerve-tracts are termed *ganglia*, the connecting cords are conveniently distinguished either as *connectives* or as *commissures*. Commissures connect two ganglia of the same pair. We have a cerebral commissure, a pedal commissure and a visceral commissure. Connectives connect ganglia of dissimilar pairs, and we speak accordingly of the cerebro-pedal connective, the cerebro-pleural connective, the pleuro-pedal connective, and the visceropleural connective.

An ENTERIC NERVOUS SYSTEM forming a plexus on the walls of the alimentary canal exists, but does not exhibit cords and ganglia visible to the naked eye except in the large Dibranchiate Cephalopods.

Our schematic Mollusc is provided with certain ORGANS OF SPECIAL SENSE. Tactile organs occur on the head in the form of short CEPHALIC TENTACLES (*a*). Deeply placed are

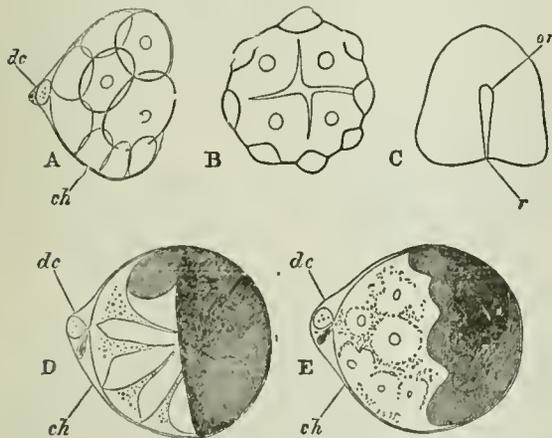

FIG. 3.—Development of the Pond-Snail, *Limnaeus stagnalis* (after Lankester, 15). *dc*, directive corpuscles (præsenital outcast cells); *ch*, egg-envelope or chorion; *or*, oral end of the blastopore; *r*, anal end of the blastopore. A. Formation of the Dibrastula by the invagination of larger cells into the area of smaller cells (optical section). B. View of the same specimen from the surface of invagination; the smaller cells are seen at the periphery; by division they will multiply and extend themselves over the four larger cells. C. Fully-formed Dibrastula, surface view to show the elongated form of the orifice of invagination or blastopore; its middle portion closes up and coincides with the region of the foot; the extremity, *or*, coincides with the mouth and stomodæum, the opposite extremity, *r*, with the anus. D. Optical section of an embryo a little older than A. E. Surface view of the same embryo.

a pair of closed vesicles containing each a calcareous concretion and acting as auditory organs; these are known as OCTOCYSTS (*D, y*). They are situated behind the mouth in the foremost portion of the foot. At the base of each cephalic tentacle is a pigmented eye-spot—the CEPHALIC EYE (*D, w*). The OSPHRADIUM (*h*), or peculiar patch of olfactory epithelium at the base of the ctenidium, has already been mentioned.

To the scheme thus exhibited of the possible organization of the ancestral Mollusc we shall now add a sketch of the mode in which this form of body and series of internal organs are developed from the egg.

The egg-cell of Mollusca is either free from food material—a simple protoplasmic corpuscle—or charged with food

material to a greater or less extent. Those cases which appear to be most typical—that is to say, which adhere to a

procedure which was probably common at one time to all then existing Mollusca, and which has been departed from

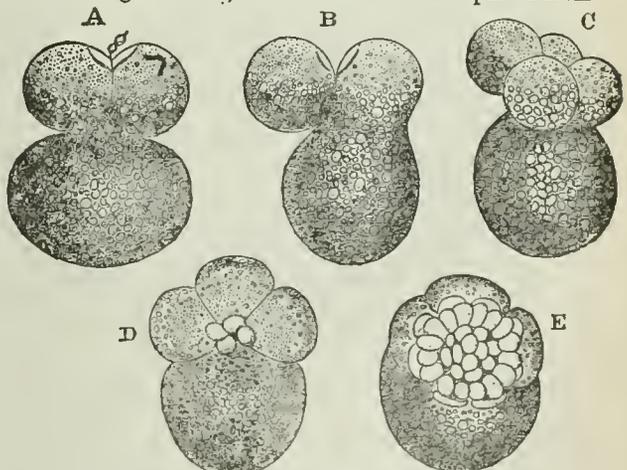

FIG. 5.—Early stages of division of the fertilized egg-cell in *Nassa mutabilis* (from Balfour, after Eobretzky). A. The egg-cell has divided into two spheres, of which the lower contains more food-material, whilst the upper is again incompletely divided into two smaller spheres. Resting on the dividing upper sphere are the eight-shaped "directive corpuscles," better called "præsenital outcast cells or apoblasts," since they are the result of a cell-division which affects the egg-cell before it is impregnated, and are mere refuse, destined to disappear. B. One of the two smaller spheres is reunited to the larger sphere. C. The single small sphere has divided into two, and the reunited mass has divided into two, of which one is oblong and practically double, as in B. D. Each of the four segment-cells gives rise to a small pellucid cell. E. The cap of small cells has increased in number by repeated formation of pellucid cells in the same way, and by division of those first formed. The cap will spread over and enclose the four segment-cells, as in fig. 3, A, B.

only in later and special lines of descent—show approxi-

B), in an equatorial position. As growth proceeds, one hemisphere remains relatively small, the other elongates and enlarges. Both mouth and anus are placed in the larger area; the smaller area is the prostomium simply; the ciliated band is therefore in front of the mouth. The larval form thus produced is known as the Trochosphere. It exactly agrees with the larval form of many Chætopod worms and other Cœlomata. Most remarkable is its agreement with the adult form of the Wheel animalcules or Rotifera, which retain the præ-oral ciliated band as their chief organ of locomotion and prehension throughout life. So far the young Mollusc has not reached a definitely Molluscan stage of development, being only in a condition common to it and other Cœlomata. It now passes to the veliger phase, a definitely Molluscan form, in which the disproportion between the area in front of the ciliated circlet and that behind it is very greatly increased, so that the former is now simply an emarginated region of the head fringed with cilia (fig. 8; fig. 6, F; fig. 7, F; and fig. 60, A). It is termed the "velum," and is frequently drawn out into lobes and processes. As in the Rotifera, it serves the veliger larva as an organ of loco-

ing from this spot as a centre, forms and spreads upon the surface of the visceral dome.

The embryonic shell-sac or shell-gland represents in a transient form, in the individual development of most Mollusca, that condition of the shell-forming area which we have sketched above in the schematic Mollusc. In very few instances (in Chiton, and probably in Limax), as we shall see below, the *primitive shell-sac* is retained and enlarged as the permanent shell-forming area. It is supplanted in other Molluscs by a *secondary shell-forming area*, namely, that afforded by the free surface of the visceral hump, the shell-forming activity of which extends even to the surface of the depending mantle-skirt. Accordingly, in most Mollusca the *primitive shell* is represented only by the horny plug of the primitive shell-sac. The permanent shell is a new formation on a new area, and should be distinguished as a *secondary shell*.

The ctenidia, it will be observed, have not yet been mentioned, and they are indeed the last of the characteristic Molluscan organs to make their appearance. Their possible relation to the præ-oral and post-oral ciliated bands of embryos similar to the Trochosphere will be discussed in the final section of this article dealing with the Polyzoa and Brachiopoda. The Veliger, as soon as its shell begins to assume definite shape, is no longer of a form common to various classes of Mollusca, but acquires characters peculiar to its class. At this point, therefore, we shall for the present leave it.

SYSTEMATIC REVIEW OF THE CLASSES AND ORDERS OF MOLLUSCA.

We are now in a position to pass systematically in review the various groups of Mollusca, showing in what way they conform to the organization of our schematic Mollusc, and in what special ways they have modified or even suppressed parts present in it, or phases in the representative embryonic history which has just been sketched. It will be found that the foot, the shell, the mantle-skirt, and the ctenidia, undergo the most remarkable changes of form and proportionate development in the various classes—changes which are correlated with extreme changes and elaboration in the respective functions of those parts.

Division of the Phylum into two Branches.—The Mollusca are sharply divided into two great lines of descent or branches, according as the prostomial region is atrophied on the one hand, or largely developed on the other.

The probabilities are in favour of any ancestral form—the hypothetical archi-Mollusc which connected the Mollusca with their non-Molluscan forefathers—having possessed, as do all the more primitive forms of Cœlomata, a well-marked prostomium, and consequently a head. The one series of Mollusca descended from the primitive head-bearing Molluscs have acquired an organization in which the Molluscan characteristics have become modified in definite relation to a sessile inactive life. As the most prominent result of the adaptation to such sessile life they exhibit an atrophy of the cephalic region. They form the branch LIPOCEPHALA—the mussels, oysters, cockles, and clams. The other series have retained an active, in many cases a highly aggressive, mode of life; they have, correspondingly, not only retained a well-developed head, but have developed a special aggressive organ in connexion with the mouth, which, on account of its remarkable nature and the peculiarities of the details of its mechanism, serves to indicate a very close genetic connexion between all such animals as possess it. This remarkable organ is the odontophore, consisting of a lingual ribbon, rasp, or radula, with its cushion and muscles. On account of the possession of this organ this great branch of the Molluscan phylum may be best designated GLOSSOPHORA. Any term

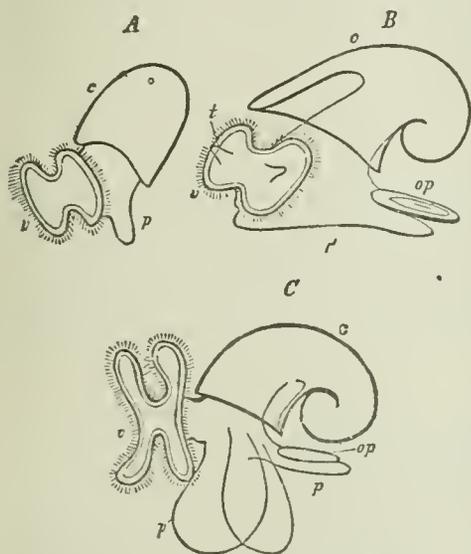

FIG. 8.—"Veliger" embryonic form of Mollusca (from Gegenbaur). v, velum; c, visceral dome with depending mantle-skirt; p, foot; t, cephalic tentacles; op, operculum. A, Earlier, and B, later, Veliger of a Gastropod. C, Veliger of a Pteropod showing lobe-like processes of the velum and the great paired outgrowths of the foot.

motion. In a very few Molluscs, but notably in the Common Pond-Snail, the emarginated bilobed velum is retained in full proportions in adult life (fig. 70), having lost its marginal fringe of specially long cilia and its locomotor function. The body of the Veliger is characterized by the development of the visceral hump on one surface, and by that of the foot on the other. Growth is greater in the vertical dorso-ventral axis than in the longitudinal oro-anal axis; consequently the foot is relatively small and projects as a blunt process between mouth and anus, which are not widely distant from one another, whilst the antipedal area projects in the form of a great hump or dome. In the centre of this antipedal area there has appeared (often at a very early period) a gland-like depression or follicle of the integument (fig. 6, C, sk; fig. 7, E, F, shgl; fig. 60, B; fig. 68, shs; fig. 72***, ss). This is the primitive shell-sac discovered by Lankester (18) in 1871, and shown by him to precede the development of the permanent shell in a variety of Molluscan types. The cavity of this small sac becomes filled by a horny substance, and then it very usually disappears, whilst a delicate shell, commenc-

which merely points to the possession of a head is objectionable, since this is common to them and the hypothetical archi-Mollusca from which they descend. The term Odontophora, which has been applied to them, is also unsuitable, since the organ which characterizes them is not a tooth, but a tongue.

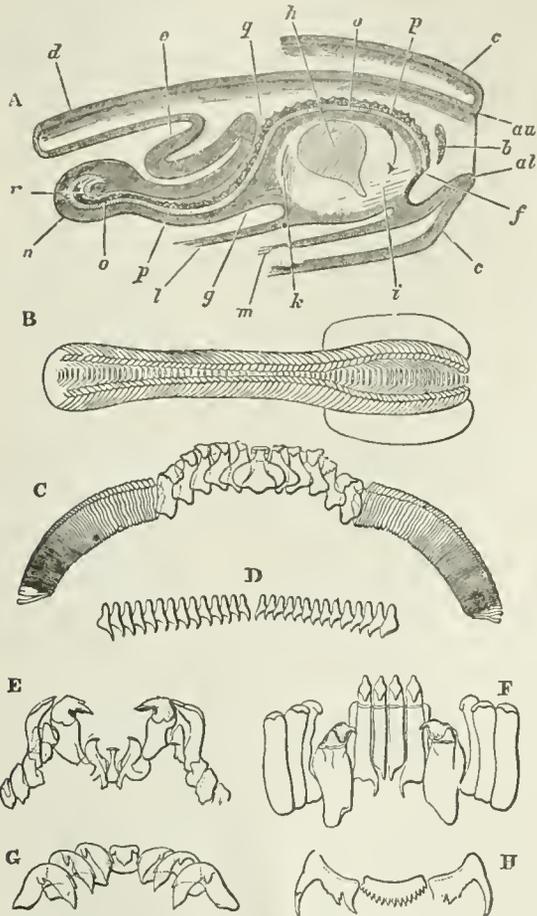

FIG. 9.—Odontophore of Glossophorous Mollusca.

- A. Diagram showing mouth, esophagus, and lingual apparatus of a Gastropod in section. *au*, upper lip; *al*, lower lip; *b*, calcareo-corneous jaw of the left side; *c*, outer surface of the snout; *d*, esophagus; *e*, fold in the wall of the esophagus behind the radular sac (*n*); *f*, anterior termination of the radula and its bed, the point at which it wears away; *g*, base of the radular sac or recess of the pharynx; *h*, cartilaginous piece developed in the floor of the pharynx beneath the radula, and serving for the attachment of numerous muscles, and for the support of the radula; *i*, anterior muscles; *k*, posterior muscles attached to the cartilage; *l*, muscle acting as a retractor of the buccal mass; *m*, muscle attached to the lower lip; *n*, posterior extremity of the radular sac; *o*, the bed of the radula or layer of cells by which its lower surface is formed; *p*, the horny radula or lingual ribbon; *q*, opening of the radular sac into the pharynx or buccal cavity; *r*, cells at the extreme end of the inner surface of the radular sac which produce as a "cuticular secretion" the rows of teeth of the upper surface of the radula.
- B. Radula or lingual ribbon of *Paludina vivipara*, stripped from its bed,—a ribbon-like area, upon which are set numerous tooth-like processes of various form in transverse rows, which follow one another closely, and exactly resemble one another in the form of their teeth (fig. 9, B). The tooth-like processes in a single transverse row are of very different shape and number in different members of the Glossophora, and it is possible to use a formula for their description. Thus, when in each row there is a single median tooth with three teeth on each side of it more or less closely resembling one another, as in fig. 9, G, we write the formula 3.1.3. When there are additional lateral pieces of a different shape to those immediately adjoining the central tooth, we indicate them by the figure 0, repeated to represent their number, thus 0000.1.1.1.0000 is the formula for the lingual teeth of *Chiton Stelleri*. A single median tooth, an admedian series, and a lateral series may be thus distinguished. In some Glossophora only median teeth are present, or large median teeth with a single small admedian tooth on each side of it (fig. 9, H); these are termed Rachiglossa (formula, —.1.— or 1.1.1). In a large number of Glossophora we have three admedian on each side and one median, no lateral pieces (fig. 9, G); these are termed Tanioglossa (formula, 3.1.3). Those with numerous lateral pieces, four to six or more admedian pieces, and a median piece or tooth (fig. 9, C) are termed Rhipidoglossa (formula, x.6.1.6.x, where x stands for an indefinite number of lateral pieces). The Toxicoglossa have
- C. A single row of teeth from the radula of *Trochus cinerarius*. Rhipidoglossate, formula, x.5.1.5.x.
- D. A single row of teeth from the radula of *Faullima fragilis*. Ptenoglossate; formula, x.0.x.
- E. A single row of teeth from the radula of *Chiton cinereus*. Too elaborate for formulation.
- F. A single row of teeth from the radula of *Patella vulgata*. Formula, 3.1.4.1.3.
- G. A single row of teeth from the radula of *Cypraea helvola*. Tanioglossate; formula, 3.1.3.
- H. A single row of teeth from the radula of *Nassa annulata*. Rachiglossate; formula, 1.1.1. The Common Whelk is similar to this.

The general structure of the odontophore (=tooth-bearer, in allusion to the rasp-like ribbon) of the glossophorous Mollusca may be conveniently described at once. Essentially it is a tube-like outgrowth—the *radular sac* (fig. 9, A, *g*, *n*)—in the median line of the ventral floor of the stomodæum, upon the inner surface of which is formed a chitinous band (the radula) beset with minute teeth like a

rasp (*p*). Anteriorly the ventral wall of the diverticulum is converted into cartilage (*h*), to which protractor and retractor muscles are attached (*k*, *i*), so that by the action of the former the cartilage, with the anterior end of the ribbon resting firmly upon it, may be brought forward into the space between the lips of the oral aperture (*au*, *al*), and made to exert there a backward and forward rasping action by the alternate contraction of retractor and protractor muscles attached to the cartilage. But in many Glossophora (e.g., the Whelk) the apparatus is complicated by the fact that the diverticulum itself, with its contained radula, rests but loosely on the cartilage, and has special muscles attached to each end of it, arising from the body wall; these muscles pull the whole diverticulum or radular sac alternately backwards and forwards over the surface of the cartilage. This action, which is quite distinct from the movement of the cartilage itself, may be witnessed in a Whelk if the pharynx be opened whilst it is alive. It has also been seen in living transparent Gastropods. The chitinous ribbon is continuously growing forward from the tube-like diverticulum as a finger-nail does on its bed, and thus the wearing away of the part which rests on the cartilage and is brought into active use, is made up for by the advance of the ribbon in the same way as the wearing down of the finger-nail is counterbalanced by its own forward growth. And, just as the new substance of the finger-nail is formed in the concealed part, sunk posteriorly below a fold of skin, and yet is continually carried forward with the forward movement of the bed on which it rests, and which forms its undermost layers, so is the new substance of the radula formed in the compressed extremity of the radular sac (*n*), and carried forward by the forward movement of the bed (*o*) on which it rests, and by which is formed its undermost layer. This forward-moving bed is not merely the ventral wall of the radular diverticulum, but includes also that portion of the floor of the oral cavity to which the radula adheres (as far forward as the point *f* in fig. 9, A). At the spot where the radula ceases, the forward growth-movement of the floor also ceases, just as in the case of the finger-nail the similar growth-movement ceases at the line where the nail becomes free.

The radula or cuticular product of the slowly-moving bed can be stripped off, and is then found to consist of a ribbon-like area, upon which are set numerous tooth-like processes of various form in transverse rows, which follow one another closely, and exactly resemble one another in the form of their teeth (fig. 9, B). The tooth-like processes in a single transverse row are of very different shape and number in different members of the Glossophora, and it is possible to use a formula for their description. Thus, when in each row there is a single median tooth with three teeth on each side of it more or less closely resembling one another, as in fig. 9, G, we write the formula 3.1.3. When there are additional lateral pieces of a different shape to those immediately adjoining the central tooth, we indicate them by the figure 0, repeated to represent their number, thus 0000.1.1.1.0000 is the formula for the lingual teeth of *Chiton Stelleri*. A single median tooth, an admedian series, and a lateral series may be thus distinguished. In some Glossophora only median teeth are present, or large median teeth with a single small admedian tooth on each side of it (fig. 9, H); these are termed Rachiglossa (formula, —.1.— or 1.1.1). In a large number of Glossophora we have three admedian on each side and one median, no lateral pieces (fig. 9, G); these are termed Tanioglossa (formula, 3.1.3). Those with numerous lateral pieces, four to six or more admedian pieces, and a median piece or tooth (fig. 9, C) are termed Rhipidoglossa (formula, x.6.1.6.x, where x stands for an indefinite number of lateral pieces). The Toxicoglossa have

1.0.2, the central tooth being absent and the lateral teeth peculiarly long and connected with muscles. The term *Ptenoglossa* (fig. 9, D) is applied to those *Glossophora* in which the radula presents no median tooth, but an indefinite and large number of admedian teeth, giving the formula $x.0.x$. When the admedian teeth are indefinite (forty to fifty), and a median tooth is present, the term *Myriaglossa* is applied (formula, $x.1.x$). It must be understood that the pieces or teeth thus formulated may themselves vary much in form, being either flat plates, or denticulated, hooked, or spine-like bodies. We shall revert to the terms thus explained in the systematic descriptions of the groups of *Glossophora*.

The muscular development in connexion with the whole buccal mass, and with each part of the radular apparatus, is exceedingly complicated,—as many as twenty distinct muscles having been enumerated in connexion with this organ. In addition to the radula, and correlated with its development, we find almost universally present in the *Glossophora* a pair of horny jaws (usually calcified) developed as cuticular productions upon the epidermis of the lips (fig. 9, A, *b*). The radula and the shelly jaws of the *Glossophora* enable their possessors not only to voraciously attack vegetable food, but the radula is used in some instances for boring the shells of other Mollusca, and the jaws for crushing the shells of Crustacea, and for wounding even Vertebrata.

PHYLUM MOLLUSCA.

BRANCH A.—GLOSSOPHORA.

Characters.—Mollusca with head-region more or less prominently developed; always provided with a peculiar rasping-tongue—the odontophore—rising from the floor of the buccal cavity.

The *Glossophora* comprise three classes, chiefly distinguished from one another by the modifications of the foot.

Class I.—GASTROPODA.

Characters.—*Glossophora* in which (with special exception of swimming forms) the foot is simple, median in position, and flattened so as to form a broad sole-like surface, by the contractions of which the animal crawls, often divided into three successive regions—the pro-, meso-, and meta-podium—by lateral constrictions.

The *Gastropoda* exhibit two divergent lines of descent indicated by the term sub-class (see p. 649).

Sub-class 1.—GASTROPODA ISOPLEURA.

Characters.—*Gastropoda* in which not only the head and foot but also the visceral dome with its contents and the mantle retain the primitive BILATERAL SYMMETRY of the archi-Mollusc. The anus retains its position in the median line at the posterior end of the body. The whole visceral mass together with the foot is elongated, so that the axis joining mouth and anus is relatively long, whilst the dorso-ventral axis at right angles to it is short. The CTENIDIA, the NEPHRIDIA, GENITAL DUCTS, and CIRCULATORY ORGANS are paired and bilaterally symmetrical. The pedal and visceral NERVE-CORDS are straight, parallel with one another, and all extend the whole length of the body; the ganglionic enlargements are feebly or not at all developed. The *Isopleura* comprise three orders.

Order 1.—Polyplacophora (the Chitons).

Characters.—*Gastropoda Isopleura* with a metameric repetition of the shell to the number of eight. The shells of the primitive type are partially or wholly concealed in shell-sacs comparable to the single embryonic shell-sac of other Mollusca. On the surface of the mantle-flap numerous

calcified spines and knobs are frequently developed. The ctenidia are of the typical form, small in size and metamERICALLY repeated along the sides of the body to the

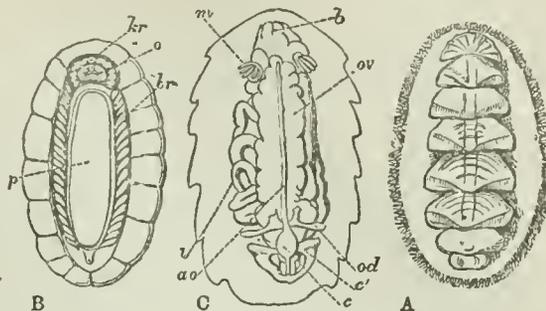

FIG. 10.—Three views of *Chiton*. A. Dorsal view of *Chiton Wasnesenskii*, Midd., showing the eight shells (After Middendorf). B. View from the pedal surface of a species of *Chiton* from the Indian Ocean. *p*, foot; *o*, mouth (at the other end of the foot is seen the anus raised on a papilla); *kr*, oral fringe; *br*, the numerous ctenidia (branchial plumes); spreading beyond these, and all round the animal, is the mantle-skirt. (After Cuvier). C. The same species of *Chiton*, with the shells removed and the dorsal integument reflected. *b*, buccal mass; *m*, retractor muscles of the buccal mass; *ov*, ovary; *od*, oviduct; *t*, coils of intestines; *ao*, aorta; *c*, left auricle; *v*, ventricle.

number of sixteen or more; an osphradium or area of "olfactory epithelium" (Spengel) is found at the base of each ctenidium. The other organs are not subject to metameric repetition. The odontophore is highly developed; the teeth of the lingual ribbon are varied in form,—several in each transverse row (fig. 9, E). Paired genital ducts distinct from the paired nephridia are present.

The order Polyplacophora contains but one family, the *Chitonidae*, with the genera *Chiton*, Lin. (figs. 10, 15, &c.); *Cryptochiton*, Midd., 1847; and *Cryptoplax* (= *Chitonellus*), Blainv., 1818.

Order 2.—Neomeniæ.

Characters.—*Gastropoda Isopleura* devoid of a shell, which is replaced by innumerable microscopic calcified plates or spicules set in the dorsal epidermis; mantle-flap not lateral, but reduced to a small collar surrounding the

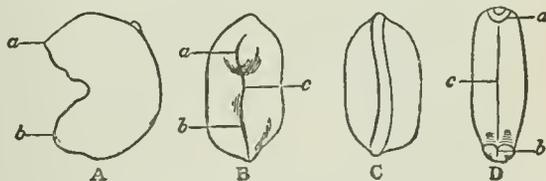

FIG. 11.—*Neomenia carinata*, Tullberg (after Tullberg). A. Lateral view. B. Ventral view. C. Dorsal view. D. Ventral view of a more extended specimen. *a*, anterior; *b*, posterior extremity; *c*, furrow, in which the narrow foot is concealed.

anus; ctenidia represented by a symmetrical group of branchial filaments on either side of the anus; foot very narrow, sunk in a groove; odontophore feebly developed, but the radula many-toothed: zonads placed in the pericardium discharging by the nephridia; no special generative ducts.

The order *Neomeniæ* contains the two genera *Neomenia*, Tullberg (*Solenopus*, Sars) (fig. 11); and *Pronomenia*, Hubrecht.

Order 3.—Chatoderma.

Characters.—*Gastropoda Isopleura* devoid of a shell, which is replaced by numerous minute calcareous spines

FIG. 12.—*Chatoderma nitidulum*, Loven (after Graff). The cephalic enlargement is to the left, the anal chamber (reduced pallial chamber, containing the concealed pair of ctenidia) to the right.

standing up like hairs on the surface of the body; body

much elongated so as to be vermiform; mantle-flap as in Neomenia; ctenidia in the form of a pair of branchial plumes, one on each side of the anus; foot aborted, its position being indicated by a longitudinal furrow; odontophore greatly reduced, the radula only represented by a single tooth; gonads and nephridia as in Neomenia.

The order Chætoderma contains the single genus *Chætoderma* (fig. 12).

Further remarks on the Isopleurous Gastropods.—The union of the Chitons with the remarkable worm-like forms Neomenia and Chætoderma was rendered necessary by Hubrecht's discovery (25) in 1881 of a definitely constituted radula and odontophore in his new genus *Proneomenia*, founded on two specimens brought from the arctic regions by the Barents Dutch expedition.

By some writers—e.g., Kefenstein—the Chitons have been too intimately associated with the other Gastropoda, whilst, on the other hand, Gegenbaur seems to have gone a great deal too far in separating them altogether from the other Mollusca as a primary subdivision of that phylum, inas-

much as they are intimately bound to the other Glossophora by the possession of a thoroughly typical and well-developed odontophore. They undoubtedly stand nearer to the archi-Mollusca than any other Glossophora in having retained a complete bilateral symmetry and the primitive shell-sac, though the metameric repetition of this organ and of the ctenidia is a complication of, and departure from, the primitive character. It is not improbable that in the calcareous spines and plates of the dorsal integument of Neomenia and Chætoderma, which occur also on the part of the dorsum uncovered by shell in Chiton, we have the retention of

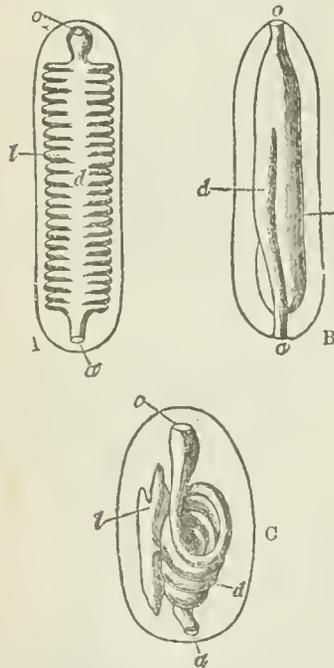

FIG. 13.—Diagrams of the alimentary canal of *Isopleura* (from Hubrecht). *o*, mouth; *a*, anus; *d*, alimentary canal; *l*, liver (digestive gland). A. *Neomenia* and *Proneomenia*. B. *Chætoderma*. C. *Chiton*.

a condition preceding the development of the solid Molluscan shell, or a reversion to it. The minute calcareous bodies may have the same relation to a compact shell which the shagreen denticles of the sharks have to a continuous dermal bone.

The anatomy of the Gastropoda *Isopleura* has been largely elucidated within the past year by the researches of Hubrecht and of Sedgwick, who have been the first to apply the method of sections to the study of this group.

The leading points in the modifications of mantle-flap, foot, and ctenidia are set forth in the preceding summaries, and in the accompanying references to the figures. With regard to other organs, we have to note the form of the alimentary canal (fig. 13), which is simplest in Chætoderma, symmetrically sacculated in Neomenia, and wound upon itself, forming a few coils, in Chiton. The latter has a compact liver with arborescent duct, which is represented by the sacculi in Neomenia and by a single

cæcum in Chætoderma. Salivary glands are present in Chiton and in *Proneomenia*. The radula is highly developed in Chiton, and, though present in *Proneomenia*, has not been described in Neomenia. A single tooth in Chætoderma appears to represent the radula in a reduced state. The circulatory organs of Chiton alone are known with any degree of detail (fig. 10, C). There is a median dorsal blood-vessel—the aorta—which is enlarged to form a ventricle in the posterior region of the body. On either side the ventricle is connected to a well-developed auricle, which pours into it the aerated blood from the gills (ctenidia). The extent to which vascular trunks are developed has not been determined, but vessels to and from the ctenidia, and in the mid-line of the foot, are known. As in other Mollusca, the vessels do not extend far, but lead into lacunæ between the organs and tissues. Dorsal and ventral vessels have been detected in Neomenia and Chætoderma, but no specialized heart.

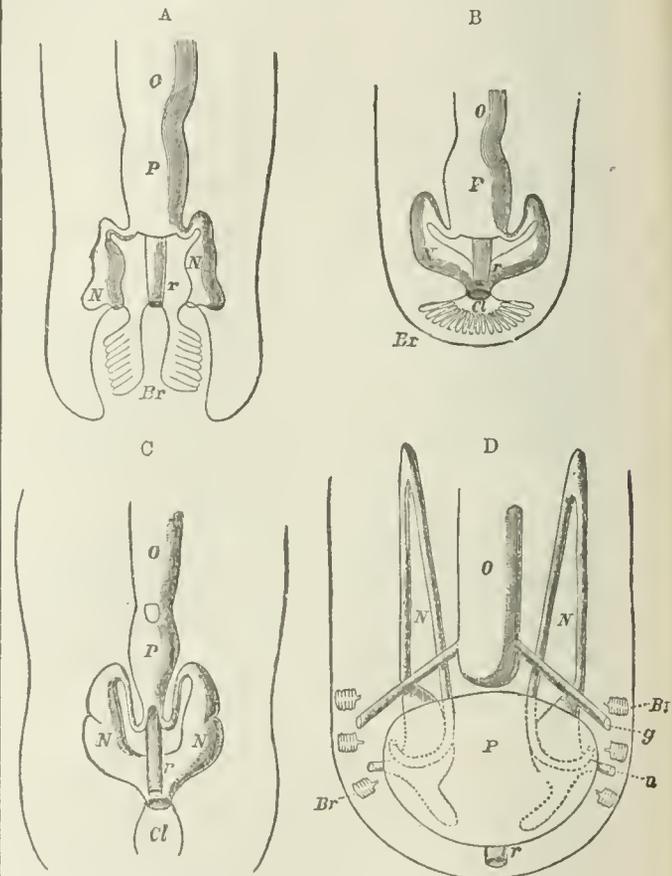

FIG. 14.—Diagrams of the excretory and reproductive organs of *Isopleura* (after Hubrecht). *o*, ovary; *P*, pericardium; *N*, nephridium; *u*, external aperture of nephridium; *g*, external aperture of the genital duct of Chiton; *r*, rectum; *cl*, cloacal or pallial chamber of *Neomenia* and *Chætoderma*; *Br*, ctenidia (branchial plumes). A. *Chætoderma*. B. *Neomenia*. C. *Proneomenia*. D. *Chiton*.

The heart of Chiton lies in a space which is to be regarded as a specialized part of the cœlom, and, as in other Molluscs, is termed the pericardium. In front of this space in Chiton lies the ovary (fig. 14, D). In the other *Isopleura* the genital bodies (gonads) lie in the pericardium, which has a longer form and extends dorsally above the intestine. Opening into the pericardium equally in all the *Isopleura* (fig. 14) is a pair of bent tubes which lead to the exterior. These are the nephridia, which in Chiton are essentially renal in function. Their disposition has been determined by Sedgwick (26), who has shown that each nephridium is much bent on itself, so that, as in the

nephridia of Conchifera (organ of Bojanus), the internal aperture lies near the external. From the folded stem of the nephridium very numerous secreting cæca are given off, —omitted in the diagram (fig. 14, D), but accurately drawn in fig. 15. The sexes in Chiton are distinct, and the ovary or testis, as the case may be, though lying in and filling a chamber of the original cœlom, does not discharge into the pericardium, but has its own ducts, which pass to the exterior just in front of those of the nephridia (fig. 14, D, g, and fig. 16). In this respect Chiton is less primitive than the other Isopleura, and even than some other Gastropods (the Zygobranchia), and some Conchifera (Spondylus, &c.), which have no special genital apertures, but make use of the nephridia for this purpose. In *Chiton discrepans*, in which there are sixteen pairs of ctenidia, the orifices of the nephridia are coincident with the sixteenth pair of ctenidia, those of the genital ducts with a point between the thirteenth and fourteenth ctenidia.

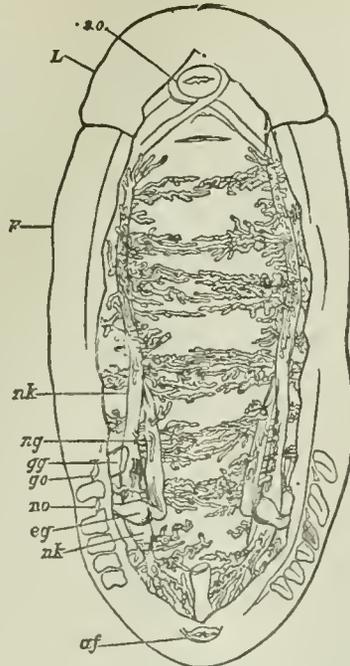

FIG. 15.—Dissection of the renal organs (nephridia) of *Chiton siculus*, after Haller (*Arbeiten, Zool. Instit., Vienna, 1852*). F, foot; L, edge of the mantle not removed in the front part of the specimen; s.o., esophagus; af, anus; gg, genital duct; go, external opening of the same; eg, stem of the nephridium leading to no, its external aperture; nk, reflected portion of the nephridial stem; ng, fine cæca of the nephridium, which are seen ramifying transversely over the whole inner surface of the pedal muscular mass.

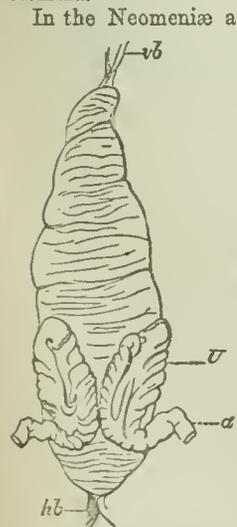

FIG. 16.—Ovary and oviducts of *Chiton siculus* (after Haller, *loc. cit.*). vb, hb, anterior and posterior suspensor of the ovary; U, uterus (enlarged part of oviduct); a, oviduct.

presence of nerve-fibres in the cords, and of nerve-ganglion cells in the specialized ganglia. The numerous transverse connexions of the pedal nerve-cords in Chiton and Neo-

menia (seen also in *Fissurella* (fig. 36) and some other Gastropods) are comparable to the transverse connexions of the ventral nerve-cords of Chaetopod worms and Arthropods. In the abundance of the nervous network connected with its longitudinal nerve-tracts, Chiton appears to retain something of the early condition of the Cœlomite nervous system when it had the form of a sub-epidermic network or nerve-tunic (seen more clearly in Planarians and some Nemertines), and when the concentration into definitely compacted cords had not set in.

Ganglia are, however, distinguishable upon the nervous cords of Chiton (fig. 18). The cerebral ganglia are not distinguishable as such, but a pair of buccal ganglia (B in fig. 18) are developed on two connectives which pass forward from the cerebral region to the great muscular mass of the mouth. These buccal ganglia are special developments connected

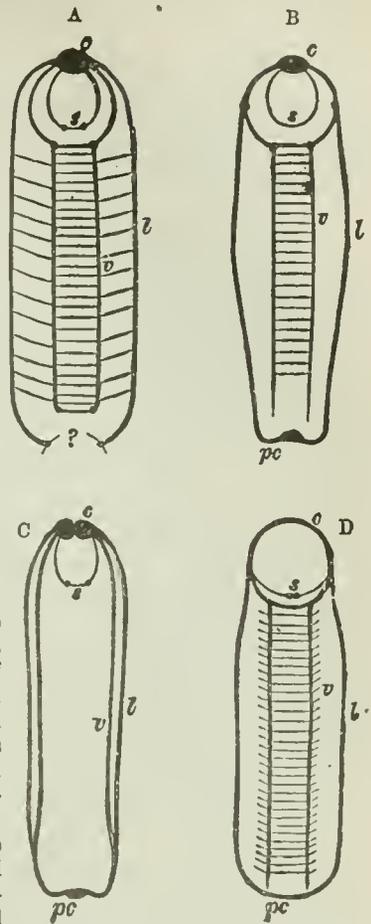

FIG. 17.—Diagrams of the nervous system of *Isopleura* (after Hubrecht, *loc. cit.*). c, cerebral ganglia; s, sublingual ganglia; v, pedal (ventral) nerve-cord; l, visceral (lateral) nerve-cord; pc, post-anal junction of the visceral nerve-cords. A, *Proneomenia*. B, *Neomenia*. C, *Chaetoderma*. D, *Chiton*.

with the special muscularity of the lips and odontophore, and are found in all Glossophora, but not in the Lipocephala. Such special ganglia related to special organs (and not introduced in our schematic Mollusc, fig. 1) we find in connexion with the siphons of the Lipocephala, and in various positions upon the visceral nerve-cords of other Mollusca, both Glossophora and Lipocephala.

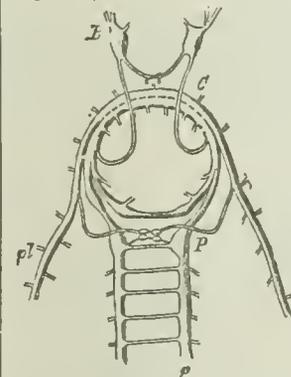

FIG. 18.—Anterior part of the nervous system of *Chiton cinereus*, in more detail (from Gegenbaur, *Elements of Comp. Anatomy*). B, buccal ganglia (concerned with the odontophore); C, cerebral nerve-mass; P, pedal ganglion and commencement of pedal nerve-cord; pl, visceral nerve-cord. The sublingual ganglia are not lettered.

which to compare that of other Mollusca on account of the small amount of concentration of its nerve-ganglion cells into ganglia, such as we find well developed in other forms.

The development of *Neomenia* and *Chaetoderma* from

twisted into a figure-of-eight—the *STREPTONEURA* (fig. 21). Probably the *Euthyneura* and the *Streptoneura* have developed independently from the ancestral bilaterally symmetrical Gastropods. The escape of the visceral nerve-loop from the torsion depends on its having acquired a somewhat deeper position and shorter extent, previously to the commencement of the phenomenon of torsion, in the ancestors of the *Euthyneura* than in those of the *Streptoneura*. The junction of the two halves of the visceral loop in the *Euthyneura* is below the anus, and the loop is therefore not caught by the intestine. In the *Streptoneura* the junction is (as in the *Isopleura*) above the anus.

Branch a.—*STREPTONEURA* (Spengel, 1881).

Characters.—Gastropoda Anisopleura in which the visceral "loop" (the conterminous visceral nerves) embraces the intestine and therefore shares in the torsion of the visceral hump, the right cord crossing above the left so as to form a figure-of-eight (see fig. 19).

The *Streptoneura* comprise two orders—the *Zygobranchia* and the *Azygobranchia*.

Order 1.—*Zygobranchia*.

Characters.—*Streptoneura* in which, whilst the visceral torsion is very complete so as to bring the anus into the middle line anteriorly or nearly so, the atrophy of the primitively left-side organs is not carried out. The right and left ctenidia, which have now become left and right respectively, are of equal size, and are placed symmetrically on either side of the neck in the pallial space. Related to them is a simple pair of osphradial patches. Both right

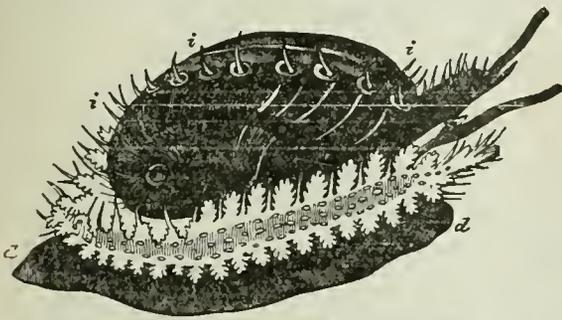

FIG. 23.—*Haliotis tuberculata*. *d*, foot; *t*, tentacular processes of the mantle. (From Owen, after Cuvier.)

and left nephridia are present, the actual right one being much larger than the left. Two auricles may be present right and left of a median ventricle (*Haliotis*), or only one (*Patella*). The *Zygobranchia* are further very definitely characterized by the archaic character of absence of special genital ducts. The generative products escape by the larger nephridium. The sexes are distinct, and there is no copulatory or other accessory generative apparatus. The teeth of the lingual ribbon are highly differentiated (*Rhipidoglossate*). The visceral dome lies close upon the oval sucker-like foot, and is coextensive with its prolongation in the aboral direction.

The *Zygobranchia* comprise three families, arranged in two sub-orders.

Sub-order 1. *Ctenidiobranchia*.

Character.—Large paired ctenidia acting as gills.

Family 1.—*Haliotidae*.

Genera: *Haliotis* (Ear-Shell, Ormer in Guernsey); mostly tropical; *Teinotis*.

Family 2.—*Fissurellidae*.

Genera: *Fissurella* (Key-hole Limpet) (figs. 24, 36), *Emarginula*, *Parmophorus* (fig. 25); mostly tropical.

Sub-order 2. *Phyllidiobranchia*.

Characters.—Ctenidia reduced to wart-like papillæ; special sub-

pallial lamellæ, similar to those of the *Opisthobranchia* *Liurophyllidia*, perform the function of gills.

Family 3.—*Patellidae*.

Genera: *Patella* (Limpet, figs. 26, &c.), *Nacella* (Bonnet-Limpet), *Lottia*.

Further Remarks on Zygobranchia.—The Common Limpet is a specially interesting and abundant example of the remarkable order *Zygobranchia*. A complete and accurate account of its anatomy has yet to be written. Here we have only space for a brief outline. The foot of the Limpet is a nearly circular disc of muscular tissue; in front, projecting from and raised above it, are the head and neck (figs. 26, 30). The visceral hump forms a low conical dome above the sub-circular foot, and standing out all round the base of this dome so as to completely overlap the head and foot, is the circular mantle-skirt. The depth of free mantle-skirt is greatest in front, where the head and neck are covered in by it. Upon the surface of the visceral dome, and extending to the edge of the free mantle-skirt, is the conical shell. When the shell is taken away (best effected by immersion in hot water) the surface of the visceral dome is found to be covered by a black-coloured epithelium, which may be removed, enabling the observer to note the position of some organs lying below the transparent integument (fig. 27). The muscular columns (*c*) attaching the foot to the shell form a ring incomplete in front, external to which is the free mantle-skirt. The limits of the large area formed by the flap over the head and neck (*ecr*) can be traced, and we note the anal papilla showing through and opening on the right shoulder, so to speak, of the animal into the large anterior region of the sub-pallial space. Close to this the small renal organ (*i*; mediad) and the larger renal organ (*k*, to the right and posteriorly) are seen, also the pericardium (*l*) and a coil of the intestine (*int*) embedded in the compact liver.

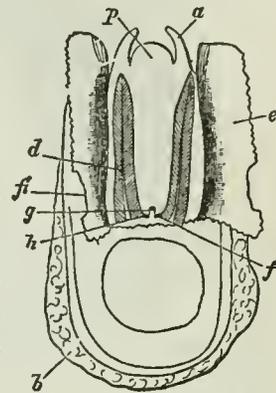

FIG. 24.—Dorsal aspect of a specimen of *Fissurella* from which the shell has been removed, whilst the anterior area of the mantle-skirt has been longitudinally slit and its edges reflected. *a*, cephalic tentacles; *b*, foot; *c*, left (archaic right) gill-plume; *d*, reflected mantle-flap; *e*, the fissure or hole in the mantle-flap traversed by the longitudinal incision; *f*, right (archaic left) nephridium's aperture; *g*, anus; *h*, left (archaic right) aperture of nephridium; *p*, snout. (Original.)

On cutting away the anterior part of the mantle-skirt so as to expose the sub-pallial chamber in the region of the neck, we find the right and left renal papillæ (discovered by Lankester (27) in 1867) on either side the anal papilla (fig. 28), but no gills. If a similar examination be made of the allied genus *Fissurella* (fig. 24, *d*), we find right and left of the two renal apertures a right and left gill-plume or ctenidium, which by their presence here and in *Haliotis* furnish the distinctive character to which the name *Zygobranchia* refers. In *Patella* no such plumes exist, but right and left of the neck are seen a pair of minute oblong yellow bodies (fig. 28, *d*), which were originally described by Lankester as orifices possibly connected with the evacuation of the generative

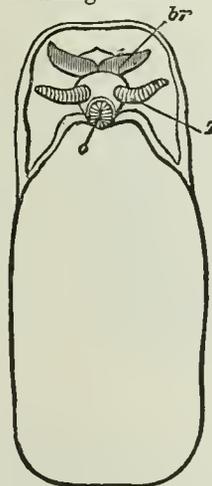

FIG. 25.—*Parmophorus*, seen from the pedal surface. *a*, mouth; *b*, cephalic tentacles; *br*, one of the two symmetrical gills placed on the neck. (Original.)

of the allied genus *Fissurella* (fig. 24, *d*), we find right and left of the two renal apertures a right and left gill-plume or ctenidium, which by their presence here and in *Haliotis* furnish the distinctive character to which the name *Zygobranchia* refers. In *Patella* no such plumes exist, but right and left of the neck are seen a pair of minute oblong yellow bodies (fig. 28, *d*), which were originally described by Lankester as orifices possibly connected with the evacuation of the generative

products. On account of their position they were termed by him the "capito-pedal orifices," being placed near the junction of head and foot. Spengel (24) has, however, in a most ingenious way shown that these bodies are the representatives of the typical pair of ctenidia, here reduced to a mere rudiment. Near to each rudimentary ctenidium Spengel

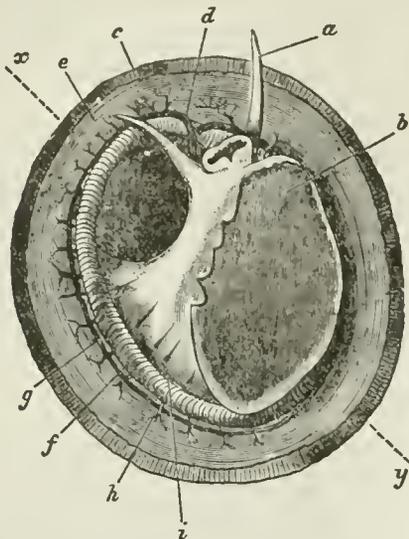

FIG. 26.—The Common Limpet (*Patella vulgata*) in its shell, seen from the pedal surface. *x, y*, the median antero-posterior axis; *a*, cephalic tentacle; *b*, plantar surface of the foot; *c*, free edge of the shell; *d*, the branchial efferent vessel carrying aerated blood to the auricle, and here interrupting the circlet of gill lamellae; *e*, margin of the mantle-skirt; *f*, gill lamellae (not ctenidia, but special pallial growths, comparable to those of Pleurophyllidia); *g*, the branchial efferent vessel; *h*, factor of the branchial adherent vessel; *i*, interspaces between the muscular bundles of the root of the foot, causing the separate areas seen in fig. 27, *c*. (Original.)

has discovered an olfactory patch or osphradium (consisting of modified epithelium) and an olfactory nerve-ganglion (fig. 32). It will be remembered that, according to Spengel, the osphradium of Mollusca is definitely and intimately related to the gill-plume or ctenidium, being always placed near the base of that organ; further, Spengel has shown that the nerve-supply of this olfactory organ is always derived from the visceral loop. Accordingly, the nerve-supply affords a means of testing the conclusion that we have in

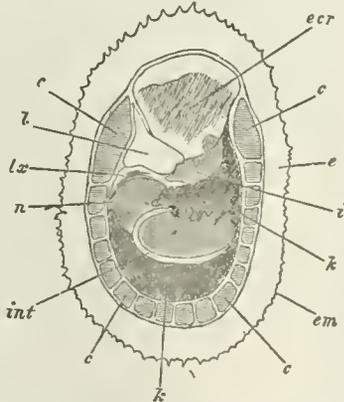

FIG. 27.—Dorsal surface of the Limpet removed from its shell and deprived of its black pigmented epithelium; the internal organs are seen through the transparent body-wall. *c*, muscular bundles forming the root of the foot, and adherent to the shell; *e*, free mantle-skirt; *em*, tentaculiferous margin of the same; *i*, smaller (left) nephridium; *k*, larger (right) nephridium; *l*, pericardium; *lx*, fibrous septum, behind the pericardium; *n*, liver; *int*, intestine; *ecr*, anterior area of the mantle-skirt overhanging the head (cephalic hood). (Original.)

Spengel, show the identity in the origin of the nerves passing from the visceral loop to Spengel's olfactory ganglion of the Limpet, and that of the nerves which pass from the visceral loop of *Haliotis* to the olfactory patch or osphradium, which lies in immediate relation on the right and on the left side to the right and the left gill-plumes (ctenidia) respectively. The same diagrams serve to de-

monstrate the Streptoneurous condition of the visceral loop in Zygobranchia.

Thus, then, we find that the Limpet possesses a symmetrically-disposed pair of ctenidia in a rudimentary condition, and justifies its position among Zygobranchia. At the same time it possesses a totally distinct series of functional gills, which are not derived from the modification of the typical Molluscan ctenidium. These gills are in the form of delicate lamellae (fig. 26, *f*), which form a series extending completely round the inner face of the depending mantle-skirt. This circlet of gill-lamellae led Cuvier to class the Limpets as Cyclobranchiata, and erroneously identification of them with the series of metamericly repeated ctenidia of Chiton, to associate the latter Mollusc with the former. The gill-lamellae of *Patella* are processes of the mantle comparable to the plait-like folds often

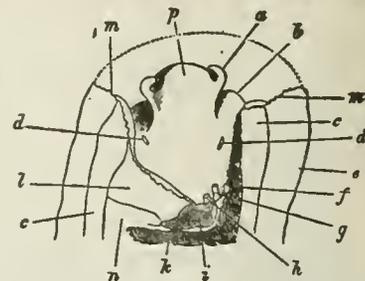

FIG. 28.—Anterior portion of the same Limpet, with the overhanging cephalic hood removed. *a*, cephalic tentacle; *b*, foot; *c*, muscular substance forming the root of the foot; *d*, the capito-pedal organs of Lankester (=rudimentary ctenidia); *e*, mantle-skirt; *f*, papilla of the larger nephridium; *g*, anus; *h*, papilla of the smaller nephridium; *i*, smaller nephridium; *k*, larger nephridium; *l*, pericardium; *m*, cut edge of the mantle-skirt; *n*, liver; *p*, snout. (Original.)

This circlet of gill-lamellae led Cuvier to class the Limpets as Cyclobranchiata, and erroneously identification of them with the series of metamericly repeated ctenidia of Chiton, to associate the latter Mollusc with the former. The gill-lamellae of *Patella* are processes of the mantle comparable to the plait-like folds often

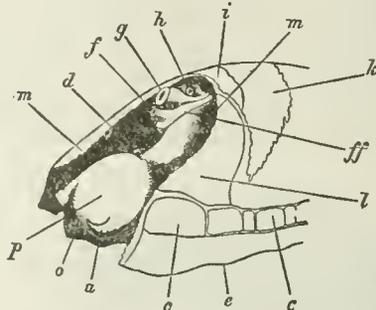

FIG. 29.—The same specimen viewed from the left observed on the front, so as to show the sub-anal tract (*ff*) of the larger nephridium, by which it communicates with the pericardium. *o*, mouth; other letters as in fig. 28.

in other Gastropoda (e.g., *Buccinum* and *Haliotis*). They are termed pallial gills. The only other Molluscs in which they are exactly represented are the curious Opisthobranchs *Phyllidia* and *Pleurophyllidia* (fig. 57). In these, as in *Patella*, the typical ctenidia are aborted, and the branchial function is assumed by close-set lamelliform processes arranged in a series beneath the mantle-skirt on either side of the foot. In fig. 26, *d* the large branchial vein of *Patella* bringing blood from the gill-series to the heart is seen; where it crosses the series of lamellae there is a short interval devoid of lamellae.

The heart in *Patella* consists of a single auricle (not two as in *Haliotis* and *Fissurella*) and a ventricle; the former receives the blood from the branchial vein, the latter distributes it through a large aorta which soon leads into irregular blood-lacunae.

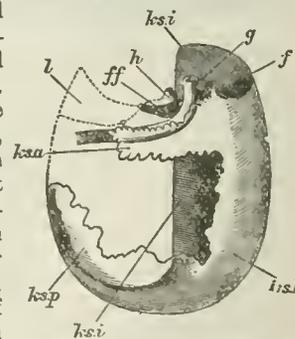

FIG. 30.—Diagram of the two renal organs (nephridia), to show their relation to the rectum and to the pericardium. *f*, papilla of the larger nephridium; *g*, anal papilla with rectum leading from it; *h*, papilla of the smaller nephridium, which is only represented by dotted outlines; *l*, pericardium indicated by a dotted outline,—at its right side are seen the two reno-pericardial pores; *ff*, the sub-anal tract of the large nephridium given off near its papilla and seen through the unshaded smaller nephridium; *ksa*, anterior superior lobe of the large nephridium; *ksl*, left lobe of same; *ksp*, posterior lobe of same; *ksi*, inferior sub-visceral lobe of same. (Original.)

between the mass of the liver and the muscular foot. The radula has 160 rows of teeth with twelve teeth in each row. Two pairs of salivary ducts, each leading from a salivary gland, open into the buccal chamber. The oesophagus leads into a remarkable stomach, plaited like the manyplices of a sheep, and after this the intestine takes a very large number of turns embedded in the yellow liver, until at last it passes between the two renal sacs to the anal papilla. A curious ridge (spiral valve) which secretes a slimy cord is found upon the inner wall of the intestine. The general structure of the Molluscan intestine has not been sufficiently investigated to render any comparison of this structure of Patella with that of other Mollusca possible. The eyes of the Limpet (28) deserve mention as examples of the most primitive kind of eye in the Molluscan series. They are found one on each cephalic tentacle, and are simply minute open pits or depressions of the epidermis, the epidermic cells lining them being pigmented and connected with nerves (compare fig. 118).

The Limpet breeds upon the southern English coast in the early part of April, but its development has not been followed. It has simply been traced as far as the formation of a Dibrastula which acquires a ciliated band, and becomes a nearly spherical Trochosphere. It is probable that the Limpet takes several years to attain full growth, and during that period it frequents the same spot, which becomes gradually sunk below the surrounding surface, especially if the rock be carbonate of lime. At low tide the Limpet (being a strictly intertidal organism) is exposed to the air, and is to be found upon its spot of fixation; but when the water again covers it, it (according to trustworthy observers) quits its attachment and walks away in search of food (minute encrusting algæ), and then once more as the tide falls returns to the identical spot, not an inch in diameter, which belongs, as it were, to it. Several million Limpets—twelve million in Berwickshire alone—are annually used on the east coast of Britain as bait.

Order 2.—Azygobranchia.

Characters.—Streptoneura which, as a sequel to the torsion of the visceral hump, have lost by atrophy the originally left ctenidium and the originally left nephridium, retaining the right ctenidium as a comb-like gill-plume to the actual left of the rectum, and the right nephridium (that which is the smaller in the Zygobranchia) also to the actual left of the rectum, between it and the gill-plume. The right olfactory organ only is retained, and may assume the form of a comb-like ridge to the actual left of the ctenidium or branchial plume. It has been erroneously described as the second gill, and is known as the parabranchia. The rectum itself lies on the animal's right

shoulder. The presence of glandular plication of the surface of the mantle-flap (fig. 46, *x*) and an adrectal gland (purple-gland, fig. 47, *gp*) are frequently observed. The sexes are always distinct; a special genital duct (oviduct or sperm duct) unpaired is present, opening either by the side of the anus or, in the males, on the right side of the neck in connexion with a large penis. The shell is usually large and spiral; often an operculum is developed on the upper surface of the hinder part of the foot. The dentition of the lingual ribbon is very varied. In most cases the visceral hump and the foot increase along axes at right angles to one another, so that the foot is extended far behind the visceral hump in the ab-oral direction, whilst the visceral hump is lofty and spirally twisted.

This is a very large group, and is conveniently divided into two sections, the Reptantia and the Natantia. The former, containing the immense majority of the group, breaks up into three sub-orders, the Holochlamyda, Pneumochlamyda, and Siphonochlamyda, characterized by the presence or absence of a trough-like prolongation of the margin of the mantle-flap, which conducts water to the respiratory chamber (sub-pallial space where the gill, anus, &c., are placed), and notches the mouth of the shell by its presence, or again by adaptation to aerial respiration. The sub-orders are divided into groups according to the characters of the lingual dentition. In some Azygobranchia the mouth is placed at the end of a more or less elongated snout or rostrum which is not capable of introversion (Rostrifera); in the others (Proboscifera) the rostrum is partly invaginated and is often of great length. It is only everted when the animal is feeding, and is withdrawn (introverted) by the action of special muscles; the over-worked term "proboscis" is applied to the retractile form of snout. The term "introversible snout," or simply "introvert," would be preferable. The presence or absence of this arrangement does not seem to furnish so natural a division of the Reptant Azygobranchia as that afforded by the characters of the mantle-skirt.

Section a.—REPTANTIA.

Characters.—Azygobranchia adapted to a creeping life; foot either wholly or only the mesopodium in the form of a creeping disc.

Sub-order 1.—Holochlamyda.

Characters.—Reptant Azygobranchia with a simple margin to the mantle-skirt, and, accordingly, the lip of the shell unnotched; mostly Rostrifera (*i.e.*, with a non-introversible snout), and vegetarian; marine, brackish, fresh-water, terrestrial.

a. *Rhipidoglossa* (x.4 to 7.1.4 to 7.x).

Family 1.—*Trochidae*.

Genera: *Turbo*, Lin.; *Phasianella*, Lam.; *Imperator*, Montf.; *Trochus*, Lin.; *Rotella*, Lam.; *Euomphalus*, Low.

Family 2.—*Neritidae*.

Genera: *Nerita*, L.; *Neritina*, Lam.; *Pilcolus*, Low; *Navicella*, Lam.

Family 3.—*Pleurotomariidae*.

Genera: *Pleurotomaria*, DeFr.; *Anatomus*, Montf.; *Stomatia* Helbing.

β. *Ptenoglossa* (x.0.x).

Family 4.—*Scalariidae*.

Genus: *Scalaria*, Lam.

Family 5.—*Janthinidae*.

Genera: *Janthina*, Lam. (fig. 44); *Recluzia*, Petit.

γ. *Tanioglossa* (3.1.3).

Family 6.—*Cerithiidae*.

Genera: *Cerithium*, Brug.; *Potamidex*, Brong.; *Nerinea*, DeFr.

Family 7.—*Melanidae*.

Genera: *Melania*, Lam.; *Melanopsis*, Fér.; *Ancylotus*, Lay.

Family 8.—*Pyramidellidae*.

Genera: *Pyramidella*, Lam.; *Stylina*, Flem.; *Aclis*, Loven.

Family 9.—*Turritellidae*.

Genera: *Turritella*, Lam.; *Cœcum*, Flem.; *Vermetus*, Adans.; *Siliquaria*, Brug.

Family 10.—*Xenophoridae*.

Genus: *Phorus*, Montf. (fig. 39).

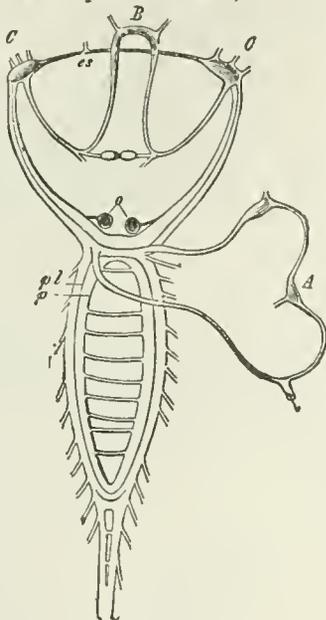

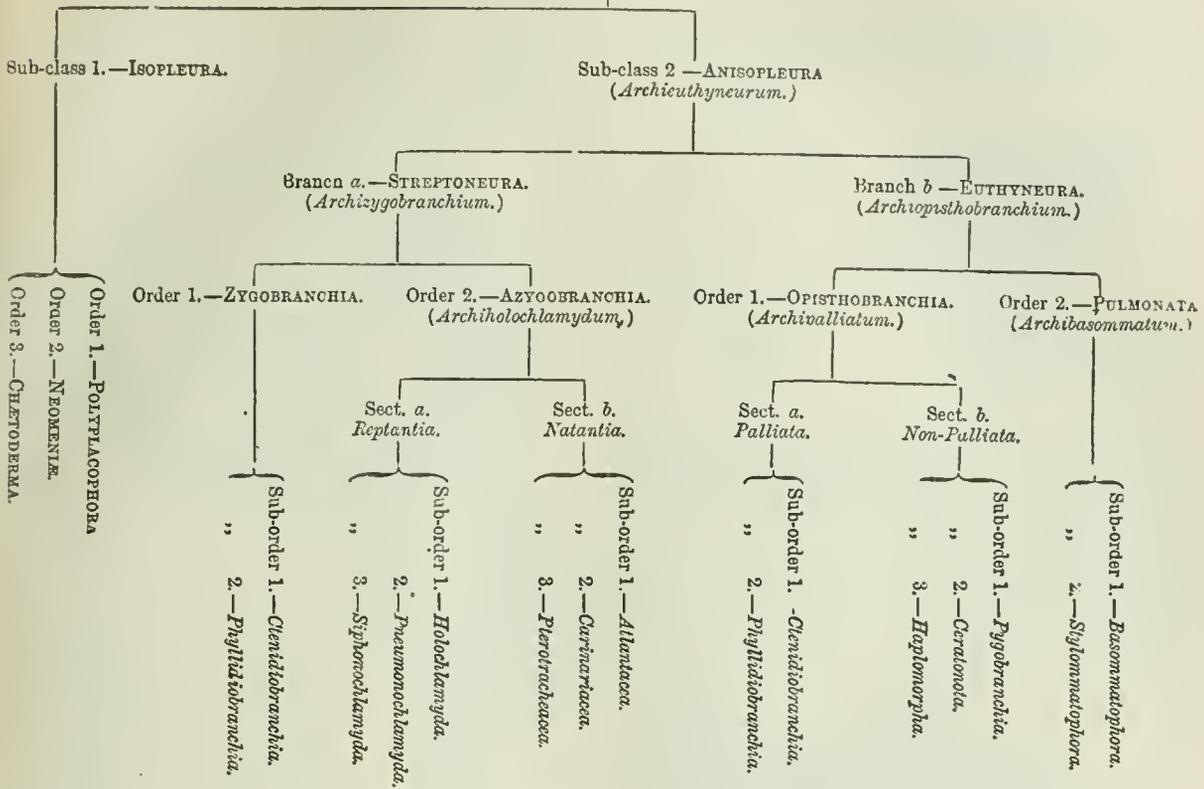

FIG. 36.—Nervous system of *Fissurella*. *pl*, pallial nerve; *p*, pedal nerve; *A*, abdominal ganglia in the Streptoneurous visceral commissure, with supra- and sub-intestine ganglion on each side; *B*, buccal ganglia; *C, C*, cerebral ganglia; *es*, cerebral commissure; *o*, otcysts attached to the cerebro-pedal connectives. (From Gegebauer, after Jhering.)

TABULAR VIEW OF THE SUBDIVISIONS OF THE CLASS GASTROPODA, ARRANGED SO AS TO SHOW THEIR SUPPOSED GENETIC RELATIONSHIPS.

Class.—GASTROPODA.
(*Archisopleurum.*)

Family 11.—*Naticidae*.
Genera: *Natica*, Lam.; *Sigarellus*, Lam.; *Neritopsis*, Gratel.

Family 12.—*Entoconchidae*.
The single genus and species *Entoconcha mirabilis*, discovered by Joh. Müller in 1851, parasitic in *Synapta digitata*. The adult form is not known.

Family 13.—*Marseniidae*.
Genera: *Marsenia*, Leach; *Onchidiopsis*, Beck.

Family 14.—*Acmæidae*.
Genera: *Acmæa*, Eschsch.; *Lottia*, Gr.; (probably these will be found to belong to the Zygobranchia).

Family 15.—*Capulidae*.
Genera: *Capulus*, Montf.; *Calyptrea*, Lam. (fig. 40); *Trochita*, Schum.

Family 16.—*Littorinidae*.
Genera: *Littorina* (the Periwinkles, fig. 46); *Modulus*, Gray; *Lacuna*, Turt.; *Rissoa*, Frem.; *Hydrobia*, Hartm.; *Assiminea*, Leach.

Family 17.—*Paludinidae*.
Genera: *Paludina* (River-Snail) (figs. 7, 21); *Bithynia*, Gray; *Tanalia*, Gray.

Family 18.—*Valvatidae*.
Genus: *Valvata* (fig. 45), fresh-water.

Family 19.—*Ampullaridae*.
Genus: *Ampullaria* (can breathe air by means of the walls of the pallial chamber as well as water by the gill: fresh waters of tropical America, Africa, and East Indies).
Sub-order 2.—*Pneumochlamyda*.
Characters.—Pallial chamber a lung-sac; no gill; mouth on a rostrum, not a retractile proboscis; terrestrial habit.

Family 20.—*Cyclostomidae*.
Genera: *Cyclostoma*, Lam.; *Cyclophorus*, Montf.; *Ferussina*, Gratel.; *Pupina*, Vignard.

Family 21.—*Helicinidae* (radula rhipidoglossate rather than tænioglossate).
Genera: *Stoastoma*, Adams; *Trochatella*, Swains.; *Helicina*, Lam.; *Proserpina*, Guild.

Family 22.—*Aciculidae*.
Genera: *Acicula*, Hartm.; *Geometania*, Pfr.

Sub-order 3.—*Siphonochlamyda*.
Characters.—Reptant Azygobranchia with the margin of the mantle drawn out to form a trough-like siphon which notches the lip of the shell; shell always spiral; usually an operculum, horny or lamelliform; either a rostrum or a retractile proboscis; exclusively marine; mostly carnivorous.
**Tænioglossa* (3.1.3).

Family 1.—*Strombidae*.
Genera: *Strombus*, L.; *Pteroceras*, Lam.; *Rostellaria*, Lam. (fig. 43).

Family 2.—*Aporrhaidæ*.
Genus: *Aporrhais*, Da Costa.

Family 3.—*Pedicularidæ*.
Genus: *Pedicularia*, Swains.

Family 4.—*Dolidæ*.
Genera: *Cassis*, Lam.; *Cassidaria*, Lam.; *Dolium*, Lam.; *Picula*, Swains.

Family 5.—*Tritonidæ*.
Genera: *Tritonium*, Cuv. (fig. 42); *Ranella*, Lam.

Family 6.—*Cypræidæ* (the Cowries).
Genera: *Cypræa*, L.; *Ovulum*, Brug. (fig. 41); *Erato*, Risso.
**Toxiglossa* (1.0.1).

Family 7.—*Conidæ*.
Genus: *Conus*, L.

Family 8.—*Terebridæ*.
Genus: *Terebra*, Adams.

Family 9.—*Pleurotomidæ*.
Genus: *Pleurotoma*, Lam.

Family 10.—*Cancellariidæ*.
Genus: *Cancellaria*, Lam.
**Rachiglossa* (1.1.1 or 1.).

Family 11.—*Muricidæ*.
Genera: *Murex*, L.; *Trophon*, Montf.; *Fævus*, Brug.; *Pyrula*, Lam. (fig. 38); *Turbinella*, Lam.

Family 12.—*Buccinidæ*.
Genera: *Buccinum*, L.; *Nassa*, Lam. (fig. 5); *Purpura*, Eruz. (fig. 47); *Concholepas*, Lam.; *Magilus*, Montf.

Family 13.—*Mitridæ*.
Genus: *Mitra*, Lam.

Family 14.—*Olivida*.

Genera: *Olivia*, Brug.; *Ancilla*, Lam.; *Harpa*, Lam.

Family 15.—*Volutida*.

Genera: *Voluta*, L.; *Cymbium*, Montf.; *Marginella*, Lam.; *Volvaria* Lam.

Further Remarks on the Reptant Azygobranchia.—The very large assemblage of forms coming under this order comprises the most highly developed predaceous sea-snails, numerous vegetarian species, a considerable number of

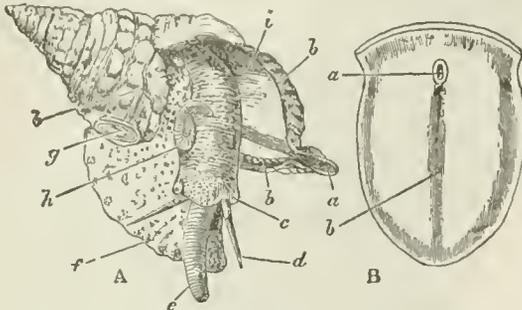

FIG. 37.—A. *Trilon variegatum*, to show the proboscis or buccal introvert (*c*) in a state of eversion. *a*, siphonal notch of the shell occupied by the siphonal fold of the mantle-skirt (Siphonochlamyda); *b*, edge of the mantle-skirt resting on the shell; *c*, cephalic eye; *d*, cephalic tentacle; *e*, everted buccal introvert (proboscis); *f*, foot; *g*, operculum; *h*, penis; *i*, under surface of the mantle-skirt forming the roof of the sub-pallial chamber. B. Sole of the foot of *Pyrala tuba*, to show *a*, the pore usually said to be "aquiferous" but probably the orifice of a gland; *b*, median line of foot.

fresh-water, and some terrestrial forms. The partial dissection of a male specimen of the Common Periwinkle, *Littorina littoralis*, drawn in fig. 46, will serve to exhibit the disposition of viscera which prevails in the group.

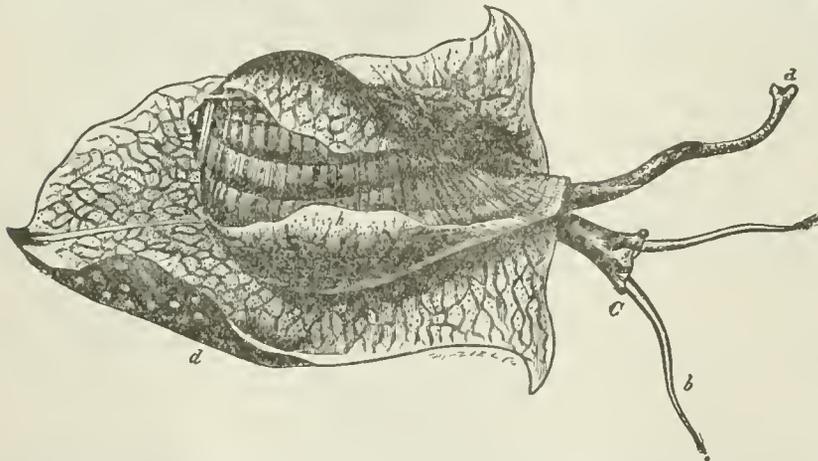

FIG. 38.—Animal and shell of *Pyrala levigata*. *a*, siphon; *b*, head-tentacles; *C*, head, the letter placed near the right eye; *d*, the foot, expanded as in crawling; *h*, the mantle-skirt reflected over the sides of the shell. (From Owen.)

The branchial chamber formed by the mantle-skirt overhanging the head has been exposed by cutting along a line extending backward from the letters *vd* to the base of the columella muscle *mc*, and the whole roof of the chamber thus detached from the right side of the animal's neck has been thrown over to the left, showing the organs which lie upon the roof. No opening into the body-cavity has been made; the organs which lie in the coiled visceral hump show through its transparent walls. The head is seen in front resting on the foot and carrying a median non-retractile snout or rostrum, and a pair of cephalic tentacles at the base of each of which is an eye. In many Gastropoda the eyes are not thus sessile but raised upon special eye-tentacles (figs. 43, 69). To the right of the head is seen the muscular penis *p* close to the termination of the vas deferens (spermatic duct) *vd*. The testis *t* occupies a median position in the coiled visceral mass. Behind the penis on the same side is the hooklike columella muscle, a development of the

retractor muscle of the foot, which clings to the spiral columa or columella of the shell (see fig. 42). This columella muscle is the same thing as the muscular surface marked *c* in the figures of *Patella*, marked *k* in fig. 91 of *Nautilus*, and the posterior adductor of *Lamellibranchs* (fig. 131).

The surface of the neck is covered by integument forming the floor of the branchial cavity. It has not been cut into

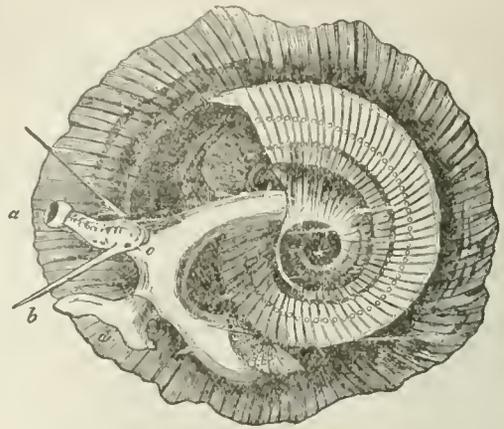

FIG. 39.—Animal and shell of *Phorus exustus*. *a*, snout (not introvertible); *b*, cephalic tentacles; *c*, right eye; *d*, pro- and meso-podium,—to the right of this is seen the metapodium bearing the sculptured operculum.

Of the organs lying on the reflected mantle-skirt, that which in the natural state lay nearest to the vas deferens on the right side of the median line of the roof of the branchial chamber is the rectum *r*, ending in the anus *a*. It can be traced back to the intestine *i* near the surface of the visceral hump, and it is found that the apex of the coil formed by the hump is occupied by the liver *h* and the stomach *v*. Pharynx and cesophagus are concealed in the head. The enlarged glandular structure of the walls of the rectum is frequent in the Azygobranchia, as is also though not universally the gland marked *g*, next to the rectum. It is the adrectal gland, and in the genera *Murex* and *Purpura* secretes a colourless liquid which turns purple upon exposure to the atmosphere, and was used by the

ancients as a dye.

Near this, and less advanced into the branchial chamber, is the single renal organ or nephridium *r* with its opening to the exterior *r'*. Internally this glandular sac presents a second slit or aperture which leads into the pericardium (as is now found to be the case in all Mollusca). The heart *c* lying in the pericardium is seen in close proximity to

FIG. 40.—Shell of *Calyptraea*, seen from below so as to show the inner whorl *b*, concealed by the cap-like outer whorl *a*.

The heart *c* lying in the pericardium is seen in close proximity to

the renal organ, and consists of a single auricle receiving blood from the gill, and of a single ventricle which pumps it through the body by an anterior and posterior aorta (see fig. 105). The surface α of the mantle between the rectum and the gill-plume is thrown into folds which in many sea-snails (Whelks, &c) are very strongly developed. The whole of this surface appears to be active in the secretion of a mucous-like substance. The single gill-plume br lies to the left of the median line in natural position. It corresponds to the right of the two primitive archaic condition of the Molluscan body, and does not project freely into the branchial cavity, but its axis is attached (by concrecence) to the mantle-skirt (roof of the branchial chamber). It is rare for the gill-plume of an Anisopleurous Gastropod to stand out freely as a plume, but occasionally this more archaic condition is exhibited, as in *Valvata* (fig. 45). Next beyond (to the left of) the gill-plume we find the so-called parabranchia, which is here simple, but sometimes lamellated as in *Purpura* (fig. 47). This organ has, without reason, been supposed to represent the second ctenidium of the typical Mollusc, which it cannot do on account of its position. It should be to the right of the anus were this the case. Recently Spengel has shown that the parabranchia of Gastropods is the typical olfactory organ or osphradium in a highly-developed condition

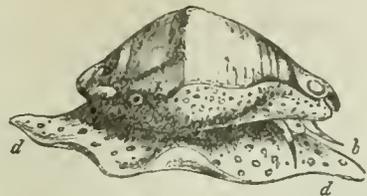

FIG. 41.—Animal and shell of *Ovulum*. b , cephalic tentacles, d , foot; h , mantle-skirt, which is naturally carried in a reflected condition so as to cover in the sides of the shell.

The minute structure of the epithelium which clothes it, as well as the origin of

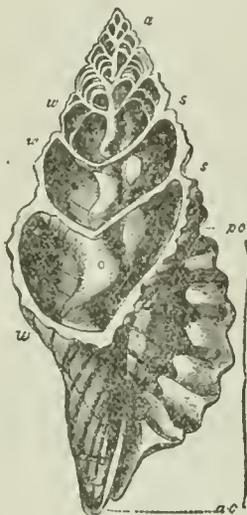

FIG. 42.—Section of the shell of *Tritonium*. a , apex; ac , aliphonal notch of the mouth of the shell; cc to pc , mouth of the shell; w , m , whorls of the shell; s , s , sutures. Occupying the axis, and exposed by the section, is seen the "columella" or spiral pillar. The upper whorls of the shell are seen to be divided into separate chambers by the formation of successively formed "septa." (From Owen.)

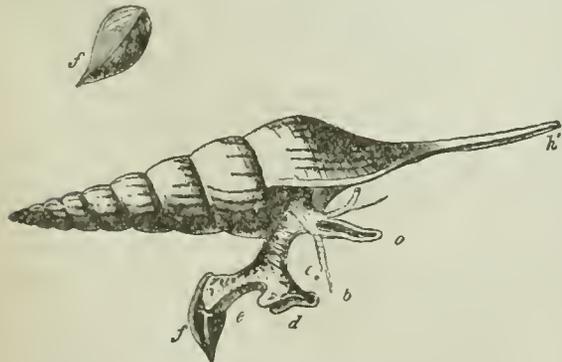

FIG. 43.—Animal and shell of *Rostellaria rectirostrata*. a , snout or rostrum; b , cephalic tentacle; c , eye; d , propodium and mesopodium; e , metapodium; f , operculum; h , prolonged siphonal notch of the shell occupied by the alpheo, or trough-like process of the mantle-skirt. (From Owen.)

the nerve which is distributed to the parabranchia, proves it to be the same organ which is found universally in Mol-

luses at the base of each gill-plume, and tests the in-drawn current of water by the sense of smell. The nerve to this

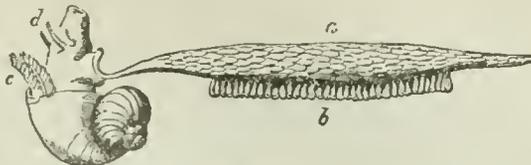

FIG. 44.—Female *Jantlhoa*, with egg-float (a) attached to the foot; b , egg-capsules; c , ctenidium (gill-plume); d , cephalic tentacles.

organ is given off from the superior (original right, see fig. 19) visceral ganglion.

The figures which are here given of various Azygobranchia are in most cases sufficiently explained by the references attached to them. As an excellent general type of the nervous system, attention may be directed to that of *Paludina* drawn in fig. 21. On the whole, the ganglia are strongly individualized in the Azygobranchia, nerve-cell tissue being concentrated in the ganglia and absent from the cords (contrast with Zygobranchia and Isopleura). At the same time, the junction of the visceral loop above the intestine prevents in all Streptoneura the shortening of the visceral loop, and it is rare to find a fusion of the visceral ganglia with either pleural, pedal, or cerebral—a fusion which can and does take place where the visceral loop is not above but below the intestine, e.g., in the Euthyneura (fig. 67), Cephalopoda (fig. 112), and Lamellibranchia (fig. 144). As contrasted with the Zygobranchia and the Isopleura, we find that in the Azygobranchia the pedal nerves are distinctly nerves given off from the pedal ganglia, rather than cord-like nerve-tracts containing both nerve-cells and nerve-fibres. Yet in some Azygobranchia (*Paludina*) a ladder-like arrangement of the two pedal nerves and their lateral branches has been detected (30). The histology of the nervous system of Mollusca has yet to be seriously inquired into.

FIG. 45.—*Palvata rotunda*, Moll. a , mouth; op , operculum; br , ctenidium (branchial plume); α , filiform appendage (? rudimentary ctenidium). The freely projecting ctenidium of typical form not having its axis fused to the roof of the branchial chamber is the notable character of this genus

in some Azygobranchia (*Paludina*) a ladder-like arrangement of the two pedal nerves and their lateral branches has been detected (30). The histology of the nervous system of Mollusca has yet to be seriously inquired into.

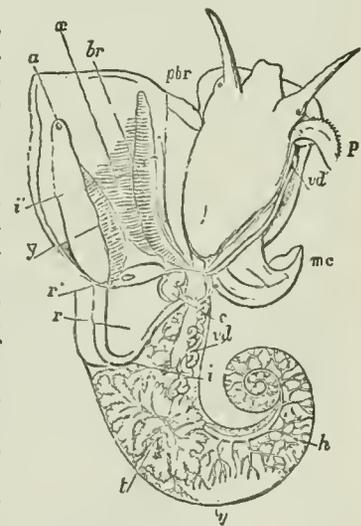

FIG. 46.—Male of *Littorina littoralis*, Linn., removed from its shell; the mantle-skirt cut along its right line of attachment and thrown over to the left side of the animal so as to expose the organs on its inner face. a , snus; i , intestine; r , nephridium (kidney); r , aperture of the nephridium; c , heart; br , ctenidium (gill-plume); pbr , parabranchia (= the osphradium or olfactory patch); α , glandular lamella of the inner face of the mantle-skirt; y , adrectal (parpurarone) gland; t , testis; vd , vas deferens; p , penis; mc , columella muscle (muscular process grasping the shell); s , stomach; b , liver. *N.B.* Note the simple snout or rostrum not inverted as a "proboscis."

The alimentary canal of the Azygobranchia presents little diversity of character, except in so far as the buccal region is concerned. Salivary glands are present, and in some carnivorous forms (*Dolium*) these secrete free sul-

phuric acid (as much as two per cent is present in the secretion), which assists the animal in boring holes by means of its rasping tongue through the shells of other Molluscs upon which it preys. A crop-like dilatation of the gut and a recurved intestine, embedded in the compact yellowish-brown liver, the ducts of which open into it, form the rest of the digestive tract and occupy a large bulk of the visceral hump. The buccal region presents a pair of shelly jaws placed laterally upon the lips, and a wide range of variation in the form of the denticles of the lingual ribbon or radula, the nature of which will be understood by a reference to fig. 9, whilst the systematic list of families given above shows the particular form of dentition characteristic of each division of the order.

The modification in the form of the snout upon which the mouth is placed, leading to the distinction of "probosciferous" and "rostriferous" Gastropods, requires further notice. The condition usually spoken of as a "proboscis" appears to be derived from the condition of a simple rostrum (having the mouth at its extremity) by the process of *incomplete introversion* of that simple rostrum.

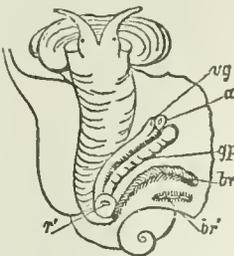

FIG. 7.—Female of *Purpura lapillus* removed from its shell; the mantle-skirt cut along its left line of attachment and thrown over to the right side of the animal so as to expose the organs on its inner face. *a*, anus; *vg*, vagina; *gp*, adrenal purpuriparous gland; *r*, aperture of the nephridium (kidney); *br*, ctenidium (branchial plume); *br'*, parabranchia (= the comb-like osphradium or olfactory organ).

There is no reason in the actual significance of the word why the term "proboscis" should be applied to an alternately introversible and eversible tube connected with an animal's body, and yet such is a very customary use of the term. The introversible tube may be completely closed, as in the "proboscis" of Nemertean worms, or it may have a passage in it leading into a non-eversible œsophagus, as in the present case, and in the case of the eversible pharynx of the predatory Chætopod worms. The diagrams here introduced (fig. 48) are intended to show certain important distinctions which obtain amongst the various "introverts," or intro- and eversible tubes so frequently met with in animal bodies. Supposing the tube to be completely introverted and to commence its eversion, we then find that eversion may take place, either by a forward movement of the side of the tube near its attached base, as in the proboscis of the Nemertine worms, the pharynx of Chætopods, and the eye-tentacle of Gastropods, or, by a forward movement of the inverted apex of the tube, as in the proboscis of the Rhabdocœl Planarians, and in that of Gastropods here under consideration. The former case we call "pleurebolic" (fig. 48, A, B, C, H, I, K), the latter "acrebolic" tubes or introverts (fig. 48, D, E, F, G). It is clear that, if we start from the condition of full eversion of the tube and watch the process of introversion, we shall find that the pleurebolic variety is introverted by the apex of the tube sinking inwards; it may be called acrebolic, whilst conversely the acrebolic tubes are pleurebolic. Further, it is obvious enough that the process either of introversion or of eversion of the tube may be arrested at any point, by the development of fibres connecting the wall of the introverted tube with the wall of the body, or with an axial structure such as the œsophagus; on the other hand, the range of movement of the tubular introvert may be unlimited or complete. The acrebolic proboscis or frontal introvert of the Nemertine worms has a complete range. So has the acrebolic pharynx of Chætopods, if we consider the organ as terminating at that point where the jaws are placed and the œsophagus commences. So too the acrebolic eye-tentacle of the snail has a complete range of movement, and also the

pleurebolic proboscis of the Rhabdocœl prostoma. The introverted rostrum of the Azygobranch Gastropods presents in contrast to these a limited range of movement. The "introvert" in these Gastropods is not the pharynx as in the Chætopod worms, but a præ-oral structure, its apical limit being formed by the true lips and jaws, whilst the apical limit of the Chætopod's introvert is formed by the jaws placed at the junction of pharynx and œsophagus, so that the Chætopod's introvert is part of the stomodæum or fore-gut, whilst that of the Gastropod is external to the alimentary canal altogether, being in front of the mouth, not behind it, as is the Chætopod's. Further, the Gastropod's introvert is pleurebolic (and therefore acrebolic), and is limited both in eversion and in introversion; it cau-

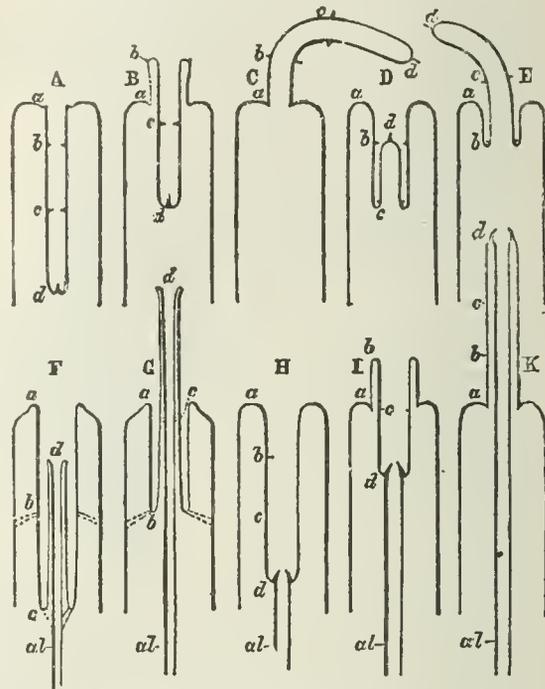

FIG. 48.—Diagrams explanatory of the nature of so-called proboscides or "introverts." A, Simple introvert completely introverted. B, The same, partially everted by eversion of the sides, as in the Nemertine proboscis and Gastropod eye-tentacle=pleurebolic. C, The same, fully everted. D, E, A similar simple introvert in course of eversion by the forward movement, not of its sides, but of its apex, as in the proboscis of the Rhabdocœl=acrebolic. F, Acrebolic (=pleurebolic) introvert, formed by the snout of the probosciferous Gastropod. *a*, alimentary canal; *d*, the true mouth. The introvert is not a simple one with complete range both in eversion and introversion, but is arrested in introversion by the fibrous bands at *c*, and similarly in eversion by the fibrous bands at *b*. G, The acrebolic snout of a probosciferous Gastropod, arrested short of complete eversion by the fibrous band *b*. H, The acrebolic (=pleurebolic) pharynx of a Chætopod fully introverted. *a*l, alimentary canal; *a*l, the jaws; *a*, the mouth; therefore *a* to *d* is stomodæum, whereas in the Gastropod (F) *a* to *d* is inverted body-surface. I, Partial eversion of H. K, Complete eversion of H. (Original.)

not be completely everted owing to the muscular bands (fig. 48, G), nor can it be fully introverted owing to the bands (fig. 48, F) which tie the axial pharynx to the adjacent wall of the apical part of the introvert. As in all such intro- and eversible organs, eversion of the Gastropod proboscis is effected by pressure communicated by the muscular body-wall to the liquid contents (blood) of the body-space, accompanied by the relaxation of the muscles which directly pull upon either the sides or the apex of the tubular organ. The inversion of the proboscis is effected directly by the contraction of these muscles. In various members of the Azygobranchia the mouth-bearing cylinder is introversible (i.e., is a *proboscis*)—with rare exceptions these forms have a siphonate mantle-skirt. On the other hand, many which have a siphonate mantle-skirt are not provided with an introversible mouth-bearing cylinder, but have a simple non-introversible rostrum, as it has been

termed, which is also the condition presented by the mouth-bearing region in nearly all other Gastropoda. One of the best examples of the introversible mouth-cylinder or proboscis which can be found is that of the Common Whelk and its immediate allies. In fig. 37 the proboscis is seen in an everted state; it is only so carried when feeding, being withdrawn when the animal is at rest. Probably its use is to enable the animal to introduce its rasping and licking apparatus into very narrow apertures for the purpose of feeding, *e.g.*, into a small hole bored in the shell of another Mollusc.

The foot of the Azygobranchia, unlike the simple muscular disc of the Isopleura and Zygobranchia, is very often divided into lobes, a fore, middle, and hind lobe (pro-, meso-, and meta-podium, see figs. 39 and 43). Very usually, but not universally, the meta-podium carries an operculum. The division of the foot into lobes is a simple case of that much greater elaboration or breaking up into processes and regions which it undergoes in the class Cephalopoda. Even among some Gastropoda (*viz.*, the Opisthobranchia), we find the lobation of the foot still further carried out by the development of lateral lobes, the epipodia, whilst there are many Azygobranchia, on the other hand, in which the foot has a simple oblong form without any trace of lobes.

The development of the Azygobranchia from the egg has been followed in several examples, *e.g.*, *Paludina*, *Purpura*, *Nassa*, *Vermetus*, *Neritina*. As in other Molluscan groups, we find a wide variation in the early process of the formation of the first embryonic cells, and their arrangement as a Diblastula dependent on the greater or less amount of food-yolk which is present in the egg-cell when it commences its embryonic changes. In fig. 7, the early stages of *Paludina vivipara* are represented. There is but very little food-material in the egg of this Azygobranch, and consequently the Diblastula forms by invagination; the blastopore or orifice of invagination coincides with the anus, and never closes entirely. A well-marked Trochosphere is formed by the development of an equatorial ciliated band; and subsequently, by the disproportionate growth of the lower hemisphere, the Trochosphere becomes a Veliger. The primitive shell-sac or shell-gland is well marked at this stage, and the pharynx is seen as a new ingrowth (the stomodæum), about to fuse with and open into the primitively invaginated arch-enteron (fig. 7, F).

In other Azygobranchs (and such variations are representative for all Mollusca, and not characteristic only of Azygobranchia), we find that there is a very unequal division of the egg-cell at the commencement of embryonic development, as in *Nassa* (fig. 5). Consequently there is strictly speaking no invagination (emboly), but an overgrowth (epiboly) of the smaller cells to enclose the larger. The general features of this process and of the relation of the blastopore to mouth and anus have been explained above in treating of the development of Mollusca generally. In such cases the blastopore may entirely close, and both mouth and anus develop as new ingrowths (stomodæum and proctodæum), whilst, according to the observations of Bobretzky, the closed blastopore may coincide in position with the mouth in some instances (*Nassa*, &c.), instead of with the anus. But in these epibolic forms, just as in the embolic *Paludina*, the embryo proceeds to develop its ciliated band and shell-gland, passing through the earlier condition of a Trochosphere to that of the Veliger. In the veliger stage many Azygobranchia (*Purpura*, *Nassa*, &c.) exhibit, in the dorsal region behind the head, a contractile area of the body-wall. This acts as a larval heart, but ceases to pulsate after a time. Similar rhythmically contractile areas are found on the foot of the embryo Pulmonate *Limax* and on the yolk-sac (distended foot-surface) of the Cephalopod *Loligo* (see fig. 72**).

The history of the shell in the development of Azygobranchia (and other Gastropods) is important. Just as the primitive shell-sac aborts and gives place to a cap-like or boat-like shell, so in some cases (*Marsenia*, Krohn) has this first shell been observed to be shed, and a second shell of different shape is formed beneath it.

A detailed treatment of what is known of the histogenesis in relation to the cell-layers in these Mollusca would take us far beyond the limits of this article, which aims at exposing only the well-ascertained characteristic features of the Mollusca and the various subordinate groups. There is still a great deficiency in our knowledge of the development of the Gastropoda, as indeed of all classes of animals. The development of the gill (ctenidium) as well as of the renal organ, and details as to the process of torsion of the visceral hump, are still quite insufficiently known.

One further feature of the development of the Azygobranchia deserves special mention. Many Gastropoda deposit their eggs, after fertilization, enclosed in capsules; others, as *Paludina*, are viviparous, others, again, as the Zygobranchia, agree with the Lamellibranch Conchifera (the Bivalves) in having simple exits for the ova without glandular walls, and therefore discharge their eggs unenclosed in capsules freely into the sea-water; such unencapsuled eggs are merely enclosed each in its own delicate chorion. When egg-capsules are formed they are often of large size, have tough walls, and in each capsule are several eggs floating in a viscid fluid. In some cases all the eggs in a capsule develop; in other cases one egg only in a capsule (*Neritina*), or a small proportion (*Purpura*, *Buccinum*), advance in development; the rest are arrested either after the first process of cell-division (cleavage) or before that process. The arrested embryos or eggs are then swallowed and digested by those in the same capsule which have advanced in development. The details of this history require renewed study, our present knowledge of it being derived from the works of Koren and Danielssen, Carpenter and Claparède. In any case it is clearly the same process in essence as that of the formation of a vitellogenous gland from part of the primitive ovary, or of the feeding of an ovarian egg by the absorption of neighbouring potential eggs; but here the period at which the sacrifice of one egg to another takes place is somewhat late. What it is that determines the arrest of some eggs and the progressive development of others in the same capsule is at present unknown.

Section *b* (of the Azygobranchia).—*NATANTIA*.

Characters.—Azygobranchiate Streptonera which have the form and texture of the body adapted to a free-swimming pelagic habit. They appear to be derived from holochlamydic forms of Reptant Azygobranchia. The foot takes the form of a swimming organ. The nervous system and sense-organs (eyes, otocysts, and osphradium) are highly developed. The odontophore also is remarkably developed, its admedian teeth being mobile, and it serves as an efficient organ for attacking other pelagic forms upon which the *Natantia* prey. The sexes are distinct as in all Streptonera; and genital ducts and accessory glands and pouches are present as in all Azygobranchia. The *Natantia* exhibit a series of modifications of the form and proportions of the visceral mass and foot, leading from a condition readily comparable with that of a typical Azygobranch such as *Rostellaria*, with the three regions of the foot (pro-, meso-, and meta-podium) strongly marked, and a coiled visceral hump of the usual proportions, up to a condition in which the whole body is of a tapering cylindrical shape, the foot a plate-like vertical fin, and the visceral hump almost completely atrophied. Three steps of this modification may be distinguished as three sub-orders, the *Atlantæca*, the *Carinariæcer*, and the *Pterotracheæca*.

Sub-order 1.—*Atlantæca*.

Characters.—*Natantia* with a large spirally-wound visceral hump, covered by a hyaline spiral shell; mantle-skirt large, overhanging a well-developed sub-pallial branchial chamber as in Azygobranchia, to the wall of which is attached the branchial ctenidium; foot well developed, divisible into a mobile propodium, a mesopodium on which is formed a sucker, and a metapodium which, when the animal is expanded, extends backwards beyond the shell and visceral

hump; upon the upper surface of the metapodium is developed an operculum.

Genera: *Atlanta*, *Oxygurus*. Probably here belong the Palæozoic fossils *Bellerophon*.

Sub-order 2.—*Carinariacea*.

Characters.—Visceral hump greatly reduced in relative size; shell small, cap-like, hyaline; ctenidium (branchial plume) projecting from the small sub-pallial chamber; body cylindrical; of the foot-lobes only the mesopodium is prominent, provided with a sucker, and compressed laterally so as to form a vertical plate-like fin projecting from the ventral surface; the propodium forms simply the ventral surface of the anterior region of the cylindrical body whilst the metapodium forms its posterior region.

Genera: *Carinaria*, *Cardiopoda*.

Sub-order 3.—*Pterotracheacea*.

Characters—Visceral hump still further reduced, forming a mere oval sac embedded in the posterior dorsal region of the cylindrical body; no shell; foot as in Carinariacea, except that the sucker is absent from the mesopodium in the females.

Genera: *Pterotrachea*, *Firuloides*.

Further Remarks on the Natantia Azygobranchia.—

Logically the Natantia should stand as we have placed them, viz., as a special branch or section of the Azygobranchia, related to them somewhat as are the Birds to the Reptiles. They are true Azygobranchia which have taken to a pelagic life, and the peculiarities of structure which they exhibit

the visceral loop of the Natantia is Streptoneurous. Special to the Natantia is the high elaboration of the lingual ribbon, and, as an agreement with some of the Opisthobranchiate Euthyneura but as a difference from the Azygobranchia, we find the otocysts closely attached to the cerebral ganglia. This is however, less of a difference than it was

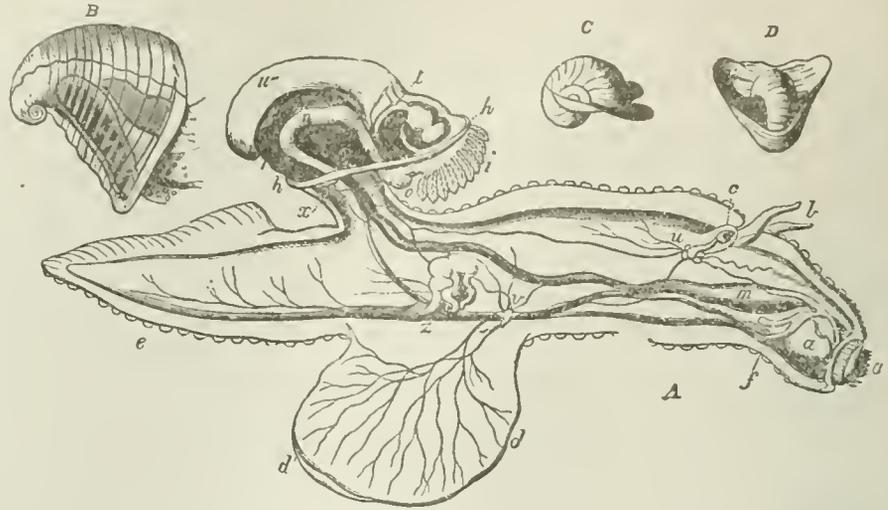

FIG. 50.—*Carinaria mediterranea*. A. The animal. B. The shell removed. C, D. Two views of the shell of *Cardiopoda*. a, mouth and odontophore; b, cephalic tentacles; c, eye; d, the fin-like mesopodium; d', its sucker; e, metapodium; f, salivary glands; h, border of the mantle-flap; i, ctenidium (gill-plume); m, stomach; n, intestine; o, anus; p, liver; t, sorta, springing from the ventricles; u, cerebral ganglion; v, pleural and pedal ganglion; w, testis; x, visceral ganglion; y, vesicula seminalis; z, penis. (From Owen.)

at one time supposed to be, for it has been shown by Lacaze Duthiers, and also by Leydig, that the otocysts of Azygobranchia even when lying close upon the pedal ganglion (as in fig. 21) yet receive their special nerve (which can sometimes be readily isolated) from the cerebral ganglion (see fig. 36). Accordingly the difference is one of position of the otocyst and not of its nerve-supply. The Natantia are further remarkable for the high development of their cephalic eyes, and for the typical character of their osphradium (Spengel's olfactory organ). This is a groove, the edges of which are raised and ciliated, lying near the branchial plume in the genera which possess that organ, whilst in *Firuloides*, which has no branchial plume, the osphradium occupies a corresponding position. Beneath the ciliated groove is

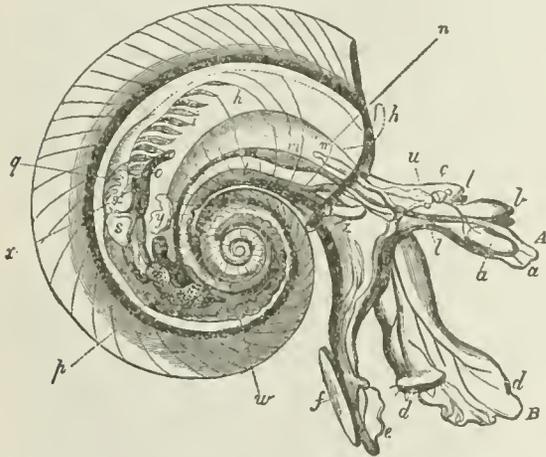

FIG. 49.—*Atlanta (Oxygura) Keraudrenii* (magnified 20 diameters). a, mouth and odontophore; b, cephalic tentacles; c, eye; d, propodium (B) and mesopodium; e, operculum; h, mantle-chamber; i, ctenidium (gill-plume); k, retractor muscle of foot; l, optic tentacle; m, stomach; n, dorsal surface overhung by the mantle-skirt, the letter is close to the salivary gland; o, rectum and anus; p, liver; q, renal organ (nephridium); s, ventricle; u, the otocyst attached to the cerebral ganglion; w, testis; x, auricle of the heart; y, vesicle on genital duct; z, penis. (From Owen.)

are strictly adaptations of the structure common to them and the Azygobranchia consequent upon their changed mode of life. Such adaptations are the transparency and colourlessness of the tissues, and the modifications of the foot, which still shows in *Atlanta* the form common in Azygobranchia (compare fig. 49 and fig. 39).

The cylindrical body of Pterotracheacea is paralleled by the slug-like forms of Euthyneura. Spengel has shown that

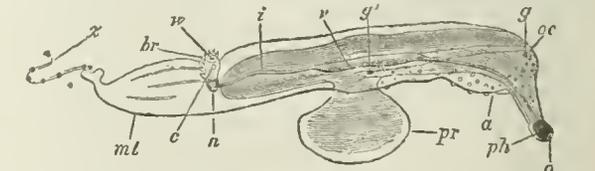

FIG. 51.—*Pterotrachea mutica*, seen from the right side. a, pouch for reception of the enant when retracted; c, pericardium; ph, pharynx; oc, cephalic eye; g, cerebral ganglion; g', pleuro-pedal ganglion; pr, foot (mesopodium); v, stomach; t, intestine; n, so-called nucleus; br, branchial plume (ctenidium); w, osphradium; mt, foot (metapodium); z, caudal appendage. (After Keferstein.)

placed an elongated ganglion (olfactory ganglion) connected by a nerve to the supra-intestinal (therefore the primitively dextral) ganglion of the long visceral nerve-loop, the strands of which cross one another,—this being characteristic of Streptoneura (Spengel).

The Natantia belong to the "pelagic fauna" occurring near the surface in the Mediterranean and great oceans in company with the Pteropoda, the Siphonophorous Hydrozoa, Salpæ, Leptocephali, and other specially-modified transparent swimming representatives of various groups of the animal kingdom. In development they pass through the typical trochosphere and veliger stages provided with boat-like shell.

Branch *b*.—*EUTHYNEURA* (Spengel, 1881).

Characters.—Gastropoda Anisopleura in which the visceral loop (the continuous visceral nerves) does not share in the torsion of the visceral hump, but, being placed entirely below the intestine, remains straight and untwisted, the junction of the visceral cords being below, and not

FIG. 52.—*Bulla verrillii* (Chemnitz), as seen crawling. *a*, oral hood (compare with *Tethya*, fig. 62, B), possibly a continuation of the epipodia; *b*, *U*, cephalic tentacles. (From Owen.)

above, the intestine as it is in Streptoneura. Although the anus is not brought so far forward by the visceral torsion as in the Streptoneura, and may even by secondary growth assume a posterior median position, yet, as fully developed, an asymmetry has resulted as in the Azygobranchia, only the original right renal organ, right ctenidium (if any), right osphradium, right side of the heart, and right genital ducts being retained. All the Euthyneura are hermaphrodite. The lingual ribbon has very usually numerous fine denticles undifferentiated into series in each row. The shell is light and little calcified; often it is not developed in the adult, though present in the embryo. An operculum, often found in the embryo, is never present in the adult (except in Tornatella,

fig. 53). Many Euthyneura show a tendency to, or a complete accomplishment of, the suppression of the mantle-skirt as well as of the shell, also of the ctenidium, and acquire at the same time a more or less cylindrical (slug-like) form of body.

The Euthyneura comprise two orders, the Opisthobranchia and the Pulmonata.

Order 1.—Opisthobranchia.

Marine Euthyneura the more archaic forms of which have a relatively large foot and a small visceral hump, from the base of which projects on the right side a short mantle-skirt. The anus is placed in such forms far back

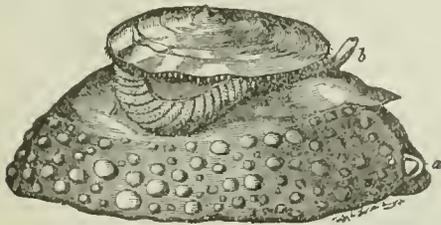

FIG. 54.—*Umbrella mediterranea*. *a*, mouth; *b*, cephalic tentacles; *h*, gill (ctenidium). The free edge of the mantle is seen just below the margin of the shell (compare with *Aplysia*, fig. 63). (From Owen.)

beyond the mantle-skirt. In front of the anus, and only partially covered by the mantle-skirt, is the ctenidium with its free end turned backwards. The heart lies in front of, instead of to the side of, the attachment of the ctenidium, —hence Opisthobranchia as opposed to “Prosobranchia,”

which correspond to the Streptoneura. A shell is possessed in the adult state by but few Opisthobranchia, but all pass through a veliger larval stage with a nautiloid shell (fig. 60). Many Opisthobranchia have by a process of atrophy lost the typical ctenidium and the mantle-skirt, and have developed other organs in their place. As in some Azygobranchia, the free margin of the mantle-skirt is frequently reflected over the shell when a shell exists; and, as in some Azygobranchia, broad lateral outgrowths of the foot (epipodia) are often developed, which, as does not occur in Azygobranchia, may be thrown over the shell or naked dorsal surface of the body.

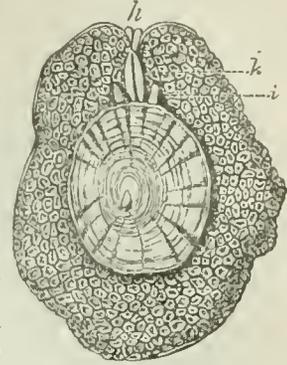

FIG. 55.—*Umbrella mediterranea*, seen from above. *h*, mouth; *i*, cephalic tentacles; *k*, penis-sheath. (After Kieferstein.)

The variety of special developments of structure accompanying the atrophy of typical organs in the Opisthobranchia and general degeneration of organization is very great, and renders their classification difficult. Two sections of the order may be distinguished, according as the typical Molluscan mantle-skirt (limbus pallialis) is or is not atrophied, and within each section certain sub-orders.

Section *a*.—PALLIATA (= Tectibranchiata, Woodward)—the typical Molluscan mantle-skirt or pallium retained.

Sub-order 1.—Ctenidiobranchia.

Characters.—Palliata in which the ctenidium is retained as the branchial organ; with rare exceptions a delicate shell, which may be very small or completely enclosed by the reflected margin of the mantle; epipodia (lateral outgrowths of the foot) frequently present. Family 1.—Tornatellidae.

Genera: *Tornatella*, Lam. (fig. 53); *Cinulia*, Gray, &c.

Family 2.—Bullidae.

Genera: *Bulla*, Lam. (fig. 52); *Accra*, Müller; *Scaphander*, Montf.; *Bullæa*, Lam.; *Doridium*, Meckel; *Gastropteron*, Meckel, &c.

Family 3.—Aplysiidae

Genera: *Aplysia*, Gmelin (the Sea-Hare) (figs. 20, 56, &c.); *Dolabella*, Lam.; *Lobiger*, Krohn, &c.

Family 4.—Pleurobranchiada.

Genera: *Pleurobranchus*, Cuvier; *Umbrella*, Chemnitz (figs. 54, 55); *Runcina*, Forbes, &c.

Sub-order 2.—Phyllidiobranchia.

Characters.—Palliata in which the ctenidia have atrophied; much as in Patellidae among the Zygobranchiate Streptoneura their place is taken by laterally-placed lamellæ, developed from the inner surface of the bilaterally-disposed mantle-skirt in two lateral rows. Family 5.—Phyllidiada.

Genera: *Phyllidia*, Cuvier; *Pleurophyllidia*, Meck. (fig. 57).

Section *b*.—NON-PALLIATA.

Characters.—The typical Molluscan mantle-skirt is atrophied in the adult. No shell is present in the adult, though the dorsal integument may be strengthened by calcareous spicules (Doris). The otocysts are not sessile on the pedal ganglia as in other Gastricpods, but, as in the *Natantia* Azygobranchia, lie close to the cerebral ganglia. In one sub-order (Pygobranchia) the typical ctenidium appears to be retained in a modified form; in the others special developments of the body-wall take its place, or no special respiratory processes exist at all. The general form of the body is slug-like, the foot and visceral hump being coextensive, and a secondary bilateral symmetry is asserted by the usually median (sometimes right-sided) dorsal position of the anus on the hinder part of the body.

Sub-order 1.—Pygobranchia.

Characters.—The ctenidium assumes the form of a circlet of pinnate processes surrounding the median dorsal anus; a strongly marked epipodial fold may occur all round the foot and simulate a mantle-skirt (see fig. 62, C, Doris); papillæ or “cerata” of the dorsal integument may occur as well as the true ctenidium (fig. 61). Family 6.—Dorididae.

Genera: *Doris*, L.; *Gonicodoris*, Forbes; *Triopa*, Johnst.; *Ægirus* Loven; *Thecacera*, Fleming; *Polycæra*, Cuvier; *Idalia*, Leuckert; *Anælis*, Loven; *Ceratostoma*, Adams; *Onchidoris*, Blainv.

Sub-order 2.—*Ceratonota*.

Characters.—The typical Molluscan ctenidium is not developed; upon the dorsal area is developed a more or less numerous series of cylindrical or branched processes (the cerata) into each of which the intestine usually ends a process; anus dorsal, median, or right-sided.

Family 7.—*Tritoniadae*.

Genera: *Tritonia*, Cuvier; *Scyllaea*, L.; *Tethys*, L. (fig. 62, B); *Dendronotus*, A. and H.; *Doto*, Oken.

Family 8.—*Eolidae*.

Genera: *Eolis*, Cuvier (fig. 62, A); *Glaucus*, Forster; *Fiona*, A. and H. (fig. 67); *Embletonia*, A. and H.; *Proctonotus*, A. and H.; *Antiopa*, A. and H.; *Hermæa*, Loven; *Alderia*, Allman.

Sub-order 3.—*Haplomorpha*.

Characters.—No ctenidia, cerata, mantle-skirt, or other processes of the body-wall; degenerate forms of small size.

Family 9.—*Phyllirhoideae*.

Genera: *Phyllirhoë*, Peron and Lesueur (fig. 58); *Acura*, Adams.

Family 10.—*Elysiadae*.

Genera: *Elysia*, Risso (fig. 62, D, E); *Acteonina*, Quatref.; *Cenia*, A. and H.; *Limapontia*, Johnston; *Rhodope* Köll.

Further Remarks on the Opisthobranchia.—The Opisthobranchia present the same wide range of superficial appearance as do the Azygobranchiate Streptoneura, forms

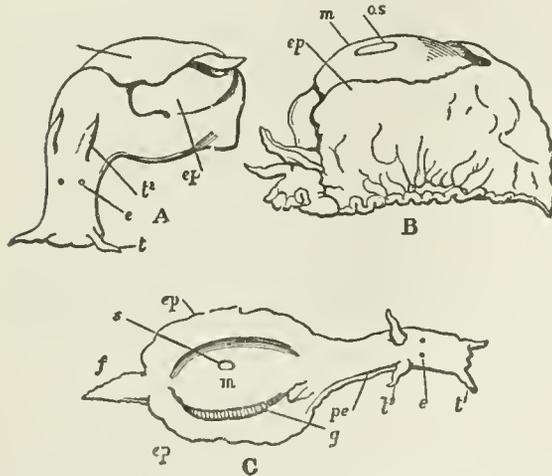

FIG. 56.—Three views of *Aplysia* sp., in various conditions of expansion and retraction. *t*, anterior cephalic tentacles; *p*, posterior cephalic tentacles; *e*, eyes; *f*, metapodium; *ep*, epipodium; *g*, gill-plume (ctenidium); *m*, mantle-flap reflected over the thin oval shell; *os*, orifice formed by the unclosed border of the reflected mantle-skirt, allowing the shell to show; *sp*, the spermatheca. (After Cuvier.)

carrying well-developed spiral shells and large mantle-skirts being included in the group, together with flattened or cylindrical slug-like forms. But in respect of the substitution of other parts for the mantle-skirt and for the gill which the more degenerate Opisthobranchia exhibit, this Order stands alone. Some Opisthobranchia are striking examples of degeneration (some Haplomorpha), having none of those regions or processes of the body which distinguish the archaic Mollusca from such flat-worms as the Dendrocoel Planarians.

Indeed, were it not for their retention of the characteristic odontophore we should have little or no indication that such forms as *Phyllirhoë* and

Limapontia really belong to the Mollusca at all. The interesting little *Rhodope Veranyi*, which has no odontophore, has been associated by systematists both with these simplified Opisthobranchs and with Rhabdocoel Planarians (29).

In many respects the Sea-Hare (*Aplysia*) of which several species are known (some occurring on the English coast), serves as a convenient example of the fullest development of the organization characteristic of Opisthobranchia. The woodcut (fig. 56) gives a faithful representation of the great mobility of the various parts of the body.

The head is well marked and joined to the body by a somewhat constricted neck. It carries two pairs of cephalic tentacles and a pair of sessile eyes. The visceral hump is low and not drawn out into a spire. The foot is long, carrying the oblong visceral mass upon it, and projecting (as metapodium) a little beyond it (*f*). Laterally the foot gives rise to a pair of mobile fleshy lobes, the epipodia (*ep*), which can be thrown up so as to cover in the dorsal

surface of the animal. Such epipodia are common, though by no means universal, among Opisthobranchia. The torsion of the visceral hump is not carried out very fully,

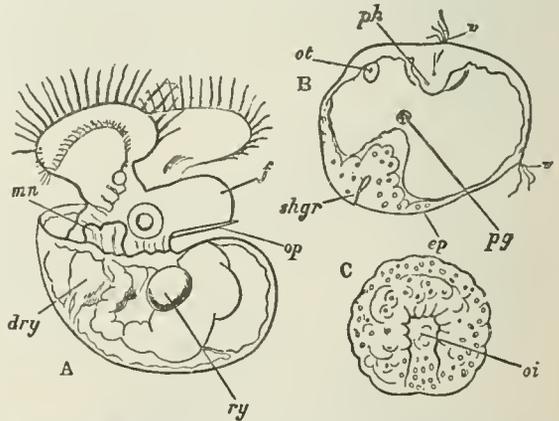

FIG. 60.—A Vellger-larva of an Opisthobranch (Polycera). *f*, foot; *op*, operculum; *mn*, anal papilla; *ry*, *dry*, two portions of unabsorbed nutritive yolk on either side the intestine. The right otocyst is seen at the root of the foot. B. Trochosphere of an Opisthobranch (Pleurobranchidium) showing: *shgr*, the shell-gland or primitive shell-sac; *o*, the cilia of the velum; *ph*, the commencing stomodæum or oral invagination; *ot*, the left otocyst; *rg*, red-coloured pigment spot. the consequence being that the anus has a posterior position a little to the right of the median line above the metapodium, whilst the branchial chamber formed by the overhanging mantle-skirt faces the right side of the body instead of lying well to the front as in Streptoneura and as in Pulmonate Eutayneura. The gill-plume which in *Aplysia* is the typical Molluscan ctenidium is seen in fig.

63 projecting from the branchial sub-pallial space. The relation of the delicate shell to the mantle is peculiar, since it occupies an oval area upon the visceral hump, the extent of which is indicated in fig. 56, C, but may be better understood by a glance at the figures of the allied genus *Umbrella* (figs. 54, 55), in which the margin of the mantle-skirt coincides, just as it does in the Limpet, with the margin of the shell. But in *Aplysia* the mantle is reflected over the edge of the shell, and grows over its upper surface so as to completely enclose it, excepting at the small central area *s* where the naked shell is exposed. This enclosure of the shell is a permanent development of the arrangement seen in many Streptoneura (e.g., *Pyrrula*, *Ovulum*, see figs. 38 and 41), where the border of the mantle can be, and usually is, drawn over the shell, though it is withdrawn (as it cannot be in *Aplysia*) when they are irritated. From the fact that *Aplysia* commences its life as a free-swimming Veliger with a nautiloid shell not enclosed in any way by the border of the mantle, it is clear that the enclosure of the shell in the adult is a secondary process. Accordingly, the shell of *Aplysia* must not be confounded with a primitive shell in its shell-sac, such as we find realized in the shells of *Chiton* and in the plugs which form in the remarkable transitory "shell-sac" or "shell-gland" of Molluscan embryos

FIG. 61.—*Polycera cristata*, one of the Pygobranchiate Opisthobranchs (dorsal view). *a*, anus; *br*, the tentidium peculiarly modified so as to encircle the anus; *i*, cephalic tentacles. External to the branchial tentidium are seen ten club-like processes of the dorsal wall, these are the "cerata" which are characteristically developed in another sub-order of Opisthobranchs, the Ceratonota (see fig. 62, A). (From Gegenbaur, after Alder and Hancock.)

develops a primitive shell-sac in its trochosphere stage of development (fig. 68), which disappears and is succeeded by a nautiloid shell (fig. 60). This forms the nucleus of the adult shell, and, as the animal grows, becomes enclosed by a reflexion of the mantle-skirt. In reference to the possible comparison of the enclosed shell of *Aplysia* and its allies with those of some Slugs and of Cuttle-fishes, the reader is referred to the paragraphs dealing especially with those Molluscs. When the shell of an *Aplysia* enclosed in its mantle is pushed well to the left, the sub-pallial space is fully exposed as in fig. 63, and the various apertures of the body are seen. Posteriorly we have the anus, in front of this the lobate gill-plume, between the two (hence corresponding in position to that of the Azygobranchia) we have the aperture of the renal organ. In front, near the anterior attachment of the gill-plume, is the osphradium (olfactory organ) discovered by Spengel, yellowish in colour, in the typical position, and overlying an olfactory ganglion with typical nerve-connexion (see fig. 20). To the right of Spengel's osphradium is the opening of a peculiar gland which has, when dissected out, the form of a bunch of grapes; its secretion is said to be poisonous. On the under side of the free edge of the mantle are situated the numerous small cutaneous glands which, in the large *Aplysia camelus* (not in other species), form the purple secretion which was known to the ancients. In front of the osphradium is the single genital pore, the aperture of the common or hermaphrodite duct. From this point there stretches forward to the right side of the head a groove—the spermatid groove—down which the spermatid fluid passes. In other Euthyneura this groove may close up and form a canal. At its termination by the side of the head is the muscular introverted penis. In the hinder part of the foot (not shown in any of the diagrams) is the opening of a large mucous-forming gland very often found in the Molluscan foot.

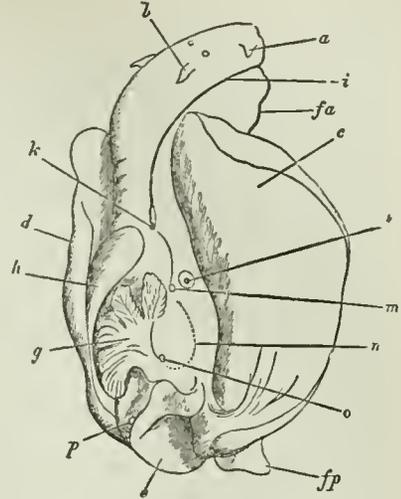

FIG. 63.—*Aplysia leporina* (*camelus*, Cuv.), with epipodia and mantle reflected away from the mid-line. *a*, anterior cephalic tentacles; *b*, posterior do.; between *a* and *b*, the eyes; *c*, right epipodium; *d*, left epipodium; *e*, hind part of visceral hump; *fa*, anterior part of the foot underlying the head; *g*, the tentidium (branchial plume); *h*, the mantle-skirt tightly spread over the horny shell and pushed with it towards the left side; *i*, the spermatid groove; *k*, the common genital pore (male and female); *l*, orifice of the grape-shaped (supposed poisonous) gland; *m*, the osphradium (olfactory organ of Spengel); *n*, outline of part of the renal sac (nephridium) below the surface; *o*, external aperture of the nephridium; *p*, anus. (Original.)

(Original.)

(see figs. 7, 68, and 72***). *Aplysia*, like other Mollusca,

With regard to internal organization we may commence with the disposition of the renal organ (nephridium), the external opening of which has already been noted. The position of this opening and other features of the renal organ have been determined recently by Mr. J. T. Cunningham, Fellow of University College, Oxford, who writes as follows from Naples, February 1883:—

"There is considerable uncertainty with respect to the names of the species of *Aplysia*. There are two forms which are very common in the Gulf of Naples, and which I have used in studying the anatomy of the renal organ in the genus. One is quite black in colour, and measures when outstretched eight or nine inches in length. The other is light brown and somewhat smaller, its length usually not exceeding seven inches. The first is flaccid and sluggish in its movements, and has not much power of contraction; its epipodial lobes are enormously developed and extend far forward along the body; it gives out when handled an abundance of purple liquid, which is derived from cutaneous glands situated on the under side of the free edge of the mantle. In the Zoological Station this form is known as *Ap. leporina*; but according to Blochmann it is identical with *A. Camelus* of Cuvier. The other species is *A. depilans*; it is firm to the touch, and contracts forcibly when irritated; the secretion of the mantle-glands is not abundant, and is milky white in appearance. The kidney has similar relations in both genera, and is identical with the organ spoken of by many authors as the triangular gland. Its superficial extent is seen when the folds covering the shell are cut away and the shell removed; the external surface forms a triangle with its base bordering the pericardium and its apex directed posteriorly and reaching to the left-hand posterior corner of the shell-chamber. The dorsal surface of the kidney extends to the left beyond the shell-chamber beneath the skin in the space between the shell-chamber and the left epipodium.

"When the animal is turned on its left-hand side and the mantle-chamber widely opened, the gill being turned over to the left, a part of the kidney is seen beneath the skin between the attachment of the gill and the right epipodium (fig. 63). On examination this is found to be the under surface of the posterior limb of the gland, the upper surface of which has just been described as lying beneath the shell. In the posterior third of this portion, close to that edge which is adjacent to the base of the gill, is the external opening (fig. 63, o).

"When the pericardium is cut open from above in an animal otherwise entire, the anterior face of the kidney is seen forming the posterior wall of the pericardial chamber; on the deep edge of this face, a little to the left of the attachment of the auricle to the floor of the pericardium, is seen a depression; this depression contains the opening from the pericardium into the kidney.

"To complete the account of the relations of the organ: the right anterior corner can be seen superficially in the wall of the mantle-chamber above the gill. Thus the base of the gill passes in a slanting direction across the right-hand side of the kidney, the posterior end being dorsal to the apex of the gland, and the anterior end ventral to the right-hand corner.

"As so great a part of the whole surface of the kidney lies adjacent to external surfaces of the body, the remaining part which faces the internal organs is small; it consists of the left part of the under surface; it is level with the floor of the pericardium, and lies over the globular mass formed by the liver and convoluted intestine.

"More dissection does not give sufficient evidence concerning such communications as these of the kidney in *Aplysia*. I studied the external opening by taking a series of sections through the surrounding region of the gland; to demonstrate the internal aperture injected a solution of Berlin blue into the pericardium; it did not fill the whole kidney easily, but ran down into the part adjacent to the base of the gill."

Thus the renal organ of *Aplysia* is shown to conform to the Molluscan type. The heart lying within the adjacent pericardium has the usual form, a single auricle and ventricle. The vascular system is not extensive, the arteries soon ending in the well-marked spongy tissue which builds up the muscular foot, epipodia, and dorsal body-wall.

The alimentary canal commences with the usual buccal mass; the lips are cartilaginous, but not armed with horny jaws, though these are common in other Opisthobranchs; the lingual ribbon is multidentulate, and a pair of salivary glands pour in their secretion. The oesophagus expands into a curious gizzard, which is armed internally with large horny processes, some broad and thick, others spinous, fitted to act as crushing instruments. From this we pass to a stomach and a coil of intestine embedded in the lobes of a voluminous liver; a caecum of large size is given off near

the commencement of the intestine. The liver opens by two ducts into the digestive tract.

The generative organs lie close to the coil of intestine and liver, a little to the left side. When dissected out they appear as represented in fig. 64. The essential reproductive

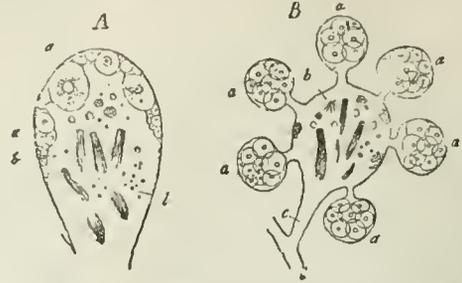

FIG. 65.—Follicles of the hermaphrodite gonads of *Euthyneurous Anisopleura*. A, of *Helix*; B, of *Eolidia*. a ova; b, developing spermatozooids; c, common efferent duct.

organ or gonad consists of both ovarian and testicular cells (see fig. 65). It is an ovo-testis. From it passes a common or hermaphrodite duct, which very soon becomes entwined in the spire of a gland—the albuminiparous gland. The latter opens into the common duct at the point x, and here also is a small diverticulum of the duct y. Passing on, we find not far from the genital pore a glandular spherical body (the spermatheca a) opening by means of a longish

duct into the common duct, and then we reach the pore (fig. 63, k). Here the female apparatus terminates. But when the male secretion of the ovo-testis is active, the seminal fluid passes from the genital pore along the spermatheca (fig. 63,) to the penis, and is by the aid of that eversible muscular organ introduced into the genital pore of a second *Aplysia*, whence it passes into the spermatheca, there to await the activity of the female element of the ovo-testis of this second *Aplysia*. After an interval of some days—possibly weeks—the ova of the second *Aplysia* commence to descend the hermaphrodite duct; they become enclosed in a viscid secretion at the point where the albuminiparous gland opens into the duct intertwined with it; and on reaching the point where the spermathecal duct debouches they are impregnated by the spermatozoa which escape now from the spermatheca and meet the ova.

The development of *Aplysia* from the egg presents many points of interest from the point of view of comparative embryology, but in relation to the morphology of the Opisthobranchia it is sufficient to point to the occurrence of a trochosphere and a veliger stage (fig. 60), and of a shell-gland or primitive shell-sac (fig. 68, *shs*), which is succeeded by a nautiloid shell.

The nervous system of *Aplysia* will be found on comparison of fig. 20, which represents it, with our schematic Mollusc (fig. 1, D) to present but little modification. It is in fact a nervous system in which the great ganglion-pairs are well developed and distinct. The *Euthyneurous* visceral loop is long, and presents only one ganglion (in *Aplysia camelus*, but two distinct ganglia joined to one another in

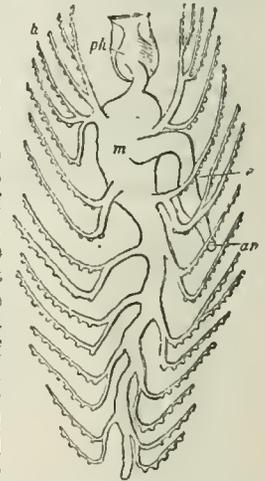

FIG. 66.—Enteric canal of *Eolidia papillosa*. ph, pharynx; m, mid-gut, with its hepatic appendages h, all of which are not figured; e, hind gut; an, anus. (From Gegenbaur, after Alder and Hancock.)

Aplysia hybrida of the English coast), placed at its extreme limit, representing both the right and left visceral ganglia and the third or abdominal ganglion, which are so often separately present. The diagram (fig. 20) shows the nerve connecting this abdomino-visceral ganglion with the olfactory ganglion of Spengel. It is also seen to be connected with a more remote ganglion—the genital. Such special irregularities in the development of ganglia upon the visceral loop, and on one or more of the main nerves connected with it, are, as the figures of Molluscan nervous systems given in this article show, very frequent. Our figure of the nervous system of *Aplysia* does not give the small pair of buccal ganglia which are, as in all Glosso-phorous Molluscs, present upon the nerves passing from the cerebral region to the odontophore.

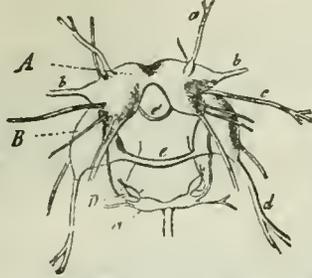

FIG. 67.—Central nervous system of Flons (one of the Ceratonotous Opisthobranchs), showing a tendency to fusion of the great ganglia. A, cerebral, pleural, and visceral ganglia united; B, pedal ganglion; C, buccal ganglion; D, oesophageal ganglion connected with the buccal; a, nerve to superior cephalic tentacles; b, nerve to inferior cephalic tentacles; c, nerve to generative organs; d, pedal nerve; e, pedal commissure; e', visceral loop or commissure (?). (From Gegenbaur, after Bergh.)

For a comparison of various Opisthobranchs, *Aplysia* will be found to present a convenient starting-point. It is one of the more typical Opisthobranchs, that is to say, it belongs to the section Palliata, but other members of the Palliata, namely, *Bulla* and *Tornatella* (figs. 52 and 53), are less abnormal than *Aplysia* in regard to their shells and the form of the visceral hump. They have naked spirally-twisted shells which may be concealed from view in the living animal by the expansion and reflexion of the epipodia,

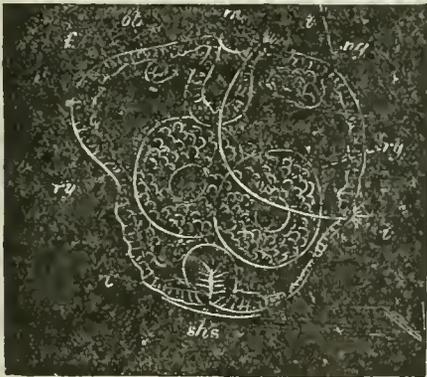

FIG. 68.—Young veliger larva of an Opisthobranch (Pleurobranchidium). m, mouth; v, ciliated band marking off the velum; ng, cerebral ganglion developing from epiblast, within the velar area; of, otocyst also developing from epiblast; f, foot; t, intestine; ry, residual nutritive yolk; shs, primitive shell-sac or shell-gland. (From Lankester.)

but are not enclosed by the mantle, whilst *Tornatella* is remarkable amongst all Euthyneura for possessing an operculum like that of so many Streptoneura.

The great development of the epipodia seen in *Aplysia* is usual in Palliate Opisthobranchs; it occurs also in *Elysia* (fig. 62, D) among Non-Palliata; in *Doris* it seems probable that the mantle-like fold overhanging the foot is to be interpreted as epipodium, the mantle-skirt being altogether absent, as shown by the naked position of the gills and anus on the dorsal surface (figs. 61 and 62, C). The whole surface of the body becomes greatly modified in those Non-Palliata forms which have lost, not only the mantle-skirt and the shell, but also the ctenidium. Many of these (Ceratonota) have peculiar processes developed on the dorsal surface (fig. 62, A, B), or retain purely

negative characters (fig. 62, D). The chief modification of internal organization presented by these forms, as compared with *Aplysia*, is found in the condition of the alimentary canal. The liver is no longer a compact organ opening by a pair of ducts into the median digestive tract, but we find very numerous hepatic diverticula on a shortened axial tract (fig. 66). These diverticula extend usually one into each of the dorsal papillæ or "cerata" when these are present. They are not merely digestive glands, but are sufficiently wide to act as receptacles of food, and in them the digestion of food proceeds just as in the axial portion of the canal. A precisely similar modification of the liver or great digestive gland is found in the Scorpions, where the axial portion of the digestive canal is short and straight, and the lateral ducts sufficiently wide to admit food into the ramifications of the gland there to be digested; whilst in the Spiders the gland is reduced to a series of simple cæca.

The typical character is retained by the heart, pericardium, and the communicating nephridium or renal organ in all Opisthobranchs. An interesting example of this is furnished by the fish-like transparent *Phyllirhoë* (fig. 58), in which it is possible most satisfactorily to study in the living animal, by means of the microscope, the course of the blood-stream, and also the reno-pericardial communication. With reference to the existence of pores placing the vascular system in open communication with the surrounding water, see the paragraph as to Molluscs generally. In a form closely allied to *Aplysia* (*Pleurobranchus*) such a pore leading outwards from the branchial vein has been precisely described by Lacaze Duthiers. No such pore has been detected in *Aplysia*. In many of the Non-Palliata Opisthobranchs the nervous system presents a concentration of the ganglia (fig. 67), contrasting greatly with what we have seen in *Aplysia*. Not only are the pleural ganglia fused to the cerebral, but also the visceral to these (see in further illustration the condition attained by the Pulmonate *Linnæus*, fig. 22), and the visceral loop is astonishingly short and insignificant (fig. 67, e'). That the parts are rightly thus identified is probable from Spengel's observation of the oosphradium and its nerve-supply in these forms; the nerve to that organ, which is placed somewhat anteriorly—on the dorsal surface—being given off from the hinder part (visceral) of the right compound ganglion—the fellow to that marked A in fig. 67. The Ceratonotous Opisthobranchs, amongst other specialities of structure, are stated to possess (in some cases at any rate) apertures at the apices of the "cerata" or dorsal papillæ, which lead from the exterior into the hepatic cæca. This requires confirmation. Some amongst them (*Tergipes*, *Eolis*) are also remarkable for possessing peculiarly modified epidermic cells placed in sacs at the apices of these same papillæ, which resemble the "thread-cells" of the Planarian Flatworms and of the Cœlentera. The existence of these thread-cells is sufficiently remarkable, seeing that the Non-Palliata Opisthobranchs resemble in general form and habit the Planarian worms, many of which also possess thread-cells. But it is not conceivable that their presence is an indication of genetic affinity between the two groups, rather they are instances of homoplasy. The development of many Opisthobranchia has been examined—e.g., *Aplysia*, *Pleurobranchidium*, *Elysia*, *Polycera*, *Doris*, *Tergipes*. All pass through trochosphere and veliger stages, and in all a nautiloid or boat-like shell is developed, preceded by a well-marked "shell-gland" (see figs. 60 and 68). The transition from the free-swimming veliger larva with its nautiloid shell (fig. 60) to the adult form has not been properly observed, and many interesting points as to the true nature of folds (whether epipodia or mantle or velum) have yet to be cleared up by a knowledge of such development in forms like *Tethys*, *Doris*, *Phyllidia*, &c.

As in other Molluscan groups, we find even in closely-allied genera (for instance, in *Aplysia* and *Pleurobranchidium*, and other genera observed by Lankester) the greatest differences as to the amount of food-material by which the egg-shell is encumbered. Some form their *Diblastula* by emboly (fig. 7), others by epiboly (fig. 5); and in the later history of the further development of the enclosed cells (arch-enteron) very marked variations occur in closely-allied forms, due to the influence of a greater or less abundance of food-material mixed with the protoplasm of the egg.

Order 2 (of the Euthyneura).—Pulmonata.

Characters.—Euthyneurous Anisopleurous Gastropoda, probably derived from ancestral forms similar to the Palliate Opisthobranchia by adaptation to a terrestrial life. The ctenidium is atrophied, and the edge of the mantle-skirt is fused to the dorsal integument by concrecence, except at one point which forms the aperture of the mantle-chamber, thus converted into a nearly closed sac. Air is admitted to this sac for respiratory and hydrostatic purposes, and it thus becomes a lung. An operculum is never present; a contrast being thus afforded with the operculate Pulmonate Streptoneura (*Cyclostoma*, &c.), which differ in other essential features of structure from the Pulmonata. The Pulmonata are, like the other Euthyneura, hermaphrodite, with elaborately-developed copulatory organs and accessory glands. Like other Euthyneura, they have very numerous small denticles on the lingual ribbon. The ancestral Pulmonata appear to have retained both the right and the left osphradia (Spengel's olfactory organs), since in some (*Planorbis*, *Auricularia*) we find the single osphradium to be that of the original left side, whilst in others (*Limnæus*) it is that of the original right side.

In some Pulmonata (Snails) the foot is extended at right angles to the visceral hump, which rises from it in the form of a coil as in Streptoneura; in others the visceral hump is not elevated, but is extended with the foot, and the shell is small or absent (Slugs).

The Pulmonata are divided into two sub-orders according to the position of the cephalic eyes.

Sub-order 1.—Basommatophora.

Characters.—Eyes placed mediad of the cephalic tentacles at their base; the embryonic velar area retained in adult life as a pair of cephalic lobes (fig. 70, *v*); male and female generative apertures separate, placed (as is typical in Anisopleura) on the right side of the neck; visceral hump well developed, with a well-developed shell; aquatic in habit.

Family 1.—*Limnæidæ*.

Genera: *Limnæus*, Lam. (figs. 3, 4, &c.); *Chilinia*, Gray; *Physa*, Draparn.; *Ancylus*, Geoff.; *Planorbis*, Müll., &c.

Family 2.—*Auriculidæ*.

Genera: *Auricula*, Lam.; *Conovulus*, Lam.; *Pitharella*, Wood, &c.

Sub-order 2.—*Stylommatophora*.

Characters.—Eyes placed on the summit of two hollow tentacles; visceral hump well or not at all developed; shell large and coiled, or minute or absent; almost exclusively terrestrial.

Family 1.—*Helicidæ*.

Genera: *Helix*, L. (figs. 69, A; 72*); *Vitrina*, Draparn.; *Succinea*, Draparn.; *Bulimus*, Scopoli; *Achatina*, Lam.; *Pupa*, Lam.; *Clausilia*, Draparn., &c.

Family 2.—*Limacidæ* (Slugs).

Genera: *Limax*, L.; *Incilaria*, Benson; *Arion*, Ferussac (fig. 69, D); *Parmacella*, Cuvier; *Testacella*, Cuvier (fig. 69, C), &c.

Family 3.—*Oncidindæ*.

Genera: *Oncidium*, Buchanan; *Peronia*, Blainv. (fig. 72); *Vaginulus*, Ferussac, &c.

Further Remarks on Pulmonata.—The land-snails and slug's forming the group Pulmonata are widely distinguished from a small set of terrestrial Azygobranchia, the Pneumono-chlamyda (see above), at one time associated with them on account of their mantle-chamber being converted, as in

Pulmonata, into a lung, and the ctenidium or branchial plume aborted. The Pneumono-chlamyda (represented in England by the common genus *Cyclostoma*) have a twisted

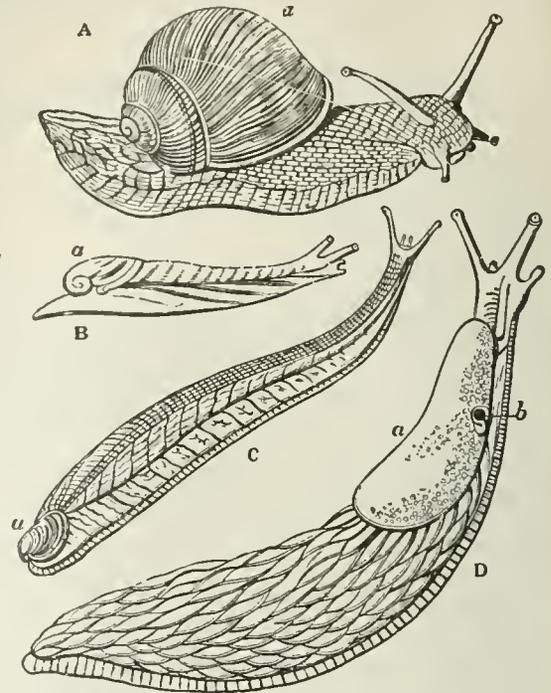

FIG. 69.—A series of Stylommatophorous Pulmonata, showing transitional form between snail and slug.

a, Shell in A, B, C, shell-sac (closed) in D; b, orifice leading into the subpallial chamber (Gung).

visceral nerve-loop, an operculum on the foot, a complex rhipidoglossate or tænioglossate radula, and are of distinct sexes; they are, in fact, Azygobranchiate Streptoneura. The Pulmonata have a straight visceral nerve-loop, never an operculum (even in the embryo), and a multidenticulate

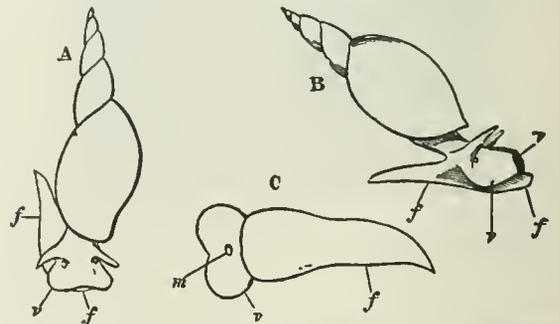

FIG. 70.—A, B, C. Three views of *Limnæus stagnalis*, in order to show the persistence of the larval velar area *v*, as the circum-oral lobes of the adult. *m*, mouth; *f*, foot; *v*, velar area, the margin *v* corresponding with the ciliated band which demarcates the velar area or velum of the embryo Gastropod (see fig. 4, D, E, F, H, I, *v*). (Original)

radula, the teeth being equi-formal; and they are hermaphrodite. Some Pulmonata (*Limnæus*, &c.) live in fresh-waters although breathing air. The remarkable discovery has been made that in deep lakes such *Limnæi* do not breathe air, but admit water to the lung-sac and live at the bottom. The lung-sac serves undoubtedly as a hydrostatic apparatus in the aquatic Pulmonata, as well as assisting respiration. It is not improbable that here, and in other air-breathing animals, the hydrostatic function was the primary one, and the respiratory a later development.

The same general range of body-form is shown in Pulmonata as in the Natant Azygobranchia and in the Opisthobranchia; at one extreme we have Snails with coiled visceral hump, at the other cylindrical or flattened Slugs (see fig. 69). Limpet-like forms are also found (fig. 71, *Ancylus*). The foot is always simple, with its flat crawling surface extending from end to end, but in the embryo *Limnæus* (fig. 4, H) it shows a bilobed character, which leads on to the condition characteristic of Pteropoda.

The adaptation of the Pulmonata to terrestrial life has entailed little modification of the internal organization. The vascular system appears to be more complete in them than in other Gastropoda, fine vessels and even capillaries being present in place of lacunæ, in which arteries and veins find their meeting-point. The subject has not, however, been investigated by the proper methods of recent histology, and our know-

FIG. 71.—*Ancylus fluviatilis*, a patelli-form aquatic Pulmonate.

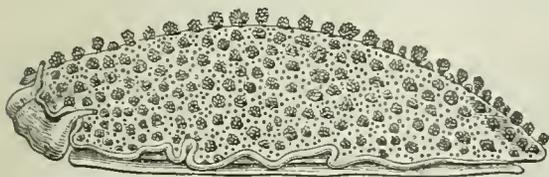

FIG. 72.—*Peronia Tonger*, a littoral Pulmonate, found on the shores of the Indian and Pacific Oceans (Mauritius, Japan).

ledge of it, as of the vascular system of Molluscs generally, is most unsatisfactory. In one genus (*Planorbis*) the plasma of the blood is coloured red by hæmoglobin, this being the only instance of the presence of this body in the blood of Glossophorous Mollusca, though it occurs in corpuscles in the blood of the bivalves *Arca* and *Solen* (Lankester, 31).

The generative apparatus of the Snail (*Helix*) may serve as an example of the hermaphrodite apparatus common to the Pulmonata and Opisthobranchia (fig. 72*). From the ovo-testis, which lies near the apex of the visceral coil, a common hermaphrodite duct *v.e* proceeds, which receives the duct of the compact white albuminiferous gland *E.d.*, and then becomes much enlarged, the additional width being due to the development of glandular folds, which are regarded as forming a uterus *u*. Where these folds cease the common duct splits into two portions, a male and a female. The male duct *v.d* becomes fleshy and muscular near its termination at the genital pore, forming the penis *p*. Attached to it is a diverticulum *f.*, in which the spermatozoa which have descended from the ovo-testis are stored and modelled into sperm ropes or spermatophores. The female portion of the duct is more complex. Soon after quitting the uterus it is joined by a long duct leading from a glandular sac, the spermatheca (*R.f.*). In this duct and sac the spermatophores received in copulation from another snail are lodged. In *Helix hortensis* the sperma-

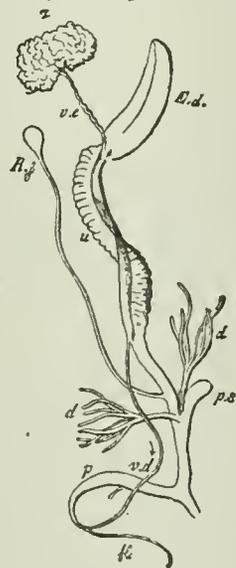

FIG. 72*.—Hermaphrodite reproductive apparatus of the Garden Snail (*Helix hortensis*). *z*, ovo-testis; *v.e*, hermaphrodite duct; *E.d.*, albuminiferous gland; *u*, uterine dilatation of the hermaphrodite duct; *d*, digitate accessory glands on the female duct; *p.s*, calciferous gland or dart-sac on the female duct; *R.f*, spermatheca or receptacle of the sperm in copulation, opening into the female duct; *v.d*, male duct (vas deferens); *p*, penis; *f.*, flagellum.

theca is simple. In other species of *Helix* a second duct (as large in *Helix aspersa* as the chief one) is given off from the spermathecal duct, and in the natural state is closely adherent to the wall of the uterus. This second duct has normally no spermathecal gland at its termination, which is simple and blunt. But in rare cases in *Helix aspersa* a second spermatheca is found at the end of this second duct. Tracing the widening female duct onwards we now come to the openings of the digitate accessory glands *d, d*, which probably assist in the formation of the egg-capsule. Close to them is the remarkable dart-sac *ps*, a thick-walled sac, in the lumen of which a crystalline four-fluted rod or dart consisting of carbonate of lime is found. It is supposed to act in some way as a stimulant in copulation, but possibly has to do with the calcareous covering of the egg-capsule. Other Pulmonata exhibit variations of secondary importance in the details of this hermaphrodite apparatus.

The nervous system of *Helix* is not favourable as an example on account of the fusion of the ganglia to form an almost uniform ring of nervous matter around the œsophagus. The Pond-Snail (*Limnæus*) furnishes, on the other hand, a very beautiful case of distinct ganglia and connecting cords (fig. 22). The demonstration which it affords of the extreme shortening of the Euthyneurous visceral nerve-loop is most instructive and valuable for comparison with and explanation of the condition of the nervous centres in Cephalopoda, as also of some Opisthobranchia. The figure (fig. 22) is sufficiently described in the letter-press attached to it; the pair of buccal ganglia joined by the connectives to the cerebrals are, as in most of our figures, omitted. Here we need only further draw attention to the osphradium, discovered by Lacaze Duthiers (32), and shown by Spengel to agree in its innervation with that organ in all other Gastropoda. On account of the shortness of the visceral loop and the proximity of the right visceral ganglion to the œsophageal nerve-ring, the nerve to the osphradium and olfactory ganglion is very long. The position of the osphradium corresponds more or less closely with that of the vanished right ctenidium, with which it is normally associated. In *Helix* and *Limax* the osphradium has not been described, and possibly its discovery might clear up the doubts which have been raised as to the nature of the mantle-chamber of those genera. In *Planorbis*, which is dextrotropic (as are a few other genera or exceptional varieties of various Anisopleurous Gastropods) instead of being leiotropic, the osphradium is on the left side, and receives its nerve from the left visceral ganglion, the whole series of unilateral organs being reversed. This is, as might be expected, what is found to be the case in all "reversed" Gastropods. It is also the case in the Pulmonate *Auricula*, which is leiotropic.

The shell of the Pulmonata, though always light and delicate, is in many cases a well-developed spiral "house," into which the creature can withdraw itself; and, although the foot possesses no operculum, yet in *Helix* the aperture of the shell is closed in the winter by a complete lid, the "hibernaculum," more or less calcareous in nature, which is secreted by the foot. In *Clausilia* a peculiar modification of this lid exists permanently in the adult, attached by an elastic stalk to the mouth of the shell, and known as the "clausilium." In *Limnæus* the permanent shell is preceded in the embryo by a well-marked shell-gland or primitive shell-sac (fig. 72***), at one time supposed to be the developing anus, but shown by Lankester to be identical with the "shell-gland" discovered by him in other Mollusca (*Pisidium*, *Pleurobranchidium*, *Neritina*, &c.). As in other Gastropoda *Anisopleura*, this shell-sac may abnormally develop a plug of chitinous matter, but normally it flattens out and disappears, whilst the cap-like rudiment of the permanent shell is shed out from the dome-like surface

"mesoblasts," which bud off from the invaginated arch-enteron, partly to cells derived from the ectoderm, which at a very early stage is connected by long processes with the invaginated endoderm, as shown in fig. 3, D. The external form of the embryo goes through the same changes as in other Gastropods, and is not, as was held previously to Lankester's observations, exceptional. When the middle and hinder regions of the blastopore are closing in, an equatorial ridge of ciliated cells is formed, converting the embryo into a typical "Trochosphere" (fig. 4, E, F).

The foot now protrudes below the mouth (fig. 4), and the post-oral hemisphere of the Trochosphere grows more rapidly than the anterior or velar area. The young foot shows a bilobed form (fig. 4, D, f). Within the velar area the eyes and the cephalic tentacles commence to rise up (fig. 4, D, t), and on the surface of the post-oral region is formed a cap-like shell and an encircling ridge, which gradually increases in prominence and becomes the freely depending mantle-skirt. The outline of the velar area becomes strongly emarginated and can be traced through the more mature embryos to the cephalic lobes or labial processes of the adult *Limnæus* (fig. 70).

This permanence of the distinction of the part known as the velar area through embryonic life to the adult state is exceptional among Mollusca, and is therefore a point of especial interest in *Limnæus*. None of the figures of adult *Limnæus* in recent works on Zoology show properly the form of the head and these velar lobes, and accordingly the figures here given have been specially sketched for the present article. The increase of the visceral dome, its spiral twisting, and the gradual closure of the space overhung by the mantle-skirt so as to convert it into a lung-sac with a small contractile aperture, belong to stages in the development later than any represented in our figures.

We may now revert briefly to the internal organization at a period when the Trochosphere is beginning to show a prominent foot growing out from the area where the mid-region of the elongated blastopore was situated, and having therefore at one end of it the mouth and at the other the anus. Fig. 72*** represents such an embryo under slight compression as seen by transmitted light. The ciliated band of the left side of the velar area is indicated by a line extending from *v* to *v*; the foot *f* is seen between the pharynx *ph* and the pedicle of invagination *pi*. The mass of the arch-enteron or invaginated endodermal sac has taken on a bilobed form (compare *Pisidium*, fig. 151), and its cells are swollen (*gs* and *tge*). This bilobed sac becomes entirely the liver in the adult; the intestine and stomach are formed from the pedicle of invagination, whilst the pharynx, œsophagus, and crop form from the stomodæal invagination *ph*. To the right (in the figure) of the rectal peduncle is seen the deeply invaginated shell-gland *ss*, with a secretion *sh* protruding from it. The shell-gland is destined in *Limnæus* to become very rapidly stretched out, and to disappear. Farther up, within the velar area, the rudiments of the cerebral nerve-ganglion *ng* are seen separating from the ectoderm. A remarkable cord of cells having a position just below the integument occurs on each side of the head. In the figure the cord of the left side is seen, marked *re*. This paired organ consists of a string of cells which are perforated by a duct. The opening of the duct at either end is not known. Such cannulated cells are characteristic of the nephridia of many worms, and it is held that the organs thus formed in the embryo *Limnæus* are embryonic nephridia. The most important fact about them is that they disappear, and are in no way connected with the typical nephridium of the adult. In reference to their first observer they are conveniently called "Stiebel's canals." Other Pulmonata possess, when embryos, Stiebel's canals in a more fully-developed state, for instance, the

common slug *Limax* (fig. 72**, *pk*). Here too they disappear during embryonic life. Further knowledge concerning them is greatly needed. It is not clear whether there is anything equivalent to them in the embryos of marine Gastropoda or other Mollusca, the ectodermal cells called "embryonic renal organs" in some Gastropod embryos having only a remote resemblance to them. The three pairs of transient embryonic nephridia of the medicinal leech, the ciliated cephalic pits of Nemertines, and the anterior nephridia of Gephyraeans, all suggest themselves for comparison with these enigmatical canals.

Marine Pulmonata.—Whilst the Pulmonata are essentially a terrestrial and fresh-water group, there is one genus of slug-like Pulmonates which frequent the sea-coast (*Peronia*, fig. 72), whilst their immediate congeners (*Onchidium*) are found in marshes of brackish water. Semper (33) has shown that these slugs have, in addition to the usual pair of cephalic eyes, a number of eyes developed upon the dorsal integument. These dorsal eyes are very perfect in elaboration, possessing lens, retinal nerve-end cells, retinal pigment, and optic nerve. Curiously enough, however, they differ from the cephalic Molluscan eye (for an account of which see fig. 118) in the fact that, as in the vertebrate eye, the filaments of the optic nerve penetrate the retina, and are connected with the surfaces of the nerve-end cells nearer the lens instead of with the opposite end. The significance of this arrangement is not known, but it is important to note, as shown by Hensen, Hickson, and others, that in the bivalves *Pecten* and *Spondylus*, which also have eyes upon the mantle quite distinct from typical cephalic eyes, there is the same relationship as in *Onchidiadæ* of the optic nerve to the retinal cells (fig. 145). In both *Onchidiadæ* and *Pecten* the pallial eyes have probably been developed by the modification of tentacles, such as coexist in an unmodified form with the eyes. The *Onchidiadæ* are, according to Semper, pursued as food by the leaping fish *Periophthalmus*, and the dorsal eyes are of especial value to them in aiding them to escape from this enemy.

Class II.—SCAPHOPODA.

Characters.—Mollusca Glossophora with the foot adapted to a BURROWING life in sand (figs. 73, 74, f). The body,

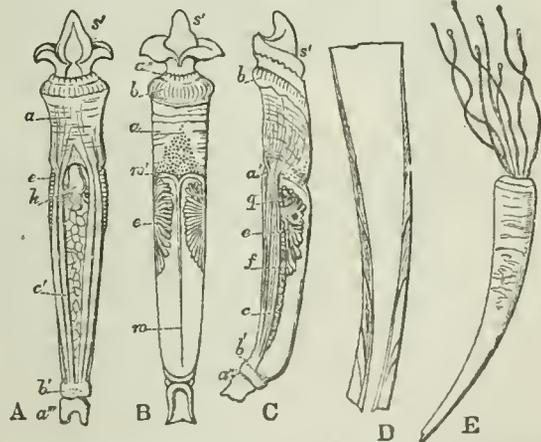

FIG. 73.—*Dentalium vulgare*, Da C. (after Lacaze Duthiers). A. Ventral view of the animal removed from its shell. B. Dorsal view of the same. C. Lateral view of the same. D. The shell in section. E. Surface view of the shell with gill-tentacles exerted as in life. *a*, mantle; *a'*, longitudinal muscle; *a''*, fringe surrounding the anterior opening of the mantle-chamber; *a'''*, the posterior appendix of the mantle; *b*, anterior circular muscle of the mantle; *b'*, posterior do.; *c*, *c'*, longitudinal muscle of mantle; *e*, liver; *f*, gonad; *k*, buccal mass (showing through the mantle); *q*, left nephridium; *s'*, club-shaped extremity of the foot; *w*, *w'*, longitudinal blood-sinus of the mantle.

and to a much greater extent the mantle-skirt and the foot, are elongated along the primitive antero-posterior (oro-anal)

axis, and retain, both externally and in the disposition of internal organs, the archi-Molluscan BILATERAL SYMMETRY. The margins of the mantle-skirt of opposite sides (right and left) meet below the foot and fuse by concrecence; only a small extent in front and a small extent behind of the mantle-margin is left unfused. Thus a CYLINDRICAL FORM is attained by the mantle, and on its surface a TUBULAR shell (incomplete along the ventral line in the youngest stages) is secreted (fig. 73, D). The FOOT is greatly elongated, and can be protruded from the anterior mantle-aperture. It has a characteristic clavate form (fig. 74, f).

The pair of typical CTENIDIA are symmetrically developed in the form of numerous gill-filaments (fig. 74, A, g)

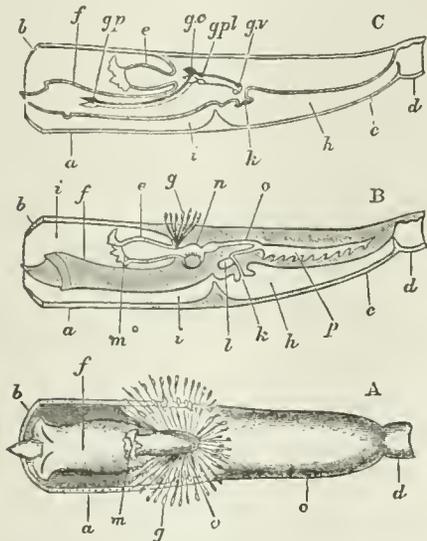

FIG. 74.—Diagrams of the anatomy of *Dentalium*. A. The anterior portion of the tubular mantle is slit open along the median dorsal line, and its margins (c) reflected so as to expose the foot, snout, and gills. B. Lateral view with organs showing as though by transparency. C. Similar lateral view from the peri-anal portion of the sub-pallial chamber, *h*; *e*, the snout or oral process; *f*, the foot; *g*, the ctenidial filaments; *h*, the peri-anal part of the sub-pallial chamber; *i*, the peri-oral part of the same chamber; *k*, the anus; *l*, the left nephridium; *m*, the mouth surrounded by pinnate tentacles; *n*, the buccal mass and odontophore; *o*, oesophagus; *p*, the left lobe of the liver; *g, p*, pedal ganglion-pair; *g, c*, cerebral ganglion-pair; *g, pl*, pleural ganglion-pair; *g, v*, visceral ganglion-pair. Possibly further research will show that *g, pl* is the typical visceral ganglion-pair, and that *g, v* is a pair of olfactory ganglia placed on the visceral loop as in the Lipocephala according to Spengel.

placed at the base of the cylindrical cephalic prominence or snout (fig. 74, c). A pair of NEPHRIDIA (fig. 74, l) are present, opening near the anus (fig. 74, k). The right serves as a genital duct, the left is apparently renal in function. The LIVER (*p*) is large and bilobed, the lobes divided into parallel lobules. The NERVE-GANGLIA are present (fig. 74, C) as well-marked cerebral, pleural, pedal, and visceral pair the typical pleural pair being closely joined to the cerebral. The visceral loop or commissure is untwisted, that is to say, the Scaphopoda are EUTHYNEUROUS. HEART and distinct VESSELS are not developed; a colourless blood is contained in the sinuses and networks formed by the body-cavity. The GONADS are either male or female, the sexes being distinct.

The embryo is remarkable for developing five ciliated rings posterior to the ciliated ring and tuft characteristic of the trochosphere larval condition of Molluscs generally. These rings are comparable to those of the larva of *Pneumodermon* (fig. 84), and like them disappear.

The class Scaphopoda is not divisible into orders or families. It contains only three genera: *Dentalium*, L. (figs. 73, 74); *Siphonodentalium*, Sars.; and *Entalium*, Dfr.

They inhabit exclusively the sand on the sea-coast in depths of from 10 to 100 fathoms.

It is worthy of remark that the Scaphopoda constitute among the Glossophora a parallel to the sand-boring forms so common among the Lipocephala (such as *Solen* and *Mya*). This parallelism is seen in the special mode of elongation of the body, in the form of the foot, and in the tubular form of the mantle brought about by the concrecence of its ventral margins, as in the Lipocephala mentioned. The cylindrical shell of *Dentalium* is also comparable to the two semi-cylindrical valves of the shell of *Solen*; or, better, to the tubular shell of *Aspergillum* and *Teredo*. Nevertheless, it is necessary to consider the Scaphopoda as standing far apart from the Lipocephala, and as having no special genetic but only a homoplastic relationship to them, in consequence of their possessing a well-developed odontophore, the characteristic organ of the Glossophora never possessed by any Lipocephala.

Class III.—CEPHALOPODA.

Characters.—Mollusca Glossophora with the foot primarily adapted to a FREE-SWIMMING mode of life. The archi-Molluscan BILATERAL SYMMETRY predominates both in the external and internal organs generally, though in many cases (especially the smaller forms) a one-sided displacement of primitively median organs and a suppression of one of the primitively paired organs is to be noted.

An ANTERIOR, MEDIAN, and POSTERIOR region of the FOOT can be distinguished (fig. 75, (4), (5), (6)), corresponding to but probably not derived from the pro-, meso-,

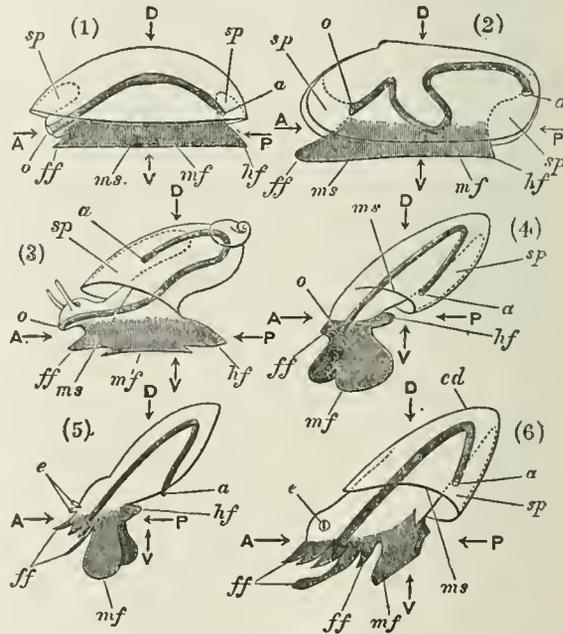

FIG. 75.—Diagrams of a series of Molluscs to show the form of the foot and its regions, and the relation of the visceral hump to the antero-posterior and dorso-ventral axes. (1) A Chiton. (2) A Lamellibranch. (3) An Anisopleurous Gastropod. (4) A Thecosomatus Pteropod. (5) A Gymnosomatous Pteropod. (6) A Siphonopod (Cuttle). A, P, antero-posterior horizontal axis; D, V, dorso-ventral vertical axis at right angles to A, P; o, mouth; a, anus; ms, edge of the mantle-skirt or flap; sp, sub-pallial chamber or space; ff, fore-foot; mf, mid-foot; hf, hind-foot; e, cephalic eyes; cd, centro-dorsal point (in 6 only).

and meta-podium of Gastropoda. The fore-foot invariably has the HEAD MERGED into it, and grows up on each side (right and left) of that part so as to surround the mouth, the two upgrowths of the fore-foot meeting on the dorsal aspect of the snout,—whence the name Cephalopoda. In the more typical forms of both branches of the class, the peri-oral portion of the foot is drawn out into paired arm-

like processes, either very short and conical (*Clio*, *Eurybia*), or lengthy (*Pneumodermon*, *Octopus*); these may be beset with suckers or hooks, or both. The mid-foot (fig. 75, *mf*) is expanded into a pair of muscular lobes right and left, which either are used for striking the water like the wings of a butterfly (*Pteropoda*), or are bent round towards one another so that their free margins meet and constitute a short tube,—the siphon or funnel (*Siphonopoda*). The hind foot is either very small or absent.

A distinctive feature of the *Cephalopoda* is the ABSENCE of anything like the TORSION of the visceral mass seen in the *Anisopleurous Gastropoda*, although as an exception this torsion occurs in one family (the *Limacinidæ*).

The ANUS, although it may be a little displaced from the median line, is (except in *Limacinidæ*) approximately median and posterior. The MANTLE-SKIRT may be aborted (*Gymnosomatous Pteropoda*); when present it is deeply produced posteriorly, forming a large sub-pallial chamber around the anus. As in our schematic Mollusc, by the side of the anus are placed the single or paired apertures of the NEPHRIDIA, the GENITAL APERTURES (paired only in *Nautilus*, in female *Octopoda*, female *Ommastrephes*, and male *Eledone*), and the paired CTENIDIA (absent in all *Pteropoda*). The VISCERAL HUMPH or dome is elevated, and may be very much elongated (see fig. 75, (4), (5), (6)) in a direction almost at right angles to the primary horizontal axis (*A*, *P* in fig. 75) of the foot.

A SHELL is frequently, but not invariably, secreted on the visceral hump and mantle-skirt of *Cephalopoda*; but there are both *Pteropoda* and *Siphonopoda* devoid of any shell. The shell is usually light in substance or lightened by air-chambers in correlation with the free-swimming habits of the *Cephalopoda*. It may be external, when it is box-like or boat-like, or internal, when it is plate-like. Very numerous minute pigmented sacs capable of expansion and contraction, and known as CHROMATOPHORES, are usually present in the integument in both branches of the class. The GONADS of both sexes are developed in one individual in some *Cephalopoda* (*Pteropoda*), in others the sexes are separate.

SENSE-ORGANS, especially the cephalic eyes and the otocysts, are very highly developed in the higher *Cephalopoda*. The osphradia have the typical form and position in the lower forms, but appear to be more or less completely replaced by other olfactory organs in the higher. The normal NERVE-GANGLIA are present, but the connectives are shortened, and the ganglia concentrated and fused in the cephalic region. Large special ganglia (optic, stellate, and supra-buccal) are developed in the higher forms (*Siphonopoda*).

The *Cephalopoda* exhibit a greater range from low to high organization than any other Molluscan class, and hence they are difficult to characterize in regard to several groups of organs; but they are definitely held together by the existence in all of the encroachment of the fore-foot so as

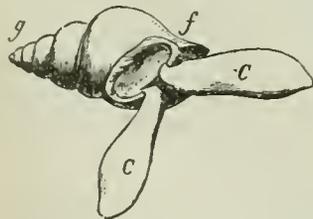

Fig. 76.

Fig. 77.

Fig. 76.—*Spiralis bulimoides*, Soult., one of the *Limacinidæ* enlarged (from Owen). C C, pteropodial lobes of the mid-foot; f, operculum carried on the hind-foot; g, spiral shell.

Fig. 77.—Operculum of *Spiralis* enlarged.

to surround the head, and by the functionally important GLOBATION OF THE MID-FOOT.

Two very distinct branches of the *Cephalopoda* are to be recognized: the one, the *Pteropoda*, more archaic in the condition of its bilobed mid-foot, including a number of minute, and in all probability degenerate, oceanic forms of simplified and obscure organization: the other, the *Siphonopoda*, containing the Pearly *Nautilus* and the Cuttles, which have for ages (as their fossil remains show) dominated among the inhabitants of the sea, being more highly gifted in special sense, more varied in movement, more powerful in proportion to size, and more heavily equipped with destructive weapons of offence than any other marine organisms.

FIG. 77a.—*Cymbulia Peronii*, Cuvier (from Owen). C, C, the expanded pteropodial lobes or wing-like fins of the mid-foot.

Branch a.—PTEROPODA.

Characters.—*Cephalopoda* in which the mid-region of the foot is (as compared with the *Siphonopoda*) in its more primitive condition, being relatively largely developed and drawn out into a pair of wing-like muscular lobes (identical with the two halves of the siphon of the *Siphonopoda*) which are used as paddles (see figs. 76-86). The hind-region of the foot is often aborted, but may carry an operculum (figs. 76, 77). The fore-region of the foot (that embracing the head) is also often rudimentary, but may be drawn out into one or more pairs of tentacles, simulating cephalic tentacles, and provided with suckers (figs. 84, 85).

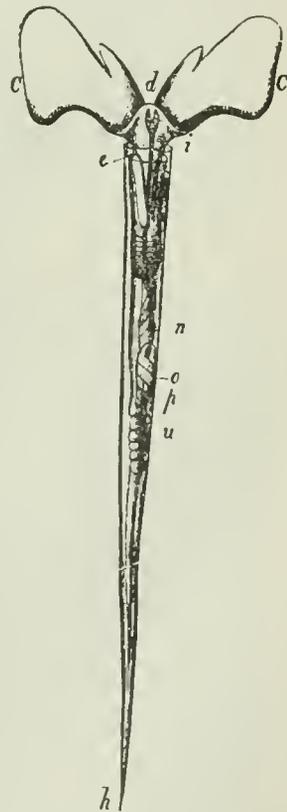

FIG. 78.—*Stylitola actenta*, Rang. sp. enlarged (from Owen). C, C, the wing-like lobes of the mid-foot; d, median fold of same; e, copulatory organ; a, pointed extremity of the shell; i, anterior margin of the shell; n, stomach; o, liver; u, hermaphrodite gonad.

Though the visceral hump is not twisted except in the *Limacinidæ* (fig. 76), there is a very general tendency to one-sided development of the viscera, and of their external apertures (as contrasted with *Siphonopoda*). The ctenidia are aborted, with the possible exception of the processes (fig. 85, c) at the end of the body of *Pneumodermon*. The vascular system resembles that of the *Gastropoda*. The nephridium is a single tubular body corresponding to the right nephridium of the typical pair of the archi-Mollusc. The anal aperture is usually placed a little to the left of the median line, more rarely to the right. In the *Limacinidæ* it has an exceptional position, owing to the torsion of the visceral mass, as in *Anisopleurous Gastropoda*.

Jaws and a lingual ribbon are present as in typical Glossophora, the dentition of the ribbon and the number of jaw-pieces presenting a certain range of variation. Sense-

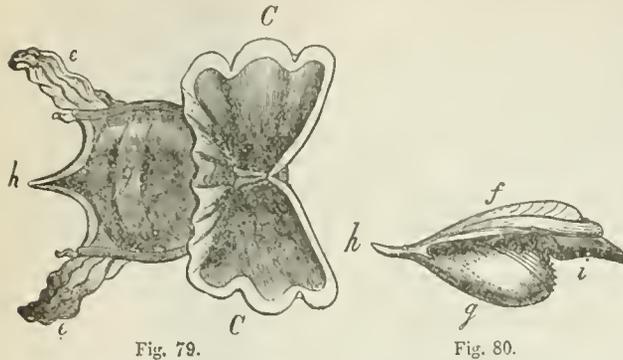

Fig. 79.

Fig. 80.

FIG. 79.—*Carolinia tridentata*, Forsk. from the Mediterranean, magnified two diameters (from Owen). a, mouth; b, pair of cephalic tentacles; c, c, pteropodial lobes of the mid-foot; d, median web connecting theae; e, e, processes of the mantle-skirt reflected over the surface of the shell; f, the shell enclosing the visceral hump; g, the median spine of the shell.
FIG. 80.—Shell of *Carolinia tridentata*, seen from the side. f, postero-dorsal surface; g, antero-ventral surface; h, median dorsal spine; i, mouth of the shell.

organs are present in the form of cephalic eyes in very few forms (*Cavolinia*, *Clione*, and in an undescribed form discovered by Suhm during the "Challenger" Expedition); otocysts are universally present. The osphradia are present in typical form, although the ctenidia are aborted; only one osphradium (the right of the typical pair) is present (fig. 87). The gonads are both male and female in the same individual. The genital aperture is single. Copulatory organs, often of considerable size, are present (fig. 86, z).

The mantle-skirt is present in one division of the Pteropoda (*Thecosomata*), and in these an extensive sub-pallial chamber is developed, the walls of which in the absence of ctenidia have a branchial function. In a second division (*Gym-*

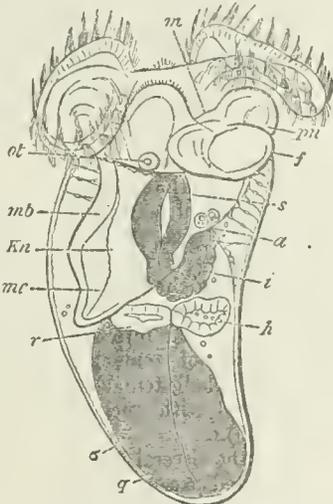

FIG. 81.—Embryo of *Carolinia tridentata* (from Balfour, after Fol.). a, anus; f, median portion of the foot; pn, pteropodial lobe of the foot; h, heart; i, intestine; ot, otocyst; g, shell; r, nephridium; s, oesophagus; sigma, sac containing nutritive yolk; mb, mantle-skirt; mc, sub-pallial chamber; Kn, contractile sinus.

The Pteropoda are divided into two orders.

Order 1.—*Thecosomata*.

Characters.—Pteropoda provided with a mantle-skirt,

and with a delicate hyaline shell developed on the surface of the visceral hump and mantle-skirt; visceral hump, and consequently the shell, spirally twisted in one family, the *Limacinae*; shell often with contracted mouth and dilated body, its walls sometimes drawn out into spine-like processes, which are covered by reflexions of the free margin of the mantle (*Cavolinia*, figs. 79, 80).

Family 1.—*Cymbuliidae*.

Genera: *Tiedemannia*, Chj.; *Halopsyche*, *Thecureurybia* (figs. 82, 83), *Cymbulia*, P. and L. (fig. 77a).

Family 2.—*Conulariidae* (fossil).

Genus: *Conularia*, Mill.

Family 3.—*Tentaculitidae* (fossil).

Genera: *Tentaculites*, Schlh.; *Cornulites*, Schlh.; *Colocoprion*, Sandb.

Family 4.—*Hyaleidae*.

Genera: *Triptera*, Q. and G.; *Styliola*, Les. (fig. 78); *Balantrum*, Leh.; *Vaginella*, Dand.; *Cleodora*, P. and L.; *Diacria*, Gr.; *Pleuropus*, Esch.; *Cavolinia*, Gioni. (figs. 79, 80, 81).

Family 5.—*Thecidae*.

Genera: *Theca*, Low; *Pterotheca*, Salt.

Family 6.—*Limacinae*.

Genera: *Eccyliomphalus*, Porti.; *Heterofusus*, Flg.; *Spirialis*, E. S. (fig. 76); *Limacina*, Cuv.

Order 2.—*Gymnosomata*.

Characters.—Pteropoda devoid of mantle-skirt and shell; tentacular processes of the fore-foot well developed and provided with suckers.

Family 1.—*Pterocymodoceidae*.

Genus: *Pterocymodoce*, Kef.

Family 2.—*Clionidae*.

Genera: *Clionita*, Q. and G.; *Clionopsis*, Trosch.; *Clione*, Pall. (fig. 86).

Family 3.—*Pneumodermidae*.

Genera: *Trichocyclus*, Esch.; *Spongobranchia*, d'Orb.; *Pneumodermopsis*, Kef.; *Pneumodermion*, Cuv. (fig. 85).

Branch b.—*SIPHONOPODA*.

Cephalopoda in which the two primarily divergent right and left lobes of the mid-region of the foot have their free borders recurved towards the middle line, where they are either held in apposition (*Tetrabranchiata*), or fused with one another to form a complete cylinder open at each end (*Dibranchiata*). This fissured or completely closed tube is the siphon (fig. 75, (6), *mf*) characteristic of the *Siphonopoda*, and is used to guide the stream of water expelled by the contractions of the walls of the branchial chamber. The pallial skirt is accordingly well developed and muscular, subserving by its contractions not only respiration but locomotion. The visceral hump is never twisted, and accordingly the main development of the pallial skirt and chamber is posterior, the excretory apertures, anus, and gills having a posterior position; as in the *archi-Moll sc*. At the same time the visceral hump is usually much elongated in a direction corresponding to an oblique line between the vertical dorso-ventral and the horizontal antero-posterior axes (see fig. 75, (6)).

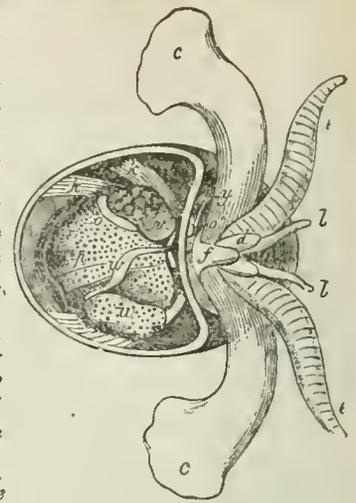

FIG. 82.—*Thecureurybia Gaudichaudii*, Soull. (from Owen). Much enlarged; the body-wall removed. a, the mouth; c, the pteropodial lobes of the foot; d, the centrally-placed hind-foot; e, l, e, three pairs of tentacle-like processes placed at the sides of the mouth, and developed (in all probability) from the fore-foot; o, anus; u, genital pore; k, retractor muscles; c and p, the liver; u, v, u, genitalia.

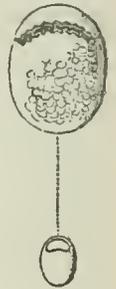

FIG. 83.—Shell of *Thecureurybia norfolkensis*; the lower figure shows the natural size.

The fore-part of the foot which surrounds the mouth, as in all Cephalopoda, is drawn out into four or five pairs of lobes, sometimes short, but usually elongated and even fili-

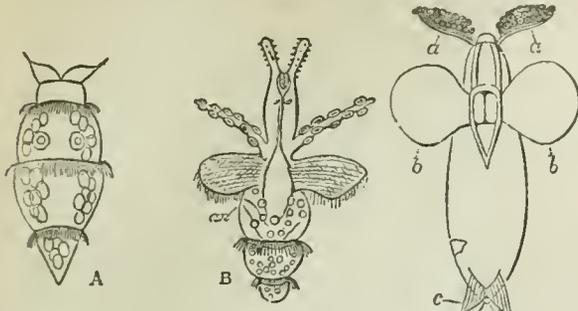

Fig. 84

Fig. 85.

Fig. 84.—Larva of *Pseudodermon* (from Balfour, after Gegenbaur). The pre-oral ciliated band of the trochosphere stage (velum) has atrophied. In A three post-oral circlets of cilia are present. The otcysts are seen, and the rudiments of a pair of processes growing from the head. In B the foremost ciliated ring has disappeared; the cephalic region is greatly developed, and, as compared with the adult (fig. 85), is large and free; the pair of hook-bearing processes on each side of the mouth are retractile, probably part of the fore-foot. At the base of the cephalic snout are seen the pair of arm-like processes (fore-foot) provided with suckers, and behind these the broad pteropodial lobes or wing-like fins of the mid-foot.

Fig. 85.—*Pseudodermon violaceum*, d'Orb.; magnified five diameters. *a*, the sucker-bearing arms; *b*, the fins of the mid-foot (in the middle line, between these, is seen the sucker-like median portion of the foot, by means of which the animal can crawl as a Gastropod); *c*, the four branchial processes. (After Kieferstein.)

form. These lobes either carry peculiar sheathed tentacles (*Nautilus*), or, on the other hand, acetabuliform suckers, which may be associated with claw-like hooks (*Dibranchiata*). The hind-foot is probably represented by the valve which depends from the inner wall of the siphon in many cases.

A shell (figs. 89, 100) is very generally present, affording protection to the visceral mass and attachment for muscles. It may be external or enclosed in dorsal upgrowing folds of the mantle, which (except in *Spirula*) close up at an early period of development, so as to form a shut sac in which the shell is secreted. The ctenidia are well developed as paired gill-plumes, serving as the efficient branchial organs (figs. 101, 103, and fig. 2, B).

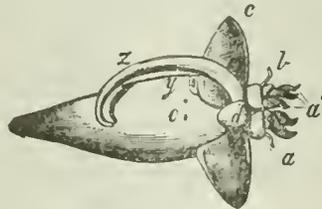

Fig. 86.—*Clione borealis*, L.; magnified two diameters, postero-ventral aspect. *a*, the cephalic region carrying *a'*—three pairs of cephalic cones provided each with very numerous minute sucker-like processes, and surrounded by a hood-like upgrowth,—and *b*, the more elongated tentacles (the retractile eye-tentacles are not seen, being placed dorsally); *c*, the pteropodial tus; *d*, the median portion of the foot; *e*, the anus; *f*, the vagina; *z*, the penis. (From Owen, after Eschricht.)

The vascular system is very highly developed; the heart consists of a pair of auricles and a ventricle (figs. 104, 105) Branchial hearts are formed on the adhevent vessels of the branchiæ. It is not known to what extent the minute subdivision of the arteries extends, or whether there is a true capillary system.

The pericardium is extended so as to form a very large sac passing among the viscera dorsal wards and sometimes containing the ovary or testis—the visceropericardial sac—which opens to the exterior either directly

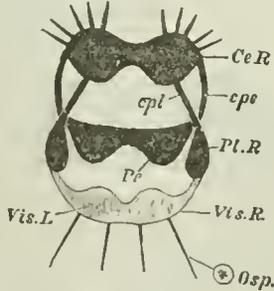

Fig. 87.—Enlarged diagram of the nerve-centres of *Pseudodermon* (from Spengel, after Sœulcyet). *Ce.R.*, right cerebral ganglion; *Pl.R.*, right pleural ganglion; *Pe.*, right pedal ganglion; *Vis.R.*, right visceral ganglion; *Vis.L.*, left visceral ganglion; *cpe.*, right cerebro-pedal connective; *cpL.*, right cerebro-pleural connective; *Osp.*, oosphradium connected by a nerve with the right visceral ganglion.

or through the nephridia. It has no connexion with the vascular system. The nephridia are always paired sacs, the walls of which invest the branchial adhevent vessels (figs. 104, 108). They open each by a pore into the visceropericardial sac except in *Nautilus*. The anal aperture is median and raised on a papilla. Jaws (fig. 88, *e*) and a lingual ribbon (fig. 107) are well developed. The jaws have the form of a pair of powerful beaks, either horny or calcified (*Nautilus*), and are capable of inflicting severe wounds

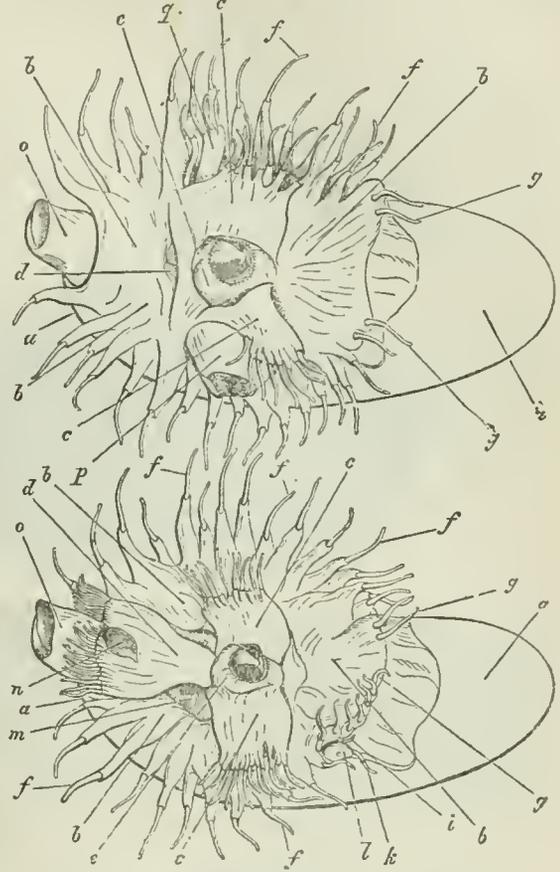

Fig. 88.—Male (upper) and female (lower) specimens of *Nautilus pompilius* as seen in the expanded looking condition, the observer looking down on to the buccal cone *c*; one-third the natural size linear. The drawings have been made from actual specimens by A. G. Bourne, B.Sc., and serve to show the natural disposition of the tentaculiferous lobes and tentacles of the circum-oral portion of the foot in the living state, as well as the great differences between the two sexes. *a*, the shell; *b*, the outer ring-like expansion (annular lobe) of the circum-oral muscular mass of the fore-foot, carrying nineteen tentacles on each side—posteriorly this is enlarged to form the "hood" (marked *g* in fig. 89 and *n*, in figs. 90 and 91), giving off the pair of tentacles marked *g* in the present figure; *c*, the right and left inner lobes of the fore-foot, each carrying twelve tentacles in the female, in the male subdivided into *p*, the "spadix" or hectocotylys on the left side, and *q*, the "anti-spadix," a group of four tentacles on the right side,—it is thus seen that the subdivided right and left inner lobes of the male correspond to the undivided right and left inner lobes of the female; *d*, the inner inferior lobe of the fore-foot, a bilobed structure in the female carrying two groups, each of fourteen tentacles, separated from one another by a lamellated organ *n*, supposed to be olfactory in function—in the male the inner inferior lobe of the fore-foot is very much reduced, and has the form of a paired group of lamellæ (*d* in the upper figure); *e*, the buccal cone, rising from the centre of the three inner lobes, and fringing the protruded calcareous beaks or jaws with a series of minute papillæ; *f*, the tentacles of the outer circum-oral lobe or annular lobe of the fore-foot, projecting from their sheaths; *g*, the two most posterior tentacles of this series belonging to that part of the annular lobe which forms the hood (*g*, in figs. 90 and 91); *h*, superior ophthalmic tentacles; *k*, inferior ophthalmic tentacles; *l*, eyes; *m*, paired laminated organ on each side of the base of the inner inferior lobe (*d*) of the female, probably olfactory in function; *n*, olfactory lamellæ upon the inner inferior lobe (in the female); *o*, the siphon (hind-foot); *p*, the spadix (in the male), the hectocotylyzed portion of the left inner lobe of the fore-foot representing four modified tentacles, eight being left unmodified; *q*, the anti-spadix (in the male), being four of the twelve tentacles of the right inner lobe of the fore-foot isolated from the remaining eight, and representing on the right side the differentiated spadix of the left side. The four tentacles of the anti-spadix are set, three on one base and one on a separate base.

There are thus in the female, where they are most numerous, ninety-four tentacles, thirty-eight on the outer annular lobe, four ophthalmic (a pair to each eye), twelve on each of the right and left inner lobes, and twenty-eight on the inner inferior lobe.

The anal aperture is median and raised on a papilla. Jaws (fig. 88, *e*) and a lingual ribbon (fig. 107) are well developed. The jaws have the form of a pair of powerful beaks, either horny or calcified (*Nautilus*), and are capable of inflicting severe wounds

Sense-organs are highly developed; the eye exhibits a very special elaboration of structure in the Dibranchiata, and a remarkable archaic form in the Nautilus. Otcocysts are present in all. The typical osphradium is not present,

term hectocotylization is applied to this modification (see figs. 88, 95, 96). Elaborate spermatophores or sperm-ropes are formed by all Siphonopoda, and very usually the female possesses special capsule-forming and nidamental glands for providing envelopes to the eggs (fig. 101, *g.n.*). The egg of all Siphonopoda is large, and the development is much modified by the presence of an excessive amount of food-material diffused in the protoplasm of the egg-cell. Trochosphere and veliger stages of development are consequently not recognizable.

The Siphonopoda are divisible into two orders, the names of which (due to Owen) describe the number of gill-plumes present; but in fact there are several characters of as great importance as those derived from the gills by which the members of these two orders are separated from one another.

Order 1.—Tetrabranchiata (= Schizosiphona, Tentaculifera).

Characters.—Siphonopodous Cephalopods in which the inrolled lateral margins of the mid-foot are not fused, but form a siphon by apposition (fig. 101). The circum-oral lobes of the fore-foot carry numerous sheathed tentacles (not suckers) (fig. 88). There are two pairs of ctenidial gills (hence Tetrabranchiata), and two pairs of nephridia, consequently four nephridial apertures (fig. 101). The visceropericardial chamber opens by two independent apertures to the exterior and not into the nephridial sacs. There are two oviducts (right and left) in the female and two spermducts in the male, the left duct in both sexes being rudimentary.

A large external shell either coiled or straight is present, and is not enclosed by reflexions of the mantle-skirt, except such narrow-mouthed shells as that of Gomphoceras, which were probably enclosed by the

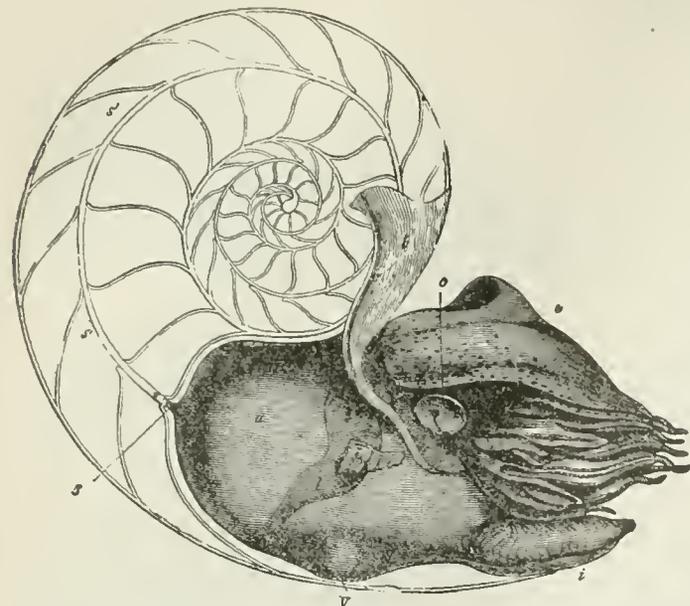

FIG. 89.—Lateral view of the female Pearly Nautilus, contracted by spirit and lying in its shell, the right half of which is cut away (from Gegenbaur, after Owen). *a*, visceral hump; *b*, portion of the free edge of the mantle-skirt reflected on to the shell,—the edge of the mantle-skirt can be traced downwards and forwards around the base of the mid-foot or siphon; *l*, *l*, superficial origin of the retractor muscle of the mid-foot (siphon), more or less firmly attached to the shell, of which a small piece (*s*) is seen between the letters *l*, *l*; *s* (farther back) points to the siphuncular pedicle, which is broken off short and not continued, as in the perfect state, through the whole length of the siphuncle of the shell, also marked *s* and *s'*; *o* points to the right eye; *t* is placed near the extremities of the contracted tentacles of the outer or annular lobe of the fore-foot,—the jointed tentacles are seen protruding a little from their long cylindrical sheaths; *v*, the dorsal "hood" formed by an enlargement in this region of the annular lobe of the fore-foot (*m*, in figs. 90, 91); *v*, a swelling of the mantle-skirt, indicating the position on its inner face of the nidamental gland (see fig. 101, *g.n.*).

except in Nautilus, but other organs are present in the

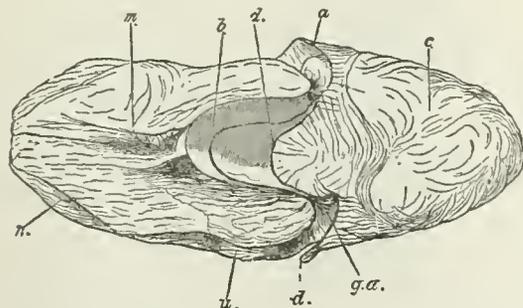

FIG. 90.—Spirit specimen of female Pearly Nautilus, removed from its shell, and seen from the antero-dorsal aspect (drawn from nature by A. G. Bourne). *m*, the dorsal "hood" formed by the enlargement of the outer or annular lobe of the fore-foot, and corresponding to the sheaths of two tentacles (*g*, *g* in fig. 88); *n*, tentacular sheaths of lateral portion of the annular lobe; *u*, the left eye; *b*, the nuchal plate, continuous at its right and left posterior angles with the root of the mid-foot, and corresponding to the nuchal cartilage of Sepia; *c*, visceral hump; *v*, the free margin of the mantle-skirt, the middle letter *d*, points to that portion of the mantle-skirt which is reflected over a part of the shell as seen in fig. 89, *b*; the cap-like fossa to which *b*, and *d*, point in the present figure is occupied by the coil of the shell; *g.a.* points to the lateral continuation of the nuchal plate *b*, to join the root of the mid-foot or siphon.

cephalic region, to which an olfactory function is ascribed both in Nautilus and in the other Siphonopoda.

The gonads are always separated in male and female individuals. The genital aperture and duct is sometimes single, when it is the left; sometimes the typical pair is developed right and left of the anus. The males of nearly all Siphonopoda have been shown to be characterized by a peculiar modification of the arm-like processes or lobes of the fore-foot, connected with the copulative function. The

the mantle-skirt, except such narrow-mouthed shells as that of Gomphoceras, which were probably enclosed by the

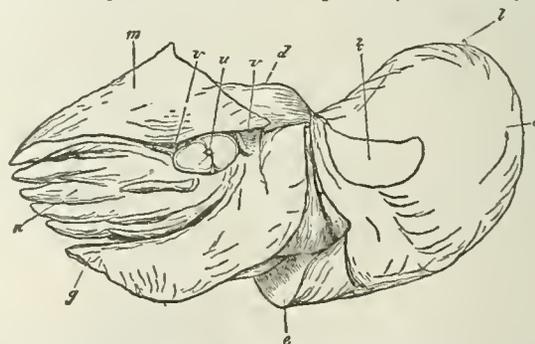

FIG. 91.—Lateral view of the same specimen as that drawn in fig. 90. Letters as in that figure with the following additions—*p* points to the concave margin of the mantle-skirt leading into the sub-pallial chamber; *g*, the mid-foot or siphon; *k*, the superficial origin of its retractor muscles closely applied to the shell and serving to hold the animal in its place; *l*, the siphuncular pedicle of the visceral hump broken off short; *v*, *v*, the superior and inferior ophthalmic tentacles.

mantle as in the Dibranch Spirula. The shell consists of a series of chambers, the last formed of which is occupied by the body of the animal, the hinder ones (successively deserted) containing gas (fig. 89).

The pair of cephalic eyes are hollow chambers (fig. 118, A) opening to the exterior by minute orifices (pinhole camera), and devoid of refractive structures. A pair of osphradia are present at the base of the gills (fig. 101, *olf*). Salivary glands are wanting. An ink-sac is not present. Branchial hearts are not developed on the branchial advent vessels.

Family 1.—*Nautilidæ*.

Genera: [*Orthoceras*], Breyn., [*Cyrtoceras*], Goldfuss; [*Gonphoceras*], Münster; [*Phragmoceras*], Brud.; [*Gyroceras*], Meyer; [*Ascoceras*], Barraude; [*Oncoceras*], Hall; [*Litnites*], Breyn.; [*Trochoceras*], Barraude; *Nautilus*, L. (figs. 88, 89, 90, &c.); [*Clymenia*], Münst.; [*Nothoceras*], Barraude.

Family 2.—*Ammonitidæ*.

Genera: [*Bacrites*], Sanderg.; [*Goniatites*], de Haan; [*Rhabdoceras*], Hauer; [*Clydonites*], Hauer; [*Cochloceras*], Hauer; [*Baculina*], d'Orb.; [*Ceratites*], de Haan; [*Baculites*], Lam.; [*Toxoceras*], d'Orb.; [*Crioceras*], Leveillé; [*Ptychoceras*], d'Orb.; [*Hanites*], Parkinson; [*Ancyloceras*], d'Orb.; [*Scaphites*], Parkinson; [*Anmonites*], Breyn.; [*Turrillites*], Lam.; [*Helicoceras*], d'Orb.; [*Heloceras*], d'Orb.

N.B.—The names in brackets are those of extinct genera.

Order 2.—*Dibranchiata* (= *Holosiphona*, *Acetabulifera*).

Characters.—Siphonopodous Cephalopods in which the inflected lateral margins of the mid-foot are fused so as to form a complete tubular siphon (fig. 96, *r*). The circumoral lobes of the fore-foot carry suckers disposed upon them in rows (as in the Pteropod Pneumodermon), *not* tentacles (see figs. 92, 95, 96). There is a single pair of typical ctenidia (fig. 103) acting as gills (hence *Dibranchiata*), and

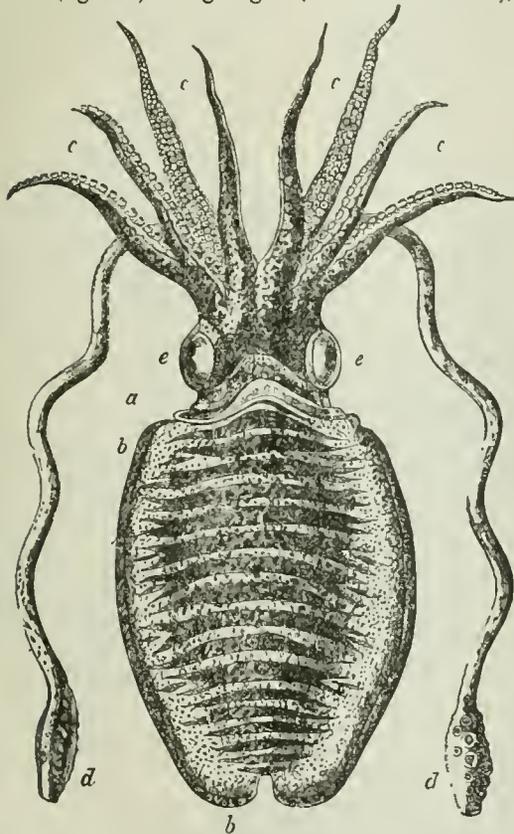

FIG. 92.—*Sepio officinalis*, L., half the natural size, as seen when dead, the long prehensile arms being withdrawn from the pouches at the side of the head, in which they are carried during life when not actually in use. *a*, neck; *b*, lateral fin of the mantle-sac; *c*, the eight shorter arms of the fore-foot; *d*, the two long prehensile arms; *e*, the eyes.

a single pair of nephridia opening by apertures right and left of the median anus (fig. 103, *r*), and by similar internal pores into the pericardial chamber, which consequently does not open directly to the surface as in *Nautilus*. The oviducts are sometimes paired right and left (*Octopoda*), sometimes that of one side only is developed (*Decapoda*, except *Ommastrephes*). The sperm-duct is always single except, according to Keferstein, in *Eledone moschata*.

A plate-like shell is developed in a closed sac formed by the mantle (figs. 98, 99), except in the *Octopoda*, which have none, and in *Spirula* (fig. 100, D) and the extinct *Belemnitidæ*, which have a small chambered shell resembling that

of *Nautilus* with or without the addition of plate-like and cylindrical accessory developments (fig. 100, C).

The pair of cephalic eyes are highly-developed vesicles with a refractive lens (fig. 120), cornea, and lid-folds,—the vesicle being in the embryo an open sac like that of *Nautilus* (fig. 119). Oosphradia are not present, but cephalic olfactory organs are recognized. One or two pairs of large salivary glands with long ducts are present. An ink-sac formed as a diverticulum of the rectum and opening near the anus is present in all *Dibranchiata* (fig. 103, *t*), and has been detected even in the fossil *Belemnitidæ*. Branchial hearts are developed on the two branchial advehent blood-vessels (fig. 104, *vc*, *vi*).

The *Dibranchiata* are divisible into two sub-orders, according to the number and character of the arm-like sucker-bearing processes of the fore-foot.

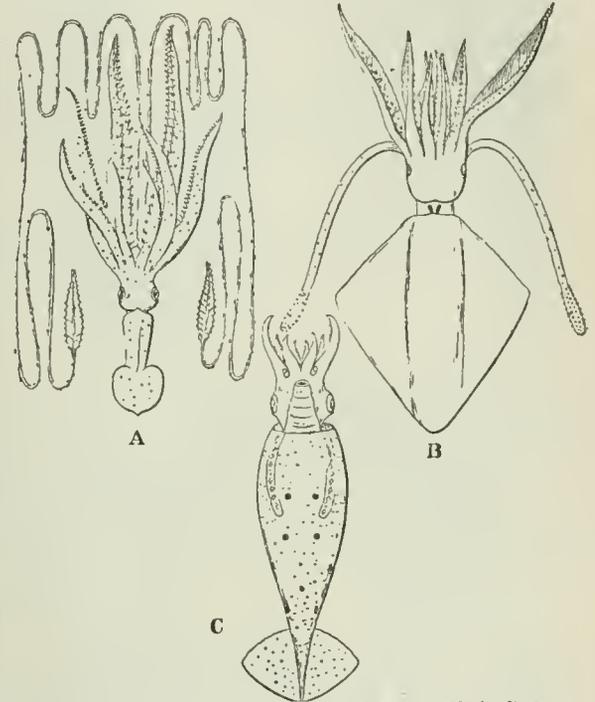

FIG. 93.—Decapodous Siphonopods; one-fourth the natural size linear. A. *Chetroteuthis Vernayi*, d'Orb. (from the Mediterranean). B. *Thyasoteuthis rhombus*, Troschel (from Messina). C. *Loligopsis cyclura*, Fér. and d'Orb. (from the Atlantic Ocean).

Sub-order 1.—*Decapoda*.

Characters.—*Dibranchiata* with the fore-foot drawn out into eight shorter and two longer arms (prehensile arms), the latter being placed right and left between the third and fourth shorter arms. The suckers are stalked and strengthened by a horny ring. The eyes are large and have a horizontal in place of a sphincter-like lid. The body is elongated and provided with lateral fins (lamelliform expansions of the mantle). The mouth has a buccal membrane. The mantle-margin is locked to the base of the siphon by a specially-developed cartilaginous apparatus. Numerous water-pores are present in the head and anterior region of the body, leading into recesses of the integument of unknown significance. The oviduct is single; large nidamental glands are present. The visceropericardial space is large, and lodges the ovary (*Sepia*). There is always a shell present which is enclosed by the upgrowth of the mantle, so as to become "internal."

Section a.—*Decapoda Calciphora*.

Character—Internal shell calcareous.

Family 1.—*Spirulidæ*.

Genus: *Spirula*, Lam. (fig. 100, D).

Family 2.—*Belemnitidæ*.

Genera: [*Spirulirostra*], d'Orb. (fig. 100, C); [*Beloptera*], Desh.; [*Belennosis*], Etw.; [*Conoteuthis*], d'Orb. (fig. 100, A); [*Acanthoteuthis*], R. Wag.; [*Belemnites*], Lister, 1678; [*Belemnitella*], d'Orb.; [*Xiphoteuthis*], Huxley.

Family 3.—*Sepiadæ*.

Genera: *Sepia*, L. (figs. 92, 98, &c.); [*Belosepia*], Valtz; *Coccoluthis*, Owen.

Section b.—Decapoda Chondrophora.

Character.—Internal shell horny.

Sub-section a.—Myopsidæ (d'Orb.).

Eye with closed cornea, so that the surrounding water does not touch the lens; mostly frequenters of the coast.

Family 1.—Loligidæ.

Genera: *Loligo*, Schneid. (figs. 99, &c.); *Loliolus*, Steenstrup; *Sepioteuthis*, Blv.; [*Teuthopsis*], Desl.; [*Leptoteuthis*], Meyer; [*Eleutherosepia*], Ag.; [*Beloteuthis*], Münt.

Family 2.—Sepioidæ.

Genera: *Sepioteuthis*, Schneid.; *Rossia*, Owen.

Sub-section β.—Oigopsidæ (d'Orb.).

Eye with open cornea, so that the surrounding water bathes the anterior surface of the lens; mostly pelagic animals

Family 3.—Cranchiadeæ.

Genus: *Cranchia*, Leach (fig. 94, C).

Family 4.—Loligopsidæ.

Genus: *Loligopsis*, Lam. (fig. 93, C).

Family 5.—Cheiroteuthidæ.

Genera: *Cheiroteuthis*, d'Orb. (fig. 93, A); *Histioteuthis*, d'Orb.

Family 6.—Thysanoteuthidæ.

Genus: *Thysanoteuthis*, Troschel (fig. 93, B).

Family 7.—Onychoteuthidæ.

Genera: *Gonatus*, Gray; *Onychoteuthis*, Lichtenst. (fig. 97); *Onychia*, Lesueur; *Enoptoteuthis*, d'Orb.; *Veranya*, Krohn; [*Plesio-teuthis*], A. Wag.; [*Celæno*], Münt.; *Dosidicus*, Steenstrup; *Ommastrephes*, d'Orb.

Sub-order 2.—Octopoda.

Characters.—Dibranchiata with the fore-foot drawn out into eight arms only; suckers sessile, devoid of horny ring; eyes small, the

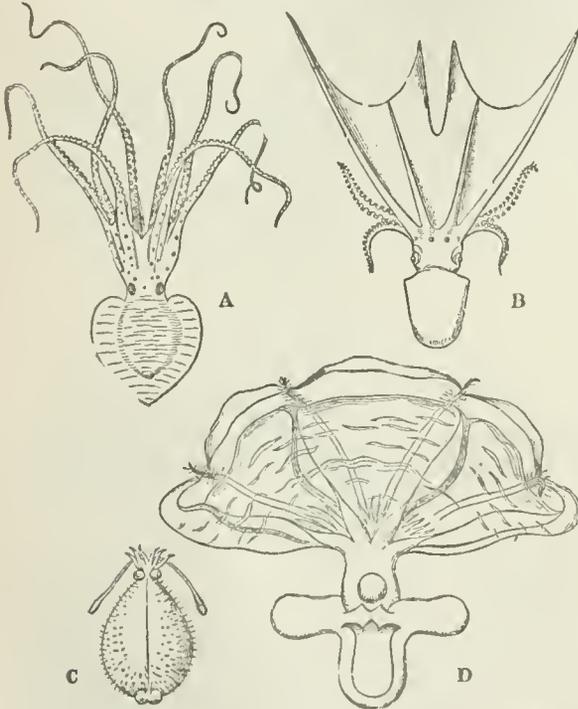

FIG. 94.—Octopodous Siphonopode; one-fourth the natural size linear. A. *Pinnoctopus cordiformis*, Quoy and Gaim (from New Zealand). B. *Tremoctopus violaceus*, Ver. (from the Mediterranean). C. *Cranchia scabra*, Owen (from the Atlantic Ocean; one of the Decapoda). D. *Cirrhototeuthis Mülleri*, Esch. (from the Greenland coast).

outer skin can be closed over them by a sphincter-like movement. The body is short and rounded; the mantle has no cartilaginous locking apparatus, and is always fused to the head dorsally by a broad nuchal band. No buccal membrane surrounds the mouth. The siphon is devoid of valves. The oviducts are paired; there are no nidamental glands. The visceropericardial space is reduced to two narrow canals, passing from the nephridia to the capsule of the genital gland. There is no shell on or in the visceral hump.

Family 1.—Cirrhototeuthidæ.

Genus: *Cirrhototeuthis*, Esch. (*Sciædephorus*, Reink.) (fig. 94, D).

Family 2.—Octopodidæ.

Genera: *Pinnoctopus*, d'Orb. (fig. 94, A); *Octopus*, Lam. (fig. 95); *Seourgus*, Trosch.; *Eledone*, Leach; *Bolitaena*, Steenstrup.

Family 3.—Philonexidæ.

Genera: *Tremoctopus*, Delle Chiaje (*Philonezis*, d'Orb.) (fig. 94, B); *Parasira*, Steenstrup (*Octopus catenulatus*, Fér., is the female, and *Octopus carena*, Ver., is the male of the one species of this genus according to Steenstrup (fig. 96)); *Argonarda*, L. (the shell of this genus is formed only in the female by the expanded ends of the two large "arms" of the fore-foot).

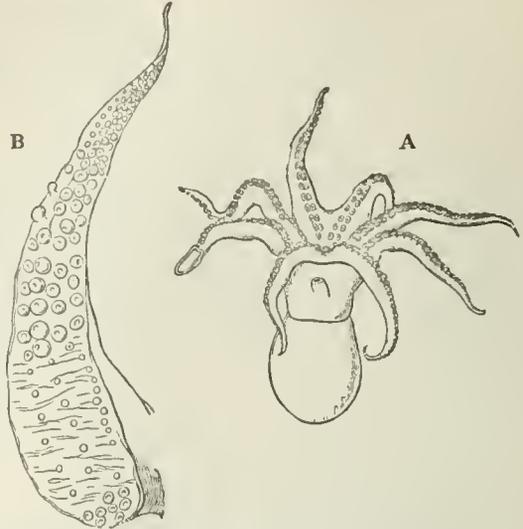

FIG. 95.—A. Male specimen of *Octopus granlandicus*, with the third arm of the right side hectocotylized. B. The extremity of the hectocotylized arm magnified.

Further Remarks on the Cephalopoda.—In order to give a more precise conception of the organization of the Cephalopoda in a concrete form we select the Pearly-Nautilus for further description, and in passing its structure in review we shall take the opportunity of comparing here and there the peculiarities presented by that animal with those obtaining in allied forms. In the last edition of this work the Pearly Nautilus was made the subject of a detailed exposition by Professor Owen, and it has seemed accordingly appropriate that it should be somewhat fully treated on the present occasion also. The figures which illustrate the present description are (excepting fig. 89) original, and prepared from dissections (made under the direction of the writer) of a male and female *Nautilus pompilius*, lately purchased for the Museum of University College, London.

Visceral Hump and Shell.—

The visceral hump of *Nautilus* (if we exclude from consideration the fine siphuncular pedicle which it trails, as it were, behind it) is very little, if at all, affected by the coiled form of the shell which it carries, since the animal always slips forward in the shell as it grows, and inhabits a chamber which is practically cylindrical (fig. 89). Were the deserted chambers thrown off instead of being accumulated behind the inhabited chamber as a coiled series of air-chambers, we should have a more correct indication in the shell of the extent and form of the animal's

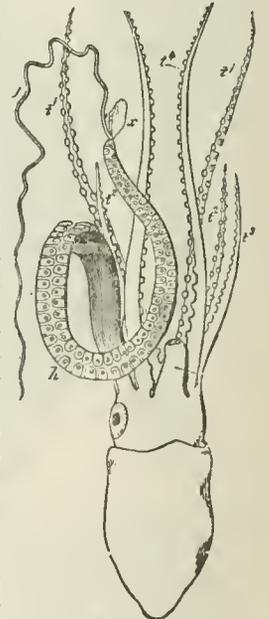

FIG. 96.—Male of *Parasira catenulata*, Steenstrup (*Octopus carena*, Ver.), showing the hectocotylized arm. *a*, *b*, *c*, *d*, the first, second, third, and fourth arms or processes of the fore-foot; *e*, the third arm of the right side hectocotylized; *f*, the apical sac of the hectocotylized arm; *g*, the filament which issues from the sac when development is complete; *h*, the siphon. (From Gegenbaur.)

body. Amongst Gastropods it is not very unusual to find the animal slipping forward in its shell as growth advances and leaving an unoccupied chamber in the apex of the shell. This may indeed become shut off from the occupied cavity by a transverse septum, and a series of such septa may be formed (fig. 42), but in no Gastropod are these apical chambers known to contain a gas during the life of the animal in whose shell they occur. A further peculiarity of the Nautilus shell and of that of the allied extinct Ammonites, Scaphites, Orthoceras, &c., and of the living Spirula, is that the series of deserted air-chambers are traversed by a cord-like pedicle extending from the centro-dorsal area of the visceral hump to the smallest and first-formed chamber of the series. No structure comparable to this siphuncular pedicle is known in any other Mollusca. Its closest representative is found in the so-called "contractile cord" of the remarkable form Rhabdopleura, referred according to present knowledge to the Polyzoa. There appears to be no doubt that the deserted chambers of the Nautilus shell contain in the healthy living animal a gas which serves to lessen the specific gravity of the whole organism. The gas is said to be of the same composition as the atmosphere, with a larger proportion of nitrogen. With regard to its origin we have only conjectures. Each septum shutting off an air-containing chamber is formed during a period of quiescence, probably after the reproductive act, when the visceral mass of the Nautilus may be slightly shrunk, and gas is secreted from the dorsal integument so as to fill up the space previously occupied by the animal. A certain stage is reached in the growth of the animal when no new chambers are formed. The whole process of the loosening of the animal in its chamber and of its slipping forward when a new septum is formed, as well as the mode in which the air-chambers may be used as a hydrostatic apparatus, and the relation to this use, if any, of the siphuncular pedicle, is involved in obscurity, and is the subject of much ingenious speculation. In connexion with the secretion of gas by the animal, besides the parallel cases ranging from the Protozoon Arcella to the Physoclistic Fishes, from the Hydroid Siphonophora to the insect-larva Corethra, we have the identical phenomenon observed in the closely-allied Sepia when recently hatched. Here, in the pores of the internal rudimentary shell, gas is observable, which has necessarily been liberated by the tissues which secrete

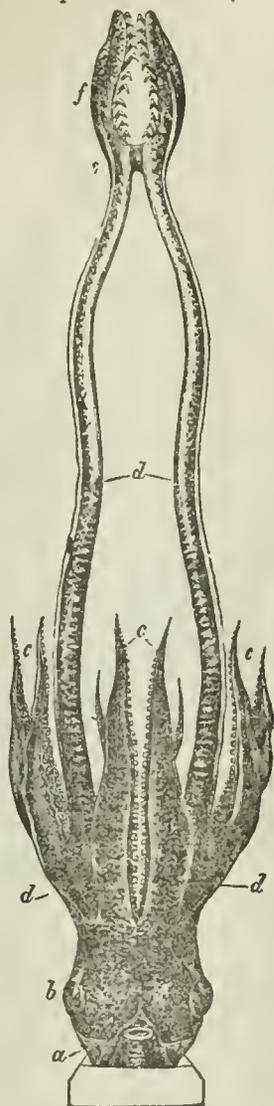

FIG. 97.—Head and circum-oral processes of the fore-foot of *Onychoteuthis* (from Owen). *a*, neck; *b*, eye; *c*, the eight short arms; *d*, long prehensile arms, the clavate extremities of which are provided with suckers at *e*, and with a double row of hooks beyond at *f*. The temporary conjunction of the arms by means of the suckers enables them to act in combination.

the shell, and not derived from any external source (Huxley).

The coiled shell of Nautilus, and by analogy that of the Ammonites, is peculiar in its relation to the body of the animal, inasmuch as the curvature of the coil proceeding

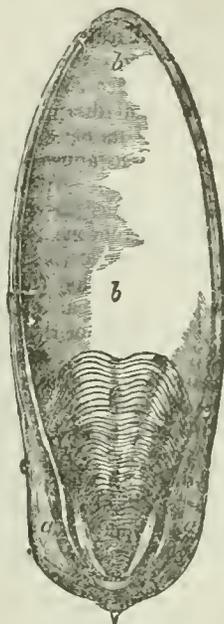

Fig. 98.

FIG. 98.—The calcareous internal shell of *Sepia officinalis*, the so-called cuttle bone. *a*, lateral expansion; *b*, anterior cancellated region; *c*, laminated region, the laminae enclosing air.

Fig. 99.

FIG. 99.—The horny internal shell or gladius or pen of Loligo.

from the centro-dorsal area is towards the head or forward, instead of away from the head and backwards as in other discoid coiled shells such as Planorbis; the coil is in fact absolutely reversed in the two cases. Amongst the extinct allies of the Nautilus (Tetrabranchiata) we find shells of a variety of shapes, open coils such as Scaphites, leading on to perfectly cylindrical shells with chamber succeeding chamber in a straight line (Orthoceras), whence again we may pass to the cork-screw spires formed by the shell of Turritites.

Whilst the Tetrabranchiata, so far as we can recognize their remains, are characterized by these large chambered shells, which, as in Nautilus, were with the exception of some narrow-mouthed forms such as Gomphoceras but very partially covered by reflexions of the mantle-skirt (fig. 89, *b*), the Dibranchiata present an interesting series of gradations, in which we trace—(*a*) the diminution in relative size of the chambered shell; (*b*) its complete investiture by reflected folds of the mantle (*Spirula*, fig. 100, *D*); (*c*) the condescence

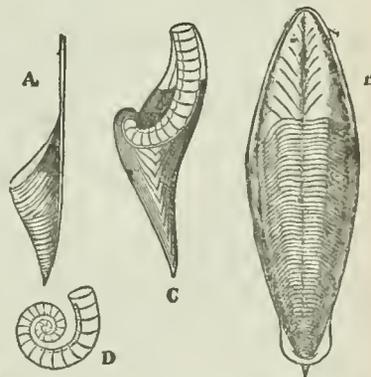

FIG. 100.—Internal shells of Cephalopoda. A. Shell of *Conotestis dupiniana*, d'Orb. (from the Neocomian of France). B. Shell of *Sepia orbigniana*, Fér. (Mediterranean). C. Shell of *Spirulirostra Bellardii*, d'Orb. (from the Miocene of Turin). The specimen is cut so as to show in section the chambered shell and the laminated "guard" deposited upon its surface. D. Shell of *Spirula levis*, Gray (New Zealand).

of the folds of the mantle to form a definitely-closed shell-sac; (*d*) the secretion by these mantle-folds or walls of the shell-sac of additional laminae of calcareous shell-substance, which invest the original shell and completely alter its appearance (*Spirulirostra*, fig. 100, C; *Belemnites*); (*e*) the gradual dwindling and total disappearance of the original chambered shell, and survival alone of the calcareous laminae deposited by the inner walls of the sac (*Sepia*, fig. 100, B); (*f*) the disappearance of all calcareous substance from the pen or plate which now represents the contents of the shell-sac, and its persistence as a horny body simply (*Loligo*, fig. 99); (*g*) the total disappearance of the shell-sac itself, and consequently of its pen or plate, nevertheless the rudiments of the shell-sac appearing in the embryo and then evanescing (*Octopus*). The early appearance of the sac of the mantle in which the shell is enclosed, in *Dibranchiata*, has led to an erroneous identification of this sac with the primitive shell-sac of the archi-Mollusc (fig. 1), of *Chiton* (fig. 10, A), of *Arion* (fig. 69, D, *a*), and of the normally-developing Molluscan embryo (figs. 68 and 72***, *sh*). The first appearance of the shell-sac of *Dibranchiata* is seen in figs. 121 and 122, its formation as an open upgrowth of the centro-dorsal area of the embryo having been demonstrated by Lankester (34) in 1873, who subsequently showed (35) that the same shell-sac appears and disappears without closing up in *Argonauta* and *Octopus*, and pointed out the distinctness of this sac and the primitive shell-gland. The shell of the female *Argonauta* is not formed by the visceral hump, but by the enlarged arms of the foot, which are in life always closely applied to it.

The shell of such Pteropoda as have shells (the Thecosomata) is excessively light, and fits close to the animal, no air-chambers being formed. It is important to note that in this division of the Cephalopoda there is the same tendency, which is carried so far in the *Dibranchiate* Siphonopods, for the mantle-skirt to be reflected over and closely applied to the shell (*e.g.*, *Cavolinia*, figs. 79 and 80). But in Pteropoda there is no complete formation of a closed sac by the reflected mantle, no thickening of the enclosed shell, no dwindling of the original shell and substitution for it of a laminated plate. The variety of form of the glass-like shells of Pteropoda is a peculiarity of that group.

Head, Foot, Mantle-skirt, and Sub-pallial Chamber.—In the Pearly Nautilus the ovoid visceral hump is completely encircled by the free flap of integument known as mantle-skirt (fig. 91, *d, e*). In the antero-dorsal region this flap is enlarged so as to be reflected a little over the coil of the shell which rests on it. In the postero-ventral region the flap is deepest, forming an extensive sub-pallial chamber, at the entrance of which *e* is placed in fig. 91. A view of the interior of the sub-pallial chamber, as seen when the mantle-skirt is retroverted and the observer faces in the direction indicated by the reference line passing from *e* in fig. 91, is given in fig. 101. With this should be compared the similar view of the sub-pallial chamber of the *Dibranchiate* *Sepia* (fig. 103). It should be noted as a difference between *Nautilus* and the *Dibranchiates* that in the former the nidamental gland (in the female) lies on that surface of the pallial chamber formed by the dependent mantle-flap (figs. 101, *g.n.*; 89, *V*), whilst in the latter it lies on the surface formed by the body-wall; in fact in the former the base of the fold forming the mantle-skirt comprises in its area a part of what is unreflected visceral hump in the latter.

The apertures of the two pairs of nephridia, of the visceropericardial sac, of the genital ducts, and of the anus are shown in position on the body-wall of the pallial chamber of *Nautilus* in figs. 101, 102. There are nine apertures

in all, one median (the anus), and four paired. Besides these apertures we notice two pairs of gill-plumes which are undoubtedly typical ctenidia, and a short papilla (the

O. Bourne). *a*, muscular band passing from the mid-foot to the integument; *b*, the valve on the surface of the funnel-like mid-foot, partially concealed by the inrolled lateral margin of the latter; *c*, the mantle-skirt retroverted; *an*, the median anus; *r.ov.*, post-anal papilla of unknown significance; *g.n.*, nidamental gland; *r.ov.*, aperture of the right oviduct; *l.ov.*, aperture of the rudimentary left oviduct (pyriform sac of Owen); *neph.p.*, aperture of the left posterior nephridium; *visc.per.*, left aperture of the visceropericardial sac; *of*, the left osphradium placed near the base of the anterior gill-plume. The four gill-plumes (ctenidia) are not lettered.

osphradium) between each anterior and posterior gill-plume (see figs. 101, 102, and explanation). As compared with this in a *Dibranchiate*, we find (fig. 103) only four aper-

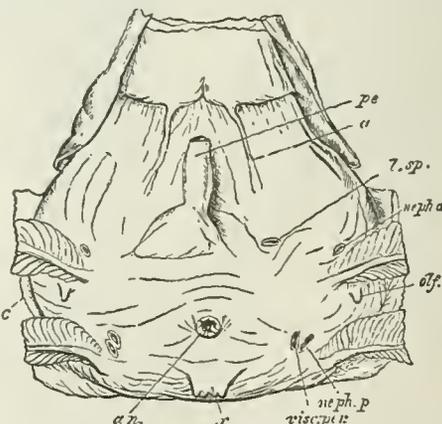

FIG. 102.—View of the postero-ventral surface of a male Pearly Nautilus, the mantle-skirt (*c*) being completely reflected so as to show the inner wall of the sub-pallial chamber, and the four ctenidia and the foot cut short (drawn from nature by A. O. Bourne). *pe*, penis, being the enlarged termination of the right spermatid duct; *l.sp.*, aperture of the rudimentary left spermatid duct (pyriform sac of Owen). Other letters as in fig. 101.

tures, viz., the median anus with adjacent orifice of the ink-sac, the single pair of nephridial apertures, and one asymmetrical genital aperture (on the left side), except in female Octopoda and a few others where the genital ducts and their apertures are paired. No visceropericardial pores are present on the surface of the pallial chamber, since in the *Dibranchiata* the visceropericardial

sac opens by a pore into each nephridium instead of directly to the surface. A single pair of ctenidia (gill-plumes) is present instead of the two pairs in Nautilus. The existence of two pairs of ctenidia and of two pairs of nephridia in Nautilus, placed one behind the other, is highly remarkable. The interest of this arrangement is in relation to the general morphology of the Mollusca, for it is impossible to view this repetition of organs in a linear series as anything else than an instance of metameric segmentation, comparable to the segmentation of the ringed worms and Arthropods. The only other example which we have of this metamerism in the Mollusca is presented by the Chitons. There we find not two pairs of ctenidia merely, but sixteen pairs (in some species more) accom-

panied by a similar metamerism of the dorsal integument, which carries eight shells. In Chiton the nephridia are not affected by the metamerism as they are in Nautilus. It is impossible on the present occasion to discuss in the way which their importance demands the significance of these two instances among Mollusca of incomplete or partial metamerism; but it would be wrong to pass them by without insisting upon the great importance which the occurrence of these isolated instances of metameric segmentation in a group of otherwise unsegmented organisms possesses, and the light which they may be made to throw upon the nature of metameric segmentation in general.

The foot and head of Nautilus are in the adult inextricably grown together, the eye being the only part belonging primarily to the head which projects from the all-embracing foot. The fore-foot or front portion of the foot

in Nautilus has the form of a number of lobes carrying tentacles and completely surrounding the mouth (figs. 88, 89, 91). The mid-foot is a broad median muscular process which exhibits in the most interesting manner a curling in of its margins so as to form an incomplete siphon (fig. 101), a condition which is completed and rendered permanent in the tubular funnel, which is the form presented by the corresponding part of Dibranchiata (fig. 96). The hind-foot possibly is represented by the valvular fold on the surface of the siphon-like mid-foot. In the Pteropoda the wing-like swimming lobes (epipodia or pteropodia) correspond to the two halves of the siphon, and are much the largest element of the foot. The fore-foot surrounding the head is often quite small, but in Clione and Pneumodermon carries lobes and suckers. A hind-foot is in Pteropoda often distinctly present; it is open to doubt as to whether the corresponding region of the foot in Siphonopoda is developed at all.

The lobes of the fore-foot of Nautilus and of the other Siphonopoda require further description. It has been doubted whether these lobes were rightly referred (by Huxley) to the fore-foot, and it has been maintained by some zoologists (Grenacher, Jhering) that they are truly processes of the head. It appears to the present writer to be impossible to doubt that the lobes in question are the fore-portion of the foot when their development is examined (see fig. 121, and especially fig. 79**), further, when the fact is considered that they are innervated by the pedal ganglion, and, lastly, when the comparison of such a Siphonopod as Sepia is made with such a Pteropod as Pneumodermon in its larval (fig. 84) as well as in its adult condition (fig. 85). The

larval Pneumodermon shows clearly that the sucker-bearing processes of that Mollusc are originally far removed from the head and close in position to the pteropodial lobes of the foot. By differential growth they gradually embrace and obliterate the head, as do the similar sucker-bearing processes of Sepia. In both cases the sucker-bearing processes are "fore-foot." The fore-foot of Nautilus completely surrounds the buccal cone (fig. 88, e), so as to present an appearance with its expanded tentacles similar to that of the disc of a sea-anemone (Actinia). No figure has hitherto been published exhibiting this circum-oral disc with its tentacles in natural position as when the animal is alive and swimming, the small figure of Valenciennes being deficient in detail. All the published figures represent the actual appearance of the contracted spirit-specimens. Mr A. G.

Bourne, B.Sc., of University College, has prepared from actual specimens the drawings of this part in the male and female *Nautilus* reproduced in fig. 88, and has restored the parts to their natural form when expanded. The drawings show very strikingly the difference between male and female. In the female (lower figure), we observe in the centre of the disc the buccal cone *e* carrying the beak-like pair of jaws which project from the finely papillate buccal membrane. Three tentaculiferous lobes of the fore-foot are in immediate contact with this buccal cone; they are the right and left (*c, c*) inner lobes, as we propose to call them, and the inferior inner lobe (*d*),—called inferior because it really lies ventralwards of the mouth. This inner inferior lobe is clearly a double one, representing a right and left inner inferior lobe fused into one. A lamellated organ on its surface, probably olfactory in function (*n*), marks the separation of the constituent halves of this double lobe. Each half carries a group of fourteen tentacles. The right and the left inner lobes (*c, c*) each carry twelve tentacles. Ex-

ternal to these three lobes the muscular substance of the mouth-embracing foot is raised into a wide ring, which becomes especially thick and large in the dorsal region where it is notably modified in form, offering a concavity into which the coil of the shell is received, and furnishing a protective roof to the retracted mass of tentacles. This part of the external annular lobe of the fore-foot is called the "hood" (figs. 90, 91, *m*). The median antero-posterior line traversing this hood exactly corresponds to the line of concrescence of the two halves of the fore-foot, which primitively grew forward one on each side of the head, and finally fused together along this line in front of the mouth. The tentacles carried by the great annular lobe are nineteen on each side, thirty-eight in all. They are somewhat larger than the tentacles carried on the three inner lobes. The dorsalmost pair of tentacles (marked *g* in fig. 88) are the only ones which actually belong to that part of the disc which forms the great dorsal hood *m*. The hood is, in fact, to a large extent formed by the enlarged sheaths of these two tentacles. In the *Ammonites* (fossil Tetrabranchiata allied to *Nautilus*) the dorsal surface of the hood secreted a shelly plate in two pieces, known to paleontologists as *Trigonellites* and *Aptychus*. Possibly, however, this double plate was carried on the surface of the bilobed nidamental gland with the form and sculpturing of which, in *Nautilus*, it closely agrees. All the tentacles of the circum-oral disc are set in remarkable tubular sheaths, into which they can be drawn. The sheaths of some of those belonging to the external or annular lobe are seen in fig. 91, marked *n*. The sheaths are muscular as well as the tentacles, and are simply tubes from the base of which the solid tentacle grows. The functional significance of this sheathing arrangement is as obscure as its morphological origin. With reference to the latter, it appears highly probable that the tubular sheath represents the cup of a sucker such as is found on the fore foot of the

Dibranchiata. In any case, it seems to the writer impossible to doubt that each tentacle, and its sheath on a lobe of the circum-oral disc of *Nautilus*, corresponds to a sucker on such a lobe of a Dibranchiate. Keferstein follows Owen in strongly opposing this identification, and in regarding such tentacle as the equivalent of a whole lobe or arm of a Decapod or Octopod Dibranch. We find in the details of these structures, especially in the facts concerning the hectocotylus and spadix, the most conclusive reasons for dissenting from Owen's view. We have so far enumerated in the female *Nautilus* ninety tentacles. Four more remain which have a very peculiar position, and almost lead to the suggestion that the eye itself is a modified tentacle. These remaining tentacles are placed one above (before) and one below (behind) each eye, and bring up the total to ninety-four (fig. 91, *v, v*). They must be considered as also belonging to the fore-foot which thus surrounds the eye.

In the adult male *Nautilus* we find the following important differences in the tentaculiferous disc as compared with the female (see upper drawing in fig. 88). The inner inferior lobe is rudimentary, and carries no tentacles. It is represented by three groups of lamellæ (*d*), which are not fully exposed in the drawing. The right and left inner lobes are subdivided each into two portions. The right shows a larger portion carrying eight tentacles, and smaller detached groups (*g*) of four tentacles, of which three have their sheaths united whilst one stands alone. These four tentacles may be called the "anti-spadix." The left inner lobe shows a similar larger portion carrying eight tentacles, and a curious conical body in front of it corresponding to the anti-spadix. This is the "spadix" of Van der Hoeven (36). It carries no tentacles, but is terminated by imbricated lamellæ. These lamellæ appear to represent the four tentacles of the anti-spadix of the right internal lobe, and are generally regarded as corresponding to that modification of the sucker-bearing arms of male Dibranchiate Siphonopods to which the name "hectocotylus" is applied. The spadix is in fact the hectocotylized portion of the fore-foot of the male *Nautilus*. The hectocotylized arm or lobe of male Dibranchiata is connected with the process of copulation, and in the male *Nautilus* the spadix has probably a similar significance, though it is not possible to suggest how it acts in this relation. It is important to observe that the modification of the fore-foot in the male as compared with the female *Nautilus* is not confined to the existence of the spadix. The anti-spadix and the reduction of the inner inferior lobe are also male peculiarities. The external annular lobe in the male does not differ from that of the female; it carries nineteen tentacles on each side. The four ophthalmic tentacles are also present. Thus in the male *Nautilus* we find altogether sixty-two tentacles, the thirty-two additional tentacles of the female being represented by lamelliform structures.

If we now compare the fore-foot of the Dibranchiata with that of *Nautilus*, we find in the first place a more simple arrangement of its lobes, which are either four or five pairs of tapering processes (called "arms") arranged in a series around the buccal cone, and a substitution of suckers for tentacles on the surface of these lobes (figs. 92, 95, 96). The most dorsally-placed pair of arms, corresponding to the two sides of the hood of *Nautilus*, are in reality the most anterior (see fig. 75, (6)), and are termed the first pair. In the Octopoda there are four pairs of these arms (figs. 94, 95), in the Decapoda five pairs, of which the fourth is greatly elongated (figs. 92, 93). In *Sepia* and other Decapoda (not all) each of these long arms is withdrawn into a pouch beside the head, and is only ejected for the purpose of prehension. The figures referred to show some of the variations in form which these arms may assume. In the

Octopoda they are not unfrequently connected by a web, and form an efficient swimming bell. The suckers are placed on the ad-oral surface of the arms, and may be in one, two, or four rows, and very numerous. In place of suckers in some genera we find on certain arms or parts of the arms horny hooks; in other cases a hook rises from the centre of each sucker. The hooks on the long arms of *Onychoteuthis* are drawn in fig. 97. The fore-foot, with its apparatus of suckers and hooks, is in the Dibranchiata essentially a prehensile apparatus, though the whole series of arms in the Octopoda serve as swimming organs, and in many (*e.g.*, the Common Octopus or Poulp) the sucker-bearing surface is used as a crawling organ.

In the males of the Dibranchiata one of the arms is more or less modified in connexion with the reproductive function, and is called the "hectocotylized arm." This name is derived from the condition assumed by the arm in those cases in which its modification is carried out to the greatest extent. These cases are those of the Octopods *Argonauta argo* and *Parasira catenulata* (fig. 96). In the males of these the third arm (on the left side in *Argonauta*, on the right side in *Parasira*) is found before the breeding season to be represented by a globular sac of integument. This sac bursts, and from it issues an arm larger than its neighbours, having a small sac at its extremity in *Parasira* (fig. 96, *x*), from which subsequently a long filament issues. Before copulation the male charges this arm with the spermatophores or packets of spermatozoa removed from its generative orifice beneath the mantle-skirt, and during coitus the arm becomes detached and is left adhering to the female by means of its suckers. A new arm is formed at the cicatrix before the next breeding season. The female, being much larger than the male, swims away with the detached arm lodged beneath her mantle-skirt. There, in a way which is not understood, the fertilization of the eggs is effected. Specimens of the female *Parasira* with the detached arm adherent were examined by Cuvier, who mistook the arm for a parasitic worm and gave to it the name *Hectocotylus*. Accordingly, the correspondingly modified arms of other Siphonopoda are said to be hectocotylized. Steenstrup has determined the hectocotylized condition of one or other of the arms in a number of male Dibranchs as follows:—in all, excepting *Argonauta* and *Parasira*, the modification of the arm is slight, consisting in a small enlargement of part or the whole of the arm, and the obliteration of some of its suckers, as shown in fig. 95, A, B; in *Octopus* and *Eledone* the third right arm is hectocotylized; in *Rossia* the first left arm is hectocotylized along its whole length, and the first right arm also in the middle only; in *Sepioida* only the first left arm along its whole length; in *Sepia* it is the fourth left arm which is modified, and at its base only; in *Sepioteuthis*, the same at its apex; in *Loligo*, the same also at its apex; in *Loliolus*, the same along its whole length; in *Ommastrephes*, *Onychoteuthis*, and *Loligopsis* no hectocotylized arm has hitherto been observed.

In the females of several Dibranchs (*Sepia*, &c.) the packets of spermatozoa or spermatophores received from the male have been observed adhering to the smaller arms. How they are passed in this case by the female to the ova in order to fertilize them is unknown.

Musculature, Fins, and Cartilaginous Skeleton.—Without entering into a detailed account of the musculature of *Nautilus*, we may point out that the great muscular masses of the fore-foot and of the mid-foot (siphon) are ultimately traceable to a large transverse mass of muscular tissue, the ends of which are visible through the integument on the right and left surfaces of the body dorsal of the free flap of the mantle-skirt (fig. 89, *l, l*, and fig. 91, *k*). These muscular arms have a certain adhesion to the shell,

and serve both to hold the animal in its shell and as the fixed supports for the various movements of the tentaculiferous lobes and the siphon. They are to be identified with the ring-like area of adhesion by which the foot-muscle of the Limpet is attached to the shell of that animal (see fig. 27). In the Dibranchs a similar origin of the muscular masses of the fore-foot and mid-foot from the sides of the shell—modified, as this is, in position and relations—can be traced.

In *Nautilus* there are no fin-like expansions of the integument, whereas such occur in the Decapod Dibranchs along the sides of the visceral hump (figs. 92, 93). As an exception among Octopoda lateral fins occur in *Pinnoctopus* (fig. 94, A), and in *Cirrhoteuthis* (fig. 94, D). In the Pteropodous division of the Cephalopoda such fin-like expansions of the dorsal integument do not occur, which is to be connected with the fact that another region, the mid-foot, which in Siphonopods is converted into a siphon, is in them expanded as a pair of fins.

In *Nautilus* there is a curious plate-like expansion of integument in the mid-dorsal region just behind the hood, lying between that structure and the portion of mantle-skirt which is reflected over the shell. This is shown in fig. 90, *b*. If we trace out the margin of this plate we find that it becomes continuous on each side with the sides of the siphon or mid-foot. In *Sepia* and other Decapods (not in Octopods) a closely similar plate exists in an exactly corresponding position (see *b* in figs. 110, 111). In *Sepia* a cartilaginous development occurs here immediately below the integument forming the so-called "nuchal plate," drawn in fig. 116, D. The morphological significance of this nuchal lamella, as seen both in *Nautilus* and in *Sepia*, is not obvious. Cartilage having the structure shown in fig. 117 occurs in various regions of the body of Siphonopoda. In all Glossophorous Mollusca the lingual apparatus is supported by internal skeletal pieces, having the character of cartilage; but in the Siphonopodous Cephalopoda such cartilage has a wider range.

In *Nautilus* a large H-shaped piece of cartilage is found forming the axis of the mid-foot or siphon (fig. 116, A, B). Its hinder part extends up into the head and supports the peri-oesophageal nerve-mass (*x*), whilst its two anterior rami extend into the tongue-like siphon. In *Sepia*, and Dibranchs generally, the cartilage takes a different form, as shown in fig. 116, C. The processes of this cartilage cannot be identified in any way with those of the capitopedal cartilage of *Nautilus*. The lower larger portion of this cartilage in *Sepia* is called the cephalic cartilage, and forms a complete ring round the oesophagus; it completely invests also the ganglionic nerve-collar, so that all the nerves from the latter have to pass through foramina in the cartilage. The outer angles of this cartilage spread out on each side so as to form a cup-like receptacle for the eyes. The two processes springing right and left from this large cartilage in the median line (fig. 116, C) are the "præ-orbital cartilages;" in front of these, again, there is seen a piece like an inverted T, which forms a support to the base of the "arms" of the fore-foot, and is the "basibrachial" cartilage. The Decapod Dibranchs have, further, the "nuchal cartilage" already mentioned, and in *Sepia*, a thin plate-like "sub-ostreal" or (so-called) dorsal cartilage, the anterior end of which rests on and fits into the concave nuchal cartilage. In Octopoda there is no nuchal cartilage, but two band-like "dorsal cartilages." In Decapods there are also two cartilaginous sockets on the sides of the funnel—"siphon-hinge cartilages"—into which fleshy knobs of the mantle-skirt are loosely fitted. In *Sepia*, along the whole base-line of each lateral fin of the mantle (fig. 92), is a "basi-ptyrgial cartilage." It is worthy of remark that we have, thus developed, in Dibranch Siphonopods a more

complete internal cartilaginous skeleton than is to be found in some of the lower Vertebrates. There are other instances of cartilaginous endo-skeleton in groups other than the Vertebrata. Thus in some capito-branchiate Chaetopods cartilage forms a skeletal support for the gill-plumes, whilst in the Arachnids (*Mygale*, *Scorpio*) and in *Limulus* a large internal cartilaginous plate—the ento-sternite—is developed as a support for a large series of muscles.

Alimentary Tract.—The buccal cone of *Nautilus* is terminated by a villous margin (buccal membrane) surrounding the pair of beak-like jaws. These are very strong and dense in *Nautilus*, being calcified. Fossilized beaks of *Tetrabranchiata* are known under the name of *Rhyncholites*. In *Dibranchs* the beaks are horny, but similar in shape to those of *Nautilus*. They resemble in general those of a parrot, the lower beak being the larger, and overlapping the upper or dorsal beak. The lingual ribbon and odontophoral apparatus has the structure which is typical for *Glossophorous Mollusca*. In fig. 107, A is represented a single row of teeth from the lingual ribbon of *Nautilus*, and in fig. 107, B, C, of other Siphonopoda.

In *Nautilus* a long and wide crop or dilated œsophagus (*cr*, fig. 110) passes from the muscular buccal mass, and at the apex of the visceral hump passes into a highly muscular stomach, resembling the gizzard of a bird (*gizz*, fig. 110). A nearly straight intestine passes from the muscular stomach to the anus, near which it develops a small cœcum. In other Siphonopods the œsophagus is usually narrower (fig. 106, *oe*), and the muscular stomach more capacious (fig. 106, *v*), whilst a very important feature in the alimentary tract is formed by the cœcum. In all but *Nautilus* the cœcum lies near the stomach, and may be very capacious—much larger than the stomach in *Loligo vulgaris*—or elongated into a spiral coil, *cc* in fig. 106, *e*. The simple

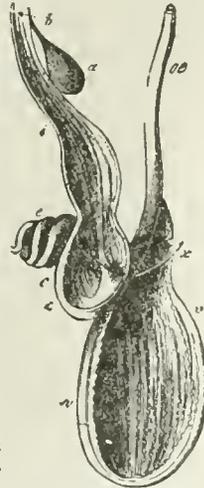

FIG. 106.—Alimentary canal of *Loligo sagittata* (from Gegenbaur). The buccal mass is omitted. *oe*, œsophagus; *v*, the stomach opened longitudinally; *x*, probe passed through the pylorus; *c*, commencement of the cœcum; *e*, its spiral portion; *i*, intestine; *a*, ink-bag; *b*, its opening into the rectum.

Loligo vulgaris—or elongated into a spiral coil, *cc* in fig. 106, *e*. The simple

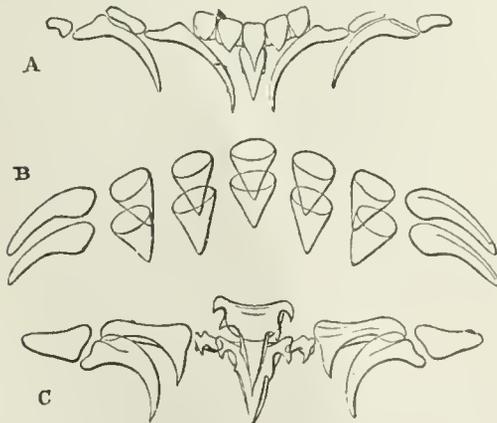

FIG. 107.—Lingual dentition of Siphonopoda. A. A single row of lingual teeth of *Nautilus pompilius* (after Kieferstein). B. Two rows of lingual teeth of *Sepia officinalis* (after Troschel). C. Lingual teeth of *Eledone cirrhosa* (after Loven).

U-shaped flexure of the alimentary tract as seen in fig. 106, and in fig. 110, is the only important one which it exhibits in the Cephalopoda,—the Pteropoda (except the *Limacinida*) agreeing with the Siphonopoda in this sim-

ilarity in consequence of their visceral hump being untwisted. The acini of the large liver of *Nautilus* are compacted into a solid reddish-brown mass by a firm membrane, as also is the case in the *Dibranchiata*. The liver has four paired lobes in *Nautilus*, which open by two bile-ducts into the alimentary canal at the commencement of the intestine. The bile-ducts unite before entering the intestine. In *Dibranchiata* the two large lobes of the liver are placed antero-dorsally (beneath the shell in *Decapoda*), and the bile-ducts open into the cœcum. Upon the bile-ducts in *Dibranchiata* are developed yellowish glandular diverticula, which are known as “pancreas,” though neither physiologically nor morphologically is there any ground for considering either the so-called liver or the so-called pancreas as strictly equivalent to the glands so denominated in the Vertebrata. In *Nautilus* the equivalents of the pancreatic diverticula of the *Dibranchs* can be traced upon the relatively shorter bile-ducts.

Salivary Glands are not developed in *Nautilus* unless a pair of glandular masses lying on the buccal cavity are to be considered as such. In the *Dibranchs*, on the contrary, one (*Sepia*, *Loligo*) or two pairs of large salivary glands are present, an anterior and a posterior (*Octopus*, *Eledone*, *Onychoteuthis*). Each pair of salivary glands has its paired ducts united to form a single duct, which runs forward from the glands and opens into the buccal cavity

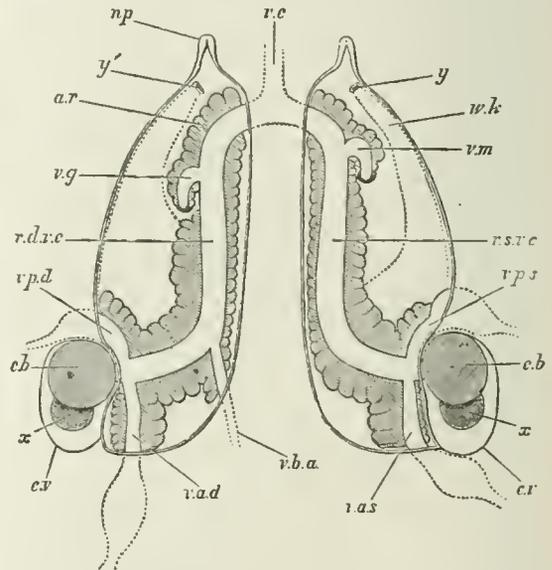

FIG. 108.—Diagram of the nephridial sacs, and the veins which run through them, in *Sepia officinalis* (after Vigelins). The nephridial sacs are supposed to have their upper walls removed. *v.c.*, vena cava; *v.d.*, *v.e.*, right descending branch of the same; *v.s.*, *v.c.*, left descending branch of the same; *v.b.a.*, vein from the ink-bag; *v.m.*, mesenteric vein; *v.g.*, genital vein; *v.a.d.*, right abdominal vein; *v.a.s.*, left abdominal vein; *v.p.d.*, right pallial vein; *v.p.s.*, left pallial vein; *c.b.*, branchial heart; *x*, appendage of the same; *v.p.s.*, capsule of the branchial heart; *np*, external aperture of the right nephridial sac; *y*, reno-pericardial orifice placing the left renal sac or nephridium in communication with the visceropericardial sac, the course of which below the nephridial sac is indicated by dotted lines; *y'*, the similar orifice of the right side; *a.r.*, glandular renal outgrowths; *w.k.*, visceropericardial sac (dotted outline).

near the radula. The anterior pair of glands when present lie in the head near the buccal mass, the posterior pair lie much farther back beneath the liver, at the sides of the œsophagus. It is the posterior pair which alone are present in *Sepia* and *Loligo*. The ink-bag is to be considered as an appendage of the rectum. It is not developed in *Nautilus*, nor in the Pteropoda; in all *Dibranchiata* (even in the fossil *Belemnites*) it is present (fig. 106, *a*; fig. 103, *t*), and has been observed to develop as a diverticulum of the rectum, with spirally plaited walls which very early secrete a black pigment. The spiral plaitings of the walls diminish

of the two nephridia to form one sac is still more obvious, since the ventral portions are united. In *Octopus* the nephridia are quite separate.

Tegumental pores have not been described in *Nautilus*, but exist in Dibranchiata, and have been (probably erroneously, but further investigation is needed) supposed to introduce water into the vascular system. A pair of

FIGS. 113, 114.—Nerve-centres of *Octopus*. Figure 113 gives a view from the dorsal aspect, figure 114 one from the ventral aspect. *bc*, the buccal mass; *ped*, pedal ganglion; *opt*, optic ganglion; *cer*, cerebral ganglion; *pl*, pleural ganglion; *visc*, visceral ganglion; *es*, oesophagus; *f*, foramen in the nerve-mass formed by pedal, pleural, and visceral ganglion-pairs, traversed by a blood-vessel.

such pores leading into sub-tegumental spaces of considerable area, the nature of which is imperfectly known, exist on the back of the head in *Philonexis*, *Tremoctopus*, and *Argonauta*. At the base of the arms and mouth four such pores are found in *Histioteuthis* and *Ommastrephes*, six in *Sepia*, *Loligo*, *Onychoteuthis*. Lastly, a pair of such pores are found in the Decapoda at the base of the long arms, leading into an extensive sub-tegumental pouch on each side of the head into which the long arms can be, and usually are, withdrawn. In *Sepia*, *Sepiola*, and *Rosia* the whole arm is coiled up in these sacs; in *Loligo* only a part of it is so; in *Histioteuthis*, *Ommastrephes*, and *Onychoteuthis*, the sacs are quite small and do not admit the arms.

Nervous System.—*Nautilus*, like the other Cephalopoda (e.g., *Pneumodermon*, fig. 87; *Octopus*, fig. 113), exhibits a great concentration of the typical Molluscan ganglia, as shown in fig. 112. The ganglia take on a band-like form, and are but little differentiated from their commissures and connectives,—an archaic condition reminding us of *Chiton*. The special optic outgrowth of the cerebral ganglion, the optic ganglion (fig. 112, *o*), is characteristic of the big-eyed Siphonopoda. The cerebral ganglion-pair (*a*) lying above the oesophagus

is connected with two sub-oesophageal ganglion-pairs of band-like form. The anterior of these is the pedal *b, b*, and supplies the fore-foot with nerves *e', t*, as also the mid-foot (siphon). The hinder band is the visceral and pleural pair fused (compare fig. 112 with fig. 87, and especially with the typical Euthyneurous nervous system of *Limnæus*, fig. 22); from its pleural portion nerves pass to the mantle; from its visceral portion nerves to the branchiæ and genital ganglion (*d* in fig. 112), and in immediate connexion with the latter is a nerve to the osphradium or olfactory papilla. No buccal ganglia have been observed in *Nautilus*, nor has an enteric nervous system been described in this animal, though both attain a special development in the Dibranchiata. The figures (114 and 115) representing the nerve-centres of *Octopus* serve to exhibit the disposition of these parts in the Dibranchiata. The ganglia are more distinctly swollen than in *Nautilus*. In *Octopus* an infra-buccal ganglion-pair are present corresponding to the buccal ganglion-pair of *Gastropoda*. In Decapoda a supra-buccal ganglion-pair connected with these are also developed. Instead of the numerous radiating pallial nerves of *Nautilus*, we have in the Dibranchiata on each side (right and left) a large pleural nerve passing from the pleural portion of the pleuro-visceral ganglion to the mantle, where it enlarges to form the stellate ganglion. From each stellate ganglion nerves radiate to supply the powerful muscles of the mantle-skirt. The nerves from the visceral portion of the pleuro-visceral ganglion have the same course as in *Nautilus*, but no osphradial papilla is present. An enteric nervous system is richly developed in the Dibranchiata, connected with the somatic nervous centres through the buccal ganglia, and anastomosing with deep branches of the visceral nerves of the visceropleural ganglion-pair. It has been especially described by Hancock (39) in *Ommastrephes*. Upon the stomach it forms a single large and readily-detected gastric ganglion. It is questionable as to how far this and the "caval ganglion" formed in some Decapoda by branches of the visceral nerves which accompany the vena cava are to be considered as the equivalents of the "abdominal ganglion," which in a typical *Gastropod* nervous system lies in the middle of the visceral nerve-loop or commissure, having the right and left visceral ganglia on either side of it, separated by a greater or less length of visceral nerve-cord (see figs. 20, 21, 22). There can be little doubt that the enteric nervous system is much more developed in the Dibranchiata than in other Mollusca, and that it effects a fusion with the typical "visceral" cords more extensive than obtains even in *Gastropoda*, where such a fusion no doubt must also be admitted.

Special Sense-Organs.—*Nautilus* possesses a pair of osphradial papillæ (fig. 101, *olf*) corresponding in position and innervation to Spengel's organ placed at the base of the ctenidia (branchiæ) in all classes of Mollusca. This organ has not been detected in other Siphonopoda. In Pteropoda it is well developed as a single ciliated pit, although the ctenidia are in that group aborted (fig. 87, *Osp.*). *Nautilus* possesses other olfactory organs in the region of the head. Just below the eye is a small triangular process (not seen in our figures), having the structure of a shortened and highly-modified tentacle and sheath. By Valenciennes, who is followed by Keferstein, this is regarded as an olfactory organ. The large nerve which runs to this organ originates from the point of juncture of the pedal with the optic ganglion. The lamelliform organ upon the inner inferior tentacular lobe of *Nautilus* is possibly also olfactory in function. In Dibranchs behind the eye is a pit or open canal supplied by a nerve corresponding in origin to the olfactory nerve of *Nautilus* above mentioned.

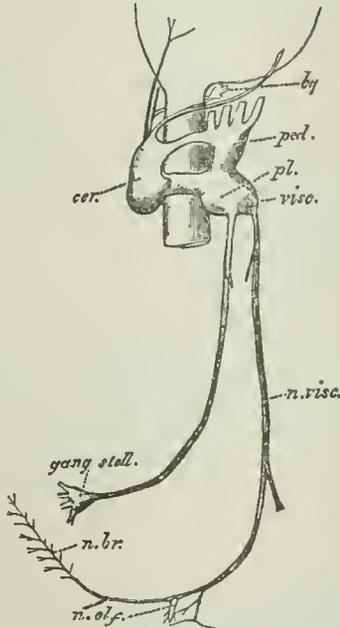

FIG. 115.—Lateral view of the nervous centres and nerves of the right side of *Octopus vulgaris* (from a drawing by A. C. Bourne). *bc*, buccal ganglion; *cer*, cerebral ganglion; *ped.*, pedal ganglion; *pl.*, pleural, and *visc.*, visceral region of the pleuro-visceral ganglion; *gang. stell.*, the right stellate ganglion of the mantle connected by a nerve to the pleural portion; *n. visc.*, the right visceral nerve; *n. olf.*, its (probably) olfactory branches; *n. br.*, its branchial branches.

Possibly the sense of taste resides in certain processes within the mouth of Nautilus and other Siphonopoda.

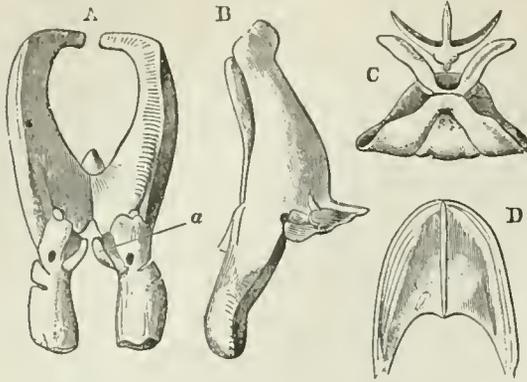

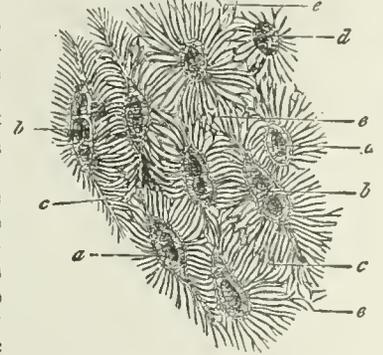

FIG. 116.—Cartilaginous skeleton of Siphonopoda (after Keferstein). A. Capito-pedal cartilage of *Nautilus pompilius*; a points to the ridge which supports the pedal portion of the nerve-centre. B. Lateral view of the same,—the large anterior processes are sunk in the muscular substance of the siphon. C. Cephalic cartilages of *Sepia officinalis*. D. Nuchal cartilage of *Sepia officinalis*.

The otocysts of Nautilus were discovered by Macdonald (40). Each lies at the side of the head, ventral of the eye, resting on the capito-pedal cartilage, and supported by the large auditory nerve which arises from the pedal ganglion. It has the form of a small sac, 1 to 2 mm. in diameter, and contains whetstone-shaped crystals, such as are known to form the otoliths of other Mollusca. The otocysts of Dibranchiata are larger and deeply sunk in the cephalic cartilage. It has been shown by Lankester that they develop as open pits (fig. 121, (5), (6), o), which gradually close up, the communication with the exterior becoming narrowed into a fine canal, which is reflected over one end of the sac, and finally has its external opening obliterated. A single otolith only is found in all Dibranchiata.

FIG. 117.—Minute structure of the cartilage of Lolligo (from Gegenbaur, after Furbinger). a, simple, b, dividing, cells; c, canaliculi; d, an empty cartilage capsule with its pores; e, canaliculi in section.

The eye of Nautilus is among the most interesting structures of that remarkable animal. No other animal which has the same bulk and general elaboration of organization has so simple an eye as that of Nautilus. When looked at from the surface no metallic lustre, no transparent coverings, are presented by it. It is simply a slightly projecting hemispherical box like a kettle-drum, half an inch in diameter, its surface looking like that of the surrounding integument, whilst in the middle of the drum-membrane is a minute hole (fig. 91, w). Owen very naturally thought that some membrane had covered this hole in life, and had been ruptured in the specimen studied by him. It, however, appears from the researches of Hensen (41) that the hole is a normal aperture leading into the globe of the eye, which is accordingly filled by sea-water during life. There is no dioptric apparatus in Nautilus, and in place of refracting lens and cornea we have actually here an arrangement for forming an image on the principle of "the pin-hole camera." There is no other eye known in the whole animal kingdom which is so constructed. The wall of the eye-

globe is tough, and the cavity is lined solely by the naked retina, which is bathed by sea-water on one surface and receives the fibres of the optic nerve on the other (see fig. 118, A). As in other Siphonopods (e.g., fig. 120, Ri, Re, p), the retina consists of two layers of cells separated by a layer of dark pigment. The most interesting consideration connected with this eye of Nautilus is found when the further facts are noted—(1) that the elaborate lens-bearing eyes of Dibranchiata pass through a stage of development in which they have the same structure as the eye of Nautilus—namely, are open sacs (fig. 119); and (2), that amongst other Mollusca examples of cephalic eyes can be found which in the adult condition are, like the eye of Nautilus and the developing eye of Dibranchs, simple pits of the integument, the cells of which are surrounded by pigment and connected with the filaments of an optic nerve. Such is the structure

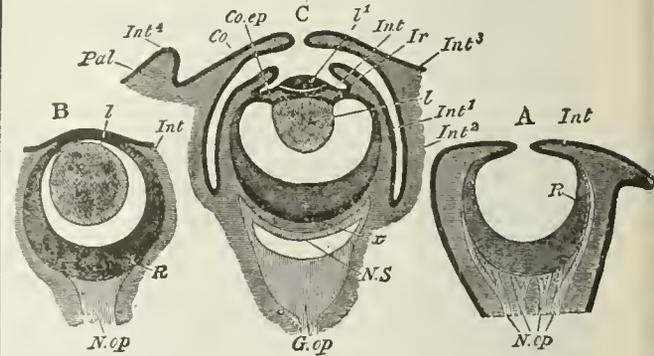

FIG. 118.—Diagrams of sections of the eyes of Mollusca. A. Nautilus (and Patella). B. Gastropod (*Limax* or *Helix*). C. Dibranchiate Siphonopod (*Oligopsis*). Pal, eyelid (outermost fold); Co.ep, cornea (second fold); Ir, iris (third fold); Int¹, 2, 3, 4, different parts of the integument; l, deep portion of the lens; l', outer portion of the lens; Co.ep, ciliary body; R, retina; N.op, optic nerve; G.op, optic ganglion; z, inner layer of the retina; N.S., nervous stratum of the retina. (From Balfour, after Grenacher.)

of the eye of the Limpet (*Patella*); and in such a simple eye we obtain the clearest demonstration of the fact that the retina of the Molluscan cephalic eye, like that of the Arthropod cephalic eye and unlike that of the Vertebrate myelonic eye, is essentially a modified area of the general epiderm, and that the sensitiveness of its cells to the action of light and their relation to nerve-filaments is only a specialization and intensifying of a property common to the whole epiderm of the surface of the body. What, however, strikes us as especially remarkable is that the simple form of a pit, which in *Patella* serves to accumulate a secretion which acts as a refractive body, should in Nautilus be glorified and raised to the dignity of an efficient optical apparatus. Natural selection has had an altogether exceptional opportunity in the ancestors of Nautilus. In all other Mollusca, starting as we may suppose from the follicular or pit-like condition, the eye has proceeded to acquire the form of a closed sac, the cavity of the closed vesicle being then filled partially or completely by a refractive body (lens) secreted by its walls (fig. 118, B). This is the condition attained in most Gastropoda. It presents a striking contrast to the simple Arthropod eye, where, in consequence of the existence of a dense exterior cuticle, the eye does not form a vesicle, and the lens is always part of that cuticle.

In the Dibranchiate division of the Siphonopoda the greatest elaboration of the dioptric apparatus of the eye is attained, so that we have in one sub-class the extremes of the two lines of development of the Molluscan eye, those two lines being the punctigerous and the lentigerous. The structure of the Dibranchiate eye is shown in section in fig. 118, C, and in fig. 120, and its development in fig. 119 and fig. 123. The open sac which forms the retina of the young Dibranchiate closes up, and constitutes the posterior chamber of the eye, or primitive optic vesicle (fig. 123, A, poc). The

lens forms as a structureless growth, projecting inwards from the front wall of this vesicle (fig. 123, B, l). The integument around the primitive optic vesicle which has sunk below

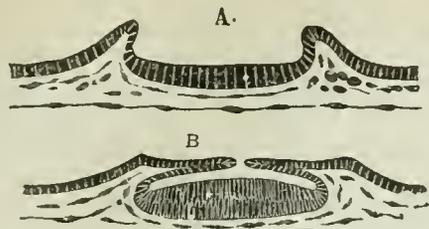

FIG. 119.—Diagrams of sections showing the early stage of development of the eye of *Loligo* when it is, like the permanent eye of *Nautilus* and of *Patella*, an open sac. A. First appearance of the eye as a ring-like ingrowth. B. Ingrowth of the ring-like wall so as to form a sac, the primitive optic vesicle of *Loligo*. (From Lankester.)

the surface now rises up and forms firstly nearest the axis of the eye the iridian folds (*if* in B, fig. 123; *ik* in fig. 120; *Ir* in fig. 118), and then secondly an outer circular fold grows up like a wall and completely closes over the iridian folds and the axis of the primitive vesicle (fig. 120, C). This covering is transparent, and is the cornea. In the oceanic Decapoda the cornea does not completely close, but leaves a central aperture traversed by the optic axis. These forms are termed *Oigopsidæ* by d'Orbigny (42), whilst the Decapoda with closed cornea are termed *Myopsidæ*. In the Octopoda the cornea is closed, and there is yet another fold thrown over the eye. The skin surrounding the cornea presents a free circular margin, and can be drawn over the surface of the cornea by a sphincter muscle. It thus acts as an adjustable diaphragm, exactly similar in

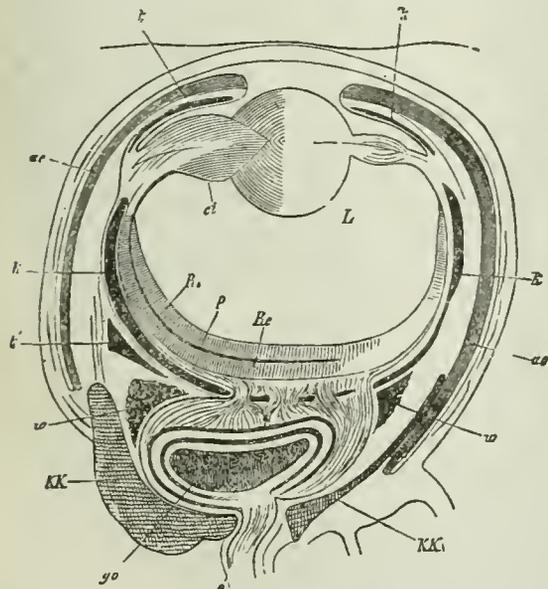

FIG. 120.—Horizontal section of the eye of *Sepia* (*Myopsid*). *KK*, cephalic cartilages (see fig. 119); *C*, cornea (closed); *L*, lens; *ci*, ciliary body; *R1*, internal layer of the retina; *Re*, external layer of the retina; *p*, pigment between these; *a*, optic nerve; *go*, optic ganglion; *k* and *k'*, capsular cartilage; *ik*, cartilage of the iris; *w*, white body; *ae*, argentine integument. (From Gegenbaur, after Hensen.)

movement to the iris of Vertebrates. *Sepia* and allied Decapods have a horizontal lower eyelid, that is to say, only one-half of the sphincter-like fold of integument is movable. The exact history of the later growth of the lens in the Dibranchs' eye is not clear. As seen in fig. 120, it appears, after attaining a certain size, to push through the front wall of the primitive optic vesicle at the point corresponding to its centre of closure, and to project a little into the anterior chamber formed by the cornea. The wall of the

primitive optic vesicle adjacent to the embedded lens (*L*) now becomes modified, forming a so-called "ciliary body," in which muscular tissue is present, serving to regulate the focus of the lens (*ci* in fig. 120). Bobretzky (43) differs from Lankester, whose view is above given, in assigning a distinct origin to the protruding anterior segment of the lens (*l* in fig. 118). The optic ganglion, as well as the other large ganglia of the Dibranchiata, originate in the mesoblast of the embryo. The connexion between the cells of the retina and the nerve-fibres proceeding from the optic ganglion must therefore be a secondary one.

Chromatophores.—In *Nautilus* these remarkable structures, which we mention here as being intimately associated with the nervous system, appear to be absent. In Dibranchiata they play an important part in the economy, enabling their possessor, in conjunction with the discharge of the contents of the ink-bag, to elude the observation of either prey or foe. They consist of large vesicular cells (true nucleated cells converted into vesicles), arranged in a layer immediately below the epidermis. Each chromatophore-cell has from six to ten muscular bands attached to its walls, radiating from it star-wise. The contraction of these fibres causes the chromatophore-cell to widen out; it returns to its spherical resting state by its own elasticity. In the spherical resting state such a cell may measure .01 mm., whilst when fully stretched by its radiating muscles it covers an area of .5 mm. The substance of the chromatophore-cells is intensely coloured with one of the following colours—scarlet, yellow, blue, brown—which are usually of the greatest purity and brilliance. The action of the chromatophores may be watched most readily in young *Loligo*, either under the microscope or with the naked eye. The chromatophores are suddenly expanded, and more slowly retracted with rapidly-recurring alternation. All the blue, or all the red, or all the yellow may be expanded and the other colours left quiescent. Thus the animal can assume any particular hue, and change its appearance in a dazzling way with extraordinary rapidity. There is a definite adaptation of the colour assumed in the case of *Sepia* and others to the colour of the surrounding rock and bottom.

Gonads and Genital Ducts.—In *Nautilus* it has recently been shown by Lankester and Bourne (37) that the genital ducts of both sexes are paired right and left, the left duct being rudimentary and forming the "pyriform appendage," described by Owen as adhering by membranous attachment to the ventricle of the heart, and shown by Keferstein to communicate by a pore with the exterior. Thus the Cephalopoda agree with our archi-Mollusc in having bilaterally symmetrical genital ducts in the case of the most archaic member of the class. The ovary (female gonad) or the testis (male gonad) lies in *Nautilus* as in the Dibranchs in a distinct cavity walled off from the other viscera, near the centro-dorsal region. This chamber is formed by the coelomic or peritoneal wall; the space enclosed is originally part of the coelom, and in *Sepia* and *Loligo* is, in the adult, part of the viscero-pericardial chamber. In *Octopus* it is this genital chamber which communicates by a right and a left canal with the nephridium, and is the only representative of pericardium. The ovary or testis is itself a growth from the inner wall of this chamber, which it only partly fills. In *Nautilus* the right genital duct, which is functional, is a simple continuation to the pore on the postero-dorsal surface of the membranous walls of the capsule in which lies the ovary or the testis, as the case may be. The gonad itself appears to represent a single median or bilateral organ.

The true morphological nature of the genital ducts of the Cephalopoda and of other Mollusca is a subject which invites speculation and inquiry. In all the cases in which such

ducts continuous with the tunic of the gonad itself occur—viz., in Nemertoid worms, in Arthropoda, and in Teleostean fishes, besides Mollusca—there is an absence of definite knowledge as to the mode of development of the duct. It seems, however, from such facts as have been ascertained that the gonad lies at first freely in the coelom, and that the duct develops in connexion with the genital pore, and attaches itself to the embryonic gonad, or to the capsule which grows around it. The question then arises as to the nature of the pore. In other groups of animals we find that the pore, and funnel or tube connected with it by which the genital products are conveyed to the exterior, is a modified nephridium (usually a pair, one right and one left). Is it possible that this is also the case where the duct very early becomes united to the gonad, and even gives rise to the appearance of a tubular ovary or testis? Probably this is the case in Teleostean fishes (see Huxley's observations on the oviducts of the smelt, 44); but it seems to be a tenable position that in other cases, including the Mollusca, the genital pore is a simple opening in the body-wall leading into the body-cavity or coelom, such as we find on the dorsal surface of the earth-worm, which has become specialized for the extrusion of the genital products. Possibly, as in Nemertine and Chætopod worms, the condition preceding the development of these definite genital pores was one in which a temporary rupture of the body-wall occurred at the breeding season, and this temporary aperture has gradually become permanent. The absence of genital pores in Patella, and some Lamellibranchs which make use of the nephridia for the extrusion of their genital products, suggests that the very earliest Mollusca or their forefathers were devoid of genital ducts and pores. In no Mollusca, however, is the nephridium used in the same way as a genital duct as it is in the Chætopoda, the Gephyrea, and the Vertebrata; for the open mouth of the nephridium in Mollusca leads into the pericardial space, and it is not through this space and this mouth that the genital products of any Mollusca enter the nephridium (except perhaps in Neomenia), although it is by this mouth that the genital products enter the nephridium in the former classes above named. Hence the arrangement in Patella, &c., is to be looked upon as a special development from the simpler condition when the Mollusca brought forth by rupture (=schizodinic, from *σχίζω*, travail), and not as derived from the common arrangement of adaptation of a nephridium to the genital efferent function (=nephrodinic).¹

The functional oviduct of Nautilus forms an albuminiparous gland as a diverticulum, which appears to correspond to a dilatation in the male duct, which succeeds the testis itself, and is called the "accessory gland." The male duct has a second dilatation (Needham's sac), and then is produced in the form of a large papilla. In Dibranchs the genital ducts are but little more elaborated. They are ciliated internally. In female Octopoda, in Ommastrephes, and in one male Octopod (*Eledone moschata*) the genital ducts are paired, opening right and left of the anus. But in all other Dibranchs a single genital duct only is developed, viz., that of the left side, and leads from the genital capsule or chamber of the gonad to an asymmetrically-placed pore. In the male Dibranchs the genital duct is coiled and provided with a series of glandular dilatations and

receptacles. These are connected with the formation of the spermatophores. In the Siphonopoda the spermatic fluid does not flow as a liquid from the genital pore, but the spermatozoa are made up into little packets before extrusion. In other Mollusca (Pulmonata) and in other animals (Chætopoda) this formation of "sperm-ropes" is known, but in the Siphonopoda it attains its highest development. Exceedingly complicated structures of a cylindrical form (sometimes an inch in length) are formed in the male genital duct by a secretion which embeds and cements together the spermatozoa. They are formed in Nautilus as well as in Dibranchs, the actual manner in which their complicated structure is produced being not easily conjectured. Accessory glands not forming part of the oviduct, but furnishing the material for enclosing the eggs in an elastic envelope, are found as paired structures, opening some way behind the anus in Nautilus (101, *g.n.*) and in the Dibranchs. They are known as the nidamental glands. In the female Sepia they are particularly large and prominent, and are accompanied by a second smaller pair.

Reproduction and Development.—The details of sexual congress and of the actual fertilization of the egg are quite unknown in Nautilus, and imperfectly in the Dibranchs and the Pteropoda. Allusion has already been made to the subject in connexion with the hectocotylized arm. The mature eggs of Nautilus are unknown, as well as the appearance which they present when deposited. In the Dibranchs the eggs are always very large; in some cases the amount of food-yolk infused into the original egg-cell is so great as to give it the size of a large pea. This results in that mode of development which is only known outside this class among the Vertebrata; it is discoblastic. The protoplasm of the fertilized egg-cell segregates to one pole of the egg, and there undergoes cell-division, resulting in the formation of a disc of cleavage cells (fig. 121, (1)) resembling the cicatrula of the hen's egg, which subsequently spreads over and invests the whole egg (fig. 121, (2)). For details of this process we must refer the reader to other works (45, 46); but it may here be noted that in addition to the layer of cleavage cells, which consists of more than one stratum of cells in the future embryonic area as opposed to the yolk-sac area, additional cells are formed in the mass of residual yolk apparently by an independent process of segregation, each cell having a separate origin, whence they are termed "autoplasts." The autoplasts eventually form a layer of fusiform cells (fig. 121, (7), *h*; fig. 122, *m*; and fig. 123, *ps*),—the "yolk-membrane" which everywhere rests upon and encloses the residual yolk. The cleavage cells form a single layer on the yolk-sac area and two layers on the embryonic area, an outer layer one cell deep (fig. 122, *ep*), and an inner—the middle layer of the three—which is often thick and many cells deep (fig. 122, *m*). There is great difficulty here in identifying the layers with the three typical layers of other animal embryos, except in regard to the outermost, which corresponds with the epiblast of Vertebrates in many respects. The middle layer, however, gives rise to the nerve-ganglia as well as to the muscles, coelom, and skeleto-trophic tissues, and to the mid-portion of the alimentary canal with its hepatic diverticula, the liver (see fig. 121, (7) and explanation, where the origin of the mid-gut as a vesicle *r* is seen). It is clearly, therefore, something more than the mesoblast of the Vertebrate, giving rise, as it does, to important organs formed both by epiblast and hypoblast in other animals. Lastly, the yolk-membrane, though corresponding to the Vertebrate hypoblast in position and structure, furnishes no part of the alimentary tract, but disappears when the yolk is completely absorbed. In fact, the developmental phenomena in Sepia, Loligo, and Octopus are profoundly perturbed by the excessive proportion of food-yolk. Balfour has shown

¹ Coelomate animals are, according to this nomenclature, either Schizodinic or Porodinic. The Porodinic group is divisible into Nephrodinic and Idiodinic, in the former the nephridium serving as a pore, in the latter a special (*ιδίος*) pore being developed. In each of these latter-groups the pore may be—(1) devoid of a duct, (2) provided with a duct which is unattached to the gonad and opens into the body-cavity, (3) provided with a duct which fuses with the gonad. The genital ducts of Idiodinic forms may be called Idiogonaducts, as distinguished from the Nephrogonaducts of nephrodinic forms.

that in the chick the orifice of closure of the overspreading blastoderm does not represent the whole of the blastopore,

a structure corresponding to the primitive streak of the chick, and lying near the klastic pole, will be found in *Sepia* and *Loligo*, and the strange vesicular origin of the mid-gut will be traced to and explained by it.

Leaving this difficult question of the cell-layers of the embryo, we would draw the reader's attention to the series of sketches representing the semi-transparent embryo of *Loligo*, drawn in fig. 121. When the cleavage cells have nearly enclosed the yolk, the upper or embryonic area shows the rudiments of the centro-dorsal mantle-sac or pen-sac, the mouth, the paired optic pits, and the paired

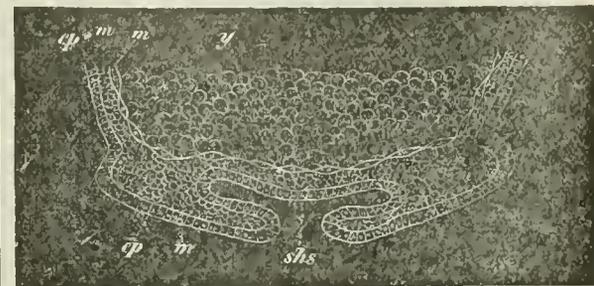

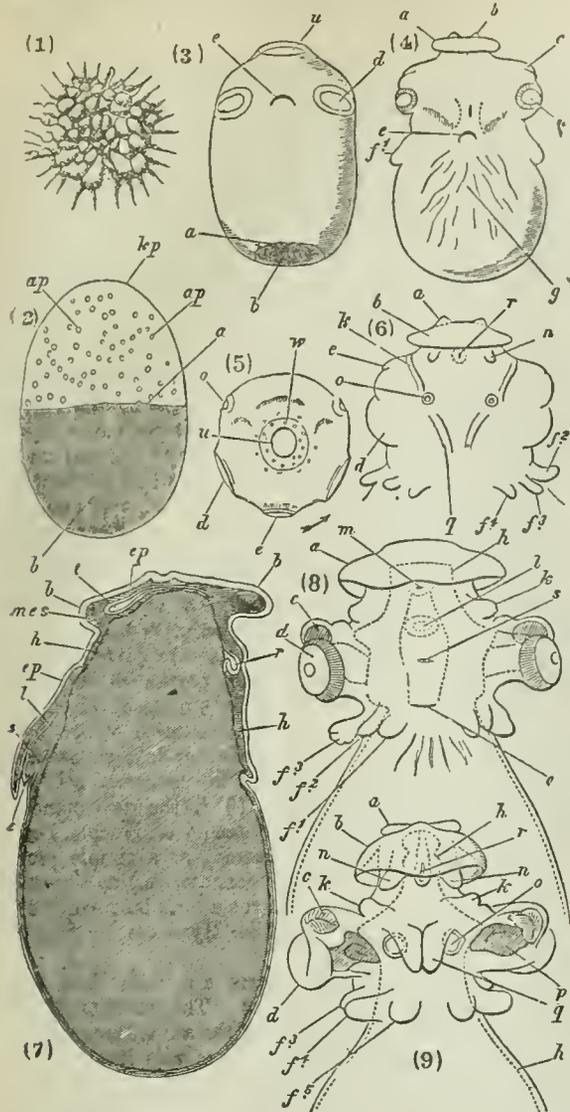

FIG. 122.—Section through the still open shell-sac occupying the centro-dorsal area of an embryo of *Loligo*; the position is inverted as compared with fig. 121 (3) and (7). *ep*, outer cell-layer; *m*, middle cell-layer; *m'*, deep cell-layer of fusiform cells; *y*, the granular yolk or food-material of the egg; *shs*, the still open shell-sac. (From Lankester.)

otic pits (fig. 121, (3), (5)). The eye-pits close up (fig. 119), the orifice of the mantle-sac narrows, and its margin becomes raised and freely produced as mantle-skirt; at the same time an hour-glass-like pinching in of the whole embryo commences, separating the embryo proper from the so-called yolk-sac (fig. 121, (4)). Around the "waist" of constriction, pair by pair, ten lobes arise (fig. 121, (8)),—the arms of the fore-foot. It now becomes obvious that the yolk-sac is but the median surface of the fore-foot bulged out inordinately by food-yolk, just as the hind region of the foot is in the embryo slug (see fig. 72***, and explanation). Just as in the slug, this dilated yolk-holding foot is rhythmically contractile, and pulsates steadily over the area *g* in fig. 121, (4). At this stage, and long subsequently, the mouth of the young Cephalopod is in no way surrounded by the fore-foot, but lies well above its nascent lobes (*e* in fig. 121). Subsequently it sinks, as it were, between the right and left most anterior pair of the series, which grow towards one another and fuse above it, and leave no trace of their original position and relations. Fig. 121, (6) gives a view of the postero-dorsal surface of an embryo, in which the important fact is seen of the formation of the funnel or siphon by the union of two pieces (*g*), which grow up each independently, one right and one left, like the sides of the siphon of *Nautilus* or the swimming lobes of a Pteropod, and subsequently come together, as shown in (9), where the same letter *g* indicates the same part. The explanations of figs. 121 and 123 are given very full, and here, therefore, we shall only allude to two additional points. A curious mass of tissue of unknown significance occurs in the orbit of Dibranchs, known as the white body (*w* in fig. 120). A strongly-marked invagination just above the orbit is a very prominent feature in the embryo of *Loligo*, *Sepia*, and *Octopus*, and appears to give rise to this so-called white body. This invaginated portion of the outer cell-layer is seen in fig. 121, (8) and (9), lettered *c*; in fig. 123, A and B, it is lettered *wb*.

Lastly, in fig. 123, A, the origin of the optic nerve-ganglion *ng* from the cells of the middle layer should be especially noticed. In some other Molluscs the nerve-ganglia have been definitely traced to the outer cell-layer,

FIG. 121.—Development of *Loligo*. (1) View of the cleavage of the egg during the first formation of embryonic cells. (2) Lateral view of the egg at a little later stage. *a*, limit to which the layer of cleavage-cells has spread over the egg; *b*, portion of the egg (shaded) as yet uncovered by cleavage-cells; *ap*, the autoplasts; *kp*, cleavage-pole where first cells were formed. (3) Later stage, the limit *a* now extended so as to leave but little of the egg-surface (*b*) unenclosed. The eyes (*d*), mouth (*e*), and mantle-sac (*u*) have appeared. (4) Later stage, anterior surface, the embryo is becoming nipped off from the yolk-sac (*g*). (5) View of an embryo similar to (3) from the cleavage-pole or centro-dorsal area. (6) Later stage, posterior surface. (7) Section in a median dorso-ventral and antero-posterior plane of an embryo of the same age as (4). (8) View of the anterior face of an older embryo. (9) View of the posterior face of an embryo of the same age as (8). Letters in (3) to (9):—*a*, lateral fins of the mantle; *b*, mantle-skirt; *c*, supra-ocular invagination to form the "white body"; *d*, the eye; *e*, the mouth; *f*, 1, 2, 3, 4, 5, the five paired processes of the fore-foot; *g*, rhythmically contractile area of the yolk-sac, which is itself a hernia-like protrusion of the median portion of the fore-foot (see fig. 72**); *h*, dotted line showing internal area occupied by yolk (food-material of the egg); *k*, first rudiment of the mid-foot (paired ridges which unite to form the siphon or funnel); *l*, sac of the radula or lingual ribbon; *m*, stomach; *n*, rudiments of the gills (paired tentacles); *o*, the otcyates,—a pair of invaginations of the surface of the mid-foot; *p*, the optic ganglion; *q*, the distal portion of the ridges which form the siphon or mid-foot, *k* being the basal portion of the same structure; *r*, the vesicle-like rudiment of the intestine formed independently of the parts connected with the mouth, *s*, *k*, *m*, and without invagination; *s*, rudiment of the salivary glands; *t* in (7), the shell-sac at an earlier stage open (see fig. 122), now closed up; *u*, the open shell-sac formed by an uprising ring-like growth of the centro-dorsal area; *w* in (6), the mantle-skirt commencing to be raised up around the area of the shell-sac. In (7) *mes* points to the middle cell-layer of the embryo, *ep* to the outer layer, and *h* to the deep layer of fusiform cells which separates everywhere the embryo from the yolk or food-material lying within it. (Original.)

but that this is in part to be sought in the widely-separated primitive streak. The present writer has little doubt that

whilst in some Gastropods, according to Bobretzky, they originate, as here shown, for *Loligo*.

The egg-coverings of the Dibranchiate are very complete. Argonauta and Octopus deposit each egg in a firm oval case, thin and transparent, which has a long stalk by which (in Octopus) the egg is fixed in company with two or three hundred others to some foreign object. *Sepia* encloses each egg in a thick envelope of many layers resembling india-rubber. *Loligo* encloses many rows of eggs in a copious tough jelly, and affixes a dozen or twenty such egg-strings to one spot. *Sepia* and *Loligo* desert their eggs when laid. The female Octopus most jealously

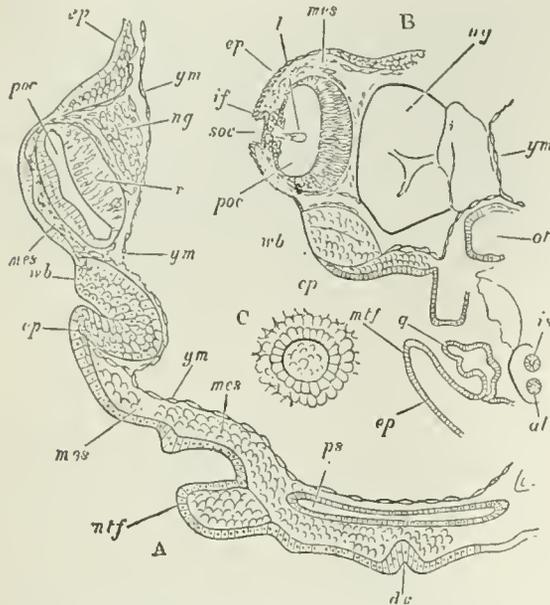

FIG. 123.—Right and left sections through embryos of *Loligo*. A. Same stage as fig. 121 (4). B. Same stage as fig. 121 (8); only the left side of the sections is drawn, and the food-material which occupies the space internal to the membrane *ym* is omitted. *al*, rectum; *is*, ink-sac; *ep*, outer cell-layer; *mes*, middle cell-layer; *ym*, deep cell-layer of fusiform cells (yolk-membrane); *ng*, optic nerve-ganglion; *ot*, otcyst; *wb*, the "white body" of the adult ocular capsule forming as an invagination of the outer cell-layer; *mtf*, mantle-skirt; *g*, gill; *ps*, pen-sac or shell-sac, now closed; *dg*, dorsal groove; *poc*, primitive optic vesicle, now closed (see fig. 119); *l*, lens; *r*, retina; *soc*, second or anterior optic chamber still open; *if*, iridian folds. C. The primitive invagination to form one of the otcysts, as seen in fig. 121 (5) and (6). (After Lankester.)

guards them, building a nest of stones and incubating. Argonauta carries hers with her in a special brood-holding shell.

The development of the Pteropoda, so far as is known, presents no points of contact with that of the Siphonopoda rather than with that of the Gastropoda, owing to the fact that in them the egg has not an excess of food-yolk. Consequently, we find typical trochosphere and veliger larvæ among the Thecosomata (fig. 8, C, and fig. 81), whilst the isolated observation of Gegenbaur has made known very remarkable larvæ referable to the Gymnosomata, and with little doubt to Pneumodermon (fig. 84). The former set of larvæ are sufficient to demolish once for all the view which has been entertained by some zoologists, viz., that the velar disc of the veliger larva is the same thing as the pteropodial lobes of the mid-foot of Pteropoda. The latter larvæ are of importance in showing that, as in embryo Siphonopods so in embryo Pteropods, the sucker-bearing lobes of the fore-foot are truly podial structures, and only embrace the head and surround the mouth as the result of late embryonic growth.

BRANCH B.—LIPOCEPHALA.

Characters.—Mollusca with the head region undeveloped. No cephalic eyes are present; the buccal cavity is devoid

of biting, rasping, or prehensile organs. The animal is sessile, or endowed with very feeble locomotive powers. The Lipocephala comprise but one class, the Lamellibranchia, also known as Elatobranchia and Conchifera.

Class: LAMELLIBRANCHIA

Characters.—Lipocephala in which the archaic BILATERAL SYMMETRY of the Mollusca is usually fully retained, and raised to a dominant feature of the organization by the lateral compression of the body and the development of the shell as two bilaterally symmetrical plates or valves covering each one side of the animal. The foot is commonly a simple cylindrical or ploughshare-shaped organ, used for boring in sand and mud, and more rarely presents a crawling disc similar to that of Gastropoda; in some forms it is aborted. The paired CTENIDIA are very greatly developed right and left of the elongated body, and form the most prominent organ of the group. Their function is chiefly not respiratory but nutritive, since it is by the currents produced by their ciliated surface that food-particles are brought to the feebly-developed mouth and buccal cavity.

The Lamellibranchia present as a whole a somewhat uniform structure, so that, although they are very numerous, it is not possible to divide them into well-marked sub-classes or sections, and orders. The chief points in which they vary are—(1) in the structure of the ctenidia or branchial plates; (2) in the presence of one or of two chief muscles, the fibres of which run across the animal's body from one valve of the shell to the other (adductors); (3) in the greater or less elaboration of the posterior portion of the mantle-skirt so as to form a pair of tubes, by one of which water is introduced into the sub-pallial chamber, whilst by the other it is expelled; (4) in the perfect or deficient symmetry of the two valves of the shell and the connected soft parts, as compared with one another; (5) in the development of the foot as a disc-like crawling organ (*Arca*, *Nucula*, *Pectunculus*, *Trigonia*, *Lepton*, *Galeomma*), as a simple plough-like or tongue-shaped organ (*Unionacea*, &c.), as a re-curved saltatory organ (*Cardium*, &c.), as a long burrowing cylinder (*Solenacea*, &c.), or its partial (*Mytilacea*) or even complete abortion (*Ostracea*).

The essential Molluscan organs are, with these exceptions, uniformly well developed. The MANTLE-SKIRT is always long, and hides the rest of the animal from view, its dependent margins meeting in the middle line below the ventral surface when the animal is retracted; it is, as it were, slit in the median line before and behind so as to form two flaps, a right and a left; on these the right and the left calcareous valves of the shell are borne respectively, connected by an uncalcified part of the shell called the ligament. In many embryo Lamellibranchs a centro-dorsal PRIMITIVE SHELL-GLAND or follicle has been detected (figs. 8 and 151). The MOUTH lies in the median line anteriorly, the ANUS in the median line posteriorly.

Both CTENIDIA right and left are invariably present, the axis of each taking origin from the side of the body as in the schematic archi-Mollusc (see fig. 1 and fig. 131). A pair of NEPHRIDIA opening right and left, rather far forward on the sides of the body, are always present. Each opens by its internal extremity into the pericardium. A pair of GENITAL APERTURES, connected by genital ducts with the paired gonads, are found right and left near the nephridial pores, except in a few cases where the genital duct joins that of the nephridium (*Spondylus*). The sexes are often, but not always, distinct. No accessory glands or copulatory organs are ever present in Lamellibranchs. The ctenidia often act as brood-pouches.

A dorsal contractile HEART, with symmetrical right and left auricles (fig. 143, A) receiving aerated blood from the ctenidia and mantle-skirt, is present, being unqually de-

veloped only in those few forms which are inequivalve. The typical PERICARDIUM is well developed. It appears, as in other Mollusca, not to be a blood-space although developed from the cœlom, and it communicates with the exterior by the pair of nephridia. As in Cephalopoda (and possibly other Mollusca) space can be introduced through the nephridia into this space. The ALIMENTARY CANAL keeps very nearly to the median vertical plane whilst exhibiting a number of flexures and loopings in this plane. A pair of large glandular outgrowths, the so-called "liver" or great digestive gland, exists as in other Mollusca. A pair of pedal oocysts, and a pair of OSFRADIA at the base of the gills, appear to be always present. A typical NERVOUS SYSTEM is present (fig. 144), consisting of a cerebro-pleuro-visceral ganglion-pair, united by connectives to a pedal ganglion-pair and an osphradial ganglion-pair (parieto-splanchnic).

A special cœcum connected with the pharynx is sometimes found, containing a tough flexible cylinder of transparent cartilaginous appearance and unknown significance, called the "crystalline style" (Mactra), which possibly represents the radular sac of Glossophora. In many Lamellibranchs a gland is found on the hinder surface of the foot in the mid line, which secretes a substance which sets into the form of threads—the so-called "byssus"—by means of which the animal can fix itself. Sometimes this gland is found in the young and not in the adult (Anodon, Unio, Cyclas). In some Lamellibranchs (Pecten, Spondylus, Pholas, Mactra, Tellina, Pectunculus, Galeomma, &c.), although cephalic eyes are always absent, special eyes are developed on the free margin of the mantle-skirt, apparently by the modification of tentacles which are commonly found there (fig. 145). The existence of pores in the foot and elsewhere in Lamellibranchia by which liquid can pass into and out of the vascular system, although asserted as in the case of other Mollusca, appears to be improbable. It has yet to be shown by satisfactory microscopic sections that the supposed pores are anything but epidermal glands.

The Lamellibranchia live chiefly in the sea, some in fresh waters. A very few have the power of swimming by opening and shutting the valves of the shell (Pecten, Lima); most can slowly crawl or rapidly burrow; others are, when adult, permanently fixed to stones or rocks—either by the shell or the byssus. In development some Lamellibranchia pass through a free-swimming trochosphere stage with præoral ciliated band; other fresh-water forms which carry the young in brood-pouches formed by the ctenidia have suppressed this larval phase.

The following classification and enumeration of genera are based primarily upon the characters of the adductor muscles. The Heteromya and Monomya must be conceived of as derived from forms resembling such Gastropodous Isomya as Nucula and Trigonia, which undoubtedly are the nearest living representatives of the ancestral Lipocephala, and bring us nearest to the other branch of the Mollusca, the Glossophora.

Order 1.—Isomya.

Character.—Anterior and posterior adductor muscles of approximately equal size.

Sub-order 1.—Integripallia.

Characters.—Marginal attachment of the mantle to the shell not inflected to form a sinus; siphons not developed in some, present in most.

Family 1.—Arcaea.

Genera: *Arca*, L. (fig. 132); *Cucullæa*, Lam.; *Pectunculus*, Lam.; *Limopsis*, Sassi; *Nucula*, Lam. (fig. 134); *Isoarca*, Münster; *Leda*, Schu.; *Yoldia*, Möll.; *Solenella*, Sowerby, &c.

Family 2.—Trigoniacea.

Genera: *Trigonia*, Brug.; *Axinus*, Sow.; *Lyrodosma*, Conrad.

Family 3.—Unionacea.

Genera: *Unio*, Retz.; *Castalia*, Lam.; *Anodon*, Cuv. (figs. 124, &c.); *Iridina*, Lam.; *Mycetopus*, d'Orb., &c.

Family 4.—Lucinacea.

Genera: *Lucina*, Brug.; *Corbis*, Cuv.; *Diplodonta*, Brown; *Kellia*, Turton; *Montacuta*, Turton; *Lepton*, Turton; *Galeomma*, Turton; *Astarte*, Sow.; *Crassatella*, Lam.; *Cardinia*, Ag.; *Cardita*, Brug., &c.

Family 5.—Cyprinacea.

Genera: *Tridacna*, Da C.; *Chama*, L.; *Dimya*, Ron.; *Diceras*, Lk.; *Isocardia*, Lam.; *Hippopodium*, Sow.; *Cardium*, L.; *Corbicula*, Meg.; *Cyrena*, Lk.; *Cyclus*, Brug. (fig. 146); *Pisidium*, Pfr. (figs. 148-153); *Cyprina*, Lam., &c.

Sub-order 2.—Sinupallia.

Characters.—Marginal attachment of the mantle to the shell inflected so as to form a sinus into which the pallial siphons can be withdrawn: siphons always present, and large.

Family 6.—Veneracea.

Genera: *Cypricardia*, Lam.; *Topes*, Megl.; *Cyclina*, Desn.; *Cytherea*, Lam. (figs. 125, &c.); *Chione*, Megl.; *Venus*, L.; *Lucinopsis*, F. H.; *Sanguinolaria*, Lam.; *Psammobia*, Lam. (fig. 130); *Tellina*, L.; *Donax*, L.; *Scrobicularia*, Schu.; *Cumingia*, Sow.; *Rangia*, Dsml.; *Mactra*, L. (fig. 140); *Trigoniella*, Da C.; *Vaganella*, Gr.; *Lutraria*, Lam.

Family 7.—Myacea.

Genera: *Myochama*, Stb.; *Chamostrea*, Rois; *Pandora*, Sol.; *Thracia*, Leach; *Thetis*, Sow.; *Pholadomya*, Sow.; *Corbula*, Brug.; *Mya*, Lam.; *Saricava*, Fleur.; *Panopæa*, Ad.; *Glycymeris*, Lam.; *Siliqua*, Mhlf., &c.; *Solen*, L.

Family 8.—Pholadacea.

Genera: *Clavagella*, Lam.; *Aspergillum*, Lam. (figs. 123, 129); *Humphreyia*, Gr.; *Pholas*, L.; *Pholadidea*, Turt.; *Teredo* L. *Tercedina*, Lam.; *Furcella*, Oken, &c.

Order 2.—Heteromya.

Characters.—Anterior adductor (pallial adductor) much smaller than the posterior adductor (pedal adductor); siphons rarely present.

Family 1.—Mytilacea.

Genera: *Mytilus*, L. (fig. 133); *Modiola*, Lam.; *Crenella*, Brown; *Lithodomus*, Cuv.; *Dreissena*, Ben. (fig. 136); *Modiolarca*, Gr., &c.

Family 2.—Mulleriacea.

Genera: *Aetheria*, Lam.; *Mulleria*, Fér.

Order 3.—Monomya

Characters.—Anterior adductor absent in the adult; siphons never developed.

Family 1.—Aviculacea.

Genera: *Cardiola*, Brdp.; *Avicula*, Kl.; *Malleus*, Lam.; *Inoceramus*, Sow.; *Crenatula*, Lam.; *Perna*, Brug., &c.

Family 2.—Ostracea.

Genera: *Ostrea*, L. (fig. 6); *Anomia*, L.; *Spondylus*, L.; *Plicatula*, Lam.; *Vulsella*, Lam.; *Lima*, Brug.; *Pecten*, L.; *Hiunites*, Dfr., &c.

Further Remarks on the Lamellibranchia.—The Lamellibranchia are the only members of the Lipocephalous branch of Mollusca existing at the present day; and we must suppose that, whilst on the one hand the earliest Glossophorous forms were developing from the archi-Mollusca by the elaboration of the buccal apparatus, the bivalved sessile Lamellibranchs were developing in another direction from univalve cephaloporous ancestors. The large bilobed mantle-flap with its pair of shells covering in the whole animal, the current-producing largely-expanded ctenidia, and the reduced cephalic region are characters which go hand in hand, and were simultaneously acquired, each being related to the development of the others. Unless the "crystalline style" of Lamellibranchs is to be considered as the rudiment of the "radular sac" of Glossophora, as suggested by Balfour, there is no indication whatever that the ancestors of the Lamellibranchia had acquired a representative of the buccal apparatus—so highly developed in Glossophora—before diverging from the archi-Mollusca; that is to say, the common ancestors of the two great branches of Mollusca presented the distinctive character of neither branch—they had not an aborted cephalic region, and they had not a lingual ribbon.

As an example of the organization of a Lamellibranch, we shall review the structure of the Common Pond-Mussel (*Anodonta cygnea*), comparing its structure with those of

other Lamellibranchia. The Swan Mussel has superficially a perfectly-developed bilateral symmetry. The left side of the animal is seen as when removed from its shell in fig. 124 (1). The valves of the shell have been removed by severing their adhesions to the muscular areas *h, i, k, l, m, u*.

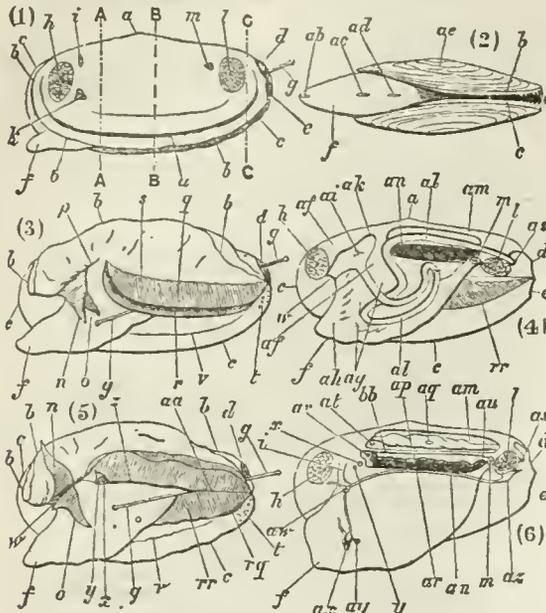

FIG. 124.—Diagrams of the external form and anatomy of *Anodonta cygnea*, the Pond-Mussel; in all the figures the animal is seen from the left side, the centro-dorsal region uppermost, as in the drawings of fig. 75, which compare. (1) Animal removed from its shell, a probe *g* passed into the sub-pallial chamber through the excurrent siphonal notch. (2) View from the ventral surface of an *Anodonta* with its foot expanded and issuing from between the gaping shells. (3) The left mantle-flap reflected upwards so as to expose the sides of the body. (4) Diagrammatic section of *Anodonta* to show the course of the alimentary canal. (5) The two gill-plates of the left side reflected upwards so as to expose the fissure between foot and gill where the probe *g* passes. (6) Diagram to show the positions of the nerve-ganglia, heart, and nephridia. Letters in all the figures as follows:—*a*, centro-dorsal area; *b*, margin of the left mantle-flap; *c*, margin of the right mantle-flap; *d*, excurrent siphonal notch of the mantle margin; *e*, incumbent siphonal notch of the mantle margin; *f*, foot; *g*, probe passed into the superior division of the sub-pallial chamber through the excurrent siphonal notch, and issuing by the side of the foot into the inferior division of the sub-pallial chamber; *h*, anterior (pallial) adductor muscle of the shells; *i*, posterior (pedal) adductor muscle of the shells; *k*, protractor muscle of the foot; *l*, posterior (pedal) adductor muscle of the shells; *m*, posterior retractor muscle of the foot; *n*, anterior labial tentacle; *o*, posterior labial tentacle; *p*, base-line of origin of the reflected mantle-flap from the side of the body; *q*, left external gill-plate; *r*, left internal gill-plate; *rr*, inner lamella of the right inner gill-plate; *rs*, right outer gill-plate; *s*, line of concrescence of the outer lamella of the left outer gill-plate with the left mantle-flap; *t*, pallial tentacles; *u*, the thickened muscular pallial margin which adheres to the shell and forms the pallial line of the left side; *v*, that of the right side; *w*, the mouth; *x*, aperture of the left organ of Bojanus (nephridium) exposed by cutting the attachment of the inner lamella of the inner gill-plate; *y*, aperture of the genital duct; *z*, fissure between the free edge of the inner lamella of the inner gill-plate and the side of the foot, through which the probe *g* passes into the upper division of the sub-pallial space; *aa*, line of concrescence of the inner lamella of the right inner gill-plate with the inner lamella of the left inner gill-plate; *ab*, *ac*, *ad*, three pit-like depressions in the median line of the foot supposed by some writers to be pores admitting water into the vascular system; *ae*, left shell valve; *af*, space occupied by liver; *ag*, space occupied by gonad; *ah*, muscular substance of the foot; *ai*, duct of the liver on the wall of the stomach; *ak*, stomach; *al*, rectum traversing the ventricle of the heart; *am*, pericardium; *an*, glandular portion of the left nephridium; *ap*, ventricle of the heart; *aq*, aperture by which the left auricle joined the ventricle; *ar*, non-glandular portion of the left nephridium; *as*, anus; *at*, pore leading from the pericardium into the glandular sac of the left nephridium; *au*, pore leading from the glandular into the non-glandular portion of the left nephridium; *av*, internal pore leading from the non-glandular portion of the left nephridium to the external pore *x*; *aw*, left cerebro-pleuro-visceral ganglion; *ax*, left pedal ganglion; *ay*, left otocyst; *az*, left olfactory ganglion (parieto-splanchnic); *bb*, floor of the pericardium separating that space from the non-glandular portion of the nephridia.

The free edge of the left half of the mantle-skirt *b* is represented as a little contracted in order to show the exactly similar free edge of the right half of the mantle-skirt *c*. These edges are not attached to, although they touch, one another; each flap (right or left) can be freely thrown back in the way which has been carried out in fig. 124, (3) for that of the left side. This is not always the case with Lamellibranchs; there is in the group a tendency for the corresponding edges of the mantle-skirt to fuse together by concrescence,

and so to form a more or less completely closed bag, as in the Scaphopoda (*Dentalium*). In this way the notches *d, e* of the hinder part of the mantle-skirt of *Anodonta* are in the Siphonate forms converted into two separate holes, the edges of the mantle being elsewhere fused together along this hinder margin. Further than this, the part of the mantle-skirt bounding the two holes is frequently drawn out so as to form a pair of tubes which project from the shell (figs. 130, 141). In such Lamellibranchs as the oysters, scallops, and many others which have the edges of the mantle-skirt quite free, there are numerous tentacles upon those edges. In *Anodonta* these pallial tentacles are confined to a small area surrounding the inferior siphonal notch (fig. 124, (3), *t*).

The centro-dorsal point *a* of the animal of *Anodonta* (fig. 124, (1)) is called the umbonal area; the great anterior muscular surface *h* is that of the anterior adductor muscle, the posterior similar surface *i* is that of the posterior adductor muscle; the long line of attachment *u* is the simple "pallial muscle,"—a thickened ridge which is seen to run parallel to the margin of the mantle-skirt in this Lamellibranch. In some of the Siphonate *Isomya*, which are hence termed "Sinupallia," the pallial muscle is not simple but deeply incurved at the posterior region so as to allow of the large pallial siphons being retracted within the shell or expanded at will (fig. 127, and figs. 140, 141).

It is the approximate equality in the size of the anterior and posterior adductor muscles which has led to the name *Isoyoma* for the group to which *Anodonta* belongs. The hinder adductor muscle may be considered as representing morphologically the transverse fibres of the root of the foot of *Nautilus* by which it adheres to its shell (fig. 91, *k*), the annular muscular area of *Patella* (fig. 27, *c*), and the columella muscle of the *Gastropods* generally. It is always large in Lamellibranchs, but the anterior adductor may be very small (*Heteromya*), or absent altogether (*Monomya*). The anterior adductor muscle is in front of the mouth and alimentary tract altogether, and must be regarded as a special and peculiar development of the median anterior part of the mantle-flap

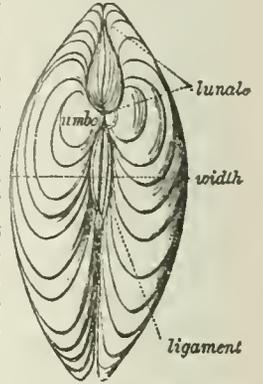

FIG. 125.—View of the two valves of the shell of *Cytherea* (one of the Sinupalliate *Isomya*), from the dorsal aspect.

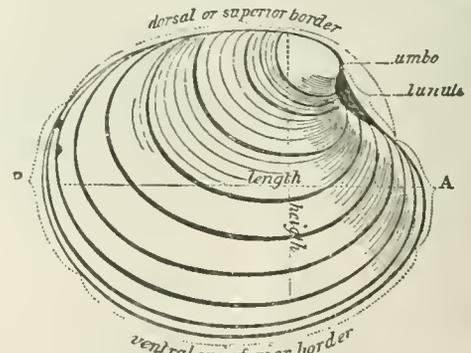

FIG. 126.—Right valve of the same shell from the outer face.

in *Heteromya* and *Isomya*. Amongst those Lamellibranchs which have only a posterior adductor (*Monomya*), it is remarkable that the oyster has been found (by Huxley) to possess, when the young shells and muscles first develop, a well-marked anterior adductor as well as a posterior one. Accordingly there is ground for supposing

that the *Monomya* have been developed from *Isomya*-like ancestors, and have lost by atrophy their anterior adductor. The single adductor muscle of the *Monomya* is separated by a difference of fibre into two portions, but neither of these can be regarded as possibly representing the anterior adductor of the other Lamellibranchs. One of these portions is more ligamentous, and serves to keep the two shells constantly attached to one another, whilst

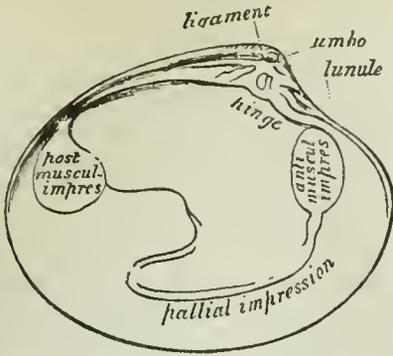

FIG. 127.—Left valve of the same shell from the inner face. (Figs. 125, 126, 127 from Owen.)

the more fleshy portion serves to close the shell rapidly when it has been gaping. In removing the valves of the shell from an *Anodon*, it is necessary not only to cut through the muscular attachments of the body-wall to the shell but to sever also a strong elastic ligament, or spring resembling india-rubber, joining the two shells about the umbonal area. The shell of *Anodon* does not present these parts in the most strongly marked condition, and accordingly our figures (figs. 125, 126, 127) represent the valves of the Sinupalliate genus *Cytherea*. The corresponding parts are recognizable in *Anodon*. Referring to the figures (125, 126) for an explanation of terms applicable to the parts of the valve and the markings on its inner surface—corresponding to the muscular area which we have already noted on the surface of the animal's body—we must specially note here the position of that denticulated thickening of the dorsal margin of the valve which is called the hinge (fig. 127). By this hinge one valve is closely fitted to the other. Below this hinge each shell becomes concave, above it each shell rises a little to form the umbo, and it is into this ridge-like upgrowth of each valve that the elastic ligament or spring is fixed (fig. 127). As shown in the diagram (fig. 127*)

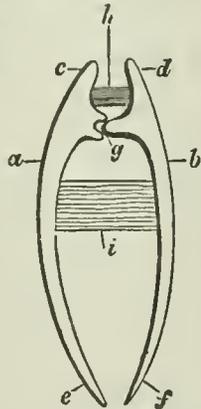

FIG. 127*.—Diagram of a section of a Lamellibranch's shells, ligament, and adductor muscle. a, b, right and left valves of the shell; c, d, the umbones or short arms of the lever; e, f, the long arms of the lever; g, the hinge; h, the ligament; i, the adductor muscle.

representing a transverse section of the two valves of a Lamellibranch, the two shells form a double lever, of which the toothed-hinged is the fulcrum. The adductor muscles placed in the concavity of the shells act upon the long arms of the lever at a mechanical advantage; their contraction keeps the shells shut, and stretches the ligament or spring *h*. On the other hand, the ligament *h* acts upon the short arm formed by the umbonal ridge of the shells; whenever the adductors relax, the elastic substance of the ligament contracts, and the shells gape. It is on this account that the valves of a dead Lamellibranch always gape; the elastic ligament is no longer counteracted by the effort of the adductors. The state of closure of the valves of the shell is not, therefore, one of rest; when it is at rest—that is, when there is no muscular effort—the valves of a Lamellibranch are slightly gaping, and are closed by the action of the adductors when the animal is disturbed. The ligament is simple in *Anodon*; in many Lamellibranchs it is separated into two layers, an outer and an inner (thicker and denser). That the condition

of gaping of the shell-valves is essential to the life of the Lamellibranch appears from the fact that food to nourish it, water to aerate its blood, and spermatozoa to fertilize its eggs, are all introduced into this gaping chamber by currents of water, which are set going by the highly-developed ctenidia. The current of water enters into the sub-pallial space at the spot marked *e* in fig. 124, (1), and, after passing as far forward as the mouth *w* in fig. 124, (5), takes an outward course and leaves the sub-pallial space by the upper notch *d*. These notches are known in *Anodon* as the afferent and efferent siphonal notches respectively, and correspond to the long tube-like afferent inferior and efferent superior "siphons" formed by the mantle in many other Lamellibranchs (fig. 130).

Whilst the valves of the shell are equal in *Anodon* we find in many Lamellibranchs (*Ostræa*, *Chama*, *Corbula*, &c.) one valve larger, and the other smaller and sometimes flat, whilst the larger shell may be fixed to rock or to stones (*Ostræa*, &c.). A further variation consists in the development of additional shelly plates upon the dorsal line between the two large valves (*Pholadidæ*). In *Pholas dactylus* we find a pair of umbonal plates, a dors-umbonal plate and a dorsal plate. It is to be remembered that the whole of the cuticular hard product produced on the dorsal surface and on the mantle-flaps is to be regarded as the "shell," of which a median band-like area, the ligament, usually remains uncalcified, so as to result in the production of two valves united by the elastic ligament. But the shelly substance does not always in boring forms adhere to this form after its first growth. In *Aspergillum* the whole of the tubular

FIG. 128.

FIG. 128.—Shell of *Aspergillum vaginiferum* (from Owen). FIG. 129.—Shell of *Aspergillum vaginiferum* to show the original valve *a*, now embedded in a continuous calcification of tubular form (from Owen).

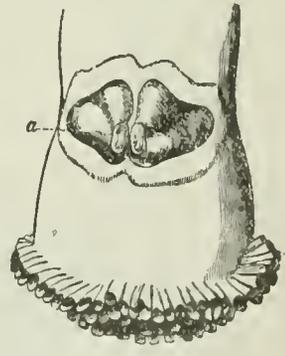

FIG. 129.

mantle area secretes a continuous shelly tube, although in the young condition two valves were present. These are seen (fig. 129) set in the firm substance of the adult tubular shell, which has even replaced the ligament, so that the tube is complete. In *Teredo* a similar tube is formed as the animal elongates (boring in wood), the original shell-valves not adhering to it but remaining movable and provided with a special muscular apparatus in place of a ligament. Let us now examine the organs which lie beneath the mantle-skirt of *Anodon*, and are bathed by the current of water which cir-

culates through it. This can be done by lifting up and throwing back the left half of the mantle-skirt as is represented in fig. 124, (3). We thus expose the plough-like foot (*f*), the two left labial tentacles, and the two left gill-plates or left ctenidium. In fig. 124, (5), one of the labial tentacles *a* is also thrown back so as to show

the mouth *w*, and the two left gill-plates are reflected so as to show the gill-plates of the right side (*rr*, *rq*) projecting behind the foot, the inner or median plate of each side being united by concrescence to its fellow of the opposite side along a continuous line (*aa*). The left inner gill-plate is also snipped so as to show the subjacent orifices of the left nephridium *x*, and of the genital gland (testis or ovary) *y*. The foot thus exposed in Anodon is a simple muscular tongue-like organ. It can be protruded between the flaps of the mantle (fig. 124, (1), (2)) so as to issue from the shell, and by its action the Anodon can slowly crawl, or burrow in soft mud or sand. It has been supposed that water is taken into the blood-vessels of the Anodon through pores in the foot, and in spite of opposition this view is still maintained (Griesbach, 47). In fig. 124, (2) the letters *ab*, *ac*, *ad*, point to three pit-like depressions, supposed by Griesbach to be pores leading into the blood-system. According to Carrière (48) these pits are nothing but irregularities of the surface; in some cases they are the entrances to ramified glands. Other Lamellibranchs may have a larger foot relatively than has Anodon. In *Arca* it has a sole-like surface. In *Arca* too and many others it carries a byssus-forming gland and a byssus-cementing gland. In the Cockles, in *Cardium*, and in *Trigonia*, it is capable of a sudden stroke, which causes the animal to jump when out of the water, in the latter

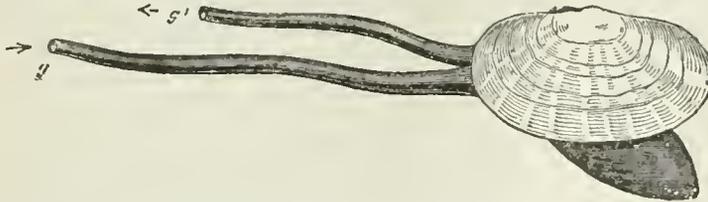

FIG. 130.—*Psammobla florida*, right side, showing expanded foot *e*, and *g* incurrent and *g'* excurrent siphons (from Owen).

genus to a height of four feet. In *Mytilus* the foot is reduced to little more than a tubercle carrying the apertures of these glands. In the *Oyster* it is absent altogether.

The labial tentacles of *Anodon* (*n*, *o* in fig. 124, (3), (5)) are highly vascular flat processes richly supplied with nerves. The left anterior tentacle (seen in the figure) is joined at its base in front of the mouth (*w*) to the right anterior tentacle, and similarly the left (*o*) and right posterior tentacles are joined behind the mouth. Those of *Arca* (*l*, *k* in fig. 132) show this relation to the mouth (*a*). These organs are characteristic of all Lamellibranchs; they do not vary except in size, being sometimes drawn out to streamer-like dimensions. Their appearance and position suggest that they are in some way related morphologically to the gill-plates, the anterior labial tentacle being a continuation of the outer gill-plate,

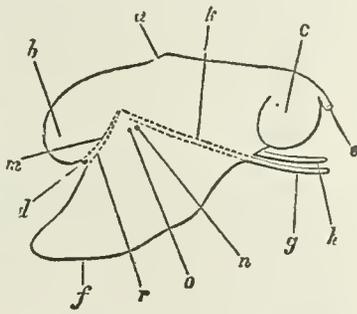

FIG. 131.—Diagram of a view from the left side of the animal of *Anodonta cygnea*, from which the mantle-skirt, the labial tentacles, and the gill-filaments have been entirely removed so as to show the relations of the axis of the gill-plumes or ctenidia *g*, *h*. *a*, centro-dorsal area; *b*, anterior adductor muscle; *c*, posterior adductor muscle; *d*, mouth; *e*, anus; *f*, foot; *g*, free portion of the axis of left ctenidium; *h*, axis of right ctenidium; *i*, portion of the axis of the left ctenidium which is fused with the base of the foot, the two dotted lines indicating the origins of the two rows of gill-filaments; *m*, line of origin of the anterior labial tentacle; *n*, nephridial aperture; *o*, genital aperture; *r*, line of origin of the posterior labial tentacle. (Original.)

and the posterior a continuation of the inner gill-plate. There is no embryological evidence to support this suggested connexion, and, as will appear immediately, the history of the gill-plates in various forms of Lamellibranchs does not directly favour it. Yet it is very probable that the labial tentacles and gill-plates are modifications of a double horseshoe-shaped area of ciliated filamentous processes which existed in ancestral Mollusca such as in *Phoronis* and the *Polyzoa*, and is to be compared with the continuous præ- and post-oral ciliated band of the Echinid larva *Pluteus* and of *Tornaria* (49).

The gill-plates have a structure very different from that of the labial tentacles, and one which in *Anodon* is singularly complicated as compared with the condition presented by these organs in some other Lamellibranchs, and with what must have been their original condition in the ancestors of the whole series of living Lamellibranchia. The phenomenon of "concrescence" which we have already had to note as showing itself so importantly in regard to the free edges of the mantle-skirt and the formation of the siphons, is what, above all things, has complicated the structure of the Lamellibranch ctenidium. Our present knowledge of the interesting series of modifications through which the Lamellibranch gill-plates have developed to their most complicated form is due to R. Holman Peck (50) and to Mitsukuri (51). The Molluscan ctenidium is typically, as shown in fig. 2, a plume-like structure, consisting of a vascular axis, on each side of which is set a row of numerous lamelliform or filamentous processes. These processes are hollow, and receive the venous blood from, and return it again aerated into, the hollow axis, in which an afferent and an efferent blood-vessel may be differentiated. In the genus *Nucula* (fig. 134), one of the Arcacea, we have an example of a Lamellibranch retaining this plume-like form of gill-

In other Arcacea (*e.g.*, *Arca* and *Pectunculus*) the lateral processes which are set on the axis of the ctenidium are not lamellæ, but are slightly-flattened, very long tubes or hollow filaments. These filaments are so fine and are set so closely together that they appear to form a continuous membrane until examined with a lens. The microscope shows that the neighbouring filaments are held together by patches of cilia, called "ciliated junctions," which interlock with one another just as two brushes may be made to do. In fig. 133, A a portion of four filaments of a ctenidium of the Sea-Mussel (*Mytilus*) is represented, having precisely the same structure as those of *Arca*. The filaments of the gill (ctenidium) of *Mytilus* and *Arca* thus form two closely set rows which depend from the axis of the gill like two parallel plates. Further, their structure is profoundly modified by the curious condition of the free ends of the depending filaments. These are actually reflected at a sharp angle—

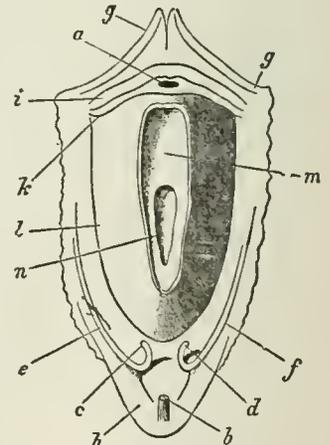

FIG. 132.—View from the ventral (pedal) aspect of the animal of *Arca Noe*, the mantle-flap and gill-filaments having been cut away. *a*, mouth; *b*, anus; *c*, free spirally turned extremity of the gill-axis or ctenidial axis of the right side; *d*, do. of the left side; *e*, *f*, anterior portions of these axes fused by concrescence to the wall of the body; *g*, anterior adductor muscle; *h*, posterior adductor; *i*, anterior labial tentacle; *k*, posterior labial tentacle; *l*, base line of the foot; *m*, sole of the foot; *n*, callosity. (Original.)

doubled on themselves in fact—and thus form an additional row of filaments (see fig. 133, B). Consequently, each primitive filament has a descending and an ascending ramus, and instead of each row forming a simple plate, the plate is double, consisting of a descending and an ascending lamella. As the axis of the ctenidium lies by the side of the body, and is very frequently connate with the body, as so often happens in Gastropods also, we find it convenient to speak of the two plate-like structures formed on each ctenidial axis as the outer and the inner gill-plate; each of these is

in the trellis-work formed by the united gill-filaments (fig. 138, A, B). The larger the intra-lamellar spongy

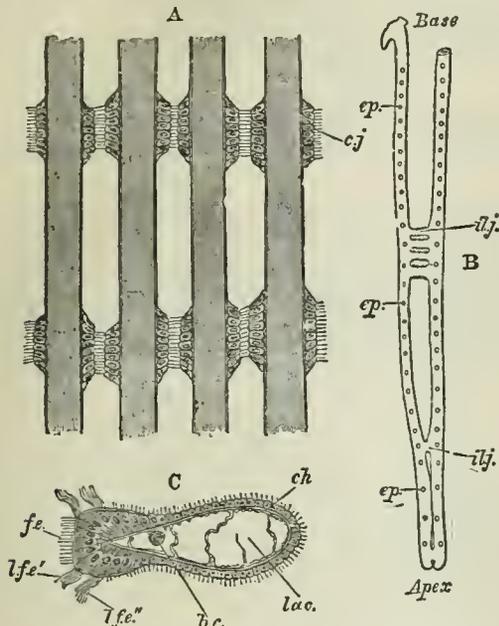

FIG. 133.—Filaments of the ctenidium of *Mytilus edulis* (after Holmen Peck). A. Part of four filaments seen from the outer face in order to show the ciliated junctions *c.j.* B. Diagram of the posterior face of a single complete filament with descending ramus and ascending ramus ending in a hook-like process. *cp.*, *cp.*, the ciliated junctions; *il.j.*, inter-lamellar junction. C. Transverse section of a filament taken so as to cut neither a ciliated junction nor an inter-lamellar junction. *fe.*, frontal epithelium; *lfe.*, *lfe.*, the two rows of latero-frontal epithelial cells with long cilia; *ch.*, chitinous tubular lining of the filament; *lac.*, blood lacuna traversed by a few processes of connective tissue cells; *b.c.*, blood-corpuscle.

composed of two lamellæ, an outer (the reflected) and an adaxial in the case of the outer gill-plate, and an adaxial and an inner (the reflected) in the case of the inner gill-plate. This is the condition seen in *Arca* and *Mytilus*, the so-called plates dividing upon the slightest touch into their constituent filaments, which are but loosely conjoined by their "ciliated junctions." Complications follow upon this in other forms. Even in *Mytilus* and *Arca* a connexion is here and there formed between the ascending and descending rami of a filament by hollow extensible outgrowths called "interlamellar junctions" (*il.j.* in B, fig. 133). Nevertheless the filament is a complete tube formed of chitinous substance and clothed externally by ciliated epithelium, internally by endothelium and lacunar tissue—a form of connective tissue—as shown in fig. 133, C. Now let us suppose, as happens in the genus *Dreissena*—a genus not far removed from *Mytilus*—that the ciliated inter-filamentar junctions (fig. 136) give place to solid permanent inter-filamentar junctions, so that the filaments are converted, as it were, into a trellis-work. Then let us suppose that the inter-lamellar junctions which we have already noted in *Mytilus* become very numerous, large, and irregular; by them the two trellis-works of filaments would be united so as to leave only a sponge-like set of spaces between them. Within the trabeculæ of the sponge-work blood circulates, and between the trabeculæ the water passes, having entered by the apertures left

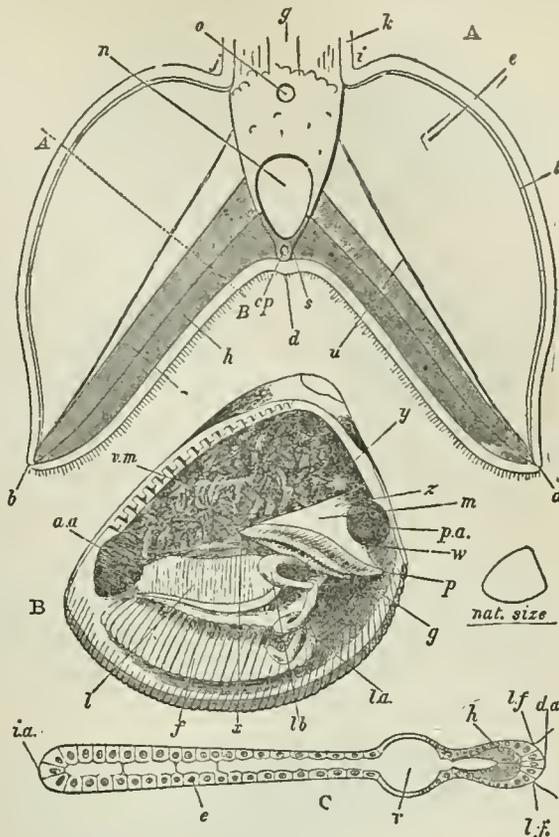

FIG. 134.—Structure of the ctenidia of *Nacula* (after Mitsukurii); see also fig. 2. A. growth becomes, the more do the original gill-filaments lose the character of blood-holding tubes and tend to become dense elastic rods for the simple purpose of supporting the spongy growth. This is seen both in the section of *Dreissena* gill (fig. 136) and in those of *Anodon* (fig. 137, A, B, C). In the drawing of *Dreissena* the individual filaments *f.*, *f.*, *f.* are cut across in one lamella at the horizon of an inter-filamentar junction, in the other (lower in the figure) at a point where they are free. The chitinous substance *ch.* is observed to be greatly thickened as compared with what it is in fig. 133, C, tending in fact to obliterate altogether the lumen of the filament. And in *Anodon* (fig. 137, C) this obliteration is effected. In *Anodon*, besides being thickened, the skeletal substance of the filament develops a specially dense rod like body on each side of each filament. Although the structure of the ctenidium is thus highly complicated in *Anodon*, it is yet more so in some of the Siphonate genera of Lamellibranchs. The filaments take on a secondary grouping, the surface of the lamella being thrown into a series of half-cylindrical ridges, each consisting of ten or twenty filaments; a filament

of much greater strength and thickness than the others may be placed between each pair of groups. In *Anodon*, as in

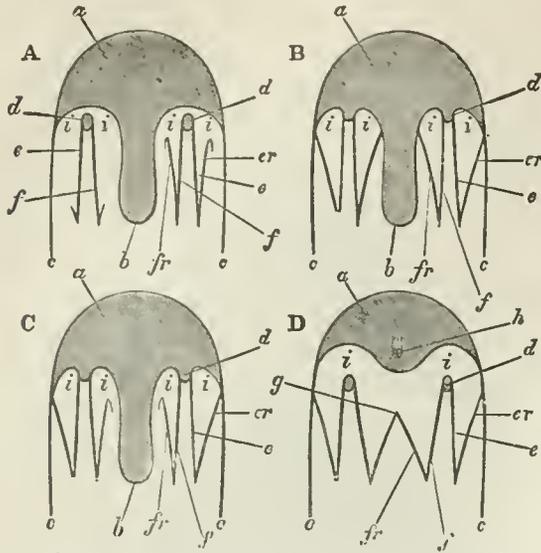

FIG. 135.—Diagrams of transverse sections of a Lamellibranch to show the adhesion, by concrescence, of the gill-lamellae to the mantle-laps, to the foot, and to one another. (Original.)

many other Lamellibranchs, the ova and hatched embryos are carried for a time in the ctenidia or gill apparatus, and in this particular case the space between the two lamellae

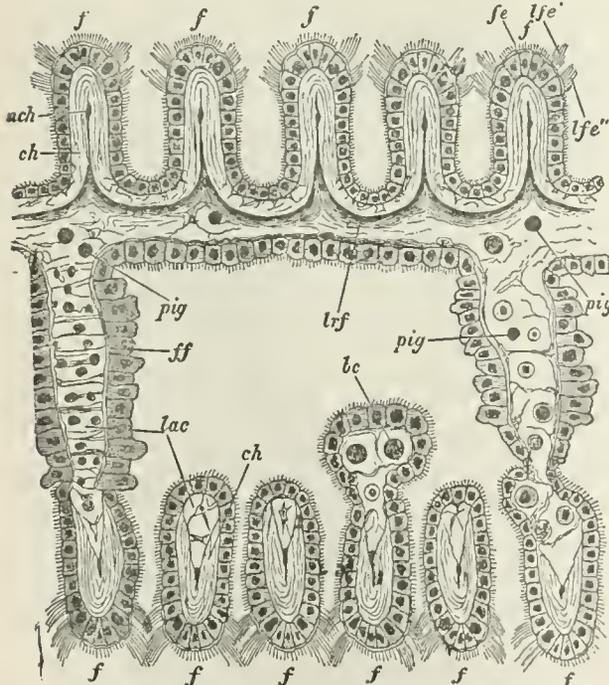

FIG. 136.—Transverse section of the outer gill-plate of *Dretssena polymorpha* (after Holman Peck). f, constituent gill-filaments; ff, fibrous sub-epidermic tissue; ch, chitinous substance of the filaments; ach, cells related to the chitinous substance; lac, lacunar tissue; pig, pigment-cells; bc, blood-corpuses; fe, frontal epithelium; lfe, lfe', two rows of latero-frontal epithelial cells with long cilia; lfe'', fibrous, possibly muscular, substance of the inter-filamentar junctions.

of the outer gill-plate is that which serves to receive the ova (fig. 137, A). The young are nourished by a substance

formed by the cells which cover the spongy inter-lamellar outgrowths.

There are certain other points in the modification of the typical ctenidium which must be noted in order to understand the ctenidium of *Anodon*. The axis of each ctenidium, right and left, starts from a point well forward near the labial tentacles, but it is at first only a ridge, and does not project as a free cylindrical axis until the back part of

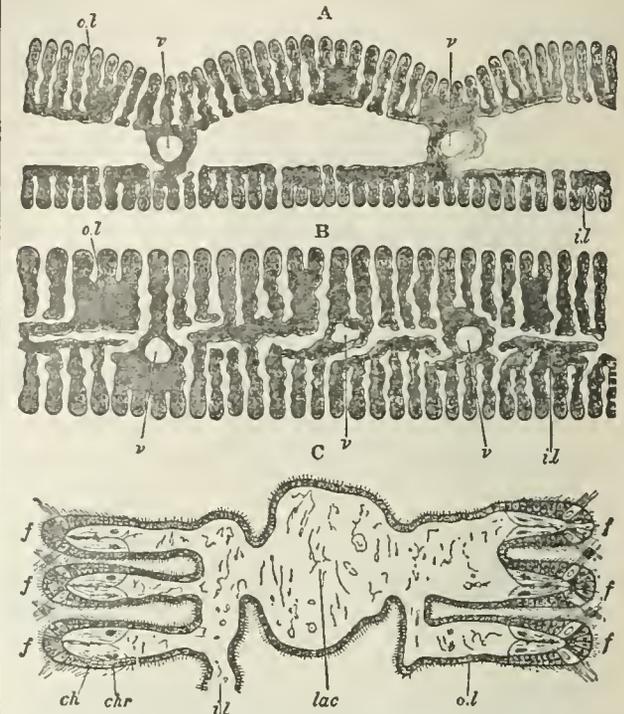

FIG. 137.—Transverse sections of gill-plates of *Anodon* (after Peck). A. Outer gill-plate. B. Inner gill-plate. C. the foot is reached. This is difficult to see at all in *Anodon*, but if the mantle-skirt be entirely cleared away, and if the dependent lamellae which spring from the ctenidial axis be carefully cropped away so as to leave the axis itself intact, we obtain the form shown in fig. 131, where g and h are respectively the left and the right ctenidial axes projecting freely beyond the body. In *Arca* this can be seen with far less trouble, for the filaments are more easily removed than are the consolidated lamellae formed by the filaments of *Anodon*, and in *Arca* the free axes of the ctenidia are large and firm in texture (fig. 132, c, d).

If we were to make a vertical section across the long axis of a Lamellibranch which had the axis of its ctenidium free from its origin onwards, we should find such relations as are shown in the diagram fig. 135, A. The gill axis d is seen lying in the sub-pallial chamber between the foot b and the mantle c. From it depend the gill-filaments or lamellae—formed by united filaments—drawn as black lines f. On the left side these lamellae are represented as having only a small reflected growth, on the right side the reflected ramus or lamella is complete (fr and er). The actual condition in *Anodon* at the region where the gills commence anteriorly is shown in fig. 135, B. The axis of the ctenidium is seen to be adherent to, or fused by concrescence with, the body-wall, and moreover on each side the outer lamella of the outer gill-plate is fused to the mantle, whilst the inner lamella of the inner gill-plate is fused to the foot. If we pass a little backwards and take another section nearer the hinder margin of the foot, we

get the arrangement shown diagrammatically in fig. 135, C, and more correctly in fig. 142. In this region the inner lamellæ of the inner gill-plates are no longer affixed to the foot. Passing still further back behind the foot, we find

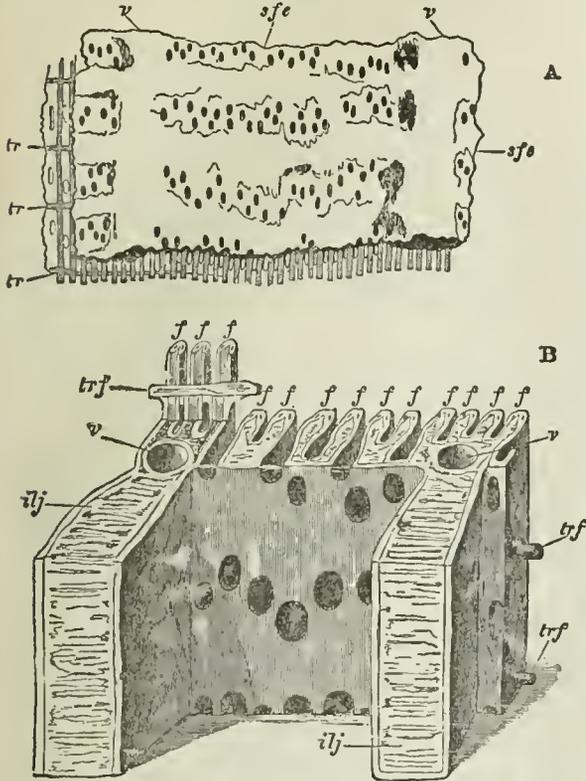

FIG. 138.—Gill-lamellæ of *Anodon* (after Peck). A. Fragment of the outer lamella of an inner gill-plate torn from the connected inner lamella, the sub-filamentar tissue also partly cut away round the edges so as to expose the filaments, their transverse junctions *tr*, and the "windows" left in the lattice-work; *sfc*, internal surface of the lamella; *v*, vessel. B. Diagram of a block cut from the outer lamella of the outer gill-plate and seen from the inter-lamellar surface (after Peck). *f*, constituent filaments; *trf*, fibrous tissue of the transverse inter-filamentar junctions; *v*, blood-vessel; *ilj*, inter-lamellar junction. The series of oval holes on the back of the lamella are the water-pores which open between the filaments in irregular rows separated horizontally by the transverse inter-filamentar junctions.

in *Anodon* the condition shown in the section D, fig. 135. The axes *i* are now free; the outer lamellæ of the outer gill-plates (*er*) still adhere by concrescence to the mantle-skirt, whilst the inner lamellæ of the inner gill-plates meet

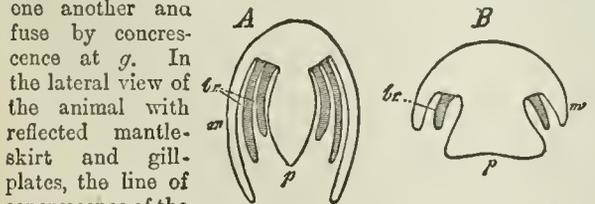

FIG. 139.—Transverse sections of A, a Lamellibranch, and B, an Isopleurous Gastropod (*Chiton*), to show the relations of *p*, the foot; *br*, the branchiæ; and *m*, the mantle. (From Gegenbaur.)

one another and fuse by concrescence at *g*. In the lateral view of the animal with reflected mantle-skirt and gill-plates, the line of concrescence of the inner lamellæ of the inner gill-plates is readily seen; it is marked *aa* in fig. 124, (5). In the same figure the free part of the inner lamella of the inner gill-plate resting on the foot is marked *z*, whilst the attached part—the most anterior—has been snipped with scissors so as to show the genital and nephridial apertures *x* and *y*. The concrescence, then, of the free edge of the reflected lamellæ of the gill-plates of *Anodon* is very extensive. It is important, because such a concrescence is by no means universal, and does not occur, for example, in *Mytilus* or in *Arca*; further, because

when its occurrence is once appreciated, the reduction of the gill-plates of *Anodon* to the plume-type of the simplest ctenidium presents no difficulty; and, lastly, it has importance in reference to its physiological significance. The mechanical result of the concrescence of the outer lamellæ to the mantle-flap, and of the inner lamellæ to one another as shown in section D, fig. 135, is that the sub-pallial space is divided into two spaces by a horizontal sep-

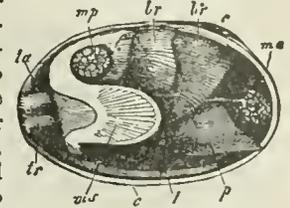

FIG. 140.—Lateral view of a *Mactra*, the right valve of the shell and the right mantle-flap removed, and the siphons retracted. *br*, *br'*, outer and inner gill-plates; *ta*, labial tentacle; *ta*, *tr*, upper and lower siphons; *ms*, siphonal muscle of the mantle-flap; *ma*, anterior adductor muscle; *mp*, posterior adductor muscle; *p*, foot; *c*, umbo. (From Gegenbaur.)

lower siphonal notch (*e* in fig. 124). The only communication between the two spaces, excepting through the trellis-work of the gill-plates, is by the slit (*z* in fig. 124, (5)) left by the non-concrescence of a part of the inner lamella *ci* of the inner gill-plate with the foot. A probe (*g*) is introduced through this slit-like passage, and it is seen to pass out by the excurrent siphonal notch. It is through this passage, or indirectly through the pores of the gill-plates, that the water introduced into the lower sub-pallial space must pass on its way to the excurrent siphonal notch. Such a subdivision of the pallial chamber, and direction of the

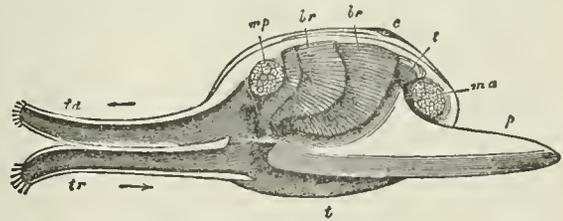

FIG. 141.—The same animal as fig. 140, with its foot and siphons expanded. Letters as in fig. 140. (From Gegenbaur.)

currents set up within it do not exist in a number of Lamellibranchs which have the gill-lamellæ comparatively free (*Mytilus*, *Arca*, *Trigonia*, &c.), and it is in these forms that there is least modification by concrescence of the primary filamentous elements of the lamellæ. Probably the gill-structure of Lamellibranchs will ultimately furnish some classificatory characters of value when they have been thoroughly investigated throughout the class.

The alimentary canal of *Anodon* is shown in fig. 124, (4). The mouth is placed between the anterior adductor and the foot; the anus opens on a median papilla overlying the posterior adductor, and discharges into the superior pallial chamber along which the excurrent stream passes. The coil of the intestine in *Anodon* is similar to that of other Lamellibranchs, but the crystalline style and its diverticulum are not present here. The rectum traverses the pericardium, and has the ventricle of the heart wrapped, as it were, around it. This is not an unusual arrangement in Lamellibranchs, and a similar disposition occurs in some Gastropoda (*Haliotis*). A pair of ducts (*ax*) lead from the first enlargement of the alimentary tract called stomach into a pair of large digestive glands, the so-called liver, the branches of which are closely packed in this region (*ax*). The food of the *Anodon*, as of other Lamellibranchs, consists of microscopic animal and vegetable organisms, which are brought to the mouth by the stream which sets into the sub-pallial chamber at the lower siphonal notch *e* in fig. 124). Probably a straining of water from solid

particles is effected by the lattice-work of the ctenidia or gill-plates.

The heart of *Anodon* consists of a median ventricle embracing the rectum (fig. 143, A), and giving off an anterior and a posterior artery, and of two auricles which open into the ventricle by orifices protected by valves.

The blood is colourless, and has colourless amœboid corpuscles floating in it. In two Lamellibranchs, *Solen* (*Ceratisolen*) *legumen* and *Arca Noë*, the blood is crimson, owing to the presence of corpuscles impregnated with hæmoglobin (Lankester, 31). In *Anodon* the blood is driven by the ventricle through the arteries into vessel-like spaces, which soon become irregular lacunæ surrounding the viscera, but in parts—*e.g.*, the labial tentacles and walls of the gut—very fine vessels with endothelial cell-lining are found. The blood makes its way by large veins to a venous sinus which lies in the middle line below the heart, having the paired renal organs (nephridia) placed between it and that organ. Hence it passes through the vessels of the glandular walls of the nephridia right and left into the gill-lamellæ, whence it returns through many openings into the widely-stretched auricles. A great deal more precision has been given to accounts of the structure of arteries, veins, and capillaries in *Anodon* than the facts warrant. The course of the blood-stream can only be somewhat vaguely inferred except in its largest, out-lines. Distinct arterial and venous channels cannot be distinguished in the gill-lamellæ, in spite of what Langer (52) has written on the subject, though it is highly probable that there is some kind of circulation in the gills. In the filaments of the gill of *Mytilus* the tubular cavity is divided

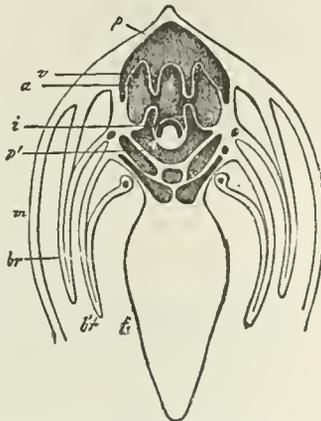

FIG. 142.—Vertical section through an *Anodonta*, about the mid-region of the foot. *m*, mantle-flap; *br*, outer, *br'*, inner gill-plate—each composed of two lamellæ; *f*, foot; *v*, ventricle of the heart; *a*, auricle; *p*, *p'*, pericardial cavity; *i*, intestine.

by a more or less complete fibrous septum into two chambers, presumably for an ascending and a descending blood-current. The ventricle and auricles of *Anodon* lie in a pericardium which is clothed with a pavement endothelium (*d*, fig. 143). Veins are said by Keber and others to open anteriorly into it, but this appears to be an error. It does not contain blood or communicate directly with the blood-system; this isolation of the pericardium we have noted already in Gastropods and Cephalopods. A good case for the examination of the question as to whether blood enters the pericardium of Lamellibranchs, or escapes from the foot, or by the renal organs when the animal suddenly contracts, is furnished by the *Solen legumen*, which has red blood-corpuscles. According to observations made by Penrose (53) on an uninjured *Solen legumen*, no red corpuscles are to be seen in the pericardial space, although the heart is filled with them, and no such corpuscles are ever discharged by the animal when it is irritated.

The pair of nephridia of *Anodon*, called in Lamellibranchs the organ of Bojanus, lie below the membranous floor of the pericardium, and open into it by two well-marked apertures (*e* and *f* in fig. 143). Each nephridium, after being bent upon itself as shown in the fig. 143, C, D, opens to the exterior by a pore placed at the point marked *x* in fig. 124, (5), (6). It is no doubt possible, as in the

Gastropoda and Cephalopoda, for water to enter from the exterior by the nephridia into the pericardium, but that it ever does so is as yet not proved. What is certain from the set of the ciliary currents is that liquid generally

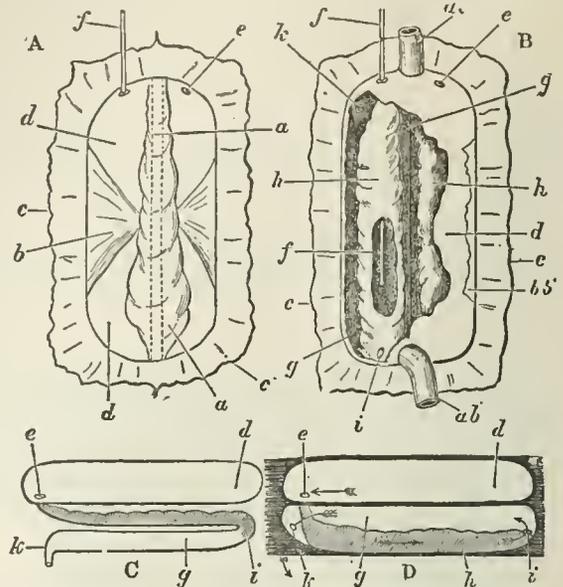

FIG. 143.—Diagrams showing the relations of pericardium and nephridia in a Lamellibranch such as *Anodon*. A. Pericardium opened dorsally so as to expose the heart and the floor of the pericardial chamber *d*. B. Heart removed and floor of the pericardium cut away on the left side so as to open the non-glandular sac of the nephridium; exposing the glandular sac *b*, which is also cut into so as to show the probe *f*. C. Ideal pericardium and nephridium viewed laterally. D. Lateral view showing the actual relation of the glandular and non-glandular sacs of the nephridium. The arrows indicate the course of fluid from the pericardium outwards. *a*, ventricle of the heart; *b*, auricle; *bb'*, cut remnant of the auricle; *c*, dorsal wall of the pericardium cut and reflected; *e*, reno-pericardial orifice; *f*, probe introduced into the left reno-pericardial orifice; *g*, non-glandular sac of the left nephridium; *h*, glandular sac of the left nephridium; *i*, pore leading from the glandular into the non-glandular sac of the left nephridium; *k*, pore leading from the non-glandular sac to the exterior; *ac*, anterior, *ab*, posterior, cut remnants of the intestine and ventricle.

passes out of the pericardium by the nephridia. One half of each nephridium is of a dark-green colour and glandular (*h* in fig. 143). This opens into the reflected portion which overlies it as shown in the diagram fig. 143, D, *i*; the latter has non-glandular walls, and opens by the pore *k* to the exterior. The nephridia may be more ramified in other Lamellibranchs than they are in *Anodon*. In some they are difficult to discover. That of the common oyster has recently (1882) been detected by Hoek (54). Each nephridium in the oyster is a pyriform sac, which communicates by a narrow canal with the urino-genital groove placed to the front of the great adductor muscle; by a second narrow canal it communicates with the pericardium. From all parts of the pyriform sac narrow stalk-like tubes are given off, ending in abundant widely-spread branching glandular cæca, which form the essential renal secreting apparatus. The genital duct opens by a pore into the urino-genital groove of the oyster (the same arrangement being repeated on each side of the body) close to but distinct from the aperture of the nephridial canal. Hence, except for the formation of a urino-genital groove, the apertures are placed as they are in *Anodon*. Previously to Hoek's discovery a brown-coloured investment of the auricles of the heart of the oyster had been supposed to represent the nephridia in a rudimentary state. This investment, which occurs also in *Mytilus* but not in *Anodon*, may possibly consist of secreting cells, and may be comparable to the pericardial accessory glandular growths of Cephalopoda.

Nervous System and Sense-organs.—In *Anodon* there are three well-developed pairs of nerve-ganglia (fig. 144, B and fig. 124, (6)). An anterior pair lying one on each side of the

mouth (fig. 144, B, a) and connected in front of it by a commissure, are the representatives of the cerebral, pleural, and visceral ganglia of the typical Mollusc, which are not here differentiated as they are in Gastropods (compare, however, fig. 67). A pair placed close together in the foot (fig. 144, B, b, and fig. 124, (6), ax) are the typical pedal ganglia; they are joined to the cerebro-pleuro-visceral ganglia by connectives.

Posteriorly beneath the posterior adductors, and covered only by a thin layer of elongated epidermal cells, are the olfactory ganglia, their epidermal clothing constituting the pair of osphradia, which are thus seen in Lamellibranchs to occupy their typical position and to have the typical innervation,—the nerve to each osphradium being given off by the visceral ganglion—that is to say, by the undifferentiated cerebro-pleuro-visceral ganglion of its proper side. This identification of the posterior ganglion-pair of Lamellibranchs is due to Spengel (11). Other

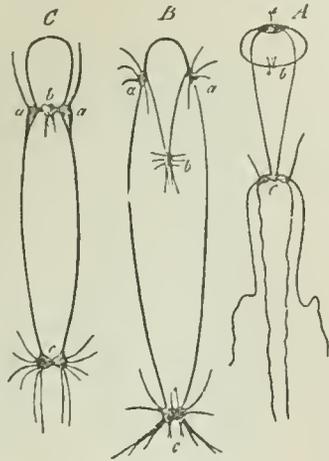

FIG. 144.—Nerve-ganglia and cords of three Lamellibranchs (from Gegenbaur): A, of *Teredo*; B, of *Anodonta*; C, of *Pecten*. σ , cerebral ganglion-pair (=cerebro-pleuro-visceral); b, pedal ganglion-pair; c, olfactory (osphradial) ganglion-pair.

and very frequently some of these tentacles have undergone a special metamorphosis converting them into highly-organized eyes. Such eyes on the mantle-edge are found in *Pecten*, *Spondylus*, *Lima*, *Ostrea* (?), *Pinna*; *Pectunculus*, *Modiola*, *Mytilus* (?), *Cardium*, *Tellina*, *Maetra*, *Venus*, *Solen*, *Pholas*, and *Galeomma*. They are totally distinct from the cephalic eyes of typical Mollusca, and have a different structure and historical development. They have not originated as pits but as tentacles. They agree with the dorsal eyes of *Onchidium* (*Pulmonata*) in the curious fact that the optic nerve penetrates the capsule of the eye and passes in front of the retinal body (fig. 145), so that its fibres join the anterior faces of the nerve-end cells as in Vertebrates, instead of their posterior faces as in the cephalic eyes of Mollusca and Arthropoda; moreover, the lens is not a cuticular product but a cellular structure, which, again, is a feature of agreement with the Vertebrate eye. It must, however, be distinctly borne in mind that there is a fundamental difference between the eye of Vertebrates and of all other groups in the fact that in the Vertebrata the retinal body is itself a part of the central nervous system, and not a separate modification of the epidermis—myelonic as opposed to epidermic. The structure of the reputed eyes of several of the above-named genera has not been carefully examined. In *Pecten* and *Spondylus*, however, they have been fully studied (see fig. 145, and explanation).

The gonads of *Anodon* are placed in distinct male and female individuals. In some Lamellibranchs—for instance, the European Oyster and the *Pisidium pusillum*—the sexes are united in the same individual; but here, as in most hermaphrodite animals, the two sexual elements are not ripe in the same individual at the same moment. It has been conclusively shown that the *Ostrea edulis* does not fertilize itself. The American Oyster (*O. virginiana*) and the Portuguese Oyster (*O. angulata*) have the sexes separate, and fertilization is effected in the open water after the discharge of the ova and the spermatozoa from the females and males respectively. In the *Ostrea edulis* fertilization of the eggs is effected at the moment of their escape from the uro-genital groove, or even before, by means of spermatozoa drawn into the sub-pallial chamber by the in-current ciliary stream, and the embryos pass through the early stages of development whilst entangled between the gill-lamellæ of the female parent (fig. 6). In *Anodon* the eggs pass into the space between the two lamellæ of the outer gill-plate, and are there fertilized, and advance whilst

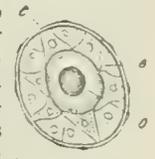

FIG. 146.—Otocyst of *Cyclas* (from Gegenbaur). c, capsule; e, ciliated cells lining the same; o, otolith.

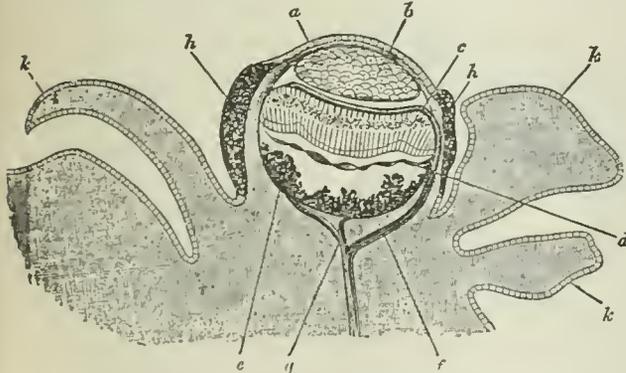

FIG. 145.—Pallial eye of *Spondylus* (from Hickson). a, pra-corneal epithelium; b, cellular lens; c, retinal body; d, tapetum; e, pigment; f, retinal nerve; g, complementary nerve; h, epithelial cells filled with pigment; k, tentacle.

anatomists have considered this ganglion-pair as corresponding to either the pleural or the visceral of Gastropoda, or to both, and very usually it is termed "the parieto-splanchnic" (Huxley).

The sense-organs of *Anodon* other than the osphradia consist of a pair of otocysts attached to the pedal ganglia (fig. 124, (6), ay). The otocysts of *Cyclas* are peculiarly favourable for study on account of the transparency of the small foot in which they lie, and may be taken as typical of those of Lamellibranchs generally. The structure of one is exhibited in fig. 146. A single otolith is present as in the veliger embryos of Opisthobranchia. In adult Gastropoda there are frequently a large number of rod-like otoliths instead of one.

Anodon has no eyes of any sort, and the tentacles on the mantle edge are limited to its posterior border. This deficiency is very usual in the class; at the same time, many Lamellibranchs have tentacles on the edge of the mantle supplied by a pair of large well-developed nerves, which are given off from the cerebro-pleuro-visceral ganglion-pair,

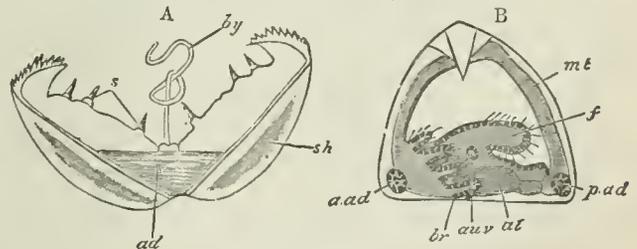

FIG. 147.—Two stages in the development of *Anodonta* (from Balfour). Both figures represent the glochidium stage. A, when free swimming, shows the two dentigerous valves widely open. B, a later stage, after fixture to the fin of a fish. sh, shell; ad, adductor muscle; s, teeth of the shell; by, byssus; a.ad, anterior adductor; p.ad, posterior adductor; mt, mantle-flap; f, foot; br, branchial filaments; au.v, otocyst; al, alimentary canal.

still in this position to the glochidium phase of development (fig. 147). They may be found here in thousands in the summer and autumn months. The gonads themselves are extremely simple arborescent glands which open to the exterior by two simple ducts, one right and one

left, continuous with the wall of the tubular branches of the gland (fig. 124, (5), (6), *y*). In no Lamellibranch is there a divergence from this structure, excepting that in some (*Ostrea*) the contiguous nephridial and the genital aperture are sunk in a urino-genital groove, which in other cases (*Spondylus*?) may partially close up so as to constitute a single pore for the nephridial and genital ducts. No accessory genital glands are present.

The development of *Anodon* is remarkable for the curious larval form known as *Glochidium* (fig. 147). The *Glochidium*

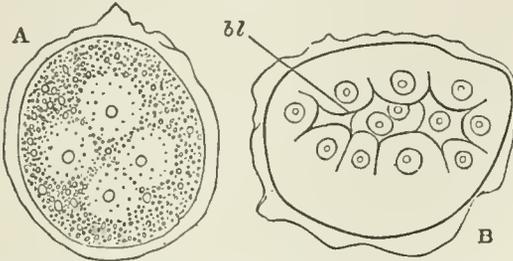

Fig. 148.—Embryos of *Pisidium pusillum* (after Lankester). A. Only four embryonic cells are present, still enclosed in the egg envelope. B. The cells have multiplied and commenced to invaginate, forming a blastopore or orifice of invagination, *bl*.

quits the gill-pouch of its parent and swims by alternate opening and shutting of the valves of its shell, as do adult *Pecten* and *Lima*, trailing at the same time a long

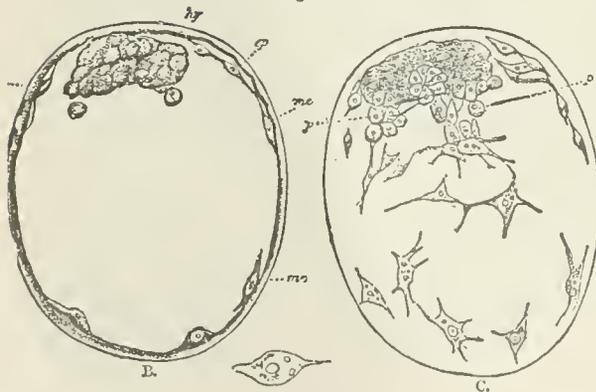

Fig. 150.

Fig. 149.—Embryo of *Pisidium pusillum* in the diblastula stage, surface view (after Lankester). The embryo has increased in size by accumulation of liquid between the outer and the invaginated cells. The blastopore has closed.

Fig. 150.—B. Same embryo as fig. 149, in optical median section, showing the invaginated cells *hy* which form the arch-enteron, and the mesoblastic cells *me* which are budded off from the surface of the mass *hy*, and apply themselves to the inner surface of the deric or epiblastic cell-layer *ep*. C. The same embryo focused so as to show the mesoblastic cells which immediately underlie the outer cell-layer.

byssus thread. By this it is brought into contact with the fin of a fish, such as *Perch*, *Stickleback*, or others, and effects

a hold thereon by means of the toothed edge of its shells. Here it becomes encysted, and is nourished by the excretions of the fish. A distinct development of its internal organs has been traced by the late Professor Balfour, but no one has followed it to the moment at which it drops from the fish's fin and assumes the form of shell characteristic of the parent. Other Lamellibranchs exhibit either a trochophore larva which becomes a *Veliger*, differing only from the *Gastropod's* and *Pteropod's Veliger* in having bilateral shell-calcifications instead of a single central one; or, like *Anodon*, they may develop within the gill-plates of the mother, though without presenting such a specialized larva as the *Glochidium*. An example of the former is seen in the

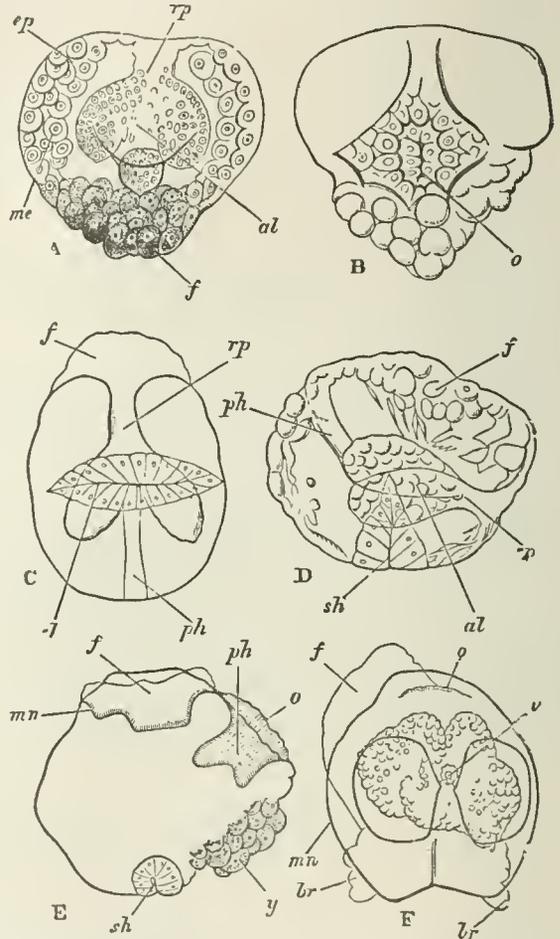

Fig. 151.—Further stages in the development of *Pisidium pusillum* (after Lankester). A. Optical section of an embryo in which the foot has begun to develop. B. The same embryo focused to its surface plane to show the mouth *o*. C. Later embryo, showing the shell-gland *sh*. D. Lateral view of the same embryo. E. Later stage, with rudiments of the mantle-flap, lateral view. F. Still later stage, with shell-valves and branchial filaments. *ep*, epiblast; *me*, mesoblast; *al*, met-enteron; *rp*, rectal peduncle or pedicle of invagination connecting the met-enteron with the cicatrix of the blastopore; *o*, mouth; *ph*, pharynx; *sh*, shell-gland; *mn*, mantle-flap; *br*, branchial filaments; *y*, granular cells of doubtful significance; *v*, vesicular structure of unknown significance.

development of the European Oyster, to the figure of which and its explanation the reader is specially referred (fig. 6). An example of the latter is seen in a common little fresh-water bivalve, the *Pisidium pusillum*, which has been studied by Lankester (12). The successive stages of the development of this Lamellibranch are illustrated in the woodcuts figs. 148 to 153 inclusive. These should be compared with the figures of *Gastropod* development (figs. 3, 4, 5, 7, and 72***). Fig. 148 shows the cleavage of the egg-cell into four (A), and at a later stage the tucking in of some of the cells to form an invaginated series (B).

The embryonic cells continue to divide, and form an oval vesicle containing liquid (fig. 149); within this, at one pole, is seen the mass of invaginated cells (fig. 150, *hy*). These invaginated cells are the arch-enteron; they proliferate and give off branching cells, which apply themselves (fig. 150, C) to the inner face of the vesicle, thus forming the meso-

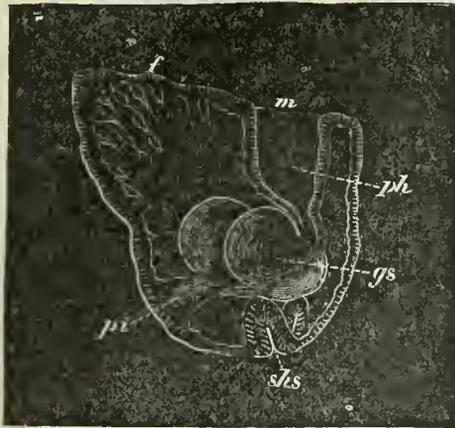

FIG. 152.—Diagram of embryo of Pisidium in the same stage as E in fig. 151. *m*, mouth; *f*, foot; *ph*, pharynx; *gs*, met-enteron; *pi*, rectal peduncle or pedicle of invagination; *shs*, shell-gland. (From Lankester.)

blast or cœlomic outgrowths. The outer single layer of cells which constitutes the surface of the vesicle (fig. 147) is the ectoderm or epiblast or deric cell-layer. The little mass of hypoblast or enteric cell-mass now enlarges, but remains connected with the cicatrix of the blastopore or orifice of invagination by a stalk, the rectal peduncle (fig. 151, A, *rp*). The enteron itself becomes bilobed and is joined by a new invagination, that of the mouth and stomodæum, *ph*. Fig. 151, B shows the origin of the mouth *o*, being a deeper view of the same specimen

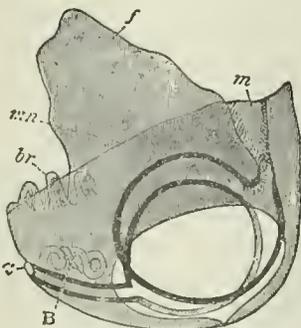

FIG. 153.—Diagram of embryo of Pisidium, in same stage as F in fig. 151 (after Lankester). *m*, mouth; *z*, anus; *f*, foot; *br*, branchial filaments; *mn*, margin of the mantle-skirt; *B*, organ of Bojanus (cephalidium). The unshaded area gives the position of the shell-valve.

view of the same specimen in the same position which is drawn in fig. 151, A. The mesoblast multiplies its cells, which become partly muscular and partly skeleto-trophic. Centro-dorsally now appears the embryonic shell-gland (fig. 151, C, *sh*). The pharynx or stomodæum is still small, the foot not yet prominent. A later stage is seen in fig. 152, where the pharynx is widely open and the foot prominent. No ciliated velum or pre-oral (cephalic) lobe ever develops. The shell-gland disappears, the mantle-skirt is raised as a ridge (fig. 151, E, *mn*), the paired shell-valves are secreted, the anus opens by a proctodæal ingrowth into the rectal peduncle, and the rudiments of the gills (*br*) and of the nephridia (B) appear (figs. 151, F, and 153, dorsal and lateral views of same stage), and thus the chief organs and general form of the adult are

acquired. Later changes, not drawn here, consist in the growth of the shell-valves over the whole area of the mantle-flaps, and in the multiplication of the gill-filaments and their consolidation to form gill-plates. It is important to note that the gill-filaments are formed one by one *posteriorly*. The labial tentacles are formed late. In the allied genus *Cyclas*, a byssus gland is formed in the foot and subsequently disappears, but no such gland occurs in *Pisidium*. The nerve-ganglia and the otocysts probably form from thickenings of the epiblast, but detailed observation on this and other points of histogenesis in the Lamellibranchia is still wanting.

MOLLUSCOIDS. See BRACHIOPODA and POLYZOÆ.

MOLOCH, or MOLECH—in Hebrew, with the doubtful exception of 1 Kings xi. 7, always מוֹלֵךְ with the article—the name or title of the divinity which the men of Judah

in the last ages of the kingdom were wont to propitiate by the sacrifice of their own children. The phrase employed in speaking of these sacrifices is "to make one's son or daughter pass through fire to the Moloch" (2 Kings xxiii.

10; Jer. xxxii. 35, and so without the words "through fire" Lev. xviii. 21; but it appears from Ezek. xvi. 20, 21 that this phrase denotes a human holocaust,¹ and not, as sometimes has been thought, a mere consecration to Moloch by passing through or between fires, as in the Roman *Palilia* and similar rites elsewhere. Human sacrifices were common in Semitic heathenism, and at least the idea of such sacrifices was not unknown to Israel in early times (Isaac, Jephthah's daughter), though in the sunny days of the nation, when religion was a joyous thing, there is no reason to think that they were actually practised.² It was otherwise in the neighbouring nations, and in particular we learn from 2 Kings iii. 27 that the peculiar sacrifice of his son and heir was the last offering which the king of Moab made to deliver his country. Even the Hebrew historian ascribes to this act the effect of rousing divine indignation against the invading host of Israel; it is not, therefore, surprising that under the miseries brought on Palestine by the westward march of the Assyrian power, when the old gladness of Israel's faith was swallowed up in a crushing sense of divine anger, the idea of the sacrifice of one's own son, as the most powerful of atoning rites, should have taken hold of those kings of Judah (Ahaz and Manasseh, 2 Kings xvi. 3, xxi. 6) who were otherwise prone, in their hopelessness of help from the old religion (Isa. vii. 12), to seek to strange peoples and their rites. Ahaz's sacrifice of his son (which indeed rests on a somewhat late authority) must have been an isolated act of despair; human sacrifices are not among the corruptions of the popular religion spoken of by Isaiah and Micah. But in the 7th century, when the old worship had sustained rude shocks, and all religion was transformed into servile fear (Micah vi. 1 *sq.* belongs to this period; see מִיכָאֵל), the example of Manasseh spread to his people; and Jeremiah and Ezekiel make frequent and indignant reference to the "high places" for the sacrifice of children by their parents which rose beneath the very walls of the temple from the gloomy ravine of Hinnom or Tophet³ (Jer. vii. 31, xix., xxxii. 35; Ezek. xvi. 20, xxiii. 37). It is with these sacrifices that the name of "the Moloch" is always connected; sometimes "the Baal" (lord) appears as a synonym. At the same time, the horrid ritual was so closely associated with Jehovah worship (Ezek. xxiii. 39) that Jeremiah more than once finds it necessary to protest that it is not of Jehovah's institution (vii. 31, xix. 5). So too it is the idea of sacrificing the firstborn to Jehovah that is discussed and rejected in Micah vi. It is indeed plain that such a sacrifice—for we have here to do, not with human victims in general, but with the sacrifice of the dearest earthly thing—could only be paid to the supreme deity; and Manasseh and his people never ceased to acknowledge Jehovah as the God of Israel, though they sought to make their worship more efficacious by the adoption of foreign rites. Thus the way in which Jeremiah, and after him

¹ In 2 Chron. xxviii. 3 (parallel to 2 Kings xvi. 3) a single letter is transposed in the phrase, changing the sense from "caused to pass through the fire" to "caused to burn with fire." Geiger (*Urschrift und Uebersetzung*, p. 305) very unnecessarily supposes that this is everywhere the original reading, and has been changed to soften the enormity ascribed to the ancient Hebrews. The phrase "to give one's seed to Moloch," Lev. xx. 2 *sq.*, and the fact that these victims were (like other sacrifices) regarded as food for the deity (Ezek. xvi. 20) explain and justify the common reading.

² In Hosea xiii. 2 the interpretation "they that sacrifice men" is improbable, and 2 Kings xvii. 17 and Lev. xviii. xx. are of too late date to prove the immolation of children to Moloch in old Israel. The "ban" (בְּרִיחַ), which was a religious execution of criminals or enemies, was common to Israel with its heathen neighbours (stone of Mesha), but lacked the distinctive character of a sacrifice in which the victim is the food of the deity, conveyed to him through fire.

³ The etymology of the word Tophet is obscure; its meaning appears from *tophtch*, "pyre." Isa. xxx. 33.

the legislation of Leviticus and the author of Kings, seem to mark out the Moloch or Baal as a false god, distinct from Jehovah, is precisely parallel to the way in which Hosea speaks of the golden calves or Baalim. In each case the people thought themselves to be worshipping Jehovah under the title of Moloch or Baal; but the prophet refuses to admit that this is so, because the worship itself is of heathenish origin and character. "The Moloch," in fact, like "the Baal," is not the proper name of a deity, but a honorific title, as appears from the use of the article with it. According to the Hebrew consonants, it might simply be read "the king," which is a common appellation for the supreme deity of a Semitic state or tribe.⁴ And so the LXX., except in 2 Kings xxiii. 10, and perhaps Jer. xxxii. 35, actually treat the name as an appellative ("ruler," "rulers"). The traditional pronunciation, which goes back as far as the LXX. version of Kings (Μολόχ), appears to mean "the kingship"—an unsuitable sense, which lends probability to the conjecture that the old form was simply "the king," and that the later Jews gave it the vowels of מֶלֶךְ, the contemptuous name for Baal (G. Hoffman in *Z. f. A.T.W.*, 1883, p. 124).

From these arguments it would appear that the rise of Moloch worship does not imply the introduction into the religion of Judah of an altogether new deity, but only a heathenish development of Jehovah worship, in the familiar fashion of religious syncretism, and under that sense of the inadequacy of the old popular ritual to divert the wrath of the Godhead which was inspired by the calamities of the nation in the 7th century B.C., and led to more than one new development of atoning ritual. The key to the phenomenon is to be found in Micah vi., not in any vein of mythological speculation as to the forces of nature, such as is supposed in Movers's theory that Moloch represents the fiery destructive power of the sun. Moloch, in fact, in the Old Testament has no more to do with fire than any other deity. The children offered to him were not burned alive; they were slain and burned like any other holocaust (Ezek. *ut supra*; Isa. lvii. 5); their blood was shed at the sanctuary (Jer. xix. 4; Ps. cvi. 38). Thus the late Rabbinical picture of the calf-headed brazen image of Moloch within which children were burned alive is pure fable, and with it falls the favourite comparison between Moloch and the Carthaginian idol from whose brazen arms children were rolled into an abyss of fire, and whom Diodorus (xix. 14) naturally identifies with the child-eater Kronos, thus leading many moderns to make Moloch the planet Saturn. On the other hand, the Massoretic text of 1 Kings xi. 7 makes Moloch (without the article) the name of the god of the Ammonites, elsewhere called Milcom or Malcam. But in this place the LXX. translators certainly found the longer form מלכמ in their MSS. (as the Hebrew still reads in verse 33), while it is plain from 2 Kings xxiii. 10, 13 that the worship of Milcom at the shrine set up by Solomon was distinct from the much later Moloch worship of Tophet. In the usual printed text of the LXX., indeed, this distinction is not made in 2 Kings xxiii.; but this is an error of the Roman edition, the Vatican MS. really reading MOAXOA in verse 13.

(W. R. S.)

MOLUCCAS, MOLUCCOS, or SPICE ISLANDS, THE, comprise, in the wider use of the term, all the islands of the East Indian Archipelago between Celebes on the west, the Papuan Islands and New Guinea on the east, Timor on the south, and the open Pacific on the north. They are

⁴ Compare the Tyrian Melkart (king of the city) and the two names compounded with *melech*, "king," in 2 Kings xvii. 31. These latter cases are specially instructive, because Adramelech and Annahmelech were also worshipped by the sacrifice of children.

thus distributed over an area measuring about 450 miles from east to west, and about 800 from north to south, and include—(1) the Moluccas proper or Ternate group, of which Jilolo is the largest and Ternate the capital; (2) the Batchian, Obi, and Sula groups; (3) the Ambon or Amboyna group, of which Ceram (Serang) and Buru are the largest; (4) the Banda Islands (the spice or nutmeg islands *par excellence*), of which Lantoir or Great Banda is the largest, and Neira politically the most important; (5) the south-eastern islands, comprising Tenimber or Timor-Laut, Larat, &c.; (6) the Kei Islands and the Aru Islands, of which the former are sometimes attached to the south-eastern group; and (7) the south-western islands or the Babber, Sermatta, Letti, Wetter, Roma, and Damme groups. At the close of the 16th century this part of the archipelago was divided among four rulers settled at Ternate, Tidore, Jilolo, and Batchian. The northern portion belongs to the Dutch residency of Ternate, the southern portion to that of Amboyna.

The name Moluccas seems to be probably derived from the Arabic for "king." Argensola (1609) uses the forms *islas Malucas*, *Maluco*, and *el Maluco*; Coronel (1623), *islas del Moluco*; and Camoens, *Maluco*.

Compare the articles on INDIAN ARCHIPELAGO, ARU ISLANDS, JILOLO, TERNATE, &c., and J. J. de Hollander, *Handleiding bij de Beoefening der Land- en Volkenkunde van Ned. Oost. Indië*, Breda, 1877 and 1882.

MOLYBDENUM, one of the rarer metallic elements (symbol for atomic weight, Mo=96; H=1), occurs in nature chiefly in the two forms of Yellow Lead Ore (PbOMoO_3) and Molybdenite (MoS_2). The latter mineral is very similar in appearance and in mechanical properties to graphite or black lead, and, in fact, was long confounded with it chemically, until Scheele in 1778 and 1779 proved their difference by showing that only the mineral now called molybdenite yields a white earth on oxidation. The metallic radical of the earth, after its discovery by Hjelm, was called molybdenum, from $\mu\lambda\nu\beta\delta\omicron\varsigma$, lead.

By heating molybdenite in a combustion tube in a current of air, we obtain the trioxide MoO_3 (molybdic acid) as a white crystalline sublimate. This substance, when heated to redness in close vessels, fuses without much volatilization into a yellow liquid, which, on cooling, freezes into a crystalline radiated mass of 4.39 specific gravity. It dissolves in 500 parts of cold, and in 960 of hot water. It dissolves readily in aqueous ammonia or alkalies, forming *molybdates*. Like silica, it combines with bases in a great variety of proportions. Of these many salts, an ammonia salt of the composition $3(\text{NH}_4)_2\text{O} \cdot 7\text{MoO}_3 + 4\text{H}_2\text{O}$ (known in laboratory parlance simply as molybdate of ammonia) is the most important, affording, as it does, the most delicate, characteristic, and widely applicable precipitant for ortho-phosphoric acid. To detect phosphoric acid in any substance soluble in water or nitric acid, add first to a solution of molybdate of ammonia an excess of nitric acid, and then (not too much) of the nitric solution of the phosphate, and keep the mixture at 40°C .; the whole of the phosphoric acid gradually separates out in the shape of a canary-yellow crystalline precipitate of "*phospho-molybdate of ammonia*," of the composition

(according to Gibbs), which is insoluble in the reagent, even in the presence of dilute nitric acid, but soluble in excess of phosphoric acid. By treatment of this complex ammonia salt with aqua regia we can eliminate its acid $24\text{MoO}_3 \cdot \text{P}_2\text{O}_5 \cdot 3\text{H}_2\text{O}$ as a substance soluble in water and crystallizing from this solution with 59 molecules of water.

This phospho-molybdic acid plays a great part in chemical toxicology, being a generically characteristic precipitant for all (organic) alkaloïds, which combine with it, pretty much as ammonia does, into precipitates insoluble in dilute mineral acids. A solution of the acid sufficient for this purpose may be obtained by saturating carbonate of soda solution with molybdic acid, adding phosphate of soda, one part for every five of MoO_3 , evaporating to dryness, fusing, dissolving in water, filtering, and adding nitric acid until the liquid becomes yellow.

Metallic molybdenum is obtained by reduction of the trioxide in hydrogen gas at very high temperatures. It is thus obtained in small crystalline granules which are infusible even in the oxy-hydrogen flame. An alloy of the metal with four or five per cent.

of carbon (formerly accepted as molybdenum) fuses in the oxy-hydrogen flame into a silver-white metal, of 8.6 specific gravity, which is harder than topaz (Debray).

Analysis.—Molybdenum in all its forms is readily converted into molybdic acid by oxidizing agents, such as nitric acid; or if in non-volatile forms into alkaline molybdate by fusion with carbonate of alkali and nitre. Alkaline molybdate is soluble in water; the solution, on a gradual addition of hydrochloric acid, gives first a white precipitate, which then dissolves in the excess of acid. When a piece of zinc is added to such a solution, the latter, through gradual reduction of its MoO_3 to lower oxides, assumes first a blue, then a green, and lastly a deep blackish-brown colour. Molybdic acid colours the blowpipe flame yellowish green. It dissolves in fused borax, forming a head which in the oxidizing flame becomes yellow in the heat, but almost colourless on cooling; the reducing flame colours it dark brown, and may cause the separation of brown flakes of MoO_3 . Compare CHEMISTRY, vol. v. pp. 541, 542.

MOMBASA, or less correctly **MOMBAS**, the *Mwita* of the Sawahili, a town on the east coast of Africa, in $4^\circ 4' \text{S}$. lat., with the best harbour on all the Zanzibar mainland. The coralline island of which it occupies the eastern portion is 3 miles long by $2\frac{1}{2}$ broad, and lies in the middle of a double inlet of the sea stretching northward into Port Tudor (so called after the English officer who surveyed it) and westward into Port Reitz (after the English resident who died while exploring the Pangani river in 1823). Except at the western end, the coast of the island consists of cliffs from 40 to 60 feet high. In the vicinity of the town palms, mangoes, guavas, baobabs, and cinnamon-trees flourish abundantly, and farther to the west are stretches of virgin forest, the haunt of monkeys, wild hogs, and hyenas. The citadel, originally constructed by Xeixas and Cabrera in 1635, still remains in good condition, "a picturesque yellow pile with long buttressed curtains," but has preserved little of its Portuguese architecture. Of the twenty Portuguese churches which Mombasa once contained, only two or three can be identified. A few of the houses are built of stone, but most of them are mere thatched huts. The population in 1844 was, according to Dr Krapf, from 8000 to 10,000, mostly Wasawahili, but with a considerable number of Arabs and some thirty or forty Banyans. In 1857 Burton estimated the inhabitants at 8000 to 9000, and in 1883 they numbered about 20,000. The Arabs, the Wamwita, and the Wakilindini (the two divisions of the Wasawahili residents, of which the former is the original stock) have each their own chief. In 1875-76 the Church Missionary Society, which made Mombasa one of its stations in 1844, established a settlement for liberated slaves at Freretown (Kisauini) on the mainland, opposite Mombasa. By 1881 it consisted of about 450 persons, of whom about one-fourth were children attending school. The pupils are taught to read both English and Sawahili (*Ch. Miss. Intelligencer*, 1875-76 and 1881). A branch station at Rabhai numbers 600 inhabitants.

Mombasa takes its name from Mombasa in Oman. It is mentioned by Ibn Batûta in 1331 as a large place, and at the time of Vasco da Gama's visit it was the residence of Calicut Banyans and Christians of St Thomas, and the seat of considerable commerce. The "king" of the city, however, tried to entrap Da Gama, and with this began a series of troubles which give full force to the native name *Mwita* (war). The principal incidents are the capture and burning of the place by Almeïda (1505), Nuno da Cunha (1529), and Duarte de Menezes (1587)—this last as a revenge for its submission to the sultan of Constantinople—the building of the Portuguese fort (1594), the revolt of Yusuf ibn Ahmed (1631), the erection of the Portuguese citadel (1635), the five years' siege by the imam of Oman (1660-65), and the final expulsion of the Portuguese (1698). In 1823 the Mazara family, who had ruled in Mombasa from the early part of the 18th century, placed the city under British protection; but Britain soon withdrew, and left the place to be bombarded and captured by Sayyid Said of Zanzibar, who was obliged to make repeated attacks between 1829 and 1833, and only got possession in 1834 by treachery. A revolt against Zanzibar in 1875 was put down by British assistance.

MONACHISM

THE word Monachism, or Monasticism, primarily meaning the act of "dwelling alone" (*μοναχός, μονάζειν. μόνος*), has come, by an easy and natural transition, to denote the corporate life of religious communities living a life of poverty, celibacy, and obedience, under a fixed rule of discipline. The root-idea of monachism, in all its varieties of age, creed, and country, is the same—namely, retirement from society in search of some ideal of life which society cannot supply, but which is thought attainable by abnegation of self and withdrawal from the world. This definition applies to all the forms of monachism which have left their mark on history, whether amongst Bráhmans, Buddhists, Jews, Christians, Moslems, or the communistic societies of the present day, even when theoretically anti-theological.

This broad general conception of monachism is differed in the following ways:—It may take the form of absolute separation, so far as practicable, from all human intercourse, so as to give the whole life to solitary contemplation—the anchoretic type; or, contrariwise, it may seek fellowship with kindred spirits in a new association for the same common end—the cœnobitic type; it may abandon society as incurably corrupt, as a City of Destruction out of which the fugitive must flee absolutely—the Oriental view, for the most part; or it may consider itself as having a mission to influence and regenerate society—which has been, on the whole, and with minor exceptions, the Western theory of the monastic life.

The question has been warmly debated whether monachism be an evil or a good,—whether a natural, perhaps a necessary, part of Christianity (as being, indeed, the strict logical issue of the triple vow of baptism, literally construed), or a foreign element introduced into it with unfortunate results, and rather an excrescence on its system than an orderly and healthy development. Unlike many other institutions which have needed the lapse of centuries and the gradual approach of decay and degeneracy to show their weak places, monachism in its Christian form displays some of its most unlovely features while yet almost in its cradle, whereas not a few of its best achievements belong to a late period in its history; and it has throughout displayed a singular elasticity and power of taking a fresh departure, after seeming to have exhausted its energies. Its champions and its opponents have thus always had ample materials for their briefs, and there is little probability of the controversy ever coming to an end. But the most philosophical mode of viewing its relation to Christianity is to recognize that monachism has made a part of every creed which has attained a certain stage of ethical and theosophical development; that there is a class of minds for which it has always had a powerful attraction, and which can otherwise find no satisfaction; and consequently that Christianity, if it is to make good its claim to be a universal religion, must provide expression for a principle which is as deeply seated in human nature as domesticity itself, albeit limited to a much smaller section of mankind.

Three main factors combined to produce the phenomenon of monachism in early Christianity, each of them set in motion by the general dissolution of morals in the pagan society of the time, of which we get a sufficient glimpse from the Christian standpoint in the first chapter of the Epistle to the Romans, and from the pagan standpoint in the sixth Satire of Juvenal. These three factors were—(1) the Oriental tendency towards retirement, contemplation, and asceticism, influencing the infant Christian church through the agency of those Jewish ascetics, the Essenes

and Therapeutæ, who had begun long before the gospel times both the solitary and the common life in Palestine and Egypt, and who probably contributed many converts to Christianity, and became practically merged therein, as they disappear from history in the first century of the Christian era; (2) the Hellenic teaching of the Alexandrine Neo-Platonists on the purification of the intellect by abstention from physical indulgence; and (3), perhaps a more powerful influence than either, that old Roman spirit of austerity and discipline which, while looking back regretfully to the memories of the simpler habits of republican times, could find nothing amidst the social luxury and administrative weakness of the decaying empire which presented its ideal, save the monastic system with its rigid proscription of luxury, and even of comfort, in every form. The first-named of these three factors was, however, necessarily the earliest to operate. The Scriptures attest clearly the existence of a body of ascetics in the persons of the Nazarites, leading always for a certain period, and sometimes for life, a stricter existence than the ordinary Jew; Elijah and John the Baptist furnished examples of the solitary hermit type; the Schools of the Prophets at least seem to have been celibate and cœnobitic communities, living by a fixed ascetic rule; and it is familiar to all that such was the actual discipline of the Essenes (see *ESSENES*). The sect of the Therapeutæ, known to us only from the book *De Vita Contemplativa* (ascribed to Philo), and described as chiefly, though not exclusively, established in Egypt, bore much resemblance to the Essenes, differing from them for the most part by greater austerity in the matter of food, and by their preference for the solitary life over the common fellowship of the Essenes; for their custom was that each member confined himself to his lonely dwelling (called by the afterwards famous name of *μοναστήριον*) throughout the week, while all assembled on the Sabbath for joint worship, and for instruction from the senior of the society. So closely does this polity resemble that of several of the earliest Christian societies of the kind that Eusebius devotes a chapter of his *Ecclesiastical History* (ii. 17) to asserting their identity, holding that Philo could have been speaking of none save Christian ascetics, a view in which he is followed by Sozomen and Cassian in ancient times, as also by many moderns. This view has been rendered much more probable by recent inquirers, who seem to have made out that the *De Vit. Cont.* is spurious, and was written about 300 A.D.;¹ for there is a general agreement amongst the fathers that the monastic life did not begin till nearly two hundred years after Philo lived; and Tertullian (160-240 A.D.) declares explicitly that Christians in his time did not withdraw from society,—“We are not Indian Bráhmans or Gymnosophists, dwellers in woods, and exiles from life; . . . we sojourn with you in the world” (*Apol.*, xlii.). Yet there is no reason to doubt that the leaven of Essenism was at work in the church from the earliest time, and helped to form the temper which issued in monachism. Still, the process was slow and gradual, passing through very much the same stages as can be traced by careful inquiry in the case of the Essenes. That is to say, the new converts to Christianity, being for the most part dwellers in cities, were in necessary and daily contact with the heathen society around, whose relaxation was such as to induce an even greater recoil from habits of self-indulgence than the stricter morality of their new creed enjoined, so that a body known by the name of “Ascetics” sprang up very soon within the church, and

¹ See especially Lucius, *Die Therapeuten*, 1879.

were urged on to still greater severity of life when the rapid progress of Christianity brought large numbers of merely nominal converts in, whose practice fell too conspicuously below their profession. The desire of protest against such a state of things led to the gradual separation of the devotees into a kind of order within the main body, and to their actual withdrawal from habitual intercourse with their less strict fellows, which led in turn to their departure from the towns into more secluded places, even before any formal conception of the monastic life had shaped itself in their minds. But the first glimpse obtainable of the "common life," and that only an indistinct one, is in the New Testament, and applies to women alone. There is mention in the pastoral epistles (1 Tim. v. 9-12) of a class of widows, apparently not as mere recipients of relief, but as constituting an ecclesiastical grade; while in Acts ix. 39 it appears as if a number of women belonging to this order were united in some kind of community under the headship of Dorcas, for the narrative rather implies that they were her assistants in making clothing for the poor than themselves the objects of her bounty. This conjecture receives some confirmation from the mention of "the virgins who are called widows" (*τὰς παρθένους τὰς λεγομένας χήρας*) in the shorter recension of the Ignatian Epistle to the Smyræans, and from the statement of Athanasius, that Anthony, when himself about to begin the solitary life which he is regarded as having instituted, first placed his sister in a convent of virgins (*παρθενῶνα*),—facts which prove the organization of women at an earlier date in community life than of men, and lend some probability to the notion that it may have begun very soon indeed, especially when the prominence given to the virgins as a separate and seemingly long-established order in the church by such early writers as Tertullian and Cyprian is borne in mind.

Two other causes must be taken into account as tending to stimulate monachism when once it began. First is the theological opinion, early formulated, and never since without many advocates, that two distinct standards of life and holiness are set forth in the gospel: that of precept, and that of "counsels of perfection,"—the former binding all Christians without exception, the latter being voluntary, and merely offered for acceptance to such as aim at especial sanctity. The second, and even more powerful, agent was Gnosticism, not only in its earlier forms and in the kindred spirit of Montanism, but still more in its Manichæan development, when its dualism led to exaggeration of the antagonism between flesh and spirit, and the human body was regarded no longer as a servant to be trained, but as an enemy to be crushed and beaten down with unrelenting hostility. But in every age of monachism, from the earliest to the latest, social disorders and insecurity have proved the chief feeders of the cloister, never widely popular in times of healthy and orderly national life, but eagerly resorted to as a place of shelter from social turbulence.

There are five main classes of monastic institutions, each of which approximately marks a new departure in the history of Western monachism (for the East has never had more than the first), as they succeed one another in chronological order, without in any instance involving the abandonment of the previous foundations. They are—(1) Monks; (2) Canons Regular; (3) Military Orders; (4) Friars; (5) Clerks Regular. All of these have communities of women, either actually affiliated to them, or formed on similar lines.

There is no doubt as to the time and the person, when, and by whom, the first decisive step was taken which left a marked interval for all time between those ascetics who continued to live in family life, if not really part of it, or who at least dwelt close to some ordinary church, to which they

resorted habitually, and the seekers after some more retired and separate mode of life, whether singly or in communities. During the stress of the Decian persecution (249-250 A.D.) Paul, a native of the Lower Thebaid, born of wealthy parents about 228, was denounced by his brother-in-law to the authorities as a Christian, and fled for safety into the desert, where he established himself in a cavern, shaded by a palm-tree, and with a spring of water close by. There he remained till extreme old age, dying, if we may accept Jerome's chronology, in his hundred and thirteenth year, about 342. Although he did not collect any band of disciples around him, nor even, so far as is recorded, attract any casual visitors, except his more famous successor, Anthony, who is alleged, in a narrative containing many legendary details, to have had an interview with him when himself a very old man, the day before Paul's death; yet there seems reason to believe that the fame of his example spread sufficiently to induce imitation of it, and that anchoritic cells began to be set up sparsely in the deserts even before Anthony adopted that mode of life. Anthony's career differed in various respects from that of his precursor. In the first place, it was voluntary choice, not fear of persecution, which sent him into solitude. He was born about 250 at Coma in Upper Egypt, of wealthy Christian parents, and was left at eighteen years of age in possession of a large fortune and of the guardianship of a younger sister. He had received what was probably a fair vernacular education, but distaste for study, or perhaps more probably that difficulty which contemplative intellects experience in the acquisition of languages, left him unacquainted with Greek or Latin; yet the intimate knowledge of Scripture which he afterwards displayed cannot be satisfactorily accounted for in any other way than as the result of attentive perusal, since no mere listening to the lections in church would suffice to convey it; and we must therefore take Athanasius's statement of his ignorance of letters to denote the absence of culture, not as implying actual illiteracy. One day, hearing the gospel read, "Go and sell that thou hast, and give to the poor . . . and come, and follow Me," he took it as a direct address to himself, and at once returned home, distributed his property amongst his neighbours, reserving only a small sum for the support of his sister whom he placed in charge of some Christian virgins, and then betook himself to a solitary life, first visiting the most eminent ascetics and anchorites he could find, in order that he might learn the peculiar merit of each, and imitate it. He fixed his dwelling first in a tomb, then in a ruined fort near the Nile, where he remained for twenty years, leaving it but once, in 311, to encourage the Christians of Alexandria during the persecution of Maximin; and lastly in a small grove of date-palms, a few miles west of the western coast of the Red Sea, near the base of Mount Kolzim, where he made an enclosure and planted it as a garden. He quitted this retirement but once in his remaining life, when he again visited Alexandria in 335, at the request of Athanasius, to preach against the Arians. Yet his fame drew not only frequent visitors to his cell, but numerous disciples and imitators around him, attracted not alone by his pious austerities, but by his cheerful and courteous manners and shrewd practical judgment. He made the solitary life honourable and popular, fully justifying Jerome's phrase in comparing him with Paul, "*Hujus vitæ auctor Paulus, illustrator etiam Antonius.*" When Anthony died in 365, aged one hundred and five, the desert was already studded with hermitages in every direction, and the second great step in the development of monachism had been long taken by Pachomius, who stands out in history at once as the founder of the cœnobitic life amongst Christians and as the author of the first formal monastic rule. Born about 292,

and converted to Christianity in early manhood while serving in the army, he was baptized on obtaining his discharge, and at once adopted the ascetic life under the direction of the hermit Palemon, with whom he retired to Tabennæ, an island in the Nile, between Farshoot and Dendarah. Here he began his new institute, whose distinguishing features were as follows. The monks were distributed into cells, each of which contained three inmates, known in this relation as *syncelli* (the usual number in other Egyptian foundations was two in each cell, while in Syria the tenant had no partner). A large number of such cells clustered near each other formed a *laura*, and each such laura had but one common place for meals and other assemblies. Work and food were apportioned to each inmate according to his physical strength, and such as were permitted exceptional strictness in fasting were not to undertake the heavier tasks of bodily labour. Their dress was to be a close linen tunic, with a white goatskin by way of upper garment, which they were not to lay aside at meals or in bed, but only when they assembled for the eucharist, when they wore their hoods only in addition to the tunic. They were divided into twenty-four groups or classes numbered according to the letters of the Greek alphabet, into which they were distributed according to their intellectual and spiritual proficiency, the least intelligent being placed in class ι , the letter of simplest form, and the ablest in class ξ , the most complicated. Each group was subdivided into bands of ten and a hundred under decurions and centurions, and all subject to the Abbot, who was himself in turn, when the institution spread and ramified, subject to the Superior (or Archimandrite) of the mother-house; while the finance of each house was managed by a steward (*οικονόμος*), who was similarly accountable to the treasurer or steward at Tabennæ. Their usual food was bread and water; their luxuries, oil, salt, and a few occasional fruits or vegetables, chiefly pulse; frugal meals which they ate in strict silence—sometimes broken by the voice of a reader, appointed to recite lections from the Bible—each man so wearing his hood or cowl as to hide his face from his companions. They assembled twice daily for common prayer, and met further for communion on Saturdays and Sundays. A strict probation of three-years was imposed on postulants for admission, during which they were confined to simple tasks of labour, and were not permitted to enter upon actual study till they had satisfactorily passed through this term. Their work was tillage for their own immediate wants, and weaving mats or baskets for sale, to procure such necessaries as their direct labour was insufficient to provide; and, as time went on, other handicrafts were practised in the cloisters, such as those of smiths, tailors, boat-builders, tanners, and so forth. Pachomius induced his sister to found a convent of nuns governed by very similar rules, and subject to the authority of a visitor appointed by himself, as superior of the whole institute. Such was the success of the Pachomian rule that before the founder died (between 348 and 360) he had no fewer than fourteen hundred monks in his own cœnobium, and seven thousand altogether under his authority. Nor was its influence confined to Tabennæ and its dependencies. Ammon carried the rule into the Nitrian desert, where five thousand monks were soon collected; Hilarion bore it into Syria and Palestine, Eustathius of Sebaste into Armenia, Ephraem Syrus into Mesopotamia, Basil the Great into Cappadocia and Pontus (though a rule of his own framing supplanted it later); and, above all, it was brought by Athanasius himself into Italy, whence it spread over the West till modified in various ways by subsequent legislation, and finally displaced by the Benedictine institute. And such was its popularity, meeting as it did a need of

the time, that its votaries in Egypt alone amounted by the 5th century to more than a hundred thousand, of whom three-fourths were men. This rule has come down to us in two very different forms: an earlier and probably original one, preserved for us in the *Historia Lausiaca* of Palladius, bishop of Helenopolis (367-430)—a great storehouse of details on Egyptian monachism, which is very brief, and has been summarized above—and a much longer recension, extending to 194 heads or chapters, preserved in a translation by Jerome, in whose time the monks governed by it had increased to fifty thousand. It had not, however, a complete monopoly, for there were also similar rules in local use, going by the names of famous ascetics such as Paphnutius, Macarius, and Serapion; nor was it uncommon to find communities wherein two or three different rules were followed simultaneously by the various inmates. The rule of Basil, however, proved to the East what that of Benedict did to the West, in that it practically absorbed or supplanted all its predecessors, while, unlike the great Western reform, it has had no subsequent competitors, and remains to this day the single monastic code of the Oriental Church. This rule is embodied in the *Ascetic Sermons* of Basil, and also in two recensions, a longer and a shorter one, of the actual provisions of his code, which are marked with not a little of the shrewd practical sense, as well as lofty piety, which characterized the founder,—being especially noticeable for their discouragement of the solitary mode of life, and for their recommendation of labour. The development of Oriental monachism thus ceases with the Basilian rule, and there are only two seeming exceptions to this fact: the institution of the Acemeti (*ἀκοίμητοι*), or “sleepless” monks in the 5th century, for the purpose of keeping up unbroken prayer day and night—a system copied much later in the West by the communities founded for “perpetual adoration;” and the erection, for these very monks, of the great monastery of the Studium at Constantinople (named from Studius, its founder), which was the Cluny of its time and country, as a centre of the more intellectual monastic life, and as the model of stateliness in ecclesiastical ceremonial.¹ Greek monachism, as an institute, has no history later than the 5th century. The monks indeed constantly appear as factors in the controversies of the centuries which followed, at once the polemical and the political disputes showing them equally fierce and eager partisans (notably in the Iconoclastic controversy, which found them the most ardent champions of images); but they cannot be said to have exerted much influence upon society till a very late period of their history, when they were instrumental in keeping the national spirit and the national religion alive in Russia when suffering under the Tatar yoke, and they performed a like service for Greece during the centuries of Turkish oppression. It may further be added that, however low the intellectual life of Eastern monasteries may appear when judged by a Western standard, the clergy who are trained in them, technically known as the “Black clergy,” stand much higher in character, acquirements, and general influence than the secular or “White clergy” of the parishes, whether in Greece or in Russia.

It has been already mentioned that the bad side of monachism appears almost as early as its good side.

¹ This great abbey, at the height of its prosperity, contained more than a thousand monks, and the following list of its staff of office-bearers, due to Theodore the Studite, may be usefully compared with the Western monastic hierarchy:—*Ἡγούμενος* (abbot), *ὑποτακτικός* (prior), *οικονόμος* (treasurer), *ἐπιστημονάρχης* (ceremoniarist), *ἐπιτηρητής* (inspector), *κανονάρχης* (precentor), *ταξίαρχης* (seneschal), *κελλαρίτης* (cellarer), *ἀριστηάριος* (refectory), *βεστιάριος* (sacrist), *ἀφικνωστής* (evigilator), *νοσοκόμος* (infirmarer). One or two of the offices do not quite correspond in East and West, but the general resemblance is close.

While the system won the admiration of all the most eminent Christian teachers of the age which saw its birth and early growth, and while we are met by a still more remarkable fact that from the time when monachism was fairly established till we enter on the Middle Ages there are but two or three names of distinction amongst the clergy, whether as writers or administrators, to be found outside the ranks of monachism, amongst whom the most famous are Ambrose and Leo the Great, nevertheless, there is a heavy account on the other side. Not only did the institute speedily find itself caricatured by the Messalians, Euchites, Gyrovagi, Sarabaites or Remoboth, Circumcelliones, and other companies of professed ascetics, wild in doctrine, vagrant in habits, and turbulent in conduct, but the more genuine societies had scarcely fewer faults in too many cases. Lay in their origin, and for the greater part of their earlier history having but rarely ecclesiastics amongst them (a single priest ordained for each monastery to minister to its inmates being the utmost allowed for a considerable time), they were not subject to the same strict inspection and discipline as the clergy, in case a whole community chose to disregard its rule; though of course it was easy to deal with an offender who had the tone of his monastery against him. The clergy were subject to the direct control of the bishops, and many disciplinary canons of councils laid down rules for their conduct; but this was not the case with the monks for a considerable time—nor indeed ever effectively in the East—and their lay character gave them practical independence of any authority external to their abbot. And, despite the stringency of the monastic rule itself, which, even before actual vows began to be introduced (probably on the recommendation of Basil), always involved during compliance with it the three engagements to the observance of poverty, chastity, and obedience, which make up the staple of the monastic principle, and though pains were taken to exclude unfit applicants (such as criminals, slaves who had fled for reasons other than ill-treatment, or persons who had kindred dependent on them), while a long probation was exacted from all who were accepted, yet it was impossible that more than a small proportion of the many thousands who flocked in during the first enthusiasm for the new movement should have had any real sympathy with the restraints and aspirations of such a mode of life. Severe asceticism operates differently on different natures, and while there are some whom it does but discipline and refine there are more whom it tends to coarsen and to brutalize, even apart from the many whom it is apt to affect with morbidness, if not actual insanity. And it is unquestionable that vast numbers of those who entered on the monastic life came from the poorer classes, in search of some less toilsome mode of existence than they had previously led, preferring the contemplative societies, wherein almost no labour, certainly none of a severe and trying cast, was practised, to those where agriculture and other active employments, requiring more energy than mat and basket weaving, were enjoined. Such men, uneducated and undisciplined, were liable to be thrown entirely out of gear by the complete revolution in their mode of life,—especially when the community they joined was not only contemplative, but situated in some place where the ungrateful soil made tillage nearly impracticable, and the vast numbers crowded together were far too numerous for any tasks which could be assigned them. From the bosom of such societies came not only single examples of exaggerated spiritual pride, bitter fanaticism, avaricious greed of the scanty articles whose usufruct was permitted, fierce sensuality, and wild religious delusions, but they gave birth to companies like the *βοσκοί*, or “grazing monks,” of Mesopotamia and Palestine, who roved about shelter-

less and nearly naked, as Sozomen and Evagrius tell us, in the mountains and deserts, grovelling on the earth, and browsing like cattle on the herbs they casually found; and to those fierce bands of Nitrian and Syrian ascetics who, reared in the narrowest of schools, treated any divergence from their own standard of opinion as a crime which they were entitled to punish in their own riotous fashion, two instances of which have left an indelible brand on their history—the murder of Hypatia in Alexandria, and that of the patriarch Flavian at the Robber Synod of Ephesus. An equally singular, but more sporadic and temporary, form of asceticism was that of the Stylites or Pillar-hermits (*στυλίται, κιονίται*), who followed a fashion first set by Simeon, a Syrian monk who spent almost half of the 5th century on the summit of a column 60 feet in height. This unwonted kind of austerity at first gave rise to strong objections, even from hermits themselves, and a messenger was sent to Simeon, bidding him in the name of a synod of bishops to descend from his pillar, but with instructions to permit him to remain if he showed himself ready to comply. Such proved to be the case; and, having thus assured themselves that he was not influenced by spiritual pride, they left him to follow his own devices. And we have the direct personal testimony of the wise and temperate Theodoret that he exercised a strong and salutary influence over the nomadic Saracen tribes, converting many hundreds and even thousands to Christianity, besides being the shrewd and trusted adviser, not only of the peasants who flocked to him for counsel, but of Arab princes, Persian kings, and even Roman emperors. He cannot be judged, therefore, by ordinary standards, and it is more than likely that a less extraordinary mode of life would have given him less power for good; but he is the only eminent figure in the class to which he belongs, and the fashion he set may be said to have died out with his namesake, the younger Simeon, a century later. Even when the healthier side of monachism as it appeared in Egypt and Syria is dwelt upon, and the fullest weight is allowed to the contemporary pictures drawn by great Christian writers of the monasteries as schools of a philosophy truer and purer than that of the Porch or the Academy, as places where the equality and brotherhood, merely dreamed of as unrealizable fancies in the outer world, could be seen in living action—where children, deserted by their parents or otherwise orphaned, were carefully reared—where the sick were lovingly tended—where calmness, piety, and self-forgetfulness were the rule of all,—it must be confessed that the complaint of the Government, embodied in the hostile legislation of the emperor Valens in 373, subjecting monks to the conscription (which drew forth an indignant protest from Chrysostom), that monachism was injurious to society and to the healthy condition of civil life by draining off so large a fraction of the population into the backwater of the cloister, was perfectly well founded. And no small part of the overthrow of Christianity in Egypt and Syria by Islam is due to the practical withdrawal of all the devout from family and public life, leaving no spiritual energy to cope with the Koran in the towns and villages whither the conquering Arabs came to settle and proselytize.

The history of monachism in the West is far more varied, chequered, and interesting than in the East. It takes its beginning from the visit of Athanasius to Rome in 340, during his second term of exile, when he brought with him his *Life of St Anthony*, and pressed his example on the Roman Christians who mourned as patriots, not less than as devotees, over the lax and encrusted habits of society. The popular imagination was caught at once, and not only was the basis of monachism successfully laid in Rome itself, but Eusebius of Vercelli introduced it

into northern Italy, where it was fostered a little later by the illustrious Ambrose at Milan. From the very beginning a marked difference shows itself in the spirit of Western monachism as compared with the parent institute in the East. Partly from dissimilarity of climate, but still more from that of racial and national temperament, there has always been less tendency in the West to either abstract contemplation or severe self-torture, such as is equally common to many of the Egyptian or Syrian ascetics and to the Jogis of Hindustan. Hard work, with due intervals for food and recreation, occupied all that part of a Western monk's time which was not devoted to prayer or study, and a careful apportionment of his duties throughout the day gave each hour its appointed task to be fulfilled, leaving very few loose ends of time to be wasted. It is true that the Basilian rule aimed at this same end, and that a very minute time-table forms a part of other early Eastern codes; but, as already remarked, the work was neither hard enough nor abundant enough to provide really healthy labour, or to occupy the mind sufficiently to keep it from vague speculation or morbid brooding during the hours of so-called toil. From this fundamental unlikeness springs the broad distinction between the two types of the monastic life, in that the West did not merely provide shelter for such as felt unable to endure the storms of the world, leaving secular society to take care of itself as best it could, but, contrariwise, employed the cloister far more as a training-school for the strong, as the standpoint whence to work the lever which moved a world. Even the more remotely secluded monasteries of the West, instead of serving as refuges wherein the inmates might effectually cut themselves off from all intercourse from without, were rather military outposts and frontier forts of civilization, which taught the arts of peace, the processes of agriculture, and at least the rudiments of social morality, to the rude and almost nomadic hunters and forayers, of whom many of the wilder tribes in outlying districts consisted. And if such was the case even where the conditions seemed least favourable, it may readily be understood what an ample field for exertion the more settled regions provided.

It would seem that it was some modification of the Pachomian rule which first made its way into Europe, but the interest excited by the movement led to variety of choice on the part of the teachers who aimed at spreading its influence in Italy. Thus, Urseus, abbot of Pinetum (probably near Ravenna), translated the Basilian rule into Latin, and it soon took root in southern Italy, where it continued to hold its ground for a considerable time. But a far more important part in the propagation of the monastic institute in the West was taken by Jerome, who, after spending a considerable time, beginning in 374, first as a hermit in the desert of Chalcis, and later at Constantinople, returned to Rome in 382, where he was secretary to Pope Damasus. He acquired much influence over a distinguished group of Roman ladies of high social position, the most celebrated of whom are Paula, and her daughters Blesilla and Eustochium, and employed that influence in urging the adoption of the monastic life upon them. Blesilla died early, it was said and believed in consequence of austerities pressed upon her which her constitution was unable to bear; and the unpopularity which this report brought upon Jerome, co-operating with the death of his patron Damasus and other causes, drove him back to the East, whither Paula and Eustochium also betook themselves, finally settling down in Bethlehem, where the elder lady built three convents, of one of which she was superior, while Jerome, who similarly erected a monastery for monks in the immediate vicinity, acted as chaplain and director to the community.

As the taste for pilgrimages had already become deeply rooted, the convent at Bethlehem was ere long a favourite resort of pilgrims, and exerted considerable influence in prompting the erection of similar foundations in the West. Quite another impulse was given to the furtherance of monachism by Augustine. While, amongst the many documents which have been ascribed to him, the only one which is of the nature of a monastic code is his 109th Epistle, addressed in terms of severe reproof to the nuns of a convent he had himself founded at Hippo, but which had fallen away from discipline, his personal example gave rise to a new type of the common life, in that he formed a sort of college of priests, who shared the episcopal house with him, ate at a common table, and copied in other particulars the observances of monasteries, but without losing their secular character. This was the origin of the institute afterwards famous as the Austin Canons, a foundation of the 11th century. It is true that Eusebius of Vercelli had anticipated Augustine by collecting the clergy of his cathedral (and, as it would seem, the remaining ecclesiastics of the city) into a common dwelling, but the difference in his case was that he obliged them to adopt the habit and style of monks, and thus was in no sense the originator of a new institute. Another important contribution of Augustine's to the history of the common life is his treatise *De Opere Monachorum*, wherein he sets forth the imperative need of making hard work an invariable factor of the monastic profession, notably on the ground that most of the monks in Africa came from the lower ranks of society, such as freedmen, farm-labourers, and artisans, who were spiritually injured by being raised into a grade viewed with more general respect than that from which they had sprung, while they were actually subject to fewer privations and lighter employment than they had been accustomed to. And he adds that amongst other evil consequences of this idleness was that they were found tramping the country selling sham relics, which they palmed off on the unwary, extorting money in other fashions also, and bringing discredit on their profession by their hypocrisy and vices—a picture only too faithfully repeated by the Mendicants a thousand years after the date of this treatise. The 5th century was one of rapid progress in the spread of monachism in the West. Chief amongst those who helped to popularize it stands the name of John Cassian (350-433), a monk of Bethlehem, who made a long and careful study of the Egyptian forms of monachism, of which he has bequeathed us valuable details in his *De Institutione Canobiorum* and *Collationes Patrum*, the former of which is a treatise on the monastic life, and indeed virtually a rule, though a somewhat prolix one, mainly derived from Macarius, while the latter is a record of the teachings of some hermits of the desert of Scete. Both of these works exercised a powerful influence in their own day, and the second retained its repute much longer, having been warmly approved and recommended for study by Benedict, Bruno, Dominic, and Ignatius Loyola, all four founders of celebrated orders. Cassian fixed himself at Marseilles, where he founded a famous monastery of which he was probably abbot, and which was the centre whence monachism, uniting the peculiarities of East and West, was propagated in southern Gaul, and notably planted in the island of Lerins, which became the seat of one of the most eminent monasteries of the early Middle Ages. Northern Gaul had received the institute earlier through the agency of Martin, bishop of Tours (316-397), who founded monasteries near Poitiers and in his own diocese, which were soon thronged, so that his funeral was attended by two thousand monks. Spain was even earlier in the field than Gaul, but there is some obscurity as to the history

of the introduction of monachism there, all that is certain being that it had made its footing good before 380, the date of a council of Saragossa (Cæsaraugusta) which forbade priests to assume the monkish habit. Still more obscurity hangs over the first establishment of monachism in Britain, as to which no trustworthy records have come down to us, though all probability points to its importation from Gaul in some variety of the Pachomian rule; while Germany did not receive the institute till the following century.

It must not be supposed, however, that the principle of monachism met with no opposition in the course of its progress. Apart from the opposition of those who disliked it precisely for its merits, for its protest against the dissolute morals and enervated habits of a luxurious and rotting society, and for the manner in which it won to itself many of the noblest and most promising of the young and ardent of both sexes, and without taking into account the more reasonable objections of statesmen, there were not lacking warnings of the dangers attending exaggerations of the principle of monachism, uttered by some of its most eminent upholders. Augustine's sharp censures have been already mentioned, and to them may be added the decrees of the council of Gangra in 363, or thereabouts, which anathematize those who adopt a celibate life on the ground that marriage is evil, who wear a peculiar dress as a mark of holiness, condemning such as use ordinary clothing, or who desert their parents or children dependent on them under the plea of desiring to lead an ascetic life. So, too, the great Chrysostom, himself a warm advocate of monachism, found himself obliged to teach his flock the sanctity of Christian family life, and the truth that there was often as much selfishness as piety in retirement to a hermitage from the cares and duties of society. These arguments and decisions were, however, aimed only at abuses and exaggerations of the monastic idea. It remained for Jovinian and Vigilantius to assail the actual principle. Their writings have not survived, and we can judge of their arguments only from the account given of them by their chief opponent Jerome, whose eminent gifts, however, did not include either moderation or controversial fairness, so that it is not safe to assume that we have all their case before us. As regards Vigilantius, he accurately represents the Puritan type of mind protesting against the external part of the popular religion of his day, often with good reason, but also showing equal intolerance for harmless, if not useful, practices; so that his condemnation of monachism is only part of his general objection to the temper of his time. But Jovinian's objections seem to have gone deeper. He had been himself a monk (and indeed never resumed secular life), but he disputed absolutely the thesis that any merit lay in monachism, celibacy, fasting, and asceticism considered in themselves, save in so far as they contributed to foster the Christian temper and life, which might and did flourish equally, he urged, under quite different conditions, while it was by no means unfrequent for spiritual pride, if not Manichæan error, to lay hold of those who devoted themselves to the ascetic profession. This was, in fact, going very little further than Chrysostom had done, or than Nilus did a short time later. But Jovinian's divergence from the standard of his day was not confined to practical questions; it extended to theological doctrines also, and accordingly his strictures on monachism, probably more incisive and less qualified than those of its other critics, were involved in his condemnation as a heretic by synods at Rome and Milan in 390. The reaction, of which he may be regarded as the mouthpiece rather than as the sole representative, was thus effectually crushed, and that for centuries. And though Jovinian is undoubtedly more

in accord than his opponents with the modern temper on the subject of monachism, and while it may be allowed that his teaching might have been a useful corrective in Eastern Christendom, where family life was all but overborne by asceticism, yet the impartial historian must admit that his success would have been an irreparable misfortune for civilization in the West. Such a dispassionate estimate of asceticism as his, if widely entertained, would have been fatal to the spread of monachism, and thus one of the most important conservative and statical forces in the preservation of the older culture, one of the most powerful dynamical forces in reducing the chaotic materials of early mediæval society to order and coherence, would have been lost to Europe; nor is it easy to conjecture what effectual substitute could have taken its place. As it was, the movement was not checked for a moment by this partial reaction; and not only did the older communities thrive and spread during the 5th and early 6th centuries, but new ones were established,—chief among which stand those of Cæsarius of Arles and of Donatus of Besançon in southern Gaul, that of Isidore of Seville in Spain, and the early Celtic code, of which only traditional fragments survive, but which seems in Britain to have been strongly affected by tribal influences, so that a monastery was often recruited from a single clan, and the abbacy became hereditary in the family of the chieftain, a fact which is noticeable even in the succession of the abbots of Iona, who for ten elections after Columba were of his family in the tribe of Conall Gulban.¹

But, swiftly as monachism spread in Europe during the breaking-up of the Western empire, some of the causes which hastened its progress also tended to its rapid decay. The disturbed state of society, and, in particular, the prevalence of petty warfare, drove many thousands of persons to seek a quiet refuge in the cloister without any more directly religious motive. When once there, they found in every place some rule in force which was either imported directly from Egypt or Syria, or else, like that of Cæsarius, modelled on Eastern lines, and therefore ill suited to the severer climate of Europe and the more active habits of the people. The austerities were thus too oppressive for general observance, and the result was a widespread neglect of rules which continued nominally in force, while at the same time the very monks who had ceased to keep them laid claim to special sanctity on the pretence of their strict way of life. The time was ripe for a reform, or rather for a wholly new departure in the shape of a rule devised to meet Western needs, and not merely adapted more or less clumsily from Oriental asceticism. The fitting man to accomplish this difficult task appeared in the person of Benedict of Nursia, author of the most famous of all monastic codes. Born of a respectable family about 480, he adopted the ascetic life at fourteen in a cave near Subiaco, not far from Rome, where he remained for three years, at the expiration of which he was chosen abbot of a neighbouring convent, then in a very relaxed state. His rule proved too stern for his new subjects, who attempted to poison him, whereupon he resigned his office and returned to Subiaco, around which he soon erected twelve monasteries, each peopled by an abbot and twelve monks. Fresh attempts on his life and on the discipline of his society drove him out again in the year 528, when he fixed his dwelling at Monte Cassino, the place where his celebrated rule was drafted in the following year, and which has ever since prided itself on its rank as the cradle of the Benedictine Order and the premier abbey of Western Christendom. The famous institute which he devised

¹ Adamnan, *Vita Columb.*, ed. Reeves.

has a great surface likeness to the rule of Basil, which alone has rivalled it in permanence, though far below it in diffusion and, it may be added, in services to humanity. Superior in flexibility and in the power of adapting itself in new conditions of circumstance and society to any rule which preceded it (and indeed to most of those devised later), the effect it produced in its own immediate day and for several centuries afterwards is almost incalculable.

Obedience, silence, humility; worship, study, and work; such are the ideas and employments with which this code of seventy-three chapters is occupied. It opens with a sermon or hortatory preface, and then proceeds to define the existing classes of monks, as divided into Cœnobites, Anchorets, Sarabaites, living by twos and threes together without any fixed rule or lawful superior, and Gyrovagi, vagrant tramps who, even at that time, as more than a century earlier, continued to bring discredit on the monastic profession. It was one great aim of the Benedictine reform to extirpate these two latter classes, and the method adopted was the addition of a fourth vow, that of "stability," to the three usual pledges. This fourth vow bound the monk to continuance in his profession, and even to residence for life at the monastery in which he was professed, unless temporary absence or permanent transfer were permitted by the authorities, and thus struck directly against the temper of restlessness and desire for change which were such powerful factors in generating the irregular and wandering classes just named. Chapter ii. describes the qualities of an abbot, and also decrees that no distinctions of worldly rank or station are to be recognized amongst the inmates of the monastery. Chapter iii. is one of those which best enable us to estimate the foresight and good sense of Benedict. It enacts that the abbot is to call the entire body of the brethren together to deliberate on any weighty matter, and not to decide it till he has heard the counsel of even the very youngest; while in matters of less moment consultation with the elder members suffices. Chapter iv. enumerates the instruments of good works, summed up in seventy-two pithy maxims, mainly Scriptural in letter or spirit. Chapter v. is on the obedience of disciples. Chapter vi. is on silence, recommending sparseness and wholesomeness of speech, but not laying down any hard-and-fast rules such as those of the Trappists of a later day. Chapter vii. treats of humility, including injunctions to the monk to confess his secret faults and thoughts to the abbot, to do nothing but what the common rule or the example of his seniors teaches, and to exhibit lowliness and meekness in outward bearing as well as in the inward spirit. Chapters ix.-xx. are occupied with directions about the performance of Divine service, so far as relates to the recitation of the Canonical Hours, seven of the day and one of the night. Chapter xxi. provides for the appointment of deans (officers over ten monks) in large monasteries, to be chosen by merit, and not by mere seniority. Chapter xxii. prescribes rules for the dormitory, each monk to have a separate bed with suitable coverings, and to sleep in his habit, and girded, so as to be ready to rise at a moment's notice, and a light is to be kept burning in the dormitory till morning. Eight chapters (xxiii.-xxx.) then deal with offenders, a graduated scale of penalties being provided: first, private admonition; next, separation from the brethren at meals and recreation; then scourging; and, finally, expulsion in the case of hardened offenders, but not until the abbot has used every means to soften and reclaim them. Even in this last event, the outcast may be received again, and that thrice, on the condition of forfeiting his seniority and descending to the lowest place. After the third expulsion, return was finally barred. Chapter xxxi. is on the character and duties of the cellarer, an important officer in monasteries; who was steward, and had the charge of all the stores, and the responsibility of serving them out as needed; while the next chapter provides for the appointment of inferior officers to take charge of the tools, clothes, and other goods belonging to the monastery. Chapter xxxiii. prohibits any monk to give, receive, or keep aught as his own without leave of the abbot, who is, however, bound to supply him with all necessaries. Murmuring at anything in the manner of distribution is censured in the next chapter as a very grave offence. Chapter xxxv. ordains that the brethren are to serve in the kitchen by turns, unless excused by reason of sickness or some more important occupation, and that whoever is on duty on Saturday is to clean up for the week, and to deliver all the cloths and utensils to the cellarer in good condition for his successor in office. Chapter xxxvi., while warning the sick not to be impatient or exacting, gives careful directions for their comfort. They are to be placed in an infirmary and to be committed to the care of a competent attendant, are to be allowed baths as often as is expedient, and a flesh diet to promote their recovery, though against the rule for those in health. Old men and children are also to be dispensed from the rigour of the rule, and they may have their meals before the usual hours, instead of waiting for the others. Chapter xxxviii. directs that reading aloud during meals is to be practised, and that no conversation, even about the subject of the reading, is to be carried on by the brethren, who are to keep

silence, using signs if they need anything. The reader is to be appointed for a week, and to enter upon his duties on Sunday. He is to be allowed a little food before beginning his task, lest he should become faint, and is to finish his meal afterwards along with the kitcheners and waiters. And the readers are not to take turns of duty in order, but only such persons are to be appointed as can discharge the office satisfactorily. Chapters xxxix. and xl. prescribe the daily rations of food and drink. Two meals are allowed, consisting of two cooked dishes (*pulmentaria*), to permit a choice of food, lest one or other dish should be unsuitable to any one, and a third dish of fruit or young vegetables is granted as an occasional addition. A pound of bread is to be served out daily for each, though the abbot is empowered to increase the rations of such as had extra hard work to do; while the rations of children are to be proportionably diminished, and flesh-meat is forbidden to all except the sick and weak, but there is no prohibition of any flesh save that of four-footed beasts, thus leaving the use of poultry, eggs, and fish optional. One pint of wine daily is allowed to each monk, but the hesitation with which this is conceded is noteworthy; and, while the prior is empowered to increase the allowance if he judge it well, the brethren are told that voluntary abstinence is the best course, and that where a house is too poor to provide wine those debarred from it are not to murmur. Chapter xli. prescribes the hours for meals at different seasons of the year, care being taken that both meals shall be taken by daylight, without need of lamps. Chapter xlii. directs the monks to assemble in the evening for a reading, preferably of the *Collations* of Cassian, followed by compline, after which silence is to be strictly observed, save for some necessary cause. Chapters xliii.-xlvi. impose penalties for minor breaches of rule, such as coming late to prayers or meals. Chapter xlvii. gives some further directions as to Divine service, throwing on the abbot or his deputy the responsibility of notifying the hour for it, and provides that no incompetent person shall be set to chant or read. Chapter xlviii., although brief, is one of the most important and characteristic in the rule. It is on daily manual labour, and begins with the pithy axiom, "Idleness is an enemy of the soul" (*Otiositas inimica est anime*). It proceeds to enjoin that the brethren are to distribute the time not already taken up with prayer, meals, and sleep, into periods of manual labour or devout reading. From Easter till the 1st October they are to work from prime till the fourth hour. From the fourth till nearly the sixth hour they are to read. On rising from meal-time after the sixth hour they are to rest in silence on their beds—the familiar *siesta* of warm countries—but those who prefer to read may do so, provided they disturb no one. Nones are to be said about the middle of the eighth hour (2.30 p.m.), and then work is to be resumed till evening. From the 1st October till the beginning of Lent they are to read till the second hour, then to say *terce*, after which to work till the ninth hour. At the ninth hour they are to leave off work, and after their meal to read spiritual books or the Psalms. In Lent they are to read from the morning till the third hour, then to work till the end of the tenth hour. And every one is to have a book given out to him from the library at the beginning of Lent, which he is to read through; while two senior brethren are to go the rounds during reading hours to see that the monks are actually reading, and neither lounging nor gossiping. On Sundays all are to read throughout the day, except such as have special duties to discharge; and if there be any who either cannot or will not read or meditate, some task to keep them from idling is to be assigned them. Sickly and delicate brethren are to be given light work, suitable to their health. Chapter xlix. suggests, without commanding, the adoption of some voluntary self-denial during Lent, to be undertaken with the abbot's approval only,—austerities without such sanction being denounced as vainglorious. Chapter l. directs that brethren who work at a distance, so as to be unable to attend common prayer, are to recite the office where they may happen to be. Chapter li. prescribes that monks sent on an errand, and expecting to return the same day, are not to eat while out, unless they have special leave from the abbot. Chapter lii. gives a few directions as to behaviour in the oratory. Chapter liii. contains rules for the entertainment of guests. The most noteworthy provisions are that the abbot is licensed to break his fast with the guests, unless on a church fast-day, in order to bear them company at meal-times; that the kitchen for the abbot and guests is to be separate from the general kitchen, and served by the same two brethren for a year, to insure that no additional labour may fall on the ordinary kitcheners through the unexpected arrivals of strangers needing to be fed; that the guest-room be entrusted to a brother (the hospitaller), and that no monk shall speak to or mix with the guests unless by special appointment—a very salutary regulation, in view of the miscellaneous rout of visitors likely to apply for food and shelter. Chapter liv. forbids monks to receive letters, tokens, or gifts, even from their nearest kin, without the abbot's permission, or to give any such things to another; and the abbot is empowered to transfer presents to some person other than him for whom they were intended. Chapter lv. prescribes the dress, and, with Benedict's usual good sense, leaves it wholly in the abbot's discretion to provide clothing suitable to the climate and locality,

merely ruling that in temperate places a cowl and tunic, thick in winter and thin in summer, with a scapular (a sleeveless woollen garment passed over the head, and falling down over the breast and back) for work hours, as also shoes and stockings, all of the ordinary country make and cheapest kind, shall suffice. Each monk is to have a change of these garments, to allow of washing, and yet another for use when sent on a journey, to be of rather better materials, and to be kept in the general wardrobe when not in actual wear. The old clothes are to be given up when new ones are served out, and are to be laid by in the wardrobe for the poor. A straw mattress, blanket, quilt, and pillow are to be furnished for each bed; and in addition the abbot is to give every monk a knife, a pen, a needle, a handkerchief, and tablets. Chapter lvi. rules that the abbot is to take his meals with the guests and strangers, with the privilege, if guests be few, of inviting any of the brethren he chooses, so long as some seniors are left in charge. Chapter lvii. prescribes that craftsmen amongst the brethren are to work with the abbot's permission, and if their work is to be for sale, those who are entrusted with making the bargains are to deal honestly with purchasers, and to sell rather below the current trade price. Chapter lviii. lays down the rules for the admission of new members. It is not to be made too easy. The postulant is to be allowed to knock for entrance in vain for four or five days, then to be brought into the guest-room for a few days more, and so he transferred to the novice-house, where he is to remain under the charge of a senior monk for two months. If he persevere at the end of this time, the rule is to be read over to him, and the option of departing or remaining is to be offered. If he persevere, he is returned to the novice-house for six months' further probation, after which the rule is again read to him as before, and yet a third time after a further term of four months. Not till he has surmounted this final ordeal can he be admitted into the community, and before that is done he must divest himself of his property, either giving it to the poor, or making a deed of gift to the monastery. Then he is allowed to sign the act of profession, including the vow of stability, which he is to lay with his own hand on the altar. Chapter lix. provides for the dedication of young children, noble or poor, by their parents to the monastic life, and requires a promise from the latter never to endow the oblate with any property, directly or in trust, though they may give to the monastery if they please and reserve the life-income to themselves. Chapter lx. regulates the position of priests who desire to live in the monastery. They are to enjoy no relaxations or priority in virtue of their ecclesiastical rank, though the abbot may assign clerical functions to them; and a somewhat like rule is laid down for clerks in minor orders. Chapter lxi. provides for the reception of strange monks as guests, and for their admission if desiring to join the community. The abbot is enjoined to listen to any criticisms such a guest may offer, and is empowered to give him, if accepted as a new member, higher standing than that of his entrance, but is forbidden so to admit a monk of any known monastery without the consent or letters commendatory of its abbot. Chapter lxii. rules that the abbot may choose a monk for ordination as priest or deacon; but the ordinee is to rank in the house from the date of his admission, except when officiating, or if the community and the abbot single him out for promotion by merit. If he misbehave, he is to be reported to the bishop, and if continuing to misconduct himself, shall be expelled,—only, however, in case of obstinate disobedience to the rule. Chapter lxiii. lays down rules for the gradation of rank in the community, and warns the abbot against arbitrary government. Chapter lxiv. allows the abbot to be chosen either by the common consent of the whole community, or by a select electoral committee; and the lowest in standing may be chosen, if fit. In the event of a bad choice, the bishop of the diocese, the neighbouring abbots, or even the neighbouring laity, if having reason to think the election made for the purpose of keeping up abuses, may annul it and appoint another superior. Chapter lxv. speaks of the mischief occasioned in many monasteries by the rivalry of the provost or prior with the abbot, and advises that no such officer be appointed; yet, if the circumstances of the place need one, the abbot may name a brother to the post, but he is to be as entirely subject to the abbot as any other monk, and may be admonished, deposed, or expelled for misconduct. Chapter lxvi. directs the appointment of a porter to answer at the gate, and further recommends that every house shall have its own well, mill, garden, bakery, and handicraftsmen, to avoid the need of intercourse with the outer world. Chapter lxvii. directs that no monk shall quit the cloister without leave of the abbot, and that, on the return of any from a journey, they are to beg the prayers of the community for any faults they have committed during their absence, and are forbidden to speak of what they have heard or seen outside. Chapter lxviii. bids a monk who has received a hard or impossible command to undertake it patiently and obediently. If he find it beyond his powers, he may mention the cause quietly to his superior; and, if the command is still persisted in, he must obey as best he can. Chapter lxix. forbids monks to uphold or defend one another in the monastery, even their nearest of kin. Chapter lxx. forbids striking or excommunicating another, without the abbot's authority, and provides that children until fifteen, shall

be subject to discipline from all the monks; but any who shall chastise those above fifteen without the abbot's leave, or be unduly severe towards the younger, shall be himself punishable by rule. Chapter lxxi. lays down that the principle of obedience is to prevail throughout the community, not only towards the abbot, or his officers, but from the juniors towards their seniors. Chapter lxxii. is a brief exhortation to zeal; and chapter lxxiii. a note to the effect that the Benedictine rule is not offered as an ideal of perfection, or even as equal to the teachings of Cassian and Basil, but for mere beginners in the spiritual life, who may thence proceed further.

It has been necessary to make this detailed analysis of the rule, because no mere summary of its general scope conveys an adequate notion of it; and it plays so important a part in the history of European civilization that it is expedient to obtain a clear idea of its details as well as of its main outlines. The first peculiarity in it meriting attention is the absence of any severe austerities. Plain and bare as the food and lodging appear if tested by modern notions, yet it is to be remembered that what is called "comfort" is a wholly recent idea, and even still scarcely familiar, it may almost be said, out of Great Britain and its colonies. The scale of living appointed by the rule secures a greater abundance of the necessaries of life, not only than was at all common amongst the Italian poor of the 6th century, but than is to be found amongst the humbler peasantry of any European country at the present day; while even the excluded superfluities entered but little into the habits of any save the very wealthy. Next, high thinking—the highest thought of the time—was united with this plain living, as the considerable stress laid upon reading attests. To this part of the code is due the great service performed by the Benedictines, both in the erection of schools, and in the preservation of almost all the remains of ancient Latin literature which have come down to us. It made it not only possible but easy for them to become a learned order, and it is a very imperfect estimate of the stride forward in this provision which Milman makes, when he views the injunctions as to reading in the mere light of expedients to fill up time somehow. If it were so, the hours for reading would have been fewer, shorter, and more occasional, merely rounding off the intervals between times of labour; but they are just as prominent and nearly as long as these. It is true that Benedict, whose own education had been abruptly broken off by his early retreat from Rome, did not specifically enjoin the pursuit of learning on his monks; but they borrowed the idea at once from his contemporary, the celebrated Cassiodorus, the real founder of monastic learning, of which his monastery of Viviers in Bruttium is the first known school. But the most valuable feature of the rule is the position of dignity which it assigns to work. It is scarcely possible to realize at the present day the dishonour into which toil of all kinds had sunk in the days of Benedict. Not only had the institution of slavery degraded many kinds of occupation, but the gradual disappearance from Italy of the yeoman class, ruined and exiled by the concentration of great estates (*latifundia*), or slain in the ceaseless battles of competitors for empire or of barbarian invaders, left few save serfs and bondsmen to till the soil, while the military habits of the invading tribes led them to contemn any life except that of a warrior. It is the special glory of Benedict that he taught the men of his day that work, sanctified by prayer, is the best thing which man can do, and the lesson has never been wholly lost sight of since.

The new institute spread with even more astonishing rapidity than the earlier monachism which it practically supplanted in the West, and its history thenceforward is, with one important exception, that of Western conventual life for some centuries. Moreover, besides marking the close of the first or tentative era of monachism, when all kinds of crude essays and experiments were being made,

and being itself the beginning of a new and settled order, it has the distinction of giving greater dignity and weight to the female side of monachism than had been the rule previously. Numerous and crowded as convents for women were in the early church, there is little evidence of their exercising any powerful influence as a factor in the practical religious life of the time, and though a few individual women of eminence, a Euphrosyne or a Macrina, illustrate the annals of the common life in the East, yet as a class the Basilian nuns do not play at all so important a part in ecclesiastical history as the spiritual descendants of Scholastica, sister of Benedict; for the same flexibility and comparative gentleness of his rule which made it healthier for men than its precursors were still more effective when dealing with the more sensitive organization of women. Accordingly, the Benedictine nuns offer a far greater variety of type than their Eastern sisters, and exerted a much more visible influence upon society, even before those newer forms of the organization of women's work in the church were devised which have given it much additional importance. Further, whereas the most serious and well-founded objection alleged against monachism is that by parting large companies of men and women irrevocably from each other, and treating this severance as an indispensable condition of the highest kind of life, it has tended to throw discredit on marriage and the family, and so to weaken society, which is based on family life alone, a strong counter-plea can be put in for the Benedictines. Not merely are they free, as already remarked, from the anti-social tendencies of Oriental monachism, which actually did disintegrate society in Egypt, but their institute was the one corrective in the early Middle Ages of those habits and ideas which tended to degrade the position of women. The cloister was not alone the single secure shelter for women who had no strong arm to rely on; but it provided the only alternative profession to marriage, and that one recognized by public opinion as of even higher distinction, and opening to women positions of substantial rank and authority, less precarious than the possession of temporal estates, which might only serve to attract cupidity, and so invite attack. The abbess of a great Benedictine house was more than the equal of the wife of any save a very great noble; and, as single women were thus not obliged to look to wedlock as the only path to safety and consequence, they were enabled to mate on more equal terms, and were less likely to be viewed as the mere toys or servants of the stronger sex.

But the special eminence of the Benedictines, in which they were without even the semblance of rivalry till the Jesuits arose, is that they were a missionary, civilizing, and educational body. It is true that the first successful efforts to convert the barbarian conquerors of the empire somewhat precede their entrance on that field of labour, and Ulfilas amongst the Mæso-Goths, Valentinus in Bavaria, and Severinus in Austria had achieved much even before Benedict was born; but their work needed to be taken up on a larger scale, and by a permanent organization not liable to be imperilled by the death of any one missionary or group of missionaries. And the task of laying the very foundations of civilized society, apart from the question of religious conversion, was as yet quite unessayed. It was as teachers of what for those times was scientific agriculture, as drainers of fens and morasses, as clearers of forests, as makers of roads, as tillers of the reclaimed soil, as architects of durable and even stately buildings, as exhibiting a visible type of orderly government, as establishing the superiority of peace over war as the normal condition of life, as students in the library which the rule set up in every monastery, as the masters in schools open not

merely to their own postulants but to the children of secular families also, that they won their high place in history as benefactors of mankind. No doubt there was another side to this picture, even before the order began to deteriorate collectively; but the good actually effected far exceeded the evils which may have accompanied it. The Benedictine institute was carried to Sicily by Placidus in 534; to France by Maurus, Simplicius, and their companions in 543; to Spain at a somewhat later and uncertain date; but did not touch any of the Teutonic countries till the very end of the century. That work was chiefly accomplished by another agency, that of the Celtic monks, themselves disciples of a Christianity presumably carried to Ireland from Gaul, and following a rule seemingly adapted from that of Pachomius. The early history and constitution of Irish and Scottish monachism are too obscure to be set down with any confidence, but it is at least clear that it was mainly tribal in organization, and even less subject to episcopal authority than the Eastern and Italian forms. The same holds good of the Welsh communities which survived the Saxon invasions of Britain. Legend is abundant, trustworthy record is scanty, and only a few facts can be rescued from oblivion. Amongst them may be included the introduction into Scotland of a species of monachism resembling that of Augustine, by Ninian, first missionary of the southern Picts, who borrowed his institute from Martin of Tours, and set up a cathedral, a house of canons, and a school of learning at Whithorn (*Candida Casa*) in Galloway before the close of the 4th century, himself dying, it is thought, about 432 (*Ælfred, Vit. Nin.*). The foundation of the second model of Welsh monachism (the first has gone below the horizon of history) is ascribed to the bishops Germanus of Auxerre and Lupus of Troyes, who visited Britain in 429 to combat the prevalent Pelagianism, itself a form of opinion due to a British monk. They are alleged to have been, directly or through their disciples, founders of great monasteries and schools at Hentland on the Wye, at Llantwit, Llanearvan, Docwinni, Bangor, Whitland, &c.; while among the more famous names connected with these and similar houses may be mentioned Asaph, David, Illtud, Dubric, Cadoc, Gildas the Wise, and Kentigern, the last-named being a zealous missionary. But Ireland was the true stronghold of Celtic monachism, and before the close of the 5th century was already thickly planted with religious houses. Armagh, Clonard, Aran, Lismore, Cluain-ednech, Clonfert, and, above all, Benchor or Bangor, the famous abbey of Comgall, on the coast of Down, near the entrance of Belfast Lough, are some of the more conspicuous foundations; and there are numberless stories recorded of the learning, the austerities, and the miracles of their inmates. The chief interest they have for the student of ecclesiastical history lies rather, however, in the colonies they sent forth than in their home operations, and it is to the great foundation of Columba (521-597) at Iona, the hive of missions and home of Western learning, more than to any Irish monastery, except Bangor, that the Celtic raid on heathenism is mainly due. The rule of Columba¹ resembles the Benedictine in prescribing three kinds of employment—prayer, work, and reading; while under the last-named head not only Scripture but all attainable secular learning was included, and it is also certain that the work of copying MSS. in a careful and beautiful fashion, which became so important a part of monastic occupation, reached maturity first at Iona. It remains only to say in this connexion that the discipline of Iona, apparently borrowed from Irish use, made the abbot supreme, not

¹ Published by Dean Reeves in Colton's *Visitation of Derry*, p. 109, and in another form by Haddan and Stubbs, *Councils*, &c., ii. p. 119.

merely over his monks, as in other rules, but over bishops also, whose office was simply that of ordaining such as were to be promoted to holy orders;¹ they had no territorial jurisdiction as rulers, because the monastery, not the diocese, was the primary local unit in Celtic Christianity, and thus a great founder or abbot was of more account and power than a bishop. Another famous pupil of Irish monachism, Columbanus, trained at Benchor along with his companion Gallus, exercised a powerful influence on the religious life of his time (543-615), not only as the founder of important monasteries at Luxeuil, Fontenay, and Bobbio, and as scholar and missionary, but also as the author of a rule, more severe both in its provisions and in its penalties than the Benedictine, with which it disputed for a considerable time the first place, and which it might very probably have displaced, had not the Benedictine institute, as of Italian origin, found that favour at Rome which a Celtic code, bearing more than one trace of divergence from Latin usages, could scarcely expect. With the mention of another prominent name in the list of distinguished Celtic reformers and missionaries, that of Fursey, abbot of Lagny near Paris (c. 650), we close this sketch of the Celtic movement in the 6th and 7th centuries, merely adding that its extent and influence may be partly estimated from the number of monasteries founded in England and various parts of the Continent by Irish monks, and the list of Celtic saints recoverable from the different martyrologies and similar records. The former amount to more than one hundred; the latter to nearly three hundred.

Returning to the Benedictines, the most important event in their history after the consolidation of their institute was the favour they received from Gregory the Great, himself once a monk, who set himself to reform monastic discipline, then at a very low ebb save where the new foundation was at work. He enacted several regulations for the better government of monasteries, such as prohibiting the admission of any persons under eighteen, exacting two years' novitiate, enforcing inclosure, visiting relinquishment of monachism with imprisonment for life, and finally, in the Lateran synod of 601, exempting monasteries in all cases from the jurisdiction of bishops (a measure due, it appears, to episcopal misconduct and oppression rather than to monastic ambition), thereby abolishing the measure of control which the eighth canon of Chalcedon and the legislation of Justinian I. in 535 had left to the hands of the diocesan, and leaving only the still surviving check, that the bishop's consent was required for the erection of any new monastery. The mission of the monk Augustine to England in 596 was, however, destined to produce more immediate and fortunate results than this piece of legislation. It brought Latin monachism into a part of Britain whence Welsh monachism had been long extirpated, and though little success attended the original foundation at Canterbury, yet two other houses were destined to be the cradles of great things. Jarrow-on-Tyne, founded by Benedict Biscop, trained the illustrious Bede, to whom is due the monastic school of York, which in its turn sent out Alcuin to reconstitute European learning under the fostering hand of Charlemagne; Nutcell in Hampshire reared Boniface to be the apostle of Germany, and founder of one of the most celebrated and powerful monasteries of the Middle Ages, that of Fulda. Nevertheless, decline set in very soon,

and the 8th century was a time of deterioration amongst both the seculars and the regulars. To amend the former, Chrodegang, bishop of Metz, instituted in 760 an order of Canons Regular, living by a rule carefully based on and adapted from the Benedictine, with the bishop as abbot, the archdeacon as prior, and with a general likeness in all the details of community life, except that there was no obligation to poverty, and the canons were allowed to enjoy any private property and such fees as they might receive for the performance of religious rites. This rule became extremely popular, was sanctioned by the council of Aix-la-Chapelle in 816, and was adopted in most cathedrals of France, Germany, and Italy within fifty years after, besides making some way in England also. It prevailed till the institute of the Austin Canons was substituted for it. And, as regards the laxity amongst regulars at this time, there is extant a very interesting letter from Bede addressed to Ecgberht, archbishop of York, calling his attention to the excessive number of monasteries in northern England which were conducted without a rule, and were often merely fictitious institutions, founded by laymen with the object of obtaining charters of privilege which would exempt them from civil and military burdens,—such laymen then assuming, without warrant, the title and powers of abbots, and filling their houses either with monks expelled from their own societies, or with lay retainers induced to receive the tonsure and promise obedience. Bede calls on the archbishop to convene a synod and institute a visitation for the correction of these abuses. The cause of the decline of the monasteries is to be sought in their popularity, which brought them great estates and other kinds of wealth, leading to the relaxation of the vow of poverty, which was interpreted as merely forbidding individual property; in the growth of pluralities; and in yet another cause which at first does not seem to lead in the same direction—the growing custom of ordaining monks, hitherto laymen, to fit them better for missionary work. But this led, not only to much more intercourse with the society of a lax and turbulent age than suited with claustral rules, but to ambition, as it became customary to fill several sees with monks from certain abbeys. The declension, notably in the habits of the superiors of wealthy houses, had become very marked, when a reformer arose in the person of a second Benedict, of Aniane in the modern department of the Hérault (750-821), who, in gratitude for an escape from drowning in the Ticino in 774, adopted the monastic life, and changed his name Witiza to that of the great Nursian monk. But he accounted the Benedictine rule too easy, and adopted instead the severest practices of Eastern monachism. He quitted the house of Seine, where he had been professed, and betook himself with a couple of companions to Aniane, where by 782 he had built a monastery for a thousand monks, with dependent cells, and collected a considerable library, paying special attention to the acquisition of the rules of the different monastic bodies both of East and West. He was transferred by his warm patron, the emperor Louis the Pious, to an abbey built for him near Aix-la-Chapelle, whence he acted as in some sense a superior-general and inspector of all the Benedictine houses, and drew up a harmony of all the rules he had collected to aid him in the task of reform. What he actually effected was the practical abolition of most of the competing codes, so as to leave the Benedictine in nearly sole possession, and to procure the enactment of a large body of canons in the council of Aix-la-Chapelle before mentioned, which laid down detailed provisions for the government of monasteries, whose very minuteness made them vexatious and ultimately intolerable, so that the reform lasted scarcely two

¹ So Bede tells us: "Habere autem solet ipsa insula rectorem semper abbatem presbyterum, cujus juri et omnis provincia et ipsi etiam episcopi, ordine inusitato, debeant esse subjecti, juxta exemplum primi doctoris illius, qui non episcopus sed presbyter extitit et monachus" (*Hist. Eccl.*, iii. 4); though, after all, the principle is precisely that of the Benedictine rule as applied to priests.

generations from its inception. Parallel with the time of declension and partial reform just described was the rise and decay of the noble and far-sighted school-system projected by Charlemagne, and entrusted to the superintendence of Alcuin. Its relation to monachism as distinguished from the history of education, is that one of its main features was the capitulary of 789, which directed that, besides the primary school attached to each monastery, all the more important houses were to found and open secondary ones also, with a higher range of subjects, even if such schools were interior or claustral, and only for the junior monks and novices, not exterior and free to the general public. Several of these schools rose to considerable efficiency and repute, notably those of Fulda, St Gall, Tours, and Rheims, discharging to some extent the functions of universities. But the weakness of the later Carolings involved this plan in the troubles which ended in the break-up of the empire of the Franks, and the 10th century saw the end of it. In England monachism shared the common destiny of decay. It had been marked during the period known as the Heptarchy by a degree of royal favour unparalleled elsewhere; for it may almost be said that the number of kings, queens, and persons of royal race who here betook themselves voluntarily to the cloister—and not under political compulsion, as often in contemporary France—exceeds the aggregate of those in all other countries. Yet it is likely that the fashion set in this wise helped to hasten decay, by inducing many persons to adopt the monastic life with little taste for its restrictions; and it is certain that secularity (chiefly manifesting itself in costly dress), riotousness, and drinking had become frequent amongst the English monks of the 8th and the early part of the 9th century. The decay was further precipitated by the spread of the institute of Chrodegang, which thinned the supply of recruits to monachism proper, as the easier life of canons regular was preferred. The same cause affected the convents of nuns, for an order of canonesses was established about this time on similar lines. The one bright spot in the history of 9th century monachism is the conversion of Sweden by Anskar, a monk trained in the famous house of Old Corbie in Picardy, which, albeit Benedictine, had been mainly planted by a colony from the stricter Columbanian house of Luxeuil, and had thus kept the traditions of a purer time almost unimpaired.

The 10th century—emphatically the “Dark Age” or “Age of Lead”—was the time when monachism, both in East and West, touched its lowest point. Three causes contributed to this in the West:—first may be placed the raids of the Northmen; next, the growth of the feudal system, converting abbots into secular lords in virtue of the lands held by their monasteries being chargeable with feudal obligations; and lastly, the seizure and impropriation of monastic revenues by kings, princes, and bishops. The last of these causes was at work in the East also, further complicated, as we learn from the decrees of a council held at Constantinople in 861, by the foundation of monasteries intended from the first merely as sources of pecuniary advantage to the founders; although the success of Greek monks in the conversion of Bulgaria, Moravia, and, somewhat later, southern Russia, showed that the cloister had not become quite effete even under the conditions of the Byzantine empire in that era.

What the state of things was in the West, even at the outset of the 10th century, may be learned from the language of the council of Trosley, near Soissons, in 909. It speaks of the ruin of many abbeys by the heathen, and of the disorderly condition of many which survived. Monks abandon their profession; married lay

abbots, with guards and hunting retinue, occupy the cloisters of monks, canons, and nuns; and the rules are universally disregarded. But, as constantly before, so then, reformers were at hand. Berno first abbot of Cluny in France, Dunstan in England, and, somewhat later, Anno archbishop of Cologne in Germany, undertook, and to a considerable extent effected, the work of reform. Only the first of these, however, calls for special notice here; and it will suffice to say that Berno, after having been abbot of Beaume, was set by William the Pious, duke of Aquitaine, over his new foundation of Cluny in 910, where he speedily initiated a reform of the Benedictine rule, whose very name, and even the memory of the reforms of Benedict of Aniane, had been forgotten in nearly all the so-called religious houses of the time. This new rule is the first example of the establishment of an order within an already existing order, of which it still formed part, many subsequent instances of which occur later. It was stricter than the original code in several particulars, notably as regards fasting and silence; and it laid especial stress on liturgical splendour. Cluny became the head of a large number of dependent houses, and, under the government of Berno's successors, Odo, Aymard, Majolus (who refused the papacy), Odilo, and Hugh I., rose to great eminence, but was nearly brought to ruin by Pontius, abbot in 1109, who was soon deposed, and succeeded by Hugh II., and then by Peter the Venerable, who completed the work of drafting the statutes of the new order, begun long before, but not finished, by his predecessors. In his time (1093-1156) the Cluniacs spread over not only the whole of France, but had houses in Italy, Spain, England, Palestine, and in Constantinople itself, and the “Arch-Abbot,” as he was called, had more than 300 churches, colleges, and monasteries under his authority. It is enough to say, with regard to Dunstan's reforms in England, that they were directed to two objects: the substitution of monks for secular canons, and the introduction of the Benedictine rule, till then practically unknown in England, into the monasteries,—for the monachism introduced by Augustine belonged to an earlier type.

The 11th century is noticeable for several events in the history of monachism; first of which stands the foundation of the Order of Camaldoli by Romuald, early in the 11th century, a strict community of hermits, living by the system of an Eastern laura of detached cells; but this society has never been of much importance. The Order of Vallombrosa, founded by John Gualbert in 1039, is more remarkable, as being the first to introduce the grade of “lay-brothers,” which plays so large a part in later monastic annals,—the object being at once to open the cloister to a class previously barred by the obligation to recite the office in choir, which necessitated a certain degree of education, and to lighten the strain on the choir-brethren by relegating the rough work of the monastery to an inferior grade of inmates, thus securing more time for reading and meditation for the cultured monks. A series of struggles between bishops and abbots in this century in respect of monastic jurisdiction—the practice having constantly vacillated in despite of Gregory the Great's decision 400 years earlier—issued mainly, though not wholly, in favour of exemption, and the reforms pushed everywhere rehabilitated monachism in popularity. The great stimulus given to the spirit of ecclesiastical discipline and energy by the Hildebrandine movement continued not only during the reign of Gregory VII., but for a considerable time after: amongst its results were the Order of Grammont, founded in 1074, but not transferred to the place whence it is named till 1124; the far more celebrated and influential Carthusians, a peculiarly ascetic

community, established by Bruno at the Chartreuse, near Grenoble, in 1084, which still boasts that it is the only order which has never been reformed on the ground of deviation from its original institute; and the Order of Fontevraud, founded for both monks and nuns (more strictly, canons and canonesses) by Robert of Arbrissel in 1100. Regarding the last named two remarkable facts may be cited: that the founder in 1115 entrusted the superior-generalship of the whole institute to the abess of the nuns; and that he provided that new abbesses should always be elected from secular women, as having more practical knowledge of affairs and capacity for administration than women trained in a cloister. There is yet one order more belonging to this period of new foundations, of higher note than most—that of the Cistercians, founded by Robert of Molesme in 1098 at Cîteaux, near Dijon. This society, chiefly famous as that to which Bernard of Clairvaux belonged, carried its asceticism into a region whence the other monastic bodies had banished it, that of Divine service. The barest simplicity in buildings, church furniture, and worship was enjoined by the rule: plain linen or fustian vestments, iron chandeliers, brass or iron censers, no plate save a chalice and a tube (and those of silver rather than of gold), no pictures, stained glass, or images, and only a few crosses of painted wood, and the most rigid simplicity in chanting,—such was the ceremonial code with which they challenged the costly ritual of Cluny. A more durable innovation was the institution of "General Chapters," to which every abbot of a Cistercian house had a right to be summoned to share in the deliberations held at the chief establishment, and which he was even bound to attend, that, while each dependent house thus obtained a representation in the parliament of the order, it could be called on to render to the central authority an account of its own doings. The Austin Canons, already mentioned, were probably founded at Avignon about 1061, and the Order of Prémontré by Norbert in 1120. This society was simply a stricter body of Austin Canons, standing towards them much as Cluny did to the Benedictines. But there are yet two other institutes of this active period which differ from all previous foundations. So far, the new orders are merely modifications, more or less sweeping, of the original Egyptian system, but the crusades gave birth to two entirely unprecedented forms of monachism:—the Military Orders, of which the most celebrated are the Templars, the Hospitallers, and the Teutonic Knights; and convents of women, affiliated to these orders, who were appointed to serve in the lazar-houses, hospitals, and similar institutions attached to them, and whose rule, for the first time in monastic history, was drawn up on a distinctly active and not a contemplative basis. Work of the sort had been done long before, but only as a casual accident, not as the primary object of a community.

The military orders arose in a more accidental fashion than any other variety of monachism, being due to the desire felt to lessen the perils which attended pilgrimage to Jerusalem, then almost as much part of the religious craving of Christendom as the hajj to Mecca is with devout Moslems. The Templars were at first designed only as an armed escort to protect the visitors from attack, and the idea of permanent guardianship of the Holy Places did not shape itself till later; while the Hospitallers (afterwards famous as Knights of Rhodes and of Malta, as the main bulwark of Christendom against the Turks, and as maintaining the police of the Mediterranean against all pirates and rovers), borrowed the first idea of their institute from the knightly order of St Anthony of Vienne, founded in Dauphiné about 1095, and devoted themselves originally to tending sick pilgrims at Jerusalem. The Teutonic Knights date from the third crusade, and owe their foundation to

the sufferings of the duke of Swabia's army at the siege of Acre, as it would seem that the Hospitallers were either unable or unwilling to supply the needed assistance. These knights, when at last the Eastern crusades were abandoned, turned their arms against the heathen of Prussia, which they conquered, as also Livonia, Courland, and Pomerania, besides keeping the Slavonic enemies of Germany in check by frequent raids into Lithuania and Poland, holding their ground as a sovereign order for three centuries, till the Reformation brought about their fall. The common characteristic of all these orders was the union of the seemingly incompatible qualities of the monk and the soldier in the same persons, of the convent and the barrack in the same house. But the contrast was not so sharp to mediæval eyes as it would be to modern ones; for while knighthood was surrounded with religious ceremonies and sanctions on the one hand, and on the other the feudal rank of bishops and abbots made them in some sense military chiefs, occasionally even taking the field in person, there was no great difficulty in accepting the permanent combination of what was often found casually united. The military orders passed away when their work was ended: the Templars, as the victims of a great crime, closed by a ghastly tragedy; the Hospitallers, and those Spanish and Portuguese orders which were enrolled as regiments against the Arab invaders of the Peninsula, though titularly still existing, yet really ceased to be more than a name when the Moslem power in Europe was finally broken. But the active organization of women was a more fruitful germ, and has never since ceased to put forth new developments, varying with the noticed wants of each period. To this epoch belongs also the beginning of that policy of the Roman see of utilizing the monastic orders, won over by special privileges and exemptions, as a body of supporters—almost a militia—more to be relied on than the secular clergy, and thereby the seed of conflict between seculars and regulars, destined to work much evil later, was sown, and also the beginning made of that denationalization of monachism which tended from the first to its unpopularity and decay.

It was found that a new order was the best safety-valve for enthusiasm which might become dangerous if discouraged, but which could be made a valuable ally if allowed to take shape in a fresh society, hoping to surpass all its precursors; and it is worth remarking that the one occasion when this wise policy was departed from, when Peter Waldo vainly sought in 1179 recognition and sanction from Pope Alexander III. for his proposed institute of mission preachers, gave rise to a sect (the Waldenses) which is still existing, and which has given trouble to the Roman Church quite disproportionate to its numbers and influence. The Carmelites, founded by Berthold of Calabria on Mount Carmel about 1180, and incorporated under rule by Albert, Latin patriarch of Jerusalem in 1209, were the last order of importance which sprang up at this time; for the Gilbertines, an English order founded at Sempringham in Lincolnshire in 1148, curious chiefly for their double monasteries for men and women; the Beguines, c. 1170 (who are, however, notable for their semi-secular and parochial organization, whence many later active bodies have borrowed hints); the Humiliati, c. 1196; and the Trinitarians, for the ransom of captives amongst the Moors and Saracens, founded by John de Matha and Felix de Valois in 1197, never rose to great influence or popularity, though the Servites, an order of the year 1223, became powerful in Italy. This period of rapid multiplication was quickly followed by one of equally rapid decay, the first to show clear tokens of degeneracy being the once rigid Cistercians, who never recovered their old moral footing, and who, it may be mentioned, were accountable for much of that hatred of the Church of the Pale in Ireland

by the natives, which, given fresh fuel by the Reformation, has lasted to the present day.¹

Yet another fresh departure in the history of monachism, in some respects the most momentous of all, was taken in the 13th century by the institution of the Mendicant Orders, or Friars. Pope Innocent III., in the 13th of the 70 constitutions or canons he promulgated at the Lateran council in 1215, had expressly forbidden the foundation of any new orders, bidding all who desired to embrace the monastic life join some approved community, and similarly directing that such as desired to found new houses should take their rule and constitution from one of the recognized societies. But circumstances were too strong for him, and this very pope was destined himself to sanction two of the most remarkable societies which the Latin Church has ever produced. The time was an anxious one. The speculative activity of the age, coupled with the abuses in the church, was multiplying sects, formidable in numbers, and still more from the contrast their austere mode of life presented, not only to that of the secular society of the day, but to that of the ecclesiastics, notably those of rank, whose pomp and luxury gave rise to the first faint stirrings of a revolutionary spirit amongst the commons, which the great pope, who was then the most conspicuous figure in Europe, did not fail to observe. No effectual weapon of resistance seemed at hand; the parochial clergy, yielding to the difficulties which an isolated rural life throws in the way of intellectual effort (far graver then than even now), had almost everywhere sunk into sloth and incapacity; the monastic orders were content, in the better instances, with maintaining their own internal discipline, and had no surplus energy for external work, while in the worse examples (as in that of the Cistercians, just referred to) they served rather as beacons of warning than as patterns for imitation; and, in short, there was an ever-increasing mass of home mission work to be done, and no one to do it.

But the two men who were to do it were already at hand in the persons of Francis Bernardone of Assisi and Dominic Guzman of Osma. The ruling idea in the mind of the former was the elevation of poverty to the first place amongst Christian graces, as the most obvious way of conforming the life of a Christian to that of the founder of his faith; the more intellectual Spaniard dreamed of an aggressive body of skilfully-trained preachers, able at once to grapple with the subtle dialectic of the enemies of the established creed, and to appeal in clear and homely language to the uneducated, amongst whom the Albigenses and other sectaries were making considerable conquests. Francis, the poet and devotee, in renouncing even the scantiest provision which the strictest orders of his time secured for their members, and bidding his followers to live on alms daily begged, taking, in the most literal sense,

¹ There is a very curious letter from Arnulf, bishop of Lisieux, to Pope Alexander III. (1159-1181), asking him to dissolve the Benedictine abbey of Grestain in that diocese, and to draft its inmates into other houses, which illustrates both the kind of abuses which were sometimes found and the desire of the authorities to suppress them. He charges the monks with lack of charity and hospitality, in that they reserved even the broken scraps from the common table as perquisites for their private friends; that they habitually quarrelled, and wounded one another with their knives, being prevented from homicide only by the knife-blades having no point; that one monk had actually murdered the cook, who had complained of his visits to the cook's wife; that the abbot did not provide for the daily wants of the community, but allowed the monks to roam abroad, picking up food for themselves as best they might; that some of them had caused the death of a sick woman by plunging her into ice-cold water under pretext of working a miraculous cure; that the abbot was frequently absent on pretence of business, but really living a loose life; that he had been thus two years in England, till recalled by the bishop, who was forced to send him away again, after appointing a deputy; that this deputy, when drunk, had wounded two of the monks, who thereupon murdered him; so that the house was practically past reformation, and ought to be dissolved.

no thought for the morrow, appealed to the popular imagination, always ready to kindle at the sight of genuine self-sacrifice; Dominic, with not less insight as a thinker whose first care was for doctrinal orthodoxy, as that of Francis was for personal piety, saw that there was a demand ready to spring up for more exact and intelligent religious teaching than could then be had, save in a few great cities. The occasion which urged him to the task he undertook is noteworthy. He had long been a canon of Osma, the strictest and sternest member of an ascetic community, when in 1203 he had to go on a journey with his bishop, which brought them into the very midst of the Albigenses in the county of Toulouse, where they saw how powerless the clergy were to contend against their rivals. On their road home the bishop and Dominic met the three papal legates returning discomfited from Languedoc, but attended with as much pomp as a triumphal progress would have justified. Dominic rebuked them sternly, telling them that it was not by splendid retinues and costly garb that the heretics won their converts, but by zealous preaching, by humility, by austerity, and by at least seeming holiness. Both the new founders sought and obtained at Romè, after some difficulty, the approval of their new institutes, and that in the very year 1215 which had seen the formal prohibition of all fresh orders. Francis speedily returned to his home, but Dominic, whose idea had by this time expanded from that of converting merely the Albigenses of Provence and Languedoc to that of influencing the whole world of nominal Christians and outer heathen, settled himself in Rome, where the pope appointed him to the important office of Master of the Sacred Palace, which has ever since been held by a Dominican, and carries with it the authority of chief censorship of the press. The two new foundations borrowed from each other, Francis copying Dominic's scheme of itinerant preachers, and Dominic imposing on his disciples the mendicant poverty of Assisi. These two particulars, the total absence—at any rate at first—of such endowments as had proved a snare to the older societies, and the substitution of itinerancy for inclosure, are the features which distinguish the friars from the monks who preceded them. The Franciscan institute was a bold attempt to democratize the church; Dominic's Friar Preachers, though recruited freely from men of a humble grade, have always had somewhat more of an aristocratic tone about them, due to their intellectual calling; they have held a high place in Christian art, counting amongst them such names as Fra Angelico and Baccio della Porta; and their reputation for orthodoxy and for a purer type of moral theology than the Jesuit one has always stood high. They also count amongst their members the two most eminent divines of the Middle Ages, Albertus Magnus and Thomas Aquinas, and they have been fruitful in producing zealous missionaries; but the one great blot on their career is that they have been the directors and officials of the Inquisition ever since the formal constitution of that tribunal as a permanent organization. The Franciscans, less distinguished for mental triumphs than their competitors, have yet some famous names, chief of which are Duns Scotus and Roger Bacon—for Bonaventura, though set by the Franciscans as the "Seraphic Doctor" in competition with Aquinas, the "Angelic Doctor" of the Dominicans, is scarcely entitled to very high intellectual rank—and at one time they seemed likely to establish as firm a hold on the university of Oxford as the Dominicans did on that of Paris. The swiftest success and popularity attended the two new orders; privileges and exemptions were showered on them from Rome, wealth, in despite of their vow of mendicancy, was emulously thrust upon them by the laity; and, above all,

a remarkable and widespread religious revival, a dead-lift to ministerial efficiency in every direction, repaid their early labours, while they had between them almost a monopoly of the popedom for nearly two hundred years. And one peculiarity of their organization gave them a degree of strength which no other orders possessed. Each monastery of the older societies was practically isolated and independent of all others, unless it were itself a dependent priory or cell belonging to a greater house. Some societies had, it is true, general chapters, but these were rare, and at best only effectual in establishing a certain uniformity of practice in all houses of the same rule. But the Friars, like the Templars and Hospitallers of an earlier day, and like the Jesuits of a later one, were enrolled in something of military fashion, under a superior-general, with wide powers, who directed and controlled their actions from one central point. Every group of neighbouring friaries was formed into a congregation, under a local head or provincial, and he was always in direct communication with the general, so that a common government united the whole body into a compact mass. But their very success was fatal to their character. The vow of poverty was the first part of their institute to break down. Even before they began to be counted amongst the richest orders of Christendom, there is indisputable evidence—that of Bonaventura, himself general of the Franciscans—that the mendicant system was working nothing but mischief. He tells us, writing while the order was still very young, and within fifty years of the founder's death, that it was even more entangled in money cares and business concerns than the endowed communities, precisely because there were no funds available to fall back on in emergencies; that the brethren, discouraged from work by mendicancy, were habitually idle; that they roamed about in disorderly fashion under pretext of questing; that they were such brazen and shameless beggars as to make a Franciscan as much dreaded by travellers as a highwayman; that they made undesirable acquaintances, thus giving rise to evil reports and scandal; that conventual offices had to be entrusted to untried, unspiritual, and incompetent brethren; that vast sums were lavished on costly buildings; and that the friars were greedy in the pursuit of burial fees and of legacies, so that they encroached upon the rights of the parochial clergy. If such were the mischiefs at work before the first zeal had begun to cool, it may readily be gathered how entire was the failure at a later time. Indeed, as regards the Franciscans, not only did they endeavour to evade the stringency of their institute even in their founder's lifetime, but the whole society was soon divided into two hostile camps, one of which desired to adhere closely to the original rule, while the other was content to fall in with the habits of the "possessors," as they had been wont contemptuously to name the endowed orders. And what is very curious in this connexion is that the friars who were loyal to the principle of poverty broke away for the most part from the church, forming new sects, such as the Fratricelli, or attaching themselves to elder ones, like the Beghards and the Apostolici, which handed on in secret the Gnostic traditions of the thirteenth century, apparently stamped out in the crusade against the Albigenses, while those who openly disregarded the will of their founder remained steadfastly in the Latin church. No order, except the Benedictines, has had so many branches and reforms as the Franciscans; amongst which it will suffice to name the Capuchins, the Minims, the Observants, and the Recollects; while the Poor Clares, the nuns of the institute, have also divided into Clarissines and Urbanists. The institution of Tertiaries, seculars affiliated to the order as honorary members, while

continuing to live in the world, and adopting a certain modified daily rule, was a powerful factor in the success and strength of the order, and was adopted, but with less conspicuous results, by the Dominicans. The rivalry of these two great bodies with each other, prolonged with much bitterness for centuries, and their disputes with the parochial clergy, whom they long displaced in general repute and influence, belong rather to general church history than to the annals of monachism, and may be passed by with this brief allusion; while it suffices to say that all the support they, and the other less important communities of the same kind, such as the Carmelite and Austin Friars, received from the popes, whose most effective allies they were in every country where their houses were found, was not able to avert their decline in general estimation; and there is no figure in later mediæval literature on which the vials of contempt and indignation are so freely poured as on the begging friar, and that, if most be said, deservedly.

As the 13th century is the apogee of later monachism, so the decline begins steadily at the very outset of the 14th (which is also the date of ordination becoming the normal custom for choir-monks, instead of the exception, as formerly), continuing down to the crash of the Reformation.¹ The great schism of the West, the rise of the Wickliffites and Lollards in England, and of the body later known as Hussites in Bohemia, could not fail to act injuriously on the monastic orders; and, though the creation of fresh ones continued, none of those founded during this era were influential, and few durable. It will suffice to name some of the more prominent:—the Olivetans in 1313, who were rigid Benedictines; the nuns of Bridget of Sweden in 1363, who followed a rule compiled from those of Basil and Augustine; the Hieronymite monks in 1374; the Brethren of the Common Life, founded by Gerard Groot in 1376, who did much for education and in home mission work, but are chiefly famous now in virtue of one member of their society, Thomas a Kempis; the Hieronymite Hermits in 1373-1377; the Minims in 1435; the Barnabites, a preaching and educational order, in 1484; the Theatins (a body of Clerks Regular who aimed at little more than raising the tone of clerical life, made but slight pretension to austerity, and are, indeed, mainly noticeable as having suggested to Ignatius Loyola several points which he adopted in regulating the mode of life to be pursued by the members of his institute) in 1524; and the Capuchins in 1525.

In the Reformation era itself the monastic bodies had sunk so low in the estimation of even the rulers of the church that one clause in the report of the committee of cardinals appointed by Pope Paul III. (a body composed of Sadolet, Contarini, Reginald Pole, Giberti, Fregoso, Badiano, Alejandro, and Caraffa, afterwards Paul IV.), delivered in 1538, was worded as follows:—

"Another abuse which needs correction is in the religious orders, because they have deteriorated to such an extent that they are a grave scandal to seculars, and do the greatest harm by their example. We are of opinion that they should be all abolished, not so as to injure [the vested interests of] any one, but by forbidding them to receive novices; for in this wise they can be quickly done

¹ The language of Nicolas de Clamenges (1360-1440)—rector of the university of Paris, known as the "Doctor Theologus"—in his treatise *De Corrupto Ecclesie Statu*, paints the moral decay of the monastic bodies, and especially of the Mendicants, in the very darkest colours. He not only charges them with waste, idleness, gluttony, drunkenness, and profligacy, but alleges the condition of convents of nuns to be such that there was little practical difference between allowing a girl to take the veil and openly consigning her to a life of public vice. And the *Revelations* of Bridget of Sweden (1302-1373), approved by the councils of Constance and Basel, and by Popes Urban VI., Martin V., and Paul V., fully confirm the darkest features of this testimony as regards the religious houses of the 14th century.

away with without wrong to any one, and good religious can be put in their place. At present we think the best thing to be done is to dismiss all the unprofessed youths from their monasteria."

As this formal document showed the current of high ecclesiastical opinion, so the lay view took expression in the *Epistolæ Obscurorum Virorum* of Ulrich von Hutten, which was to the Dominicans of the 16th century almost what the *Provinciales* of Pascal were to the Jesuits of the 17th; while they came also under the more delicate scalpel of Erasmus's wit. Not that the objections were wholly new, for it is evident from Thomas Aquinas's defence of monachism against its detractors that they were nearly all used in the 13th century. The interests involved were, however, too vast and complicated, the supposed impolicy of an admission on so large a scale of the charges alleged against monachism by the men of the New Learning too serious, to allow of any such sweeping measure of reform as that proposed by the cardinals being carried out. A certain amount of discouragement shown towards the older societies; the enactment of some partial corrections by the council of Trent, not touching any principle whatever, but apparently saying something because public feeling looked for something to be said; and, above all, the creation of a new type of order, the famous Company of the JESUITS (1534), represent the total action taken by the Roman Church during the actual crisis of the Reformation. Apart from such direct revolts from the Latin obedience as those in Bern, Zurich, Denmark, and Sweden, which at once involved the monasteries in the general overthrow of the old system of things religious, the most remarkable proceedings in the reaction against monachism were those taken in England, at a time when no breach with the Roman Curia was thought of. So far back as the 13th century Kings John and Edward I., and yet again in 1337 Edward III., had confiscated the "alien priories," as those houses were called which were dependencies of foreign monasteries, and the last named let out their lands and tenements until the peace with France in 1361, when he restored their estates; and similar raids were made on them both in his reign and in that of Richard II. Henry IV. showed them more favour; but in 1410 the House of Commons proposed the confiscation of all the temporalities held by bishops, abbots, and priors, petitioning the crown to employ their revenues in paying a standing army of knights and soldiers, in augmenting the incomes of some of the nobles and gentry, in endowing a hundred hospitals, and in making small yearly payments to the secular clergy. This fact attests the unpopularity of the church and the religious orders at the time, and, though the large scheme was dropped, yet in 1416 parliament dissolved all the alien priories, and vested their estates in the crown. They were for the most part applied to ecclesiastical purposes; but some portion, at any rate, passed into private hands, and was permanently alienated. Hence there was nothing to create surprise, much less opposition, when Cardinal Wolsey in 1523 obtained bulls from the pope authorizing the suppression of forty small monasteries and the application of their revenues to educational foundations, on the plea that these lesser houses were quite useless, and not homes of either religion or learning, whereas a learned clergy was imperatively needed to combat the new religious opinions which were making rapid way. And that the monasteries had been subject to serious vicissitudes all along appears from the fact that only about one half of all the foundations known to have been made in England were in existence at the date of the dissolution. There is little reason to trust the charges of immorality brought against the monks when Henry VIII. had once resolved on the pillage of the monasteries, seeing how the path opened

by Wolsey could be followed up. The characters of the king himself, of Cromwell, his chief agent in the dissolution, and of Layton, Legh, and others of the visitors appointed to inquire into the condition of the houses, are such as to deprive their statements of all credit; and, besides, the earlier Act of dissolution, granting the smaller monasteries to the king, limits the charges of misconduct to them, expressly acquitting the larger houses. Nevertheless, when the appetite for plunder had increased with the first taste of booty, accusations of precisely the same sort were brought up against the great monasteries, though in no instance has any verifiable proof been preserved.¹ But there can be no reasonable doubt (especially in view of the visitations of Archbishop Warham and other pre-Reformation prelates), that the religious houses, viewed simply as corporate estates, had been very badly managed for a considerable time, were heavily encumbered, and a weight round the neck of financial progress in England; and that, as spiritual agencies, they had mainly outlived their usefulness, so that, lamentable as were the circumstances of their destruction, and scandalous as was the waste of the property seized, there is little reason to suppose that any practical benefit would have flowed from their continuance, whatever might have been the advantages of an honest and economical measure of reform, or even of transfer to other purposes on the principle of *cy præs*.²

The negative evidence of the effectness of the older orders supplied by their very small share in the counter-Reformation, which lay virtually in the hands of the Jesuits alone, is reinforced by the reports made by the emissaries of the new company to their superiors, which attest that the accusations of the German reformers against both the secular and regular clergy on the score of ignorance and dissoluteness were only too well founded. Accordingly several new societies were instituted during the latter half of the 16th century, aiming at putting new wine into the old bottles of the Carmelites, Cistercians, Augustinians, Dominicans, and Benedictines; but none of them proved of much importance. A larger measure of success attended some established on an active basis, such as the Fathers of Christian Doctrine, a catechizing order erected by Pius V. in 1571; two communities for tending the sick, one founded in Italy by Camillo de' Lelli in 1584, the other, the Brothers of Charity, by John of God at Granada in 1538, but not formally sanctioned till 1572; and still more prosperity attended the Ursuline Nuns, a community chiefly devoted to the education of young girls, founded at Brescia by Angela de' Merici in 1537, and confirmed by Paul III. in 1544. Yet, with the single exception of the Jesuits, no new society could be said to have laid hold in any degree of the popular mind, nor were the attempts to revivify the elder bodies continued. It remained for two newer still to rehabilitate the waning respect for monachism of all kinds, and that by borrowing one chief feature of the Jesuit organization, the abandonment of that principle of isolation from the outer world which lies at the root of true monachism.³ Of these the

¹ A full examination of the case against the monasteries will be found in Dixon, *History of the Church of England*, vol. i. pp. 324-333.

² The number of houses suppressed and overthrown by the two Acts of 1536 and 1538 was as follows:—186 Benedictine houses, 173 Augustinians, 101 Cistercians, 33 Dominican, Franciscan, Carmelite, and Austin friaries, 32 Premonstratensians, 28 Knights Hospitallers, 25 Gilbertines, 20 Cluniacs, 9 Carthusians, 3 Fontevraud, 3 Minors, 2 Bonhommes, 1 Brigittine; total, 616. Their aggregate revenue were valued at £142,914, 12s. 9d. annually.

³ Soon after the Jesuits rose into note and popularity, a very curious and little known extension of their institute was made in Flanders. Two English ladies, acting with the sympathy and counsel if not at the recommendation of F. Gerard, rector of the Jesuit college at Liège, founded a community which they named Jesuitesses, adopting

first was the Oratory, founded by Philip Neri in 1558, but not approved by authority till 1577, and copied independently by Cardinal de Berulle at Paris in 1611. There were no vows imposed on the members of this society, though they lived under rule, and they employed themselves in doing all kinds of clerical work under episcopal supervision. The Italian house is chiefly celebrated as having included the famous Cardinal Baronius amongst its earliest recruits; but the French one held a high place in the religious revival of the 17th century, well-nigh rivalling the Benedictines of St Maur in learning (with such representatives as Simon, Thomassin, Morin, and Malebranche), and the reformed Cistercians of Port-Royal in piety, though sharing with the latter the reproach of Jansenism. But the second was far more influential, and has been fruitful ever since in the works of its copyists as well as in its own. It was the institute of the Sisters of Charity, established by Vincent de Paul in 1634, on the lines of the ancient community of the Hospitaller Nuns of St Augustine, but with some remarkable modifications, not only in respect of the vows, which were only yearly and inward, but in the spirit of their discipline, as formulated in his own memorable words,—“Your convent must be the houses of the sick; your cell, the chamber of suffering; your chapel, the parish church; your cloister, the streets of the city, or the wards of the hospital; your rule, the general vow of obedience; your grille, the fear of God; your veil to shut out the world, holy modesty.” The original scheme of Francis de Sales for the Nuns of the Visitation, founded in 1610, was almost identical; but the opposition was then far too strong, and he was forced to make them a cloistered community. Vincent’s order of Mission Priests, more commonly known as Lazarists, was also a successful and useful institute, though not vying in the extent of its influence with the other, which, as has been implied, has powerfully affected the organization of many of the active communities which have since been formed. No religious body did more to enable French monachism to bear up against the general obloquy it encountered during the 16th, 17th, and early 18th centuries,—a temper on the part of the public due to more than one cause. In the first place, the wars of religion had done much to harden and coarsen the feelings on both sides, and rigid adherence to the extreme positions of Catholics or Huguenots, as the case might be, was set far above any gentler and higher ideas. Next, the monasteries of both sexes had all but universally fallen into the patronage of the crown (in virtue of the concordat of Bologna, between Pope Leo X. and Francis I.), and were jobbed away as apanages for a dissolute nobility, who squandered the revenues, and suffered discipline to become relaxed, often to the generation of serious scandals. This malversation operated in two ways. It made the monasteries hard and bad landlords, grasping closely all the fental privileges and monopolies which they continued to enjoy, a proceeding which bore hard on the tenants and labourers, so that the monks shared to the full the unpopularity of the nobles (precisely as was the case in Germany, during the Peasants’ War of 1525); and the evil repute of

the rule and organization of the famous company, and taking the three usual vows, but, with a bold disregard of precedent, not only omitting the customary vow of inclosure, but actually sending the members of the society out as itinerant preachers. Their object was to train a body of emissaries for the Roman Catholic mission in England, who might obtain entrance and escape the incidence of the penal laws in a manner impracticable for men. They had considerable success for a time, and Mrs Ward, their projector, obtained some degree of papal approval, and became “mother-general” over more than 200 of these female preachers in the various colleges of the society. But after an existence of about eighty years it was suppressed by Pope Urban VIII. in 1630.

the convents—of whose real character we get at least one trustworthy glimpse in the account of the abbey of Maubuisson which Angélique Arnauld reformed—came home to all the Huguenots and their friends, because both before and after the legal continuance of the edict of Nantes they were used (according to a very early application of monastic houses not yet obsolete) as prisons, where Huguenot women and girls were shut up in order to bring about their conversion, forcibly if necessary, but somehow in any case. And there is evidence to show that the Huguenots resented this policy most bitterly, not only on polemical grounds, but because they were firmly persuaded that the morals of their wives, daughters, and sisters were in no less peril than their faith in such places. When to this sentiment is added the hostility of the Jansenists to the school of opinion which had persecuted them, razed their famous house of Port-Royal, and literally flung the bones of its deceased members to the dogs, it will be easy to judge how powerful were the forces mustering for the overthrow of monachism, and how little even such stern reforms as De Rancé’s at La Trappe, which has always had a marked attraction for soldiers, could do towards abating the danger. Nor were there wanting public scandals and cases before the law-courts which helped to fan the rising flames of hatred.¹ Another cause which contributed much to the decay of discipline and of practical religion in monasteries of both sexes was the custom which prevailed throughout the 16th, 17th, and 18th centuries, of disposing of the younger members of poor but noble families in the cloister as a safe and reputable provision, without any regard to the vocation of those so dedicated, and merely because the sum which sufficed to secure permanent admission was much smaller than that necessary to purchase a commission or public office for a son, or to provide an adequate dowry for a daughter.² At the Revolution, the religious houses, amounting (without reckoning various minor colleges and dependent establishments) to 820 abbeys of men and 255 of women, with aggregate revenues of 95,000,000 livres, were suppressed by the laws of 13th February 1790 and 18th August 1792. In Germany the storm had broken somewhat earlier, if not quite so violently. The Thirty Years’ War had wrought much mischief to not a few of the religious houses, without taking into account the great number which had been destroyed in the territories of the Protestant princes; and when the death of Maria Theresa in 1780 left her son Joseph II. free to act as he pleased, he dissolved the Mendicant orders, and suppressed, in despite of the personal remonstrances of Pius VI., the greater number of monasteries and convents in his dominions. In Italy, despite the multiplication of new institutes, the process of decay continued throughout the 17th century, and one most remarkable testimony to the fact appears in the report of the Venetian ambassadors at Rome in 1650 to their government of an interview they had with Pope Alexander VII.

¹ One of these is interesting, as settling a point which has been often disputed,—the existence of those monastic dungeons known by the name of “in-pace,” familiar to the readers of *Marmion*. It is the condemnation of the abbot of Clairvaux by the parlement of Paris in 1763 to a fine of 40,000 crowns for causing the death of a prisoner in an “in-pace.”

² This worked much evil in France, but produced perhaps even greater mischief in Germany, where what were styled “Noble Abbeys” were not uncommon, entrance to which, save in the inferior capacity of lay-members, was barred against all who could not prove patrician descent and a certain number of armorial quarterings. A relic of this survives in a few secular *Stiftungen* (Protestant and Catholic) for noble canons in Germany; and the notion was at any rate as respectable as that which holds good in some communities even now, where women who can pay a certain sum at entrance are admitted as choir-sisters, while those who cannot do so must accept the humbler position of lay-sisters.

"The Pontiff . . . began by saying that for some time past the Apostolic See, considering not the abundance only, but the superfluity of religious institutes, had become convinced that some of them, degenerating from the first design of their founders, had lapsed into a total relaxation of discipline, and that it was just as advisable for the church as for the laity to adopt the expedients used by wise husbandmen when they see that the multitude of branches has impoverished their vines instead of making them more fruitful. That a beginning had been made in that matter by suppressing some orders; but this was not enough. . . . A great number of very small convents had been suppressed, . . . and it was proposed to continue the work by proceeding to the final abolition of certain others which, by their licentious mode of life, filled the world with scandal and murmurs. . . . That he proceeded slowly, because he desired, in a matter of so much importance, to obtain the good-will of the secular princes. . . ." The remarks closed with a recommendation to the republic of Venice to suppress the canons of San Spirito and the Cruciferi in their city, and to apply their revenues towards defraying the cost of the war in Candia. (Ranke, *Die Röm. Päpste*, App. No. 129.)

But the policy thus indicated was not carried out by Alexander VII.'s successors, and there is evidence that things did not mend as time went on. The emperor Francis I., in his character of grand-duke of Tuscany, caused an edict to be published at Florence in 1751, forbidding the clergy to acquire property in mortmain, and issued together with it a paper of instructions pointing out the grave social disadvantages of enriching artificial families, such as convents, colleges, and the like, at the expense of natural families. And the menace implied in these documents was carried into operation by the suppression of several convents of nuns, for which the reluctant consent of the pope (Benedict XIV.) was extorted. When Francis died in 1765, and was succeeded in Tuscany by his brother Peter Leopold, the latter began his reign with what may be styled a formal act of war against the Roman Curia, by declaring the bull *In Cæna Domini* null and void in Tuscany, and forbidding its recognition or publication there. At once he was beset with appeals from priests and nuns, calling his attention to several grave abuses in the church, and notably to moral scandals of the most serious kind in the convents of nuns, especially those under the direction of the Dominicans, accusations which were fortified with full details of time and place. The result was that Leopold caused a scheme of ecclesiastical reform to be drawn up in 1770, containing stringent enactments for the abatement of monachism, for the suppression of all small convents of mendicants, and for the exclusion of monks and friars from the direction of nunneries, which were to be subject in all spiritual matters to the ordinaries only. And the Jansenist bishop of Pistoia and Prato, Scipio de' Ricci, upon entering on his diocese in 1780, at once began to inquire into the scandals which raged in the Dominican nunneries of his jurisdiction, especially in Pistoia,¹ the result being that he excommunicated the Dominican friars, and prohibited them from officiating. The pope at that time was Pius VI., an ardent devotee, warmly in favour of monachism generally, and of the lately suppressed Jesuits in particular, so that he took up the cause of the friars (though their evil repute had prevailed for 150 years), and issued a brief of censure against Ricci. He laid it before the grand-duke, who wrote a strong remonstrance, accompanied with proofs furnished by Ricci, and informed the pope that unless the brief were promptly withdrawn, and the convents obliged to submit to the ordinary's jurisdiction, he would himself reform at his own discretion every religious house in Tuscany. Accordingly, the brief was retracted, and Ricci was given full liberty to repress the disorders complained of. There is not any similar evidence forthcoming as to the condition

of the monasteries in other parts of Italy; but Tuscany is likely, from local causes, to have been above, rather than below, the average moral level. Against this general tendency to monastic decay may be set the foundation of the Passionists in 1725, and of the Redemptorists or Liguorians in 1732; but these two institutes, though pious and respectable, have never exerted much influence.

There is little to chronicle in regard to the later annals of monachism in Spain and Portugal. Peter of Alcantara, as reformer of the Franciscans of the latter country in the middle of the 16th century, and his more famous contemporary, Teresa, as reformer of the Carmelites in Spain, are eminent figures in the annals of their time; but they cannot be said to have produced any permanent effect on the fortunes and tone of their several institutes, far less upon the common life in general. The stamping out of all varieties of opinion, at any rate in respect of outward expression, by the Inquisition in the Peninsula makes the evidence scanty and vague; but the fact that Portugal took the lead in 1759 in striking at the Jesuits, then the most eminent and powerful of the orders, though far surpassed in mere wealth and numbers throughout Western Europe by the Franciscans, and that its policy in this respect was quickly followed by Spain, attests the growth of a hostile feeling by no means likely to have been limited to the great company. In fact, if popular rhymes and proverbs may be trusted, the charges current against the religious orders in Spain do not seem to have differed from those alleged elsewhere, whatever may have been the amount of truth in them. And the testimony of Blanco White, always to be trusted on matters within his experience, is decidedly adverse.

The terrible crash of the French Revolution, which affected, directly or indirectly, every country in Europe, was not least influential in its incidence on monachism. On the one hand, the actual destruction which it brought upon the religious houses of France was adopted as part of the revolutionary programme in all countries where such institutions were still intact; and, on the other, there was a considerable measure of improvement brought about in not a few places by the fear of public opinion, while the new institutes which continued to spring up were all but invariably active, both founders and the sanctioning authorities recognizing that any society seeking to make its footing good must needs first prove its capacity for practical usefulness. In France itself the laws which abolished all religious communities were relaxed by connivance in favour of the Sisters of Charity even under the Terror and the Directory; while in 1801 a decree of the Consular Government, issued by the Minister of the Interior, authorized Citizeness Duleau, former superior of that society, to revive it by taking young women to train for hospital work; and various other active communities were restored by Napoleon in 1807. Further revivals took place at the Restoration, the most celebrated of which was the Dominican, owing to the talents and eloquence of Lacordaire and the group he gathered round him; but Benedictines, Carthusians, Trappists, and other societies of the older type were not slow to avail themselves of the opportunity to return and to found anew, amidst a poverty which recalls the original institution, their abbeys and priories. But they met with little favour under the Orleanist monarchy, and the Second Empire was their time of most security and progress. Since its fall, they have again been actively discouraged by a strong party in the Republic, and their position remains precarious. France has been, further, the chief seat of the many new societies founded for some especial department of charitable work, the most characteristic example of which is perhaps that of the Little Sisters of the Poor,

¹ As to which documentary evidence will be found in the Appendix to De Potter's *Life of Scipio de' Ricci*.

who house and tend aged invalids. As a broad general rule, nearly every post-Reformation institute is styled, not an "Order," but a "Congregation"; but the only distinction which can be drawn between these two names is that "order" is the wider, and may include several congregations within itself (as the Benedictine order, for example, includes the congregations of Cluny and of St Maur), while a "congregation" is a simple unit, complete in itself, and neither dependent on another institute nor possessed of dependent varieties of its own. Another distinction drawn between the elder and younger societies is that the former are said to make "solemn vows," the latter only "simple vows." The difference here is not in the matter of the vows, which are usually the same in all cases, nor even in the ceremonies attending their utterance, which may also be alike, but in the superior binding efficacy of the solemn vows in Roman canon law, which rules that they so bind the member to his society, and the society to each member, that neither can sever the connexion, so that only the pope can dissolve it, and that in rare and exceptional cases alone. And it may be added that the term "religious" is restricted in the Latin Church to communities whose institute has been formally approved by the Roman see, and whose vows are for life, and not merely renewable,—a principle which excludes the Sisters of Charity, for example, from the use of this title. By the laws of France, and of some other countries, life-vows are invalid and even prohibited, but when they make part of the original institute, such disapproval by the civil power is not held to reduce them to the canonical level of temporary vows.

Returning to the history of Western monachism, the fall of the religious houses in Spain dates from the law of 21st June 1835, which suppressed nine hundred monasteries at a blow; and the remainder had but a short respite, as they were dissolved on 11th October of the same year. In Portugal, where a bias against the Roman Curia has been a traditional part of patriotism ever since the revolution of 1640, when the pope sided with Spain against the house of Braganza, there was little feeling to protect the monasteries when it happened that the crown wanted their possessions, and they were all suppressed by the decree of 28th May 1834. No European country had so many religious houses as Portugal in proportion to its population and area, and the number of the foundations dissolved in 1834 exceeded 500. In Switzerland, a considerable measure of suppression followed the war of the Sonderbund in 1847; while in Italy, the last country where monachism had remained almost unmolested, an Act was passed in the Sardinian Parliament on 7th July 1866 for the suppression of monasteries within the Piedmontese dominions, and for the confiscation of their property. The measure was extended to the whole of Italy after the unification of the kingdom; the orders were expropriated in 1873; their houses were declared national property, and were put to secular uses, no exception being made in

favour of San Marco at Florence, of Assisi, of Vallombrosa, or even of Monte Cassino itself.¹

On the other hand, several Roman Catholic societies have attained considerable success in the United States and Canada, thus in some degree recovering for the principle they represent part at least of the ground lost in Europe; while in three religious communions outside the pale of the Latin obedience—the Evangelicals of Germany, the Reformed of France, and the Church of England—the organization of women for charitable and religious work on the lines of various old institutes has been actively carried out. The Deaconesses of Kaiserswerth, founded by Pastor Fliedner in 1836, derive part of their rule, and even of their dress, from the Dames de St Augustine, themselves lineal descendants of the first Hospitallers of the crusades, and have ramified into several countries; the Strasburg and Mühlhausen Deaconesses derive theirs partly from the Flemish Beguines and partly from some points in the Moravian organization, itself handed down from those seceding Franciscans to whom the *Unitas Fratrum* really owes its origin; while the various Anglican communities, of which there are several, have borrowed freely from different sources, according to the preference and knowledge of each founder. Some attempts at reviving the common life for men also have likewise been made, but none on any large scale; only one has as yet exhibited any signs of vitality, a preaching order at Cowley, near Oxford, which has obtained some footing in England, and has even been able to spread to America.

Bibliography.—The bibliography of Monachism is excessively copious, and it is impracticable to indicate more than a few of the most important and trustworthy books. General:—Hospinianus, *De Monachis Libri Sex* (Geneva, 1659), bitterly hostile, but a copious and trustworthy record of facts; Helyot, *Histoire des Ordres Religieux* (8 vols., Paris, 1714-1721), and again (as *Dictionnaire des Ordres Religieux*), with continuation by Badiche (4 vols., Paris, Migne, 1860),—this book has itself a copious catalogue of works on its subject prefixed; Alteserra, *Asceticism, sive Originum Rei Monasticæ Libri Decem* (Paris, 1674); Holstenius, *Codex Regularum* (3 vols., Rome, 1661); Montalembert, *Moines d'Occident* (7 vols., Paris, 1860-1877); Dugdale, *Monasticon Anglicanum* (edited by Caley, Ellis, and Bandinel, 8 vols., London, 1846); Rosweyde, *Vitæ Patrum* (Lyons, 1617). Special:—Benedictines—Mabillon, *Acta SS. Ordinis S. Benedicti* (9 vols., Venice, 1733); Clunians—Marrier, *Bibliotheca Cluniacensis* (Paris, 1614); Cistercians—Gaillardio, *Les Trappistes* (Paris, 1844); Besoigne, *Histoire de l'Abbaye de Port-Royal* (8 vols., Cologne, 1752-56); Dominicans—Touron, *Histoire des Hommes Illustres de l'Ordre de Saint Dominique* (6 vols., Paris, 1743-49); Franciscans—Sedulius, *Historia Scythica* (Antwerp, 1613); Wadding, *Annales Minorum* (20 vols., Rome, 1731-94).

(R. F. L.)

¹ The total number of monasteries, &c., suppressed in Italy down to the close of 1892 was 2255, involving an enormous displacement of property and dispersion of inmates. And yet there is some reason to think that the state did but do roughly and harshly what the church should have done more gradually and wisely; for the judgment passed on the dissolution by Pius IX. himself, in speaking to an English Roman Catholic bishop, was: "It was the devil's work; but the good God will turn it into a blessing, since their destruction was the only reform possible to them." (Cited by Rev. R. R. Sufield in *Modern Review*, vol. ii. p. 359, April 1881.)

CHRONOLOGICAL TABLE OF MONASTIC FOUNDATIONS.

THE religious communities which have been formed at various times in the Western Church amount to many hundreds, and receive fresh accessions almost yearly, while some among them have been suppressed, absorbed, or suffered to die out. No official list of those actually in existence and recognized by authority is published; it is thus impracticable to enumerate them accurately, especially as many of them are only local varieties or branches of identical rules and institutes, and there are not a few cases where a once celebrated and powerful order has practically disappeared from view, though, as still lingering in one or two houses, not definitely extinct. The following table, however, gives the more remarkable foundations in chronological order, some of the earlier dates being only approximate, and even a few later ones uncertain, for the historians often vary as to the exact year, sometimes giving that of the first attempt at organization, and sometimes that of the final approval by authority.

Date.	Name.	Founder.	Place.	Date.	Name.	Founder.	Place.
250	Monks of the Thebaid	Paul the Hermit	Upper Egypt.	895	Austin Canons (original)	Augustine	Hippo Regius, Africa.
320	Tabennites	Pachomius	Tabennæ, in the Nile.	400	Acemeti, or Sleepless Monks	Alexander	Mesopotamia.
363	Basilian Monks	Basil the Great	Mataza, Pontus.				

Date.	Name.	Founder.	Place.	Date.	Name.	Founder.	Place.
420	Monks of Lerins	Honoratus of Arles ..	I. of Lerins, France.	1431	Mitigated Carmelites, or "Billettes" ..	Pope Eugenius IV. ..	Rome (?).
529	Benedictines, or Black Monks	Benedict of Nursia ..	Monte Cassino, Italy.	1435(?)	Congregation of St Ambrose ad Nemus ..	(?)	Milan.
540-570	Welsh Monks	Debric, Illtud, David ..	Wales.	1433	Oblate Nuns	Frances of Rome ..	Rome.
563	Monks of Iona	Columba ..	Iona, Scotland.	1435	Munins, or Hermits of St Francis ..	Francis de Paola ..	Vincennes, Paris.
590	Monks of Luxeuil	Columbanus ..	Ancray, France.	1443	Daughters of St Martha (Hospitaliers) ..	Nicolas Rollin, chancellor of Burgundy ..	Beaune, France.
641	Nuns (later Canonesses) of Nivelles	Ituberga, wife of Pippin of Landen ..	Nivelles, Flanders.	1444	Augustines of the Lombard Congregation ..	Gregorio Rocchi ..	Pavia.
700	Canons Regular	Chrodegang ..	Metz.	1453	Madelonettes ..	Bishop de Boppart ..	Metz.
910	Benedictines of Cluny	Berno ..	Cluny, France.	1454	Barnabites, or Clerks Regular ..	Pope Innocent VIII. ..	Rome.
1012	Order of Camaldoli	Romuald ..	Camaldoli, Italy.	1498	Filles Repenties	Jean Tisserand	Paris.
1039	Order of Vallombrosa	John Gualbert	Vallombrosa, Tuscany.	1503	Annonciades	Queen Jeannede Valois ..	Bourges, France.
1061(?)	Austin or Black Canons	Avignon (?) ..	1503	Theatines	Giovanni Pietro Caraffa (Pope Paul IV.) ..	Treate or Chieti, Italy.
1074	Order of Grammont	Stephen	Mont Moret, Liноges.	1524	Capuchins, or Reformed Franciscans ..	Matteo di Bassi ..	Pisa.
1034	Carthusians	Bruno ..	Ncar Grenoble.	1531	Clerks-Regular of St Majolus of Pavia, or "Somaschi" ..	Girolamo Emiliani ..	Pavia.
1095	Order of St Anthony of Vienne	Gaston ..	Vienne, Dauphiné.	1532	Recollects, or Strict Franciscans ..	(?)	Spain (?).
1098	Cistercians	Robert ..	Molesme, Burgundy.	1523	Barnabites of St Paul ..	Giacopo Antonio Morignia ..	Milan.
1100(?)	Cruciferi (suppressed, 1656) ..	(?) ..	Jerusalem (?) ..	1531	Jesuits	Ignatius Loyola ..	Montmartre, Paris.
1100	Order of Fontevraud	Robert d'Arbrissel ..	Fontevraud, Poitiers.	1537	Ursulines	Angela de' Merici ..	Brescia, Italy.
1104	Knights Hospitallers of St John ..	Gerard (Raymond du Pay, first Grand Master) ..	Jerusalem.	1538	Brothers of Charity ..	John of God ..	Granada.
1118	Templars (suppressed in 1313) ..	Hugh de Payens ..	Jerusalem.	1544(?)	Jesuitesses (suppressed, 1631) ..	An Englishwoman, named Ward ..	Flanders.
1119(?)	Knights of St Lazarus ..	(?) ..	Jerusalem.	1558	Oratorians	Philip Neri ..	Rome.
1120	Canons Regular of Prémontré ..	Norbert ..	Prémontré, Picardy.	1568	Discalced Carmelites ..	Theresa ..	Avila, Spain.
1140	Trappists	Rotrou II., count of Perche ..	La Trappe, France.	1571	Fathers of Christian Doctrine ..	Pope Pius V. ..	Rome.
1148	Gilbertines	Gilbert of Sempringham ..	Sempringham, Lincolnshire.	1577	Feuillants	Jean de la Barrière ..	Feuillans, France.
1156	Knights of Alcantara	Sauro, and Gomez, de Barrantes ..	St Julian, Ciudad Rodrigo.	1578	Oblates of St Ambrose ..	Carlo Borromeo ..	Milan.
1156	Hermits of St William, or White-Mantles ..	William de Malaval ..	Pescara, Italy.	1579	Latin Monks of St Basil ..	Pope Gregory XIII. ..	Rome.
1158	Knights of Calatrava	Sancho III., of Castile ..	Calatrava, Spain.	1584	Clerks Regular, Ministers of the Sick ..	Camillo de' Lelli ..	Rome.
1162	Knights of St Bennet of Aviz ..	Alfonso I., of Portugal ..	Evora, Portugal.	1588	Clerks Minor ..	Agostino Adorno ..	Genoa.
1170	Knights of Santiago of the Sword ..	Ferdinand II., of Leon ..	Compostella, Galicia.	1588	Discalced Augustinians ..	Thomas d'Andrada (Thomas de Jesus) ..	Talavera.
1178	Beguines	Bega, or Lambert le Begue ..	Liège.	1594	Congregation of Piepus ..	Vincent Mussart ..	Frsnconville-sons-bois, Paris.
1191	Teutonic Knights	Heinrich Walpot ..	Acre, Syria.	1595	Discalced Trinitarians ..	Juan Baptista Garcias ..	Val de Peñas, Spain.
1196(?)	Humiliati (suppressed, 1570) ..	(?) ..	Milan.	1596	Notre Dame de St Paul ..	Madeleine d'Escoublean de Sourdais ..	St Paul, France.
1197	Trinitarians	John de Matha and Felix de Valois ..	Meaux, Paris.	1608	Jacobins, or Reformed Dominicanans ..	Jean Michaelia ..	Paris.
1198	Knights Hospitallers of the Holy Spirit ..	Guy of Montpellier ..	Montpellier, France.	1609	English Institute of B. V. Mary ..	Mary Ward ..	St Omer, France.
1200(?)	Penitents of St Mary Magdalene ..	(?) ..	Germany.	1610	Nuns of the Visitation ..	Jeanne Françoise de Chantal ..	Anaey, Savoy.
1208	Franciscans	Francis Bernardone ..	Assisi.	1611	French Ursulines	Marie Lhuillier ..	Paris.
1209	Carmelites	Albert, titular patriarch of Jerusalem ..	Mount Carmel, Palestine.	1611	French Oratorians	Cardinal de Berulle ..	Paris.
1212	Nuns of St Clare	Francis and Clara ..	Assisi, Italy.	1615	Canons Regular of St Saviour ..	Fournier de Mataincourt ..	Lorraine.
1212	Order of Val-des-Écoliers ..	William of Paris ..	Chaumont, France.	1617	Hospitaller Nuns of St Charles	Nancy.
1214	Canons Regular of the Holy Cross ..	Theodore de Celles ..	Clair-Lieu, Belgium.	1617	Pauline Congregation of the Mother of God ..	Joseph Calasanza ..	Rome.
1214(?)	Hermits of St Augustine ..	Giovanni Bono ..	Cesena, Italy.	1618	Nuns of Calvary ..	Antoinette d'Orléans ..	Poitiers.
1215	Dominicans	Dominic Guzman ..	Rologna.	1621	Congregation of Benedictines of St Maur ..	Didier de la Cour ..	Verdun, France.

1842	Deaconesses of Strasburg (Luth.)	Paastor Harter	Strasburg.				

MONACO (French *Monegue*), the smallest of the sovereign principalities of Europe, with an area of 8.34 square miles, a population (1878) of 7049, and an army of 72 men, is situated on the coast of the Mediterranean, 9 miles east of Nice, and bounded on all sides by the French department of the Maritime Alps. Previous to 1861, when the communes of Mentone (Menton) and Roccabruna (Roquebrun) were sold to France for 4,000,000 francs, the area was about a third larger; but the population, which with those portions again included would now be 15,000, was only about 8000. Monaco has long had the reputation of being one of the most beautiful and sheltered spots on all the Franco-Italian coast; *non Corus in illum Jus habet aut Zephyrus; solus sua littora turbat Circeus*, said Lucan; and a luxuriant growth of aloe and prickly pears (introduced in 1537), palm-trees, eucalyptus, lemon-trees, and geraniums gives a warmer colour to the scene than Lucan can have known. The town occupies the level summit of a rocky headland, rising about 195 feet from the shore, and still surrounded with ramparts. Though largely modernized, the palace is a fine specimen of Renaissance architecture; the new "cathedral" (French Renaissance style), the new church of St Charles, and the museum may also be mentioned. Behind the rock, between Mont Tête de Chien and Mont de la Justice, the high grounds rise towards Turbie, the village on the hill which takes its name from the *tropæa* with which Augustus marked the boundary between Gaul and Italy. On the eastern side lies the little port or bay of Monaco; along the lower ground at the head of the bay stretches the village of Condamine with orange-gardens, manufactures of perfumes and liqueurs, and the chapel of Ste Dévôte, the patron saint of Monaco; farther to the east, on the rocky

slopes of the Spélugues (Speluncæ) are grouped the various buildings of the Casino of Monte Carlo and the numerous villas and hotels which it has called into existence. Previous to 1828 the Spélugues were mere barren rocks; but after

Plan of Monaco.

they were traversed by the new road to Mentone, Count Rey caused them to be covered with soil by Italian convicts; and since 1858, when the first stone of the Casino was laid, the process of artificial embellishment has been carried

out on the most magnificent scale. The gaming establishment is now in the hands of a joint-stock company with a capital of 15,000,000 francs. None of the inhabitants of Monaco have access to the tables; and their interest in the maintenance of the *status quo* is secured by their complete exemption from taxation, and the large prices paid for their lands. Gambling-tables were set up at Monaco in 1856; but it was not till 1860, when M. Blanc, expelled from Homburg, took possession of the place, that Monte Carlo began to be famous.

A temple of Heracles Monæus was built on the Monaco headland at a very early date, probably by the Greeks of Massilia. Monæci Portus or Portus Herculis is frequently mentioned by the later Latin writers. From the 10th century the place was associated with the Grimaldi, a powerful Genoese family who held high offices under the republic and the emperors; but not till a much later date did it become their permanent possession and residence. In the beginning of the 14th century it was notorious for its piracies. Charles I. (a man of considerable mark, who, after doing great service by sea and land to Philip of Valois in his English wars, was severely wounded at Crécy) purchased Mentone and Rocca-bruna, and bought up the claims of the Spinola to Monaco. The princes of Monaco continued true to France till 1524, when Augustin Grimaldi threw in his lot with Charles V. Honoré I., Augustin's successor, was made marquis of Campagna and count of Canosa, and people as well as rulers were accorded various important privileges. The right to exact toll from vessels passing the port continued to be exercised till the close of the 18th century. Honoré II., who renewed the alliance with France in 1641, was compensated for the loss of Canosa, &c., with the duchy and peerage of Valentinois and various lesser lordships; and duke of Valentinois long continued to be the title of the heir-apparent of the principality. The National Convention annexed the principality to France in 1793; restored to the Goyon Grimaldis by the Treaty of Paris in 1814, it was placed by that of Vienna under the protection of Sardinia. King Albert of Sardinia took the opportunity of disturbances that occurred in 1848 to annex Mentone and Rocca-bruna; but this high-handed proceeding was condemned by the protocol of 1856, and Charles III. (born 1818) entered upon his full rights. With the transference of Nice to France in 1860 the principality passed again under French protection.

See Charles de Venasques, *Genealogia et historica Grimaldis gentis arbor* (the work of Honoré II.).

MONAGHAN, an inland county of Ireland in the province of Ulster, is bounded E. by Armagh, S.E. by Louth, S. by Meath, S.W. by Cavan, W. by Fermanagh, and N. by Tyrone. The area is 318,806 acres, or 498 sq. miles. The north-western part of the county is included in the great central plain of Ireland; but in the south-east there is an uprising of Lower Silurian rocks. The surface is irregular, although none of the hills are of great elevation. The principal range is that of Slievebeagh, a rugged and barren tract extending into Fermanagh, its highest summit being 1254 feet above sea-level. Formerly much of the country was under forest, but it is now very bare of trees, except in the many demesnes of the nobility and gentry. The scenery is redeemed from monotony by the large number of small lakes and streams. The lakes number in all nearly 200. The principal rivers are the Finn, which rises near the centre of the county and passes into Fermanagh, and the Blackwater, which forms the boundary with Tyrone. The Ulster Canal passes the towns of Monaghan and Clones, affording communication between Lough Neagh and Lough Erne. Eskers occur at several places. There are seams of unworkable coal in the south-west of the county. The limestone is not only abundant and good, but from the position of the rocks it can be obtained at very small expense in working. Freestone and slates are quarried in considerable quantities. The other minerals include lead ore, antimony, fuller's earth, marble, and manganese; but the quantities obtained are inconsiderable.

Climate and Agriculture.—Partly owing to the large proportion of bog and water the climate is somewhat moist. The soil in the more level portions of the county is very fertile where it rests on limestone, and there is also a mixed soil of deep clay, which is capable of high cultivation; but in the hilly regions a strong retentive clay prevails, which could be made productive only by careful drain-

ing and culture. Spade husbandry generally prevails. The most common manure is a compost of lime and burned turf mould. Marl is abundant, but is little used, and gypsum also is found.

The number of holdings in 1881 was 17,849, of which as many as 10,784 did not exceed 15 acres in extent, and 2870 of these did not exceed 5 acres; 6454 ranged between 15 and 50 acres, and only 24 were above 200 acres. The area of arable land was 278,755 acres, or 87 per cent. of the whole, while 5258 were under plantations, 7580 bog and marsh, 5239 barren mountain land, and 21,582 water, roads, and fences. The following table shows the areas under the different crops in 1850 and 1882:—

	Wheat.	Oats.	Other Cereals.	Potatoes.	Turnips.	Other Green Crops.	Flax.	Meadow and Clover.	Total.
1850	5,861	80,946	7,467	22,105	7,190	2,543	10,157	11,899	147,668
1882	1,228	58,997	1,665	21,321	7,562	1,533	12,348	31,450	131,134

Horses numbered 10,229 in 1872, and 10,666 in 1882. In the same years mules numbered 300 and 469, and asses 4314 and 3476. The number of cattle in 1872 was 81,333, and in 1882 only 72,266, an average of 25·9 to every 100 acres under cultivation, the average for Ireland being 25·8. Sheep between 1872 and 1882 declined from 17,964 to 9858, a very inconsiderable number; pigs increased from 26,008 to 29,972; goats from 8873 to 12,391; and poultry from 341,874 to 434,260.

According to the latest return, the land was divided among 1470 proprietors, who possessed 311,440 acres, with a total annual value of £261,382. The average size of the properties was 211 acres, and the average value per statute acre 17 shillings. The following seven proprietors possessed upwards of 10,000 acres: E. P. Shirley, 26,886; marquis of Bath, 22,762; earl of Dartrey, 17,345; Lord Rossmore, 14,839; Sir John Leslie, 13,621; Viscount Templetown, 12,845; A. A. Hope, 11,700.

Manufactures.—The only manufacture of consequence is linen, which of late years has been on the increase. The number of scutching mills in 1881 was 55, of which 45 were wrought by water, 8 by steam, and 2 by water and steam.

Administration.—The county includes 5 baronies, 23 parishes, and 1850 town lands. Assizes are held at Monaghan, and quarter-sessions at Carrickmacross, Castleblayney, Clones, and Monaghan. There are 8 petty sessional districts within the county, and part of another. It includes the poor-law unions of Carrickmacross and Monaghan, and portions of Castleblayney, Clogher, Clones, Coote-hill, and Dundalk. It is in the Belfast military district, sub-district of Armagh. There is a barrack station at Monaghan. In the Irish parliament two members were returned for the county and two for the town of Monaghan, but at the Union Monaghan was disfranchised.

Population.—The population in 1841 was 200,442; but in 1851 it had diminished to 141,823, in 1871 to 114,969, and in 1881 to 102,748, of whom 50,077 were males and 52,671 females. At the last census 73 per cent. of the inhabitants were Roman Catholics, 13 per cent. Episcopalians, and 11 per cent. Presbyterians. The number of emigrants from 1st May 1851 to 31st December 1881 was 56,408, or about 1840 persons per annum; while during the twenty years ending 31st March 1881 the annual rate of emigration was 13·8 per 1000 of the population. The death-rate to every thousand of the population for the ten years ending 1881 was 16·9, the birth-rate 23·4, and the marriage-rate 3·6. The towns possessing more than 1000 inhabitants are—Monaghan 3369, Clones 2216, Carrickmacross 2002, Castleblayney 1810, and Ballyblay 1654. Monaghan, the county town, received its name *Muinnechan* (the town of monks) from a monastery founded there at a very early period. The town was incorporated by James I., but it was little more than a hamlet till towards the close of last century. Besides the usual county buildings, it contains a Roman Catholic college, and National model schools.

History and Antiquities.—In the time of Ptolemy, Monaghan formed part of the territory of the Scoti. Subsequently included in the district of Oriel or Orgial, and long known as Macmahon's country, it became shire ground in the reign of Elizabeth.

The antiquarian remains of Monaghan are comparatively unimportant. At Clones there is a round tower in good preservation, but very rude in its masonry; another at Inniskeen is very dilapidated. Near Clones there are two large raths. Although there are several old Danish forts, there are no mediæval castles of importance. The only monastic structure of which any vestiges remain is the abbey of Clones, which was also the seat of a bishopric. The abbey dates from the 6th century, but was rebuilt in the 14th century after destruction by fire. On the site of the Franciscan abbey at Monaghan a castle was erected, which was in a ruinous condition in the time of James I.

MONARCHIANISM, in its technical Christological sense, designates the view taken by those Christians who,

within the church, towards the end of the 2d century and during the 3d, opposed the doctrine of a hypostatic Logos (hypostasianism) or of an independent personal subsistence of the Divine Word. It is usual (and convenient) to speak of two kinds of monarchianism,—the dynamistic and the modalistic. By monarchians of the former class Christ was held to be a mere man, miraculously conceived indeed, but constituted the Son of God simply by the infinitely high degree in which he had been filled with Divine wisdom and power. This view was represented in Asia Minor about the year 170 by the anti-Montanistic Alogi, so called by Epiphanius on account of their rejection of the Fourth Gospel; it was also taught at Rome about the end of the 2d century by Theodotus of Byzantium, a carrier, who was excommunicated by Bishop Victor, and at a later date by Artemon, excommunicated by Zephyrinus. About the year 260 it was again propounded within the church by PAUL of Samosata (*q.v.*), who held that, by his unique excellency, the man Jesus gradually rose to the Divine dignity, so as to be worthy of the name of God. Modalistic monarchianism, conceiving that the whole fulness of the Godhead dwelt in Christ, took exception to the "subordinationism" of some church writers, and maintained that the names Father and Son were only two different designations of the same subject, the one God, who "with reference to the relations in which He had previously stood to the world is called the Father, but in reference to His appearance in humanity is called the Son." It was first taught, in the interests of the "monarchia" of God, by Praxeas, a confessor from Asia Minor, in Rome about 190, and was opposed by Tertullian in his well-known controversial tract. The same view—the "patripassian" as it was also called, because it implied that God the Father had suffered on the cross—obtained fresh support in Rome about 215 from certain disciples of Noetus of Smyrna, who received a modified support from Bishop Callistus. It was on this account that Hippolytus, the champion of hypostasian subordinationism, along with his adherents, withdrew from the obedience of Callistus, and formed a separate community. A new and conciliatory phase of patripassianism was expounded at a somewhat later date by Beryllus of Bostra, who, while holding the divinity of Christ not to be *ιδία*, or proper to Himself, but *πατρική* (belonging to the Father), yet recognized in His personality a new *πρόσωπον* or form of manifestation on the part of God. Beryllus, however, was convinced of the wrongness of this view by ORIGEN (*q.v.*), and recanted at the synod which had been called together in 244 to discuss it. For the subsequent history of modalistic monarchianism, see SABELLIUS.

MONASTICISM. See MONACHISM.

MONASTIR, BITOLIA, or TOLI MONASTER, a city of Macedonia, now the chief town of the Turkish vilayet of Roumelia, is situated at a height of 1880 feet above the sea, in a western inlet of the beautiful, fertile, and many-villaged plain which, with a breadth of about 10 miles, stretches for 40 miles eastward from Mount Peristeri (7714 feet high) to the Babuna chain. It is embosomed in rich masses of foliage, and crossed by a rough-channeled mountain stream, the Drahor, which joins the Czerna or Karasu, a tributary of the Vardar. The military advantages of its position at the meeting-place of roads from Salonica, Durazzo, Uskiub, and Adrianople led the Turks about 1820 to make Monastir the headquarters of the Roumelian *corps d'armée*. Since then its general and commercial importance has greatly increased. A considerable amount of gold and silver work (especially clasps and filigree) is made by the local craftsmen. The population is about 40,000.

Monastir—so called from the monastery of Bukova (The Beeches), some hundred feet up the slope of Peristeri—is identified with the

ancient Heraclea Lyncestis on the Egnatian Way; and its bishopric is still called the bishopric of Pelagonia from the ancient name of the plain. In 1833 the town was the scene of the massacre of the Albanian beys.

MONBODDO, JAMES BURNETT, LORD (1714-1799), author of works on the *Origin and Progress of Language* (published in 1773), and *Ancient Metaphysics* (1779), was one of the most marked characters in Scottish literary circles in the 18th century. He was born in 1714 at Monboddo in Kincardineshire, studied at Aberdeen and Groningen, and quickly took a leading position at the Edinburgh bar, being made one of the Lords of Session in 1767. Many of his eccentricities, both of conduct and opinion, appear less eccentric to the present generation than they did to his contemporaries; though he seems to have heightened the impression of them by his humorous sallies in their defence. He may have had other reasons than the practice of the ancients for dining late and performing his journeys on horseback instead of in a carriage. His views about the origin of society and language and the faculties by which man is distinguished from the brutes afforded endless matter for jest to the wags of his day; but readers of this generation are more likely to be surprised by the scientific character of his method and the acuteness of his conclusions than amused by his eccentricity. These conclusions have many curious points of contact with Darwinism and Neo-Kantism. His idea of studying man as one of the animals, and of collecting facts about savage tribes to throw light on the problems of civilization, bring him into contact with the one, and his intimate knowledge of Greek philosophy with the other. In both respects Monboddo was far in advance of his neighbours. His happy turn of Virgil's line—

"Tantæ molis erat humanam condere gentem"—

might be adopted as a motto by the Evolutionists; and Neo-Kantians would find it hard to believe that he published his criticism of Locke in 1773. His studied abstinence from fine writing—from "the rhetorical and poetical style fashionable among writers of the present day"—on such subjects as he handled confirmed the idea of his contemporaries that he was only an eccentric concocter of supremely absurd paradoxes. He died, 26th May 1799, at the advanced age of eighty-five.

MONCTON, a town of the Dominion of Canada, in Westmoreland, New Brunswick, 89 miles by rail north-east of St John, is a port at the head of navigation on the Petitcodiac, and the seat of the workshops and general offices of the Intercolonial Railway. The population, about 1200 in 1871, was 5032 in 1881; the growth of the place has been favoured by the establishment of sugar-refining factories, and factories for cotton and brass and iron wares since the Canadian Parliament in 1879 adopted a policy of protection. For the year 1881-82 the exports amounted to \$64,817, and the imports to \$252,571.

MONDOÑEDO, an ancient city of Spain, 27 miles north-north-east from Lugo, in the province of that name, is situated on the Sixto, a small tributary of the Masma, on the Atlantic side of the Cantabrian chain, in a sheltered site surrounded on all sides by considerable hills. The population in 1878 was 10,112. The principal buildings are the cathedral, a Corinthian structure of the 17th century, an ex-convent of Franciscan friars of Alcantara, which is now used for a theatre and a public school, and the civil hospital. The industries, which are unimportant, include lace-making, linen-weaving, and leather manufacture.

According to local tradition, the bishopric of Dumium, near Braga, was transferred to San Martin de Mondoñedo (three leagues from Mondoñedo) in the 8th century; it was brought to Mondoñedo itself by Doña Urraca in the beginning of the 12th century; for about sixty years prior to 1233 the see was at Ribadeo. After having

been for nearly a century and a half in the hands of the Moors, Mondoëdo was recaptured by Ordoño I. in 858; and the Christian possession was made permanent by Alphonso III. in 870. It was taken by surprise by the French in 1809.

MONDOVI, a city of Italy, in the province of Cuneo, 15 miles east of Cuneo and about 55 west of Genoa by rail, was formerly the chief town of the Sardinian province of Mondovì, and between 1560 and 1719 the seat of a Piedmontese university. The central quarter occupies the summit of a hill 1670 feet high, and contains the hexagonal piazza, a citadel erected in 1573 by Emanuel Philibert, the cathedral of St Donatus, a spacious episcopal palace, and the statue of Beccaria, who was a native of the town. At the foot of the hill along the banks of the

Ellero (a tributary of the Po) lie the industrial and commercial suburbs of Breo, Borgatto, Pian della Valle, and Carassone, with their potteries, tanneries, marble-works, &c. The mansion of Count San Quintino in Pian della Valle was the seat of the printing-press which from 1472 issued books with the imprint Mons-Regalis; and in modern times the Ducal press founded by Emanuel Philibert has acquired a great reputation. The population of the town was 9637 in 1871, with the suburbs 11,958; that of the commune 17,726 in 1861, and 17,902 in 1881.

Breo is identified with a certain Colonia Bredolensis; but Mondovì proper—Mons Vici, Mons Regalis (Monteregale), or Vicodunum—probably did not take its rise till about 1000 A.D. The bishopric dates from 1338.

M O N E Y

1. *Definition and Functions of Money.*—The precise definition of Money is a question presenting no small difficulty, and it has been complicated by the attempts of some writers to define the term so as to lend support to their favourite theories. The real difficulties of the subject are, however, chiefly connected with paper-money, and as that side of the question has been dealt with in the article BANKING (*q.v.*) it will here be sufficient to adopt the clear and careful description of money given by a distinguished American economist as being "that which passes freely from hand to hand throughout the community in final discharge of debts and full payment for commodities, being accepted equally without reference to the character or credit of the person who offers it and without the intention of the person who receives it to consume it or enjoy it or apply it to any other use than in turn to tender it to others in discharge of debts or payment for commodities."¹ In this passage the essential features of money are plainly set forth, though, as is frequently the case in economics, particular cases hard to bring within the description may be found.²

The functions which money discharges in the social organism are—at least in the opinion of all writers worth noticing here—clearly manifest. The most important is that of facilitating exchanges. It is not necessary to dwell on the great importance of this office. The mere consideration of industrial organization shows that it is based on the division of employments; but the earliest economic writers saw clearly that division of employments was rendered possible only by the use of a medium of exchange. They saw that the result of increasing specialization of labour was to bring about a state of things in which each individual produced little or nothing directly adapted to satisfy his own wants, and that each one was to live by exchanging his products for those of others. They saw, moreover that this was not feasible without some object which all would be willing to accept for their peculiar products, for otherwise, the difficulty of getting those together whose wants were reciprocal would be a complete hindrance to the development of exchange, which alone made division of labour possible. A second function hardly inferior in importance to the one just mentioned is that of affording a ready means of estimating the comparative value of different commodities. Without some common commodity as a standard of comparison this would be almost impossible. "If a tailor had only coats and wanted to buy bread or a horse, it would be very troublesome to ascertain how much bread he ought to obtain for a coat or how many coats he

should give for a horse;"³ and as the number of commodities to be dealt with increased the problem would become harder, "for each commodity would have to be quoted in terms of every other commodity." Indeed it may be reasonably maintained that the idea of general value could not be formed without the existence of money, and all that is known of savage races tends to bear out this view.⁴ The adoption of some one commodity renders the comparison of values easy. "The chosen commodity becomes a *common denominator* or *common measure of value* in terms of which we estimate the values of all other goods,"⁵ and thus money, which in its primary function renders exchanges possible by acting as an intermediate term in each exchange, also makes exchanges easier by making them definite. Another function of money comes into being with the progress of society. One of the most distinctive features of advancing civilization is the increasing tendency of people to trust each other. Thus there is a continual increase in relations of contract, as may be seen by examining the development of any legal system. Now a contract implies something to be done in the future, and for estimating the value of that future act a standard is required; and here money, which already acts as a *medium of exchange* and as a *measure of value* at a given time, performs a third function, by affording an approximate means of estimating the present value of the future act, and in this respect may be regarded as a *standard of value*, or, if the phrase be preferred, *of deferred payments*.⁶ Some writers attribute a fourth function to money, inasmuch as they regard it as being a means of easily storing up value. Doubtless it does supply this need, which is a specially pressing one in early civilizations owing to the insecurity which then exists, but with the progress of settled government the need becomes less extreme. Other forms of investment grow up, and the habit of hoarding money becomes unusual. It is therefore better to regard the functions of money as being only three in number, viz., to furnish—(1) the common medium by which exchanges are rendered possible, (2) the common measure by which the comparative values of those exchanges are estimated, and (3) the standard by which future obligations are determined.

2. *Causes which Determine the Value of Money. Quantity of Money needed by a Nation.*—The problem of the determining causes of the value of money is a particular case of the general problem of values, but there are circumstances which render the inquiry more than usually complicated. Before considering these it will be well to deal with a use of the phrase "value of money" which has led to much con-

¹ F. A. Walker, *Money, Trade, and Industry*, p. 4.

² For further information as to the discussions relative to the proper definition of "Money," the reader may consult J. S. Mill, *Prin. of Pol. Econ.*, B. iii. ch. 12, § 7; Jevons, *Money*, pp. 248 sq.; É. de Laveleye, *Marché Monétaire*, pp. 226 sq.; and especially Mr H. Sidgwick's article "What is Money?" in the *Fortnightly Review* (April 1879), also his *Principles of Political Economy*, pp. 231 sq.

³ Mill, *Prin.*, B. iii. ch. 7, § 1.

⁴ W. Bagehot, *Economic Studies*, pp. 42-43. ⁵ Jevons, *Money*, p. 6.

⁶ For an ingenious argument against the use of the terms "measure" or "standard" of value, see F. A. Walker, *Money*, pp. 4 sq., 12, and *Money, Trade, and Industry*, pp. 27 sq., 60 sq. The shorter title is uniformly used here for his larger treatise.

fusion. In mercantile phraseology the value of money means the interest charged for the use of loanable capital. Thus, when the market rate of interest is high money is said to be dear, when it is low money is regarded as cheap. Whatever may be the force of the reasons in favour of this use, it is only mentioned here for the purpose of excluding it. For our present subject, "the value of a thing is what it will exchange for; the value of money is what money will exchange for, or its purchasing power. If prices are low, money will buy much of other things, and is of high value; if prices are high, it will buy little of other things, and is of low value. The value of money is inversely as general prices, falling as they rise and rising as they fall."¹ Now in the general theory of value it appears that the proximate condition which determines it is the equation between supply and demand; and this is clearly the case with reference to money. These terms, supply and demand, need, however, some elucidation. Let us consider what is meant by the supply of, and demand for, money. The supply of a commodity means the quantity of it which is offered for sale. But in what shape does the sale of money take place? By being offered for goods. "The supply of money, then, is the quantity of it which people are wanting to lay out;" or, to put the point more concisely, it is "all the money in circulation at the time." Again, to take the case of demand,—the demand for a commodity is the purchasing power offered for it.² Demand in the special case of money consists of all the goods offered for sale. There is, however, a peculiar feature in the case of money which arises from its position as the medium of exchange, viz., that money is, so to say, in a "constant state of supply and demand," since its principal service is to act as the means of purchasing commodities.³ From this it follows that the factors which determine the value of money within a given time are: (1) the amount of money in circulation, and (2) the amount of goods to be sold. On closer examination it will, however, appear that there are other elements to be taken into account. In the first place, the quantity of money is not by itself the sole element on the supply side. In some instances a coin will not circulate more than two or three times in a year, while another coin may make hundreds of purchases. In determining the value of money these varying rates of circulation have to be considered, and by taking an average we may establish the existence of a fresh element to be estimated, namely, the average rapidity with which money does its work, or, to use Mill's expression, "the efficiency of money." On the side of demand, again, it is not the quantity of commodities that is the determining element, but the amount of sales, and the same article may, and generally does, pass through several hands before it reaches the consumer. From this it follows that (if the consideration of credit in its various forms be omitted) the value of money is inversely as its quantity multiplied by its efficiency, the amount of transactions being assumed to be constant. This formula requires, however, some further explanations before it can be accepted as a full expression of the truth on the subject. It must be noticed that it is not commodities only that are exchanged for money. Services of all kinds constitute a large portion of the demand, while the payment of interest on the various forms of obligation requires a large amount of the circulating medium. The potent influence of credit also must be dwelt on. This latter force is the main element to be considered in dealing with variations of prices; but

so far as it is based on a deposit of metallic money it may be looked on as a means of increasing the efficiency of money, and therefore as coming within the formula given above. In its other aspects it lies outside the range of this article. Some interesting conclusions may be deduced from the results we have arrived at. One of these is that the "increased development of trade," or "expansion of commerce," of itself tends to lower not to raise prices; for, by increasing the work which money has to do while the amount remains the same, it raises its value.⁴ Another consequence is that a large addition may be made to the money in a country without any effect being produced on prices. This is evident, since money only acts on prices by being brought into circulation; therefore, if the money which is added to the national stock is not used in this way, prices will remain unaffected.

We have now sufficiently considered the proximate conditions which determine the value of money; the next step is to inquire: What is the ultimate regulator of its value? The value of freely-produced commodities is—according to the ordinary theory of economists—determined by their "cost of production," or, where the article is produced at different costs, by the cost of production of the most costly portion. We have now to consider how far this theory applies to the special case of money. Gold and silver, the principal materials of money, are the products of mines, and are produced at different costs; therefore the cost of the part produced at greatest cost ought to determine their value. This theory is, however, true only under certain conditions—namely, that competition is perfectly free, and that there are accurate data for computing the cost of production, and even then it is true only "in the long run." Moreover, cost only operates on value by affecting supply. "The latent influence," says Mill,⁵ "by which the values of things are made to conform in the long run to the cost of production is the variation that would otherwise take place in the supply of the commodity." From these considerations it follows that cost of production does not so influentially affect the value of money as some writers have supposed. In former periods it was a common proceeding on the part of the state to either restrict or stimulate coinage and mining for the precious metals. At all times the working of gold and silver mines has been rather a hazardous speculation than a legitimate business. "When any person undertakes to work a new mine in Peru," says Adam Smith,⁶ "he is universally looked upon as a man destined to bankruptcy and ruin, and is upon that account shunned and avoided by everybody. Mining, it seems, is considered there in the same light as here, as a lottery, in which the prizes do not compensate the blanks;" and all subsequent experience confirms this view. With regard to the adjustment of supply to meet an altered cost of production, the difficulties are, if possible, still greater. The supply of money is so large compared with the annual production, that any change can operate but slowly on its value. The total stoppage of fresh supplies from the mines would not be felt for some years in the increased value; and an increased amount of production, though more rapid in its operation, takes some time to produce an effect. "Hence the effects of all changes in the conditions of production of the precious metals are at first, and continue to be for many years, questions of quantity only, with little reference to cost of production." On these grounds it is apparent that cost of production is not, for short periods, the controlling force which governs the value of money, and even for long

¹ Mill, *Prin.*, B. iii. ch. 8, § 1.

² For a clear statement of this, see J. E. Cairnes, *Leading Principles*, part i. ch. 2.

³ The leading exception to this is in the case of money which is hoarded for an indefinite period, and is therefore withdrawn from circulation.

⁴ This view, which seems to most persons a paradox, is well put by Adam Smith, *Wealth of Nations*, p. 81 (ed. McCulloch); also by J. E. Cairnes, *Essays on Political Economy*, p. 4.

⁵ *Prin.*, B. iii. ch. 3, § 2.

⁶ *Wealth of Nations*, p. 78 (ed. McCulloch).

periods the speculative nature of the industries connected with the production of money renders the cost of production an element very hard to ascertain. Another consideration which gives a peculiar feature to the problem of money-value is that in the case of other commodities a change in cost of production affects value without any actual change in the supply. The knowledge that a commodity can be produced at a lower cost will cause a reduction in its value. This is not true of money. Either the quantity or the efficiency of money must be altered to change its value. This is, of course, a result of its position as the circulating medium. When all these circumstances are taken into account it becomes clear that the most correct way to regard the question of money-value is that which looks on supply and demand, as interpreted above, as the regulator of its value for a limited time, while regarding cost of production as a force exercising an influence of uncertain amount on its fluctuations during long periods. Where the coinage of a state is artificially limited, the value of its money plainly depends on supply and demand as we have interpreted it.

The next question which arises is: What quantity of money does a nation require? What amount of the circulating medium is necessary for the proper working of the industrial organism? To this puzzling problem the earlier economists gave answers in the shape of definite formulæ. Thus, Sir W. Petty was of opinion that the amount of coin required by a country was one-half the rent of land, one-fourth the amount of building rent, and one fifty-second part of the annual wages of labour. Locke's view was that one-fiftieth of labourers' wages, one-fourth landowners' revenue, and one-twentieth of traders' yearly returns, was the proper amount. Modern statisticians, however, though having command of much greater resources, decline to attempt a quantitative answer, and content themselves with indicating the conditions which the problem involves. In fact we must first examine the work which money has to perform, and this depends on several conditions. The first of these is the population; *ceteris paribus*, twice as many people will want twice as much money. The second is the amount of transactions; for, if the amount of business done is doubled, the amount of money must be also doubled, unless at the same time some improvement in credit is introduced. The efficiency of money is a third element which affects the quantity needed, and this is largely dependent on the habits of the people and the facilities for communication. Other elements which can be only briefly indicated are—"the degree in which credit exists between man and man; the amount of travelling which takes place; and the commercial and banking organization which exists."¹ Another factor which requires to be estimated is the extent to which habits of hoarding exist; for all money hoarded is withdrawn from circulation, and therefore increases the total amount needed. The habits of saving in the rural districts of France remarkably exemplify this element in the question. Again, the existence of barter does away with the use of so much money as would be required to carry on the exchanges effected by barter. The custom of paying wages in kind has a similar effect. This bare statement shows how insoluble the question is. When we contemplate the matter from an international point of view, the amount needed, after allowance is made for the cost of transporting goods, is plainly that which will keep a country's prices at a level with those of the countries with which it has commercial relations.² For otherwise the country would have an excess either of importation or of exportation, which would necessitate a flow of money to the country whose prices were lower than the general level.

This, then, is the condition which determines comparative prices between different countries; and, prices being so determined, the quantity of money needed to keep up those prices depends on the conditions above indicated. In the case of England reliable statistics tend to show that the gold in circulation was, in 1872, about £105,000,000, and the note circulation £43,000,000. In any Continental country the amount would probably be proportionally much greater, owing to the fact that there is in England a greater development of credit.

3. *Early Forms of Currency.*—Up to the present we have considered money as being fully established and properly adapted to fulfil its various functions. We have now to trace the steps by which a suitable system of currency was evolved from a state of barter. It is important for a right understanding of the question to grasp the fact that exchanges took place originally between groups, and not between individuals. This explains the slow growth of exchanges, as each group produced most of the articles necessary for itself, and such acts of barter as took place were rather reciprocal presents than mercantile exchanges. Such is actually the case at present among modern savages. "It is instructive to see trade in its lowest form among such tribes as the Australians. The tough greenstone valuable for making hatchets is carried hundreds of miles by natives, who receive from other tribes in return the prized products of their districts, such as red ochre to paint their bodies with; they have even got so far as to let peaceful traders pass unharmed through tribes at war, so that trains of youths might be met, each lad with a slab of sandstone on his head to be carried to his distant home and shaped into a seed-crusher. When strangers visit a tribe they are received at a friendly gathering or corroboree, and presents are given on both sides. No doubt there is a general sense that the gifts are to be fair exchanges, and if either side is not satisfied there will be grumbling and quarrelling; but in this roughest kind of barter we do not yet find that clear notion of a unit of value which is the great step in trading."³ This vivid description of what is going on at present among lower races enables us to realize the way in which money came into existence. When any commodity becomes an object of desire, not merely from its use to the persons desiring it, but from their wanting it as being readily exchangeable for other things, then that article may be regarded as rudimentary money. Thus the greenstone and ochre are on their way to being promoted to the position of currency, and the idea of a "unit of value" is all that is needed to complete the invention. "This higher stage is found among the Indians of British Columbia, whose strings of *haiqua*-shells worn as ornamental borders to their dresses serve them also as currency to trade with,—a string of ordinary quality being reckoned as worth one beaver's skin."⁴ These shells, therefore, are in reality money, inasmuch as they discharge its functions.

On a review of existing savage tribes and ancient races of more or less civilization we are surprised at the great variety of objects which have been used to supply the need of a circulating medium. Skins, for instance, seem to be one of the earliest forms of money. They are to be found at present among the Indians of Alaska⁵ discharging this service, while accounts of leather money seem to show that their use was formerly more general. As the hunting stage gives place to the pastoral, and animals become domesticated, the animal itself, instead of its skin, becomes the principal form of currency. There is a great mass of evidence to show that, in the most distant regions and at very different times, cattle formed a currency for pastoral and early agricultural nations. Alike among existing barbarous tribes and in the survivals discovered among classical nations, sheep and oxen both appear as units of value. Thus we find that at Rome, and through the Italian tribes generally, "oxen and sheep formed the oldest medium of exchange, ten sheep being

¹ F. A. Walker, *Money*, p. 73.

² *Ib.*, p. 57.

³ E. B. Tylor, *Anthropology*, pp. 281-282.

⁴ Tylor, *loc. cit.* ⁵ Whympfer, *Alaska*, p. 285

reckoned equivalent to one ox. The recognition of these objects, as universal legal representatives of value, or, in other words, as money, may be traced back to the epoch of a purely pastoral economy.¹ The Icelandic law bears witness to a similar state of things; while the various fines in the different Teutonic codes are estimated in cattle. The Latin word *pecunia* (*pecus*) is an evidence of the earliest Roman money being composed of cattle. The English *fee* and the famous term *feudal*, according to its most probable etymology, are derived from the same root. In a well-known passage of the *Iliad*² the value of two different sets of armour is estimated in terms of oxen. The Irish law tracts bear evidence as to the use of cattle as one of the measures of value in early Irish civilization.³ Within the last few years it has been prominently brought before the public that oxen form the principal wealth and the circulating medium among the Zulus and Kaffres. On the testimony of an eye-witness we are assured that, "as cattle constitute the sole wealth of the people, so they are their only medium of such transactions as involve exchange, payment, or reward."⁴ We find that cattle-rents are paid by the pastoral Indian tribes to the United States Government.⁵ From the prominence of slavery in early societies it is natural to suppose that slaves would be adopted as a medium of exchange, and one of the measures of value in the Irish law tracts, *cumhal*, is said to have originally meant a female slave. They are at present applied to this purpose in Central Africa, and also in New Guinea. On passing to the agricultural stage a greater number of objects are found capable of being applied to currency purposes. Among these are corn—used even at present in Norway—maize, olive oil, coconuts, and tea. The most remarkable instance of an agricultural product being used as currency is to be found in the case of tobacco, which was adopted as legal tender by the English colonists in North America. Another class of articles used for money consists of ornaments, which among all uncivilized tribes serve this purpose. The baiqua-shells mentioned before are an instance, cowries in India, whales' teeth among the Fijians, red feathers among some South Sea Island tribes, and finally, any attractive kinds of stone which can be easily worked. Mineral products, so far as they do not come under the preceding head, furnish another class. Thus salt was used in Abyssinia and Mexico, while the metals—a phenomenon which will require a more careful examination—have succeeded in finally driving all their inferior competitors out of the field, and have become the sole substances for money at present.

4. *Metallic Forms of Money. Their Superiority over other Substances. Special Advantages of Silver and Gold.*—The use of metals as a form of money can be traced far back in the history of civilization, but, as it is not possible to ascertain the historical order of their respective adoptions for this purpose, we will take them in the order of their value, beginning with the lowest. Iron, judging from the statement of Aristotle, was extensively employed as currency. One remarkable instance of this which at once occurs to the mind is the Spartan money, which is clearly a survival of the older system that had died out among the other Greeks, though by modern writers it has been attributed to ascetic policy. In conjunction with copper, iron formed an early Chinese currency, and till recently it was a subsidiary coinage in Japan. Iron spikes are used in Central Africa, while Adam Smith notices the use of nails for money in Scotland.⁶ Lead has also served as money, as it does at present in Burmah. Copper has been more widely employed than either of the previously-mentioned metals. Its use in China as a parallel standard with iron has just been mentioned. The early Hebrew coins were chiefly composed of it, while down to 269 B.C. the sole Roman coinage was an alloy of copper. Till a very recent period it formed the principal money of some poorer European states (as Sweden), and was the subsidiary coinage of the United Kingdom till the present bronze fractional currency was introduced. Tin was not so favourite a material for money as copper, but the early English coinages were composed of it, probably on account of the fertile tin mines of Cornwall, and in later times halfpence and farthings of tin have been struck. The

next metal which comes into notice is silver, which up to the last few years was the principal form of money, and even still is able to dispute the field with its most formidable rival. It formed the main basis of Greek coins, and was introduced at Rome in 269 B.C. The mediæval money was principally composed of silver, and its position in recent times will have to be subsequently noticed more at length. Gold, which is the most valuable of the metals widely used for monetary purposes, has been steadily gaining ground with the growth of commerce. The earliest trace of its use in common with that of silver is to be found "in the pictures of the ancient Egyptians weighing in scales heaps of rings of gold and silver."⁷ The only other metals used for money—platinum and nickel—may be easily disposed of. The former of these was coined for a short time by the Russian Government, and then given up as unsuitable. The latter is only used as an alloy.

The examination of the forms of currency, both metallic and non-metallic, in which we have been engaged leads to certain definite conclusions as to the course which the evolution of currency is pursuing. It appears (1) that the metals tend to supersede all other forms of money among progressive peoples, and (2) that certain metals tend to supersede the others. From this we are led to consider the qualities which are desirable in the material of money, and to conclude that the presence or absence of those qualities is the reason of the adoption or rejection of any given substance.

(1) In the first place, it is necessary that the material of money should be desirable, or, in other words, possess value; and to this condition all the commodities we have reviewed conform, for otherwise they would never have attained the position of being a medium of exchange. This quality, then, is not the reason for the preference of some forms over others. (2) The second requisite clearly is that the value of the article shall be high in proportion to its weight or bulk, or, to put the same truth in another way, it is requisite that it shall be portable. Want of this quality has been a fatal obstacle to many early forms of money retaining their place. Skins, corn, and tobacco were found very difficult to transfer from place to place. Iron and copper too suffered from the same defect, while sheep and oxen, though moving themselves, were expensive to transfer. (3) It is further desirable that the material of money shall be the same throughout, and that one unit shall be equal in value to another. This is a reason for rejecting the widespread currency composed of cattle, as the difference between one and another head is of course often considerable. The metals possess a particular advantage in this respect, as, after being refined, they are almost exactly homogeneous. (4) A fourth requisite is that the substance used as money can without damage be divided and, if needed, united again; here also the desired quality is peculiarly possessed by the metals, as they are easily fusible, while skins or precious stones suffer greatly in value by division, and it need hardly be added that the same is the case with regard to animals. (5) Money must also be durable. This at once removes from the articles suitable for money all animal and many vegetable substances. Eggs or oil will not keep, and consequently soon lose their value. Iron, too, is liable to rust, which, combined with its low value, is a reason for its disuse as currency. (6) Money should be easily distinguishable, and there should be no trouble in ascertaining its value. This condition is one of the reasons why precious stones have never been much used as money, their value being hard to estimate. The same objection applies to most non-metallic currencies, and is only obviated even in their case by the process of assaying. (7) The last condition which

⁷ Tylor, p. 233.

appears desirable for the money material is, that its value shall be steady. This, however, is of but slight importance in early societies, and it is only as deferred payments become a prominent feature of industrial life that this requisite is much needed. It is enough for the other purposes of money that it shall not vary within short periods, which is found to be a feature of metals, and especially of silver and gold, while corn especially varies widely in value from season to season. From the foregoing examination of the requisites desirable in the material of money it is easy to deduce the empirical laws which the history of money discloses, since metals, as compared with non-metallic substances, evidently possess those requisites in a great degree. They are all durable, homogeneous, divisible, and recognizable, and in virtue of these superior advantages they are the only substances now used for money by advanced nations. Nor is the case different when the decision has to be made between the different metals. Iron has been rejected because of its low value and its liability to rust, lead from its extreme softness, and tin from its tendency to break. Both these metals, as well as copper also, are unsuitable from their low value, which hinders their speedy transmission so as to adjust inequalities of local prices.

The elimination of these metals leaves silver and gold as the only suitable materials for forming the principal currency. Of late years there has been a movement towards the adoption of the latter as the sole monetary standard, silver being regarded as suitable only for a subsidiary coinage. Indeed this question, which is reserved for subsequent discussion, may be regarded as the principal matter of controversy in the field of metallic currency. The special features of gold and silver which render them the most suitable materials for currency may here be noted. "The value of these metals changes only by slow degrees; they are readily divisible into any number of parts which may be reunited by means of fusion without loss; they do not deteriorate by being kept; their firm and compact texture makes them difficult to wear; their cost of production, especially of gold, is so considerable that they possess great value in small bulk, and can of course be transported with comparative facility; and their identity is perfect."¹ The possession by both these metals of all the qualities needed in money is more briefly but forcibly put by Cantillon when he says that "gold and silver alone are of small volume, of equal goodness, easy of transport, divisible without loss, easily guarded, beautiful and brilliant, and durable almost to eternity."² This view has even been pushed to an extreme form in the proposition of Turgot, that they became universal money by the nature and force of things, independently of all convention and law, from which the deduction has been drawn that to proscribe silver by law is a violation of the nature of things.³

5. *Coinage: its Advantages, and the Principal Questions connected therewith.*—The development of monetary systems has now been traced down to the establishment of metallic currencies. These, in the early stages of their existence, passed by weight. The Hebrew records bear witness to this fact, as also do the Greek writers. Aristotle, for example, after indicating the circumstances which led to the invention of currency, proceeds to point out that it was "afterwards determined in value by men putting a stamp upon it, in order that it may save them from the trouble of weighing it."⁴ There are two distinct stages in the

introduction of coining. In the first, only the quality or fineness of the metal is denoted by the stamp, no attempt being made to fix the weight. In other words, the stamp acts as a kind of *hall-mark*. The Chinese cubes of gold may have been the earliest money. Herodotus attributes the first use of coined gold and silver to the Lydians,⁵ while in another passage he mentions that the first Greek coinage was at Ægina, by Pheidon of Argos.⁶ The second step was to certify the weight as well as the fineness of the metal, thus completing the invention. The necessity of preventing any interference with the coin after it had been stamped led to the adoption of a regular form, and, though hexagonal or octagonal coins are to be found, the received shape of a coin is that of a flat circle, each side of which is stamped, as well as in many cases the edge. By this contrivance all persons into whose hands the coin came had a guarantee as to its quality and quantity, and we may reasonably infer that the great improvement in coinage among the Grecian colonies was the effect, and also in some degree the cause, of the expansion of their commerce in the 6th century B.C. From Greece the art of coining spread to Italy, being introduced by the Greek colonists in Lower Italy. Since then coinage as an art has always existed in the more advanced societies. The progress of invention, however, does not end with the introduction of the art of coining, since a number of practical questions arise with reference to the best system to be adopted, which for a protracted period present great difficulties to those who are called upon to solve them. One of these, before touched on, is: What is the best shape for coins? The answer has finally been in favour of the circular, but square and oblong pieces are also to be found.⁷ Closely allied with this is the question of the most suitable limits of size. The inferior limit is plainly fixed by the convenience of those using the coins. They ought not to be so small "that they can be easily lost, or can with difficulty be picked up."⁸ Instances of violations of this principle occur in the case of the English threepenny piece and the American one-dollar gold piece. The superior limit is a more difficult point. Its determination turns partly on the difficulty of coining large pieces, and partly on the facilities which such large coins as the American gold double-eagle give for improper treatment. It is an easy process to drill holes, which can be concealed by hammering, while in some cases the coin has been sawn in two, and the interior gold removed, the outside surfaces being soldered together, while platinum is put in the midst to maintain the weight. As a general rule it may be laid down that no gold coin much larger than the English sovereign, or silver one at all larger than the half-crown, should be issued. Another consideration to be borne in mind when determining the proper size of coins is the relative amount of wear which takes place. Experience proves that large coins are less worn than small ones. "According to experiments made at the mint in 1833, the loss per cent. per annum on half-crowns is about 2s. 6d., on shillings, 4s., and on sixpences, 7s. 6d." This result has been confirmed by other inquiries. From this it follows that the larger coins are less expensive, but their size is limited by the fear of their being tampered with. Again, the character of the stamp to be impressed

money: διὰ πρὸς τὰς ἀλλαγὰς τοιοῦτόν τι συνέθεντο πρὸς σφᾶς αὐτοῖς δίδοναι καὶ λαμβάνειν, ὃ τῶν χρησίμων αὐτῶ ὅν εἶχε τὴν χρεῖαν εὐμεταχειριστόν πρὸς τὸ ζῆν, ὅσον σίδηρος καὶ ἄργυρος, κἄν εἰ τι τοιοῦτον ἕτερον, τὸ μὲν πρῶτον ἀπλῶς ὀρισθὲν μεγέθει καὶ σταθμῷ, τὸ δὲ τελευταῖον καὶ χαρακτῆρα ἐπιβαλλόντων, ἵνα ἀπολύσῃ τῆς μετρήσεως αὐτοῦ.

⁴ *Pol.*, i. 9, 8. The whole passage is worthy of quotation, as showing how clearly Aristotle conceived the primary function of

is a matter requiring much care. The objects aimed at in imposing the stamp are (1) to prevent the coin being counterfeited, and (2) to prevent any of the metal being abstracted. The former of these objects can be best attained by making the device such as can be obtained only by powerful and expensive machinery. The most improved methods must be adopted, and the greatest pains taken to have the device perfectly executed. The latest improvement in the process of coining is the introduction of the knee-joint press. The latter difficulty is best obviated by using special care in marking the edges of the coins. Ancient coins were issued with unstamped edges which presented no impediment to clipping, but modern coins, at least those of any size, are protected by the edge being milled or by a legend being inscribed round it. The combination of milled edges with a raised legend would be a still more effectual means of protecting the coinage from interference.

Another matter of importance in the process of coining is the nature and proportion of alloy to be used. The necessity for some mixture arises from the fact that gold and silver are both naturally soft, and, to obviate this, copper has been mixed with them, so as to produce a harder substance. The Austrian ducat is the nearest approach to purity among the principal coins of Europe, being composed of seventy-one parts of pure gold to one of alloy. The English gold coins are eleven-twelfths pure gold, while the silver ones are thirty-seven-fortieths pure silver. The origin of the difference is purely historical. The general gold proportion is nine-tenths gold to one-tenth alloy, while in some coinages the proportion of silver to alloy is nearly five to one, the countries composing the Latin Union having adopted that proportion in order to reduce their smaller silver coins to tokens. Copper is the usual material for alloying, but the Melbourne mint used silver for some time. It is this silvery alloy that accounts for the yellow appearance of many Australian sovereigns. They, however, are rapidly disappearing, as it is profitable to melt them down. It has been mentioned above that the wear of small coins is greater than that of large ones, and it may be added here that the wear of coins in general is an important question in connexion with their legal circulation. The English sovereign is believed to remain above the least current weight for from fifteen to twenty years. For the technical processes of coining, &c., reference may be made to the article MINT.

The next topic to be considered is: Who should issue money? In the earlier stages of currency the question was not so prominent, but the establishment of coining brought it forward. In Greece each city being autonomous claimed and exercised the right of freely coining as it desired, the coins being, of course, received in other cities only at their real value. The consequences of this system were generally beneficial. The Greek coins were usually up to their nominal value, as debased coinage was unable to circulate beyond the place of issue, and therefore extremely inconvenient to the members of the state issuing it.¹ Under the Roman republic private persons were probably allowed to bring metal to be coined, though the coins seem generally to have had the name of one of the consuls for the year on them. Under the empire the doctrine became established that the right of coining belonged exclusively to the emperor, and till the fall of the Western empire this was acted on. After the establishment of the various barbarian kingdoms, each sovereign assumed the privilege of coining, a right which in France was extended to or rather usurped by the principal nobles.² In England the king alone coined silver.³ At present the

control of the operations of the mint is completely in the hands of the executive; and, until recently, no question on theoretical grounds as to the propriety of this method has ever been raised.⁴

In close connexion with the right of coining comes the consideration as to the proper persons to bear the expense of the process. At first sight the answer seems plain enough. Coins are a manufactured article quite as much as plate, and are rendered more valuable by being assayed, weighed, and certified. It appears therefore quite proper that those who bring metal to be coined should bear the expense of the coinage, or, in other words, should give up a part of the metal to the mint, thus paying for the service rendered to them in the same manner as those sending letters pay the postal department for their transmission. This course has been usually adopted. England, however, has taken a different line. In order to encourage the coining of the precious metals, no charge was made at the mint beyond that involved in the necessary delay in the operation, and this is at present the case with gold. Though this arrangement was originally introduced in obedience to the prejudices of the mercantile system which regarded gold and silver as being peculiarly wealth, it may be defended on reasonable grounds: for (1) the expense of the mint is very small compared with the amount of coin turned out, and (2) the coins produced are used by the nation, and therefore their expense may quite fairly be defrayed from the national revenue. Again, as the profit on the silver coinage (owing to circumstances to be subsequently discussed) is large, that may be set off against the free coinage of gold. The charge levied on coining, if confined to the expenses incurred, is called *brassage*; if it is anything above that cost it is known as *seigniorage*, which latter term is also used to denote both kinds of charge. The effect of seigniorage (using the term in its more extended sense) on the value of coins is to lower them, in fact, as Tooke has put it, seigniorage is always a kind of debasement, unless accompanied with limitation.⁵ If the same quantity of metal be in circulation there will be a greater number of coins, and therefore nominal prices will be higher. It is, however, possible that the increased prices may check the production of the precious metals, thus making the value of the metal higher than it would otherwise be. Whether this will happen or not depends on the actual conditions of production, and is incapable of being predicted. One advantage which undoubtedly results from a charge on coinage is that it checks the tendency to melt coin when exported, for where a seigniorage is imposed coins are more valuable than the uncoined metal by the amount of the seigniorage. It therefore becomes the interest of the holder not to melt down the coins, as in doing so he loses the extra value given by the coining. Another factor in the expense of currency is the loss which arises from the wear and tear which money undergoes, and the consequent cost of replacing the light or missing pieces. The last and largest item is the interest on the total amount of money in use. To take the case of England, the value of the metallic currency is estimated at about £130,000,000. The interest

⁴ "We may take as an example the function (which is a monopoly too) of coining money. . . . No one, even of those most jealous of state interference, has objected to this as an improper exercise of the powers of government." Mill, *Princ.*, B. v. ch. 1, § 2. But see, for objections, H. Spencer, *Social Statics*, pp. 400-402, and J. L. Shadwell, *System of Pol. Econ.*, p. 264.

⁵ Tooke, *Hist. of Prices*, i. 121 sq. It is impossible, however, to agree with Tooke that uncoined bullion would be higher in value than coin when a seigniorage is charged on the latter. He seems to ignore the fact that the value of the precious metals is partly dependent on their use as currency, and that the seigniorage represents a tax levied on the extra value resulting from the use of the metal as money.

¹ See Lenormant, *Contemp. Rev.*, February 1879.

² Hallam, *Middle Ages*, i. pp. 205-206.

³ Lord Liverpool, *Coins of the Realm*, ch. v.

on this at 5 per cent. would amount to £6,500,000. This apparently heavy charge is justified by the fact that it is desirable to have a currency possessing, or at least based on, value. The expense of a metallic currency is, however, combined with its weight, a strong reason for the great developments of representative money and credit in modern times, with the result that gold and silver are hardly ever used in large domestic transactions, all such payments being made by cheques, which are cleared off against one another. For a full account of the modern organization of credit, see the article BANKING.

6. *Historical Outline of Depreciations.*—The earliest systems of currency whose progressive debasements it is possible in any degree to trace are those of the various Greek states, though even here many details remain in obscurity. The Roman currency system is comparatively better known; while for the mediæval currencies from the time of Charlemagne (800 A.D.) elaborate materials are available, which naturally increase in bulk and precision as we approach more modern times. The general treatment of the history of coins belongs to NUMISMATICS (*q.v.*); but the history of monetary depreciations is important in connexion with the theory of money as illustrating the value of sound economic knowledge.

Until coinage became a state function a continued debasement was impossible, since it was open to any one to refuse the money offered in payment if it was not up to the proper standard. When, however, coinage became a function of government strong motives for debasement soon presented themselves. (1) The cost of coinage falling on the state, and being generally defrayed by a seigniorage, led to the idea that this seigniorage could be made more profitable by making it larger, while the existence of any deduction veiled the injustice of a charge exceeding the expense incurred in the operation of coining. (2) The position of most Governments was that of debtors, and as a debasement favoured all debtors at the expense of all creditors it was only natural that rulers, ignorant of the ultimately ruinous effects of a series of debasements, should seek to relieve themselves without exciting the odium incurred by the levy of heavy taxes. A more pressing case than the foregoing, and one where more justification exists, is that of a severe social crisis, when large numbers of the community are burdened with debt, and a depreciation of the monetary standard seems the simplest mode of escaping from so critical a situation. Whatever may be the inducements to enter on the perilous course of tampering with the monetary standard, a long experience has incontestably proved its disastrous effects. One of the great causes of the weakness of France during the "hundred years' war" was the extremely debased state of its currency, and the dread of further reductions in the value of the coins.¹ Lord Macaulay has given a graphic picture of the evils which England suffered from its depreciated silver currency towards the end of the 17th century.² And a debasement brought about by design possesses a further element of evil by creating a belief that similar devices will soon be again resorted to. So manifest are the evils that result from debasement that it may be reasonably hoped that all civilized Governments have abandoned the practice for ever; though, unfortunately, similar bad effects are produced by the over-issue of inconvertible paper currencies, and this is still an expedient adopted under the pressure of difficulties. "It is proper to observe that coins may be debased in three different ways—(1) by diminishing the quantity or weight of the metal of a certain standard of which any coin of a given denomination is made; (2) by raising the nominal value of coins of a given weight and made of a

metal of a certain standard, that is, by making them current or legal tender at a higher rate than that at which they passed before; (3) by lowering the standard or fineness of the metal of which coins of a given weight and denomination are made, that is, by diminishing the quantity of pure metal and proportionally increasing the quantity of alloy."³ The last of these methods is the most dangerous, since the detection of it is more difficult, as it is so much easier to discover the weight than the fineness of the metal in a coin; but all of them produce the same results and are adopted for the same reasons.

Greek Depreciations.—The first debasement of coinage known to us on good evidence is that of the Athenian coinage by Solon in 594 B.C.⁴ In order to obviate the severe distress of that period in Attica, he reduced the quantity of silver in the coins more than 25 per cent., so that 138 new *drachmæ* (the standard Athenian coin) were only equivalent to 100 pieces of the older coinage. This proceeding was perhaps justified by the critical state of things previously existing, and was a decided success. It is probable that another debasement of the gold coinage took place at Athens in 408 B.C. during the strain of the Peloponnesian War, though doubts have been cast on the reality of this debasement.⁵ It may, however, be said that generally the Greek cities fairly maintained the standard of money, though some states were notorious for dishonesty in this respect. The existence of an electrum coinage is no proof of a tendency to debasement, since it was regarded as a separate substance, and issued at its cost value, allowing for the expense of coining. As remarked before, this comparative honesty in relation to the coinage may be partly explained by the small extent of the Greek states, so that a debased coinage was unable to circulate beyond the boundaries of the issuing state. The keen perceptions of the more advanced Greek thinkers and their teachings on this subject may have also contributed to the same result.⁶

Roman Depreciations.—The earliest Roman coinage was composed of an alloy of copper (*æs*), and this continued unaltered up to the time of the First Punic War. Silver was introduced in 269 B.C., the proportion between it and the older copper being fixed at 250:1.⁷ The copper currency was first debased during the Punic wars at the most critical period of the Hannibalic invasion—"the Romans had debased the silver and copper coin, raised the legal value of the silver currency more than a third, and issued a gold coinage far above the value of the metal."⁸ Soon after this period the copper money, whose successive debasements are recorded by Pliny,⁹ seems to have been reduced to the position of a subsidiary currency, so that it is not really a case of debasement of the standard. The silver *denarius* which at first was $\frac{1}{4}$ of a Roman pound, had been debased to $\frac{1}{8}$ of a pound. In 91 B.C. a number of plated denarii were issued at the rate of one for every seven silver pieces issued. This proceeding, which was simply for political purposes, was proposed by Drusus, but in 84 B.C. a proposal for calling in these plated pieces was passed, and was extremely popular. It is probable that a slight debasement took place under Sulla, and one of the Cornelian laws seems to state the so-called *fiat* theory of money.¹⁰ The denarius was lowered under Nero to $\frac{1}{16}$ of a pound, while the later period of the empire is a scene of continual tampering with the currency. The gold *aureus* was at first $\frac{1}{4}$ of a pound, but at the time of Augustus it was only $\frac{1}{8}$ of a pound, while under Constantine it had come to be only $\frac{1}{16}$ of a pound. The comparison of Hellenic with Roman monetary history seems to show that a considerable number of small states, all issuing coins, are less likely to meddle with the standard than the mint of a single large empire. It also proves the value of an acquaintance with monetary theory, if we can judge by contrasting the views of the Greek thinkers with those of the Roman lawyers.¹¹ A few words of caution may here be added against the danger of a careless comparison of values, as expressed in ancient or even mediæval money with those of modern times. It is extremely hard to accept the

prices given by any ancient writer, since the varying factors necessary to be estimated are so many, viz., (1) the weight of the coin, (2) its purity, (3) the value of the monetary metal at the time, (4) the value of the commodity sold in relation to other things, (5) the question whether the commodity was in its normal state as regards supply and demand; to all these may be added (6) the difficulty of determining whether the figures have not been altered.¹ After the fall of the Western empire, the various barbarian sovereigns adopted silver as their principal coinage, combined with the greatest diversity in the systems adopted. On the revival of the empire under Charlemagne an effort was made by him to establish a general system of currency, based on the silver pound as a unit, and thus corresponding to the unit of weight. This system was introduced into England, and thence into Scotland, but the rapid decay of the Carolingian empire prevented any uniformity being preserved in these different countries, while the different debasements in each produced widely divergent systems, which will require separate notice.

English Depreciations.—The first debasement undergone by the English silver coinage was in 1300, when Edward I. reduced the amount of metal in the coins by $1\frac{1}{4}$ per cent., or, in other words, 20 shillings and 3 pence were coined out of the Tower pound instead of 20 shillings as previously.² This was the prelude to a series of changes which were carried out during the next three centuries, and which terminated in 1600, when the pound troy of silver was coined into 62 shillings; since that time the silver coinage has not been debased, the reduction carried out in 1816, by which 66 shillings were coined from the troy pound, being accompanied by a limitation of its use in discharging debts to a maximum amount of £2, as well as by the abolition of the public right of coining silver at the mint. The period extending from 34th Henry VIII. to 6th Edward VI. (1543-1552) has been specially noted by Lord Liverpool as a time of peculiar interference with the fineness of the metal.³ The old proportion of 11 oz. 2 dwts. of metal to 13 dwts. of alloy, was altered to 10 oz. of metal per pound, then to 6 oz. or one-half, 4 oz. or one-third, and finally in 1551 to 3 oz. of pure metal and 9 oz. of alloy. A tendency to reformation began under Edward VI., and was finally carried out under Elizabeth in the recoinage of 1560, which has been fully described by Mr Froude.⁴ Various proposals to depreciate the silver currency have been made since then, and one of these, as above mentioned, was accepted in 1600. The most remarkable of the unsuccessful schemes for debasing the standard was that of Lowndes, which was advanced in 1695, when the discussions preparatory to the recoinage of 1696 were being carried on. Lowndes's plan was to coin the pound troy of standard silver into 77s. 6d., thus debasing it 25 per cent. He was resisted by Locke, who, in his *Further Considerations concerning Raising the Value of Money*, contributed materially to the development of monetary theory; and the recoinage was, mainly in consequence of his efforts, in combination with those of Newton and Montague, based on thoroughly sound principles.⁵ The first English gold coinage, so far as has been clearly proved, was that of 1257, in the reign of Henry III., when a small number of gold pennies were coined at the ratio of 10 to 1 to the existing silver coins. Previously to this date the need of gold for business transactions could not have been felt, as the commerce of the country was necessarily limited. It is probable that for the few transactions of foreign trade a species of gold coins issued by the Greek emperors at Constantinople, and thence called *byzants*, were used.⁶ Another gold coin, known as a *florence*, from the place where it was first coined, was also used after 1250. The regular series of English gold coinage begins in 1344, when Edward III. coined, in imitation of the foreign coin just mentioned, a large number of florins at the rate of 50 to the Tower pound. The gold coinage was, however, for a long period a secondary part of the monetary system, and suffered a series of changes, the last of which took place in 1717.⁷ The present English coinage system is regulated by the Coinage Act of 1870,⁸ which amends and consolidates previous Acts on the subject. The schedule to that Act, which is reproduced at p. 434 of the present volume, gives full information as to existing coins, their weight, fineness, "remedy," &c.

Scotch Depreciations.—The coinage of Scotland was derived from the primitive Carolingian system through the medium of England, and for a long period remained the same as at first. The pressure

under which the resources of Scotland suffered during the constant wars with England, as well as perhaps the example of their closely ally France, led the Scottish sovereigns to debase their coins out of all proportion to the English system. This was the reason for the prohibition of Scotch coins as currency *by tale* in England, the variation in course of time being so great that in 1600 the pound of silver, which contained about three pounds sterling English, was made into thirty-six pounds Scotch, the latter being thus twelve times as much debased. After the union of the crowns in 1603 no steps were taken to assimilate the two systems, which continued as before till the complete union of the two countries in 1707. At the latter date a complete recoinage on the basis of the English system was carried out, thus rendering the coinage of both countries exactly similar. This most valuable reform was at first viewed with suspicion by the Scotch people, and a large amount of the old Scotch currency was hoarded or exported.

Irish Depreciations.—No coined money existed in Ireland before the English invasion in 1170. The English colony, as a matter of course, used the same coinage as the mother-country, but on several occasions inferior money was introduced, as being good enough for a subject country. At the recoinage of 1560 it was proposed to send the bad coins that were called in to Ireland, but to this Elizabeth refused to assent. From 1689 to 1825 the nominal value of the coinage was 8½ per cent. higher in Ireland than in England. In the latter year Irish money was reduced to the English standard,⁹ from which time the United Kingdom has possessed a perfectly uniform system of metallic coin.

French Depreciations.—The monetary system established by Charlemagne throughout his dominions soon disappeared in Italy and the German provinces. It continued to exist in France proper. The general state of confusion, however, and the weakness of the central authority, led to local issues by the various feudal lords. "At the accession of Hugh Capet as many as a hundred and fifty are said to have exercised this power."¹⁰ The increase of the power of the Capetian kings enabled them to restrict this freedom of coinage, and to reserve to themselves this profitable function, the seigniorage on the process of coining being a special branch of the royal revenue. They were unfortunately not inclined to confine their gains to this legitimate source. The French coinage was recklessly debased during the many centuries from Philip I. (*ob.* 1108) to Louis XV. (*ob.* 1774). The management of the mint under Louis IX. was always regarded as a model for imitation,¹¹ but even in his time the *livre*, originally a pound, was debased to less than one-fourth of its primitive value. The dealings with the currency were still more unscrupulous during the protracted wars with England, the result being that at the accession of Louis XI. (1461), when the English had been finally expelled from France, the *livre* was only about one-fiftieth of its original value. Nor did the depreciation of the currency rest here. The period of something over a century, extending from 1497 to 1602, presents a remarkable series of changes in a downward direction, no less than nineteen depreciations having taken place, many of them consisting of changes in the fineness of the metal.¹² There is in this respect a remarkable analogy between this epoch or French coinage and the English period from 1543 to 1552.

The history of French depreciations did not terminate, as that of the English ones did, with the close of the 16th century; under Louis XIV. the *livre* was only one-half of what it had been under Henry IV. The final result was that in 1789 the *livre* had come to be only one seventy-eighth of its weight in the time of Charlemagne. At the Revolution it was converted into the *franc*, at the rate of 81 *livres* to 80 francs.¹³ It is not, however, to be supposed that the changes in the French currency were always towards debasement. The terrible evils arising from the debased coinage led to a general outcry, which in some cases was so strong as to force the king of the time to reform the monetary standard; one striking instance occurred in the reign of Philip IV.,¹⁴ whose dealings with the currency led to his receiving the epithet of "le faux monnoyeur."

Depreciations in other Countries.—The very brief notice of the depreciations in the originally uniform currencies of England and France which has just been given is sufficient to establish the general tendency, and throws light enough on the resulting consequences; a similar course was followed in the other countries of Europe, but the details are too unconnected to be conveniently presented. A few facts will suffice. Thus, the German *florin* "was originally a gold coin of the value of about 10 shillings of our present money; it is now become a silver coin of the value of

¹ As to the various elements requisite for a proper estimate of mediæval prices, see Cibrario, *Della Economia Politica del Medio Evo*, l. iii. c. 8.

² The Tower pound, which was three-quarters of an oz. troy less than the troy pound, was used in England until the 15th of Henry VIII. (1527), when it was replaced by the troy weight. This should be always remembered in considering the precise amount of depreciation at any given time.

³ *Coins of the Realm*, ch. xiii. ⁴ *Hist. of Eng.*, vii. p. 2.

⁵ Macaulay's account of this recoinage, which is written in his typical manner, has made this episode of English monetary history very generally known.

⁶ Lord Liverpool, *Coins of the Realm*, p. 47.

⁷ The third great English recoinage was that of the gold coin, which took place in 1773-1775. It is commonly known as the recoinage of 1774.

⁸ 83 & 84 Vic. c. 10.

⁹ A survival of this older system is to be found in many charges on Irish lands, which are reduced to English money by deducting one thirteenth from the nominal amount.

only 20d."¹ Similar depreciations took place in the cases of the Spanish *maravedi* and the Portuguese *rei*. At the present these coins are so subordinate, where they have not been abolished, as to possess little practical interest.

It is well to notice before concluding the question of depreciations that it is the poorer classes who especially suffer from a change in the coinage. The reasons of this are very plain, for from their ignorance they are less able to understand the nature of the alteration, and, even if it were not so, the absence of available resources places them at a disadvantage in comparison with others. Masters and dealers are quick to discount—so to speak—the nominal value of the depreciated money, and prices are much more speedily adjusted to the new state than wages, so that it may be confidently asserted that a debased coinage is especially injurious to the more helpless classes of society. The same remark applies to an over-issue of inconvertible paper.²

7. *Economic Aspects of the Production of the Precious Metals.*—In considering various monetary questions it is essential to have some acquaintance with the economic aspects of the production of gold and silver. The technical matters connected with the processes of preparing those metals for use are to be found in the articles GOLD and SILVER (*q.v.*). The first point to which we will here direct attention is the field over which production extends. At one time or other these two metals have been found in every continent. Asia Minor in early times possessed its gold fields, or rather auriferous sands.³ Ceylon also undoubtedly contained gold mines. China and India both produced silver to a considerable extent. Egyptian remains show that gold was commonly known in that country, probably procured from Nubia and Abyssinia. On the opposite side of Africa, too, the name of Gold Coast shows that that metal was thence exported. Neither Asia nor Africa, however, has been the main contributor to the stock of money in more modern times. The mines of Laurium in Attica were a source of supply to the Greeks, and were worked as a state monopoly. At an earlier date the Babylonian and Assyrian empires had each large accumulated stores of gold. The Phœnician importations of gold from the Red Sea coasts (Ophir) are known from Scripture.⁴ The Persian kings from the time of Darius levied tribute on all their provinces,—in gold from India, in silver from the remaining districts; and the larger part of this was stored up in the royal treasuries.⁵ This tendency of sovereigns to accumulate had all through ancient history important effects on the economic structure of society. At present it is quite natural to assume that the materials of money are distributed by means of international trade, and tend to keep at an equal level all the world over,—an assumption which is in general well grounded, though an important exception exists. Ancient history presents a widely different set of forces in operation. Gold and silver were produced by slaves under the pressure of fear, and were drawn towards the ruling parts of the great empires; in a word, war, not commerce, was the distributing agency. From this condition of affairs it is easy to see that whatever may be the reasons for assigning to cost of production a potent influence over the value of money in modern times (and grounds have been already advanced for the belief that this influence has been exaggerated), no such reasons then existed. The production of the precious

metals was carried on, as the great buildings and other works of those periods, on non-economic grounds, and therefore produced quite different effects. The whole history of the Persian monarchy to its overthrow by Alexander (330 B.C.) shows that the mass of the precious metals hoarded up continued constantly to increase. On the capture of Persepolis by the Grecian army an enormous treasure was found there, some estimates placing it as high as 120,000 talents of gold and silver (£27,600,000).⁶ All the temples, too, were receptacles for the precious metals, so that the stock accumulated at about 300 B.C. must have been very great. The only causes which tended to diminish the store were the losses arising from wars, when the various treasuries were liable to be plundered and their contents dispersed.⁷ There was therefore a more unequal distribution of the material of money than at present. The growth of the Roman dominion led to important results, since under their rule the Spanish mines were developed and became a leading source of supply. The great masses of treasure set towards Rome, so that it became the monetary centre of the world. The overthrow of the Republican government and the peace which followed also affected the conditions of production. The inefficiency of the Roman administration made it advantageous to let out the mines to farmers, who worked them in a wasteful and improvident manner, while the supply of slaves was reduced, thus depriving the lessees of their principal agency for carrying on production. The result was a continuous decline in the store of money. Mr Jacob has made an attempt to estimate the amount at the death of Augustus (14 A.D.), and he arrives at the conclusion that it was £358,000,000.⁸ Without placing much value on this necessarily conjectural estimate, it is safe to assume that this period marked the highest point of accumulation.

The succeeding centuries exhibit a steady decline, though it is of course impossible to attach any value to even the most carefully-guarded numerical estimates. The phenomenon which has since so often attracted notice—the drain of the precious metals to the East—began at this time, and was a subject of complaint to the Roman writers,⁹ while the stock of gold and silver being thrown into more general circulation suffered more from abrasion, and was more likely to be lost than when stored up in the royal treasure-houses and temples. These causes tended to depress the scale of prices, while the barbarian invasions produced a strong effect on the supply by drawing off the mining population and damaging the various erections used for working the mines. The conjectural estimate is, that about 800 A.D. the total supply had been reduced to £33,000,000 (or about one-eleventh of what it had been at the death of Augustus).¹⁰ A new period in the history of gold and silver production may be fixed at this date. The Moors, now firmly established in Spain, began to reopen the mines in that country which had been allowed to fall into disuse. Other European mines also were opened.¹¹ The international system of currency based on the pound of silver as a unit which was introduced by Charlemagne must have tended to economize the wear of the metals. We may therefore conclude that from this date (800 A.D.) the supply was sufficient to coun-

⁶ Grote, xi. p. 499, note 3.

⁷ A commercial agency which existed for the distribution of gold and silver was the Phœnician system of trading, which extended all over the Mediterranean.

⁸ Jacob, *Production and Consumption of the Precious Metals*, i. p. 224.

⁹ See Pliny, *H. N.*, xii. c. 18.

¹⁰ Jacob, i. p. 237.

¹¹ It was at this time that the most productive European mines were discovered, namely, those of Saxony and the Harz Mountains, as well as the Austrian mines, which were the chief sources of supply during the Middle Ages.

teract the loss by wear and exportation,¹ and accordingly regard the metallic supply as fixed in amount until the next change in the conditions of production, which was the result of the discovery of America. Though 1492 is the date of the first landing, yet for some time no important additions were made to the supply of money. The conquest of Mexico (1519) gave opportunities of working the silver mines of that country, while the first mines of Chili and Peru were almost simultaneously discovered, and in 1545 those of Potosi were laid open. From this latter date we may regard the American supply

dependencies in South America tended to check the usual supply from those countries, and a marked increase in the value of money was the consequence. During the period 1809-1849 the value of gold and silver rose to about two and a half times their former level, notwithstanding fresh discoveries in Asiatic Russia.⁶ The annual yield in 1849 was estimated at £8,000,000. The next important date for our present purpose is the year 1848, when the Californian mines were opened, while in 1851 the Australian discoveries took place. By these events an enormous mass of gold was added to the world's supply. The most careful estimates fix the addition during the years 1851-1871 at £500,000,000, or an amount nearly equal to the former stock in existence. The problems raised by this phenomenon have received the most careful study by several distinguished economists,⁷ to whose writings those desiring more extensive information may refer. The main features of interest may be briefly summed up. (1) The additional supply was almost entirely of gold, thus tending to produce a distinction between the two principal monetary metals and an alteration in the currency of bimetallic countries. Under this influence France, from being a silver-using, became a gold-using, country. (2) The contemporaneous development of the Continental railway systems, and the partial adoption of free trade, with the consequent facilities for freer circulation of commodities, led to the course of distribution being different from that of the 16th century. The more backward districts were the principal gainers, and a more general equalization of prices combined with a slight elevation in value was the outcome. (3) The increased supply of gold rendered a general currency reform possible, and made the use of a gold monometallic standard appear feasible. The movements for currency reform, as will be seen, all arose after these discoveries. (4) The change in the value of money, which may for the period 1849-1869 be fixed at 20 per cent., enabled a general increase of wages to be carried out, thus improving the condition of the classes living on manual labour. It may be added that the difficulty of tracing the effects of this great addition to the money stock is a most striking proof of the complexity of modern economic development. (5) The last point to be noticed is the very small influence exercised on the value of silver by the new gold.⁸ Hardly had the gold discoveries of 1848-1851 ceased to produce a decided effect when new silver mines of unusual fertility came into working. During the period immediately succeeding the gold discoveries the production of silver remained at an annual amount of from £8,000,000 to £9,000,000. This amount suddenly, about 1870, increased to £15,000,000,⁹ and remained at that amount for the next five years. More than half of the supply came from new mines opened in Nevada. This increased supply was accompanied by a marked depreciation in the gold price of silver, though the prices of commodities in countries having a silver standard did not rise. The result of the close investigations to which all aspects of the question were subjected was to show that the increased production of silver was only a minor element in causing its depreciation. The policy pursued by various states—viz., (1) Germany and the Scandinavian

TABLE I.—Estimated production of gold and silver from 1493.

Period.	No. of Years.	Amount in Kilos.		Value in Millions of Francs.		Ratio of Value of Gold to Silver.
		Gold.	Silver.	Gold.	Silver.

as an influential factor in the matter,² and look upon the stock of money as increasing. The annual addition to the store of money has been estimated as £2,100,000 for the period from 1545 to 1600. At this date the Brazilian supply began. The course of distribution of these fresh masses of the precious metals is an interesting point, which has been studied by Mr Cliffe Leslie.³ The flow of the new supplies was first towards Spain and Portugal, and from thence they passed to the larger commercial centres of the other European countries, the effect being that prices were raised in and about the chief towns, while the value of money in the country districts remained unaltered. The additions to the supply of both gold and silver during the two centuries 1600-1800 continued to be very considerable; but, if Adam Smith's view be correct, the full effect on prices was produced by 1640,⁴ and the increased amount of money was from that time counterbalanced by the wider extension of trade.⁵ At the commencement of this century, the annual production of gold has been estimated as being from £2,500,000 to £3,000,000. The year 1809 seems to mark an epoch in the production of these metals, since the outbreak of the revolts of the various Spanish

dependencies in South America tended to check the usual supply from those countries, and a marked increase in the value of money was the consequence. During the period 1809-1849 the value of gold and silver rose to about two and a half times their former level, notwithstanding fresh discoveries in Asiatic Russia.⁶ The annual yield in 1849 was estimated at £8,000,000. The next important date for our present purpose is the year 1848, when the Californian mines were opened, while in 1851 the Australian discoveries took place. By these events an enormous mass of gold was added to the world's supply. The most careful estimates fix the addition during the years 1851-1871 at £500,000,000, or an amount nearly equal to the former stock in existence. The problems raised by this phenomenon have received the most careful study by several distinguished economists,⁷ to whose writings those desiring more extensive information may refer. The main features of interest may be briefly summed up. (1) The additional supply was almost entirely of gold, thus tending to produce a distinction between the two principal monetary metals and an alteration in the currency of bimetallic countries. Under this influence France, from being a silver-using, became a gold-using, country. (2) The contemporaneous development of the Continental railway systems, and the partial adoption of free trade, with the consequent facilities for freer circulation of commodities, led to the course of distribution being different from that of the 16th century. The more backward districts were the principal gainers, and a more general equalization of prices combined with a slight elevation in value was the outcome. (3) The increased supply of gold rendered a general currency reform possible, and made the use of a gold monometallic standard appear feasible. The movements for currency reform, as will be seen, all arose after these discoveries. (4) The change in the value of money, which may for the period 1849-1869 be fixed at 20 per cent., enabled a general increase of wages to be carried out, thus improving the condition of the classes living on manual labour. It may be added that the difficulty of tracing the effects of this great addition to the money stock is a most striking proof of the complexity of modern economic development. (5) The last point to be noticed is the very small influence exercised on the value of silver by the new gold.⁸ Hardly had the gold discoveries of 1848-1851 ceased to produce a decided effect when new silver mines of unusual fertility came into working. During the period immediately succeeding the gold discoveries the production of silver remained at an annual amount of from £8,000,000 to £9,000,000. This amount suddenly, about 1870, increased to £15,000,000,⁹ and remained at that amount for the next five years. More than half of the supply came from new mines opened in Nevada. This increased supply was accompanied by a marked depreciation in the gold price of silver, though the prices of commodities in countries having a silver standard did not rise. The result of the close investigations to which all aspects of the question were subjected was to show that the increased production of silver was only a minor element in causing its depreciation. The policy pursued by various states—viz., (1) Germany and the Scandinavian

¹ Jacob, i. p. 311.

² Adam Smith assumes 1570 as the date when prices were affected in England, *Wealth of Nations*, p. 88. Humboldt estimated the total production (1492-1545) as being about £17,000,000; but see Table I., which contains Dr Sötbeer's estimates, based on the best available data.

³ *Essays in Pol. and Mor. Phil.*, Essay xx.

⁴ *Wealth of Nations*, p. 83.

⁵ The total production is roughly computed at over £1,200,000,000 for the two centuries 1600-1800; but see Table I. for more precise estimates.

⁶ The Russian supply became important after 1823.

⁷ The following may be specially consulted:—Chevalier, *Depreciation of Gold* (trans. by Cobden); Tooke and Newmarch, *Hist. of Prices*, vol. vi., pp. 135-236 (Part vii.); article "Precious Metals," *Ency. Brit.* (8th Ed.); J. E. Cairnes, *Essays in Pol. Econ.*, pp. 1-165; T. E. C. Leslie, *Essays*, pp. 264-374; W. S. Jevons, *Serious Fall in the Value of Gold*.

⁸ The price of silver in London rose from 59½d. per oz. to 62½d. per oz., or 2½d. per oz.—that is, only 3 to 4 per cent.

⁹ See Report of Select Committee on the Silver Question, 1876; and for another estimate see Table I.

states in adopting a single gold standard, (2) the countries composing the Latin Union in limiting the coinage of silver, (3) the Indian Government by adopting a new method of drawing bills—proved to be the really influential causes for the decline in the value of silver as contrasted with gold.¹

Before closing this notice of the economical aspects of gold and silver production, the consumption of those metals must be considered. It may be classed roughly under three heads, viz., (1) their use as merchandise, (2) their use as money, (3) the export to the East. With regard to the first of these, while it is impossible to give precise data, it may be still held with some confidence that the demand for this purpose tends, after society has passed a certain not very advanced stage, to decline. The desire for personal adornment is with most civilized persons not a strong one. It is, so far as it exists, gratified by other articles than those made of silver or gold. Their use as manufactured goods continues to be large, and is one of the principal forms of use at present. The second head with which we have here to deal is the one by which prices are affected. The laws regulating the value of the metals as money have been considered above, p. 721, the primary one being "that the value of money varies inversely as its quantity multiplied by its efficiency," though this proposition needs limitation and explanation. Under the third head a remarkable exception occurs to the general theory of the tendency to equal diffusion of the precious metals. For a period extending over nearly 2000 years the movement of silver from West to East has been noticed. Humboldt has made the ingenious remark that these metals move in the opposite direction to civilization, and history bears out his view. During the Middle Ages the chief Eastern products used in Europe were silks and spices, and to pay for these commodities silver was sent from Europe. The discovery of the passage round the Cape of Good Hope increased the Eastern trade, and added to the drain of silver. Humboldt and Sötbeer have given copious details. In more recent times the flow has continued, the amount of silver which passed to Asia by the Isthmus of Suez during the twelve years from 1851 to 1862 being £110,000,000.² There are two points requiring some further notice with reference to the form and the reason for this drain. Silver is the metal which is exported from Europe, since gold is not used for currency purposes in the East, and even as merchandise silver possesses a higher relative value than it does in Europe. Those European countries that had a double standard were the natural source of supply for exportation, their silver currency being replaced by gold. The unceasing drain of the precious metals to the East may further be explained by the fact that the greater part of the new metal is used for ornamental and not for currency purposes, and thus the demand is not checked by a rise of prices. Another reason, not generally noticed, is that Eastern prices are very much influenced by custom, and thus do not depend on supply and demand. But it is this tendency of an increased quantity of money to raise prices which forms the basis of the economical theory of the distribution of the precious metals.³ This explains the otherwise unaccountable phenomenon of a continual drain of the money material towards those countries where custom has remained most powerful in regard to commercial transactions, or, in other words, the backward countries of India and China.

One of the technical features of the production of the precious metals may sometimes produce remarkable economic effects,—namely, the fact that gold is generally found near the surface, while silver is obtained by deep mining. It follows from this that the production of the former metal depends more on accidental circumstances, while the production of silver is affected chiefly by the state of mechanical skill. In the Nevada mines, gold and silver are found together, and their value in a given mass is nearly equal.

8. *Miscellaneous Questions regarding Metallic Money.*—The recent discussions of matters relating to currency, and the increased intercourse among the more advanced nations, have led to the raising of some questions with regard to the proper constitution of monetary systems. Each country possessing any claim to enlightenment has directed its attention to its own monetary arrangements, and compared them with those of others, while the effect which the currency system of any nation exercises on its neighbours leads to the exciting of a lively interest in its monetary legislation. The principal problems may be summed up under

three heads: (1) The proper standard to use, the discussion of which in practice turns on the comparative merits of a single standard of gold or silver and of a double standard of gold and silver at a fixed ratio; (2) the system of subdividing the currency, which is generally discussed under the title of proposals for decimal coinage; (3) proposals made in many quarters to assimilate the various currency systems of the world. These take one of two forms. It is either desired that a group of nations shall assimilate their currencies, in which case the coinage may be called an international one; or a wider view is taken, and a single system is advocated for all states. This may be styled universal coinage. The question of the proper standard may be deferred for the present, as it is of a more complex nature than the others: Before discussing even the simpler of these questions it is desirable to state some elementary facts involved in all such points. Every currency system must be based on a *standard unit of value* which consists of a "fixed quantity of some concrete substance defined by reference to the units of weight or space." Thus the English unit is the *pound*, which consists of a definite quantity of gold (123·27447 grs. standard fineness), while the French unit is the *franc* (composed of 5 grammes of silver $\frac{2}{3}$ ths fine). It is not, however, necessary that the standard unit shall be a coin. All that is needful is that the current coins shall be multiples or submultiples of the unit, or at all events easily reducible to it. The Portuguese *rei* is too small to be coined, and the pound of silver which formed the unit of the early French and English currency was too large. Distinct from both the actual coins and the unit of value is the *money of account*, though in practice it is usually identical with one of them. In Russia in early times the *rouble* was an imaginary money of account not coined, while the copper *copeck* was the unit of value. Another distinction must be pointed out, namely, that between *standard* and *token* money, the former being of the same value as the metal it is made of, while the latter is rated at a nominal value higher than that of its material. The silver and copper coins in England and the smaller silver coins in the Latin Union are merely tokens, being in the case of the English silver coins about 30 per cent. below their nominal value. The French coins are of inferior fineness (835 per 1000). Token coins are only admissible in small payments, as otherwise—in accordance with an elementary principle to be presently explained—the standard coins would be driven out of circulation. The maximum amount in payment for which they are legal tender is in England 40s. One of the functions of money being to afford a standard for estimating deferred payments,⁴ it is generally used as the means of discharging obligations when they become due, and in this aspect is styled *legal tender*. The principal coinage of any country is legal tender to an unlimited amount, and, when offered, discharges any pecuniary obligation. It is only the standard coinage which possesses this property, or rather the standard coinage is that which does possess it.

In discussing monetary questions it is also important to remember that a metallic currency has to circulate among the most diverse classes of society, and must be suited to the wants, and even to the prejudices, of the population using it. Many curious instances of the preference of a community for some particular coin could be given. The Austrian Maria Theresa dollar is a special favourite on the coast of Africa, and is still coined exactly as it was in 1780. The inhabitants of California refused to accept the greenbacks issued during the American civil war, and consequently gold was always used in payments in that State. Many apparently well-devised reforms have miscarried

⁴ See p. 720, above.

owing to the habits of the people not having been attended to. Some writers have, however, misconceived the principles of currency and extended this influence to cases where it does not apply. Thus it has been sought to explain the adoption of gold as the principal English coinage after 1696 by assuming that the English deliberately preferred that metal.¹ The fact of different nations possessing different currencies, as the prevalence of gold in England and of silver in France during the 18th century, is to be otherwise accounted for. The great mass of a population, it is true, take and give money without particularly observing it. It is enough if the coin conforms to the usual type. There exists, however, in all mercantile communities a class of dealers in money² who make a profit by selecting the best coins for exportation, or, if two metals are in concurrent use, the coins of that metal which is undervalued in the proportion fixed. The mode in which self-interest thus operates produces an effect which may be briefly formulated by saying that *bad money drives out good money*. It is often now called "Gresham's law," from a former master of the English mint,³ who observed it. The illustrations of its working are numerous. Under its action the gold which was overvalued relatively to silver in England in 1696 became the main English coinage, as above stated. And in order to meet the want of silver coins, Sir I. Newton advocated, and secured, the reduction of the guinea from 21s. 6d. to 21s. The exportation of metallic money when an over-issue of inconvertible paper takes place is another case of the theorem. By means of this principle we can easily explain the tendency of currency to depreciation, for when once, either by wear or by the issue of inferior coins, a currency has become debased, no reformation is possible unless the debased coins are removed from circulation, as otherwise they will be preferred for payments by dealers, and will not be melted down or exported. All demands for foreign trade will be met from the best part of the coinage. An argument in favour of state coinage has been founded on Gresham's law. It is argued that private coinage would lead to the issue of depreciated money.⁴ It is, however, overlooked in this argument that the action of the law arises from the fact that the depreciated currency is legal tender; were it not so, coins less than the proper weight would be at once rejected. It may be added that Greek monetary history bears out this view.⁵

Having disposed of these elementary questions, the general groups into which all currency systems fall may now be stated. The simplest form of currency seems to be that in which the state coins ingots of different metals, and allows them to circulate freely, without any ratio being fixed. This, which is the lowest form of currency proper,⁶ has arisen in many countries through the introduction of coins of various other nations. Turkey is a European example. Many of the South American republics possess a currency of this description. A theoretical form of this system has been advocated in France. It is proposed to issue coins of one, two, five, and ten grammes of gold, and to allow the present silver coins which are multiples of the gramme to circulate along with them. The difficulties of this plan are so obvious that there is no likelihood of its being adopted. The arguments in its favour are of little

force, since it is hardly correct to contend that it is a natural system, when it has never been willingly adopted by any country. The next system to be noticed is that of a single metal being fixed as legal tender. This in early times is the really natural arrangement, and has been widely adopted. It is needless to recapitulate the instances which have already been given in dealing with other matters. There is, however, a difficulty which soon arises under this system. If the metal chosen is not very valuable, it is too cumbrous for large payments; if, on the other hand, it possesses a high value, it is hard to coin pieces suitable for small transactions. Thus, even silver would be too bulky for such payments as frequently occur. £100 in silver at its present value would weigh nearly 40 lb, while it would be impossible to coin gold pieces of the value of a penny or even a shilling. This system thus naturally leads to the use of other metals besides the standard one, and when the state fixes the ratio between these metals a new system has come into existence, which has been called the *multiple tender* system. In it the ratios between the metals are fixed, either once for all, or until changed by state authority. This system was in force in England from 1257 (or rather 1344) to 1664, the ratio between gold and silver being fixed from time to time by proclamation. France, too, adopted it during the Revolution, the ratio of 15½ to 1 being that fixed between gold and silver. The fluctuation of currencies arranged on this method, owing to the action of Gresham's law, has led in England and Germany to a modified system, which seeks to combine any advantages of the multiple standard with the principle of the single standard. By this method one metal is fixed as the principal legal tender, while the smaller coins are made of a less valuable material, and circulated at a nominal value somewhat above their real one, or, in other words, as token coins, but they are only legal tender to a limited amount. This has been called the *composite legal tender* system.⁷

For further details reference may be made to Tables II. and III., and the notes appended. Every currency system requires the existence of subsidiary coins, and, as stated before, this want is met by using a less valuable metal, generally silver, and for smaller payments copper or bronze. But, apart from the question of the material of the smaller coins, it is important to determine the best ratio between them. The simplest of all would be the *binary*. In it each coin would be the half of the next highest one, and double the one immediately below it. Nothing, apparently, is plainer or simpler than this scale, but the objection to it is the great number of coins that would be required, as well as the want of conformity with the general arithmetical scale. In a modified form it does prevail in many countries. Thus in England we have the *penny*, *half-penny*, and *farthing*. At a higher stage we have the *florin*, *shilling*, *six-penny piece*, and *threepenny piece*, and, again, the *sovereign*, *half-sovereign*, *five-shilling piece*,⁸ and *half-crown*. The coinages of the Latin and Scandinavian Unions, as also those of Germany and the United States, have several binary series in their coins.⁹ There is, however, no completely binary system known. The old English scale was partly *duodecimal*, and the arguments in favour of this arrangement are by no means weak. At present the shilling is duodecimally divided. It is urged in favour of this scale that the main divisions of time (year and month, day and hour, are duodecimally related, and that time is one of the elements in all questions of value.¹⁰ Another argument is that 12 is capable of being resolved into several factors (2 and 6, 3 and 4), and therefore

⁷ This system came into existence in England accidentally, through silver being overvalued by the mint regulations, but its theoretical basis was given by the often-quoted work of Lord Liverpool, *Coins of the Realm* (1805), which contains even now the best explanation of its principles.

⁸ This piece is now almost extinct.

⁹ For instance, the 20-franc, 10-franc, and 5-franc pieces, and, again, 2-franc, 1-franc, and 50-centime pieces in France, &c.; 20-kroner and 10-kroner pieces, and 4-kroner, 2-kroner, 1-krone, 50-öre, and 25-öre pieces in Denmark, &c.; 20-, 10-, and 5-mark pieces, and 2-mark, 1-mark, and 50-pfennige pieces in Germany; while the United States have eagle, half-eagle, and quarter-eagle, and also dollar, half-dollar, and quarter-dollar.

¹⁰ See S. Laing, *Notes of a Traveller*, pp. 57-59.

¹ R. Giffen, *Essays in Finance*, p. 303.

² The Jewish and Lombard merchants discharged this function in the mediæval period; Hallam, *Middle Ages*, iii. p. 369, note t.

³ Aristotle (Ran. 719-733) appears to recognize this principle. Grote (vol. iii. 116 note) has misunderstood him, and seems to deny the principle stated.

⁴ Jevons, *Money*, p. 82.

⁵ See p. 726, above.

⁶ In his discussion of this subject Prof. Jevons, on whose excellent work much of this section is based, mentions currency by weight as the simplest form, but it is hardly correct to regard this as a currency system: it is rather a primitive stage, closely akin to barter.

enables a large series of coins to be formed.¹ The main reason, however, for the adoption of a duodecimal system appears to have been the preference for the number 12 so frequently shown by early societies; thus, among the Semitic races, the Jews were organized in 12 tribes, and in Italy the Etruscan league consisted of two groups, each of 12 cities. In connexion with this it may be noted that a duodecimal system of currency prevailed south of the Apennines. At Rome the *as* was divided into 12 *uncia*. The modern tendency, however, has been to adopt a decimal scale. This method of notation, which is found very widely in use among savage tribes, is undoubtedly derived from the ten fingers of the human hands. Though the base 10 is not so convenient as 12, it is firmly established as the only system of counting, and is in process of extension to

weighing and measuring.² For the purposes of currency this scale is not very convenient, as 10 can be only resolved into two factors (2 and 5), and one of these is a rather high number. This disadvantage has retarded the adoption of decimal coinage, and is the base of the objections made to it. It has been contended that it is unsuitable for small purchases, and for such fractions as one-third.³ France adopted the decimal system of coinage in 1799, and it has now extended over all the countries of the Latin Union (see Table II.). It is also in use in Germany, Denmark, Sweden and Norway, the Netherlands, and Finland, as well as in the United States. But none of these countries has a decimal coinage pure and simple. In-

* Inconvertible paper currency.

¹ Present system introduced in 1870, in place of system of 1857; 8-gulden piece equivalent to 20 francs; silver not freely coined. The Maria Theresa dollar (28.0644 grammes, 1/2 fine) is coined as commercial money.

² The system now in use in the Scandinavian Union (Denmark, Sweden, and Norway) came into force 1st January 1875. It is a monometallic gold standard on the decimal system.

³ The coinage system of France came into force 6th May 1799. It was extended to the countries composing the "Latin Union" (France, Belgium, Italy, Switzerland) by the convention of 1865, and has since been adopted by Greece, Roumania, Servia, and Spain. It is thus the most widely-extended system in Europe. Austria, too, has established some connexion with it by its gold coinage. The population using the Latin system has therefore been estimated (*Journal des Economistes*, April 1879) at 148,000,000. The system is theoretically a double standard one, with a ratio of 154 to 1; but the states composing the Union have restricted the coinage of silver to a small amount, thus producing what is called the *etalon botteux*, or "limping standard." By it coined silver is kept above its market value. The unit in the different states is called by different names: in France, Belgium, and Switzerland, *franc* and *centime*; in Italy, *lira* and *centesimo*; in Greece, *drachme* and *lepta*; in Roumania, *lei* and *bani*; in Servia, *dinar* and *para*; in Spain, *peseta* and *centesimo*; but in all cases the value is the same.

⁴ The substitution of the *mark* for the older *thaler* came into force 1st January 1876. The German coinage law is modelled on the English system, but is not yet completely settled, owing to the large quantity of silver in circulation.

⁵ The Dutch standard has been several times changed. In 1847 a silver standard was adopted, and continued till 1872, the unit being the *silver guilder*. In June 1875 the free coinage of gold was decreed, the silver coinage having been restricted since 1872. The ratio of gold to silver is 16.625 to 1, but practically the "limping standard" exists.

⁶ The single gold standard is in force in Portugal. The English sovereign is legal tender for 4500 reis.

⁷ The coinage of the Russian mint are exceptionally good. They pass as commercial money at varying prices. Finland has a decimal system resembling the French since 1877, the mark in gold and silver being equivalent to the franc.

⁸ The Spanish coinage was assimilated to the Latin Union in 1871. Spain, however, coins a 25-peseta piece; the other countries of the Union do not.

⁹ The Medjidie coinage was introduced in 1844. English sovereigns circulate at 125 piastres, 20-franc pieces at 100 piastres.

price quotations, would have to be altered, while the new unit of the farthing would not be assimilated to any other unit. This plan has therefore no chance of acceptance. Another proposal starts from the present pound as unit. It is to be divided into 10 *florins* (2s.), which would contain 100 *milis* (or *farthings* reduced 4 per cent.). A new coin, 10 *milis* (2s. 4d.), would probably have to be introduced. The advantages of this plan are—(1) the pound would be preserved as unit, (2) the *florin* and *skilling* would also be retained—the latter being 50 *milis*, (3) accounts for large amounts need not be altered. The objections are such as follow—(1) the copper coins, which are those most used by the poor, would all be changed, thus causing great confusion, (2) all charges expressed in pence would be altered to the loss of one of the parties. Still, this scheme is much to be preferred to the one first mentioned. A third plan is based on the fact that 8s. in English money is only $\frac{1}{2}$ d. more than 10 francs. Having regard to this link between the English and French systems, it is proposed to coin a 10-franc piece in gold to serve as a token for 8s. If the penny were then reduced by 4 per cent. this piece would contain 100 pence, and, by coining a franc or tenpenny piece in silver, a perfect decimal currency would be obtained. This arrangement would involve the abolition of the pound as well as of most of the present English coins. In fact, it is as yet premature to expect a system which will be international as well as decimal, and the most that can be hoped for is some progress towards that ultimate end. All that can be said at present is that all schemes for the introduction of the decimal system should be considered with regard to their tendency to help towards the assimilation of the English system to other currencies. The problem of international money has during the last twenty years acquired much prominence. In previous historic periods the idea was partially realized. Thus the drachme was an international Hellenic coin, though it had three different values.¹ Under the Roman hegemony and the succeeding empire the denarius became the coin of the west, the drachme that of the east.² The next currency which can be called international was the frequently-mentioned Carolingian system. The growth of the different European nationalities, and their frequent wars, prevented any common coinage system being adopted by them. Each state debased its own coin at different times, so that any original resemblances disappeared. The question of unification of the various monetary systems was thus left open for the present century, when increased facilities for intercourse have led to more complex international relations. An association for promoting unity in weights, measures, and coins was founded in Paris in 1855, and actively advocated its principles. In pursuance of this object a series of conferences and congresses were held on the subject, the first of them in 1860. The congress of 1863 was held at Berlin, and adopted a series of important resolutions. Its report advocates the superior convenience of a gold system with a subsidiary coinage of silver; the millesimal scale of 900 as to fineness of the higher coins was also approved of, as well as the definition of the weights of coins on the metric system. The first practical outcome of the movement was in the monetary convention of 1865, which founded the so-called Latin Union, by which France, Belgium, Italy, and Switzerland became a single monetary region, with the franc or lira as unit. The subsequent accessions to the Union are given in the note to the French coinage system (Table II.). In 1867 a monetary conference was held at the same time as the Exhibition of that year, when the idea of a universal coinage was advocated, and three leading principles were laid down as necessary to that result, viz.—(1) the universal adoption of a single gold standard, (2) the general use of the decimal scale for this coinage, (3) that all coinages should be co-ordinated with the French system.³ Owing to the accidents of historical development, certain points of connexion existed between the leading European systems. Thus, the franc being regarded as a unit, the Austrian florin was as 2·47, the American gold dollar as 5·18, and the English pound as 25·22. Very slight changes would bring these coins into a series of 1·24 : 5 : 25, and it was proposed by the congress of 1863 that, when thus modified, they should have international currency in all countries where any of the four units prevailed. All outside nations were recommended to select whichever of these units they preferred. The subsequent monetary changes in the various European systems have, however, ended rather in the formation of international systems without any tendency towards the establishment of a universal one. Thus, of the three principles laid down by the conference of 1867, two only have been adopted in recent currency reforms. On the creation of a united Germany after the Franco-German war of 1870-1871, it was the aim of the rulers of that country to develop as much as possible all outward expressions of that unity, and, in accordance with that conception, a German currency was devised which was monometallic and decimal (see Table II.), but which was not easy to assimilate to the French system, thus rejecting the third principle laid down by the Paris conference, and rendering future progress more difficult. The

Scandinavian Union proceeded on very much the same lines as the German reform, and was, in fact, mainly caused by it. The Dutch Government, under the pressure of circumstances, have abandoned the silver standard and coined some gold, but their position is still undecided. The Austrian Government have made a slight step by issuing as gold coins 8- and 4-gulden pieces, which are the same as the 20- and 10-franc coins. In one part of the Russian dominions, Finland, the French system has been introduced, the new mark being equivalent to the franc. The main Russian system has not been changed, nor have any alterations been made by England, Turkey, or Portugal.⁴ The question of universal coinage has become implicated with the question of the proper standard, and the strong ground taken up in 1867 has certainly to some extent been abandoned. It may, however, be considered that the present systems of coinage are capable of being assimilated. A comparison of the amount of pure metal in English, French, German, United States, and even Japanese coin shows how small is the difference.⁵ An ingenious proposal was made in 1868 to the English commission on the question, by which the sovereign would be made identical with the French 25-franc piece (if that were coined). It was based on the fact that the sovereign contained only about 1 grain more of gold than the amount in 25 francs. It was proposed to deduct this small amount from the bullion brought for coinage as seigniorage, so that no change need be made. The advocates of this scheme contended that prices would not be affected by the alteration. This reasoning did not commend itself to the commission. They accepted the view put forward by Newmarch, who argued that all contracts would have to be altered to allow for the depreciation caused by the change, and this position seems impregnable, so long as metallic currency alone is considered. Another ingenious plan was that of Bagehot to assimilate the English and American systems, as a step towards a wider change.⁶ At the present moment the great monetary systems of (1) France and her allies, (2) England and the larger part of her colonies, and (3) the United States are so firmly established in their several countries, and the advantages of each system are so equal, that it is hard to see which is to give way. The wide area of the Latin Union, and the perfect decimal division of its coinage, are arguments in favour of the franc; the greater value of the pound, and the immense extent of the English colonies and English trade, are in favour of the British unit of value; while the dollar, from its convenient size and the prospect of the future growth of the United States, has claims to be considered in the discussion. The most probable conclusion, however, seems to be that the future unit will not be any of these coins, but the result of a compromise, which will lead to a new system being established. The difficulties which arise when universal coinage schemes are brought forward ought not to conceal from us the solid advantages which such an institution would confer on the world. The arguments urged in its favour are various, and are regarded as being of different relative importance by their advocates. They may, however, all be stated as follows. (1) Increased facility of travelling. Though there is a tendency to under-estimate this element of the question, it seems impossible to doubt that the saving of trouble to travellers by any universal coinage system would be very great. The abolition even of the local currencies of Germany and Italy, and their replacement by uniform national systems, has been a great boon to tourists, but an arrangement which would obviate the necessity for procuring any different money whatever would be a still greater advance. In the interests of peace, which is greatly promoted by extended international communication, it is very desirable to remove any obstacle which retards increased intercourse among persons of different countries. (2) Greater ease in adjusting the foreign exchanges. This argument has been sometimes pushed too far. It has been apparently held that, were a universal currency adopted, the problems of the foreign exchanges would no longer exist. There are, however, other factors in the question, namely, those of time and place, which could not be eliminated by the adoption of a single coinage system.⁷ Still, the removal of even one complicating element would simplify exchange dealings. The question of mint pars would no longer arise, and the specie points would be stated more simply. The friction which sometimes arises from the necessity of recoining the exported gold would also be removed, and the profits of those dealers who gain by

⁴ As Austria, Russia, and Turkey possess inconvertible paper currencies, and various foreign coins circulate in the last-named country, the question does not possess much importance for them. Portugal is closely connected with England, and will probably follow her example. It may also be noticed that the gold coins of all these countries have a fineness of $\frac{1}{11}$ ths.

⁵ Sovereign=7·92 grammes fine gold.

25 francs=7·20 " "
U. S. half-egle=7·52 " "
German 20 mark=7·16 " "
Japanese 5 yen=7·50 " "

⁶ See his pamphlet reprinted from the *Economist*. It is nearly the same as the first proposal mentioned above, but it differs in contemplating the assimilation of American money, the 6-dollar piece being equivalent to the new pound.

⁷ See, for this, Goschen, *Foreign Exchanges*, p. 5, and the article EXCHANGE (vol. viii. p. 784 sq.). A practical illustration is the case of Australia, where, though the currency is identical with that of England, bills on England are at a premium.

their special knowledge would be saved to ordinary traders. (3) The improvement of the currencies of backward states. Many countries still possess those mixed currencies which were once common all over Europe, and much confusion consequently arises. The commercial coins have been introduced for international circulation,¹ and a universal currency would perform their function more satisfactorily. (4) Greater facility in comparing price-lists, &c. This advantage, which is reserved for the last, has been regarded by competent judges as the greatest.² It has a practical and a theoretical interest: the former, since trade with foreign countries would be rendered easier and safer; the latter, since statistical inquiries would be very much facilitated. At present, it is quite impossible for an ordinary trader to understand a set of foreign price-lists, each perhaps expressed in terms of a different currency from the others,—a difficulty which is enhanced by the variations of gold and silver values, not to add the case of an inconvertible paper currency. The existence of a common monetary language would remove these difficulties, and the premium on gold could be allowed for in the case of depreciated paper. A much wider development of smaller trading transactions would become possible, and would add to the world's wealth. Nor would the greater ease of statistical inquiry be unimportant; the rates of wages in different countries, and the profits on different transactions, would be readily compared, and the movements of labour and capital to the most advantageous points rendered more rapid. Against these great gains can be set only a certain and a possible disadvantage—namely, the loss and trouble involved in change, which would, of course, for the time be considerable, but would soon be over, and the chance that some states might issue a depreciated currency, which would expel the other and better coins. In the case of a universal coinage this case would hardly arise, since there would be no field of employment for the prater coins, and they would consequently remain in circulation, but the whole currency would become depreciated. Proper mint regulations, however, would obviate this danger, and could surely be devised. It may be said that the principal hindrance to one coinage system for all civilized states is the as yet unsettled question of the standard to be employed. Till the debate on this problem is closed it is vain to expect monetary unification. The establishment of a universal system based on gold seemed quite feasible to the conference of 1867, but doubtful to that of 1878, while a double standard was the proposal discussed in 1881.

9. *Considerations on the Questions arising from the Conflict of Standards.*—In the preceding section the various possible monetary systems were set forth, but no discussion was entered into with respect to their comparative merits. Only three of these systems need be here examined, namely, the *single* standard system, the *multiple* standard system, and, lastly, the *composite* system. Nor even is there any need for examining the various possible single or multiple standards. The single silver standard is the only one of the former, as the double gold and silver standard is the only one of the latter, which need be taken into account. It is true, historical inquiry has shown that the problem of the proper proportion between two different metals when used together presented itself to the Chinese with regard to their iron and copper coinages; but the course of monetary evolution, as discussed in section 3, has resulted in the rejection of the less valuable metals and in confining the material of the principal coins to silver and gold. The use of silver as a principal coinage was, as we have seen, widely diffused. The Hellenic coins were composed of that metal, gold being afterwards introduced as a variable commercial money; and copper was brought in still later as a token currency. Though copper preceded silver as money in Rome, the latter, soon after its introduction, succeeded in displacing it, the ratio first fixed being 1 to 250. A regular gold coinage did not exist at Rome till the empire, but gold in bars passed, the legal ratio being 1 to 11·91. Still the questions connected with the use of a double standard do not seem to have arisen.³ The various European monarchies had silver as their principal money (see p. 726 sq., above), gold where it was used being, as in Greece, a

commercial money. The advance of gold to a position parallel to silver was commenced in the 13th and continued in the 14th century, the method of regulating the mixed gold and silver currencies being by proclamation, which fixed the varying ratios from time to time. In England this course was followed from the first introduction of gold coins (1257) to 1663.⁴ From 1663 to 1717 silver was the standard, and the gold coins passed at their market value. As the silver coins were very much debased, the gold guinea sometimes was deemed equivalent to 30s. After the recoinage of 1696 the guinea passed at 21s. 6d. At this ratio silver was underrated, and was accordingly exported to Continental Europe and to India. The loss of the silver coins aroused the public attention, and the matter was submitted to Sir I. Newton, whose answer was given in his *Third Representation*. He proposed to reduce the guinea from 21s. 6d. to 21s. as an experimental measure.⁵ The proper reduction for the object in view would have been to 20s. 8d. The silver drain, therefore, continued, and England came to have a gold currency. An opposite arrangement gave France a silver coinage. The recent facts of French monetary history, as well as those of the United States, illustrate the same condition of affairs. The difficulty of constituting a double standard system on a secure basis is thus made clear, so far at least as regards a single country. For the continuance of the two metals in the currency depends on the market ratio and the legal ratio between gold and silver being the same. The slightest examination of the history of these metals will show how variable they have been. Without accepting the estimates which regard silver as being more valuable than gold,⁶ the well-attested variations of the precious metals have been very considerable. Thus, Herodotus estimates the ratio as 1 to 13, Plato 1 to 12, Menander 1 to 10, and in Cæsar's time the ratio was 1 to 9.⁷ Table I. contains the variations since the discovery of America. In the 14th century the value of gold rose remarkably, and the gradual movement has ever since been towards an appreciation of gold relatively to silver. Another point, previously noticed, is the tendency, as wealth increases, to adopt a more valuable form of currency. Greece, Rome, and England all afford illustrations of this movement. The experience of the evils of a mixed currency led the earlier writers on coinage in England to regard a single standard system as the best, and silver as the most suitable metal for the standard. Locke, Petty, and Harris all advocated this view. The earlier Italian writers proposed to combine gold and silver at a ratio of 1 to 12, which they conceived to be the actual proportion. The theory of a composite system was, as before mentioned, first given by Lord Liverpool.⁸ This method

⁴ The various changes made can be estimated from the Tables given in James's *Essays on Money*, &c.; see also *Ency. Brit.*, 8th ed., article "Money." A careful statement will be found in Lord Liverpool's work, ch. xi.

⁵ Newton's report will be found in *Select Tracts on Money*, edited by J. R. McCulloch for the Political Economy Club (1856). One passage is worth quoting. "The demand for exportation arises from the higher price of silver in other places than in England in proportion to gold, . . . and may therefore be diminished by lowering the value of gold in proportion to silver. If gold in England, or silver in East India, could be brought down so low as to bear the same proportion to one another in both places, there would be here no greater demand for silver than for gold to be exported to India. And if gold were lowered only so as to have the same proportion to the silver money in England which it hath to silver in the rest of Europe, there would be no temptation to export silver rather than gold to any other part of Europe" (p. 277). The italics are in the original passage, which has been much discussed in recent controversies.

⁶ Del Mar, *Hist. of the Precious Metals*, p. 221. According to this writer, the variation has been 200 degrees—i.e., from silver being 10 times as valuable as gold, gold has come to be 20 times more valuable than silver.

⁷ See Smith, *Dict. of Ant.*, s. y. "Argentum."

⁸ See above, p. 731.

¹ The principal of these are—the Austrian Maria Theresa dollar, the Mexican dollar, and the United States trade dollar, which is 7½ grs. heavier than the national coin of the same name. See also Tables. II. and III.

² E.g., Bagehot and Prof. Jevons. The former dwells on the commercial aspect; the latter naturally places the scientific side first.

³ See Mommsen, *Hist. of Rome*, ii. p. 382 and iv. p. 533.

of regulating the metallic currency was established in England, as it were, accidentally, and deliberately adopted only in 1816. The practical good results which followed made all English economists of that period warm advocates of the composite system. Thus, M'Culloch and Tooke agree in supporting the English system, as also does J. S. Mill.¹ On the Continent the weight of authority was more divided, and the existence of the French bimetallic system gave support to the advocates of a double standard. The result of the gold discoveries in Australia and California was to greatly increase the supply of that metal, and, under the action of Gresham's law, to change the French currency from silver to gold, while Holland, to avoid the evils which were anticipated from the reduced value of that metal, adopted silver as the standard. The movements in favour of a universal currency described above, combined with the course of events, brought the standard question into greater prominence. The proposal of the Paris conference of 1867 for a single gold standard, and a universal coinage on that basis, raised the question to great prominence. Wolowski and Courcelle Seneuil strongly opposed the recommendation, the former predicting that a disastrous appreciation of gold would follow. This view seems borne out by the result, for, although a universal coinage was not created, yet Germany and the Scandinavian Union both changed from a silver to a gold standard, while Holland and the United States both made movements in the same direction by demonetizing silver and making preparations for adopting gold. The Latin Union at the same time restricted their silver coinage, which had nearly the same effect as the adoption of a gold standard.² The result of these extensive changes was to cause much confusion. The more ardent advocates of a double standard, too, attributed most of the continued trade depression to this cause. The altered condition of opinion on the question was seen at the monetary conference held at Paris in 1878, where the universal demonetization of silver was considered to be dangerous. The "Bland Act" of the United States, which theoretically decreed the double standard (1878), was another instance of reaction. The great depreciation of silver, which resulted mainly from its having ceased to be money over a large part of the civilized world, severely affected the Indian finances,³ and thus the advocates of a double standard were able to command some attention in England. The conference held in Paris in 1881 reflected these changed views. The supporters of the double standard took the initiative and proposed a treaty based on the double standard at a fixed ratio, but no conclusion was arrived at—England, Germany, and the Scandinavian Union upholding the gold standard.

Such, in brief, has been the recent history of the standard question, and it now becomes desirable to examine more closely the conflicting arguments in the various shapes they have taken. The older English advocates of the gold standard have found their best representatives in Lord Liverpool and Tooke. The former of these adopted the argument used by Petty, Locke, and Harris, that only one metal can be the standard of value at a given time, but he held that the advance of England in wealth rendered gold a more suitable material than silver for the principal money. He added that by law the power lay in the sovereign to settle the standard, and, as a matter of fact, he contended that gold was actually at that time (1805) the English standard in common estimation. These arguments were

¹ Lord Ashburton was the only person of influence who advocated the double standard.

² The amounts decreed to be coined each year were as follows—

	Frs.	
1874	= 120,000,000	
1875	= 150,000,000	
1876	= 120,000,000	
1877	= 65,000,000	
1878	= 9,000,000	} For Italy only.
1879	= 20,000,000	

³ See, for a full discussion, W. Bagehot, *Depreciation of Silver*.

supported by a mass of historical examples.⁴ Tooke, who dealt with the subject in his *History of Prices*, severely criticizes the double standard. He points out that it would be impossible to keep both metals in circulation, and that it would be the inferior one which would remain. He also indicates a more refined objection, namely, the difficulty of constituting a bank reserve under the double standard. Thus, if silver were the more valuable, and the reserve consisted mainly of it, there would be an inducement to make a run on the reserve, so as to drain out the small quantity of gold and then get the more valuable silver.⁵ The silver standard was preferred by Ricardo, who fully accepted the arguments against the double standard as conclusive; his view was, that silver was steadier in value than gold, and was the standard money in other countries, while the objection to it on account of its greater bulk was, he thought, obviated by the use of paper money for circulation.⁶ J. S. Mill pronounces no opinion as to the comparative merits of gold and silver, but he objects to the double standard on the usual ground that the cheaper metal is the only one used in payments, and that therefore the fluctuations are more frequent under a double standard régime. The advocates of the concurrent use of the two metals, prominent among whom were Wolowski on the Continent and Seyd in England, contended that these objections were ill-founded, for (1) the double standard, though it produced (*i.e.*, admitting the assumption of their opponents) more frequent fluctuations, still did not vary so widely from the mean, since in each case it was the cheaper metal which determined the value,⁷ and (2) the action of Gresham's law would produce a compensatory action. Thus, if silver be undervalued in a double-standard system, a drain sets in to other countries where it is more valuable. The quantity of silver is thus reduced and its value raised, while gold is imported, its quantity increased, and its value lowered. Were gold the undervalued metal, the converse process would take place. The soundness of this position is illustrated by the case of the great transformation of the French currency (1849-1860). During the rapid increase of the gold supplies the value of silver only rose about 3 per cent.; in fact the depreciation was spread over the two metals, and not confined to gold.⁸ In addition to the above arguments, it was urged by Wolowski that any attempts to establish a universal gold standard as contemplated by the Paris conference of 1867 would cause a great appreciation of gold, which would be disastrous to commercial interests, while silver would lose most of its value. The services which the double-standard countries rendered by acting as intermediaries between gold and silver standard countries was also dwelt on, the ease with which the mass of silver needed for exportation to the East was supplied from France during the years 1853-56 being an instance in point. The monetary difficulties, as indicated above, which followed the adoption of gold by Germany and the Scandinavian Union, as well as the embarrassment of the Indian Government, from the resulting depreciation of silver, revived the double-standard advocates. Cernuschi and De Laveleye came forward as supporters of what the former called *bimetallism*, that is to say, the establishment of a universal, or at all events a large international, currency, based on the concurrent circulation of the two metals gold and silver at a fixed ratio. This plan has gained many supporters, though the tendency among English economists was at first to decline even to consider it; and not even yet does the question appear to have received that careful examination by monometallists which would be desirable.⁹

The bimetallicists start with a discussion as to the causes which determine the value of money. They point out that there are two extreme theories: one that the value of money depends on the will of the sovereign (the *fiat* theory); the other that the value of money is entirely independent of state control, and determined by economic conditions (the *free trade* theory). Neither of these is accepted by the bimetallicists. They take up a middle ground and hold that, by its power of deciding what substance shall be deemed legal tender and discharge all obligations, the state is able to determine, *within limits*, what substances shall be money and what the

⁴ *Coins of the Realm*, pp. 123-165.

⁵ This objection to the double standard is also urged by Prof. Thorold Rogers and by Bagehot. Actual instances of the difficulty occurred in 1860, and again in 1876, with the Bank of France.

⁶ "Proposals for an Economical and Secure Currency," *Works* (ed. M'Culloch), p. 403.

⁷ The superposition of two curves, each representing the variations of one metal, and the formation of a third curve representing the lowest concurrent points of each, will make this clear. See Jevons, *Money*, p. 138.

⁹ Mr A. J. Wilson has collected a series of articles on Reciprocity, Bimetallism, and Land Tenure Reform, and Prof. Bouamy Price dealt with Bimetallism and Fair Trade in his address to the Social Science Congress in 1882. But there is no fair reason for placing E. de Laveleye, Luzzati, Cernuschi, Dana Horton, and other supporters of bimetallicism—and we may add Prof. F. A. Walker—in the same category with the advocates of (so-called) "Reciprocity."

value of these substances shall be. They argue from history that several metals have been successively demonetized, that different ratios have been fixed between metals circulating together, that inconvertible paper currencies have been kept in circulation by the will of the state.¹ The doctrine of cost of production as determining the value of money is also assailed by them. They hold that it is the quantity of money which governs its value,² and that cost of production has little or no influence in the matter. The next step in the bimetallic argument is to contend that their proposed ratio for gold to silver (1 to 15½) can be maintained by the legal regulations to that effect. The common objection to bimetalism is, that whichever metal was undervalued would be exported. They answer that the same ratio existing over all, or a great part of, the world, there would be no inducement to export either metal, and in support of their argument they appeal to the passage from Newton quoted above, and claim him as the inventor of modern bimetalism.³ Thirdly, a greater stability as regards value is claimed for the two metals combined than for either singly, since the fluctuations are distributed over a wider field, and, the conditions of production of gold and silver being somewhat different, fluctuations in them tend to counterbalance each other. A fourth point consists in the greater facilities which would exist for trade, since the fluctuations of the exchanges which arise from the existence of gold and silver currencies, and the variations of relative value of these metals, would under a bimetallic system disappear. The fifth argument for bimetalism is the advantages which would result from the increased prices caused by the greater abundance of money, or at all events from the check to any fall in prices which might arise from a diminution in the production of gold. The final argument is that a universal currency is desirable, and that, a single gold currency being by general consent practically impossible, this advantageous reform can be realized in no other way than by adopting a plan which permits the concurrent circulation of two metals. Most of these positions are contested by the monometallists, and even where any concession is made the value of the advantage to be reaped is estimated at a much smaller amount. The contention that the value of money is largely influenced by state demand is met by the assertion that cost of production is the ultimate regulator of value, and that any artificial regulation would stimulate the production of the cheaper metal, and thus flood the world with it. The fixing of a ratio different from the market one is derided by them as absurd, and an extreme case is instanced for this purpose. Is it possible, they ask, to make the value of silver equal to that of gold? If not, how can it be possible to alter the market ratio in even the slightest degree? Is there not a great demand for the precious metals in the various trades? And would not the ratio of this demand be affected by the fixing of a new ratio? The argument of bimetalists that their system would produce greater stability in the value of money is met by the answer that there is no proof of this. It is quite possible that a single metal may be steadier in value than two combined, and the evidence of history shows that silver is more liable to depreciation than gold. The argument derived from the advantages to exchange transactions is to a slight extent admitted, but it is pointed out that the factors which affect the foreign exchanges are so numerous, and are so rapidly eliminated in the course of trade, that a radical currency change need not be adopted for this purpose. It is also shown that, even when most European countries were bimetallic, fluctuations in the exchange price of silver took place; and still more that, where it is the less valuable metal that is in course of depreciation, bimetalism can afford no aid. The assumed tendency of the bimetallic scheme to produce a higher scale of prices than would otherwise prevail is dwelt on by opponents as a proof of its inherently vicious character. The claim to benefit the world by adding to its stock of money places bimetalists in the same class with the advocates of inconvertible paper money, and shows the absence of reason in their views. Their position becomes the same as that of the Birmingham currency school. The proposition that the quantity of money is of no consequence since prices vary in proportion to it is cited as conclusive, and the contempt so frequently expressed for bimetalists is accounted for by their advocacy of this principle of the beneficial effects of an increased amount of money. To the contention that bimetalism is the necessary condition for a universal coinage system the answer is, that the idea of universal coinage is premature, and that the gradual introduction of the gold standard is desirable as preparing the way for a future universal coinage based on gold monometallism. On the practical question as to the actual introduction of the system, the monometallists deny the possibility of

forming a universal bimetallic league which would not be liable to be broken up by war, or impaired by some of the states which composed it issuing inconvertible paper. On the other hand, the various international conventions for postal purposes, extradition, commercial arrangements, and other matters of interest, are considered by bimetalists as evidences of the feasibility of their plan.⁴

The above summary gives the main arguments on each side of the discussion as given by the advocates of the contending principles. A short consideration will show that the controversy may be suitably divided into three heads, viz.—(1) the possibility of constructing a universal bimetallic system which shall be in accordance with sound economic principle; (2), if the first question be answered in the affirmative, the comparative merits of this system as opposed to the present variety of systems, or a future universal gold-standard system; and (3) the expediency under present circumstances of nations in general, and England in particular, joining in the proposed convention. Each of these topics calls for some remark. (1) The possibility of a bimetallic system can hardly be denied. Under all the difficulties attending its existence in a single country, it was retained in practical working in France during the early part of the 18th century, and it is plain that a widely-extended league would afford a better field for its action. It is quite possible that national preferences for one metal or the other would be displayed, but this would be no hindrance, since the exchanges would be regulated by the legal rate, and prices would depend on the total quantity of both metals (the amount of gold being multiplied by the legal ratio, and added to the amount of silver).⁵ The objection which denies the power of Governments to fix the relative values of gold and silver, and which is supported by the instance of the extreme case of silver being made equal in value to gold, may be set aside by the consideration that the use of the precious metals takes two forms—(a) their use as commodities, (b) their use as money. Since the state can influence the demand for these metals as money, and since therefore it can raise the value of either of them by this increased demand, it follows that, within assignable limits, it can fix the ratios between them, and that these limits are “the ratio which would subsist between their values if gold were demonetized, and that which would subsist if silver were demonetized.”⁶ The possibility of bimetalism, if all nations were agreed, is allowed by some monometallists (e.g., Professor Jevons), and an unconscious argument to this effect was given by the proposal of Chevalier, at the time of the Australian gold discoveries, to adopt silver as the standard and demonetize gold, which is a clear recognition of the force of law in monetary questions. It is therefore reasonable to answer in the bimetalists' favour the question first raised. (2) The considerations to be taken into account under the second head are far more complex, and do not admit of accurate determination. The present currency systems of England and the Scandinavian Union are based on the composite system, and afford the greatest satisfaction to the inhabitants of those countries. The bimetallic system of the Latin Union has been suspended, the introduction of silver as the principal money not being desired by the various peoples concerned. Germany has lost considerably by the sale of depreciated silver, and, were a gold standard once firmly established, it is not likely that any wish for change would be manifested. With silver countries the case is different. They have to receive masses of depreciated silver and to give commodities in exchange, while their purchasing power is reduced owing to the greater relative value of gold to silver. It would therefore be clearly advantageous for silver-using countries that a system should be adopted which would raise the value of their money, and save them from the necessity of importing large quantities of silver to produce a proper adjustment. The ultimate consequences of the complete demonetization of silver as regards silver-using countries are not so clear. The supply of gold might suffice for all wants, and might furnish a better currency than the heavier silver. The preservation of two separate monometallic systems, of gold for the more advanced countries of Europe and the United States, of silver for Russia and India, would, when the superfluous stock of silver had passed to the East, present little difficulty after equilibrium was attained. The new ratio between silver and gold would become established, and silver prices in silver-using countries would be higher in proportion to the fall in the value of silver. It is therefore plain that a suitable adjustment would be reached under any variety of currency systems, and it may therefore be concluded that the comparative merits of the competing standards are not capable of

⁴ The principal sources for the above summary, besides works before cited, are the pamphlets of Seyd, Cernschi, and De Laveleye, on the bimetallic side, as well as the articles of the latter in the *Fort*, and *Contemp. Reviews*. The monometallist arguments are given by Prof. Jevons (*Contemp.*, May 1881), Mr R. Giffen (*Essays in Finance*, pp. 286-310), and Lord Sherbrooke (*Nineteenth Century*, April 1882). See also the *Report of the Paris conference*, 1881, and Mr T. H. Farrer, *The State in its Relation to Trade*, pp. 49-52.

⁵ It is assumed that the other factors which influence the value of money (see p. 722, above) remain constant.

⁶ Mr J. J. Murphy in *Dublin Statistical Journal*, vol. viii. p. 282. See also M. Walras, *Journal des Economistes*, May 1881, “Théorie Mathématique du bimétallisme.”

¹ See Dana Horton's paper on the *Position of Law in the Doctrine of Money*, presented to the monetary conference of 1881 (Appendix ix. C).

² On p. 721, above, the theory of money value has been stated, and the objections to the cost of production theory given. It is strange to find Jevons arguing (in common with Bagehot and Prof. Price) that the value of money ultimately depends on cost of production, when his examination of that doctrine in general is considered. Compare *Contemp. Rev.* (May 1881) with Jevons's *Theory of Pol. Econ.*, p. 201 sq.

³ Modern bimetalists freely admit that two different bimetallic systems—i.e., having different ratios—could not exist, for each would drain the other of one metal.

being decided at present. The immediate introduction of a universal gold currency is by the admission of all parties eminently undesirable, and this is the only settled point in the controversy. (3) The last head which the bimetallic question embraces is the practical expediency of joining in a bimetallic league with a ratio of 1 to 15½. With regard to this aspect of the question the answer, for England at least, ought to be a negative one. The present English monetary system has worked well. It is firmly rooted in English habits, and is not therefore to be lightly abandoned. Again, the interests of English creditors are plainly opposed to any movement calculated to raise the value of silver relatively to gold, and to depreciate prices in general. The threat of some bimetallicists, that all nations will be driven to adopt a gold standard, and thus produce a crisis in the English money market by the resulting gold drain, is of no weight; any drain of English gold will have to be paid for at a high price, and the simple expedient of raising the bank-rate will restore as much bullion as is needed in England. The interests of other countries cannot be so clearly determined. A state like Germany, holding a large store of depreciated silver, may desire other states to become bimetallic, but will hardly desire to do so herself. The interests of India and other silver-standard countries have been considered before. When all these aspects of the question have been examined the most probable conclusion is, that the chances of a bimetallic league in the immediate future are very small, and that future monetary evolution will be ruled rather by the course of events, and the pressure of circumstances in each separate state, than by the conscious deliberations of an international conference.

Bibliography.—The literature of the various questions connected with money is very extensive, and only a brief notice of it can be given here. The principal authority among the Greeks is Aristotle, who in two passages (*Nic. Eth.*, v. 5; *Pol.*, i. 9) has discussed the qualities of money, and pointed out its functions with great clearness. Xenophon also, in his work *On the Athenian State*, dealt with the value of the precious metals, though his views are partially erroneous. The only passages worth noticing in Latin literature are those of Pliny, who seems to have held a form of the mercantile theory, and Paulus, who, in a fragment preserved in the *Digest*, has treated of the origin of money. The mediæval literature embraces several works dealing specially with the question of changes in the standard of money, which were condemned by the theologians. The first treatise professionally on the special subject of money is a work by Nicholas Oresme, bishop of Lisieux (ob. 1382), entitled *De Origine, Natura, Jure, et Mutationibus Monetarum*, reprinted in 1864 (Paris) by Wolowski, and even now worth reading. The next work to be noticed is the *De Monetarum Potestate simul et Utilitate libellus* (Nuremberg, 1542), a fragment or a larger treatise on economics, of Gabriel Biel (ob. 1495). It has been remarked that "the favourite subject of the economists of the 16th century was that of money." The first of these works to be noticed is *De Monetæ Cudendæ Ratione* by Copernicus, reprinted along with the work of Oresme above mentioned. At a later date the Jesuit Mariana discussed the variations in prices under the title *De Monetæ Mutatione*. In the same century an anonymous work appeared in German, with the title *Gemeine Stimmen von der Muntze* (1530). In 1588 Davanzati issued *Lezioni delle Monete*, advocating a bimetallic system. The problem of the elevation of prices caused by the American mines led to the issue of several works, one of the most remarkable being the *Dialogues* of William Stafford (1581).

In the 17th century Sir W. Petty dealt with money in a tract,

Quantulumcumque (1682). The recoinage of 1696 called forth Lowndes's *Essay for the Amendment of the Silver Coins*, and Locke's *Further Considerations concerning raising the Value of Money*. In the 18th century the *Reports* of Sir I. Newton, as Master of the Mint, are valuable. Cantillon's *Essai* (Paris, 1755) contains in its 2d and 3d parts a sound account of currency. Harris's *Essay on Money and Coins* (1757) is also useful. An earlier tract by Rice Vaughan, *Discourse of Coin and Coinage* (1675), is brief, but correct in principle. Adam Smith's *Wealth of Nations* (London, 1776) discusses the subject of money in B. I. chs. 4 and 5, while seigniorage is examined in B. iv. ch. 6. The treatise, *The Coins of the Realm* (London, 1805), by the first earl of Liverpool, elaborately discussed the question of the proper standard, and has powerfully influenced monetary legislation in England and Germany. Ricardo's pamphlets on the bullion question added to the knowledge of the laws which regulated a depreciated currency. Senior, in his *Lectures on the Cost of obtaining Money* (London, 1829), developed the theory of the international distribution of the precious metals.

The last half century has been a time of active discussion regarding monetary questions,—the gold discoveries, international coinage, decimal coinage, bimetallicism, the resumption of specie payments in countries where an inconvertible currency has existed, each of these topics having had its special literature. Some of these works have been mentioned when dealing with the special questions they refer to, and these, in turn, refer to many others. It will suffice here to mention more general works. The theory of money is dealt with by the leading English economists in their systematic works (Mill, *Principles*, B. iii. chs. 7-10, 19, 21; Fawcett, *Manual*, B. iii. chs. 5, 6, 15, 16; Shadwell, *System*, B. iii. chs. 1-3 and 8), also by Cherbuliez (*Précis*, B. ii. ch. 3, vol. i. and B. ii. ch. 3, vol. ii.). Chevalier has devoted the third volume of his *Cours* (Paris, 1842-50) to the subject, with the title of "La Monnaie." The late Professor W. S. Jevons's valuable work, *Money and the Mechanism of Exchange*, and Professor Hussey Walsh's concise *Treatise on Metallic Currency* (Dublin, 1853) may also be used. More elaborate than either of these is F. A. Walker's *Money*, the most comprehensive work on the subject in English; his smaller work, *Money in its Relation to Trade and Industry*, is likewise very good. Wolowski's *L'Or et l'Argent* contains much information, as does also Knies's *Das Geld*. E. Seyd's *Bullion and Foreign Exchanges* is serviceable, but the changes since its publication (1869) deprive it of most of its value. The various editions of Tate's *Cambist* give the most accurate (though often imperfect) statements as to the facts of currency. Jacob's work on *The Production and Consumption of the Precious Metals* gives many interesting details, though the conclusions are often fanciful, and the authorities relied on not trustworthy. The recent work of Del Mar, *History of the Precious Metals* (London, 1880), furnishes a criticism and continuation of Jacob, and supplies many new details. His criticism of the "cost of production" theory as applied to gold and silver is especially useful. Some of his views on the moral aspects of the question need qualification. Professor Sumner's *History of the American Currency* may be relied upon for its facts. The *Reports* of the various conferences also supply abundant information on their special topics. Among these may be mentioned the *Proceedings of the Paris conferences of 1867, 1878, and 1884*; the *Decimal Coinage Commission* (1868); the French *Enquête Monétaire* (1870); and the *Report of the Committee of the House of Commons on the Depreciation of Silver* (1876). The *Reports of the (English) Mint* furnish information as to the coinage changes of each preceding year. (C. F. B.)

MONFERRATO, or MONTFERRAT, an ancient marquise of North Italy, in the valley of the Tanaro, the name of which still survives in the fuller title (Casale Monferrato) of the town of Casale. The princes of Monferrato were among the most powerful Italian families of the Middle Ages. Among them were several famous crusaders: Conrad, prince of Tyre from 1187 to 1192, the valiant opponent of Saladin; and Boniface, king of Thessalonica from 1183 to 1207. In 1305, on the extinction of the male line, the marquise passed to Theodore Palæologus through his mother, the empress Irene. The Palæologi became extinct in 1533. The duchy was subsequently attached to Mantua, and ultimately absorbed in Savoy in the beginning of last century.

MONGE, GASPARD (1746-1818), French mathematician, the inventor of descriptive geometry, was born at Beaune on the 10th May 1746. He was educated first at the college of the Oratorians at Beaune, and then in their college at Lyons,—where, at sixteen, the year after he had

been learning physics, he was made a teacher of it. Returning to Beaune for a vacation, he made, on a large scale, a plan of the town, inventing the methods of observation and constructing the necessary instruments; the plan was presented to the town, and preserved in their library. An officer of engineers seeing it wrote to recommend Monge to the commandant of the military school at Mézières, and he was received as draftsman and pupil in the practical school attached to that institution; the school itself was of too aristocratic a character to allow of his admission to it. His manual skill was duly appreciated: "I was a thousand times tempted," he said long afterwards, "to tear up my drawings in disgust at the esteem in which they were held, as if I had been good for nothing better." An opportunity, however, presented itself: being required to work out from data supplied to him the "determination" of a proposed fortress (an operation then only performed by a long arithmetical process), Monge, substituting for this a geometrical method, obtained the

result so quickly that the commandant at first refused to receive it—the time necessary for the work had not been taken; but upon examination the value of the discovery was recognized, and the method was adopted. And Monge, continuing his researches, arrived at that general method of the application of geometry to the arts of construction which is now called descriptive geometry. But such was the system in France before the Revolution that the officers instructed in the method were strictly forbidden to communicate it even to those engaged in other branches of the public service; and it was not until many years afterwards that an account of it was published. The method consists, as is well known, in the use of the two halves of a sheet of paper to represent say the planes of xy and xz at right angles to each other, and the consequent representation of points, lines, and figures in space by means of their plan and elevation, placed in a determinate relative position.

In 1768 Monge became professor of mathematics, and in 1771 professor of physics, at Mézières; in 1778 he married Madame Horbon, a young widow whom he had previously defended in a very spirited manner from an unfounded charge; in 1780 he was appointed to a chair of hydraulics at the Lycéum in Paris (held by him together with his appointments at Mézières), and was received as a member of the Academy; his intimate friendship with Berthollet began at this time. In 1783, quitting Mézières, he was, on the death of Bezout, appointed examiner of naval candidates. Although pressed by the minister to prepare for them a complete course of mathematics, he declined to do so, on the ground that it would deprive Madame Bezout of her only income, arising from the sale of the works of her late husband; he wrote, however (1786), his *Traité élémentaire de la Statique*.

Monge contributed (1770-1790) to the *Memoirs* of the Academy of Turin, the *Mémoires des Savants Étrangers* of the Academy of Paris, the *Mémoires* of the same Academy, and the *Annales de Chimie*, various mathematical and physical papers. Among these may be noticed the memoir "Sur la théorie des déblais et des remblais" (*Mém. de l'Acad. de Paris*, 1781), which, while giving a remarkably elegant investigation in regard to the problem of earth-work referred to in the title, establishes in connexion with it his capital discovery of the curves of curvature of a surface. Euler, in his paper on curvature in the Berlin *Memoirs* for 1760, had considered, not the normals of the surface, but the normals of the plane sections through a particular normal, so that the question of the intersection of successive normals of the surface had never presented itself to him. Monge's memoir just referred to gives the ordinary differential equation of the curves of curvature, and establishes the general theory in a very satisfactory manner; but the application to the interesting particular case of the ellipsoid was first made by him in a later paper in 1795. A memoir in the volume for 1783 relates to the production of water by the combustion of hydrogen; but Monge's results in this matter had been anticipated by Watts and Cavendish.

In 1792, on the creation by the Legislative Assembly of an executive council, Monge accepted the office of minister of the marine, but retained it only until April 1793. When the Committee of Public Safety made an appeal to the savants to assist in producing the *matériel* required for the defence of the republic, he applied himself wholly to these operations, and distinguished himself by his indefatigable activity therein; he wrote at this time his *Description de l'art de fabriquer les canons*, and his *Avis aux ouvriers en fer sur la fabrication de l'acier*. He took a very active part in the measures for the establishment of the Normal School (which existed only

during the first four months of the year 1795), and of the School for Public Works, afterwards the Polytechnic School, and was at each of them professor for descriptive geometry; his methods in that science were first published in the form in which the shorthand writers took down his lessons given at the Normal School in 1795, and again in 1798-99. In 1796 Monge was sent into Italy with Berthollet and some artists to receive the pictures and statues levied from several Italian towns, and made there the acquaintance of General Bonaparte. Two years afterwards he was sent to Rome on a political mission, which terminated in the establishment, under Massena, of the short-lived Roman republic; and he thence joined the expedition to Egypt, taking part with his friend Berthollet as well in various operations of the war as in the scientific labours of the Egyptian Institute of Sciences and Arts; they accompanied Bonaparte to Syria, and returned with him in 1798 to France. Monge was appointed president of the Egyptian commission, and he resumed his connexion with the Polytechnic School. His later mathematical papers are published (1794-1816) in the *Journal* and the *Correspondance* of the Polytechnic School. On the formation of the Senate he was appointed a member of that body, with an ample provision and the title of count of Pelusium; but on the fall of Napoleon he was deprived of all his honours, and even excluded from the list of members of the reconstituted Institute. He died at Paris on the 28th July 1818.

For further information see B. Brisson, *Notice historique sur Gaspard Monge*; Dupin, *Essai historique sur les services et les travaux scientifiques de Gaspard Monge*, Paris, 1819, which contains (pp. 162-166) a list of Monge's memoirs and works; and the biography by Arago (*Œuvres*, t. ii., 1854).

Monge's various mathematical papers are to a considerable extent reproduced in the *Application de l'Analyse à la Géométrie*, 4th edition (last revised by the author), Paris, 1819—the pure text of this is reproduced in the 5th edition (revue, corrigée et annotée par M. Liouville), Paris, 1850, which contains also Gauss's Memoir, "Disquisitiones generales circa superficies curvas," and some valuable notes by the editor. The other principal separate works are *Traité élémentaire de la Statique*, 8^e édition, conformée à la précédente, par M. Hachette, et suivie d'une Note etc., par M. Cauchy, Paris, 1846; and the *Géométrie Descriptive* (originating, as mentioned above, in the lessons given at the Normal-School). The 4th edition, published shortly after the author's death, seems to have been substantially the same as the 7th (*Géométrie Descriptive* par G. Monge, suivie d'une théorie des Ombres et de la Perspective, extraite des papiers de l'auteur, par M. Brisson, Paris, 1847). (A. CA.)

MONGHYR, or MUNGIR, a district in the lieutenant-governorship of Bengal, lying between 24° 22' and 25° 49' N. lat., and 85° 40' and 86° 52' E. long., is bounded on the N. by Darbhanga and Bhágalpur, on the E. by Bhágalpur, on the S. by the Santál Parganá and Hazáribágh, and on the W. by Gayá, Patná, and Darbhanga, with an area of 3922 square miles. The Ganges divides the district into two portions. The northern, intersected by the Burí Gandak and Tiljugá, two important tributaries of the Ganges, is always liable to inundation during the rainy season, and is a rich, flat, wheat and rice country, supporting a large population. A considerable area, immediately bordering the banks of the great rivers, is devoted to permanent pasture. Immense quantities of buffaloes are sent every hot season to graze on these marshy prairies; and the *ghí*, or clarified butter, made from their milk forms an important article of export to Calcutta. To the south of the Ganges the country is dry, much less fertile, and broken up by fragmentary ridges. The soil consists of quartz, mixed in varying proportions with mica. Ranges of hills intersect this part of the district, and in the extreme south form conical peaks, densely covered with jungle, but of no great height. Irrigation is necessary throughout the section lying on the south of the Ganges.

In 1872 the population of Monghyr was 1,812,986 (males, 897,074; females 915,912): Hindus, 1,613,546; Mohammedans,

182,269; the remainder, consisting mainly of aboriginal tribes and hill races, profess primitive forms of faith. There are also a few Buddhists and Christians. Seven towns contained upwards of 5000 inhabitants in 1872—Monghyr, 59,698; Shaikhpara, 11,536; Jamalpur, 10,453; Barhiya, 10,405; Surajgarha, 7935; Barbigha, 6362; and Jamui, 5197. No trustworthy statistics of the area under cultivation exist since the revenue survey in 1847, when it was returned at 1,311,768 acres; it is known, however, that cultivation has largely extended since then. The land is held principally under the tenure known as *bhāoli-jot*, by which the tenant pays rent, either in money or in kind, according to the out-turn of his crops in each year. It is of ancient standing, and popular with the tenantry. Monghyr is famous for its manufactures of iron: firearms, swords, and iron articles of every kind are produced in abundance, but are noted for cheapness rather than quality. The art of inlaying sword-hilts and other articles with gold and silver affords employment to a few families. The most important manufacture, however, is that of indigo, conducted by means of European capital and under European supervision. The total area under indigo is estimated at about 10,000 acres, with an average out-turn of 2900 cwts. of dye. Minor industries include weaving, dyeing, cabinet-making, boot-making, soap-boiling, and pottery. The principal exports, sent to Calcutta both by rail and river, are oil-seeds, wheat, rice, indigo, gram and pulse, hides, and tobacco, and the chief imports consist of European piece goods, salt, and sugar. The value of the former in 1876-77 was £430,000, and of the latter £314,000. Education is making fair progress, and in 1874-75 there were 229 Government and aided schools, attended by 6675 pupils. The climate is dry and healthy. The temperature is high

in the hot weather, reaching 107° Fahr. in May; but the cold weather is cool and pleasant. The average annual rainfall is 46½ inches. Malarial fever is comparatively uncommon, but epidemics of cholera occur frequently.

Monghyr was one of the principal centres of the Mohammedan administration in Bengal. In the early years of British rule, Monghyr formed a part of Bhagalpur, and was not created a separate district till 1832.

MONGHYR, chief town and administrative headquarters of the above district, is situated on the south bank of the Ganges (25° 22' N. lat., 86° 30' E. long.). The population in 1872 was 59,698: viz., Hindus, 44,900; Mohammedans, 14,346; Buddhists, 33; Christians, 305; "others," 24.

In 1195 Monghyr, a fortress of great natural strength, appears to have been taken by Muhammad Bakhtyar Khilji, the first Moslem conqueror of Bengal. Henceforth it is often mentioned by the Mohammedan chroniclers as a place of military importance, and was frequently chosen as the seat of the local government. After 1590, when Akbar established his supremacy over the Afghan chiefs of Bengal, Monghyr was long the headquarters of his general, Todar Mall, and it also figures prominently during the rebellion of Sultan Shuja against his brother, Aurangzeb. In more recent times Nawab Mir Kasim, in his war with the English, selected it as his residence and the centre of his military preparations. The fame of Monghyr armourers is said to date from the arsenal which he established. The town is now purely a civil station, and in some respects one of the most picturesque in Bengal.

M O N G O L S

THE early history of the Mongols, like that of all central-Asian tribes, is extremely obscure. Even the meaning of the name "Mongol" is a disputed point, though a general consent is now given to Schott's etymology of the word from "mong," meaning brave. From the earliest and very scanty notice we have of the Mongols in the history of the Tang dynasty of China (A.D. 619-90) and in works of later times, it appears that their original camping-grounds were along the courses of the Kerulon, Upper Nonni, and Argun rivers. But in the absence of all historical particulars of their origin, legend, as is usual, has been busy with their early years. The Mongol historian Ssanang Ssetzen gives currency to the myth that they sprang from a blue wolf; and the soberest story on record is that their ancestor Budantsar was miraculously conceived of a Mongol widow. By craft and violence Budantsar gained the chieftainship over a tribe living in the neighbourhood of his mother's tent, and thus left a heritage to his son. Varying fortunes attended the descendants of Budantsar, but on the whole their power gradually increased, until Yesukai, the father of Jenghiz Khan, who was eighth in descent from Budantsar, made his authority felt over a considerable area. How this dominion was extended under the rule of Jenghiz Khan has already been shown (see JENGHIZ KHAN), and when that great conqueror was laid to rest in the valley of Keleen in 1227 he left to his sons an empire which stretched from the China Sea to the banks of the Dnieper.

Over the whole of this vast region Jenghiz Khan set his second surviving son Oghotai or Ogdai as khakan, or chief khan, while to the family of his deceased eldest son Juchi he assigned the country from Kayalik and Kharezm to the borders of Bulgar and Saksin "where'er the hoofs of Mongol horses had tramped;" to Jagatai, his eldest surviving son, the territory from the borders of the Uigur country to Bokhara; while Tulé, the youngest, received charge of the home country of the Mongols, the care of the imperial encampment and family, and of the archives of the state. The appointment of Ogdai as his successor, being contrary to the usual Mongol custom of primogeniture, gave rise to some bitterness of feeling among the followers of Jagatai. But the commands of Jenghiz Khan subdued these murmurs, and Ogdai was finally led to the throne

by his dispossessed brother amid the plaudits of the assembled Mongols. The ceremony was completed by Ogdai making three solemn genuflexions to the sun, and by the princes taking an oath by which they swore "that so long as there remained of his posterity a morsel of flesh which thrown upon the grass would prevent the cows from eating, or which put in the fat would prevent the dogs from taking it, they would not place on the throne a prince of any other branch." In accordance with Mongol customs, Ogdai signalized his accession to the throne by distributing among his grantees presents from his father's treasures, and to his father's spirit he sacrificed forty maidens and numerous horses. Once fairly on the throne, he set himself vigorously to follow up the conquests won by his father. At the head of a large army he marched southwards into China to complete the ruin of the Kin dynasty, which had already been so rudely shaken, while at the same time Tulé advanced into the province of Honan from the side of Shense. Against this combined attack the Kin troops made a vigorous stand, but the skill and courage of the Mongols bore down every opposition, and over a hecatomb of slaughtered foes they captured Kai-fung Foo, the capital of their enemies. From Kai-fung Foo the emperor fled to Joo-ning Foo, whither the Mongols quickly followed. After sustaining a siege for some weeks, and enduring all the horrors of starvation, the garrison submitted to the Mongols, and at the same time the emperor committed suicide by hanging. Thus fell in 1234 the Kin or "Golden" dynasty, which had ruled over the northern portion of China for more than a century.

But though Ogdai's first care was to extend his empire in the rich and fertile provinces of China, he was not forgetful of the obligation under which Jenghiz Khan's conquests in western Asia had laid him to maintain his supremacy over the kingdom of Kharezm. This was the more incumbent on him since Jelal al-din, who had been driven by Jenghiz into India, had returned, reinforced by the support of the sultan of Delhi, whose daughter he had married, and, having reconquered his hereditary domains, had advanced westward as far as Tiflis and Khelat. Once more to dispossess the young sultan, Ogdai sent a force of 300,000 men into Kharezm. With such amazing rapidity did this army march in pursuit of its foe that the

advanced Mongol guards reached Amid (Diarbekr), whither Jelál al-dín had retreated, before that unfortunate sovereign had any idea of their approach. Accompanied by a few followers, Jelál al-dín fled to the Kurdish mountains, where he was basely murdered by a peasant. The primary object of the Mongol invasion was thus accomplished; but, with the instinct of their race, they made this conquest but a stepping-stone to another, and without a moment's delay pushed on still farther westward. Unchecked and almost unopposed, they overran the districts of Diarbekr, Mesopotamia, Erbil, and Khelat, and then advanced upon Azerbijan. So great was the terror with which these fierce warriors inspired the people of the provinces they attacked that single Mongols are said to have slain the inhabitants of entire villages without a hand having been raised against them. In the following year (1236) they invaded Georgia and Great Armenia, committing frightful atrocities, sparing neither man nor woman, young nor old, with the exception of those whom they saved to minister to their wants or passions. Tifis was among the cities captured by assault, and Kars was surrendered at their approach in the vain hope that submission would gain clemency from the victors. Meanwhile, in 1235, Ogdai, whose troops were as numerous as their thirst for conquest was devouring, despatched three armies in as many directions. One was directed against Corea, one against the Sung dynasty, which ruled over the provinces of China south of the Yang-tsze Keang, and the third was sent westward into eastern Europe. This last force was commanded by Batu, the son of Juchi, Ogdai's deceased eldest brother, who took with him the celebrated Sabutai Bahádúr as his chief adviser. Bulgar, the capital city of the Bulgars, fell before the force under Sabutai, while Batu pushed on over the Volga. With irresistible vigour and astonishing speed the Mongols made their way through the forests of Penza and Tamboff, and appeared before the "beautiful city" of Riazan. For five days they discharged a ceaseless storm of shot from their balistas, and, having made a breach in the defences, carried the city by assault on the 21st of December 1237. "The prince, with his mother, wife, sons, the boyars, and the inhabitants, without regard to age or sex, were slaughtered with the savage cruelty of Mongol revenge; some were impaled, some shot at with arrows for sport, others were flayed or had nails or splinters of wood driven under their nails. Priests were roasted alive, and nuns and maidens ravished in the churches before their relatives. 'No eye remained open to weep for the dead.'" Moscow, at this time a place of little importance, next fell into the hands of the invaders, who then advanced against Vladimir. After having held out for several days against the Mongol attacks, the city at length succumbed, and the horrors of Riazan were repeated. The imperial family, with a vast crowd of fugitives, sought shelter in the cathedral, only to perish by the swords of the conquerors or by the flames which reduced it to ashes. If possible, a more dire fate overtook the inhabitants of Kozelsk, near Kaluga, where, in revenge for a partial defeat inflicted on a Mongol force, the followers of Batu held so terrible a "carnival of death" that the city was renamed by its captors Mobalig, "the city of woe." With the tide of victory thus strong in their favour the Mongols advanced against Kieff, "the mother of cities," and carried it by assault. The inevitable massacre followed, and the city was razed to the ground. While the scene of bloodshed was at its height a catastrophe occurred which at any other time would have been considered of supreme horror. Under the weight of a vast crowd of fugitives the flat roof of the metropolitan church fell in, burying all, young and old, in a vast hecatomb.

Victorious and always advancing, the Mongols, having

desolated this portion of Russia, moved on in two divisions, one under Batu into Hungary, and the other under Baidar and Kaidu into Poland. Without a check, Batu marched to the neighbourhood of Pesth, where the whole force of the kingdom was arrayed to resist him. The Hungarian army was posted on the wide heath of Mohi, which is bounded by "the vine-clad hills of Tokay," the mountains of Lomnitz, and the woods of Diosgyor. To an army thus hemmed in on all sides defeat meant ruin, and Batu instantly recognized the dangerous position in which his enemies had placed themselves. To add to his chances of success he determined to deliver his attack by night, and while the careless Hungarians were sleeping he launched his battalions into their midst. Panic-stricken and helpless, they fled in all directions, followed by their merciless foes. Two archbishops, three bishops, and many of the nobility were among the slain, and the roads for two days' journey from the field of battle were strewn with corpses. The king, Béla IV., was saved by the fleetness of his horse, though closely pursued by a body of Mongols, who followed at his heels as far as the coast of the Adriatic, burning and destroying everything in their way. Meanwhile Batu captured Pesth, and on Christmas Day 1241, having crossed the Danube on the ice, took Gran by assault. While Batu had been thus triumphing, the force under Baidar and Kaidu had carried fire and sword into Poland. At their approach the inhabitants of Cracow deserted the city, after having given it over to the flames. Disappointed at the loss of their expected spoil, the Mongols advanced to Wahlstatt in the neighbourhood of Liegnitz, where the Polish army under Duke Henry II. of Silesia awaited their onslaught. With savage impetuosity, the troops of Baidar rushed to the attack, and completely defeated the Poles. As usual, no quarter was given. The massacre was frightful, and Duke Henry himself was amongst the slain. It was a Mongol habit to cut off an ear from each corpse of their slaughtered foes, and on this occasion it is said that they filled nine sacks with these ghastly trophies. Following the example of the inhabitants of Cracow, the people of Liegnitz left but the blackened walls of what had once been the town as a prey for the Mongols, who without delay pushed south-eastward into Moravia as far as the vicinity of Troppau. While laying waste the country in the neighbourhood of that town, they received the announcement of the death of Ogdai, and at the same time a summons for Batu to return eastwards into Mongolia.

While his lieutenants had been thus carrying his arms in all directions, Ogdai had been giving himself up to ignoble ease and licentiousness. Like many Mongols, he was much given to drink, and it was to a disease produced by this cause that he finally succumbed on the 11th of December 1241. He was succeeded by his son Kuyuk, who reigned only seven years. Little of his character is known, but it is noticeable that his two ministers to whom he left the entire conduct of affairs were Christians, as also were his doctors, and that a Christian chapel stood before his tent. This leaning towards Christianity, however, brought no peaceful tendencies with it. On the contrary, we hear of an advance against the sultan of Rüm (Asia Minor), and of an expedition into Syria, by which that country was made tributary to the Great Mongol empire, of a fresh campaign against Corea, and of another attack on the Sung dynasty of China. On the death of Kuyuk dissensions which had been for a long time smouldering between the houses of Ogdai and Jagatai broke out into open war, and after the short and disputed reigns of Kaidu and Chapai, grandsons of Ogdai, the lordship passed away from the house of Ogdai for ever.

On the 1st of July 1251 Mangu, the eldest son of Tulé, and nephew to Ogdai, was elected khakan. Witi

perfect impartiality, Mangu allowed the light of his countenance to fall upon the Christians, Mohammedans, and Buddhists among his subjects, although Shamanism was recognized as the state religion. Two years after his accession his court was visited by Rubruquis and other Christian monks, who were hospitably received. The description given by Rubruquis of the khakan's palace at Karakorum shows how wide was the interval which separated him from the nomad, tent-living life of his forefathers. It was "surrounded by brick walls. . . Its southern side had three doors. Its central hall was like a church, and consisted of a nave and two aisles, separated by columns. Here the court sat on great occasions. In front of the throne was placed a silver tree, having at its base four lions, from whose mouths there spouted into four silver basins wine, kumiss, hydromel, and terasine. At the top of the tree a silver angel sounded a trumpet when the reservoirs that supplied the four fountains wanted replenishing." On his accession complaints reached Mangu that dissensions had broken out in the province of Persia, and he therefore sent a force under the command of his brother Hulagu to punish the Ismailites or Assassins, who were held to be the cause of the disorder. Marching by Samarkand and Kesh, Hulagu crossed the Oxus and advanced by way of Balkh into the province of Kohistan. The terror of the Mongol name induced Rokn al-din, the chief of the Assassins, to deprecate the wrath of Hulagu by offers of submission, and he was so far successful that he was able to purchase a temporary immunity from massacre by dismantling fifty of the principal fortresses in Kohistan. But when once the country had thus been left at the mercy of the invaders, their belief in the old saying "Stone dead hath no fellow" sharpened their battle-axes, and, sparing neither man, woman, nor child, they exterminated the unhappy people. Hulagu then marched across the snowy mountains in the direction of Baghdad. On arriving before the town he demanded its surrender. This being refused, he laid siege to the walls in the usual destructive Mongol fashion, and at length, finding resistance hopeless, the caliph was induced to give himself up and to open the gates to his enemies. On the 15th of February 1263 the Mongols entered the walls, and, following their instincts, sacked the city. For seven days it was given up to pillage, fire, and the sword, and the number of killed was said to have reached the enormous sum of 800,000. For the moment the caliph's life was spared, and he was allowed to carry away 100 wives out of 700 who lived in his harem, as being those upon whom "neither the sun nor moon had shone." But his fate soon overtook him. Accounts differ as to the circumstances of his death, some saying that he was sewn up in a sack and trodden to death by horses, others that he was starved to death. To the Moslem world his loss was a religious catastrophe, as by it Islam lost its spiritual head. While at Baghdad Hulagu gave his astronomer, Násir al-din, permission to build an observatory. The town of Maragha was the site chosen, and, under the superintendence of Násir al-din and four western Asiatic astronomers who were associated with him, a handsome observatory was built, and furnished with "armillary spheres and astrolabes, and with a beautifully-executed terrestrial globe showing the five climates." One terrible result of the Mongol invasion was a fearful famine, which desolated the provinces of Irak-Arabi, Mesopotamia, Syria, and Róm. But, though the inhabitants starved, the Mongols had strength and energy left to continue their onward march into Syria. Aleppo was stormed and sacked, Damascus surrendered, and Hulagu was meditating the capture of Jerusalem with the object of restoring it to the Christians when he received the news of Mangu's death, and, as in duty bound, at once set out on his return to

Mongolia, leaving Kitubuka in command of the Mongol forces in Syria. As a reward for his services, Hulagu received the investiture of his conquests, and established there the empire of the Ilkhans.

While Hulagu was prosecuting these conquests in western Asia, Mangu and his next brother Kublai were pursuing a like course in southern China. Southward they even advanced into Tong-king, and westward they carried their arms over the frontier into Tibet. But in one respect there was a vast difference between the two campaigns. Under the wise command of Kublai all indiscriminate massacres were forbidden, and probably for the first time in Mongol history the inhabitants and garrisons of captured cities were treated with humanity. While carrying on the war in the province of Sze-ch'uen Mangu was seized with an attack of dysentery, which proved fatal after a few days' illness. His body was carried into Mongolia on the backs of two asses, and, in pursuance of the custom of slaughtering every one encountered on the way, 20,000 persons were, according to Marco Polo, put to the sword.

At the Kuriltai, or assembly of notables, which was held at Shang-tu after the death of Mangu, his brother Kublai (see KUBLAI KHAN) was elected khakan. For thirty-five years he sat on the Mongol throne, and at his death in 1294, in his seventy-ninth year, he was succeeded by his son Timur Khan, or, as he was otherwise called, Uldsheitu Khan. The reign of this sovereign was chiefly remarkable for the healing of the division which had for thirty years separated the families of Ogdai and Jagatai from that of the ruling khakan. Uldsheitu was succeeded by his nephew Khaissan. In accordance with the usual ceremony, on the election being announced four of the princes of the blood raised the new khakan aloft on a piece of white felt, two others supported him, while a seventh offered him the cup. "Meanwhile, while Shaman offered up prayers for his prosperity and saluted him by the title of Kuluk Khan, carts full of gold pieces and rich tissues were brought out and distributed. So many pearls were spread on the ground that it resembled the sky. The feast lasted a week, during each day of which 40 oxen and 4000 sheep were consumed. Libations of milk from 700 sacred cows and 7000 ewes were sprinkled on the ground." With that tolerance which so markedly characterized the Mongols at this period, Kuluk worshipped indiscriminately at the temples of the Chinese Shang-te and before the Buddhist shrines, while at the same time he lent a favourable countenance to John of Montecorvino, who, during the whole of his reign, was archbishop of Peking. Unfortunately the archbishop was not so tolerant as the khakan, and carried on as fierce a dispute with the Nestorian Christians of his day as that which divided the Dominicans and Jesuits in China three centuries later. After a short reign, and at the early age of thirty-one, Kuluk was gathered to his fathers in February 1311. His nephew and successor, Buyantu, was a man of considerable culture, and substantially patronized Chinese literature. Among other benefits which he conferred on letters, he rescued the celebrated inscription-bearing "stone drums," which are commonly said to be of the Chow period (B.C. 1122-255), from the decay and ruin to which they were left by the last emperor of the Kin dynasty, and placed them in the gateway of the temple of Confucius at Peking, where they now stand. After a reign of nine years Buyantu was succeeded by his son Gegen, who perished in 1323 by the knife of an assassin,—the first occasion on which a reigning descendant of Jenghiz Khan thus met his fate. Yissun Timur, who was the next sovereign, devoted himself mainly to the administration of his empire. He divided China, which until that time had been apportioned into twelve provinces, into eighteen provinces, and rearranged the

system of state granaries, which had fallen into disorder. His court was visited by Friar Odoric, who gives a minute description of the palace and its inhabitants. Speaking of the palace this writer says—

“Its basement was raised about two paces from the ground, and within there were twenty-four columns of gold, and all the walls were hung with skins of red leather, said to be the finest in the world. In the midst of the palace was a great jar more than two paces in height, made of a certain precious stone called merdacas (jade); its price exceeded the value of four large towns. . . . Into this vessel drink was conducted by certain conduits from the court of the palace, and beside it were many golden goblets, from which those drank who listed. . . . When the khakan sat on his throne, the queen was on his left hand, and a step lower two others of his women, while at the bottom of the steps stood the other ladies of his family. All those who were married wore upon their heads the foot of a man as it were a cubit and a half in length, and at the top of the foot there were certain cranes' feathers, the whole foot being set with great pearls, so that if there were in the whole world any fine and large pearls they were to be found in the decoration of those ladies.”

The following years were years of great natural and political convulsions. Devastating floods swept over China, carrying death and ruin to thousands of homes; earthquakes made desolate whole districts; and in more than one part of the empire the banners of revolt were unfurled. The khakans who now successively occupied the throne, instead of striving to stem the tide of discontent and disorder, gave themselves up to every kind of debauchery. As a natural consequence, the conduct of affairs fell entirely into the hands of their ministers, who but too often reflected the vices of their sovereigns. A comet which appeared in the reign of Toghon Timur Khan, and which was believed to be the precursor of fresh disasters to the reigning house, justified the prediction by being almost immediately followed by an earthquake, which overthrew the temple of the Imperial Ancestors, from the altars of which, as if to complete the misfortune, the silver tablets of the emperors were in the consequent confusion stolen. It was not long before the popular discontent found vent. In order to prevent the recurrence of the periodical inundations caused by the overflow of the Yellow river, the emperor ordered a levy of 70,000 men to excavate a new channel for its dangerous stream, and imposed a heavy tax to meet the necessary expenses. These oppressive edicts overstrained the patience of the people, and they broke into open rebellion. Under various leaders the rebels captured a number of cities in the provinces of Keang-nan and Honan, and took possession of Hang-chow, the capital of the Sung emperors. At the same time pirates ravaged the coasts and swept the imperial vessels off the sea. While these combined disorders were disturbing the country, the emperor, under the guidance of Tibetan Lamas, was being initiated into the sensual enjoyments peculiar to the warmer climates of Asia.

In 1355 a Buddhist priest named Cheo Yuen-chang became so impressed with the misery of his countrymen that he threw off his vestments and enrolled himself in the rebel army. His military genius soon raised him to the position of a leader, and with extraordinary success he overcame with his rude levies the trained legions of the Mongol emperor. While unable to defeat or check the rebels in the central provinces Toghon Timur was also called upon to face a rebellion in Corea. Nor were his arms more fortunate in the north than in the south. An army which was sent to suppress the revolt was cut to pieces almost to a man. These events made a dream which the emperor dreamt about this time of easy interpretation. He saw in his sleep “a wild boar with iron tusks rush into the city and wound the people, who were driven hither and thither without finding shelter. Meanwhile the sun and the moon rushed together and perished.” “This dream,” said the diviner, “is a prophecy that the

khakan will lose his empire.” The fulfilment followed closely on the prophecy. By a subterfuge, the rebels, after having gained possession of most of the central provinces of the empire, captured Peking. But Toghon Timur by a hasty flight escaped from his enemies, and sought safety on the shores of the Delonor in Mongolia. For a time the western provinces of China continued to hold out against the rebels, but with the flight of Toghon Timur the Mongol troops lost heart, and in 1368 the ex-Buddhist priest ascended the throne as the first sovereign of the Ming or “Bright” dynasty, under the title of Hung-woo.

Thus ended the sovereignty of the house of Jenghiz Khan in China, nor need we look far to find the cause of its fall. Brave and hardy the Mongols have always shown themselves to be; but the capacity for consolidating the fruits of victory, for establishing a settled form of government, and for gaining the allegiance of the conquered peoples, have invariably been wanting in them. For a time their prowess and the exceptional ability of some of the first emperors of their line held the people of China in a bondage which was only outwardly peaceful, and, when the hands which held the reins lost their nervous power, and the troops, enervated by the softer climate of China, lost much of their hardihood, the long pent-up hatred of a foreign yoke broke out and with gathering strength drove the invaders back to their Mongolian pasture-grounds.

Not content with having recovered China, the emperor Hung-woo sent an army of 400,000 men into Mongolia in pursuit of the forces which yet remained to the khakan. Even on their own ground the disheartened Mongols failed in their resistance to the Chinese, and at all points suffered disaster. Meanwhile Toghon Timur, who did not long survive his defeat, was succeeded in the khakanate by Biliktu Khan, who again in 1379 was followed by Ussakhal Khan. During the reign of this last prince the Chinese again invaded Mongolia, and inflicted a crushing defeat on the khan's forces in the neighbourhood of Lake Buyur. Besides the slain, 2994 officers and 77,000 soldiers are said to have been taken prisoners, and an immense booty to have been secured. This defeat was the final ruin of the eastern branch of the Mongols, who from this time surrendered the supremacy to the western division of the tribe. At first the Keraites or Terged, as in the early days before Jenghiz Khan rose to power, exercised lordship over the eastern Mongols, but from these before long the supremacy passed to the Oirad, who for fifty years treated them as vassals. Notwithstanding their subjection, however, the Keraites still preserved the imperial line, and khakan after khakan assumed the nominal sovereignty of the tribe, while the real power rested with the descendants of Toghon, the Oirad chief, who had originally attached them to his sceptre. Gradually, however, the Mongol tribes broke away from all governing centres, and established scattered communities with as many chiefs over the whole of eastern Mongolia. The discredit of having finally disintegrated the tribe is generally attached to Lingdan Khan (1604-1634), of whom, in reference to his arrogant and brutal character, has been quoted the Mongolian proverb: “A raging khakan disturbs the state, and a raging sahan (elephant) overthrows his keepers.”

At this time the Mongols, though scattered and in isolated bodies, had recovered somewhat from the shock of the disaster which they suffered at the hand of the first Ming sovereign of China. When first driven northwards, they betook themselves to the banks of the Kerulen, from whence they had originally started on their victorious career; but gradually, as the Chinese power became weaker among the frontier tribes, they again pushed southwards,

and at this time had established colonies in the Ordu country, within the northern bend of the Yellow river. The Mongol royal family and their immediate surroundings occupied the Chakhar country to the north-west of the Ordu territory, where they became eventually subjugated by the Manchus on the overthrow of the Ming dynasty in 1644 by the present rulers of China. Possibly out of consideration for the royal descent of their chiefs, the Chinese emperors have invariably placed these Mongols in a privileged position, and have incorporated the eight banners or military divisions of the Chakhars as one of the eight banners of the imperial Manchu army. The remaining Mongols who submitted to the Manchus were divided into 135 banners, 49 representing all those on the south-east of the desert, and 86 the Khalkhas, whose territory stretched along the north of the desert from the neighbourhood of Barkhul on the west to the Dalainor on the north-east. From and before this period the history of the eastern Mongols has been that of all the nomad tribes of central Asia, about which nothing can be more certainly said than that that which appears most improbable is most likely to happen, and that that which might naturally be expected rarely occurs. Each tribe, as its fortunes varied, either rose to power or sank into insignificance. At times the old vigour and strength which had nerved the arm of Jenghiz Khan seemed to return to the tribe, and we read of successful expeditions being made by the Ordu Mongols into Tibet, and even of invasions into China. The relations with Tibet thus inaugurated brought about a rapid spread of Buddhism among the Mongolians, and in the beginning of the 17th century the honour of having a Dalai Lama born among them was vouchsafed to them. In 1625 Toba, one of the sons of Bushuktu Jinung Khan, went on a pilgrimage to the Dalai Lama, and brought back with him a copy of the Tanjur to be translated into Mongolian, as the Kanjur had already been. But though the prowess of the Ordu Mongols was still unsubdued, their mode of living was as barren and rugged as the steppes and rocky hills which make up their territory. Their flocks and herds, on which they are entirely dependent for food and clothing, are not numerous, and, like their masters, are neither well fed nor well favoured. But though living in this miserable condition their princes yet keep up a certain amount of barbaric state, and the people have at least the reputation of being honest. Several of the tribes who had originally migrated with those who finally settled in the Ordu territory, finding the country to be so inhospitable, moved farther eastward into richer pastures. Among these were the Tumeds, one of whose chiefs, Altan Khan, is famous in later Mongol history for the power he acquired. For many years during the 16th century he carried on a not altogether unsuccessful war with China, and finally, when peace was made (1571), the Chinese were fain to create him a prince of the empire and to confer a golden seal of authority upon him. In Tibet his arms were as successful as in China; but, as has often happened in history, the physical conquerors became the mental subjects of the conquered. Lamaism has always had a great attraction in the eyes of the Mongols, and, through the instrumentality of some Lamaist prisoners whom Altan brought back in his train, the religion spread at this time rapidly among the Tumeds. Altan himself embraced the faith, and received at his court the Bogda Sodnam Gyamtso Khutuktu, on whom he lavished every token of honour. One immediate effect of the introduction of Buddhism among the Tumeds was to put an end to the sacrifices which were commonly made at the grave of their chieftains. In 1584 Altan died, and was succeeded by his son Senge Dugureng Timur. The rich territory occupied by the Tumeds, together with the increased intercourse with

China which sprang up after the wars of Altan, began to effect a change in the manner of life of the people. By degrees the pastoral habits of the inhabitants became more agricultural, and at the present day, as in Manchuria, Chinese immigrants have so stamped their mark on the fields and markets, on the towns and villages, that the country has become to all intents and purposes part of China proper.

Passing now from the inner division of the Mongols—that is to say, the Chakhars and the 49 banners who live in the southern and eastern portions of the desert—we come to the outer division, which is divided into 86 banners, and occupies the territory to the north of the desert. Of these the chief are the Khalkhas, who are divided into the Western and Eastern Khalkhas. These people form the link of communication between Europe and eastern Asia. Early in the 17th century the Russians sent an embassy to the court of the Golden Khan with the object of persuading the Mongol khan to acknowledge allegiance to the czar. This he did without much hesitation or inquiry, and he further despatched envoys to Moscow on the return of the Russian embassy. But the allegiance thus lightly acknowledged was lightly thrown off, and in a quarrel which broke out between the Khirghiz and the Russians the Khalkhas took the side of the former. The breach, however, was soon healed over, and we find the Golden Khan sending an envoy again to Moscow, asking on behalf of his master for presents of jewels, arms, a telescope, a clock, and “a monk who had been to Jerusalem that he might teach the Khalkhas how the Christians prayed.” Their submission to Russia on the north did not save them, however, from the Chinese attacks on the south. In central Asia, as the recent history of Russia in that part of the world shows, the depredations of a tribe on the property of its neighbours supply a ready cause of quarrel at any moment, and the Chinese had no difficulty, therefore, in justifying an invasion of the Khalkha territory. At that time the present Manchu dynasty ruled in China, and to the then reigning sovereign the Khalkhas gave in their submission. For some time the Chinese yoke sat lightly on their consciences, but difficulties having arisen with the Kalmuks, they were ready enough to claim the protection of China. To cement the alliance the emperor K'ang-he invited all the Khalkha chiefs to meet him at the plain of Dolonor. This ceremony brought the separate history of the Khalkhas to a close, since from that time they have been engulfed in the Chinese empire.

Another important branch of the great Mongolian family is the tribe of the Koshod or Eleuths. These claim that their chieftains have maintained unbroken the direct descent from Khassar, a brother of Jenghiz Khan. Their home is in the neighbourhood of the Kōkō-nōr, and in the country to the north of the narrow strip of the Kansuh province which separates that district from Mongolia proper. The pasture in the territories thus indicated is rich and abundant, and the Eleuths have therefore had fewer temptations to wander than most of their cognate tribes. Being thus stationary and within a short distance of the Chinese frontier, they easily fell under the dominion of that empire, and in the year 1725 were incorporated into 29 imperial banners.

During the Kin dynasty of China the Keraites, as has been pointed out, were for a time supreme in Mongolia, and it was during that period that one of the earliest recognized sovereigns, Merghus Bnyuruk Khan, sat on the throne. In an engagement with a neighbouring Tatar tribe their khan was captured and sent as a propitiatory present to the Kin emperor, who put him to death by nailing him on a wooden ass. On the treacherous Tatar chief the widow determined to avenge herself, and chose the occasion of a feast as a fitting opportunity. With well-disguised friendship she sent him a present of

ten oxen, a hundred sheep, and a hundred sacks of kumiss. These last, however, instead of being filled with skins of the liquor which Mongolians love so well, contained armed men, who, when the Tatar was feasted, rushed from their concealment and killed him. A grandson of Merghus was the celebrated Wang Khan, who was sometimes the ally and sometimes the enemy of Jenghiz Khan, and has also been identified as the Prester John of early Western writers. In war he was almost invariably unfortunate, and it was with no great difficulty, therefore, that his brother Ki Wang detached the greater part of the Kerait tribes from his banner, and founded the Torgod chieftainship, named probably from the country where they settled themselves. The unrest peculiar to the dwellers in the Mongolian desert disturbed the Torgod as much as their neighbours. Their history for several centuries consists of nothing but a succession of wars with the tribes on either side of them, and it was not until 1672, when Ayuka Khan opened relations with the Russians, that the country obtained an even temporarily settled existence. Its position, indeed, at this time made it necessary that Ayuka should ally himself either with the Russians or with his southern neighbours the Turks, though at the same time it was obvious that his alliance with the one would bring him into collision with the other. His northern neighbours, the Cossacks of the Yaik and the Bashkirs, both subject to Russia, had the not uncommon propensity for invading his borders and harassing his subjects. This gave rise to complaints of the czar's government and a disposition to open friendly relations with the Krim khan. A rupture with Russia followed, and Ayuka carried his arms as far as Kasan, burning and laying waste the villages and towns on his route and carrying off prisoners and spoils. Satisfied with this vengeance, he advanced no farther, but made a peace with the Russians, which was confirmed in 1722 at an audience which Peter the Great gave him at Astrakhan. On Ayuka's death shortly after this event, he was succeeded by his son Cheren Donduk, who received from the Dalai Lama a patent to the throne. But this spiritual support availed him little against the plots of his nephew Donduk Ombo, who so completely gained the suffrages of the people that Cheren Donduk fled before him to St Petersburg, where he died, leaving his nephew in possession. With consummate impartiality the Russians, when they found that Donduk Ombo had not only seized the throne but was governing the country with vigour and wisdom, formally invested him with the khanate. At his death he was succeeded by Donduk Taishi, who, we are told, went to Moscow to attend the coronation of the empress Elizabeth, and to swear fealty to the Russians. After a short reign he died, and his throne was occupied by his son Ubasha. The position of the Torgod at this time, hemmed in as they were between the Russians and Turks, was rapidly becoming unbearable, and the question of migrating "bag and baggage" was very generally mooted. In the war between his two powerful neighbours in 1769 and 1770, Ubasha gave valuable assistance to the Russians. His troops took part in the siege of Otchakoff, and gained a decided victory on the Kalans. Flushed with these successes, he was in no mood to listen patiently to the taunts of the governor of Astrakhan, who likened him to a "bear fastened to a chain," and he made up his mind to break away once and for all from a tutelage which was as galling as it was oppressive. He determined, therefore, to migrate eastward with his people, and on the 5th of January 1771 he began his march with 70,000 families. In vain the Russians attempted to recall the fugitives, who, in spite of infinite hardships, after a journey of eight months reached the province of Ili, where they were welcomed by the Chinese authorities. Food for a year's consumption was supplied to each family;

and land, money, and cattle were freely distributed. How many lost their lives on the toilsome march it is impossible to say, but it is believed that 300,000 persons survived to receive the hospitality of the Chinese. This migration is interesting as illustrating the many displacements of tribes and peoples which have taken place on the continent of Asia at different periods of history. Such another migration occurred between four and five thousand years ago, when the Chinese crossed from western Asia into their present empire; such, again, was the movement which carried the Osmanli Turks from north-eastern Asia into Asia Minor, and eventually across the Bosphorus. By this desperate venture the Torgod escaped, it is true, the oppression of the Russians, but they fell into the hands of other masters, who, if not so exacting, were equally determined to be supreme. The Chinese, flattered by the compliment implied by the transference of allegiance, settled them on lands in the province of Ili, in the neighbourhood of the Altai Mountains, and to the west of the desert of Gobi. But the price they were made to pay for this liberality was absorption in the Chinese empire. Like the other Chinese-subdued Mongols, the Torgod were divided into banners, and from that time forth they lost their individuality.

Among the Mongol chiefs who rose to fame during the rule of the Ming dynasty of China was Toghon, the Kalmuk khan, who, taking advantage of the state of confusion which reigned among the tribes of Mongolia, established for himself an empire in north-western Asia. Death carried him off in 1444, and his throne devolved upon his son Ye-seen, who was no degenerate offspring. Being without individual foes in Mongolia for the same reason that Narvaez had no enemies—namely, that he had killed them all—he turned his arms against China, which through all history has been the happy hunting-ground of the northern tribes, and had the unexampled good fortune to take prisoner the Chinese emperor Ching-tung. But victory did not always decide in his favour, and, after having suffered reverses at the hands of the Chinese, he deemed it wise to open negotiations for the restoration of his imperial prisoner. Thus, after a captivity of seven years, Ching-tung re-entered his capital in 1457, not altogether to the general satisfaction of his subjects. On the death of Ye-seen, shortly after this event, the Kalmuks lost much of their power in eastern Asia, but retained enough in other portions of their territory to annoy the Russians by raids within the Russian frontier, and by constant acts of pillage. In the 17th century their authority was partly restored by Galdan, a Lama, who succeeded by the usual combination of wile and violence to the throne of his brother Senghé Khan. Having been partly educated at Lhasa, he was well versed in Asiatic politics, and, taking advantage of a quarrel between the Black and White Mountaineers of Kashgar, he overran Little Bokhara, and left a viceroy to rule over the province with his capital at Yarkand. At the same time he opened relations with China, and exchanged presents with the emperor. Having thus secured his powerful southern neighbour, as he thought, he turned his arms against the Khalkhas, whose chief ground of offence was their attachment to the cause of his brothers. But his restless ambition created alarm at Peking, and the emperor K'ang-he determined to protect the Khalkhas against their enemy. Great preparations were made for the campaign. The emperor, in person commanding one of the two forces, marched into Mongolia. After enduring incredible hardships during the march through the desert of Gobi the imperial army encountered the Kalmuks at Chao-modo. The engagement was fiercely contested, but ended in the complete victory of the Chinese, who pursued the Kalmuks for 10 miles, and completely dispersed their forces. Immense

numbers were slain, among whom was Galdan's wife, and many thousands surrendered themselves to the victors. Galdan, with his son, daughter, and a few followers, fled westward and escaped; and thus collapsed a power which had threatened at one time to overshadow the whole of Central Asia. For a time Galdan still maintained a semblance of resistance to his powerful enemy, and death overtook him while yet in the field against the Chinese. The news of his death was received with great rejoicings at Peking. The emperor held a special service of thanksgiving to Heaven for the deliverance vouchsafed, and ordered that the ashes of his enemy, whose body had been burned, should be brought to the capital and there scattered to the four winds. The fear which had been thus inspired was no idle terror. Galdan was a man to be feared. The conqueror of Samarkand, Bokhara, Urgenj, Kashgar, Hami, and twelve hundred other towns, might well be considered a formidable foe, and Heaven a merciful deliverer in ridding Asia of so restless and dangerous a chieftain.

But though Galdan was dead the Chinese did not enjoy that complete immunity from war at the hand of his successor that they had looked for. Tse-wang Arabtan was, however, but the shadow of his brother and predecessor, and a dispute which arose with the Russians during his reign weakened his power in other directions. Little Bokhara was said to be rich in gold mines, and therefore became a coveted region in the eyes of the Russians. Under the vigorous administration of Peter the Great an expedition was despatched to force a passage into the desired province. To oppose this invasion the Kalmuks assembled in force, and after a protracted and undecided engagement the Russians were glad to agree to retire down the Irtysh and to give up all further advance.

To Tse-wang Arabtan succeeded Amursama owing to the support he received from the Chinese emperor K'een-lung, who nominated him khan of the Kalmuks and chief of Sungaria. But, though to the ear these titles were as high-sounding as those of his predecessors, in reality the power they represented was curtailed by the presence of Chinese commissioners, in whose hands rested the real authority. The galling weight of this state of dependence drove Amursama before long into revolt. He dispersed the Chinese garrisons stationed in Ili, killed the generals, and advanced his own forces as far as Palikun on the river Ili. To punish this revolt, K'een-lung sent a large force into the rebellious province. As on the previous occasion, the Chinese were everywhere victorious, and Amursama fled into Siberia, where he died of smallpox after a short illness. The Chinese demanded his body, but the Russians refused to give it up, though they allowed the Chinese commissioners to identify it. On the death of Amursama, K'een-lung determined to abolish the khanate, and in place of it he nominated four Hans to rule over the Sungars, the Torgod, the Khoshod, and the Dörböd. But this divided authority proved quite as unmanageable as that which had been wielded by the khan, and the new rulers soon attempted to throw off the yoke imposed upon them from Peking. Again a Chinese army marched into Ili, and this time a severe measure of repression was meted out to the rebels and their sympathizers. A general massacre of the Kalmuks was ordered, and was faithfully carried out. The province which had been as a fruitful field was utterly wrecked, and the place of the Sungars was taken by exiled criminals from China.

But while China was thus absorbing the Mongols within her reach, Russia was gathering within her borders those with whom she came into contact. Among these were the Buriats, who occupied a large territory on both sides of the Baikal Lake. As usual in such cases, disputes arose out of disturbances on the frontier, and were ended by

the Buriats and the neighbouring Mongol tribes becoming one and all tributary to Russia.

Of the Mongol tribes who became entirely subject to Russia the principal are those of the Crimea, of Kasan, and of Astrakhan; of these the Tatars of Kasan are the truest representatives of the Golden Horde or Kipchaks, who originally formed the subjects of Batu and Orda. Batu whose victorious campaign in Russia has already been sketched, was finally awarded as his fief the vast steppes which stretch from the Carpathian Mountains to the Balkash Lake. Over these vast plains the Mongols followed their flocks and herds, while the more settled among them established themselves along the banks of the rivers which flow through that region. Batu himself fixed his headquarters on the Volga, and there set up his Golden Tent from which the horde acquired the name of the Golden Horde. In 1255 Batu died and was succeeded by his brother Bereke Khan. During the reign of this sovereign the exactions which were demanded from the Russian Christians by the Mongols aroused the Christian world against the barbarian conquerors, and at the command of Pope Alexander IV. a general crusade was preached against them. But though the rage of the Christians was great, they lacked that united energy which might have availed them against their enemies; and, while they were yet breathing out denunciations, a Tatar host, led by Nogai and Tulabagha, appeared in Poland. After a rapid and triumphant march, the invaders took and destroyed Cracow, and from thence advanced as far as Bythom in Oppeln, from which point they eventually retired, carrying with them a crowd of Christian slaves. From this time the Mongols became for a season an important factor in European politics. They corresponded and treated with the European sovereigns, and intermarried with royal families. Hulagu, the famous general, married a daughter of Michael Palæologus; Toktu Khan took as his wife Maria, the daughter of Andronicus II.; and to Nogai Michael betrothed his daughter Irene. But Bereke's influence extended beyond Europe into Egypt, from which country, as well as from Constantinople, he secured the services of artisans to build him dwellings of a more substantial nature than that of his Golden Tent. But his widely extending intercourse with foreign nations brought in its train a consequence which tended fatally to undermine the existence of the horde. His conversion to Islam introduced a strongly disintegrating influence into the community, and with it were sown the seeds of its final disruption. Bereke was succeeded on his death in 1265 by his grandson Mangu Timur, who throughout his reign was constantly engaged in hostilities with the Russians and his other European neighbours. The Genoese alone found under his patronage a means of advancing their possessions. For some time these people had held large colonies in southern Russia, and in the Crimea had divided the trade with the Venetians. By the support of Mangu Timur these last were driven out of the field, and the Genoese were left in the enjoyment of a monopoly of the commerce. The reigns of the khans who succeeded Mangu Timur were no less stormy than his had been; but even in these troublous times the influences which surrounded the Mongols led them onward in the path of civilization. Toktu, the next khan but one to Mangu Timur, is the first Mongol ruler whom we hear of as having struck coins. Those issued during his reign bear the mint marks of Sarai, New Sarai, Bulgar, Ukek, Kharezmi, Krim, Jullad, and Madjarai, and vary in date from 1291 to 1312.

The adoption of Islam by the rulers of the Golden Horde had as one result the drawing closer of the relations of the Mongols with Constantinople and Egypt. Embassies passed between the three courts, and so important was the alliance with the Mongols deemed by the sultan Nâsir,

ruler of Egypt, that he sent to demand in marriage a princess of the house of Jenghiz Khan. At first his request was refused by the proud Mongols, but the present of a million gold dinars, besides a number of horses and suits of armour, changed the refusal into an acquiescence, and in October 1319 the princess landed at Alexandria in regal state. Her reception at Cairo was accompanied with feasting and rejoicing, and the members of her escort were sent back laden with presents. With that religious toleration common to his race, Uzbek Khan, having married one princess to Nâsir, gave another in marriage to George the prince of Moscow, whose cause he espoused in a quarrel existing between that prince and his uncle, the grand-prince Michael. Assuming the attitude of a judge in the dispute, Uzbek Khan summoned Michael to appear before him, and, having given his decision against him, ordered his execution. The sentence was carried out with aggravated cruelty in sight of his nephew and accuser. From this time Uzbek's sympathies turned towards Christianity. He protected the Russian churches within his frontiers, and put his seal to his new religious views by marrying a daughter of the Greek emperor, Andronicus III. He died in 1340, after a reign of twenty-eight years. His coins were struck at Sarai, Kharezm, Mokshi, Bulgar, Azak, and Krim, and are dated from 1313 to 1340. His son and successor, Tinibeg Khan, after a reign of only a few months, was murdered by his brother Janibeg Khan, who usurped his throne, and, according to the historian Ibn Haidar, proved himself to be "just, God-fearing, and the patron of the meritorious." These excellent qualities did not, however, prevent his making a raid into Poland, which was conducted in the usual Mongol manner, nor did they save his countrymen from being decimated by the black plague, which for the first time in 1345 swept over Asia and Europe, from the confines of China to Paris and London. With all their love of war the Mongols had a keen eye to monetary advantage, and Janibeg, who was no exception to the rule, concluded treaties with the merchant-princes of Venice and Genoa, in which the minute acquaintance displayed with shipping dues and customs charges shows how great were the advances the Mongols had made in their knowledge of European commerce since the days of Jenghiz Khan. The throne Janibeg had seized by violence was, in 1357, snatched from him by violence. As he lay ill on his return from a successful expedition against Persia he was murdered by his son Berdibeg, who in his turn was, after a short reign, murdered by his son Kulpa. With the death of Berdibeg the fortunes of the Golden Horde began rapidly to decline. As the Uzbek proverb says,—“The hump of the camel was cut off in the person of Berdibeg.”
