But while the power of the Golden Horde was dwindling away, the White Horde or Eastern Kipchak, which was the inheritance of the elder branch of the family of Juchi, remained prosperous and full of vitality. The descendants of Orda, Batu's elder brother, being far removed from the dangerous influences of European courts, maintained much of the simplicity and vigour of their nomad ancestors, and the throne descended from father to son with undiminished authority until the reign of Urus Khan (1360), when complications arose which changed the fortunes of the tribe. Like many other opponents of the Mongol rulers, Khan Tuli Khoja paid with his life for his temerity in opposing the political schemes of his connexion Urus Khan. Toktamish, the son of the murdered man, fled at the news of his father's death and sought refuge at the court of the famous Timur-i-leng (Tamerlan), who received him with honour and at once agreed to espouse his cause. With this intention he despatched a force against Urus Khan, and gained some advantage over him, but, while fitting out another army to make a fresh attack.

news reached him of the death of Urus. Only at Signhak are coins known to have been struck during the reign of Urus, and these bear date from 1372 to 1375.

He was followed on the throne by his two sons, Tuktakia and Timur Malik, each in turn; the first reigned but for a few weeks, and the second was killed in a battle against Toktamish, the son of his father's enemy. Toktamish now seized the throne, not only of Eastern Kipchak but also of the Golden Horde, over which his arms had at the same time proved victorious. His demands for tribute from the Russian princes met with evasions from men who had grown accustomed to the diminished power of the later rulers of the Golden Horde, and Toktamish therefore at once marched an army into Russia. Having captured Serpukhoff, he advanced on Moscow. On the 23d August 1382 his troops appeared before the doomed city. For some days the inhabitants bravely withstood the constant attacks on the walls, but failed in their resistance to the stratagems which were so common a phase in Mongolian warfare. With astonishing credulity they opened the gates to the Mongols, who declared themselves the enemies of the grand-prince alone, and not of the people. The usual result followed. The Russian general, who was invited to Toktamish's tent, was there slain, and at the same time the signal was given for a general slaughter. Without discriminating age or sex, the Mongol troops butchered the wretched inhabitants without mercy, and, having made the streets desolate and the houses tenantless, they first plundered the city and then gave it over to the flames. The same pitiless fate overtook Vladimir, Zvenigorod, Yurieff, Mozhaïsk, and Dimitroff. With better fortune, the inhabitants of Pereslavl and Kolomna escaped with their lives from the troops of Toktamish, but at the expense of their cities, which were burned to the ground. Satisfied with his conquests, the khan returned homewards, traversing and plundering the principality of Riazan on his way. Flushed with success, Toktamish demanded from his patron Timur the restoration of Kharezm, which had fallen into the hands of the latter at a period when disorder reigned in the Golden Horde. Such a request was not likely to be well received by Timur, and, in answer to his positive refusal to yield the city, Toktamish marched an army of 90,000 men against Tabriz. After a siege of eight days the city was taken by assault and ruthlessly ravaged. Meanwhile Timur was collecting forces to punish his rebellious *protégé*. When his plans were fully matured, he advanced upon Old Urgenj and captured it. More merciful than Toktamish, he transported the inhabitants to Samarkand, but in order to mark his anger against the rebellious city he levelled it with the ground and sowed barley on the site where it had stood. On the banks of the Oxus he encountered his enemy, and after a bloody battle completely routed the Kipchaks, who fled in confusion. A lull followed this victory, but in 1390 Timur again took the field. To each man was given “a bow, with thirty arrows, a quiver, and a buckler. The army was mounted, and a spare horse was supplied to every two men, while a tent was furnished for every ten, and with this were two spades, a pickaxe, a sickle, a saw, an axe, an awl, a hundred needles, 8½ lb of cord, an ox's hide, and a strong pan.” Thus equipped the army set forth on its march. After a considerable delay owing to an illness which overtook Timur his troops arrived at Kara Saman. Here envoys arrived from Toktamish bearing presents and a message asking pardon for his past conduct; but Timur was inexorable, and, though he treated the messengers with consideration, he paid no attention to their prayer. In face of innumerable difficulties, as well as of cold, hunger, and weariness, Timur marched forward month after month through the Kipchak country in pursuit of Toktamish. At

last, on the 18th of June, he overtook him at Kandurcha, in the country of the Bulgars, and at once forced him to an engagement. For three days the battle lasted, and after inclining now to this side and now to that victory finally decided in favour of Timur. The Kipchaks were completely routed and fled in all directions, while it is said as many as 100,000 corpses testified to the severity of the fighting. Timur pursued his flying enemy as far as the Volga, slaughtering all who fell into his hands, and ravaged and destroyed the towns of Sarai, Saraichuk, and Astrakhan. Having inflicted this terrible blow on the Golden Horde, Timur distributed rewards to his chieftains, and presided at a series of banquets in celebration of his victory. These rejoicings over, he returned to Samarkand laden with spoils and trophies. But Toktamish, though defeated, was not subdued, and in 1395 Timur found it necessary again to undertake a campaign against him. This time the armies met upon the Terek, and after a fiercely-contested battle the Kipchaks again fled in confusion. When the victory was gained, Timur, we are told, knelt down on the field and returned thanks to Heaven for his success. The pursuit along the Volga was vigorously undertaken, and the slaughter among the fugitives was terrible. The hurried advance of Timur's horsemen threw the Russians into a state of wild alarm, and the grand-prince of Moscow ordered that an ancient image of the Virgin which was believed to possess miraculous power should be taken to Moscow to save that city from the destroyer. Success appeared to attend this measure, for Timur, threatened by the advancing autumn, gave up all further pursuit, and retired with a vast booty of gold ingots, silver bars, pieces of Antioch linen and of the embroidered cloth of Russia, &c. On his homeward march southwards he arrived before Azak, which was then the entrepôt where the merchants of the east and west exchanged their wares. In vain the natives, with the Egyptian, Venetian, Genoese, Catalan, and Basque inhabitants, besought him to spare the city. His answer was a command to the Moslems to separate themselves from the rest of the people, whom he put to the sword, and then gave the city over to the flames. Circassia and Georgia next felt his iron heel, and the fastnesses of the central Caucasus were one and all destroyed. After these successes Timur gave himself up for a time to feasting and rejoicing, accompanied by every manifestation of Oriental luxury. "His tent of audience was hung with silk, its poles were golden, or probably covered with golden plates, the nails being silver; his throne was of gold, enriched with precious stones: the floor was sprinkled with rose water." But his vengeance was not satisfied, and, having refreshed his troops by this halt, he marched northwards against Astrakhan, which he utterly destroyed. The inhabitants were driven out into the country to perish with the cold, while the commander of the city was killed by being forced beneath the ice of the Volga. Sarai next shared the same fate, and Timur, having thus crushed for the second time the empire of Toktamish, set out on his return home by way of Derbend and Azerbaijan. The defeated han succeeded shortly afterwards in recapturing Sarai; but, being again driven out, he retired in 1398 to Kieff, a fugitive from his kingdom. During his reign, which lasted for twenty-four years, he struck coins at Kharezm, Krim, New Krim, Azak, Sarai, New Sarai, Saraichuk, and Astrakhan. The power in the hands of the successors of Toktamish never revived after the last campaign of Timur. They were constantly engaged in wars with the Russians and the Krim Tatars, with whom the Russians had allied themselves, and by degrees their empire decayed, until, on the seizure and death of Ahmed Khan at the beginning of the 16th century, the domination of the Golden Horde came to an end

One solitary fragment of the Golden Horde, the khanate of Astrakhan, maintained for a time an existence after the fall of the central power. But even this last remnant ceased to be a Mongol apannage in 1554, when it was captured by the Russians and converted into a Russian province. The fate which thus overtook the Golden Horde was destined to be shared by all the western branches of the great Mongol family. The khans of Kasan and Kasimoff had already in 1552 succumbed to the growing power of Russia, and the Krim Tatars were next to fall under the same yoke. In the 15th century, when the Krim Tatars first appear as an independent power, they attempted to strengthen their position by allying themselves with the Russians, to whom they looked for help against the attacks of the Golden Horde. But while they were in this state of dependence another power arose in eastern Asia which modified the political events of that region. In 1453 Constantinople was taken by the Osmanli Turks, who, having quarrelled with the Genoese merchants who monopolized the trade on the Euxine, sent an expedition into the Crimea to punish the presumptuous traders. The power which had captured Constantinople was not likely to be held in check by any forces at the disposal of the Genoese, and without any serious opposition Kaffa, Sudak, Balacava, and Inkerman fell before the troops of the sultan Mohammed. It was plain that, situated as the Crimea was between the two great powers of Russia and Turkey, it must of necessity fall under the direction of one of them. Which it should be was decided by the invasion of the Turks, who restored Mengli Girai, the deposed khan, to the throne, and virtually converted the khanate into a dependency of Constantinople. But though under the tutelage of Turkey, Mengli Girai, whose leading policy seems to have been the desire to strengthen himself against the khans of the Golden Horde, formed a close alliance with the grand-prince Ivan of Russia. One result of this friendship was that the Mongols were enabled, and encouraged, to indulge their predatory habits at the expense of the enemies of Russia, and in this way both Lithuania and Poland suffered terribly from their incursions. It was destined, however, that in their turn the Russians should not escape from the marauding tendencies of their allies, for, on pretext of a quarrel with reference to the succession to the Kasan throne, Mohammed Girai Khan in 1521 marched an army northwards until, after having devastated the country, massacred the people, and desecrated the churches on his route, he arrived at the heights of Vorobieff overlooking Moscow. The terror of the unfortunate inhabitants at the sight once again of the dreaded Mongols was extreme; but the horrors which had accompanied similar past visitations were happily averted by a treaty, by which the grand-prince Vasili undertook to pay a perpetual tribute to the Krim khans. This, however, proved but a truce. It was impossible that an aggressive state like Russia should live in friendship with a marauding power like that of the Krim Tatars. The primary cause of contention was the khanate of Kasan, which was recovered by the Mongols, and lost again to Russia with that of Astrakhan in 1555. The sultan, however, declined to accept this condition of things as final, and instigated Devlet Girai, the Krim khan, to attempt their recovery. With this object the latter marched an army northwards, where, finding the road to Moscow unprotected, he pushed on in the direction of that ill-starred city. On arriving before its walls he found a large Russian force occupying the suburbs. With these, however, he was saved from an encounter, for just as his foremost men approached the town a fire broke out, which, in consequence of the high wind blowing at the time, spread with frightful rapidity, and in the space

of six hours destroyed all the churches, palaces, and houses, with the exception of the Kremlin, within a compass of 30 miles. Thousands of the inhabitants perished in the flames. "The river and ditches about Moscow," says Horsey, "were stopped and filled with the multitudes of people, laden with gold, silver, jewels, chains, ear-rings, and treasures. So many thousands were there burned and drowned that the river could not be cleaned for twelve months afterwards." Satisfied with the destruction he had indirectly caused, and unwilling to attack the Kremlin, the khan withdrew to the Crimea, ravaging the country as he went. Another invasion of Russia, a few years later (1572), was not so fortunate for the Mongols, who suffered a severe defeat near Molody, 50 versts from Moscow. A campaign against Persia made a diversion in the wars which were constantly waged between the Krim khan and the Russians, Cossacks, and Poles. So hardly were these last pressed by their pertinacious enemies in 1649 that they bound themselves by treaty to pay an annual subsidy to the khan. But the fortunes of war were not always on the side of the Tatars, and with the advent of Peter the Great to the Russian throne the power of the Krim Mongols began to decline. In 1696 the czar, supported by a large Cossack force under Mazeppa, took the field against Selim Girai Khan, and gained such successes that the latter was compelled to cede Azoff to him. By a turn of the wheel of fortune the khan had the satisfaction in 1710 of having it restored to him by treaty; but this was the last real success that attended the Tatar arms. In 1735 the Russians in their turn invaded the Crimea, captured the celebrated lines of Perekop, and ravaged Baghchi Serai, the capital. The inevitable fate which was hanging over the Krim Tatars was now being rapidly accomplished. In 1783 the Krim, together with the eastern portion of the land of the Nogais, became absorbed into the Russian province of Taurida.

Another branch of the Mongol family which requires mention is that of the Kazaks (see KIRGHIZ, vol. xiv. pp. 95, 96), whose ancient capital was Signak, which, as we have seen, passed into the hands of the great Timur. It will now only be necessary to refer briefly to the Uzbeks, who, on the destruction of the Golden Horde, assumed an important position on the east of the Caspian Sea. The founder of their greatness was the khan Abulhair, who reigned in the 15th century, and who, like another Jenghiz Khan, consolidated a power out of a number of small clans, and added lustre to it by his successful wars. Sheibani Khan, his grandson, proved himself a worthy successor, and a doughty antagonist of the great Moghul emperor Baber. In 1500 he inflicted a severe defeat on Baber's forces, and captured Samarkand, Herat, and Kandahar. By these and other conquests he became possessed of all the country between the Oxus and the Jaxartes, of Ferghana, Kharezem, and Hissar, as well as of the territory of Tashkend from Kashgar to the frontiers of China. In the following year, by a dashing exploit, Baber recovered Samarkand, but only to lose it again a few months later. During several succeeding years Sheibani's arms proved victorious in many fields of battle, and but for an indiscreet outrage on the territories of the shah of Persia he might have left behind him a powerful empire. The anger, however, of Shah Ismael roused against him a force before which he was destined to fall. The two armies met in the neighbourhood of Merv, where, after a desperate encounter, the Uzbeks were completely defeated. Sheibani, with a few followers, sought refuge in a cattle-pound. But, finding no exit on the farther side, the refugees tried to leap their horses over the wall. In this attempt Sheibani was killed. When his body was recognized by his exultant enemies

they cut off the head and presented it to the shah, who caused the skull to be mounted in gold and to be converted into a drinking-cup. After this defeat the Uzbeks withdrew across the Oxus and abandoned Khorásán. Farther east the news aroused Baber to renewed activity, and before long he reoccupied Samarkand and the province "Beyond the River," which had been dominated by the Uzbeks for nine years. But though the Uzbeks were defeated, they were by no means crushed, and ere long we find their khans reigning, now at Samarkand, and now at Bokhara. As time advanced and European powers began to encroach more and more into Asia, the history of the khanates ceases to be confined to the internecine struggles of rival khans. Even Bokhara was not beyond the reach of Russian ambition and English diplomacy. Several European envoys found their way thither during the first half of the present century, and the murder of Stoddart and Connolly in 1842 forms a melancholy episode in British relations with that fanatical capital. With the absorption of the khanate of Bokhara and the capture of Khiva by the Russians the individual history of the Mongol tribes in Central Asia comes to an end, and their name has left its imprint only on the dreary stretch of Chinese-owned country from Manchuria to the Altai Mountains, and to the equally unattractive country in the neighbourhood of the Kókö-nör. (R. K. D.)

Language and Literature.—The Mongol tongue is a member of the great stock which recent scholars designate as Finno-Tataric or Ural-Altai, which comprehends also the languages of the Tungoos (Manchu), Turko-Tatars, Finns, and Samoyeds. The members of this group are not so closely related to one another as those of the Indo-European stock; but they are all bound together by the common principle of agglutinative formation, especially the so-called harmony of vowels, by their grammatical structure, and also by certain common elements in the stock of roots which run through them all, or through particular more closely-connected families within the group.¹

The fatherland proper of the Mongols is the so-called Mongolia. It stretches from Siberia in the north towards the Great Wall of China in the south, from Dauria and Manchuria in the east to the Altai and the sources of the Irtysh, Thian-shan (*i.e.*, heaven mountains), and East Turkestan in the west. In the centre of this country is the desert of Gobi (Chinese *Sha-mo*, *i.e.*, sand-sea). The Mongolian-population, however, extends in the south over the Great Wall to the basin of the Kókö-nör (blue lake), and thence extends due west over Tangut and the northern border of Tibet. Crossing the political frontier, we find Mongols in the Russian province Turkestan, in the territories of Semiryetshensk (land of the seven streams), Alatau, and Semipalatinsk in the west, in the south of the province of Tomsk, with a more populous region due north in Siberia, round the Baikal Lake. The country north of the Gobi, from the Altai, Tangnu, and the Saian mountains in the west to Manchuria in the east, is called Khalkha, with the chief districts Urga (Küürä), Uliassntai, Khobdo (Kobdo). In a north-westerly direction from Gobi, between Thian-shan and the Altai, is Suigaria. The sum total of the Mongol population under Chinese government is calculated at between two and three millions.

Generally the whole Mongol tribe may be divided into three branches: East Mongols, West Mongols, and Buriats.

(1) The East Mongols are divided into the Khalkhas in the borders just mentioned, the Shara Mongols south of the Gobi along the Great Wall north-eastward to Manchuria, and lastly the Shir-aigol or Sharaigol in Tangut and in northern Tibet.

(2) On the signification and employment of the different names of the West Mongols (Kalmuks, Oelöd, Oirad or Dörbön Oirad—the four Oirad, Mongol Oirad), and also as regards the subdivision of the tribes, there is much uncertainty. The name Kalmuk, so generally employed among us, is in fact only used by the Volga Kalmuks (Khalimak), but even with them the name is not common, and almost a byname. It is of foreign origin, and most likely a Tataric word which has yet to be explained. *Oirad* means the "near ones," the "related." The usual explanation given is that the single tribes consider themselves as being related to each other,—hence *Mongol Oirad*, "the Mongol related tribe." This is the favourite name among Kalmuks. Dörbön Oirad, or the four related tribes, comprise (1) Sungars, (2) Torgod, (3) Khoshod, (4) Dörböd.

¹ Compare W. Schott, *Versuch über die tatarischen Sprachen* (Berl., 1836), *Ueber das altai'sche oder finnisch-tatarische Sprachengeschlechte* (Berl., 1849), *Altai'sche Studien*, Parts i.-v. (Berl., 1860-1870); and A. Castrén, *Ethnologische Vorlesungen über die Altai'schen Völker*; edited by A. Schiefner (Petersb., 1857).

The signification of the name *Oelöd*, in the East Mongolian *Oegelöd*, now the most widely spread among the tribes living in China, is likewise very doubtful. Some assert that "Oelöd" is nothing but the Chinese transcription of Oirad, as the ordinary Chinese language does not possess the sound *r*. We have, however, to bear in mind that we have a Mongolian root *ügelökü*, with the sense "to be inimical," "to bear hatred, ill-will," &c. The main population of the Kalmuks live, or rather drag out, their existence after the usual fashion of nomad tribes in Sungaria, in the eastern part of the Thian-shan, on the south border of the Gobi, on Koko-nör, and in the province of Kan-suh. All these are under the Chinese Government. In consequence, however, of the extension of the Russian empire in Thian-shan and Alatau, many hordes have come under the Russian sway. According to an approximate account we may reckon in the territory Semiryetsbensk (Kuldja) and Semipalatinsk 34,000 Kalmuks, while in the southern part of the government Tomsk, on the Altai, the Kalmuk population amounted formerly to 19,000. Besides these we find a section of Kalmuk population far in the west, on the banks of the Volga (near Astrakhan). From their original seats in Sungaria they turned in their migrations to the north, crossed the steppe of the Kirghiz, and thus gradually reached the Emba and the Or. Between these two rivers and the Ural the Torgod settled in 1616; thence they crossed the Volga in 1650, and took possession of the now so-called steppe of the Kalmuks, being followed in 1673 by the Dörböd, and in 1675 by the Khoshod. In 1771 a considerable number returned to the Chinese empire. At the present time there is a not unimportant population in the so-called steppe of the Kalmuks, which extends between the Caspian and the Volga in the east and the Don in the west, and from the town of Srepta in the north to the Kuma and the Manytch in the south. According to modern statistical accounts, this population amounts to 75,630. To these we have to add 24,603 more on the borders of the Cossacks of the Don, and lastly 7298 in the bordering provinces of Orenburg and Saratoff. The sum total of the so-called Volga Kalmuks is therefore 107,531.

(3) In the southern part of the Russian province of Irkutsk, in a wide circle round the Baikal Lake, lies the heidrom proper of the Buriats, which they also call the "Holy Sea;" the country east of the lake is commonly called Transbaikalia. Their country practically extends from the Chinese frontier on the south within almost parallel lines to the north, to the town Kirensk on the Lena, and from the Onon in the east to the Oka, a tributary of the Angars, in the west, and still farther west towards Nijni-Udinsk. They are most numerous beyond the Baikal Lake, in the valleys along the Uda, the Onon, and the Selenga, and in Nertchinsk. These Trans-Baikalian Buriats came to these parts only towards the end of the 17th century from the Khalkhas. While Mongols and Kalmuks generally continue to live after the usual fashion of nomads, we find here agricultural pursuits, most likely, however, due mainly to Russian influence. Christianity is also making its way. The sum total of the Buriats amounts at present to about 250,000.

Another tribe separated from the rest of the Mongols is the so-called Hazära (the thousand), and the four Aimak (i.e., tribes), who wander about as herdsmen in Afghanistan, between Herat and Kabul. In external characteristics they are Mongols, and in all probability they are the remains of a tribe from the time of the Mongol dynasty. Their language, which shows, of course, Persian influence, is strictly Mongolian, more particularly West Mongolian or Kalmuk, as has been proved by H. C. von der Gabelentz.¹

Agreeably with this threefold division of the Mongols we have also a threefold division of their respective languages: (1) East Mongolian or Mongolian proper, (2) West Mongolian or Kalmuk, (3) Buriatic.

The dialects just mentioned are found to be in close relation to each other when we examine their roots, inflexions, and grammatical structure. The difference between them is indeed so slight that whoever understands one of them understands all. Phonetically a characteristic of them all is the "harmony of vowels," which are divided into two chief classes: the hard *a, o, u*; and the soft *e, ö, ü*; between which *i* is in the middle. All vowels of the same word must necessarily belong to the same class, so that the nature of the first or root-vowel determines the nature of the other or inflexion-vowels; now and then a sort of retrogressive harmony takes place, so that a later vowel determines the nature of the former. The consonants preceding the vowels are equally under their influence.

The Mongolian characters, which in a slightly altered form are also in use among the Manchus, are written perpendicularly from above downward, and the lines follow from left to right, the alphabet having signs for seven vowels *a, e, i, o, u, ö, ü*, and diphthongs derived from them *ao, ai, ei, ii, oi, ui, öi, üi*, and for seventeen consonants *n, b, kh, gh, k, g, m, l, r* (never initial), *t, d, y, s (ds), ts, ss, sh, w*. All these are modified in shape according to their position, in the beginning, middle, or end of a word, and also by certain orthographic rules. In Mongolian and Manchu writing the syllable (i.e., the consonant together with the vowel) is considered as a unit,

in other words, a syllabarium rather than an alphabet. The existing characters are lineal descendants of the original Uigurian forms, which were themselves derived from the Syriac, having been brought to the Uigurs by Nestorian missionaries. An Indian and Tibetan influence may also be noticed, while the arrangement of the characters in perpendicular lines is common to the Chinese. The writing was brought into its present shape by the learned Lsmas Saksya Pandita, Phags-pa Lama, and Tshoitsu Odsen in the 13th century,¹ but is exceedingly imperfect. To express the frequently-occurring letters borrowed from Sanskrit and Tibetan, which are wanting in the Mongol alphabet, a special alphabet called *Galik* is employed. Every one who has tried to read Mongolian knows how many difficulties have to be overcome, arising from the ambiguity of certain letters, or from the fact that the same sign is to be pronounced differently according to its position in the word. Thus, there are no means for distinguishing the *o* and *e*, *ö* and *ü*, the consonants *g* and *k*, *t* and *d*, *y* and *s (ds)*. *A* and *e*, *o (u)* and *ö (ü)*, *a (e)* and *n, g* and *kh, t (d)* and *on*, are liable to be mistaken for each other. Other changes will be noticed and avoided by advanced students. It is a great defect that such common words as *ada* (a fury) and *ende* (here), *ende* (here) and *nada* (me), *aldan* (fathead) and *ollan* (gold), *ordu* (court-residence) and *wrtu* (long), *onokhu* (to seize) and *unukhu* (to ride), *tere* (this) and *dere* (pillow), *gebe* (said) and *kebe* (made), *gem* (evil) and *kem* (measure), *ger* (house) and *ker* (how), *naran* (sun) and *nere* (name), *yagon* (what) and *dsagon* (hundred), should be written exactly alike. This list might be largely increased. These defects apply equally to the Mongolian and Buriatic alphabets.

In 1648 the Saja Pandita composed a new alphabet (the Kalmuk), in which these ambiguities are avoided, though the graphic differences between the two alphabets are only slight. The Kalmuk alphabet avoids the angular and clumsy shapes of the Mongolian, and has, on the contrary, a rounded and pleasing shape. The Kalmuk alphabet has also this great advantage, that every sound has its distinct graphic character; a mistake between two characters can scarcely occur. The Kalmuk words once mastered, they can be easily recognized in their Mongolian shape. The dialectical differences are also very slight.

The Kalmuk, therefore, is the key of the Mongolian, and should form the groundwork of Mongolian studies. The Kalmuk and East Mongolian dialects do not differ much, at least in the spoken language; but the Kalmuks write according to their pronunciation, while the Mongols do not. For example, *sen (dsen)*, "hundred," is pronounced alike by the Kalmuks and the East Mongolians; but according to Mongolian orthography the word appears in the form *dsagon*. The dialectic difference between the two dialects very frequently lies only in a different pronunciation of some letters. Thus East Mongolian *ds* is in Kalmuk soft *s*, &c. The chief difference between the two dialects lies in the fact that in Kalmuk the soft guttural *g* between two vowels is omitted, while, through the joining of the two vowels, a long vowel is produced. In the pronunciation of common East Mongolian the *g* is likewise omitted, but it is written, while in Kalmuk, as just now mentioned, the guttural can only be traced through the lengthening of the syllable. Thus we find: Mongol *khagan*, "prince," Kalmuk *khän*; *M. dagon*, "voice, sound," *K. dön, dün*; *M. dologan*, "seven," *K. dolön*; *M. agola*, "mountain," *K. öla, äla*; *M. nagor*, "lake," *K. nör, nür*; *M. ulagan*, "red," *K. ulän*; *M. yagon*, "what," *K. yön (yän)*; *M. dabagan*, "mountain-ridge," *K. dabän*; *M. ssagan*, "thought," *K. ssanän*; *M. baragan*, "on the right," *K. barön, barün*; *M. shibagon*, "bird," *K. showön*; *M. chilagan*, "stone," *K. chilön (chulün)*; *M. jirgagan*, "six," *K. surgän*; *M. degere*, "high, above," *K. däre*; *M. ugukhu*, "to drink," *K. ukhu*; *M. togodshi*, "history," *K. tödshi, tädshi*; *M. egüden*, "door," *K. öden*; *M. dsegün*, "left," *K. sön*; *M. ügede*, "in the height," *K. ödö*; *M. ügeded*, "the Kalmuks," *K. öldö*; *M. üileded*, "if one has done," *K. üiled*; *M. köbcgün*, "son," *K. kövön*; *M. gegün*, "mare," *K. gän*; *M. kegür*, "corpse," *K. kür*; *M. kharigad*, "returned," *K. kharöd*, &c.

The Buriatic, in these peculiarities, is almost always found with East Mongolian, with which it is in every respect closely allied. In the pronunciation of some letters the transition of East Mongolian *ts*, *ts* into Buriatic *ss* is noticeable; for instance: *Mong. tsesek*, "flower," Buriatic *ssessek*; *M. tsak*, "time," *B. ssak*; *M. tsagan*, "white," *B. ssagan*; *M. tselsen*, "prudent," *B. ssessen*. *Ss* is sometimes pronounced like (the German) *ch*: East *M. ssain*, "good," *B. chain*; *M. ssedkil*, "heart," *B. chedkil*. *K* in the beginning or middle of a word is always aspirated.

The noun is declined by the help of appended particles, some of which are independent post-positions, viz., Gen. *yin, u, un*; Dat. *dur, a*; Acc. *yi, i*; Ablat. *ets*; Instrum. *ber, yer*; Associative, *luga, lüge*. The dative and accusative have also special forms which have at the same time a possessive sense, viz., Dat. *dagan, degen*; Accus. *ben, yen*. The plural is expressed by affixes (*nar, ner, od, ss, ä*), or frequently by words of plurality, "all," "many," e.g., *kümüra nogöd* (man, many ≠ men). The oblique cases have the

¹ Cf. his essay, "Ueber die Sprache der Hazäras und Aimaks," in the *Zeitschrift der deutschen morgenländischen Gesellschaft*, vol. xx, pp. 326-335.

¹ Cf. H. C. von der Gabelentz, in the *Zeitschrift f. d. Kunde d. Morgenlandes* Göttingen, 1833, vol. II, pp. 1-21, "Versuch über eine alte mongolische Inschrift."

same endings in singular and plural. Gender is not indicated. The adjective is uninflected both as attribute and as predicate; there is no comparative form, this idea being expressed by the construction or by the use of certain particles. The personal pronouns are *bi*, I; *ichi*, thou; *vida*, we; *ta*, ye; their genitives serve as possessives. The demonstratives are *ene*, *tere* (this, that), plural *ede*, *tede*; interrogative *ken*, who? The relative is lacking, and its place is supplied by circumlocutions. The numerals are: 1, *nigen*; 2, *khoyar*; 3, *gurban*; 4, *dörben*; 5, *tabun*; 6, *jürgugan*; 7, *dologan*; 8, *naiman*; 9, *yisun*; 10, *arban*; 100, *dsagon*; 1000, *minggan*. The ordinals are formed by appending *tugar*, *tüger*. The theme of the verb is seen in the imperative, as *bari*, grasp. The conjugation is rich in forms for tense and mood, but person and number are with few exceptions unexpressed. The present is formed from the theme by adding *mui* (*barimui*), the preterite by *dai* or *luga* (*baribai*, *bariluga*), the future by *ssugai* or *ssu* (*barissugai*, *barissu*). The preterite has also in the third person the terminations *dsugui* and *run*; the future has in the third person *yu*, and in the first *ya*. The conditional ends in *basu* (*baribassu*), the precative in *tugai*, *tügei*, the potential in *sa* (*barimuisa*), the imperative plural in *ktun*, the gerund in the present in *n*, *dsu* (*barin*, *baridsu*) or *tala*, "while, till" (*baritala*, "inter capiendum"), in the preterite it is formed in *gad* (*barigad*); the present part. has *kichi* (*barikichi*), the past part. *kessan* (*barikessan*); and the supine ends in *ra*, the infinitive in *khu* (*barikhu*, or when used substantively *barikhui*). There is but one perfectly regular conjugation, and derivative forms, derived from the theme by infixes, are conjugated on the same scheme. Thus the passive has infixed *ta* or *ida* (*baritakhu*, to be grasped), the causative *gul* (*barigulkhu*, to cause to grasp), the co-operative or sociative *lisa* or *lda* (*bariltsakhu*, to grasp together).

There are no prepositions, only post-positions. Adverbs are either simple particles (affirmative, negative, interrogative, modal, &c.), or are formed by suffixes from other parts of speech. There are very few conjunctions; the relations of clauses and sentences are mainly indicated by the verbal forms (part., sup., conditional, but mainly by the gerund)

The order of words and sentences in construction is pretty much the opposite of that which we follow. In a simple sentence the indication of time and place, whether given by an adverb or a substantive with a post-position, always comes first; then comes the subject, always preceded by its adjective or genitive, then the object and other cases depending on the verb, last of all the verb itself preceded by any adverbs that belong to it. So in the structure of a period all causal, hypothetical, concessive clauses, which can be conceived as preceding the main predication in point of time, or even as contemporary with it, or as in any way modifying it, must come first; the finite verb appears only at the end of the main predication or apodosis. The periods are longer than in other languages; a single one may fill several pages.

Grammars and dictionaries may be divided according to the three dialects. For East Mongolian, I. J. Schmidt gave the first grammar (Petersb., 1831), and a Mongolian-German-Russian dictionary (Petersb., 1835). Next Jos. Kowalewski published in Russian a Mongolian grammar (Kasan, 1835), a chrestomathy (2 vols., Kasan, 1836, 1837), and his great *Dictionnaire mongol-russe-français* (3 vols., Kasan, 1844, 1846, 1849). We name also R. Yuille, *Short Mongolian Grammar* (in Mongolian), xylographed at the mission press near Sselenginsk beyond Lake Baikal (1839). A. Bobrownikow's Russian *Grammar of the Mongolian-Kalmuk Language* (Kasan, 1849) is also very good. An abridgment of Schmidt's work is C. Puiui, *Elementi della grammatica mongolica* (Florence, 1876). A. Popow's *Mongolian Chrestomathy* appeared in 2 vols. at Kasan (1836). For the Kalmuk we have grammars by Popow (Kasan, 1847), Bobrownikow as above, and H. A. Zwick (*s. l. et a.*), autographed at Donaueschingen (1851). Zwick's autographed Kalmuk and German dictionary with a printed German index appeared (*s. l. et a.*) in 1852; B. Jülg's edition of the tales of Siddhi-kür (Leips., 1866) gives a complete glossary to these stories. There are small Russian and Kalmuk vocabularies by F. Smirnov (Kasan, 1857) and C. Golstunskiy (Petersb., 1860).

For the Buriatic we have Castrón, *Versuch einer Burjätischen Sprachlehre*, edited by Schiefner (1857), and A. Orlov's Russian grammar of the Mongol-Buriatic colloquial language (Kasan, 1876).

Literature.—A clear distinction must be drawn between the higher and nobler written or book-language and the common or conversational language of every-day life. The difference between the two is very considerable, and may be fairly compared to that between the Modern High German book-language and the different dialects. All grammars and dictionaries as yet published treat only of the book-language; and so also, with a few exceptions, the published literary documents are written in this higher style. The exceptions are the *Gesser-Khan*, and the *Siddhi-kür* and *Djangariad* (the last two published by Golstunskiy). The popular or conversational language has only quite lately been fixed in writing by A. Pozdnyeyev in his Russian work, *Specimens of the Popular Literature of the Mongolian Tribe*, part i., "Popular Songs" (Petersb., 1850), which contains rich material for the study of the popular literature.

The literature known at present consists mostly of translations from the Tibetan, the holy language of Buddhism, which is still the language of the learned. The Tibetan Buddhist literature is itself translated from the Sanskrit; hence, now and then, through Mongols and Kalmuks we get acquainted with Indian works the originals of which are not known in Sanskrit. Such is the case, for instance, with the tales of Siddhi-kür. Many books have also been translated from the Chinese. Most of the writings are of a religious, historical, philosophical, medical, astronomical, or astrological character. Favourite subjects are folk-lore and fairy tales. Among the religious books, perhaps the most important is that containing the legends entitled *üliger ün dalai*, "ocean of companions" (edited by the late I. Jacob Schmidt under the title, *Zer Weise und der Thor*, in Tibetan and German, Petersb., 1843). To this may be added the *boddhi mör*, or "the holy path," the *atlan gerel*, "gleaming of gold," the *mani gambo*, and *yertüichü yin toli*, "mirror of the world." What was known of poetical literature before Pozdnyeyev is scarcely worth mentioning. In some parts of the historical and narrative literature we find, wherever the narrative takes a higher flight, an admixture of poetical diction. The poetry appears in a certain parallelism of the phrases, with a return either of the same endings (rhyme) or of the same words (refrain). Frequently we find, besides the rhyme or refrain, alliteration. The essay of H. C. von der Gabelentz in *Z. f. d. Kunde des Morgenlandes*, vol. I, pp. 20-37, "Einige über Mongolische Poesie," has been superseded by the work of Pozdnyeyev.

Among historical works a high place is due to that composed by the tribal prince, Ssanang Ssetsen, in the middle of the 17th century (*Geschichte der Ost-Mongolen und ihres Fürstenhauses*, Mong. and Germ., by I. J. Schmidt, Petersb., 1829), and to the *Altan tobchi*, i. e., "Golden knob" or "precious contents" (text and Russian translation by the Lama Galsang Gomboyev, Petersb., 1858). Of folk-lore and fairy tales, we have the legend of the hero *Gesser-Khan* (text ed. by I. J. Schmidt, Petersb., 1834 and German version, 1839; comp. Schott, *Ueber die Sage v. Gesser-Khan*, Berl., 1851, and B. Jülg in the *Transactions of the Würzburger Philol. Versam.* of 1868, pp. 58 sqq., Leips., 1869); and the tales about *Arshid Bordschi* (Russian version by Galsang Gomboyev, Petersb., 1858; text and German trans. by B. Jülg, Inesbr., 1867, 1868). A favourite book is the tales of Siddhi-kür based on the Sanskrit *Pétala panchavati* (Russian trans. by Galsang Gomboyev, Petersb., 1865; note of the tales in Mongolian and German by B. Jülg, Inesbr., 1868). The fuller collection of these tales in Kalmuk first became known by the German trans. of B. Bergmann in vol. I. of his *Nomadische Streifereien unter d. Kalmüken* (4 vols., Riga, 1804-1805), an autographed edition in the vulgar dialect was published by C. Oolstunskiy (Petersb., 1864; text and German trans. with glossary by B. Jülg, Leips., 1866). A poetic heroic story is the *Djangariad*, extracts from which were given by Bergmann (*op. cit.*, iv. 181 sqq.); a complete Russian version by A. Bobrownikow (Petersb., 1854); a German version by F. v. Erdmann in *Z. D. M. G.*, 1857 (Kalmuk text by Golstunskiy, Petersb., 1864). A similar poem is the history of Ubashi Khuntaidshi and his war with the Öirad, Kalmuk text and Russian trans. by G. Gomboyev in his *Altan tobchi* as above, and text alone autographed by Golstunskiy (Petersb., 1864). Some books of religion for the Christian Buriats (transcribed in Russian characters) represent the Buriatic dialect. The Russian and English Bible Societies have given us a translation of the whole Bible. 1. J. Schmidt translated the Gospels and the Acts into Mongolian and Kalmuk for the Russian Bible Society (8 vols., Petersb., 1819-1821),—a masterly work. The English missionaries, E. Stallybrass and W. Swan, and afterwards R. Yuille, translated the whole Old Testament into Mongolian (1836-1840). This work was printed at a mission press erected at great cost for the purpose near Sselenginsk, beyond Lake Baikal in Siberia. In 1846 the New Testament by the same hands appeared at London.

The richest collections of Mongolian and Kalmuk printed books and MSS. are in the Asiatic museum of the Petersburg Academy, and in the libraries of Kasan and Irkutsk; there is also a good collection in the royal library at Dresden. Consult in general, besides the already-cited works of Bergmann and Pozdnyeyev, P. S. Pallas, *Sammlungen historischer Nachrichten ü. d. Mongolischen Völkerschaften* (2 vols., Petersb., 1776-1801); L. J. Schmidt, *Forschungen im Gebiete der älteren . . . Bildungsgeschichte der Völker Mittelasiens, vorz. d. Mongolen und Tibeter* (Petersb. and Leips., 1824); B. Jülg, "On the Present State of Mongolian Researches," *Journ. R. As. Soc.*, xiv. (1832), pp. 42-65. (B. J.)

MONGOOS, or MUNGUOS. See ICHNEUMON.

MONITION, in the practice of the English ecclesiastical courts, is an order requiring or admonishing the person complained of to do something specified in the monition, "under pain of the law and penalty thereof." It is the lightest form of ecclesiastical censure, but disobedience to it, after it has been duly and regularly served, entails the penalties of contempt of court. See Phillimore, *Ecclesiastical Law* (London, 1873).

MONK, GEORGE (1608-1669), duke of Albemarle, the second son of Sir Thomas Monk, a gentleman of good family but in embarrassed circumstances, was born at Potheridge, near Torrington in Devonshire, on 6th December 1608. An exploit which brought him within the reach of the law compelled him to begin his career as a soldier of fortune at the age of seventeen. He acted under Sir R. Grenville as a volunteer in the expedition to

Cadiz, and the next year did notable service at the Isle of Rhé.

In 1629 Monk went to the Low Countries, the training ground for military men, where in Oxford's and in Goring's regiments he obtained a high reputation for courage and for a thorough knowledge of his trade. In 1638 he threw up his commission in consequence of a quarrel with the Dutch civil authorities, came to England, and obtained the lieutenant-colonelcy of Newport's regiment during the operations on the Scottish border. Here he showed his skill and coolness in the dispositions by which he saved the English artillery at Newborn, though himself destitute of ammunition; and in the councils of war he confidently voted with Strafford for fighting, and against retreat or composition. One of Monk's biographers relates that he now thought of joining the adventurers who proposed to colonize Madagascar. The Irish rebellion, however, offered

more congenial employment, and in February 1641 he landed at Dublin as colonel of Lord Leicester's regiment. Here he greatly increased his reputation. Under the most difficult circumstances he was ever cool, patient, vigorous. A rigid disciplinarian, he was always attentive to the wants of his men, and completely won their confidence and affection. All the qualities for which he was noted through life, the calculating selfishness which kept him ever on the winning side and by which he accomplished his great historic success, the imperturbable temper and impenetrable secrecy, were fully displayed in this employment. He had but one interest, that of George Monk; and to secure that interest he laboured, while retaining his freedom from party ties, to make himself indispensable as a soldier. The governorship of Dublin was vacant, and Monk was appointed by Leicester. But Charles I. overruled the appointment in favour of Lord Lambert, and Monk, with great shrewdness, gave up his claims. Ormond, however, who viewed him with suspicion as one of the two officers who refused the oath to support the royal cause in England, sent him under guard to Bristol. He now deemed it safest to affect Royalist views. His value caused him to be received at once into Charles's confidence; he was appointed major-general of the Irish brigade, and served under Byron at the siege of Nantwich. Here he was taken prisoner by Fairfax, on 25th January 1644, in one of the most skillful operations of the war. After a short captivity in Hull he was placed in the Tower, where he remained for three years (during which his father died), beguiling his imprisonment by writing his *Observations on Military and Political Affairs*.

So long as the war lasted Monk could not be released. Charles, however, became a prisoner; the troubles in Ireland made the parliament anxious to secure Monk's services, and he was told that if he would take the Covenant he might have an important command. With some show of hesitation the terms were accepted, and, after a service of two months in Lord Lisle's abortive expedition, Monk was placed in command of the British forces in the north of Ireland. Compelled in 1649 to conclude a pacification with the rebel O'Neill, he returned to England after the king's execution. In the same year he succeeded, by his elder brother's death, to the family estate. His idleness lasted but a short while. Cromwell gave him a regiment and the command of the ordnance in the Scotch war of 1650, and after the battle of Dunbar, in which he led the attack, he was left with 6000 men to subdue the country, which, after taking Edinburgh, Tantallon, and Stirling castles, he did most completely in a few weeks. In 1651 he was seized with fever, but recovered at Bath, and in the same year was appointed on the commission for promoting the Union. In 1653, with Admiral Dean, he commanded the British fleet against the Dutch, and on 2d and 3d June and 29th July fought two of the most sanguinary naval battles on record, in which both his colleague and Van Tromp were slain. A peace on very humiliating terms to the Dutch was concluded, but policy shortly led Cromwell to allow milder conditions,—a concession against which Monk strongly remonstrated. On his return he married his mistress, Anne Clarges, a woman of the lowest extraction, "ever a plain homely dowdy," says Pepys, who, like other writers who mention her, is usually still less complimentary. Monk was now sent to quell the revolt headed by Middleton in Scotland, and, when this service was over, settled down to a steady government of the country for the next five years. For fanaticism in any shape he had no sympathy, and he set himself to diminish the influence of the Presbyterian clergy—Cromwell's chief opponents,—taking from them the power of excommunication and their general assemblies, but allowing them to

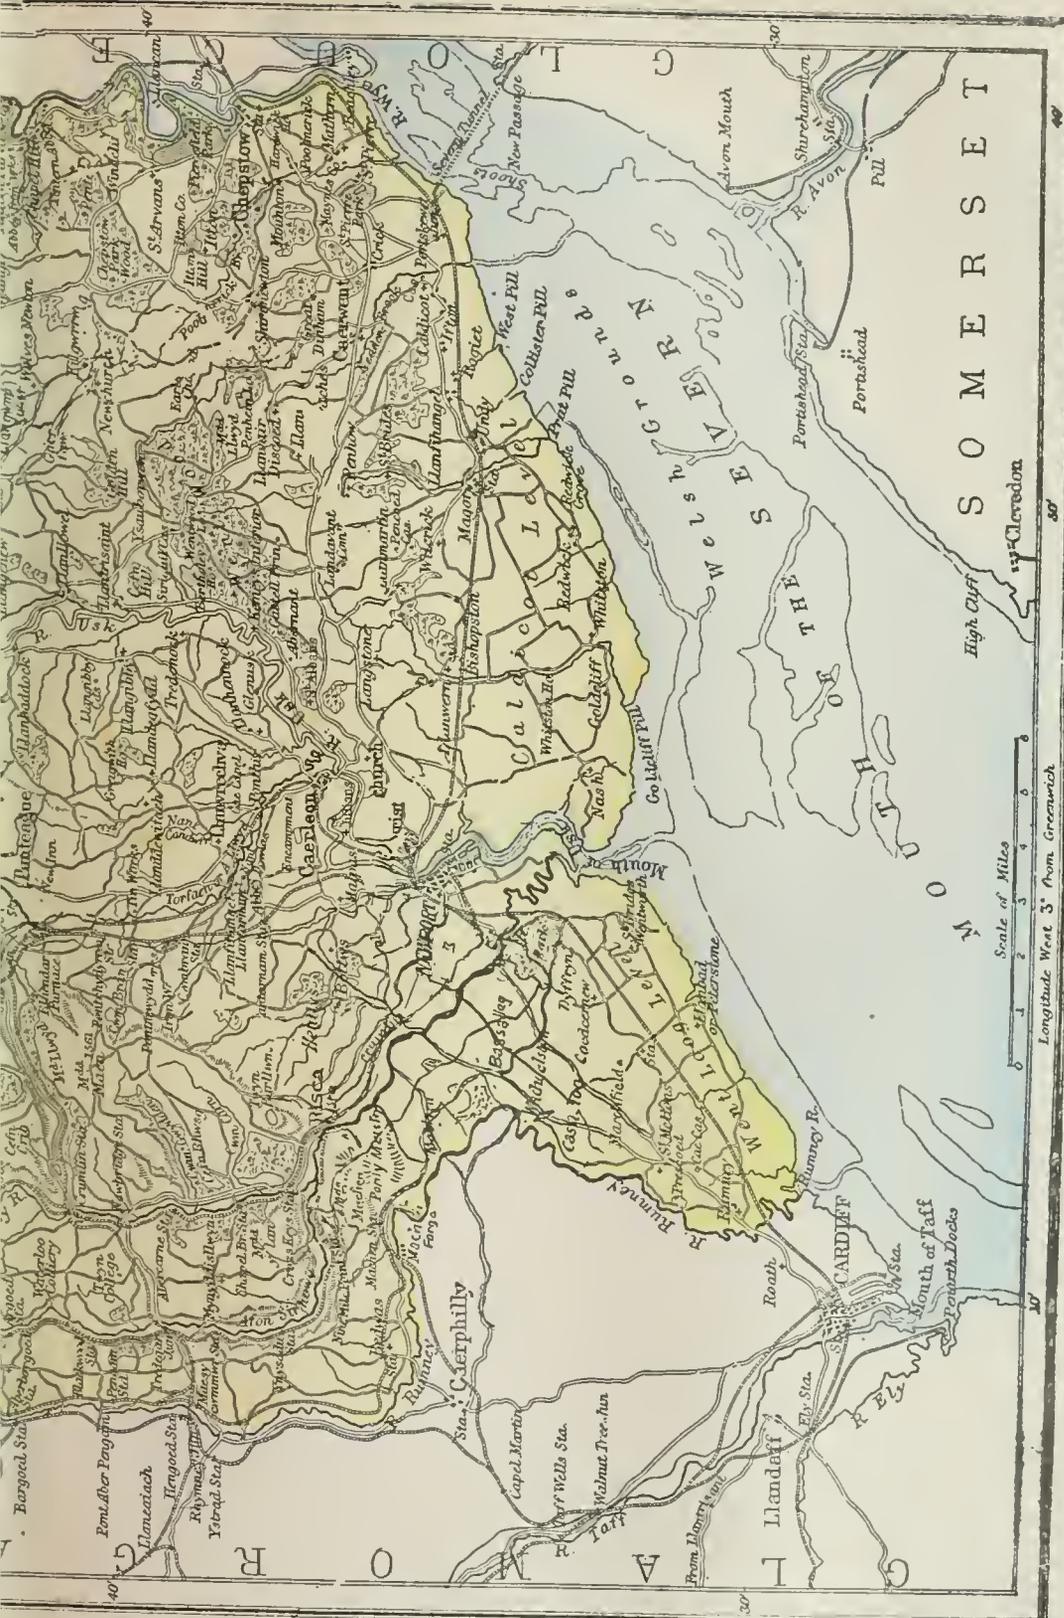

retain their presbyteries. Equal repression was exercised against the nobility and gentry. The timely discovery of a plot fomented by Overton for killing Monk on New Year's Day gave him an excuse for thoroughly purging his army of all Anabaptists, Fifth Monarchy men, and other dangerous enthusiasts. It is doubtful whether at this time Monk had proposed to himself the restoration of the king. He probably had it always in his mind as a possibility, but he would run no risks. His very reticence, however, caused alarm on one side and hope on the other. In 1655 he received a letter from Charles II., a copy of which he at once sent to Cromwell, whom, however, we find writing to him in 1657 in the following terms: "There be that tell me that there is a certain cunning fellow in Scotland called George Monk, who is said to lye in wait there to introduce Charles Stuart; I pray you, use your diligence to apprehend him, and send him up to me."

During the confusion which followed Cromwell's death Monk remained silent and watchful at Edinburgh, careful only to secure his hold on his troops. In July 1659 direct and tempting proposals were again made to him by the king. His brother Nicholas, a clergyman, was employed by Sir J. Grenvil to bring to him the substance of Charles's letter. No bribe, however, could induce him to act one moment before the right time. He bade his brother go back to his books, and refused to entertain any proposal. But when Booth rose in Cheshire for the king, so tempting did the opportunity seem that he was on the point of joining forces with him; and a letter was written to the Rump parliament threatening force if it did not at once fill up its numbers. His habitual caution, however, induced him to wait until the next post from England, and the next post brought news of Booth's defeat. On 17th October he heard of Lambert's *coup d'état*. From that moment his plan of action seems to have been settled. In most vehement language he discarded the idea of restoring Charles, and, with admirable perception of the state of English feeling, took for his principles that in all cases the army must obey the civil government, and that the civil government must be parliamentary. At present the Rump was crushed by the military party; the first thing, therefore, to be done was to free it. His army underwent a second purging of disaffection, and he then issued a declaration embodying the principles mentioned above, and wrote to Lenthall the speaker, and to the military party to the same effect. In a treaty with the Committee of Safety his commissioners, who were to treat only on the basis of the restoration of parliament, were outwitted. Monk at once refused to accept the terms proposed, and marched to Berwick, having received an offer from Fairfax of assistance if he would promise that the secluded members should be restored. Meanwhile Lambert had marched northwards to oppose his advance.

Monk's action gave fresh heart to the adherents of the parliament. The old council of state met, and named him general of all the forces; the fleet and the Irish army, hitherto hostile, came round to his side, and so did Whetham at Portsmouth. Monk now, in the depth of winter, crossed the Tweed at Coldstream and marched by Morpeth to Newcastle, receiving letters on his way from the lord mayor and corporation of London urging him to declare for a free parliament. On his approach Lambert's army fell away from their general, and no obstacle remained on the path to London. At York, when urged by Fairfax, he refused to declare for the king, and is said to have caned an officer who affirmed that such was his design. The parliament now ordered him to come to London. Fleetwood's army which occupied the city was, however, a great obstacle; and it was not until the parlia-

Scale of Miles

Longitude West 3° from Greenwich

ment, in accordance with his desire, had arranged for its dispersion that he would enter with his troops. Even now his intentions were strictly concealed; the spies set upon him by the various anxious parties were baffled by his impenetrable reserve. He was careful to appear only as the servant of parliament, but when he was desired to take the oath of abjuration he skilfully evaded the request. The city, always jealous of the Rump, now refused to pay taxes except at the orders of a free parliament. Monk, in consequence, was ordered to march his troops into the city, take down the chains and posts, and unhinge the gates. He obeyed these unpleasant orders to the letter on 10th February, thus permitting the hatred against the Rump to rise to the height, while he showed how unwilling an instrument of its will he was. On the 11th, however, he threw off the mask, and wrote to the Rump, peremptorily ordering them to admit the secluded members, and to arrange for the dissolution of parliament by 6th May. On 21st February he conducted the secluded members to their seats. At the same time he refused to restore the Lords, and issued an order disowning Charles Stuart to all officers commanding garrisons. Every day brought him fresh opportunities for tact or evasion. His partisans urged him to take the protectorate himself; another party pressed upon him to accomplish the restoration by the army alone; a body of his officers sent him a declaration expressing their fears that his action would lead to the restoration of monarchy; the parliament tried to make him their own by the offer of Hampton Court. His trained habits of dissimulation and evasion, assisted now and again by downright lying, carried him triumphantly through all these dangers, and at length the dissolution of parliament on 17th March removed his greatest difficulties.

It was now that, with the utmost secrecy, he gave an interview for the first time to the king's agent Grenvil, and by him sent to Charles the conditions of his restoration, afterwards embodied in the Declaration of Breda. For himself at present he would accept nothing but a royal commission as captain-general, which he carefully kept to himself. All parties were anxious to gain the credit of the now certain restoration. The Presbyterians in particular, fearful of the king being restored without terms, did their best to discredit Monk and to impose the old Isle of Wight conditions; but in vain. The new parliament was elected, and the House of Lords restored; an insurrection by Lambert, who had escaped from the Tower, was quelled by Monk's prompt measures, and on the 25th of April he received the solemn thanks of both Houses, and the title of captain-general of the land forces. Even yet the farce was kept up. Monk received with feigned surprise the king's official letter from Grenvil, denied all knowledge of its contents, and handed it over sealed to the council, who decided to defer opening it until the meeting of parliament on the 1st of May.

With the Restoration the historic interest of Monk's career ceases. The rude soldier of fortune had played the game with incomparable dexterity, and had won the stakes. He was made gentleman of the bedchamber, knight of the Garter, master of the horse, commander-in-chief, and duke of Albemarle, and had a pension of £7000 a year allotted him. His utmost desires were satisfied, and he made no attempt to compete further in a society in which neither he nor his vulgar wife could ever be at home, and which he heartily despised. As long as the army existed of which he was the idol, and of which the last service was to suppress Venner's revolt, he was a person not to be displeased. But he entirely concurred in the measure for disbanding it, and thenceforward his influence was small, though men's eyes turned naturally to him in emergency. In the trial of the regicides he was on the side of moderation, and his

interposition saved Hazelrig's life; but his action at the time of Argyll's trial will always be regarded as the most dishonourable episode in his career. In 1664 he had charge of the admiralty when James was in command of the fleet, and when in 1665 London was deserted on account of the plague, Monk, with all the readiness of a man accustomed to obey without thinking of risk, remained in charge of the government of the city. Once more, at the end of this year, he was called upon to fight, having a joint commission with Prince Rupert against the Dutch. The whole burden of the preparations fell upon him. On 23d April 1666 the admirals joined the fleet, and on the 1st of June began a battle near Dunkirk which lasted four days, followed by another on 23d July, in which Monk showed all his old coolness and skill, and a reckless daring which had seemed hitherto foreign to his character. His last service was in 1667, when the Dutch fleet sailed up the Thames, and Monk, ill as he was, hastened to Chatham to oppose their further progress. From that time he lived much in privacy, and died of dropsy on the 3d of December 1669.

See the *Lives* of Monk by Dr Gumble, his chaplain (London, 1671), and Dr Skinner (London, 1724), and Guizot's *Essay*, which contain all necessary information concerning his life up to the Restoration. The numerous and amusing notices of him in the court of Charles in Pepys's *Diary* should on no account be omitted. (O. A.)

MONKEY. See APE.

MONMOUTH, a maritime county of England, is bounded E. by Gloucester, N.E. by Hereford, N.W. by Brecknock, W. and S.W. by Glamorgan, and S. by the Bristol Channel. Its greatest length from north to south is about 35 miles, and its greatest breadth about 28 miles. The area is 368,399 acres, or about 572 square miles.

The surface of Monmouth is very varied, and in many districts picturesque, especially along the valley of the Wye, and between that river and the Usk. In the west and north the hills rise to a considerable height, and this mountain region encircles a finely undulating country. The highest summits are Sngar Loaf (1954 feet), Blorenge (1908), and Skyridd Vawr (1601). Along the shore on both sides of the Usk are two extensive tracts of marsh land, called the Caldicot and Wentlooge levels, stretching from Cardiff to Portskewett, and protected from inundations by strong embankments.

The principal rivers are: the Wye, which forms the eastern boundary of the county with Gloucester, and falls into the Severn; the Monnow, which forms a portion of its boundary with Hereford, and falls into the Wye at the town of Monmouth; the Usk, which rises in Brecknock, and flows southward through the centre of the county to the Bristol Channel; the Ebbw, which rises in the north-west, and enters the estuary of the Usk at Newport; and the Rumney, which rises in Brecknock, and, after forming the boundary between Monmouth and Glamorgan, enters the Bristol Channel a little to the east of Cardiff. Salmon abound especially in the Wye and the Usk, and trout are plentiful in all the streams. The Monmouthshire canal extends from Newport to Pontypool, where it is joined by the Brecknockshire canal, which enters the county near Abergavenny. The Crumlin canal also joins it a little north of Newport.

Geology and Minerals.—The geological formation is principally Old Red Sandstone and Carboniferous,—the Old Red forming the larger and eastern half of the county, from a line drawn between Abergavenny and Newport, and varying in thickness from between 8000 and 10,000 feet in the north to about 4000 feet in the south. In the centre of the county adjoining the Usk there is an outcrop of Silurian rocks, extending to a distance of about 8 miles north and south and 4 miles east and west, with a thickness of 1500 feet. Towards the east the Old Sandstone rocks dip beneath the Mountain Limestone, which enters the county from the Forest of Dean coal-field, and gives its peculiar character to the fine scenery along the banks of the Wye. The formation varies in thickness from

500 to 700 feet. The Carboniferous rocks connected with the great coal-field of South Wales, which occupy the western half of the county, include—(1) the Coal-measures, consisting of shales and ironstones, sandstones and coal-beds, of which there are about twenty-five beds more than 2 feet thick—total thickness of the strata 11,650 feet; (2) Millstone Grit, thickness 330 feet; (3) Carboniferous Limestone surrounding the coal-field, thickness 1000 feet; (4) Old Red Sandstone, thickness 600 feet; and (5) Devonian beds, consisting of red and brown sandstone, marls, &c., thickness about 6000 feet. The coal-field of Monmouth has an area of about 90,000 acres. The beds are very rich and easily wrought, the most common way of reaching them being by excavating passages in the sides of the hills instead of by perpendicular shafts. The number of collieries in operation in 1881 was 124, and the quantity of coal obtained 5,412,840 tons. The ironstone of Monmouth occurs both in beds and in large detached masses, the yield of iron being 18 to 55 per cent. The ore is the common clay ironstone. The iron industry was prosecuted successfully at Pontypool in the 16th century by a family of the name of Grant, who were succeeded by the Hanburys. In 1740 Monmouth contained, however, only two furnaces, which made together about 900 tons annually; but during the present century they have increased with great rapidity. In 1881 the number of furnaces built was 52, of which 35 were in operation; the amount of pig-iron made was 527,277 tons. The works are situated chiefly in the neighbourhood of Pontypool, and occupy the valleys running in the direction of Merthyr-Tydfil in Glamorganshire. The following were the Monmouth ironworks in 1881: Abersychan, Pontypool, Pontnewynydd, Ebbw Vale, Victoria, Blaenavon, Cwmbran, Nantyglo, Oakfields, Blaina, Rhymney, and Tredegar. In all, there were 258 puddling furnaces and 42 rolling mills in operation. The tinplate manufacture is extensively carried on, the number of mills in the Monmouth and Gloucester district in 1881 being 95, the majority of which are in Monmouth. Fireclay is extensively dug; 57,680 tons were obtained in 1881.

Soil and Agriculture.—Along the seashore the soil is deep and loamy, and admirably suited for the growth of trees. The most fertile land is that resting on Red Sandstone, especially along the banks of the Usk, where wheat is raised of a very fine quality. In the more mountainous regions there is very little land that is capable of cultivation, the soil being generally thin and peaty. More attention is paid to grazing than to the raising of crops. There are a considerable number of dairy-farms, but sheep-farming is much more largely followed. Of the 5241 holdings existing in 1880—the latest year in regard to which there is information—3661 were under 50 acres, 1521 between 50 and 300 acres, and only 59 above 300 acres. According to the agricultural returns for 1882 there were 243,063 acres, or almost exactly two-thirds of the total area, under cultivation. Of this, 176,137 acres were permanent pasture, and 14,729 rotation grasses. Of the 35,038 acres under corn crops, 16,151 were under wheat, 3596 under barley, and 8711 under oats. Turnips occupied 7486 acres, and potatoes only 1777. The area under woods was 29,856, and under orchards 3921. The total number of horses in 1882 was 11,631; of which the number used solely for agricultural purposes was 6449. Of the 44,168 cattle, 16,500 were cows and heifers in milk or in calf. Sheep numbered 134,682, and pigs 17,621. According to the latest return there were 7811 proprietors possessing 296,971 acres, with a gross annual rental of £337,254. Of the owners, 4970, or 63 per cent., possessed less than 1 acre, 17 possessed between 1000 and 2000 acres, and 15 between 2000 and 5000. The following four proprietors possessed over 5000 acres each: Lady Llanover, 6312; the executors of C. H. Leigh, 10,211; Lord Tredegar, 25,229; and the duke of Beaufort, 27,299.

Railways.—The South Wales Railway passes along the coast, and many branch lines cross the county in various directions, the majority of them being connected either with the Great Western Railway or with the London and North-Western.

Administration and Population.—Monmouth comprises six hundreds, and the municipal boroughs of Monmouth (6111) and Newport (38,427). In addition to these two boroughs there are fifteen urban sanitary districts, viz., Abergavenny (6941), Abersychan (13,496), Abertillery (6003), Blaenavon (9451), Caerleon (1099), Chepstow (3591), Christchurch (3114), Ebbw Vale (14,700), Llanvachra (4177), Panteg (3321), Pontypool (5244), Rhymney (8663), Risca (5540), Tredegar (18,771), Usk (1470). With the exception of Abergavenny, Caerleon, Chepstow, Pontypool, and Usk, these towns are all of modern growth, and owe their rise chiefly to the iron manufacture,—some, however, being partly dependent on that of tinplate. The county returns two members to parliament; and Monmouth, Newport, and Usk, with a united population in 1881 of 46,033, constitute the Monmouth district of boroughs, which returns one member. The county has one court of quarter sessions, and is divided into twelve petty sessional divisions. It is within the diocese of Llandaff, and contains 147 civil parishes, townships, or places. The population, which in 1801 was 45,563, had increased in 1841 to 134,368, in 1871 to 195,448, and in 1881 to 211,267 (of whom 108,262 were males, and 103,005 females).

History and Antiquities.—At the time of the Romans, Monmouthshire formed part of the territory of the Silures, whose principal seat was at Caerwent, and who were finally subdued by Julius Frontinus in the year 78. The old Roman road, the *Via Julia*, leading from the mouth of the Severn to Caerwent, Caerleon, and onwards to Neath in Glamorgan, can still be traced. The Romans made Caerwent, under the name of *Venta Silurum*, one of their principal stations. Tessellated pavements, pottery, coins, and the remains of a Roman villa, have been found, and portions of the walls still exist. The great station of the Romans was, however, *Isca Silurum*, now Caerleon (Caer legionis), so called from the fact that it was the headquarters of the second imperial legion. By Richard of Cirencester it is called a colonia, being the only station of that dignity in Wales. The mound of the old fortress still remains, as well as portions of an amphitheatre. Other less important stations were those of *Gobannium* (Abergavenny), *Blestium* (Monmouth), and *Burrium* (probably Usk). Monmouthshire is closely associated with Arthurian legends. In one of the Welsh tales Arthur is represented as holding his court at Caerleon during Easter and Pentecost; and an oval bank near the town is pointed out as Arthur's Round Table. When Wales was subdivided into three kingdoms on the death of Rhodri the Great, Monmouth and Glamorgan were placed under a separate government distinct from either of these. In the 9th and 10th centuries Monmouth was frequently invaded by the Danes. Edward the Confessor, after various victories in Wales, is said to have established a palace at Porth-is-coed (Portskewett). At the Norman Conquest the district was delivered over to certain Norman nobles called the "Lords of the Marches," who held the lands which they conquered *per baroniam*, with the right of administering justice. Frequent contests took place between the lords of the marches and the Welsh princes, until, in 1535, the jurisdiction of the lords of the marches was abolished by Henry VIII., and Monmouth was included among the English counties. Monmouth was the scene of frequent contests during the Civil War.

Of Norman fortresses in Monmouth, either built or taken possession of by the lords of the marches, there are remains of no less than twenty-five. The more interesting and important are: Caldicot, the seat of the De Bohuns, still entire; Chepstow, one of the finest examples of the old Norman fortress extant, built by Fitz Osborn in the 11th century, in an imposing situation on a cliff above the Wye; Newport, now used as a brewery; Abergavenny, now partly occupied as a private house; the gateway and hall of Grósmont, once the residence of the dukes of Lancaster; and Usk Castle, rebuilt by the Clares in the time of Edward IV. Raglan Castle, begun in the reign of Henry V., is a very extensive ruin, still in good preservation, and contains examples of several styles of architecture. Charles I. resided in it after the battle of Naseby. In 1646 it was delivered up to the parliament.

At the Reformation there were in Monmouth two hospitals and fifteen other religious houses; but of these there are now important remains of only two—Llanthony Abbey and Tintern Abbey. Llanthony Abbey in the Black mountains was founded by William de Lacy for Cistercians in 1103, and is one of the earliest examples in England of the Pointed style. The ruins consist of portions of the nave, transept, central tower, and choir. Tintern Abbey, belonging to the same order, and founded by Walter de Clare in 1131, occupies a position of great beauty on the Wye. The building, which is Early English to Decorated, is almost entire, with the exception of the roof, and may be ranked as among the finest of the monastic ruins in England. Of the churches, those chiefly worthy of mention are Abergavenny, belonging to a Benedictine priory, and containing a number of old tombs; Chepstow, partly Norman, and possessing a richly-moulded doorway; St Woolos church, Newport, also Norman; the Norman church of St Thomas, Monmouth; Christ Church, principally Norman; Matherne, Early English, with a tablet to Tewdris, king of Gwent; and Usk, formerly attached to a Benedictine priory.

MONMOUTH (Welsh *Mynwy*), a parliamentary and municipal borough of England, and the county town of Monmouthshire, is picturesquely situated at the confluence of the Wye and Monnow, in a valley almost surrounded by hills, 18 miles south of Hereford, and 128 west of London. By means of the Wye it has water communication with Bristol and with Hereford, but the former trade by barges has now ceased. Portions of the old walls and of the four gates still remain; but there are only insignificant ruins of the old castle in which Henry V. was born, and which was originally a Saxon fortress. After the Norman Conquest it was placed in the hands of William Fitz Osborn, whose descendant, John lord of Monmouth, rebuilt it on a more extensive scale. Subsequently it came into the possession of John of Gaunt, and thus became attached to the house of Lancaster. In 1646 it was taken by the parliamentary

forces. Besides the churches—the new church of St Mary, completed in 1882, and the church of St Thomas, an Old Norman structure—the principal public buildings are the market-house, the town-hall, and Jones's free grammar school in the Tudor style, which dates from 1614. The manufactures of the town are unimportant. The fine scenery of the Wye attracts a large number of tourists.

Monmouth was one of the strongholds of the Saxons; and under the name of *Blestium* formed one of the stations of the Romans. It was incorporated by Edward VI., and received additional privileges from Queen Mary, James I., and Charles II. It has sent members to parliament since the 27th of Henry VIII., and, along with Newport and Usk, forms the Monmouth district of boroughs. The area of the municipal and parliamentary borough is 4983 acres, with a population in 1871 of 5879, and in 1881 of 6111.

MONMOUTH, a small manufacturing city of the United States, in Warren county, Illinois, 180 miles southwest of Chicago by the main line of the Chicago, Burlington, and Quincy Railroad, and 182 miles north of St Louis, by the St Louis division of the same railway. The Iowa Central Railway passes through the city. An opera-house and Monmouth College are among the principal buildings. The population increased from 4662 in 1870 to 5000 in 1880. The city charter dates from 1852.

MONMOUTH, JAMES, DUKE OF (1649-1685), was the son of Lucy Walters, "a brown, beautiful, bold, but insipid creature," who became the mistress of Charles II. during his exile at the Hague. He was born at Rotterdam on 9th April 1649. That Charles was his father is more than doubtful, for Lucy Walters had previously lived with Robert Sidney, brother of Algernon, and the boy resembled him very closely. Charles, however, always recognized him as his son, and lavished on him an almost doting affection. Until the Restoration he was placed under the care, first of Lord Crofts, and then of the queen-dowager, receiving his education to the age of nine from Roman Catholics, but thenceforward from Protestant tutors. In July 1662 he was sent for by Charles, and at thirteen was placed under the protection of Lady Castlemaine and in the full tide of the worst influences of the court. No formal acknowledgment of his relation to the king was made until his betrothal to Anne Scott, daughter of the earl of Buccleuch, and the wealthiest heiress of Scotland, whom he married in 1665. During 1663 he was made duke of Orkney, duke of Monmouth, and knight of the Garter, and received honorary degrees at both universities. At court he was treated as a prince of the blood. In 1665 he served with credit under the duke of York in the sanguinary naval battle off Lowestoft. A captaincy in the Life Guards was given him, and in 1670, on the death of Monk, he was made captain-general of the king's forces. Offices of wealth also were showered upon him, and he was admitted to the privy council. In 1670 Monmouth was with the court at Dover, and it is affirmed by Resesby that the mysterious death of Charles's sister, the duchess of Orleans, was due to her husband's revenge on the discovery of her intrigue with the duke. It is certain, from an entry by Pepys, that as early as 1666 he had established a character for vice and profligacy. He was the direct author of the attack in December 1670 on Sir John Coventry, and only a few months later received the royal pardon for his share in the wanton murder of a street watchman. De Gramont, in his vivid sketch of Monmouth, after describing the beauty and bodily prowess for which he was celebrated, notices the fatal emptiness and poverty of his mind: "Tous les avantages du corps paroissent pour lui; mais son esprit ne disoit pas un petit mot en sa faveur. Il n'avoit de sentimens que ce qu'on lui en inspirait."

Hitherto Monmouth had been but the spoiled child of a wicked court. Now, however, by no act or will of his

own, he began to be a person politically important. As early as 1662 the king's excessive fondness for him had caused anxiety. Even then the fear of a "difference" between Monmouth and James, duke of York, exercised men's minds; and every caress or promotion kept the fear alive. Who could tell but that, in default of legitimate issue from his queen, Charles might declare Monmouth himself his lawful son? A civil war would be the certain consequence. Soon after 1670 the matter took a more serious aspect. The anti-popery spirit was rapidly becoming a frenzy, and the succession of James a probability and a terror. Charles was urged to legitimize Monmouth by a declaration of his marriage with Lucy Walters. He returned answer that, much as he loved the duke, he would rather see him hanged at Tyburn than own him for his legitimate son. Every attempt, however, was henceforth made, especially by Shaftesbury, to accustom people to this idea. He was taught to regard himself as the representative of the Protestant interest, and his position was emphasized by James's second marriage with the Roman Catholic princess Mary of Modena. From this time his popular title was "the Protestant duke." Charles was induced to confer many prominent employments upon him. The influence of James, however, was strong enough to prevent his obtaining the lord-lieutenancy of Ireland; but he received the command of the 6000 troops who assisted the French in the second Dutch war, and, though without any claims to generalship, behaved with courage in the field. In 1674 he was made "commander-in-chief;" and, in connexion with this, another unsuccessful attempt, graphically described in Clarke's *Life of James*, was made to gain from Charles a tacit admission of his legitimacy. At Shaftesbury's instance he was placed in command of the army employed in 1675 against the Scottish Covenanters, and was present at Bothwell Bridge (22d June 1679). He was also, at the king's request, elected chancellor of the university of Cambridge. In 1678, when Charles was driven into war with Louis, Monmouth took the command of the English contingent, and again gained credit for personal courage at the battle of St Denis. On his return to London England was in the throes of the popish terror. The idea of securing the Protestant succession by legitimizing Monmouth again took shape and was eagerly pressed on by Shaftesbury; at the time it seemed possible that success would wait on the audacity.

The Pensionary parliament was dissolved in January 1678-79, and was succeeded by one still more determined in its anti-popery spirit. To avoid the storm, and to save, if possible, his brother's interests, Charles instructed him to leave the country. James retired to Brussels, the king having previously signed a declaration that he "never was married, nor gave contract to any woman whatsoever but to my wife Queen Catherine." In spite of this, Monmouth might naturally now nourish ambitious views. His rival was off the stage; Shaftesbury, his chief supporter, was president of the remodelled privy council; and he himself was the favourite of the city. In the summer of 1679 the king suddenly fell ill, and the dangers of a disputed succession became terribly apparent. The party opposed to Monmouth, or rather to Shaftesbury, easily prevailed upon Charles to consent to his brother's temporary return. When, after the king's recovery, James went back to Brussels, he received a promise that Monmouth too should be removed from favour and ordered to leave the country. Accordingly, in September 1679, the latter repaired to Utrecht, while shortly afterwards James's friends so far gained ground as to obtain for him permission to reside at Edinburgh instead of at Brussels. Within two months of his arrival at Utrecht, Monmouth secretly returned to England, arriving in London on 27th

November. Shaftesbury had assiduously kept alive the anti-popery agitation, and Monmouth, as the champion of Protestantism, was received with every sign of popular delight. The king appeared to be greatly incensed, deprived him of all his offices, and ordered him to leave the kingdom at once. This he refused to do, and the only notice taken of the disobedience was that Charles forbade him to appear at court.

It was at this time that the *Appeal from the Country to the City*, written by Ferguson, was published, in which the legitimacy was tacitly given up, and in which it was urged that "he that hath the worst title will make the best king." Now it was too that the exclusionists, who, in the absence of parliament, were deprived of their best basis for agitation, developed the system of petitioning. So promptly and successfully was this answered by the "abhorrrers" that Charles, feeling the ground safer under him, recalled James to London,—a step immediately followed by the resignation of the chief Whigs in the council.

Once more, however, a desperate attempt was made, by the fable of the "black box," to establish Monmouth's claims; and once more these claims were met by Charles's public declarations in the *Gazette* that he had never been married but to the queen. Still acting under Shaftesbury's advice, Monmouth now went upon the first of his progresses in the west of England, visiting the chief members of the country party, and gaining by his open and engaging manner much popularity among the people. In August 1680 James returned to Edinburgh, his right to the succession being again formally acknowledged by Charles. Monmouth at once threw himself more vehemently than ever into the plans of the exclusionists. He spoke and voted for exclusion in the House of Lords, and used language not likely to be forgotten by James when an opportunity should come for resenting it. He was ostentatiously feasted by the city, the stronghold of Shaftesbury's influence; and it was observed as he drove to dinner that the mark of illegitimacy had been removed from the arms on his coach.

The year 1681 seemed likely to witness another civil war. The parliament finished a session of hysterical passion by passing a series of resolutions of extreme violence, of which one was that Monmouth should be restored to all his offices and commands; and when Charles summoned a fresh parliament to meet at Oxford the leaders of the exclusionists went thither with troops of armed men. Not until the dissolution of this last parliament on 27th March 1681 did the weakness of Monmouth's cause appear. In a moment the ground was cut from under the feet of his supporters; their basis for agitation was gone; pamphlets and broadsheets could ill supply the place of a determined and unscrupulous majority of the House of Commons. The deep-seated respect for legitimate descent asserted itself, and a great reaction took place. In November Dryden published *Absalom and Achitophel*. Shaftesbury was attacked, but was saved for the time by a favouring jury. Monmouth himself did not escape insult in the street and from the pulpit. He thought it wise to try to make his peace with the king, but he did so in terms which incensed Charles the more. He was forbidden to hold communication with the court; and, when he went in September 1682 on a second progress through the western and north-western counties, his proceedings were narrowly watched, and he was at length arrested at Stafford. Severity and extreme lenity were strangely mingled in the treatment he received. He was released on bail, and in February 1683, after the flight and death of Shaftesbury, he openly broke the implied conditions of his bail by paying a third visit to Chichester with Lord Grey and others on pretence of a hunting expedition.

It is probable that Monmouth never went so far as to think of armed rebellion; but there is little doubt that he had talked over schemes likely to lead to this, and that Shaftesbury had gone further still. The Rye House plot gave an excuse for arresting the Whig leaders; Russell and Sidney were judicially murdered; Monmouth retired to Toddington in Bedfordshire, and was left untouched. Court intrigue favouring him, he succeeded, by the betrayal of his comrades and by two submissive letters, in reconciling himself with the help of Halifax both to the king and to James, though he had the humiliation of seeing his confessions and declarations of penitence published at length in the *Gazette*. His character for pettishness and folly was now amply illustrated. He denied that he had given evidence; he then wrote a recantation of the denial. He managed by importunity to get from the king the paper of recantation; and lastly, by the advice of his wife, he offered again to sign the paper which he had withdrawn. Charles heartily despised him, and yet appears to have retained affection for him. His partial return to favour raised the hopes of his partisans; to check these, Algernon Sidney was executed. Monmouth was now subpoenaed to give evidence at the trial of young Hampden. To escape from the difficulties thus opened before him he fled to Holland, probably with Charles's connivance, and though he once more, in November 1684, visited England, it is doubtful whether he ever again saw the king. From that time till the king's death he lived with Henrietta Wentworth, his mistress, in Holland and at Brussels.

The quiet accession of James II. soon brought Monmouth to the crisis of his fate. Though at first desirous of retirement, his character was too weak to withstand the urgency of more determined men. Within two months of Charles's death he had yielded to the impetuosity of Argyll and others of the exiles, and to vague invitations from England. It is curious, as showing the light in which his claims were viewed by his fellow-conspirators, that one of the terms of the compact between them was that, though Monmouth should lead the expedition, he should not assume the title of king without their consent, and should, if the rebellion were successful, resign it and accept whatever rank the nation might offer. Now, as always, he was but a puppet in other men's hands.

On the 2d of May Argyll sailed with three ships to raise the west of Scotland; and three weeks later, with a following of only eighty-two persons, of whom Lord Grey, Fletcher of Saltoun, Wade, and Ferguson, the author of the *Appeal from the Country to the City*, were the chief, Monmouth himself set out for the west of England, where, as the stronghold of Protestant dissent and as the scene of his former progresses, he could alone hope for immediate support. Even here, however, there was no movement; and when on 11th June Monmouth's three ships, having eluded the royal fleet, arrived off Lyme Regis, he landed amid the curiosity rather than the sympathy of the inhabitants. In the market-place his "declaration," drawn up by Ferguson, was read aloud. In this document James was painted in the blackest colours. Not only was he declared to be the murderer of Essex, but he was directly charged with having poisoned Charles to obtain his crown. Monmouth soon collected an undisciplined body of some 1500 men, with whom he seized Axminster, and entered Taunton. Meanwhile the parliament had declared it treason to assert Monmouth's legitimacy, or his title to the crown; a reward of £5000 was offered for him dead or alive, and an act of attainder was passed in unusual haste. Troops had been hurriedly sent to meet him, and when he reached Bridgwater Albemarle was already in his rear. From Bridgwater the army marched through Glastonbury to attack Bristol, into which Lord Feversham had hastily thrown a regiment of foot-

guards. The attempt, however, miscarried; and, after summoning Bath in vain, Monmouth, with a disordered force, began his retrograde march through Philips-Norton and Frome, continually harassed by Feversham's soldiers. At the latter place he heard of Argyll's total rout in the western Highlands. He was now anxious to give up the enterprise, but was overruled by Grey, Wade, and others. On the 3d of July he reached Bridgwater again, with an army little better than a rabble, living at free quarters and behaving with reckless violence. On Sunday the 5th Feversham entered Sedgemoor in pursuit; Monmouth the same night attempted a surprise, but his troops were hopelessly routed. He himself, with Grey and a few others, fled over the Mendip Hills to the New Forest, hoping to reach the coast and escape by sea. The whole country, however, was on the alert, and at midnight on the 8th, within a month of their landing, James heard that the revolt, desperate from the first, was over, and that his rival had been captured close to Ringwood, in Hampshire.

The poor strain in Monmouth's character was now shown. On the day of his capture he wrote to James in terms of the most unmanly contrition, ascribing his wrongdoings to the action of others, and imploring an interview. On the 13th the prisoners reached the Tower, and on the next day Monmouth was allowed to see James. The accounts of this interview are difficult to reconcile in some points, but all agree that Monmouth's behaviour was unmanly in the extreme. No mercy was shown him, nor did he in the least deserve mercy; he had wantonly attacked the peace of the country, and had cruelly libelled James. The king had not, even in his own mind, any family tie to restrain him from exercising just severity, for he had never believed Monmouth to be the son of any one but Robert Sidney. Two painful interviews followed with the wife for whom he bore no love, and who for him could feel no respect; another imploring letter was sent to the king, and abject protestations and beseechings were made to all whom he saw. He offered, as the last hope, to become a Roman Catholic, and this might possibly have proved successful, but the priests sent by James to ascertain the sincerity of his "conversion" declared that he cared only for his life and not for his soul.

He met his death on the scaffold with calmness and dignity. In the paper which he left signed, and to which he referred in answer to the questions wherewith the busy bishops plied him, he expressed his sorrow for having assumed the royal style, and at the last moment confessed that Charles had denied to him privately, as he had publicly, that he was ever married to Lucy Walters. He died at the age of thirty-six, on the 15th of July 1685. "Thus ended," says Evelyn, "this quondam duke, darling of his father and the ladies, being extremely handsome and adroit; an excellent souldier and dancer, a favourite of the people, of an easy nature, debauched by lusts, seduced by crafty knaves, who would have set him up only to make a property, and took the opportunity of the king being of another religion to gather a party of discontented men. He failed and perished."

Authorities for Monmouth's career are, besides the known modern histories, Robert's *Life* (1844), Evelyn's and Pepys's *Diaries*, Oldmixon's *History* (1724), James II.'s *Memoirs*, Clarke's *Life of James*, Reresby's *Memoirs*, Sidney's *Diary* (1843), Scott's notes to *Absalom and Achitophel*, and *The Heroic Life*, &c. (1683). For the rebellion, Lord Grey's *Secret History* should be consulted. (O. A.)

MONMOUTH, GEOFFREY OF. See **GEOFFREY OF MONMOUTH.**

MONOPHYSITES. See **EUTYCHES** and **JACOBITE CHURCH.**

MONOPOLI, a city of Italy, in the province of Bari, is situated on the coast of the Adriatic, 25 miles by rail south-east of Bari. It is a bishop's see, is surrounded by

ancient walls, and possesses a castle built by Charles V. in 1552, a cathedral, and a hospital dating from 1368. The harbour is neither large nor well protected, but a certain amount of trade is carried on in the export of local products. The population was about 12,000 in the 17th century; 12,377 in 1861; and 13,000 in 1871, that of the commune being 20,918. Monopoli probably grew up after the destruction of Egnatia (5th century), the ruins of which lie a few miles to the south.

MONOPOLY (*μονοπωλία*, *exclusive sale*). Though still used in the sense of the original Greek, the term is more accurately applied only to grants from the crown or from parliament, the private act of an individual whereby he obtains control over the supply of any particular article being properly defined as "engrossing." It was from the practice of the sovereign granting to a favourite, or as a reward for good service, a monopoly in the sale or manufacture of some particular class of goods that the system of protecting inventions arose, and this fact lends additional interest to the history of monopolies (see **PATENTS**). When the practice of making such grants first arose it does not appear easy to say. Sir Edward Coke laid it down that by the ancient common law the king could grant to an inventor, or to the importer of an invention from abroad, a temporary monopoly in his invention, but that grants in restraint of trade were illegal. Such, too, was the law laid down in the first recorded case, *Darcy v. Allin* (the case of monopolies, 1602), and this decision was never overruled, though the law was frequently evaded. The patent rolls of the Plantagenets show few instances of grants of monopolies (the earliest known is temp. Edw. III.), and we come down to the reign of Henry VIII. before we find much evidence of this exercise of the prerogative in the case of either new inventions or known articles of trade. Elizabeth, as is well known, granted patents of monopoly so freely that the practice became a grave abuse, and on several occasions gave rise to serious complaints in the House of Commons. Lists prepared at the time show that many of the commonest necessities of life were the subjects of monopolies, by which their price was grievously enhanced. That the queen did not assume the right of making these grants entirely at her pleasure is shown, not only by her own statements in answer to addresses from the House, but by the fact that the preambles to the instruments conveying the grants always set forth some public benefit to be derived from their action. Thus a grant of a monopoly to sell playing-cards is made, because "divers subjects of able bodies, which might go to plough, did employ themselves in the art of making of cards"; and one for the sale of starch is justified on the ground that it would prevent wheat being wasted for the purpose. Accounts of the angry debates in 1565 and 1601 are given in Hume and elsewhere. The former debate produced a promise from the queen that she would be careful in exercising her privileges; the latter a proclamation which, received with great joy by the House, really had but little effect in stopping the abuses complained of. A few grants were cancelled, others limited, and others again left to the action of the ordinary law courts (instead of the privy council). In speaking of the results of the proclamation, previous writers seem to have been misled by the promises made in the queen's speech, promises by no means carried out in the text of the document itself, a copy of which still exists in the British Museum.

In the first parliament of James I. a "committee of grievances" was appointed, of which Sir Edward Coke was chairman. Numerous monopoly patents were brought up before them, and were cancelled. Many more, however, were granted by the king, and there grew up a race of "purveyors," who made use of the privileges granted them

under the great seal for various purposes of extortion. One of the most notorious of these was Sir Giles Mompesson, who fled the country to avoid trial in 1621. After the introduction of several bills, and several attempts by James to compromise the matter by orders in council and promises, the Statute of Monopolies was passed in 1623. This made all monopolies illegal, except such as might be granted by parliament, or were in respect of new manufactures or inventions. Upon this excepting clause is built up the entire English system of letters patent for inventions, the statute itself (amended by later Acts) being still in force. The Act was strictly enforced, and by its aid the evil system of monopolies was eventually abolished. This result was not indeed immediately achieved, for even during the Protectorate cases of monopoly patents were brought up, and the patents cancelled as grievances. Parliament has, of course, never exercised its power of granting to any individual exclusive privileges of dealing in any articles of trade, such as the privileges of the Elizabethan monopolists; but the licences required to be taken out by dealers in wine, spirits, tobacco, &c., are lineal descendants of the old monopoly grants, while the quasi-monopolies enjoyed by railways, canals, gas and water companies, &c., under Acts of Parliament, are also representative of the ancient practice.

MONOTHELITES (*μονοθεληται*, *monothelitæ*) was the name given to those who, in the 7th century, while otherwise orthodox, fell into the heresy of maintaining that Christ had only one will. The monothelite controversy had its origin in the efforts of the emperor Heraclius to win back for the church and the empire the excommunicated and persecuted Monophysites or Eutychians of Egypt and Syria. It seems to have been while in Armenia in 622 that, in an interview with Paul, the head of the Severians (Monophysites) there, he first broached the doctrine of the *μία ἐνέργεια* of Christ, *i.e.*, the doctrine that the divine and human natures, while quite distinct in His one person, had but one activity and operation.¹ At a somewhat later date he wrote to Arcadius of Cyprus, commanding that "two energies" should not be spoken of; and in 626, while in Lazistan (Colchis), he had a meeting with the metropolitan, Cyrus of Phasis, during which this command was discussed, and Cyrus was at last bidden seek further instruction on the subject from Sergius, patriarch of Constantinople, a strong upholder of the *μία ἐνέργεια*, and the emperor's counsellor with regard to it. So well did he profit by the teaching he received in this quarter that, in 630 or 631, Cyrus was appointed to the vacant patriarchate of Alexandria, and in 633 succeeded in reconciling the Severians of his province on the basis of *μία θεανδρική ἐνέργεια* (one divine-human energy). He was, however, opposed by Sophronius, a monk from Palestine, who, after vainly appealing to Cyrus, actually went to Constantinople to remonstrate with Sergius himself. Shortly afterwards Sergius wrote to Pope Honorius, and received a friendly reply. Sophronius, however, who meanwhile had been made patriarch of Jerusalem (634), refused to be silenced, and in his *Epistola Synodica* strongly insisted on the "two energies." So intense did the controversy now become that at last, towards the end of 638, Heraclius published his *Ecthesis*, or Exposition of the Faith, which prohibited the use of the phrase "one energy," because of its disquieting effects on some minds, as seeming to militate against the doctrine of the two natures; while, on the other hand, the expression "two energies" was interdicted because

¹ According to some church historians, it was Paul who introduced the doctrine; but this statement seems to rest on a misinterpretation of the authorities. See Hefele, *Conciliengesch.*, iii. p. 124 sq. (1877), who also traces the previous history of the expressions *μία ἐνέργεια*, *θεανδρική ἐνέργεια*, especially as found in the writings of the Pseudo-Dionysius Areopagita.

it seemed to imply that Christ had two wills. That Christ had but one will was declared to be the only orthodox doctrine, and all the faithful were enjoined to hold and teach it without addition or deduction. The document was not acceptable, however, to Popes Severinus and John IV., the immediate successors of Honorius; and Maximus, the confessor, succeeded in stirring up such violent opposition in North Africa and Italy that, in 648, Constans II. judged it expedient to withdraw his grandfather's offensive edict, and to substitute for it his own *Τυπος* (*τύπος περὶ πίστεως*), forbidding all discussion of the questions of the duality or singleness of either the energy or the will of Christ. The scheme of doctrine of the first four general councils, in all its vagueness as to these points, was to be maintained; so far as the controversy had gone, the disputants on either side were to be held free from censure, but to resume it would involve penal consequences. The reply of the Western Church was promptly given in the unambiguously dyothelite decrees of the Lateran synod held by Martin I. in 649; but the cruel persecutions to which both Martin and Maximus were exposed, and finally succumbed, secured for the imperial *Τυπος* the assent at least of silence. With the accession of Constantine Pogonatus in 668 the controversy once more revived, and the new emperor resolved to summon a general council. It met at Constantinople in 680, having been preceded in 679 by a brilliant synod under Pope Agatho at Rome, where it had been agreed to depart in nothing from the decrees of the Lateran synod. At Constantinople the condemnation of the monothelite heresy was explicit and complete, Pope Honorius being anathematized by name along with the others who had supported it. Beyond the limits of the empire, monothelism survived for some centuries in Lebanon among the MARONITES (*q.v.*), who did not abjure their heresies until 1182.

See the church historians, and especially Hefele (*op. cit.*), whose obvious partisanship can only slightly affect the reader's appreciation of his full and accurate learning.

MONREALE, a contraction of "monte-reale," was so called from a palace built there by the Norman Roger I., king of Sicily. It is now a town of about 16,300 inhabitants, situated 5 miles inland from Palermo, on the slope of Mount Caputo overlooking the beautiful and very fertile valley called "La Concha d'Oro" (the Golden Shell), famed for its orange, olive, and almond trees, the produce of which is exported in large quantities. The town, which for long was a mere village, owed its origin to the founding of a large Benedictine monastery, with its church, the seat of the metropolitan archbishop of Sicily.¹ This, the greatest of all the monuments of the wealth and artistic taste of the Norman kings in northern Sicily, who in 1072 expelled the Mohammedans and established themselves there with Palermo as their capital, was begun about 1170 by William II., and in 1182 the church, dedicated to the Assumption of the Virgin Mary, was, by a bull of Pope Lucius III., elevated to the rank of a metropolitan cathedral. It was, and is even now, one of the most magnificent buildings in the world, and Pope Lucius in no way exaggerated its splendour when he said in his bull, "ut simile opus per aliquem regem factum non fuerit a diebus antiquis."

The archiepiscopal palace and monastic buildings on the south side were of great size and magnificence, and were surrounded by a massive precinct wall, crowned at intervals by twelve towers. This has been mostly rebuilt, and but little now remains except ruins of some of the towers, a great part of the monks' dormitory and frater, and the very splendid cloister, completed about 1200. This latter is well

¹ An earlier church appears to have existed at Monreale since the 6th century, but no traces of it now remain.

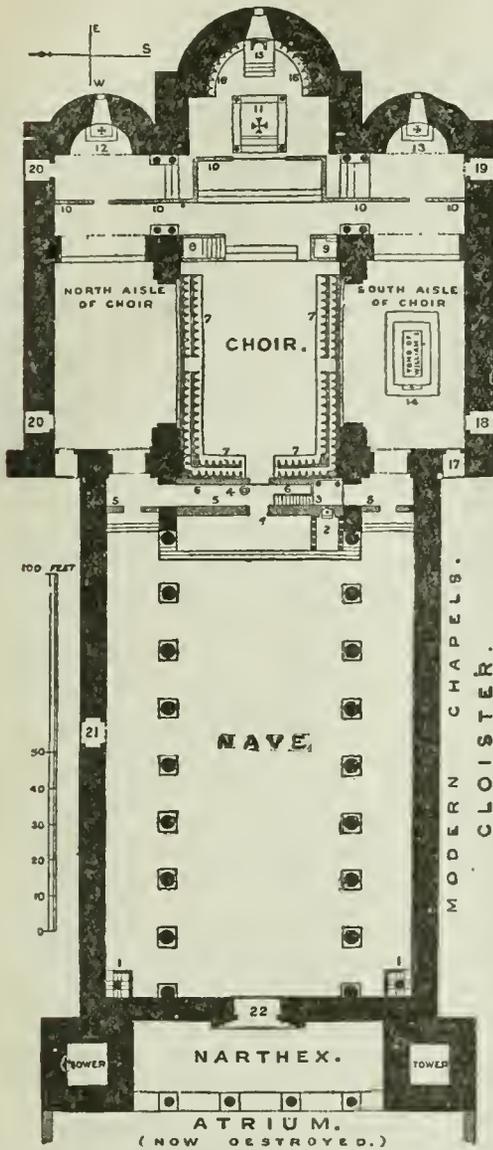

preserved, and is one of the finest cloisters both for size and beauty of detail that now exists anywhere. It is about 170 feet square, with pointed arches covered with marble inlay, supported on pairs of columns in white marble, 216

contains the marble fountain or monks lavatory, evidently the work of Moslem sculptors.

The chief feature of the place—the church—like the main cloister, is fortunately well preserved. In plan it is a curious mixture of Eastern and Western arrangement (see fig.). The nave is like an Italian basilica, while the large triple-apsed choir is like one of the early three-apsed churches, of which so many examples still exist in Syria and other Eastern countries (see De Voguë, *Syrie Centrale*). It is, in fact, like two quite different churches put together endwise. The basilican nave is wide, with narrow aisles. Monolithic columns of Oriental granite (except one, which is of cipollino), evidently the spoils of older buildings, on each side support eight pointed arches much stilted. There is no triforium, but a high clerestory with wide two-light windows, with simple tracery like those in the nave-aisles and throughout the church. The other half, Eastern in two senses, is both wider and higher than the nave. It also is divided into a central space with two aisles, each of the divisions ending at the east with an apse. The roofs throughout are of open woodwork very low in pitch, constructionally plain, but richly decorated with colour, now mostly restored. At the west end of the nave are two projecting towers, with narthex-entrance between them. A large open atrium, which once existed at the west, is now completely destroyed. The outside of the church is plain, except the aisle walls and three eastern apses, which are decorated with intersecting pointed arches and other ornaments inlaid in marble. The outsides of the principal doorways and their pointed arches are magnificently enriched with carving and inlay, a curious combination of three styles—Norman-French, Byzantine, and Arab.

It is, however, the enormous extent (80,630 square feet) and glittering splendour of the glass mosaics covering the interior, which make this church so marvellously splendid (see Mosaic). With the exception of a high dado, itself very beautiful, made of marble slabs enriched with bands of mosaic, the whole interior surface of the walls, including soffits and jambs of all the arches, is covered with minute mosaic-pictures in brilliant colours on a gold ground. This gorgeous method of decoration takes the place of all purely architectural detail, such as mouldings and panelling. The mosaic covers even the edges of the arches and jambs, which are slightly rounded off, so as to allow them to be covered by the glass tesserae. This device gives apparent softness to all the edges, and greatly enhances the richness of effect produced by the gleaming gold grounds. The only carving inside is on the sculptured caps of the nave arcade, mostly Corinthian in style. The mosaic pictures are arranged in tiers, divided by horizontal and vertical bands of elaborate flowing mosaic ornament. In parts of the choir there are five of these tiers of subjects or single figures one above another. The half dome of the central apse has a colossal half-length figure of Christ, with a seated Virgin and Child below; the other apses have full-length colossal figures of St Peter and St Paul. Inscriptions on each picture explain the subject or saint represented; these are in Latin, except some few which are in Greek. The subjects are partly from the Old Testament types of Christ and His scheme of redemption, with figures of those who prophesied and prepared for His coming. Towards the east are subjects from the New Testament, chiefly representing Christ's miracles and suffering, with apostles, evangelists, and other saints. The design, execution, and choice of subjects all appear to be of Byzantine origin, the subjects being selected from the *Menologium* drawn up by the emperor Basilius Porphyrogenitus in the 10th century.

No other mosaics perhaps so closely resemble the Mon-

Plan of the cathedral of Monreale, as built in the 12th century, omitting later additions.

in all, which are sumptuously decorated either by rich surface carving or by bands of patterns in gold, silver, and colours, made of glass tesserae, arranged either spirally or vertically from end to end of each shaft. The marble caps are each richly carved with figures and foliage executed with great skill and wonderful fertility of invention—no two being alike. At one angle, a square pillared projection

reale ones as those over the nave columns in the Church of the Nativity at Bethlehem. They are alike, not only in design and treatment, but also in the curious mixture of Latin and Greek in the inscriptions (see De Vogüé, *Églises de la Terre Sainte*, 1860). This similarity is easily accounted for by the fact that these two sets of mosaics, though so far apart, were executed about the same date and under the same conditions, viz., by the hands of Byzantine artists, working for Norman-French kings.

In the central apse at Monreale, behind the high altar, is a fine marble throne for the archbishop. This position of the throne is a survival of the early basilican arrangement, when the apse and altar were at the west end. In that case the celebrant stood behind the altar at mass, and looked over it eastwards towards the people. This position of the throne was frequently reproduced in churches which, like this, have the apse at the east. On the north side, in front of the high altar, is another somewhat similar throne for the use of the king. The tomb of William I., the founder's father—a magnificent porphyry sarcophagus contemporary with the church, under a marble pillared canopy—and the founder William II's tomb, erected in 1575, were both shattered by a fire, which in 1811 broke out in the choir, injuring some of the mosaics, and destroying all the fine walnut choir-fittings, the organs, and most of the choir roof. The tombs were rebuilt, and the whole of the injured part of the church restored, mostly very clumsily, a few years after the fire. On the north of the choir are the tombs of Margaret, wife of William I., and her two sons Roger and Henry, together with an urn containing the viscera of St Louis of France, who died in 1270. The pavement of the triple choir, though much restored, is a very magnificent specimen of marble and porphyry mosaic in "opus Alexandrinum," with signs of Arab influence in its main lines.

Two bronze doors, those on the north and west of the church, are of great interest in the history of art. They are both divided into a number of square panels with subjects and single figures, chiefly from Bible history, cast in relief. That on the north is by Barisanos of Trani in southern Italy, an artist probably of Greek origin. It is inscribed BARISANUS TRAN. ME FECIT. The cathedrals at Trani and Ravello also have bronze doors by the same sculptor. The western door at Monreale, inferior to the northern one both in richness of design and in workmanship, is by Bonannus of Pisa, for the cathedral of which place he cast the still existing bronze door on the south, opposite the leaning tower. The one at Monreale is inscribed A.D. MCLXXXVI IND. IIL BONANNUS CIVIS PISANVS ME FECIT. It is superior in execution to the Pisan one. The door by Barisanos is probably of about the same time, as other examples of his work with inscribed dates show that he was a contemporary of Bonannus. (See METAL-WORK.) The monastic library contains some valuable MSS., especially a number of bilingual documents in Greek and Arabic, the earliest being dated 1144. The archbishop now occupies the eastern part of the monastic buildings, the original palace being destroyed.

(J. H. M.)

MONROE, JAMES (1758-1831), fifth president of the United States, was born 28th April 1758, in the county of Westmoreland, Virginia. According to the family tradition, their ancestors are traced back to a family of

Scottish cavaliers descended from Hector Monroe, an officer of Charles I. At the outbreak of the Revolutionary war, James Monroe was a student at the College of William and Mary, but left his studies in 1776 to join the continental army. He took part as lieutenant in the New Jersey campaign of that year, and was wounded at the battle of Trenton. The next year he served with the rank of captain on the staff of General William Alexander ("Lord Stirling"), but, thus being out of the line of promotion, he soon found himself without military employment. In 1780 he began the study of the law under the direction of Jefferson, then governor of Virginia. His intimacy with Jefferson at this time had probably a controlling influence upon his subsequent political career. He continued through all vicissitudes to possess the friendship and support of both Jefferson and Madison.

In 1782 Monroe was in the State legislature, and from 1783 to 1786 was a member of Congress. On retiring from Congress he entered upon the practice of the law at Fredericksburg, and was again elected to the legislature. In the Virginia convention of 1788 for the ratification of the constitution, he was among the opponents of that instrument; but his course was approved by the legislature of his State, who elected him United States senator in 1790 to fill the vacancy caused by the death of William Grayson. As senator he was a decided opponent of the Federalist administration. Nevertheless he was selected by Washington in 1794 as minister to France in place of Gouverneur Morris, a Federalist, recalled upon the request of the French Government. Being of the party who sympathized with the revolutionary struggle in France, it was expected that his appointment would be flattering to the Government of that country, and would also conciliate the French party at home. The Government of the National Convention received Monroe with open signs of favour, and on his part he expressed his own and his country's sympathy with the French Republic with so much enthusiasm that Washington deemed his language not in keeping with the neutral policy which the administration had recently proclaimed. At about the same time John Jay had negotiated a treaty of amity and commerce with England which gave great umbrage to France. It was alleged that the earlier treaty of 1778 with France was violated by the stipulations of the Jay treaty; and the Directory seemed disposed to make of this a *casus belli*. In this emergency it was believed by Washington and his advisers that Monroe failed to represent properly the policy of the Government, and he was therefore recalled in 1796. In justification of his diplomatic conduct, he published the next year his *View*, a pamphlet of 500 pages. In 1799 he became governor of Virginia, and was twice re-elected. In the meantime the Republican party had come into power, with Jefferson as president, and Monroe was again called upon to fill an important diplomatic station. He was commissioned on 10th January 1803 to act with Livingston, resident minister at Paris, in negotiating the purchase of New Orleans and the territory embracing the mouth of the Mississippi, which formed a part of the province of Louisiana, recently ceded by Spain to France. In view of the anticipated renewal of hostilities between England and France in 1803, Napoleon was anxious, for a consideration, to part with his new acquisition, which in the event of a war with England he would probably lose by conquest. The American commissioners met therefore with little difficulty in the accomplishment of their object. But, in the absence of instructions, they assumed the responsibility of negotiating the purchase not only of New Orleans but of the entire territory of Louisiana—an event that is hardly second in importance to any in the history of the country. Monroe was next commissioned as minister to England,

to succeed Rufus King, who had resigned. In 1804 he undertook a mission to Madrid, with the object of negotiating the purchase of the Floridas; but in this he was unsuccessful, and returned to London in 1805. The next year he was joined in a commission with William Pinkney to negotiate a treaty with England to take the place of the Jay treaty, which expired in that year. Lords Auckland and Howick having been appointed on the part of England, a treaty was concluded on the last day of the year, which was perhaps more favourable to the United States than the Jay treaty; but, like the latter, it contained no provision against the impressment of American-seamen. For this reason President Jefferson refused to submit it to the Senate for ratification, but sent it back for revision. In the meantime Canning had become foreign secretary in place of Fox, and refused to reopen the negotiation. Monroe returned to the United States in 1807, and, as in the case of his first French mission, he drew up a defence of his diplomatic conduct in England. In 1808 certain disaffected Republicans attempted to put Monroe forward as the candidate for the presidency, but as Virginia declared in favour of Madison Monroe withdrew his name. In 1810 he was again in the legislature of his native State, and the next year its governor. But in this year he was called from the state to the national councils, superseding Robert Smith as secretary of state in Madison's cabinet, and took an active part in precipitating the war against England in 1812. On the retirement of Armstrong, after the capture of Washington in 1814, Monroe assumed the duties of the war department in addition to those of the state department, and by his energy and decision infused something of vigour into the conduct of the war. He was elected president in 1816, and was re-elected in 1820 without opposition. The period of his administration (1817-25) has been called "the era of good feeling," for the reason that the party issues of the past were mostly dead, and new issues had not yet arisen. In the formation of his cabinet Monroe showed the soundness of his judgment, selecting for the leading positions J. Q. Adams, J. C. Calhoun, W. H. Crawford, and William Wirt. With these able advisers he devoted himself to the economic development of the country, which had been so long retarded by foreign complications. As president, moreover, he was able to accomplish in 1819 the acquisition of the Floridas, which as minister to Spain he had failed to do in 1804, and to define the boundary of Louisiana, which he had been the agent in purchasing in 1803. But Monroe is best known to later generations as the author of the so-called "Monroe doctrine," a declaration inserted in his seventh annual message, 2d December 1823. It was the formulation of the sentiment, then beginning to prevail, that America was for Americans. One of the principles of the neutral policy of the country, which had been established with much difficulty, had been that the United States would not interfere in European politics; and now this policy was held to include the converse as a necessary corollary—that is, that Europe should not interfere in American politics, whether in North America or South America. The occasion of proclaiming this doctrine was the rumoured intervention of the Holy Alliance to aid Spain in the reconquest of her American colonies. President Monroe believed that such a policy entered upon by the allied continental powers of Europe would be dangerous to the peace and safety of the United States; he therefore declared that "we would not view any intervention for the purpose of oppressing them (the Spanish American states) or controlling in any manner their destiny, by any European power, in any other light than as the manifestation of an unfriendly disposition towards the United

States." This declaration, together with the known hostility of England to such a project, was sufficient to prevent further action on the part of the Alliance.

On the expiration of his presidential term Monroe retired to Oak Hill, his residence in London county, Virginia; but at the time of his death, 4th July 1831, he was residing in New York. He was married about 1786, and left two daughters. He was a man of spotless character; and, though not possessing ability of the first order, he ranks high as a wise and prudent statesman. His *Life* has been written by D. C. Gilman. (F. SN.)

MONROE, a city of the United States, county seat of Monroe county, Michigan, lies 32 miles south-south-west of Detroit, on both banks of the Raisin river, 3 miles inland from Lake Erie, with which it has been connected by a ship-canal since 1843. It is a station on the Canada Southern, the Flint and Père Marquette, and the Detroit division of the Lake Shore and Michigan Southern Railways. Agricultural implement factories, a spoke and hub factory, foundries and engineering-works, carriage-works, grist-mills, paper-mills, and fruit-drying establishments are in operation. From 400 to 500 tons of grapes are shipped yearly from the neighbouring vineyards, and over 100,000 gallons of wine are made here. The population in 1880 was 4928. Settled as Frenchtown by a body of Canadians in 1784, Monroe received its present name, in honour of President Monroe, in 1817. Its city charter dates from 1837. It was the scene of the battle of the river Raisin, 22d January 1813.

MONROVIA. See LIBERIA, vol. xiv. p. 508.

MONS, a town of Belgium, the capital of the province of Hainault, on the rivers Haine and Trouille, and 31 miles south-west of Brussels. The population in 1880 was 25,600. Mons is divided by the river Trouille into an upper and lower town, the first built on rising ground in the shape of an amphitheatre, the second extending into the plain; four bridges connect the two. The place is pleasing and cheerful of aspect, having broad well-paved streets and handsome squares. The fortifications, once among the strongest of the Continent, have quite recently been razed, their site being now occupied by an extensive avenue or boulevard. Among the monuments worthy of mention are—the church of St Wandru, one of the best types of original architecture to be found in Belgium; the church of St Elizabeth, a combination of the Gothic style and the Corinthian; the town-hall, erected in 1458; and the belfry tower, next to which formerly rose the old castle of the counts of Hainault, the demolition of which led, a few years ago, to the discovery of some curious mural paintings belonging to the 12th century. Mons possesses a military arsenal, a school of engineering, and a public library of importance; the administration of law and government for the province is concentrated there. It contains manufactures of cotton, velvet, cloth, muslin, soap, and clay pipes; also brass-foundries, tan-yards, and breweries, and a market of some note for agricultural produce, cattle, horses, and tobacco. The main source of the wealth and prosperity of Mons is derived from the collieries which exist in its vicinity, and yield annually between two and three million tons of first-class coal, the greater part of which is carried into France; in the immediate neighbourhood of the town are the large and important villages of Jemmapes, Quaregnon, Frameries, Paturages, Wasmes, and Dour, each with a population of from ten to twelve thousand inhabitants; these localities, together with many others somewhat less peopled, form an agglomeration called the Borinage, rich in coal-mines, in iron-foundries, in stone and marble quarries, and may be considered as one of the busiest centres in the world.

Mons is built on the site of a Roman camp erected by Julius

Cæsar, and afterwards occupied by a brother of Cicero, who was besieged there by Ambiorix, chief of the Eburones. In the 8th century a lady of the name of Wandru or Waltrud, countess of Hainault, founded a convent, which became the centre of the town. In 804 Charlemagne made it the capital of the county of Hainault; it was fortified in 1148. Baldwin VI., afterwards Latin emperor of Constantinople, was very active in promoting the interests of Mons, and endowed it with a celebrated charter in the year 1200. After being reduced by nearly one half by the plague, Mons received within its walls the Jews whom Philip the Long had expelled from France. The city attained its highest degree of prosperity under Charles V., but its greatness was arrested during the government of the duke of Alba by civic disturbances, which lasted until the reign of Albert and Isabella. In more recent times Mons has had to pay tribute to the warlike spirit of its neighbours; it was taken by Louis XIV. in 1691, given back in 1697, and retaken in 1701 and again in 1709. In 1748 it fell into the hands of Austria; the Belgian insurgents stormed it in 1789; the French in 1792, when Dumouriez won the battle of Jemmapes under its walls; in 1814 it belonged to the Netherlands, and has formed part of the Belgian kingdom since 1830.

MONSOON. See METEOROLOGY, *supra*, p. 148 *sq.*, and INDIAN OCEAN.

MONSTER. Monsters or monstrous births are the subject of Animal Teratology, a department of morphological science treating of deviations from the normal development of the embryo. The term "embryo" is conventionally limited, in human anatomy, to the ovum in the first three months of its intra-uterine existence, while it is still developing or acquiring the rudiments of its form, the term "fœtus" being applied to it in the subsequent months during which the organism grows on the lines of development already laid down. It is mostly in the first or embryonic period that those deviations from the normal occur which present themselves as monstrosities at the time of birth; these early traces of deviation within the embryo may be slight, but they "grow with its growth and strengthen with its strength," until they amount to irreparable defects or accretions, often incompatible with extra-uterine life. The name of "teratology," introduced by Étienne Geoffroy St-Hilaire (1822), is derived from *τέρας*, the equivalent of *monstrum*; teratology is a term new enough to have none but scientific associations, while the Latin word has a long record of superstitions identified with it. The myths of siren, satyr, Janus, cyclops, and the like, with the corresponding figures in Northern mythology, find a remote anatomical basis in monstrosities which have, for the most part, no life except in the fœtal state. The mythology of giants and dwarfs is, of course, better founded. The term monster was originally used in the same sense as portent: Cicero (*De Div.*, i.) says, "*Monstra, ostenta, portenta, prodigia appellantur, quoniam monstrant, ostendunt, portendunt, et prædicunt.*" Luther¹ speaks of the birth of a monstrous calf, evidently the subject of contemporary talk, as pointing to some great impending change, and he expresses the hope that the catastrophe might be the Last Day itself. The rise of more scientific views will be sketched at the close of the article.

Although monstrosities, both in the human species and in other animals, tend to repeat certain definite types of erroneous development, they do not fall readily into classes. It is remarked by Vrolik that a scientific classification is impracticable from being too cumbrous, and that a convenient grouping is all that need be attempted. The most usual grouping (originally suggested by Buffon, 1800) is into *monstra per excessum*, *monstra per defectum*, and *monstra per fabricam alienam*. It seems useful, however, to place the more simple cases of excess and of defect side by side; and it is necessary, above all, to separate the double monsters from the single, the theory of the former being a distinct chapter in teratology.

1. *Monstrosities in a Single Body.*—The abnormality may extend to the body throughout, as in well-proportioned giants and dwarfs; or it may affect a certain region or member, as—to take the simplest case—when there is a finger or toe too many or too few. It is very common for one malformation to be correlated with several others, as in the extreme case of acardiac monsters, in which the non-development of the heart is associated with the non-development of the head, and with other radical defects.

Giants are conventionally limited to persons over 7 feet in height. The normal proportions of the frame are adhered to more or less closely, except in the skull, which is relatively small; but accurate measurements, even in the best-proportioned cases, prove, when reduced to a scale, that other parts besides the skull, notably the thigh-bone and the foot, may be undersized though overgrown.² In persons who are merely very tall, the great stature depends often on the inordinate length of the lower limbs; but in persons over 7 feet the lower limbs are not markedly disproportionate. In many cases the muscles and viscera are not sufficient for the overgrown frame, and the individuals are usually, but not always, of feeble intelligence and languid disposition, and short-lived. The brain-case especially is undersized—the Irish giant in the museum of Trinity College, Dublin, is the single exception to this rule—but the bones of the face, and especially the lower jaw, are on a large scale. Giants are never born of gigantic parents; in fact, sterility usually goes with this monstrosity. Their size is sometimes excessive at birth, but more often the indications of great stature do not appear till later, it may be as late as the ninth year; they attain their full height before the twenty-first year. They have been more frequently male than female; the German giantess lately exhibited (1882) was as tall as any authentic case in the male sex.

Dwarfs are conventionally limited to persons under 4 feet. They are more likely than giants to have the modulus of the body perfect. "In the true dwarf, as far as I have been able to ascertain, the proportions between the several parts of the frame are good, corresponding, or nearly corresponding, with those of the normal adult; and the diminutive stature depends, accordingly, not upon relatively imperfect growth of any particular segments, or even upon the permanence of a fœtal or childlike condition, but upon the whole frame being undersized" (Humphry). Where disproportion occurs in the true dwarf it takes the form of a large-sized head, broad shoulders and capacious chest, and undersized lower limbs. Dwarfs with rickets are perhaps to be distinguished from true dwarfs; these are cases in which the spine is curved, and sometimes the bones of the limbs bent and the pelvis deformed. As in the case of giants, dwarfs are seldom the progeny of dwarfs, who are, in fact, usually sterile; the unnatural smallness may be obvious at birth, but is more likely to make itself manifest in the years of growth. Dwarfs are much more easily brought up than giants, and are stronger and longer-lived; they have usually also strong passions and acute intelligence. The legends of the dwarfs and giants are on the whole well based on fact (see DWARF and GIANT).

Redundancy and Defect in Single Parts.—The simplest case of this redundancy is a sixth digit, well formed, and provided with muscles (or tendons), nerves, and blood-vessels like the others; it is usually a repetition of the little finger or toe, and it may be present on one or both hands, or on one or both feet, or in all four extremities, as in the giant of Gath. The want of one, two, or more digits on hand or foot, or on both, is another simple anomaly; and

¹ In a passage quoted by Bischoff from the 19th volume of Luther's works, Halle ed., p. 2416.

² See the tables in Humphry's *Treatise on the Human Skeleton*, p. 109f.

like the redundancy, it is apt to repeat itself in the same family. Meckel saw a girl who had an extra digit on each extremity, while a sister wanted four of the fingers of one hand. Where the supernumerary digits are more than one on each extremity, the whole set are apt to be rudimentary or stunted; they look as if two or more of the embryonic buds had been subject to cleavage down the middle, and to arrest of longitudinal growth. There are two or three authentic instances of a whole lower limb appearing at birth as two withered halves, as if from embryonic cleavage.¹ Other redundancies of the skeleton are extra vertebræ (sometimes the coccygeal, giving the appearance of a rudimentary tail), or an extra rib. A double row of teeth is occasionally met with; the most interesting case of this anomaly is that in which the rudiments of a double row exist from the first, but the phenomenon is sometimes produced by the milk teeth persisting along with the second set. One or more extra teeth are occasionally met with in line with the rest. Among redundancies of the soft parts, by far the most frequent is an extra nipple, or pair of nipples. It is only the nipple, or the most external mechanical adjunct of the mammary apparatus, that is repeated, and very seldom, if ever, the breast structure itself. The nipple, although it is the latest addition to the mechanism of lactation, is in the individual mammal developed on the skin before the gland is formed underneath; and that facility, which applies to the development of external characters generally, appears to be the reason why there may be one or more extra nipples but no redundant gland. In the same connexion, it is interesting to observe that the supernumerary nipple has been shown by statistics on a large scale to be twice as common in men as in women, although in the male the mammary function never comes to maturity, and even the structure retrogrades after puberty. Traces of an additional nipple, or pair of them, in more or less symmetrical position below the normal ones, are not very uncommon when carefully looked for. Among the sense organs there is a remarkable instance recorded of doubling of the appendages of the left eye, but not of the eyeball itself; the left half of the frontal bone is double, making two eye-sockets on that side, and the extra orbit has an eyebrow and eyelid.² The external ear (*pinna*) has also been found double on one side. Doubling of any of the internal organs is extremely rare, and is probably always traceable to a more or less complete fissuring or lobation. The ducts or vessels connected with organs, and playing a purely mechanical part, are not unfrequently doubled; thus each kidney may have two ureters, and a similar variation may occur in veins and arteries.

Monstrosities from Defective Closure in the Middle Line.—Under this head come some of the commonest congenital malformations, including slight deficiencies such as harelip, and serious defects such as a gap in the crown of the head with absence of the brain. The embryo is originally a circular flattened disc spread out on one pole of the yolk, and it is formed into a cylindrical body (with four appendages) by the free margins of the disc, or rather its ventral laminae, folding inwards to meet in the middle line and so close in the pelvic, abdominal, thoracic, pharyngeal, and oral cavities. Meanwhile, and indeed rather earlier, two longitudinal parallel ridges on the top or along the back of the disc have grown up and united in the middle line to form the second barrel of the body—the neural canal—of small and uniform width in the lower three-fourths or spinal region, but expanding into a wide chamber for the brain. This division into neural (dorsal) and hæmal (ventral) canals

underlies all vertebrate development. Imperfect closure along either of those embryonic lines of junction may produce various degrees of monstrosity. The simplest and commonest form, hardly to be reckoned in the present category, is harelip with or without cleft palate, which results from defective closure of the ventral laminae at their extreme upper end. Another simple form, but of much more serious import, is a gap left in the neural canal at its lower end; usually the arches of the lumbar vertebræ are deficient, and the fluid that surrounds the spinal cord bulges out in its membranes, producing a soft tumour under the skin at the lower part of the back. This is the condition known as *hydrohæchis*, depending on the osseous defect known as *spina bifida*. Children born with this defect are difficult to rear, and are very likely to die in a few days or weeks. More rarely the gap in the arches of the vertebræ is in the region of the neck. If it extend all along the back, it will probably involve the skull also. Deficiency of the crown of the head, and in the spine as well, may be not always traceable to want of formative power to close the canal in the middle line; an over-distended condition of the central water-canal and water-spaces of the cord and brain may prevent the closure of the bones, and ultimately lead to the disruption of the nervous organs themselves; and injuries to the mother, with inflammation set up in the foetus and its appendages, may be the more remote cause. But it is by defect in the middle line that the mischief manifests itself, and it is in that anatomical category that the malformations are included. The osseous deficiency at the crown of the head is usually accompanied by want of the scalp, as well as of the brain and membranes. The bones of the face may be well developed and the features regular, except that the eyeballs bulge forward under the closed lids; but there is an abrupt horizontal line above the orbits where the bones cease, the skin of the brow joining on to a spongy kind of tissue that occupies the sides and floor of the cranium. This is the commonest form of an *anencephalous* or brainless monster. There are generally mere traces of the brain, although, in some rare and curious instances, the hemispheres are developed in an exposed position on the back of the neck. The cranial nerves are usually perfect, with the exception sometimes of the optic (and retina). Vegetative existence is not impossible, and a brainless monster has been known to survive sixty-five days. The child is usually a very large one.

Closely allied, as we have seen, to the anencephalous condition is the condition of congenital *hydrocephalus*. The nervous system at its beginning is a neural canal, not only as regards its bony covering, but in its interior; a wide space lined by ciliated epithelium and filled with water extends along the axis of the spinal cord, and expands into a series of water-chambers in the brain. As development proceeds, the walls thicken at the expense of the internal water-spaces, the original tubular or chambered plan of the central nervous system is departed from, and those organs assume the practically solid form in which we familiarly know them. If, however, the water-spaces persist in their embryonic proportions notwithstanding the thickening of the nervous substance forming their walls, there results an enormous brain which is more than half occupied inside with water, contained in spaces that correspond on the whole to the ventricles of the brain as normally bounded. A hydrocephalic foetus may survive its birth, and will be more apt to be affected in its nutrition than in its intelligence. In many cases the hydrocephalic condition does not come on till after the child is born. The *microcephalous* condition, where it is not a part of cretinism, is not usually a congenital defect in the strict sense, but more often a consequence of the

¹ See Förster's *Atlas*, Taf. viii., figs. 13 and 14.

² See preparation in the Würzburg Museum, figured by Förster, Taf. viii., figs. 9-12.

premature union of the bones of the skull along their sutures or lines of growth.

Returning to the ventral middle line, there may be defects of closure below the lips and palate, as in the breast-bone (fissure of the sternum), at the navel (the last point to close in any case), and along the middle line of the abdomen generally. The commonest point for a gap in the middle line of the belly is at its lower part, an inch or two above the pubes. At that point in the embryo there issues the allantois, a balloon-like expansion from the ventral cavity, which carries on its outer surface blood-vessels from the embryo to interdigitate with those of the mother on the uterine surface. Having served its temporary purpose of carrying the blood-vessels across a space, the balloon-like allantois collapses, and rolls up into the rounded stem-like umbilical cord through most of its extent; but a portion of the sac within the body of the foetus is retained as the permanent urinary bladder. That economical adaptation of a portion of a vesicular organ, originally formed for purposes of communication between the embryo and the mother, appears to entail sometimes a defect in the wall of the abdomen just above the pubes, and a defect in the anterior wall of the bladder itself. This is the distressing congenital condition of fissure of the urinary bladder, in which its interior is exposed through an opening in the skin; the pubic bones are separated by an interval, and the reproductive organs are ill formed; the urachus is wanting, and the umbilicus is always placed exactly at the upper end of the gap in the skin. A monstrosity recalling the cloacal arrangement of the bird is met with as a more extreme defect in the same parts.

Hermaphroditism.—Although this anomalous condition does not fall under defective closure in the middle line, it may be said to be due to a similar failure of purpose, or to an uncertainty in the *nisus formativus* at a corresponding stage of development. There is a point of time, falling about the eighth week, up to which the embryo may develop either the reproductive organs of the male or the reproductive organs of the female; in the vast majority of cases the future development and growth are carried out on one line or the other, but in a small number there is an ambiguous development leading to various degrees of hermaphroditism or doubtful sex. The primary indecision, so to speak, affects only the ovary or testis respectively, or rather the common germinal ridge out of which either may develop; the uncertainty in this embryonic sexual ridge sometimes leads actually to the formation of a pair of ovaries and a pair of small testes, or to an ovary on one side and a testis on the other; but even when there is no such double sex in the essential organs (as in the majority of hermaphrodites) there is a great deal of doubling and ambiguity entailed in the secondary or external organs and parts of generation. Those parts which are rudimentary or obsolete in the male but highly developed in the female, and those parts which are rudimentary in the female but highly developed in the male tend in the hermaphrodite to be developed equally, and all of them badly. In some cases the external organs of one sex go with the internal organs of the opposite sex. It has been observed that when middle life is reached or passed the predominance in features, voice, and disposition leans distinctly towards the masculine side. The mythological or classical notions of hermaphroditism, like so much else in the traditions of teratology, are exaggerated.

Cyclops, Siren, &c.—The same feebleness of the formative energy (the *Bildungstrieb* of Blumenbach) which gives rise to some at least of the cases of defective closure in the middle line, and to the cases of undecided sex, leads also to imperfect separation of symmetrical parts. The most

remarkable case of the kind is the cyclops monster. At a point corresponding to the root of the nose there is found a single orbital cavity, sometimes of small size and with no eyeball in it, at other times of the usual size of the orbit and containing an eyeball more or less complete. In still other cases, which indicate the nature of the anomaly, the orbital cavity extends for some distance on each side of the middle line, and contains two eyeballs lying close together. The usual nose is wanting, but above the single orbital cavity there is often a nasal process on the forehead, with which nasal bones may be articulated, and cartilages joined to the latter; these form the framework of a short fleshy protuberance like a small proboscis. The lower jaw is sometimes wanting in cyclopeans; the cheek-bones are apt to be small, and the mouth a small round hole, or altogether absent; the rest of the body may be well developed. The key to the cyclopean condition is found in the state of the brain. The olfactory nerves or lobes are usually described as absent, although Vrolik has found them in some instances; the brain is very imperfectly divided into hemispheres, and appears as a somewhat pear-shaped sac with thick walls, the longitudinal partition of dura mater (*falx cerebri*) being wanting, the surface almost unconvoluted, the corpus callosum deficient, the basal ganglia rudimentary or fused. The optic chiasma and nerves are usually replaced by a single mesial nerve, but sometimes the chiasma and pair of nerves are present. The origin of this monstrosity dates back to an early period of development, to the time when the future hemispheres were being formed as protrusions from the anterior cerebral vesicle or fore-brain; it may be conceived that, instead of two distinct buds from that vesicle, there was only a single outgrowth with imperfect traces of cleavage. That initial defect would carry with it naturally the undivided state of the cerebrum, and with the latter there would be the absence of olfactory lobes and of a nose, and a single eyeball placed where the nose should have been. A cyclops has been known to live for several days. The monstrosity is not uncommon among the domestic animals, and is especially frequent in the pig. There is another congenital malformation, in which an eyeball is wanting from one of the sockets; but in that case there is no defect of development in the bones, and the brain and nose are normal.

Another curious result of defective separation of symmetrical parts is the siren form of fetus, in which the lower limbs occur as a single tapering prolongation of the trunk like the hinder part of a dolphin, at the end of which a foot (or both feet) may or may not be visible. The defects in the bones underlying this siren form are very various: in some cases there is only one limb (thigh and leg-bones) in the middle line; in others all the bones of each limb are present in more or less rudimentary condition, but adhering at prominent points of the adjacent surfaces. The pelvis and pelvic viscera share in the abnormality. A much more common and harmless case of unseparated symmetrical parts is where the hand or foot has two, three, or more digits fused together. This syndactylous anomaly runs in families.

Limbs Absent or Stunted.—Allied to these fused or unseparated states of the extremities, or of parts of them, are the class of deformities in which whole limbs are absent, or represented only by stumps. The trunk (and head) may be well formed, and the individual healthy; all four extremities may be reduced to short stumps either wanting hands and feet entirely, or with the latter fairly well developed; or the legs only may be rudimentary or wanting, or the arms only, or one extremity only. Although some of these cases doubtless depend upon aberrant or deficient formative power in the particular direc-

tions, there are others of them referable to the effects of mechanical pressure, and even to direct amputation of parts within the uterus.

Acardiac and Acranial Monsters.—It sometimes happens in a twin pregnancy that one of the embryos fails to develop a heart and a complete vascular system of its own, depending for its nourishment upon blood derived from the placenta of its well-formed twin by means of its umbilical vessels. It grows into a more or less shapeless mass, in which all traces of the human form may be lost. Other viscera besides the heart will be wanting, and no head distinguishable; the most likely parts to keep the line of development are the lumbar region (with the kidneys), the pelvis, and the lower limbs. The twin of this monster may be a healthy infant.

Reversed Position of the Viscera.—This is a developmental error depending on the retention of the right aortic arch as in birds, instead of the left as is usual in mammals. The position of all the unsymmetrical viscera is transposed, the spleen and cardiac end of the stomach going to the right side, the liver to the left, the cæcum resting on the left iliac fossa, and the sigmoid flexure of the colon being attached to the right. This condition of *situs inversus viscerum* need cause no inconvenience; and it will probably remain undetected until the occasion should arise for a physical diagnosis or *post-mortem* inspection. There are numerous other anomalies in the development of the great vessels. In the heart itself there may be an imperfect septum ventriculorum, and there is more frequently a patency of the foetal communication between the auricles, permitting the venous blood to pass into the arterial system, and producing the livid appearance of the face known as *cyanosis*.

The causes of congenital anomalies are difficult to specify. There is no doubt that, in some cases, they are present in the sperm or germ of the parent; the same anomalies recur in several children of a family, and it has been found possible, through a variation of the circumstances, to trace the influence in some cases to the father alone, and in other cases to the mother alone. The remarkable thing in this parental influence is that the malformation in the child may not have been manifested in the body of either parent, or in the grandparents. More often the malformation is acquired by the embryo and foetus in the course of development and growth: either through the mother or in itself independently. Maternal impressions during pregnancy have often been alleged as a cause, and this causation has been discussed at great length by the best authorities. The general opinion seems to be that it is impossible to set aside the influence of subjective states of the mother altogether. The doctrine of maternal impressions has often been resorted to when any other explanation was either difficult or inconvenient; thus, Hippocrates is said to have saved the virtue of a woman who gave birth to a black child by pointing out that there was a picture of a negro on the wall of her chamber. Injuries to the mother during pregnancy have been unquestionably the cause of certain malformations, especially of congenital hydrocephalus. The embryo itself and its membranes may become the subject of inflammations, atrophies, hypertrophies, and the like; this causation, to which Otto traced all malformations of the foetus, is doubtless accountable for a good many of them. But a very large residue of malformations must still be referred to no more definite cause than the erratic spontaneity of the embryonic cells and cell-groups. The *nisus formativus* of the fertilized ovum is always made subject to morphological laws, but, just as in extra-uterine life, there may be deviations from the beaten track; and even a slight deviation at an early stage will carry with it far-reaching

consequences. This is particularly noticeable in double monsters.

2. *Double Monsters.*—Twins are the physiological analogy of double monsters, and some of the latter have come very near to being two separate individuals. Triple monsters are too rare to dwell upon, but their analogy would be triplets. The Siamese twins, who died in 1874 at the age of sixty, were joined only by a thick fleshy ligament from the lower end of the breast-bone (xiphoid cartilage), having the common navel on its lower border; the anatomical examination showed, however, that a process of peritoneum extended through the ligament from one abdominal cavity to the other, and that the blood-vessels of the two livers were in free communication across the same bridge. There are one or two cases on record in which such a ligament has been cut at birth, one, at least, of the twins surviving. From the most intelligible form of double monstrosity, like the Siamese twins, there are all grades of fantastic fusion of two individuals into one down to the truly marvellous condition of a small body or fragment parasitic upon a well-grown infant,—the condition known as *foetus in fetu*. These monstrosities are deviations, not from the usual kind of twin gestation, but from a certain rarer physiological type of dual development. In by far the majority of cases twins have separate uterine appendages, and have probably been developed from distinct ova; but in a small proportion of (recorded) cases there is evidence, in the placental and enclosing structures, that the twins had been developed from two rudiments arising side by side on a single blastoderm. It is to the latter physiological category that double monsters almost certainly belong, and there is some direct embryological evidence for this opinion. Allen Thomson observed in the blastoderm of a hen's egg at the sixteenth or eighteenth hour of incubation two "primitive traces" or rudiments of the backbone forming side by side; and in a goose's egg incubated five days he found on one blastoderm two embryos, each with the rudiments of upper and lower extremities, crossing or cohering in the region of the future neck, and with only one heart between them. Somewhat similar observations had been previously published (four cases in all) by Wolff, Von Baer, and Reichert. Malformations in the earliest stages of the blastoderm have been more frequently observed of late, especially in the ova of the pike; and these point not so much to a symmetrical doubling of the primitive trace as to irregular budding from the margin of the germinal disc. In any case, the perfect physiological type appears to be two rudiments on one blastoderm, whose entirely separate development produces twins (under their rarer circumstances), whose nearly separate development produces such double monsters as the Siamese twins, and whose less separate development produces the various grotesque forms of two individuals in one body. There can be no question of a literal fusion of two embryos; either the individuality of each was at no time complete, or, if there were two distinct primitive traces, the uni-axial type was approximately reverted to in the process of development, as in the formation of the abdominal and thoracic viscera, limbs, pelvis, or head. Double monsters are divided in the first instance into those in which the doubling is symmetrical and equal on the two sides, and those in which a small or fragmentary foetus is attached to or enclosed in a foetus of average development,—the latter class being the so-called cases of "parasitism."

Symmetrical Double Monsters are subdivided according to the part or region of the body where the union or fusion exists—head, thorax, umbilicus, or pelvis. One of the simplest cases is a Janus head upon a single body, or there may be two pairs of arms with the two faces. Again, there may be one head with two necks and two complete trunks

and pairs of extremities. Two distinct heads (with more or less of neck) may surmount a single trunk, broad at the shoulders but with only one pair of arms. The fusion, again, may be from the middle of the thorax downwards, giving two heads and two pairs of shoulders and arms, but only one trunk and one pair of legs. In another variety, the body may be double down to the waist, but the pelvis and lower limbs single. The degree of union in the region of the head, abdomen, or pelvis may be so slight as to permit of two distinct organs or sets of organs in the respective cavities, or so great as to have the viscera in common; and there is hardly ever an intermediate condition between those extremes. Thus, in the Janus head there may be two brains, or only one brain. The Siamese twins are an instance of union at the umbilical region, with the viscera distinct in every respect except a slight vascular anastomosis and a common process of peritoneum; but it is more usual for union in that region to be more extensive, and to entail a single set of abdominal and thoracic viscera. The pelvis is one of the commonest regions for double monsters to be joined at, and, as in the head and abdomen, the junction may be slight or total. The Hungarian sisters Helena and Judith (1701-1723) were joined at the sacrum, but had the pelvic cavity and pelvic organs separate; the same condition obtained in the South Carolina negroes Millie and Christina, known as the "two-headed nightingale," and in the other recent case of the Bohemian sisters Rosalie and Josepha. More usually the union in the pelvic region is complete, and produces the most fantastic shapes of two trunks (each with head and arms) joining below at various angles, and with three or four lower limbs extending from the region of fusion, sometimes in a lateral direction, sometimes downwards. A very curious kind of double monster is produced by two otherwise distinct fœtuses joining at the crown of the head and keeping the axis of their bodies in a line. It is only in rare instances that double monsters survive their birth, and the preserved specimens of them are mostly of foetal size.

Unequal Double Monsters, Fœtus in Fœtu.—There are some well-authenticated instances of this most curious of all anomalies. The most celebrated of these parasite-bearing monsters was a Genoese, Lazarus Johannes Baptista Colloredo, born in 1716, who was figured as a child by Licetus, and again by Bartholinus at the age of twenty-eight as a young man of average stature. The parasite adhered to the lower end of his breast-bone, and was a tolerably well-formed child, wanting only one leg; it breathed, slept at intervals, and moved its body, but it had no separate nutritive functions. The parasite is more apt to be a miniature acardiac and acephalous fragment, as in the case of the one born in front of the abdomen of a Chinaman figured by I. Geoffroy St-Hilaire. Sometimes the parasite is contained in a pouch under the skin of the abdominal wall, and in another class (of which there is a specimen in the Hunterian Museum) it has actually been included, by the closure of the ventral laminae, within the abdominal cavity of the fœtus,—a true *fœtus in fœtu*. Shapeless parasitic fragments containing masses of bone, cartilage, and other tissue are found also in the space behind the breast-bone (mediastinal teratoma), or growing from the base of the skull and protruding through the mouth ("epignathous teratoma," appearing to be seated on the jaw), and, most frequently of all, attached to the sacrum. These last pass by a most interesting transition into common forms of congenital sacral tumours (which may be of enormous size), consisting mainly of one kind of tissue having its physiological type in the curious gland-like body (coccygeal gland) in which the middle sacral artery comes to an end. The congenital sacral tumours have a tendency to become cystic, and they are probably related to

the more perfect congenital cysts of the neck region, where there is another minute gland-like body of the same nature as the coccygeal at the point of bifurcation of the common carotid artery. Other tumours of the body, especially certain of the sarcomatous class, may be regarded from the point of view of *monstra per excessum*; but such cases suggest not so much a question of aberrant development within the blastoderm as of the indwelling spontaneity of a single post-embryonic tissue; and they fall to be considered more properly, along with tumours in general, in the article PATHOLOGY (*q.v.*).

The scientific appreciation of monsters hardly began before the 18th century; even so great a rationalist in surgical practice as Ambrose Paré (1517-1590), although he was attracted as a scholar in later life to the subject, did not advance in it materially beyond the fantastic and credulous standpoint of the time, which is exemplified in the elaborate treatise of Lycosthenes, *Prodigiorum ac ostentorum chronicon*, Basel, 1557. Throughout the 17th century fabulous monsters continued to be described along with actual specimens; the embryological studies of Harvey (1651) were doubtless calculated to help in the growth of rational opinion about monsters, though Harvey himself mentions them only casually. The first systematic discussion of them from a strictly objective or anatomical point of view occurs in various writings of Haller from 1735 to 1753, and the subject continued after that to engage a large amount of precise and philosophical thought on the part of Caspar Friedrich Wolff (1735-1794), who first stated the relation of monstrosities to embryonic deviations in words that even now hardly require to be altered, and of Blumenbach, Sömmering, Auteurieth, Tiedemann, and others. The engrossing interest of the subject in the early part of the 19th century is shown by the fact that J. F. Meckel's *Handbuch der pathologischen Anatomie* (1817) was largely occupied with congenital malformations. Geoffroy St-Hilaire, the father, gave them a prominent place in his *Philosophie Anatomique* (Paris, 1822), and his son Isidore made them the subject of a special and very elaborate treatise in 3 vols. (Paris, 1832-37), illustrated by a small and inadequate atlas of plates. Monstrosities were at this period a prominent part of all text-books of morbid anatomy. From 1840 to 1850 may be regarded as the period in which human teratology reached its highest point; in 1840-42 the special treatise of Vrolik was published (2 vols., Amsterdam), containing an introduction on the normal development, and his sumptuous and incomparable atlas to the same followed in 1849; in 1841 Otto published at Warsaw a description of 600 monsters with 30 folio plates; and in 1842 the embryologist Bischoff contributed to Wagner's *Handwörterbuch der Physiologie*, vol. i., an article on teratology as elucidated by the best information on mammalian development. An article by Allen Thomson in the *London and Edinburgh Monthly Journal of Medical Science*, July 1844, followed by a critical survey in the next number, is of the first importance for the theory of double monsters, and it is one of the few notable English contributions to animal teratology apart from museum catalogues,—the general article in Todd's *Cyclopædia of Anatomy and Physiology* having been written by Vrolik, while the special subject of Hermaphroditism is treated of in a long and learned article by J. Y. Simpson (reprinted in his collected works). One of the latest important works on monsters is that by Förster (Jena, 1861), *Die Missbildungen des Menschen systematisch dargestellt*, with an atlas of 26 4to plates containing 524 figures (on a small scale), of which 162 were drawn from original specimens, mostly in the Würzburg Museum; this work has a very great variety of illustrations from all sources, and most copious bibliographical references. The newest treatise is Ahlfeld's *Missbildungen des Menschen* (Leipzig, 1880-82), with an extensive atlas of folio plates, as comprehensive as Förster's and on a larger scale. Monsters have of late been assigned a comparatively subordinate position in pathological teaching, owing, doubtless, to the more immediate interest of microscopic and experimental pathology. Among recent pathological text-books that of Perls (Stuttgart, 1877-79) may be named as containing an adequate treatment of the subject. The two most considerable contributors to teratology recently have been Panum (Berlin, 1860), and Dareste (Paris, 1877), both of whom have occupied themselves mainly with producing monstrosities artificially in the bird's egg by varying the temperature in the hatching oven. See also L. Gerlach, *Die Entstehungsweise der Doppelmissbildungen bei den höheren Wirbelthieren*. Stuttgart, 1883. (C. C.)

MONSTRELET, ENGUERRAND DE (ob. 1453) (who, rather owing to accident than to merit, held, until within the present century, the same position as chronicler of French affairs during the early part of the 15th century as Froissart deservedly holds with regard to the last half of the 14th), was born at an uncertain date, apparently not later than 1400, and died in July 1453. He was of

a noble family in the district of Boulogne. He held in 1436, and later, the office of lieutenant-gavener (receiver of the *gave*, a kind of church rate) in the city of Cambrai, and seems to have usually resided there. Besides this he was for some time bailiff of the chapter of that city, and later provost. He was married, and left children. But this almost exhausts the amount of our knowledge respecting him, except that he was present, not at the capture of the Maid of Orleans, but at her subsequent interview with the duke of Burgundy. As a subject of this latter prince he naturally takes the Burgundian side in his history, which extends in the genuine part of it to two books, and covers the period from 1400 to 1444. At this time, as another chronicler Matthieu de Coucy informs us, Monstrelet ceased writing. But, according to a habit by no means uncommon in the Middle Ages, a clumsy sequel, extending to a period long subsequent to his death, was formed out of various other chronicles and tacked on to his work. The genuine part of this, dealing with the last half of the Hundred Years War, is valuable because it contains a large number of documents which are certainly, and reported speeches which are probably, authentic. It has, however, little colour or narrative merit, is dully, though clearly enough, written, and is strongly tinged with the pedantry of its century,—the most pedantic in French history. The best edition is that published for the Société de l'Histoire de France by M. Douet d'Arceq in 1856.

MONTAGU, LADY MARY WORTLEY (1690-1762), one of the most brilliant letter-writers of the 18th century, was the eldest daughter of Evelyn Pierrepont, duke of Kingston, and Lady Mary Fielding, daughter of the earl of Denbigh. Her near relationship with Fielding the novelist is worth remarking. She was born at Thoresby in Nottinghamshire in 1690. Her mother died when she was a child, and by some chance she received or gave herself an unusually wide literary education, had the run of her father's library, was encouraged in her studies by Bishop Burnet, and while still a girl translated the *Enchiridion* of Epictetus. After a courtship in which she showed a singular power of thinking for herself, she was married in 1712, against her father's wish, to Mr. E. Wortley Montagu, an accomplished and scholarly friend of the Queen Anne wits. At the new court of George I. her beauty and wit brought her much homage; Pope was among her most devoted worshippers, and she even gained and kept the friendship of the great duchess of Marlborough. Her husband being appointed ambassador to the Porte in 1716, she accompanied him to Constantinople, and wrote to her friends at home brilliant descriptions of Eastern life and scenery. These letters were not published till 1763, the year after her death; but, copies being handed about in fashionable circles, their lively, witty style, graphic pictures of unfamiliar life, and shrewd and daring judgments gave the writer instant celebrity. In one of them she described the practice of inoculation for the smallpox, and announced her intention of trying it on her own son, and of introducing it in spite of the doctors into England. The most memorable incident in her life after her return from the East was her quarrel with Pope, caused, according to her account, by her laughing at him when he made love to her in earnest. He satirized her under the name of Sappho, and she teased him with superior ingenuity and hardly inferior wit. From 1739 to 1761 Lady Mary lived abroad, apart from her husband, maintaining an affectionate correspondence with her daughter Lady Bute, in which she set forth views of life largely coloured by the asceticism of her master Epictetus, and wearing an appearance of oddity and eccentricity from their contrast with conventional thought. The character of coldness and unwomanliness which Pope contrived to fix on his

enemy was far from being deserved; her letters show her to have been a very warm-hearted woman, though on principle she turned the hard side to the world. She died 21st August 1762. The best edition of her works is that of 1861, with a memoir by Moy Thomas.

MONTAIGNE, MICHEL DE (1533-1592), essayist, was born, as he himself tells us, between eleven o'clock and noon on 28th February 1533. The patronymic of the Montaigne family, who derived their title from the chateau at which the essayist was born and which had been bought by his grandfather, was Eyquem. It was believed to be of English origin, and the long tenure of Gascony and Guienne by the English certainly provided abundant opportunity for the introduction of English colonists. But the elaborate researches of M. Malvézin have proved the existence of a family of Eyquems or Ayquems before the marriage of Eleanor of Aquitaine to Henry II. of England, though no connexion between this family, who were Sieurs de Lesparre, and the essayist's ancestors can be made out. Montaigne is not far from Bordeaux, and in Montaigne's time was in the province of Perigord. It is now in the arrondissement of Bergerac and the department of Dordogne. The Eyquem family had for some time been connected with Bordeaux. Indeed, though they possessed more than one estate in the district, they were of doubtful and certainly very recent nobility. Pierre Eyquem, Montaigne's father, had been engaged in commerce (a herring-merchant Scaliger calls him), had filled many municipal offices in Bordeaux, and had served under Francis I. in Italy as a soldier. The essayist was not the eldest son, but the third. By the death of his elder brothers, however, he became head of the family. He had also six younger brothers and sisters. His father appears, like many other men of the time, to have made a hobby of education. Michel was not a strong boy, indeed he was all his life a valetudinarian, and this may have especially prompted his father to take pains with him. At a time when the rod was the universal instrument of teaching it was almost entirely spared to Montaigne. He was, according to the French fashion common at all times, put out to nurse with a peasant woman. But Pierre Eyquem added to this the unusual fancy of choosing his son's sponsors from the same class, and of accustoming him to associate with it. He was taught Latin orally by servants who could speak no French, and many curious fancies were tried on him, as, for instance, that of waking him every morning by soft music. But he was by no means allowed to be idle. A plan of teaching him Greek, still more out of the common way than his Latin course, by some kind of mechanical arrangement, is not very intelligible, and was quite unsuccessful. These details of his education (which, like most else that is known about him, come from his own mouth) are not only interesting in themselves, but remind the reader how, not far from the same time, the other greatest writer of French during the Renaissance was also exercising himself, though not being exercised, in plans of education almost as fantastic. At six years old (for the father's reforming views in education do not seem to have disgusted him with the extremely early age at which it was then usual to begin school training) Montaigne was sent to the Collège de Guienne at Bordeaux, then at the height of its reputation, having more than double the number of scholars (two thousand) that even the largest English public school has usually boasted. Among its masters were Buchanan, afterwards the teacher of James I., and Muretus, one of the first scholars of the age. These, with their colleague Guérente, composed Latin plays for their pupils to act, and are held to have given no small impulse to the production of the classical French tragedy

of the *Pléiade*. Montaigne remained at school seven years, and, like almost all Frenchmen of all times, retained no pleasant or complimentary memory of it. At thirteen he left the Collège de Guienne and began to study law, it is not known where, but probably at Toulouse, the most famous university, despite its religious intolerance, of the south of France. Of his youth, early manhood, and middle life extremely little is known. Allusions to it in the *Essays* are frequent enough, but they are rarely precise. In 1548 he was at Bordeaux during one of the frequent riots caused by the gabelle, or salt tax. Six years afterwards, having attained his majority, he was made a counsellor in the Bordeaux parliament. In 1558 he was present at the siege of Thionville. Like his father, he certainly served in the army, for he has frequent allusions to military experiences. He was also much about the court, and he admits very frankly that in his youth he led a life of pleasure, if not exactly of excess. In 1566 he married Françoise de la Chassaingne, whose father was, like himself, a member of the Bordeaux parliament. Three years later his father died, and he succeeded to the family possessions. Finally, in 1571, as he tells us in an inscription still extant, he retired to Montaigne to take up his abode there. This was the turning-point of his life.

It has been said that his health was never strong, and it had been further weakened by the hard living (in both senses of that phrase) which was usual at the time. He resolved, accordingly, to retire to a life of study and contemplation, though he did not in the least seclude himself, and indulged in no asceticism except careful diet. Montaigne was a large country house unfortified (in which circumstance its astute possessor saw rather safety than danger from the turbulence of the religious wars), and its owner's revenues, without being large, appear to have been easy. He neither had nor professed any enthusiastic affection for his wife, but he lived on excellent terms with her, and bestowed some pains on the education of the only child (a daughter) who survived infancy. In his study, which he has minutely described, he read, wrote, dictated, meditated, inscribed moral sentences, which still remain on the walls and rafters, and in other ways gave himself up to learned ease. He was not new to literature. In his father's lifetime, and at his request, he had translated the *Theologia Naturalis* of Raymond de Sebonde, a Spanish schoolman. On first coming to live at Montaigne he edited the works of his deceased friend Étienne de la Boétie, who had been the comrade of his youth, who died early, and who, with poems of real promise, had composed a declamatory and schoolboyish theme on republicanism, entitled the *Contr' Un*, which is one of the most over-estimated books in literature. But the years of his studious retirement were spent on a work of infinitely greater importance. Garrulous after a fashion, as Montaigne is, he gives us no clear idea of any original or definite impulse leading him to write the famous *Essays*. It is very probable that if they were at first intended to have any special form at all it was that of a table-book or journal, such as was never more commonly kept than in the 16th century. But the author must have been more or less conscious of an order existing in the disorder of his thoughts, and this may have induced him to keep them apart in chapters, or at least under chapter-headings, and at the same time not to cut them up into mere *pensées*. It is certainly very noticeable that the earlier essays, those of the first two books, differ from the later in one most striking point, in that of length. Speaking generally, the essays of the third book average fully four times the length of those of the other two. This of itself would suggest a difference in the system of composition. For the present, however, we may confine ourselves to the first

two books. These appeared in 1580, when their author was forty-seven years old.

They contain, as at present published, no less than ninety-three essays, besides an exceedingly long apology for the already-mentioned Raymond Sebonde, which amounts to about a quarter of the whole in bulk, and differs curiously from its companions in matter no less than in scale. The book begins with a short *avis* (address to the reader), opening with the well-known words, "C'est icy un livre de bon foy lecteur," and sketching in a few lively sentences the character of mediative egotism which is kept up throughout. His sole object, the author says, is to leave for his friends and relations a mental portrait of himself, defects and all; he cares neither for utility nor fame. The essays then begin without any attempt to explain or classify their subjects. Their titles are of the most diverse character. Sometimes they are proverbial sayings, or moral adages, such as: "Par divers moyens on arrive à pareille fin", "Qu'il ne faut juger de notre heur qu'après la mort", "Le profit de l'on est le dommage de l'autre." Sometimes they are headed like the chapters of a treatise on ethics: "De la tristesse", "De l'oisiveté", "De la peur", "De l'amitié." Sometimes a fact of some sort which has awakened a train of associations in the mind of the writer serves as a title, such as: "On est puni de s'opiniâtrer à une place sans raison", "De la bataille de Dreux", &c. Occasionally the titles seem to be deliberately fantastic, as: "Des puces", "De l'usage de se vestir." Sometimes, though not very often, the sections are in no proper sense essays, but merely commonplace book entries of singular facts or quotations with hardly any comment. These point to the haphazard or indirect origin of them which has been already suggested. But generally the essay-character—that is to say, the discussion of a special point, it may be with wide digressions and divergences—displays itself. The digressions are indeed constant, and sometimes have the appearance of being absolutely wulful. The nominal title, even when most strictly observed, is rarely more than a starting-point; and, though the brevity of these first essays for the most part prevents the author from journeying very far, he contrives to get to the utmost range of his tether. Quotations are very frequent. These are the principal external characteristics of the book; its internal spirit had better be treated when it can be spoken of completely.

Between the publication of the first two books of essays in 1580 and the publication of the third in 1588, Montaigne's life as distinguished from his writings becomes somewhat better known, and somewhat more interesting. He had, during the eight years of composition of his first volume, visited Paris occasionally and travelled for health or pleasure to Caunterets, Eaux Chaudes, and elsewhere. Charles IX., apparently, had made him one of his gentlemen in ordinary, and perhaps conferred on him the order of St Michael. The fiercest period of the religious wars, save that yet to come of the League, passed over him without harming him, though not without subjecting him to some risks. But his health grew worse and worse, and he was tormented by stone and gravel. He accordingly resolved to journey to the baths of Lucca. Late in the 18th century a journal was found in the chateau of Montaigne, giving an account of this journey, and it was published in 1774; part of it is written in Italian and part dictated in French, the latter being for the most part the work of a secretary or servant. Whatever may be the biographical value of this work, which has rarely been reprinted with the *Essays* themselves, it is almost entirely destitute of literary interest. Written, moreover, according to its own showing merely for the author's own eye, it contains abundance of details as to the medicinal effect of the various baths which he visited, details which may be said to be superfluous to a medical reader, and disgusting to any other. The course of the journey was first northwards to Plombières, then by Basel to Augsburg and Munich, then through Tyrol to Verona and Padua in Italy. Montaigne visited most of the famous cities of the north and centre, staying five months at Rome, and finally establishing himself at the baths of Lucca for nearly as long a time. There he received news of his election as mayor of Bordeaux, and after some time journeyed homewards. The tour contains much minute information about roads, food, travelling, &c., but the singular condition in which it exists, and the absence of a really good critical

edition hitherto, make it rather difficult to use it as a document. The freak of writing part of it in a strange dog-Italian is not uncharacteristic of Montaigne, but the words of his last and best editors, M.M. Courbet and Royer, who speak of the letters as "l'unique complément des essais," seem to indicate that they are not of those who accept the published *Voyage* as authentic. Of the fact of the journey there is no doubt whatever.

Montaigne (as was not unnatural in a man of his temperament, who had for some years, if not for the greater part of his life, lived solely to please himself) was not altogether delighted at his election to the mayoralty, which promised him two years of responsible if not very hard work. The memory of his father, however, and the commands of the king, which seem to have been expressed in a manner rather stronger than a mere formal confirmation, induced him to accept it; and he seems to have discharged it neither better nor worse than an average magistrate. Indeed, he gave sufficient satisfaction to the citizens to be re-elected at the close of his term, and it may be suspected that the honour of the position, which was really one of considerable dignity and importance, was not altogether indifferent to him. Unfortunately, it cannot be said that nothing in his office became him like the leaving of it, for it was at the close of his second tenure that he gave the only sign of the demoralizing effect which is sometimes alleged by severe moralists to come of the half epicurean, half sceptical philosophy which he undoubtedly professed. It was his business, if not exactly his duty, to preside at the formal election of his successor, the maréchal de Matignon; but there was a severe pestilence in Bordeaux, and Montaigne writes to the jurats of that town, in one of the few undoubtedly authentic letters which we possess, to the effect that he will leave them to judge whether his presence at the election is so necessary as to make it worth his while to expose himself to the danger of going into the town in its then condition, "which is specially dangerous for men coming from a good air as he does." That is to say, the chief magistrate of one of the greatest towns in France not only declined to visit it because of sickness prevailing there, but had left it to itself at a time when nearly half the population perished, and when, according to the manners of the age, civil disturbance was almost sure to follow accordingly. Attempts have been made to justify Montaigne, and it may be at least said that he at no time pretended to unselfish heroism; but it is to be feared that the facts and the inference drawn from them admit of no dispute. At the least, Montaigne's conduct must be allowed to contrast very little to his advantage with that of Rotrou in the next century under somewhat similar circumstances though in a position of much less responsibility. It may, however, be urged in Montaigne's favour that the general circumstances of the time, where they did not produce reckless and foolhardy daring, almost necessarily produced a somewhat excessive caution. The League was on the point of attaining its greatest power, the extreme Calvinist and Navarrese party, on the other side, was (as may be seen in Agrippa d'Aubigné) no less fanatical than the League itself, and the salvation of France seemed to lie in the third party of *politiques*, or trimmers, to which Montaigne belonged. The capital motto of this party was that of the Scotch saying, "Jouk and let the jaw gang by," and the continual habit of parrying and avoiding political dangers might be apt to extend itself to dangers other than political. However this may be, Montaigne had difficulty enough during this turbulent period, all the more so from his neighbourhood to the chief haunts and possessions of Henry of Navarre. He was able, however, despite the occupations of his journey, his mayoralty, and the pressure of civil war and pestilence, which was not confined to the town, to continue his essay

writing, and in 1588, after a visit of some length to Paris, the third book of the *Essays* was published, together with the former ones considerably revised. The new essays, as has been remarked, differ strikingly from the older ones in respect of length; these being only one which confines itself to the average of those in the first two books. The whimsical unexpectedness of the titles, moreover, reappears in but two of them: "Des coches" and "Des boîtes." They are, however, identical with the earlier ones in spirit, and make with them a harmonious whole—a book which has hardly been second in influence to any of the modern world.

This influence is almost equally remarkable in point of matter and in point of form, as regards the subsequent history of thought and as regards the subsequent history of literature. The latter aspect may be taken first. Montaigne is one of the few great writers who have not only perfected but have also invented a literary form. The essay as he gave it had no forerunner in modern literature, and no direct ancestor in the literature of classical times. It is indeed not improbable that it owes something to the body of tractates by different authors and of different dates, which goes under the name of Plutarch's *Morals*, and it also bears some resemblance to the miscellaneous work of Lucian. But the resemblance is in both cases at most that of suggestion. The peculiar desultoriness and tentative character of the essay proper were alien to the orderly character of the Greek mind, as were also its garrulity and the tendency which it has rather to reveal the idiosyncrasy of the writer than to deal in a systematic manner with the peculiarities of the subject. It has been suggested that the form which the essays assumed was in a way accidental, and this of itself precludes the idea of a definite model even if such a model could be found. Beginning with the throwing together of a few stray thoughts and quotations linked by a community of subject, the author by degrees acquires more and more certainty of hand, until he produces such masterpieces of apparent desultoriness and real unity as the essay "Sur des vers de Virgile." In matter of style and language Montaigne's position is equally important, but the ways which led him to it are more clearly traceable. His favourite author was beyond all doubt Plutarch, and his own explicit confession makes it undeniable that Plutarch's translator Amyot was his master in point of vocabulary, and (so far as he took any lessons in it) of style. Amyot was unquestionably one of the most remarkable writers of French in the 16th century, and to him more than to any one else is due the beauty of the prose style which marked the second half of that century, a style which, though unequal and requiring to be modified for general use, is at its best the very flower of the language. Montaigne, however, followed with the perfect independence that characterized him. He was a contemporary of Ronsard, and his first essays were published when the innovations of the Pléiade had fully established themselves. He adopted them to a great extent, but with much discrimination, and he used his own judgment in Latinizing when he pleased. In the same way he retained archaic and provincial words with a good deal of freedom, but by no means to excess. In the arrangement as in the selection of his language he is equally original. There is little or no trace in him of the interminable sentence which is the drawback of early prose in all languages when it has to deal with anything more difficult to manage than mere narrative. He has not the excessive classicism of style which mars even the fine prose of Calvin, and which makes that of some of Calvin's followers intolerably stiff. As a rule he is careless of definitely rhythmical cadence, though his sentences are always pleasant to the ear. But the principal characteristic of Montaigne's prose style is its remarkable ease and flexibility. These peculiarities, calculated in themselves to exercise a salutary influence on a language as yet somewhat undisciplined, acquired by accident an importance of an extraordinary kind. A few years after Montaigne's death a great revolution, as is generally known, passed over French. The criticism of Malherbe, followed by the establishment of the Academy, the minute grammatical censures of Vaugelas, and the severe literary censorship of Boileau turned French in less than three-quarters of a century from one of the freest languages in Europe to one of the most restricted. The Latinisms and Grecisms of the Pléiade were tabooed at the same time with the most picturesque expressions of the older tongue. The efforts of the reformers were directed above all things to weed and to refine, to impose additional difficulties in the way of writing exquisitely, at the same time that, by holding out a strictly-defined model, they assisted persons of little genius and imagination to write tolerably. During this revolution only two writers of older date held their ground, and those two were Rabelais and Montaigne,—Montaigne being of his nature more generally readable than Rabelais. The *Essays*, the popularity of which no academic censorship could touch, thus kept before the eyes of the 17th and 18th centuries a treasury of French in which every generation could behold

the riches of their ancestors. The study of them influenced all the great prose writers of France, and they could not fail to be influenced in the direction which it was most important that they should take by the racy phrase, the quaint and picturesque vocabulary, and the unconstrained constructions of Montaigne.

It would be impossible, however, for the stoutest defender of the importance of form in literature to assign the chief part in Montaigne's influence to style. It is the method or rather the manner of thinking of which that style is the garment which has in reality exercised influence on the world. Like all writers except Shakespeare, Montaigne thoroughly and completely exhibits the intellectual and moral complexion of his own time. When he reached manhood the French Renaissance (which was perhaps on the whole the most characteristic example of that phenomenon, the religious element being neither in excess as it was in England and Germany, nor in defect as it had been in Italy) was at high water, and the turn of the tide was beginning. Rabelais, who died when Montaigne was still in early manhood, exhibits the earlier and rising spirit, though he needs to be completed on the poetical side. The Renaissance had, as all revolts against authority must have, a certain sceptical element, but it was not at first by any means eminently sceptical. Despite the half ironical, half warning termination of *Pantagruel*, an immense confidence and delight, as of the invader of a promised land, fills the pages of Rabelais. He rejoices in his strength, in his knowledge, in his freedom, in the pleasures of the flesh and the spirit. With Montaigne begins the age of disenchantment. By the time at least when he began to meditate his essays in the retirement of his country house it was tolerably certain that no golden age was about to return. The Reformation had brought not peace but a sword, and the Calvinists were as intolerant as the Catholics. The revival of learning had, whatever its benefits, merely changed the outward guise of pedants instead of extirpating pedantry. The art of printing had multiplied rubbish as well as valuable matter. The discovery of America had brought ruin to the discovered, and disease and discord to the discoverers. The horrors of a disputed succession were already threatening France. These things were enough to make thoughtful men dubious about the blessings of progress and reform; but the extreme dissoluteness which characterized the private life of the time also brought about its natural result of satiety. Physical science had hardly yet emerged to occupy some active minds; scholasticism was dead, while Bacon and Descartes had not arisen; nothing like a theory of politics had been evolved, though Bodin and a few others were feeling after one. As the earlier Renaissance had specially occupied itself with the practical business and pleasures of life, so the later Renaissance specially mused on the vanity of this business and these pleasures. The predisposing circumstances which affected Montaigne were thus likely to incline him to scepticism, to ethical musings on the vanity of life and the like. But to all this there had to be added the peculiarity of his own temperament. This was a decidedly complicated one, and neglect of it has led some readers to adopt a more positive idea of Montaigne's scepticism than is fully justified by all the facts. The municipality of Rome has put up a tablet on the house occupied by Montaigne during his visit there, which speaks of him as a founder of the new philosophy." In Italian mouths at the present day this is equivalent to an assertion that Montaigne was an enemy of Christianity. No assumption can be more gratuitous or less borne out by the text of his works and the reasonable inferences to be drawn from them. The attitude which he assumed was no doubt ephectic and critical chiefly. He decorated his study at Montaigne with inscriptions (still, by dint of accidental preservation and restoration not accidental, legible there), most of which are of the most pessimist and sceptical character. Ecclesiastes, Ecclesiasticus, Horace, Lucretius, Sextus Empiricus, the fragments of the Greek dramatists and philosophers, are ransacked for epigraphs indicating the vanity of human reason, human wishes, human belief, human thoughts and actions of every kind. In one curious essay (if indeed it is to be called an essay), the "Apologie de Raymond Sebonde," he has apparently amused himself with gathering together, in the shape of quotations as well as of reflections, all that can be said against certainty in æsthetics as well as in dogmatics. But the general tenor of the essays is in complete contrast with this sceptical attitude, at least in its more decided form, and it is worth notice that the motto "Que scai-je?" does not appear on the title page till after the writer's death. The general disposition, moreover, manifested in these famous writings is very far from being determinedly Pyrrhonist or despairingly misanthropic. Montaigne is far too much occupied about all sorts of the minutest details of human life to make it for a moment admissible that he regarded that life as a whole but as smoke and vapour. He is much too curious of the varieties of belief, and too keenly interested in following them out, to leave himself in peril of the charge that all belief was to him a matter of indifference. The reason of the misapprehension of him which is current is due very mainly to the fact that he was eminently a humorist in the midst of a people to whom, since his time, humour has been nearly unknown. But there is more than this. The humorist as a recog-

nized genus almost always passes into the satirist. The temper which has been admirably defined as thinking in jest while feeling in earnest naturally throws itself into opposition, though it may not always take the irreconcilable form of the opposition of Swift. Perhaps the only actual parallel to Montaigne in literature is Lamb. There are differences between them, arising naturally enough from differences of temperament and experience; but both agree in their attitude—an attitude which is sceptical without being negative, and humorist without being satiric. There is hardly any writer in whom the human comedy appears treated with such completeness as it is in Montaigne. There is discernible in his essays no attempt to map out a complete plan, and then to fill up its outlines. But in the desultory and haphazard fashion which distinguishes him there are few parts of life on which he does not touch. The exceptions are chiefly to be found in the higher and more poetical strains of feeling to which the humorist temperament lends itself with reluctance and distrust, though it by no means excludes them. The French disposition, by a change which has never been sufficiently accounted for, and of which the most accurate examination of documents fails fully to detect the reason, had become, after being strongly idealist in the earlier Middle Ages, absolutely positive in the later, and from this positiveness it has never since quite freed itself. This positiveness is already noticeable in Rabelais; it becomes more noticeable still in Montaigne. He is always charming, but he is rarely inspiring, except in a very few passages where the sense of vanity and nothingness possesses him with unusual strength. As a general rule, an agreeable grotesque of the affairs of life (a grotesque which never loses hold of good taste sufficiently to be called burlesque) occupies him. There is a kind of anticipation of the scientific spirit in the careful zeal with which he picks up odd aspects of mankind, and comments upon them as he places them in his museum. Such a temperament is most pleasantly shown when it is least personal. The letter to the Bordeaux jurats does not, as has been said, show Montaigne in his best light, nor does another letter to his wife, in which he condescends with her on the death of one of their children in a strain which must have drawn from any woman of sensibility and spirit a torrent of indignant tears. But what is almost offensive in immediate and private relationships becomes not only tolerable but delightful in the impersonal and irresponsible relationship of author to reader. A dozen generations of men have rejoiced in the gentle irony with which Montaigne handles the *Iudicium humani sæculi*, in the quaint felicity of his selection of examples, and in the real though sometimes fantastic wisdom of his comment on his selections.

Montaigne did not very long survive the completion of his book. His sojourn at Paris for the purpose of getting it printed was by no means uneventful, and on his way he stayed for some time at Blois, where he met De Thou. In Paris itself he had a more disagreeable experience, being for a short time committed to the Bastille by the Leaguers, as a kind of hostage, it is said, for a member of their party who had been arrested at Rouen by Henry of Navarre. But he was in no real danger. He was well known to and favoured by both Catherine de' Medici and the Guises, and was very soon released. In Paris, too, at this time he made a whimsical but pleasant friendship. Marie le Jars, Demoiselle de Gournay, one of the most learned ladies of the 16th and 17th centuries, had conceived such a veneration for the author of the *Essays* that, though a very young girl and connected with many noble families, she travelled to the capital on purpose to make his acquaintance. He gave her the title of his "fille d'alliance" (adopted daughter), which she bore proudly for the rest of her long life. She lived far into the 17th century, and became a character and something of a laughing-stock to the new generation; but her services to Montaigne's literary memory were, as will be seen, great. Of his other friends in these later years of his life the most important were Étienne Pasquier and Pierre Charron. The latter, indeed, was more than a friend, he was a disciple; and Montaigne, just as he had constituted Mademoiselle de Gournay his "fille d'alliance," bestowed on Charron the rather curious compliment of desiring that he should take the arms of the family of Montaigne. It has been thought from these two facts, and from an expression in one of the later essays, that the marriage of his daughter Léonore had not turned out to his satisfaction. But family affection, except towards his father, was by no means Montaigne's strongest point.

Not much is known of him in these later years, and indeed, despite the laborious researches of many biographers, of whom one, Dr Payen, has never been excelled in persevering devotion, it cannot be said that the amount of available information about Montaigne is large at any time of his life. It would seem that the essayist had returned to his old life of study and meditation and working up his *Essays*. No new ones were found after his death, but many alterations and insertions. His various maladies grew worse; yet they were not the direct cause of his death. He was attacked with quinsy, which rapidly brought about paralysis of the tongue, and he died on the 11th of September 1592, under circumstances which, as Pasquier reports them, completely disprove any intention, at least on his part, of displaying anti-Christian or anti-Catholic leanings. Feeling himself on the point of death, he summoned divers of his friends and neighbours to his chamber, had mass said before him, and endeavoured to raise himself and assume a devotional attitude at the elevation of the host, dying almost immediately afterwards. He was buried, though not till some months after his death, in a church in Bordeaux, which after some vicissitudes became the chapel of the Collège. During the Revolution the tomb and, as it was supposed, the coffin were transferred with much pomp to the town museum; but it was discovered that the wrong coffin had been taken, and the whole was afterwards restored to its old position. Montaigne's widow survived him, and his daughter left posterity which became merged in the noble houses of Ségur and Lur-Saluces. But it does not appear that any male representative of the family survived, and the chateau is not now in the possession of any descendant of it.

When Mademoiselle de Gournay heard of the death of Montaigne she undertook with her mother a visit of ceremony and condolence to the widow, which had important results for literature. Madame de Montaigne gave her a copy of the edition of 1588, annotated copiously; at the same time, apparently, she bestowed another copy, also annotated by the author, on the convent of the Feuillants in Bordeaux, to which the church in which his remains lay was attached. Mademoiselle de Gournay thereupon set to work to produce a new and final edition with a zeal and energy which would have done credit to any editor of any date. She herself worked with her own copy, inserting the additions, marking the alterations, and translating all the quotations. But when she had got this to press she sent the proofs to Bordeaux, where a poet of some note, Pierre de Brach, revised them with the other annotated copy. The edition thus produced has with justice passed as the standard even in preference to those which appeared in the author's lifetime. Unluckily, Mademoiselle de Gournay's original does not appear to exist, and her text was said, until the appearance of MM. Courbet and Royer's edition, to have been somewhat wantonly corrupted, especially in the important point of spelling. The Feuillants copy is in existence, being the only manuscript or partly manuscript authority for the text. It was edited in 1803 by Nageon, the disciple of Diderot; but, according to later inquiries, considerable liberties were taken with it. The first edition of 1580, with the various readings of two others which appeared during the author's lifetime, was reprinted by MM. Dezimeris and Burckhausen. Hitherto the edition of Le Clerc (3 vols., Paris, 1826-28) and in a more compact form that of Louandre (4 vols., Paris, 1854) have been the most useful. The edition, however, of MM. Courbet and Royer, which is based on that of 1595, will undoubtedly be the standard; but, though the text is complete (Paris, Lemerre, 1873-1877), the fifth volume, containing the biography and all the editorial apparatus, has unluckily yet (1883) to make its appearance. The editions of Montaigne in France and elsewhere, and the works upon him during the past three centuries, are innumerable. His influence upon his successors has already been hinted at, and cannot here be traced in detail. In one case, however,—that of Pascal—it is of sufficient importance to deserve mention. Pascal, who has left a special discourse on Montaigne, was evidently profoundly influenced by him, and the attitude towards his teacher is an interesting one. The sceptical method of the essayist is at once tempting and terrible to him. He accepts it in so far as it demolishes the claims of human reason and heathen philosophy, but evidently dreads it in so far as it is susceptible of being turned against religion itself. In England Montaigne was early popular. It was long supposed that the autograph of Shakespeare in a copy of Florio's translation showed his study of the *Essays*. The autograph has been disputed,

but divers passages, and especially one in *The Tempest*, show that at first or second hand the poet was acquainted with the essayist. Towards the latter end of the 17th century, Cotton, the friend of Isaac Walton, executed a complete translation, which, though not extraordinarily faithful, possesses a good deal of rough vigour. It has been frequently reprinted with additions and alterations. The most noteworthy critical handling of the subject in English is unquestionably Emerson's in *Representative Men*. (G. SA.)

MONTALEMBERT, CHARLES FORBES DE (1810-1870), historian, was born on 29th May 1810. The family was a very ancient one, belonging to Poitou, or rather to Angoumois. Direct descent is said to be provable to the 13th century, and charters and other documents carry the history of the house two centuries further back. For some generations before the historian the family had been distinguished, not merely in the army, but for scientific attainments. Montalembert's father, René, emigrated, fought under Condé, and subsequently served in the English army. He married a Miss Forbes, and his eldest son Charles was born at London. At the Restoration René de Montalembert returned to France, was raised to the peerage in 1819, and became ambassador to Sweden (where Charles received much of his education) in 1826. He died a year after the overthrow of the legitimate monarchy. Charles de Montalembert was too young to take his seat as a peer (twenty-five being the necessary age), but he retained other rights; and this, combined with his literary and intellectual activity, made him a person of some importance. He had eagerly entered into the somewhat undefined plans of Lamennais and Lacordaire for the establishment of a school of Liberal Catholicism, and he co-operated with them, both in the *Avenir* (see LAMENNAIS, vol. xiv. pp. 239, 240) and in the practical endeavour, which absorbed some of the best energies of France at the time, to break through the trammels of the system of state education. This latter scheme first brought Montalembert into notice, as he was formally charged with unlicensed teaching. He claimed the right of trial by his peers, and made a notable defence, of course with a deliberate intention of protest. His next most remarkable act was his participation in the famous pilgrimage to Rome of his two friends. This step, as is well known, proved useless to mitigate the measures which private intrigues, and perhaps a not altogether injudicious instinct, prompted the Roman curia to take against the *Avenir* and the doctrines of its promoters. Montalembert, however, submitted dutifully to the encyclical of June 1835, and only devoted himself more assiduously to the work on which he was engaged, the *Life of St Elizabeth of Hungary*. This appeared in 1836. It displayed Montalembert's constant literary characteristics, and, though inferior to *Les Moines d'Occident* in research and labour, is perhaps superior to it as a work of art. The famous speech by which Montalembert is best known,—"Nous sommes les fils des croisés et jamais nous ne reculerons devant les fils de Voltaire", expresses, or at least indicates, his attitude not insufficiently. He was an ardent student of the Middle Ages, but his mediæval enthusiasm was strongly tinged with religious sentiment, and at the same time by no means connected with any affection for despotism. Montalembert still clung to his early liberalism, and he made himself conspicuous during the reign of Louis Philippe by his protests against the restrictions imposed on the liberty of the press, besides struggling for freedom in national education. The party which he represented, or rather which he strove to found, was by no means wholly Legitimist at heart, and at the downfall of Louis Philippe Montalembert had no difficulty in accepting the republic and taking, when elected, a seat in the assembly. He had not a little to do with the support given by France to the pope. As he had accepted the republic, he was not disinclined to accept the empire; but the measures which

followed the *coup d'état* disgusted him, though he still sat in the chamber. A defeat in 1857 put an end to his parliamentary appearances. He was still, however, recognized as one of the most formidable of the moderate opponents of the empire, and he was repeatedly prosecuted for anti-imperialist letters and pamphlets. In the ten years between 1840 and 1850 he had written little but political pamphlets, but after the establishment of the empire, and especially after he lost his seat in the chamber, he became more prominent as an author. Even before this he had produced a volume on the *Avenir Politique de l'Angleterre* (1855), and another on *Pie IX. et Lord Palmerston* (1856), besides numerous articles and pamphlets, the chief of which were perhaps *Une Nation [Poland] en Deuil*, and *L'Église Libre dans l'État Libre*.

His great work, the fruit of many years' labour, did not appear till he was fifty years old, and ten years before his death, which occurred before its completion. *Les Moines d'Occident depuis St Benoît jusqu'à St Bernard* has some of the peculiar drawbacks which have characterized almost all historical work of any literary pretensions during the present generation. It is planned on too large a scale, and executed with too much regard to profusion of picturesque detail and abundance of fluent argument on points which the writer has at heart. Its best passages are inferior to the best of a younger writer of very different opinions though not dissimilar style and temperament—M. Ernest Renan; but it is a work of great interest and value.

Montalembert, who had married Mademoiselle de Merode, sister of one of Pius IX.'s ministers, but who had no male offspring, died in March 1870, the year so fatal to France. His health had long been very bad, and was understood to have suffered from the chagrins attending his exclusion from political life and the defeat of most of his plans. Since his death his works have appeared in a complete edition. They have, regarded from the literary point of view, many of the faults of their time. A voluminous and vigorous writer, Montalembert was more of a journalist, a pamphleteer, and an orator than of a man of letters properly so called. His talents were diffused rather than concentrated, and they were much occupied on merely ephemeral topics. But of picturesque eloquence in a fluent and rather facile kind he was no inconsiderable representative.

MONTALVAN, JUAN PEREZ DE (1602-1638), Spanish dramatist and writer of fiction, was the son of the king's bookseller, and was born at Madrid in 1602. At the early age of seventeen he became a licentiate in theology, and in 1626, after entering the priesthood, he received a notarial appointment in connexion with the Inquisition. His overtaxed brain succumbed under the numerous literary labours he imposed on it, and he died when only thirty-six years old (25th June 1638).

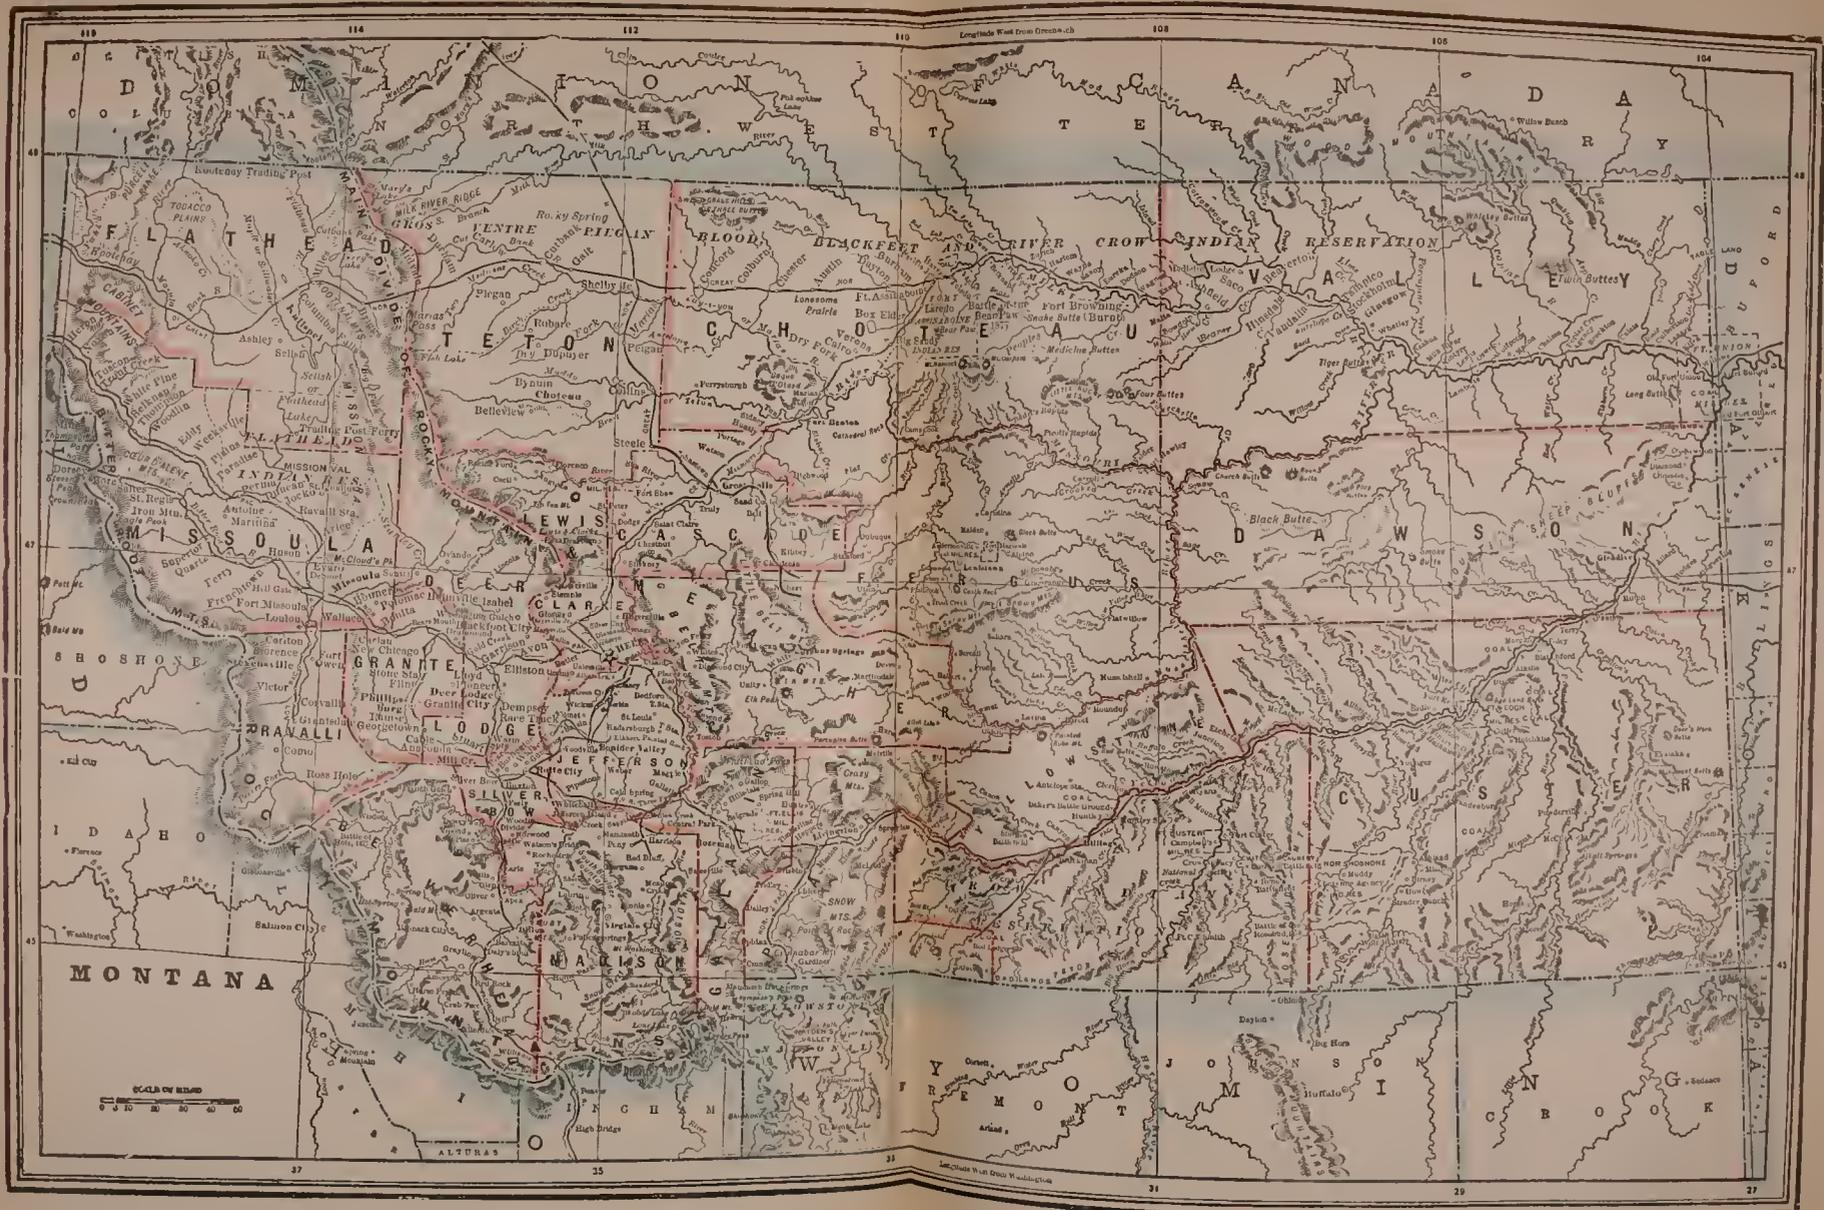

In 1624 he published eight prose tales (*Sucesos y prodigios en amor, en ocho novelas ejemplares*), one of which, "The Disastrous Friendship," has been characterized by Ticknor as one of the best in the language. This, as well as a subsequent volume of stories (*Para todos: Ejemplos morales, humanos y divinos*, 1633), was frequently reprinted. His last prose writing was a popular panegyric on his lately deceased friend and master Lope de Vega (*Epitafio póstumo de Lope de Vega*, 1638), whom he almost rivalled in dramatic productiveness, and whose conventional manner, flimsiness in construction, and carelessness in execution he too closely followed. The first volume of his collected *Comedias* appeared in 1638, the second in 1639. On the Spanish stage they were in great request, and Montalvan's repute led inferior writers in some cases to borrow his name. His dramas are distinctly superior to his "Antos sacramentales," but even of the former the tragedy *Los Amantes de Teruel* is the only one that has enjoyed permanent popularity. See Ticknor, *Hist. of Span. Lit.*, vol. ii. (1863).

MONTANA, one of the north-western Territories of the United States, is limited on the N. by British Columbia, on the E. by Dakota, on the S. by Wyoming and Idaho, and on the W. by Idaho. Its boundaries, as established

by statute, are as follows:—on the N., the 49th parallel; on the E., the 27th meridian west of Washington, or the 104th west of Greenwich; on the S. and W. the boundary follows the 45th parallel from the 27th meridian west to the 34th meridian west, then turns south along the latter meridian to its point of intersection with the continental watershed, thence along the crest-line of this watershed westward and north-westward until it reaches the Bitter-root Mountains; it then follows the crest of this range north-westward to the point where it is crossed by the 39th meridian west, which it follows north to the line of British Columbia. The total area is about 146,080 square miles—an approximate estimate, as the boundary along the continental watershed and the Bitter-root Mountains has not been exactly surveyed. The average elevation above sea-level has been estimated at 3900 feet.

Topographically, Montana may be separated into two great divisions—that of the plains comprising the eastern two-thirds, and that of the mountains comprising the western portion. The former, a monotonous rolling expanse, broken only by the beds of the few streams which traverse it, and by a few small groups of hills, extends over nine degrees of longitude in a gentle uniform slope, rising from 2000 feet above the sea at the eastern boundary to 4000 at the base of the Rocky Mountains. Except along the streams and upon the scattered groups of hills, this section is entirely devoid of forest-growth of any kind. Vegetation is limited to the bunch grasses, artemisia, and cacti. The grasses are the most abundant and luxuriant near the mountains, where the rainfall is greatest. The mountain section, comprising the western third of the Territory, is composed, in general terms, of a succession of ranges and valleys running very uniformly somewhat in a north-west and south-east direction. The mountains vary in height from 8000 to 10,000, even in isolated cases reaching 11,000 feet, with mountain-passes 6000 to 8000 feet above the sea. Towards the north the ranges become almost continuous, forcing the streams into long and circuitous courses in order to disentangle themselves from the maze of mountains, while, on the other hand, the ranges of the south-western part of the Territory are much broken, affording numerous low passes and water-gaps.

In the mountainous part of the Territory are the headwaters of the Missouri (Atlantic basin) and Clark's Fork of the Columbia (Pacific basin). The former rises in the south-west of the territory in three large branches, the Jefferson, Madison, and Gallatin, which meet at the foot of the Gallatin valley at a point known as the "Three Forks of the Missouri." Here the Missouri is a good-sized stream, fordable with difficulty even when the current is lowest. From this point to its mouth navigation is possible when the stream is not below its mean height; it is interrupted only at the Great Falls of the Missouri, near Fort Benton, above which, however, it is practically little used for navigation. Its other principal tributaries in its upper course are the Sun, Teton, Marias, Mnsshell, and Milk rivers, all of which vary much in size with the season,—the last two being nearly or quite dry near their mouths in the fall of the year. The Yellowstone, one of the most important tributaries of the Missouri, has nearly all its course in Montana, and is navigable for small steamers as far as the Crow Agency, except when the water is low. Clark's Fork of the Columbia is formed by the junction of the Flathead and the Missoula or Hellgate river. The former rises in the mountains of British Columbia and flows nearly south through Flathead Lake to its point of junction with the Missoula. The latter rises opposite the Jefferson river and flows north-westward, receiving on its way several large affluents. Below the point of junction of these streams, Clark's Fork flows north-west along the

base of the Bitter-root Mountains into Idaho. This stream is very rapid, and is not navigable. Its course, as well as those of most of its tributaries, passes through narrow valleys, the surrounding country being well watered and covered with dense forests of *Conifera*.

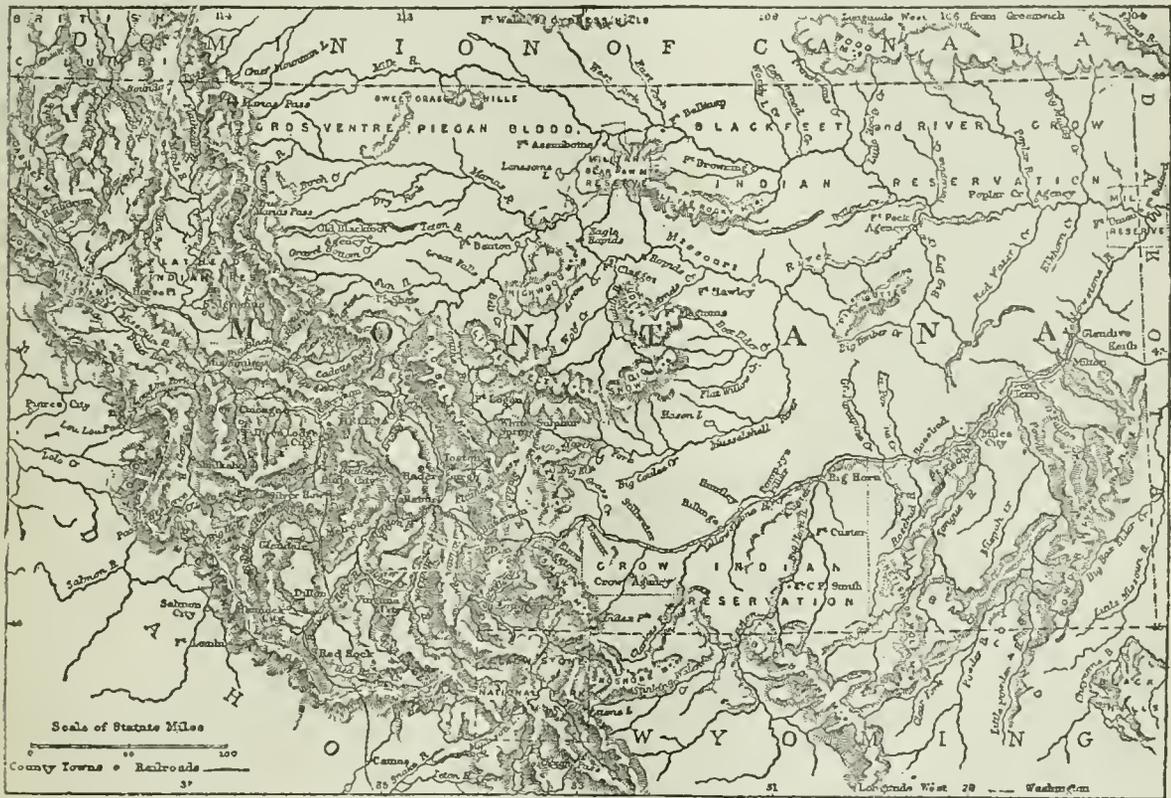

Geology.—Most of the mountain area belongs to the Eozoic and Silurian formations. Along the base of the mountains is a Triassic belt of variable width. Succeeding this is a broad area of nearly horizontal Cretaceous beds, followed by the Tertiary formation, which covers nearly one-third of the Territory. These recent formations are interrupted here and there by volcanic upheavals.

Climate.—The climate of Montana differs almost as greatly in different parts of the Territory as that of California. In the north-west it resembles that of the Pacific coast. The westerly winds blowing off the Pacific do not meet with as formidable a barrier as farther south, and consequently are not chilled, or deprived of so large a proportion of their moisture. The result is that the north-western portion of Montana enjoys a mild temperature and a rainfall sufficient for the needs of agriculture. The valleys of the Kootenai, Flathead, Missoula, and Bitter-root can be cultivated without irriga-

tion with little danger of loss from drought. Farther east and south the rainfall decreases. In the valleys of the upper Missouri, the Jefferson, Madison, Gallatin, and the upper Yellowstone irrigation is almost everywhere required, as well as over the broad extent of the plains. Over most of the Territory the rainfall ranges from 10 to 15 inches annually; in the north-western corner it rises to 25.

The general temperature is comparatively mild for the latitude, the elevation above the sea being decidedly less than that of the average of the Rocky Mountain region. The mean annual temperature ranges from 40° to 50° Fahr., but the variations are very great and violent. Frosts and snowstorms are possible during every month of the year, so that agriculture and stock-raising are more or less hazardous. On the other hand, the ordinary extremes of temperature are not so great as in more arid portions of the country.

Forests.—Throughout the Territory, as everywhere else in the Cordilleran region, forests follow rainfall. The plains are treeless; the mountain valleys about the heads of the Missouri are clothed only with grass and artemisia, many localities extending to a considerable height up the mountains, which are themselves timbered, though not heavily. In the north-western part, roughly defined as the drainage area of Clark's Fork, where the rainfall is somewhat greater, the forests become of importance. The mountains are forest-

Sketch Map of Montana Territory.

clad from summit to base; and the narrower valleys are also covered, while the timber is of larger size and of much greater commercial value than elsewhere in the Territory,—the valuable timber consisting entirely of the various species of *Conifera*, pine, fir, cedar, &c. Of the broad-leaved species, willow, aspen, and cotton-wood are abundant.

Fauna.—The native fauna is not sharply distinguished from that of neighbouring States and Territories. The higher latitude is, however, indicated by the relatively greater abundance of species favouring a colder climate. The moose and the Rocky Mountain goat, though by no means abundant, still frequent chosen haunts in the mountains,—the former in the cool marshy valleys, the latter upon the most rugged inaccessible elevations. The black-tailed and mule deer, the antelope, elk, and mountain sheep are abundant, and the bison still ranges the plains, though in sadly reduced numbers. Among *Carnivora*, the black and grizzly bears, mountain lion, lynx, wild cat, and several species of wolves are still plentiful.

Agriculture and Industry.—Agriculture is dependent in most parts of Montana upon the supply of water furnished by the streams. Owing to this fact it is probable that not more than 8 per cent. of the total area of the Territory can ever, even under the most economical distribution of the water-supply, be brought under cultivation. In the drainage area of Clark's Fork are

several fine valleys containing a considerable extent of arable land, such as those of the Missoula, Bitter-root, Deer Lodge, Jocko, and Flathead. Upon the head-waters of the Missouri is also a large extent of arable land. The valleys of the Jefferson and Madison also deserve mention. Along the eastern base of the mountains, near the head-waters of the Sun, Teton, and Marias rivers, are considerable areas susceptible of irrigation. Below the Forks the Missouri flows for 75 miles through a broad valley, much of which can be irrigated; below Fort Benton, however, the bluffs become higher and close in on the river. The Yellowstone, also, after leaving the mountains, flows through a similar kind of valley, which extends with a few minor breaks down to the point where the river turns from an east to a north-east course, when it enters a country of *mauvaises terres*, which, except as a mausoleum of fossil remains, is utterly valueless.

Owing to the comparatively isolated position of the Territory, agricultural pursuits have been limited by the demands of home consumption. The census of 1880 reported the area in farms to consist of 405,683 acres, with an average of 267 acres to each farm. The whole is less than one-half per cent. of the entire area of the Territory. The improved land is reported as amounting to 262,611 acres. The following are the amounts of the principal agricultural products:—wheat, 469,688 bushels; maize, 5639 bushels; oats,

900,915 bushels; barley, 39,970 bushels; hay, 63,947 tons; wool, 993,484 pounds;—value of all farm products, \$2,024,923. The live-stock interest is large, and is increasing rapidly. The great extent of pasture afforded by the plains and the broad valleys of the mountains would seem to promise an almost unlimited extension of this industry in the future. Both cattle and sheep owners, however, labour under disadvantages as compared with the owners farther south. The lower temperature and heavier snows, and particularly the danger of great extremes of temperature, require that provision of shelter and food be made for a part or all of the winter season, otherwise the ranchman runs the risk of occasional severe losses. The census of 1880 furnishes the following statistics of live-stock:—horses, 35,114; mules and asses, 858; working oxen, 936; milch cows, 11,308; other cattle, 160,143; sheep, 184,277; swine, 10,278;—total value of live-stock, \$5,151,554.

In mineral production Montana has never taken a leading place, although in the early days some of the placer ground yielded well. The rich placers of Little Prickly Pear, Bannack, and Alder Gulch were quickly exhausted. The produce of the latter has been reported variously at from \$25,000,000 to \$40,000,000, the greater part of which was extracted in a few months. In the year 1879-80 \$1,805,767 worth of gold and \$2,905,068 of silver were extracted, about three-fourths from deep mines and one-fourth from placers. For the year 1882 the total mineral production is reported at \$8,004,000, of which about \$1,000,000 was for copper and lead.

Population.—Owing largely to its remote position the population as well as the material prosperity of Montana have had a slow growth in comparison with other more favoured portions of the west. The population in 1880, as reported by the census, was 39,159 (28,177 males, and 10,982 females),—an increase of 90·1 per cent. over that in 1870. There were 27,638 natives, and 11,521 of foreign birth, while 35,385 were whites, 346 negroes or of mixed negro blood, 1765 Chinese, and 1663 citizen Indians. By far the greater portion of the population is found in the western half, upon the head-waters of the Missouri and Clark's Fork. The eastern half is as yet but very sparsely settled, and probably it will never sustain more than a small population.

The Territory is divided into eleven counties, which, with their population in 1880, were the following:—Beaverhead, 2712; Choteau, 3058; Custer, 2510; Dawson, 180; Deer Lodge, 8876; Gallatin, 3643; Jefferson, 2464; Lewis and Clark, 6521; Madison, 3915; Meagher, 2743; Missoula, 2537. The principal settlements are—Helena, the capital (3624); Butte, a mining town (3363); and Bozeman, in the Gallatin valley upon the Northern Pacific Railway, which in 1880 had a population of 894 and has probably double that number at present (1883).

The total number of Indians in Montana is estimated by the Indian office at 19,764. These are nominally congregated at five agencies, although in reality they roam over the entire Territory. They are of various tribes, the principal of which are the Sioux, Crow, Blackfoot, Gros Ventre, Assinaboine, and Pend' d'Oreille. Their reservations cover more than one-third of the Territory.

Government and Finance.—The government of Montana is similar to that of the other Territories. The governor, secretary, chief justice, and two associate justices are appointed by the president of the United States. The treasurer, auditor, and superintendent of public instruction are elected by the people of the Territory, as are also the members of the two houses of the legislature. Montana is represented in Congress by a delegate, also elective, who has liberty to take part in debate but has no vote. The Territorial debt at the close of 1881 was but \$70,000. The amount raised by Territorial taxation was \$93,211.

History.—The Montana country was originally acquired by the United States under the Louisiana purchase. It became successively a part of Louisiana Territory, of Missouri Territory, of Nebraska Territory, and of Dakota. On 26th May 1864 it was organized under a Territorial government of its own, with practically its present boundaries. The exploration of this region commenced with the celebrated expedition of Lewis and Clark in 1803-1806. Between 1850 and 1855 it was traversed and mapped by a number of exploring parties, having in view the selection of trans-continental railroad routes. Since then numberless expeditions have examined it, and some systematic topographic work has been done under different branches of the United States Government. The first settlers entered the Territory in 1861, discovered placer gold on Little Prickly Pear Creek, and shortly after built the city of Helena. Later, the placers at Bannack were discovered, and a small "rush" to the Territory commenced. In 1863 the rich placers at Alder Gulch were brought to view, and miners and adventurers swarmed in from all parts. Then it was that the early social history of California was repeated on a smaller scale in Montana. The lawless elements assumed control, and for many months neither life nor property was safe. Indeed, for a time the community was in a state of blockade; no one with money in his possession could get out of the Territory. Finally, the citizens organized a "Vigilance Committee" for self-preservation, took the offensive, and after a short sharp struggle rid the community of its disturbing elements. After the exhaustion of the placers, the population decreased, owing

to the migration of the floating mining class; but their place was soon taken by more permanent settlers.

(H. G*.)

MONTANISM is a somewhat misleading name for the movement in the 2d century which, along with Gnosticism, occupied the most critical period in the history of the early church. It was the overthrow of Gnosticism and Montanism that made the "Catholic" church. The credit of first discerning the true significance of the Montanistic movement belongs to Ritschl.¹

In this article an account will be given of the general significance of Montanism in relation to the history of the church in the 2d century, followed by a sketch of its origin, development, and decline.

1. From the middle of the 2d century a change began to take place in the outward circumstances of Christianity. The Christian faith had hitherto been maintained in a few small congregations scattered over the Roman empire. These congregations were provided with only the most indispensable constitutional forms, neither stricter nor more numerous than were required by a religious bond resting on supernatural expectations, strict discipline, and brotherly love ("Corpus sumus de conscientia religionis, de unitate disciplinæ, de spei fœdere"). This state of things passed away. The churches soon found numbers within their pale who stood in need of supervision, instruction, and regular control. The enthusiasm for a life of holiness and separation from the world, the eager outlook for the end of the world, the glad surrender to the gospel message, were no longer the influences by which all minds were swayed. In many cases sober convictions or submissive assent supplied the want of spontaneous enthusiasm. There were many who did not *become*, but who *were*, and therefore remained, Christians,—too powerfully attracted by Christianity to abandon it, and yet not powerfully enough to have adopted it for themselves. Then, in addition to this, social distinctions asserted themselves amongst the brethren. Christians were already found in all ranks and occupations—in the imperial palace, among the officials, in the abodes of labour and the halls of learning, amongst slaves and freemen. Were all these to be left in their callings? Should the church take the decisive step into the world, consent to its arrangements, conform to its customs, acknowledge as far as possible its authorities, and satisfy its requirements? Or ought she, on the other hand, to remain, as she had been at first, a society of religious devotees, separated and shut out from the world by a rigorous discipline and working on it only through a direct propaganda? This was the dilemma that the church had to face in the second half of the 2d century: either she must commence a world-wide mission in the comprehensive sense by an effective entrance into Roman society—renouncing, of course, her original peculiarities and exclusiveness; or, retaining these peculiarities and clinging to the old modes of life, she must remain a small insignificant sect, barely intelligible to one man in a thousand, and utterly incapable of saving and educating nations. That this was the question at issue ought to be obvious enough to us now, although it could not be clearly perceived at the time. It was natural that warning voices should then be raised in the church against secular tendencies, that the well-known counsels about the imitation of Christ should be held up in their literal strictness before worldly Christians, that demands should be made for a restoration of the old discipline and severity, and for a return to apostolic simplicity and purity. The church as a whole, however, under pressure of circumstances rather than by a spontaneous impulse, decided otherwise. She marched through the open door into the Roman state, and settled

¹ *Entstehung der Altkatholischen Kirche*. 2d ed., Bonn, 1857.

down there for a long career of activity, to Christianize the state along all its thoroughfares by imparting to it the word of the gospel, but at the same time leaving it everything except its gods. On the other hand, she furnished herself with everything of value that could be taken over from the world without overstraining the elastic structure of the organization which she now adopted. With the aid of its philosophy she created her new Christian theology; its polity furnished her with the most exact constitutional forms; its jurisprudence, its trade and commerce, its art and industry, were all taken into her service; and she contrived to borrow some hints even from its religious worship. Thus we find the church in the 3d century endowed with all the resources which the state and its culture had to offer, entering into all the relationships of life, and ready for any compromise which did not affect the confession of her faith. With this equipment she undertook, and carried through, a world-mission on a grand scale. But what of those believers of the old school who protested in the name of the gospel against this secular church, and who wished to gather together a people prepared for their God regardless alike of numbers and circumstances? Why, they joined an enthusiastic movement which had originated amongst a small circle in a remote province, and had at first a merely local importance. There, in Phrygia, the cry for a strict Christian life was reinforced by the belief in a new and final outpouring of the Spirit,—a coincidence which has been observed elsewhere in church history, as, for instance, in the Irvingite movement. The wish was, as usual, father to the thought; and thus societies of "spiritual" Christians were formed, which served, especially in times of persecution, as rallying-points for all those, far and near, who sighed for the end of the world and the *excessus e sæculo*, and who wished in these last days to lead a holy life. These zealots hailed the appearance of the Paraclete in Phrygia, and surrendered themselves to his guidance. In so doing, however, they had to withdraw from the church, to be known as "Montanists," or "Kataphrygians," and thus to assume the character of a sect. Their enthusiasm and their prophesying were denounced as demoniacal; their expectation of a glorious earthly kingdom of Christ was stigmatized as Jewish, their passion for martyrdom as vainglorious, and their whole conduct as hypocritical. Nor did they escape the more serious imputation of heresy on important articles of faith; indeed, there was a disposition to put them on the same level with the Gnostics. The effect on themselves was what usually follows in such circumstances. After their separation from the church, they became narrower and pettier in their conception of Christianity. The strict rules of conduct which in a former age had been the genuine issue of high-strung religious emotion were now relied on as its source. Their asceticism degenerated into legalism, their claim to a monopoly of pure Christianity made them arrogant. As for the popular religion of the larger church, they scorned it as an adulterated, manipulated Christianity. But these views found very little acceptance in the 3d century, and in the course of the 4th they died out. Regardless of the scruples of her most conscientious members, and driving the most earnest Christians into secession and the conventicle, the church went on to prosecute her great mission in the world. And before she was able, as church of the state and of the empire, to call in the aid of the civil power to suppress her adversaries the Montanistic conventicles were almost extinct.

2. Such is, in brief, the position occupied by Montanism in the history of the ancient church. The rise and progress of the movement were as follows.

At the close of the reign of Antoninus Pius—probably in the year 156 (Epiphanius)—Montanus appeared at

Aradaban in Phrygia, bringing revelations of the "Spirit" to Christendom. It is unnecessary to seek an explanation of his appearance in the peculiarities of the Phrygian temperament. The Christian churches had always held that prophecy was to be continued till the return of Christ, although, as a matter of fact, prophets had not been particularly numerous. Montanus claimed to have a prophetic calling in the very same sense as Agabus, Judas, Silas, the daughters of Philip, Quadratus, and Ammia, or as Hermas at Rome. At a later time, when the validity of the Montanistic prophecy was called in question in the interest of the church, the adherents of the new movement appealed explicitly to a sort of prophetic succession, in which their prophets had received the same gift which the daughters of Philip, for example, had exercised in that very country of Phrygia. The burden of the new prophecy was a more exacting standard of moral obligations, especially with regard to marriage, fasting, and martyrdom. But Montanus had larger schemes in view. He wished to organize a special community of true Christians to wait for the coming of their Lord. The small Phrygian towns of Pepusa and Tymion were selected as the headquarters—the Jerusalem, as the prophet called them—of his church. He spared no effort to accomplish this union of believers. Funds were raised for the new organization, and from these the leaders and missionaries, who were to have nothing to do with worldly life, drew their pay. But the ecstasy of the prophet did not prove so contagious as his preaching. Only two women, Prisca and Maximilla, were moved by the Spirit; like Montanus, they uttered in a state of frenzy the commands of the Spirit, which spoke through them sometimes as God the Father, sometimes as the Son, and urged men to a strict and holy life. This does not mean that visions and significant dreams may not have been of frequent occurrence in Montanistic circles. But, as chosen and permanent organs of the Paraclete, only three persons were recognized—Montanus, Prisca, and Maximilla; by their side, however, Alcibiades and Theodotus, from a very early date, played an active part as missionaries and organizers.

For twenty years this agitation appears to have been confined to Phrygia and the neighbouring provinces. How could it be otherwise? To assemble the whole of Christendom at Pepusa was a rather impracticable proposal. But after the year 177 a persecution of Christians, from some unexplained causes, broke out simultaneously in many provinces of the empire. Now in these days every persecution was regarded as the beginning of the end. It quickened the conscience, and gave more strength to eschatological hopes; it was a call to observe the signs of the times and the intimations of God's presence. It would seem that before this time Montanus had disappeared from the scene; but Maximilla, and probably also Prisca, were working with redoubled energy. And now, throughout the provinces of Asia Minor, in Rome, and even in Gaul, amidst the raging of persecution, attention was attracted to this remarkable movement. The desire for a sharper exercise of discipline, and a more decided renunciation of the world, combined with a craving for some plain indication of God's will in these last critical times, had prepared many minds for an eager acceptance of the tidings from Phrygia. There the Spirit, whom Christ had promised to His disciples, had begun His work; there, at least, there were holy Christians and joyful martyrs. The oracles of the Phrygian prophets became household words in distant churches, and it was always the more serious-minded who received them with undisguised sympathy. And thus, within the large congregations where there was so much that was open to censure in doctrine and constitution and morals, conventicles were formed in order

that Christians might prepare themselves by strict discipline for the day of the Lord.

Meanwhile in Phrygia and its neighbourhood—especially in Galatia, and also in Thrace—a controversy was raging between the adherents and the opponents of the new prophecy. Between 150 and 176 the authority of the episcopate had been immensely strengthened, and along with it a settled order had been introduced into the churches. It need hardly be said that, as a rule, the bishops were the most resolute enemies of the Montanistic enthusiasm. It disturbed the peace and order of the congregations, and threatened their safety. Moreover, it made demands on individual Christians such as very few could comply with. But the disputation which Bishops Zoticus of Cumana and Julian of Apamea arranged with Maximilla and her following turned out most disastrously for its promoters. The "spirit" of Maximilla gained a signal victory, a certain Themison in particular having reduced the bishops to silence. Sotas bishop of Anchialus attempted to refute Prisca, but with no better success; he too had to retire from the field in disgrace. These proceedings were never forgotten in Asia Minor, and the report of them spread far and wide. In after times the only way in which the discomfiture of the bishops could be explained was by asserting that they had been silenced by fraud or violence. This was the commencement of the excommunication or secession, whichever it may have been, of the Montanists in Asia Minor. "I am pursued like a wolf," exclaimed the spirit that spoke through Maximilla; and her admonitions about the end became more emphatic than ever—"After me there will come no other prophetess, but the end." Not only did an extreme party arise in Asia Minor rejecting all prophecy and the Apocalypse of John along with it, but the majority of the churches and bishops in that district appear (c. 178) to have broken off all fellowship with the new prophets, while books were written to show that the very form of the Montanistic prophecy was sufficient proof of its spuriousness.¹

In Gaul and Rome the prospects of Montanism seemed for a while more favourable. The confessors of the Gallican Church were of opinion that communion ought to be maintained with the zealots of Asia and Phrygia; and they addressed a letter to this effect to the Roman bishop, Eleutherus. Whether this is the bishop of whom Tertullian (*Adv. Prax.*, 1) relates that he was on the point of making peace with the churches of Asia and Phrygia—i.e., the Montanistic communities—is not certain; it was either he or his successor Victor. It is certain, at any rate, that there was a momentary vacillation, even in Rome. Nor is this to be wondered at. The events in Phrygia could not appear new and unprecedented to the Roman Church. If we may believe Tertullian, it was Praxeas of Asia Minor, the relentless foe of Montanism, who succeeded in persuading the Roman bishop to withhold his letters of conciliation.

Early in the last decade of the 2d century two considerable works appeared in Asia Minor against the Kataphrygians. The first, by a bishop or presbyter whose name is not known, is addressed to Abircius bishop of Hierapolis, and was written in the fourteenth year after the death of Maximilla, i.e., apparently about the year 193. The other was written by a certain Apollonius forty years after the appearance of Montanus, consequently about 196. From these treatises we learn that the adherents of the new prophecy were very numerous in Phrygia, Asia, and Galatia (Ancyra), that they had tried to defend them-

selves in writing from the charges brought against them (by Miltiades), that they possessed a fully-developed independent organization, that they could boast of many martyrs, and that they were still formidable to the church in Asia Minor. Many of the small congregations had gone completely over to Montanism, although in large towns, like Ephesus, the opposite party maintained the ascendancy. Every bond of intercourse was broken, and in the Catholic churches the worst calumnies were retailed about the deceased prophets and the leaders of the societies they had founded.

In many churches outside of Asia Minor a different state of matters prevailed. Those who accepted the message of the new prophecy did not at once leave the Catholic Church in a body. They simply formed small conventicles within the church; in many instances, indeed, their belief in the new prophecy may have remained a private opinion which did not affect their position as members of the larger congregation. Such, for example, appears to have been the case in Carthage (if we may judge from the Acts of the martyrs Perpetua and Felicitas) at the commencement of the persecution of Septimius Severus about the year 202. But even here it was impossible that an open rupture should be indefinitely postponed. The bishops and their flocks gave offence to the spiritualists on so many points that at last it could be endured no longer. The latter wished for more fasting, the prohibition of second marriages, a frank, courageous profession of Christianity in daily life, and entire separation from the world; the bishops, on the other hand, sought in every way to make it as easy as possible to be a Christian, lest they should lose the greater part of their congregations. The spiritualists would have excluded from the church every one who had been guilty of mortal sin; the bishops were at that time specially anxious to relax the stringency of the old disciplinary laws. And lastly, the bishops were compelled more and more to take the control of discipline into their own hands; while the spiritualists, appealing to the old principle that God alone can remit or retain sins, insisted that God Himself—i.e., the Spirit—was the sole judge in the congregation, and that therefore all proceedings must be conducted according to the directions of the prophets. On this point especially a conflict was inevitable. It is true that there was no rivalry between the new organization and the old, as in Asia and Phrygia, for the Western Montanists recognized in its main features the Catholic organization as it had been developed in the contest with Gnosticism; but the demand that the "organs of the Spirit" should direct the whole discipline of the congregation contained implicitly a protest against the actual constitution of the church. Even before this latent antagonism was made plain, there were many minor matters which were sufficient to precipitate a rupture in particular congregations. In Carthage, for example, it would appear that the breach between the Catholic Church and the Montanistic conventicle was caused by a disagreement on the question whether or not virgins ought to be veiled. For nearly five years (202-207) the Carthaginian Montanists strove to remain within the church, which was as dear to them as it was to their opponents. But at length they quitted it, and formed a congregation of their own, declaring that the Catholic Church was henceforth only a body of "psychic" Christians, because she would not acknowledge the Spirit whom God had at last poured out on His people.

It was at this juncture that Tertullian, the most famous theologian of the West, left the church of which he had been the most loyal son and the most powerful supporter, and whose cause he had so manfully upheld against pagans and heretics. He too had come to the conviction that the

¹ Miltiades, *περὶ τοῦ μὴ δεῖν προφήτην ἐν ἐκστάσει λαλεῖν*. At the same time as Miltiades, if not earlier, Apollinaris of Hierapolis also wrote against the Montanists.

church at large was given over to worldliness, that she had forsaken the old paths and entered on a way that must lead to destruction. The writings of Tertullian afford the clearest demonstration that what is called Montanism was a reaction against secularism in the church, and an effort to conserve the privileges of primitive Christianity. At the same time, they show no less clearly that Montanism in Carthage was a very different thing from the Montanism of Montanus. Western Montanism, at the beginning of the 3d century, admitted the legitimacy of almost every point of the Catholic system. It allowed that the bishops were the successors of the apostles, that the Catholic rule of faith was a complete and authoritative exposition of Christianity, and that the New Testament was the supreme rule of the Christian life. How, then, one may well ask, was it possible to separate from the Catholic Church? On what ground could the separation be justified? How could it be said that a new era of the Spirit had come in when the Spirit had already given all necessary instructions in the Scriptures of the New Testament? And what claim could be thought to exceed the legitimate rights of the successors of the apostles? Montanus himself and his first disciples had been in quite a different position. In his time there was no fixed, divinely-instituted congregational organization, no canon of New Testament Scriptures, no anti-Gnostic theology, and no Catholic Church. There were simply certain communities of believers bound together by a common hope, and by a free organization, which might be modified to any required extent. When Montanus proposed to summon all true Christians to Pepuza, in order to live a holy life and prepare for the day of the Lord, there was nothing whatever to prevent the execution of his plan except the inertia and lukewarmness of Christendom. But this was not the case in the West at the beginning of the 3d century. At Rome and Carthage, and in all other places where sincere Montanists were found, they were confronted by the imposing edifice of the Catholic Church, and they had neither the courage nor the inclination to undermine her sacred foundations. This explains how the later Montanism never attained a position of influence. In accepting, with slight reservations, the results of the development which the church had undergone during the fifty years from 160 to 210 it reduced itself to the level of a sect. For, if the standpoint of the Catholic Church is once acknowledged, then Montanism is an innovation; and if the canon of the New Testament is accepted the doctrine of a new era of the Spirit is heresy. Tertullian exhausted the resources of dialectic in the endeavour to define and vindicate the relation of the spiritualists to the "psychic" Christians; but no one will say he has succeeded in clearing the Montanistic position of its fundamental inconsistency.

Of the later history of Montanism very little is known. But it is at least a significant fact that prophecy could not be resuscitated. Montanus, Prisca, and Maximilla were always recognized as the inspired authorities. At rare intervals a vision might perhaps be vouchsafed to some Montanistic old woman, or a brother might now and then have a dream that seemed to be of supernatural origin; but the overmastering power of religious enthusiasm was a thing of which the Montanists knew as little as the Catholics. Their discipline was attended with equally disappointing results. In place of an intense moral earnestness binding itself by its own strict laws, we find in Tertullian a legal casuistry, a finical morality, from which no good could ever come. It was only in the land of its nativity that Montanism held its ground till the 4th century. It maintained itself there in a number of close communities, probably in places where no Catholic congregation had been formed; and to these the Novatians at a later period

attached themselves. In Carthage there existed down to the year 400 a sect called Tertullianists; and in their comparatively late survival we have a striking testimony to the influence of the great Carthaginian teacher. On doctrinal questions there was no real difference between the Catholics and the Montanists. The early Montanists (the prophets themselves) used expressions which seem to indicate a Monarchian conception of the person of Christ. After the close of the 2d century we find two sections amongst the Western Montanists, just as amongst the Western Catholics,—there were some who adopted the Logos-Christology, and others who remained Monarchians.

Sources.—The materials for the history of Montanism, although plentiful, are fragmentary, and require a good deal of critical sifting. They may be divided into four groups. (1) The utterances of Montanus, Prisca, and Maximilla¹ are our most important sources, but unfortunately they consist of only twenty-one short sayings. (2) The works written by Tertullian after he became a Montanist furnish the most copious information,—not, however, about the first stages of the movement, but only about its later phase, after the Catholic Church was established. (3) The oldest polemical works of the 2d century, extracts from which have been preserved, especially by Eusebius (*Hist. Eccles.*, bk. v.), form the next group. These must be used with the utmost caution, because even the earliest orthodox writers give currency to many misconceptions and calumnies. (4) The later lists of heretics, and the casual notices of church fathers from the 3d to the 5th century, though not containing much that is of value, yet contain a little.²

Literature.—Ritschl's investigations, referred to above, supersede the older works of Tillemont, Wernsdorf, Mosheim, Walch, Neander, Baur, and Schwegler (*Der Montanismus und die christliche Kirche des 2ten Jahrhunderts*, Tübingen, 1841). The later works, of which the best and most exhaustive is that of Bonwetsch, *Die Geschichte des Montanismus*, 1881, all follow the lines laid down by Ritschl. See also, Gottwald, *De Montanismo Tertulliani*, 1862; Réville, "Tertullien et le Montanisme" in the *Revue des Deux Mondes*, 1st November 1864; Stroelin, *Essai sur le Montanisme*, 1870; De Soyres, *Montanism and the Primitive Church*, London, 1878; W. Cunningham, *The Churches of Asia*, London, 1880; Renan, "Les Crises du Catholicisme Naissant" in *Rev. d. Deux Mondes*, 15th February 1881; Möller, art. "Montanismus" in *Herzog's Theol. Realencyklop.*, 2d ed. Special points of importance in the history of Montanism have been quite recently investigated by Lipsius, Overbeck, Weizsäcker (*Theol. Lit.-Zeitung*, Nr. 4, 1882), and Harnack (*Das Mönchtum, seine Ideale und seine Geschichte*, 2d ed., 1882, and *Z. f. Kircheng.*, iii. pp. 369-408). Weizsäcker's short essays are extremely valuable, and have elucidated several important points hitherto overlooked. (A. H.A.)

MONTARGIS, chief town of an arrondissement in the department of Loiret, France, lies 40 miles east-north-east of Orleans on the railway from Paris to Lyons. Traversed by the Loing, Montargis belongs to the basin of the Seine, but it communicates with the Loire by the Orleans and the Briare canals. It has a fine church (Ste Magdelaine), dating in part from the 12th century, a museum, and a public library; and it still preserves portions of its once magnificent castle, which was capable of containing 6000 men, and, previous to the erection of Fontainebleau, was so favourite a residence of the royal family that it acquired the title of "Berceau des Enfants de la France." Paper-making (introduced in the beginning of the 18th century) and several other considerable industries are carried on. The population of both commune and town was 9175 in 1876.

Montargis (*Mons Argi* or *Algi*, *M. Arginus*, *Montargium*) was formerly the capital of the Gâtinais (*Pagus Vastinensis*). Having passed in 1188 from the Courtenai family to Philip Augustus, it long formed part of the royal domain. In 1528 Francis I. mortgaged town, castle, and forest (this last a tract of great value) to Renée d'Este, daughter of Louis XII., the famous Huguenot princess; and in 1570 Charles IX. gave them in full property to her daughter Anne, through whom they descended to the dukes of Guise, but they were repurchased for the crown in 1612. Montargis was several times taken or attacked by the English in the 15th century, and is particularly proud of the successful defence it made in 1427. Both Charles VII. and Charles VIII. held court in the town; and it was the latter who set the famous Dog of Montargis to fight a duel with his master's murderer whom he had tracked and captured.

¹ Collected by Münter, and by Bonwetsch, *Geschichte des Montanismus*, p. 197 s7.

² On the sources, see Bonwetsch, pp. 16-55.

MONTAUBAN, chief town of the department of Tarn-et-Garonne, France, is situated on a slight eminence between the right bank of the Tarn and its tributary streams the Tescou and Lagarrigue, 128 miles by rail east-south-east of Bordeaux. It is connected with the suburb of Ville-Bourbon on the left bank of the Tarn by a remarkable brick bridge of the 14th century, which is 672 feet in length, and consists of seven pointed arches resting on piers, themselves pierced by pointed arches. The cathedral, built in 1739, contains the Vow of Louis XIII., one of the finest paintings of Ingres, a native of Montauban, and at the end of the Carmelite walk a monument was erected to his memory in 1871. In the town-house, once occupied as a palace by the counts of Toulouse and by the Black Prince, are the paintings bequeathed by Ingres, an archæological collection, and a very curious library containing the bequests of several celebrated collectors. Montauban possesses a Protestant theological college. The town has some trade in corn, wine, and grapes. The manufacture of corn-dressers, coarse cloth, pens, and earthen and china ware are the principal industries; and there are also corn and woollen mills. The population in 1881 was 28,325.

Montauban was only a village in the time of the Romans. In the 8th century a monastery was founded there by the Benedictines, who exercised lordship over the neighbouring population. A considerable impetus was in the 12th century given to its prosperity by a decree of the counts of Toulouse offering freedom to all serfs taking up their residence in the town. Montauban was twice besieged by Simon de Montfort in the Albigensian wars, and was sacked in 1207. By the treaty of Breigny (1360) it was ceded to the English; but shortly afterwards they were expelled by the inhabitants. In 1560 the bishops and magistrates embraced Protestantism, expelled the monks, and demolished the cathedral. About ten years later it became one of the Huguenot strongholds, and formed a small independent republic. It was the headquarters of the Huguenot rebellion of 1621, and was vainly besieged by Louis XIII. for eighty-six days; nor did it submit until after the fall of Rochelle in 1629, when its fortifications were destroyed by Richelieu. In the same year the plague cut off over 6000 of its inhabitants.

MONTBÉLIARD, chief town of an arrondissement in the department of Doubs, France, is situated 1020 feet above the sea at the confluence of the Allaine and the Lusine, tributaries of the Doubs, and on the canal between the Rhine and the Rhone, about 40 miles north-east of Besançon. Once a fortified city, it still retains the old castle of the counts of Montbéliard. A bronze statue of Cuvier, the most illustrious native of Montbéliard, and several fine fountains adorn the town, which also possesses a museum of natural history and antiquities, and a Protestant normal school. Since 1870 a considerable impetus has been given to its prosperity by the arrival of Alsatian immigrants. The industries embrace watchmaking, the manufacture of graving tools, iron wire, files, watch-springs, and pumps, cotton spinning and weaving, printing, and tanning. The chief exports are cheese, leather, and wood. The population in 1881 was 8784, of which the great majority were Protestants.

After belonging to the Burgundians and Franks, Montbéliard was, by the treaty of Verdun (843), added to Lorraine. In the 11th century it became the capital of a countship, which formed part of the second kingdom of Burgundy, and latterly of the German empire. From the end of the 14th century until 1793 it belonged to the house of Würtemberg. It resisted the attacks of Charles the Bold, King Louis XII., and the duke of Guise, but was taken in 1676 by Marshal Luxembourg, who razed its fortifications. In 1871 the battle of Héricourt between the French and Germans had its commencement within its walls.

MONT-DORE-LES-BAINS, a village of France in the department of Puy de Dôme, 17 miles as the crow flies south-west of Clermont Ferrand, 3432 feet above the sea, on the right bank of the Dordogne not far from its source. The Monts Dore, from which it takes its name, close the valley towards the south; their culminating peak, Puy de

Sancy (6188 feet), is the highest eminence of central France. The mineral springs of Mont Dore were known to the Romans. The eight now used yield 94,600 gallons in twenty-four hours. Bicarbonate of soda, iron, and arsenic are the principal ingredients of the water; to the two last it owes its efficacy in cases of pulmonary consumption, bronchitis, asthma, and nervous and rheumatic paralysis. From the elevation and exposure of the valley, which opens to the north and runs up towards mountains never quite free from snow, the climate of Mont-Dore-les-Bains is severe, and the season is consequently short. About 5000 patients visit the place between 15th June and 15th September, when a casino and theatre are opened. The chief building is the solid but sombre bath-house (hot baths). The surrounding country, with its fir woods, pastures, waterfalls, and mountains, is very attractive. In the "park" at Mont-Dore-les-Bains, which forms a little promenade along the Dordogne, relics from the old Roman baths have been collected, but the ancient establishment must have been on a larger scale than the present one. A pantheon erected about the time of Augustus existed till the 16th century. The population in 1881 was 1438.

MONTE CARLO. See **MONACO.**

MONTE CASSINO (or **CASSINO**). The Benedictine monastery known as the abbey of Monte Cassino is a huge square building of three stories, built on the usual Benedictine plan (see **ABBEY**) on the summit of a picturesque isolated hill, about $3\frac{1}{2}$ miles to the north-east of the town of Cassino (Casinum) or San Germano (population about 5000), which lies midway between Rome and Naples in the valley of the Garigliano. The most prominent architectural feature is the large church (1727), richly decorated in the interior with marbles, mosaics, and paintings. The library and archivio have been spoken of elsewhere (vol. xiv. pp. 531, 548).

The date of Benedict's withdrawal from Subiaco to Cassino is 529. At that time Cassino was the site of a temple of Apollo and of a grove sacred to Venus. The result of the saint's preaching was that the natives demolished both, chapels to St Martin and John the Baptist being built in their stead, while farther up the hill a monastery began to rise. About 589 the monks were driven from it to Rome by the Lombards of Benevento, and it lay waste for more than a century, until resuscitated by Gregory II. (719). In 787 it received fresh privileges from Charlemagne; in 884 it was burnt by the Saracens, and was not restored until about seventy years later. From 1322 to 1366 the abbot held episcopal rank; under the house of Anjou he bore the title of *Abbas abbatum*, and ranked as first baron of the realm. In 1504 the abbey was sacked by the troops of Gonzalo de Cordova. In 1866 it shared the fate of all other religious houses in Italy; it is now inhabited by a few monks, and used as a seminary, having about 200 pupils.

MONTECUCULI, RAIMONDO, COUNT OF (1608-1680), a prince of the empire and duke of Melfi, a famous Austrian general, was born at the castle of Montecuculi in Modena, in 1608. At the age of nineteen he began his career in a regiment of infantry under his uncle, Ernest, count of Montecuculi; and during the Thirty Years' War he found many opportunities of displaying his military genius in the imperial service. In 1631, having been severely wounded, he was made prisoner while retreating after the battle of Breitenfeld. Soon after his release he was promoted to the rank of major; and he distinguished himself at the siege of Nördlingen in 1634, and at the storming of Kaiserslautern in 1635. As colonel, he took part in much hard fighting in Pomerania and in Bohemia; and in 1639 at Melnik, where he tried to prevent the Swedes from crossing the Elbe, he was taken prisoner a second time, being compelled on this occasion to spend more than two years in Stettin. The time was not lost, for he devoted it to a thorough study of military science. In 1642 he was again at work in the imperial army, and for eminent services in Silesia he was made a major-general of cavalry. After a brief visit to Italy, during which he entered the service of the duke of Modena, he returned to Germany, and became councillor

of war in 1644. In the following year he supported the archduke Leopold in a campaign against Prince Rakoczy of Transylvania, resisted Marshal Turenne in the Rhine country, and fought with the Swedes in Silesia and Bohemia. The victory at Triebel in Silesia, in 1647, was due chiefly to him, and he was rewarded by being raised to the rank of general of cavalry. After the peace of Westphalia in 1648 he occupied himself for some time with the work of the council of war; and in 1654 he undertook diplomatic missions to Christina, queen of Sweden, and to Cromwell. In 1657 he commanded an expedition against Prince Rakoczy and the Swedes, who had attacked the king of Poland, and Rakoczy was soon forced to withdraw from the Swedish alliance, and to accept terms of peace. As field-marshal he was sent to the aid of Denmark against Sweden; and this war he conducted so successfully that the peace of Oliva was concluded in 1660. In 1663 he resigned the command of an army with which, for about three years, he had been opposing the Turks; but in 1664 he was again made commander-in-chief, and in the same year he defeated the Turks so decisively near the abbey of St Gotthard that they concluded an armistice for twenty years. He had to deal with more formidable enemies in 1672, when, the emperor and the imperial diet having resolved to uphold the Dutch against Louis XIV., Montecuculi, who had been serving as president of the council of war and director of artillery, was appointed commander of the imperial forces. He took Bonn, and, although closely watched by Turenne, contrived to effect a junction with the prince of Orange, thereby overthrowing all the calculations of the French. When the elector of Brandenburg received the supreme command in 1674 Montecuculi withdrew from the army; but in 1675, being restored to his former position, he resumed operations against Turenne. The two commanders manœuvred so brilliantly that for about four months neither could do the other much injury; but, Turenne having been killed by a cannon-ball on the 27th of July 1675, Montecuculi pursued the French into Alsace, and besieged Hagenau and Zabern, retiring from Alsace only when he found himself confronted by Condé. Montecuculi's last achievement in war was the siege of Philippsburg. During the rest of his life he was president of the council of war. In 1679 the emperor Leopold made him a prince of the empire, and shortly afterwards he received from the king of Naples the dukedom of Meli. Having accompanied the emperor to Linz during the pestilence, he was injured by the fall of a beam when entering the castle, and died at Linz on the 16th of October 1680.

Montecuculi was an ardent lover of science, and wrote several important military works. The *Opere complete di Montecuculi* were published in two volumes, at Milan in 1807, at Turin in 1821, and there is a German translation (1736) of his *Memorie della guerra ed istruzioni d'un generale*.

See Campori, *Raimondo Montecuculi, la sua famiglia e i suoi tempi* (1877).

MONTELEONE (usually called Monteleone of Calabria to distinguish it from Monteleone of Apulia in the province of Avellino, which gave its name to the mediæval duchy of the Pignatelli family) is a city of Italy in the province of Catanzaro, on the western side of the Bruttian peninsula, and is beautifully situated on an eminence gently sloping towards the gulf of Sta Eufemia. It was almost totally destroyed by earthquake in 1783, and for many years afterwards consisted mainly of slight wooden erections, but under the French occupation it was made the capital of a province and the headquarters of General Regnier, and it is now a well-built town. The castle was built by Roger, count of Sicily, whom tradition accuses of carrying off the ruins of the ancient temple of Proserpine to the cathedral of Mileto. The population of the town was 9244 in 1871, that of the commune 10,262 in 1861 and 12,047 in 1881.

Monteleone is identified with the ancient Hipponium, a Greek city first mentioned in 389 B.C., when its inhabitants were removed to Syracuse by Dionysius. Restored by the Carthaginians (356), held for a time by Agathocles of Syracuse (294), and afterwards occupied by the Bruttians, Hipponium ultimately became as Vibo Valentia a flourishing Roman colony. The harbour established by Agathocles proved of great service as a naval station to Cæsar and Octavius in their wars with Pompeius Magnus and Sextus Pompeius, and remains of its massive mason-work still exist at the village of Bivoua on the coast. In the town itself there are no traces of antiquity beyond a mosaic pavement in the church of St Leoluca (patron saint of Monteleone) and one or two Latin inscriptions.

MONTE LIMAR, chief town of an arrondissement and canton in the department of Drôme, France, is situated near the left bank of the Rhone, 93 miles south of Lyons on the railway to Marseilles. The waters of the Roubion and Jabron, which unite at Montélimar, spread fertility over the plains surrounding the town. A well-planted park separates the town from the station, but within the four gates that still remain the streets are narrow and uninviting. The ancient castle, one of the most interesting military remains of central France, is now used as a prison. Silk throwing and spinning, and the manufacture of flowered silks and of hats, are the principal industries; there are also foundries, tool-shops, and tanneries, and agricultural implements and hydraulic lime are made. Montélimar is famed for its *nougat*, a cake composed of almonds and honey. The population of the town in 1881 was 12,894.

Montélimar was called by the Romans *Acusium*. At a later period it belonged to the family of Aymar or Adhémar, whence its present name. After coming into the possession of the counts of Valentinois, and then of the dauphins of Viennois, it was united by Louis XI. to the crown of France. It frequently changed hands during the religious wars, and, although it resisted Coligny, it was taken in 1589 by Lesdiguières.

MONTENEGRO, often pronounced and sometimes written **MONTENERO** (Montenegrin, *i.e.*, Servian, *Crnagora*, Russian *Tchernogorija*, and Turkish *Karadagh*, all equivalent to Black Mountain), one of the smallest of European countries, lies on the eastern side of the Adriatic, and is bounded by Dalmatia, Herzegovina, Bosnia, and Albania. Previous to 1878 it had an area variously estimated at 1669 square miles (Kaptsevitch), 1711 (Kiepert), and, including the Kutchi territory, 1796 (Behm). The enlargement to about 5272 square miles proposed by the San Stefano treaty (1878) would probably have swamped the Montenegrin nationality, and the Berlin congress brought the total area only up to 3680 miles, or almost exactly half the size of Wales.¹

Apart from her new maritime district, Montenegro seems

¹ Since 1870 several rectifications of frontier and exchanges of territory have been arranged between Montenegro and Turkey, but these have left the area practically undisturbed. All the figures are approximate estimates, as the only geodetic survey of the country, carried out by Russian officers, is still (1883) in progress. The old frontier line had the great disadvantage to the Montenegrins of leaving the fortress of Niksitch in the north-west, and that of Spuzh in the south-east in the hands of the Turks, who thus commanded the valley of the Zeta, and strategically almost cut the country in two, the distance from the frontier near Niksitch to the frontier near Spuzh being only some 15 miles. The present frontier includes not only these strongholds, but also those of Podgoritz, Zhabliak (Jablac), and Lesendra, a great part of Lake Scutari, and the coast district with Antivari and Dulcigno. To get access to the sea had long been the ambition of Montenegro, which in her early days had possessed not only Dulcigno but Durazzo, and had surrendered them to purchase from Venice assistance in her struggle against the Turks. The Berlin congress gave her the coast from Cape Maria to Cape Kruci or Krutch, but Spizza, the harbour to the north, was retained by Austria, and Dulcigno, to the south, by Turkey. In the beginning of 1880, by the Corti compromise, the Kutchi territory and the plain of Podgoritz were accepted by Montenegro in lieu of Plava and Gnssinye, assigned to her by the congress; but the exchange was deferred, and the terms ultimately modified by the congress so as to include Dulcigno in Montenegrin territory. The occupation of the district (November 1880) was only effected after a naval demonstration on the part of the great powers.

little better at first than a chaos of mountains, but on closer examination it appears that there are two distinct groups, an eastern and a western, divided by the Zeta-Moratcha valley. The loftiest summit is Dörmitor, 8146 feet high, in the new territory near the north frontier, next come Kom Kutchi (8031), Kom Vassoyevitzki (7946), and Dörmitor Schlime (7936).¹ Had the original frontier of the Berlin congress towards the south-east been retained it would have run along the still higher Prokletia range. Many of the mountain-tops remain white with snow for the greater part of the year, and from some of the dark ravines the snow never disappears. The south-western portion of the country consists of limestone, the north-eastern mainly of Palæozoic sandstones and schists with underlying trap.² In their general aspect the two regions are strikingly distinct. The former seems, as it were, one enormous mass of hard crystalline rock, bare and calcined, with its strata dipping to the south-west at an angle often of 70 degrees. Its whole surface has been split by atmospheric agencies into huge prismatic blocks, and the cracks

Map of Montenegro.

have been gradually worn into fissures several fathoms deep. In some places the process has resulted in clusters of immense sharp-pointed crags, the sides of which are furrowed by rain-channels, while in others there are countless funnels running down into the rock for 200 feet and more. In like manner the interior of the mass is hollowed out into immense galleries and caves, and during the rainy season subterranean landslips frequently produce local earthquakes, extending over an area of 10 or 12 miles. The sandstone region, on the other hand, presents lofty but rounded forms, clothed for the most part with virgin forest or rich alpine pasture, broken here and there by dolomitic peaks.

¹ Bull. de la Soc. de Géogr., Paris, 1881.

² Dr Tietze, whose full report was to appear in the *Jahrb. der Reichsanstalt* for 1883, informed the writer that the existence of the following formations in Montenegro has been clearly ascertained:—(1) Palæozoic schists, (2) Wirfen strata of Lower Trias, (3) Trap of the Palæozoic and Wirfen strata, (4) Triassic limestone, (5) Jurassic limestone, (6) Cretaceous limestone, (7) Flysch, in part certainly Eocene, and (8) Neogenic or younger Tertiary formations. The existence of nummulitic limestone is still doubtful.

The watershed between the Adriatic and the Black Sea crosses the country from west to east in a very irregular line, the southern districts being drained by the Zeta-Moratcha river system, which finds its way to the Adriatic by Lake Scutari and the Boyanna, while the streams of the northern districts form the head-waters of the Drina, which reaches the Danube by way of the Save. The Zeta, rising in Lake Slano, is remarkable for its subterranean passage beneath a mountain range 1000 feet high. At a place called Ponor the water plunges into a deep chasm, seeming almost to lose itself in foam, but at a distance of several miles it reappears on the other side of the mountains. Its whole course to its junction with the Moratcha is about 30 miles. Rising in the Yavorje Planina, the Moratcha sweeps through the mountain gorges as a foaming torrent till it reaches the plain of Podgoritz; then, for a space, it almost disappears among the pebbles and other alluvial deposits, nor does it again show a current of any considerable volume till it approaches Lake Scutari. In the neighbourhood of Duklea,³ and Leskopolye it flows through a precipitous ravine from 50 to 100 feet high. In the dry season it is navigable to Zhabliak. The whole course is about 60 miles. Of the left-hand tributaries of the Moratcha the Sem or Tsievna deserves to be mentioned for the magnificent cañon through which it flows between Most Tamarui and Dinosh. On the one side rise the mountains of the Kutchi territory, on the other the immense flanks of the Prokletia range,—the walls of the gorge varying from 2000 to 4000 feet of vertical height. Lower down the stream the rocky banks approach so close that it is possible to leap across without trouble. The Ryeka issues full-formed from an immense cave south-east of Cettinje (Tsetinje) and falls into Lake Scutari. The three-tributaries of the Drina which belong in part to Montenegro are the Piva, the Tara, and the Lim, respectively 55, 95, and 140 miles in length. The Tara forms the northern boundary of the principality for more than 50 miles, but the Lim leaves the country altogether after the first 30 miles of its course. Great alterations have taken place on Lake Scutari in recent times. The river Drin, which previous to 1830 entered the Adriatic to the south of Alesia near S. Giovanni di Medua, subsequently changed its course so as to join the Boyanna just below its exit from the lake; one of the chief results has been to raise the level of the lake, and so to flood the lower valleys of the tributary streams. When the International Frontier Commission was at Scutari in April 1879, the water stood 8 feet deep in some of the principal streets, and the inundation of city and suburbs lasted that year eight months. A few small lakes are scattered among the mountains, and it is evident that their number was formerly much greater. The plain or hollow of Cettinje was doubtless filled with water at no very distant (geological) date, and even now, when the sudden rains cannot escape fast enough by the ordinary subterranean outlet, the royal village suffers from a flood.

³ Duklea is the name still borne by the ruins of the Roman Doclea, often, but wrongly, called Dioclea from its association with the family of Diocletian.

marked by extreme simplicity. Chastity is a national virtue, and in time of war the women and children of the Turks have often found their safest asylum among their hereditary foes. The main stock of the people is of Servian descent; and, though the purity of both blood and language has been to some extent affected by foreign elements, mostly Albanian and Turkish, the national unity has not been impaired. The curious Gipsy colony, which, though speaking Servian, never intermarries with the Montenegrins, is numerically of little importance.¹ The great mass of the people belong to the Orthodox Greek Church, only some 7000 being Roman Catholics, and 3000 Mohammedans. According to Kaptsevitch, the population was 10,700 in 1838, 120,000 in 1849, 124,000 in 1852, and 170,000 in 1877, but in 1879 it was found that, inclusive of the new territory, the number could not exceed 150,000; since then about 15,000 have been added with Dulcigno. The official returns for 1882 (not based on a census, however) give 236,000 as the total, of whom some 23,000 live in the so-called towns.

Fauna.—Bears are still found in the higher forests, and wolves, and especially foxes, over a much wider area. A few chamois roam on the loftiest summits, the roebuck is not infrequent in the backwoods, the wild boar may be met with in the same district, and the hare is abundant wherever the ground is covered with herbage. There are one or two species of snakes in the country, including the poisonous Illyrian viper. Esculent frogs, tree frogs, the common tortoise, and various kinds of lizards are all common. The list of birds observed by Baron Kaulbars includes golden eagles and vultures, 12 species of falcons, several species of owls, nightingales, larks, buntings, hoopoes, partridges, herons, pelicans, ducks (10 species), goatsuckers, &c. The abundance of fish in Lake Scutari and the lower course of the Ryeka is extraordinary, the shoals of bleak (*scorantza*, *Leuciscus alburnus*) that come up the river forming almost solid masses. Both trout and salmon are caught in the Moratcha.

Flora.—The flora of Montenegro is comparatively scanty. In the forest districts the beech is the prevailing tree up to a height of 5000 or 5500 feet, and then its place is taken by the pine. The chestnut forms little groves in the country between the sea and Lake Scutari, but never ascends more than 1000 feet, and the olive also is mainly confined to the neighbourhood of the Adriatic. Pomegranate bushes grow wild, and in many parts of the south cover the foot of the hills with dense thickets, the rich blossoms of which are one of the special charms of the spring landscape. Wheat, rye, barley, maize, capsicums, and a little tobacco are grown in the north, and in the south, vines, figs, peaches, apples, cherries, citrons, oranges, &c. The potato, introduced in 1786, is cultivated considerably beyond the local demand; the planting of mulberry trees and the rearing of silk-worms is of growing economical importance.

Towns.—CETTINYE (*q. v.*), with about 2000 inhabitants, is the capital of the country. Podgoritz (about 6000 or 7000 in 1879, since reduced to 4000) is the principal trading town; it lies at the foot of the mountains (as its name imports), at the junction of the Ruibnitza with the Moratcha, and in Turkish hands was one of the strongest of their fortresses towards Montenegro. Dulcigno (see vol. vii. p. 520) has 3000 inhabitants (before the transfer 5000 to 7000). Niksitch, a fortified place on a slight eminence in the midst of a plain, is about the same size. Antivari (see vol. ii. p. 138), so called from its position opposite Bari in Italy, suffered greatly in the war 1879-80, and lost half of its 5000 inhabitants. Danilovgrad, with 2000, lies on the north side of the Zeta valley; in the vicinity is Orioluka, the prince's palace with its mulberry nurseries, and the monasteries of Zhdrebanik (burnt by the Turks in 1877, but since rebuilt), while Tcheliya, Moratcha (the most ancient in the principality), and Ostrog (visited annually by about 10,000 pilgrims) are not far off. Spuzh (Spouge), a little lower on the same side of the stream, is a fortified post with about 1000 inhabitants. Nyegush or Nyegosh (1200), about three hours distant from Cetinje on the road to Cattaro, is the native seat of the reigning family, which originally came thither from Nyegush in Herzegovina. Zhabliak (1200) was once the "capital," and has been a fortified post since the time of the Venetian power. Ryeka (1500), on the river of that name, is next to Podgoritz in commercial importance; the prince has two residences in the town. Grahovo (2000) is famous for the great battles of 1851 and 1876.

Montenegro is an absolute hereditary monarchy, vested according to the principle of primogeniture in the family of Petrovitch Nyegush. The prince bears the title "Prince of Montenegro and the Berda (mountains)"—Montenegro here meaning the old Montenegrin nahas (provinces) of Katunska, Tzmitza, Ryetchka, and

Lyeshanska, and Berda the territory added in the 18th century, or the provinces Byelopavlitshka, Piperska, Moratchska, Vasoyevitchska, and Kutska. A responsible ministry was introduced in 1877, and there are now separate departments of justice, foreign affairs, war, and finance and education. The highest administrative body is the council of state, instituted in 1879, and consisting of eight members appointed by the prince. Justice in ordinary cases is rendered in primitive fashion. Formal codes were drawn up by Peter I. (1795) and by Danilo (1855), but the real statute book is national custom. A great court, consisting of the minister of justice, and five members named by the prince, is held in the capital, and there are inferior courts in each of the captaincies (86 in 1879). While formerly the very president of the senate, Mirko Petrovitch (*ob.* 1865), whose songs are the delight of his countrymen, could neither read nor write, primary education has been widely diffused during the reign of Prince Nicholas (Nikita). In 1851 there was only one school, but before the recent war they had increased to 58, nearly every clan having one for girls as well as for boys. The female Montenegrin Institut (founded and supported by the empress of Russia) attracts pupils from beyond the frontier. It was from the printing-presses of Cetinje and Ryeka that the first books in the Slavonic languages were issued between 1483 and 1493, under the patronage especially of Ivan Beg and George (IV.) Crnoyevitch, "waywodes of the Zeta," but this promise of literary productiveness was soon cut off by wars with the Turks. Peter Petrovitch Nyegush (1813-1851), who was called to rule in 1830, is recognized as perhaps the greatest of all Servian poets,—his *Gorski Vijenac*, or "Mountain Wreath," giving dramatic expression to the "very soul of the Serbian people." Though the press which he established in 1834 was destroyed in the war of 1852-53, another was soon obtained, and under Prince Nicholas, himself a poet, his memory has proved a potent stimulus to intellectual culture. The first Montenegrin newspaper, *Crnogorac*, now *Glas Crnogorca*, began to appear in 1870; the first book-shop was opened in 1879.²

The Montenegrins, however, have had more to do with the sword than with the pen. "Every man, dressed in the picturesque costume of his tribe, carries his pistol and yataghan in his girdle." Nominally the age of military service is between sixteen and sixty-five, but when war-breaks out schoolboy and superannuated veteran are equally eager for the fray. When Prince Nicholas tried to prevent an old man of eighty from joining his forces, the insulted warrior drew his pistol and shot himself. War with the Turks, indeed, is the essence of Montenegrin history. On the death of the Servian king Stephen Dushan, Prince Balsha became independent lord of the province of the Zeta; and when the Servian power was shattered by the Turks in the battle of Kossovo (1389) his territory formed the asylum of all those who determined to make another stand for freedom. In 1485 Ivan Crnoyevitch, finding Zhabliak untenable, fixed his "capital" at Cetinje. In 1516 his son George, who had succeeded him, left his country to its fate; but the people chose their bishop as their chief. Prince-bishops or vladikas, elected by the people, continued to lead them with success against the common foe of Christendom till 1697, when the authority was handed over to Petrovitch Nyegush, with the right of appointing his successors, subject to national approval. At length, in 1851, Danilo, nephew and nominee of the previous vladika Peter II., prevailed on the "skuptchina" to declare Montenegro a secular state with the hereditary government of a prince. His nephew Nicholas succeeded to the throne in 1860, and at the close of the war 1876-78 Montenegro was declared a sovereign principality. For an account of the defeats and victories (the latter by far the more numerous) which have marked the national struggle for existence during its four centuries, the reader is referred to Denton's *Montenegro* (Lond., 1877).

(H. A. W.)

MONTEREY, a city of the United States, the capital of California up to 1847, is situated on Monterey Bay, 125 miles south from San Francisco by the southern division of the Southern Pacific Railroad. Originally founded in 1770 as a mission station and presidio (garrison) by Junipero Serra, it is still in the main a Spanish-looking town, with Spanish talk in its streets and painted on its signboards. At the meeting of the first constitutional convention of California Monterey was a port of entry with a flourishing trade and a promising future; but it soon suffered from the rivalry of San Francisco, and it is

¹ See Bogisic in *Das Ausland*, 1874.

² Cf. Pypin and Spasovitch, *Hist. of Slav. Literatures*, vol. i.

now a sleepy place, straggling and dirty, with many of its adobe buildings abandoned to decay. The flourishing Monterey whaling company (chiefly Portuguese from the Azores) has its station under the old fort; and, the Southern Pacific Railroad Company having erected (1881) a magnificent hotel, the place bids fair to become one of the leading watering-places on the Californian coast. The mission church of San Carlos, about four miles from the town, is a curious and striking ruin. Population is now (1883) about 1400.

See Franc. Palou, *Vida del ven. padre fray J. Serra*, Mexico, 1787; Lady Duffus Gordon, *Through Cities and Prairie-lands*, 1882; and *Harper's Monthly Magazine*, October 1882.

MONTEREY, a city of Mexico, capital of the state of Nuevo Leon, lies 1600 feet above the sea on a sub-tributary of the Rio Grande del Norte, 150 miles south-south-west of Nuevo Laredo, and 190 west-south-west of Matamoras. A handsome and well-planned city, with a cathedral and a number of good public buildings, Monterey is also in commercial and manufacturing activity the most important place in the northern parts of the republic, and one of the principal stations on the railway opened in 1882 between the city of Mexico and the United States frontier (at Matamoras and Nuevo Laredo). The population was about 37,000 in 1880. The city was founded in 1596, became a bishopric in 1777, and was captured by the United States forces under General Taylor in September 1846.

MONTE SAN GIULIANO, a city of Sicily, in the province of Trapani and 12 miles north-east of the town of Trapani, occupies the summit of the mountain from which it takes its name. Rising in the midst of an undulating plain, this magnificent and conspicuous peak (the Eryx of the ancients) has, whether seen from sea or land, such an appearance of altitude that, while it really does not exceed 2464 feet, it has for ages been popularly considered the culminating point of western Sicily, and second only to Mount Etna. By the Phœnicians it was early chosen as the site of a temple, which continued down to the time of the Roman empire to be one of the most celebrated of all the shrines of Venus (Venus Erycina). The ancient city of Eryx, situated lower down the mountain side, disappears from history after the establishment of the Roman power in Sicily,—the inhabitants having probably taken advantage of the protection afforded by the sanctity, fortifications, and garrison of the temple-enclosure. In the modern town, the population of which has recently decreased to about 3000 by the migration of considerable numbers to the plain, the chief points of interest are the cathedral, internally restored in 1865, the castle, which occupies the site of the temple, and the three so-called *torri del Balio*, which probably represent the propylæa. Remains of Phœnician masonry are still seen on the north side of the town. The great rock-hewn cistern in the garden of the castle is very like one of the cisterns of the Haram at Jerusalem.

The antiquities of Monte San Giuliano have been carefully investigated by Giuseppe Polizzi (*I Monumenti d'Antichità della Provincia di Trapani*), and by Professor Salinas (*Archivio Storico Siciliano*, i., &c.). Compare Renan, *Mélanges d'Histoire et de Voyages*; and Sayce in *Academy*, 30th December 1882.

MONTE SANT' ANGELO, a city of Italy in the province of Foggia (Capitanata), 10 miles north of Manfredonia, stands on an offshoot of Monte Gargano 2824 feet high. In 491 the archangel Michael pointed out the place to St Laurentius, archbishop of Sipontum (Manfredonia), and the chapel, which was built over the cave, to which he drew more particular attention, soon became a famous place of pilgrimage. Though plundered by the Lombards in 657, and by the Saracens in 869, St Michael's was already a wealthy sanctuary in the 11th century, and its prosperity continued till the time of the French occupation. The canons (*Canonici Garganici*, as

they are usually called) maintained a prolonged contest with the Sipontine archbishops for episcopal independence. According to Ughelli (*Italia Sacra*, vol. vii. p. 816), a marble statue of the saint by Michelangelo Buonarroti took the place of a silver image. The bronze doors still preserved are fine pieces of Byzantine work, made, as an inscription bears witness, in Constantinople in 1076. The town of Sant' Angelo, which had only about 3000 inhabitants in the 17th century, numbered 14,759 in 1861, and 13,902 in 1871. Besides the festival of the saint celebrated on the 9th of May, there is a great fair on the 29th of September.

MONTEQUIEU, CHARLES LOUIS DE SECONDAT, BARON DE LA BRÈDE ET DE (1689-1755), philosophical historian, was born at the chateau of La Brède, about 10 miles to the south-east of Bordeaux, in January 1689 (the exact date being unknown), and was baptized on the 18th of that month. His mother was Marie Françoise de Penel, the heiress of a Gascon-English family. She had brought La Brède as a dowry to his father, Jacques de Secondat, a member of a good if not extremely ancient house, which seems first to have risen to importance in the early days of the 16th century. The title of Montesquieu came from his uncle, Jean Baptiste de Secondat, "président à mortier" in the parliament of Bordeaux,—an important office, which, as well as his title, he left to his nephew. Montesquieu was in his youth known as M. de la Brède. His mother died when he was seven years old, and when he was eleven he was sent to the Oratorian school of Juilly, near Meaux, where he stayed exactly five years, and where, as well as afterwards at Bordeaux, he was thoroughly educated. The family had long been connected with the law, and Montesquieu was destined for that profession. He was made to work hard at it notwithstanding his prospects (for his uncle's office was his by reversion); but, as in his later life, he seems to have tempered much study with not a little society. His father died in 1713, and a year later Montesquieu, or, as he should at this time strictly be called, La Brède, was admitted counsellor of the parliament. In little more than another twelve-month he married Jeanne Lartigue, an heiress and the daughter of a knight of the order of St Louis, but plain, somewhat ill-educated, and a Protestant. Montesquieu does not seem to have made the slightest pretence of affection or fidelity towards his wife—things which, indeed, the times did not demand; but there is every reason to believe that they lived on perfectly good terms. Like the three previous years, 1716 was an eventful one to him; for his uncle died, leaving him his name, his important judicial office, and his whole fortune. He thus became one of the richest and most influential men in the district. He continued to hold his presidency for twelve years, in the course of which he had much judicial work to perform, as well as the non-descript administrative functions which under the old régime fell to the provincial parliaments. He was none the less addicted to society, and he took no small part in the proceedings of the Bordeaux Academy, to which he contributed papers on philosophy, politics, and natural science. He also wrote much less serious things, and it was during the earlier years of his presidency that he finished, if he did not begin, the *Lettres Persanes*. They were completed before 1721, and appeared in that year anonymously, with Cologne on the title-page, but they were really printed and published at Amsterdam. This celebrated book (the original notion of which is generally set down to a work of Dufresny, the comic author, but which is practically original) would have been surprising enough as coming from a magistrate of the highest dignity in any other time than in the regency of the duke of Orleans, and even as it was it rather scandalized the graver among Montesquieu's contemporaries. In the guise of letters written by and to two Persians of distinction

travelling in Europe, Montesquieu not only satirized unmercifully the social, political, ecclesiastical, and literary follies of his day in France, but indulged in a great deal of the free writing (so free as very nearly to deserve the term licentious) which was characteristic of the tale-tellers of the time. But what scandalized grave and precise readers naturally attracted the majority, and the *Lettres Persanes* were very popular, passing, it is said, through four editions within the year, besides piracies. Then the vogue suddenly ceased, or at least editions ceased for nearly nine years to appear. It is said that a formal ministerial prohibition was the cause of this, and it is not improbable; for, though the regent and Dubois must have enjoyed the book thoroughly, they were both shrewd enough to perceive that underneath its playful exterior there lay a spirit of very inconvenient criticism of abuses in church and state. The fact is that the *Lettres Persanes* is the first book of what is called the Philosophic movement. The criticism is scarcely yet aggressive, much less destructive, and in Montesquieu's hands it never became so; but what it might become in the hands of others was obvious enough. It is this precursorship in his own special line which in all probability made Voltaire so jealous of Montesquieu, as well as the advantage which a wealthy and well-born noble of high official position had over himself. It is amusing to find Voltaire describing the *Lettres* as a "trumpery book," a "book which anybody might have written easily." It is not certain that, in its peculiar mixture of light badinage with not merely serious purpose but gentlemanlike moderation, Voltaire could have written it himself, and it is certain that no one else at that time could. The reputation acquired by this book brought Montesquieu much into the literary society of the capital, and he composed for, or at any rate contributed to, one of the coteries of the day the clever but rather rhetorical *Dialogue de Sylla et d'Eucrate*, in which the dictator gives an apology for his conduct. For Mademoiselle de Clermont, a lady of royal blood, a great beauty and a favourite queen of society, he wrote the curious prose poem of the *Temple de Gnide*. This is half a narrative, half an allegory, in the semi-classical or rather pseudo-classical taste of the time, decidedly frivolous and dubiously moral, but of no small elegance in its peculiar style. A later *jeu d'esprit* of the same kind, which is almost but not quite certainly Montesquieu's, is the *Voyage à Paphos*, in which his warmest admirers have found little to praise. In 1725 Montesquieu was elected a member of the Academy, but an almost obsolete rule requiring residence in Paris was appealed to, and the election was annulled. It is doubtful whether a hankering after Parisian society, or an ambition to belong to the Academy, or a desire to devote himself to literary pursuits of greater importance, or simple weariness of not wholly congenial work determined him to give up his Bordeaux office; it is certain that he continued to hold it but a short time after this. It is tolerably clear that he had already begun his great work, and the character of some papers which, about this time, he read at the Bordeaux Academy is graver and less purely curious than his earlier contributions. In 1726 he sold the life tenure of his office, reserving the reversion for his son, and went to live in the capital, returning, however, for half of each year to La Brède. There was now no further formal obstacle to his reception in the Académie Française, but a new one arose. Ill-wishers had brought the *Lettres Persanes* specially under the minister Fleury's attention, and Fleury, a precisian in many ways, was shocked by them. There are various accounts of the way in which the difficulty was got over, but all seem to agree that Montesquieu made concessions which were more effectual than dignified. He was elected and received in January 1728. Almost immediately afterwards he started on a tour through Europe to observe

men, things, and constitutions. He travelled through Austria to Hungary, but was unable to visit Turkey as he had proposed. Then he made for Italy, where he met Chesterfield. They sojourned together at Venice for some time, and a curious story is told of the way in which either a piece of mischief on Chesterfield's part, or Montesquieu's own nervousness and somewhat inordinate belief in his own importance, made the latter sacrifice his Venetian notes. At Venice, and elsewhere in Italy, he remained nearly a year, and then journeyed by way of Piedmont and the Rhine to England. Here he stayed for some eighteen months, and acquired an admiration for English character and polity which never afterwards deserted him. He returned, not to Paris, but to La Brède, and to outward appearance might have seemed to be settling down as a squire. He altered his park in the English fashion, made sedulous inquiries into his own genealogy, arranged an entail, asserted, though not harshly, his seigniorial rights, kept poachers in awe, and so forth. Nor did he neglect his fortune, but, on the contrary, improved his estates in every way, though he met with much opposition, partly from the dislike of his tenants to new-fangled ways, and partly from the insane economic regulations of the time, which actually prohibited the planting of fresh vineyards.

Although, however, Montesquieu was enough of a *grand seigneur* to be laughed at, and enough of a careful steward of his goods to be reviled for avarice, by those of his contemporaries who did not like him, these matters by no means engrossed or even chiefly occupied his thoughts. In his great study at La Brède (a hall rather than a study, some 60 feet long by 40 wide) he was constantly dictating, making abstracts, revising essays, and in other ways preparing his great book. Like some other men of letters, though perhaps no other has had the experience in quite the same degree, he found himself a little hampered by his earlier work. He may have thought it wise to soften the transition from the *Lettres Persanes* to the *Esprit des Lois*, by interposing a publication graver than the former and less elaborate than the latter. He had always, as indeed was the case with most Frenchmen of his century, been interested in ancient Rome and her history; and he had composed not a few minor tractates on the subject, of which many titles and some examples remain, besides the already-mentioned dialogue on Sylla. All these now took form in the *Considérations sur les Causes de la Grandeur et la Décadence des Romains*, which appeared in 1734 at Amsterdam, without the author's name. This, however, was perfectly well known; indeed, Montesquieu formally presented a copy to the French Academy. Anonymity of title-pages was a fashion of the day which meant nothing. The book was not extraordinarily popular in France at the time. The author's reputation as a jester stuck to him, and the salons affected to consider the *Lettres Persanes* and the new book respectively as the "grandeur" and the "décadence de M. de Montesquieu;" but more serious readers at once perceived its extraordinary merit, and it was eagerly read abroad. A copy of it exists or existed which had the singular fortune to be annotated by Frederick the Great, and to be abstracted from the Potsdam library by Napoleon. It is said, moreover, by competent authorities to have been the most enduringly popular and the most widely read of all its author's works in his own country, and it has certainly been the most frequently and carefully edited. Its merits are indeed undeniable. Merely scholastic criticism may of course object to it, as to every other book of the time, the absence of the exactness of modern critical inquiry into the facts of history; but this is only a new example of a frequent *ignoratio elenchi*. The virtue of Montesquieu's book is not in its facts but in its views. It is (putting Bossuet and Vico aside) almost

the first important essay in the philosophy of history. The point of view is entirely different from that of Bossuet, and it seems entirely improbable that Montesquieu knew anything of Vico. In the *Grandeur et Décadence* the characteristics of the *Esprit des Loix* appear with the necessary subordination to a narrower subject. Two things are especially noticeable in it: a peculiarity of style, and a peculiarity of thought. The style has a superficial defect which must strike every one, and which was not overlooked by those who were jealous of Montesquieu at the time. The page is broken up into short paragraphs of but a few lines each, which look very ugly, which irritate the reader by breaking the sense, and which prepare him to expect an undue and ostentatious sententiousness. The blemish, however, is chiefly mechanical, and, though no editor has hitherto had the perhaps improper audacity so to do, it would be perfectly possible to obliterate it without changing a word. On the other hand, the merits of the expression are very great. It is grave and destitute of ornament, but extraordinarily luminous and full of what would be called epigram, if the word epigram had not a certain connotation of flippancy about it. It is a very short book; for, printed in large type with tolerably abundant notes, it fills but two hundred pages in the last edition of Montesquieu's works. But no work of the century, except Turgot's second *Sorbonne Discourse*, contains, in proportion to its size, more weighty and original thought on historical subjects, while Montesquieu has over Turgot the immense advantage of style.

Although, however, this *ballon d'essai*, in the style of his great work, may be said to have been successful, and though much of that work was, as we have seen, in all probability already composed, Montesquieu was in no hurry to publish it. He went on "cultivating the garden" diligently both as a student and as an improving landowner. He had lawsuits, sometimes on his own account, sometimes on that of others, and in one case he won from the city of Bordeaux no less than eleven hundred *arpents* of, it is true, the unproductive *landes* of the country. He is said to have begun a history of Louis XI., and there is a story that it was completed but burnt by mistake. He wrote the sketch of *Lysimaque* for Stanislaus Leczinski; he published new and final editions of the *Temple de Guide*, of the *Lettres Persanes*, of *Sylla et Eucrate* (which indeed had never been published, properly speaking). After allowing the *Grandeur et Décadence* to be reprinted without alterations some half dozen times, he revised and corrected it. He also took great pains with the education of his son Charles and his daughter Denise, of whom he was extremely fond. He frequently visited Paris, where his favourite resorts were the salons of Madame de Tencin and Madame d'Aiguillon. But all the time he must have been steadily working at his book, indeed, a contemporary accuses him of having only gone into society to pick up materials for it. But it seems that he did not begin the final task of composition till 1743. Two years of uninterrupted work at La Brède finished the greater part of it, and two more the rest. It was finally published at Geneva in the autumn of 1748, in two volumes quarto. The publication was, however, preceded by one of those odd incidents which in literature illustrate Clive's well-known saying about courts-martial in war. Montesquieu summoned a committee of friends, according to a very common practice, to hear and give an opinion on his work. It was an imposing and certainly not an unfriendly one, consisting of Hénault, Helvétius, the financier Silhouette, the dramatist Saurin, Crébillon the younger, and lastly, Fontenelle,—in fact, all sorts and conditions of literary men. The members of this eminently competent tribunal unanimously, though for different reasons and in different forms of expression, advised the author not to

publish a book which has been recently described by a judge of certainly not less competence as "one of the most important books ever written," and which, when importance of matter and excellence of manner are jointly considered, may be almost certainly ranked as the greatest book of the French 18th century.

Montesquieu, of course, did not take his friends' advice. In such cases no man ever does, and in this case it was certainly fortunate. The *Esprit des Loix* represents the reflexions of a singularly clear, original, and comprehensive mind, corrected by forty years' study of men and books, arranged in accordance with a long deliberated plan, and couched in language of remarkable freshness and idiosyncrasy. The title has been somewhat cavilled at, and, like that of the *Considérations*, it gave a handle to the somewhat malicious frivolity of the salons. But if it had been preserved in full it would have escaped much of the criticism which it has received. In the original editions it runs *L'Esprit des Loix ou du Rapport que les Loix doivent avoir avec la Constitution de chaque Gouvernement, les Mœurs, le Climat, la Religion, le Commerce, etc.* It consists of thirty-one books, which in some editions are grouped in six parts. This division into parts is known to have entered into the author's original plan, but he seems to have changed his mind about it. Speaking summarily, the first part, containing eight books, deals with law in general and with forms of government; the second, containing five, with military arrangements, with taxation, &c.; the third, containing six, with manners and customs, and their dependence on climatic conditions; the fourth, containing four, with economic matters; and the fifth, containing three, with religion. The last five books, forming a kind of supplement, deal specially with Roman, French, and feudal law. The most noteworthy peculiarity of the book to a cursory reader lies in the section dealing with effects of climate, and this indeed was almost the only characteristic which the vulgar took in, probably because it was easily susceptible of parody and *reductio ad absurdum*. But this theory is but the least part of the claims of the book to attention. Its vast and careful collection of facts, the novelty and brilliancy of the generalizations founded on them, the constructive spirit which penetrates it, its tolerance, its placid wisdom lighted up by vivacious epigram, could only escape the most careless reader. The singular spirit of moderation which distinguishes its views on politics and religion was indeed rather against it than in its favour in France, and Helvétius, who was as outspoken as he was good-natured, had definitely assigned this as the reason of his unfavourable judgment. On the other hand, if not destructive it was sufficiently critical, and it thus raised enemies on more than one side. Montesquieu was thought too English in his ideas by some, the severe defenders of orthodoxy considered him latitudinarian, and one zealous Jansenist informed him that he was "a pig." It was long suspected, but is now positively known, that the book (not altogether with the goodwill of the pope) was put on the Index, and the Sorbonne projected, though it did not carry out, a regular censure. To all these objectors the author replied in a masterly *défense*; and there seems to be no foundation for the late and scandalous stories which represent him as having used Madame de Pompadour's influence to suppress criticism. The fact was that, after the first snarlings of envy and incompetence had died away, he had little occasion to complain. Even Voltaire, who was his decided enemy, was forced at length to speak in public, if not in private, complimentarily of the *Esprit*, and from all parts of Europe the news of success arrived.

Montesquieu enjoyed his triumph rather at La Brède than at Paris. He was becoming an old man, and, unlike Fonte-

nelle, he does not seem to have preserved in old age the passion for society which had marked his youth. A rather dubious description, published long after his death, represents him as "wandering in his woods from morn to night with a white cotton nightcap on his head, and a vine prop on his shoulder." This, in the florid language of its time (the Republican period), is probably only an imaginative expression of his known interest in managing his estate. But he certainly spent much of his later years in the country, though he sometimes visited Paris, and on one visit had the opportunity, which he is likely to have enjoyed, of procuring the release of his admirer La Beaumelle from an imprisonment which La Beaumelle had suffered at the instance of Voltaire. He is said also to have been instrumental in obtaining a pension for Piron. Indeed, indigent or unlucky men of letters found in him a constant protector, and that not merely at the royal expense. Nor did he by any means neglect literary composition. The curious little romance of *Arsace et Isménie*, a short and unfinished treatise on Taste, many of his published *Pensées*, and much unpublished matter date from the period subsequent to the *Esprit des Lois*. He did not, however, live many years after the appearance of his great work. At the end of 1754 he visited Paris, with the intention of getting rid of the lease of his house there and finally retiring to La Brède. He was shortly after taken ill with an attack of fever, which seems to have affected the lungs, and in less than a fortnight he died, on 10th February 1755, aged sixty-six. He was buried in the church of Saint-Sulpice with little pomp, and the Revolution obliterated all trace of his remains.

The literary and philosophical merits of Montesquieu and his position, actual and historical, in the literature of France and of Europe, form a subject of rather unusual interest in its kind. At the beginning of this century the vicomte de Bonald classed him with Racine and Bossuet, as the object of a "religious veneration" among Frenchmen. But Bonald was not quite a suitable spokesman for France, and it may be doubted whether the author of the *Esprit des Lois* has ever really occupied any such position in his own country. For a generation after his death he remained indeed the idol and the great authority of the moderate reforming party in France, and at such times as that party recovered power during the revolutionary period Montesquieu recovered vogue with it. But the tendency of the century and a quarter which have passed since his death has been to reduce the numbers and position of this party ever more and more, and Montesquieu is not often quotable, or quoted, either by Republicans, Bonapartists, or Legitimists, at the present day. Again, his serious works contain citation of or allusion to a vast number of facts, and the exact (let it be hoped that posterity will not call it the pettifoggling) criticism of our time challenges the accuracy of these facts. Although he was really the founder, or at least one of the founders, of the sciences of comparative politics and of the philosophy of history, his descendants and followers in these sciences think they have outgrown him. In France his popularity has always been dubious and contested. It is a singular thing that, until within the last decade, there has been no properly edited edition of his works, and nothing even approaching a complete biography of him, the place of the latter being occupied by the meagre and rhetorical *Éloges* of the last century. He is, his chief admirers assert, hardly read at all in France to-day, and a tolerable familiarity with modern French literature enables its possessor to corroborate this by first-hand knowledge, to the effect that no writer of equal eminence is so little quoted. The admirers just mentioned attempt to explain the fact by confessing that Montesquieu, great as he is, is not altogether great according to French principles. It is not only that he is an Anglo-maniac, but that he is rather English than French in style and thought. His work, at least the *Esprit*, is lacking in the proportion and the almost ostentatious lucidity of arrangement which a Frenchman demands. His sentences are often enigmatical, and suggestive rather than clear. He is almost entirely dispassionate in politics, but he lacks the unswerving deductive consistency which Frenchmen love in that science. His wit, it is said, is quaint and a little provincial, his style irregular and in no definite genre.

Some of these things may be allowed to exist and to be defects in Montesquieu, but they are balanced by merits which render them almost insignificant. Of the minor works, which are on the whole rather unworthy of their author, nothing need be said here. In the few *Pensées*, and in detached thoughts of the same kind

scattered about the tolerably numerous letters which have reached us, there is much acuteness and point, as also in some of the best sentences of the *Considérations* and of the *Esprit*. But no one would put Montesquieu as a *pensé*, or maxim, writer beside La Rochefoucauld and Joubert, Pascal and Vauvenargues. It is on his three principal works that his fame does and must rest. Each one of these is a masterpiece in its kind. It is doubtful whether the *Lettres Persanes* yield at their best either in wit or in giving lively pictures of the time to the best of Voltaire's similar work, though they are more unequal. There is, moreover, the great difference between Montesquieu and Voltaire that the former is a rational reformer, and not a mere *persifleur* or *frondeur*, to whom fault-finding is more convenient for showing off his wit than acquiescence. Of course this last description does not fully or always describe Voltaire, but it often does. It is seldom or never applicable to Montesquieu. Only one of Voltaire's own charges against the book and its author must be fully allowed. He is said to have replied to a friend who urged him to give up his habit of sneering at Montesquieu, "il est coupable de lèse-poésie," and this is true. Not only are Montesquieu's remarks on poetry (he himself occasionally wrote verses, and very bad ones) childish, but he is never happy in purely literary appreciation. The *Considérations* are noteworthy, not only for the complete change of style (which from the light and mocking tone of the *Lettres* becomes grave, weighty, and sustained, with abundance of striking expression), but for the profundity and originality of the views, and for the completeness with which the author carries out his plan. These words—except, perhaps, the last clause—apply with increasing force to the *Esprit des Lois*. The book has been accused of desultoriness, but this arises, in part at least, from a misapprehension of the author's design. At the same time, it is impossible to say that the equivocal meaning of the word "law," which has misled so many reasoners, has not sometimes misled Montesquieu himself. For the most part, however, he keeps the promise of his sub-title (given above) with fidelity, and applies it with exhaustive care. It is only in the last few books, which have been said to be a kind of appendix, that something of irrelevancy suggests itself. The real importance of the *Esprit des Lois*, however, is not that of a formal treatise on law, or even on polity. It is that of an assemblage of the most fertile, original, and inspiring views on legal and political subjects, put in language of singular suggestiveness and vigour, illustrated by examples which are always apt and luminous, permeated by the spirit of temperate and tolerant desire for human improvement and happiness, and almost unique in its entire freedom at once from doctrinaireism, from visionary enthusiasm, from egotism, and from an undue spirit of system. As for the style, no one who does not mistake the definition of that much used and much misused word can deny it to Montesquieu. He has in the *Esprit* little ornament, but his composition is wholly admirable. Every now and then there are reminiscences, perhaps a little more close than is necessary, of the badinage of the *Lettres Persanes*, but these are rare, and the author's wit is for the most used only to lighten his pages. Yet another great peculiarity of this book, as well as of the *Considérations*, has to be noticed. The genius of the author for generalization is so great, his instinct in political science so sure, that even the falsity of his premises frequently fails to vitiate his conclusions. He has known wrong, but he has thought right.

The sole edition of Montesquieu which need be mentioned here is that of Edouard Laboulaye (7 vols., Paris, 1875-1879), the sole biography that of Louis Vian (Paris, second edition, 1879). From the latter the facts of the above notice are principally drawn. The bibliography of Montesquieu's published works is not of any special interest, but in respect of *anecdota* he occupies a singular position. There is known to exist at La Brède a great mass of MSS. materials for the *Esprit des Lois*, additional *Lettres Persanes*, essays and fragments of all kinds, diaries, letters, notebooks, and so forth. The present possessors, however, who represent Montesquieu, though not in the direct male line, have hitherto refused permission to examine these to all editors and critics, though the publication of some of them has been vaguely promised. At present they are chiefly known by a paper contributed nearly half a century ago to the *Transactions of the Academy of Agen* (1834). (G. SA.)

MONTEVERDE, CLAUDIO (1568-1643), the inventor of the "free style" of musical composition, was born at Cremona in 1568; he was engaged at an early age as violist to the duke of Mantua, and studied composition with some success under Ingegneri, the duke's "maestro di capella," though without thoroughly mastering the difficulties of musical science. His knowledge of counterpoint was limited, and his ear imperfect, but he was a bold experimenter, and his undisguised empiricism led to discoveries which exercised a lasting influence upon the progress of art. He was the first composer who ventured to use unprepared dissonances,—employing them first in his madrigals, the beauty of which they utterly destroyed, but afterwards introducing them into music of another kind with such excellent effect that their value was universally recognized, and all opposition to their use effectually silenced. In 1603 he succeeded

years passed before the settlement was declared a port; but by 1781 it had 6460 inhabitants, and by 1792 was importing to the value of 2,993,267 dollars, and exporting to the value of 4,150,523. In 1808 the governor of Montevideo was the first to revolt against the Spanish authorities, and to establish an independent junta; twenty years later, after much disastrous confusion and conflict, the city became the recognized capital of the newly-formed republic of Banda Oriental. Its population, which had been about 36,000 at the opening of the century, was reduced to 9000 by 1829; and it had hardly recovered its ground in this respect (31,189) when, in 1843, Rosas, dictator of Buenos Ayres, wishing to compel annexation to Buenos Ayres, commenced the siege which was irregularly maintained till 1852, and left the city and the country exhausted and almost ruined. By 1860, however, the population had increased to 49,548; and though the Brazilians blockaded the port in 1864-5 and reinstated ex-president Flores the prosperity of the place was but little impaired. During the Paraguayan war, which lasted till 1864, Montevideo grew rapidly rich, attracting a large share of the trade diverted from Buenos Ayres. Immigrants flocked from all quarters, and excessive investments were made in all kinds of real property. The valuation of the city and suburbs, which was 14,156,000 dollars in 1860, reached the sum of 74,000,000 dollars in 1872. Reckless speculation, political dissension, and the financial mismanagement of the Government have told heavily; the value of house property has greatly diminished, and commercial activity has been grievously restricted. Since 1881, however, Montevideo has been rapidly recovering, and its natural advantages are so great that, with better political circumstances, a future of yet higher prosperity may be anticipated.

Notices of Montevideo will be found in Bonelli, *Travels in Bolivia*, &c., 1854; Hadfield, *Brazil, the River Plate*, &c., 1854, and his supplemental volume, 1863; Molhall, *Handbook of the River Plate Republics*, 1874; and Gallaga, *South America*, 1881. See also Brigardello, *Della vicende dell' America merid. e specialm. di Montevideo nell' Uruguay*, Genoa, 1879; *The Republic of Uruguay*, 1883; the reports of the municipal junta, and Vaillant's statistical publications.

MONTEZUMA. See CORTES and MEXICO.

MONTEFALCONE, BERNARD DE (1655-1741), critic and scholar, was born of a noble and ancient family at the chateau of Soulage (now Soulatgé, in the department of Aube, France), on 13th January 1655. Though destined for the army, he passed most of his time in the library of the castle of Roquetaillade (the usual residence of his family), devouring books in different languages and on almost every variety of subject, his studies being directed by a learned friend of his father, Pavillon, bishop of Aleth. In 1672 he entered the army, and in the two following years served as a volunteer in Germany under Turenne. But ill-health and the death of his parents brought him back to his studious life, and in 1675 he entered the cloister of the Congregation of St Maur, at La Daurade, Toulouse, taking the vows there on 13th May 1676. Apart from his vast literary labours, the remainder of his life presents little to record. He lived successively at various abbeys—at Sorèze, where he specially studied Greek and examined the numerous MSS. of the convent library, at La Grasse, and at Bordeaux; and in 1687 he was removed to Saint Germain des Prés. From 1698 to 1701 he lived in Italy, chiefly in Rome. Returning to Saint Germain, he was made a member of the Académie des Inscriptions et Belles-Lettres in 1719. He died on 21st December 1741.

His first publication, in which he was assisted by Lopin and Pouget, was the first volume of a never completed series of previously unpublished *Analecra Græca* (1688). In 1690 appeared his defence of the literally historical character of the book of Judith. *Athanasii opera omnia*, still the best edition of that father, was issued with a biography and critical notes in 1698. The first-fruits of his visit to Italy were seen in his copious *Diarium Italicum, sive monumentorum veterum, bibliothecarum, museorum, &c., notitiæ singulares in itinere Italico collectæ* (1702). The *Palæographia Græca, sive de ortu et progressu Uterarum Græcarum, et de variis omnium sæculorum scriptiois Græcæ generibus* (1704) is a standard work, which has not yet been superseded; in its own field it is as original as the *De re diplomatica* of Mabillon. In 1713 Montefalcone edited *Hexaplorum Origenis quæ supersunt* (2 vols. fol.), only recently superseded by the work of Field; and between 1718 and 1738 he completed his edition of *Joannis Chrysostomi opera omnia* (13 vols. fol.), which is hardly an improvement upon that of H. Saville. His *L'Antiquité expliquée et représentée en figures* (10 vols. fol., 1719) would of itself suffice to establish a reputation for colossal diligence. It was continued by him in *Les Monuments de la Monarchie Française* (5 vols. fol., 1729-1733). A complete list of his literary labours, including his numerous contributions to the *Mémoires* of

the Academy of Inscriptions, will be found in the *Nouvelle Biographie Générale*, s.v. "Montfalcone."

MONTFORT, SIMON DE, EARL OF LEICESTER (c. 1200-1265), a great political leader, and sometimes even referred to as the "founder of the English House of Commons," born in France about the beginning of the 13th century, was the fourth and youngest son of Simon IV. de Montfort and of Alice de Montmorency. Of his early life and education nothing is known, the first definitely recorded fact about him being that in April 1230 he was in England and had attached himself to the service of Henry III., who granted him a temporary pension of 400 marks, with a promise of the earldom which his father had held.¹ In the following year he did homage for the honour of Leicester, and in 1232 the king confirmed to him all the land with appurtenances which had belonged to the late earl in England. But, though thus formally admitted to the ranks of the English baronage, he did not for several years succeed in making way against the strong dislike in which "aliens" were now held, and until 1236 most of his time was spent, in considerable poverty, abroad. In that year, however, he attended the king's marriage to Eleanor of Provence as lord high steward, and thenceforward began to take part in the business of the royal council. Handsome, talented, and brave, he gained the love of Eleanor, widow of the earl of Pembroke, and sister of the king, to whom he was privately married at Westminster on 7th January 1238, Henry himself giving away the bride. When the fact became known, the indignation of the baronage and of the people had almost broken out in open rebellion, and after Simon had with difficulty averted this by propitiating his brother-in-law, Richard, earl of Cornwall, he found it necessary to go to Rome to meet the objections which the church had raised on the ground of an alleged previous vow made by Eleanor. Having succeeded in obtaining (by bribery, it would seem) the papal sanction to his marriage, he returned to England in October, and early next year, still in the enjoyment of the royal favour, he had the earldom of Leicester formally conferred upon him in presence of the assembled barons. In June (1239) he assisted as godfather and high steward at the baptism of Prince Edward; but the machinations of his enemies were soon afterwards successful in bringing about a change in the fickle humour of Henry, and when Simon came back to Westminster in August to attend the churning of the queen the king met him with the information that he was an excommunicated person, and ordered him to leave the church.² Along with his wife he forthwith went into voluntary exile in France; but in April 1240 he returned to England, and was received by the king on a footing of at least outward friendship. Of his private and public life during the

¹ Simon IV. de Montfort, the well-known Albigenian crusader, in right of his mother, Amicia de Beaumont, sister and co-heiress of Robert Fitz-Pernell, earl of Leicester, succeeded to that earldom in 1204, and in 1207 was confirmed in the high stewardship of England, hereditary in connexion with the title. Soon afterwards he was deprived of his English possessions under some pretext, the real reason doubtless being his position as captain-general of the French forces against the Albigenes (1208). He received them again towards the end of John's reign, their custody, however, being committed to his nephew, the earl of Chester. The long hostility between England and France during the early years of Henry III. made it practically impossible for the alien De Montforts to maintain any hold upon their English earldom on the death of Simon IV. in 1218; in 1231, after the peace, the eldest son Amaury (now constable of France) renounced all claim to it, thus leaving the field clear to his next surviving brother Simon.

² There is no evidence, that Simon actually had been excommunicated, but it seems clear that certain payments he had agreed to make to the Roman curia had not been punctually attended to, and that some annoyance had been in this way caused to the king. The charge of immoral relations with Eleanor was probably only a conveniently coarse way of restating the ecclesiastical offence for which De Montfort had already purchased absolution.

next eight years very few facts have been preserved. There is some ground for believing that he went to the Holy Land in 1240, and a letter is still extant in which the nobility of the kingdom of Jerusalem ask Frederick II. (June 1241) to allow Simon de Montfort, earl of Leicester, to act as regent till the arrival of his son Conrad. In 1242 he accompanied Henry's unsuccessful expedition to France. In the parliamentary history of these years his name appears but seldom, but where he is mentioned he is invariably found on the side of the people, resisting alike the arbitrary wastefulness of the king and the rapacious exactions of the pope. In 1248 De Montfort was appointed for six years the king's "seneschal," or "locum-tenens," in Gascony. In this capacity he was very inadequately supported from home with either men or money; he more than once subdued the rebellious provinces, indeed, but meanwhile his enemies at home gained strength and encouraged the Gascons in repeated accusations and complaints against the seneschal. These resulted in one-sided inquiries, but ultimately in his acquittal, and led to a demand on his part for reparation, and a consequent quarrel with the king. Towards the end of 1252 De Montfort retired into France, where such was the reputation he enjoyed as a statesman that, on the death of the queen-regent and in the absence of Louis IX., he was offered the office of high steward and a place among the guardians of the crown. This, however, he declined, "being unwilling to prove a renegade;" and, after a partial reconciliation with Henry, he returned to England in 1254. In the following year he was sent on a secret mission into Scotland, and in 1257 he was one of the king's ambassadors to France; but his chief activity between 1254 and 1258, if we are to judge by the prominent place he took in the revolution of the last-named year, must have been in the meetings of parliament. At the Westminster parliament in April 1258 it was significantly upon the earls of Gloucester and Leicester that the king's half-brother, William de Valence, laid the blame of all the evils under which the country was groaning, De Montfort in particular being called by him "an old traitor and a liar." At Leicester's suggestion the barons leagued for the defence of their rights, and presented themselves armed at the meeting, which extorted the appointment of the committee of twenty-four to meet at Oxford and proceed at once with the reform of the realm. The Provisions of Oxford having been signed (October 1258), De Montfort received the custody of the castle of Winchester, where the parliament continued its session, he meanwhile apparently holding the position of military commander-in-chief; and, after the removal of the barons to London, he was appointed member of an embassy to Scotland. In the early part of 1259 he was chiefly busied with the task of adjusting the terms of a peace with France, which was not settled until the end of that year. From the date of the conclusion of that peace, owing to divisions in the reforming party, the king began to regain his lost power, and in 1262 he felt himself strong enough to repudiate the Provisions of Oxford, thus giving the signal for civil war. The successes of the barons, led by De Montfort, in the west, and his victorious entry into London again reduced the king to submission, but only to bring once more also into prominence the divided state of Leicester's supporters. Louis's one-sided Mise of Amiens (1264), however, rendered another appeal to arms on the part of the barons inevitable, and by the victory of Lewes (14th May 1264) De Montfort for the time became master of England. Taking Henry, his prisoner, along with him to London, he summoned thither the parliament, which met in June, and drew up the constitution or scheme of government associated with his name, of which the most striking feature is the new development it gives to the

representative system. A still further advance in the development took place in 1265, when borough members, as distinguished from county members, were for the first time summoned. Meanwhile troubles in the west required De Montfort's presence in the field, and, by the alliance of his rival Gloucester with Roger Mortimer, as well as by the escape of Prince Edward, who put himself at the head of the royalist opposition, the great parliamentary leader was placed in serious straits. At Evesham, where he had halted on his march to join his son at Kenilworth, he was surprised by the army of Prince Edward, and after a struggle of about two hours was slain on the field of battle (4th August 1265). As regards the personal character of De Montfort, it is not surprising to find that contemporary opinion was divided; but of his determination, constancy, and energy there can be no question, while much is revealed by the fact that, though in an unauthorized way, his memory was revered in England as a saint and martyr, offices were drawn up in his honour, his intercession invoked, and miraculous virtues attributed to his relics. The painstaking labours of recent investigators have tended to bring into clearer light the purity and nobleness of purpose of Simon de Montfort as a consistent defender of the rights of the governed; on the other hand, it has also become obvious that the representative institutions of England, though largely helped forward by him, can hardly be claimed as his creation. Thus on both sides the statement of Hume that the House of Commons was planted by the inauspicious hand of this bold and artful conspirator must be rejected as inconsistent with the facts.

Compare ENGLAND, vol. viii. p. 310 *sqq.*, and see the monographs of Pauli (*Simon von Montfort, Graf von Leicester, Der Schöpfer des Hauses der Gemeinen*, Tübingen, 1867) and Prothero (*The Life of Simon de Montfort*, 1877), and the literature there referred to.

MONTGOMERY (Welsh, *Sirydd Tre Faldwyn*), an inland county of Wales, is bounded E. by Shropshire, N.E. by Denbigh, N.W. by Merioneth, S.W. by Cardigan, and S. by Radnor. Its greatest length from south-east to north-west is about 40 miles, and its breadth from east to west about 35 miles. The area is 495,089 acres, or about 773 square miles. The surface is broken and undulating, but it is only round the borders of the county that the hills reach any great height, the highest summits of the different ranges being generally in the adjoining counties. To the north are the Berwyn chain, stretching into Denbighshire, in the east the Breidden hills, in the south the Kerry hills, and in the south-west Plinlimmon, the highest summit of which is in Cardigan. These various mountain ranges form the watershed of the numerous rivers of Montgomeryshire. With the exception of the Dyfi, which rises near Bala Lake and falls into Cardigan Bay, and the Wye, which flows south into Radnorshire, all the principal rivers are tributaries of the Severn (Welsh, *Hafren*), which rises on the east side of Plinlimmon and traverses the whole length of the county from south-west to north-east. The principal of these tributaries are the Clywedog, the Taranon, the Rhiew, and the Vyrnwy. This fine succession of river-valleys broaden out as they reach the great vale of the Severn, and the beauty of the scenery is enhanced by an abundance of oak and other trees. The Montgomeryshire canal, which has a length of 27 miles, and passes the principal towns, is connected with the Ellesmere canal, thus affording water communication with Chester and Shrewsbury.

Montgomeryshire is occupied chiefly by Lower Silurian rocks. The boundary between it and Merioneth is formed by the Bala beds. In the centre and east, near Llanfair and Montgomery, Wenlock shales prevail. In the neighbourhood of Welshpool the Silurian rocks have been frequently dislocated by volcanic masses, one of the most

remarkable of which is Corndon Hill, rising to a height of 1700 feet. In some places the sedimentary rocks have been penetrated by trap mingled with shale or schist. Along the lines of dislocation there are frequent deposits of metallic lodes, carried there by the heated water rising from below. The lead mines of Montgomeryshire are of considerable importance, and at present the metal is wrought at seven different places. In 1881 the amount of lead ore obtained in the various mines was 3432 tons, yielding 2693 tons of lead and 25,432 oz. of silver, the total value being £36,495. There were also obtained 1414 tons of zinc ore, yielding 610 tons of zinc, of a total value of £3231.

Agriculture.—The climate is mild and genial, and the soil in the valleys remarkably fertile, especially along the banks of the Severn. A considerable portion on the borders of Merioneth is, however, occupied chiefly by heath and moss. The number of holdings has been rather decreasing of late years, the decrease being chiefly in those below 50 acres in extent, which in 1880 (the latest year regarding which there is information) numbered 3572, while there were 1650 between 50 and 300 acres, and 45 above 300 acres, of which 2 were above 1000. According to the agricultural returns of 1882, the total area of arable land was 256,084 acres, or nearly one-half of the whole. Of this 53,538 were under corn crops, 163,441 were permanent pasture, 23,882 rotation grasses, and only 11,107 green crops; 457 acres were under orchards, 2 under market gardens, 37 under nursery grounds, and 22,744 under woods. Of the corn crops, wheat occupied 18,665 acres, and oats 23,937 acres. Cattle, which are chiefly Herefords and cross-breeds, though there are some Devons and a few of the old Montgomeryshire breed, numbered 62,033 in 1882, of which 21,912 were cows and heifers in milk or in calf. Horses in 1882 numbered 13,985, of which 7060 were used solely for agricultural purposes. The county was long famous for its hardy breed of small horses called *merlins*, which are still to be met with. Many good hunters and cart-horses are now bred. The number of sheep in 1882 was 305,641. On some of the heath lands in the centre and west of the county a diminutive breed of sheep called *cluns* is pastured, but those kept in the better cultivated regions are principally Shropshire Downs. According to the latest return, the land was divided among 3241 proprietors, possessing 387,342 acres, with a gross annual rental of £378,512. Of these, 1314, or 40 per cent., possessed less than one acre, 32 possessed between 1000 and 2000 acres, and 25 between 2000 and 5000; the following possessed upwards of 5000 acres, viz.—Earl Powis, 33,545; Sir W. W. Wynn, 32,963; Lord Sudeley, 17,158; J. Naylor, 9276; and marquis of Londonderry, 7400.

Manufactures.—In all the towns the manufacture of woollen cloth, especially Welsh flannel, is carried on, and although the industry was lately on the decline it is now reviving.

Administration and Population.—Montgomeryshire comprises nine hundreds, and the municipal boroughs of Llanidloes (3421) and Welshpool (7107). Llanfyllin, Llanidloes, Machynlleth, Montgomery, Newtown, and Welshpool form the Montgomery district of boroughs, with a total population in 1881 of 19,925, and return one member to parliament. One member is also returned for the county. Montgomeryshire is partly in the dioceses of Bangor, Hereford, and St Asaph, and contains sixty-eight civil parishes, townships, or places, as well as parts of other parishes in adjoining counties. From 65,700 in 1831 the population had increased in 1851 to 67,335, and in 1871 to 67,623, but in 1881 it had diminished to 65,718, of whom 33,004 were males and 32,714 females.

History.—At the time of the Roman invasion, Montgomery was possessed by a tribe of the Cymri called Ordovices. Traces of several of the old British camps still remain, the principal being those at Dolarddyn, on Breidden Hill, and at Caereinion. There are also a large number of cairns and barrows. The county was traversed by the great Roman road, the *Via Devana*, which was joined by a number of others; but the remains of Roman camps or stations are unimportant. After being vacated by the Romans, little is known of the history of Montgomery, until Wales was subdivided into three districts at the death of Rhodri the Great. Montgomery was then included under Powys, and formed the chief portion of Powys Gwenwynawyn, sometimes called Upper Powys. Powys or Powis Castle, the seat of the rulers of Upper Powys, was founded in 1108. Baldwyn, from which the county takes its Welsh name, was lieutenant of the marches; and, for the purpose of holding the district in check, a castle was built about the end of the 11th century, which, after being captured by the natives, was retaken by Roger de Montgomery. He gave his name to the castle, and to the surrounding district of ancient Powys, which was made a county by Henry VIII. in 1533.

MONTGOMERY, the county town, is situated on the declivity of a well-wooded hill near the eastern bank of the Severn, 2½ miles south by west of Shrewsbury, and 187¼

by rail north-west by north of London. It is a clean and well-built town, but somewhat scattered and irregular. The principal buildings are the parish church of Saint Nicholas (an old cruciform structure) and the town-hall. The borough has returned members to parliament since the time of Henry VIII., but by the Reform Act of 1832 it was constituted one of the Montgomery district of boroughs, which together return one member. The population of the borough (area, 3323 acres) was 1194 in 1881.

There are only a few crumbling remains of the old fortress of Montgomery, originally founded in the time of William the Conqueror to overawe the Welsh, and held by Roger de Montgomery, from whom the town takes its name. The castle was greatly enlarged in the time of Henry III., when it was the scene of frequent contests between that monarch and Llewelyn the Great. In the 14th century it was held by the Mortimers, from whom it passed to the house of York. By the crown it was granted in the 15th century to the Herberts of Chisbury, but during the Civil War it was surrendered by Lord Herbert of Chisbury to the Parliamentary forces, by whom it was dismantled.

MONTGOMERY, a district in the lieutenant-governorship of the Punjab, lying between 29° 53' and 31° 33' N. lat., and between 72° 29' and 74° 10' E. long., is bounded on the N.E. by Lahore, on the S.E. by the river Sutlej, on the S.W. by Múltán, and on the N.W. by Jhang. The area is 5573 square miles. Montgomery district, formerly known as Gugaira, occupies a wide extent of the Bári Doáb, or wedge of land between the Sutlej and the Rávi, besides stretching across the latter river into the adjoining Rechna Doáb. In the former tract a fringe of cultivated lowland skirts the bank of either river, but the whole interior upland consists of a desert plateau partially overgrown with brushwood and coarse grass, and in places with impenetrable jungle. On the farther side of the Rávi, again, the country at once assumes the same desert aspect.

The census of 1868 returned the population at 359,437 (males 200,016, females 159,421), viz., Hindus, 69,805; Mohammedans, 277,291; Sikhs, 12,286; and "others," 55. The Játs, or pastoral tribe, form the most distinctive class in the district. They bear the name of "Great Rávi," in contradistinction to the purely agricultural classes, who are contemptuously styled "Little Rávi." They possess a fine physique, with handsome features, claim a Rájput ancestry, and despise all who handle the plough. In former days they exercised practical sovereignty over the agricultural tribes. Only two towns in the district contain over 5000 inhabitants, viz., Pak Pattan (6086) and Kamalia (5695). The town of Montgomery, the headquarters station, had a population of only 2416 in 1868.

Out of a total assessed area of 3,569,746 acres, only 533,240 are returned as under cultivation. In 1872-73 the *rabi* (or spring harvest) acreage was as follows:—wheat (the chief crop), 162,989 acres; barley, 30,134; gram, 21,416; mustard, 2077; and tobacco, 1303 acres. In the same year the *khari* (or autumn harvest) acreage was:—*judr*, 20,509 acres; rice, 18,727; cotton, 16,916; *til*, 12,457; *kangni*, 9493; and sugar-cane, 498 acres. Irrigation is practised from rivers, canals, and wells; the total area irrigated by public works is 66,495 acres, and by private works, 158,709. The desert uplands afford after the rains a scanty pasturage for the scattered herds of the Great Rávi Játs, and yield an impure carbonate of soda (*sajji*) from the alkaline plants with which they abound. The commercial staples include wheat, rice, gram, millets, cotton, wool, *ghí*, hides, and *sajji*. Large numbers of camels are bred for exportation. The imports comprise sugar, salt, oil, English piece goods, metals, indigo, and fruits. The manufactures consist of country cloth, coarse striped silk, and lequered wood-work. The Lahore and Múltán railway intersects the district, which is also traversed in every direction by good unmetalled highways. The revenue of the district in 1871-72 amounted to £47,954, of which £42,355 was derived from the land-tax. Education in 1871-72 was afforded by 59 aided and unaided schools, with a total of 1417 pupils. The average annual rainfall for the seven years ending 1872-73 was 9·6 inches.

From time immemorial the Rechna Doáb has formed the home of a wild race of pastoral Játs, who have constantly maintained a sturdy independence against the successive rulers of northern India. The historians of Alexander's invasion mention a tribe called the Cathæans, who probably had their capital at Sangala in the Jhang district, and the Malli with their metropolis at Múltán, as in possession of this part of the country. The sites of Kot Kamalia and Harappa in Montgomery contain large mounds of antique bricks and other ruins, while many other remains of ancient cities

or villages lie scattered along the river bank, or dot the now barren stretches of the central waste, clearly marking the former existence of a considerable population. The pastoral tribes of this barren expanse do not appear to have paid more than a nominal allegiance to the Moslem rulers, and even in later days, when Ranjit Singh extended the Sikh supremacy as far as Multán, the country yielded little or no revenue, and the population for the most part remained in a chronic state of rebellion. British influence was first exercised in the district in 1847, when an officer was deputed to effect a summary settlement of the land revenue. Direct British rule was effected on the annexation of the Punjab in 1849. The only incident since then was a general rising of the wild clans during the mutiny of 1857, several actions being fought before the clans were defeated and dispersed and order restored.

MONTGOMERY, a city of the United States, the capital of Alabama, is built on a high bluff on the left bank of the Alabama river, 158 miles north-east of Mobile, with which it is connected by rail (180 miles) and by a steamboat service (330 miles). The State-house, rebuilt in 1851 at a cost of \$75,000, occupies a commanding site on Capitol Hill. There are a city-hall, a court-house, and two theatres, a large flour-mill, a cotton-factory, two oil-mills, a fertilizer-factory, and several foundries and machine shops. The population was 16,713 in 1880; and, in consequence of the marked increase in commercial and industrial activity since that date, it is now (1883) estimated at 19,000. Founded in 1817, and named after General Richard Montgomery (1736-75), the town of Montgomery became in 1847 the seat of the State Government instead of Tuscaloosa. From February 1861 to May 1862 it was the capital of the Southern Confederation. In 1865 it was seized by the Federal forces under General Wilson.

MONTGOMERY, ALEXANDER, whose life fell between 1550 and 1610, was the last of the series of Scottish poets who flourished in the 16th century under the patronage of the Jameses. With the union of the crowns, and the transference of James VI. from Edinburgh to London, court favour was withdrawn from Lowland Scotch; it practically ceased to be a literary language, and no poetry of mark was written in the dialect, if we except that of Allan Ramsay's school, till it reappeared in literature as the instrument of the Ayrshire peasant. By a curious coincidence, Montgomery seems to have been, like Burns, a native of Ayrshire. A commendatory sonnet from his pen, extravagantly flattering, as was the custom of the time, was printed with King James's *Essays of a Prentice* in 1584; he received a pension from the crown a few years later, fell into disgrace apparently for a time, was reinstated in favour, and accompanied his patron to England. As might be expected from the poet of a court where the king himself was a keen critic, Montgomery's miscellaneous poems show a careful attention to form, he tried many metrical experiments, and managed many complicated staves with skill. The sonnet form, at that time a leading fashion in English verse, was also cultivated at the Scottish court; and Montgomery's sonnets possess considerable merit. His most successful poem, published in 1597, and frequently reprinted in Scotland, was the allegory of *The Cherry and the Slae*. The poet, smitten by Cupid, conceives a longing for some cherries, beautiful fruit, but growing high up on a steep and dangerous bank, above a roaring waterfall. Shall he climb and win? Hope and courage and will urge him to try; dread and danger and despair counsel him to be content with the humbler fruit of the sloe, which grows within easy reach. Experience, reason, wit, and skill debate the question. In the end he resolves to venture for the cherry, with the active help of these last-named powers. The conflicting counsels of the poet's advisers are very pithily expressed in proverbs for and against the adventurous enterprise, and the description of the situation is strong and vivid. Montgomery was no unworthy successor to Henryson and

Dunbar in executive finish, but the want of originality in his poems shows that the old impulse was nearly exhausted. There are traces of Italian influence in his sonnets and love songs, but it was much less powerful with him than with his English contemporaries.

MONTGOMERY, JAMES (1771-1854), poet and journalist, was justly described by Lord Byron, in a footnote to *English Bards and Scotch Reviewers*, as "a man of considerable genius," though it was going far beyond the mark to speak of his *Wanderer of Switzerland* (his first notable poem, published in 1806) as being worth a thousand "Lyrical Ballads." Montgomery was born 4th November 1771, at Irvine in Ayrshire, Scotland. Part of his boyhood was spent in Ireland, but he received his education in Yorkshire, at the Moravian school of Fulneck, named after the original home of the Moravians, to which sect his father belonged. He drifted at an early age into journalism, and edited the *Sheffield Iris* for more than thirty years. When he began his career the position of a Dissenting journalist was a difficult one, and he twice suffered imprisonment (in 1795 and 1796) on charges that now seem absurdly forced and unfair. His *Wanderer* was mercilessly ridiculed by the *Edinburgh Review*, but in spite of this Montgomery published many poems, which had a wide popularity:—*The West Indies*, 1810; *The World Before the Flood*, 1812; *Greenland*, 1819; *Songs of Zion*, 1822; *The Pelican Island*, 1827. On account of the religious character of his poetry, he is sometimes confounded with Robert Montgomery, very much to the injustice of his reputation. The inspiring force of James Montgomery's poetry was the humanitarian sentiment which has been such a power in the political changes of this century, and the pulse of this sentiment is nowhere felt beating more strongly than in his verse. His poetry has thus an historical interest altogether apart from its intrinsic value as poetry. But this value is far from contemptible or commonplace. Strictly speaking, Montgomery was more of a rhetorician than a poet, but his imagination was bold, ardent, and fertile, and more than one of his greater contemporaries owed occasional debts to his vigorous invention and even to his casual felicities of diction, while some passages from his poems keep a place in the literature that is universally read and quoted. At the close of his career as a journalist, when all parties agreed in paying him respect, he claimed for his poetry that it was at least not imitative, and the claim was just as regarded conception and choice of subjects; but as regards diction and imagery the influence of Campbell is very apparent in his earlier poems, and the influence of Shelley is supreme in the *Pelican Island*, his last and best work as a poet. His *Lectures on Poetry and General Literature*, published in 1833, show considerable breadth of sympathy and power of expression. *Memoirs* of him were published in seven volumes in 1856-8. They furnish valuable materials for the history of English provincial politics in the 19th century. He died at Sheffield 30th April 1854.

MONTGOMERY, ROBERT (1807-1855), author of *The Omnipresence of the Deity* (1828), *Satan* (1830), and *The Messiah* (1832), was the Montgomery ridiculed and denounced in Macaulay's famous essay. As a poet, he deserved every word of Macaulay's severe censure; the marks of intellectual feebleness—tautologous epithets, absurdly mixed metaphors, and inapt lines introduced for the sake of rhyme—are visible in every page of his versification. It should be mentioned that Macaulay's "trouncing" did not diminish the sale of his so-called poems; one of the works expressly ridiculed reached its 28th edition in 1858. His real name is said to have been Gomery.

MONTH. See ASTRONOMY, vol. ii. p. 800. and CALENDAR.

MONTILLA, a small and unimportant city of Spain in

the province of Cordova, 32 miles to the south of the city of Cordova, on the Malaga railway, is strikingly situated on two hills which command a beautiful and extensive prospect of the surrounding country. The manufactures (principally weaving) are unimportant, and the trade of the place is chiefly in agricultural produce. The oil of the surrounding district is abundant and good; and it is the peculiar flavour of the pale dry light wine of Montilla that gives its name to the sherry known as Amontillado. The population in 1878 was 13,207. Montilla was the birthplace of "The Great Captain," and still shows the ruins of the castle of his father, Don Pedro Fernandez de Cordova.

MONTLUC, BLAISE DE LASSERAN-MASSENCÔME, SEIGNEUR DE (c. 1503-1577), marshal of France, was born about 1503, at the family seat near Condom in the modern department of Gers. He was the eldest son, and his family was a good one, but it was large and poor, and, like most gentlemen of Gascony, he had to trust for endowment to his sword. He served first as a private archer and man-at-arms in Italy, with Bayard for his captain, fought all through the wars of Francis I., and was knighted on the field of Cériseles (1538). Having apparently enjoyed no patronage, he was by this time a man of middle age. Thenceforward, however, his merits were recognized by his appointment to various important posts. His chief feat was the famous defence of Siena (1555), which he has told so admirably. When the religious wars broke out in France, Montluc, a staunch royalist, held Guienne for the king, and exercised severe but impartial justice on Catholics and Protestants alike. He would have nothing to do with the Massacre of St Bartholomew. Henry III., however, made him marshal of France, an honour which he had earned by nearly half a century of service and by numerous wounds. He died at Estillac near Agen in 1577. Montluc's eminence above other soldiers of fortune in his day is due to his *Commentaires* (Bordeaux, 1592), in which he described his fifty years of service. This book, the "soldier's Bible" (or "breviary," according to others), as Henry IV. called it, is one of the most admirable of the many admirable books of memoirs produced by the unlearned gentry of France at that time. It is said to have been dictated, which may possibly account in some degree for the singular vivacity and picturesqueness of the style. Hardly any author excels Montluc in the clearness with which he brings military operations before the reader. As with most of his contemporaries, his work is didactic in purpose, and he often pauses to draw morals for the benefit of young commanders, but never tediously. The eloquence displayed in some of the speeches is remarkable. These *Commentaires* are to be found conveniently in the collection of Michaud and Ponjoulat, but the standard edition is that of the *Société de l'Histoire de France*, edited by M. de Ruble (5 vols. 1865-72).

MONTLUÇON, the industrial capital of the centre of France, sometimes called the French Manchester, is the head of an arrondissement, and the largest town (26,079 inhabitants in 1881) of the department of Allier. The upper town consists of steep, narrow, winding streets, and preserves several buildings of the 15th and 16th centuries; the lower town, traversed by the river Cher (there converted into a canal communicating with that along the Loire), is the seat of the manufacturing industries, which embrace glass, steel, and iron works, lime-kilns, saw-mills, and a wool-spinning factory. The Commentry coal-mines are only a few miles distant. There is railway connexion with Moulins (50 miles to the east-north-east), Bourges, Limoges, and Clermont-Ferrand, and a new line is about to be opened to Tours *via* Chateauroux. Of the churches, Notre Dame is of the 15th century, St Pierre partly of the 12th, and St Paul modern. The town-hall, with a library, occupies the

site of an old Ursuline convent, and two other convents now serve as college and hospital.

Montluçon, which existed as early as the 10th century, was taken by the English in 1171 and by Philippe Auguste in 1181; the English were beaten under its walls in the 14th century. The castle, rebuilt by Louis II., duke of Bourbon, was taken by Henry IV. during the religious wars; at present it is occupied as a barracks.

MONTMORENCY, the name of one of the oldest and most distinguished families in France, is derived from Montmorency, now in the department of Seine-et-Oise, in the immediate neighbourhood of Enghien and St Denis, and about 9 miles to the north-north-west of Paris. The family, since its first appearance in history in the person of BOUCHARD or BURCHARD I., sire de Montmorency in the 10th century, has furnished six constables and twelve marshals of France, several admirals and cardinals, numerous grand officers of the crown and grand masters of various knightly orders, and was declared by Henry IV. to be, after that of the Bourbons, the first house in Europe. MATTHIEU I., sire de Montmorency, received in 1138 the post of constable, and died in 1160. His first wife was Aline, the natural daughter of Henry I. of England; his second, Adelaide or Alice of Savoy, widow of Louis VI. and mother of Louis VII. According to Duchesne, he shared the regency of France with Suger, during the absence of the latter king on the second crusade. MATTHIEU II. had an important share in the victory of Bouvines (1214), and was made grand constable in 1218. During the reign of Louis VIII. (1223-1226) he distinguished himself chiefly in the south of France (Niort, Rochelle, Bordeaux). On the accession of Louis IX. he was one of the chief supports of the queen-regent Blanche of Castile, and was successful in reducing all the vassals to obedience. He died in 1230. His younger son, Guy, in right of his mother, became head of the house of Montmorency-Laval. ANNE de Montmorency (1493-1567), so named, it is said, after his godmother Anne of Brittany, was the first to attain the ducal title. He was born at Chantilly in 1493, and was brought up with the dauphin, afterwards Francis I., whom he followed into Italy in 1515, distinguishing himself especially at Marignano. In 1516 he became governor of Novara; in 1520 he was present at the Field of Cloth of Gold, and afterwards had charge of important negotiations in England. Successful in the defence of Mézières (1521), and as commander of the Swiss troops in the Italian campaign of the same year, he was made marshal of France in 1522, accompanied Francis into Italy in 1524, and was taken prisoner at Pavia in 1525. Released soon afterwards, he was one of the negotiators of the treaty of Madrid, and in 1530 reconducted the king's sons into France. On the renewal of the war by Charles V.'s invasion of France in 1536, Montmorency compelled the emperor to raise the siege of Marseilles; he afterwards accompanied the king of France into Picardy, and on the termination of the Netherlands campaign marched to the relief of Turin. In 1538, on the ratification of the ten years' truce, he was rewarded with the office of constable, but in 1541 he fell into disgrace, and did not return to public life until the accession of Henry II. in 1547. In 1548 he repressed the insurrections in the south-west, particularly at Bordeaux, with great severity, and in 1549-1550 conducted the war in the Boulonnais, negotiating the treaty for the surrender of Boulogne on 24th March 1550. In 1551 his barony was erected into a duchy. Soon afterwards his armies found employment in the north-east in connexion with the seizure of Metz, Toul, and Verdun by the French king. His attempt to relieve St Quentin issued in his defeat and captivity (10th August 1557), and he did not regain his liberty until the peace of Cateau-Cambrésis in 1559. Supplanted in the interval by the Guises, he was treated with coldness by the new king, Francis II., and compelled to give up his mastership of the royal house-

hold,—his son, however, being appointed marshal by way of indemnity. On the accession of Charles IX. in 1560 he resumed his offices and dignities, and, uniting with his former enemies, the Guises, played an important part in the Huguenot war of 1562. Though the arms of his party were victorious at Dreux, he himself fell into the hands of the enemy, and was not liberated until the treaty of Amboise (19th March 1563). In 1567 he again triumphed at St Denis, but received the death-blow of which he died soon afterwards at Paris. His eldest son, FRANÇOISE de Montmorency (1530-1579), was married to Diana, natural daughter of Henry II.; another son, HENRI I. de Montmorency (1534-1614), was constable of France from 1593. HENRY II. (1595-1632), son of duke Henry I., succeeded to the title in 1614, having previously been raised by Louis XIII. to the office of grand admiral. In 1625 he defeated the French Protestant fleet under Soubise, and seized the islands of Rhé and Oleron, but the jealousy of Richelieu deprived him of the means of following up these advantages. In 1628-1629 he was allowed to command against the duke of Rohan in Languedoc; in 1630 he defeated the Piedmontese, and captured Prince Doria, at Avigliana, and took Saluces. In the same year he was created marshal. In 1632 he joined the party of Gaston, duke of Orleans, and placed himself at the head of the rebel army, which was defeated by Marshal Schomberg at Castelnaudary (1st September 1632); severely wounded, he fell into the enemy's hands, and abandoned by Gaston, was executed as a traitor at Toulouse on 30th October. The title passed to his sister CHARLOTTE-MARGUERITE, princess of Condé.

MONTORO, a town of Spain, in the province of Cordova, 27 miles to the north-north-east of that city, on the Madrid railway, stands on a rocky peninsula on the south bank of the Guadalquivir, here crossed by a fine bridge of four arches dating from the 16th century. Its most conspicuous building is a hospital, said to be one of the best in Andalusia. The most important article of commerce is the oil of the surrounding district. The population of the ayuntamiento was 13,293 in 1878.

MONTPELIER, a town of the United States, the capital of Vermont (since 1805), and the county seat of Washington county (since 1811), is situated in 44° 17' N. lat. and 72° 36' W. long., on the Winooski or Onion river, which falls into Lake Champlain. It has a station on the Central Vermont Railroad, and is the western terminus of the Montpelier and Wells River and the Montpelier and White River Railroads. The State-house, in the form of a Greek cross with a dome and Doric portico, was erected at a cost of \$150,000, to replace the structure burned down in 1857. Under the portico stands a marble statue (by Larkin G. Mead) of Ethan Allen (1737-1789), the hero of Vermont. The State library contains 20,000 volumes. From 2411 in 1860 the population had increased to 3219 in 1880.

MONTPELLIER, chief town of the department of Hérault, France, is situated at the junction of several railway lines, on a small hill rising above the Lez, at its confluence with the Merdanson, about 480 miles south of Paris, and about 7 miles from the Mediterranean, from which it is separated by the lagoons of Pérols and l'Arnel. As the headquarters of the 16th corps d'armée, as the seat of a bishop, of a university, and of a court of appeal, Montpellier is the principal place of lower Languedoc. The Place du Peyrou, 575 feet in length by 410 in breadth, one of the finest squares in France, occupies the highest part of the town, and terminates in a terrace, commanding a magnificent view of the coasts of the Mediterranean, and of a wide stretch of country reaching to the Cevennes on the north, to the spurs of the Pyrenées on the south-west, and to those of the Alps on the north-east. On the terrace is situated the reservoir of the town, the water being

brought from a distance of 5 or 6 miles by an aqueduct of two tiers of arches, about 70 feet in height. In the centre of the square is an equestrian statue of Louis XIV. To the right and left are promenades, on which the chief boulevards converge. The Boulevard Henri IV. to the north leads to the botanical garden, medical college, and cathedral; to the east the Rue Nationale leads to the palace of justice, the préfecture, and the citadel. The cathedral, which until 1536 was the church of a Benedictine monastery, suffered severely during the religious wars, but about thirty years ago it was restored in the style of the 13th century. It has four towers, and is one of the largest churches in southern France, being more than 300 feet in length, 92 in breadth, and 88 in height. The monastery, after being converted into the bishop's palace, has since 1795 being occupied by the famous medical school. The portrait of Rabelais hangs in the gallery of former professors. Connected with the medical school is an anatomical museum and a rich library. Montpellier also possesses a faculty of science, with several fine collections, a faculty of letters, a higher school of pharmacy, an agricultural college, and a sericultural institute. The museum contains more than 600 paintings, in addition to collections of marbles, bronzes, and antiquities. The botanical garden, more than 10 acres in extent, is the oldest in France, having been laid out in 1593. The esplanade, ornamented by fine old trees planted by the duc de Roquelaure, formerly governor of Languedoc, leads towards the citadel. The inner city has narrow and tortuous streets, but many good houses. Among the public buildings, the principal are the palace of justice—a modern structure, the façade adorned with statues of the statesman Cambacérès and of Cardinal Fleury—the barracks, several hospitals, the juvenile seminary, and the central prison for females. There are several learned societies, including an academy of science and letters, an antiquarian society, several medical societies, and others for various separate branches of study, including the dialect of Languedoc. The Lez has been deepened and widened so as to connect Montpellier with the Canal du Midi and with the sea at Palavas. The town has a considerable trade in wine and brandy. The principal industrial establishment is a manufactory for wax-tapers, candles, and soap, doing business to the amount of £400,000 per annum. There are also chemical works, cooperages, distilleries, &c. The population in 1881 was 56,005.

Montpellier first rose into importance after the destruction of Maguelone by Charles Martel in 737. Its prosperity dates from the beginning of the 12th century, when its school of medicine (see vol. xv. p. 807) first began to acquire fame. It had a school of law in 1160, and a university was founded by Pope Nicholas IV. in 1292. St Louis (Louis IX.) granted to the town the right of free trade with the whole of the kingdom, a privilege which greatly increased its prosperity. In 1204 Montpellier became a dependency of the house of Aragon, through marriage, and in 1350 it was sold to Philip of Valois. In the time of Charles VIII. it is said to have had 35,000 hearths. It took the place of the bishopric of Maguelone in 1536. At the time of the Reformation it became one of the most important centres of Protestantism, but was taken by Louis XIII., who erected the citadel commanding the town. Several years afterwards Montpellier was partly depopulated by the plague. Of the old fortifications little now remains save the gate of Peyrou, a triumphal arch of date 1712, opposite the place of the same name.

See Germain, *Histoire du commerce de Montpellier antérieurement à l'ouverture du port de Cette* (2 vols., 1801), and *Histoire de la commune de Montpellier* (3 vols., 1851); Aigrefeuille, *Histoire de la ville de Montpellier* (1877).

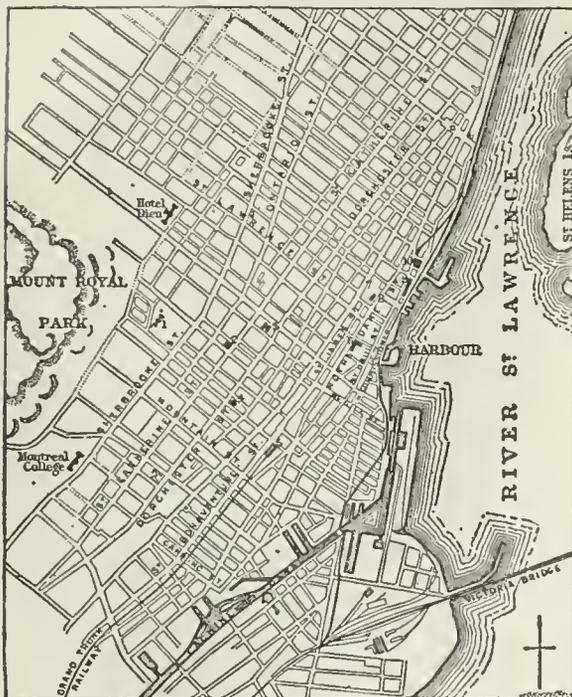

MONTPENSIER, ANNE MARIE LOUISE D'ORLÉANS, DUCHESSE DE (1627-1693), one of the most remarkable names on the somewhat arbitrary list of royal and noble authors, was born at the Louvre on 29th May 1627. Her father was Gaston of Orleans, "Monsieur," the brother of Louis XIII., celebrated for the invariable ill fate which attended his favourites and partisans. Her mother was Marie de Bourbon, heiress of the Montpensier family. Being

thus of the blood-royal of France on both sides, and an heiress to immense property, she appeared to be very early destined to a splendid marriage. It was perhaps the greatest misfortune of her life that "Mademoiselle" (as her courtesy title went) was encouraged or thought herself encouraged to look forward to the throne of France as the result of a marriage with Louis XIV., who was, however, eleven years her junior. Ill-luck, or her own wilfulness, frustrated numerous plans for marrying her to various persons of more or less exalted station, including Charles II. of England, then Prince of Wales. She was just of age when the Fronde broke out, and, attributing as she did her disappointments to Mazarin, she sympathized with it not a little. It was not, however, till the new or second Fronde that she displayed in a very curious fashion a temper and courage as masculine and adventurous as those of her father Gaston had always been effeminate and timid. She not only took nominal command of one of the armies on the princes' side, but she literally and in her own person took Orleans by escalade, crossing the river, breaking a gate, and mounting the walls with the applause of the populace of the city, but in face of the refusal of the authorities to admit her. No good result, however, came to her party from this extraordinary act, and she had to retreat to Paris, where she practically commanded the Bastille and the adjoining part of the walls. On the 2d of July (1652) the battle of the Faubourg Saint Antoine, between the Frondeurs under Condé and the royal troops under Turenne, took place, and the former, being beaten, found themselves in an awkward situation, between their conquerors and the walls of a city, which, though not exactly hostile to them, was not nominally on their side, and had closed its gates against them. Mademoiselle saved them by giving orders not merely for the gates under her control to be opened but for the cannon of the Bastille to fire on the royalists, which was done. Her own residence (and indeed her property) was the Luxembourg, and here she found herself during the riots which followed the battle; but in the heat of the *émeute* she installed herself in the *hôtel de ville*, and played the part of mediatrix between the opposed parties. Her political importance lasted exactly six months, and did her little good, for it created a lifelong prejudice against her in the mind of her cousin, Louis XIV., who never forgave opposition to his sovereign power. Nor had she any support to look for from her pusillanimous father, who hastened to make terms for himself,—a matter the less difficult that his known faithlessness had prevented the chiefs of the Fronde from engaging him at all deeply in their schemes. Mademoiselle, on the other hand, was for some years in disgrace, and resided on her estates. It was not till 1657 that she reappeared at court, but, though projects for marrying her were once more set on foot, she was now past her first youth. Her incurable self-will, moreover, still stood in her way, and suitor after suitor was rejected for reasons good or bad. She was nearly forty, and had already corresponded seriously with Madame de Motteville on the project of establishing a ladies' society "sans mariage et sans amour," when a young Gascon gentleman named Puyguilhem, afterwards celebrated as M. de Lauzun, attracted her attention. It was some years before the affair came to a crisis, but at last, in 1670, Mademoiselle solemnly demanded the king's permission to marry Lauzun. Madame de Sévigné's letter on this occasion is one of the most famous of her collection. Louis, who liked Lauzun, and who had been educated by Mazarin in the idea that Mademoiselle ought not to be allowed to carry her vast estates and royal blood to any one who was himself of the blood-royal, or even to any foreign prince, gave his consent, but it was not immediately acted on. The pride of the other members of the

royal family, and the spite of the king's brother, Monsieur, who had, after the death of Henrietta of England, made offers to his cousin, prevailed with Louis to rescind his permission. Not long afterwards Lauzun, for another cause, was imprisoned in Pignerol, and it was years before Mademoiselle was able to buy his release from the king by settling no small portion of her estates on Louis's bastards. The elderly lovers (for in 1681, when Lauzun was released, he was nearly fifty, and Mademoiselle was fifty-four) were then secretly married, if indeed they had not gone through the ceremony ten years previously. But Lauzun, a coarse and brutal adventurer, tyrannized over his wife, and her spirit, which was yet unbroken, at length got the better of her passion. It is said that on one occasion he addressed her thus, "Louise d'Orléans, tire-moi mes bottes," and that she at once and finally separated from him. She lived, however, for some years after he had achieved his last adventure (that of assisting the family of James II. to escape from England, and attempting to defend their cause in Ireland), gave herself to religious duties, and finished her *Mémoires*, which extend to within seven years of her death (9th April 1693), and which she had begun when she was in disgrace thirty years earlier. These *Mémoires* (Amsterdam, 1729) are of very considerable merit and interest, though, or perhaps because, they are extremely egotistical and often extremely desultory. Mademoiselle writes without art, but with the hereditary ability of her family, and the strongly personal view which she takes of public events is rather an advantage than a disadvantage. They are to be found in the great collection of Michaud and Poujoulat, and have been frequently edited apart. (G. SA.)

MONTREAL, the largest city in the Dominion of Canada, its chief seat of commerce and principal port of entry, is situated on an island of about 30 miles in length and 7 in breadth, at the confluence of the rivers Ottawa and St Lawrence, 45° 32' N. lat. and 73° 32' W. long. It stands at the head of ocean navigation, 160 miles above Quebec, and nearly 1000 miles (986) from the Atlantic Ocean, and lies at the foot of the great chain of river, lake, and canal navigation which extends westward through the great lakes. Montreal is built upon a series of terraces, the former levels of the river or of a more ancient sea. Behind those rises Mount Royal, a mass of trap-rock thrown up through the surrounding limestone strata to a height of 700 feet above the level of the river. From this rock the city derives its name, though its original founder, Paul de Chomedey, sire de Maisonneuve, in 1642, gave it the name of Ville-Marie, when it was dedicated with religious enthusiasm, not as a centre of commercial enterprise, but as the seat of a mission which aimed specially at the conversion of the native Indians. The modern city of Montreal occupies an area of about eight square miles,—its principal streets running parallel with the river. On the north side of the Mountain the Trenton limestone approaches the surface, and is there quarried for building purposes. Of this grey limestone most of the public edifices and many of the better class of private dwellings are built. But both brick and wood are largely used for workshops and private houses of a humbler class. The western slope of the Mountain is occupied by the Côte des Neiges (Roman Catholic) cemetery, and the Mount Royal (Protestant) cemetery. The upper portion of the Mountain, embracing an area of 430 acres, is now laid out as a public park, with fine drives shaded by well-grown trees. From its commanding site, and the wide expanse of the valley of the St Lawrence, the views on all sides are of great variety and beauty. A well-cultivated and wooded country, watered by the Ottawa and the St Lawrence, stretches away on either hand, being bounded on the west by the lakes of St Louis and the Two Mountains, and on the distant horizon by

the Laurentian Hills, the Adirondacks, and the Green Mountains of Vermont. On the east side the city occupies the slope towards the river St Lawrence, which has here a breadth of from one to two miles. Two islands, the Nun's and St Helen's Isles—the latter rising to a height of 150 feet, beautifully wooded, and laid out as a public park—occupy the bed of the river immediately below the Lachine Falls, and between them the river is spanned by the great Victoria Bridge. This wonderful triumph of engineering skill is a tubular iron bridge supported on twenty-four piers of solid masonry, with the terminal abutments of the same, and measuring 9184 feet in length. The river descends at the rate of 7 miles an hour at the point where it is thus crossed; and the

Plan of Montreal.

piers are constructed with a view to resist the enormous pressure of the ice in spring. Near at hand the towers, spires, and domes of numerous churches and public buildings rise from the general mass of houses. The wharves and docks are crowded with shipping during the season of navigation, for the St Lawrence is navigable to Montreal by the largest ocean steamers. But immediately above the city the river is impeded by a natural dyke of trap and limestone which here arrests the waters in their descent, forming the Lake St Louis at a height of 44 feet above the level of Montreal harbour. The river here forces its way through a channel of about half a mile wide, with a rapidity of about 18 miles an hour, forming the Lachine or St Louis Rapids. Owing to the immense volume of water concentrated in a narrow channel, steamers drawing ten feet of water are safely navigated down the rapids, but these necessarily present an insuperable barrier to the ascent of the river. This is accordingly surmounted by means of the Lachine Canal, which, commencing at the port of Montreal, passes round the falls by a series of locks, in a course of nine miles, to Lake St Louis, opposite the Indian village of Caughnawaga. The fall of water

in the canal furnishes water-power for saw-mills, boiler and engine works, sash, blind, door, edge-tool, and other factories, established on its banks. Sugar-refining has also been carried on here with great profit. Woollen and cotton mills, silk factories, a large rubber factory, rope and cordage works, boot and shoe factories, &c., are likewise organized on an extensive scale. The water supply of Montreal is derived from the river above the city; and, after passing along an open canal 5 miles in length, it is raised to a reservoir excavated out of the solid rock on the east slope of the Mountain, 205 feet above the level of the harbour.

The circumstances attendant on the foundation of Montreal, and the marked contrasts in its mixed population of French and English, give a peculiar character to its religious and benevolent institutions. This has led to the multiplication of churches, colleges, convents, and religious and charitable foundations, and to a rivalry in the zeal of their promoters, one result of which is seen in the scale and imposing character of many of their buildings. The Metropolitan Cathedral of St Peter, designed to reproduce on a reduced scale the chief features of St Peter's at Rome, was projected by Bishop Bourget after the destruction of his church and palace in the great fire of 1852. It occupies a prominent site in Dorchester Street, at the corner of Dominion Square; and, when surmounted by the projected dome and finished in front with its classic façade, it will form a striking feature in the general view of the city. The parish church of Notre-Dame, on the Place d'Armes, affords accommodation for 10,000 worshippers. The Jesuits' Church is another large church, elaborately painted in the interior. Near it is the College of St Mary. Christchurch Cathedral (Protestant) is a fine specimen of Decorated Gothic, built externally of the native limestone, but with the chief facings and carvings of the exterior and the whole of the interior of fine Caen stone. It was erected under the direction of Bishop Fulford, the first Anglican bishop of Montreal, to whose memory a memorial cross, after the model of the Queen Eleanor crosses, has been erected on the south side of the cathedral. The other churches of the various Protestant denominations include St George's, Anglican, St Andrew's and St Paul's (Presbyterian), St James Street Methodist Church, the Church of the Messiah, Unitarian, &c.

The Hôtel Dieu, founded in 1644 for the cure of the sick, now occupies a building at the head of St Famille Street. A body of professed sisters and novices perform the duties of nursing and attendance, and upwards of 3000 sick persons are annually received into its wards. The order of the Grey Nuns, founded in 1737, have built a new hospital in Guy Street. The professed sisters of this religious community, numbering at present 310, receive under their care the aged and infirm and orphan and foundling children of the French Canadian population. They also undertake the care of various asylums and schools in different parts of the city. Montreal has also a General Hospital, founded in 1822; a Protestant House of Industry, the Mackay Institution for Deaf-Mutes, the Protestant Orphan Asylum, Infants' Home, &c. The curiously mixed character of the population of Montreal is further shown in its separate daily and weekly newspapers in the English and French languages, and in its various national societies, of St George, St Andrew, St Patrick, St Jean Baptiste, and New England,—each confining its charitable operations to those of the nationality which it represents. There are two theatres in Montreal, but the Roman Catholic clergy have systematically discountenanced the stage, and the diverse languages have further tended to limit the numbers who patronize the drama.

Among the chief civic buildings is the city hall, built in the modern French style, with lofty mansard roofs, and a central pavilion. It affords accommodation for all the municipal offices, including the waterworks and fire alarm departments, the recorder's court, the police office, and for the meetings of the city corporation, which consists of a mayor and twenty-seven aldermen. Three aldermen are elected by each of the nine wards, one of whom retires every year. The court house, situated close to the city hall, between the Champ de Mars and Jacques Cartier Square, is a handsome classical building where all the law courts hold their sittings; and accommodation is provided for the Advocates' Library, which numbers upwards of 10,000 volumes, including a fine collection of books in the department of old French civil law. Bonsecours Market in St Paul Street is a large structure surmounted by a dome, which forms a prominent feature in every view of the city. When it is crowded with the peasants bringing in their country produce, and by the French Canadian city populace as purchasers, as is the case especially on Tuesdays and Fridays, the scene is very striking to a stranger.

Foremost among the educational institutions is the university of McGill College, founded by James McGill, a Scotchman, who in the later years of the 18th century engaged in the north-west fur trade,

and ultimately became one of the leading merchants in Montreal. At his death in 1813 he left his property for the founding of a college. The most recent and liberal addition to it is the Peter Redpath Museum, valued at upwards of \$100,000, the gift of a wealthy citizen. The university embraces the faculties of arts, law, and medicine, and has also a department of practical science. The college buildings stand in a pleasant park fronting on Sherbrooke Street, at the base of the Mountain. Theological colleges in connection with the Church of England, the Presbyterian, Methodist, and Congregational Churches, occupy buildings in the vicinity, and their students attend the classes at McGill College for secular instruction. The Seminary of St Sulpice is a theological training school for priests, where the larger portion of the Roman Catholic clergy of the province of Quebec have received their training, and also a college where a large number of the French Canadian youth obtain their education. This seminary is held in high esteem, and attracts many Roman Catholic students from the United States. Laval University, which has its chief seat at Quebec, has also a branch at Montreal, with a large staff of professors, chiefly in theology, law, and medicine. The McGill and the Jacques Cartier Normal Schools for training teachers for the Protestant and Roman Catholic public schools are conducted under the Protestant and Roman Catholic boards of public instruction; and model schools attached to them afford the requisite practical training for teachers. The principal public monuments are the column erected in honour of Lord Nelson, and a bronze statue of Queen Victoria, by the late Marshall Wood, which occupies a good site in Victoria Square.

The commerce of Montreal is well represented by the architectural character of its banking establishments and many of the large mercantile houses. It is also the seat of a large manufacturing industry. But the most substantial evidence of its importance as a commercial centre is its harbour. The solidly-built basins, wharves, quays, and canal locks extend for upwards of a mile and a half along the river-side. In 1849, at a period of depression, the total value of the imports and exports amounted to £2,013,478 sterling. In 1882 they had risen to £15,633,657 sterling. The business of the port at the same date is thus expressed in Canadian currency:—total value of exports \$26,334,312, of imports \$49,749,461; customs duties collected estimated at \$8,100,366. The number of sea-going vessels in port was 643, of which fully one-half were ocean steamers, in addition to which the inland vessels arriving at the port numbered 6543. The estimated value of real estate in Montreal is \$63,978,930. The population in 1851 numbered 57,715; in 1881 it had increased to 140,747, of whom 78,634 were of French and 23,995 of Irish origin, and of the whole number, 103,579 were Roman Catholic.

The city returns three members to the Canadian House of Commons, and the same number to the provincial legislature of Quebec.

When the first French explorers landed on the island of Montreal under the leadership of Jacques Cartier in 1535, a large Indian palisaded town existed a little to the west of Mount Royal, and not far from the present English cathedral. To this fortified town the Indians gave the name of Hochelaga, and Jacques Cartier describes it as surrounded by fields of grain and other evidences of a settled native population. The name is now applied to the eastern suburb of the modern city. Sixty years later, when Samuel de Champlain made his way up the St. Lawrence, and climbed to the summit of Mount Royal, the populous native town had disappeared, and only two Indians were found from whom some obscure hints were derived of war between rival tribes, followed by the destruction of the town and the extermination or flight of its former occupants. The enmity thus established between the Wyandotts or Hurons of Canada and the Iroquois settled in the valley of the Hudson and south of Lake Ontario was perpetuated throughout the whole period of French occupation. Champlain took the side of the Hurons, while the Iroquois allied themselves with the Dutch and English settlers on the Hudson. Thus the early history of Montreal is largely occupied with incidents of Indian warfare. In 1665 the marquis de Tracy arrived from France, bringing with him a regiment of French soldiers, with whose aid the Indian assailants were driven off, and forts erected and garrisoned to repel their incursions; thus protected, Montreal became the centre of the fur trade with the west, and entered on its history as a commercial city. In 1722 it was fortified with a bastioned wall and ditch, under the directions of De Lery; and the citadel was erected on a height now laid out as Dalhousie Square. The taking of Quebec by the English under General Wolfe in 1759 was followed ere long by the surrender of Montreal. Since that date it has rapidly developed as an important centre of commercial and manufacturing enterprise. (D. W.)

MONTROSE, a royal and parliamentary borough and seaport of Forfarshire, Scotland, is situated on the German Ocean at the mouth of the South Esk, on a branch of the Caledonian Railway, 30 miles east-north-east of Dundee, and 38 south-south-west of Aberdeen. Its harbour basin.

formed by the estuary of the South Esk, has an area of about 4 square miles, and is dry at ebb-tide, but at high water there is a depth of about 18 feet at the bar. The length of the quays and docks is about 1½ miles. The South Esk is crossed by a suspension bridge erected in 1829 at a cost of £20,000, and having a length from the points of suspension of 422 feet (with its approaches 800 feet). On the links to the east of the town is one of the finest golfing greens in Scotland. In the High Street, which is of considerable width, and contains several very lofty houses, there are monuments to Sir Robert Peel and to Joseph Hume, formerly member for the Montrose boroughs. The principal buildings are the parish church—one of the largest churches in Scotland—the town-house, the infirmary, and the academy. There is a public library with 19,000 volumes, and a mechanics' library with 7000 volumes. Besides the staple industry of flax-spinning, there are manufactures of linen, sail-cloth, sheetings, starch, and soap. Iron-founding, tanning, and brewing are also carried on. The export trade is chiefly in manufactured goods, agricultural produce, and fish; the principal imports are timber and coal. In 1881 the number of ships that entered coastwise was 373 of 48,828 tons, the number that cleared 250 of 21,877 tons; the number engaged in the foreign and colonial trade in the same year was—entered 108 of 34,868 tons, cleared 42 of 10,359 tons. Montrose is also one of the principal fishing-stations in Scotland, the number of registered boats in 1881 being 342 of 4168 tons, giving constant employment to 697 persons, and occasional employment to 300. Montrose joins with Arbroath, Brechin, Forfar, and Inverbervie in returning one member to parliament. The population of the royal burgh in 1871 was 15,720, and 16,280 in 1881; the population of the parliamentary burgh in the same years was 14,452 and 14,975.

Montrose received a charter from David I. in the 12th century, and was made a royal burgh by David II. in 1352. The town was destroyed by fire in 1244. It was from the port of Montrose that Sir James Douglas in 1330 embarked for the Holy Land with the heart of Bruce, and that Prince James Stuart, "the Old Pretender," set sail in 1716 for France, after the failure of his cause in Scotland. The town is the birthplace of Andrew Melville, of the great marquis of Montrose, and of Joseph Hume.

MONTROSE, JAMES GRAHAM, MARQUIS OF (1612-1650), born in 1612, became the fifth earl of Montrose by his father's death in 1626. He was educated at St Andrews; and in 1629, at the early age of seventeen, he married Magdalene Carnegie, daughter of the earl of Southesk. In 1636, on his way home from a prolonged visit to the Continent, he sought an introduction to Charles I., but, as it is said, was frustrated in his hope of obtaining the king's favour by an intrigue of the marquis of Hamilton. Not long after the outbreak of the Scottish troubles in 1637 he joined the party of resistance, and was for some time its most energetic champion. He had nothing puritanical in his nature, but he shared in the ill feeling aroused in the Scottish nobility by the political authority given by Charles to the bishops, and in the general indignation at the king's ill-judged scheme of imposing upon Scotland a liturgy which had been drawn up at the instigation of the English court, and which had been corrected in England by that Archbishop Laud who now became known in Scotland under the nickname of "the pope of Canterbury." Montrose's chivalrous enthusiasm eminently qualified him to be the champion of a national cause, and the resistance of Scotland was quite as much national as it was religious. He signed the Covenant, and became one of the foremost Covenanters. The part assigned to him was the suppression of the opposition to the popular cause which arose around Aberdeen and in the country of the Gordons. Three times, in July 1638, and in March and June 1639. Montrose

entered Aberdeen, where he thoroughly succeeded in effecting his object, on the second occasion carrying off the head of the Gordons, the marquis of Huntly, as a prisoner to Edinburgh.

In July 1639, after the signature of the treaty of Berwick, Montrose was one of the Covenanted leaders who visited Charles upon the borders. This change of policy on his part is frequently ascribed to the fascination of the king's conversation. In reality it arose from the nature of his own convictions. He wished to get rid of the bishops without making presbyters masters of the state. His was essentially a layman's view of the situation. Taking no account of the real forces of the time, he aimed at an ideal form of society in which the clergy should confine themselves to their spiritual duties, and in which the king, after being enlightened by open communication with the Scottish nation, should maintain law and order without respect of persons. In the Scottish parliament which met in September, Montrose attempted to carry out this policy, and found himself in opposition to Argyll, who had placed himself at the head of the Presbyterian and national party, which, by an alteration of the rules that had hitherto regulated the selection of the Lords of the Articles, gave supremacy in parliament to the representatives of the middle classes. Montrose, on the other hand, wished to bring the king's authority to bear upon parliament to defeat this object, and offered him the support of a great number of the nobles, who were by this time as much opposed to the predominance of the Presbyterian clergy acting upon the middle classes as they had before been opposed to the predominance of the bishops. He failed, because Charles could not even then consent to abandon the bishops, and because no Scottish party of any weight could be formed unless Presbyterianism were established ecclesiastically.

Rather than give way, Charles prepared in 1640 to invade Scotland. As usual, he prepared difficulties for those who wished to support him. Montrose was of necessity driven to play something of a double part. In August 1640 he signed the Bond of Cumbernauld as a protest against the particular and direct practising of a few—in other words, against the ambition of Argyll. But he took his place amongst the defenders of his country, and in the same month he was the first to wade across the Tweed at the head of the invaders of England. After the invasion had been crowned with success, Montrose still continued to cherish his now hopeless policy. On 27th May 1641 he was summoned before the Committee of Estates charged with intrigues against Argyll, and on 11th June he was imprisoned in Edinburgh Castle. When Charles visited Scotland to give his formal assent to the abolition of Episcopacy, Montrose communicated to him his belief that Hamilton was a traitor. It has indeed been alleged, on Clarendon's authority, that he proposed to murder Hamilton and Argyll; but this is in all probability only one of Clarendon's many blunders. His letters to Charles, however, must be taken in connexion with this so-called incident. During the progress of the investigation of this plot, Montrose remained in custody, and upon the king's return to England he shared in the amnesty which was tacitly accorded to all Charles's partisans.

For a time Montrose retired, not voluntarily, from public life. After the Civil War in England began he constantly pressed Charles to allow him to make a diversion on Scotland. At last in 1644, when the Scottish army entered England to take part against the king, Montrose, now created a marquis, was allowed to try what he could do. He set out to invade Scotland with about 1000 men. But his followers deserted, and his condition appeared hopeless. Genius, however, inspired him with courage. Disguised

as a groom, he, with only two gentlemen, started on 18th August to make his way to the Highlands. No enterprise might seem rasher. Highlanders had never before been known to combine together, but Montrose knew that most of the clans detested Argyll, not because they were royalist but because Argyll, as the head of the Campbells, was the chief of an aggressive and unscrupulous tribe. Montrose did not miscalculate his chances. The clans rallied to his summons. About 2000 Irish had crossed the sea to assist him. He won battle after battle. He defeated the Covenanters at Tippermuir on 1st September, and at the Bridge of Dee on 12th September. Rapidity of movement was the distinguishing feature of his generalship. He crossed the mountains deep with a winter's snow into the country of Argyll, burning and destroying as he rested for a time from more active operations. On 2d February 1645 he crushed the Campbells at Inverlochy, whilst the head of the house, who was no warrior, looked on at the disaster from a boat. The Scottish parliament declared Montrose to have forfeited his life and estate as a traitor, but it could not reach him to execute the sentence. On 19th February he captured Elgin, through March he was ravaging Aberdeenshire and Kincardineshire, on 3d April he stormed Dundee, then on 9th May came the victory of Auldearn, on 2d July the victory of Alford, and on 15th August the great victory of Kilsyth. Never till after this battle had Montrose ventured far from the Highland hills. The Highlanders had the habit of running home after a victory to secure their booty. Now, however, Montrose found himself apparently master of Scotland. In the name of the king, who now appointed him lord-lieutenant and captain-general of Scotland, he summoned a parliament to meet at Glasgow on 20th October, in which he no doubt hoped to reconcile loyal obedience to the king with the establishment of a non-political Presbyterian clergy. That parliament never met. In England Charles was in evil case. He had been defeated at Naseby on 14th June, and Montrose must come to his help if there was to be still a king to proclaim. He never had a chance of knowing what Montrose could do against the "new model" army. David Leslie, the best of the Scottish generals, was despatched against Montrose to anticipate the invasion. On 12th September he came upon Montrose, deserted by his Highlanders and guarded only by a little group of followers, at Philiphaugh. He won an easy victory. Montrose cut his way through to the Highlands; but he failed to reorganize an army. On 3d September 1646 he embarked for Norway.

Montrose was to appear once more on the stage of Scottish history. In June 1649 he was restored by the exiled Charles II. to his nominal lieutenant-governorship of Scotland. In March 1650 he landed in the Orkneys to take the command of a small force which he had sent on before him. Crossing to the mainland, he tried to raise the clans, but the clans would not rise, and on 27th April he was surprised and captured at Corbiesdale in Ross-shire. On 18th May he entered Edinburgh as a prisoner. On the 20th he was sentenced to death by the parliament, and he was hanged on the 21st, with Wishart's laudatory biography of him put round his neck. To the last he protested that he was a real Covenanter and a loyal subject. "The Covenant which I took," he said, "I own it and adhere to it. Bishops, I care not for them; I never intended to advance their interest." Something, at least, of Montrose's dream, so impossible to realize at that time, has been realized in Scotland. Scotland has remained ecclesiastically Presbyterian. The political legality which Montrose wished to uphold against factions by means of the king has been upheld by means of the political ripeness of the Scottish nation itself. (s. r. a.)

MONT ST MICHEL, a curious rocky islet, consisting

of a mass of granite about 3000 feet in compass and 165 feet in height, rises at a distance of nearly a mile from the shore in the bay of St Michel, near the mouth of the Couësson, at the vertex of the angle formed by the coasts of Brittany and Normandy. The quicksands by which it is surrounded, and which stretch far to seaward, are exposed at low water, and highly dangerous to those who venture on them without a guide. Recently efforts at reclamation have been made, and amongst other works a causeway has been constructed connecting Mont St Michel with the nearest point of the mainland (near Moidrey); an unfortunate consequence of these operations has been that some portions of the ramparts of the island have been sapped by the altered tidal currents. The fortress-abbey, to which the rock owes its fame, stands upon the more precipitous side towards the north and west; the sloping portion towards the east and south is occupied by dwelling-houses. The strong machicolated and turreted wall by which the whole is surrounded is pierced only by a single gateway. The northward wall of the abbey (La Merveille), dating from the 13th century, is of remarkable boldness; it is 246 feet in length and 108 feet in height, is supported by twenty buttresses, and is pierced by a variety of openings. The single street of the island, leading from the one gateway up to the donjon of the fortress, is lined with houses, most of them used as lodging-houses by visitors and pilgrims; it contains an old parish church, and the house of Du Guesclin is also pointed out. The abbey consists principally of two parallel buildings of three stories each, that on the east containing hospitiun, refectory, and dormitory, and that on the west the cellar, knights' hall, and cloister. The knights' hall is a superb piece of Gothic architecture, measuring 85 feet by 59, with three rows of richly-ornamented pillars. The cloister is one of the purest and most graceful works of the 13th century (1228). The church has a number of imperfect turrets, and is surmounted by a square tower of the 17th century, with a statue of St Michael, which was crowned in 1877. The nave, which dates from the 11th century, is Norman; but the choir, which collapsed in 1421, has been rebuilt in the flamboyant style. Beneath is a fine crypt.

Mont St Michel was a sacred place even in the time of the Druids. It became a seat of Christian worship in the 8th century, when a monastery was founded upon it (with the usual miraculous accompaniments) by St Aubert, bishop of Avranches. It soon became a favourite resort of pilgrims, not only from all parts of France, but also from Great Britain and Ireland, and even from Italy. It was plundered by the Normans; but Rollo, on his conversion, made restitution. At the time of the Conquest it supplied William of Normandy with six ships, and received a considerable share of the English spoils. About this time the monks began to give themselves to learning and to collect a large library, and in the 12th century the establishment reached its highest prosperity. It was burnt by the troops of Philip Augustus, who afterwards furnished large sums for its restoration (La Merveille). St Louis (Louis IX.) made a pilgrimage to Mont St Michel, and was afterwards very liberal to it. During the hundred years' war it offered a memorable resistance to the English; and here, on 1st August 1469, Louis XI. instituted the order of St Michel, and held a brilliant chapter. A similar celebration was held by Francis I. During the religious wars the Huguenots made repeated unsuccessful attempts to seize the fortress; it opened its gates to Henry IV. after his abjuration. About 1615 the Benedictine monks of Mont St Michel were replaced by monks of the Congregation of St Maur; after the Revolution the abbey was used as a prison for political offenders. It is now an historical monument: it contains an orphanage, and is undergoing repairs.

MONTSERRAT, one of the Leeward Islands in the West Indies, situated 16° 45' N. lat. and 62° 7' W. long., is 12 miles long and 8 broad in its widest part, and has an area of 32 square miles. The uneven and rugged surface suggests possibly volcanic origin. Its general appearance is very picturesque, the most interesting natural feature being the Soufrière. The island was discovered by Columbus in 1493, and received its name either because

of its broken appearance or after the mountain in Spain. It was colonized by the English under Sir Thomas Warner in 1632, and was taken by the French in 1664. Restored to the English in 1668, it capitulated to the French in 1782, but was again restored in 1784. It is now a presidency under the general government at Antigua, and has a legislative council, composed of officials and crown nominees. The climate is the most healthy in the West Indies. The population (10,087) consists principally of negroes, with several hundred whites. The revenue and expenditure average £5600 per annum. Sugar exports range from 1200 to occasionally 2000 tons. An important industry is the cultivation of limes and the manufacture of juice. About 700 puncheons of raw lime juice, 300 hogsheads of concentrated juice, and an increasing quantity of fresh green limes are exported annually. For the three years ending 1880 the average value of imports was £26,390, of exports £32,963. The principal town is Plymouth, lying midway along the south-west coast.

MONTSERRAT. Thirty miles to the north-west of Barcelona in Spain there rises a very remarkable mountain of grey conglomerate, 24 miles in circumference, and at its loftiest point (San Geronimo) a little more than 4000 feet in height. From the comparative lowness of the surrounding district, and from its extraordinary configuration, it is a conspicuous object for many miles around. The mountain consists of jagged pinnacles and spires rising abruptly from the base of the mass, which is cloven with many clefts, and abounds with steep precipices. It is the *Mons Serratus* of the Romans, the *Monte Serrado* of the Spaniards, and is thus named either in allusion to its jagged appearance, like the teeth of a saw, or because the eastern face is split, as if sawn,—which occurred, say the Spanish legends, at the time of the crucifixion, when the rocks were rent. The arms of the monastery represent a mountain with a saw resting upon it and penetrating some distance into its mass. Its pinnacles and pyramids and sharp angular masses resemble a mountain of hard crystalline volcanic tuff which occurs between Akureyri and Kalmanstunga in Iceland. The effect of Montserrat may be realized faintly if we place ourselves upon the roof of Milan cathedral, and imagine the forest of spires magnified a thousandfold. The central spire will represent San Geronimo. The result of this varied contour in the case of Montserrat is to make it one of the most picturesque places in Europe. Paths wind along the faces of the precipices, ascending to bare grey summits, descending to sheltered valleys filled with evergreens and flowers. The Pyrenees are seen in one direction, the sea in another, while the Llobregat winds at the foot of the mountain through the village of Monistrol. Manresa and other villages are seen scattered over the plain; and hills covered with a warm red soil alternate with rich valleys. Street says of Montserrat,—“After much experience of mountains, it strikes me more each time that I see it as among the very noblest of rocks.”

The monastery, a great pile of buildings, stands upon a narrow platform on the edge of a vast chasm in the eastern face of the mountain. It owes its existence to an image of the Virgin, said to have been carved by St Luke, and brought to Barcelona by St Peter in 30 A.D. When the Moors invaded the province in 717, the image was taken to Montserrat and hidden in a cave. In 880 Gondemar, bishop of Vich, was attracted to the cave by sweet sounds and smells, and there found the image, which he determined to take to Manresa. But at a certain spot on the mountain the image refused to proceed farther; there it was consequently deposited, and a chapel was erected to contain it. A stone cross near the walls of the monastery still marks the spot where the image refused to move. Round the chapel a nunnery was built, and in 976 this was enlarged

and converted into a Benedictine monastery. Philip II. built the present church. In 1835 the monastery was suppressed and despoiled of the vast treasures which had accumulated during the Middle Ages. But the buildings were allowed to remain, as well as a few of the fathers to take charge of the Virgin's shrine. At present they number 19; a hundred years ago there were 76 monks, 28 lay-brothers, 25 singing boys, together with surgeon, physician, and servants. The possessions then consisted of numerous hamlets, besides great quantities of plate and jewels, including 85 silver lamps.

Nuestra Señora de Montserrat, Patrona de Cataluña, is one of the most celebrated images in Spain, and her church is visited annually by more than 80,000 pilgrims. It is a small carved wooden image, "regularly handsome, but the colour of a negro woman," and possesses magnificent robes and jewels. It has been visited by numbers of sovereigns and high ecclesiastics, and by millions of Catalonians. In September 1881 it was solemnly crowned by Leo XIII., who sent a crown from Rome for that purpose. Quantities of *ex votos* are offered at the shrine: wax models of injured or diseased limbs, models of ships, pictures and clothes, jewels and silver hearts. As the celebrity and sanctity of Montserrat increased, so did the number of devotees. Ignatius Loyola laid his sword upon the altar of the Virgin, and, placing himself under her protection, started from Montserrat to commence his new life. Many eminent Spaniards, weary of the world, have retired to this monastery to end their days. Some preferred solitary hermitages perched among the rocks. Of these there were fifteen, eleven of which once formed a *via sacra*, ending at the summit of San Geronimo. They were destroyed by the French, but the ruins of some of them still remain. From all the view is magnificent; some are indeed placed on the edges of precipices in almost inaccessible places. There are also caves in the mountain, some of which were formerly occupied by monks. The most celebrated of these are the cave of the Virgin, in which the *Santa Imagen* remained hidden until found by Gondemar, and the cave of Fray Juan Garin, a notorious sinner, who ended his days in the practice of revolting penances at Montserrat. At Collbato, on the south-east side of the mountain, near the base, there are also some very curious caves.

MONTUCLA, JEAN-ÉTIENNE (1725-1799), a learned mathematician, was the son of a merchant, and was born at Lyons in 1725. He attended the college of the Jesuits in his native city, and was early distinguished for his tenacious memory and his aptitude for mathematics. At the age of sixteen he removed to Toulouse to prosecute the study of law; and after taking the usual degrees he repaired to Paris. There his conversational powers, his solid information, and his acquirements as a linguist soon introduced him to the notice of the learned. In the society of D'Alembert and Lalande his taste for mathematical studies was confirmed and stimulated. After publishing two anonymous treatises on the *Quadrature of the Circle* and on the *Duplication of the Cube*, he gave to the world in 1758 the first part of his great work, *The History of Mathematics*. Not long after this his merits were recognized by the Government, and he was promoted to several important offices. He was appointed intendant-secretary at Grenoble in 1758, secretary to the expedition for colonizing Cayenne in 1764, and "premier commis des bâtimens" and censor-royal for mathematical books in 1765. During the next twenty-five years his time was divided between his official duties and the study of his favourite science. The Revolution then ensuing deprived him of his income, and left him in great destitution. The offer in 1795 of a mathematical chair in one of the schools of Paris was declined on account of his infirm health, and he was still in straitened circumstances in 1798 when he published a second edition of the first part of his *History*. He also enlarged Ozanam's *Mathematical Recreations*, afterwards published in English by Dr Hutton (4 vols., Lond., 1803). About four months before his death (December 1799) a pension of 2400 francs was conferred upon him. His *History of Mathematics* was completed by Lalande, and published at Paris in 1799-1802 (4 vols. 4to).

Montucla's work was the first history of mathematics worthy of the

name. It is characterized alike by elegance of style and by breadth of treatment. Montucla rarely fails in candour, and never in breadth of sympathy; he lived at a time when it would have been pardonable to treat mathematics "as a French science," yet he cannot with justice be accused of Chauvinism. The study of the history of mathematics has greatly revived of late years, especially in Germany, and numerous monographs on special departments have appeared, in which, as was to be expected, many defects and some positive errors in Montucla's work have been pointed out, but, taken as a whole, it stands as yet unsurpassed, unrivalled, fit, as to its admirable style and enduring quality, to be compared with Gibbon's *Decline and Fall of the Roman Empire*.

MONZA (locally Monscia), a city of Italy in the province of Milan, at the branching of the railway for Lecco and Como, lies on the Lambro, a tributary of the Po, mainly on the right bank, in a healthy and attractive situation. Of the mediæval fortifications little remains save the Porta d'Agrate. The cathedral of St John Baptist is the principal object of interest: Theodelinda's basilica was enlarged at the close of the 13th century by throwing the atrium into the main building; and the present marble façade was erected about the middle of the 14th by Matteo da Campione. On the left-hand side of the front rises an incongruous brick-built tower, 278 feet high, erected by Peregrini. Within the church are the iron crown of Lombardy (removed by Austria in 1859, and since restored) and the relics of Theodelinda, comprising her crown, fan and comb of gold, and the golden hen and seven chickens, representing Lombardy and her seven provinces. Next to the cathedral in artistic importance come the church of Santa Maria in Istrada, and the broletto or old palace of the commune, usually styled the Arengario: the former (founded in 1357) has a rich Bramantesque façade, reckoned one of the best pieces of terra-cotta work in Lombardy, and the latter is raised on a system of pointed arches, and has a tall square tower terminating in machicolations surrounding a sharp central cone. San Michele was the scene of the coronation of Conrad III. in 1128, and San Gerardo (formerly Sant' Ambrogio) is named after the patron saint of Monza, Gerardo de' Tintori, who founded the first local hospital in 1174. The royal palace of Monza (1777), with its extensive gardens and parks, lies not far from the town on the banks of the Lambro. Cotton goods and felt hats are the staple products of Monza industry; then dyeing, organ-building, and a publishing trade. The population of the city was 15,450 in 1871, and that of the commune increased from 24,661 in 1861 to 28,012 in 1881.

Local antiquaries claim for Monza (Módicia or Modætia) the rank of a Roman colony, but it cannot have been a place of consequence till it attracted the discerning eye of Theodoric; and, though it was a favourite residence with his immediate successors, its first important associations are with Theodelinda (see vol. xiv. p. 815). During the period of the republics Monza was sometimes independent, sometimes subject to Milan. The Visconti, who ultimately became masters of the city, built a castle in 1325 on the site now occupied by the Palazzo Durini. In the course of its history Monza has stood thirty-two sieges, and been repeatedly plundered, notably by the forces of Charles V. The countship (1499-1796) was purchased in 1546 by the wealthy banker Durini, and remained in his family till the Revolution.

MOOLTAN. See MŪLTÁN.

MOON, THE. The subject of the moon divides itself into two separate branches, the one concerned with the constitution of the lunar globe, the other with its motions. For the first subject the reader is referred to the article ASTRONOMY (vol. ii. p. 801 *sq.*); the present article is confined to the second, which is commonly called the *Lunar Theory*.

The lunar theory does not yet form a well-defined body of reasoning and doctrine, like other branches of mathematical science, but consists only of a series of researches, extending through twenty-centuries or more, and incapable of being welded into a consistent whole.

This state of things arises from the inherent difficulties and complexities of the subject, and from the fact that no one method or system has yet been discovered by which all the difficulties can be surmounted and all the complexities disentangled. Hence each investigator, when he has desired to make any substantial advance beyond his predecessors, has been obliged to take up the subject from a new point of view, and to devise such method as might seem to him most suitable to the special object in hand. The historical treatment is therefore that best adapted to give a clear idea of the results of these investigations. The ancient and modern histories of the subject are quite distinct, the modern epoch commencing with Newton. The great epoch made by Copernicus did not extend to the case of the moon at all, because in every investigation of the moon's motion, modern as well as ancient, the motion is referred to the earth as a centre. Hence the heliocentric system introduced no new conception of this motion, except that of taking place round a moving earth instead of round a fixed one. This change did not affect the consideration of the relative motion of the earth and moon, with which alone the lunar theory is concerned. The two stages of the lunar theory are therefore—(1) that in which the treatment was purely empirical, (2) that in which it was founded rationally on the law of gravitation.

It is in the investigation of the moon's motion that the merits of ancient astronomy are seen to the best advantage. In the hands of Hipparchus (see *ASTRONOMY*, vol. ii. p. 749) the theory was brought to a degree of precision which is really marvellous when we compare it, either with other branches of physical science in that age, or with the remarks and speculations of contemporary non-scientific writers. Whether this was wholly the work of Hipparchus, or whether he simply perfected a system already devised by his predecessors, it is now impossible to say; but, so far as certain knowledge extends, the works of his predecessors did not embrace more than the determination of the mean motion of the moon and its nodes. Although the general fact of a varying motion may have been ascertained, the circumstances of the variation had probably never been thoroughly investigated. The discoveries of Hipparchus were:—

1. *The Eccentricity of the Moon's Orbit.*—He found that the moon moved most rapidly near a certain point of its orbit, and most slowly near the opposite point. The law of this motion was such that the phenomena could be represented by supposing the motion to be actually circular and uniform, the apparent variations being explained by the hypothesis that the earth was not situated in the centre of the orbit, but was displaced by an amount about equal to one-twentieth of the radius of the orbit. Then, by a well-known law of kinematics, the angular motion round the earth would be most rapid at the point nearest the earth—that is, at *perigee*—and slowest at the point most distant from the earth—that is, at *apogee*. Thus the apogee and perigee became two definite points of the orbit, indicated by the variations in the angular motion of the moon.

2. *The Motion of the Perigee and Apogee.*—As already defined, the perigee and apogee are at the ends of that diameter of the orbit which passes through the eccentrically situated earth, or, in other words, they are on that line which passes through the centre of the earth and the centre of the orbit. This line was called the *line of apsides*. On comparing observations made at different times, it was found that the line of apsides was not fixed, but made a complete revolution in the heavens, in the order of the signs of the zodiac, in about nine years.

3. *The Numerical Determination of the Elements of the Moon's Motion.*—In order that the two capital discoveries just mentioned should have the highest scientific value it

was essential that the numerical values of the elements involved in these complicated motions should be fixed with precision. This Hipparchus was enabled to do by lunar eclipses. Each eclipse gave a moment at which the longitude of the moon was 180° different from that of the sun, and the latter admitted of ready calculation. Assuming the mean motion of the moon to be known and the perigee to be fixed, three eclipses observed in different points of the orbit would give as many true longitudes of the moon, which longitudes could be employed to determine three unknown quantities—the mean longitude at a given epoch, the eccentricity, and the position of the perigee. By taking three eclipses separated at short intervals, both the mean motion and the motion of the perigee would be known beforehand, from other data, with sufficient accuracy to reduce all the observations to the same epoch, and thus to leave only the three elements already mentioned unknown. In the hands of a modern calculator the problem would be a very simple one, requiring little more than the solution of a system of three equations with as many unknown quantities. But without algebra the solution was long and troublesome, and not entirely satisfactory. Still, it was probably correct within the necessary limits of the errors of the observations. The same three elements being again determined from a second triplet of eclipses at as remote an epoch as possible, the difference in the longitude of the perigee at the two epochs gave the annual motion of that element, and the difference of mean longitudes gave the mean motion. Such was the method of determining the elements of the moon's motion down to the time of Copernicus.

The determination of the eccentricity from eclipses, as above described, leads to an important error in the resulting value of the eccentricity, owing to the effect of the neglected evection. We know from our modern theory that the two principal inequalities in the moon's true longitude are—

$$\begin{aligned} 6^\circ.29 \sin g & \quad (\text{Equation of centre}) \\ + 1^\circ.27 \sin (2D - g) & \quad (\text{Evection}), \end{aligned}$$

where g = mean anomaly, and D = mean angular distance of the moon from the sun. Now during a lunar eclipse we always have $D = 180^\circ$ very nearly, and $2D = 360^\circ$. Hence the evection is then $-1^\circ.27 \sin g$, and so has the same argument, g , as the equation of centre, and so is confounded with it. The value of the equation of centre derived from eclipses is thus $(6^\circ.29 - 1^\circ.27 = 5^\circ.02) \sin g$. Therefore the eccentricity found by Hipparchus and Ptolemy was only $5'$, and was more than a degree less than its true value.

The next important step in advance was the discovery of the "evection," which is described by Ptolemy (see *ASTRONOMY*, vol. ii. p. 750) as if made by himself. In view of the bad habit which Ptolemy had of making his own observations verify results previously arrived at, which were sometimes in error, we must view such a discovery by him as quite exceptional, and as best explainable by the large magnitude of the outstanding error. Although, as just shown, the erroneous eccentricity found by Hipparchus would always represent eclipses, so that the error could never be detected by eclipses, the case was entirely different when the moon was in quadratures. Comparing the inequalities already written with that found by Hipparchus, we see that the latter required the correction—

$$\begin{aligned} 1^\circ.27 \{ \sin g + \sin (2D - g) \} = \\ 1^\circ.27 \{ (1 - \cos 2D) \sin g + \sin 2D \cos g \}. \end{aligned}$$

At quadratures we have $D = \pm 90^\circ$, $2D = 180^\circ$, and hence $\cos 2D = -1$ and $\sin 2D = 0$. The omitted inequalities at these points of the orbit have therefore the value $2^\circ.54 \sin g$, a quantity so large that it could not fail to be detected by careful observations with the astrolabe. Such an inequality as this, superposed upon the eccentric motion of the moon, was very troublesome to astronomers who had no way of representing the celestial motions except by geometrical construction. The construction proposed by Ptolemy was so different from those employed for the

motions of the planets, and withal so intricate, that little interest attaches to it.

The student of Arabian science may find much to interest him in the astronomical speculations of the Arabs, but this people do not seem to have furnished anything in the way of suggestive theory. In the fourth book of *De Revolutionibus*,¹ where we find the lunar theory of Copernicus, no writer later than Ptolemy is referred to. Moreover, as already intimated, the work of Copernicus in this particular direction forms little more than an episode in the history of the subject. The working hypothesis of the great founder of modern astronomy was borrowed from the ancients, and was that the celestial motions were all either circular or compounded of circular motions. The hypothesis of equal circular motions, though accepted by Ptolemy in name, was so strained by him in its applications that little was left of it in the *Almagest* (the Arabic translation of his *Syntaxis*). But, by taking the privilege of compounding circular motions indefinitely—in other words, of adding one epicycle to another—Copernicus was enabled to represent the planetary and lunar inequalities on a uniform system, though his heavens were perhaps worse “scribbled o’er” than those of Ptolemy. To one epicycle representing the equation of the centre he added another for the evection, and thus represented the longitude of the moon both at quadratures and oppositions. But the third inequality, “variation,” which attains its maxima at the octants and vanishes at all four quarters, was unknown to him. To Tycho Brahe is commonly and justly ascribed the discovery of the variation. Joseph Bertrand of Paris has indeed claimed the discovery for Abū ’l-Wefā, an Arabian astronomer, and has made it appear probable that Abū ’l-Wefā really detected inequalities in the moon’s motion which we now know to have been the variation. But he has not shown, on the part of the Arabian, any such exact description of the phenomena as is necessary to make clear his claim to the discovery. As regards Tycho, although he discovered the fact, he could add nothing in the way of suggestive theory. To the double epicycle of Copernicus he was obliged to add a motion of the centre of the whole lunar orbit round a circle whose circumference passed through the centre of the earth, two revolutions round this circle being made in each lunation. Kepler, by introducing a moving ellipse having the earth as its focus, was enabled to make a nearer approach to the truth than any of his predecessors. But the geometrical hypotheses by which he represented the inequalities due to the action of the sun form no greater epoch in the progress of science than do the geometrical constructions of his predecessors. We may therefore dispose of the ancient history of the lunar theory by saying that the only real progress from Hipparchus to Newton consisted in the more exact determination of the mean motions of the moon, its perigee and its line of nodes, and in the discovery of three new inequalities, the representation of which required geometrical constructions increasing in complexity with every step.

The modern lunar theory commenced with Newton, and consists in determining the motion of the moon deductively from the theory of gravitation. But the great founder of modern mechanics did not employ the method best adapted to lead to the desired result, and hence his efforts to construct a lunar theory are of more interest as illustrations of his wonderful power and correctness in mathematical reasoning than as germs of new methods of research. He succeeded perfectly in explaining the elliptic motion of two mutually attracting bodies round their common centre of gravity by geometrical constructions. But when the prob-

lem was one of determining the variations from the elliptic motion which would be produced by a third body, such constructions could lead only to approximate results. The path to modern methods was opened up by the Continental mathematicians, whose great work consisted in reducing the problem to one of pure algebra. The chasm between the laws of motion laid down by Newton and a problem of algebra seems so difficult to bridge over that it is worth while to show in what the real spirit of the modern method consists. We call to mind the statement of Newton’s first two laws of motion: that a body uninfluenced by any force moves in a straight line and with uniform velocity for ever, and that the change of motion is proportional to the force impressed upon the body and in the direction of such force. These two laws admit of being expressed in algebraic language thus:—let us put m the mass of a material point; x its distance from any fixed plane whatever; t the time; X the sum of the components of all the forces acting upon the point in the direction perpendicular to the fixed plane, it being supposed that each force is resolved into three mutually perpendicular components, one of which is perpendicular to the fixed plane; then the differential equation

$$m \frac{d^2x}{dt^2} = X$$

expresses Newton’s first two laws of motion with a completeness and precision which is entirely wanting in all statements in ordinary language. The latter can be nothing more than lame attempts to express the equation in language which may be understood by the non-mathematical reader, but which bear the same relation to the algebraic equation that a statement of the operations of the Bank of England in the symbolic language of a tribe of savages would bear to the bank statement in pounds, shillings, and pence. By taking two other planes, perpendicular to each other and to the first plane, we have three equations like the one last written. The law of gravitation and Newton’s third law of motion enable us to substitute for X and the other forces the masses and coordinates of the various attracting bodies. Thus the data of the problem are expressed by a triplet of three equations for each attracting body. The integration of these equations is a problem of pure algebra, which, when solved, leads to expressions that give the position of each body in terms of the time, which is what is wanted. The special form which it is necessary to give the equations has not been radically changed during the century and a half since this method of research was opened out. The end aimed at is the algebraic expression of all the quantities involved in the form of an infinite series of terms, each consisting of a constant coefficient multiplied by the sine or cosine of an angle increasing uniformly with the time. It is indeed a remarkable fact that, notwithstanding the great advances which modern mathematics has made in the discovery of functions more general than the old-fashioned sines and cosines of elementary trigonometry, especially of elliptic functions, yet the form of development adopted by the mathematicians of the last century has remained without essential change.

It will be instructive to notice the general and simple property of the trigonometric functions to which is due their great advantage in the problems of celestial mechanics. It may be expressed thus:—*If we have any number of quantities, each of which is expressed in the form of a trigonometric series in which the angles increase uniformly with the time, then all the powers and products of these quantities, and all their differentials and integrals with respect to the time, may be expressed in series of the same form.* This theorem needs only an illustration by an example. Let our quantities be X and Y , and let us suppose them expressed in the form

$$X = a \cos A + b \cos B + c \cos C + \text{&c.},$$

$$Y = a' \sin A' + b' \sin B' + c' \sin C' + \text{&c.},$$

in which we may suppose that the quantities a, b, c , &c., converge towards zero. In forming their product, the first term will be

¹ The full title, *De Revolutionibus Orbium Caelestium Libri VI.* (small folio, Nuremberg, 1543).

$aa' \cos A \sin A'$. But we have $\cos A \sin A' = \frac{1}{2} \sin (A' + A) + \frac{1}{2} \sin (A' - A)$. Hence the product XY will be of the form

$XY = \frac{1}{2} aa' \sin (A' + A) + \frac{1}{2} aa' \sin (A' - A) + \frac{1}{2} ab' \sin (A + B') + \text{&c.}$, which is another series of the same general form. Moreover, if we suppose the angles $A, B, \text{&c.}$, to increase uniformly with the time—that is, to admit of expression in the form

$$A = a + mt, \quad A' = a' + m't, \quad \text{&c.}$$

we shall have, by integrating,

$$2 \int XY dt = -\frac{aa'}{m+m'} \cos (A' + A) - \frac{aa'}{m'-m} \cos (A' - A), \quad \text{&c.}$$

which, again, is a trigonometric series of the same general form, which admits of being manipulated at pleasure in the same way as the original expressions X and Y . This property does not belong to the elliptic functions, and in consequence, notwithstanding the great length of the trigonometric series, no attempt to supersede them has been successful.

The efforts to express the moon's motion by integrating the differential equations of the dynamical theory may be divided into three classes. (1) Laplace and his immediate successors found the problem so complex that they sought to simplify it by reversing its form; instead of trying from the beginning to express the moon's coordinates in terms of the time, they effected the integration by expressing the time in terms of the moon's true longitude. Then, by a reversal of the series, the longitude was expressed in terms of the time. Although it would be hazardous to say that this method is unworthy of further consideration, we must admit that its essential inelegance is such as to repel rather than attract study, and that it holds out no promise of further development. (2) By the second general method the moon's coordinates are obtained in terms of the time by the direct integration of the differential equations of motion, retaining the algebraic symbols which express the values of the various elements. Most of the elements are small numerical fractions: e , the eccentricity of the moon's orbit, about 0.055; e' , the eccentricity of the earth's orbit, about 0.017; γ , the sine of half the inclination of the moon's orbit, about 0.046; m , the ratio of the mean motions of the moon and earth, about 0.075; and the expressions for the longitude, latitude, and parallax appear as an infinite trigonometric series, in which the coefficients of the sines and cosines are themselves infinite series proceeding according to the powers of the above small numbers. This method was applied with success by Pontécoulant and Sir John W. Lubbock, and afterwards by Delaunay. It should be remarked that the solution by the first method appears in the same form as by this one after the true longitude is expressed in terms of the mean longitude. (3) By the method just mentioned the series converge so slowly, and the final expressions for the moon's longitude are so long and complicated, that the series has never been carried far enough to insure the accuracy of all the terms. This is especially the case with the development in powers of m , the convergence of which has often been questioned. Hence, when numerical precision alone is aimed at, it has been found best to avoid this difficulty by using the numerical values of the elements instead of their algebraic symbols. This method has the advantage of leading to the more rapid and certain determination of the numerical values of the several coefficients of sines and cosines. It has the disadvantage of giving the solution of the problem only for a particular case, and of being inapplicable in researches in which the general equations of dynamics have to be applied. It has been employed by Damoiseau, Hansen, and Airy.

The methods of the second general class are those most worthy of study. And among these we must assign the first rank to the method of Delaunay, developed in his *Théorie du Mouvement de la Lune*, because it contains a germ which may yet develop into the great desideratum of a general method in celestial mechanics. To explain it, we must call to mind the general method of "variation of

elements," due to Lagrange. This method is applicable to cases in which a problem of dynamics can be completely solved when any small forces which come into play are left out, but which does not admit of direct solution when these forces are included. Omitting the small forces, commonly called "disturbing forces," let us suppose the problem of the motion of a body under the influence of the "principal forces" completely solved. This will mean that we have found algebraic expressions for the coordinates which determine the position of the body in terms of the time, and (in the case of a material point) of six constant quantities, to which we may assign values at pleasure. Then Lagrange showed how, by supposing these constant quantities to become variable, the same expressions could be used for the case in which the effect of the disturbing forces was included. In other words, the effect of the disturbing forces could be determined by assuming them to change the constants of the first approximate solution into very slowly varying elements.

In the researches on the lunar theory before Delaunay the principal force was taken to be the attraction of the earth upon the moon, and the disturbing force was that due to the sun's attraction. When the action of the earth alone was included the moon would move in an ellipse, in accordance with Kepler's laws. The effect of the sun's action could be allowed for by supposing this ellipse to be movable and variable. But when it was required to express this variation the problem became excessively complicated, owing to the great number of terms required to express the sun's disturbing force. Now, instead of passing from the elliptic to the disturbed motion by one single difficult step, Delaunay effected the passage by a great number of easy steps. Out of several hundred periodic terms, the sum of which expressed the disturbing force of the sun, he first took one only, and determined the variations of the Keplerian ellipse on the supposition that this term was the only one. In the solution the variable elements of the ellipse would be expressed in terms of six new constants. He then showed how these new constants could be taken as variables instead of the elements of the original ellipse. Taking a second term of the disturbing force, he expressed the new constants in terms of a third set of constants, and so repeated the process until all the terms of the disturbing force were disposed of.

Among applications of the third or numerical method, the most successful yet completed is that of Hansen. His first work appeared in 1838, under the title *Fundamenta nova investigationis orbitæ veræ quam luna perlustrat*, and contained an exposition of his ingenious and peculiar methods of computation. During the twenty years following he devoted a large part of his energies to the numerical computation of the lunar inequalities, the re-determination of the elements of motion, and the preparation of new tables for computing the moon's position. In the latter branch of the work, he received material aid from the British Government which published his tables on their completion in 1857. The computations of Hansen were published some seven years later by the Saxon Royal Society of Sciences.

It is found on comparing the results of Hansen and Delaunay that there are some outstanding discrepancies, which, though too small to be of great practical importance, are of sufficient magnitude to demand the attention of those interested in the mathematical theory of the subject. It is therefore desirable that the numerical inequalities should be again determined by an entirely different method. This is the object of Sir G. B. Airy's *Numerical Lunar Theory*, which is not yet completely published, but is sufficiently far advanced to give hopes of an early completion. The essence of Sir George's method consists in

starting with a provisional approximate solution (that of Delaunay being accepted for the purpose), and substituting the expressions for the moon's coordinates in the fundamental differential equations of the moon's motion as disturbed by the sun. If the theory were perfect, the two sides of each equation would come out equal. As they do not come out exactly equal, Sir George puts the problem in the form: What corrections must be applied to the expressions for the coordinates that the two sides may be made equal? He then shows how these corrections may be found by solving a system of equations.

The several methods which we have described have for their immediate object the determination of the motion of the moon round the earth under the influence of the combined attractions of the earth and sun. In other words, the question is that of solving the celebrated "problem of three-bodies" in the special case when one of the bodies, the sun, has a much greater mass than the other two, and is at a much greater distance from them than they are from each other. All methods lead to a solution of the same general form which we shall now describe. Let us put g the moon's mean anomaly; g' the mean anomaly of the sun (or earth); ω the angular distance of the lunar perigee from the moon's node on the ecliptic; ω' the angular distance of the sun's perigee from the moon's node on the ecliptic. When no account is taken of the action of the sun the angles g and g' increase uniformly with the time, representing in fact the uniform motion of the moon round the earth and of the earth round the sun, while ω and ω' remain constant. When account is taken of the action of the sun all four of the angles change with a uniform progressive motion. In consequence, the mean orbit of the moon round the earth becomes a moving ellipse whose major axis makes a revolution round the earth in about nine years, and the line of whose nodes makes a revolution in about eighteen and a half years. All the other elements of this ellipse—namely, its major axis, its eccentricity, and its inclination to the ecliptic—remain absolutely constant however long the motion may continue, unless some other disturbing force than that of the sun comes into play. But in the actual motion of the moon there are periodic deviations from this ellipse, which may be represented by an infinite trigonometric series, each term of which is of the form

$$e (\sin \text{ or } \cos) (ig + i'g' + j\omega + j'\omega'),$$

in which the quantities e are absolutely constant coefficients, and $i, i', j,$ and j' are integers which may take all combinations of values—positive, negative, or zero. The circular function is, a sine in the expression for longitude or latitude, a cosine in the expression for the parallax. Also, j and j' must be both even or both odd in the expressions for longitude and parallax, but the one even and the other odd in the case of the latitude. For example, if we suppose $j, j',$ and i all zero, we shall have terms of the form

$$c_1 \sin g' + c_2 \sin 2g' + c_3 \sin 3g' + \text{&c.}$$

To write other terms, suppose $i=1$, then we have terms of the form

$$e_1 \sin (g - g') + e_2 \sin (g + g') + e_3 \sin (g + 2g') + \text{&c.}$$

Taking the case when $j=2$ and $j'=-2$, we shall have terms of the form

$$m_1 \sin (g - g' + 2\omega - 2\omega') + m_2 \sin (g - 2g' + 2\omega - 2\omega') + \text{&c.}$$

As the indices $i, i', j,$ and j' become larger, the coefficients $e, e, m,$ &c., become smaller; but the number of terms included in the theories of Hansen and Delaunay amount to several hundreds. In the analytical theories, like that of Delaunay, each of the coefficients $e, e, m,$ &c., is a complicated infinite series, but in the numerical theories it is a constant number. And the principal problem of the modern theory of three bodies is to find the appropriate coefficient for each of these hundreds of terms.

Action of the Planets on the Moon.—For nearly two centuries it has been known from observations that the mean motion of the moon round the earth is not absolutely constant, as it ought to be were there no disturbing body but the sun. The general fact that the motion has been accelerated since the time of Ptolemy was first pointed out by Halley, and the amount of the acceleration was found by Dunthorne. After vain efforts by the greatest mathematicians of the last century to find a physical cause for the acceleration, Laplace was successful in tracing it to the secular diminution of the eccentricity of the earth's orbit, produced by the action of the planets. He computed its amount to be $10''$ per century—that is, if the place of the moon were calculated forward on its mean motion at the beginning of any century, it would at the end of the century be $10''$ in advance of its computed place. This theoretical result of Laplace agreed so closely with the acceleration found by Lalande from the records of ancient and mediæval eclipses that it was not questioned for nearly a century. In 1852 Mr John C. Adams showed that Laplace had failed to take account of a series of terms, the effect of which was to reduce

the acceleration to $6''$ or less. The result was inconsistent with the accounts of ancient eclipses of the sun, and a cause for the discrepancy had to be sought for. A probable cause was pointed out, first by Ferrel, and afterwards by Delaunay. The former, in papers published in *Gould's Astronomical Journal*, and in the *Proceedings of the American Academy of Arts and Sciences*, showed that the action of the moon on the tidal waves of the ocean would have the effect of increasing the time of the earth's axial rotation or the length of the day, which is necessarily taken as the unit of time. Since, as the days became longer, the moon would move farther in one day, though its absolute motion should remain unchanged, and hence an apparent acceleration would be the result. That this cause really acts there can be no doubt. But the data for determining its exact amount are discrepant. If we take only such data as are purely astronomical—namely, the eclipses recorded by Ptolemy between 720 B.C. and 150 A.D., and those observed by the Arabians between 800 and 1000 A.D.—the apparent excess of the observed acceleration to be accounted for by the tidal retardation amounts to only $2''$ per century, and may be even less. But this small acceleration is entirely incompatible with conclusions drawn from certain supposed accounts of total eclipses of the sun, notably the eclipse associated with the name of Thales. This is the famous eclipse supposed to be alluded to by Herodotus when he describes a battle as stopped by a sudden advent of darkness, which had been predicted by Thales. If the true value of the coefficient resulting from the combined effect of tidal retardation of the earth and secular acceleration of the moon is less than $10''$, then not only could the path of totality not have passed over the field of battle but the greatest eclipse could not have occurred till after sunset. In fact, to represent this and other supposed eclipses of the sun, the acceleration must be increased to about $12''$, which is near the value found by Hansen from theory, and adopted in his tables of the moon. But his theoretical computation is undoubtedly incorrect, because in computing in what manner the eccentricity of the earth's orbit enters into the moon's motion he took account only of the first approximation, as Laplace had done. The following is a summary of the present state of the question:—

The theoretical value of the acceleration, assuming the day to be constant, is, according to Delaunay	6"-176
Hansen's value, in his <i>Tables de la Lune</i> , is	12-18
Hansen's revised but still theoretically erroneous result is	12-56
The value which best represents the supposed eclipses (1) of Thales, (2) at Larissa, (3) at Stikkelstad, is about	11-7
The result from purely astronomical observations is	8-3
The result from Arabian and modern observations alone is about	7-0

Inequalities of Long Period.—Combined with the question of the secular acceleration is another which is still entirely unsettled—namely, that of inequalities of long period in the mean motion of the moon round the earth. Laplace first showed that modern observations of the moon indicated that its mean motion was really less during the second half of the 18th century than during the first half, and hence inferred the existence of an inequality having a period of more than a century. All efforts to find a satisfactory explanation were, however, so unavailing that Poisson, in 1835, disputed the reality of the inequality. But Airy, from his discussion of the Greenwich observations between 1750 and 1830, conclusively proved its existence. About the same time Hansen announced that he had found from theory two terms of long period arising from the action of Venus which fully corresponded to the inequalities indicated by the observations. These terms, as employed in his *Tables de la Lune*, are

$$15'' \cdot 34 \sin (-g - 16g' + 18g'' + 33^\circ 36') + 21'' \cdot 47 \sin (8g' - 13g'' + 4^\circ 44'),$$

in which $g, g',$ and g'' represent the mean anomalies of the moon, the earth, and Venus respectively. During the first few years after the publication of Hansen's tables they represented observations so well that their entire correctness was generally taken for granted. But doubt soon began to be thrown upon the inequalities of long period just mentioned. Indeed, Hansen himself admitted that the second and larger term was partly empirical, being taken so as to satisfy observations between 1750 and 1850. Delaunay re-computed both terms, and found for the first term a result substantially identical with that of Hansen. But he found for the second or empirical one a coefficient of only $0'' \cdot 27$, which would be quite insensible. With this smaller coefficient the observations from 1750 could not be satisfied, so that, so far as observations could go in deciding a purely mathematical question, the evidence was in favour of Hansen's result. But on comparing Hansen's tables with observations between 1650 and 1750 it was found that the supposed agreement with observation was entirely illusory. Moreover, since 1865 the moon has been steadily falling behind the tabular place. These inequalities of long period have not yet been satisfactorily explained. The most plausible supposition is that they are due to the action of one or more of the larger planets. But the problem of the action of the planets on the moon

is the most difficult and intricate of celestial mechanics, and no satisfactory general method of attacking it has yet been found. The sources of difficulty are two in number. First, the disturbing action of the planets is modified by that of the sun in such a way that the ordinary equations of disturbed elliptic motion are no longer rigorous, and hence new and more complicated ones must be constructed. And, secondly, the combination of the four bodies—moon, earth, sun, and planet—leads to terms so numerous and intricate that it has hardly been found possible to isolate them. The question has, indeed, been raised whether the rotation of the earth on its axis, and hence the unit of time, may not be subject to slow and irregular changes of a nature to produce apparent corresponding changes in the motion of the moon. But it has recently been found, from a discussion of the observed transits of Mercury since 1677, that, although such inequalities may exist, they cannot have the magnitude necessary to account for the observed changes of long period in the moon's motion.

The following is a summary of the present state of the various branches of the lunar theory. (1) The numerical solution of the problem of the sun's action on the moon may be regarded as quite satisfactory, at least when Hansen's results shall have been verified by an independent method. (2) The analytic theory needs to be perfected by finding some remedy for the slow convergence of the series by which it is expressed, but its general form may be regarded as quite satisfactory. (3) Except in one or two special cases, the action of the planets on the moon, when treated with the necessary rigour, is so intricate that no approach to a satisfactory solution has yet been attained. When this desideratum is reached, the mathematical theory will be complete. (4) The general discussion of ancient and modern observations with a view to finding what real or apparent inequalities of long period in the mean motion may exist is still to be finished. With it the astronomical theory will be complete. (S. N.)

MOORCROFT, WILLIAM (c. 1770-1825), traveller in Asia, was born in Lancashire, about 1770. He was educated as a surgeon in Liverpool, but on completing his course he resolved to devote himself to veterinary surgery, and, after studying the subject in France, began its practice in London. In 1795 he published a pamphlet of directions for the medical treatment of horses, with special reference to India, and in 1800 a *Cursory Account of the Methods of Shoeing Horses*. Having been offered by the East India Company the inspectorship of their Bengal stud, Moorcroft left England for India in 1808. Under his care the stud rapidly improved; in order to perfect the breed, he resolved to undertake a journey into Central Asia to obtain a stock of Turcoman horses. In company with Captain William Hearsay, and encumbered with a stock of merchandise for the purpose of establishing trade relations between India and Central Asia, Moorcroft left Josimath, well within the mountains, on 26th May 1812. Proceeding along the valley of the Dauli, they reached the summit of the frontier pass of Niti on 1st July. Descending by the towns of Daba and Ghortope, Moorcroft struck the main upper branch of the Indus near its source, and on 5th August arrived at the sacred lake of Manasarowara. Returning by Bhután, he was detained some time by the Gúrkhás, and reached Calcutta in November. This journey only served to whet Moorcroft's appetite for more extensive travel, for which he prepared the way by sending out a young Hindustani, who succeeded in making very extensive explorations. In company with this young man and George Trebeck, Moorcroft set out on his second journey in October 1819. His enterprise was looked upon rather coldly by the directors, who merely allowed him his pay for a time, all the expenses being borne by Moorcroft himself. By way of Almorá and Srínagar, Lahore was reached on 6th May 1820. On 14th August the source of the Biyah (Hyphasis) was discovered, and subsequently that of the Chenáb. Leh, the capital of Ladák, was reached on 24th September, and here several months were spent in exploring the surrounding country. A commercial treaty was concluded with the Government of Ladák, by which the whole of Central Asia was virtually opened to British trade. Kashmir was reached on 3d November 1822, and by the Pir Panjál mountains Jalálabád on 4th June 1824, Cabul on 20th June, and by

Khulm, Kunduz, and Balkh Moorcroft arrived at Bokhara on 25th February 1825. Everywhere he bought horses for the company, and endeavoured to establish trade relations. At Andkho in Cabul Moorcroft was seized with fever, of which he died on 27th August 1825, Trebeck surviving him only a few days. It was not till several years afterwards that his papers were obtained by the Asiatic Society, and published under the editorship of Horace Hayman Wilson in 1841 under the title of *Travels in the Himalayan Provinces of Hindustan and the Punjab, in Ladakh and Kashmir, in Peshawar, Kabul, Kunduz, and Bokhara, from 1819 to 1825*. Though published so long after the traveller's death, the narrative was a valuable contribution to a knowledge of Central Asia, and still remains a classic. In vol. xii. of *Asiatic Researches* will be found an account by Moorcroft of his first journey, and in the *Transactions of the Royal Asiatic Society*, vol. i., a paper on the Purik sheep.

MOORE, EDWARD (1712-1757), minor poet, dramatist, and miscellaneous writer, was the son of a dissenting minister of Abingdon, where he was born in 1712. He was the author of the thrilling domestic tragedy of *The Gamester*, originally produced in 1753 with Garrick in the leading character, and still in the repertory of acting plays. It is perhaps the strongest lesson against gambling ever preached from stage or pulpit. The literary merit of the play is not great, but it is powerfully constructed and full of impressive incident, and the career of Beverley the gambler (a character modelled on Fielding's Captain Booth) affords great scope for the actor. Moore also wrote two comedies. As a poet he produced clever imitations of Gay and Gray, and with the assistance of Lyttelton, Chesterfield, and Horace Walpole conducted *The World* (1753-57) during the great decade of the revival of periodical essay-writing. *The World* followed Johnson's *Rambler*, and was followed by *The Idler*; it had as rivals *The Adventurer* and *The Connoisseur*. Moore died at London in 1757.

MOORE, DR JOHN (1730-1802), born at Stirling in 1730, was one of the most prominent writers of travels and novels in the latter part of the 18th century. His novel *Zeluco* (published in 1789) produced a powerful impression at the time, and indirectly, through the poetry of Byron, has left an abiding mark on literature. The novel would in these days be called a psychological novel; it is a close analysis of the motives of a headstrong, passionate, thoroughly selfish and unprincipled profligate. It is full of incident, and the analysis is never prolonged into tedious reflexions, nor suffered to intercept the progress of the story, while the main plot is diversified with many interesting episodes. The character took a great hold of Byron's imagination, and probably influenced his life in some of its many moods, as well as his poetry. It is not too much to say that the common opinion that Byron intended *Childe Harold* as a reflexion of himself cannot be cleared of its large mixture of falsehood without a study of Moore's *Zeluco*. Byron said that he intended the Childe to be "a poetical *Zeluco*," and the most striking features of the portrait were undoubtedly taken from that character. At the same time it is obvious to everybody acquainted with Moore's novel and Byron's life that the moody and impressionable poet often adopted the character of *Zeluco*, fancied himself and felt himself to be a *Zeluco*, although he was at heart a very different man. Moore's other works have a less marked individuality, but his sketches of society and manners in France, Germany, Switzerland, Italy, and England furnish valuable materials for the social historian. Like his countrymen Burnett and Boswell, he was a sagacious, penetrating, and in the main unprejudiced observer, with something of a natural historian's interest in the human species; and he had exceptional opportunities of observation.

He was a doctor by profession, and the son of a Stirlingshire clergyman. After taking his medical degree at Glasgow, he served with the army in Flanders, then was attached to the household of the English ambassador at Paris, then practised for five years in Glasgow, next travelled on the Continent for five years with a young nobleman, settled for some years as a physician in London, accompanied Lord Lauderdale to Paris in 1792 and witnessed some of the principal scenes of the Revolution. All classes thus came under his observation, while his profession preserved him in an unusual degree from flippant bias. His works attest great shrewdness and sagacity of judgment, and show no small skill in literary presentation. He died at London in 1802.

MOORE, SIR JOHN (1761-1809), the only English general who has gained lasting fame by the conduct of a retreat, was the son of Dr Moore (the subject of the preceding notice), and was born at Glasgow on 13th November 1761. It was his appointment as tutor to the young duke of Hamilton which procured for John Moore educational advantages by which he profited so much as to be called in after life the most cultivated officer in the army. It was then the fashion for young noblemen to travel from court to court, and Moore accompanied his father and the duke to all the chief capitals in Europe, until he was suddenly ordered in 1777 to join the 51st regiment, in which he had been appointed an ensign. He learned his drill at Minorca, and in 1779 was appointed lieutenant and paymaster in a new regiment recently raised by the duke of Hamilton, with which he served in America till the peace of 1783. In 1784 Moore, though but twenty-three years of age, was returned by the duke of Hamilton as member of parliament for the united boroughs of Selkirk, Peebles, and Linlithgow. In parliament he does not seem to have opened his mouth, though he always voted with the Government; but he made some useful friends, notably the duke of York and Pitt. In 1788 he was promoted to a majority in the 51st regiment, and in 1790 he became lieutenant-colonel and resigned his seat in parliament. He soon got his regiment in fine order, and in 1792 sailed with it for the Mediterranean. He was too late to assist at Toulon, but was engaged throughout the operations in Corsica, and especially distinguished himself at the taking of Calvi. After the expulsion of the French, Moore became very intimate with Paoli and many of the leading Corsican patriots, which intimacy was so obnoxious to Sir Gilbert Elliot, the viceroy, that Moore was ordered to leave the island in forty-eight hours. Sir Gilbert's hasty conduct by no means met with approval in London, and Moore was gazetted brigadier-general, and ordered to proceed with his brigade to the West Indies. In April 1796 he reached Barbados, and at once became the right hand of Sir Ralph Abercromby, the commander-in-chief. The first enterprise was the reconquest of the island of St Lucia, which was completely occupied by an agent of Victor Hugues with a mixed force of Caribs, negroes, and Frenchmen. The key of the island was a fortified and almost impregnable height called the Morne Fortuné, which was at last stormed, though with great loss, by the valour of brigadier-generals Moore and Hope, who were to be comrades on a yet more memorable field. After this success, Sir Ralph left the island, and appointed Moore governor and commander-in-chief. A difficult post he found his government, owing to the swarms of Caribs and negroes in the woods; but just as he was on the point of triumphing he fell ill of yellow fever, and was ordered home. In 1798 he was well and again eager to be on active service, and he accompanied his friend Abercromby over to Ireland, where he received the command of the Bandon district. In the Irish rebellion of 1798 he distinguished himself by his activity in saving

Wexford from destruction after the battle of Vinegar Hill. His services were in universal request, and Abercromby insisted upon his serving with him in the expedition to the Helder in 1799, where he did creditably all that was creditably done in that ill-managed expedition. On his return from Holland he was made colonel of the 52d regiment, and in 1800 accompanied Abercromby to the Mediterranean as major-general.

Throughout the Egyptian expedition he commanded the reserve, and especially distinguished himself at the battle of Alexandria, when he was wounded in three places, and behaved with such distinction that he was recognized universally as the greatest English general, now that Abercromby was gone. The short interval of the peace of Amiens did not injure Moore's prospects, and in 1803 he was appointed commandant of the camp at Shorncliffe. Here he proved his greatness as an organizer, for it was at this time that he organized those light regiments which were to form the reserve in his own campaign and the light division in the Peninsular War. While at Shorncliffe he renewed his intimacy with Pitt, who was then residing at Walmer Castle, and who on his return to office made Moore a knight of the Bath, and consulted him on every military project. Fox, when he succeeded to office, showed the same appreciation of Moore, and in May 1806 appointed him second-in-command to his brother, General Fox, who was ordered with a strong force to Sicily to supersede Sir John Stuart. Moore won but little credit at this time, for there was none to gain, but employed his time, according to Napier, in falling in love with Miss Fox, to whom, however, he never proposed, fearing to be accepted for his position and not for himself. In 1807 he was able to escape from the intrigues of the Sicilian court, and was ordered to Portugal, which he reached too late to make any defence of Lisbon, already in the possession of the French. He then went home, and had four months' rest, the last he ever had. In May 1808 he was ordered with a force of 11,000 men to Sweden to assist the king against the united forces of France and Russia. The mad conduct of the Swedish king, however, who even went so far as to declare Sir John Moore under arrest when he refused to acquiesce in his plans, ruined any chance of successful co-operation, and the English general made his escape and returned to England. He was at once ordered to proceed with his division to Portugal, where Sir Arthur Wellesley had already landed; but the appointment of Dalrymple and Burrard to the chief commands was even more of a slight on Moore as a general of European experience than on Wellesley, whose laurels had hitherto been won in India. He regarded himself as personally insulted by the ministers, and especially by Lord Castlereagh, but deemed it his duty to go where he was ordered. He met his reward; for when, after the excitement caused by the Convention of Cintra, Dalrymple and Burrard went home, he was left in command of the largest English army since the commencement of the war. Wellesley had appreciated him, and in an interesting letter (published in the *Wellington Despatches*) had expressed his desire to use his own great political influence to reconcile him to the ministers and the ministers to him.

Now began the glorious three months on which Moore's reputation as a soldier and a statesman must rest. The Spaniards, flushed with their former success at Baylen, regarded Napoleon, who had in person crossed the Pyrenees, as another Dupont, and loudly summoned Moore to a share in their coming victories. Moore knew better what was the value of Napoleon's genius, but he had been commanded to assist the Spaniards, and therefore gave the order to advance. His army marched in four distinct divisions, and on 13th November 1808 he concentrated at Sala-

manca, where he waited to see what would happen. He heard that a subsidiary force under Sir David Baird had arrived at Corunna, and ordered it up to join him. At Salamanca he remained a whole month watching the triumphant successes of Napoleon and his lieutenants, and learning how little Spanish reports or Spanish valour were to be relied on. Though irritated by the menaces and abuse of Frere, the English minister to the junta, he waited till the 13th December, hearing daily of Spanish defeats, and then he determined to draw off upon his own small force the weight of Napoleon's power, and thus give Andalusia the winter in which to organize an army and prepare for another Baylen. With this intention he advanced through Toro and Mayorga, where Baird joined him, to Sahagun. He judged rightly that Napoleon would never advance into Andalusia and leave the English behind him, but that he would turn all his power against them. Having once drawn Napoleon's attention to himself, he began his famous retreat and fell back quickly, fighting every day and invariably with success. He now could test the military spirit he had taught at Shorncliffe, for the reserve under Sir Edward Paget consisted entirely of his own light regiments. To detail each step of the retreat and every skirmish would be but to rewrite Napier; suffice it to say that, with great loss of life and material, Moore reached Corunna on 12th January 1809. But the fleet to take the army home was not there; and the English would have to fight Soult, whose army was even more weakened and demoralized than Moore's, before they could embark. It was on 16th January that Moore fought his last battle; he fell early in the day, and knew at once that his wound was mortal. His last hours were cheered with the knowledge of victory, but were spent in recommending his old friends, such as Graham and Colborne, to the notice of the Government. Sir H. Hardinge's description of these hours is in its way inimitable, and in it must be studied how a modern Bayard should die in battle, every thought being for others, none for himself.

It may be possible in the face of his heroic death to exaggerate Moore's actual military services, but his influence on the British army cannot be overrated. The true military spirit of discipline and of valour, both in officers and men, had become nearly extinct during the American war. Abercromby, who looked back to the traditions of Minden, was the first to attempt to revive it, and his work was carried on by Moore. The formation of the light regiments at Shorncliffe was the answer to the new French tactics, and it was left to Wellington to show the success of the experiment. Moore's powers as a statesman are shown in his despatches written at Salamanca, and he had the trust gift of a great man, that of judging men. It may be noticed that, while Wellington perpetually grumbled at the bad qualities of his officers and formed no school, Moore's name is associated with the career of all who made their mark. Among generals, Hope, Graham, Sir E. Paget, Hill, and Craufurd, all felt and submitted to his ascendancy, and of younger officers it was ever the proud boast of the Napier, Colborne, the Beckwiths, and Barnard that they were the pupils of Moore, not of Wellington. Nay more, he inspired an historian. The description of Moore's retreat in Napier is perhaps the finest piece of military history in the English language, not only because the author was present, but because his heart was with the leader of that retreat; and, if Napier felt towards Wellington as the soldiers of the tenth legion felt towards Caesar, he felt towards Moore the personal love and devotion of a cavalier towards Montrose.

The great authority for Moore's life is the *Life of Sir John Moore*, by his brother, J. C. Moore (1833); see also *Narrative of the Campaign of Sir John Moore in Spain*, by his brother, J. C. Moore (4to, with plans, 1809); Napier, *Peninsular War*, Bk. iv., and his *Life of Sir Charles Napier*. For views adverse to Moore's retreat, see Charmilly, *Narrative* (1810), and Sir Bartle Frere, *Life of the Rt. Hon. J. H. Frere* (published in vol. I. of his works). Consult also Wilson, *Campaign in Egypt*, for Moore's services there, and the *Life of Gilbert Elliot, First Lord Minto*, for the squabble in Corsica. (H. M. S.)

MOORE, THOMAS (1779-1852), born at Dublin on 28th May 1779, fairly shares with Lord Byron the honour of being the most popular poet of his generation. Whatever may be thought now of the intrinsic qualities of his verse, this much cannot be denied. The most trustworthy of all measures of popularity is the price put upon a writer's work

in the publishing market, and when Moore's friend Perry, in negotiating the sale of the unwritten *Lalla Rookh*, claimed for the poet the highest price that had up to that time been paid for a poem the publisher at once assented. Moore was then in the heyday of his reputation, but twenty years later publishers were still willing to risk their thousands on his promise to produce. Much of Moore's success was due to his personal charm. This at least gave him the start on his road to popularity. There is not a more extraordinary incident in the history of our literature than the instantaneousness with which the son of a humble Dublin grocer just out of his teens, on his first visit to London, captivated the fashionable world and established himself in the course of a few months as one of its prime favourites. The youth crossed St George's Channel in 1799 to keep terms at the Middle Temple, carrying with him a translation of the *Odes of Anacreon*, which he wished to publish by subscription. In a very short time he had enrolled half the fashionable world among his subscribers, and had obtained the permission of the prince of Wales to dedicate the work to him. The mere power of writing graceful and fluent amatory verses would not alone have enabled the poet to work this miracle. Moore's social gifts were of the most engaging kind. He charmed all whom he met, and charmed them, though he was not a trained musician, with nothing more than with his singing of his own songs. The piano, and not the harp, was his instrument, but he came nearer than anybody else in modern times to Bishop Percy's romantic conception of the minstrel. To find a parallel to him we must go back to the palmy days of Provençal song, to such *troubadours* and *jongleurs* as Arnaud Daniel and Perdigon, whose varied powers of entertainment made them welcome guests wherever they went. It was not merely the fashionable world that the young adventurer captivated; the landlady of his lodgings in London, a countrywoman of his own, offered to place at his disposal all the money of which she had the command.

The fragment of autobiography in which Moore draws a softly-coloured picture of his early life in Dublin lets us into the secret of the seeming miracle of his social conquest. External apart, the spirit of his social surroundings in Little Aungier Street had much in common with the society to which he was introduced in London. He was born in the proscribed sect of Catholics, whose exclusion from the society of the Castle produced a closer union among their various ranks, and thus, from the first, Moore was no stranger to the more refined gaieties of social intercourse. It was, upon the whole, a gay life in Catholic society, though the conspiracy of the United Irishmen was being quietly formed beneath the surface. Amateur theatricals was one of their favourite diversions, and gifts of reciting and singing were not likely to die for want of applause. Moore's schoolmaster was a leader in these entertainments, a writer of prologues and epilogues and incidental songs; and at a very early age Master Thomas Moore was one of his show-boys, ardently encouraged in all his exercises by a very affectionate mother at home. Before he left school he had acquired fame in his own circle as a song-writer, and had published, in the *Anthologia Hibernica*, verses "to Zelia on her charging the author with writing too much on love." This was in 1793. In that year the prohibition against Catholics entering Trinity College was removed, and next year Moore took advantage of the new freedom. As one of the first Catholic entrants, he had an exceptional stimulus to work, and there industriously acquired that classical scholarship with which he won the hearts of such learned Whigs as Lansdowne and Holland, while he charmed fashionable ladies with the grace of his songs. Young Moore's social atmosphere was, of course, strongly charged with patriotism and hatred of the excesses of

English despotism. Some of his closest friends in Trinity were deep in the conspiracy of 1798. But even for his patriotism—a genuine passion which he never sought to disguise—Moore found plenty of sympathy among the Whig political leaders, when he made their acquaintance in the first years of the century.

Moore was fairly established in London society in the first year of the century, and from that time the hope of its applause was the ruling aspiration of his life and its judgment the standard of his work. In his letters to his mother, which are delightful prose lyrics and show the most charming side of Moore's character—he wrote to her constantly and with warm affection in his busiest weeks—we find him, even in 1800, declaring himself surfeited with duchesses and marchionesses, and professing his readiness at any moment to exchange all his fineries for Irish stew and salt fish. But he never did make the exchange, even for more potent attractions than the fare of his youth. He could not bear the shortest banishment from fashionable drawing-rooms without uneasy longings. The dignity and ease, the luxury, the gaiety, the brightness of fashionable life, wholly satisfied his joyous and self-indulgent nature. When men of rank courted his company, when princesses sang his songs and peeresses wept at them, Moore was too frank to affect indifference; he was in the highest heaven of delight, and went home to record the incident to his relatives or transmit it to posterity in his diary. If prudence whispered that he was frittering away his time and dissipating his energies, he persuaded himself that his conduct was thoroughly worthy of a solid man of business: that to get a lucrative appointment from his political friends he must keep himself in evidence, and that to make his songs sell he must give them a start with his own voice. But his mind was seemingly not much troubled either with sordid care or with sober prudence; he lived in the happy present, and he liked fashionable company for its own sake,—and no wonder, seeing how he was petted, caressed, and admired. Swift's saying that great men never reward in a more substantial way those whom they make the companions of their pleasures was often in Moore's mind. It was verified to some extent in his own case. Through Lord Moira's influence he was appointed registrar of the admiralty court in Bermuda in 1803. He went there to take possession, but four or five months of West India society, jingling pianofortes, and dusky beauties bored him excessively, and he appointed a deputy and returned to London, after little more than a year's absence. The office continued to bring him about £400 a year for fourteen or fifteen years, but at the end of that time embezzlement by the deputy, for whom he was responsible, involved him in serious embarrassment. This was all that Moore received from his great political friends,—no great boon as things went in the days of patronage. He had hopes from Lord Moira in the Grenville ministry in 1806,—hopes of an Irish commissionership or something substantial, but the king's obstinacy about Catholic emancipation destroyed the ministry before anything worth having turned up. The poet's long-deferred hopes were finally extinguished in 1812, when Lord Moira, under the Liverpool administration, went out as governor-general to India without making any provision for him. From that time Moore set himself in earnest to make a living by literature, his responsibilities being increased by his marriage in 1811. From his boyhood to 1812 may be called the first period of Moore's poetical activity. He had formed the design of translating Anacreon while still at college, and several of the pieces published in 1801 under the *nom de plume* of "Thomas Little" were written before he was eighteen. The somewhat ostentatious scholarship of the notes to his *Anacreon*, the parade of learned authorities, he explained

by his habit of omnivorous reading in Trinity College library. Throughout his literary life he retained this habit of out-of-the-way reading and clever display of it. Moore had really abundance of miscellaneous scholarship as well as great quickness in the analogical application of his knowledge; and, though he made sad havoc of quantities when he tried to write in Greek, there was probably no scholar of his time who would have surpassed him in the interpretation of a difficult passage. He seems to have spent a good deal of time in the libraries of the great houses that he frequented; Moira, Lansdowne, and Holland were all scholarly men and book-collectors. It might be asked,—What had "passion's warmest child," whose "only books were women's looks," to do with obscure mediæval epigrammatists, theologians, and commentators? But it would seem that Moore took the hints for many of his lyrics from books, and, knowing the great wealth of fancy among mediæval Latinists, turned often to them as likely quarters in which to find some happy word-play or image that might serve as a motive for his muse. The public, of course, were concerned with the product and not with the process of manufacture, and "Little's" songs at once became the rage in every drawing-room. He found his songs in Virginia when he landed there on his way to Bermuda. And not only were his songs sung but his poems were read, passing rapidly through many editions. The bulk of them were simple fancies, gracefully, fluently, and sometimes wittily expressed, the lyricist's models being the amatory poets of the 17th century from Carew to Rochester. Carew is the only eminent poet of that century with whom Moore will bear comparison. The highest praise that can be given to his amatory lyrics is that he knew his audience, wrote directly for them, and pleased them more than any of his competitors. His publication of 1806 was savagely reviewed in the *Edinburgh* by Jeffrey, who accused him of a deliberate design to corrupt the minds of innocent maidens with his wanton fancies, and who had in consequence to figure in a ludicrous attempt at a duel—ludicrous in its circumstances, though Moore was ferociously in earnest. We may well acquit Moore of the diabolic intention attributed to him, but Jeffrey's criticism of his poetry as poetry was just enough. The only parts of the volume that Jeffrey praised were the satirical epistles. The vein essayed in these epistles Moore pursued afterwards in his *Corruption*, *Intolerance* (1808), and *The Sceptic*, a philosophical satire (1809); but as long as he kept to the heroic couplet and the manner of Pope he could not give full scope to his peculiar powers as a satirist. It may be remarked in passing that the result of the hostile meeting with Jeffrey is a striking evidence of the impressiveness of Moore's personality; in the course of a few minutes' conversation he changed a bitter critic into a lifelong friend. Of all the poetical enterprises that Moore undertook, either at this period or later, none was so exactly suited to his powers as the task proposed to him by the publisher Power of supplying fit words to a collection of Irish melodies. The first number appeared in 1807, and it was so successful that for twenty-seven years afterwards writing words to music was one of Moore's most regular occupations and his steadiest source of income, Power paying him an annuity of £500. Six numbers of Irish melodies were published before 1815; then they turned to sacred songs and national airs, issuing also four more numbers of Irish melodies before 1834. Moore entered into this work with his best and most practised powers and with all his heart. From his boyhood he had been in training for it. The most characteristic moods of Irish feeling, grave and gay, plaintive and stirring, were embodied in those airs, and their variety touched the whole range of Moore's sensitive spirit, carrying him far beyond the shallows of his

spurious Anacreontic sentiment, namby-pamby when not purient; he wrote with full inspiration, unreserved sincerity, and thoroughly roused faculty. Divorced from the music, many of them are insipid enough, but they were never meant to be divorced from the music; the music was meant, as Coleridge felt when he heard them sung by the poet himself, to twine round them and overtop them like the honeysuckle. Moore accomplished this with exquisite art. His most conspicuous failures may be traced to his habit of taking as his starting-point not an emotional incident but some unmanageable intellectual conceit. Hence arose intellectual discords, incongruous and imperfectly harmonized fancies, which even the music can hardly gloss over.

The regent's desertion of the Whigs in 1812 cut them off from all hope of office for many years to come, and Moore from his last hope of a snug sinecure, when Lord Moira also was practically "oblivious" of him. There was at once a marked increase in his literary fertility, and he broke ground in a new field, which he cultivated with pre-eminent success—political squib-writing. Moore was incapable of anything like rancour, but he felt the disappointment of his hopes enough to quicken his fancy and sharpen the edge of his wit. The prince regent, his old friend and patron, who was said to have begged all Lord Moira's appointments for personal favourites, was his first butt. The prince's defects and foibles, his fatness, his huge whiskers, his love for cutlets and curaçoa, for aged mistresses and practical jokes, were ridiculed with the lightest of clever hands. Moore opened fire in the *Morning Chronicle*, and crowned his success next year (1813) with a thin volume of "Intercepted Letters," *The Twopenny Post Bag*. A very little knowledge of the gossip of the time enables us to understand the delight with which Moore's sallies were received in the year which witnessed the imprisonment of Leigh Hunt for more outspoken attacks on the regent. Moore received every encouragement to work the new vein. He was at one time in receipt of a regular salary from the *Times*; and his little volumes of squibs published at intervals,—*The Fudge Family in Paris*, 1818; *The Journal of a Member of the Pocomurante Society*, 1820; *Fables for the Holy Alliance*, 1823; *Odes on Cash, Corn, Catholics, and other Matters*, 1828; *The Fudges in England*, 1835—went through many editions. The prose *Memoirs of Captain Rock* (1824) may be added to the list. Moore's only failure was *Tom Cribb's Memorial to Congress* (1819), for which he had made an elaborate study of thieves' slang. It was of course on the side of the Whigs that Moore employed his pen, and his favourite topics were the system of repression in Ireland and the disabilities of the Catholics. He made rather too serious a claim for his pasquinades when he spoke of "laying the lash on the back of the bigot and the oppressor." It was not exactly a lash or a scourge that he wielded. It was in happy, airily malicious ridicule of personal foibles that his strength lay; he pricked and teased his victims with sharp and tiny arrows. But, light as his hand was, he was fairly entitled to the enthusiastic gratitude of his countrymen for his share in effecting Catholic emancipation.

The disappointment of 1812, which started Moore on his career as a squib-writer, nerved him also to a more sustained effort in serious verse than he had before attempted. *Lalla Rookh* would never have been written if the author's necessities had not compelled him to work. To keep himself at the oar, he contracted with the Longmans to supply a metrical romance on an Eastern subject, which should contain at least as many lines as Scott's *Rokeby*, and for which the publishers bound themselves to pay three thousand guineas on delivery. The poem was not published till May 1817. Moore, as was his habit,

made most laborious preparation, reading himself slowly into familiarity with Eastern scenery and manners. He retired to a cottage in Derbyshire, near Lord Moira's library at Dorington Park, that he might work uninterruptedly, safe from the distractions of London society; and there, "amid the snows of a Derbyshire winter" as he put it, he patiently elaborated his voluptuous pictures of flower-scented valleys, gorgeous gardens, tents, and palaces, and houris of ravishing beauty. The confidence of the publishers was fully justified. Moore's contemporaries were dazzled and enchanted with *Lalla Rookh*. It was indeed a wonderful *tour de force*. There was not a single image or allusion in it that an ordinary Englishman could understand without a foot-note. High testimonies were borne to the correctness of the local colouring, and the usual stories were circulated of Oriental natives who would not believe that Moore had never travelled in the East. Moore was less successful in realizing Oriental character than he was in details of dress and vegetation. His fire-worshipper is an Irish patriot betrayed by an informer, his Zebica a piously nurtured Catholic maiden brooding over unpardoned sin, his Mokanna a melodramatic stage monster,—though they are so thickly covered with Oriental trappings that their identity is considerably disguised. Of the four tales put into the mouth of Feramorz, the "Veiled Prophet" was the least suited to Moore's Turkey-carpet treatment. We can understand the enthusiasm with which Moore's Orientalism was received as "the best that we have had yet," and we can honour the honest labour with which he achieved this success; but such artificial finery, as the poet himself had the sense to suspect, could have only a temporary reputation. He deliberately sacrificed the higher qualities of poetry for accuracy of costume and soft melody of rhyme and rhythm, and he had his reward. His next Orientalism, the *Loves of the Angels*, published in 1822, was hardly less popular than *Lalla Rookh*. The artificiality of the manufacture was shown by the ease with which, after a few editions, he changed his angels from Jews into Turks, to evade a charge of impiety which was supposed to impede the sale of the work. Immediately after the completion of *Lalla Rookh* Moore changed his residence to Sloperton Cottage in Wiltshire, to be near Lord Lansdowne and the library at Bowood, his next literary project being a life of Sheridan. His plans were interrupted by the consequences of the rascality of his deputy at Bermuda, which has been already mentioned. To avoid arrest for the sum embezzled, Moore retired to the Continent, and fixed his residence at Paris. He could not return till November 1822, when the affair was compromised. His friends lamented that the attractions of Paris occupied so much of his time, but, though his diary contains almost daily records of visits to operas, fêtes, and fashionable entertainments, it shows also that he was busier than he seemed. He wrote a goodly number of squibs during his exile, besides composing the *Loves of the Angels* and accumulating materials for his prose tale of the *Epicurean*—a fair amount of production considering his slow and painstaking habits of composition. His alertness of mind, self-possession, and steadiness of purpose enabled him to work as few men could in the midst of diversions and distractions; and, although he himself took a brilliant part in conversation, we can see, from a comparison of his diary with his published writings, that he kept his ears open for facts and witticisms which he afterwards made his own. The darling of the drawing-room was as much bee as butterfly. On his return to England he resumed work steadily at his memoirs of Sheridan, writing *Captain Rock* as a *jeu d'esprit* by the way. The *Sheridan* triumphantly despatched in the autumn of 1825, Moore's next important work was the *Life of Byron*. The first

volume of this was published early in 1830, and the second was ready by the end of the same year. In 1831 he completed a memoir of Lord Edward Fitzgerald, for which he had been collecting materials for some time. Moore's biographies call for no comment, except that they were faithful and conscientious pieces of work. He spent much industry in the collection of characteristic anecdotes, for which his position in society gave him exceptional opportunity. His connexion with the burning of Byron's autobiography is too complicated a question to be discussed here. His own version of the circumstances is given in his diary for May 1824.

It was a misfortune for the comfort of the last twenty years of Moore's life that he allowed himself to be drawn into a project for writing the "History of Ireland" in *Lardner's Cyclopædia*. Scott and Mackintosh scribbled off the companion volumes on Scotland and England with very little trouble, but Moore had neither their historical training nor their despatch in writing. Laborious conscientiousness and indecision are a fatal combination for a man who undertakes a new kind of task late in life. The history sat like a nightmare on Moore for fifteen years, and after all was left unfinished on the melancholy collapse of his powers in 1845. From the time that he burdened himself with it Moore did very little else, beyond a few occasional squibs and songs, the last flashes of his genius, and the *Travels of an Irish Gentleman in Search of a Religion*, although he had tempting offers of more lucrative and, it might have been thought, more congenial work. Moore's character had a deeper manliness and sincerity than he often gets credit for; and his tenacious persistence in this his last task was probably due to an honourable ambition to connect himself as a benefactor with the history of his country, by opening the eyes of the English people to the misgovernment of Ireland. It was a misjudgment altogether; the light irony of *Captain Rock* was much more effective than the minute carefully-weighed details of the history. Moore's last years were harassed by the weakness, and misconduct of his sons, and by pecuniary embarrassments. An annual pension of £300 was conferred upon him in 1833, and he had always received large sums for his work; but, while waiting for the sinecure which never came, he had contracted an unfortunate habit of drawing upon his publishers in advance. After the death of his last child in 1845, Moore became a total wreck, but he lingered on till 26th February 1852. The diary, which he seems to have kept chiefly that it might be the means of making some provision for his wife, and which contains so many touching expressions of his affection for her, was edited by Lord John Russell with his letters and a fragment of autobiography in 1853-56. The charge of vanity has often been brought against this diary from the writer's industry in recording many of the compliments paid him by distinguished personages and public assemblies. It is only vanity that is annoyed by the display of vanity in others. (w. m.)

MOOR-HEN,¹ the name by which a bird, often called Water-hen and sometimes Gallinule, is most commonly known in England. An earlier name was Moat-hen, which was appropriate in the days when a moat was the ordinary adjunct of most considerable houses in the country. It is the *Gallinula chloropus* of ornithologists, and almost too well known to need description. About the size of a small Bantam-hen, but with the body much compressed (as is usual with members of the Family *Rallidæ*, to which it belongs), its plumage above is of a deep olive-brown, so dark as to appear black at a short distance, and beneath

iron-grey, relieved by some white stripes on the flanks, with the lower tail-coverts of pure white,—these last being very conspicuous as the bird swims. A scarlet frontlet, especially bright in the spring of the year, and a red garter on the tibia of the male render him very showy. Though often frequenting the neighbourhood of man, the Moor-hen seems unable to overcome the inherent stealthy habits of the *Rallidæ*, and hastens to hide itself on the least alarm; but under exceptional circumstances it may be induced to feed, yet always suspiciously, with tame ducks and poultry. It appears to take wing with difficulty, and may be often caught by an active dog; but, in reality, it is capable of sustained flight, its longer excursions being chiefly performed by night, when the peculiar call-note it utters is frequently heard as the bird, itself invisible in the darkness, passes overhead. The nest is a mass of flags, reeds, or other aquatic plants, often arranged with much neatness, almost always near the water's edge, where a clump of rushes is generally chosen; but should a mill-dam, sluice-gate, or boat-house afford a favourable site, advantage will be taken of it, and not unfrequently the bough of a tree at some height from the ground will furnish the place for a cradle. The eggs, from seven to eleven in number, resemble those of the COOT (vol. vi. p. 341), but are smaller, lighter, and brighter in colour, with spots or blotches of reddish-brown. In winter, when the inland waters are frozen, the majority of Moor-hens betake themselves to the tidal rivers, and many must leave the country entirely, though a few seem always able to maintain their existence however hard be the frost. The common Moor-hen is extensively spread throughout the Old World, being found also at the Cape of Good Hope, in India, and in Japan. In America it is represented by a very closely-allied form, *G. galeata*, so called from its rather larger frontal helm, and in Australia by another, *G. tenebrosa*, which generally wants the white flank-markings. Both closely resemble *G. chloropus* in general habits, as does also the *G. pyrrhorhoa* of Madagascar, which has the lower tail-coverts buff instead of white. Celebes and Amboyna possess a smaller cognate species, *G. hamatopus*, with red legs; tropical Africa has the smallest of all, *G. angulata*; and some more that have been recognized as distinct are also found in other more or less isolated localities. One of the most remarkable of these is the *G. nesiotis* of Tristan da Cunha,² which has wholly lost the power of flight concomitantly with the shortening of its wings and a considerable modification of its external apparatus, as well as a strengthening of its pelvic girdle and legs.³ A more extreme development in this direction appears to be exhibited by the singular *Habroptila wallacii* of Jilolo,⁴ and to some extent by the *Pareudiastes pacificus* of Samoa,⁵ but at present little is known of either. Of other forms, such as the common *Gallinula (Erythra) phœnicura*, and *Gallinula cristata* of India, as well as the South-American species classed in the genus *Porphyrion*, there is not room to speak; but mention should be made of the remarkable Australian genus *Tribonyx*, containing three species,⁶ which seem to be more terrestrial than aquatic in their haunts and habits.

Allied to all these is the genus *Porphyrion*, including the bird so named by classical writers, and perhaps a dozen other species often called Sultanas and Purple Water-hens, for they all have a plumage of deep blue,—some becoming violet, green, or black in parts, but preserving the white lower tail-coverts, so generally characteristic

² *Proc. Zool. Society*, 1861, p. 260, pl. xxx.

³ A somewhat intermediate form seems to be presented by the Moor-hen of the island of St Denis, to the north of Madagascar (*Proc. Zool. Society*, 1867, p. 1036), hitherto undescribed.

¹ Not to be confounded with "Moor-cock" or "Moor-fowl," names formerly in general use for the Red Grouse (vol. xi. 221).

of the group; and their beauty is enhanced by their scarlet bill and legs. Two, *P. alleni* of the Ethiopian Region and the South-American *P. parva*, are of small size. Of the larger species, *P. caruleus* is the "Porphyrio" of the ancients, and inhabits certain localities on both sides of the Mediterranean, while the rest are widely dispersed within the tropics, and even beyond them, as in Australia and New Zealand. But this last country has produced a more exaggerated form, *Notornis*, which has an interesting and perhaps unique history. First described from a fossil skull by Prof. Owen,¹ and then thought to be extinct, an example was soon after taken alive,² the skin of which (with that of another procured like the first by Mr Walter Mantell) may be seen in the British Museum. Other fossil remains were from time to time noted by Prof. Owen³; but it began to be feared that the bird had ceased to exist,⁴ until a third example was taken about the year 1879, the skin and most of the bones of which, after undergoing examination in New Zealand by Dr Buller and Prof. T. J. Parker,⁵ found their way to the museum of Dresden, where Dr A. B. Meyer discovered the recent remains to be specifically distinct from the fossil, and while keeping for the latter the name *N. mantelli* gives the former that of *N. hochstetteri*. What seems to have been a third species of *Notornis* formerly inhabited Lord Howe's Island, but is now extinct (see BIRDS, vol. iii. p. 732, note). Whether the genus *Aptornis*, of which Prof. Owen has described the remains from New Zealand, was most nearly allied to *Notornis* and *Porphyrio* cannot here be decided. Prof. T. J. Parker (*loc. cit.*) considers it a "development by degeneration of an ocydromine type" (see OCYDROME). (A. N.)

MORAL PHILOSOPHY. See ETHICS, vol. viii. p. 574.

MORATIN, LEANDRO FERNANDEZ DE (1760-1828), Spanish dramatist and poet, was the son of N. F. Moratin mentioned below, and was born at Madrid on 10th March 1760. His poetical and artistic tastes were early developed, but his father, keenly alive to the difficulties of the literary calling, caused him to be apprenticed to a jeweller. At the age of eighteen Moratin surprised his friends by winning the second prize of the Academy for a heroic poem on the conquest of Granada, and two years afterwards he attracted still more general attention by a similar success of his *Lección Poética*, a satire upon the popular poets of the day. Through Jovellanos he was now appointed secretary to Cabarrus on his special mission to France in 1787, and during his stay there he diligently improved his opportunities of becoming acquainted with the contemporary French drama, and of cultivating the acquaintance of men of letters. Of the literary friendships he then formed the most important was that with Goldoni; indeed, Moratin is much more correctly styled "the Spanish Goldoni" than "the Spanish Molière." On his return to Spain Florida Blanca presented him to a sinecure benefice in the diocese of Burgos; and in 1790 his first play, *El Viejo y la Niña* (The Old Husband and the Young Wife), a highly finished but somewhat dreary verse comedy in three acts, written in 1786, but delayed by objections of the actors,

² *Proc.*, 1850, pp. 209-214, pl. xxi.; *Trans.*, iv. pp. 69-74, pl. xxv.

³ Thus the leg-bones and what appeared to be the sternum were described and figured by him (*Trans.*, iv. pp. 12, 17, pls. ii. iv.), and the pelvis and another femur (vii. pp. 369, 373, pls. xlii. xliii.); but the supposed sternum subsequently proved not to be that of *Notornis*, and Professor Owen's attention being called to the fact he rectified the error (*Proc.*, 1882, p. 689) which he had previously been "inclined to believe" (*Trans.*, viii. p. 120) he had made.

⁴ Notwithstanding the evidence, which it must be allowed presented some incongruities, offered by Mr Mackay (*Ibis*, 1867, p. 144).

⁵ *Trans. N. Zeal. Inst.*, xiv. pp. 238-258.

was at length produced at the Teatrò del Principe. Its success was only moderate. *El Café* or *La Comedia Nueva*, on the other hand, given at the same theatre two years afterwards, at once became deservedly popular, and had considerable influence in modifying the public taste. It is a short prose comedy in two acts, avowedly intended to expose the follies and absurdities of the contemporary dramatists—the school of Lope de Vega run to seed—who commanded the support of the masses; and it is still read with pleasure for the simple ingenuity of its plot, the liveliness of its dialogue, and the easy grace of its style, while to the student of literature it throws much useful light on the contemporary state of the Spanish drama, and on the reforming aims of the author and his party. In the same year (1792) Florida Blanca was disgraced, but Moratin at once found another patron in Godoy, who provided him with a pension and the means for foreign travel; he accordingly passed through France into England, where he began the free and somewhat incorrect translation of *Hamlet* which was printed in 1798, but which has never been performed. From England he passed to the Low Countries, Germany, Switzerland, and Italy, and on his return to the Peninsula in 1796 he received a lucrative post at the Foreign Office. His next appearance in the drama did not take place until 1803, when *El Baron* was first publicly exhibited in its present form. It successfully weathered a determined attempt to damn it, and still keeps the stage. It was followed in 1804 by *La Mogigata* (The Female Hypocrite), of which imperfect manuscript copies had begun to circulate as early as 1791. It was favourably received, as on the whole it deserved to be, by a public which was now at one with the author as to the canons of his art, and an attempt to suppress it by means of the Inquisition on alleged religious grounds (*La Mogigata* being an imitation, a somewhat feeble one, of Molière's *Tartuffe*) was successfully frustrated. Moratin's last and crowning triumph in the department of original comedy was achieved in 1806, when *El Si de las Niñas* (A Girl's Yes) was performed night after night to crowded houses, ran through several Spanish editions in a year, and was soon translated into several foreign languages. In 1808, on the fall of the Prince of the Peace, Moratin found it necessary to leave Spain, but shortly afterwards he returned and consented to accept the office of royal librarian under Joseph Bonaparte—a false step, which, as the event proved, permanently alienated from him the sympathies of his country, and compelled him to spend almost all the rest of his life in exile. In 1812 his *Escuela de los Maridos*, a translation and adaptation to the more dignified and stately Spanish standard of Molière's *École des Maris*, was produced at Madrid, and in 1814 *El Médico a Palos* (from *Le Médecin Malgré Lui*) at Barcelona. From 1814 to 1828 Moratin lived in France, principally at Paris, and devoted himself to the preparation of a learned work on the history of the Spanish drama (*Orígenes del Teatro Español*), which unfortunately stops short of the period of Lope de Vega. He died at Paris on 21st June 1828.

An edition of his *Obras Dramaticas y Liricas* in three vols. was published at Paris in 1825. The lyrical works, consisting of odes, sonnets, and ballads, are of comparatively little interest; they reflect the influence of his father and of the Italian Conti. The best edition of the *Obras* is that published by the Spanish Academy of History in four vols. at Madrid in 1830-1831; see also vol. ii. of *Biblioteca de Autores Españoles* (1846).

MORATIN, NICOLAS FERNANDEZ DE (1737-1780), Spanish poet, was descended from an old Biscayan family, and was born at Madrid in 1737. He was educated at the Jesuit college in Calatayud, and afterwards studied law at the university of Valladolid. He then received an appointment in the service of Queen Elizabeth, the widow of Philip V., which enabled him to see much of the society

of leading statesmen, poets, and men of letters; and ultimately he became the leading spirit of the club of literary men which frequented the *Fonda de San Sebastian* and included Ayala, Cadahalso, Iriarte, Conti, and others. In 1772 he left the court, and was called to the bar; four years afterwards he succeeded Ayala in the chair of poetry in the Imperial College. He died on 11th May 1780.

Moratin became at an early period of his life a convert to the opinions of those who (such as Montianb and others) were attempting to drive the native romantic drama from the Spanish stage, and his first literary efforts were devoted to the cause of theatrical reform. In 1762 he published three small pamphlets entitled *Desengaño al Teatro Español* (The Truth told about the Spanish Stage), in which he severely criticized the old drama generally, and particularly the still flourishing "auto sacramental." They were so far successful that the exhibition of "autos sacramentales" was prohibited by royal edict three years afterwards (June 1765). In 1762 he also published a play entitled *La Petimetre* (the Petite-Maitresse, or Female Fribble), the earliest original Spanish comedy formed avowedly on French models. It was preceded by a dissertation in which Lope de Vega and Calderon are very unfavourably criticized. Neither the *Petimetre*, however, nor the *Lucrecia*, an original tragedy still more strictly in accordance with the conventions of the French stage, ever obtained the honour of a public representation. Two subsequent tragedies, *Hormesinda* (1770) and *Guzman el Bueno* (1777), were exhibited with partial success. In 1764 Moratin published a collection of short pieces, chiefly lyrical, under the title of *El Poeta*, and in 1765 a short didactic poem on the chase (*Diana o Arte de la Caza*). His "epic canto" on the destruction of his ships by Cortes (*Las Naves de Cortes Destruídas*), written, but without success, for a prize offered by the Academy in 1777, was not published until after his death (1785). It is justly characterized by Ticknor as "the noblest poem of its class produced in Spain during the 18th century;" it must be remembered, however, that the historical epic in Spain is chiefly remarkable for its mass. A volume of *Obras Postumas*, with a life, was published at Barcelona in 1821, and reprinted at London in 1825. See also *Biblioteca de Autores Españoles*, vol. ii. (1846).

MORAVIA (in German MÄHREN), a margraviate and crownland in the Cisleithan part of the Austrian-Hungarian empire, lies between 15° 5' and 18° 45' E. long., and 48° 50' and 50° 10' N. lat. Its superficial extent is about 8580 square miles. Physically Moravia may be described as a mountainous plateau sloping from north to south, and bordered on three sides by mountain ranges of considerable elevation. On the north it is separated from Austrian and Prussian Silesia by the Sudetes, which attain a height of 4775 feet in the Altvater or Schneeberg, and sink gradually towards the west, where the valley of the Oder forms a break between the German mountains and the Carpathians. The latter are the dividing range between Moravia and Hungary, having here an average height of 3000 to 4000 feet. On the west are the so-called Bohemian-Moravian mountains, forming the elevated east margin of Bohemia and descending in terraces, but without clearly-defined ridges, to the river March. Branches of these different ranges intersect the whole country, making the surface very irregular, except towards the south, where it consists of fertile and extensive plains. Owing to this configuration of the soil the climate varies more than might be expected in so small an area, so that, while the vine and maize are cultivated successfully in the southern plains, the weather in the mountainous districts is somewhat rigorous. The mean average temperature at Brünn is 48° Fahr. The harvest amid the mountains is often four or five weeks later than that in the south. Almost the whole of Moravia belongs to the basin of the March or Morava, from which it derives its name, and which, after traversing the entire length of the country in a course of 140 miles and receiving numerous tributaries (Thaya, Hanna, &c.), enters the Danube at Pressburg. The Oder rises among the mountains in the north-east of Moravia, but soon turns to the north and quits the country. With the exception of a stretch of the March none of the rivers are navigable. Moravia is destitute of lakes, but contains numerous large ponds. There are also several mineral springs.

Nearly 97 per cent. of the soil of Moravia is productive, arable land occupying 53, gardens and meadows 8.5, pasturage 9, and forests 26 per cent. of the total. It is one of the chief corn-growing regions of the Austrian empire, and also produces excellent hemp, flax, potatoes, vegetables, and fruit. The following table shows the amount of the chief crops in 1881:—

Wheat	454,480 qrs.	Leguminous crops	27,850 cwt.
Rye	1,242,480 "	Beet (for sugar)	11,533,340 "
Barley	331,190 "	Flax	47,100 "
Oats	1,497,450 "	Hemp	6,260 "
Maize	48,100 "	Fruit	1,106,570 "
Potatoes	1,271,850 cwt.	Wine	2,869,460 gall.

Large quantities of hay and other fodder, besides hops, clover-seed, anise, fennel, &c., are also raised. The forests on the slopes of the Sudetes produce abundance of excellent timber. The live-stock of Moravia in 1880 consisted of 122,858 horses, 677,807 cattle, 158,852 sheep, 205,976 swine, and 116,880 goats. The breed of sheep on the Carpathians is of an improved quality, and the horses bred in the fertile plain of the Hanna are highly esteemed. Geese and poultry are also reared. In 1880 Moravia contained 83,440 beehives, and the produce of wax and honey may be estimated at 3500 to 4000 cwts.

The mineral wealth of Moravia, consisting chiefly of coal and iron, is very considerable. In 1881 the produce included 392,625 tons of anthracite coal, 50,665 tons of lignite, 5700 tons of iron-ore, 1713 tons of graphite, and smaller quantities of alum, potter's clay, and roofing-slate. The mines give employment to 4500 persons, and the annual value of the raw minerals produced is about £370,000. The amount of raw and cast iron produced by the ironworks and foundries in 1880 was 40,000 tons, and the value about £320,000.

In point of industry Moravia belongs to the foremost provinces of the empire. The principal manufactures are woollen, cotton, linen, and cast-iron goods, beet-sugar, leather, and brandy. Its woollen cloths and flannels, the manufacture of which centres in Brünn, have long been celebrated. The linen manufacture is decreasing in importance as cotton manufactures develop. The quantity of sugar made from beetroot is steadily increasing; in 1880 about 600,000 cwts. of sugar were produced in fifty-seven factories. About 10 per cent. of the total value of the manufactures of Austria, representing an annual amount of £13,000,000 to £15,000,000, falls to the share of Moravia. The trade of Moravia consists mainly in the exchange of the various raw and manufactured materials above mentioned for colonial produce, salt, and raw manufacturing material. The lack of navigable rivers or canals is compensated by good roads and an extensive railway system. The most important commercial towns are Brünn for manufactures and Olmütz for live-stock.

In educational matters Moravia compares favourably with most of the Austrian states. It contains 10 gymnasia, 10 real-gymnasia, 13 real-schools, numerous schools for special purposes, and nearly 2000 lower schools. The old university of Brünn is now represented by a technical academy and a theological seminary. Of children of school-going age 79 per cent. attend school regularly. In 1870 about 46 per cent. of the Moravian recruits could write their names, as compared with the extremes of 83½ per cent. in Lower Austria and 1¼ per cent. in Dalmatia. Fully 95 per cent. of the inhabitants are Roman Catholics under the ecclesiastical jurisdiction of the archbishop of Olmütz and the bishop of Brünn, while about 2 per cent. are Jews, and 3 per cent. Protestants.

Moravia sends 36 members to the Austrian reichstag, 9 of these representing the landed proprietors, 16 the towns and chambers of commerce, and 11 the peasantry.

Provincial affairs are managed by the landtag, consisting of the Roman Catholic archbishop and bishop, 30 representatives of the landed gentry, 37 representatives of the towns and chambers of commerce, and 31 representatives of the country districts. There are six courts of justice of the first instance in Moravia, and one of the second instance (at Brünn), whence appeal lies to the supreme court at Vienna. For military and judicial purposes Moravia is united with Austrian Silesia.

Moravia belongs to the group of old Slavonic states which have preserved their nationality while losing their political independence. Upwards of 70 per cent. of the inhabitants are Slavs, who are scarcely distinguishable from their Bohemian neighbours. The differences in dialect between the two countries are very slight, and are being gradually lost in a common literary language. The name of Czech, however, is usually reserved for the Bohemians, while the Slavs of Moravia and West Hungary are called Moravians and Slovaks. The Czechs have lost sight of their ancient tribal names, but the Moravians are still divided into numerous secondary groups (Hovaks, Hanaks, &c.), differing slightly in costume and dialect. The peasants usually wear a national costume. In the south of Moravia are a few thousand Croats, still preserving their manners and language after three centuries' separation from their kinsmen in Croatia; and in the north-east are numerous Poles. The Germans form about 26 per cent. of the population, and are found mostly in the towns and in the border districts. The Jews are the best educated of the inhabitants, and in a few small towns form a full half of the population. Their sympathies generally lie with the Germans. In 1880 the population was 2,153,407, showing an increase of 136,133 since 1869. Moravia is one of the most densely-populated parts of Austria-Hungary, the proportion being 252 persons per square mile. About 12 per cent. of the births are illegitimate. The chief towns are Brünn, the capital and industrial centre (82,660 inhabitants), Olmütz, a strong fortress defending the "Moravian Gate" (20,176 inhabitants), Znaim, and Iglau.

History.—At the earliest period of which we have any record Moravia was occupied by the Boii, the Celtic race which has perpetuated its name in Bohemia. Afterwards it was inhabited by the Germanic Quadi, who accompanied the Vandals in their westward migration; and they were replaced in the 6th century by the Rugii and Heruli. The latter tribes were succeeded about the year 550 A.D. by the Lombards, and these in their turn were soon forced to retire before an overwhelming invasion of Slavs, who, on their settlement there, took the name of Moravians (German, *Mähranen* or *Mähren*) from the river Morava. These new colonists became the permanent inhabitants of this district, and in spite of the hostility of the Avars on the east founded the kingdom of Great Moravia, which was considerably more extensive than the province now bearing the name. Towards the end of the 8th century they aided Charlemagne in putting an end to the Avar kingdom, and were rewarded by receiving part of it, corresponding to North Hungary, as a fief of the German emperor, whose supremacy they also acknowledged more or less for their other possessions. After the death of Charlemagne the Moravian princes took advantage of the dissensions of his successors to enlarge their territories and assert their independence, and Rastislaus (*circa* 850) even formed an alliance with the Bulgarians and the Byzantine emperor. The chief result of the alliance with the latter was the conversion of the Moravians to Christianity by two Greek monks, Cyril and Methodius, despatched from Constantinople. Rastislaus finally fell into the hands of Louis the German, who blinded him, and forced him to end his days as a monk; but his successor, Svatopluk (*ob.* 890), was equally vigorous, and extended the kingdom of Great Moravia to the Oder on the west and the Gran on the east. At this period there seemed a strong probability of the junction of the north-western and south-eastern Slavs, and the formation of a great Slavonic power to the east of the German empire. This prospect, however, was dissipated by the invasions of the Magyar hordes in the 10th century, the brunt of which was borne by Moravia. The invaders were encouraged by the German monarchs and aided by the dissensions and mismanagement of the successors of Svatopluk, and in a short time completely subdued the eastern part of Great Moravia. The name of Moravia was henceforth confined to the

district to which it now applies. For about a century the possession of this marchland was disputed by Hungary, Poland, and Bohemia, but in 1029 it was finally incorporated with Bohemia, and so became an integral part of the German empire. Towards the close of the 12th century Moravia was raised to the dignity of a margraviate, but with the proviso that it should be held as a fief of the crown of Bohemia. It henceforth shared the fortunes of this country, and was usually assigned as an appanage to younger members of the Bohemian royal house. In 1410 Jobst, margrave of Moravia, was made emperor of Germany, but died a few months after his election. In 1526, on the death of Louis II. of Hungary, Moravia came with the rest of that prince's possessions into the hands of the Austrian house. During the Thirty Years' War the depopulation of Moravia was so great that after the peace of Westphalia the states-general published an edict giving every man permission to take two wives, in order to "repeople the country." After the Seven Years' War Moravia was united in one province with the remnant of Silesia, but in 1849 it was made a separate and independent crownland. The most noticeable feature of recent Moravian history has been the active sympathy of its inhabitants with the anti-Teutonic home-rule agitation of the Bohemian Czechs (see BOHEMIA).

Authorities.—Dudik, *Mährens allgemeine Geschichte* (Brunn, 1880-76); Wolny, *Die Markgrafschaft Mähren, topographisch, statistisch, und historisch geschildert* (Brünn, 1835-40); D'Elvert, *Beiträge zur Geschichte der Neugestaltung Mährens im 17ten Jahrhundert* (1867); Trampler, *Heimatkunde der Mark Mähren* (Vienna, 1877); *Statistische Jahrbücher* of the Imperial Statistical Commission (J. F. M.).

MORAVIAN BRETHERN, THE, are a society of Christians whose history can be traced back to the year 1457 and their origin found among the religious movements in Bohemia which followed the martyrdom of John Huss by the council of Constance. The beginnings of the Bohemian Brethren (for that was their earlier name) are somewhat obscure. The followers of Huss broke up into two factions, one of which, the Calixtines, was willing to acknowledge allegiance to Rome, provided the "compact" of the council of Basel permitting the Lord's Supper *sub utraque specie* were maintained, and in the end it became the national church of Bohemia; the other, the Taborites, refused all terms of reconciliation, and appealed to arms. Separate from both these were many pious people who were content to worship God in simple fashion, in quiet meetings for prayer and Scripture-reading, like the *Gottesfreunde* of Germany, and who called themselves *Brethren*. Bohemian historians have conclusively shown that the Brethren represent the religious kernel of the Hussite movement, and do not come either from the German Waldenses or from the Taborites. Before 1457 many of these quiet Christians were known as the Brethren of Chelcic, and were the followers of Peter Chelcicky, a Bohemian, whose religious influence, strongly Puritan in its character, seems to have been inferior only to that of Huss. In that year the Calixtine leader, Rokyzana, wishing to protect them, permitted his nephew Gregory to gather them together at Kunewald near Senftenberg, and form them into a community. This meeting was really the foundation of the Brethren or *Unitas Fratrum*, and its founder Gregory announced that he and his companions received and taught the rejection of oaths, of the military profession, of all official rank, titles, and endowments, and of a hierarchy. They did not profess communism, but they held that the rich should give of their riches to the poor, and that all Christians should live as nearly as possible in the fashion of the apostolic community at Jerusalem. At the synod of Lhota near Reichenau, in 1467, they constituted themselves into a church separate from the Calixtine or national church of Bohemia. They appointed ministers of their own election and with the guidance of the "lot," and had an organization and discipline of their own; at their head was a bishop, who, it is said, received ordination from the Austrian Waldenses, but apostolic succession among the Brethren is one of the most obscure parts of their history.

The constitution of the society was revised at a second synod held at Lhota under the direction of Luke of Prague, who may be regarded as their second founder. This re-

organization enabled the society to grow rapidly. In the earlier years of the 16th century the *Unitas* included nearly 400 congregations in Bohemia and Moravia with 150,000 members, and, including Poland, embraced three provinces—Bohemia, Moravia, Poland. Each province had its own bishops and synods, but all were united in one church and governed by the general synod.

The Lutheran movement in Germany awakened lively interest among the Brethren, and some unsuccessful attempts were made under the leadership of Augusta to unite with the Lutheran Church (1528-1546); but when the Calvinist reformation reached Bohemia the Brethren found themselves more in sympathy with it than with the Lutheran. The Jesuit anti-Reformation, instigated by Rudolf and his brothers Matthias and Ferdinand, found the Brethren a prosperous church, but the pitiless persecution which followed the unsuccessful attempt at revolution crushed the whole Protestantism of Bohemia, and in 1627 the Evangelical churches there had ceased to exist. About the same time the Polish branch of the Unity, in which many refugees from Bohemia and Moravia had found a home, was absorbed in the Reformed Church of Poland. A few families, however, especially in Moravia, held religious services in secret, preserved the traditions of their fathers, and, in spite of the vigilance of their enemies, maintained some correspondence with each other. In 1722 some of these left home and property to seek a place where they could worship in freedom. The first company, led by Christian David, a mechanic, settled by invitation from Count Zinzendorf on his estate at Berthelsdorf near Zittau, in Saxony. They were soon joined by others (about 300 coming within seven years), and built a town which they called Herrnhut. The small community at first adopted the constitution and teaching of the old *Unitas*. The episcopate had been continued, and in 1735 David Nitschmann was consecrated first bishop of the Renewed Moravian Church. The new settlement was not, however, destined to be simply a revival of the organization of the Bohemian Brethren. Zinzendorf, who had given them an asylum, came with his wife, family, and chaplain to live among the refugees. He was a Lutheran who had accepted Spener's pietism, and he wished to form a society distinct from national churches and devoted to good works. After long negotiation a union was effected between the Lutheran element and the adherents of the ancient *Unitas Fratrum*. The emigrants at Herrnhut attended the parish church at Berthelsdorf, and were simply a Christian society within the Lutheran Church (*ecclesiola in ecclesia*). This peculiarity is still to some extent preserved in the German branch of the church, and the Moravian Brethren regard themselves as a church within the church, or the Brethren's Congregation within the Evangelical Protestant churches, which enables them to do evangelistic work without proselytizing. The society adopted a code of rules in 1727, and ordained twelve elders to carry on pastoral work. This was the revival of the *Unitas Fratrum* as a church.

Constitution.—The Unity of Moravian Brethren at present embraces three provinces—German, English, and American. Each province has its own government by synod and provincial elders' conferences; but it firms with the other two one organic whole, and is therefore under the control of a general government also. The general synod, which governs the whole church, meets every ten years at Herrnhut, and is attended by delegates from all the provinces and from the missions. The elders' conference of the Unity is an executive board, which superintends all the provinces and the missions. The present constitution dates from 1857, when the old organization of the *Unitas Fratrum* was remodelled.

Ministers and Worship.—The ministers are bishops, presbyters, and deacons. The bishops alone can ordain, but they are not diocesan. They are appointed by the general synod, or by the elders' conference of the Unity, and have official seats both in the synods of the provinces where they preside, and in the general synod. Unordained assistants in the ministry, whether men or

women, are formally set apart as acolytes. The worship is liturgical. Special services are used on the festivals of the ecclesiastical year, on the "Memorial Days" 1st March, 12th May, 17th and 25th June, 6th July, 13th and 21st August, 16th September, 31st October, and 13th November. Love-feasts are still held, but the feet-washing and the use of the lot in the election of ministers and in marriages have fallen into disuse. The use of the lot in marriages was abolished in 1818.

Doctrine.—The Moravian Church has no formal creed, but its doctrine, as found in the catechism, in the Easter morning litany, and in the *Synodal Results*, embraces the following points (settled by the synod of 1879):—(1) that Scripture is the only rule of faith and practice, (2) the total depravity of human nature, (3) the love of God the Father, (4) the real Godhead and the real humanity of Jesus Christ, (5) our reconciliation unto God, and our justification before Him, through the sacrifice of Jesus Christ, (6) the doctrine of the Holy Ghost and the operations of His grace, (7) good works as the fruit of the Spirit, (8) the fellowship of believers one with another in Christ Jesus, (9) the second coming of the Lord in glory, and the resurrection of the dead unto life or unto condemnation.

Work.—(a) *Home Work in the Three Provinces.*—This embraces two divisions. (1) Besides congregational work, special home missions are carried on in each province. In the German province there is a peculiar home mission called the *Diaspora*, which dates from 1729. Its object is unsectarian. It seeks to excite and foster spiritual life by means additional to those provided by the established churches, and does not make proselytes nor strive to draw members from other Protestant churches. The work is carried on in Denmark, in Norway and Sweden, in the various parts of Germany, in the Baltic provinces of Russia, in Poland, and in Switzerland. In the English province home mission work is conducted on the principle of establishing preaching-stations in populous places, which may ultimately become congregations connected with the church. There is also a society for propagating the gospel in Ireland. The work in the American province is of the same kind. (2) The Brethren have always paid special attention to education. Each province has a theological college, and there are in the three provinces forty-seven boarding-schools for boys and girls not connected with the Moravian Church. At these schools nearly 2500 pupils are educated.

(b) *Foreign Missions.*—The Moravian Church since its reorganization by Zinzendorf has been the missionary church *par excellence*. The third jubilee of missions was celebrated in 1882. The first period began with 1732, when two men, Leonard Dover and David Nitschmann, were sent to preach to the negroes of St Thomas, when it ended in 1782, the church had 167 brethren and sisters occupying 27 stations. In 1832 the church had to record 40,000 converts under the direction of 209 missionaries at 41 stations. The latest statistics show 115 stations with 317 additional preaching-places, 7 normal schools with 70 scholars, 215 day schools with 15,616 pupils, 215 teachers, and 634 monitors, 94 Sunday schools with 13,355 pupils and 884 teachers, 312 missionaries (male and female), 1471 native assistants, and 76,646 converts.

(c) *The Bohemian Mission.*—The Brethren early made missionary circuits from Herrnhut and Silesia through Bohemia and Moravia, and since 1862 this itinerating work was largely increased. In 1869 it was resolved to re-establish the church in these countries of its birth, and the first congregation was inaugurated in October 1870. It now contains four congregations, and in 1880 obtained legal sanction.

(d) *The Leper Mission* was begun in 1822 in South Africa, and carried on there till 1867, when the English Government appointed a chaplain to do the work. The Leper Home in Jerusalem was established in 1867, and formally taken over by the elders' conference of the Unity in 1881.

MORAYSHIRE. See ELGIN, vol. viii. p. 129.

MORBILHAN, a department of western France, formed of part of Lower Brittany, lies on the Atlantic seaboard between 2° 2' and 3° 45' W. long., and between 47° 26' and 48° 12' N. lat., being bounded S.E. by the department of Loire-Inférieure, E. by that of Ille-et-Vilaine, N. by Côtes

du Nord, and W. by Finistère. Its chief town, Vannes, is 248 miles west-south-west of Paris in a direct line and 310 by rail. From the Montagnes Noires on the northern frontier the western portion of Morbihan slopes southward towards Finistère, watered by the Quimperlé, the Blavet with its affluent the Scorff, and the Auray; the eastern portion, on the other hand, dips towards the south-east in the direction of the course of the Oust and its feeders, which fall into the Vilaine. Though the Montagnes Noires contain the highest point (975 feet) in the department, the most striking orographic feature of Morbihan is the dreary, treeless, streamless tract of moorland and marsh known as the Landes of Lanvaux, which extends (west-north-west to east-south-east) with a width of from 1 to 3 miles for a distance of 31 miles between the valley of the Claire and that of the Arz (affluents of the Oust). A striking contrast to this district is afforded by the various inlets of the sea, whose shores are clothed with vegetation of exceptional richness, large fig-trees, rose-laurels, and aloes growing as if in Algeria. The coast-line is exceedingly irregular: the mouth of the Vilaine (the longest river of the department), the peninsula of Ruis, the great gulf of Morbihan (Inner Sea), from which the department takes its name, and the mouth of the Auray, the long Quiberon peninsula attached to the mainland by the narrow isthmus of Fort Penthièvre, the deep-branching estuary of Etel, the mouths of the Blavet and the Scorff uniting to form the port of Lorient, and, finally, on the borders of Finistère the mouth of the Laita, follow each other in rapid succession. Off the coast lie the islands of Groix, Belle-isle, Houat, and Hoedik. Vessels drawing 13 feet can ascend the Vilaine as far as Redon; the Blavet is canalized throughout its course through the department; and the Oust, as part of the canal from Nantes to Brest, forms a great waterway by Redon, Josselin, Rohan, and Pontivy. The climate of Morbihan is characterized by great moisture and mildness, due to the influence of the Gulf Stream.

Of the 2625 square miles forming the department, nearly one half is occupied by moors (*landes*), arable soil forming little more than a third part of the whole, meadows a tenth, and woodlands a fifteenth. The horses number 36,000, horned cattle 235,000, sheep 92,000, pigs 60,000, goats 6,000, and beehives 76,000. In 1882 the agricultural produce comprised 3,751,680 bushels of rye and 1,544,170 bushels of wheat; and considerable quantities of buckwheat, oats, potatoes, pease and beans, chestnuts, beetroot, hemp, colza, and flax are grown. A little wine also is made, but the usual liquor of the district is cider (manufactured to the extent of 11 to 13 million gallons per annum). The sea-ware gathered along the coast helps greatly to improve the soil. Outside of Lorient there is little industrial activity in Morbihan, though canvas, leather, preserved foods, paper, and chemical products derived from the sea are all manufactured. Salt marshes give employment to 400 hands, and yield on an average 9892 tons of salt; and slate, kaolin, iron-ore, and granite are also worked. The catching and curing of sardines and the breeding of oysters form the business of many of the inhabitants of the coast, who also fish for anchovies, lobsters, &c., for tinning. There are 154 miles of railway in the department, and it was intended (1833) that the line from Nantes to Brest should have branches from Auray to St Briac and to Quiberon, and from Questembert to Ploermel. Morbihan is divided into four *arrondissements*.—Vannes, Lorient, Ploermel, and Pontivy—37 cantons, and 249 communes. The population in 1881 was 521,614.

Few departments contain so many localities interesting for their historical associations. Besides the megalithic monuments of CARNAC (2800 inhabitants) (*q.v.*) and of Loemariaquer (2050), may be mentioned—Sarzeau (5720) with its castle of Sucinio, one of the ancient dukes of Brittany; Josselin (2710) with the tomb of Olivier de Clisson, constable of France, and of his second wife Marguerite de Rohan; the castle of the Rohans, and in the neighbourhood a column in memory of the "Combat of the Thirty;" Guéméné (1570) and the château of the Rohan Guéméné family; Le Palais (4885), the chief place in Belle-isle, containing the château of Fouquet (Louis XIV.'s superintendent of finance) and the hospital erected by his wife. Quiberon (2380) is associated with the disaster of the French émigrés; Hennebont (6050) has a magnificent railway viaduct over the Blavet, and La Roche Bernard (1230) a suspension

bridge over the Vilaine, 646 feet long and 103 feet above spring tides.

MORDAUNT, CHARLES. See PETERBOROUGH, EARL OF.
MORDVINIANS, more correctly MORDVA or MORDVS, are a people numbering about one million, of Finnish origin, belonging to the Ural-Altaic family, who inhabit the middle Volga provinces of Russia and spread in small detached communities to the south and east of these. Their settlement in the basin of the Volga is of high antiquity. One of the two great branches into which they are divided, the Aorses (now Erzya), is mentioned by Ptolemy as dwelling between the Baltic Sea and the Ural mountains, whilst the Aorses of Asia occupied at the same time the country to the north-east of the Caspian between the Volga and the Jaxartes. Their king is said to have come with 200,000 horsemen to aid Mithradates in his wars. Strabo mentions also the Aorses as inhabitants of the country between the Don, the Caspian Sea, and the Caucasus. The name of Mordvs is mentioned for the first time by Jordanes, and they were known under the same name to the Russian annalist Nestor. The Russians made raids on the Mordvs in the 12th century, and after the fall of Kasan they rapidly invaded and colonized their abodes. The Mordvs now occupy the Russian provinces of Simbirsk, Penza, Samara, and Nijni-Novgorod, as well as those of Saratoff and Tamboff. But their villages are dispersed among those of the Russians, and they constitute only 10 to 12 per cent. of the population in the four first-named provinces, and from 5 to 6 per cent. in the last two. They are unequally distributed over this area in ethnographical islands, and constitute as much as 23 to 44 per cent. of the population of several districts of the governments of Tamboff, Simbirsk, Samara, and Saratoff, and only 2 or 3 per cent. in other districts of the same provinces. A small number of Mordvs are found also in the provinces of Ufa, Orenburg, Astrakhan, and even in Siberia as far east as the river Tom. They are divided into two great branches, the Erzya and the Moksha, differing in their ethnological features and in their language. The southern branch, or the Moksha, have a darker skin and darker eyes and hair than the northern. A third branch, the Karatays, is due to mixture with Tatars, whilst a fourth branch, mentioned by several authors, is, according to Mainoff, but a local name for pure Mordvs. Their language is considered by M. Ahlqvist as the third branch of the Western Finnish family, the two other branches being the Laponian and the Baltic Finnish, which last embodies now the languages of the Karelians, the Tavastes, the Wotes, the Wespes, the Esthes, and the Lives. The Mordvs are for the most part completely Russified,—even the Mokshas who consider themselves as the only pure Mordvs,—yet they have well maintained their ethnological features, and can be easily distinguished even when living completely as Russians. They have nearly quite forgotten their own language, only a few women remembering it among the Mokshas; but they have maintained a good deal of their old national dress, especially the women, whose profusely embroidered skirts, original hair-dress, large earrings which sometimes are merely hare-tails, and numerous necklaces covering all the chest and consisting of all possible ornaments easily distinguish them from Russian women. They have mostly dark hair, but blue eyes, generally small and rather narrow. The cephalic index of the Mordvs is very near to that of the Finns. They are brachycephalous, or sub-brachycephalous, and a few are mesocephalous. They are finely built, rather tall and strong, and broad-chested. Their chief occupation is agriculture; they work harder and (in the basin of the Moksha) are more prosperous than their Russian neighbours. Their capacities as carpenters were well

known in Old Russia, and Ivan the Terrible used them to build bridges and clear forests during his advance on Kasan. At present they manufacture in their villages great quantities of wooden ware of various sorts. They are also great masters of apiculture, and the commonwealth of bees often appears in their poetry and religious beliefs. All explorers are unanimous in recognizing their honesty, morality, and sympathetic character; it is noticed also that they have remarkable linguistic capacities, and learn with great ease not only Russian but also several Finnish and Turkish dialects. Nearly all are Christians; they received baptism in the reign of Elizabeth; the Nonconformists have recently made many fervent proselytes among them. But they still preserve very much of their own rich mythology, which they have adapted to a certain extent to the Christian religion. They have preserved also, especially the less Russified Moksha, the practice of kidnapping brides, with the usual battles between the party of the bridegroom and that of the family of the bride. The worship of trees, water (especially of the water-divinity which favours marriage), the sun or Shkay, who is the chief divinity, the moon, the thunder, and the frost, and that devoted to the home-divinity Kardaz-serko can be seen in full force among them; and a small stone altar or flat stone covering a small pit to receive the blood of slaughtered animals can be found in very many houses. Their burial-customs are of a quite pagan character. On the fortieth day after the death of a kinsman the dead is not only supposed to return home but a member of his household, dressed in his dress, plays his part, and, coming from the grave, speaks in his name. The practice of animal sacrifice is still deep rooted among the Mokshas, who continue to drink the warm blood of immolated animals.

The Mordvs have always had a great attraction for Russian inquirers; Strahlenberg, Georgi, Pallas, and especially Lepekhin have written about them. Melnikoff has published in several Russian periodicals interesting sketches of their religious beliefs. A great number of smaller sketches have appeared in periodicals; these are enumerated by Mainoff in the *Izvestia* of the Russian Geographical Society for 1877. Entrusted by the Geographical Society with the study of this race, Mainoff has recently made extensive anthropological measurements and studies of their customs and common-law. The results are published, but not yet in full, in the *Izvestia* of the Russian Geographical Society for 1878, and in the periodicals *Slovo* for 1879, and *Old and New Russia* for 1878. They were to appear in full in the *Memoirs* of the Society.

MORE, HANNAH (1745-1833), who was born at Stapleton near Bristol in 1745, may be said to have made three reputations in the course of her long life: first, as a clever verse-writer and witty converser in the circle of Johnson, Reynolds, and Garrick; next, as an animated writer on moral and religious subjects on the Puritanic side; and lastly, as a practical philanthropist. She was the youngest but one of the five daughters of Jacob More, a scion of a landed Norfolk family, who taught a school at Stapleton in Gloucestershire. The sisters established a boarding-school at Bristol in 1767. Hannah's first literary efforts were pastoral plays, suitable for young ladies to act, published in 1773 under the title of *A Search after Happiness*. Metastasio was one of her literary models; on his opera of *Regulus* she based a drama, *The Inflexible Captive*, published in 1774. An annuity from a wealthy admirer set the young lady free for literary pursuits. Some verses on Garrick's *Lezar* led to an acquaintance; Miss More was taken up by the great female Mæcenas, Mrs Montague; and her unaffected enthusiasm, simplicity, vivacity, and wit won the hearts of the whole Johnson set, the great lexicographer himself being especially fascinated. Miss More was petted, complimented, and encouraged to write. Her ballad, *Eldred of the Bower*, was praised and quoted by the highest living authorities; and she wrote for Garrick the tragedy *Percy*, which was

acted with great success in 1777. Another drama, *The Fatal Falsehood*, produced in 1779 after Garrick's death, was less successful. In these dramas she borrows from Shakespeare situation, imagery, and phrasology with greater freedom than modern criticism would tolerate; but they are written with great vigour, freshness, and effect. Her *Sacred Dramas* appeared in 1782. These and the sprightly octosyllabic poems *Bas-Bleu* and *Florio* (1786) mark her gradual transition to more serious views of life, which were fully expressed in verse in her *Thoughts on the Manners of the Great* (1788), and *An Estimate of the Religion of the Fashionable World* (1790). She had never been overpowered by the flattering reception given her in fashionable society; she had received its attentions with misgivings and reservations, never touching cards, keeping Sunday strictly, and preferring company where she could have serious conversation; and finally, soon after Garrick's death, she set herself against theatre-going under any pretence. There is great uniformity of tone and topic in her ethical books and tracts:—*Strictures on Female Education* (1799), *Hints towards forming the Character of a Young Princess* (1805), *Cælebs in Search of a Wife* (only nominally a story, 1809), *Practical Piety* (1811), *Christian Morals* (1813), *Character of St Paul* (1815), *Moral Sketches* (1818). The tone is uniformly animated; the writing fresh and vivacious; her favourite subjects the minor immoralities, the thoughtless self-indulgences and infirmities which are rather indirectly than directly harmful. She was a rapid writer, and her work is consequently discursive and formless; but there was an originality and force in her way of putting commonplace sober sense and piety that fully accounts for her extraordinary popularity. An interesting episode in her literary life was her three years' labour in writing spirited rhymes and prose tales in the *Cheap Repository* series (1795-1798) to counteract the doctrines of Tom Paine and the influence of the French Revolution. Two millions of these rapid and telling sketches were circulated in one year, teaching the poor in rhetoric of most ingenious homeliness to rely upon the virtues of content, sobriety, humility, industry, reverence for the British constitution, hatred of the French, trust in God and in the kindness of the gentry. Perhaps the noblest testimony to Hannah More's sterling worth was her indefatigable philanthropic work—her long-continued exertions to improve the condition of the children in the benighted districts in the neighbourhood of her country residences at Cowslip Green and Barley Wood. She limited her aims strictly, as a good churchwoman and anti-Revolutionist, to teaching them to read good books and trying to raise their moral tone; but no philanthropist ever laboured at greater self-sacrifice or with purer motives. In her serene old age, philanthropists from all parts of the world made pilgrimages to see the bright and amiable old lady, and she retained all her faculties till within two years of her death, dying at Clifton on 7th September 1833, at the mature age of eighty-seven.

MORE, HENRY (1614-1687), one of the most remarkable and interesting of the "Cambridge Platonists," was born at Grantham in Lincolnshire in the year 1614. His father was "Alexander More, Esq., a gentleman of fair estate and fortune," highly spoken of by his son, who attributes to his father his own poetical tastes and generous love of learning from his early youth. Both his father and mother, he further tells us, were "earnest followers of Calvin," but he himself "could never swallow that hard doctrine." As soon as he went to Eton he gave himself up to what he considered a more genial and encouraging train of religious thought. From his boyhood in the Eton playing-fields he was a philosophical and religious dreamer, and he describes his moods of religious reverie in a very

interesting manner.¹ His communings and ecstasies had no morbid taint; they are the natural carriage of a strangely gifted spirit. "From the beginning all things in a manner came flowing to him," and his mind, according to his own saying, "was enlightened with a sense of the noblest theories in the morning of his days." In 1631 he went to Cambridge, and was admitted at Christ's College about the time Milton was leaving it. He immersed himself "over head and ears in the study of philosophy," and fell for a time into a sort of scepticism, from which, however, he was delivered by a study of the "Platonic writers." He was fascinated especially by Neo-Platonism; and this fascination never left him. The *Theologia Germanica* also exerted a great and permanent influence over him. He entered upon a course of spiritual self-discipline which made all his previous studies seem of comparatively no value; and gradually light as well as peace came to him. He got "into a most joyous and lucid state of mind," which he described in a Greek epigram, as he had formerly described his state of mental and spiritual darkness in the same manner. He took his bachelor's degree in 1635, his master's degree in 1639, and immediately afterwards was chosen fellow of his college. In this position he may be said to have remained all his life. Many offers of preferment were made to him, but he refused them all, with one exception. Fifteen years after the Restoration, he accepted a prebend in Gloucester cathedral, but only to resign it in favour of his friend Dr. Edward Fowler, afterwards the well-known bishop of Gloucester. He had no ambition, and steadily declined all attempts to draw him towards public life. He would not even accept the mastership of his college, to which, it is understood, he would have been preferred in 1654, when Cudworth was appointed. He drew many young men of a refined and thoughtful turn of mind around him, but among all his pupils the most interesting was a young lady of noble family, a "heroine pupil," as his biographer (Ward) says, "of an extraordinary nature." This lady is supposed to have been a sister of Lord Finch, afterwards earl of Nottingham, a well-known statesman of the Restoration. She afterwards became Lady Conway, and at her country seat at Ragley in Warwickshire More continued at intervals to spend "a considerable part of his time." She and her husband both greatly appreciated him, and amidst the woods of this pleasant retreat he composed several of his books. There is reason to think that the spiritual enthusiasm of Lady Conway was a considerable factor in some of More's speculations, none the less that she at length passed from his religious pupillage into the ranks of the Quakers. Susceptible to all the excited impulses of her time, this lady became the friend not only of More and Penn but of Baron van Helmont and Valentine Greatrakes, mystical thaumaturgists who played a considerable part amid the teeming enthusiasms of the 17th century. Ragley became a centre not only of devotion but of wonder-working spiritualism.² "Many happy days," More says, he spent in this "paradise," and its fantastic mysticism had more allurements for him than he himself realized. His genius suffered in consequence, and the play of rationality which distinguishes his earlier is much less conspicuous in his later works. He was a voluminous writer both in verse and prose, and the mere list of his works would occupy more space than we can give to it. Many of his productions are now unreadable; but the *Divine Dialogues*, published in 1668, may be still read with pleasure. It is animated and sometimes even brilliant, with less prolixity and digression than his other productions, while it has also

the advantage for modern readers that it condenses his general view of philosophy and religion. Most of his characteristic principles may in fact be gathered from it.

The year in which he composed the *Divine Dialogues* may be said to mark the highest point of his intellectual activity. His *Manual of Metaphysics* and elaborate treatises on Jacob Boehme and Spinoza were subsequent to this; but the elasticity and freshness of his philosophical genius are less buoyant in these efforts, and the prophetic-mystical elements which were a weakness in his mental constitution from the first grew as his years advanced. He represents more than any other member of the school the mystical and theosophic side of the Cambridge movement. Its lofty rationality, the rationality of which he himself had spoken earlier in noble language, at length evaporates in him in intellectual reverie and dreams. The Neo-Platonic extravagances which lay hidden in the school from the first came in his writings to a head, and merged in pure phantasy,—a set of favourite ideas which not merely guided but dominated the reason. Withal Henry More can never be spoken of save as a spiritual genius and significant figure in the history of British philosophy, less robust and manly and in some respects less learned than Cudworth but more interesting and fertile in thought, and more sweet, singular, and genial in character. From youth to age he describes himself as gifted with a most happy and buoyant temper. The presence of nature filled him with rapture; he wished he could be always *sub diu*. "Walking abroad after his studies his sallies towards nature would be often inexpressibly ravishing, beyond what he could convey to others." His own thoughts were to him a never-ending source of pleasurable excitement. His mind moved with great rapidity and at a lofty elevation, so that, as he says, he seemed "all the while to be in the air." This mystical glow and elevation were the chief features of his mind and character, a certain transport and radiance of thought which carried him beyond the common life without raising him to any false or artificial height, for his humility and charity were not less conspicuous than his piety. The last ten years of his life are without any special record, and he died on the morning of 1st September 1687, and was buried in the chapel of the college he loved so well, where within less than a year his friend Cudworth was laid beside him.

Before his death More issued complete editions of his works, his *Opera Theologica* in 1675, and his *Opera Philosophica* in 1678. The chief authorities for his life are Ward's *Life*, 1710; the "Prefatio Generalissima" prefixed to his *Opera Omnia*, 1679; and also a general account of the manner and scope of his writings in an *Apology* published in 1664. The collection of his *Philosophical Poems*, 1647, in which he has "compared his chief speculations and experiences," should also be consulted. An elaborate analysis of his life and works is given in Principal Tulloch's *Rational Theology*, vol. ii., 1874. (J. T.)

MORE, THOMAS (1478-1535), lord chancellor, and one of the most illustrious Englishmen of his century, was born in Milk Street in the City of London, 7th February 1478. He received the rudiments of education at St Anthony's School in Threadneedle Street, at that time under Nicolas Holt held to be the best in the city. He was early placed in the household of Cardinal Morton, archbishop of Canterbury. Admission to the cardinal's family was esteemed a high privilege, and was sought as a school of manners and as an introduction to the world by the sons of the best families in the kingdom. Young Thomas More obtained admission through the influence of his father, Sir Thomas, then a rising barrister and afterwards a justice of the Court of King's Bench. The usual prognostication of future distinction is attributed in the case of More to Cardinal Morton, "who would often tell the nobles sitting at table with him, where young Thomas waited on him, whosoever liveth to trie it shall see this

¹ "Prefatio Generalissima" prefixed to his *Opera Omnia*, 1679.

² The place and its religious marvels are glanced at in the romance of *John Inglesant* (chap. xv.).

child prove a notable and rare man."¹ At the proper age young More was sent to Oxford, where he is said vaguely to have had Colet, Grocyn, and Linacre for his tutors.² All More himself says is that he had Linacre for his master in Greek. Learning Greek was not the matter of course which it has since become. Greek was not as yet part of the arts curriculum, and to learn it voluntarily was ill looked upon by the authorities. Those who did so were suspected of an inclination towards novel and dangerous modes of thinking, then rife on the Continent and slowly finding their way to England. More's father, who intended his son to make a career in his own profession, took the alarm; he removed him from the university without a degree, and entered him at New Inn to commence at once the study of the law. The young man had been kept in a state of humiliating dependence in money matters, having had no allowance made him, and having had to apply to his father even for a pair of new shoes when the old were worn out. This system was pursued by his parents not from niggardliness but on principle; and Thomas More in later years often spoke with approbation of this severe discipline, as having been a means of keeping him from the vulgar dissipations in which his fellow-students indulged. After completing a two-years' course in New Inn, an Inn of Chancery, More was admitted in February 1496 at Lincoln's Inn, an Inn of Court. "At that time the Inns of Court and Chancery presented the discipline of a well-constituted university, and, through professors under the name of readers and exercises under the name of mootings, law was systematically taught" (Campbell). In his professional studies More early distinguished himself, so that he was appointed reader-in-law in Furnival's Inn; but he would not relinquish the studies which had attracted him in Oxford. We find him delivering a lecture to audiences of "all the chief learned of the city of London."³ The subject he chose was a compromise between theology and the humanities, being St Augustine's *De Civitate*. In this lecture More sought less to expound the theology of his author than to set forth the philosophical and historical contents of the treatise. The lecture-room was a church, St Lawrence Jewry, placed at his disposal by Grocyn, the rector.

Somewhere about this period of More's life two things happened which gave in opposite directions the determining impulse to his future career. More's was one of those highly susceptible natures which take more readily and more eagerly than common minds the impress of that which they encounter on their first contact with men. Two principal forms of thought and feeling were at this date in conflict, rather unconscious than declared, on English soil. Under the denomination of the "old learning," the sentiment of the Middle Ages and the idea of church authority was established and in full possession of the religious houses, the universities, and the learned professions. The foe that was advancing in the opposite direction, though without the conscience of a hostile purpose, was the new power of human reason animated with the revived sentiment of classicism. In More's mind both these hostile influences found a congenial home. Each had its turn of supremacy, and in his early years it seemed as if the humanistic influence would gain the final victory. About the age of twenty he was seized with a violent access of devotional rapture. He took a disgust to the world and its occupations, and experienced a longing to give himself over to an ascetic life. He took a lodging near the Charterhouse, and subjected himself to the discipline of a Carthusian monk. He wore a sharp shirt of hair next his skin, scourged himself every Friday and

other fasting days, lay upon the bare ground with a log under his head, and allowed himself but four or five hours' sleep. This access of the ascetic malady lasted but a short time, and More recovered to all outward appearance his balance of mind. But he never entirely emancipated himself from the sentiment of devotion, though in later life it exhibited itself in a more rational form. Even when he was chancellor he would take part in church services, walking in their processions with a surplice. This, however, was at a later time. For the moment the balance of his faculties seemed to be restored by a revival of the antagonistic sentiment of humanism which he had imbibed from the Oxford circle of friends, and specially from Erasmus. The dates as regards More's early life are uncertain, and we can only say that it is possible that the acquaintance with Erasmus might have begun during Erasmus's first visit to England in 1499. Tradition has dramatized their first meeting into the story given by Cresacre More,⁴—that the two happened to sit opposite each other at the lord mayor's table, that they got into an argument during dinner, and that, in mutual astonishment at each other's wit and readiness, Erasmus exclaimed, "Aut tu es Morus, aut nullus," and the other replied, "Aut tu es Erasmus, aut diabolus!" Rejecting this legend, which bears the stamp of fiction upon its face, we have certain evidence of acquaintance between the two men in a letter of Erasmus with the date "Oxford, 29th October 1499." If we must admit the correctness of the date of *Ep. 14* in the collection of Erasmus's *Epistolæ*, we should have to assume that their acquaintance had begun as early as 1497. Ten years More's senior, and master of the accomplishments which More was ambitious to acquire, Erasmus could not fail to exercise a powerful influence over the brilliant young Englishman. More's ingenuous demeanour, quick intelligence, and winning manners fascinated Erasmus from the first, and acquaintance rapidly ripened into warm attachment. This contact with the prince of letters revived in More the spirit of the "new learning," and he returned with ardour to the study of Greek, which had been begun at Oxford. The humanistic influence was sufficiently strong to save him from wrecking his life in monkish mortification, and even to keep him for a time on the side of the party of progress. He acquired no inconsiderable facility in the Greek language, from which he made and published some translations. His Latin style, though wanting the inimitable ease of Erasmus and often offending against idiom, is yet in copiousness and propriety much above the ordinary Latin of the English scholars of his time.

More's attention to the new studies was always subordinate to his resolution to rise in his profession, in which he was stimulated by his father's example. As early as 1502 he was appointed under-sheriff of the city of London, an office then judicial, and of considerable dignity. He first attracted public attention by his conduct in the parliament of 1504, by his daring opposition to the king's demand for money. Henry VII. was entitled, according to feudal laws, to a grant on occasion of his daughter's marriage. But he came to the House of Commons for a much larger sum than he intended to give with his daughter. The members, unwilling as they were to vote the money, were afraid to offend the king, till the silence was broken by More, whose speech is said to have moved the House to reduce the subsidy of three-fifteenths which the Government had demanded to £30,000. One of the chamberlains went and told his master that he had been thwarted by a beardless boy. Henry never forgave the audacity; but, for the moment, the only revenge he could take was upon

¹ *Life* by B. R.² *Life* by B. R.³ Roper, *Life*.⁴ *Life*, p. 93.

More's tather, whom upon some pretext he threw into the Tower, and he only released him upon payment of a fine of £100. Thomas More even found it advisable to withdraw from public life into obscurity. During this period of retirement the old dilemma recurred. One while he devoted himself to the sciences, "perfecting himself in music, arithmetic, geometry, and astronomy, learning the French tongue, and recreating his tired spirits on the viol,"¹ or translating epigrams from the Greek anthology; another while resolving to take priest's orders.

From dreams of clerical celibacy he was roused by making acquaintance with the family of John Colt of New Hall, in Essex. The "honest and sweet conversation" of the daughters attracted him, and though his inclination led him to prefer the second he married the eldest, not liking to put the affront upon her of passing her over in favour of her younger sister. The death of the old king in 1507 restored him to the practice of his profession, and to that public career for which his abilities specially fitted him. From this time there was scarce a cause of importance in which he was not engaged. His professional income amounted to £400 a year, equal to £4000 in present money, and, "considering the relative profits of the law and the value of money, probably indicated as high a station as £10,000 at the present day" (Campbell). It was not long before he attracted the attention of the young king and of Wolsey. The Latin verses which he presented to Henry on the occasion of his coronation did not deserve particular notice amid the crowd of congratulatory odes. But the spirit with which he pleaded before the Star Chamber in a case of the Crown *v.* the Pope recommended him to the royal favour, and marked him out for employment. More obtained in this case judgment against the crown. Henry, who was present in person at the trial, had the good sense not to resent the defeat, but took the counsel to whose advocacy it was due into his service. In 1514 More was made master of the requests, knighted, and sworn a member of the privy council. He was repeatedly employed on embassies to the Low Countries, and was for a long time stationed at Calais as agent in the shifty negotiations carried on by Wolsey with the court of France. In 1519 he was compelled to resign his post of undersheriff to the city and his private practice at the bar. In 1521 he was appointed treasurer of the exchequer, and in the parliament of 1523 he was elected speaker. The choice of this officer rested nominally with the House itself, but in practice was always dictated by the court. Sir Thomas More was pitched upon by the court on this occasion in order that his popularity with the Commons might be employed to carry the money grant for which Wolsey asked. To the great disappointment of the court More remained firm to the popular cause, and it was greatly owing to his influence that its demands were resisted. From this occurrence may be dated the jealousy which the cardinal began to exhibit towards More. Wolsey made an attempt to get him out of the way by sending him as ambassador to Spain. More defeated the design by a personal appeal to the king, alleging that the climate would be fatal to his health. Henry, who saw through the artifice, and was already looking round for a more popular successor to Wolsey, made the gracious answer that he would employ More otherwise. In 1525 More was appointed chancellor of the duchy of Lancaster, and no pains were spared to attach him to the court. The king frequently sent for him into his closet, and discoursed with him on astronomy, geometry, and points of divinity. This growing favour, by which many men would have been carried away, did not impose upon More. He dis-

couraged the king's advances, showed reluctance to go to the palace, and seemed constrained when there. Then the king began to come himself to More's house at Chelsea, and would dine with him without previous notice. Roper mentions one of these visits, when the king after dinner walked in the garden by the space of an hour, holding his arm round More's neck. Roper afterwards congratulated his father-in-law on the distinguished honour which had been shown him. "I thank our Lord," was the reply, "I find his grace my very good lord indeed; and I believe he doth as singularly favour me as any subject within this realm. Howbeit, son Roper, I may tell thee I have no cause to be proud thereof, for if my head would win him a castle in France, it should not fail to go." As a last resource More tried the expedient of silence, dissembling his wit and affecting to be dull. This had the desired effect so far that he was less often sent for. But it did not alter the royal policy, and in 1529, when a successor had to be found for Wolsey, More was raised to the chancellorship. The selection was justified by More's high reputation, but it was also significant of the modification which the policy of the court was then undergoing. It was a concession to the rising popular party, to which it was supposed that More's politics inclined him. The public favour with which his appointment had been received was justified by his conduct as judge in the Court of Chancery. Having heard causes in the forenoon between eight and eleven, after dinner he sat again to receive petitions. The meaner the suppliant was the more affably he would speak to him, and the more speedily he would despatch his case. In this respect he formed a great contrast to his predecessor, whose arrears he soon cleared off. One morning being told by the officer that there was not another cause before the court, he ordered the fact to be entered on record, as it had never happened before. He not only refused all gifts, such as had been usual, himself, but took measures to prevent any of his connexions from interfering with the course of justice. One of his sons-in-law, Heron, having a suit in the chancellor's court, and refusing to agree to any reasonable accommodation, because the judge "was the most affectionate father to his children that ever was in the world," More thereupon made a decree against him.

Unfortunately for Sir Thomas More, a lord chancellor is not merely a judge, but has high political functions to perform. In raising More to that eminent position, the king had not merely considered his professional distinction but had counted upon his avowed liberal and reforming tendencies. In the *Utopia*, which, though written earlier, More had allowed to be printed as late as 1516, he had spoken against the vices of power and declared for indifference of religious creed with a breadth of philosophical view of which there is no other example in any Englishman of that age. At the same time, as he could not be suspected of any sympathy with Lutheran or Wickliffite heretics, he might fairly be regarded as qualified to lead the party which aimed at reform in state and church within the limits of Catholic orthodoxy. But in the king's mind the public questions of reform were entirely sunk in the personal one of the divorce. The divorce was a point upon which Sir Thomas would not yield. And, as he saw that the marriage with Anne Boleyn was determined upon, he petitioned the king to be allowed to resign the great seal, alleging failing health. With much reluctance, the royal permission was given and the resignation accepted, 10th May 1532, with many gracious expressions of good will on the part of the king. The promise held out of future bounty was never fulfilled, and More left office, as he had entered it, a poor man. His necessitous condition was so notorious that the clergy in convocation voted him

¹ Roper, *Life*.

a present of £5000. This he peremptorily refused, either for himself or for his family, declaring that he "had rather see it all cast into the Thames." Yet the whole of his income after resigning office did not exceed £100 a year.

Hitherto he had maintained a large establishment, not on the princely scale of Wolsey, but in the patriarchal fashion of having all his sons-in-law, with their families, under his roof. When he resigned the chancellorship he called his children and grandchildren together to explain his reduced circumstances. "If we wish to live together," said he, "you must be content to be contributories together. But my counsel is that we fall not to the lowest fare first: we will not, therefore, descend to Oxford fare, nor to the fare of New Inn, but we will begin with Lincoln's Inn diet, where many right worshipful men of great account and good years do live full well; which if we find ourselves the first year not able to maintain, then we will in the next year come down to Oxford fare, where many great learned and ancient fathers and doctors are continually conversant; which if our purses stretch not to maintain neither, then may we after, with bag and wallet, go a-begging together, hoping that for pity some good folks will give us their charity."

More was now able, as he writes to Erasmus, to return to the life which had always been his ambition, when, free from business and public affairs, he might give himself up to his favourite studies and to the practices of his devotion. Of the Chelsea interior Erasmus has drawn a charming picture, which may vie with Holbein's celebrated canvas, *The Household of Sir Thomas More*.

"More has built, near London, upon the Thames, a modest yet commodious mansion. There he lives surrounded by his numerous family, including his wife, his son, and his son's wife, his three daughters and their husbands, with eleven grandchildren. There is not any man living so affectionate to his children as he, and he loveth his old wife as if she were a girl of fifteen. Such is the excellence of his disposition that whatsoever happeneth that could not be helped, he is as cheerful and as well pleased as though the best thing possible had been done. In More's house, you would say that Plato's Academy was revived again, only, whereas in the Academy the discussions turned upon geometry and the power of numbers, the house at Chelsea is a veritable school of Christian religion. In it is none, man or woman, but readeth or studieth the liberal arts, yet is their chief care of piety. There is never any seen idle; the head of the house governs it not by a lofty carriage and oft rebukes, but by gentleness and amiable manners. Every member is busy in his place, performing his duty with alacrity; nor is sober mirth wanting."¹

But More was too conspicuous to be long allowed to enjoy the happiness of a retired life. A special invitation was sent him by the king to attend the coronation of Anne Boleyn, accompanied with the gracious offer of £20 to buy a new suit for the occasion! More refused to attend, and from that moment was marked out for vengeance. A first attempt made to bring him within the meshes of the law only recoiled with shame upon the head of the accusers. They were maladroit enough to attack him on his least vulnerable side, summoning him before the privy council to answer to a charge of receiving bribes in the administration of justice. One Parnell was put forward to complain of a decree pronounced against him in favour of the contending party Vaughan, who he said had presented a gilt cup to the chancellor. More stated that he had received a cup as a New Year's gift. Lord Wiltshire, the queen's father, exultingly cried out, "So, did I not tell you, my lords, that you would find this matter true?" "But, my lords," continued More, "having pledged Mrs. Vaughan in the wine wherewith my-butler had filled the cup, I restored the cup to her." Two other charges of a like nature were refuted as triumphantly. But the very futility of the accusations must have betrayed to More

the bitter determination of his enemies to compass his destruction. Foiled in their first ill-directed attempt, they were compelled to have recourse to that tremendous engine of regal tyranny, the law of treason. A bill was brought into parliament to attain Elizabeth Barton, a nun, who was said to have held treasonable language. Barton turned out afterwards to have been an impostor, but she had duped More, who now lived in a superstitious atmosphere of convents and churches, and he had given his countenance to her supernatural pretensions. His name, with that of Fisher, was accordingly included in the bill as an accomplice. When he came before the council, it was at once apparent that the charge of treason could not be sustained, and the efforts of the court agents were directed to draw from More some approbation of the king's marriage. But to this neither cajolery nor threats could move him. The preposterous charge was urged that it was by his advice that the king had committed himself in his book against Luther to an assertion of the pope's authority, whereby the title of "Defender of the Faith" had been gained, but in reality a sword put into the pope's hand to fight against him. More was able to reply that he had warned the king that this very thing might happen, that upon some breach of amity between the crown of England and the pope Henry's too pronounced assertion of the papal authority might be turned against himself, "therefore it were best that place be amended, and his authority more slenderly touched." "Nay," replied the king, "that it shall not; we are so much bound to the see of Rome that we cannot do too much honour unto it. Whatsoever impediment be to the contrary, we will set forth that authority to the utmost; for we have received from that see our crown imperial;" "which," added More, "till his grace with his own mouth so told me, I never heard before." Anything more defiant and exasperating than this could not well have been said. But it could not be laid hold of, and the charge of treason being too ridiculous to be proceeded with, More's name was struck out of the bill. When his daughter brought him the news, More calmly said, "I' faith, Meg, quod differtur, non aufertur: that which is postponed is not dropt." At another time, having asked his daughter how the court went, and how Queen Anne did, he received for answer, "Never better; there is nothing else but dancing and sporting." To this More answered, "Alas, Meg, it pitieth me to remember unto what misery, poor soul, she will shortly come; these dances of hers will prove such dances that she will spurn our heads off like footballs; but it will not be long ere her head will dance the like dance."² So the speech runs in the *Life* by More's great-grandson; but in the only trustworthy record, the life by his son-in-law Roper, More's reply ends with the words, "she will shortly come." In this, as in other instances, the later statement has the appearance of having been an imaginative extension of the earlier.

In 1534 the Act of Supremacy was passed, and the oath ordered to be tendered. More was sent for to Lambeth, where he offered to swear to the succession, but steadily refused the oath of supremacy as against his conscience. Thereupon he was given in charge to the abbot of Westminster, and, persisting in his refusal, was four days afterwards committed to the Tower. After a close and even cruel confinement (he was denied the use of pen and ink) of more than a year, he was brought to trial before a special commission and a packed jury. Even so More would have been acquitted, when at the last moment Rich, the solicitor-general, quitted the bar and presented himself as a witness for the crown. Being sworn, he detailed a confidential conversation he had had with the

¹ *Ep.* 426, *app.*

² *Cresacre More*, p. 231.

prisoner in the Tower. He affirmed that, having himself admitted in the course of this conversation "that there were things which no parliament could do,—*e.g.*, no parliament could make a law that God should not be God," Sir Thomas had replied, "No more could the parliament make the king supreme head of the church." By this act of perjury a verdict of "guilty" was procured from the jury. The execution of the sentence followed within the week, on 7th July 1535. The head was fixed upon London Bridge. The vengeance of Henry was not satisfied by this judicial murder of his friend and servant; he enforced the confiscation of what small property More had left, expelled Lady More from the house at Chelsea, and even set aside assignments which had been legally executed by More, who foresaw what would happen before the commission of the alleged treason. More's property was settled on Princess Elizabeth, afterwards queen, who kept possession of it till her death. At his death Sir Thomas More was in the fifty-eighth year of his age. He was twice married, but had children only by his first wife. His eldest daughter Margaret, married to William Roper, is one of the foremost women in the annals of the country for her virtues, high intelligence, and various accomplishments. She read Latin and Greek, was a proficient in music, and in the sciences, so far as they were then accessible. Her devotion to her father is historical; she gave him not only the tender affection of a daughter but the high-minded sympathy of a soul great as his own.

It is unfortunate for More's reputation that he has been adopted as a champion of a party and a cause which is arrayed in hostility to the liberties and constitution of his country. Apart from the partisan use which is made of his name, we must rank him among the noblest minds of England, as one who became the victim of a tyrant whose policy he disapproved and whose servile instruments he despised. If his language towards the tyrant is often more servile than became a freeman, we must remember that such was the court style of the period, and that we must not construe literally phrases of compliment. It is, however, impossible to deny that More's policy in later life did not bear out the more liberal convictions of his earlier years. His views and feelings contracted under the combined influences of his professional practice and of public employment. In the *Utopia*, published in 1516, he not only denounced the ordinary vices of power, but evinced an enlightenment of sentiment which went far beyond the most statesmanlike ideas to be found among his contemporaries, pronouncing not merely for toleration but rising even to the philosophical conception of the indifference of religious creed. It was to this superiority of view, and not merely to the satire on the administration of Henry VII., that we must ascribe the popularity of the work in the 16th century. For, as a romance, the *Utopia* has little interest either of incident or of character. It does not, as has been said, anticipate the economical doctrines of Adam Smith, and much of it is fanciful without being either witty or ingenious. Mackintosh says of it: "It intimates a variety of doctrines, and exhibits a multiplicity of projects, which the writer regards with almost every possible degree of approbation and shade of assent, from the frontiers of serious and entire belief, through gradations of descending plausibility, where the lowest are scarcely more than exercises of ingenuity, and to which some wild paradoxes are appended, either as a vehicle, or as an easy means, if necessary, of disavowing the serious intention of the whole of this Platonic fiction."

The *Epistola ad Dorpium* at a later date exhibits More emphatically on the side of the new learning. It contains a vindication of the study of Greek, and of the desirability of printing the text of the Greek Testament,—views which at that date required an enlightened understanding to enter into, and which were condemned by the party to which More afterwards attached himself. At the most, he can be doubtfully exculpated from the charge of having tortured men and children for heresy. It is admitted by himself that he inflicted punishment for religious opinion. Erasmus only ventures to say in his friend's defence "that while he was chancellor no man was put to death for these pestilent opinions, while so many suffered death in France and the Low Countries."

The *Life of Sir Thomas More* was written by his son-in-law Roper about the end of Mary's reign. It was preserved in MS. during the reign of Elizabeth, and handed about in copies, many of which were carelessly made. It was not given to the press till 1626, with the date of Paris. Reprints were made by Hearne (1716), by Lewis (1729, 1731), and by Singer (1817, 1822). Roper's life is the source of all the many subsequent biographies. More's *Life* in MS. (Harleian 6253), anonymous, but by Nicolas Harpsfield, was also written in Mary's reign. All that is material in this MS. is taken from Roper. Another anonymous *Life*,

written in 1599, printed in Wordsworth's *Ecclesiastical Biography*, ii. 43-185, is chiefly compiled from Roper and Harpsfield. The preface is signed B. R.

Stapleton (*Tres Thomæ, s. res gestæ S. Thomæ apostoli, S. Thomæ archiepiscopi Cantuariensis, Thomæ Mori*, Douay, 1588, Cologne, 1612, and the *Vita Thomæ Mori* (separately), Gratz, 1689) translates Roper, interweaving what material he could find scattered through More's works and letters and the notices of him in the writings of his contemporaries. Cresacre More, great-grandson of Sir Thomas, compiled a new life about the year 1627. He is printed without date, but, according to the editor, Hunter, in 1631. The title of this edition is—*The Life of Sir Thos. More, Lord High Chancellor of England*, 4to, s. l. et a., and with new title-page, 1642, 1726, 1828. This life is cited by the subsequent biographers as an independent authority. But it is almost entirely borrowed from Roper and Stapleton. The additions made have sometimes the appearance of rhetorical amplifications of Roper's simple statements. At other times they are decorative tourneys. The whole is couched in that strain of devotional exaggeration in which the lives of the saints are usually composed. The author seems to imply that he had received supernatural communications from the spirit of his ancestor. Already, only eighty years after More's execution, hagiography had taken possession of the facts, and was transmitting them into an edifying legend. Cresacre More's *Life* cannot be alleged as evidence for any facts which are not otherwise vouched. It has been remarked by Hunter that More's life and works have been all along manipulated for political purposes, and in the interest of the holy see. In Mary's reign, and in the tide of Catholic reaction, Roper and Harpsfield wrote lives of him; Ellis Heywood dedicated his *R. More* to Cardinal Pole, and Tottell reprinted the folio of his English works. Stapleton prepared his *Tres Thomæ* in 1588, when the recovery of England to the see of Rome was looked for by the Spanish invasion. In 1599, when there was a prospect of a disputed succession, the anonymous *Life* by B. R. was composed; and soon after Charles had allied himself with a Catholic, the *Life* by Cresacre More issued from the press. Hunter might have added that Stapleton was being reprinted at Gratz at the time when the conversion of England was expected from James II. The later lives of Sir Thomas More have been numerous, but the only one which has any critical value is that by G. T. Rudhart *Thomæ Morus, aus den Quellen bearbeitet*, Nuremberg, 1829. Other lives are by J. Hodgeson, London, 1652, 1662; by Cayley, 2 vols., London, 1808; by Mackintosh, *Lardner's Cath. Cyclop.*, London, 1831, 1844; and in *More's Works*, London, 1845, by Lord Campbell in *Lives of the Chancellors*, vol. i., 1818-50; by D. Nisard in *Renaissance et Réforme*; by Baumstark, Freiburg, 1879. A biographical study on More's Latin poems is *Philomorus* by J. H. Marsden, 2d ed., London, 1876.

More's writings are numerous, and a complete bibliography of them would occupy several columns. His English Works were collected and published in one vol. folio by Rastall, London, 1530, and reprinted by Tottell, London, 1557. His Latin Works were also separately collected in one vol., Basel, 1563; Louvain, 1566; and, most complete, Frankfurt and Leipsic, 1689. The *Utopia* has had numerous editions, the first is Louv., 1516. There are two English translations of the *Utopia*, by R. Robynson, London, 1551, 1556, 1624, and by Gibb. Burnett, 1683. The Latin poems, *Progymnasmatia*, appeared in 1518, 1520, 1563. This last edition contains the *Utopia* and other prose Latin pieces. (M. F.)

MOREAU, HÉGÉSIPPE, a minor lyric poet of disputed but considerable talent, was born at Paris on the 9th April 1810, and died in the hospital of La Charité on the 10th December 1838. In his early youth his parents, who were very ill-off, migrated to Provins, where the mother went into service and the father took the post of usher in a public school. Both died in the same refuge for the destitute which afterwards received their son. Hégésippe was fairly educated and was apprenticed to a printer, but he preferred the work (in France usually paid most miserably) of "maître d'études" in a school. He went to Paris before 1830, and appears to have practised both his occupations there, though for the most part he either adopted by choice or was driven by ill-fortune to adopt the singular life of alternate hardship and cheap dissipation which is dignified in France by the name of Bohemianism. In Moreau's case there is no doubt that the hardships exceeded the dissipation. He was habitually houseless, and is said to have exposed himself to the dangers of a cholera hospital in the great epidemic of 1832 simply to obtain shelter and food. Then he revisited Provins and published a kind of satirical serial called *Diogène*. Some years of this life entirely ruined his health, and it was only just before his death that he succeeded in getting his collected poems published, selling the copyright for £4 sterling and eighty copies of the book. It was received not unfavourably, but, as has happened in other cases, the author's death, which happened soon in the circumstances mentioned, was required to excite an interest which was proportionately excessive. Moreau's work, like that of many other young poets, has a strong note of imitation, his model being especially Béranger; and his character, both moral and literary, is not improved by obvious affectation in political, religious, and social matters. But some of his poems, such as *La Voulzie* and the charming *La Fermière*, have great sweetness, and he had a faculty of writing both in prose and poetry which seems to show that with better fortune, or, to speak honestly, with more intelligence and more perseverance he might easily have saved himself from the miserable destitution which was his lot.

MOREAU, JEAN VICTOR (1763-1813), the greatest general of the French republic after Napoleon and Hoche, was born at Morlaix in Brittany in 1763. His father was an "avocat" in good practice, and instead of allowing him to enter the army, as he wished, insisted on his studying law at the university of Rennes. Young Moreau showed no inclination for law, but revelled in the freedom of a student's life. Instead of taking his degree he continued to live with the students as their hero and leader. In that capacity he became a person of political importance, and in the troubles of 1787 formed the law students into a sort of army, which he commanded as their provost. In 1789 he became yet more important, and commanded the students in the daily affrays which took place at Rennes between the young *noblesse*, who protested against the mode of election to the states-general, and the populace. Though he had hardly weight enough to be chosen a deputy, he was elected one of the committee of correspondence with the deputies at Paris. He was thus able to follow the course of events in the early days of the Revolution, and was early impressed with the conviction that no compromise with the court was possible, and a republic the only resource. These opinions estranged him from his father, who belonged to the party of Breton independence and preferred Brittany to France. At last, in 1792, at the call for volunteers he organized a battalion, and was at once elected its commandant. With it he served under Dumouriez, and in 1793 the good order of his battalion, and his own martial character and republican principles secured his promotion as general of brigade. Carnot, who had an eye for the true qualities of a general, promoted him to be general of division in 1794, and gave him command of the right wing of the army which, under Pichegru, was destined to drive the English and Austrians out of Flanders by separating the Austrians from the English. This wing was then to cover the occupation of Holland by the main army under Pichegru. These operations established his military fame, and in 1795 he was given the command of the army of the Rhine and the Moselle, with which he crossed the Rhine and advanced into Germany. He was at first completely successful, and won several victories, but at last had to execute before the archduke Charles a retreat which only increased his fame, as he managed to bring back with him more than 5000 prisoners. In 1797 he again crossed the Rhine, but his operations were checked by the conclusion of the preliminaries of Leoben between Bonaparte and the Austrians. It was at this time he found out the traitorous correspondence between his old comrade and commander Pichegru and the prince de Condé, which he foolishly concealed, and naturally has ever since been suspected of at least partial complicity. After Fructidor the Directory ceased to employ his service, until the absence of Bonaparte and the advance of Suwaroff made it necessary to have some great general in Italy. Yet it was only as chief of the staff that he served under Scherer and Joubert, and led back the French army after the latter's death at Novi. When Bonaparte returned from Egypt he found Moreau at Paris, greatly dissatisfied with the Directory both as a general and as a republican, and obtained his assistance in the *coup d'état* of Brumaire, when Moreau commanded the force which occupied the Luxembourg. In reward, the first consul again gave him command of the army of the Rhine, with which he fought his last great campaign, that of the *Hohenlinden*, when his success was due rather to the splendid military qualities of his generals and their troops, and his own tactical genius, than to any inspiration of victory. On his return to Paris he married Mdlle. Hulot, an ambitious woman, who gained a complete ascendancy over him, and with the enormous fortune acquired during his campaigns he purchased a luxurious hotel in Paris and

also Barras's country-seat of Grosbois. His wife exercised an evil influence over him, and collected around her all who were discontented with the aggrandizement of Napoleon. This "club Moreau" frightened Napoleon, and encouraged the royalists; but Moreau, though not unwilling to become a military dictator to restore the republic, would not intrigue for the restoration of Louis XVIII. All this was well known to Napoleon, who seized the conspirators. Moreau he treated with real leniency, and permitted to retire first to Spain, and then to America. Here the general lived in great content for seven years, when his wife, who could not allow him to rest, made him enter into negotiations with Bernadotte, his old comrade, who was now crown-prince of Sweden. At his suggestion Moreau entered the service of the czar Alexander; and with Bernadotte he planned the campaign of 1813. Fortunately for his fame as a patriot he did not live to invade France, but was mortally wounded while talking to the czar at the battle of Dresden on 27th August 1813, and died on 2d September. His wife received a pension from the czar, and was given the rank of *maréchale* by Louis XVIII.

Moreau's fame as a general stands very high, and from his marvellous coolness in conducting retreats he has been called the general of retreats. His combinations were splendid, and his temper always unruffled when most closely pressed; but he lacked the sudden spirit of seizing a victory which distinguished Napoleon in his early campaigns. Moreau was a sincere republican, though his own father was guillotined in the Terror; and the army of the Rhine was the hot-bed of republicanism, as that of Italy was the great support of a military tyranny. As a man, he was little given to personal ambition till his marriage, and would probably not only have served Napoleon well but moderated his tendency to absolutism by his very existence, had not his wife ruined any such hope by involving him in intrigues. He was fortunate in the moment of his death, though he would have been more so had he died in America. He seems by his final words, "Soyez tranquilles, messieurs; c'est mon sort," not to have regretted being removed from his equivocal position as a general in arms against his country.

The literature on Moreau is copious, the best book being C. Jochnus, *General Moreau—Abriss einer Geschichte seines Lebens und seiner Feldzüge*, Berlin, 1814. A more ordinary work is A. de Beauchamp, *Vie politique, militaire, et privée du Général Moreau*, translated by Philippart, London, 1814; and there is a curious tract on his death in Russia, translated into English under the title *Some Details concerning General Moreau and his Last Moments*, by Paul Swin, London, 1814. MOREL or MORCHELLA. See MUSHROOM.

MORELIA, formerly VALLADOLID, a city of Mexico, capital of the state of Michoacan de Ocampo, is situated 125 miles west by north of Mexico, at a height of 6400 feet above the sea, in 19° 42' N. lat. and 101° W. long. The site is a rocky hill on the Guayangareo valley, and the western horizon is bounded by the great Quinceo mountain (11,000 feet). Since the middle of the century a considerable extension of the city has taken place, especially towards the north: its streets, which run for the most part at right angles to each other, had increased from thirty in 1856 to ninety-nine in 1873. The principal square is the Plaza de los Martires (formerly de Armas), where Matamoros was shot by the Spaniards in 1814; its one side is occupied by the cathedral (1745), a large building with two towers about 200 feet high. The churches of the Carmelites (del Carmen) and San José are of some note, and of the nine convents, now for the most part in ruins, several were wealthy and extensive. That of the Capuchins is now used as a hospital, the old seminary has been turned into a state-house, and the tobacco factory, one of the most ancient buildings in the city, serves as municipal offices. An important institution, supported by the state, is the college of San Nicolas de Hidalgo, originally founded by Juan de San Miguel in the 16th century and rebuilt in 1868. The Ocampo theatre dates from 1869-1870. Water is brought from a distance of about 3 miles by a fine aqueduct, constructed in 1788 by D. Antonio de San Miguel, but the quality is often deteriorated by the presence of vegetable matter. Morelia lies too far from any great natural route to have much commerce in the present

state of the country, and its manufactures are limited to the production, on a small scale, of cotton, woollen, and silk goods. A certain delicate sweetmeat called *guayabate* is a regular article of commerce to Mexico. In 1750 the city had about 18,000 inhabitants, in 1873 the municipality had 36,940 and the city proper about 30,000, and in 1880 the number is stated at 20,400.

In 1541 Mendoza chose the Guayangareo valley as the new site for the city of Michoacan, and in 1545 the place received the name of Valladolid. Turbide and Morelos were both born within its precincts; and in 1823 the Government did this latter patriot the honour of renaming the city Morelia. In 1863 it was made the seat of an archbishop. See *Bol. Soc. de geogr. de la Rep. Mex.*, Mex., 1873.

MORELLET, ANDRÉ (1727-1819), economist and miscellaneous writer, was born at Lyons on the 7th of March 1727. He was long regarded as almost the last survivor of the Philosophe school; and in this character he figures in many memoirs,—for instance in Madame de Remusat's. He was educated by the Jesuits in his native town, then at a seminary in Paris, and finally at the Sorbonne; and he took holy orders, but his designation of abbé was the chief thing clerical about him. He early joined the Philosophe party, and was a frequenter of most of their *salons*, being something of a butt (especially to his fellow-abbé and rival in political economy, Galiani), but having the credit of a ready and biting pen. Voltaire called him "L'Abbé Mord-les." His work was chiefly occasional, and the most notable parts of it were a smart pamphlet in answer to Palissot's scurrilous play *Les Philosophes* (which procured him a short sojourn in the Bastille for an alleged libel on Palissot's patroness, the princesse de Robeck), and a reply to Galiani's *Commerce des Blés* (1770). Later, he made himself useful in quasi-diplomatic communications with English statesmen, and was pensioned, being, moreover, elected a member of the Academy in 1785. The outbreak of the Revolution (soon after which he was engaged in a controversy with Chamfort on the question of the advantages and deserts of the Academy) did not, as it did with many of his friends, drive him from the country or put his life in danger, but it put him in considerable straits of fortune. He maintained a kind of moderate liberal tone, and the return of something like order under the Consulate and the Empire restored him to prosperity and pensions. A year before his death, at the great age of ninety-two, on the 12th of January 1819 at Paris, he brought out a series of *Mélanges*, composed chiefly of selections from his former publications; and after his death appeared his memoirs, which are of value for the Philosophe period. Morellet, though not a man of extraordinary ability or of specially amiable or estimable character, was in both respects a fair specimen of the man of letters of all work of the time. He was, in fact, a journalist with a special turn for economical subjects.

MORERI, LOUIS. See *ENCYCLOPÆDIA*, vol. viii. p. 194.

MORETO, AGUSTIN (1618-1669), Spanish dramatist and playwright, was born at Madrid in 1618. Of his personal and even of his literary history little is known. He studied at Alcalá between 1634 and 1639, and afterwards removed to Toledo, where he entered the household of the cardinal-archbishop and took holy orders. Ultimately he withdrew altogether from the world, and died a member of an ascetic religious brotherhood in 1669.

Moreto in his younger years was a prolific writer for the stage, and almost rivalled Calderon in popularity. Three volumes of his plays were printed between 1654 and 1681, and many dramas besides are attributed in whole or in part to him. He employed all the dramatic forms then in vogue. Of his religious plays, *Los mas Dichosos Hermanos* (The Most Fortunate Brothers), embodying the legend of the seven sleepers, may be mentioned as the least bombastic and absurd. Others are *El Rosario Perseguido*, turning on the persecutions connected with the introduction of the rezaño into Spain, and *Maria Egypciaca*, a curious representation of the extraordinary legend of St Mary of Egypt. His heroic drama, *El*

Valiente Justiciero (The Brave Justiciary), a story of the times of Pedro the Cruel, is one of considerable power. His "comedias de figuron," or "character comedies," as they are called (compare vol. vii. p. 422), include *El Lindo Don Diego* (The Handsome Don Diego) and *El Desden con el Desden* (Disdain met with Disdain), the latter partly borrowed from Lope de Vega's *Milagros del Desprecio*, and in turn imitated by Molière (in his *Princesse d'Élide*), by Carlo Gozzi (*Principessa Filosofa*), and by Schreyvogel (*Donna Diana*). The *Comedias Escogidas de Don Agustín Morcote y Cabaña* form the 39th volume of the *Biblioteca de Autores Españoles* (Madrid, 1856).

MORETTO, IL ("The Blackamoor," a term which has not been particularly accounted for), is the name currently bestowed upon ALESSANDRO BONVICINO (1498-c.1560), a celebrated painter of Brescia, Venetian school. He was born at Rovato in the Brescian territory in 1498, and studied first under Fioravante Ferramola of Brescia, afterwards, still youthful, with Titian in Venice. His own earlier method, specially distinguished by excellent portrait-painting, was naturally modelled on that of Titian. Afterwards he conceived a great enthusiasm for Raphael (though he does not appear to have ever gone to Rome), and his style became partially Raphælesque. It was, however, novel in its combination of diverse elements, and highly attractive,—with fine pencilling, a rich yet not lavish use of perspective and decorative effects, and an elegant opposition of light and shade. The human figure is somewhat slender in Bonvicino's paintings, the expression earnestly religious, the flesh-tints varied, more so than was common in the Venetian school. The backgrounds are generally luminous, and the draperies well modified in red and yellow tints with little intermixture of blue. The depth of Bonvicino's talent, however, was hardly in proportion to its vigour and vivacity; and he excelled more in sedate altar-pieces than in subjects of action, and more in oil-painting than in fresco, although some fine series of his frescos remain, especially that in the villa Martinengo at Novarino, near Brescia. Among his celebrated works in the city are—in the church of S. Clemente, the Five Virgin Martyrs, and the Assumption of the Madonna (this latter may count as his masterpiece); in S. Nazaro e Celso, the Coronation of the Madonna; in S. Maria delle Grazie, St Joseph; in S. Maria de' Miracoli, St Nicholas of Bari. In the Vienna Gallery is a St Justina (once ascribed to Pordenone); in the Städel Institute, Frankfort, the Madonna enthroned between Sts Anthony and Sebastian; in the Berlin Museum, a colossal Adoration of the Shepherds, and a large votive picture (one of the master's best) of the Madonna and Child, with infant angels and other figures above the clouds, and below, amid a rich landscape, two priests; in the London National Gallery, St Bernardin and other saints, and two impressive portraits. Il Moretto is stated to have been a man of childlike personal piety, preparing himself by prayer and fasting for any great act of sacred art, such as the painting of the Virgin-mother. His dated works extend from 1524 to 1554, and he was the master of the pre-eminent portrait-painter Moroni. His death took place towards 1560.

MORGAGNI, GIOVANNI BATTISTA (1682-1771), the founder of pathological anatomy, was born 25th February 1682 at Forlì, an ancient and important town on the Æmilian road southwards from Bologna.¹ His parents were in comfortable circumstances, but not of the nobility; it appears from his letters to Lancisi that Morgagni was ambitious of gaining admission into that rank, and it may be inferred that he succeeded from the fact that he is described on a memorial tablet at Padua as "nobilis Forolensis." At school he was conspicuous for his talents, and he was especially noted for his readiness in classical epigram. At the age of sixteen he went to Bologna to

¹ A statue of the illustrious citizen was erected at Forlì in 1875, and the town library preserves fourteen MS. volumes of his writings.

study philosophy and medicine, and he graduated with much éclat as doctor in both faculties three years later (1701). He acted as prosector to Valsalva (one of the distinguished pupils of Malpighi), who held the office of "demonstrator anatomicus" in the Bologna school. He assisted Valsalva more particularly in preparing his celebrated work on the *Anatomy and Diseases of the Ear*, which came out in 1704. Many years after (1740), Morgagni edited a collected edition of Valsalva's writings, with important additions to the treatise on the ear, and with a memoir of the author. When Valsalva was transferred to Parma Morgagni succeeded to his anatomical demonstratorship. At this period he enjoyed a high repute in Bologna; he was made president of the *Academia Inquietorum* when in his twenty-fourth year, and he is said to have signalized his tenure of the presidential chair by discouraging abstract speculations, and by setting the fashion towards exact anatomical observation and reasoning. He published the substance of his communications to the Academy in 1706 under the title of *Adversaria Anatomica*, the first of a series by which he became favourably known throughout Europe as an accurate anatomist, the book included "Observations on the Larynx, the Lachrymal Apparatus, and the Pelvic Organs in the Female." After a time he gave up his post at Bologna, and occupied himself for the next two or three years at Padua and Venice with anatomical studies (of fishes at the latter city), as well as with chemistry and pharmacy, and with reading in the libraries. He then settled in practice in his native town, and soon attracted a large amount of business; there was hardly a case of much difficulty about which he was not consulted even by the older physicians, "adeo erat in observando attentus, in prædicendo cautus, in curando felix." Such at least is the contemporary eulogy. After less than three years of this career, which he found fatiguing, he sought an opportunity of returning to more academical work. At Padua he had a friend in the elder Guglielmini, professor of medicine, but better known as a writer on physics and mathematics, whose works he afterwards edited (1719) with a biography. Guglielmini desired to see him settled as a teacher at Padua, and the unexpected death of Guglielmini himself made the project feasible, Vallisneri being transferred to the vacant chair and Morgagni succeeding to the chair of theoretical medicine. He came to Padua in the spring of 1712, being then in his thirty-first year, and he taught medicine there with the most brilliant success until his death sixty years later (6th December 1771). When he had been three years in Padua an opportunity occurred for his promotion (by the Venetian senate) to the chair of anatomy, in which he became the successor of an illustrious line of scholars, including Vesalius, Fallopius, Fabricius, Gasserius, and Spigelius, and in which he enjoyed a stipend that was increased from time to time by vote of the senate until it reached twelve hundred gold ducats. Shortly after coming to Padua he married a lady of Forlì, of noble parentage, who bore him three sons and twelve daughters; of the daughters, four died in infancy, and the other eight took the veil as they grew up; of the sons, one died in boyhood, one entered the Jesuit order, and the eldest settled at Forlì, where he married and lived to the age of fifty-two, predeceasing his father by five years and leaving a family to his care. Morgagni enjoyed an unequalled popularity among all classes. He was of tall and dignified figure, with blonde hair and blue eyes, and with a frank and happy expression; his manners were polished, and he was noted for the elegance of his Latin style. He lived in harmony with his colleagues, who are said not even to have envied him his unprecedentedly large stipend; his house and lecture-theatre were frequented

"tanquam officina sapientiæ" by students of all ages attracted from all parts of Europe; he enjoyed the friendship and favour of distinguished Venetian senators and of cardinals; successive popes conferred honours upon him; and on two occasions when a hostile army occupied the Æmilia his house was ordered to be treated with the same marked distinction that the great Æmilian conqueror showed to the house of Pindar. Before he had been long in Padua the students of the German nation, of all the faculties there, elected him their patron, and he advised and assisted them in the purchase of a house to be a German library and club for all time. No person of any learning came to Padua without seeing and conversing with Morgagni, and no one ever left him without admiring equally his character and his teaching. One of his biographers and editors, the celebrated Tissot of Lausanne, observes that he had met with several Englishmen returning from Italy who told with pleasure and gratitude "quam humaniter illos exceperat, et quantum ex illius colloquiis, doctis, variis, jucundis profecerant." He was elected into the Imperial Cæsareo-Leopoldina Academy in 1708 (originally located at Schweinfurth), and to a higher grade in 1732, into the Royal Society in 1724, into the Paris Academy of Sciences in 1731, the St Petersburg Academy in 1735, and the Berlin Academy in 1754. Among his more celebrated pupils were Scarpa (who died in 1832, connecting the school of Morgagni with the modern era), Cotunnus (Cotugno), and Caldani, the author of the magnificent atlas of anatomical plates published in 4 vols. at Venice in 1801-1814.

Meanwhile he published on a variety of subjects. In his earlier years at Padua he brought out (1717-1719) five more series of the *Adversaria Anatomica* by which his reputation was first made; but for more than twenty years after the last of these his strictly medical publications were few and casual (on gall-stones, varices of the vena cava, cases of stone, and several memoranda on medico-legal points drawn up at the request of the curia). Classical scholarship in those years occupied his pen more than anatomical observations; and the reason of this appears to have been that he spent the summer months in the country for the sake of his health, and occupied his leisure with literary studies. His writings in this class include letters to Lancisi on the manner of Cleopatra's death, commentaries on Celsus and Sammonicus, notes on Prosper Alpinus, Varro, Vegetius, Columella, and Vitruvius, and antiquarian researches into the topography of the country round Ravenna and his own birthplace (Forum Livii). His edition of the works of Valsalva, published in 1740 (in 2 vols. 4to) with plates, occupied much of his time, being enriched with a life and a commentary, and with many additional observations of his own. It was not until 1761, when he was in his eightieth year, that he brought out the great work which, once for all, made pathological anatomy a science, and diverted the course of medicine into new channels of exactness or precision—the *De Sedibus et Causis Morborum per Anatomem indagatis*. He died on 6th December 1771. During the preceding ten years the *De Sedibus*, notwithstanding its bulk, was reprinted several times (thrice in four years) in its original Latin, and was translated into French (1765), English (1769, 3 vols. 4to), and German (1771). Some account of this remarkable work remains now to be given.

The only special treatise on pathological anatomy previous to that of Morgagni was the work of Théophile Bonet of Neuchâtel, *Sepulchretum sive Anatomia practica ex cadaveribus morbo denatis*, first published (Geneva, 2 vols. folio) in 1679, three years before Morgagni was born; it was republished at Geneva (3 vols. folio) in 1700, and again at Leyden in 1709. Although the normal anatomy of the body had been comprehensively, and in some parts exhaustively written by Vesalius and Fallopius, it had not occurred to any one to examine and describe systematically the anatomy of diseased organs and parts. Harvey, a century after Vesalius, naively remarks that there is more to be learned from the dissection of one person who had died of consumption or other chronic melody than from the bodies of ten persons who had been hanged. Glisson indeed (1597-1677) shows, in a passage quoted by Bonet in the preface to the *Sepulchretum*, that he was familiar with the idea, at least, of systematically comparing the state of the organs in a series of cadavera, and of noting those conditions which invariably accompanied a given set of symptoms. The work of Bonet was, however, the first attempt at a system of morbid anatomy, and, although it dwelt mostly upon curiosities and monstrosities, it

enjoyed much repute in its day; Haller speaks of it as "an immortal work, which may in itself serve for a pathological library." Morgagni, in the preface to his own work, discusses the defects and merits of the *Sepulchretum*; it was largely a compilation of other men's cases, well and ill authenticated; it was prolix, often inaccurate and misleading from ignorance of the normal anatomy, and it was wanting in what would now be called objective impartiality,—a quality which was introduced as decisively into morbid anatomy by Morgagni as it had been introduced two centuries earlier into normal human anatomy by Vesalius. Morgagni has narrated the circumstances under which the *De Sedibus* took origin. Having finished his edition of *Valsalva* in 1740, he was taking a holiday in the country, spending much of his time in the company of a young friend who was curious in many branches of knowledge. The conversation turned upon the *Sepulchretum* of Bonet, and it was suggested to Morgagni by his dilettante friend that he should put on record his own observations. It was agreed that letters on the anatomy of diseased organs and parts should be written for the perusal of this favoured youth (whose name does not transpire); and they were continued from time to time until they numbered seventy. Those seventy letters constitute the *De Sedibus et Causis Morborum*, which was given to the world as a systematic treatise in 2 vols. folio, Venice, 1761, twenty years after the task of epistolary instruction was begun. The letters are arranged in five books, treating of the morbid conditions of the body *a capite ad calcem*. The five books are dedicated respectively to Trew, Bromfield, Senac, Schreiber, and Meckel, as representing the several learned societies of which Morgagni was a foreign member. The five books together contain, according to an enumeration by the present writer, the records of some 640 dissections. Some of these are given at great length, and with a precision of statement and exhaustiveness of detail hardly surpassed in the so-called "protocols" of the German pathological institutes of the present time; others, again, are fragments brought in to elucidate some question that had arisen. The symptoms during the course of the malady and other antecedent circumstances are always prefixed with more or less fullness, and discussed from the point of view of the conditions found after death. Subjects in all ranks of life, including several cardinals, figure in this remarkable gallery of the dead. Many of the cases are taken from Morgagni's early experiences at Bologna, and from the records of his teachers *Valsalva* and *Albertini* not elsewhere published. Those six hundred or more cases are selected and arranged with method and purpose, and they are often (and somewhat casually) made the occasion of a long excursus on general pathology and therapeutics. The range of Morgagni's scholarship, as evidenced by his references to early and contemporary literature, strikes one with astonishment. It has been contended that he was himself not free from prolixity, the besetting sin of the learned; and certainly the form and arrangement of his treatise are such as to make it difficult to use in the present day, notwithstanding that it is well indexed in the original edition, in that of *Tissot* (3 vols. 4to, Yverdon, 1779), and in more recent editions. It differs from modern treatises in so far as the symptoms determine the order and manner of presenting the anatomical facts. Although Morgagni was the first to understand and to demonstrate the absolute necessity of basing diagnosis, prognosis, and treatment on an exact and comprehensive knowledge of anatomical conditions, he made no attempt (like that of the Vienna school sixty years later) to exalt pathological anatomy into a science disconnected from clinical medicine and remote from practical needs. His orderliness of anatomical method (implying his skill with the scalpel), his precision, his exhaustiveness, and his freedom from bias are his essentially modern or scientific qualities; his scholarship and high consideration for classical and foreign work, his sense of practical ends (or his common sense), and the breadth of his intellectual horizon prove him to have lived before medical science had become largely technical or mechanical. It is clear that Morgagni's immense personal influence during his lifetime did not alone make his book famous; at a distance of two hundred years from his birth, and more than one hundred from his death, the opinion is unanimous that his treatise was the commencement of the era of steady or cumulative progress in pathology and in practical medicine. Symptoms from that time ceased to be made up into more or less conventional groups, each of which was a disease; on the other hand, they began to be viewed as "the cry of the suffering organs," and it now became possible to develop Sydenham's grand conception of a natural history of disease in a catholic or scientific spirit. *Laennec's* application of the stethoscope to detect the sounds given out in diseased states of the heart and lungs, and *Bright's* application of the test-tube and re-agents to reach the structural and functional conditions of the kidney through the state of the urine, were the direct results of Morgagni's endeavour to lay bare the seats and causes of disease by anatomy; and those two means of diagnosis are the daily and hourly resource of every modern practitioner. In more general terms, Morgagni's work substituted localization for generalization and precision for vagueness.

A biography of Morgagni by *Mosca* was published at Naples in 1768. His

life may also be read in *Fabroni's Vita illustr. Italor.*, and a convenient abridgment of *Fabroni's* memoir will be found prefixed to *Tissot's* edition of the *De Sedibus*, &c. A collected edition of his works was published at Venice in five vols. folio in 1765. (C. C.)

MORGAN, SYDNEY OWENSON, LADY (1777-1859), novelist and miscellaneous describer and critic, was one of the most vivid and hotly-discussed literary personages of her generation. She was the daughter of an Irish actor, but it was one of her whims to keep the year of her birth a secret; "once upon a time" on Christmas day was her answer to inquiries. She began her literary career with a precocious volume of poems. Her second venture, *St Clair* (1804), a novel of ill-judged marriage, ill-starred love, and impassioned nature-worship, in which the influence of *Goethe* and *Rousseau* was apparent, at once attracted attention. Another novel, *The Novice of St Dominick* (1806), was also praised for its qualities of copious imagination and description, though the critics were inclined to nibble at the writer's grammar. But the book which made her reputation and brought her name into warm controversy was *The Wild Irish Girl*, also published in 1806. In this she appeared as the ardent champion of her native country, a politician rather than a novelist, extolling the beauty of Irish scenery, the richness of the natural wealth of Ireland, the noble traditions of its early history, and sketching types of the various classes with direct reference to the misgovernment to which she traced their evil features. She followed this up with *Patriotic Sketches* and *Metrical Fragments* in 1807, fitting some Irish melodies with words ("Kate Kearney" among the number) in the same year in which *Moore* began a similar task. *Miss Owen-son's* politics and the favour shown her by the Whig aristocracy probably prompted the savage attack made upon her next novel, *Ida, a Woman of Athens*, in the first number of the *Quarterly* (1809). From first to last her style was open to the reproach of being made up too much of quotations, and her grammar was not always correct; but exuberant humour, keen wit, and fertility in the invention of striking and romantic incidents carry any unbiassed reader easily over all minor faults of composition. Her great ambition was to draw vivid pictures of the mingled "mirth and misery, ferocity and fun," of the Irish under English rule, and she succeeded. Her novels suffer as stories from this political purpose; she drags in too many character-sketches, and, though they are always drawn with vivacity and sharp penetration, they are drawn with too much bias of romantic enthusiasm on the one side and satirical spite on the other. In 1812 she was married to *Sir T. C. Morgan*, but books still continued to flow from her facile pen. In 1814 she produced her best novel, *O'Donnel*, a decided advance on previous work. She published an elaborate study of *France* under the Bourbon restoration in 1817. This was attacked with outrageous fury in the *Quarterly*, the authoress being accused of Jacobinism, falsehood, licentiousness, and impiety. She took her revenge indirectly in the novel of *Florence Macarthy* (1818), in which a *Quarterly* reviewer, *Con Crawley*, is insulted with supreme feminine ingenuity. *Italy*, a companion work to her *France*, was published in 1821; *Lord Byron* bears testimony to the justness of its pictures of life. The results of Italian historical studies were given in her *Life and Times of Salvador Rosa* (1824). Then she turned again to Irish manners and politics with a matter-of-fact book on *Absenteeism* (1825), and a highly stirring and romantic novel, *The O'Briens and the O'Flahertys* (1827). *The Book of the Boudoir* (1829) consisted of miscellaneous reflexions and reminiscences. Under the ministry of *Lord Grey* Lady Morgan obtained a pension of £300. During the last thirty years of her long life she broke no new ground, but to the last she was an entertaining writer, and sent some sprightly verses to the *Athenæum*

in January 1859, a few weeks before her death, protesting against being called old. The titles of her books in this period are:—*France in 1829-30, Dramatic Scenes from Real Life* (1833), *The Princess* (1835), *Woman and her Master* (1840), *The Book without a Name* (1841), *Passages from my Autobiography* (1859). More of her autobiography and many interesting letters were edited with a memoir by Hepworth Dixon in 1862. He respected her prejudice against disclosing her exact age.

MORGANATIC MARRIAGE. See **MARRIAGE.**

MORGHEN, RAFFAELLO SANZIO (1758-1833), a distinguished engraver, was born at Naples on 19th June 1758. He received his earliest instructions from his father, himself an engraver; but, in order to be initiated more fully in the art, he was afterwards placed as a pupil under the celebrated Volpato. He assisted this master in engraving the famous pictures of Raphael in the Vatican, and the print which represents the miracle of Bolsena is inscribed with his name. He married Volpato's daughter, and, being invited to Florence to engrave the masterpieces of the Florentine gallery, he removed thither with his wife in 1782. His reputation now became so great as to induce the artists of Florence to recommend him to the grand-duke as a fit person to engrave the Last Supper of Leonardo da Vinci; apart, however, from the dilapidated state of the picture itself, the drawing made for Morghen was unworthy of the original, and the print, in consequence, although an admirable production, fails to convey a correct idea of the style and merit of Leonardo. Morghen's fame, however, soon extended over Europe; and the Institute of France, as a mark of their admiration of his talents, elected him an associate in 1803. In 1812 Napoleon invited him to Paris and paid him the most flattering attentions. He died at Florence on 8th April 1833.

A list of the artist's works, published at Florence in 1810, comprised 200 compositions; the number was afterwards considerably increased. Amongst the most remarkable, besides those already mentioned, may be noticed the Transfiguration from Raphael, a Magdalen from Murillo, a Head of the Saviour from Da Vinci, the Car of Aurora from Guido, the Hours and the Repose in Egypt from Poussin, the Prize of Diana from Domenichino, the Monument of Clement XIII. from Canova, Theseus vanquishing the Minotaur, Francesco Moncaco after Vandyke, portraits of Dante, Petrarch, Ariosto, Tasso, and a number of other eminent men. His prints have hardly maintained the reputation which they enjoyed during the artist's lifetime. Though carefully and delicately executed, they are somewhat mechanical and wanting in force and spirit.

MORHOF, DANIEL GEORG (1639-1691), the learned author of a survey of universal literature entitled *Polyhistor sive de auctorum notitia et rerum commentarii*, was born at Wismar in 1639, studied law at Rostock, and was appointed professor of poetry there in 1660. In 1665 he went to the new university of Kiel as professor of eloquence and poetry; this chair he exchanged for that of history in 1673. He died at Lübeck in 1691. Of his numerous writings only the *Polyhistor* continues to be of value to the literary historian as a bibliographical work displaying judgment as well as knowledge. The first seven books (*Polyhistor Literarius*) appeared in 1688-1698; the publication of the two remaining parts (*P. Philosophicus* and *P. Practicus*) was completed by Moller in 1707. The best edition is that of A. Fabricius (2 vols. 4to, Leipsic, 1747).

MORIAH. In 2 Chron. iii. 1 we read that Solomon built the Temple at Jerusalem on Mount Moriah (הַר מֹרְיָהוּ). This name for the Temple hill, the ancient Zion, is not found elsewhere in the Old Testament, and can hardly have been a current one. But a mountain in the "land of Moriah" was the place where Abraham was commanded to sacrifice Isaac; Josephus (*Ant.*, i. 13, 2) assumes that this Μόριον ὄρος was the Temple hill, and the same view is expressed in the Targums, where it is exegetically based on the obscure verse, Gen. xxii. 14 (comp. Jerome,

Quæst. Heb. in Gen. xxii. 2). Probably this tradition already existed in the time of the Chronicler, who appears to connect the name etymologically with Jehovah's manifestation of himself, as is done in Gen. xxii. 14.¹

Jerome repeatedly calls the Temple hill Mount Moriah, but the currency which the name has with modern writers is mainly due to the erroneous identification of Zion with the western hill beyond the Τυροσόρον. In Christian tradition the place of Isaac's sacrifice was identified with Calvary (see Theodosius, *De Situ Terræ Sanctæ*), and it is now shown in a chapel adjoining the church of the Holy Sepulchre.

MORIER, JAMES (1780-1849), traveller and author, was born in 1780. Through the influence of his uncle Admiral William Waldegrave, Baron Radstock, he at an early period entered the diplomatic service, and as secretary to Lord Elgin followed the grand vizier in the Egyptian campaign. An account of his Eastern experiences was published in 1812, under the title *A Journey through Persia, Armenia, and Asia Minor to Constantinople in 1808-9*. From 1810 to 1816 he was the English representative at the court of Persia, and after his return he published *A Second Journey through Persia to Constantinople between the years 1810 and 1816*. His knowledge of Eastern life and manners he also turned to account in the composition of several entertaining romances, displaying some skill in the delineation of Oriental scenery and character, and considerable powers of wit and humour. The most popular of these were:—*The Adventures of Hajji Baba of Ispahan*, 1824; *The Adventures of Hajji Baba of Ispahan in England*, 1828; *Zohrab the Hostage*, 1832; and *Ayesha the Maid of Kars*, 1834. Morier died at Brighton, 23d March 1849.

MORILLON, a name commonly given by fowlers to the female or immature male of the GOLDEN-EYE (vol. x. p. 757), the *Clangula glaucion* of modern ornithology, under the belief which still very generally obtains among them, as it once did among naturalists, that they formed a distinct species of Duck. The mistake no doubt originated in, and is partly excused by, the facts that the birds called Morillons were often of opposite sexes, and differed greatly from the adult male Golden-Eye, whose full and beautiful plumage is not assumed until the second year. The word is used in French in precisely the same form, but is in that language applied to the Tufted Duck, *Fuligula cristata*, and is derived, according to Littré, from *more*, signifying black. (A. N.)

MORIN, JEAN, or, in Latin, **JOANNES MORINUS** (1591-1659), the most learned Catholic theologian of his time and one of the founders of Biblical criticism, was born in 1591 at Blois of Protestant parents, acquired Latin and Greek at Rochelle, and continued his studies at Leyden. Immersed in Biblical and patristic lore, he began to waver in his Protestantism, and moved to Paris, where he made many friends in literary circles, particularly Cardinal Du Perron, to whom his conversion to Catholicism is ascribed. In 1618 he joined the recently formed Parisian Oratory, where he could give himself to quiet study, and in due course took priest's orders. In 1625 he visited England in the train of Henrietta Maria, and in 1640 he was at Rome, on the invitation of Cardinal Barberini, and was received with special favour by Pope Urban VIII., who employed him on the commission for forwarding his project of union with the Eastern Church. He was, however, soon recalled to Paris by Richelieu, and the rest of his life was spent among books in incessant literary labour, his health, memory, and intellectual vigour remaining unimpaired even in old age. His pen sometimes brought him into trouble. The *Histoire de la délivrance de l'Église Chrétienne par l'emp. Constantin, et de la grandeur et souveraineté temporelle donnée à l'Église Romaine par les rois de France* (1630) gave great offence at Rome, and a

¹ The word Moriah, however, can hardly come from מֹרְיָהוּ, "see;" it is perhaps akin to מוֹרֵה, "revealer," "teacher."

Déclaration (1654), directed against faults in the administration of the Oratory and reflecting on the general (Father Bourgoing), was strictly suppressed. So, too, his great work on penance gave equal offence to the Jesuits and to Port-Royal, and even after his death (1659) the polemical vehemence of his *Exercitationes Biblicæ*, and the exaggeration of his assertion "apud neotericos Hæreticos verba Scripturarum non esse integra, non superficialia, non folia, nedum sensum, medullam et radicem rationis" long led Protestants to treat his valuable contributions to the history of the Hebrew text as a mere utterance of Popish prejudice.

Morinus was a voluminous and prolix writer on ecclesiastical antiquities. His principal works in this field are *Commentarius historicus de disciplina in administratione sacramenti penitentiae XIII primis seculis in Eccl. Occid. et hucusque in Orient. observata* (1651), and *Comm. de sacris Ecclesiarum ordinationibus secundum antiquos et recentiores Latinos, Græcos, Syros et Babylonios* (1655). The second of these works expresses those irenical views on the subject of ordination which recommended Morinus to Urban VIII. The literary correspondence of Morinus appeared in 1682 under the title of *Antiquitates Ecclesiarum Orientalis* (edited by R. Simon).

The chief fame of Morinus, however, now rests on his Biblical and critical labours. By his *editio princeps* of the Samaritan Pentateuch and Targum, in the Paris Polyglott, he gave the first impulse in Europe to the study of this dialect, which he acquired without a teacher (framing a grammar for himself) by the study of MSS. then newly brought to Europe. Not unnaturally he formed a very exaggerated view of the value of the Samaritan tradition of the text, exalting it above the tradition of the Jews (*Exercitationes in utrumque Samaritanorum Pentateuchum*, 1631). A similar tone of exaggerated depreciation of the Hebrew text, coloured, as has been remarked above, by polemical bias against Protestantism, mars his greatest work, the posthumous *Exercitationes biblicæ de Hebræici Græcique textus sinceritate* (1660), in which, following in the footsteps of Cappellus, but with incomparably greater learning, he brings irrefragable arguments against the then current theory of the absolute integrity of the Hebrew text of the Old Testament, and the antiquity of the vowel points. The second part of this work is still valued as a copious storehouse of materials for the history of the Hebrew text collected by the most self-denying labour—*meis ingratis*, as he said himself.

MORLAIX, the chief town of an arrondissement in the department of Finistère, France, lies 350 miles west of Paris on the railway from Paris to Brest, and at the confluence of two small streams, 7 miles distant from the sea. Its port has 13 feet of water at ordinary and 23 feet at spring tides. The entrance of the roadstead is defended by the Château du Taureau, which stands on a rock in the sea, and was built in 1542 to protect the town from the English. Morlaix still contains a considerable number of curious wooden houses of the 15th, 16th, and 17th centuries; but the most striking piece of architecture in the town is the gigantic two-storied viaduct of the railway from Paris to Brest, 934 feet long and 207 feet above the quays. The old church of the Dominicans is now occupied by the town library. The hospital has beds for 500 patients, and can accommodate 300 female lunatics besides. A tobacco-factory, employing 400 men and 700 women, is the principal industrial establishment; and there are also extensive paper-mills, a considerable flax-mill, canvas-factories, foundries, and saw-mills. A considerable trade is carried on in grain, yarn, canvas, leather, tallow, wax, and horses; and a large quantity of butter, cattle, and vegetables is exported from Roscoff, a village in the neighbourhood, which is also known for its sea-bathing and its zoological station. The population of Morlaix was 15,183 in 1876.

Judging by the numerous coins found on the spot, the site of Morlaix was probably occupied in the time of the Romans. The counts of Leon held the lordship in the 12th century, but the dukes of Brittany disputed possession with them, and in 1187 Henry II. of England, guardian of Arthur of Brittany, made himself master of the town after a siege of several weeks. During the War of the Hundred Years Morlaix was again captured and recaptured by the French and the English, and pillaged by the latter in 1522. Queen Mary of Scotland, on her way to be married to the Dauphin, made solemn entry into Morlaix in 1548. And finally, the town having joined the League, the castle was taken by storm in the name of Henry IV. in 1594.

MORLAND, GEORGE (1763-1804), animal and subject painter, was born in London on the 26th of June 1763. He came of a race of artists. His father, a painter, mezzotint-engraver, and picture-dealer, gave him a careful art-training, and at an exceptionally early age he produced works of wonderful promise. At sixteen he exhibited sketches at the Royal Academy, and even before this his productions found ready purchasers, and some of them had been engraved. But already the taste for dissipation, which was stronger in Morland than even his love for art, had begun to manifest itself, and at seventeen he escaped from the over-strict discipline of his father's house, and began a career of reckless prodigality which has hardly a parallel in art-biography, gathering round him an *entourage* of the most abandoned associates, and supporting himself by the sale of the pictures—rustic subjects and scenes from low life—which he threw off with unexampled rapidity. About 1786 there appeared to be some prospect of amendment. He went to reside at Kensal Green, came under the influence of better companions, and married a beautiful and virtuous girl, a sister of James Ward the animal-painter and William Ward the engraver. The subjects which Morland painted during this period reflect the change in his way of life. The Idle and Industrious Mechanic, and Letitia or Seduction, moralities in the style of Hogarth, were engraved and became exceedingly popular. But soon the force of old habit asserted itself, the desire for freedom and lawlessness returned to the artist with redoubled violence, and he again drifted into a career of riot and intemperance. The means of dissipation were not wanting; the dealers were eager for his productions; indeed, so greatly were they esteemed that skilled copyists were employed to make many transcripts from the pictures on which he was at work, which were sold as originals to an unsuspecting public. The finest of Morland's subjects date from 1790 to 1792. In 1791 was painted the *Inside of a Stable*, now in the National Gallery, probably the artist's masterpiece. In spite of his popularity and his industry his affairs became inextricably embarrassed. For a time he eluded the bailiffs with singular dexterity, but in November 1799 he was arrested. Obtaining the Rules of the Bench, he took a house within bounds, and continued to practise both his art and his debauchery. He was released under the Insolvent Act of 1802, but his health was ruined and he was speedily stricken with palsy. Partially recovering, he continued to paint, but before long he was again arrested for debt, and died in a sponging-house in Eyre Street, Coldbath Fields, on the 29th of October 1804. His wife survived him only some three days, and they were buried in one grave.

The most characteristic works of Morland are those which deal with rustic and homely life. They show much direct and instinctive feeling for nature, and admirable executive skill, but they have no elevation of subject, no great beauty of colour or truth of atmosphere. They suffer from the haste in which the artist habitually worked. Many of them have been admirably mezzotinted by J. R. Smith and his pupils, William Ward and John Young. Particulars of Morland's life will be found in the biographies by J. Hassell (1804), G. Dawe (1807), and Blagton (1806), and in *Memoirs of a Picture*, by W. Collins, 1805.

MORMONS, or The Church of Jesus Christ of Latter-Day Saints, are a religious sect founded by Joseph Smith at Manchester, New York, in 1830, and for the last thirty-six years settled in Salt Lake City, Territory of Utah, United States. Smith was born 23d December 1805 at Sharon, Windsor county, Vermont, from which place ten years later his parents, a poor, ignorant, thriftless, and not too honest couple, removed to New York, where they settled on a small farm near Palmyra, Wayne county (then Ontario). Four years later, in 1809, they removed to Manchester, some 6 miles off; and it was at the latter place when fifteen years old that Joseph began to have

his alleged visions, in one of which on the night of 21st September 1823 the angel Moroni appeared to him three times, and told him that the Bible of the Western Continent, the supplement to the New Testament, was buried in a certain spot near Manchester. Thither, four years later and after due disciplinary probation, Smith went, and had delivered into his charge by an angel of the Lord a stone box, in which was a volume, 6 inches thick, made of thin gold plates 8 inches by 7, and fastened together by three gold rings. The plates were covered with small writing in the "reformed Egyptian" tongue, and were accompanied by a pair of supernatural spectacles, consisting of two crystals set in a silver bow, and called "Urim and Thummim;" by aid of these the mystic characters could be read. Being himself unable to read or write fluently, Smith employed as amanuensis one Oliver Cowdery, to whom, from behind a curtain, he dictated a translation, which, with the aid of a farmer, Martin Harris, who had more money than wit, was printed and published in 1830 under the title of *The Book of Mormon*, and accompanied by the sworn statement of Oliver Cowdery, David Whitmer, and Martin Harris that an angel of God had shown them the plates of which the book was a translation. This testimony all three, on renouncing Mormonism some years later, denounced as false; but meanwhile it helped Smith to impose on the credulous, particularly in the absence of the gold plates themselves, which suddenly and mysteriously disappeared. *The Book of Mormon*, in which Joseph Smith was declared to be God's "prophet," with all power and entitled to all obedience, professes to give the history of America from its first settlement by a colony of refugees from among the crowd dispersed by the confusion of tongues at the Tower of Babel down to the year 5 A.D. These settlers having in course of time destroyed one another, nothing of importance occurred until 600 B.C., when Lehi, his wife, and four sons, with ten friends, all from Jerusalem, landed on the coast of Chili. All went well until the death of Lehi, when the divine appointment to the leadership of Nephi, the youngest son, roused the resentment of his elder brothers, who were in consequence condemned to have dark skins and to be an idle mischievous race,—hence the North-American Indians. Between the Nephites and the bad Hebrews a fierce war was maintained for centuries, until finally, in spite of divine intervention in the person of the crucified Christ, the Nephites fell away from the true faith, and in 384 A.D. were nearly annihilated by their dark-skinned foes in a battle at the hill of Cumorah, in Ontario county, New York. Among the handful that escaped were Mormon and his son Moroni, the former of whom collected the sixteen books of records, kept by successive kings and priests, into one volume, which on his death was supplemented by his son with some personal reminiscences and by him buried in the hill of Cumorah,—he being divinely assured that the book would one day be discovered by God's chosen prophet. This is Smith's account of the book; but in reality it was written in 1812 as an historical romance by one Solomon Spalding, a crack-brained preacher; and the MS. falling into the hands of an unscrupulous compositor, Sidney Rigdon, was copied by him, and subsequently given to Joseph Smith. Armed with this book and with self-assumed divine authority, the latter soon began to attract followers. On 6th April 1830 the first conference of the new sect, called by their neighbours Mormons, but by themselves subsequently Latter-Day Saints of Jesus Christ, was held at Fayette, Seneca county, New York, and in the same year another revelation was received by Smith, proclaiming him "seer, translator, prophet, apostle of Jesus Christ, and elder of the church." Smith now began to baptize; but, his character, which was none of the best, being too well known in Fayette, he

found it convenient to remove with his followers, thirty in number, to Kirtland, Ohio, which was to be the seat of the New Jerusalem. Here he had another revelation, directing the saints to consecrate all their property to God and to start a bank. This being done and Smith appointed president of the bank, the country was soon flooded with worthless notes, which fact, added to other grievances, so enraged the neighbouring Christian settlers that on the night of 22d May 1832 a number of them dragged Smith and Rigdon from their beds and tarred and feathered them. One year later, the church was fairly organized, with three presidents, Smith, Rigdon, and Frederick G. Williams, who were styled the first presidency, and entrusted with the keys of the last kingdom. About this time the licentiousness of Smith might have led to the dissolution of the church but for the accession of Brigham Young, a Vermont painter and glazier, thirty years old, who turned up in Kirtland in 1832, and was immediately ordained elder. Young's indomitable will, persuasive eloquence, executive ability, shrewdness, and zeal soon made their influence felt, and, when a further step was taken in 1835 towards the organization of a hierarchy by the institution of the quorum of the "twelve apostles," who were sent out as proselytizing missionaries among the "gentiles," Young was ordained one of the "twelve" and despatched to preach throughout the eastern States. In 1836 a large temple was consecrated in Kirtland, and in the following year Orson Hyde and Heber C. Kimball were sent off as missionaries to England, where, among the labouring masses in Manchester, Liverpool, Birmingham, Leeds, Glasgow, and the mining districts of South Wales they achieved a remarkable success. Early in 1838 the Kirtland bank failed, and Smith and Rigdon fled to Caldwell county, Missouri, where a large body of the saints, after having been driven successively from Jackson and Clay counties, had taken refuge and flourished. Smith's troubles, however, continued to increase. His gross profligacy had repelled many of his leading supporters and bred internal dissensions, while from the outside the brethren were harassed and threatened by the steadily growing hostility of the native Missourians. To counteract the efforts of his enemies, a secret society was organized in Smith's favour in October 1838, called the Danites, with the avowed purpose of supporting Smith at all hazards, of upholding the authority of his revelation and decrees as superior to the laws of the land, and of helping him to get possession, first of the State, then of the United States, and ultimately of the world. To such a height did the inner dissensions and the conflicts with the "gentiles" grow that they assumed the proportions of a civil war, and necessitated the calling out of the State militia. Defying the legal officers, Smith fortified the town and armed the saints, but finally had to succumb to superior numbers. Smith and Rigdon were arrested and imprisoned on a charge of treason, murder, and felony, and their followers to the number of 15,000 crossed over into Illinois and settled near Commerce, Hancock county. Here they were shortly afterwards rejoined by Smith, who succeeded in escaping from prison, and, having obtained a charter, they founded the city of Nauvoo. Such were the powers granted them by this charter as to render the city practically independent of the State Government, and to give Smith all but unlimited civil power. He organized a military body called the Nauvoo legion, of which he constituted himself commander with the title of lieutenant-general, while he was also president of the church and mayor of the city. On 6th April 1841 the foundations of the new temple were laid, and the city continued to grow rapidly in prosperity and size. But Smith's vices were beginning to bear fruit. Some years previously he had prevailed on several women to cohabit

with him, and in order to pacify his lawful wife and silence the objections of the saints he had a revelation on 12th July 1843 expressly establishing and approving polygamy. The proclamation of the new doctrine excited widespread indignation, which found special expression in the pages of the *Expositor*, a newspaper published by an old friend of Smith, one Dr Foster. Smith at once caused the *Expositor* printing-office to be razed and Foster expelled, on which the latter procured a warrant for the arrest of Smith, his brother Hyrum, and sixteen others. Smith resisted, the militia was called out; the Mormons armed themselves; and a civil war seemed imminent, when the governor of the State persuaded Smith to surrender and stand his trial. Accordingly, on 27th June 1844 he and Hyrum were imprisoned in Carthage jail; but that same night a mob broke into the prison and shot the two men dead. This shooting was the most fortunate thing that had ever happened to the Mormon cause, investing the murdered president with the halo of martyrdom, and effacing public recollection of his vices in the lustre of a glorious death. Of the confusion that followed Smith's "taking off" Brigham Young profited by procuring his own election to the presidency by the council of the "twelve apostles,"—a position for which his splendid executive abilities well fitted him, as subsequent events abundantly proved. The following year witnessed what appeared to be the culmination of their misfortunes. The legislature of Illinois repealed the charter of Nauvoo, and so critical did the situation become that the leaders resolved to emigrate immediately, and preparations were begun for a general exodus westward. Early in 1846 a large number of the body met at Council Bluffs, Iowa, and those who had stayed behind soon found cause to regret that they too had not left Nauvoo, as in the September of the same year that city was cannonaded, and the Mormons were driven out. Meanwhile pioneers had been despatched to the Great Salt Lake valley, Utah, and, their report proving favourable, a large body of emigrants was marched with military discipline across the wilderness to the valley, where they immediately proceeded to found Salt Lake City, and where on 24th July 1847 they were joined by their chief, Brigham Young. In the May following the main body of the saints set out to rejoin their brethren, and in the autumn of that year reached Salt Lake City. Large tracts of land were at once put under cultivation, a great city sprang up as by magic, and the untiring industry, energy, and zeal of the emigrants turned a barren wilderness into a fertile and blooming garden. An emigration fund was organized, missionaries were sent out, and soon settlers began to pour in from all quarters of the globe, particularly from Great Britain, Sweden and Norway, and in less numbers from Germany, Switzerland, and France. Strangely enough, and the fact deserves emphasis, Ireland has furnished few if any recruits to the cause of Mormonism. In March 1849 a convention was held at Salt Lake City, and a State was organized under the name of Deseret, meaning "the land of the honey-bee." A legislature was also elected, and a constitution framed, which was sent on to Washington. This Congress refused to recognize, and by way of compromise for declining to admit the proposed new State into the Union President Fillmore in 1850 organized the country occupied by the Mormons into the Territory of Utah, with Brigham Young as governor. District judges were also appointed by the Federal Government; but in 1851, a few months after their appointment, they were forced to leave by the aggressive tactics of Young. Such bold defiance of the Federal Government could not be ignored; Brigham was suspended from the governorship, and Colonel Steptoe of the United States army appointed in his stead. The new governor, backed

by a battalion of soldiers, arrived in Utah in August 1854; but so strong was the opposition which he met with that he dared not assume office, and was forced to content himself with merely wintering in Salt Lake City, after which he withdrew his troops to California. Nor did the other civil officers appointed by the United States Government at the same time show any bolder front. In February 1856 a band of armed Mormons broke into the courtroom of the United States district judge, and forced Judge Drummond to adjourn his court *sine die*. His surrender precipitated the flight of the other civil officers, and with the sole exception of the United States Indian agent they withdrew from Salt Lake City. These facts led President Buchanan to appoint a new governor in the person of Alfred Cumming, the superintendent of Indian affairs on the upper Missouri, who in 1857 went to Utah, accompanied by Judge Eckels of Indiana as chief justice, and by a force of 2500 soldiers. Enraged by this aggressive action, Brigham Young boldly called the saints to arms. In September the United States army reached Utah, but on 5th and 6th October a band of mounted Mormons destroyed a number of its supply trains, and a few days later cut off 800 oxen from its rear and drove them into Salt Lake City. The result was that the United States army, now commanded by Colonel A. S. Johnston, was compelled—it being now mid-November—to go into winter quarters at Black's Forks, near Fort Bridger. In the same year a party of Mormons and Indians, instigated and led by a Mormon bishop named John D. Lee, attacked a train of 150 non-Mormon emigrants at Mountain Meadows, near Utah, and massacred every soul. Governor Cumming at once declared the Territory in a state of rebellion; but in the spring of 1858, through the intervention of Thomas L. Kane of Pennsylvania, armed with letters of authority from President Buchanan, the Mormons were induced to submit to the Federal authority, and accepted a free offer of pardon made to them by the United States Government as the condition of their submission. Matters being thus settled, the Federal troops encamped on the western shore of Lake Utah, some 40 miles from Salt Lake City, where they remained until withdrawn from the Territory in 1860. On the close of the American Civil War a Federal governor was again appointed, and in 1871 polygamy was declared to be a criminal offence, and Brigham Young was arrested. This action, however, on the part of the United States Government was merely spasmodic, and the Mormons continued to practise polygamy, and to increase in wealth and numbers until 29th August 1877, when Brigham Young died, leaving a fortune of \$2,000,000 (£400,000) to 17 wives and 56 children. He was succeeded in office by John Taylor, an Englishman, although the actual leadership fell to George Q. Cannon, "first counsellor" to the president, and one of the ablest men in the sect. The year 1877 was otherwise signalized in Mormon history by the trial, conviction, and execution of John D. Lee for the Mountain Valley massacre of 1857. Of late years the question of Mormonism has largely occupied public attention. In 1873 Mr Frelinghuysen introduced a bill severely censuring polygamy, and declaring that the wives of polygamists could claim relief by action for divorce. In 1874 the committee of the House of Representatives reported a bill which reduced Utah to the position of a province, placing the control of affairs in the hands of Federal officials, and practically abolishing polygamy. In the same year George Q. Cannon was elected a delegate from Utah, and though his election was contested it was confirmed by the House of Representatives. This decision, however, was accompanied by the passing of a resolution by a vote of 127 to 51, appointing a committee of investigation into Delegate Cannon's alleged polygamy,—he having,

it was asserted, four wives. Later in the same year the Utah Judiciary Bill, attacking the very foundation of Mormonism, passed the House in spite of the eloquent opposition of Cannon. Other steps in the same direction have since been taken, and bills passed, having for their object the extirpation of polygamy, but all without immediate and practical effect. It is, however, a question of time merely; polygamy is doomed. The secession, chiefly because of his opposition to the practice, of Brigham Young's son, a Christian preacher, and of a large body of other anti-polygamists who claim to be the true Latter-Day Saints, represents not an individual opinion but the deep-rooted conviction of a great party, and the day is not far distant when the Mormons who acknowledge John Taylor as chief prophet must consent to lop off polygamy or cease to exist as a corporate body of the United States. Already there are not wanting signs of approaching dissolution, of which perhaps the most significant is the conference of the "Reorganized Church of Jesus Christ of Latter-Day Saints," held on 6th April 1883, at Kirtland, Lake county, Ohio. This sect originated in 1851, seven years after the death of Joseph Smith, when several officers of the church met and claimed to have received a revelation from God, directing them to repudiate Brigham Young, as not being the divinely-appointed and legitimate successor of Joseph Smith, and as being the promulgator of such false doctrines as polygamy, Adam-God worship, and the right to shed the blood of apostates. Nothing of special importance occurred, however, until 1860, when Joseph Smith jun., the eldest son of the founder of the faith, became identified with the Reorganized Church as its president. Since then the seceders have prosecuted missionary work throughout the United States, Great Britain, Canada, Scandinavia, Switzerland, Australia, and the Society Islands, until their communicants are said to number over 27,000. Their headquarters are at Plano, Illinois, to which place they removed from Lamoni, Iowa, in 1881. The Reorganized Church holds that the legitimate successor to Joseph Smith was his eldest son, that the allegation that Smith introduced polygamy on the strength of divine revelation was an invention of Brigham Young, that the Utah Church has departed grievously from the faith and practices laid down in the *Book of Mormon* and subsequent revelations to Joseph Smith, and that the Reorganized Church is the only true and lawful continuation of, and successor to, the original church, and as such is legally entitled to all that church's property and rights. And it was to celebrate the decision of the United States Court of Ohio confirming this last claim, and vesting in them the right to the temple consecrated in Kirtland, Ohio, in 1836, and for nearly forty years disused owing to litigation, that the Reorganized Church met in that temple on the 6th of April 1883.

Returning to the main body, it may be added that the population of Utah is 147,000, of whom 123,000 are Mormons; but as the saints are scattered over the globe it is difficult to arrive at a just estimate of their complete numerical strength. In Idaho, Arizona, Washington, Colorado, Montana, and Wyoming they have of late years made great progress, and their number in the United States outside of Utah cannot fall much under 27,000. In Europe they have also many adherents, and a careful study, based on recent official statistics, would place their entire number at 213,000.

Government.—At the head of the body is a president, who possesses supreme authority, supported by two counsellors. These three are supposed to be the successors of Peter, James, and John, and constitute what is known as the "first presidency." Then comes the "patriarch," whose chief duty is to bless and lay on hands, and after him the "twelve apostles," forming a travelling high council, and receiving a salary of \$1500 a year each. Of these the president is *ex officio* one, and endowed with authority equal to the other

eleven. Their duties are important. They ordain all other officers, elders, priests, teachers, and deacons, lead all religious meetings; and administer the rites of baptism and sacrament. Fourth come the seven presidents of the "seventies," each body comprising seventy elders; there are eighty seventies in Utah, each of which has seven presidents, and every seven one president. These seventies make annual reports, and are the missionaries and propagandists of the body. Fifth come the "high priests," whose chief duty is to officiate in all the offices of the church in the absence of any higher authorities. After them comes the presiding bishop, who superintends the collection of tithes, which amount to \$1,100,000 annually. The church is made up of 23 stakes, each having a president, and is divided into wards, which are subdivided into districts, each of which has a certain number of teachers, a meeting-house, Sunday school, day school, and dramatic, debating, and literary societies.

Doctrine.—The Mormons no longer claim to be a Christian sect, any more than do the Mohammedans. A system of polytheism has been grafted on the original creed, according to which there are grades among the gods, the place of Supreme Ruler of all being taken by the primeval Adam of Genesis, who is the deity highest in spiritual rank, while Christ, Mohammed, Joseph Smith, and Brigham Young also partake of divinity. The business of these deities is the propagation of souls to people bodies begotten on earth, and the sexual relation permeates every portion of the creed as thoroughly as it did that of ancient India or Egypt. The saints on leaving this world are deified, and their glory is in proportion to the number of their wives and children,—hence, the necessity and justification of polygamy, and the practice of having many wives sealed to one saint. Their distinguishing points of faith are:—religiously, a belief in a continual divine revelation through the inspired medium of the prophet at the head of the church; morally, polygamy, though this is expressly condemned in the *Book of Mormon*, and was grafted on the original faith by Smith; and, socially, a complete hierarchical organization. They believe in the Bible as supplemented by the *Book of Mormon* and the *Book of Doctrine*; in the gift of prophecy, miracles, and casting out devils; in the imminent approach of the end of the world; in their own identity with the apocalyptic saints who shall reign with Christ in a temporal kingdom, either in Missouri or Utah; in the literal resurrection of the body; in absolute liberty of private judgment in religious matters; and in the salvation of a man only if he believes in Christ's atonement, repents, is baptized by immersion by a Christ-appointed apostle, and receives the laying on of hands for the gift of the Holy Ghost by duly authorized apostles. Among their minor rules as laid down in *A Word of Wisdom*, supposed to have been revealed to Joseph Smith, 27th February 1833, are these recommendations:—that it is not good to drink wine or strong drink, except at the Lord's Supper (and even then it should be home-made grape-wine), or to use hot drinks or tobacco,—the former being meant for the washing of the body, and the latter for the healing of bruises and sick cattle; man's proper food is herbs and fruit, that for beasts and fowls, grain; and, except in winter and in case of famine and severe cold, flesh should not be eaten by man. Infant baptism is also condemned, but the children of the saints who have reached their eighth year should be baptized. The deceased, also, can be baptized by proxy, and in this way Washington, Franklin, and others have been vicariously baptized into the church.

MORNAY, PHILIPPE DE (1549-1623), Seigneur du Plessis-Marly, very generally known as Mornay Du Plessis or Du Plessis-Mornay, one of the most distinguished members of the Protestant party in France, was born at Buhy in Normandy on 5th November 1549. As a younger son he was destined for the church, and with this view was sent to the Collège de Lisieux in Paris, but in his eleventh year, along with the rest of his family, he abandoned Roman Catholicism, continuing, however, with zeal and success his studies not only in classical and general literature but also in theology. In the autumn of 1567, on the outbreak of the second religious war, he joined the army of Condé, but was prevented from taking an active part in the campaign by a fall from his horse, which broke his leg. In the following year he went abroad, and, after spending the winter at Heidelberg, travelled extensively in Italy, Germany, the Low Countries, and England, learning the languages and acquiring the friendship of many of the distinguished men of all these countries. In

June 1572 he returned to France, and had begun to enter upon a diplomatic career (his earliest extant "mémoire," laid by Coligny before Charles IX., had reference to the duty of France to support the Low Countries in their struggle for independence) when the St Bartholomew massacre, from which he escaped with difficulty, compelled him to take refuge across the Channel. There he rendered valuable services to William of Orange, and also to the duke of Alençon-Anjou, as a semi-official political agent. Returning to France at the instance of La Noue towards the end of 1573, he took part with various success in numerous military enterprises, and was made prisoner at Dormans in 1575 (10th October), but not having been recognized he got off for a small ransom. Shortly afterwards he married Charlotte Arbaleste at Sedan, and at her request wrote as a bridal present the *Discours de la Vie et de la Mort* (1576), which has been so often reprinted and translated. In 1577 Henry of Navarre made him a member of his council and sent him on a diplomatic mission to England, and during this visit, which lasted more than a year, he found time among his other pressing occupations to prepare for the press his *Traité de l'Église où l'on traite des principales questions qui ont été mues sur ce point en nostre temps* (1578), which at once became popular. From July 1578 till his return to France in 1582 he was chiefly in the Low Countries, engaged in public business, and during this interval he wrote and published a considerable work in apologetical theology (*Traité de la vérité de la religion chrétienne contre les Athées, Épicuriens, Payens, Juifs, etc.*, 1581). With the death of the duke of Anjou in 1584, by which Henry of Navarre was brought within sight of the throne of France, the period of Mornay's greatest political activity began; his importance in the Huguenot counsels was further increased in 1588 by the death of the prince of Condé, to whose influence he practically succeeded. In April 1589 he was rewarded for the reconciliation of the two Henries with the governorship of Saumur, and he took active part in many of the military operations that followed the assassination of Henry III. in the following August. He was present at the siege of Dieppe, fought by the side of Henry IV. at Ivry, and was one of the besiegers of Rouen in 1591-92, until sent on a mission to the court of Elizabeth. A crisis in his political career was marked by Henry's abjuration of Protestantism in July 1593, which gradually led to Mornay's withdrawal from the court. In this year it was that he founded the Protestant academy or university of Saumur, which had a distinguished history until its suppression by Louis XIV. in 1683. In 1598 he published a work on which he had long been engaged, entitled *De l'institution, usage, et doctrine du saint sacrement de l'Eucharistie en l'Église ancienne*. It having reached his ears that Cardinal Du Perron had alleged that of the (thousands of) citations in this controversial work he could point out five hundred that were falsified or misunderstood, he challenged his assailant to a public discussion. This was at last arranged for by the good offices of the king, and took place at Fontainebleau on 4th May 1600. Only nine passages were discussed, but in each case the decision, one is not surprised in the circumstances to learn, went against the Protestant. Mornay, from whom every indication of the particular passages to be impugned had been persistently withheld, was forced by supervening illness to withdraw. Only once again did he appear at court, in 1607. He continued, however, to give his party the benefit of his counsel and active support to the end of his long and busy life. His last work, entitled *Mystère d'iniquité, c'est à dire, l'histoire de la Papauté*, appeared in 1611. In 1618 he was chosen a deputy to represent the French Protestants at the synod of Dort. Prohibited by Louis XIII.

from personally attending, he nevertheless contributed materially to the deliberations of that assembly by written communications. In 1621 he was deprived of his governorship; and his death took place at La Forêt-sur-Sèvre on 11th November 1623.

Two volumes of *Mémoires*, from 1572 to 1589, appeared at La Forêt in 1624, and a continuation, in two volumes, at Amsterdam in 1652; a more complete edition (*Mémoires, correspondances, et vie*) in twelve volumes, 8vo, was published at Paris in 1624-25. The greater number of his works were translated into English during his lifetime.

MORNAY, CHARLES AUGUSTE LOUIS JOSEPH, DUC DE (1811-1865), was the natural son of Hortense Beauharnais, queen of Holland, and of the comte de Flahaut, a leading dandy of the period, and was thus brother to Napoleon III. The secret of his birth (23d October 1811) was carefully kept; he was acknowledged as son by the comte de Mornay for a consideration, and was brought up by his paternal grandmother, Madame de Souza, a writer of society novels, and a woman of great wit and high breeding. As a boy of nineteen he was declared after the revolution of 1830 a hero of July, and was entered at the staff college. In 1832 he was gazetted sub-lieutenant, and served in Algeria as aide-de-camp to General Oudinot; he was present at Mascara and Constantine, and was made a chevalier of the Legion of Honour. In 1838 he returned to Paris, and began his career as dandy and speculator. In the first capacity he set the fashions both of dress and manners to the young men of Paris, and conceived the idea of the modern society journal, and in the second established a manufactory of beetroot sugar at Clermont-Ferrand. This last idea brought about his election for the department of the Puy-de-Dôme. In the chamber he voted consistently with the ministers. The republic of 1848 marked the crisis in his fortunes, and by 1851 all his speculations had failed, and all his property was sold. In desperation he determined to play a part in politics, and was the heart and soul of the *coup d'état* of December 1851. The success of the *coup d'état* was certain, owing to the fear of the extreme republicans entertained by the great majority of the nation, and all that was needed was a head for intrigue and an utter absence of scruples to shed innocent blood. Mornay and St Arnaud fulfilled these requisites. Mornay was on the day of the *coup d'état* made minister of the interior, but he had no taste for the drudgery of administration, and in January 1852 found an excuse for resigning on the question of the property of the Orleanist princes. The empire established, he was again able to begin speculating, and used both the money of the state and his influence with his brother for the success of his schemes. He had been in 1852 re-elected deputy for Clermont-Ferrand, and was in 1854 elected president of the corps législatif, an office which he held for the rest of his life. This office in every way suited him; he had large pay, and resided in a magnificent official residence, where he produced little plays to admiring audiences. The work was not hard, being chiefly to maintain the Government majority in a good humour by sumptuous entertainments, and to win over the Liberals by the same tactics. He still speculated in railways, pictures, mines, and even in a new watering-place, Deauville, and, being absolutely unscrupulous and venal, amassed an immense fortune in spite of the utmost extravagance. In 1856 he was special ambassador at the coronation of Czar Alexander II., when he spent immense sums, and married a wealthy Russian, Princess Troubetzkoy. In 1862 he was created a duke, and in 1865, after continuing to the last his career of dissipation, died of sheer anæmia from the measures he took to keep himself fit for yet further excesses.

Of the duc de Mornay little good can be said either as a statesman or a man. He looked upon everything from a purely selfish point

of view, and would not have denied it; but he was shrewd enough to perceive that the empire rested on the prestige it maintained for France not only in war but in fashion, and in assisting the empress to make Paris the centre of fashion for the whole civilized world he knew he was not only pleasing himself but doing a service to the empire. He was a thorough man of the world, and was witty as such, but the wit does not appear at its brightest in his plays, published under the name of Saint-Remy, of which perhaps the most readable is *M. Choufleury restera chez lui*. He had great influence over the emperor, but could lay no claim to personal fidelity, as could his less able but equally unscrupulous colleague, M. de Persigny.

For his life consult H. Castille, *M. de Morny*, 1859, and De la Gueronnière, *Études et portraits politiques* (1856); also Alton-Shee's *Mémoires* (1868-69). His character is admirably sketched as the duc de Mora in A. Daudet's novel *Le Nabab*.

MORO, ANTONI (c. 1512-1581), otherwise known as SIR ANTHONY MORE, an eminent portrait-painter, was born at Utrecht, in 1512 according to some, but in 1525 according to Van Mander in his *Het Leven der Schilders*. He studied his art under Jan Schoorel; and after making a professional visit to Italy he commenced to paint portraits in the style of Hans Holbein. His rise to eminence was rapid. In 1552 he was invited to Madrid by the emperor Charles V. to execute a likeness of Prince Philip. Two years afterwards he was in London painting the portrait of Queen Mary. For this picture an annual salary and, as some suppose, the honour of knighthood were conferred upon him. He was also employed to sketch the likenesses of several of the English nobility. On the death of Mary in 1558 Moro returned to Spain, and lived there for two years in great honour with Philip II., executing, in addition to portraits, several copies after Titian. Having compromised himself with the Inquisition, he repaired to the Netherlands and was received into the service of the duke of Alva. His death took place at Antwerp about 1581. Among his figure-pictures Van Mander specifies the Circumcision of Christ, executed for Antwerp cathedral, as one of the most notable. His portraits are full of individuality, and characterized by firm and solid rendering of flesh. Several admirable examples are preserved in Madrid; among the rest the portrait of Queen Mary of England, which has been excellently etched by Milius (*L'Art*, 8th December 1878). "Moro's style," says Stanley in his *Dutch and Flemish Painters*, "so much resembles that of Holbein as to frequently create a doubt to which of them a portrait is to be attributed; but he is not so clear and delicate in his colouring (perhaps from having painted so much in Spain) as that master."

Plate X. MOROCCO, or MAROCCO, the term (corrupted from the name of the city Marrákush) used in English to designate the Maghrib al-Aksá or extreme west of the Arabs, is the country at the north-western corner of the African continent, with the Mediterranean on the north and the Atlantic on the west. Its landward limits can only be vaguely defined. The eastern frontier towards Algeria, determined by the treaty of 1844, is a purely conventional line starting from the mouth of a small stream called the Skis and running across country in a general south-south-east direction. The southern boundaries expand and contract according to the power and activity of the central authorities. Behm and Wagner (1882), who include Táfilet, Kenatsa, Figig, Twat, Gurara, Tidikelt, the plateau of Tedmaid, &c., estimate the total area of the sultanate at 305,548 square miles; and this, which is about twice the size of Algeria, or five times that of England and Wales, may be taken as a maximum. The allegiance of many of the tribes within this compass is questionable and intermittent. Morocco is still the portion of Northern Africa about which European information is most defective, and the ordinary maps are composed to a large extent of most unscientific material eked out by probabilities and conjecture. Since the middle of the present century a good deal has been done in the way of

exploration, mainly in the lowlands and steppes sloping towards the Atlantic—the country of the great historical cities of Tangiers, Fez, Meknes (Mequinez), and Morocco; but even there what lies but a few miles east or west of some track traversed by Europeans for centuries remains matter of question.

Since the publication of Arlett's survey from Cape Spartel to Cape Bojador (1840-44) and of Vincendon-Dumoulin and Kerhallet's surveys from the Strait of Gibraltar to the Algerian frontier (1853-57) the seaward aspect of Morocco has been known in detail. To the Mediterranean it presents for a distance of about 200 miles the rugged profile of the Rif hills (still unexplored), which generally end in lines of cliff broken at intervals by narrow sweeps of sandy beach; but occasionally open up into beautiful and fertile valleys, with abundant evidence of human occupancy and tillage. About 6 miles west of the Skis lies the mouth of the great river Mulúya; and 10 miles farther on, opposite Cape del Agua (Ras Sidi Beshir), is a group of dry and barren islands known as the Zafarines, which form the best roadstead on the Rif coast.¹ Between Point Quiviana and Melilla runs a low and sandy shore in front of a great salt marsh, the Puerto Nuevo of the Spaniards. Melilla (Mallia) is a fortified town, held by the Spaniards since 1653, built on a rocky peninsula and connected by lines of rampart with Fort Rosario on the heights behind. Near the village of Azanen is a wide open shore with the only sand-dunes on all this coast. The fine semicircular bay of Allucemas is the seaward end of one of the most beautiful valleys in the Rif, clothed with verdure and dotted with hamlets. A Spanish *presidio* occupies one of the larger of the Allucemas islands (Al-Mazemma), which are identified with the Ad Sex Insulas of the itineraries. Another Spanish fortress crowns the rocky island of San Antonio or Peñon de Velez; and in the valley off which it lies stood a town known to the Spaniards as Velez de Gomera, to the Arabs as Bádís, which continued to be a place of importance in the 16th century. The so-called Bay of Tetuan (Tettáwin)—the town is just visible from the sea—is little more than the straight stretch of coast between Cape Mazari on the south and Cape Negro or Negrete on the north; but the prominence of these two headlands gives it an appearance of depth. From Cape Negro northwards to Ceuta the most notable object on the horizon is the summit of Jebel Músá, which, though situated on the Strait of Gibraltar, towers above the intervening hills. Ceuta (Sebta), the most important and flourishing of the Spanish settlements in Morocco, occupies a peninsula,—the head, Mt. Acho, standing about 4 miles out to sea, and the neck being low and narrow. It marks the eastern end of the strait. Westwards, the first point of interest is again Jebel Músá, the Elephas of Strabo, and the Apes' Hill of English charts; the truncated top is usually hid in clouds. About 20 miles farther along the coast lies the Bay of Tangiers (Tanja), by far the finest harbour in Morocco. West from Tangiers runs the Jebel Kebir (880 feet at its highest), the seaward extremity of which forms the celebrated Cape Spartel, the north-west angle of the African continent, known to the ancients as Ampelusia or Cotes Promontorium. The lighthouse, built in 1864 at the cost of the sultan of Morocco, and maintained at the joint expense of England, France, Italy, and Spain, is the only one on the western coast.

The Atlantic coast of Morocco is remarkable for its regularity and sameness; not a single gulf or noteworthy estuary occurs throughout its whole length; the capes

¹ The name is derived from the Arab tribe of the Beni Ja'far, who settled on the neighbouring mainland at the conquest. Since 1848 the islands have belonged to Spain. They are identified with the Ad Tres-Insulas of the Roman itineraries.

are few and for the most part feebly marked. Southward from Cape Spartel the shore sinks rapidly till it is within a few feet of the sea-level. In the low cliff which it forms about $4\frac{1}{2}$ miles from the lighthouse there is a great quarry, which from remote antiquity has yielded the hand-mills used in the Tangiers district. A stretch of low marshy ground along the Tahaddart—the estuary of the Wádi Kebír (W. Muharhar) and W. al-Kharrúb—agrees with Scylax's Gulf of Cotes (Tissot). Three or four miles farther south lie the ruins of the town of Nebrosh, built by Moors from Andalusia; and 4 or 5 miles more bring us to Azfía or Arzilla, the ancient Colonia Julia Constantia Zilis or Zeles. Since its bombardment by the Austrians in 1829 it has been a wretched little place, with a mixed Moorish and Jewish population of about 1200.¹ For the next 16 miles, between Azlá and Larash or EL-ARASH (*q.v.*) the coast has a tolerably bold background of hills, Jebel Sassar near Fez forming an important landmark for the latter town, which, with its Phœnician, Roman, and mediæval remains, is historically one of the most interesting places in Morocco. A line of reddish cliffs about 300 feet high runs south for about 10 miles from the W. Aulkos, at whose mouth the town is built; then the coast sinks till it reaches Múlá Bú Selham, an eminence 220 feet high. Between Múlá Bú Selham (often wrongly called Old Mamura or Marmore) and a similar height crowned by the tomb of Sidi 'Abd Allah Jelíli lies the outlet of the Blue Lake (Marja Zarká), 10 or 12 miles long. Farther south, and separated from the sea by an unbroken line of rounded hills (230-260 feet), is the much more extensive lagoon of Ras al-Dura, which in the dry season becomes a series of marshy meres, but in the rainy season fills up and discharges into the Sebú. Eastward it is connected with the Marjat al-Gharb, fed by the W. Meda. On the south side of the outlet of the Sebú lies Ma'múra, probably founded by 'Abd al-Mumen, and originally named Mahdíya, after the Almohade Mahdí. Twenty miles farther is the mouth of the Bú Rakrak, with its cluster of interesting towns: Sallee (Sálát) on the north side, long famous for its piracies and still one of the most fanatical places in the empire, and on the south side New Sallee (Rabát) with its conspicuous tower of Hasan, and Shella (Sella of Leo Africanus) with its interesting ruins. Onward for 100 miles to Point Azammur and the mouth of the Umm Rabf river a line of hills skirts the sea; the shore is for the most part low, and, with the exception of capes at Fadála (a small village) and Dár al-Baidá or Casa Blanca, it runs in a straight line west-south-west. Casa Blanca, the ancient Anfá, once a flourishing port, was ruined by the Portuguese (1468) in revenge for its piracies. It is now a place of 4000 inhabitants, and has a thriving export trade in maize, beans, and wool, and a European colony of about 100 persons. Azammur (that is, in Berber, "The Olives," viz., of the Sheikh Bú Shuaib), with 1000 inhabitants dependent on the shebbel fisheries in the river, stands on an eminence about $1\frac{1}{2}$ miles from the sea on the south side of the Umm Rabf. The bay of Mazagan (Mázighan), a few miles to the south, curves westward with a boldness of sweep unusual on this coast. The town of Mazagan was founded by the Portuguese in 1506, and held by them till 1769.² About 8 miles to the south and less than a mile inland lie the extensive ruins of Tit, a town which proved a thorn in the side of the people of Mazagan till they sallied forth

and destroyed it. At Cape Blanc (so called from its white cliffs) the coast, which bulged out at Cape Mazagan, again bends east to resume much the same general direction for 55 miles to Cape Cantin. On this stretch the only point of interest is Walidiya, formerly Al-Ghait; the excellent harbour praised by Edrisi is formed by an extensive lagoon, and M. Tissot thinks that by a little dredging the place would again become the safest shipping station on the whole Morocco seaboard.³ Beyond Cape Cantin (300 feet high) the coast becomes bolder and more irregular, especially after the mouth of the Tensift is passed. About 18 miles farther lies Saffi (Asfi), "by far the most picturesque spot on the west coast," with the high walls and square towers of its Portuguese fortifications shown to advantage by the ruggedness of the site. South of MOGADOR (*q.v.*), and onwards beyond the limits of Morocco, the coast, becoming ever more and more inaccessible and dangerous in winter, is emphatically known as the Iron Coast. From Cape Sim or Ossim (Ras Tagriwalt), 10 miles south of Mogador, the direction is due south to Cape Gir (Igir Ufrani), the termination of Jebel Ida u Tanan (Rabbi Mardochée), the last spur of the Atlas proper. Rounding this headland we reach Agadí (Agadí 'n Ígir), the Santa Cruz Major or Santa Cruz de Berberia of the Spaniards, formerly known as the Gate of the Soudan.⁴ It is a little town with white battlements three-quarters of a mile in circumference, on a steep eminence 600 feet high. In the 15th century it was seized by the Portuguese, and Don Manuel caused it to be fortified; but in 1536 it was captured by Muley (Maulá) Ahmed al-Hasan. Its merchants were removed to Mogador in 1773. At the mouth of the Sús Leo places three little towns called Messa (Mássa), with a mosque popularly reputed the scene of Jonah's restoration to *terra firma*. The port of this name,⁵ regularly visited by the Genoese traders in the 16th century, who exported skins, gum, wax, gold, and indigo, is no doubt at the mouth of the W. Mássa, 20 miles farther south.⁶ Ifni, situated in $29^{\circ} 23' N.$ lat., and Sidi Worzek, the Cape Non⁷ of the Portuguese, are the only points calling for notice till the better known Cape Nun is reached, which lies 5 or 6 miles north of the W. Der'a. With the Der'a the Sahara may be said to begin.

On most maps the interior of Morocco is represented as extremely mountainous; but, while it is traversed from east to west by more than one strongly-defined range, the greater part of the surface is really occupied by undulating steppe-like tracts diversified by low hills. The backbone of the country is the Great Atlas (Daran of the Berbers).⁸ At its western extremity the range averages from 4000 to 5000 feet in height; after a slight falling off for a few miles it rises till it attains an elevation of 10,000 feet; beyond the pass (about 60 miles from the sea) which leads from Morocco to Tárúdan the summits seem to be between 11,000 and 11,500 feet; about 40 miles farther east there is a second pass at an altitude of about 7000 feet; and beyond that the main ridge continues 30 miles at a height of about 12,000 feet, with a few peaks reaching to 13,000 or 13,500 feet. Snow lies on some of the summits as late

³ *Bull. de la Soc. de Géogr.*, Paris, 1875.

⁴ This must not be confounded with Santa Cruz de Mar Pequena, a post established in 1476 somewhere on this coast by Herrera, lord of the Canary Islands, and in modern times the subject of much geographical disputation. After obtaining permission to reoccupy the site the Spanish Government was unable to identify it.

⁵ See Valentin Ferdinand, *Beschreibung West Afrika's* (Mem. of the Acad. of Munich, 3d Class, pt. viii.).

⁶ Ya'kúbi, *Descr. al-Maghribi*, p. 126; *Hist. des Berbères*, ii. 279.

⁷ No, Non, Nor, Naum. Não, are among the various readings. It was another Cape Non to the south of Cape Bojador which seems to have given rise to the proverb, *Quem pasar o cabo de Não ou tornara ou não*. See *Bol. de la Soc. Geogr.*, p. 316, Madrid, 1880.

⁸ Pliny says the natives called the Atlas "Dyrin."

¹ The absurd story that about the 9th century it was an English possession has its root in the visits of the Normans to this quarter. The modern town sprang from a fortress built to protect the coast against them (Dozy, *Recherches*, 3d ed., ii. 264 sq.).

² The Portuguese settlers, who had to leave it when Don José decided on surrendering this last stronghold of his country in Morocco, were afterwards sent to Brazil, where they founded Villa Nova de Mazaga.

as June, but it is probable that none of them retain it throughout the year. Taken as a whole, the Atlas has a mean elevation higher than that of any other range of equal length in Europe or in the African and Asiatic countries bordering on the Mediterranean. From the lowlands to the north it has a very fine appearance, rising, as it seems, in steep and almost abrupt ascent, though the real distance from foot to summit is a slope of 15 miles (compare the panorama prefixed to Hooker and Ball's *Morocco*).

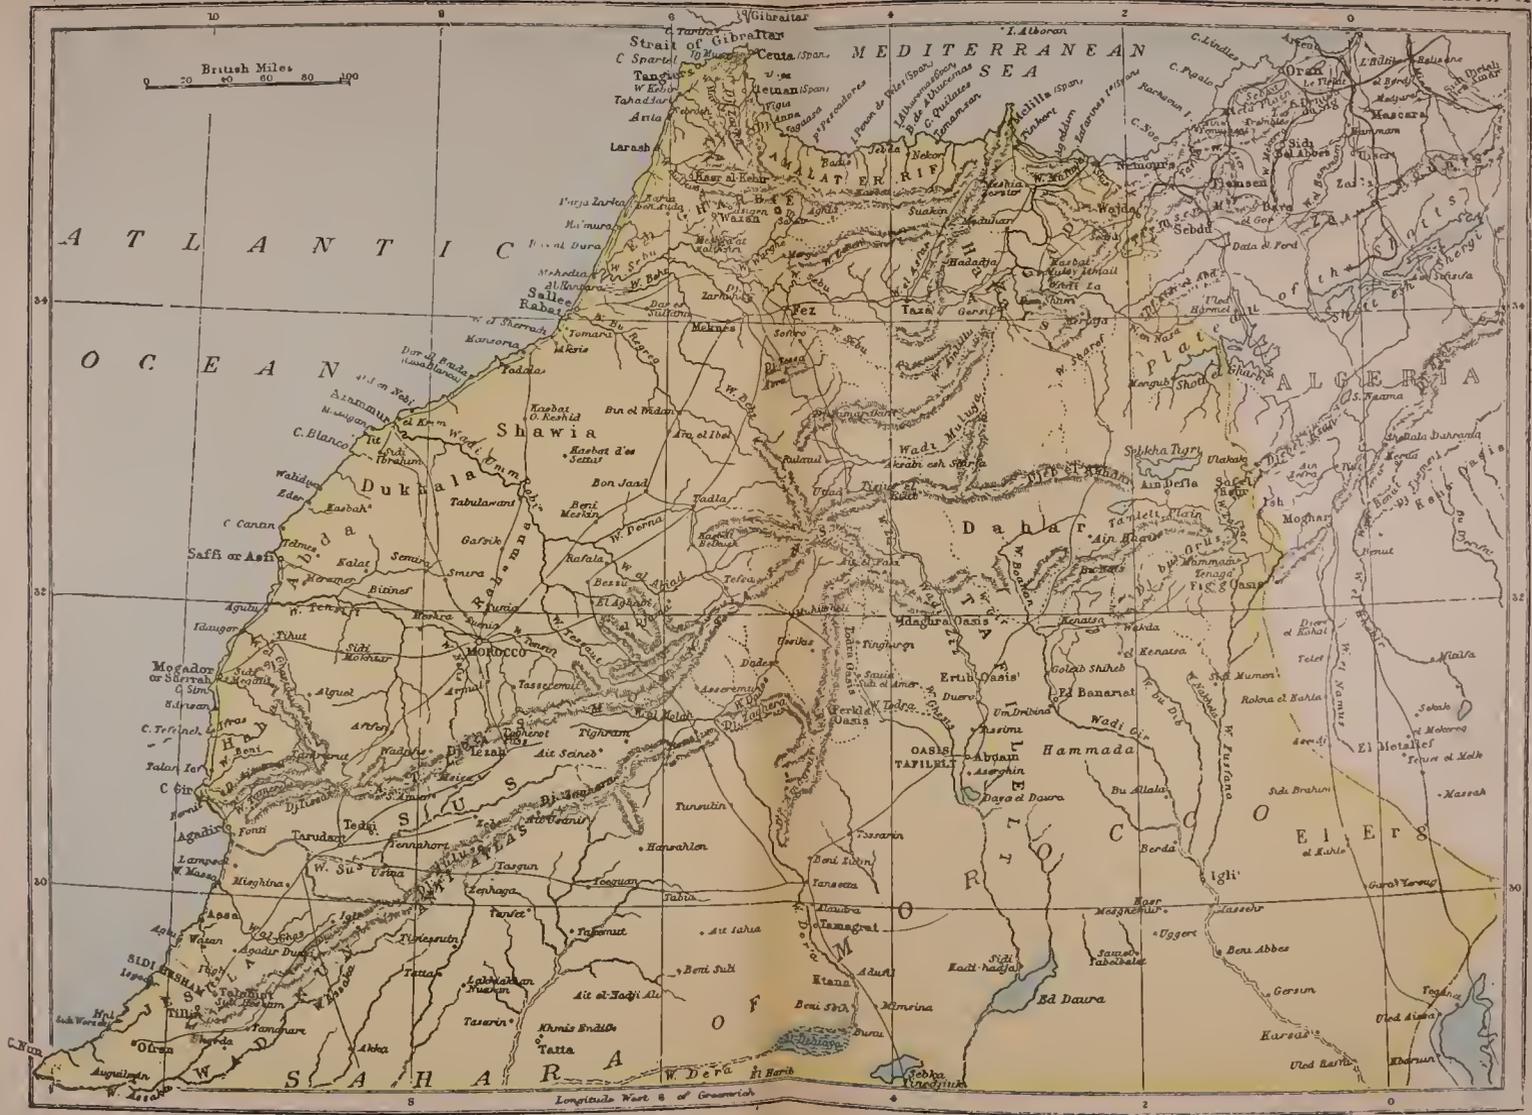

What is the culminating point of the range is quite unknown; the Miltin peak has no claim to that distinction. The English embassy of 1829-1830 advanced up the northern slope only a little beyond Tasseremut (3534 feet), and Davidson in 1836 merely reached the town, and then turned westwards. From Tasseremut eastwards the range is altogether unexplored for 200 miles till we come to the route followed by Ahmed b. Hasan al-Mtúvi (1789), Caillié (1827), and Rohlfs (1863). The English expedition of 1871 (Hooker and Ball, &c.), besides visiting Tasseremut, went up the Urika valley to a height of 4000 feet, up the Ait Mesan valley to the Tagherot pass (11,484), and up the Ansziz valley to the summit of Jebel Tezah (11,972 feet). In the Tagherot pass Mr Maw was the only one of the party who reached the watershed; but from Jebel Tezah a good view was obtained southward across the great valley of the Sús to the Anti-Atlas, which appeared to be from 9000 to 10,000 feet high. In 1830 Dr Lenz crossed the range by the ordinary route from Morocco to Táridant. "First," he says, "is a chain of comparatively low and flat hills consisting of Cretaceous and Tertiary rocks; then follows a plateau with ranges of red, probably Triassic, sandstone; and finally come the higher and steeper peaks of clay slate with great metalliferous deposits. The pass where the descent towards Sús begins is called Bibauan, and lies 4000 feet above the sea. The route down to 'Emnislah' is steep, difficult, and at times dangerous." As to the relation of the Anti-Atlas to the Atlas proper at its western end nothing certain is known.

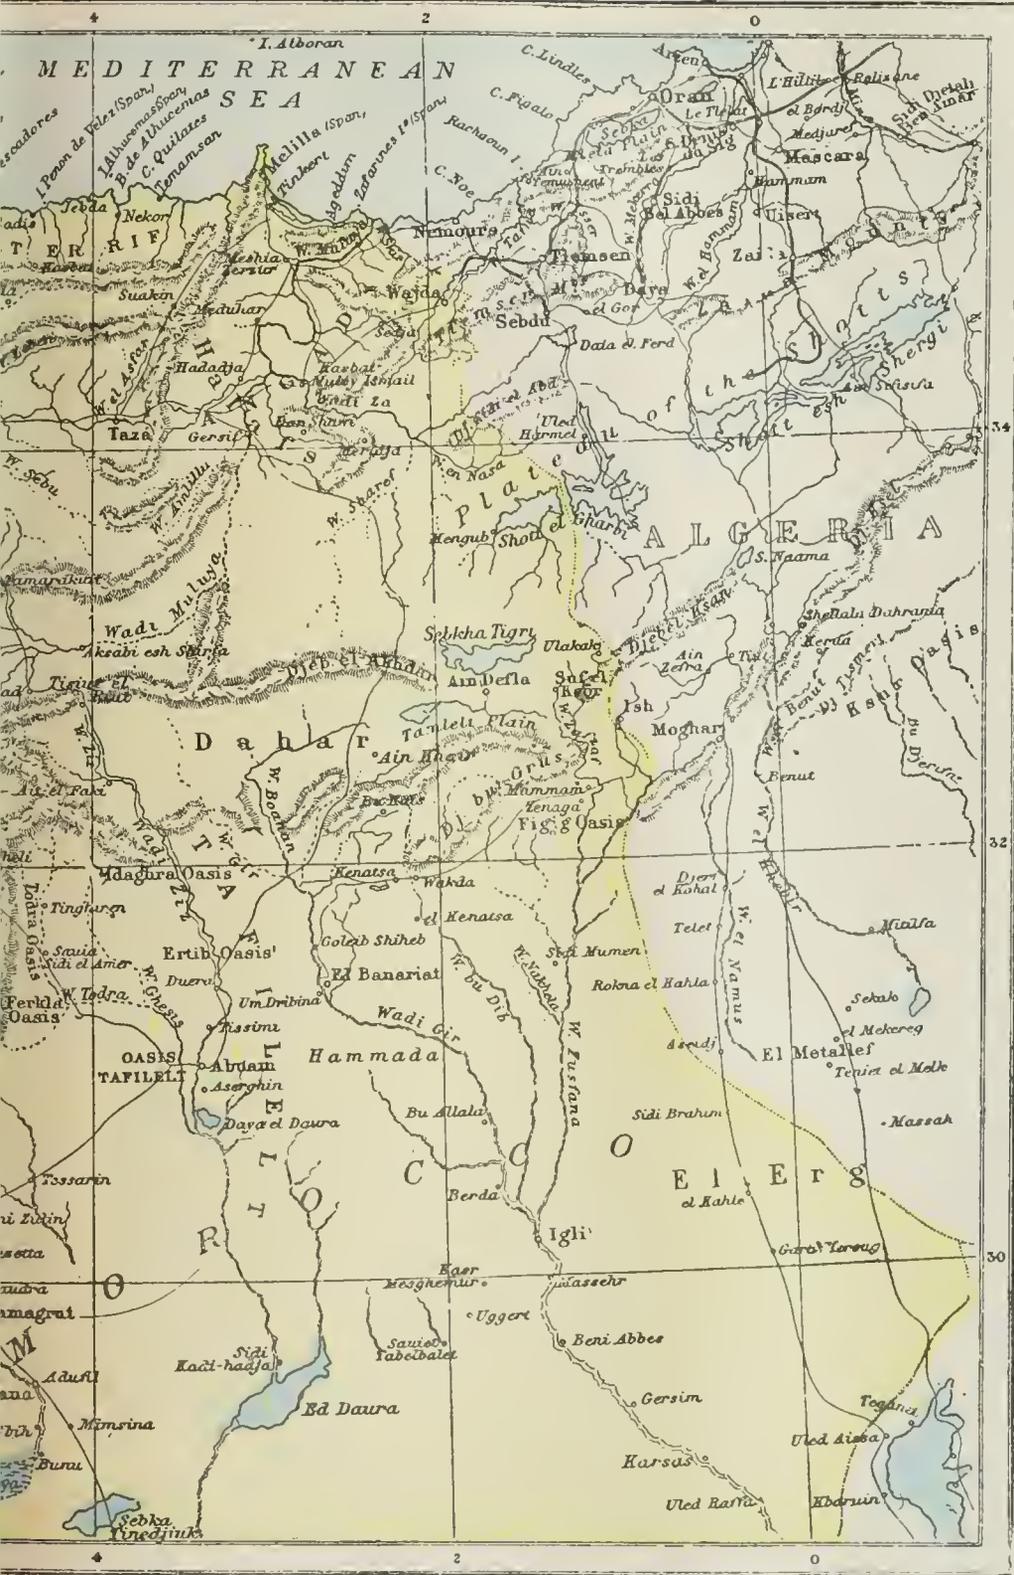

All the principal rivers of Morocco take their rise in the Atlas mountains, and the headwaters of the Mulúya, the Sebú, the Umm Rabí, the Der'a, and the Zíz are all to be placed in that part of the range which lies between 32° 20' and 32° 30' N. lat., and between 3° 30' and 5° W. long. In almost every instance the summer current is comparatively feeble, but the wide beds and often high steep banks are sufficient of themselves to show the change produced by the rains of winter and the thaws of spring. The Mulúya (Mulucha and Malva of Pliny, &c.) is mainly interesting as the river which the French have long wished to make the western boundary of Algeria. Its course is almost entirely unexplored. About 34° 20' N. lat. Captain Colville found it some 200 yards wide but quite shallow; about 25 miles east of its source where it is crossed by the route to Zíz it is already a powerful stream with a deep bed cut in the granite rock, and shortly afterwards it is joined by the W. Sgimmel, a still larger affluent (Rohlfs). Of the lesser streams which flow into the Mediterranean it is enough to mention the W. Martil or Martin (otherwise W. Bú Sfiha, W. Ras, W. Mejeksa), which falls into the Bay of Tetuan, and is identified with the Tamuda of Pliny and Thaluda of Ptolemy. On the Atlantic seaboard north of the Sebú there are a number of comparatively small streams, the chief of which is the very winding W. Aulkos or Lokkos, with several tributaries. If Renou's statement that the Sebú (the *Subur magnificus et navigabilis* of Pliny) had a course not much inferior to that of the Seine be somewhat of an exaggeration, it may at least be compared to the Thames in length and width, though not in steadiness and depth of current. At Meshra'at al-Ksiri, about 70 miles from its mouth, it is about 10 feet deep in the month of May and more than 460 feet wide; and, though its banks are 21 feet high, extensive inundations occur from time to time. The tide ascends as far as Al-Kançara, 1½ miles above Ma'núra, and steam barges with a small draught of water could make their way to the ford just mentioned, and possibly even as far as Fez (Trotter). Affluents of the Sebú are W. Mikkes and W. Al-Redem (90 miles long).

The swift and muddy current of W. Beht usually loses itself in a swamp before it reaches the main stream. The impetuous Umm Rabí, with a rocky bed and many rapids, is perhaps as large as the Sebú; but as there are no important cities in the country through which it flows its course is not so well known. W. al-Abiad, W. al-Akdur, and W. Tessaut seem to be the principal affluents. This last is separated by about 10 miles only from the valley of the Tensift, the river which flows to the north of the city of Morocco; and, by the W. Neffis, the Asif al-Mil (Asif is Berber for "river"), the W. Usbi, and other smaller tributaries, receives the waters of about 180 miles of the Atlas range. The valley between the Atlas and the Anti-Atlas is traversed by the W. Sús, whose ever-flowing stream is sufficient to turn the whole district into a garden. The Mássá or W. al-Ghás (Wholgras of Davidson, Oued Ouel R'as of Delaporte), though its headwaters drain only one or two of the lesser valleys at the south-west end of the Anti-Atlas, is "about 50 yards from bank to bank at the mouth, with a depth at high water and in the proper channel of something over a fathom." Farther south is the Assaka or W. al-Akşá, long known to European geographers by the name of W. Nun; and finally the famous W. Der'a is reached, which in length of course exceeds all the rivers of Morocco, but, except in spring when the snows are melting in the highlands, remains throughout all its lower reaches a dry sandy channel, hardly noticed by the traveller in the surrounding desert. In the upper valleys, on the contrary, innumerable streams from the south side of the main chain of the Atlas, the W. Dades from the east, and the Asif Marghen, W. al-Molah, or Warzazet from the west, flow through populous and fertile valleys, and uniting to form the Der'a cut their way southward through a gorge in the Jebel Soghér, which, as the name implies, is a lower range running parallel to the Atlas proper. For the next 130 miles the noble stream holds south-south-east, drained at every step by the irrigation canals which turn this region into a green oasis, till at last its dwindling current bends westward to the sebkhá (salt marsh) of Debiaya. For a few weeks once a year the thaw-floods fill this shallow but extensive basin and rush onwards to the Atlantic; but in summer it dries up, and, like the bed of the river for some distance below, is covered with flourishing crops. From the south of the Atlas still farther east descend a number of other streams, the W. Zíz (with its tributaries the W. Todgha and W. Gheris), the W. Ghir, the W. Kenatsa, &c., which, after watering the oases of Medghara, Táfillet (Sijilmása), Kenatsa, &c., lose themselves in the sands of the Sahara.¹ Besides the lakes and lagoons of the coast district already mentioned, there are several others, such as the Daya Sidi Ali Mohammed, which Rohlfs passed near the summit of the Atlas, but they do not form a feature of the country. The eastern frontier runs across the great Western Shatt, and south from that point lies the extensive Sebkhá Tighri.

According to Dr Lenz, in his geological map of West Africa (1837), the stretch of country in the vicinity of Ceuta and Tetuan is Jurassic; modern Tertiary and Eocene rocks cover all the rest of the great northern promontory for some distance south of Wazan, and extend in an irregular belt from the neighbourhood of Fez south-west to the province of Abda; between these two areas there lies a district of Cretaceous formations which extends to the Atlantic, and skirts the whole African coast from Larash as far south as Cape Blanc (700 miles south of the Der'a); nearly all the rest of the north-western slope of the country is occupied by alluvium. The westward portion of the Atlas shows a belt of Cretaceous rocks, a broader Jurassic belt, and one still broader of Red Sandstone, porphyrites and porphyritic tuffs forming the backbone of the ridge. From Táridant eastward runs a strip of clay slates, possibly of Carboniferous origin, and from Anti-Atlas in the west and Figig in the

¹ See Castries on the "Oued Draá" in *Bull. de la Soc. de Géogr.*, 1880.

east Devonian rocks stretch for hundreds of miles into the Sahara. The plain around the city of Morocco has a sheet-like covering of tufaceous crust rising over hill and valley and following all the undulations of the ground, the result probably of the intense heat of the sun rapidly drawing up water charged with soluble carbonate of lime from the calcareous strata, and drying it layer by layer on the surface till an accumulation several feet thick has been produced (Maw). This crust is extensively burned for lime, and it forms a natural strong roof for the matamores or underground cellars which the Moors excavate in the soft strata beneath. An enormous deposit of boulders occurs in the lateral valleys and along the escarpment of the Atlas, and the opinion that these are the products of remote glacial action is supported by the existence of true moraines in the upper part of the glens. All along the west coast there are indications of an elevation of the land in the shape of raised beaches, at Tangiers 40, at the south of Cape Spartel 50, at Mogador 60 or 70 feet high; but a number of other facts seem to show that at present a process of subsidence is in progress.¹

That mineral deposits of great value exist in Morocco there is little doubt. At Jebel Hadid or the Iron Mountain, the heights to the north of Mogador, old scoriae are found. In the Beni Madan hills near Tetuan are mines, closed, it is said, by the sultan 'Abd al-Rahmán; but whether they furnished copper or lead authorities differ. On the road to Kenatsa, Rohlfs saw lead and antimony worked by the Beni Sithe. Antimony especially seems to be abundant to the south of the Atlas; Rohlfs found it in a very pure state near Tesna, and Dr Allen (whose account was not published when this article was written) inferred the writer that he saw splendid veins of it north of the Der'a. That gold mines existed in Sús was long suspected; Gatell proved it. Rock-salt occurs in the mountains north of Fez, in the valley of the W. Martil, and probably in Jebel Zahrún. In several places, as in the route from Saffi to Morocco, are brine lakes, from which the salt is collected and exported as far as Central Africa.

The general aspect of the lowlands of Morocco varies so much according to the season of the year that, while one stranger finds it arid and sunburnt and monotonous, another is delighted with the richness of its vegetation and the bright variety of its colours. In some of the Atlas valleys there is a wealth of timber, enormous conifers, 10 to 12 feet in girth of stem, oaks, &c.,² but the greater part of the country has been cleared of every vestige of woodland, and consequently depends for its appearance on herbage, brushwood, and the lesser fruit-trees. Cultivation is confined to such comparatively narrow limits that the natural flora has full scope for its development. Cowan, writing more immediately of the country between Morocco and Mogador, speaks of "drifts of asphodel, white lilies, blue convolvuli, white broom flowers, thyme and lavender, borage, marigold, purple thistles, colossal daisies and poppies;" and Captain Trotter tells how for miles the undulating plateau of Kasr Feráún was literally covered with wild flowers, whose varied colours, and the partiality with which each species confined itself to certain ground, gave to the landscape a brilliant and most unique appearance. Dark-blue, yellow, and red—iris, marigold, and poppy—occurred in patches an acre in size; farther on whole hills and valleys were of a delicate blue tint from convolvulus and borage. At times the traveller's tent is pitched on a carpet of mignouette, at times on a carpet of purple bogloss. In the country of the Beni Hasan squills are so abundant that the fibres of the bulbs are used instead of hair in making tent-cloth; and in the north of Kasr al-Kebir the moors are covered for miles with a beautiful white heather. From such gorgeous combinations of colour one can well imagine that the Moors drew the inspiration of their chromatic art; but the season of floral splendour is brief, and under the hot African sun everything soon sinks into the monotony of its stray.

The botany of Morocco has been explored by Balansa (1867), Hooker, Bail, and Maw (1871), Rein and Fritsch (1873), Ibrahim Ammerit (a Berber collector, 1873-6), the Rabbi Mardochée Abi Súr (1872-3); and the results have been systematically arranged in Cosson's *Compendium Floræ Atlantica: ou Flore des États barbaresques* (Paris, 1881, &c.). From the presence of a large proportion of plants of central and northern Europe (none of the northern plants, however, being of alpine or arctic type) and the absence of southern types characteristic of the sub-tropical zone Ball concludes that "the mountain flora of Morocco is a southern extension of the European temperate flora, with little or no admixture of extraneous elements, but so long isolated from the neighbouring regions that a considerable number of new specific types have been developed."³ Of the individual plants none are more remarkable than the *arár* and the *argan*. The former (*Callitris quadrivalvis*, *Thuja articulata* of Shaw) is a cypress-like tree that grows on the Atlas both in Morocco and Algeria. It furnishes gum sandarach;

¹ See Mourlon in *Bull. de l'Acad. Roy. de Belgique*, vol. xxx., 1870; Coquand, *Bull. de la Soc. Géol. de France*, vol. iv.; and especially Maw's paper appended to Hooker and Bail's Morocco.

² Rohlfs says larches, but there is strong reason to doubt this.

³ Compare Drude, "Floristische Erforschung Nord-Afrika's" in *Petermann's Mittheilungen*, 1882.

and its beautiful and enduring timber has been identified with the *alerce* with which the Cordova cathedral (mosque) was roofed, and with the citron-wood of the ancient Romans. The argan (*Argania Sideroxyloz*) is confined even in Morocco to a tract of country extending only about 150 miles along the coast, from the river Tensift almost to the river Sús, and about 30 miles in breadth; and it is found nowhere else in the world. A gnarled trunk and wide-spreading contorted thorny branches give it a striking appearance. Large specimens have a height of from 20 to 30 feet, and a girth of 25 or 26 feet. The fruit, which ripens between May and August, is an olive-looking nut, greedily eaten by camels, mules, goats, sheep, and horned cattle (but not by horses) for the sake of the fleshy pericarp, and crushed by the natives to extract the oil from the kernel. Though "its strong and fulsome savour" renders it nauseous to the European palate, this oil is largely used in the cookery of southern Morocco. The prickly pear forms one of the features of the landscape from the coast up to the slopes of the mountains. The cork tree, common in the time of Addison, has lost ground enormously, though it probably forms the staple of the Mámúra forest, which extends for some 20 miles between the Bú Rakrak and the Sebú. Though not so widespread as in Algeria or some districts of southern Europe, the palmetto is often locally very abundant. Citrons, lemons, limes (sweet and sour), shaddock, mulberries, walnuts, and chestnuts are common in many parts. Tetuan is famous for oranges, Meknes for quinces, Morocco for pomegranates, Fez for figs, Táfilet and Akka for dates, Sús for almonds, Dukalls for melons, Tagodast, Edantenan, and Rabát for grapes, and Táridant for olives (Cowan). The grape is extensively cultivated; the Jews manufacture crude but palatable wines. Sugar, once grown in Sús, to supply the demands of the whole of Morocco, has disappeared. Both hemp and tobacco are cultivated under the restrictions of an imperial monopoly,—the former (of prime quality) being largely used as hashish, the latter, though never smoked, as snuff. Barley is the most usual cereal; but excellent crops of wheat, maize, millet, rye, beans, pease, chick-peas, and canary seed are also obtained. Potatoes are coming into favour in certain districts.

It is still true, as in the time of Addison, that the Moors "seldom reap more than will bring the year about," and the failure of a single harvest causes inevitable dearth. Captain Colville calculates that not more than a hundredth part of the available land is cultivated at all; and the cultivated portion possessed by each tribe is divided into three parts, one only of which is sown each year. With a plough of the most primitive description the Moorish peasant scarcely scratches the surface of the soil; and his harrow is a few branches of trees weighted with heavy stones. The corn is cut close to the ear with short curved knives, and the straw left standing. Underground granaries or matamores (*matmúra*) are constructed, sometimes capable of holding 2000 quarters; they preserve their contents in good condition for many years.

There is abundant space in the country for wild animals, even of the larger kind; but the absence of woodland keeps them in check. Besides the lion, which exists only in very limited numbers, and, according to local proverbs, with diminished courage, the spotted leopard, the hyæna, jackal, lynx, fox, and wild bear are the most important. The *awad* or wild sheep is found in the more inaccessible parts of the Atlas. Rabbits swarm in the country to the north of the Bú Rakrak, and since 1870 they have crossed this, which used to be their southern limit. A kind of ground-squirrel, the *sibib*, occurs in the southern provinces. Monkeys of the same species as those of Gibraltar frequent the neighbourhood of Jebel Músá or Apes' Hill. The list of the ordinary wild birds includes blackbirds, goldfinches, linnets, greenfinches, robins, wagtails, skylarks, and crested larks, as well as turtle-doves, nightingales, and jays. The house-sparrow is not found; between Morocco and Mogador its place is taken by a beautiful bird (*Emberiza striolata*), locally called *tabib*, or "the doctor" (Leared). The stranger is struck by the immense variety and number of hawks, and still more by the familiar terms on which they build their nests in the walls and rocks along with blue rock-pigeons and starlings. All through the country the red-legged partridge is the main resource of the sportsman, though he may also bag other varieties of partridge, bustards, and ducks and other water-fowl. Along the coasts there is no lack of gulls, whimbrel, oyster-catchers, &c. Every town has its colony of storks. Lizards, chameleons, tortoises, and frogs are familiar objects; it is from Morocco that the small tortoises hawked about the streets of London are usually obtained. The profusion of insect-life is one of the plagues of the country in the eyes of the European; and even the Moor, who has got reconciled to his mosquitoes and fleas, considers the least one of his deadliest enemies.

The camel is the great beast of burden in Morocco, though asses and mules are also employed. The horse, never reduced to such base uses, is usually a sturdy little animal, but far below the ancient reputation of the Barbary steed. Roughly broken when young, his mouth is soon spoiled by barbarous bits, and his feet by square shoes. The finest animals are said to be bred in Shidma

and Abda. In form and size the mulcs are much superior, and they usually fetch two or three times the price. The horned cattle are not unlike Alderneys; and the sheep, for the improvement of which nothing is done, have spiral horns (not unfrequently four), rounded foreheads, and long fine wool. Domestic fowls are kept in great numbers; they are of the Spanish type, small and prolific.

The mackerel fishery off the coast at Casa Blanca and Tangiers attracts fishers from Spain, Portugal, and other parts of Europe. Occasionally a small shoal may be found as far south as Mogador. Soles, turbot, bream, bass, conger eel, and mullet are common along the coast, and a large fish called the *astimsah* (rough scaled and resembling a cod). Lobsters and crayfish swarm in the rocky places, but the natives have no proper method of catching them. The tunny, pilchard, and sardine, and a kind of shad known as the "Mogador herring," all prove at times of practical importance. "The catching of the *shebbel* or Barbary salmon, a species of shad, is a great industry on all the principal rivers of the coast, and vast numbers of the fish, which are often from 5 to 15 pounds in weight, are dried and salted." They ascend from the sea in spring. Barbels and a few other small fish swarm in the streams, but for the angler there is little real sport.¹

Of the population of Morocco only the vaguest estimate is possible. Bém and Wagner give 6,410,000—probably too high a number. Ethnographically it consists of three main elements—Berbers or Shilluh, Arabs, and Jews—with a large infusion of Negro blood, and a sprinkling of Negro individuals. A distinction is sometimes drawn between the country Arab and the city "Moor," as he is called *par excellence*; but the difference between them is one not so much of race (though the "Moor" has probably absorbed a greater variety of heterogeneous elements) as of method of life, and the superficial physical results of the same. The Berbers are the original occupants of the country (as may be proved by the ancient words preserved by classical writers), and they still form not only the most numerous but the most industrious and civilizable section of the people. While the Arab is still by preference a dweller in tents, the Berber for the most part builds himself houses of stone or clay. On the whole, the Arabs are predominant in the lowlands and the Berbers in the hilly districts and mountains.

Greatly corrupted, even in the time of Ibn Khaldún, the Arabic of Morocco has now, with the complete decay of literature, reached a state of extreme degradation. Of the Schilha dialects very little is known, but everything goes to prove their general philological agreement with the better-investigated representative of the Berber. The Jews are the great commercial class in the community. They are usually said to number about 150,000 to 200,000, but Rohlfs (*Petermann's Mitth.*, 1883) shows reason to suppose that they do not exceed 62,800. Having come largely from Spain, they still use among themselves a corrupt Spanish.²

That at one time Morocco was a much more populous country is evident from the description of Leo Africanus, though even in his time the number of mined or decaying towns was very great. Besides Tangiers, Larash, Sallee, and the other places on the coast already described, there are only a few large cities in the country. Four of these—FEZ (*q. v.*), Meknes or MEQUINEZ (*q. v.*), Wazan, and Teza—are in the basin of the Sebti. On the Zarrún range, north of Meknes, lies the town of Muley Edris or Zarrún, which no Christian is allowed to enter, though in 1801 Jackson did manage to pay a hurried visit. According to Captain Trotter, who got within three-quarters of a mile, it is a place of apparently 1500 to 2000 inhabitants, compact, and with several large buildings. Wazan (Rohlfs's Wesan) is *par excellence* a sacred city, being the seat of a shérif, whose influence is even more widely acknowledged than that of the sultan. It was probably raised from a mere village by Muley 'Abd Alláh al-Sherif (*ib.* 1675). At present it is one of the cleanest and best-kept places in the empire. Teza (Tázá) is a considerable trading centre on the route between Fez and the Algerian frontier. Leo, Ali Bey, and Rohlfs agree in describing it as a place of great beauty, embowered in orchards, and the houses give evidence of wealth. The population, in Leo's time 20,000, is now 5000, of whom 800 are Jews. About 120 miles east of Teza, and only 10 from the frontier, is Wajda (Ouchda of the French), clean and neat, in the midst of an orange grove. The only other inland town of importance is Kasr al-Kebir (see ALOAZAR KEBIR), the Oppidum Novum of the Romans, which, except on market-days, wears a look of great decay. In all the country between the basin of the Sebti and the Tensift, a distance of upwards of 200 miles, there is nothing that a European would consider a town; and Morocco itself is the only really large city of south Morocco. Táruđant, the capital of Sus, lies between the Atlas and the river; it is a place of from 30,000 to 40,000 inhabitants, has recently been garrisoned and refortified by the sultan, and may be considered the frontier city of his empire. Iliĥ (Ili,

Ilec, &c.), 100 miles south-south-east on a stream which joins the Mússa, is the chief town of Tazerwalt or the state of Sidi Hishar: an independent principality founded by Sidi Ahmed u Musa, and Auguilim (Guleim or Glimin), in like manner, is the chief town of the state of 'Abd Allah u Salem, or, as it is usually called by Europeans, Wad Nun. Tagawost (Tagawst of Ibn Khaldún; about 40 miles inland from Ifri, was formerly a large city, and in the 16th century the seat of a Spanish factory trading in archil. Throughout Morocco the nomenclature of ordinary maps gives a very misleading idea of the number of inhabited sites. Most of the seeming villages are either market-places, completely deserted except on market-days, or the tombs of saints, with possibly not a house in the vicinity, or stations for caravans, with a small company of soldiers. The markets are named after the days of the week, as Sūk al Thaláthá. Tuesday market; the kubbas or saints' tombs are distinguished as Sidi (my master) so and so; and the stations are marked Nzela, or some such corruption as Inzella.

The prehistoric antiquities of Morocco are of considerable interest. In a cave at Cape Spatel M. Tissot found regularly shaped arrow-heads, and in his travels through the north of the country he met with dolmens, barrows, and cromlechs, just as in Algeria or Tunis. The dolmens usually form a trapezium, and the dead body seems to have been buried with the knees drawn up to the chir. At Mzorah (Mazorah), a quaint little village of widely-scattered houses built of rough blocks of yellow soft sandstone, about 8 or 10 miles south-east from Azila, stands a group of megalithic monuments of extraordinary extent. They have been visited and described by Sir Arthur de Capell Brooke (1830), Davidson (1835), Farley (1860), Tissot, Watson, Trotter, &c. Watson's account is the most detailed. Round the base of a mound (15 feet high) of yellow sandstone lies a circle of sixty-seven large stones, one of which (at the west side) is more than 20 feet high. In the vicinity are several other groups, some of still larger blocks. Roman roads seem to have run from Tangiers southwards to the neighbourhood of Meknes, and from Azila to the south of Rabát; and Roman sites are in several instances marked by considerable remains of masonry. At Kasr Fará'ún (Pharaoh's castle), on the western slope of J. Zarrún, are the ruins of Volubilis. The *enceinte*, constructed of large stones and flanked by round towers, is 12,000 feet in extent. Four gates are still recognizable, and a triumphal arch erected in 216 A. D. in honour of Caracalla and Julia Donna. The stones of this site have been used for Meknes. Banasa (Colonia Ælia, originally Valentia) is identified with the ruins of Sidi Ali Bú Jenun, and Thamusiada with those of Sidi Ali b. Hamed. At Tchémish, up the river from Larash, the city of Lixus (Triax of Strabo) has left splendid specimens of Punic and Roman stonework, and the similar remains on the headland of Múliá Bú Selhau probably belong to the Mudelacha of Polybius. Of early Moorish architecture good examples are comparatively few, and badly preserved. Besides those in Fez, Meknes, and Morocco, it is sufficient to mention the mausoleum of the Beni-Merín (13th to 16th centuries) at Shella, which, with the adjoining mosque, is roofless and ruined, but possesses a number of valuable inscriptions (see *Athenæum*, 1875).

The present state of Morocco is deplorable. The government is an Oriental despotism under an independent quasi-hereditary sultan; there are no administrative functionaries with definite responsibility and regular salary; the distribution of justice is utterly arbitrary, and the punishments often barbarous in the extreme; education, in the European sense of the word, there is none; foreign commerce is hampered by vexatious prohibitions and restrictions, in internal trade by the almost complete absence of roads and bridges, and by the generally lawless state of the country (the very peasant has his gun beside him as he ploughs); the only substitute for a postal system is a class of running couriers; and even the army (in which the sultan does take an interest) is only just beginning to show signs of discipline and effectiveness under the supervision of Káid M'Clean and other foreign officers. The last remnants of the once powerful Moorish fleet are rotting beyond recognition in the harbour of Larash. With good government and freedom of trade the country might soon be restored to a high state of prosperity: its climate, soil, products, and the qualities of its predominant population are full of promise; and the evident decrease of hostility towards the Christian, which may be observed since the beginning of the century, and especially within recent years, gives hope that European influence, apart from European conquest, may before long remove from Morocco the reproach of being "the China of the West," the most backward and barbarous of civilized nations.

History.—Morocco corresponds to the Roman Mauretania Tingitana (see MAURETANIA). Conquered by the Vandals (429 A. D.), Mauretania was recovered to the Eastern Empire by Belisarius. The Arabs first penetrated into the country under 'Okba (*supra*, p. 567), but the Berbers opposed an obstinate resistance to Islam, and their conversion and subjection to the caliphate was only completed in the reign of Walid by Músá b. Nusair, the conqueror of Spain (*supra*, p. 573). The dominion of the caliphs was of short duration; the Abbásids had very little hold of the Berber countries, and in the 9th century, while the Aghlabites were practically independent at Kairawán, the regions west of the salt marsh of Sobkha

¹ A scientific list of some thirty or forty fishes from Morocco will be found in *Ber. Senck. Ges.*, 1874; an account of angling experiences in Payton, *Mosses from a Rolling Stone*.

² The evidence for the existence of a tribe of warlike Jews in the interior seems on the whole to the positive side.

al-Hodna were autonomous under a number of indigenous or foreign princes. The chief of these principalities were that of the Idrisites at Fez (*supra*, p. 561), the kingdom of Tahart, and that of Nákúr. In the first years of the 10th century the Fátimite caliphs, at the head of the powerful Berber tribe of Ketáma, overthrew the Aghlabites, thus putting an end for ever to Arab rule in North Africa, and rapidly extended their empire to the Atlantic. When the Fátimites established themselves in Egypt, the Zirid dynasty reigned as their vassals in the west, and maintained themselves with varying fortunes till the rise of the great empire of the ALMORAVIDES (*q.v.*), who yielded in turn to the ALMOHADES (*q.v.*). The latter dynasty was extinguished by the princes of the Beni-Merín, whose chief, Ya'kúb b. 'Abd al-Hakk, captured Morocco in 1269 A.D. The subsequent history of Morocco and Fez under the Merínids and their successors presents little interest, being as full of internecine wars, contested successions, fratricides, general bloodshed, and barbarities as it is empty of all indications of an advance in civilization. As regards the relations of the country to European nations, four periods may be distinguished—(1) a period lasting down to the close of the 14th century, when the Moorish potentates were still the most prominent representatives of aggressive Mohammedanism; (2) a period during which the Portuguese and Spaniards, having expelled their invaders, made vigorous reprisals and obtained possession of many towns on the coast of Morocco; (3) a period in which these nations, disheartened by the disastrous defeat in the Battle of the Three Kings (1579), allowed the Moors to recover much of the ground they had lost, and to become, by their prairies and defiance of international law, an object of not of terror yet of apprehension and irritation; and (4) a period in which the prestige of this afterglow of greatness has gradually died out.

The following are the more noteworthy events in the Moorish annals since the beginning of the 15th century.

1415. Ceuta captured by the Portuguese. 1436. First expedition against Tangiers by Don Duarte; capture of Don Fernando, who died in exile in 1459 (it was proposed to ransom him by cession of Ceuta, but the pope objected). 1459. Capture of Alcazar Seguir. 1471. Capture of Tangiers. 1510-1540. Rise of the dynasty of the Sherifs. 1577. Edmond Hogan sent by Queen Elizabeth of England to Muley 'Abd al-Melek (see Report in Hakluyt). 1578. Defeat of King Sebastian (see Leared, *Visit to Court of Morocco*, appendix). 1585. Founding of the Company of Barbary Merchants (earls of Warwick, Leicester, &c.) in London; Elizabeth's second ambassador Henry Roberts well received. 1610. The Moors from Spain settle partly at Rabát, &c., and prove troublesome. 1649. Muley Zidan sends to King Charles I. requesting him to attack Sallee by sea. About this time Ali Sherif of Yanbo, near Medina, is recognized as ruler of Táfilet, and gradually of the rest of the empire except the city of Morocco; with him commences the dynasty of the Alides; on his death his sons, Mohammed and Arshid, dispute the succession. 1662. Tangiers (Portuguese since 1471) becomes an English possession as part of the dowry of Catherine of Braganza. 1664-1672. Reign of Arshid, a warlike, active, and cruel prince, who was the first to take the title of sultan. 1672-1727. Reign of Ishmael, who in ability and ferocity completely outdid his brother Arshid, and supported his throne by an enormous army of slaves from the Súdán. 1678. Great plague; ambassadors sent to Louis XIV. to ask the hand of Mademoiselle Blois, the king's natural daughter. 1682. The sultan sends two lions to the king of England. 1684. Sir Clondesley Shovel defends British interests on the coast; withdrawal of the English from Tangiers. 1687. Capture of Larash from the Spaniards. 1694. Siege of Ceuta. 1725. Thomas Betton, who had been a slave in Morocco, left £13,000, the half of his fortune, for the ransom of British captives in that country. 1727-1730. Disputed succession. 1757-1789. Reign of Mohammed. 1778. Locusts. 1780. Great famine; Agadir opened to the Dutch. 1794-1822. Reign of Soliman; abolition of Christian slavery in Morocco; suppression of piracy. 1822-1859. Reign of Abd er Rahman; rupture with Spain on account of the decapitation of Consul Darmon for the wounding of a Moor. 1844. Defeat of forces sent to assist 'Abd al-Kader in Algiers; bombardment of Tangiers and Mogador by the prince de Joinville; rout of the Moorish forces in the battle of Isly; and peace of Tangiers. 1845. Naval demonstration at Tangiers and ratification of treaty; surrender to Spain of disputed territory at Ceuta. 1853. Establishment of a customs line and regular military posts along the Algerian frontier. 1856. English commercial treaty by which no duty shall exceed 10 per cent. of the value of the wares. 1859-1873. Reign of Mohammed; Spanish invasion. 1860. Decisive battle between General O'Donnell and the Moors near Tetuan (March). By the treaty of Tetuan Morocco was to pay 20,000,000 piastres to Spain, to surrender territory at Santa Cruz de Mar Pequeña for a commercial establishment, and to allow the Spanish missionaries to have a house at Fez like that which they had at Tangiers. Money not being obtainable to pay the indemnity, the Spaniards obtained control of the customs for a term of years. 1864. Decree permitting Europeans to trade in any part of the empire. 1873. Accession of Hasan. 1880. English embassy for improvement of commercial relations; conference at

Madrid to define the rights of European representatives in regard to the protection afforded by them to subjects of the sultan; number of *protégés* limited to three. 1882. Expedition to subdue Sid llosein of Igh. 1883. Protest of the English Government against the slave trade in Morocco.

Lists of works in regard to Morocco will be found in Renou, *Descript. géogr. de l'emp. de Maroc*, Paris, 1846, forming part of *L'explor. scient. de l'Algérie*; in *Bull. de la Soc. géogr. de Madrid*, 1871, 1878; and in *Revista Contemporánea*, Madrid, 1881. Besides Renou's *Description*—a masterly criticism of all previous geographical material—the following may be mentioned: Ibn Khaldun, *Hist. des Berbères* (tr. by Baron de Blanc); Leo Africanus, *Descript. Africae*; Diego da Torres, *Origen y successo de los Xarifes*. . . de Marruecos, &c., 1585; Marmol, *Descr. de l'Afrique*, 1667; Faria y Sousa, *Africa Portuguesa*, Lisbon, 1661; Addison, *Account of West Barbary*, 1671 (Pinkerton's Coll., xv.); Chenier, *Rech. hist. sur les Maures*, 1787; Jackson, *Account of the Emp. of Morocco*, 1809, and *Timbuctoo and Housa*, 1820; Drummond Hay, *Western Barbary*, 1844; John Davidson, *Notes taken during Travels in Africa*, 1839; De Aguirre, *Expedicion al Rif*, 1853; Mrs. E. Murray, *Sixteen Years in Morocco*, Spain, &c., 1859; Richardson, *Trav. in Morocco*, 1860; Maltzan, *Drei Jahren im Nordwesten von Afrika*, 1868 (4 vols.); Rohlf's, *Reise durch Marokko*, Bremen, 1868; Fritsch in "Mittheil. d. Vereins für Erdk.", Halle, 1878; Leared, *Morocco and the Moors*, 1875, and *Visit to the Court of Morocco*, 1879; De Amici's *Morocco*, Milan, 1878—a very graphic sketch, which has been deservedly translated into English, French, German, &c.; Tissot, *Rech. sur la géogr. comparée de la Maurétanie Tingitane*, 1877; Castellanos, *Descr. hist. de Marruecos*, Santiago, 1878; Hooker and Ball, *Morocco and the Great Atlas*, 1878; Gatell, *Viajes por Marruecos*, 1879; Payton, *Mosses from a Rolling Stone*, 1879; Llana y Rodríguez, *El imp. de Marruecos*, 1880; Watson, *A Visit to Wazan*, 1880; Trotter, *Mission to the Court of Morocco*, 1881; Cowan and Johnstone, *Moorish Lotus Leaves*, 1882.

MOROCCO, or MAROCCO (Marrákush), one of the quasi-capitals of the sultanate (Fez and Meknes being the other two), lies in a spacious plain about 15 miles from the northern underfalls of the Atlas, and 90 miles east-south-east of Šaffi, at a height variously estimated as 1639 feet (Hooker and Ball), 1410 (Beaumur), and 1500 (Leared). Ranking during the early centuries of its existence as one of the greatest and most flourishing cities of Islam, Morocco has long been in a state of grievous decay; and were it not for the exceptional beauty of its situation, the luxuriant groves and gardens by which it is encompassed and interspersed, and the magnificent outlook which it enjoys towards the mountains, it would be altogether a very miserable place. The wall, 25 or 30 feet high, and relieved by square towers at intervals of 360 feet, is so dilapidated that foot-passengers, and in places even horsemen, can find their way in and out through the breaches. Open spaces of great extent are numerous enough within the walls, but for the most part they are defaced by mounds of rubbish and putrid refuse. With the exception of the tower of the Kutubia Mosque and a certain archway which was brought in pieces from Spain, there is not, it is asserted, a single stone building in the city; and even bricks (though the local manufacture is of excellent quality) are sparingly employed. *Tábiya*, or pounded clay, is the almost universal material, and the houses are consequently seldom raised more than two stories in height. The palace of the sultan covers an extensive area, and has its parks and gardens enclosed by walls similar to those of the city proper, but is architecturally quite insignificant. In the whole of Morocco the tower of the Kutubia alone is a worthy memorial of the constructive genius of the early Moors; both it and the similar tower of Hasan at Rabát are after the type of the Giralda at Seville, and, if tradition may be trusted, all three were designed by the same architect Jábir. The mosque to which the tower belongs is a large brick building erected by 'Abd al-Mumen; the interior is adorned with marble pillars, and the whole of the crypt is occupied by a vast cistern excavated by Mansúr. Other mosques of some note are those of Ibn Yúsof, Al-Mansúr, and Al-Mo'izz; the chapel of Sidi Bel Abbas, in the extreme north of the city, possesses property to the value of £200,000, and serves as a great almshouse and asylum. As in most other towns throughout Morocco, there is a special Jews' quarter walled off from the rest. The general population is of a very mixed and turbulent kind; crimes of violence are extremely common, and there are countless varieties of the professional thief. Almost the only manufacture extensively prosecuted is that of Morocco leather, mainly red and yellow, about 1500 men being employed as tanners and shoemakers. The city was founded in 1062 by Yúsof b.

Tasheffn. Before it was more than a hundred years old it is said to have had 700,000 inhabitants, but at present the total number probably does not exceed 50,000 or 60,000.

See Leo Africanus; Lambert's detailed description in *Bul. de la Soc. de géogr.*, Paris, 1865; and Dr Leared's *risfamento* of Lambert. Lambert's plan of Morocco is reproduced with some additions by Dr Leared; and another may be found in Gatell. (H. A. W.)

MORON, or MORON DE LA FRONTERA, a town of Spain, in the province of Seville, about 32 miles to the south-east of that city, occupies an irregular site upon broken chalk hillocks at a distance of a mile and a half from the right bank of the Guadaira. It is connected by rail with Utrera on the Cadiz and Seville line. On the highest elevation to the eastward are the ruins of the ancient castle, of considerable importance during the Moorish period, and afterwards used as a palace by the counts of Ureña. In 1810-11 it was fortified by the French, but blown up by them in the following year. The chief public building of Moron is the large parish church, which dates from the 16th century, but presents no noteworthy features. The fine district between Moron and the Serrania de Rozda is largely occupied by olive plantations, and the trade in oil and other agricultural produce forms the chief industry of the town. Moron is also famous throughout Spain for its chalk (cal de Moron), from which the white-wash extensively used in the Peninsula is derived. The population of the town was 14,879 in 1878.

MORONI, GIAMBATTISTA (c. 1510-1578), an eminent portrait-painter of the Venetian school, was born at Albino near Bergamo about 1510, and became a pupil of Bonvicino named Il Moretto. Beyond the record of his works very few particulars regarding him have reached us. Titian, under whom also Moroni, while still very young, is said to have studied (but this appears hardly probable), had at any rate a high opinion of his powers; he said that Moroni made his portraits "living" or "actual" (*veri*). And if the magnates of Bergamo came to the great Venetian for their likenesses he advised them to go to their own countryman. In truthful and animated portraiture Moroni ranks near Titian himself. His portraits do not indeed attain to a majestic monumental character; but they are full of straightforward life and individuality, with genuine unforced choice of attitude, and excellent texture and arrangement of draperies. There is a certain tendency to a violet tint in the flesh, and the drawing and action of the hands are not first-rate. As leading samples of his portraits may be mentioned—in the Uffizi Gallery, Florence, the Nobleman pointing to a Flame, inscribed "Et quid volo nisi ut ardëat?"; in the National Gallery, London, the portraits of a Tailor, a member of the Fenaroli family, Caon Ludovico de' Terzi, and others; in the Berlin Gallery, his own portrait; and in Stafford House, the seated half-figure of the Jesuit Ercole Tasso, currently termed "Titian's Schoolmaster"—not as indicating any real connexion between the sitter and Titian, but only the consummate excellence of the work. Besides his portraits, Moroni painted, from youth to his latest days, the ordinary round of sacred compositions; but in these he falls below his master Il Moretto, and his design, which partakes more of the Lombard or Milanese style than of the Venetian, has at times some of the dryness of the quattrocento. One of the best is the Coronation of the Virgin in S. Alessandro della Croce, Bergamo; also in the Cathedral of Verona, Sts Peter and Paul, and in the Brera of Milan, the Assumption of the Virgin. Moroni was engaged upon a Last Judgment in the church of Corlago when he died on 5th February 1578.

MOROSINI, the name of a noble Venetian family. According to the best authorities, Cappellari and Barbaro, there would seem to have been two families of that

name, distinguishing themselves by the variation of the shield. The one came from Mantua at the time of Attila's invasion, and bore or, a fess azure. The other came from Illyria in the 7th century; they bore or, a bend azure. However that may be, nothing authentic is known of the Morosini till we find them settled as one family in Venice during the 8th century. The Morosini belong to the Casa Vecchie, or twenty-four families of Venetian nobility who were descended from the tribunes of the confederate islands before Venice became united in one centre at Rialto. The 10th century was a period of danger for the family. They became involved in a blood feud with another noble house, the Caleprini, who were Ghibelline in politics, and relied upon the emperor Otto for support. The Morosini, however, proved the stronger, thanks to their popularity; and the year 991 saw them victorious through the deposition of the doge Memo, who had favoured their enemies. The Morosini engaged in commerce with the East, and in the 14th century two brothers of the family, Alban and Marco, founded a house at Aleppo with branches in Damascus, Beyrût, and elsewhere in Syria. The wealth and importance of the family may be gathered from the fact that in 1379 no less than fifty-nine Morosini subscribed towards the fund for carrying on the war of Chioggia. The house of Morosini gave four doges to Venice, and numbered among its honours two royal marriages, two cardinals, twenty-four procurators of St Mark, besides numerous generals of the republic. The Morosini continued to flourish till the opening of the last century, when the family began to decline; it is now represented by one surviving member.

Among the more distinguished members of the house must be mentioned:—Giovanni, who in 982 founded the monastic establishment on S. Giorgio Maggiore after the order of St Benedict; Domenico, doge 1148-1156—in the third year of his reign Pola and Istria, which had rebelled, were reconquered; Marino, doge 1249-1252, during whose reign the Inquisition, in a modified form and under the surveillance of Venetian officers, was introduced into Venice for the first time. In this same century (1290) Tommasina Morosini, the sister of Albertino il Grande, married Stephen, prince of Hungary. Their son Andrew succeeded to the throne, and was directed in his government by his uncle Albertino, on whom he conferred the dukedom of Slavonia and the county of Morlacchia. A cousin of Tommasina, Costanza, married Ladislaus, king of Servia. In 1382 Michele Morosini was elected doge. He had acquired a large fortune and a reputation for astuteness by buying Venetian property while the Genoese were still in Chioggia; and much was expected of him in the restoration of his country's finance when that war came to an end. But he died the year of his election. Andrea Morosini the historian was born in 1558. He studied at Padua, and on coming of age embarked on public life. He passed through the various offices of state, till in 1618 he was a candidate for the dogeship, but failed to secure it, and died the same year. On the death of the official historian Paolo Paruta, in 1598, Andrea was commissioned by the Council of Ten to continue his work, and received authority to consult the state papers down to 1594. He wrote his history in Latin. It covers from 1521 to 1615, and was first published in Venice, 1623.

Andrea's other works, of which only the first has been edited, are:—(1) *L'impresa ed espeditiõni di Terra Santa e l'acquisto fatto dell' Imperio di Costantinopoli dalla Serenissima Republica di Venetia*, Venice, 1627; (2) *De ius que Veneta Respublica ad Istriæ oras gessit adversus Othonom Federici Imperatoris filium*, in the Corner-Duodo collection of MSS.; (3) *De fortuna reipublicæ Venetæ*, in the National Library, Paris; (4) *Raccolta delle Leggi del Cons. X.*, in the Archivio Generale at the Frari, Venice; (5) *De rebus gestis ac nece*

Francisci Carmaniole, in the Corner-Duodo collection. The life of Andrea has been written by Luigi Lollin, bishop of Belluno (1623), by Niccolo Crasso (1621), and by Antonio Palazzoli (1620).

The most distinguished member of the house of Morosini was Francesco, the captain-general of the republic against the Turks and conqueror of the Morea. He was born in 1618. In 1666 he was in command during an unfortunate campaign in Candia. In 1687 he conquered Patras, and so opened the Morea to the Venetian arms. In the following year he was elected doge. After his return to Venice the republic suffered severely in Candia, and though now an old man Francesco took the field again in 1693, but died the next year at Nauplia, seventy-six years of age. A more detailed account of his exploits will be found in the article VENICE.

Authorities.—Barbaro, *Genealogia delle Famiglie Patrizie Venete*, MS., clas. vii. cod. dcccxxvii., in the Marcian Library, Venice; Cappellari, *Campidoglio Veneto*, MS., clas. vii. cod. xvii., in the same library; Romanin, *Storia documentata di Venezia*; Freschot, *La Nobiltà Veneta*; Cicogna, *Iscrizione Veneziane*.

MORPETH, a municipal and parliamentary borough of Northumberland, England, is situated in a fine valley on the Wansbeck, and on the North-Eastern Railway, 50 miles south of Berwick and 16 north of Newcastle. The Wansbeck, which is crossed by a stone and two wooden bridges, winds round the town on the west, south, and east, and a small rivulet, the Cottingburn, bounds it on the north. Morpeth is irregularly built, but possesses a number of good shops. The parish church of the Blessed Virgin, a plain building of the 14th century, is situated on Kirk Hill, a short distance from the town. Among the other public buildings are the Edward VI.'s grammar school, reopened

in 1857 after a Chancery suit lasting 150 years; the town-hall, erected in 1870 to supersede a building of 1714 by Vanbrugh; and the county-hall and former gaol, in the baronial style, built in 1814. Nothing remains of the old castle except the gateway. Morpeth had at one time one of the largest cattle-markets in England. The industries of the town include tanning, brewing, malting, iron and brass founding, and the manufacture of flannels, agricultural implements, and bricks and tiles. The population of the municipal borough (231 acres) in 1871 was 4517, and in 1881 it was 4556. The population of the parliamentary borough (17,085 acres) in the same years was 30,239 and 33,459.

Morpeth (*Morepath*, i.e., the path over the moor) had attained some size before the Norman Conquest, when it was granted to William de Merlay. From the De Merlays it passed through the Greystocks and Dacres to the Howards, earls of Carlisle. Soon after the Conquest it obtained the privilege of a market, and in 1552 arms were granted to it by Edward VI. It is a borough by prescription, and was incorporated by Charles II. By the Municipal Act of 1835 the government was placed in a mayor and burgesses, but there is a local board of health distinct from the corporation, having control over an area slightly larger than that of the municipal borough. From 1653 the borough sent two members to parliament, but since 1832 only one member has been returned, and in 1868 the area of the borough was increased.

MORPHEUS is a personification, apparently invented by Ovid (*Metam.*, xi. 635), of the power that calls up shapes before the fancy of a dreamer. The name (from *μορφή*) expresses this function; Ovid translates it *artifex simulatorque figuræ*. Morpheus is naturally represented as the son of Sleep (Somnus).

MORPHIA. See OPIUM.

MORPHOLOGY

THE term Morphology (*μορφή*, *form*), introduced by Goethe to denote the study of the unity of type in organic form (for which the Linnean term METAMORPHOSIS (*q.v.*) had formerly been employed), now usually covers the entire science of organic form, and will be employed in this more comprehensive sense in the present article.

§ 1. *Historical Outline.*—If we disregard such vague likenesses as those expressed in the popular classifications of plants by size into herbs, shrubs, and trees, or of terrestrial animals by habit into beasts and creeping things, the history of morphology commences with Aristotle. Founder of comparative anatomy and taxonomy, he established eight great divisions (to which are appended certain minor groups)—*Viviparous Quadrupeds*, *Birds*, *Oviparous Quadrupeds* and *Apoda*, *Fishes*, *Malakia*, *Malacostraca*, *Entoma*, and *Ostracodermata*—distinguishing the first four groups as *Enaima* ("with blood") from the remaining four as *Anaima* ("bloodless"). In these two divisions we recognize the Vertebrata and Invertebrata of Lamarck, while the eight groups are identical with the Mammals, Birds, Reptiles, Fishes, the Cephalopods, Crustaceans, other Articulates, and Testaceans of recent zoology. Far, too, from committing the mistake often attributed to him of reckoning Bats as Birds, or Cetaceans as Fishes, he discerned the true affinities of both, and erected the latter into a special *éveus* beside the Viviparous Quadrupeds, far more on account of their absence of limbs than of their aquatic habit. Not only is his method inductive, and, as in modern systems, his groups natural, i.e., founded on the aggregate of known characters, but he foreshadows such generalizations as those of the correlation of organs, and of the progress of development from a general to a special form, long afterwards established by Cuvier and Von Baer, respectively. In the correspondence he suggests

between the scales of Fishes and the feathers of Birds, or in that hinted at between the fins of Fishes and the limbs of Quadrupeds, the idea of homology too is nascent; and from the compilation of his disciple Nicolaus of Damascus, who regards leaves as imperfectly-developed fruits, he seems almost to have anticipated the idea of the metamorphosis of plants. In short, we find a knowledge of structural facts and a comparative freedom from the errors induced by physiological resemblance, of which his successors such as Theophrastus and Pliny, generally mere classifiers by habit, show little trace, and which the moderns have but slowly regained. Little indeed can be recorded until the 13th century, when the reappearance of Aristotle's works gave a new impulse to the study of organic nature. Of the works of this period that of Albertus Magnus is far the most important; but they are all no more than revivals of Aristotle, marking the reappearance of scientific method and the reawakening of interest in and sympathy with nature. Meanwhile leech and apothecary, alchemist and witch, were accumulating considerable knowledge of plants, which, after the invention of printing, became collected and extended in the descriptive and well-illustrated folios of Gesner and his successors, Fuchs, Lobel, and others, as well as by the establishment of botanic gardens and scientific academies, while, as Sachs expresses it, "in the sharpest contrast to the naive empiricism of the German fathers of botany came their Italian contemporary Cæsalpinus, as the thinker of the vegetable world." Both made systematic efforts,—the Germans vaguely seeking for natural affinities in mere similarities of habit, the Italian with no inconsiderable success striving towards an intellectual basis of classification. Monographs on groups of plants and animals frequently appeared, those of Belon on Birds and Rondelet on Fishes being among the earliest; and in the former of these (1555) we find a comparison of the

skeletons of Bird and Man in the same posture and as nearly as possible bone for bone,—an idea which, despite the contemporaneous renaissance of human anatomy initiated by Vesalius, disappeared for centuries, unappreciated save by the surgeon Ambroise Paré. Palissy, like Leonardo before him, discerned the true nature of fossils; and such flashes of morphological insight continued to appear from time to time during the 17th century. Thus, Joachim Jung recognized “the distinction between root and stem, the difference between leaves and foliaceous branches, the transition from the ordinary leaves to the *folia floris*,” and Harvey anticipated the generalizations of modern embryology by his researches on development and his theory of epigenesis.

The encyclopædic period of which Gesner is the highest representative was continued by Aldrovandi, Jonston, and others in the 17th century, but, aided powerfully by the Baconian movement, then profoundly influencing all scientific minds, it developed rapidly into one of genuinely systematic aim. At this stage of progress by far the most important part was taken by John Ray, whose classificatory labours both among plants and animals were crowned with marvellous success. He first definitely expelled the fabulous monsters and prodigies of which the encyclopædists had faithfully handed on the tradition from mediæval times, and, like his predecessor Morison, classifying in a truly modern spirit by anatomical characters, he succeeded, particularly among plants, in distinguishing many natural groups, for which his very terms sometimes survive, e.g., Dicotyledons and Monocotyledons, Umbelliferæ and Leguminosæ. The true precursor of Linnæus, he introduced the idea of *species* in natural history, afterwards to become so rigid, and reformed the practice of definition and terminology. Of the many works which followed up Ray's systematic and monographic labours, though often, like those of Tournefort and Rivinus, Réaumur and Klein, of great importance, none can be even named until we come to those of his great successor Linnæus, whose extraordinary grasp of logical method and unparalleled lucidity of thought and expression enabled him to reform and reorganize the whole labours of his predecessors into a compact and definite “*systema naturæ*.” The very genius of order, he established modern taxonomy (see BIOLOGY), not only by the introduction of the binomial nomenclature and the renovation of descriptive terminology and method, but by the subordination of the species—henceforth clearly defined—under the successive higher categories of genus, order, and class, so finally reconciling the analytic and synthetic tendencies of his predecessors. Although the classification of plants by the number of their essential organs (which vastly advanced not only the cultivation of botany but the knowledge of the flora of the globe, and by which he is popularly remembered) is highly artificial, it must be remembered that this artificiality is after all only a question of degree, and that he not only distinctly recognized its provisional character but collected and extended those fragments of the natural system with which Jussieu soon afterwards commenced to build. His classification of animals, too, was largely natural, and, though on the whole he unfortunately lent his authority to maintain “that disastrous philosophic and scientific aberration” inherited from the alchemists through the last encyclopædist of Gesner's school—the notion of three kingdoms of nature—he at least at one time discerned the fundamental unity of animals and vegetables, and united them in opposition to the non-living world as *Organisata*. At the same time he was still far more a scholastic naturalist than a modern investigator, and his works represent little more than the full completion of the ancient era, and in the hands of fanatical followers served often to retard the commencement of the

modern one. So, too, his excessive systematic and descriptive precision, united as it was with comparative inattention to other than superficial characters, established a tendency, even yet not extinct, to rest contented with mere method and nomenclature instead of aiming at complete morphological knowledge.

While the artificial system was at the zenith of its fame and usefulness, Bernard de Jussieu was arranging his garden on the lines afforded by the fragmentary natural system of Linnæus. His ideas were elaborated by his nephew and successor Antoine de Jussieu, who for the first time published diagnoses of the natural orders, so giving the system its modern character. Its subsequent elaboration and definite establishment are due mainly to the labours of Pyrame de Candolle and Robert Brown. The former concentrated his own long life and that of his son upon a new “*systema naturæ*,” the colossal *Prodromus systematis naturalis* (20 vols., 1818-1873), in which 80,000 species were described and arranged. Meanwhile the penetrative genius of Brown enabled him to unravel such structural complexities as those of Conifers and Cycads, Orchids and Proteaceæ, thus demonstrating the possibility of ascertaining the systematic position of even the most highly modified floral types. Both Candolle and Brown were thus no mere systematists, but genuine morphologists of the modern school. The former, as we shall afterwards see, established the theory of floral symmetry on grounds of pure comparative anatomy, and distinguished with greater success than hitherto between fundamental unity of structural type and mere superficial similarity of physiological adaptation. The latter (Humboldt's “*facile princeps botanicorum*”), using the same ideas with even keener insight, made many memorable anatomical researches, such as those on the structure of the ovule and the seed, and indeed by his demonstration of the affinities of the gymnosperms almost anticipated the discoveries of Hofmeister, who stands pre-eminent among his modern successors on account of his elucidation of the secret of phanerogamic reproduction.

The labours of Bernard and Antoine de Jussieu initiated too a vast parallel advance in zoology, the joint memoir on the classification of mammals with which Cuvier and Geoffroy St-Hilaire almost commenced their career receiving its dominant impulse from the “genera” of Antoine. Cuvier's works correspond in zoology to those of the whole period from the Jussieus to Brown, and epitomize the results of that line of advance. Although in some respects preceded by Haller and Hunter, who compared, though mainly with physiological aim, the same parts in different organisms, and much more distinctly by Vieq d'Azyr, the only real comparative anatomist of the 18th century, he truly opens the era of detailed anatomical research united with exact comparison and clear generalization. The *Règne Animal* (1817) and the theory of types (vertebrate, molluscan, articulate, and radiate) are the results of this union of analysis and synthesis (although he himself, exasperated by the aberrations of the Naturphilosophie, was accustomed to proclaim the importance of detailed empiricism alone), and mark the reconstitution of taxonomy on a new basis, henceforth to be no longer a matter of superficial description and nomenclature but a complete expression of structural resemblances and differences. More even than Linnæus he is the founder of a great school, whose names and labours are imperishable. In Germany, Bojanus, Meekel, Von Siebold, and the illustrious Johannes Müller, with his many living pupils, have carried on the work; in France, too, a succession of brilliant anatomists, such as De Quatrefages, Milne-Edwards, and Lacaze-Duthiers, are his intellectual heirs; and in England he has been admirably represented by Owen.

The histological movement inaugurated by Bichat will be subsequently discussed; the rise of embryology, however, may be briefly noted, especially since it supplied the most obvious deficiency of the Cuvierian school. Here the principal figure is Von Baer, who established independently the four types of Cuvier on developmental grounds, so for the first time applying embryology as the touchstone of anatomical classifications, besides establishing his famous law of differentiation from a general towards a special form.

It is now necessary to return to Linnæus, whose more speculative writings contain, though encumbered by fantastic hypotheses, the idea of floral metamorphosis ("Principium florum et foliorum idem est," &c.). About the same time, and quite independently, C. F. Wolff, the embryologist, stated the same theory with greater clearness, for the first time distinctly reducing the plant to an axis bearing appendages—the vegetative leaves—which become metamorphosed into bud-scales or floral parts through diminution of vegetative force. Thirty years later the same view was again independently developed by Goethe in his now well-known pamphlet (*Versuch die Metamorphose der Pflanzen zu erklären*, Gotha, 1790). In this brilliant essay the doctrine of the fundamental unity of floral and foliar parts is clearly enunciated, and supported by arguments from anatomy, development, and teratology. All the organs of a plant are thus modifications of one fundamental organ—the leaf—and all plants are in like manner to be viewed as modifications of a common type—the *Urpflanze*. The controversy as to the merits and importance of this essay, and of Goethe's morphological work in general, can scarcely be entered upon here. That Goethe discerned and proclaimed, and that more clearly than any of his predecessors or contemporaries, the fundamental idea of all morphology—the unity which underlies the multifarious varieties of organic form—and that he systematically applied this idea to the interpretation of the most important, most complex, and most varied animal and vegetable structures, is unquestionable. The difficulties arise when we seek to estimate the importance of his works in the chain of progress, and when we inquire whether, as some historians hold, his "urpflanze" was a mere ideal archetype, bringing forth as its fruit the innumerable metaphysical abstractions of the Naturphilosophie, and leading his countrymen, to their fall, into all the extravagances of that system; or whether, as Haeckel maintains, it represented a concrete ancestral form, so anticipating the view of modern evolutionists. That to him Schelling was largely indebted for the foundation upon which he erected his philosophic edifice, as also that Goethe largely shared the same ideas, is unquestionable; but it must be remembered that he lived and made progress for forty years after the publication of this essay, that he was familiar with the whole scientific movement, and warmly sympathized with the evolutionary views of Lamarck and Geoffroy St-Hilaire; it is not therefore to be wondered at that his writings should furnish evidence in favour of each and every interpretation of them. His other morphological labours must not be forgotten. Independently of Vicq d'Azyr, he discovered the human premaxillary bone; independently of Oken, he proposed the vertebral theory of the skull; and before Savigny, he discerned that the jaws of insects were the limbs of the head.

In 1813 A. P. de Candolle published his *Théorie Élémentaire de la Botanique*, which he developed into the classic *Organographie Végétale* (1827). Although at first unacquainted with Goethe's essay, and not clearly discerning the homology of leaves and floral parts, he established his theory of symmetry, reducing all flowers to "symmetrical" groupings of appendages on an axis and accounting for their various forms by cohesion and adhesion, by arrested or excessive development. The next great advance was the

investigation by Schimper and Braun of *phyllotaxis*—the ascending spiral arrangement of foliar and floral organs—thus further demonstrating their essential unity.

The term *morphology* was first introduced by Goethe in 1817, in a subsequent essay (*Zur Naturwissenschaft überhaupt, besonders zur Morphologie*). It did not come into use in botany until its popularization by Auguste de St-Hilaire in his admirable *Morphologie Végétale* (1841), and in zoology until later, although De Blainville, who also first employed the term *type*, had treated the external forms of animals under "morphologie." Though the Naturphilosophie of Schelling and its countless modifications by his followers, its mystic theories of "polarization" and the like, its apparatus of assumption and abstraction, hypothesis and metaphor, cannot here be discussed, its undoubted services must not be forgotten, since it not only stimulated innumerable reflective minds to the earnest study of natural science, but, by its incessant proclamation of the unity of nature and the free use of Platonic archetypes, gave a most powerful impulse to the study of comparative anatomy, and nobly vindicated the claims of philosophic synthesis over those of merely analytic empiricism. Among its many adherents, some are of more distinctly theological type, others metaphysical, others mystical or poetic, others, again, more especially scientific; but its most typical and picturesque figure is Lorenz Oken, who epitomizes alike the best and the worst features of the school, and among whose innumerable pseudo-morphological dreams there occasionally occurred suggestions of the greatest fruitfulness,—notably, for instance, the independent statement of the vertebral theory of the skull.

Although Lamarck shared in this movement, his great work (the *Philosophie Zoologique*, 1809), being ætiological rather than morphological, scarcely claims discussion here. By far the most distinguished anatomist of the transcendental school is Geoffroy St-Hilaire, who being comparatively free from the extravagances of Oken, and uniting a depth of morphological insight scarcely inferior to that of Goethe with greater knowledge of facts and far wider influence and reputation in the scientific world (which affected to sneer at the poet as necessarily a mere amateur), had enormously greater influence on the progress of science than either. He started from the same studies of anatomical detail as Cuvier, but, profoundly influenced by Buffon's view of unity of plan and by the evolutionary doctrines of Lamarck, he rapidly diverged into new lines, and again reached that idea of serial homology of which we have so frequently noted the independent origin. His greatest work, the *Philosophie Anatomique* (1818-1823), contains his principal doctrines. These are—(1) the theory of unity of organic composition, identical in spirit with that of Goethe; (2) the theory of analogues, according to which the same parts, differing only in form and in degree of development, should occur in all animals; (3) the "principe des connexions," by which similar parts occur everywhere in similar relative positions; and (4) the "principe du balancement des organes," upon which he founded the study of teratology, and according to which the high development of one organ is allied to diminution of another. The advance in morphological theory is here obvious; unfortunately, however, in eager pursuit of often deceptive homologies, he wandered into the transcendentalism of the Naturphilosophie, and seems utterly to have failed to appreciate either the type theory of Cuvier or the discoveries of Von Baer. He earnestly defended Buffon's and Bonnet's earlier view of unity of plan in nature; and the controversy reached its climax in 1830, when he maintained the unity of structure in Cephalopods and Vertebrates against Cuvier before the Academy of Sciences. On the point of fact he was of course utterly defeated; the type theory was

thenceforward fully accepted and the Naturphilosophie received its deathblow, while a "second empiric period" of exact anatomical and embryological research seemed for ever to replace it. Such was the popular view; only a few, like the aged Goethe, whose last literary effort was a masterly critique of the controversy, discerned that the very reverse interpretation was the deeper and essential one, that a veritable "scientific revolution" was in progress, and that the supremacy of homological and synthetic over descriptive and analytic studies was thenceforward assured. The irreconcilable feud between the two leaders really involved a reconciliation for their followers; theories of homological anatomy had thenceforward to be strictly subjected to anatomical and embryological verification, while anatomy and embryology acquired a homological aim. This union of the solid matter and rigorous method of Cuvier with the generalizing spirit and philosophic aims of Geoffroy is well illustrated in the works of Owen; and, in short, the so-called Cuvierian school is in reality thenceforward also Geoffroyan.

The further evolution of the idea of homology is sketched below (§ 7), while the extent and rapidity of the subsequent progress of the knowledge of all the structural aspects of plants and animals alike make an historical survey impossible up to the appearance of the *Origin of Species* (1859); however, no further *qualitative* advance was possible, since, as Sachs has best pointed out, morphology necessarily contains, under the Linnæan dogma of the constancy of species, the same two inconsistent and irreconcilable lines of thought which we saw represented by Cæsalpinus and the early German botanists respectively,—on one side the want of strictly scientific classification, and on the other the vaguely-felt existence of a natural relationship. Strict classification of forms supposed constant excludes in fact any *natural* relationship. The type theory, the theory of unity of organic composition, and the like, are susceptible indeed of two explanations—they may be regarded as either expressing a creative plan, or taken as purely Platonic and archetypal ideas. Both are tenable on theological and metaphysical grounds respectively, but the fact must not be disguised that of this unity of type no explanation in the least degree scientific, *i. e.*, in terms of the phenomena of the natural world, does or can exist. The needful solution was effected by Darwin. The "urpflanze" of Goethe, the types of Cuvier, and the like, at once became intelligible as schematic representations of ancestral organisms, which, in various and varying environments, have undergone differentiation into the vast multitude of existing forms. All the enigmas of structure become resolved; "representative" and "aberrant," "progressive" and "degraded," "synthetic" and "isolated," "persistent" and "prophetic" types no longer baffle comprehension; conformity to type represented by differentiated or rudimentary organs in one organism is no longer contradicted by their entire disappearance in its near allies, while systematist and morphologist become related simply as specialist and generalizer, all through this escape from the Linnæan dogma of the fixity of species. The phenomena of individual development receive interpretation in terms of ancestral history; and embryology thus becomes divided into ontogeny and phylogeny, the latter, too, coming into intimate relation with palæontology, while classification seeks henceforth the reconstruction of the genealogical tree. All these results were clearly developed in the most important work of the new period, Haeckel's *Generelle Morphologie* (1866), while the valuable contemporaneous *Principles of Biology* of Herbert Spencer also gave special attention to the relation of morphology to physiology.¹

§ 2. *Results*.—Though the preceding is but a meagre outline of the rise and progress of the science, no corresponding sketch of its results can be here attempted. A description of the refined applications of the doctrine of floral metamorphosis, an inquiry into the morphology of the Cryptogams, or an account of such beautiful homologies as those presented by the Arthropods or the Echinoderms is alike impossible; least of all can we consider the splendid simplification of the supremely complex problem of vertebrate structure by the elaboration of a new theory of the skull, and by such luminous discoveries as those of the segmental organs, or of the origin and homologies of the spinal and cranial nerves. For these organological conceptions the reader must study such articles as those on AMPHIBIA, BIRDS, HYDROZOA, MOLLUSCA, &c., and such works as those of Huxley, Gegenbaur and Haeckel, Balfour and Parker, Payer, Eichler, or Asa Gray, and (provided with the needful bibliographical equipment afforded by the various "Jahresberichte" and the kindred English publications) must indeed also plunge into the current literature of the science. And there too must be sought the innumerable attempts at taxonomic synthesis which such organological progress is constantly originating (see ANIMAL KINGDOM, BIOLOGY, vol. iii. p. 690 *sq.*, and VEGETABLE KINGDOM). Embryological generalizations, such as Haeckel's "gastræa theory," Lankester's rival "planula theory," or the ingenious "celome theory" of Hertwig, have been recently thoroughly criticized in Balfour's *Embryology*. The present article will be confined to a brief discussion of a few main problems, commencing with the cell theory and the problem of organic individuality—these being selected partly because of their special illustrativeness and intrinsic importance, partly because they have somewhat less recently been summarized.

§ 3. *Histology—Cell Theory*.—Although the application of the simple microscope to the minute structure of plants and animals had been in progress since the end of the 17th century, the rise of modern histology really dates from the *Anatomie Générale* (1801) of Bichat, which analyses the organism into a series of simple tissues with definite structural characters. This new impulse, together with the improvement of optical appliances, led to much further research. "Fibres" and "globules," "laminae" and "nuclei," were described, and even "cells" by Mirbel in 1806, and in 1835 Johannes Müller pointed out the existence of cells resembling those of plants in the vertebrate notochord. The cellular and nucleated structure of epidermis and other tissues was soon demonstrated, while Robert Brown discovered the nucleus of the vegetable cell. In 1838 Schleiden referred all vegetable tissues to the cellular type, and traced back the plant embryo to a single nucleated cell, while in 1839 Schwann boldly extended this conception of plant structure and development to the animal world, and so fully constituted the "cell theory."

Schwann's cells were essentially nucleated vesicles with fluid contents which originated in an intracellular substance; but this view was soon abandoned. Dujardin had discovered that the bodies of Foraminifera were composed of a viscid granular contractile *sarcodæ*, and Von Mohl described independently in similar terms the contents of the vegetable cell as *protoplastm*. This was identified by Max Schultze as Dujardin's *sarcodæ*, the newer name surviving; and this living matter, and not the membrane, he showed to be the essential constituent of the cell, since which his amended definition of the cell as a unit-mass of nucleated protoplasm has been generally accepted. Prevost and Dumas had noticed the segmentation of the ovum into masses as early as 1824, and these were naturally identified as cells immediately after the publication of Schwann's work. In 1846 Kölliker showed that all tissues arise from these segmentation masses, and that the multiplication of animal and vegetable cells takes place by a continuation of the same process,—that of transverse division already observed in the Protozoa.

These points gained, the attention of histologists was withdrawn for a considerable time from the scrutiny of the minute structure of the cell itself to be concentrated on the modes of origin of these unit-masses, and their subsequent differentiation and aggregation into tissues and organs. The minute structure and histogenesis of

¹ For bibliography see Carus, *Geschichte der Zoologie*; Sachs, *Ges-*

chichte d. Botanik; Cuvier, *Hist. d. Sci.*; Is. G. St-Hilaire, *Hist. Nat. Gén.*; Masters in *Méd.-Chir. Rev.*, 1858, &c.; also articles GOETHE. LINNÆUS. OKEN, &c.

plants, as well as of at least the higher animals, have been studied with much and ever-increasing accuracy of detail. (See ANATOMY, HISTOLOGY, EMBRYOLOGY.) Both vegetable and animal tissues have been simply classified both according to their adult forms and according to the embryonic layers from which they respectively arise. This scrutiny of plant and animal structure over and above the special generalizations of the botanist and the zoologist has afforded much result to general histology. The improvement of technical methods has of late years largely aided the progress of discovery. A return from the study of the cell-aggregate to that of the cell has commenced, and the question of cell-structure may be said to be again paramount in histology. The process of transverse division has of late been much elucidated, and, although its complex details cannot here be entered upon, the result has been to establish a minute and thorough correspondence in cases so widely dissimilar as pollen-grains from a flower-bud, the epidermis of a tadpole, or the cells of a tumour—a result which obviously enhances the morphological completeness of the cell theory. Minor modes of cell-multiplication also are not without their morphological interest. Gemmation, familiar in the yeast plant, occurs in other low and simple organisms, and may probably be identified with the formation of polar vesicles in ova as a modification of transverse division. Schleiden had supposed all new cells to originate within pre-existing cells, and this process, known as free-cell-formation, may really be observed in various plant and animal tissues. The protoplasm groups itself round new nuclei, the new cells being in fact formed much as Schwann had in his turn supposed; but these nuclei have repeatedly been shown to arise from segmentation of the original nucleus, and thus this process too seems a mere modification of the general one of transverse division. Conjugation, too—that coalescence of two similar cells which may be observed in many Algae, Fungi, and Protozoa—is to be considered as the undifferentiated form of that fertilization which occurs in higher animals and plants, the two apparently similar masses having become respectively differentiated into ovum and spermatozoon, or into egg-cell and antherozoid. An indefinite number of amoeboid cells, sometimes flow together into a single mass,—a phenomenon regarded by some as multiple-conjugation, or perhaps more probably as an almost mechanical coalescence of exhausted cells, from which conjugation proper and finally fertilization may indeed have originated. The amoeboid cells of higher animals similarly unite when drawn, and this formation of *plasmodia*, as these are termed, seems to be a deep-seated property of the amoeboid cell. Similarly, too, the process of rejuvenescence which occurs in many of the lowest plants and animals, such as *Protococcus* and *Amœba*, where the protoplasm passes from a resting and encysted to a naked and mobile stage, has many analogues not only among the Protista but even in the tissues of higher animals, while the phases which the lowest organisms more or less exhibit—the encysted, the ciliated, the amoeboid, and the plasmoidal—may be regarded as the fundamental forms of a “life-cycle,” fully represented indeed only in such extremely low organisms as *Protomyxa* and *Myxomycetes*, yet nowhere completely suppressed. The very highest plants and animals may thus be considered as aggregates of more or less differentiated and variously arranged encysted, amoeboid, and ciliated cells, while their development and subsequent changes, their variations normal and pathological, in reality exhibit phases more or less distinct of the ancestral life-cycle.

The examination of the precise modes of cell-division, particularly in the hands of botanists (see BIOLOGY, and summary in Sachs's *Vorlesungen über Pflanzen Physiologie*, 1833), are also constantly throwing the most interesting light upon the structure of the adult organism. Thus then, in our own day as in those of Bichat or Schwann, the labours of the histologist, when inspired by higher aims than that of the mere multiplication of descriptive detail, are of supreme morphological importance, and result in the demonstration of a unity of organic structure deeper even than any which we owe to Linnæus or Cuvier, Goethe or Geoffroy.

§ 4. *Individuality*.—Probably no subject in the whole range of biology has been more extensively discussed than that of the nature of organic individuality. The history of the controversy is of interest, since besides leading up to solid results it serves, perhaps better than any other case, to illustrate the slow emergence of the natural sciences from the influence of scholastic thought. Starting from the obvious unity and indivisibility of Man and other higher animals, and adopting some definition such as that of Mirbel (exceptionally unmetaphysical, however), “*Tout être organisé, complet dans ses parties, distinct et séparé des autres êtres, est un individu*,” it was attempted times without number to discover the same conception elsewhere in nature, or rather to impose it upon all other beings, plants and animals alike. The results of different inquirers were of course utterly discrepant. It seemed easy and natural to identify a tree or herb corresponding to the individual animal, yet difficulties at once arose. Many apparently distinct plants may arise from a common root, or a single plant may be decomposed into branches, twigs, shoots, buds, or even leaves, all

often capable of separate existence. These, again, are decomposable into tissues and cells, the cells into nucleus, &c., and ultimately into protoplasmic molecules, these finally into atoms,—the inquiry thus passing outside organic nature altogether and meeting the old dispute as to the ultimate divisibility of matter. In short, as Hæckel remarks, scarcely any part of the plant can be named which has not been taken by some one for the individual. It is necessary, therefore, briefly to notice some of the principal works on the subject, and these may conveniently be taken in descending order.

While Cassini practically agreed with Mirbel in attempting to regard separate plants as individuals, the widest interpretation of the individual is that of Gallezio (1816), who proposed to regard as an individual the entire product of a single seed, alike whether this developed into a uni-axial plant extended continuously like a Banyan, or multiplied asexually by natural or artificial means like the Weeping-willow or the Canadian Pondweed, of each of which, on this view, there is only a single individual in Britain, happily discontinuous.

At once the oldest and most frequently maintained view is that which regards the bud or shoot consisting of a single axis with appendages as the plant-individual, of which the tree represents a colony, like a branched hydroid Polyp. This conception, often attributed to Aristotle, but apparently without foundation, appears distinctly in the writings of Hippocrates and Theophrastus,—the latter saying, “*The bud grows on the tree like a plant in the ground*.” The aphorism of Linnæus, “*Gemmæ totidem herbæ*,” is well known; and in this view C. F. Wolff and Humboldt concurred, while Erasmus Darwin supported it by an appeal to the facts of anatomy and development. The most influential advocate of the bud theory during the first half of the present century was, however, Du Petit-Thouars, who, although starting much as usual with a “*principe unique d'existence*,” supported his theory on extensive though largely incorrect observations on stem structure and growth. For him the tree is a colony of *phytons*, each being a bud with its axillant leaf and fraction of the stem and root. Passing over numerous minor authors, we come to the central work of Alex. Braun (1853), in which, as Sachs has clearly pointed out, the illegitimate combination of Naturphilosophie with inductive morphology reaches its extreme. He reviews, however, all preceding theories, admits the difficulty of fixing upon any as final, since the plant, physiologically considered, is rather a *dividuum* than an *individuum*, and proposes as a compromise, or indeed as a partial cutting of the knot, the adoption of the shoot as the morphological individual, comparable to an animal, especially because, unlike the cell, leaf, &c., it includes all the representative characters of the species. Darwin and Spencer on the whole also accept the bud or shoot as at any rate the most definite individual.

The theory of metamorphosis naturally led Goethe, Oken, and others to regard the leaf as the individual, while Johannes Müller, Steenstrup, and others adopted the same view on various physiological grounds. Gaudichaud elaborated a theory intermediate between this view and that of Du Petit-Thouars, according to which the plant was built up of individuals, each consisting of a leaf with its subjacent internode of stem, which was regarded as the leaf-base, and this was supported by Edward Forbes and others, while the nominally converse view—that of the leaf as a mere outward expansion of the stem-segment—was proposed by Hochstetter.

Though sundry attempts at identifying various tissues, such as the fibro-vascular bundles, as the constituent individuals may be passed over, those associated with the cell theory are of great importance. Schwann decided in favour of the cell and regarded the plant as a cell-community, in which the separate elements were like the bees of a swarm,—a view virtually concurred in in all essential respects by Schleiden, Virchow, and other founders of the cell theory. Yet, although the structure and functions of the plant are ultimately and exclusively cellular, it is impossible to ignore the fact that, save in the very lowest organisms, these are subordinated and differentiated into larger aggregates, and form virtually but the bricks of a building, and hence the later theories outlined above. Of attempts to find the individual in the nucleus or the protoplasm granules it is of course unnecessary to speak further.

So far the theories of absolute individuality. The conception of relative individuality is well traced by Fisch upwards from the more or less vague suggestions in the writings of Goethe, Rœper, and the elder De Candolle to its clear expression in Alphonse de Candolle and Schleiden, both of whom take the cell, the shoot, and the multi-axial plant as forming three successive and subordinated categories. Nägeli too recognized not only the necessity of establishing such a series (cell, organ, bud, leafy axis, multi-axial plant) but the distinction between morphological and physiological individualities afterwards enunciated by Hæckel.

Passing over the difficulties which arise even among the Protozoa (see FORAMINIFERA), we find that a similar controversy (fully chronicled in Hæckel's *Kalkschwämme*) has raged over the individuality of Sponges. While the older observers were content to regard each sponge-mass as an individual, a view in which Lieberkuhn

and other monographers substantially concurred, the application of the microscope led to the view suggested by James Clark, and still stoutly supported by Saville Kent, that the Sponge is a city of amoeboid or infusorian individuals. Carter looked upon the separate ampullaceous sacs as the true individuals, while Schmidt, defining the individual by the possession of a single exhalant aperture, distinguishes Sponges into solitary and social. Later, however, he terms them *Zoa impersonalia*.

For the higher animals the problem, though perhaps really even more difficult, is less prominent. As Haeckel points out, the earlier discussions and even the comparatively late essay of Johannes Müller take an almost purely psychological or at least a physiological point of view; and the morphological aspect of the inquiry only came forward when the study of much lower forms, such as Cestoid Worms (see PLATYHELMINTHES) or Siphonophores (see HYDROZOA), had raised the difficulties with which botanists had so long been familiar. With the rapid progress of embryology, too, arose new problems; and in 1842 Steenstrup introduced the conception of an "alternation of generations" as a mode of origin of distinct individuals by two methods, for him fundamentally similar, the sexual from impregnated females and the asexual from unimpregnated "nurses,"—a view adopted by Edward Forbes and many other naturalists, but keenly criticized by Carpenter and Huxley. In Leuckart's remarkable essay on polymorphism (1853) the Siphonophora were analysed into colonies, and their varied organs shown to be morphologically equivalent, while the alternate generations of Steenstrup were reduced to a case of polymorphism in development. Leuckart further partly distinguished individuals of different orders, as well as between morphological and physiological individuals.

In 1852 Huxley proposed the view which he still substantially maintains (see BIOLOGY). Starting from such an undoubted homology as that of the egg-producing process of Hydra with a free-swimming Medusoid, he points out, that the title of individual, if applied to the latter, must logically be due to the former also, and avoids this confusion between organ and individual by defining the individual animal, as Galleo had done the plant, as the entire product of an impregnated ovum,—the swarm of Aphides or free Medusæ which in this way might belong to a single-individual being termed *Zooids*.

In Carus's *System of Animal Morphology* (1853) another theory was propounded, but the problem then seems to have fallen into abeyance until 1865, when it formed the subject of a prolonged and fruitful discussion in the *Principles of Biology*. Adopting the cell (defined as an aggregate of the lowest order, itself formed of physiological units) as the morphological unit, Spencer points out that these may either exist independently, or gradually exhibit unions into aggregates of the second order, like the lower Algae, of which the individuality may be more or less pronounced. The union of such secondary aggregates or compound units into individuals of a yet higher order is then traced through such intermediate forms as are represented by the higher seaweeds or the Liverworts, from the thallus of which the axes and appendages of Monocotyledons and Dicotyledons are ingeniously derived. The shoot of a flowering-plant is thus an aggregate of the third order; it branches into an aggregate of the fourth or higher order, and finally as a tree "acquires a degree of composition too complex to be any longer defined." Proceeding to animals, the same method is applied. The Protozoa are aggregates of the first order. These, like plants, exhibit transitions, of which Radiolarians, Foraminifera, and Sponges are taken as examples, to such definite compound wholes as Hydra; and such secondary aggregates multiply by gemmation into permanent aggregates of the third order, which may exhibit all degrees of integration up to that of the Siphonophora, where the individualities of the Polyps are almost lost in that of the aggregate form. The whole series of articulated animals are next interpreted as more or less integrated aggregates of the third order, of which the lower Annelids are the less developed forms, the Arthropods the more highly integrated and individualized. Molluscs and Vertebrates are regarded as aggregates of the second order.

In 1866 appeared the latest morphological classic, the *Generelle Morphologie* of Haeckel. Here pure morphology is distinguished into two sub-sciences,—the first purely structural, *tectology*, which regards the organism as composed of organic individuals of different orders; the second essentially stereometric, *promorphology*. To tectology, defined as the science of organic individuality, a large section of the work is devoted. Dismissing the theory of absolute individuality as a metaphysical figment, and starting from the view of Schleiden, De Candolle, and Nägeli of several successive categories of relative individuals, he distinguishes more clearly than heretofore the physiological individual (or *bion*), characterized by definiteness and independence of function, from the morphological individual (or *mophon*), characterized similarly by definiteness of form; of the latter he establishes six categories, as follows:—

1. *Plastides* (cytodes and cells), or elementary organisms.
2. *Organs* (cell-stocks or cell-fusions), simple or homoplastic organs (tissues), or heteroplastic organs. Organ-systems, organ-apparatuses.

3. *Antimeres* (opposite or symmetrical or hemotypic parts), e.g., rays of radiate animals, "halves of bilaterally symmetrical animals."
4. *Metameræ* (successive or homodynamous parts), e.g., stem-segments of Phanerogams, segments or zoonites of Annelids or Vertebrates.
5. *Personæ*, shoots or buds of plants, polyps of Coelenterates, &c., "individuals" in the narrowest sense among the higher animals.
6. *Corms* (stocks or colonies), e.g., trees, chains of Salpæ, polyp-stocks, &c.

In his subsequent monograph on calcareous Sponges, and in a final paper, he somewhat modifies these categories by substituting one category of extreme comprehensiveness, that of the *idorgan*, in place of the three separate orders of organs, antimeres, and metameræ. The *idorgan* (of course clearly distinguished from the physiological organ or biorgan) is finally defined as a morphological unit consisting of two or more plastids, which does not possess the positive character of the person or stock. These are distinguished into *homoplasts* or *homo-organs* and *alloplast* or *alloe-organs*, the former including, as subdivisions, plastid-aggregates and plastid-fusions, the latter idomeræ, antimeres, and metameræ. The former definition of the term *antimere*, as denoting at once each separate ray of a radiate, or the right and left halves of a bilaterally symmetrical animal, is corrected by terming each ray a *paramere*, and its symmetrical halves the antimeres. Thus an ordinary Medusoid has four parameres and eight antimeres, a Star-fish five and ten. The conception of the *persona* is largely modified, not only by withdrawing the comparison of the animal with the vegetable shoot and by omitting the antimere and metamere as necessary constituents, but by taking the central embryonic form of all the Metazoa—the gastrula (fig. 1) and its assumed ancestral representative, the gastræa—as the simplest and oldest form of *persona*. The different morphological stages to which it may attain are classified into three series: (1) Monaxonal¹ inarticulate persons, i.e., uniaxial and unsegmented without antimeres or metameræ, as in Sponges, or lowest Hydroids; (2) Stauraxonal¹ inarticulate persons with antimeres, but without metameræ, e.g., Coral, Medusa, Turbellarian, Trematode, Bryozoon; (3) Stauraxonal articulate persons with antimeres and metameræ, e.g., Annelids, Arthropods, Vertebrates.

The colonies of Protozoa are mere idorgans. True corms, composed of united persons, occur only among Sponges, Hydroids, Siphonophores, Corals, Bryozoa, Tunicates, and Echinoderms, of which the apparent parameres are regarded as highly centralized persons of a radially-budded worm colony; and these can be classified according to the morphological rank of their constituent persons. They usually arise by gemmation from a single persona, yet in Sponges and Corals occasionally by fusion of several originally distinct persons or corms. The theory of successive subordinate orders of individuality being thus not only derived from historical criticism of previous theories but brought into conformity with the actual facts of development and descent,—various groups of organisms being referred to their several categories,—the remaining problem of tectology, that of the relation of the morphological to the physiological individuality, is finally discussed. Of the latter, three categories are proposed:—(1) the "actual bion or complete physiological individual," this being the completely developed organic form which has reached the highest grade of morphological individuality proper to it as a representative of, e.g., its species; (2) the "virtual bion or potential physiological individual," including any incompletely developed form of the former from the ovum upwards; and (3) the "partial bion or apparent physiological individual," such fragments of the actual or virtual bion as may possess temporary independence without reproducing the species—this latter category having, however, inferior importance.²

Haeckel's theory, indeed in its earlier form, has been adopted by Gegenbaur and other morphologists, also in its later form by Jäger, who, however, rejects the category of idorgan on the ground of the general morphological principle that every natural body which carries on any chemical changes with its environment becomes differentiated into more or less concentric layers; but the subject, especially as far as animals are concerned, is again recently discussed in a large work by Perrier. Starting from the cell or plastid, he terms a permanent colony a *méride*, and these may remain isolated like *Sagitta* or *Rotifer*, or may multiply by gemmation to

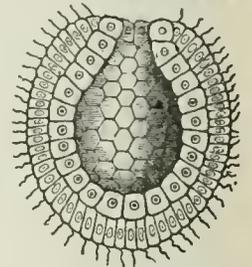

FIG. 1.—Gastrula in optical section, showing primitive opening and digestive cavity (blastopore and arch-enteron), as also outer and inner layers, ectoderm and endoderm. (After Haeckel.)

¹ For explanation of these terms see § 5, Promorphology, p. 844.

² For criticism of this theory on the ground of its making physiological dependence on morphological individuality, see Fisch, *Aufklärung und Kritik der verschiedenen Ansichten über das pflanzliche Individuum*, p. 11.

or: higher aggregates which he terms *zoides*. Such *zoides* may be irregular, radiate, or linear aggregates, of which the two former classes especially are termed *demes*. The organ—Haeckel's idorgan—is excluded, since tissues and organs result from division of labour in the anatomical elements of the *mérides*, and so have only a secondary individuality, "carefully to be distinguished from the individuality of those parts whose direct grouping has formed the organism, and which live still, or have lived, isolated from one another." Perrier further points out that undifferentiated colonies are sessile, as Sponges and Corals, while a free state of existence is associated with the concentration and integration of the colony into an individual of a higher order.

So far the various theories of the subject; detailed criticism is impossible, but some synthesis and reconciliation must be attempted. Starting from the cell as the morphological unit, we find these forming homogeneous aggregates in some Protozoa and in the early development of the ovum. But integration into a whole, not merely aggregation into a mass, is essential to the idea of individuality; the earliest secondary unit, therefore, is the gastrula or *méride*. This stage is permanently represented by an unbranched Hydra or Sponge or by a Planarian. These secondary units may, however, form aggregates either irregular as in most Sponges, indefinitely branched as in the Hydroids and Actinozoa, or linear as in such Planarians as *Catenula*. Such aggregations, colonies, or *demes*, not being aggregated, do not fully reach individuality of the third order. This is attained, however, for the branched series by such forms as Siphonophores among Hydrozoa, or *Renilla* or *Pennatula* among Actinozoa; for linear aggregates again by the higher Worms, and still more fully by Arthropods and Vertebrates. Aggregates of a yet higher order may occur, though rarely. A longitudinally dividing Nais or laterally branched *Syllis* are obviously aggregates of these tertiary units, which, on Haeckel's view, become integrated in the Echinoderm, which would thus reach a complete individuality of the fourth order. A chain of *Salpæ* or a colony of *Pyrosoma* exhibits an approximation to the same rank, which is more nearly obtained by a radiate group of *Botryllus* around their central cloaca, while the entire colony of such an Ascidian would represent the individual of the fifth order in its incipient and unintegrated state,—these and the preceding intermediate forms being, of course, readily intelligible, and indeed, as Spencer has shown, inevitable on the theory of evolution.

The exclusion of tissues and organs from rank in this series is thus seen to necessarily follow. Ectoderm and endoderm cannot exist alone; they and the organs into which they differentiate arise merely, as Jäger expresses it, from that concentric lamination, or, with Perrier, from that polymorphism of the members of the colony, which is associated with organic and social existence. The idea of the antimerie is omitted, as being essentially a promorphological conception (for a Medusoid or a Star-fish, though of widely distinct order of individuality, are equally so divisible); that of the metamere is convenient to denote the secondary units of a linear tertiary individual; the term *persona*, however, seems unlikely to survive, not only on account of its inseparable psychological connotations, but because it has been somewhat vaguely applied alike to aggregates of the second and third order; and the term colony, corm, or deme may indifferently be applied to those aggregates of primary, secondary, tertiary, or quaternary order which are not, however, integrated into a whole, and do not reach the full individuality of the next higher order. The term *zoid* is also objectionable as involving the idea of individualized organs, a view natural while the medusoid gonophores of a Hydrozoon were looked at as evolved of its homologue in Hydra, whereas the latter is really a degenerate form of the former. Passing to the vegetable world, here as before the cell is the unit of the first order, while aggregates representing almost every stage in the insensible evolution of a secondary unit are far more abundant than among animals. Complete unity of the second order can hardly be allowed to the thallus, which Spencer proposes to compound and integrate into tertiary aggregates—the higher plants; as in animals the embryological method is preferable, both as avoiding gratuitous hypothesis and as leading to direct results. Such a unit is clearly presented by the embryo of higher plants in which the cell-aggregate is at once differentiated into parts and integrated into a whole. Such an embryo possesses axis and appendages as when fully developed (fig. 2). The latter, however, being as organs mere lateral expansions of the concentric layers into which the plant embryo, like the animal, is differentiated, and so neither stages of evolution nor capable of separate existence, are not entitled to individual rank. The embryo, the bud, shoot, or uni-axial plant, all thus belong to the second order of individuality, like the Hydroid they resemble. Like the lower Colenterates, too, aggregates of such axes are formed by branching out from their low degree of integration. Such colonies can hardly be termed individuals of the third, much less of higher order, at least without somewhat abandoning that unity of treatment of plants and animals without which philosophical biology disappears. Individuality of the second order is most fully reached by the flower,—the most highly differentiated and

integrated form of axes and appendages. Such a simple inflorescence as a raceme or umbel approximates to unity of the third order, to which a composite flower-head must be admitted to have attained, while a compound inflorescence is on the way to a yet higher stage.

If, as seems probable, a nomenclature be indispensable for clear expression, it may be simply arranged in conformity with this view. Starting from the unit of the first order, the plastid or *monad*, and terming any undifferentiated aggregate a *deme*, we have a *monad-deme* integrating into a secondary unit or *dyad*, this rising through *dyad-demes* into a *triad*, this forming *triad-demes*, and these when differentiated becoming *tetrads*, the *Botryllus*-colony with which the evolution of compound individuality terminates being a *tetrad-deme*. The separate living form, whether monad, dyad, triad, or tetrad, requires also some distinguishing name, for which *persona* will probably ultimately be found most appropriate, since such usage is most in harmony with its inevitable physiological and psychological connotations, while the genealogical individual of Gallezio and Huxley, common also to all the categories, may be designated with Haeckel the *ovum-product* or *ovum-cycle*, the complete series of forms needed to represent the species being the *species-cycle* (though this coincides with the former save in cases where the sexes are separate, or polymorphism occurs). For such a peculiar case as *Diplozoon paradoxum*, where two separate forms of the same species coalesce, and still more for such heterogeneous individuality as that of a Lichen, where a composite unit arises from the union of two altogether distinct forms—Fungus and Alga,—yet additional categories and terms are required.¹

§ 5. *Promorphology*.—Just as the physiologist constantly seeks to interpret the phenomena of function in terms of mechanical, physical, and chemical laws, so the morphologist is tempted to inquire whether organic as well as mineral forms are not alike reducible to simple mathematical law. And just as the crystallographer constructs an ideally perfect mathematical form from an imperfect or fragmentary crystal, so the morphologist has frequently attempted to reduce the complex-curved surfaces of organic beings to definite mathematical expression.² Canon Moseley (*Phil. Trans.*, 1838) succeeded in showing, by a combination of measurement and mathematical analysis, that the curved surface of any turbinated or discoid shell might be considered as generated by the revolution, about the axis of the shell, of a curve, which continually varied its dimensions according to the law of the logarithmic spiral. For Goodsir this logarithmic spiral, now carved on his tomb, seemed a fundamental expression of organic curvature and the dawn of a new epoch in natural science—that of the mathematical investigation of organic form—and his own elaborate measurements of the body, its organs, and even its component cells seemed to yield, now the triangle, and again the tetrahedron, as the fundamental form. But such supposed results, savouring more of the Naturphilosophie than of sober mathematics, could only serve to discourage further inquiry and interest in that direction. Thus we find that even the best treatises on botany and zoology abandon the subject, satisfied with merely contrasting the simple geometrical ground-forms of crystals with the highly curved and hopelessly complicated lines and surfaces of the organism.

But there are other considerations which lead up to a mathematical conception of organic form, those namely of symmetry and regularity. These, however, are usually but little developed, botanists since Schleiden contenting themselves with throwing organisms into three groups—first, absolute or regular; second, regular and radiate; third, symmetrical bilaterally or zygomorphic—the last being capable of division into two halves only in a single plane, the second in two or more planes, the first in none at all. Burmeister, and more fully Bronn, introduced the fundamental improvement of defining the mathematical forms they sought not by the surfaces but by axes and their poles; and Haeckel has developed the subject with an elaborateness of detail and nomenclature which seems unfortunately to have impeded its study and acceptance, but of which the main results may, with slight variations chiefly due to Jäger (*Lehrb. d. Zool.*, i. 283), be briefly outlined.

A. *ANAXONIA*—forms destitute of axes, and consequently wholly irregular in form, e.g., Amœbe and many Sponges.

B. *AXONIA*—forms with definite axes.

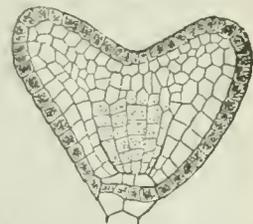

FIG. 2.—Embryo of Dicotyledon (after Sachs), showing incipient axis and appendages, as also the three concentric embryonic layers.

¹ See Haeckel, *Gen. Morph.* i., *Kalkschwämme* i., and *Jena. Zeitschr.* x.; also Sachs, *Geschichte d. Bot.*; Fisch, *Aufsatzung u. Kritik*, &c., Rostock, 1850; Perrier, *Les Colonies Animales*, 1882, as from these all other references can be obtained.

² The sciences of organic and mineral form would thus (as Haeckel points out) become thoroughly analogous, for, as promorphology develops the crystallography of organic form, so mineralogy, in the study of such phenomena as those of pseudomorphism or of mineral development, becomes parallel to morphology

I. HOMAXONIA—all axes equal.

- (a) Spheres, where an indefinite number of equal axes can be drawn through the middle point, e.g., Sphærozoum.
 (b) Polyhedra, with a definite number of like axes.

Of these a considerable number occur in nature, for example, many Radiolarians (fig. 3), pollen-grains, &c., and they are again classifiable by the number and regularity of their faces.

II. PROTAXONIA, where all the parts are arranged round a main axis, and of these we distinguish—

1. *Monaxonia*, with not more than one definite axis. Here are distinguished (a) those with similar poles, spheroid (Coccosdiscus) and cylinder (Pyrosoma) and (b) those with dissimilar poles, cone (Conulina).

2. *Stauraxonia*, where, besides the main axes, a definite number of secondary axes are placed at right angles, and the stereometric ground-form becomes a pyramid. Here, again, may be distinguished (a) those with poles similar, *Stauraxonia homopola*, where the stereometric form is the double pyramid (fig. 4), and (b) those with poles dissimilar, *Stauraxonia heteropola*, where the stereometric form is the single pyramid, and where we distinguish a basal, usually oral, pole from an apical, aboral, or anal pole. The bases of these may be either regular or irregular polygons, and thus a new classification into *Homostaura* and *Heterostaura* naturally arises.

The simpler group, the *Homostaura*, may have either an even or an odd number of sides, and thus among the *Homostaura* we have even-sided and odd-sided, single and double pyramids. In those *Homostaura* with an even number of sides, such as *Medusæ*, the radial and inter-radial axes have similar poles; but in the series with an odd number of sides, like most *Echinoderms*, each of the transverse axes is half radial and half semi-radial (fig. 5). Of the group of regular double pyramids the twelve-sided pollen-grain of *Passiflora* (fig. 4) may be taken as an example, having the ground-form of the hexagonal system, the hexagonal dodecahedron. Of the equal even-sided single pyramids (*Heteropola homostaura*), *Alcyonium*, *Geryonia*, *Aurelia* may be taken as examples of the eight-sided, six-sided, and four-sided pyramids, while those with an odd number of sides may be illustrated by *Ophiura* or *Primula* with five sides, and the flower of *Lily* or *Rush* with three sides.

In the highest and most complicated group, the *Heterostaura*, the basal polygon is no longer regular but amphithec (*ἀμφιθῆκος* = double-edged). Such a polygon has an even number of sides, and can be divided into symmetrical halves by each of two planes intersecting at right angles in the middle point, and thus dividing the whole figure into four congruent polygons. The longer of these axes may be termed lateral, the shorter the equatorial or dorso-ventral; and these two axes, along with the main axis, always define the three dimensions of space. *Ctenophores* (fig. 6) furnish examples of eight-sided amphithec pyramids, some *Madrepore Corals* of six-sided, *Crucifers*, some *Medusæ*, and *Cestodes* of four-sided amphithec pyramids.

In these forms the poles of the dorso-ventral and lateral axes are similar, and, as in the preceding *Monaxonia* and *Stauraxonia*, the centre of the body is defined by a line; and they are therefore termed *Centraxonia*, while the *Protaxonia*, which are defined by their central point, are called *Centrostroma*. There are, however, other forms, and these the most complicated, in which the poles of at least the dorso-ventral axis are unlike, and in which the body is thus defined not with reference to a line but to a median plane, and these have accordingly received the name of *Centropipeda*. Their ground-form is a polygon with an even number of sides, which can only be divided into two symmetrical halves by the one median plane. It can be obtained by halving an amphithec pyramid of double the number of sides, and is consequently termed a half amphithec pyramid (fig. 7). The whole amphithec pyramid may be most con-

veniently obtained by the reduplication of the ground-form as if in a mirror. Of half amphithec pyramids there are again two forms, termed by Hæckel *Amphipleura* and *Zygopleura*, the former including the "bilaterally symmetrical" or irregularly radiate forms of previous authors, such as *Spatangus*, *Viola*, *Orchis*, while the *Zygopleura* include forms bilaterally symmetrical in the strictest sense, in which not more than two radial planes, and these at right

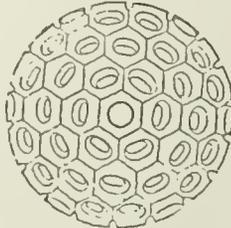

FIG. 3.—Radiolarian (*Ethmospæra*), an irregular endopæric polyhedron with equiangular faces. Type of *Homaxonia*.

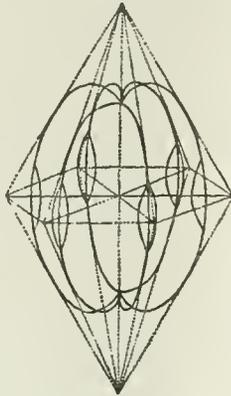

FIG. 4.—Pollen of *Passiflora*, as example of *Stauraxonia homopola*. Ground-form a regular double pyramid of six sides.

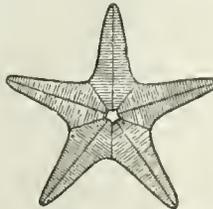

FIG. 5.—Starfish, an example of *Heteropola homostaura*. Ground-form a regular single pyramid of five sides.

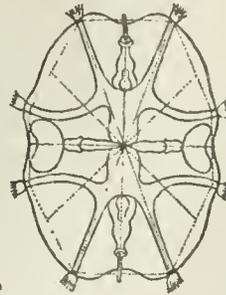

FIG. 6.

FIG. 6.—*Ctenophore* (*Eucharis*). Ground-form an eight-sided double amphithec pyramid.

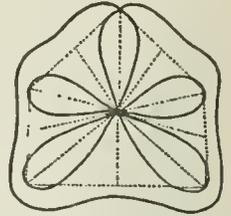

FIG. 7.

FIG. 7.—*Spatangus*. Ground-form a five-sided half amphithec pyramid.

angles to each other, are present. The stereometric ground-form is a half rhombic pyramid. Hæckel again divides these, according to the number of antimeres, into *Tetrapleura* and *Dipleura*.

Promorphology has thus shown that the reigning dogma of the fundamental difference of organic and mineral forms is false, and that a crystallography of organic forms is possible,—the form of the cell or the cell-aggregate differing from the crystal merely by its more or less viscous state of aggregation, its inherited peculiarities, and its greater adaptability to the environment. The classification into *bilateral* and *radiate* forms which usually does duty for more precise promorphological conceptions must be abandoned as hopelessly confusing essentially different forms, or at least must be rigidly restricted,—the term radial to regular and double pyramids, the term *bilateral* to the *Centropipeda* if not indeed to *dipleural* forms. Similarly, the topographical and relative terms, anterior and posterior, upper and under, horizontal and vertical, must be superseded by the terms above applied to the axes and their poles, oral and aboral, dorsal and ventral, right and left.

§ 6. *Nature of Morphological Changes.*—The main forms of organic structure being analysed and classified and their stage of individuality being ascertained, the question next arises, by what morphological changes have they arisen, and into what categories can these modes of differentiation be grouped? They at first sight seem innumerable, yet in reality are few. Goethe somewhat vaguely generalized them for the flower as ascending and descending metamorphosis, expansion and contraction of organs, &c.; but the first attempt at careful enumeration seems to be that of Auguste de St-Hilaire, who recognized defects of development, adhesences, excesses of production or "dédoublements," metamorphosis and displacement of organs. Subsequent authors have variously treated the subject; thus Asa Gray enumerates as modifications of the flower—coalescence, adnation, irregularity, abortion, non-alternation or reposition, multiplication, enation, unusual development of the axis, and other morphological modifications connected with fertilization. These are obviously too numerous, as may best be shown by a single comparison with the view of an animal morphologist. Thus Huxley, in discussing the arrangement of the Vertebrata, recognizes only three processes of modification, not only in the ancestral evolution of the Equidæ, but in the individual development of animals generally; these are "(1) excess of development of some parts in relation to others, (2) partial or complete suppression of certain parts, (3) coalescence of parts originally distinct." It is probable that this "threefold law of evolution" may include all observed cases of change, even in the flower; thus *Chorisia* and *Peloria* may be regarded as peculiar forms of excess, while displacement is probably in all cases only apparent, and really due to adhesion or coalescence (see *BIOLOGY*, vol. iii. p. 681 sq.).

§ 7. *Nature of Morphological Correspondence.*—*Categories of Homology.*—To indicate all the steps by which the idea of morphological has been distinguished from that of physiological resemblance would be to examine the whole history of morphology; it must suffice to discuss the terminology of the subject which has, as ever, served not only as an index but as an engine of progress. For these two distinct forms of resemblance the terms *homology* and *analogy* gradually became specialized, and were finally established and clearly defined by Owen in 1843,—"the former as the same organ in different animals under every variety of form and function (e.g., fore-limbs of *Draco volans* and wings of Bird); the second as a part or organ in one animal which has the same function

¹ Compare A. de St-Hilaire, *Morphologie*; Gray, *Manual*, p. 179 (1858); Huxley, *Proc. Zool. Society*, p. 619, Lond., 1880.

as another part or organ in a different animal (e.g., parachute of Draco and wings of Bird).” He further distinguishes three kinds of homology:—(1) *special*, being “that above defined, namely, the correspondence of a part or organ determined by its relative position and connexions with a part or organ in a different animal, the determination of which homology indicates that such animals are constituted on a common type,” e.g., basilar process of human occipital with basi-occipital of fish; (2) *general*, that “higher relation in which a part or series of parts stands to the fundamental or general type, involving a knowledge of the type on which the group in question is constituted,” e.g., the same human bone and centrum of the last cranial vertebra; (3) *serial* homology, “representative or repetitive relation in the segments of the same skeleton” (demonstrated when general and special homologies have been determined); thus usually the basi-occipital and basi-sphenoid are “homotypes.” These terms were henceforth accepted by naturalists; but the criterion of analogy and homology became for Agassiz and other embryologists developmental as well as comparative, reference to the ideal archetype becoming less and less frequent. Passing over the discussions of Agassiz and Bronn, of which the latter is criticized and partly incorporated by Haeckel, we find the last-named (1) placing serial under general homology; (2) erecting categories of homology partially corresponding to those of individuality,—(a) *homotypy* (of antimeres), hence distinct from that of Owen, (b) *homodynamy* (of metameres), (c) *homonomy* (of parts arranged on transverse axes); (3) defining special homology in terms of identity of embryonic origin. In 1870 this latter point was more fully insisted upon by Ray Lankester, who, decomposing it into two others, proposed to supersede the term homology by *homogeny*, being the correspondence of common descent, and *homoplasmy*, denoting any superinduced correspondence of position and structure in parts embryonically distinct. Thus, the fore-limb of a mammal is *homogenous* with that of a bird, but the right and left ventricles of the heart in both are only *homoplastic*, these having arisen independently since the divergence of both groups from a uni-ventriculate ancestor in relation to similarity of physiological needs. Mivart next proposed to retain homology as a generic term, with *homogeny* and *homoplasmy* as two species under it, and carried the analysis into great detail, distinguishing at first twenty-five, but later fifteen, kinds of correspondence:—(1) parts similar in function only, e.g., legs of Lizard and Lobster; (2) parts similar both in function and relative position, wings of Bat and Bird; (3) parts of common descent, fore-limb of Horse and Rhinoceros; (4) parts of similar embryonic origin, whatever be their racial genetic relations, e.g., occipitals of Panther and Perch; (5) parts of dissimilar embryonic origin, whatever be their racial genetic relations, e.g., legs of Diptera; (6, 7, 8, 9, 10) laterally, vertically, serially, antero-posteriorly, and radially homologous parts; (11) subordinate serial homologues, e.g., joints of antenna; (12 and 13) secondary and tertiary subordinate serial homologues; (14 and 15) special and general homologies (in Owen’s sense). In his *Kalkschwämme* Haeckel proposed to term *homophyly* the truly phylogenetic homology in opposition to *homomorphy*, to which genealogical basis is wanting; and finally Von Jhering has published a repetition of Lankester’s view.

In this discussion, as in that of individuality, it is evident that we are dealing with numerous logical cross-divisions largely corresponding, no doubt, to the complex web of inter-relations presented by nature, yet remaining in need of disentanglement. Though we must set aside analogies of functional activity, the resemblances in external shape or geometric ground-form which correspond to these, e.g., Hydrozoa and Bryozoa, Fishes and Cetaceans, mimetic organisms, are nevertheless, as our historic survey showed, the first which attract attention; and these homoplastic or homomorphic forms, as Haeckel has shown, come as fairly within the province of the promorphologist as do isomorphic crystals within that of his an-organological colleague the crystallographer. Here, too, would be considered “radial,” “vertical,” “lateral” homology, “homotypy of antimeres,” and all questions of symmetry, for which Haeckel’s nomenclature of *homaxonia*, *homopolic*, &c., is distinctly preferable. Entering the field of tectology or morphology in the ordinary sense, we may next consider whether two organisms compared are of the same category of individuality—are *homocategoric*; and under this serial homology, for instance, would come as a minor division, the correspondence between the units or parts of units of a linear dyad-deme or triad. From a third point of view, that of the embryologist we trace the development of each multicellular organism (1) from the embryonic layers and systems into which the secondary unit (gastrula or plant embryo) differentiates, (2) from a unit-deme or unit of the inferior order or orders of individuality. The parts and units thus recognized by ontogenetic research, respectively or successively *homodernic*, *homosystemic*, and *homodemie*, may then conveniently be termed (indifferently save for considerations of priority) either “specially homologous,” “homogenous,” “homophylic,” or “homogenetic,” in the language of phylogenetic theory. These three great classes of morphological

correspondence—promorphological, tectological, and embryological—may or may not coincide. But the completest homology, in which all forms of resemblance unite and from which they differentiate, is that expressed in the cell theory, or rather in that ovum theory which underlies it, and which Agassiz therefore not unjustly regarded as “the greatest discovery in the natural sciences of modern times.”¹

§ 8. *Results to Taxonomy.*—The advance and modification of classifications which follow each morphological advance have been pointed out above, and taxonomy thus never quite reaches a level with morphological knowledge. That it requires much reform at present is obvious. Although the dogma of the constancy of species is no longer maintained, its results survive, and perhaps a majority of groups have still to be remonographed in the generalizing spirit with which Haeckel has treated the calcareous Sponges, or Carpenter, Parker, and Brady the Foraminifera. The union of the Protophyta and Protozoa into the Protista (a generalization which research is constantly confirming) involves a final abandonment of the mediaeval figment of three kingdoms of nature, and a revival of the Organisa of Linnaeus. Physiological prejudices, too, are not completely expelled; hence, for instance, the constant attempts to separate Animalia and Vegetabilia by physiological characteristics, which would be irrelevant even if in themselves valid. A strictly morphological standard must be applied to the construction of classifications and the pruning of genealogical trees; organisms are “higher” or “lower” not according to their stage of evolution in beauty or intelligence but (as Huxley has most clearly pointed out in the essay referred to under § 6) to the degree of morphological differentiation by excess, suppression, or coalescence which they exhibit. Thus the supreme position of Man in classification must be abandoned, since the Primates are simply one of the less specialized, i.e., lower orders of Mammals, and the Mammals themselves are on the whole distinctly less specialized than the Birds, or perhaps even some of the higher Reptiles. The morphological importance of the “vegetable kingdom” sinks when tested by such a standard. The Cormophytes are all nothing more than an axis with appendages, and as such may fairly be compared, not with the entire animal assemblage, but merely to that group which is homomorphic (or rather isomorphic) with them as reducible to axis and appendages too. Such a group we find in the Hydromedusae, which we can easily model in imagination into all the specializations of the floral world, a single genus like *Clava* or *Tubularia* affording a starting-point for countless “natural orders.”

§ 9. *Relation of Morphology to Physiology.*—Although the pure morphologist investigates laws of structure only, and rightly eliminates the conceptions of life, environment, and function, yet if kept permanently apart from physiological considerations his labours would be incomplete and his results inexplicable, if not indeed almost illusory. For, however deeply one penetrates through superficial and adaptive characters to an apparently permanent and fundamental morphological type, this is itself but an earlier adaptation, showing the fading traces of an earlier adaptation still. And conversely, the most superficial of adaptive characters, if transmitted to numerous varying descendants, may attain high morphological importance. The morphological aspect of an organism is merely statical, and, like that of an eddy or a vortex-ring, becomes only truly intelligible when viewed in its dynamic aspect; and thus, though the demonstration of the structural unity of the organic world is in itself a great result, yet the desire of a deeper explanation of form as determined by function and environment is thereby rendered all the more pressing. An example may be taken from botany. Thus Airy beautifully explains the phenomena of phyllotaxis as adaptations to bud-life. Or again, in a common flower, say the Dead-nettle, all the details of form are indeed described by the systematist with equal minuteness (a proceeding which, except in so far as serving for specific identification, is of no further scientific value), but receive separate interpretation from the two distinct standpoints of the morphologist and physiologist. The latter, to whom form is important merely so far as explanatory of function, shows how the tough persistent calyx is protective against various dangers, how the corolla serves to lure the fertilizing bees, which find in its lip a landing stage and in each lateral process a hold-fast, while its hood at once protects the pollen against rain and determines the curvature of the stamens,—this curvature, as well as their didynamous arrangement, median position, and linearly arranged anther-lobes being all adaptations through the medium of the bee’s hairy back to meet the similarly placed stigma of another flower,—and so on. The morphologist, on the other hand, analyses the calyx into its five constituent sepals, reduces the corolla to a regular pentamerous type, ascertains the position of the four stamens, and asserts the loss of a fifth posterior one, finds the ovary to be primitively two-celled, and thus reaches a schematic conception of a not archetypal but ancestral form. This ground-form itself, however, suggests a new train of considerations both morphological and physiological respecting the origin of

¹ For bibliography see Lankester, *An. Mag. Nat. Hist.*, 1870, or Geldes, *tena. Zeitschr.*, 1883.

this primeval flower from a somewhat fern-like Cryptogam, of which the foliage-leaves, the envelopes of the spore-bearing leaves, the micro- and macrosporangiospheres had become permanently differentiated in ascending order; of which the microspores, doubtless through the intervention of a spore-eating insect, had come to germinate upon the macrosporangium instead of upon the ground; and in which this variation (evidently advantageous, since making fertilization at once more certain and more economical) was aided to perpetuate itself by the contemporaneous evolution of those floral colours which are nascent even among the Thallophytes. And thus the morphologist, though excluding teleological and functional considerations from his anatomical researches, has yet a physiological ideal, and enters sooner or later upon a new series of inquiries—those of the interdependence of structure and function. Milne-Edwards's law of the physiological division of labour, Dohrn's principle of functional change, the speculations of Claude Bernard, Spencer, and Haeckel, experimental inquiries such as those of Semper, where organisms are subjected to special modifications of their environment, and the like, are all contributions to this newest and evolutionary department of morphology. Such ideas are even applied to the study of cellular morphology. Thus, Spencer points out the relation

of the shapes of cells to their environments; James ingeniously explains the occurrence of cell-division by the rapid increase of bulk over surface which the growth of a solid involves, and the corresponding increase of difficulty of nutrition; and the writer has attempted to explain the forms of free and united cells as specializations of a (protomyxoid) cycle in which variations of functional activity are accompanied by the assumption of corresponding forms, the whole series of changes depending upon the properties of protoplasm under the variations in the supply of energy from the environment. Rauber, His, and others have even attempted to explain embryological phenomena in terms of the simplest cellular mechanics, but as yet such speculations are somewhat crude.¹

§ 10. *Orientation and Subdivisions of Morphology.*—The position of morphology in the classification of the sciences and the proper mode of subdividing it cannot be discussed within these limits, although the latter is especially the subject of much disagreement. The position above assumed, that of including under morphology the whole statical aspects of the organic world, is that of Haeckel, Spencer, Huxley, and most recent animal morphologists; botanists frequently, however, still use the term under its earlier and more limited significance.² (P. GE.)

MORRIS, ROBERT (1734-1806), American statesman, was born at Liverpool, England, on 20th January 1734. At the age of thirteen he accompanied his father to America, and after serving in a counting-house at Philadelphia he became in 1754 partner in the business. From 1776 to 1778 he was delegate to the Continental Congress, and he was one of those who signed the Declaration of Independence. During the war he served on the committee of ways and means, and freely placed his immense wealth at the disposal of his country, his personal credit being at one time pledged to the amount of \$1,400,000. He also in 1780 established the Bank of North America, and until 1784 acted as superintendent of finance. In 1786 he became a member of the Pennsylvania legislature, and he was one of the convention which framed the Federal constitution in 1787. From 1786 to 1795 he was United States senator. On account of the disastrous result of some of his financial speculations Morris passed the later years of his life in a debt prison. He died at Philadelphia, 8th May 1806. Robert Morris had as his assistant-superintendent of finance Gouverneur Morris (1752-1816), with whom he engaged also in several mercantile enterprises. Gouverneur Morris, who rose to some eminence as a statesman and orator, was more fortunate in his speculations than his colleague, and latterly became celebrated for the munificence of his hospitality. He was the author of a series of essays on currency and finance, which are included in the *Life, Correspondence, and Writings of Gouverneur Morris*, 3 vols., edited by Jared Sparks, 1832.

MORRIS-DANCE, or MORRICE-DANCE, a performance for a long time associated with certain festive seasons in England, but now wholly discontinued. The origin of the name is doubtful; and whether the dance was indigenous to England, or was introduced by John of Gaunt from Spain, or was borrowed from the French or Flemings, must be left to conjecture. That, as the name would seem to indicate, it was a development of the morisco-dance or Spanish fandango is not, however, invalidated by the fact that the morisco was for one person only, for, although latterly the morris-dance was represented by various characters, uniformity in this respect was not always observed, and the elements of the dance may have been borrowed from the morisco. There are few references to it earlier than the reign of Henry VII., but it would appear that in the reign of Henry VIII. it was an almost essential part of the principal village festivities. Although allusions to it in poems are very frequent in the 16th and 17th centuries, nothing more than fragmentary descriptions have been handed down to us, so that an accurate knowledge of its characteristic features at even any particular period is impossible. In earlier times it was usually

danced by five men and a boy dressed in a girl's habit, who was called Maid Marian. There were also two musicians; and, at least sometimes, one of the dancers, more gaily and richly dressed than the others, acted as "foreman of the morris." The garments of the dancers were ornamented with bells tuned to different notes so as to sound in harmony.³ Robin Hood, Friar Tuck, and Little John were characters extraneous to the original dance, and were introduced when it came to be associated with the May-games. At Betley, in Staffordshire, there is a painted window of the time of Henry VIII., or earlier, portraying the morris,—the characters including Maid Marian, Friar Tuck, the hobby-horse, the piper, the tabourer, the fool, and five other persons apparently representing various ranks or callings. The hobby-horse, which, latterly at least, was one of the principal characters of the dance, consisted of a wooden figure attached to the person of the actor, who was covered with trappings reaching to the ground, so as to conceal his feet. The morris-dance was abolished along with the May-games and other festivities by the Puritans, and, although revived at the Restoration, the pageant gradually degenerated in character and declined in importance. Maid Marian latterly was personated by a clown who was called Malkin. Though the dance is now wholly discontinued, it is probable that some of the original elements of it still survive in a country-dance which, under the same name, is still popular in the north of England.

See Douce, "Dissertations on the Ancient Morris Dance," in his *Illustrations of Shakspeare* (1839); Strutt, *Sports and Pastimes of the People of England*; and Brand, *Popular Antiquities* (1849).

MORRISON, ROBERT (1782-1834), the first Protestant missionary to China, was born of Scottish parents at Morpeth, Northumberland, on 5th January 1782. After receiving an elementary education in Newcastle, he was apprenticed to a lastmaker, but his spare hours were devoted to studies connected with theology, and in 1803 he was received into the Independent academy at Hoxton. In the following year he offered his services to the London Missionary Society, by which, after he had attended the mission college of Gosport and studied Chinese under a native teacher, he was sent to Canton in 1807. He was appointed translator to the East India Company's factory

there in 1808, and, in addition to his official duties connected with this post, laboured with intense application at a *Chinese Grammar* and a translation of the New Testament, both of which were published in 1814. In 1817 he published *A View of China for Philological Purposes*, and his translation of the entire Bible was completed in the following year. His next enterprise was the establishment of an Anglo-Chinese college at Malacca for "the reciprocal cultivation of Chinese and European literature," which was opened in 1820. In 1821 his *Chinese Dictionary* was published by the East India Company at an expense of £15,000. Leaving China at the close of 1823 he spent two years in England, where he advocated Chinese missions before large and enthusiastic audiences, and was elected a Fellow of the Royal Society. Returning to China in 1826 he set himself to promote education and to prepare a Chinese commentary on the Bible and other Christian literature. He died at Canton on 1st August 1834. His *Memoirs*, compiled by his widow, were published in 1839 (2 vols. Svo, London).

MORRISTOWN, a city of the United States, county seat of Morris county, New Jersey, lies on the Whippany river, 31 miles from New York by the Morris and Essex division of the Delaware, Lackawanna, and Western Railroad. It was twice the headquarters of the American army during the War of Independence, and Washington's residence, owned by the Washington Association, assisted by the State, is a half-mile to the east. On Whatnong mountain, 3 miles distant, stands the State insane asylum, usually called Morrystown Asylum, a vast granite building 1243 feet long, erected in 1874-1875, and capable of accommodating 1000 patients. The population in 1880 was 5418.

MORSE, SAMUEL FINLEY BREESE (1791-1872), artist and inventor, was born at the foot of Breed's Hill, Charlestown, Massachusetts, on 27th April 1791. His father was the Rev. Jedediah Morse, D.D., the author of *Morse's Geography*. At the age of fourteen Samuel Morse entered Yale College; under the instruction of Professors Day and Silliman he received the first impulse towards those electrical studies with which his name is mainly identified. In 1811 Morse, whose tastes during his early years led him more strongly towards art than towards science, became the pupil of Washington Allston, then the greatest of American artists, and accompanied his master to England, where he remained four years. His success at this period was considerable; but on his return to America in 1815 he failed to obtain commissions for historical paintings, and after working on portraits for two years at Charleston, S.C., he removed first to Washington and afterwards to Albany, finally settling in New York. In 1825 he laid the foundations of the National Academy of Design, and was elected its first president, an office which he filled until 1845. The year 1827 marks the revival of Morse's interest in electricity. It was at that time that he learned from Professor J. F. Dana of Columbia College the elementary facts of electromagnetism. As yet, however, he was devoted to his art, and in 1829 he again went to Europe to study the old masters.

The year of his return, 1832, may be said to close the period of his artistic, and to open that of his scientific life. On board the packet-ship "Sully," which sailed from Havre 1st October 1832, while discussing one day with his fellow-passengers the properties of the electromagnet, he was led to remark: "If the presence of electricity can be made visible in any part of the circuit, I see no reason why intelligence may not be transmitted by electricity." It was not a novel proposition, but the process of formulating it started in his mind a train of new and momentous ideas. The current of electricity, he knew, would pass

instantaneously any distance along a wire; and if it were interrupted a spark would appear. It now occurred to him that the spark might represent a part of speech, either a letter or a number; the absence of the spark, another part; and the duration of its absence, or of the spark itself, a third, so that an alphabet might be easily formed, and words indicated. In a few days he had completed rough drafts of the necessary apparatus, which he displayed to his fellow-passengers.¹ During the twelve years that followed Morse was engaged in a painful struggle to perfect his invention and secure for it a proper presentation to the public. The refusal of the Government to commission him to paint one of the great historical pictures in the rotunda of the Capitol seemed to destroy all his old artistic ambition. In poverty he pursued his new enterprise, making his own models, moulds, and castings, denying himself the common necessities of life and encountering embarrassments and delays of the most disheartening kind. It was not until 1836 that he completed any apparatus that would work, his original idea having been supplemented by his discovery in 1835 of the "relay," by means of which the electric current might be reinforced or renewed where it became weak through distance from its source. Finally, on 2d September 1837, the instrument was exhibited to a few friends at his room in the university building, New York, where a circuit of 1700 feet of copper wire had been set up, with such satisfactory results as to awaken the practical interest of the Messrs Vail, iron and brass workers in New Jersey, who thenceforth became associated with Morse in his undertaking. Morse's petition for a patent was dated 28th September 1837, and was soon followed by a petition to Congress for an appropriation to defray the expense of subjecting the telegraph to actual experiment over a length sufficient to establish its feasibility and demonstrate its value. The committee on commerce, to whom the petition was referred, reported favourably. Congress, however, adjourned without making the appropriation, and meanwhile Morse sailed for Europe to take out patents there. The trip was not a success. In England his application was refused, on the alleged ground that his invention had been already published; and, while he obtained a patent in France, it was subsequently appropriated by the French Government without compensation to himself. His negotiations also with Russia proved futile, and after a year's absence he returned to New York. On 23d February 1843 Congress passed the long-delayed appropriation, steps were at once taken to construct a telegraph from Baltimore to Washington, and on the 24th of May 1844 it was used for the first time. Morse's patents were already secured to him and his associates, and companies were soon formed for the erection of telegraph lines all over the United States. In the year 1847 Morse was compelled to defend his invention in the courts, and successfully vindicated his claim to be called the original inventor of the electromagnetic recording telegraph. Thenceforward Morse's life was spent in witnessing the growth of his enterprise and in gathering the honours which an appreciative public bestowed upon him. As years went by he received from the various foreign Governments their highest distinctions, while in 1858 the representatives of Austria, Belgium, France, the Netherlands, Piedmont, Russia, the Holy See, Sweden, Tuscany, and Turkey appropriated the sum of 400,000 francs in recognition of the use of his instruments in those countries. In the preparations for laying the first Atlantic cable he took an active part, though the attempt of 1857, in which he personally engaged, was not successful. He died 2d April

¹ Five years later the captain of the ship identified under oath Morse's completed instrument with that which Morse had explained on board the "Sully" in 1832.

1872, at New York, where his statue in bronze now stands in the Central Park. His instrument and alphabet are now used on 95 per cent. of the telegraph wires of the world.

(S. I. P.)

MORSHANSK, a district town of Russia, situated in the government of Tamboff, 58 miles (187 miles by rail) to the north of the capital of the province on the Tsna river, a tributary of the Oka, and on the railway between Moscow and Orenburg. The village Morsha was founded only in the middle of the 17th century, and received municipal institutions in 1779; but a hundred years ago it was already a wealthy town, owing to its situation in a most fertile district. Since it was brought into railway communication with Riazhsck (on the railway between Moscow and Riazan) it has acquired still more importance, and has become the chief centre for trade in wheat raised in the governments of Tamboff, Penza, Saratoff, and in the eastern districts of the government of Riazan. Merchants from Moscow, Yaroslav, Vladimir, St Petersburg, and the Baltic ports come to Morshansk to make large purchases of grain, flour, hemp-seed, tallow, and potash. These are sent, either to the Shilovskaya loading-place, or by rail to Moscow. There are in Morshansk several steam flour-mills, distilleries, and large store-houses for grain; the town, though built of wood, is cleaner than most of the towns of the black-earth region. Morshansk has also some importance for the import of manufactured ware brought from the north and sent thence to the villages of the neighbouring districts. Population, 20,000.

MORTALITY TABLES. See INSURANCE, vol. xiii. p. 169 sq.

MORTGAGE. The general object of mortgage is to secure a money debt by making it a charge on land, so that, if the debt be not paid by a time agreed upon between the parties, the creditor may sell the land and pay himself out of the proceeds. In English law this is done by a conveyance of the land in absolute terms to the creditor, subject only to its being defeated if the debt should be paid at the time fixed—an arrangement to which the law has attached peculiar incidents designed to carry out its real object. An absolute conveyance, however, is by no means essential to the purposes of mortgage.

The history of mortgage transactions in Roman law shows three well-marked stages. In the beginning the estate was conveyed absolutely to the creditor, who made a covenant (*fiducia*) to reconvey it when the debt should be paid. All the interest, however, in the meantime passed from the debtor to the creditor, and should the latter refuse to reconvey there was no remedy to the original owner except a personal action. In the second stage (that of *pignus*) the property did not pass to the creditor; he merely received possession of the thing pledged, together with certain rights of sale, &c., in the event of payment not being made at the time appointed. Lastly, without parting with the possession even of the pledge the debtor could create a lien or charge (*hypotheca*) over it in favour of the creditor, who acquired thereby a right on failure of payment to follow the thing by real action against the possessor, whosoever he might be, and to repay himself from the proceeds of his sale.

The mortgage of English law is the result of two distinct influences. Its origin and form belong to the common law; the restrictions by which it is made to serve the purpose of a security only, and nothing more, belong to the courts of equity. In the eye of the common law the mortgagee was the owner of the estate conveyed in the mortgage; in equity the mortgager remains the real owner, and the mortgagee is merely an encumbrancer. A, the owner of land in freehold, conveys to B and his heirs, with a proviso that on repayment of money lent by B to A, on

a future day, with interest until payment, B or his heirs will reconvey the estate to A and his heirs, and that, until default be made in payment, A and his heirs may hold without interruption from B and his heirs. This is a common mortgage of land, and at law, after failure of payment, the land belonged absolutely to the mortgagee, while in the meantime, before payment, the legal estate was considered to be vested in him, subject only to being defeated by payment at the proper time. The Court of Chancery first interfered in the reign of James I. to decree a redemption after forfeiture, and a case in the reign of Charles I. decides that payment after forfeiture has the same effect as payment before. The right of the mortgager to redeem his estate after it has been forfeited, according to the terms of the deed, is called his equity of redemption. No agreement between the parties was suffered to oust the jurisdiction of the court, or to deprive the debtor of his equity of redemption. And this equity, at first regarded as a mere right of the debtor, became established in course of time as an estate in land which descended to the heirs of the mortgager. On the other hand, the interest of the mortgagee is part of his personal estate, and passes to his executor and not to his heir. In spite of the terms of the mortgage, the owner of the land is still the owner, and the mortgagee is a creditor for the money he advanced and the interest thereon. It may be a question whether a given deed is a conveyance or a mortgage, and the court, in deciding, will look at all the circumstances of the case, and will treat it as a mortgage when it was the real intention of the parties that it should operate as a security only. Thus, if the price was grossly inadequate, if the purchaser was not let into immediate possession, if he accounted for the rents to the grantor, retaining an amount equivalent to interest, if the expense of the deed was borne by the grantor, there would be reason to believe that the conveyance was only meant to be a mortgage. And "once a mortgage, always a mortgage;" no subsequent agreements can change its character.

A mortgagee may, however, on default of payment file a bill of foreclosure requiring the mortgager to pay the amount of the debt with interests or costs by an appointed day, or submit to be deprived of his equity of redemption. The effect of failure to pay by the time appointed would be to make the mortgagee absolute owner of the estate; but the court in any foreclosure suit may, at the request of either side, order a sale instead of a foreclosure. And a power of sale is now implied as one of the incidents of the mortgage, unless forbidden or varied by express destination. The mortgagee is entitled to retain out of the proceeds of the sale the amount of his principal, interest, and costs, the surplus belonging to the mortgager. A mortgager cannot require the creditor to receive payment before the time appointed in the deed; and, on default of payment at the appointed time, he must give the creditor six months' notice of his intention to pay off the mortgage, so that the creditor may have time "to look out for a fresh security for his money."

When the same land is successively mortgaged to different persons, their rights take priority according to their chronological order. But the operation of equitable doctrines in the formation of the law of mortgage leads to an important modification of this rule. Of the successive mortgagees, the first only takes the legal estate, and this, according to the maxim of the Court of Chancery, will turn the scale when there is an equality of equitable rights between two contracting parties. Thus, if the third mortgagee had no notice at the time of making his advance of the existence of the second mortgagee, the equities of the two claimants are supposed to be equal, and if nothing else intervened priority of time would decide the order of

their rights. But if the third mortgagee gets an assignment of the first mortgage, he can *tack* his third mortgage to the first, and so postpone the second mortgagee. And if the first mortgagee himself makes an additional advance after the date of the second mortgage, but without notice of it, his whole debt will take precedence of the second mortgagee. A similar result of equitable rules is seen in the consolidation of securities. Two separate estates, mortgaged at different times and for different sums of money by the same mortgager to the same mortgagee, are regarded as consolidated, so that the whole of the land becomes security for the whole of the money, and the owner cannot redeem either mortgage without redeeming the other. So that, as Mr Justice Williams reasons, no person can safely lend money on a second mortgage, for, in addition to the risk of a third mortgagee *tacking*, there is the danger that, if the mortgager should have mortgaged another estate for more than its value, the holder of the deficient security may buy in the first mortgage, consolidate it with his own, and exclude the second mortgagee.

An *equitable* mortgage is constituted simply by the deposit of title-deeds in security for money advanced. The enactment of the Statute of Frauds that no action shall be brought on "any contract or sale of lands," &c., or any interests in or concerning them unless the agreement be in writing and signed by the party to be charged, has been cited as incompatible with the recognition of equitable mortgages, but it is argued by Lord Abinger that the Act was never meant to affect such a transaction. The deeds which are the evidence of title could not be recovered in an action at law, and, if they were claimed in equity, the court would require the claimant to do equity by repaying the money borrowed on the deposit. Any subsequent legal mortgagee, having notice of the deposit, will be postponed to the equitable mortgagee, and when the legal mortgagee has not inquired as to the title-deeds the court will impute to him such knowledge as he would have acquired if he had made inquiry.

As to mortgages of personal property see PLEDGE.

United States.—In the United States there is great diversity in the extent to which equitable principles have been formally substituted for the rules of the common law in dealing with mortgages. Washburn (*Law of Real Property*, vol. ii.) arranges the States into three "pretty well-defined classes." In the first, the mortgage deed is held to create a seizure of and an estate in the premises, with all its common law incidents, to be enforced if need be by ejectment. In the second, the mortgagee's rights are limited to such as the rules of equity prescribe, and may not be enforced by a suit at law. In the third, the mortgagee's interest is not deemed an *estate* at all, but is here only to be enforced by the sale of the premises as a means of paying the debt. In the first class come Massachusetts, Maine, Connecticut, New Hampshire, Rhode Island, Vermont, Indiana, Missouri, North Carolina, Mississippi, Minnesota; in the second, Iowa, Illinois, Pennsylvania, Kentucky, Ohio, Wisconsin, and Texas; in the third, California, Georgia, and New York, to which may be added Oregon. (E. R.)

MORTIFICATION, a term used in surgery signifying a local death. Any cause which interferes with the blood-supply of a portion of the body will, if sufficiently prolonged or sufficiently severe, give rise to mortification. In some cases the death may be preceded by inflammation; in others, as in old people with diseased vessels, the part may die in consequence simply of insufficient blood-supply without any previous inflammation. The part is said to mortify; the process is termed gangrene; the dead part is called a slough. A severe injury may end in mortification. Extreme heat as in severe burns, or extreme cold as in frost-bite, may give rise to the condition. Those parts of the body farthest from the centre of the circulation are most liable to mortification. Frost-bite, for example, may attack the toes or fingers as well as those parts which are most exposed to the cold, more particularly the point of the nose or the ears. The part affected

becomes pale, bloodless, cold, and insensible. The great point to attend to is to restore the circulation gradually, using gentle friction. If the person is brought before a fire, or if any hot applications are used, then a rapid reaction may issue in a severe inflammation, which may be followed by mortification. Chilblain is a mild form of frost-bite occurring in young people with sluggish circulations, very often caused by sitting down before a strong fire with cold feet; any one suffering from cold feet or hands should take plenty of exercise, and if after a return from a sharp walk the feet remain cold the heat should be restored by rubbing with a rough towel.

MORTMAIN, STATUTES OF. The object and effect of these enactments are treated in the articles **CHARITY** and **CORPORATION** (*q.v.*). The following is a list of the Mortmain Acts:—

9 Henry III. c. 36 (Magna Charta); 7 Edward I. st. 2, c. 1 (De Religiosis); 13 Edward I. c. 32; 13 Edward I. c. 41; 18 Edward I. st. 1, c. 3; 27 Edward I. st. 2; 34 Edward I. st. 3; 18 Edward III. st. 3, c. 3; 15 Richard II. c. 5; 21 Henry VIII. c. 6, s. 5; 23 Henry VIII. c. 10; 1 and 2 Philip and Mary, c. 8, s. 51; 35 Elizabeth, c. 4; 21 James I. c. 1; 13 and 14 Charles II. c. 6, s. 10; 29 Charles II. c. 8; 7 and 8 William III. c. 37; 9 George II. c. 36; 43 George III. c. 103; 9 George IV. c. 85; and 2 and 3 William IV. c. 115.

MORTON, JAMES DOUGLAS, fourth earl of (1530-1581), regent of Scotland, second son of Sir George Douglas of Pittendrieh, was born at Dalkeith in 1530. Having married Elizabeth, daughter of the third earl of Morton, he through her succeeded in 1553 to the title and estates of his father-in-law. After the return of Queen Mary in 1561 he was chosen a privy councillor, and in 1563 he became lord high chancellor. Though his sympathies were Protestant, he took no part in the combination of Protestant barons in 1565, but he headed the armed force of 150 men who took possession of Holyrood Palace to effect the assassination of Rizzio, and it was to his house that the leading conspirators adjourned while a messenger was sent to obtain Mary's signature to the "bond of security." The queen, before complying with the request, escaped to Dunbar, and on her return to Edinburgh with an escort of 2000 men Morton and the other leaders fled to England. After her marriage with Bothwell, Morton returned, and with 600 men appeared before Borthwick Castle, where the queen, in dread of a rising, had taken refuge. He was present at the remarkable conference at Carberry Hill, and he also took an active part in obtaining the consent of the queen at Lochleven to an abdication. Thereupon he was reappointed lord high chancellor, and also succeeded Bothwell as lord high admiral. On the death of the earl of Mar he became regent (October 1572). Through his persistence in recovering the crown jewels from the countess of Argyll, widow of the earl of Moray, Morton awakened the bitter animosity of Argyll and Athole, who persuaded the young king James VI. to assume the government. Morton deemed it prudent to resign, and for a time retired to Lochleven, but shortly afterwards, with the assistance of his nephew, the earl of Mar, he obtained possession of Stirling Castle, where the king was residing, and thus for a time recovered his old influence. Suddenly, however, he was accused by James Stewart, earl of Arran, of having taken part in the murder of Darnley, the father of the king, and being tried by a jury of sixteen peers, most of whom were his enemies, was condemned to death and beheaded on 2d June 1581.

MORVEAU. See GUYTON DE MORVEAU.

MOSAIC (late Greek *ψήφος*, from *ψήφος*, a small stone; also *μοσαϊον*, *i.e.*, refined, delicate work; hence the Latin *opus musivum*) is the fitting together of many, generally small, pieces of marble, opaque glass, coloured clays, or other substances, so as to form a pattern; the

design may be of various degrees of elaboration, from the simplest, almost monochromatic, geometrical pattern to the most elaborate picture, with figure-subjects represented in colours of countless gradations.

The earliest existing specimens of mosaic belong to one of the less important branches of the art—namely, the ornamentation on a small scale of jewellery, ivory thrones, and other furniture, or more rarely of some elaborate architectural ornament. Most of this earliest sort of mosaic resembles in execution what are called *cloisonnée* enamels. In the Louvre and in the British Museum are preserved some very beautiful ivory carvings in low relief, some from Nineveh and others from Egypt, in which figures of deities, ornaments formed of the lotus and papyrus plants, and royal cartouches are enriched by small pieces of glass or lapis-lazuli and other gem-like stones, which are set into holes made in the ivory. Each minute piece is separated from the next by a thin wall or *cloison* of ivory, about as thick as cardboard, which thus forms a white outline, and sets off the brilliance of the coloured stones. The favourite pattern in this sort of work for decorating the larger surfaces appears to have been suggested by the feathers on a bird's wing. See *IVORY*, vol. xiii. pl. vii. fig. 3.

Recent excavations at Tel al-Yahudiya in Lower Egypt have brought to light some mosaics on a larger scale, but treated in the same way. These are caps of columns, wall tiles, and other objects, either of white limestone or earthenware, in which designs, chiefly some forms of the papyrus, are formed by brilliantly-coloured bits of glass or enamelled earthenware, set into a sinking in the tile or column. This form of mosaic was employed by the Greeks: the Erechtheum at Athens, built in the middle of the 5th century B.C., had the bases of some of its white marble columns ornamented with a plait-like design, in which pieces of coloured glass were inserted to emphasize the main lines of the pattern.

Another, quite different sort of mosaic was known to the Egyptians of the Ptolemaic and Roman periods. This is made entirely of glass, and is extremely minute. The finest known specimen is in the British Museum: it is a small tablet about three-eighths of an inch square, apparently the bezel of a ring, on which is represented the sacred hawk,—every feather on the bird's wing being produced with a great number of colours and tints, each quite distinct, and so minute that a strong magnifying glass is required to distinguish its details.

The way in which this wonderful little mosaic was produced is extremely ingenious. Numbers of long sticks of various-coloured glass were arranged in such a way that their ends produced the figure of the hawk; other sticks of blue glass were placed all round so as to form the ground. The whole bundle of sticks of glass when looked at endwise now presented the figure of the hawk with a blue background, immensely larger than it afterwards became. The bundle was then heated till the sticks melted together, and the whole thick rod, softened by fire, was then drawn out to a greatly-diminished thickness. In this process the relative positions of the sticks of coloured glass forming the design were not altered. A slice of the rod was then cut off, and its faces polished,—the design, much reduced in size, of course being equally visible at both sides of the slice; and thus the microscopic minuteness of the mosaic was produced, with astonishing delicacy and refinement; many slices, each showing the same mosaic, could be cut from the same rod.

The more important use of mosaic has been on a large scale either for pavements or for walls and vaulted ceilings. Mosaic for these purposes has by many writers, both ancient and modern, been divided on various systems into classes; perhaps the simplest classification is the following:—

I. *For Pavements*:—(a) *Tesselated*, in which the design is formed of small cubes, generally of marble, more rarely of glass or clay; (b) *Sectile*, formed of larger pieces of marble, shaped and cut so as to fit accurately one with another. II. *For Walls and Vaults*:—*Fictile* or *vermiculいたed*; pieces of opaque glass, in small cubes, arranged so as to form complicated pictures.

This classification is not altogether satisfactory, more than one method often being employed in the same mosaic; as, e.g., in the "opus Alexandrinum" of mediæval writers, which is often partly tesselated and partly sectile.

Until Roman times we know but little of these kinds of mosaic. There is some evidence (in Pliny and other writers) to show that elaborate mosaic pavements, *λιθόστροτον* or *λιθολόγημα*, were made by the Greeks in the 4th century B.C., or even earlier; but most of the numerous fine specimens of tesselated work still existing in Greece, such as those at Sparta and Athens, must be referred to the time of the Roman occupation. The best examples of Hellenic mosaic are some pavements discovered during the recent excavations at Olympia. (see fig. 1 and *Ausgrabungen zu Olympia*, 1877-82).

Among the Romans the use of mosaic, both of marble and opaque glass, was very extensive. According to Pliny (*H.N.*, xxxvi. 25), they derived this art from the Greeks, but not until the time of the Third Punic War, 146 B.C., while glass mosaics for walls, "*vitreae parietes*," were a recent invention in his time. Many of these have been found at Pompeii; most commonly they are used to decorate niches for fountains or statuettes. Judging from the description given by Vitruvius (vii. 1), and an examination of numerous specimens of Roman tesselated mosaics:

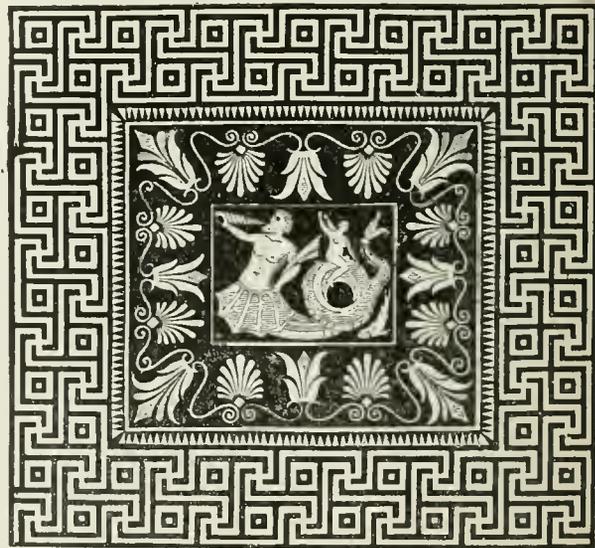

FIG. 1.—Greek Pavement from the Temple of Zeus at Olympia.

the process of manufacture was the following: The earth was first carefully rammed down to a firm and even surface; on this was laid a thick bed of stones, dry rubbish, and lime, called "*rudus*," from 6 to 9 inches deep, and above this another layer, 4 to 6 inches thick, called "*nucleus*," of one part of lime to three of pounded brick, mixed with water; on this, while still soft, the pattern could be sketched out with a wooden or metal point, and the tesserae or small bits of marble stuck into it, with their smoothest side uppermost. Lime, pounded white marble, and water were then mixed to the consistency of cream, forming a very hard setting cement, called "*marmoratum*." This cement, while fluid, was poured over the marble surface, and well brushed into all the interstices between the tesserae. When the

concrete and cement were both set, the surface of the pavement was rubbed down and polished. This kind of mosaic was largely used for floors of hypocausts; the concrete bed was then supported on large tiles resting on numbers of short pillars.

If used for upper floors very strong joists were required, and both Pliny (xxxvi. 25) and Vitruvius (vii. 1) recommend a *double* layer of boards, one crossing the other, on which the concrete and cement bedding was to be laid.

The usual Roman pavement was made of pieces of marble, averaging from a half to a quarter of an inch square, but rather irregular in shape. A few other, but quite exceptional, kinds of mosaic pavements have been found, such as that at the Isola Farnese, 9 miles from Rome, made of tile-like slabs of green glass, and a fine "sectile" pavement on the Palatine Hill, made of various-shaped pieces of glass, in black, white, and deep yellow. In some cases—*e.g.*, in the "House of the Faun" at Pompeii—glass tesserae in small quantities have been mixed with the marble ones, for the sake of greater brilliance of colour. Pompeii is especially rich in its mosaics both on floor and walls, almost every house having at least its vestibule paved in this way.

In addition to graceful flowing patterns and geometrical designs, picture-like subjects of great elaboration frequently occur: of these the most important is the large and minutely-executed scene of the battle of Issus, found in the "House of the Faun." It is of special value as being the chief classical historical picture still existing. It is a well-designed though somewhat crowded composition, representing the moment of Alexander's victorious charge against the cavalry of Darius. The expression of the faces and the characteristic dresses of the Greeks and Persians are represented with great skill (see fig. 2). The tesserae, as was always the case in this sort of work, are not all the same size, the smallest (only about one-tenth of an inch square) being reserved for the faces, where greatest refinement of detail was required. This was a floor-mosaic, though generally these minutely-executed works were affixed to walls.

The most skilfully-executed of all existing mosaics of this pictorial kind is that known as "Pliny's Doves," found in Hadrian's villa at Tivoli, and now in the Capitoline Museum. It may possibly be the one so highly praised by Pliny (xxxvi. 25) as the work of Sosus, for, although he describes it as being at Pergamum, yet it was a common practice with the Romans to transport these mosaics from one place to another, and this very celebrated one may well have been brought to Tivoli to adorn the emperor's villa. It is treated in a very realistic way: the light on the gold bowl, the plumage of the doves, and especially the reflexion in the water of the drinking dove, are represented with wonderful skill. It is, in fact, far too pictorial, and, like the late mosaics in St Peter's, Rome, is more remarkable for its technical skill than for any real artistic merit. This excessive realism, produced with great difficulty and cost, is a not uncommon fault of the more elaborate Roman mosaics, and was the inevitable result of the luxury and ostentation of imperial Rome, which made art the bond-slave of the wealthy, rather than the free and natural expression of a whole people, as it was among the earlier Greeks.

Another interesting mosaic from the wall of a house at Pompeii, of extremely delicate work, is a rehearsal scene in a Greek theatre, where the choregus is instructing the actors: it is specially remarkable from its being signed as the work of Dioscorides of Samos. Other figure-subjects are not uncommon, such as various representations of the victory of Theseus over the Minotaur, others of Achilles in Scyros, many hunting scenes, and the like.

Throughout England, Germany, France, Spain, Asia Minor, and Northern Africa in no way have signs of Roman occupation been left so clearly and in so conspicuous a form as by the numerous large and generally well-preserved mosaic pavements which have at various times been discovered in all these countries. In many cases, long after all traces of the walls of the buildings have disappeared, owing to their being dug up and removed for building purposes, the mosaics still remain to testify of the artistic power and mechanical skill of the Roman colonists.

Few countries are richer than England in these remains; the great pavements of York, Woodchester, Cirencester, and many other places are as elaborate in design and as

skilfully executed as any that now exist even in Rome itself. In whatever country these mosaics are found, their style and method of treatment are always much the same; the materials only of which the tesserae are made vary according to the stone or marble supplied by each country. In England, for instance, limestone or chalk often takes the place of the white marble so common in Italian and North African mosaics; while, instead of red marble, a fine sort of burnt clay or red sandstone is generally used; other makeshifts had to be resorted to, and many of the Anglo-Roman mosaics are made entirely without marble. It is perhaps partly owing to the great wealth of Northern Africa in marbles of many colours and of varying shades that the finest of all Roman mosaics have been found in Algeria and Tunis, especially those

FIG. 2.—Part of a Persian's Head from the Battle of Issus; full size.

from Carthage, some of which have been brought to the British Museum. See *Archæologia*, vol. xxxviii, p. 202.

The range of colour in the marble tesserae is very great, and is made use of with wonderful taste and skill: there are three or four different shades of red, and an equal number of yellows and greens, the last colour in all its tints being almost peculiar to this part of Africa, and one of the most pleasant and harmonious in almost any combination. Deep black, browns, and bluish-greys are also abundant. The white marble which forms the ground of nearly all the designs is often not pure white, but slightly striated with grey, giving great softness and beauty of texture to the surface, and doing away with too great monotony of tone. The Roman practice, common to all their mosaics, of not fitting the tesserae quite closely together, but allowing the cement joints to show freely, was also of great value in giving effect to the general texture of the surface—a point quite forgotten by some later mosaic-workers, who thought that the closer their tesserae were fitted together the better the mosaic would be. This remark does not apply to sectile mosaic, in which sufficient variety can be given by the markings and veins in each piece of marble. To return to the mosaics from Carthage, they are no less excellent in design than in the richness and beauty of their materials. Large spaces

are filled by grand sweeping curves of acanthus and other leaves, drawn with wonderful boldness and freedom of hand, and varied with great wealth of invention. Without the use of very small tesserae, much richness of effect is given by gradations of tints, suggesting light and shade, without a painful attempt to represent actual relief. The colours of the marbles used here and elsewhere by the Romans are so quiet and harmonious that it would have been almost impossible to produce with them a harsh or glaring design, and when used with the skill and strong artistic feeling of the mosaic-workers at Carthage the result is a real masterpiece of decorative design. In Rome, and in the Roman colonies of Europe, this kind of marble tessellated mosaic was largely produced, with but little alteration in style or method of treatment, till the 4th century. In Syria and Asia Minor the art survived some centuries later.

Perhaps the latest existing example in Rome is that which decorates the vault of the ambulatory of the circular church of S. Costanza, built by Constantine the Great (320), outside the walls of Rome. This very interesting mosaic might from its style and materials have been executed in the 1st century, and is equal in beauty to any work of the kind in Italy. It shows no trace whatever of the Byzantine influence which, in the next century, introduced into Italy a novel style of mosaic, in materials of the most glittering splendour. These S. Costanza mosaics are almost unique in Italy as an application of the old classical marble mosaic to the decoration of a Christian church. On the main compartment of the vault the surface is covered by vine branches, laden with grapes, twining in graceful curves over the space. In the centre is a large medallion with life-sized male bust, and at the lower part are vintage scenes—oxen carts bringing the grapes, and boys treading them in a vat. Other more geometrical designs, of circles framing busts and full-length figures, with graceful borders, cover other parts of the vault. Farther east this classical style of mosaic appears to have lasted till the 6th century. At Kabr-Hiram, near Tyre, M. Renan discovered among the ruins of a small three-apsed Christian church a fine mosaic pavement, covering the nave and aisles, thoroughly classical in style. The design, consisting of circles enclosing figures emblematic of the seasons, the months, and the winds, is almost the same as that of some mosaics discovered on the site of the Roman Italica near Seville, and others at Ephesus and Halicarnassus in Asia Minor. No trace of other than classical influence is visible, and yet it is pretty clear, from the evidence of an inscription, inlaid among the marble tesserae, that the date of this pavement is not earlier than the latter part of the 6th century. A very similar mosaic, of about the same date, was discovered at Neby Yûnas, near Sidon.

Mediæval Mosaics.—These may be divided into four principal classes:—(1) those used to decorate walls and vaults, made of glass cubes; (2) those for pavements, made of marble, partly in large shaped pieces, and partly in small tesserae; (3) glass in small pieces, either rectangular or triangular, used to enrich marble pulpits, columns, and other architectural features; (4) wood mosaics.

1. The wall mosaics were, in their origin, purely Byzantine, and appear to date from the beginning of the 5th century. They are made of coloured glass, rendered opaque by the addition of oxide of tin. The melted glass was cast into flat slabs, generally about half an inch thick, and then broken into small cubes. Every possible colour and gradation of tint was produced by the mediæval glassmakers. Tesserae of gold (which were very largely used) and of silver were made thus:—the metal leaf was spread over one of the glass slabs, the colour of which did not matter, as it was hidden by the gold or silver; over this metal-coated slab a skin of colourless glass was fused, so as to protect the metal leaf from injury or tarnish; and then the slab was broken up into cubes, the ψήφοι χρύσειοι of Byzantine writers.

The method of putting together the mosaic was much the same as that employed by the Romans in their tessellated pavements. A thick coat of cement was applied to the wall or vault, the outline indicated with a metal point, and the cubes stuck one by one into the cement while it

was yet soft,—the main difference being that no rubbing down and polishing were required, the faces of the glass tesserae showing the natural surface of the fracture, which was not quite level, and by this slight inequality of surface great additional lustre and brilliance of effect were given to the whole picture.

Owing to the intense conservatism of Byzantine art, no regular stages of progression can be traced in this class of mosaic. Some of the 5th century mosaics at Ravenna are, in every way, as fine as those of the 12th, and it was not till the end of the 13th century that any important change in style took place, when Cimabue, and more especially his pupils Jacopo da Turrita and Taddeo Gaddi, applied their increased knowledge of the human form and of the harmonies of colour to the production of the most beautiful of all mosaics, such as those in the apse of S. Maria Maggiore in Rome. It must not, however, be supposed that during all this time (from the 5th to the 14th century) one steady level of excellence was kept up. The mosaics of the 9th century are inferior in drawing and general treatment to those both of the earlier and later time, while in Italy at least this art was almost entirely extinct during the 10th and 11th centuries. Extreme splendour of colour and jewel-like brilliance combined with the most stately grandeur of form are the main characteristic of this sort of decoration. Its most frequent application is to the sanctuary arch and apse of the early basilicas.

A "majesty," or colossal central figure of Christ with saints standing on each side, is the most frequent motive. In many cases, especially in the 5th and 6th centuries, Christ was represented as a lamb, to whom the twelve apostles, in the form of sheep, are paying adoration. Christ, the Good Shepherd, is sometimes depicted as a beardless youth, seated among a circle of sheep—the treatment of the motive being obviously taken from pagan representations of Orpheus playing to the beasts. The tomb of Galla Placidia has a good example of this subject, with much of the old Roman grace in the drawing and composition. Frequently the Virgin Mary, or the patron saint of the church, occupies the central space in the apse, with ranges of other saints on each side.

The "Doom," or Last Judgment, is a favourite subject for domes and sanctuary arches; the Florence baptistery has one of the grandest mosaic pictures of this subject, executed in the 13th century. The earlier baptisteries usually have the scene of Christ's baptism,—the river Jordan being sometimes personified in a very classical manner, as an old man with flowing beard, holding an urn from which a stream pours forth. S. Vitale at Ravenna has in the sanctuary a very interesting representation of Justinian and his empress Theodora (see fig. 3), attended by a numerous suite of courtiers and ladies; these mosaics are certainly of the 6th century, and may be contemporary with Justinian, though the fact that he and Theodora are each represented with a circular nimbus appears to indicate that they were not then alive. Scenes from both Old and New Testaments or the lives of the saints are also represented in almost endless variety,—generally on the walls of the body of the church, in square-shaped pictures, arranged in one or more tiers over the nave columns or arcade.

In mosaics of the best periods the treatment of the forms and draperies is broad and simple, a just amount of relief being expressed by delicate gradations of tints. In mosaics of the 9th century the drawing is very awkward, and the folds of the robes are rudely expressed in outline, with no suggestion of light and shade.

A further application of this work was to the decoration of broad bands over the columns of the nave, as at S. Maria Maggiore in Rome, 5th century, and in the two churches of S. Apollinare at Ravenna, 6th century. In some cases almost the whole interior of the church was encrusted in this magnificent way, as at Monreale Cathedral, the Capella Palatina of Palermo, and S. Mark's at Venice, the magnificence of which no words can describe; it is quite unrivalled by that of any other buildings in the world. See MONREALE.

In these churches the mosaics cover soffits and angles entirely, and give the effect of a mass of solid gold and colour producing the utmost conceivable splendour of

decoration.¹ In many cases vaulted ceilings were covered with these mosaics, as the tomb of Galla Placidia, 450 A.D., and the two baptisteries at Ravenna, 5th and 6th centuries. For exteriors, the large use of mosaic was usually confined to the west façade, as at S. Miniato, Florence, S. Maria Maggiore, Rome, and S. Mark's, Venice. In almost all cases the figures are represented on a gold ground, and gold is freely used in the dresses and ornaments—rich jewels and embroidery being represented in gold, silver, sparkling reds, blues, and other colours, so as to give the utmost splendour of effect to the figures and their drapery.

The revival of the art of painting in Italy and the

pupils Jacopo da Turrita, Giotto, and Taddeo Gaddi was equally applicable to painting or mosaic, yet soon the development of art into greater realism and complexity required a method of expression unfettered by the necessities and canons of mosaic-work. Pietro Cavallini, a Roman artist, was one of the last who worked according to the old traditions. His mosaic of the birth of the Virgin in S. Maria in Cosmedin, Rome, executed about the middle of the 14th century, is not without merit, though his superior knowledge of form has only caused his composition to be somewhat feeble and insipid compared with the works of the earlier artists. Even in the 15th century a few good mosaics were produced at Venice and elsewhere. Since then many large pictures have been copied in glass mosaic, generally attempts to imitate oil paintings, executed with great skill and wonderful patience, but all utterly worthless as works of art, merely costly monuments of human folly and misapplied labour. The mosaics from Titian's pictures on the west end of S. Mark's at Venice, Raphael's in the Chigi Chapel in S. Maria del Popolo, and many large pictures in S. Peter's in Rome, are the most striking examples of these.

The following list, in chronological order, comprises a selection from among the most important mediæval glass wall-mosaics during the period when mosaic-working was a real art:—

FIG. 3.—Mosaic of Theodora and attendants, from S. Vitale, Ravenna; over life-size.

introduction of fresco work in the 14th century gave the deathblow to the true art of wall-mosaics. Though at first the simple and archaic style of Cimabue and his

¹ Unfortunately the world-wide fame of S. Mark's and the other great churches of Italy has subjected these extraordinary works to the fatal process of "restoration," and wherever any sign of decay in the cement backing (the tesserae themselves are quite indestructible) has given the least excuse the "restorers" have destroyed whole masses of ancient work, and supplied its place with worthless modern copies. The mosaics of the S. Mark's baptistery, and of the apses at S. Miniato, at Pisa, and many other places have in this way been wantonly renewed within the last few years.

	S. Maria in Cosmedin—on walls by Pietro Cavallini, c. 1340.
Venice.	SS. Giovanni e Paolo—in arch over effigy of Doge Morosini.

This list is by no means exhaustive, and only gives some of the best and most typical examples of the mosaic-work of each century.

The Byzantine origin of these great wall-mosaics, wherever they are found, is amply proved both by internal and documentary evidence. The gorgeous mosaics of S. Sophia and S. Saviour's in Constantinople, 6th century, and the later ones in the monasteries of Mount Athos, at Salonica and at Daphne near Athens, are identical in style with those of Italy of the same date. Moreover, the even more beautiful mosaic-work in the "Dome of the Rock" at Jerusalem, 7th and 11th centuries, and that in the sanctuary of the great mosque of Cordova, of the 10th century, are known to be the work of Byzantine artists, in spite of their thoroughly Oriental design. The same is the case with the rarer mosaics of Germany, such as those in S. Gereon at Cologne and at Parenzo.

A very remarkable, almost unique, specimen of Byzantine mosaic is now preserved in the "Opera del Duomo," Florence. This is a diptych of the 11th century, of extremely minute, almost microscopic, work, in tesserae of glass and metal, perhaps the only example of tesserae made of solid metal. It has figures of saints and inscriptions, each tessera being scarcely larger than a pin's head. This beautiful diptych originally belonged to the imperial chapel in Constantinople, and was brought to Florence in the 14th century.

2. The second mediæval class, mosaic pavements, though of great beauty, are of less artistic importance.

This so-called "opus Alexandrinum" is very common throughout Italy and in the East, and came to greatest perfection in the 13th century. It is made partly of small marble tesserae forming the main lines of the pattern, and partly of large pieces used as a ground or matrix. It is generally designed in large flowing bands which interlace and enclose circles, often of one stone sliced from a column. The finest example is that at S. Mark's, Venice, of the 12th century. The materials are mainly white marble, with green and red porphyry, and sometimes glass.

Besides the countless churches in Italy possessing these beautiful pavements, such as S. Lorenzo, S. Marco, S. Maria Maggiore, and S. Maria in Trastevere, in Rome, we have, in the Chapel of the Confessor, and in front of the high altar at Westminster, very fine specimens of this work, executed about 1268 by a Roman artist called Odericus, who was brought to England by Abbot Ware, on the occasion of a visit made by the latter to Rome. Another English example is the mosaic pavement in front of the shrine of Becket at Canterbury; this is probably the work of an Englishman, though the materials are foreign, as it is partly inlaid with bronze, a peculiarity never found in Italy. There are also many fine examples of these pavements in the churches of the East, such as that in S. Sophia at Trebizond, of the most elaborate design and splendid materials, very like the S. Mark's pavement at Venice. Palermo and Monreale are especially rich in examples of scutelle mosaic, used both for pavements and walls,—in the latter case generally for the lower part of the walls, the upper part being covered with the glass mosaics. The designs of these Sicilian works, mostly executed under the Norman kings in the 12th century, are very Oriental in character, and in many cases were actually executed by Moslem workmen. Fig. 4 gives a specimen of this

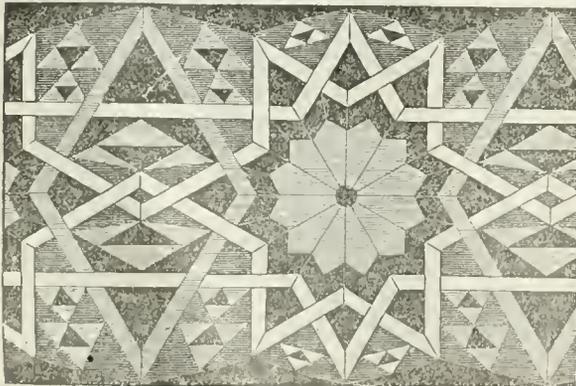

FIG. 4.—Marble Mosaic at Monreale Cathedral.

mosaic from Monreale cathedral. Its chief characteristic is the absence of curved lines, so largely used in the splendid opus Alexandrinum of Italy, arising from the fact that this class of Oriental design was mainly used for the delicate panelling in wood on their

pulpits, doors, &c.,—wood being a material quite unsuited for the production of large curves.

3. Glass mosaic, used to ornament ambones, pulpits, tombs, bishops' thrones, baldacchini columns, architraves, and other marble objects, is chiefly Italian. The designs, when it is used to enrich flat surfaces, such as panels or architraves, are very similar to those of the pavements last described. The white marble is used as a matrix, in which sinkings are made to hold the glass tessera; twisted columns are frequently ornamented with a spiral band of this glass mosaic, or flutings are suggested by parallel bands on straight columns. The cloisters of S. Giovanni in Laterano and S. Paolo fuori le mura have splendid examples of these enriched shafts and architraves.

This style of work was largely employed from the 6th to the 14th centuries. One family in Italy, the Cosmati, during the whole of the 13th century, was especially skilled in this craft, and the various members of it produced an extraordinary amount of rich and beautiful work. The pulpit in S. Maria in Ara Cœli, Rome, is one of the finest specimens (see fig. 5), as are also the ambones in S. Cle

mentino and S. Lorenzo, and that in Salerno cathedral. The tomb of Henry III., 1291, and the shrine of the Confessor, 1269, at Westminster are the only examples of this work in England. They were executed by "Petrus civis Romanus," probably a pupil of the Cosmati.

In India, especially during the 17th century, many Mohammedan buildings were decorated with fine marble inlay of the class now called "Florentine." This is scutelle mosaic, formed by shaped pieces of various-coloured marbles set into a marble matrix. A great deal of the Indian mosaic of this sort was executed by Italian workmen; the finest examples are at Agra, such as the Taj Mahal.

The modern so-called "Roman mosaic" is formed of short and slender sticks of coloured glass fixed in cement, the ends, which form the pattern, being finally rubbed down and polished.

Many not unsuccessful attempts have been made lately to reproduce the Roman tessellated work for pavements; and at Murano, near Venice, glass wall-mosaics are still produced in imitation of the magnificent works of mediæval times.

4. Mosaics in wood are largely used in Mohammedan buildings, especially from the 14th to the 17th centuries. The finest specimens of this work are at Cairo and Damascus, and are used chiefly to decorate the magnificent pulpits and other woodwork in the mosques. The patterns are very delicate and complicated, worked in inlay of small pieces of various-coloured woods, often further enriched by bits of mother-of-pearl and minutely carved ivory. The general effect is extremely splendid from the combined beauties of the materials and workmanship, as well as from the marvellous grace and fancy of the designs. This art was also practised largely by the Copts of Egypt, and much used by them to ornament the magnificent iconostases and other screens in their churches.

Another application of wood to mosaic-work, called "intarsia-tura," was very common in Italy, especially in Tuscany and Lombardy, during the 15th and early 16th centuries. Its chief use was for the decoration of the stalls and lecterns in the church-choirs. Very small bits of various-coloured woods were used to produce geometrical patterns, while figure-subjects, views of buildings with strong perspective effects, and even landscapes, were very skilfully produced by an inlay of larger pieces. Ambrogio Borgognone, Raphael, and other great painters often drew the designs for this sort of work. The mosaic figures in the panels of the stalls at the

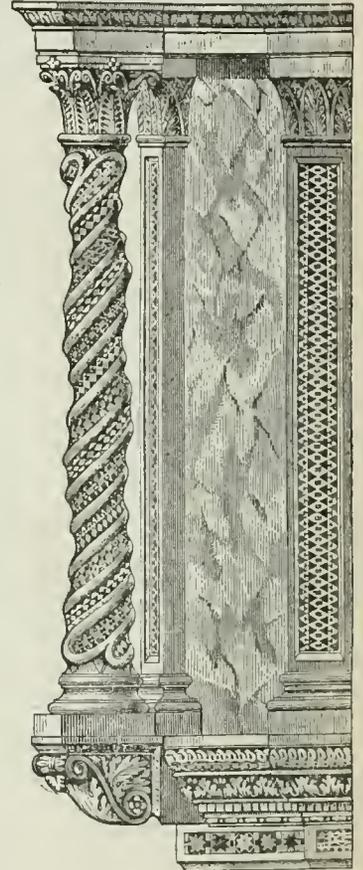

FIG. 5.—Part of Marble Pulpit with glass mosaic, church of Ara Cœli, Rome.

Certosa near Pavia were by Borgognone, and are extremely beautiful. The stalls in Siena cathedral and in S. Pietro de' Casinensi at Perugia, the latter from Raphael's designs, are among the finest works of this sort, which are very numerous in Italy. It has also been used on a smaller scale to ornament furniture, and especially the "Cassoni," or large trousseau coffers, on which the most costly and elaborate decorations were often lavished. Some traditional skill in this art still lingers in Italy, especially in the city of Siena.

MOSCHELES, IGNAZ (1794-1870), one of the most refined and accomplished pianists of the present century, was born at Prague, 30th May 1794, and first studied music at the Conservatorium in that city under the direction of Dionys Weber. At the age of fourteen he made his first appearance before the public in a pianoforte concert of his own composition with marked success. Soon after this he removed to Vienna, where he studied counterpoint under Albrechtsberger and composition under Salieri. In 1814 he prepared, with Beethoven's consent, the pianoforte arrangement of *Fidelio*, afterwards published by Messrs Artaria. In the following year he published his celebrated *Variationen über den Alexandermarsch*, a concert piece of great difficulty, which he played with so great effect that he was at once recognized as the most brilliant performer of the day. He then started on a tour, during the course of which he visited most of the great capitals of Europe, making his first appearance in London in 1822, and there securing the friendship of Muzio Clementi and John Cramer, the fathers of the English school of pianoforte playing. For a concert given by the latter he wrote his famous *Hommage à Händel*, a duet for two pianofortes, which afterwards became a lasting favourite with the public. His reception in England was sufficiently encouraging to justify his return in 1823, when he again met with a hearty welcome. During a visit to Berlin in 1824 he first became acquainted with Mendelssohn, then a boy of fifteen; and a friendship sprang up between them which was severed only by Mendelssohn's early death.

In 1826 Moscheles relinquished his wandering habits, and settled permanently in London, surrounding himself with a *clientèle* fully capable of appreciating his talents as an artist and his social worth as a firm and loyal friend. His position was henceforth a more than ordinarily enviable one. He was recognized from end to end of Europe as a *virtuoso* of the highest rank; and his popularity both as a performer and as a teacher was based on grounds which effectually secured it from the caprice of changing fashion or ephemeral patronage. He was undoubtedly for some considerable time the greatest executant of his age; but, using his brilliant touch as a means and not as an end, he consistently devoted himself to the further development of the

true classical school, interpreting the works of the great masters with conscientious fidelity, and in his extempore performances, which were of quite exceptional excellence, exhibiting a fertility of invention which never failed to please the most fastidious taste.

In 1837 Moscheles conducted Beethoven's Ninth Symphony at the Philharmonic Society's concerts with extraordinary success; and on this and other occasions contributed not a little, by his skilful use of the baton, to the prosperity of the time-honoured association. During the course of his long residence in London he laboured incessantly in the cause of art, playing at innumerable concerts, both public and private, and instructing a long line of pupils, who flocked to him, in unbroken succession, until the year 1848, when, at Mendelssohn's earnest solicitation, he removed to Leipsic, to carry on a similar work at the Conservatorium then recently founded in that city. In this new sphere he worked with unabated zeal for more than twenty years, dying 10th March 1870.

Moscheles's most important compositions are his Pianoforte Concertos, Sonatas, and Studies; his *Hommage à Händel*; and his three celebrated *Allegri di Bravura*.

MOSCHUS, of Syracuse, is one of the Greek bucolic poets; he was a friend of the Alexandrian grammarian Aristarchus (about 200 B.C.). His chief work is the epitaph of Bion of Smyrna, another of the bucolic poets, who seems to have lived in Sicily. It is probable that the miscellaneous collection of poems which we possess by the three poets Theocritus, Bion, and Moschus was known to Artemidorus in 200 B.C. His poetry is the work of a well-educated man with a trained artistic eye; he models his works on those of Bion, writing epigrammatic, epic, and idyllic or elegiac verses, all except a few lines being in hexameter verse; but he treats all his subjects in a descriptive, not in a narrative or an epigrammatic style. Besides the epitaph of Bion, he wrote two little epic poems, "Europa" and "Megara," and a pretty little epigram, "Love the Runaway;" and a few short pieces of his are also preserved. They are written with much elegance, but the style is perhaps too refined and carefully wrought, and he has few of the higher qualities of a poet.

MOSCOW, a government of Central Russia, bounded by Tver on the N.W., Vladimir and Ryazan on the E., Tula and Kaluga on the S., and Smolensk on the W., and having an area of 12,858 square miles. The surface is undulating, with broad depressions occupied by the rivers, and varies in elevation from 500 to 850 feet. Moscow is situated in the centre of the so-called Moscow coal-basin, which extends into the neighbouring governments, and consists of limestones of the Upper and Lower Carboniferous, the latter containing beds of inferior coal, while the former contains several good quarries of marble. The Carboniferous formation is covered with Jurassic clays, sandstones, and sands, which yield a good china-clay at Gjeli, copperas, a sandstone much employed for building, and a white sand used for the manufacture of glass. The whole is thickly covered with boulder-clay and alluvial sands.

The government is watered by the Volga, which skirts it for a few miles on its northern boundary, by the navigable Sestra, which brings it in communication with the canals leading to St Petersburg, by the Oka, and by the Moskva. This last takes its origin in Smolensk, and, after a course of 280 miles right across Moscow, reaches the Oka at Kolomna; it is navigable from the town of Moscow. The Oka and Moskva from a remote period have been important channels of trade, and continue to be so notwithstanding the development of railways. The Oka brings the government into water communication with the Volga, whose tributaries cover nearly the whole of middle and eastern Russia, and are separated by short land distances from the Northern Dvina and the Don. Large quantities of grain, metals, glass ware, skins, and other commodities are shipped up and down the Moskva, whilst the Myachkovo stone quarries situated on its banks supply the capital with building stone. There are several marshes, mostly in the north.

where also, as well as in the north-east, notwithstanding the immense consumption of wood in manufactures and for use in the capital, extensive forests are still found. Very large supplies of timber are also imported by rail or river, especially from the adjoining north-eastern provinces. The soil is somewhat unproductive, the average crops ranging from $3\frac{1}{2}$ to $4\frac{1}{2}$ returns; agriculture is carried on everywhere, but only two districts (Ruza and Volkolamsk) export corn, all the others being more or less dependent on extraneous supplies. The agricultural holdings of the peasants are very small, and their condition on the whole unsatisfactory.¹ Grass crops have some importance in several districts, and kitchen-gardening is an important source of wealth in Vereya, Dmitroff, and Zvenigorod. Cattle are not extensively reared, but the horse-breeding industry is somewhat important.

The population, 1,581,700 in 1864, numbered 1,913,700 in 1873, one-third being urban. They are nearly all Great-Russians, and belong to the Greek Church, or are nonconformists. Many are employed in factories, the number of which in 1879 was 1546, occupying 162,700 hands, and having an annual production of about £20,000,000 sterling. These figures show the manufacturing activity of Moscow to be greater than that of any other Russian government, while the value produced is upwards of one-fifth of the total for all Russia in Europe, including Poland. Cotton, woollen, and silk goods are the chief products. The sanitary condition of the factories is very bad; the number of children below fifteen years employed is as high as 16 per cent., the hours of daily work are often 13 to 16, and the mortality is very great. The total income obtained by the population of the government from their manufacturing industry is estimated at £485,600. The chief income of the people is derived, however, from a variety of petty industries, carried on in their villages by the peasants, who continue at the same time to cultivate the soil. Taxation during the last twenty years has been increasing rapidly, and in some parts of the government has reached an average of 12 roubles per house. The chief centres of trade are Moscow, Kolomna, Serpukhoff, Bogorodsk, Serghievsk, and Pavlovsk. There are 125 fairs. Transport is much facilitated by railways, and by good highroads radiating from the capital. Moscow is divided into thirteen districts, the chief towns with their respective populations being—Moscow (670,000), Bogorodsk (6600), Bronnitsy (3500), Ruza (4000), Kolomna (18,800), Serpukhoff (16,800), Podolsk (11,000), Zvenigorod (7800), Mojaïsk (4200), Volokolamsk (3000), Klin (6700), Dmitroff (7600), and Vereya (5500). In addition to these administrative centres may be mentioned Voskresensk (6000), Serghievski Posad (27,500), in the neighbourhood of the monastery of Troitsa, a rich commercial and industrial town, and Pavlovski Posad (4500). Many of the villages are far more important from their industries and trade than the district towns.

MOSCOW (Russian, *Moskva*), the second capital of the Russian empire and chief town of the government and district of the same name, is situated in $55^{\circ} 45' N.$ lat. and $37^{\circ} 37' E.$ long., on both banks of the river Moskva, a tributary of the Oka, at its confluence with the rivulet Yauza. The popular idea is that Moscow is built on seven hills, and in fact the city covers several eminences, the altitudes of its different parts varying from 500 to 850 feet above the level of the sea. It is 400 miles from St Petersburg, 813 from Archangel, 900 from Ufa, 938 from Astrakhan, 933 from Odessa, and 811 from Warsaw. It lies to the north of the most densely-peopled parts of Russia (the "black-earth region"), whilst the country to the north of it is rather thinly peopled as far as the Volga, and very sparsely beyond that. The space between the middle Oka and the Volga, however, was the very cradle of the Great-Russian nationality (Novgorod and Pskov excluded); and four or five centuries ago Moscow had a quite central position with regard to this.

The present city measures 7 miles from north to south, and 9 miles from west-south-west to east-north-east, and covers an area of 32 square miles (about 40 when the suburbs are included). In the centre, on the left bank of the Moskva, stands the "Kreml" or Kremlin, occupying the Borovitsky hill, which in the 12th century was covered by a dense forest. To the east of the Kremlin is the Kitay-Gorod, formerly the Great Posad, the chief centre

for trade. The Byelyi-Gorod, which was formerly enclosed by a stone wall (whence the name), surrounds the Kremlin and the Kitay-Gorod on the west, north, and north-east. A line of boulevards now occupies the place of its wall (destroyed in the 18th century), and forms a first circle of streets around the centre of Moscow. The Zemlanoy-Gorod (earthen enclosure) surrounds the Byelyi-Gorod, including the "Zamoskvoryeche" on the right bank of the Moskva. The earthen wall and palisade that formerly enclosed it no longer exist, their place being taken by a series of broad streets with gardens on both sides,—the Sadovaya, or Gardens Street. The fourth enclosure (the "Kamer-College earthen wall") was made during the reign of Catherine II.; it is of irregular shape, and encloses the outer parts of Moscow, whilst the suburbs and the villages which have sprung up on the highways extend 4, 5, and 6 miles beyond. The general view obtained from the west or south is very picturesque, especially on account of the numerous churches, monasteries, and towers with characteristic architecture, and the many gardens and ponds scattered among clusters of houses. The Kremlin is an old fort of pentagonal (nearly triangular) shape, 98 acres in extent, occupying a hill about 100 feet above the level of the Moskva. It is enclosed by a high stone wall 2430 yards in length, restored during the present century, and having eighteen towers. Its five gates are surmounted by high towers. The Spasskiya (Saviour's Gate) was erected in 1491 by a Milanese architect, the Gothic tower that surmounts it having been added in 1626 by the English architect Holloway. A sacred picture of the Saviour was placed upon it in 1685, and all who pass through the gate must uncover. The towers surmounting the four other gates were erected by order of Ivan III. Of the sacred buildings of the Kremlin the most venerated is the Uspensky cathedral. The former church of this name was erected in 1326 by Ivan Kalita, but, on its falling into disrepair, a new one was built on the same place in 1475-1479, by Fioraventi, in the Lombardo-Byzantine style, with Indian cupolas. It was restored in the 18th century and in 1813. It contains the oldest and most venerated holy pictures in Russia, one of which is attributed to the metropolitan Peter, another to St Luke. This last was brought from Kieff to Vladimir in 1155, and thence to Moscow in 1395; its jewelled metallic cover is valued at £20,000. The cathedral possesses also a gate brought from Korsun, the throne of Vladimir I., and numerous relics of saints, some of which date from the 14th century. The Russian metropolitans and patriarchs were consecrated in this cathedral, as well as the czars after Ivan IV. The Arkhangelsk cathedral was originally built in 1333, and a new one was erected in its place in 1505. It has suffered very much from subsequent restorations and decorations. It contains the tombs of the czars from Simeon (1353) to Ivan Alexeevitch (1696), and possesses vast wealth. The Blagovyeschensk cathedral, recalling the churches of Athos, was built in 1489; the remarkable pictures of Rubleff (1405), contained in the original structure of 1397-1416, have been preserved. It was the private chapel of the czars. Vestiges of a very old church, that of the Saviour in the Wood (*Spas na boru*), contemporaneous with the foundation of Moscow, still exist in the yard of the palace. A stone church took the place of the old wooden structure in 1330, and was rebuilt in 1527. Several other churches of the 15th century, with valuable archaeological remains, are found within the walls of the Kremlin. The Voznesensky convent, erected in 1393, and recently restored with great judgment, is the burial-place of wives and sisters of the czars. The Chudoff monastery, erected in 1365, was the seat of theological instruction and a state

¹ According to recent investigations instituted by the Moscow provincial assembly, 10 per cent. of the agricultural population (about 20,000 households) have no land at all; 15 per cent., while holding land, are bankrupt; and 13 per cent. are without cattle or implements.

prison. Close by, the great campanile of Ivan Veliky, erected in the Lombardo-Byzantine style by Boris Godunof in 1600, rises to the height of 271 feet (328 feet including the cross), and contains many bells, one of which weighs 1285 cwts. The view of Moscow from this campanile is really wonderful, and its gilded cupola is seen from a great distance. Close by is the well-known Tsar-Kolokol (Czar of the Bells), 60 feet in circumference round the rim, 19 feet high, and weighing 3850 cwts. It was cast in 1735, and broken during the fire of 1737 before being hung. The treasury of the patriarchs (riznitsa) contains not only such articles of value as the *sakkos* of the metropolitan Foty with 70,000 pearls, but also very remarkable monuments of Russian archæology. The library has 500 Greek and 1000

very rare Russian MSS., including a Gospel of the 8th century.

The great palace of the emperors, erected in 1849, is a fine building in white stone with a gilded cupola. It contains the *terems*, or rooms erected for the young princes in 1636 (restored in 1836-1849, their former character being maintained), a remarkable memorial of the domestic life of the czars in the 17th century. In the treasury of the czars, Granovitaya Palata and Orujeynaya Palata, now public museums, the richest stores connected with old Russian archæology are found—crowns, thrones, dresses, various articles of household furniture belonging to the czars, Russian and Mongolian arms, carriages, &c.

The four sides of the Senate Square are occupied by

Plan of Moscow.

buildings of various dates, from the 15th century onwards. The senate, now the law courts, was erected by Catherine II. Facing it is the arsenal, containing full ammunition for 200,000 men.

The Temple of the Saviour, begun in 1817 on the Vorobiovy hills, in commemoration of 1812, was abandoned in 1827, and a new one was built during the years 1838-1881 on a hill on the bank of the Moskva, at a short distance from the Kremlin. Its style is Lombardo-Byzantine, with modifications suggested by the military taste of Nicholas I. Its colossal white walls are well proportioned, and its gilded cupolas are seen from a great distance. The buildings that surround it are to be cleared away, and its wide squares adorned by obelisks, and by monu-

ments to Kutuzoff, Barclay de Tolly, Alexander I., and Nicholas I.

The Kitay-Gorod, which covers 121 acres, and has 20,000 inhabitants, is the chief commercial quarter of Moscow. It contains the Gostinoy Dvor, consisting of several stone buildings divided into 1200 shops, where all kinds of manufactured articles are sold. The "Red Square," 900 yards long, whose stone tribunal was formerly the forum, and afterwards the place of execution, separates the Gostinoy Dvor from the Kremlin. At its lower end stands the fantastic Pokrovsky cathedral (usually known as Vasilii Blajennyi), which is the wonder of all strangers visiting Moscow, on account of its towers, all differing from each other, and representing, in their variety of colours, pine-

apples, melons, and the like. It was built under Ivan the Terrible by an Italian. The exchange, built in 1838 and restored in 1873, is very lively, and its twenty-three "exchange artels" (associations of nearly 2000 brokers, possessing a capital of more than £100,000) are worthy of remark. Banks, houses of great commercial firms, streets full of old bookshops carrying on a very large trade, and finally the *Tolkuchy rynok*, the market of the poorest dealers in old clothes, occupy the *Kitay-Gorod*, side by side with restaurants of the highest class. In the *Kitay-Gorod* are also situated the house of the Romanoffs, rebuilt in 1859 in exact conformity with its former shape; a Greek monastery; and the printing-office of the synod, containing about 600 MSS. and 10,000 very old printed books, together with a museum of old typographical implements. At the entrance to the *Kitay-Gorod* stands the highly-venerated chapel of the Virgin of Iberia, which is a copy, made in 1648, of a holy picture placed on the chief gate of the monastery of Athos. Close by is the recently opened historical museum, which will contain collections respectively illustrating separate periods of Russian history.

The northern parts of the *Byelyi-Gorod* are also the centre of a lively trade. Here are situated the *Okhotnyi Ryad* (poultry market) and the narrow streets *Tverskaya* and *Kuznetsky-Most*, the rendezvous of the world of fashion. Here also are the theatres. In the south-west of the *Byelyi-Gorod*, opposite the garden of the *Kremlin*, stand the university, the public museum, and the military riding school.

The *Zemlyanoy-Gorod*, which has arisen from villages that surrounded Moscow, exhibits a variety of characters. In the neighbourhood of the railway stations it is a busy centre of traffic; other parts of it are manufacturing centres, whilst others—as, for instance, the small quiet streets in the west of the boulevard of *Prechistenka*, called the old *Konushennaya*, with their wooden houses and spacious yards—are the true abodes of the families of the old, for the most part decayed, but still proud nobility. The *Zamoskvoryeche*, on the right bank of the *Moskva*, is the abode of the patriarchal merchant families. Each house is surrounded by a yard whose gate is rarely opened, and each house, with its dependencies and gardens, bears the character of a separate estate.

The climate of Moscow is cold and continental, but healthy. The average annual temperature is 40°·1 Fahr. (January, 14°; July, 66°·5). The summer is warm (64°·2), and the winter cold and dry (15°·8), great masses of snow covering the streets. The spring, as is usually the case in cold continental climates, is beautiful. The prevailing winds are south-west and south. The river *Moskva* is frozen, on the average, for 153 days (from 12th November to 13th April).

Besides the *Moskva* and the *Yauza*, Moscow is watered also by the *Neglinnaya*, which now flows in an underground channel under the walls of the *Kremlin*. The city has about 200 ponds. The *Moskva* is crossed by five bridges; a branch of it, or rather a channel, makes an elongated island in the centre of the town. Water of excellent quality, principally from the *Mytishi* springs and ponds, 11 miles distant, is led to fountains in different parts of the town, whence it is taken by watermen. But this supply amounts only to 1,865,000 gallons a day, and the great mass of the inhabitants make use of the contaminated water of the *Moskva* and even of the *Yauza*, or of private wells.

The population of Moscow, which is steadily increasing, is estimated at 670,000; but an accurate census has not yet been made. In the middle of the 18th century it was estimated at only 150,000; in 1812, at 250,000 in summer and 400,000 in winter. In 1864 it was estimated (probably under the truth) at 365,000. The inhabitants are mostly Great-Russians, and only about 6000 are foreigners. They chiefly belong to the Greek Church, or are noneconformists, the number of Lutherans and Catholics being only 8000 to 9000. The mortality is very great: in 1879 and 1880 it reached 37·9 and 41·8 per thousand (men 39·3; women 43·9), and usually exceeds the birth-rate. Moscow, moreover, is often visited by epidemics which immensely increase the mortality, in consequence of the almost entire absence of sanitary regulations. Fires are very frequent; within ten years (1870-1879) they numbered 2492, the loss being estimated at £2,865,300.

Since the 14th century Moscow has been an important commercial city. Its merchants carried on a brisk trade with *Novgorod* and *Pakov*, with Lithuania, Poland, Hungary, Constantinople, *Azoff*, and *Astrakhan*. About the end of the 15th century its princes transported to Moscow, Vladimir, and other Russian towns no fewer than 18,000 of the richest *Novgorod* merchant families, and took over the entire trade of that city, entering into direct relations with *Narva* and *Livonia*. The shops of the *Gostinoy Dvors* of Moscow astonished foreign visitors in the 16th century by their large supply of foreign wares, and by the low prices at which the products of western Europe were sold,—a circumstance explained by the barter character of the trade. The annexation of *Kazan* and the conquest of *Siberia* gave a new importance to Moscow, bringing it into direct commercial relations with *Khiva*, *Bokhara*, and *China*, and supplying it with *Siberian furs*. The fur-trade engrossed the minds of all European merchants in the 16th century, and an English company, "The Mystery," having received the monopoly of the *Archangel* trade, caused the traffic to be sent by the *White Sea* instead of the *Baltic*. Moscow thus became the centre for nearly the whole trade of *Russia*, and the czar himself engaged in large commercial operations. All boyars, and the church too, were traders; and the poorest Moscow merchants participated in the trade through their corporations. Persians, Greeks, Armenians, Swedes, English, Germans, and Lithuanians had each its own *Gostinoy Dvor* (or *caravanserai*). Situated at the junction of six important highways (along which communication was maintained by special *yamshiks*), Moscow was the great storehouse and exchange-mart for the merchandise of Europe and Asia. The opening of the port at *St Petersburg* affected its commercial interest unfavourably at first; but the Asiatic and internal trade of Moscow has since then enormously increased. At present it is the chief centre of railway traffic. The revenue of its custom-house was in 1880 double that of *St Petersburg* (30,000,000 roubles, as against 15,620,000 at *St Petersburg* and 9,000,000 at *Warsaw*). But the home traffic is the most important branch of the Moscow trade. The city is the chief centre for the trade in grain, in hemp, and in oils, sent to the *Baltic* ports; in tea, brought both by *Siberia* and by *St Petersburg*; in sugar, refined there in large quantities; in grocery wares for the supply of more than half *Russia* and all *Siberia*; in tallow, skins, wool, metals, timber, wooden wares, and all other produce of the manufactures of middle *Russia*. No less than 10,000,000 cwts. of corn are annually brought to Moscow, half of which is sent to the *Baltic* ports. The yearly return of the Moscow trade was estimated at £9,000,000 in 1848,—probably only a half or a third of the real value, which is believed to have been at least trebled since that time. The quantity of goods carried by the six railways from Moscow to *St Petersburg*, *Yaroslav*, *Nijni*, *Ryazan*, *Kursk*, and *Brest*, amounted in 1878 to 162,343,500 cwts. (out of 635,740,000 for the whole of *Russia*); and the number of passengers was 8,637,890 (1,263,530 military) out of a total for all *Russia* of 37,580,800 (civil and military) in that year.

From the 15th century onwards the villages around Moscow were renowned for the variety of small trades they carried on; the first large manufactures in cottons, woollen fabrics, silk, china, and glass in Great *Russia* appeared at Moscow in the 17th and 18th centuries. After 1830, in consequence of protection tariffs, the manufactories in the government of Moscow rapidly increased in number; and at present two-thirds of them, or about 1000, annually producing articles to the value of upwards of £10,000,000 (the real production is probably much higher), are concentrated in the capital. There are at Moscow about 170 cotton-mills, 90 manufactories of woollens, and 70 of silks, the silk manufactured being chiefly *Caucasian*, although a good deal is also imported from the west; there are also upwards of 20 large tanneries, 50 tobacco-factories, 15 large candle-works, 70 larger workshops in metals, 13 wax-candle works, 30 carriage manufactories, 20 watch manufactories.

The income and expenditure of Moscow in 1882 were respectively 4,921,027 and 6,124,063 roubles, as compared with 4,730,724 and 5,490,433 in 1881.

Moscow has many educational institutions and scientific societies. The university, founded in 1755, exercised a powerful influence on the intellectual life of *Russia* during the years 1830-1843; and it still continues to be the most frequented *Russian* university. In 1882 it had 2430 students and a teaching staff of 334; the students are mostly poor, the sum of 107,588 roubles having been given in 1881 in scholarships to 854 of their number, and 14,000 roubles in the form of occasional assistance. The library contains nearly 200,000 volumes, and has rich collections in mineralogy, geology, and zoology. There is also an excellent higher technical school; and an agricultural college is situated in the *Petrovskoye* suburb. Moscow has also a theological academy, a commercial academy, a school of topography, an institute (of *Lazareff*) for the study of *Oriental* languages, a musical conservatory, four institutes for women, a free university for women, seven colleges for boys and three for girls, three corps of military cadets, very numerous primary and technical schools, and many private schools. But

still these are insufficient for the population, and the municipal schools every year refuse admission to about 1500 boys and girls.

The scientific societies are specially distinguished for their services in the exploration of the country. The following deserve particular mention:—the society of naturalists (founded in 1805); the society of Russian history and antiquities, which has published many remarkable works; the society of amateurs of Russian literature; the physical and medical society; the mathematical society; the society for the diffusion of useful books; the very active archaeological society, founded in 1864; a society of gardening and of agriculture; several technical, artistic, and musical societies; and the very active young society of the friends of natural science, which already has published many useful volumes.

Among the museums of Moscow, the museum, formerly Rumanstseff's, now connected with the so-called "public museum," occupies the first rank. It contains a library of 150,000 volumes and 2300 MSS., remarkable collections of old pictures, sculptures, and prints, as well as a rich mineralogical collection, and an ethnographical collection representing very accurately the various inhabitants of Russia. The historical museum has already been mentioned. The private museum of Prince Golitzyn contains a good collection of paintings and MSS.; and great treasures of archæology are amassed in various private collections in Moscow and its suburbs.

The periodical press does not on the whole exercise great influence; twenty-five periodicals are published, besides those of scientific societies. But Moscow publishes a far larger number of books for primary instruction and of the humblest kind of literature and prints for the use of peasants than any other Russian city.

The philanthropic institutions are numerous, the first rank being occupied by the immense Foundlings' Hospital, erected in 1764. The hospitals, municipal, military, and private, are very large, but much below the standard of other capitals. The number of private philanthropic institutions is very considerable.

Though the drama was introduced into Russia at Kieff, Moscow was the place of its development. The earliest stage representations were made at Moscow in 1640, and the first comedy—a translation of Molière's *Médecin Malgré Lui*—was played in the palace before Sophie, the sister of Peter I. It was only in 1759 that a theatre was erected. A large stone theatre was erected in 1776, and rebuilt in 1856 after a fire. It is for the Moscow stage that the best Russian dramas have been written, and it was in the "small theatre" that the best Russian actors—Scheppin, Sadovsky, Shumsky, and Madame Vasilieff—exhibited the comedies of Gogol, Griboyedoff, and Ostrovsky.

Moscow, where the Great-Russian language is spoken in its greatest purity, was the birthplace of the two chief Russian poets, Pushkin and Lermontoff, as well as of Griboyedoff, Ostrovsky, and Herzen. A monument to Pushkin was erected in 1880, on the Tverskoy boulevard. Griboyedoff, in his remarkable comedy *Goré ot uma*, has given a lively picture of the higher Moscow society of the beginning of this century, which continued to hold good until within the last few years. His remark as to the unmistakable individuality of the Moscow type also maintains its truth; although the physiognomy of Moscow has much changed since his day, it still has its special features that distinguish it from every other capital. The division of classes is much more felt at Moscow than elsewhere. The tendency towards originality, the love of grandiose undertakings, a kind of brag, together with little feeling of independence, a good deal of laziness, and much cordiality, still characterize the educated classes. The merchants live quite aloof from any political or even intellectual movement, under a rude patriarchal system, well described in the dramas of Ostrovsky. A large proportion of them are nonconformists. Their sons, the well-known *kupecheskiye synki*, "merchants' sons," when they leave this kind of life, astonish the capital with their extravagances and absurd display of wealth. But Moscow takes its present physiognomy chiefly from its busy lower classes. The streets are full of merchants and peasants, who continue to wear the old Russian garb, go on foot in the streets, drink tea in modest restaurants, and transact large business. From being a town of the aristocracy, Moscow is coming to be more and more a town of the wealthy middle classes, who persist in keeping the low educational level of the peasants in the villages, and have but one aspiration, to become in their turn "merchants" of the type described by Ostrovsky.

Suburbs.—Moscow is surrounded by beautiful parks and picturesque suburbs. Of the former one of the most frequented is the Petrovsky Park, to the north-west. A little farther out is the Petrovskoye Razumovskoye estate, with an agricultural academy and its dependencies (botanical garden, experimental farm, &c.). Another large park and wood surround an imperial palace in the village of Ostantkino. The private estates of Kuzminki, Kuskovo, and Kuntzevo are also surrounded by parks; the last has remains of a very old graveyard, supposed to belong to the pagan period. Twenty-eight miles westward from the city is the Sarvin-Storojersky monastery, situated, like so many other Russian monasteries, in a very fertile country, amidst beautiful forests; it has a pretty cathedral, a rich treasury, and library. Farther westward still is the New Jerusalem monastery erected by the patriarch Nikon.

In the south-west, on the right bank of the Moskva, which here makes a great bend to the south, are the Vorobiovy hills, which are accessible by steamer from Moscow, and afford one of the best views of the capital. In the bend of the Moskva is situated the Novo-Dyevitchiy convent, erected in 1525, and connected with many events of Russian history. It is now the burial-place of the Moscow aristocracy, and one of the richest nunneries in Russia. The village Arkhangelskoye has also a good park and a palace built by Rastrelli. Iliynskoye, formerly a private estate, was purchased by the imperial family in 1864.

In the south, on the road to Serpukhoff, is the village of Kolomenskoye, the residence of Alexis Mikhailovitch, with a church built in 1531 (a striking monument of Russian architecture, restored in 1830). Diakovo has also a church built in the 16th and 17th centuries—a pure example of the architecture of Moscow, recalling the temple of Vasili Blajennyi. One of the best sites in the neighbourhood of Moscow is occupied by the park of Tsaritzyno (11 miles from the Kursk railway station), purchased by Catherine II., with an unfinished palace and a beautiful park. The monastery Nikolo-Ugryeshskiy, 12 miles from the city, between the Kursk and Ryazan railways, also occupies a beautiful site, and is much visited by Moscow merchants, to venerate a holy picture by which Dmitry Donskoy is said to have been blessed before going to fight the Mongols.

In the north, the forest of Sokolniki, covering 4½ square miles, with its radial alleys and numerous summer residences, is the part of Moscow most frequented by the middle classes. Close by, towards the east, is situated the Preobrajenskoye suburb, the centre of the nonconformists, and farther south the village of Izmailovo, with a home for invalids and a model farm for apiculture. To the west of Sokolniki is situated the wood of Marina, the favourite resort of the merchants and "merchants' sons," who there spend fabulous sums of money on choirs of Gipsy singers.

History.—The Russian annals first mention Moscow in 1147 as a place where Yuri Dolgoruki met with Svyatoslav of Syversk and his allies. The site was inhabited from a very remote antiquity by the Merya and Mordvinians, whose remains are numerous in the neighbourhood, and it was well peopled by Great-Russians in the 12th century. To the end of the 13th century Moscow remained a dependency of the princes of Vladimir, and had to suffer from the raids of the Mongols, who burned and plundered it in 1237 and 1293. It is only under the rule of Daniil, son of Alexander Nevsky (1261-1302), that the prince of Moscow acquired some importance for the part he took in the wars against the Lithuanians. He annexed to his principality Kolomna, situated at the confluence of the Moskva with the Oka. His son in 1302 annexed Pereyasavl Zalesky, and next year Mojaisk (taking thus possession of the Moskva from its head to its mouth), and so inaugurated a policy which lasted for centuries, and consisted in the annexation by purchase and other means of the neighbouring towns and villages. In 1300 the Kremlin, or fort, was enclosed by a strong wall of earth and wood, offering a protection to numerous emigrants from the Tver and Ryazan principalities who went to settle around the new city. Under John Kalita (1325-1341) the principality of Vladimir—where the princes of Kieff and the metropolitan of Russia had taken refuge after the wars that desolated south-western Russia—became united with Moscow; and in 1325 the metropolitan Peter established his seat at Moscow, giving thus a new importance and a powerful support to the young principality. In 1367 the Kremlin was enclosed by stone walls, which soon proved strong enough to resist the Lithuanians under Olgerd (1368 and 1371). The son and grandson of Kalita steadily pursued the same policy. The latter (Dmitry Donskoy) annexed the dominions of Starodub and Rostoff, and took part in the renowned battle of Kulikovo (1380), where the Russians ventured for the first time to oppose the Mongols in a great pitched battle. The church, which strongly supported the princes of Moscow, ascribed the presumed victory to him and to the holy pictures of the Moscow monasteries.

At this time Moscow occupied a wide area covered with villages. The Kremlin had three cathedrals—old, small; and dark buildings, having narrow windows filled with mica-plates—which were surrounded by the plain wooden houses of the prince and his boyars.¹ To the east of the Kremlin was the *posad*, or city, also enclosed by a wall, and even then an important centre for trade. Different parts of the town belonged to different princes. In 1366 Moscow suffered from pestilence. Two years after the battle of Kulikovo it was taken and plundered (for the last time) by the khan (Toktamish).

The gradual increase of the principality continued during the first half of the 15th century, and at the death of Vasili II. the Blind, in 1462, it included not only the whole of what is now the government of Moscow, but also large parts of the present governments of Kaluga, Tula, Vladimir, Nijni-Novgorod, Kostroma, Vyatka, Vologda, Yaroslavl, and Tver. Still the prince, although assuming, like several others, the title of Great Prince, had simply

¹ The name of *boyars*, or *bolars*, was given to the descendants of the former military bands of the princes, who had become counsellors and landowners.

a little more influence than other independent rulers in the affairs of north-eastern Russia, and was recognized as the eldest prince by the khans. The towns which recognized his supremacy were quite independent, and only paid to his representatives the judiciary taxes, in exchange for military protection. It is only under Ivan III. (called the Great by some Russian historians) that the prince of Moscow asserted his claims on other parts of Russia, and called himself "Ruler of all Russia" (*Hospodar vseya Rosii*). It was about this time, when the wealth of Moscow was rapidly increasing by the extension of its trade, that the embellishment of the town began. In room of the old cathedral Uspensky, a new structure was built by Fioravanti of Bologna, aided by Novgorod masons. The cathedral Arkhangelsky was also rebuilt, and a third, Blagovyeshensky, was erected, as well as a stone palace and other buildings. The Kremlin was fortified by strong towers, and the houses and churches built close to the walls were destroyed. In 1520 Moscow was said to contain 45,000 houses and 100,000 inhabitants. Its trade was very active. Ivan IV. finally annexed Novgorod and Pskov to Moscow, and subdued Kazan and Astrakhan. But after this reign Moscow suffered for a long time a series of misfortunes. In 1547 two dreadful conflagrations destroyed nearly all the city, and a few days later the khan of the Crimea advanced against it with 100,000 men. He was compelled to retire from the banks of the Oka, but in 1571, taking advantage of the state into which Russia was brought by the extravagances of Ivan, he took Moscow and burned all the town outside the Kremlin. The gates of the Kremlin having been shut, thousands of people died in the flames, and the annals record that of the 200,000 who then formed the population of Moscow, only 30,000 remained. In 1591 the Mongols were again in Moscow and avenged their repulse from the Kremlin on the inhabitants of the open town.

By the end of the 16th century Moscow was a large city, not less than 14 miles in circumference. The "Great Posad," or city, containing several Gostinoy Dvory for merchants of all nationalities, was enclosed in 1534 by a trench and stone wall, which still exist. The "White Town" which enclosed the Kremlin and Great Posad from west and north was also fortified, in 1586, by a stone wall (destroyed in the 18th century); and in 1588 a third enclosure, a palisaded earthen wall, the Zemlyanoy-Gorod, was begun, including all the town that surrounded the three former subdivisions; it remained until the end of the 18th century. Foreigners who visited Moscow spoke with astonishment of its wealth and its beauty. But the internal affairs of the capital were in very bad case. During the century, owing to the increase of population, new annexations, and a lively trade, the power of the boyars had gradually increased. The peasants who settled on their lands, or on the estates of the prince given to boyars, had gradually become their serfs; and the political tendency of the boyars, supported by the wealthier middle classes (which had also a rapid development in the same century), was to become rulers of Russia, like the noblesse of Poland. During the reign of Theodore, Boris Godunoff, the regent, ordered the murder of the heir to the throne, Demetrius, son of Ivan IV., and himself became czar of Russia. Moscow suffered severely in the struggle which ensued, especially when the populace rose and exterminated the Polish garrison, on which occasion the whole of the town outside the Kremlin was again burned and plundered. But in compensation it had acquired in the eyes of the nation a greatly-increased moral importance, as a stronghold against foreign invasions. The monastery of Troitsa, which the Poles besieged without taking, was invested with a higher sanctity. The town also by and by recovered its commercial importance, and this the more as other commercial cities were ruined, or fell into the hands of foreigners; and thirty years after 1612 Moscow was again a wealthy city. Owing, however, to the ever-increasing concentration of power in the hands of the czars, and the steady development of autocracy, it lost much of its political importance, and assumed more and more, especially under Alexis Mikhailovitch, the character of a private estate of the czar, its suburbs becoming mere dependencies of his vast household.

During the whole of the 17th century Moscow continued to be the scene of many troubles and internal struggles. The people several times revolted against the favourites of the czar, and were subdued only by cruel executions, in which the *streltzy*—a class of citizens and merchants rendering hereditary military service—supported the czar. Afterwards appeared the *raskol* or non-conformist movement, and in 1648, when the news spread that Stenka Razin was advancing on Moscow "to settle his accounts with the boyars," the populace was kept from rising only by severe repressive measures and by the defeat of the invader. Later on, the *streltzy* themselves engaged in a series of rebellions, which led the youthful Peter I. to shed rivers of blood. The opposition encountered at Moscow by his plans of reforming Russia according to his ideal of military autocracy, the conspiracies of the boyars and merchants, the distrust of the mass of the people, all compelled him afterwards to leave the city, and to seek, as his ancestors had done, for a new capital. This he founded on the very confines of the military empire he was trying to establish.

In the course of the 18th century Moscow became the seat of a passive and discontented opposition to the St Petersburg Government. Peter I., wishing to see Moscow like other capitals of western Europe, ordered that only stone houses should be built within the walls of the town, that the streets should be paved, and so on; but his orders were only partially executed. In 1722 the Kremlin was restored. In 1739 the city became once more the prey of a great conflagration; two others followed in 1748 and 1753, and gave an opportunity for enlarging some streets and squares. In 1755 the first Russian university was founded at Moscow: Catherine II. tried to conciliate the nobility, and applied herself to benefit the capital with new and useful buildings, such as the senate house, the f. indlings' and several other hospitals, salt stores, &c. The cemeteries within the town were closed after the plague of 1771; several streets were enlarged, and the squares cleared of the small shops that encumbered them. Water was brought by an aqueduct from the Mytischki villages. In 1787 the city had 303 churches, 24 monasteries and convents, 8965 houses (of which 1595 were of stone), one printing-office, and 314 manufactories and larger workshops.

The last public disaster was experienced by Moscow in 1812. On 13th September, six days after the battle of Borodino, the Russian troops evacuated Moscow, leaving 11,000 wounded, and the next day the French occupied the Kremlin. The same night, while Napoleon was waiting for a deputation of Moscow notables, and received only a deputation of the rich *raskolnik* merchants, the capital was set on fire by its own inhabitants, the Gostinoy Dvor, with its stores of wine, spirits, and chemical stuffs, becoming the first prey of the flames. The inhabitants abandoned the city, and it was pillaged by the French troops, as well as by Russians themselves, and the burning of Moscow became the signal of a general rising of the peasants against the French. The want of supplies and the impossibility of wintering in a ruined city, continually attacked by Cossacks and peasants, compelled Napoleon to leave Moscow on 19th October, after he had unsuccessfully tried to blow up certain parts of the Kremlin. (P. A. K.)

MOSELLE. See RHINE.

MOSER, JOHANN JAKOB (1701-1785), jurist, was born at Stuttgart on 18th January 1701. He studied at the university of Tübingen, where, at the early age of nineteen, he became professor extraordinarius of law. A year later he resigned his chair, with the expectation of receiving an appointment at Vienna, but this was refused him on his declining to join the Catholic Church. From 1729 he for some years held an ordinary professorship of law at Tübingen, and in 1736 he accepted a chair and directorship in the university of Frankfort-on-the-Oder. On account, however, of differences with King William I. of Prussia, he resigned these in 1739 and retired to Ebersdorf, a village in the principality of Reuss, where for several years he devoted himself wholly to study, and especially to the production of his *Deutsches Staatsrecht*. In 1751 he was called back to Würtemberg as "landschaftsconsulent," and in 1759 was imprisoned at Hohentwiel on account of the steps he had taken in connexion with this office against certain tyrannical proceedings of the duke. In 1764 he received his liberty and was restored to office, but from that time took little part in political affairs. He died 30th September 1785.

Moser was the first to discuss in an adequate form the subject of European international law, and he is the most voluminous German writer on public law. In all, he wrote more than 500 volumes, his principal works being *Deutsches Staatsrecht*, 1737-1754; *Neues Deutsches Staatsrecht*, 1766-1775; *Deutsches Staatsarchiv*, 1751-1767; *Grundriss der heutigen Staatsverfassung von Deutschland*, 1754. See Schmid, *Das Leben J. J. Moser's*, 1868; Schulze, *J. J. Moser, der Vater des Deutschen Staatsrechts*, 1869.

MOSES. Of the life of Moses we have few certain details, though the history of Israel bears witness to the importance of his work. To what has been said under ISRAEL there will here be added a brief summary of what has been handed down about him. His origin and the history of his childhood can be read in Exod. i., ii. (comp. vi. 16 sq.); the statements there given are enlarged and modified in the Jewish Midrash, particularly as we find it in Josephus and Philo.¹ The daughter of Pharaoh, we are told, was called Thermutis (*Ant.*, ii. 9, 5), or Merris (Euseb.,

¹ In still more fantastic form in the Palestinian Targum on Exodus, the details of which need not be repeated here.

Præp. Ev., ix. 27); she named the boy Μωϋσῆς, not because she used the Hebrew verb משה to express the fact that he was drawn out of the water, but because the Egyptian word for water was *mo*, and *uws* applies to those who have been delivered from it (*Ant.*, ii. 9, 6; comp. Philo, ed. Mangey, ii. 83; Euseb., *l.c.*, ix. 28). She took care to have him trained in all the wisdom of the Egyptians (*Acts* vii. 22) and in that of the Greeks, Assyrians, and Chaldæans as well (Philo, ii. 84). To his great intellectual endowments corresponded his personal beauty, of which Josephus speaks in extravagant terms (*Ant.*, ii. 9, 6-7). It was on account of this beauty that, when on one occasion, as a young man, he led an Egyptian army against Meroe, the Ethiopian princess Tharbis opened the gates of the capital to him in order to make him her husband (*Ant.*, ii. 10; comp. *Numb.* xii. 1).

For reasons explained in *Exod.* ii. 11 *sq.*, Moses left the land of Pharaoh and came to Midian to the Kenite priest Jethro (also called Hobab Ben Raguel and Raguel), whose daughter Zipperah he married, becoming by her the father of two sons, Gershom and Eliezer (*Exod.* ii. 21 *sq.*; xviii. 2 *sq.*). During his stay in Midian he received, at the foot of Sinai (Horeb), the divine revelation at the burning bush whereby he was called to become the liberator of Israel from Egyptian bondage. With much reluctance he at last accepted this vocation, and, already expected by his brother Aaron and the elders, returned to his people.¹ Arrived in Egypt, he associated Aaron with him as his interpreter, being himself no orator, but a man of counsel and action, and appeared before Pharaoh to demand of the king in Jehovah's name permission for the people to go with flocks and herds into the wilderness to celebrate there a festival (the spring festival of the Passover) in honour of their God. Jehovah gave emphasis to the demand by great signs and wonders,—the plagues of Egypt, which have their explanation for the most part in evils to which Egypt is periodically liable, but are treated by Israelite tradition as the weapons of Jehovah in his ever-intensifying conflict with the king and the gods of Egypt. At length, by the slaying of the first-born, the stubbornness of Pharaoh was broken, so that he consented to, and even urged, the departure of the Hebrews. By and by, however, he changed his mind, and, setting out in pursuit of the Hebrews, overtook them at the Red Sea; but Jehovah fought for them, and annihilated Pharaoh's chariots and all his host. In order to present themselves in proper festal array at the celebration for the sake of which they were going into the wilderness, the Hebrew women had borrowed dresses and ornaments from those of Egypt; the Egyptians could now only blame themselves and their hostile conduct if those articles were not returned.²

By the miracle wrought at the Red Sea Moses was pointed out to the Hebrews as the man of God, to whom accordingly they now committed the task of caring for their outward life as well as their spiritual guidance. He led them first to Sinai, where the law was revealed and the worship in connexion with the ark of the covenant instituted. When he had communed face to face with the Godhead for forty days on the holy mountain, the skin of his face shone so that he had to wear a veil (hence the horns, properly rays, on his forehead). Driven from Sinai in consequence of their worship of the golden calf, the Israelites removed to Kadesh with the view of entering

Palestine. But this plan was defeated by their unbelief and faintheartedness, and, as a punishment, they were compelled to sojourn forty years in the wilderness of Kadesh (Paran, Sin). It was here and now that the people went to school with Moses; here, at the sanctuary of the camp, he declared law and judgment; and here, according to the view of the oldest tradition, the foundations of the Torah were laid (*Exod.* xviii.). The region of Kadesh was also the scene of almost all the miracles and other circumstances we read about Moses. Here he showed himself to be at once the father and mother of the people, their judge, priest, and seer. It was not till towards the very close of his life that he led the Israelites from Kadesh into northern Moab, which he wrested from the Amorite king, Sihon of Heshbon. Here he died on Mount Pisgah or Nebo, after taking leave of the people in the great legislative address of Deuteronomy. According to Deuteronomy xxxiv. 6, he "was buried in a valley in the land of Moab, . . . but no man knoweth of his sepulchre unto this day."³ As his successor in the leadership, Moses had named Joshua ben Nun, but the real heirs to his position and influence were the priests at the sanctuary of the ark of the covenant. Of his personal character the Bible tells us nothing (for *על* in *Numb.* xii. 3 means only "heavily burdened"); but later Judaism is all the more at liberty on this account to expatiate upon it (see especially Josephus, *Ant.*, iv. 8, 49).

Such in brief *résumé* are the accounts of Moses given in the Bible⁴ and the Midrash. In addition to these we have also the statements of Hellenistic writers, preserved chiefly in the *Contra Apionem* of Josephus. These are all of an Egyptian complexion, and probably embody no ancient and independent tradition, but, in all that relates to the Hebrews, where they do not rest upon pure conjecture, merely go back upon obscure rumours of Jewish origin and dress them up after the manner of the Midrash—only in a contrary sense, with hatred and not with love—and then seek to fit them as well as may be into the Egyptian history and chronology as known from other sources. The great number of new proper names of places and persons which occur in the writings of Manetho and his like cannot be urged against this view, for the Midrash also is full of them. The very name Osarsiph, given to Moses himself, moreover, suggests a suspicion of dependence on the Asaphsoph, "mixed multitude" of *Numb.* xi. 4 (comp. *Exod.* xii. 38); what is said in these places is known to have played a great part in the rise of the idle Egyptian tales about the origin of the Jews and of their lawgiver.

For literature, see the various commentaries on the Pentateuch, and especially Dillmann on *Exodus*. (J. WE.)

MOSES OF CHORENE was a native of Kher'ni⁵ in Tarón, a district of the Armenian province of Turuberan. According to the only trustworthy authority—the *History of Armenia*⁶ which bears his name—he was a pupil of the two fathers of Armenian literature, the patriarch or catholicos Sahak the Great and the vartabed Mesrób. Shortly after 431 he was sent by these men to Alexandria to study the Greek language and literature, and thus prepare himself for the task of translating Greek writings into Armenian. Moses took his journey by Edessa and the sacred places of Palestine. After finishing his studies in the Egyptian capital he set sail for Greece; but the ship was driven by contrary winds to Italy, and he seized the opportunity of paying a flying visit to Rome. He then visited Athens, and towards the end of winter (440) arrived in Constantinople, whence he set out on his homeward journey. On his arrival in Armenia he found that his patrons were both dead. The *History of Armenia* speaks of its author as an old, infirm man, constantly engaged in the work of translating.⁷ In the later Armenian tradition

¹ On the road occurred the remarkable incident which, in the view of the narrator, led to the circumcision of infants being substituted for that of the bridegroom (*Exod.* iv. 24, 25; והנע לרננו, to mark the substitution,—compare the euphemism in *Isa.* vii. 20).

² Quite contrary to the sense of the Biblical narrative, Justin (*xxxvi.* 2, 13) says, "Sacra Egyptiorum furto abstulit;" and still more perverse is the gloss which Ewald, proceeding upon this expression of Justin, gives.

³ The legend of his assumption is of later growth; see the apocryphal *Assumptio Moysis* (APOCALYPTIC LITERATURE, vol. ii. p. 177), and compare *Luke* ix. 30, 33; *Jude* 9.

⁴ Outside of the Hexateuch, however, he is almost never mentioned.

⁵ Cf. Sukias Somal, *Quadro della storia letteraria di Armenia*, p. 24 *sq.*

⁶ iii. 61 *sq.*, 63, 65.

⁷ On linguistic grounds, the Meghitarists ascribe to him the translation of Eusebius's *Chronicle* and of the Pseudo-Callistheus.

we find other notices of this celebrated man,—such as, that he was the nephew of Mesrôb, that he was publicly complimented by the emperor Marcian, that he had been ordained bishop of Bagrewand by the patriarch Giut, and that he was buried in the church of the Apostolic Cloister at Mush in the district of Tarôn; but these accounts must be received with great caution. This remark applies especially to the statement of Thomas Ardruni,² that Moses, like his Hebrew prototype, lived to the age of 120 years, and recorded his own death in a fourth book of his great work.³ The same caution must be extended to another tradition, based on an arbitrary construction of a passage in Samuel of Ani,⁴ which places his death in the year 489.

Of the works of Moses⁵ the best known is the *History of Armenia*,⁶ or, as the more exact title runs, the *Genealogical Account of Great Armenia*. It consists of three books, and reaches down to the death of Saint Mesrôb, in the second year of Jazdegerd II. (17th February 440).⁷ It is dedicated to Sahak Bagratuni (who was afterwards chosen to lead the revolted Armenians in the year 481), as the man under whose auspices the work had been undertaken. This work, which in course of time acquired canonical authority among the Armenians, is partly compiled from sources which we yet possess, viz., the *Life of Saint Gregory* by Agathangelos, the Armenian translation of the Syriac *Doctrine of the Apostle Addai*, the *Antiquities* and the *Jewish War* of Josephus, and above all the *History of Mar Abas Katina* (still preserved in the extract from the book of Sebêos),⁸ who, however, did not write, as Moses alleges, in Syriac and Greek, at Nisibis, about 131 B.C., but was a native of Medsurch, and wrote in Syriac alone about 383 A.D., or shortly thereafter. Besides these, Moses refers to a whole array of Greek authorities, which were known to him from his constant use of Eusebius, but which cannot possibly have related all that he makes them relate.⁹ Although Moses assures us that he is going to rely entirely upon Greek authors, the contents of his work show that it is mainly drawn from native sources. He is chiefly indebted to the popular ballads and legends of Armenia, and it is to the use of such materials that the work owes its permanent value. Its importance for the history of religion and mythology is, in truth, very considerable, a fact which it is the great merit of Emin¹⁰ and Dulaurier¹¹ to have first pointed out. For political history, on the other hand, it is of much less value than was formerly assumed. In particular, it is not a history of the people or of the country, but a history of the Armenian aristocracy, and, in

opposition to the Mamikonian tendency which pervades the rest of the older Armenian historical literature, it is written in the interest of the rival Bagratunians. Down to the 3d century it is proved by the contemporary Græco-Roman annals to be utterly untrustworthy; but even for the times of Armenian Christianity it must be used far more cautiously than has been done, for example, by Gibbon. The worst feature is the confusion in the chronology, which, strange to say, is most hopeless in treating of the contemporaries of Moses himself. What can be thought of a writer who assigns to Jazdegerd I. (399-420) the eleven years of his predecessor Bahrâm IV., and the twenty-one years of Jazdegerd I. to his successor Bahrâm V. (420-439)? The present writer¹² formerly attempted to explain this unhistorical character of the narrative from a tendency arising out of the peculiar ecclesiastical and political circumstances of Armenia, situated as it was between the eastern Roman and the Persian empires, circumstances which were substantially the same in the 5th as they were in the two following centuries. In the course of further investigations, however, he has come to the conclusion that, besides the many false statements which Moses of Khor'ni makes about his authorities, he gives a false account of himself. That is to say, the author of the *History of Armenia* is not the venerable translator of the 5th century, but some Armenian writing under his name during the years between 634 and 642. The proof is furnished on the one hand by the geographical and ethnographical nomenclature of a later period and similar anachronisms,¹³ which run through the whole book and are often closely incorporated with the narrative itself, and on the other hand by the identity of the author of the *History* with that of the *Geography*, a point on which all doubt is excluded by a number of individual affinities,¹⁴ not to speak of the similarity in geographical terminology. The critical decision as to the authorship of the *Geography* settles the question for the *History* also.

The *Geography* is a meagre sketch, based mainly on the *Chorography* of Pappus of Alexandria (in the end of the 4th century), and indirectly on the work of Ptolemy. Only Armenia, the Persian empire, and the neighbouring regions of the East are independently described from local information, and on these sections the value of the little work depends. Since the first published text,¹⁵ contains names like "Russians" and "Crimea," Saint Martin in his edition¹⁶ denied that it was written by Moses, and assigned its origin to the 10th century. It was shown, however, by L. Indjidjean¹⁷ that these are interpolations, which are not found in better manuscripts. And in fact it is quite evident that a book which gives the division of the Sasanid empire into four spahbeshships in pure old Persian names cannot possibly have been composed at a long interval after the time of the Sasanidae. But of course it is equally clear that such a book cannot be a genuine work of Moses of Khor'ni; for that division of the empire dates from the early part of the reign of King Chosrau I. (531-579).¹⁸ Accordingly the latest editor, K. P. Patkanow,¹⁹ to whom we are indebted for the best text of the

¹⁸ See Nöldeke's *Tabari*, p. 155 sq.

¹⁹ *Armjanskaja geographija vii. waka po r. Ch.* (připsiw awschajaja Moiseju Chorenskomu), St Petersburg, 1877, 8vo. Before him Kiepert (in the *Monatsb. d. Berliner Akad.*, 1873, p. 599 sq.) had substantially arrived at the right conclusion when he assigned the portions of the *Geography* referring to Armenia to the time between Justinian and Maurice.

Geography, is of opinion that we have in it a writing of the 7th century. In this judgment we must concur; and, if the limits within which the *Geography* was composed are to be more nearly defined, we may say that, from isolated traces of Arab rule¹ (which in Armenia dates from 651), it must have been written certainly after that year, and perhaps about the year 657.²

Another extant work of Moses is a *Manual of Rhetoric*, in ten books, dedicated to his pupil Theodorus. It is drawn up after Greek models, in the taste of the rhetoric and sophistry of the later imperial period. The examples are taken from Hermogenes, Theon, Aphthonius, and Libanius; although the author is also acquainted with lost writings, e.g., the *Peliades*, of Euripides. On account of the divergence of its style from that of the *History of Armenia*, Armenian scholars³ have hesitated to ascribe the *Rhetoric* to Moses of Khor'ni; but, from what has been said above, this is rather to be regarded as a proof of its authenticity.

Smaller works bearing the same honoured name⁴ are—the *Letter to Sahak Arderuni*; the *History of the Holy Mother of God and her Image* (in the cloister of Hogotsvanch in the district Andzevatsi of the province of Vaspurakan), which is also addressed to Sahak; and the *Panegyric on Saint Rhipsime*. Of the sacred poems attributed to him, there is only one short prayer, contained in the hymnal of Sharakan, which can really claim him as its author.

Of works passing under the name of Moses of Khor'ni, the following are regarded by the historians of Armenian literature as spurious: a *History* (distinct from the *Panegyric*) of the wanderings of *Saint Rhipsime and her companions*; a *Homily on the transfiguration of Christ*; a *Discourse on Wisdom* (i.e., the science of grammar); the *Commentaries on grammar* (an exposition of Dionysius Thrax). In the case of the grammatical writings, it has been suggested that there may have been some confusion between Moses of Khor'ni and a Moses of Sinnich, who lived in the 7th century. (A. v. G.)

MOSHEIM, JOHANN LORENZ VON (c. 1694-1755), well known as a church historian, but also distinguished in his day as a master of eloquence, was born at Lübeck on the 9th of October. There is some uncertainty as to the year, but the probability is in favour of 1693 or 1694. He received a somewhat irregular education at the gymnasium of his native place, and afterwards entered the university of Kiel, where he took his master's degree in 1718. His first appearance in the field of literature was in a polemical tract against Toland, *Vindiciæ antiquæ Christianorum disciplinæ* (1720), which was soon followed by a volume of *Observationes sacræ* (1721). These works, along with the reputation he had acquired as a lecturer on philosophy, and also as a fervent and eloquent preacher while acting as assistant to Albrecht zum Felde, his teacher and future father-in-law, secured for him a call to a theological chair at Helmstädt, in 1723. The *Institutionum Historiæ Ecclesiasticæ libri IV.* appeared in 1726 (2 vols., 12mo), and in the same year he was appointed by the duke of Brunswick abbot of Marienthal, to which dignity and emolument the abbacy of Michaelstein was added in the following year. Mosheim was much consulted by the authorities when the new university of Göttingen was being formed; especially had he to do with the framing of the statutes of the theological faculty, and with the provisions for making the theologians independent of the ecclesiastical courts. But having signed in 1726 a promise to remain in Helmstädt he was unable to accept the call to the Georgia Augusta which was urgently pressed upon him, until the year 1747, when the duke of Brunswick at last released him from his obligation. To enhance the dignity he already possessed as a learned and brilliant theological professor at Göttingen, a new office was specially created for him, that of chancellor, which, however, proved somewhat burdensome, exciting the jealousy of the nobles whom he governed. He died at Göttingen on 9th September

1755, shortly after the completion of a new and greatly improved edition of his *Church History*.

For Mosheim's place as an ecclesiastical historian, see *CHURCH HISTORY*, vol. v. p. 765. In this department of literature, in addition to the *Institutiones* must be specially mentioned his *De Rebus Christianorum ante Constantinum Magnum Commentarii* (1753), and Gibbon's just criticism: "Less profound than Petavius, less independent than Le Clerc, less ingenious than Beausobre, the historian Mosheim is full, rational, correct, and moderate." His exegetical writings, characterized by learning and good sense, include *Cogitationes in N. T. loc. select.* (1726), and expositions of 1 Cor. (1741) and the two Epistles to Timothy (1755). In his sermons (*Heilige Reden*) considerable eloquence is shown, and a mastery of style which justifies the position he held as president of the German Society. There are two English versions of the *Institutes*, that of Maclaine, published in 1764, and that of Murdock (1832), which is much more correct. The latter was revised and re-edited by Reid in 1848. An English translation of the *De Rebus Christianorum*, begun in 1813 by Vidal, was completed and edited by Murdock in 1851.

MOSQUE (*Jâmi*, or more fully *Masjid Jâmi*), the place of congregational prayer. Owing to the almost complete absence of ritual in the Moslem worship, the mosque, at least in its earlier forms, is one of the simplest of all religious buildings,—its normal arrangement being an open court (*Sahn*) surrounded by a covered cloister (*Liwân*), in the centre of which is a cistern for the ablutions requisite before prayer (*Mida'a*);⁵ the side of the mosque which is towards Mecca is occupied by a roofed building (*Maqsûra*), or place reserved for prayer, sometimes screened off from the court, but frequently quite open towards it. In the centre of this sanctuary is a niche (*Mihrab* or *Kibla*) showing the direction of Mecca; and by the side of the niche is a lofty pulpit (*Mimbar*). In front of the pulpit is a raised platform (*Dakka*) from which certain exhortations are chanted, and near it one or more seats and lecterns combined from which chapters of the Koran are read to the people.

Minarets (*Ma'âdhin*, sing. *Ma'dhana*) were not built during the first half-century after the Flight, but now as a rule no mosque is without at least one. From the upper gallery of this the *Moedhdhin* announces to the faithful the times for prayer,—five times during the day, and twice at night. Blind men are generally selected for this office, so that they may not overlook the neighbouring houses.

Most mosques have endowed property, which is administered by a warden (*Nâzir*), who also appoints the imâms and other officials. The larger mosques have two imâms: one is called (in Arabia and Egypt) the *Khatib*, and he preaches the sermon on Fridays (the Moslem Sabbath); the other, the *Râtib*, reads the Koran, and recites the five daily prayers, standing close to the *Mihrab*, and leading the congregation, who repeat the prayers with him, and closely follow his postures. The imâms do not form a priestly sect; they generally have other occupations, such as teaching in a school or keeping a shop, and may at any time be dismissed by the warden, in which case they lose the title of imâm. Doorkeepers and attendants, to sweep the floor, trim the lamps, and perform other menial offices, are attached to each mosque in numbers varying according to its size and endowment. Moslem women, as a rule, are expected to say their prayers at home, but in some few mosques they are admitted to one part specially screened off for them: This is the case in the mosque of Sitta Zainab in Cairo. In the Akṣâ mosque at Jerusalem there is a latticed balcony for the women, who can see without being visible to the male worshippers below.

The greatest possible splendour both of material and workmanship is often lavished on the building and its

¹ The passage about the trade of Basrah, which was founded in 635, is decisive on this point (Saint Martin's edition, ii. p. 368).

² The peculiar interest which the author (Saint Martin, ii. p. 340) takes in the origin of the Slavs in Thrace is best explained by the war against them which called the emperor Constans II. away from the East in the year 657. In other respects the writer displays the most complete indifference, and even ignorance, with regard to the state of affairs in the West.

³ Cf. Langlois, ii. 49.

⁴ Cf. Langlois, l.c.

⁵ In mosques frequented by Turks or other members of the Hanafi sect running water is provided from a raised tank with flowing jets, called a *hanafiya* after the sect who require it. Other Sunnis are content to wash in a stagnant tank.

fittings. The whole outside is frequently decorated with the most elaborate surface-carving in stone or marble,—the pavement of the richest marbles, inlaid in intricate patterns, the walls panelled in a similar way, or decorated with the most minute mosaics of glass, mother-of-pearl, agates and other costly stones. The central niche and the pulpit are of special magnificence; and, if the latter is of wood, it is often covered with delicate ivory carvings, and inlay of pearl and ebony. Very beautiful surface-ornament, executed in hard stucco, and enriched with gold and colours, is used to decorate arches, wall surfaces, and the pendentives of domes, which latter generally have the so-called "stalactite" form of ornament—one of great beauty and complexity. The woodwork of doors, screens, and ceilings is frequently very gorgeous with carving, inlay, and elaborate painting; the whole of the doors outside are often covered with very delicate pierced and embossed work in bronze, or more rarely iron. The magnificent tiles from Persia, Damascus, and Rhodes, enamelled in brilliant blue, green, and red, on a white ground, are often used to cover the walls. Traceried windows in pierced marble or stucco work often occur; these are filled with brilliant coloured glass, always in very small pieces, forming a transparent mosaic of jewel-like richness. Lamps of enamelled glass, or of bronze inlaid with silver, were once common, but are now rapidly disappearing.

Some mosques, especially the Karúbin mosque at Fez in Morocco, possess a collection of magnificent illuminated MSS., chiefly copies of the Koran and other religious books; in the large collection at Fez, MSS. of Aristotle's *Natural History*, with the works of Averroes and other commentators, exist in considerable number; some few of the MSS. are as early as the 10th century.

Plans of Mosques.—Considerable diversities exist in the plan and arrangement of mosques in various countries, either because the Moslem conquerors adopted to some extent the existing buildings and architecture of the conquered people, or on account of the new mosque being built on a site already cramped by surrounding buildings. The first of these causes influenced to some extent the mosques of India, and to a much greater extent those of European Turkey. The second cause, the cramped site, especially in Cairo, created a special type of plan. Nevertheless, when free from such disturbing influences, there is one normal plan adopted, at least in early times, by the Moslems in all countries—from India to Cordova, and from northern Syria to Egypt.² This normal plan is a very simple one, and is the natural product of a country like Arabia, unskilled in architecture, where land was worth but little, and timber very scarce. (See fig. 1.)

Though not the earliest, the great mosque of Cordova is the most magnificent, and in the main the best preserved, of this typical form.³ It was begun in 784-5 by the caliph 'Abd al-Rahmán I. (Abderame) and completed by his son Hisham in 793-4; though it was afterwards enlarged, and then to some extent injured by additions—the work of the Christians, who made it into a cathedral—yet it still remains but little altered, except by the loss of its magnificent carved and inlaid wood ceiling and sumptuous *Mimbar*. It consists (omitting recent additions) of two main parts, a large cloistered open court, with at one side a covered building for prayer. In one respect only it differs from the usual plan: the open court is generally much larger than the roofed space, whereas at Cordova it is smaller. For the sake of uniformity this arrangement will, in the rest of the article, be referred to as the "normal plan." In spite of neglect and alterations this mosque is still one of the most imposing buildings in the world. The long ranges of

aisles, nineteen from east to west and thirty-one from north to south—on their marble columns the spoils of many a Greek and Roman temple—seem to stretch almost endlessly in every direction, and each range of pillars appears to lose itself in the gloom of distance, so that from no point can any idea be formed of what is the real size of the whole building. The side towards the court was quite open, and all over the court orange-trees were planted at regular intervals, continuing the lines of the columns within, and set at the same distances apart; so that aisles of orange-trees in long ranges covered the open space, just as the marble columns did within. No words can describe the jewel-like splendour of the mosaics in the sanctuary, which in complicated Arabesque patterns, mixed with elaborate Cufic inscriptions, cover the walls and even the arches, which cross and recross each other in the most fanciful and daring way, forming a sort of aisle round three sides of the sanctuary. There is documentary evidence to show that these glass mosaics, though of thoroughly Oriental design, are, like those in the mosques of Jerusalem and Damascus, the work of Christian artists from Byzantium.

The most important early mosques were all built on this normal plan, with but very slight variations. The following are some of the finest examples of this type:—

Mosque of 'Amr, Old Cairo, begun in 642 A.D., but much enlarged at the end of the 7th century, and afterwards partly rebuilt (see fig. 1).

Mosque of Sidi-'Okba at Kairawán in Tunis, latter part of 7th century.

Mosque of Sidi-'Okba near Biskra in Algeria, about 684.

Mosque of Edris at Fez in Morocco, end of 8th century.

Great mosque of Damascus, 708.

Great mosque of Cordova, 784-794 (described above).

Mosque of Ibn Tulún, Cairo, 879.

Mosque of Al-Azhar, Cairo, begun about 970.

Great mosque at Old Delhi, 1196-1235.

The first of these, the mosque of 'Amr (see Coste, *Architecture*

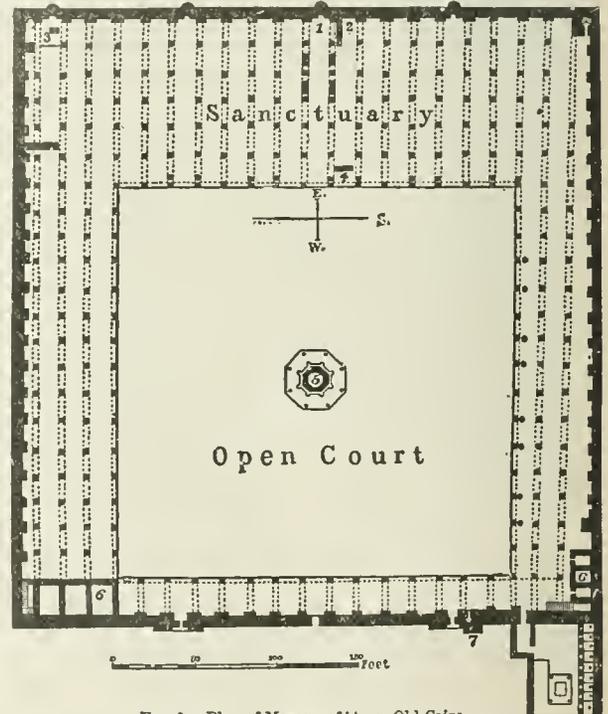

FIG. 1.—Plan of Mosque of 'Amr, Old Cairo.

Arabe, is now in a partly ruined condition. Its east wall probably still retains some of the original work of 'Amr, who in 642 built a small mosque on the site of the present one. But little remains except its fine antique marble columns to tell of its former splendour in mosaic, stucco reliefs enriched with painting, and magnificent inlaid wood ceilings and screens. According to Makrizi, it once contained 1290 MSS. of the Koran, and was lighted by 18,000 lamps. In general effect, like all mosques of this simple and extensive plan, it is very stately, from the vast size of its area, and its great number of closely-ranked columns and arches, the latter being of many forms—pointed, semicircular,

¹ See Coste, *Architecture Arabe*, 1837-39; Bourgoïn, *Les Arts Arabes*, 1863; Prisse d'Avannes, *Art Arabe*, 1874-80; and Texier, *L'Arménie et la Perse*, 1842-52.

² The great mosque of MECCA (*q.v.*) is unique in plan. For an account of the mosque of Medina, see MEDINA.

³ Contreras, *Arta Arabe en España*, 1875; *Academy*, 19th November 1381, "Mosque or Cordoba," by J. H. Middleton; *Mon. Arqu. de España*; and Prangey, *Mosquée de Cordoue*.

and horse-shoe. Fig. 1 gives its plan as a good typical specimen of this normal type of mosque.

The mosque at Kairawán, Tunis, said to have been founded by 'Okba (see *supra*, p. 567), follows the normal plan, with 439 fine antique marble columns, horse-shoe arches, some pointed and others round, and flat ceiling of dark wood, once magnificently painted. Its sanctuary is ten aisles deep by seventeen wide. In the centre of the court is a marble fountain over the sacred well, said to communicate with the spring Zemzem at Mecca. Its minaret, a rather later addition, is very massive and stately; it is square, in three stories, each battlemented, the walls battering considerably. The sanctuary is domed, and the *Mihráb* is decorated with magnificent tiles. Adjoining the sanctuary is a small room for a library.

The other great mosque of Sidi-'Okba, built soon after his death in 632, and containing his tomb, is in Algeria near Biskra; it much resembles the Kairawán mosque, but is less splendid, some of the columns being not of marble but of baked clay decorated with painting.

The great mosque of Fez, about the same date, is also very large and magnificent, with *Mimbar* and *Mihráb* richly ornamented with minute mosaics; it has also a fine inlaid and painted wood ceiling, and some elaborately-carved doors. It still possesses a fine library. (See Amici, *Journey to Fez*, 1878.)

The great mosque of Damascus was built on the site of a Christian basilica, erected by Theodosius in 395-408. From 636, when the Arabs conquered Damascus, until 708 this basilica was used jointly both by the Christians and the Moslems. The basilica was then pulled down, and the present mosque built by the caliph Walid. It has the normal plan, and is 508 feet by 320 feet. Its sanctuary is only three aisles deep; it has a central dome on the south or Mecca side, and on the east and west a large porch. Samhúdi records that one of the conditions of peace concluded between the Byzantine emperor and Walid was that the emperor should furnish a certain number of workers in mosaic for the decoration of the mosques at Mecca, Medina, Jerusalem, and Damascus.

The mosque of Ahmed Ibn Tulún, in Cairo, completed in 879, has the normal plan, with the exceptional addition of an outer court, or wide passage, running round three sides of the rectangle,—probably to cut it off completely from the noise of the surrounding streets. It is built of brick, coated with delicate reliefs in stucco, once enriched with painting. The *Mihráb* has beautiful mosaics, and the *Mimbar* is a marvel of delicate carving and inlay. The pillars and arches are of brick enriched with elaborate stucco-work. It has a very remarkable minaret on the west side, with a spiral external staircase. The architect was a Copt, an Egyptian Christian. It is perhaps the earliest important building in which the pointed arch is largely used.

The mosque Al-Azhar, "The Splendid," was built in the centre of New Cairo about 970 and, though frequently restored, has in the main been little altered. It is on the normal plan, with ranges of pointed and slightly horse-shoe arches, supported on more than 400 fine antique columns of marble and porphyry, chiefly from Roman buildings. Among its later decorations are magnificent wall-coverings of the most beautiful Persian tiles. It has a special interest in being the chief university of the Moslem world, containing some thousands of students (*mujáwirín*), for whom certain parts of the mosque (*Riwák*) are screened off, according to the country from which they come. Thus special parts are reserved for natives of the various provinces of Egypt, of Morocco, Syria, Arabia, India, Turkey, &c. Each student can, if he is too poor to hire lodgings, live, eat, and sleep in the mosque. Each has a large chest in which to keep his clothes and books; these are piled against the walls to a height of seven or eight feet. The students pay no fees, but the richer ones give presents to the lecturers, who sit on the matting in various parts of the sanctuary or cloister, while the students sit round each lecturer in a circle. The usual course of study lasts for three years, though some students remain for much longer. The chief of the lecturers, called the *Sheikh al-Azhar*, receives about £100 a year, the others little or nothing, as regular pay. The Koran, sacred and secular law, logic, poetry, and arithmetic, with some medicine and geography, are the chief subjects of study.

Of mosques which are not built on the normal plan the earliest and most important are the two in the Harám al-Sherif, (High Sanctuary) at Jerusalem (see vol. xiii. p. 642).

The Kubbet al-Šakhra (Dome of the Rock), popularly, but wrongly, called the "Mosque of Omar," is not, strictly speaking, a mosque at all. It belongs rather to the class of "shrines,"—generally small square, circular, or octagonal buildings erected over some sacred spot or tomb. It is a very beautiful building, with high central dome, and double ambulatory round it,—the outer wall being octagonal, and the dome, with the pillars that carry it, circular in plan. It is decorated in a very sumptuous way by inlay of rich marbles and very splendid glass mosaics. The outer wall and most of the internal mosaics are later than the dome itself. Its windows of mosaic-like stained glass are very beautiful, and are almost the only

Moslem example of the use of lead "comes," instead of the bits of glass being fitted into marble or stucco tracery; this, as well as the glass wall-mosaics, was probably the work of Byzantine artificers.¹

The mosque within the same enclosure, called Al-Aksá, is entirely roofed, with many aisles and columns, having no open court, quite unlike the usual arrangement of a mosque.

The finest and largest group of mosques is at Cairo. Many of them are very complicated buildings, with no resemblance to the normal plan before described. In some cases a hospital, a school, a court of justice, a monastery, or very frequently a tomb, forms part of the building, and causes considerable modifications in its plan.

The finest of these is the mosque of the sultan Hasan, built between 1356 and 1359 (fig. 2), a good specimen of a mosque

built in a crowded site with a wing for a tomb. In plan it is cruciform, the central part being open to the sky; the eastern arm of the cross is the sanctuary, and farther east is the stately domed tomb of the sultan himself. All four arms of the cross are vaulted in stone with a plain waggon vault. Its magnificent entrance on the north, with an enormously high arch, decorated with stalactite reliefs in stone, is set somewhat askew to follow the line of the old street. It has two minarets, one of great height and grandeur.

The Muristán Kalaún is a combination of hospital, tomb, and mosque,—an enormous building covering a very large area. It was built by Sultan Kalaún at the beginning of the 14th century; his tomb, built 1320, which forms part of this great building, is

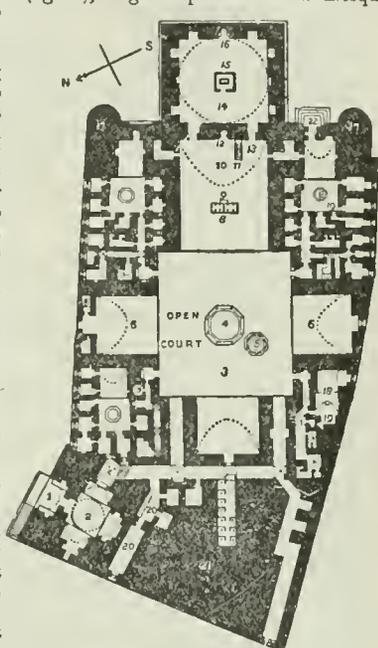

FIG. 2.—Plan of Mosque of Sultan Hasan, Cairo.

a massive square edifice with a very grand well-designed octagonal dome. Its wall-mosaics are unusually magnificent. Even a bare list of the mosques

of Cairo would occupy a large space; they are over four hundred in number, and are mostly remarkable for some beauty in design or richness in their ornament and material.

The mosque of Ibrahim Agha should specially be noted for the splendid Persian tiles which cover the east wall of its sanctuary; these are of the end of the 16th century, and are unrivalled in beauty both of drawing and colour. The tiles are 9 inches square, and work into large designs with very graceful sweeping curves of foliage, drawn with the greatest skill, and painted in the most brilliant yet harmonious colours—perfect masterpieces of coloured decoration. See MURAL DECORATION.

The so-called "Tombs of the Caliphs," really tomb-mosques of Egyptian sultans, are a large group of very fine buildings, less than a mile outside the walls of Cairo. The largest is that of Sultan Barkúk, with a superb dome and two stately minarets. In addition to an extensive open court, it has on each side of the sanctuary a magnificent tomb-chamber containing the bodies of the sultan himself, who died in 1399, and various members of his family.

The most beautiful and graceful of all these mosques is that which contains the tomb of Sultan Káit-Bey, who died in 1496; its dome is entirely covered externally with beautiful and delicate reliefs carved in stone. Its minaret is a masterpiece of invention and extreme grace of outline, combined with the richest and most exquisite detail; like most of the Cairo mosques, its exterior is ornamented by bands of red stone alternating with the yellow Mokattam limestone. Inside, marble inlaid pavements and mosaic on the walls, with decorations in painted stucco and wood carved and inlaid give extreme splendour to the building. Fig. 3 gives its plan as a typical example of the combined mosque and tomb,—the latter the more important. The mosque inside the walls of

¹ See De Vogué, *Temple de Jérusalem*, 1864; Texier, *Asie Mineure*, 1862.

Cairo, built by the same sultan, is also very beautiful, and remarkable for its carvings and mosaics.

It should be observed that the magnificent mosques of Egypt, as of other countries, owe little or nothing to the native architectural talent of the Arabs themselves. Their own buildings at the time of the Prophet were of the simplest and rudest description, but they were always ready to make use of the architectural skill and constructive power of the people they conquered.

The earlier buildings of Egypt are mainly the product of Coptic and Byzantine skill, while rather later the art of Persia, both in its general designs and details of workmanship, exercised a paramount influence over the whole Moslem world. Another influence must not be forgotten, that of French and English Gothic, produced by the buildings erected by the crusaders during their occupation of Palestine. One of the Cairo mosques, that of Kalaún, possesses a fine arched doorway, taken from a Christian church at Acre—a fine specimen of Early

English work, which would not be out of place in Salisbury Cathedral. Moslem translations of the clustered jamb-shafts and deep arch-mouldings of this style often occur.

The rest of northern Africa contains many mosques of great size and splendour; among these the most important, in addition to those already mentioned as having the normal plan, are—(1) the mosque-tomb of 'Abdallah b. Wadib in Kairawán, Tunisia, a very large building, containing several courts and cloisters, dating from the same early period as the other great mosque in Kairawán; its minaret is covered outside with fine blue and green tiles; (2) the great mosque of Algiers, 10th century; and (3) that of Tlemcen, in the extreme west of Algeria, built in the middle of the 12th century; this has a very splendid pavement, partly composed of Algerian onyx, and a beautiful bronze chandelier, 8 feet in diameter, given by Sultan Yarmorak, 1248-83.

In Spain, at Zahra near Cordova, was one of the grandest of the early mosques, finished in 941; but nothing of it now exists. Several churches in Spain were originally built as mosques, such as S. Cristo de la Luz at Toledo, a small, nearly square building, roofed by dome-like vaulting on marble pillars.

In Persia but little now remains of the magnificent early mosques, built with such splendour, especially during the reign of Hárún al-Rashid. At Erzeroum there is a fine mosque, combined with tomb and hospital, almost Early Gothic in style, dating from the 13th century.¹ At Tabriz there is another church-like mosque, evidently the work of Byzantine builders; according to Texier, this belongs to the 16th century, but it is probably two or three hundred years earlier.

The mosque of Houn, near Cæsarea in Cilicia, is a fine large rectangular building, covered with low domes on square piers. It dates from the second half of the 12th century.

At Tchekirghe near Broussa is a very remarkable mosque—that of Murad I., built in the 13th century, almost in the style of contemporary Italian Gothic. Its main façade bears an extraordinary resemblance to one of the earlier Siennese palaces.

The later capital of Persia—Ispahan—became the centre of the highest development of the Persian arts under Shah 'Abbás I., 1585-1629; to this period belongs the splendid mosque called Masjid Shah, a strangely-planned building of great size, finished in the most sumptuous way, inside and out, by wall-coverings of the finest Persian enamelled tiles. The mosque of Sultan Hosein, built as late as 1730, preserves much of the old beauty of design and decoration.

India is especially rich in mosques of great size and beauty. The earlier ones are much influenced by the still older Hindu architecture, and some of the larger mosques are built of materials from the old Jain temples. It is recorded that twenty-seven Hindu temples were destroyed to build the great mosque in Old Delhi, erected 1196 to 1235, which presents a curious mixture of the semi-barbarous Hindu carved work with the more refined and graceful decoration of the Moslem builders. This great mosque is on the normal plan, as is the 13th century mosque at Ajmir, also

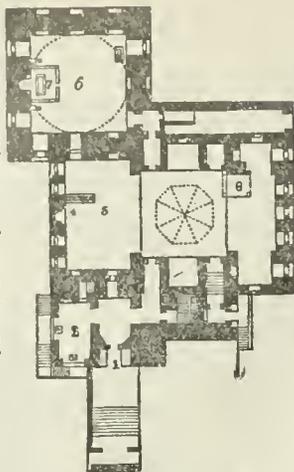

FIG. 3.—Mosque-tomb of Sultan Kait-Bey, Cairo.

built on the ruins of a Hindu temple. A whole volume would not suffice to describe the magnificent mosques of India, such as those at Ahmedabad, Mandu, Maladah, Bijapur, Fathipur, and countless others. The introduction in the 17th century of Florentine marble and mosaic workers produced a new and very splendid style of building, of which the "pearl mosque" and the Taj Mehal at Agra are the finest specimens.

At Srinagar in Kashmir there is a large and very remarkable mosque of the normal plan, constructed entirely of wood logs, with numerous pillars of deodar pine; it was built by Shah Hamadan, and is an extremely picturesque building. (See Cole, *Ancient Buildings in Kashmir*, 1869.)

In Turkey the mosques are either old Christian basilicas, such as S. Sophia and S. Saviour's at Constantinople, and the numerous fine early churches of Thessalonica and Trebizond, or else are mostly copies, more or less accurate, of Justinian's splendid church of S. Sophia, a building which seems to have been enthusiastically admired and appreciated by the Ottoman conquerors. The mosque of Solaimán the Magnificent, 1550-1555, is the finest of these Turkish reproductions of S. Sophia. Another, rather less close a copy, is the mosque of Sultan Ahmed, 1608. None of this latter class are of course earlier than the middle of the 16th century.²

In the present century Moslem art has produced but little of architectural importance. The great mosque of Mohammed Ali, on the citadel of Cairo, is the work of a German architect, and though built of rich materials is of small artistic value or interest; it is a large but feebly designed building of the S. Sophia type. Unfortunately European influence seems now to be rapidly destroying the feeling for true art that still survives among Moslem nations.

(J. H. M.)

MOSQUITO (sometimes written "Mosquita"), a Spanish word signifying "little fly," is a name popularly applied to certain annoying dipterous insects, and, strictly speaking, it should probably be used only for species of *Culicidæ* (and for the genus *Culex* in particular), for which "gnat" is the English synonym; but in many countries it is by almost common consent applied to all small dipterous insects that suck human blood, and therefore includes what we know as "sand-flies," "midges," &c., of the genera *Ceratopogon*, *Simulium*, and others. By Englishmen a distinction is often falsely drawn between "mosquito" and "gnat," the former being supposed to represent an insect native chiefly of hot climates, whereas the latter is their own too-well-known pest. In effect the terms are really synonymous, and any actual difference can only be specific. In very hot seasons we not uncommonly hear alarming reports of mosquitoes having made their appearance in London and elsewhere in the British Isles, and means whereby they were imported are often suggested,—the real facts of the case being that extra heat may render the native species more annoying, or that it causes a bodily condition in which their bites are more severely felt.³ The "mosquitoes" of high northern latitudes may be species both of *Culex* and *Simulium*.

Accounts of the numbers of these insects in tropical countries and in high latitudes, and of their irritating attacks, are to be met with—seldom exaggerated—in most books of travel. Even in Britain the annoyance caused by gnats is very great, and in marshy districts often unendurable, especially to new-comers, for it seems probable that the insects really attack a visitor more furiously than they do the natives of the district, but, on the other hand, the latter may be more indifferent to their assaults. In some subjects even the "piping" by which a hungry gnat announces its presence has most distressing effects. In

² Texier and Pullan, *Byzantine Churches*, 1864; Pulgher, *Églises de Constantinople*, 1882.

³ A few years ago a London hotel, popular with American visitors, was said to harbour mosquitoes, which some of the visitors had brought with them from the Southern States. An examination revealed the fact that the cistern was uncovered and exposed, and was the breeding-place for hosts of gnats.

¹ See Texier, *L'Arménie et la Perse*, 1842-52; Costa, *Monuments Modernes de la Perse*, 1867; Flandin and Coste, *Voyage en Perse*, 1843-54.

high latitudes they are driven off by anointing the body with fish-oil; and in hot climates "mosquito curtains" are part of the ordinary bed-furniture. It is only the female that bites; and, as it is but a very small proportion of them that can ever taste human blood or that of any warm-blooded animal, blood would not appear to be essential to their welfare. It has been suggested that warm blood may have an influence on the ova, but it cannot be supposed that the eggs of those multitudes of individuals that never get a chance to taste blood are necessarily infertile; everything tends to prove the opposite.

Of late mosquitoes have been accused of playing a hitherto unsuspected part in the dissemination of certain entozoic diseases. According to the researches, of Drs Manson and Cobbold and others, it appears certain that the insects, in sucking the blood of persons who are hosts of the entozoon known as *Filaria sanguis-hominis*, take these parasites into their own system, and it is believed that they afterwards (by their death and otherwise) contaminate drinking water with them, and thus convey the entozoa into the blood of persons previously unaffected.

Mosquitoes are aquatic in their early stages. The

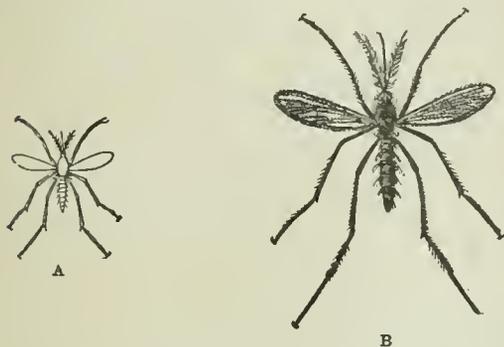

FIG. 1.—Mosquito (*Culex*). A, natural size; B, enlarged. (After Curtis.)

female deposits her eggs in boat-shaped masses on the surface of the water. The larvæ are very active, and have a peculiar jerking motion; the last segment is furnished with a respiratory apparatus, the form of which probably varies according to the species, but it is usually a long tube, the extremity of which can be exposed to the external air. The pupæ

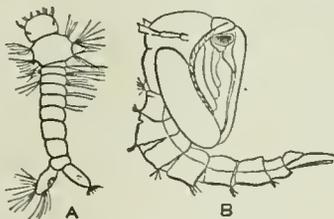

FIG. 2.—A, larva of *Culex*; B, pupa. (After Packard.)

are also active (contrary to the condition in most dipterous pupæ), and are odd-looking creatures owing to the great development of the thoracic region; the respiratory apparatus is in the thorax in this state, the extremity of the body having two swimming-plates; the pupæ do not eat, but their activity is very great.

No notice of the mosquito or gnat would be complete without an explanation of the mouth-parts by which it is enabled to cause such extreme irritation. When these parts are closed one upon the other the whole looks like a long proboscis; but in reality this consists of seven distinct slender pieces separated to the base, viz.—the labium, two maxillæ, two mandibles, the lingua, and the labrum. The nomenclature of the mouth-parts varies with different authors. G. Dimmock (*Anatomy of the Mouth-parts and of the Sucking-apparatus of some Diptera*), the latest investigator of this complex apparatus, states that the labium has for function, for the most part, the protection of the fine setæ which form the true piercing organ of *Culex*. In the female of *Culex* the protective sheath is formed by the labium alone. When the mosquito has found a place which suits it for piercing—for it often tries different places on our skin before deciding on one—it plants its labellæ firmly upon the spot, and a moment later the labium is seen to be

flering backwards in its middle; the setæ, firmly grouped together, remain straight and enter the skin. When the setæ have entered to nearly their full length, the labium is bent double beneath the body of the insect. When the mosquito wishes to withdraw the setæ it probably first withdraws the two barbed maxillæ beyond the other setæ, that is, so that their barbs or papillæ will be kept out of action by the mandibles and hypopharynx; then it readily withdraws the setæ, perhaps aiding their withdrawal by the muscles

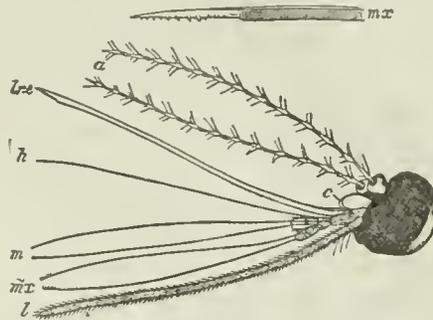

FIG. 3.—Mouth-parts, &c., of female *Culex* (after Dimmock). a, antennæ; c, clypeus; h, hypopharynx; tr-c, labrum-epipharynx; l, labium; m, mandibles; mx, maxillæ (with the tip of one of them enlarged).

of the labium, for during the process of extracting the setæ from the skin, while they are slowly sinking back into the groove upon the upper side of the straightening labium, the mosquito keeps the labellæ pressed firmly upon the skin. The withdrawal of blood is effected by means of a pumping apparatus at the base of the mouth-parts. As no investigator appears to have been able to detect a poison gland, it has been considered that the irritation caused by the bite of a mosquito was solely of mechanical origin; but the extreme irritation and its duration have not caused this idea to be commonly accepted. Dimmock avows his belief that there is use made of a poisonous saliva. In the male of *Culex* the mouth-parts vary considerably from those of the female,—a conspicuous point of difference being that in this sex the mandibles are absent, and the maxillæ are not barbed.

About 35 species of *Culex* (mosquito or gnat) have been described as inhabiting Europe, and about 130 from the rest of the world, but their differentiation is involved in great difficulty and uncertainty, and it is probable that the number of true species may be very much less. A species from Cuba has received the name *Culex mosquito*; but there is not one species that specially deserves the name more than another from a popular point of view, nor from a scientific point of view is there any difference between a mosquito and a gnat.

MOSQUITO COAST. See NICARAGUA.

MOSESSES, or MUSCI, one of the two divisions of the botanical class *Muscineæ*, which includes also the Liverworts or *Hepaticæ*. See MUSCINEÆ.

MOSSLEY, a manufacturing town of Lancashire, England, is situated on the London and North-Western Railway and on the Huddersfield canal, near the west bank of the Tame, which here separates Lancashire from Cheshire, 3 miles north-east of Ashton-under-Lyne, and 10 east-north-east of Manchester. The houses are for the most part built of stone. To supersede the old church of St George, erected in 1757, a new building was begun in 1881. A mechanics' institute was erected in 1858. In the vicinity of the town is an eminence called Hartshead Pike, on which is a lofty circular tower surmounted by a spire rebuilt of stone in 1758. Mossley has risen into importance since the introduction of the cotton manufacture about fifty years ago. A fair is held annually. The town was placed under the Local Government Act in 1864, the district to which its provisions extend including also part of Saddleworth in Yorkshire. The total population was in 1871 10,578, and 13,372 in 1881.

MOSTAR, the chief town of Herzegovina, is built on both banks of the Narenta, about 35 miles from its mouth, and 40 miles south-west of Serajevo (Bosna Serai), the capital of Bosnia. Among the public buildings are a palace, two Greek churches, and forty mosques, in several cases with Roman or Byzantine tracery in their windows. The fine old bridge from which the town takes its name

(*Most Star*, Old Bridge) is probably Roman. The town has a good trade and manufactures excellent Damascus swords; and the grapes and wine of Mostar are celebrated throughout the south Slavonic countries. The population, 7300 in 1844, had increased to 10,848 by 1879.

Whether its ancient name was Saloniāna, Sarsenterum, or Andretium, there is little doubt that Mostar, or, to use the older Slavonic name, Vitrinitcha, dates from the time of the Romans. It was enlarged in 1440 by Radivoi Gost, mayor of the palace to Stephen, first duke of St Sava. Immediately on their conquest of Herzegovina it was chosen by the Turks as their headquarters; and it afterwards became the capital of the independent government of Ali Pasha and Stolac.

See Evans, *Through Bosnia and Herzegovina*, 1876; Wilkinson's *Dalmatia and Montenegro*, vol. II. (view and plan at pp. 59-60); and Caix de Saint Aymour in *Rev. des D. Mondes*, February 1883.

MOSUL, an important town in Mesopotamia, on the right bank of the Tigris, in 36° 35' N. lat. and 43° 3' E. long. In Mosul, as in Baghdad, only part of the space within the walls is covered with buildings and the rest is occupied by cemeteries; even the solid limestone walls of the ancient town are half in ruins, being serviceable only in the direction of the river, where they check inundations. Of the town gates at present in use, five are on the south, two on the west, two on the north, and the great bridge gate on the east. Leaving Mosul by the last named, the traveller first crosses a stone bridge, 157 feet long; then a kind of island (140 feet), which is overflowed only in spring and summer by the Tigris; next a stretch of the river which, at such times as it is not fordable, is spanned by a bridge of boats, the bridge proper covering only one-sixth of the full width of the stream. During the season of low water excellent vegetables, particularly water-melons, are grown upon the islands and dry portions of the river-bed.

The interior of Mosul has an insignificant appearance, only a few of the older buildings being left, among which may be mentioned the Great Mosque, with its leaning minaret, formerly a church dedicated to St. Paul. The private houses are partly of brick and partly of stone, the district furnishing an excellent and easily-wrought building-stone resembling marble. Handsome well-built halls (*havāns*) may be seen in many houses; the underground dwellings also, to which the inhabitants retire during the day-time in the hot months of summer, are well and solidly built. The houses are high, and during three or four months of the year the inhabitants sleep on the flat roofs. The streets are for the most part badly paved and very narrow, a small square in the market-place, overlooked by airy coffee-booths, being almost the only open space. The shops are few and poor. The industry, in comparison with former times, when the town had so considerable a manufacture in "muslin" as to give its name to that fabric, is very unimportant; trade also, which is almost exclusively in the hands of native merchants, has fallen off greatly. Gall nuts, gathered on the neighbouring Kurdish mountain slopes, are mostly exported, but are also made use of by native dyers; and hides, wax, cotton, and gum are sold. Very few Europeans live in Mosul, though the market is abundantly supplied with European goods. The wholesale trade, conducted by means of caravans, has greatly declined from its former importance, owing not only to changes which have been taking place in commercial routes generally, but also to the dangers of the roads near Mosul; for to the north and east of the town there are wild tribes of Kurds, some of whom continue to

assert their independence of the Osmanli rule, while the Yezidis, a Kurdish tribe who have never yet accepted Islam, dwell in the Sinjar mountains, upon a northern spur of which the town stands. Semi-independent tribes of Bedouins also roam over the plains in the immediate vicinity. The wild hordes of the Shammar Bedouins have often plundered or threatened the citizens. Mosul, therefore, has a somewhat isolated position, and this perhaps is one reason why Christians and Moslems have lived together on better terms here than elsewhere. Both are animated by an active local patriotism, and both honour the same patron saints, Jirjis (St George) and Jonah; the grave of the latter is pointed out on an artificial mound on the left bank of the Tigris.

The language of the people of Mosul is a dialect of Arabic, partly influenced by Kurdish and Syriac. The population is probably 25,000 to 30,000. It is stated that the town is divided into 32 quarters, of which one is Jewish and three are Christian, while the rest are Moslem. The Moslems call themselves either Arabs or Kurds, but the prevalent type, very different from the true Arabian of Baghdad, proves the Aramean origin of many of their number. Of the Christians the community of the Chaldeans, *i.e.*, those who have gone over from Nestorianism to Catholicism, seems to be the most important; there are also Syrian Catholics and Jacobites. Mosul has for several centuries been a centre of Catholic missionary activity, the Dominicans especially, by the foundation of schools and printing-offices, having made a marked impression upon an intelligent and teachable population. There are very few Protestants.

Mosul shares the severe alternations of temperature experienced by Upper Mesopotamia (see MESOPOTAMIA). The summer heat is extreme, and in winter frost is not unknown. Nevertheless the climate is considered healthy and agreeable; copious rains fall in general in winter. The drinking water is got from the muddy Tigris. At the north-east corner of the town is a sulphur spring, and 4 leagues to the south there is a hot sulphur spring (Hammām 'Ali), much frequented by invalids.

Mosul probably occupies the site of a southern suburb of ancient NINEVEH (*q.v.*), but it is very doubtful whether the older name of Mespila can be traced in the modern Al-Mausil (Arab., the place of connexion); it is, however, certain that a town with the Arabic name Al-Mausil stood here at the time of the Moslem conquest (636 A.D.). The town reached its greatest prosperity towards the beginning of the decline of the caliphate, when it was for a time an independent capital. The dynasty of the Hamdanids reigned in Mosul from 934, but the town was conquered by the Syrian Ōkailids in 990. In the 11th century it belonged to the Seljuks, and in the 12th, under the sway of the Atabeks, particularly of Zenki, it had a short period of splendour. Saladin besieged it unsuccessfully in 1182. Among the later rulers of Mosul the only conspicuous name is that of Lulu, in the first half of the 13th century. The town suffered severely from the Mongols under Hulagu; under Turkish rule it became the capital of a small pashalik, bounded on the one side by the vilayet of Diarbekr, on the other by that of Baghdad. The Persians occupied Mosul for a short time in 1623, until it was, soon afterwards, recovered by Sultan Murad IV. It was visited by an earthquake in 1667, and was unsuccessfully besieged by the Persians under Nadir Shah in 1743. The governorship of the pashalik was long hereditary in the originally Christian family of the 'Abd-al-Jalīl, until the Porte, during the course of the present century, succeeded after a long and severe contest in establishing a more centralized system of government.

Compared with what it was in the Middle Ages the present town is much deteriorated, its decay having advanced steadily from the beginning of the Turkish dominion.

See Ritter, *Asien*, vol. VII. A map of the town accompanies Černik's paper, "Studienexpedition durch die Gebiete des Erphrat und Tigris," in *Ergänzungsheft* No. 45 of *Petermann's Mittheilungen*, 1876.
