AMERICAN AGRICULTURIST,

FOR THE

Farm, Garden, and Household.

"AGRICULTURE IS THE MOST HEALTHFUL, MOST USEFUL, AND MOST NOBLE EMPLOYMENT OF MAN."—WASHINGTON.

ORANGE JUDD & CO.,
PUBLISHERS AND PROPRIETORS.
Office, 41 Park Row, (Times Buildings.)

ESTABLISHED IN 1842.
Published also in German at \$1.50 a Year.

{ \$1.50 PER ANNUM, IN ADVANCE.
SINGLE NUMBER, 15 CENTS.
4 Copies for \$5; 10 for \$12; 20 or more, \$1 each

Entered according to act of Congress in the year 1865, by ORANGE JUDD & Co., in the Clerk's Office of the District Court of the United States for the Southern District of New-York.

VOLUME XXV—No. 1.

NEW-YORK, JANUARY, 1866.

NEW SERIES—No. 228.

THE "AUBURN HORSE."—THE PROPERTY OF ROBERT BONNER, ESQ.—Engraved for the American Agriculturist.

Last spring there was a large spirited chestnut horse at work, hauling lumber for some oil wells in Susquehanna Co., Pa. He was famous for the ease and power with which he worked, laying out his strength with almost magic effect. This horse was bred by Philip Smelzer, of Lodi, Seneca Co., N. Y. His dam is out of a Vermont Hamiltonian mare by a Bellfounder horse; and his sire is by the well-bred horse "Champion," a great-grandson of imported Messenger. He was foaled in April '58, hence is 7 years old. He is over 16 hands high and in color, is golden chestnut. At 2 years old, he was sold for a price stated as \$400. Mr. Parsons, of Auburn, seeing his fine points, and knowing that he had trotted quite fast, bought him last May for \$550. After some training, and after he had shown great power and speed, he sold him to Mr.

Robert Bonner, publisher of The N. Y. Ledger, a most enthusiastic lover of a fast horse, for the modest sum of \$13,000. A monstrous price for a gelding; but if any one thinks Mr. Bonner repents his bargain, we can assure him of his mistake. It would be useless to offer Mr. B. thrice the price. The "AUBURN HORSE" affords his owner intense pleasure, when he escapes from the confinement of his business, and he loves him as a friend. He is confident that he might win with him every trotting purse that is put up, and get his money back in his bets, over and over again; but Mr. Bonner never bets, and never lets his horses trot for money. The famous trotters *Lantern*, *Lady Palmer*, and her mate, *Flatbush Maid*, the beautiful grey mare, *Peerless*, and several others, are owned by the same liberal and high-minded gentleman.

The Auburn Horse in Mr. Bonner's hands has the advantages of the best training and care, and his private performances satisfy his owner and our best judges that he is the fastest trotting horse in the world. His best public performance was, since coming to New York, when, being driven by Mr. B., to a road wagon, (wagon and driver weighing 325 lbs.), he trotted a mile in 2 minutes, 29 seconds.

A glance at his great muscles and faultless bone, the feeling of his iron sinews, and hard flesh, free from fat and in the right place, will convince any one of the immense power of the animal. His clean limbs, slender neck, bony head and fine eyes are very thoroughbred in their look. He is almost a perfect model of power and speed, and will surely astonish the world one of these days by his trotting feats.

AMERICAN AGRICULTURIST.

NEW-YORK, JANUARY, 1866.

As we divide time, we are now on the threshold of a New Year, one of those times when men instinctively look forward to what time has in store for them and for the world, and, as man can only judge the future by the past, we look back also. To us, of this nation, the future, bright with hope, opening the most abundant rewards for peaceful industry, contrasts so happily with the year just past, in its beginning, that we hardly dare believe that Peace has come, and that our great Nation is to start anew in its career of progress in the arts of peace. Agriculture is an art of many arts;—what science does it not employ, and what art does not work to its advantage? If we are wide-awake to learn and to apply as well as to invent and to discover, we shall be no laggards in this race of progress. Terrible have been our sacrifices,—grand has been the hopeful fortitude of the nation, and with virtue and faithfulness to our high trusts, great will be the reward.

Farmers will give more and better thought now to their farms, and with this will come greater prosperity. Winter may stop *hand-work*, but it cannot stop *head-work*, and they both yield equally valuable results. Planning for the future, laying out improvements, and looking ahead in sundry ways should not only occupy the mind these January days and evenings, but such plans and good ideas should go, straightway, down upon paper. This avoids dreaming over the same things day after day, and makes thinking of much more avail.—It is like harrowing in the seed. This reminds us of an excellent style of a ready reference, scrap- and memorandum-book which we will describe in "*the Basket*."

Hints about Work.

The frugal legislators of some of the States (Connecticut in particular) are said to have placed the time of holding the annual sessions of the legislature in May, because as most of the members were farmers, there would be a guaranty against long sessions, in the pressing necessity for them to return to their farms to put in their crops; but when the effort was made to change the time to the winter months, the law makers, no longer so frugal of the people's money, argued that winter work upon the farm needed more the vigilant eye of the master than that of any other season. So indeed it does; spring is the seed-time, but winter is the golden fruition,—more than any other, the ripening time of the farmer's year's toil, when beef, mutton and pork, corn and wheat, are most readily converted into greenbacks. To promote this end

Animals of all kinds need constant care. We subject them to unnatural influences of food and confinement, and should see to it that the natural laws of health are not violated, that they are all clean, have pure air, light, exercise, good feed and water. The curry comb and card cannot be recommended for use on sheep and poultry, but all the other live stock of the farm will be benefited by their frequent employment. Try carding the calves and colts regularly, and mark their improved appearance; and the animals which more than any others fairly speak their gratitude for a currying are

Swine, whose thrift and good growth will also be greatly promoted by extraordinary cleanliness. Arrange this month for the farrowing of sows about the first of May. During her sixteen weeks of gestation a sow should have a clean and comfortable sty, be supplied with abundant litter and with succulent and rather bulky feed, in preference to grain, or nutriment in a concentrated form. An excellent diet is potatoes, and other roots, apples, pumpkins, etc., with oats, bran, or corn meal, in small quantity, all boiled together.

Sheep.—If so situated that you can watch the market and take advantage of its fluctuations, crowd the fattening sheep as fast as possible, so as to have them fat and ready for market in ease snows or other causes cut off the supply by rail. If the ob-

ject be to consume fodder and 'make manure, feed more deliberately—giving more freedom and exercise. Lambs need the best quality of hay, some roots, a little grain, and access to straw, or they may fall off in condition. When sheep have no roots or similar food, keep them supplied with hemlock or pine boughs, and if convenient, give them the range of a piece of woodland, where timber has been felled.

Young Stock.—One great means of having fine stock is bestowing attention and good care on them while growing. All kinds, especially colts and calves, should be kept rapidly growing, and never lack pure water. Probably three quarters of the young stock of the country nearly or quite stop in their growth during several weeks, each winter.

Calves and Yearlings should always be separated from large cattle, and receive more nutritious feed than store animals or dry cows require. Half a pound of oil-cake meal per head (soaked or scalded in much water, and sprinkled over the fodder,) will promote health and thrift.

Colts will thrive well on one quart of oats each, daily, with a good supply of bright straw or two pounds of hay. The same quantity fed as cut-feed, the oats being ground, will be much better for them.

Horses.—Curry or card all whether worked or not, if you would keep them in good health, and give all not worked daily an hour or two for exercise, turning them loose, one at a time, lest in their play they kick each other. Do not expose brood mares to danger of falling in slippery weather; bring water to them, or keep them calked, and so too,

Oxen used on slippery roads should be kept well shod, both for their comfort and their owner's security. Large bodied oxen often get a bad habit of crowding by being worked in short yokes and going in narrow sled tracks. The remedy for this difficulty is to make the sleds to run wider and the yokes longer. Long yokes alone will not cure it.

Milk Cows should not be milked too close upon their time of calving. If dried off within five weeks, it is well enough for both cow and calf. Cows not giving milk do not need so good feed, but should be stabled if possible, and fed good hay and stalks, which if chaffed and wet up with a little bran, corn meal or oil cake will go much farther. The fact is, farmers generally pay too little attention to properly economizing

Fodder of all kinds. It ought never to be fed upon the ground—the waste will pay for good racks in one season. Fodder goes farther and is reckoned to better advantage when hay, straw, cornstalks, with a suitable allowance of roots or grain are fed daily, at different feedings or mixed more or less, than when the animals are confined for days or weeks to one kind of coarse fodder. One of the most economical ways to feed

Oats is to thresh off about two-thirds of the grain and feed the straw with the remainder to sheep and cattle. It will be found nearly equal to good hay.

Grain.—It is poor economy to feed any kind of grain whole or uncooked, to any stock except sheep. They do their own corn-grinding to advantage, except when being rapidly fattened. If whole corn be fed, pour boiling water over it and let it stand twelve hours; and if boiled half an hour after that, it is all the better. A strange but general prejudice exists among many old-school farmers not only against feeding grain, but against feeding

Roots: their extended culture and free use will pay, not only in introducing a better system of farming, but in the better health and condition of the stock, and in maintaining them and fattening them at less cost. Look to it that roots do not freeze. If in pits or heaps, where the earth has caved in or been washed away, patch such spots with straw manure, or earth. Sliced or mashed they may be fed to all kinds of stock, from chickens to horses, in large or small quantities to advantage, if only with regularity. Another very generally neglected but excellent article of feed is

Oil cake or Oil meal.—This, as our readers know, is the residue after pressing out the oil from linseed and is properly called linseed oil-cake, (or

meal, if ground,) to distinguish it from cotton-seed oil-cake, hemp-seed oil-cake, etc., which are sometimes in our market. Oil-cake is worth nearly all it costs as manure, and this value it does not lose by being fed. The daily feed for a sheep is about half a pound; for a calf, a pound or more, and for neat cattle and horses, from one to five pounds, according to their other feed and the demands made upon them for labor or milk.

Manure is one of chief sources of profit in keeping stock. That of horses and cattle ought generally to be mixed and laid up in compact heaps under sheds where the leachings can be pumped over it. Otherwise scatter it evenly about the yard which is floored with a deep layer of muck. No water should ever flow in or out of a barn-yard, but if, in severe storms or thaws, water does flow out, conduct it over adjacent fields.

Bones are worth as manure from $\frac{1}{2}$ c. to 2c. per pound to almost every farmer. To save them from the dogs, have a hoghead set where they may be conveniently thrown. Save also

Ashes for fertilizing purposes, but never allow them to be moved in wooden vessels from stoves or fire places, nor to be kept in wood near any wooden building or fence even, for there is nothing for which a farmer should be more solicitous than the

Safety of Buildings against Fire.—To secure this, examine chimneys and flues, for places where smoke may escape, and be sure that sparks cannot. Be constantly careful of combustible bodies, and of lights. Allow no smoking, or uncovered lights in or near the barns.

Snow in heavy masses should not be left on any roofs; the tendency is to spread them out and weaken the walls. Besides, it is apt to thaw and freeze in spots, and especially is it likely to remain frozen near the plates and eaves, while the warm air beneath thaws it over the rest of the roof, and so ice dams are formed which cause the water to back up between the shingles and flow through the roof. During

Thaws prevent snow water behind the drifts, etc., flowing through foundations and into cellars. If the snow goes off and the ground is open, much may be thrown out, swamp ditching may be pushed ahead, and

Meadows may be improved by clearing away stumps, stones, etc., (which may often be done by blasting); knolls may be leveled down, and if not too wet, some "hand dressings" applied, as ashes, bone dust, plaster, and grass and clover seed may be sowed. Should the frost come out of the ground nearly or entirely

Draining may be done so long as the weather continues open, and

Fences may be removed, renewed, or new ones built even if post holes are to be dug, much more economically than in the growing season. Fence timber is better cut in the summer; winter is the time to work it up, but

Fire Wood should be cut in winter when the sap is not in it, as it dries faster and burns better. Secure a full supply and haul it in when the sledging is good. Touching the

Filling of Ice houses, Stables, Breaking Colts and Steers, Horse Shoes and Calks, and sundry other subjects appropriate to the season, items of interest will be found in the "Basket."

Work in the Horticultural Departments.

Were it not that many new readers come with the new volume, we might briefly refer to the notes of last month for suggestions of this. To our new friends we would say, that these notes are intended as useful reminders of what to do during the current month. They are, however, of that flexible character which often allows them to reach over both ways, and they generally include that which might have been done in the latter part of the preceding month, as well as what may be left for the first of the following one; and though calculated

for the climate corresponding with the latitude of New York City, they thus answer for a wide range of localities.

While there is not in January much work to be done out of doors, there is a great deal of "head work" which may be disposed of in the house. In whatever horticultural pursuit one may be engaged, he should add at least one new book to his library, each winter, the latest and best upon his special branch. The man is to be pitied who thinks he has learned all, and we doubt if the best read, can go through a book without getting at least one "new wrinkle." Besides books, there are papers, wholly or partly horticultural, and every progressive man is likely to have more than one of these. Now is a good time to take up those which, during the press of spring and summer work were lain aside uncut, and run over their contents. This is one class of "head work;" another is to write to the *Agriculturist* that article—about something—that you hadn't time to write when it occurred to you, but meant to do it when you "got time."

Still another profitable mental occupation is "planning"—thinking out, and where the case admits of it, marking out, just what you intend to do and how you intend to do it. A wealthy Texan once told us that he made most of his money in bed. When he had any important enterprise in view, the only way in which he could escape interruptions was to go to bed and stay there until he had thought it out. While we do not exactly commend his method, we do approve of thoroughly maturing plans for large or small projects. The saving of time in laying out, planting, building, etc., from a plan drawn to a scale, is great—to say nothing of the probabilities that the work will be much better done than if left to chance. Another thing which may be profitably done, and which might have been included in the reading suggested above is—the study of catalogues. One who is wide-awake in any branch of horticulture will not fail to read the advertisements of all the dealers in whose stock he is interested, and if he wishes to know more, will send for nursery, seed and other catalogues—observing always, that new things are seldom underrated by those who have them for sale.

Orchard and Nursery.

Both orchardist and nurseryman will find something to do in preserving the trees they already have, as well in providing for further operations whether of buying or selling. Cattle will often in winter do more injury to a young orchard in a few hours than months of nursing will repair; hence

Fences and Gates, about which people are usually so careless in winter, should be made tight. A few hours' work and some nails, may save much vexation and perhaps loss of neighborly feeling. Then other smaller animals are to be guarded against.

Rabbits, in many sections, do great damage by girdling young trees. Prevention is better than cure, and among the preventives already published are, wrapping the trunks with paper and smearing them with blood. A correspondent states, that the use of cow dung, sufficiently thinned with water to apply with a brush, some sulphur being added, renders the bark so offensive as to repel the rabbits. Apply as often as it is washed off.

Mice are also destructive, especially to small trees, currant bushes, etc. They generally work under the cover of litter or light snow, hence the ground should have been left clean. Tramp the snow down close around the trunk. Don't shoot the owls.

Broken limbs of trees sometimes result from an unusual weight of snow or other cause, and as soon as the damage is discovered, steps should at once be taken towards repairing it. The fracture usually takes place when a limb joins the trunk or a larger limb, and leaves a long ragged wound. This must be smoothed with the drawing knife, chisel, or whatever tool will best make a clean surface, and then covered with grafting wax or clay. If the latter is employed, use plenty and bind it on with old cloth. Last year there was much bemoaning the ravages, which were made upon fruit trees by the

Tent Caterpillar.—Save much vexation, and the trees at the same time, by carefully examining, on a mild day, for the clusters of eggs. These are found near the ends of the twigs and, at a distance, look like a diseased swelling. A close inspection of this swelling will show it to be composed of several hundreds of long eggs, placed closely together endwise and covered with a water-proof varnish. The engraving gives one of the clusters of the natural size, but they are deposited upon rather larger twigs. Destroy one of these clusters and hundreds of pests will never see the light. Let them remain and the young caterpillars will escape from the eggs about the time the trees leaf out, and there will soon be an "army with banners"—or with tents, which is rather worse, as it shows they mean to stay. Upon high limbs these eggs can be seen against the clear sky, and be removed from

these by means of shears or other cutting implement attached to a pole. Most orchards should be under-drained, and it may be done between the rows after planting; if there are any low spots, open

Surface Drains, to carry off the water which may accumulate there. Where there are unprofitable trees which are still thrifty, make preparations for

Grafting them with better sorts. It does not pay to graft old and worn out trees. Professional grafters who go about the country, are some of them reliable and worthy men, and others are ignorant and careless. Grafting is so simple an operation that he must be helpless indeed, who depends upon another to do it for him. Begin by securing

Clons, of the desired sorts, which may be cut any time in mild weather, from now until the buds swell. Tie each sort by itself, label securely, and pack so that they will not dry up, or be subject to great changes of temperature. A cool, frost proof cellar is the best place, and they may be buried in the earth of the cellar bottom, or if this is not practicable, place them in boxes of earth or dampened moss.

Root Grafting, which was described in January and Dec., 1864, may be carried on at leisure times.

Nurseries occupy the hands in suitable weather in cutting back and shaping young trees, and on stormy days, labels and other conveniences for packing the spring sales may be made and stakes got out for marking rows. Stakes of all kinds should have the portion that goes into the ground covered with gas tar, which is cheap and readily obtained in most cities and large towns using gas.

Fruit Garden.

The remarks relating to the care of trees in the orchard, apply equally well to those in the garden.

Grape Vines, which failed to get their annual pruning, better have it done now during a thaw than to delay until spring. In mild weather pruning may be done on

Gooseberry and Currant Bushes.—The general rule is to thin out the old wood so as to leave the bush quite open, and to shorten that of last year's growth by cutting away one-third or one-half according to its strength. It is well to look occasionally to the covering of those plants under

Winter Protection, as the earth may wash away or leaves and straw be blown off. When there is a good covering of snow all is safe as long as that remains. Look about and see what wood work will be needed, such as

Trellises, Stakes and the like. Prepare them while there is time

Kitchen Garden.

The garden is covered by a deep snow, but if our advice has been followed, there are succulent parsnips, and spinach, and savory salsify, and leeks, under the white blanket, awaiting the time when a spring or earlier thaw shall make them come-at-able. Those mounds, higher than the general level, show where cabbages and celery are

snugly stowed away, and that irregular looking patch is where the parsley has been covered with evergreen, and now by lifting the cover, a picking of bright green leaves may be had at any time. Then the cellar contains a store of most of these things—besides many others—all covered with light sandy loam, from which they may be taken fresh and in perfection. If there is any farmer who cannot thus chuckle over his garden products, we would rather not board with him. Let him immediately appropriate half an acre of the best land nearest to the house, for a garden, and resolve to read our notes every month and to follow their teachings. We do not write this for professional or market gardeners, but for those with whom gardening is not a business, though the former class will often obtain useful hints from these columns. Having fixed on a place for the garden, and considered how it shall be fenced, for chickens must be kept out at times, then decide what to grow and where to grow it, and be on the look out for seeds and plants, as well as a supply of good

Manure.—Begin a compost heap which shall receive all the odds and ends of fertilizing material, liquid or solid. Read on page 14 how our Rhode Island friend manages his privy, and see if there is not \$50 going to waste in yours, and a nuisance accumulating there besides. Have an eye open as you go by slaughter houses, tanneries, distilleries, breweries, and all sorts of manufactories, and see if there is not some fertilizing material which may be had for the carting or a little more. A stock of

Poles and Brush will be needed for peas, beans and other climbers, which are readily got in winter. If such materials are scarce, it will pay to take care of them. Dip the lower ends in gas tar, and house when not in use, and they will last several years. Those who have cabbage and other plants in

Cold-Frames should give them all the air the weather will allow, and protect during extreme cold by the use of straw mats, shutters, etc.

Hot-L, A, Frames, and Sash will need repairing. Cover the inside and the lower edge, and a few inches up the outside of the frames, with gas tar and they will last much longer. Those who have no hot-beds must wait awhile until we can find room to give directions for making them. Such work, as well as the repairing of

Tools, may be advantageously done in the winter months. A new handle or a little blacksmithing, and a touch of the grindstone or file, will frequently make an old hoe or rake as good as new. Don't wait until the cultivator is wanted before the needed new teeth are put in, but repair it now and at the same time give the wood work a coating of paint or oil. The best of neighbors will sometimes need to borrow, and it is best to have every implement marked in plain characters.

Seeds need much more care than they usually get—care especially in getting the best sorts and from reliable sources. Overhaul those on hand and be ready to make purchases. Our advertising columns direct to reliable men. Seeds, the vitality of which is doubtful, may be tried in a box of earth in a warm room, noting the proportion which start.

Flower Garden and Lawn.

If all the tender things have been covered, there will be but little out-door work. Let it be remembered that with many plants more injury is done by the alternate freezing and thawing of early spring than by the cold of winter. There is usually a mild spell in January, during which tender plants, yet neglected, may be covered. After a heavy fall of snow, shake the snow out from evergreens, and other trees and shrubs where it accumulates in large masses, while it is still light; and if large drifts have formed around low branching evergreens, shovel it away, lest the drift as it settles injure some of the branches. Nothing gives so cheerful a winter aspect to a place as evergreens, and winter is the time to decide where they may be best introduced. In a walk about the grounds on a mild day in winter, many improvements will suggest themselves. All plans may be matured

now, and it often happens that the weather will allow of breaking ground for walks and roads.

Green and Hot-Houses.

The amateur florist must look closely after his fires, the temperature of the green-house should never get below 40°, even where plants are merely to be kept alive through the winter, and it is useless to expect much of a show of flowers below an average of 60°. By proper care a succession of

Tulips, Hyacinths and other bulbs can be had in bloom. Bring a few pots at a time from the place where they have been set to root, and give them light and warmth. As soon as the flower fades, cut away the stalk, and allow the leaves to remain as long as they will.

Camellias are apt to drop their buds unless the atmosphere is kept moist. Where several buds crowd together in a cluster, remove all but two and allow them room to develop. Those in the dwelling house should be kept as cool as possible without freezing, and the foliage occasionally washed to remove the dust. A sprinkling over the bath tub, then a slight rubbing with the thumb and finger of each leaf to loosen the dirt, and then another drenching to wash it off, greatly benefit camellias and other smooth leaved plants.

Ivy, so much used now for parlor decoration, is kept bright and green by this treatment. A bath tub is a great adjunct to the window conservatory, as pots may be removed to it and sprinkled freely, to their great good. Water used on plants should be brought to the temperature of the apartment.

Cactuses may be kept at rest and nearly dry, while

Roses, that are showing flower, may have a stimulus of weak manure water.

Verbenas and Petunias may be pushed along, that their growth may furnish a stock of cuttings.

Violets, Candytuft and such things in cold frames need to be freely aired, whenever it can be done without risk, and securely covered on cold nights.

Pelargoniums need to be put near the glass, where they will have plenty of light. Tie out the branches to make good shaped specimens, and avoid growing the long-legged drawn up things we so often see. Better a few well grown and well formed plants of any thing, than a lot of shapeless rubbish.

Apiary in December.

Prepared by M. Quinby—By request.

Bees in the open air winter better in tall hives than in low flat ones. The honey is stored in the upper ends; the bees commence at the bottom, and ascend as their stores are consumed. The warmth from the bees keeps the honey immediately above them free from frost, and they have but little difficulty in reaching it at all times. But such tall hives cannot accommodate a sufficient number of surplus honey boxes; hence the necessity of compromise between the tall and flat hives. The discovery has just been made that the long, movable comb hive, such as described in Bee-keeping Explained, and *American Agriculturist* can be converted into the tall one at pleasure. Put it on its side in summer, when the room for the boxes is needed; the bees store the honey for winter in the back end. The bottom board and top are fastened to the body of the hive temporarily, when it is raised on one end, and changed at once into the tall hive. An opening being made at the bottom for air, and for a passage way for the bees during winter, completes it. In spring it is turned down, and it is the shallow hive again. Any reader of the *American Agriculturist* having such hives in use, may venture to make change without fear of infringing any patented rights.

Air passages should never be allowed to get choked with dead bees and ice. When mild weather occurs to melt the frost, raise the hive and sweep out clean. Should severe weather last three or four weeks steadily, common hives should be brought to a warm, dark room for a day to thaw out the frost, and allow the bees to get at their stores. The tall hives will only need care to keep the air passages open, to have them winter safely.

Our Excellent Premiums, STILL CONTINUED.

We invite special attention to the list of first-rate premiums offered in the accompanying table. They are designed for subscribers for this volume (25th), and the offer will be open for several months yet. So there is abundant time to fill out lists already commenced, and to start new lists of names. We are constantly receiving premium clubs from persons who say they found it quite easy to get up a club when they took hold of the matter in earnest. Not a few have obtained \$25 to \$100 articles by three or four days' work, and some by only a few evenings. It is only necessary to show a copy of the paper, and explain its leading features, its large amount of condensed information, its fine and valuable engravings, etc., to convince almost any man that it will pay him to take the paper a year.

We have no special or traveling agents, but any one disposed to do so can act as voluntary agent, and receive the premium as an acknowledgment of his efforts, and if it be an article he does not want, he can usually sell it for nearly or quite the regular price, and thus receive a good compensation.

Men and Women, of various occupations, Farmers, Gardeners, Post-masters, Merchants, Mechanics, Clergymen, Teachers, Soldiers, Boys, Girls, etc., can engage in the work, and secure good pay for it, in the premium articles, which are all good and desirable.

Table of Premiums and Terms, For Volume 25.

Names of Premium Articles.	Price of Premiums.	Names at \$1.50 each.	Names at \$1.00 each.
1—Good Books—See terms below	14	25
2—Garden Seeds for a Family (40 kinds).....	\$5 00	14	25
3—Flower Seeds for a Family (100 kinds).....	\$5 00	14	25
4—Nursery Stock (any kinds desired).....	\$20 00	30	100
5—Iona Grape Vines (12 of No. 1).....	\$18 00	27	92
6—Concord Grape Vines (100 of No. 1).....	\$12 00	19	65
7—Strawberry Plants (100 of good kinds).....	\$5 00	14	25
8—Japan Lilies (12 Bulbs).....	\$6 00	15	33
9—Downing's Landscape Gardening.....	\$6 50	15	40
10—American Cyclopaedia.....	\$20 00	30	96
11—Mitchell's New General Atlas.....	\$10 00	18	60
12—Worcester's Great Illustrated Dictionary.....	\$12 00	19	65
13—Any back Volume <i>Agriculturist</i>	\$1 75	20
14—Any Two back Volumes do.....	\$3 50	25
15—Any Three do do do.....	\$5 25	32
16—Any Four do do do.....	\$7 00	38
17—Any Five do do do.....	\$8 75	44
18—Any Six do do do.....	\$10 50	50
19—Any Seven do do do.....	\$12 25	57
20—Any Eight do do do.....	\$14 00	64
21—Vols. XVII to XXIV do.....	\$15 75	72
22—Stump Speech—Steel Plate Colored.....	\$10 00	18	60
23—The County Election do do.....	\$10 00	18	60
24—Halt in the Woods do do.....	\$10 00	18	60
25—Morton's best No. 5 Gold Pen, Silver Case.....	\$4 50	12	82
26—Case of Drawing Instruments.....	\$8 00	16	45
27—Lady's Rosewood Writing Desk.....	\$12 00	19	65
28—Gentleman's do do do.....	\$14 00	21	70
29—Best Family Clothes-Wringer.....	\$10 00	18	63
30—Doly's Washing Machine.....	\$12 00	19	65
31—Tea Set (Best Silver Plated).....	\$50 00	67	240
32—Sewing Machine, (Wheeler & Wilson).....	\$55 00	70	270
33—Sewing Machine (Wilton & Gibbs).....	\$55 00	70	270
34—Sewing Machine for Tailor Work.....	\$50 00	65	250
35—Melodeon (Best Four Octave).....	\$67 00	80	300
36—Melodeon (Best Five Octave).....	\$112 00	140	450
37—Piano, 7-Octave (Steinway & Sons).....	\$600 00	500	1500
38—Barometer (Woodruff's Mercurial).....	\$12 00	19	70
39—Barometer (Woodruff's Mercurial).....	\$18 00	22	85
40—The Aquarius, or Water Thrower.....	\$11 00	19	65
41—Buckeye Mowing Machine No. 2.....	\$125 00	150	480
42—Allen's Patent Cylinder Plow.....	\$30 50	31	100

No charge is made for packing or boxing any of the articles in this Premium List. The Premiums, 1, 2, 3, 7, 8, and 13 to 26, are DELIVERED to any part of the United States and Territories, free of all charges. The other articles cost the recipient only the freight after leaving the manufactory of each. Every article offered is new and of the very best manufacture.

*** Premium 1.—Good Books.**—Any person sending 25 or more subscribers, may select Books from the List on page 5, to the amount of 10 cents for each subscriber sent at \$1; or to the amount of 30 cents for each name sent at the (ten) club price of \$1.30 each; or to the amount of 60 cents for each name at \$1.50. This offer extends only to clubs of 25 or more names. The Books will be sent by mail or express, prepaid by us.—This is a good opportunity for the farmers of a neighborhood to unite their efforts and get up an Agricultural Library for general use.

These Winter Months afford a very favorable opportunity for collecting premium lists.

FULL PARTICULARS about each premium article, etc., are given in a "DESCRIPTIVE LIST," which we mail to any one desiring it. Send for it. The premiums are of a standard class, and enough can be obtained to give the premiums to all entitled to them. Each premium is for a specified number of names, as given in the Table, and any one knows just what he or she is working for, without regard to any higher number that others may obtain.

As fast as any subscriptions are obtained, send them along, that the subscribers may begin to receive the paper; and when all the names that can be obtained are forwarded, select the premium desired, and it will be promptly furnished. To save mistakes and the keeping of money accounts, send with each name, or list of names, the exact subscription money; or send at first the full amount for a club, and receive the premium, and then forward the names as obtained.

To avoid errors and save immense labor in looking over our books, it is absolutely essential that every name designed for a premium list be so marked when sent in. (Such names are credited to the sender in a separate book, as fast as received—ready for instant reference.)

Old and new subscribers will count in premium lists, but they should be partly new names, for it is to obtain such that the premiums are in part offered. Premium clubs need not all be at one Post office. Of course only one premium will be given for the same subscriber.

The extra copy, usually offered to clubs of 10 or 20, will not be furnished when a premium is given.

The other Articles are fully set forth in the DESCRIPTIVE LIST above referred to, but we add a few items:

The Garden and Flower Seeds (2 and 3), are of first quality, of such kinds, and in such quantities as most families desire. They are sent post-paid, and are put up for us by the well-known and reliable dealers, J. M. Thorburn & Co., 13 John-street, New York. Any receiver of these premiums will usually have enough for himself and some to distribute among his Club.

The Nursery Stock (4), can be selected of such kinds and quantities as may be desired, from the Catalogues of either Parson's & Co., Flushing, N. Y., or of F. K. Phoenix, at Bloomington, Ill. Send a postage stamp or two for their priced Catalogues, naming that they are wanted with reference to this premium, and select the premium from these. The trees or other articles will be well packed and forwarded by any conveyance ordered, as soon as the season will admit. We guarantee that these premiums will be faithfully selected and forwarded. This is a capital chance to get \$30 worth of good stock cheaply.

The Grape Vines (5, 6), are also excellent premiums, and well worth working for.

The Japan Lilies (8), are among the most beautiful flowering bulbs, and can be planted in early spring. They are easily multiplied. Sent post-paid.

No. 9.—Downing's Landscape Gardening, etc.—A most beautiful volume, splendidly bound, and finely illustrated.

No. 10.—Appleton's New American Cyclopaedia, a magnificent great work, of 16 large volumes, containing condensed but very full information upon every topic. It is a whole library of itself, describing almost every subject, place, and thing, including countries, cities, all men of note who have ever lived, etc., etc. Almost every farmer could afford to sell an acre or more of his farm to purchase this work.

No. 11.—Mitchell's Large Geography, containing 84 Maps, and Plans, is of high value, and may well be in every house.

No. 12.—Worcester's Great Dictionary, next to the Bible and Cyclopaedia, is the most important work for the family. The Unabridged Edition, illustrated with many engravings, describes and pronounces every word in our language.

Nos. 13 to 21.—We have stereotype plates of the *Agriculturist*, from volume 16 to 24, inclusive, from which we print any numbers needed. Any of these volumes desired can be furnished complete with index and title pages. Price \$1.50, or \$1.75, if sent by mail, as they must be pre-paid. These volumes are a valuable Agricultural Library in themselves, containing more varied information than can be obtained for twice the cost in any books. If desired bound, it will be done for 75 cents each volume, in neat style.

Nos. 22, 23, 24.—These are splendid large Steel Engravings, beautifully colored, the first two from paintings by BINGHAM, and the last by TAIT, which was until recently sold at \$15. They are published by Mr. Knædler, 773 Broadway, New-York City, formerly the American Branch of the celebrated House of Messrs. Goupil & Co., Paris.

No. 25.—Morton's celebrated Gold Pen, in convenient

extension Silver Case, with pencil. We give only No. 5, of his best quality, made of coin gold and silver.

No. 26.—An excellent assortment of drawing or Draughting Steel and Brass instruments, each piece neatly fitted into a Rosewood Case. For particulars see Descriptive Sheet.

Nos. 27, 28.—Very fine portable Rosewood Case, which holds all writing materials, and when opened forms a writing Desk. Very good for one's own use, or for a present to Teachers and others.

No. 29.—The Universal Clothes Wringer, with the Cog-Wheels, etc.—the best Wringer we know of—and a most valuable thing as a labor-saver and clothes-saver.

No. 30.—After nearly two years' trial, we can highly recommend this for general use. Several improvements have been recently added.

No. 31.—The Tea Set consists of six pieces, viz.: *Coffee Pot, Tea Pot, Hot-water Pot, Sugar Dish, Cream Cup, and Slop Bowl*, all of beautiful pattern and late style, embossed. They are of the best heavy plating, known as "Sheffield Plate," and are manufactured by the well-known Lucius Hart & Sons, No. 4 & 6 Burling Slip, (near our former Office). Mr. Hart has been in the same place upwards of 30 years; and the fact that he supplies the above premiums is, we suppose, a sufficient guarantee of their value.

Nos. 32, 33, 34.—We offer these kinds, to meet the wants of all. Nos. 32 and 33, for General Family Sewing.—No. 34, for family use, especially if heavy cloth, leather, etc., are to be sewed. Their respective advantages are given more fully in our Descriptive Sheet, noted above.

Nos 35, 36.—An excellent instrument, as we know from six years' trial of one in our Sunday School room. Send a stamp to Geo. A. Prince & Co., Buffalo, N. Y., for an illustrated descriptive catalogue, giving sizes, prices, etc. Many neighborhoods and schools have combined in raising clubs of subscribers, and secured through us these instruments for Churches, and for Day School and Sunday School rooms.

No. 37.—Steinway & Sons' Pianos are too well known to need a word of commendation. Sent to them at No. 71 & 73 East 14th-st., N. Y. City, for descriptive catalogue. The kind we offer is: "7 Octave, Rosewood case, large front Round Corners, Carved legs and Lyre; Over-strung Base, with their Agraffe Treble, and containing all modern improvements." We offer this premium on extraordinary terms. It will pay a Lady for a year's work. There are many who by securing the aid of friends in neighboring towns, and by a thorough canvass, may readily obtain the requisite number of subscribers. There are to almost every town more than 500 families who ought to have the *Agriculturist*. Two or three persons (one a railroad Conductor,) have each sent more than subscribers enough to obtain this magnificent premium. It would pay an enterprising man to canvass for this, and afterward sell it.

Nos. 38, 39.—A very useful instrument, for farmers especially, as a weather guide. (See remarks below.)

No. 40.—The *Aquarius*, or Water-Thrower, is an excellent portable force-pump, useful in many ways—to water the garden or plants, to wash windows, carriages, etc. One can catch up the implement, carry it to any place, and from a pail throw a considerable stream of water 20 to 30 feet or more, and thus sometimes put out an incipient fire that could not be readily reached otherwise. Send to Wm. & B. Douglas, Middletown, Conn., for circular giving full particulars.

No. 41.—The Buckeye Mower is so widely known and approved, that we need not use space to describe it. Send to Adiance, Platt & Co., Manufacturers, 163 Greenwich-st., New-York, for circulars, etc., giving particulars. A few farmers might unite their efforts, and readily secure subscribers enough for this premium, and own it in common. Many can raise a club of 100, alone.

No. 42.—Allen's Cylinder Plow. (See Descriptive List.)

Barometers Useful to All.—As an answer to sundry inquirers we say, in general, that a good barometer is useful to every person who has any occasion to be solicitous about the weather. There is hardly a change of any kind impending that is not indicated by the rise or fall of the mercury, while its steady continuance at the same level is a pretty sure "sign" that the weather is not to change soon. Any one having a barometer hanging in sight, insensibly comes to watch its indications, and base his plans upon its prognostications, and with far more certainty than upon the directions of the wind or the appearance of the sky. The interest upon the cost is hardly a dollar a year, while the whole cost is often more than counterbalanced by its aid on a single occasion. For example, many of our readers have narrated to us the saving of several loads of hay from damage, simply from having followed the barometer when it went contrary to the appearance of the sky. A barometer in the house leads the children to observation and study of atmospheric changes. We have recommended Woodruff's Patent, the one in our premium list, (made by Chas. Wilder, Peterboro, N. H.) because of its greater portability than that of any other kind of mercurial barometer. It is pretty fully described in our extra premium sheet, sent to those desiring it. A full description of the barometer, prices, etc., can be obtained by applying to Mr. Wilder. Many can obtain them with a little effort through our premium offers.

BOOKS FOR FARMERS and OTHERS.

[Any of the following books can be obtained at the Office of the *Agriculturist* at the prices named, or they will be forwarded by mail, post-paid, on receipt of the price. These prices are positively good only to February 1st.]

The following statement of facts, received from Mr. Harris, just as we are going to press, explains itself:

A CARD.

To the Friends of the Genesee Farmer: ROCHESTER, N. Y., Dec. 16, 1865.

As previously announced, I transferred the Genesee Farmer and Rural Annual, to Messrs. ORANGE JUDD & CO., of the AMERICAN AGRICULTURIST, New-York, thinking that this arrangement would be advantageous to myself and the patrons of the Genesee Farmer.

But it seems that a young man in my employ, whom I left to mail the December number of the Farmer, while I was absent, surreptitiously printed and put in copies of the paper, a circular, stating that a new Agricultural Journal would be started in Rochester, published I presume, (for I have not seen the circular,) by the young man himself.

Now, while this is exceedingly annoying to me, and clearly a "breach of trust," on his part, yet I do not suppose that any one receiving the circular, will be misled by it. For fear, however, that possibly some may not at first detect the fraud, I have thought it best to make this statement of the facts in the case. Should it be necessary for the protection of the patrons of the Genesee Farmer, legal proceedings will be instituted, restraining this young man from availing himself of the advantages (however small) of this dishonest conduct. As he has hitherto borne a good character, I presume he was induced by other parties to put in the slip, and lend his name to an enterprise which they must have known would end in failure. I should let the affair quietly drop, only that I fear some of the old friends of the Genesee Farmer may be imposed upon. I trust that every one of them will take the AMERICAN AGRICULTURIST, and I am sure that they will not then regret that the change has been made. JOSEPH HARRIS.

The Department of Agriculture.

One of our Washington correspondents informs us that the illustrious head of the Department of Agriculture does not like our strictures upon his management and that he "threatens vengeance." It is only the rumble of the distant thunder, the lightning hasn't struck us yet, though our friends of the Massachusetts Ploughman have caught it. In its issue of Dec. 9th it says: "We mentioned a few facts last spring about the general management of the Department, upon which he sent us a threatening letter, virtually telling us to 'dry up.'" Now neighbor Ploughman let us have that letter, verbatim et spellatim.. Let the farmers see what kind of a servant they are paying for. Poor Ploughman, we pity you, but we must not forget that we too are threatened. What is to be our fate? Will the commissioner write us a letter and compel us to read it? Will he squeeze the life out of us in that "hydraulic press." It would be only fair to put a press down on us, considering that the press is generally down on him. [We must state in parenthesis that a hydraulic press was needed for some purpose, and after much flourish the Commissioner procured a Hickock's cider mill and press. He was right as to the Hi, but the draulic was a little too much for him.] Will he put us down in the deep hole where the "aith sweats and makes all the petroleum?" Will he make an analys (Departmentese for analysis) of us? or—worse than all—will he resign? The agricultural community might be benefitted by the resignation, but what would the White house do for garden truck? The Department might possibly be improved, but we should lose one great source of fun.

Now we only judge of the Commissioner by his official acts. He may be both honest and kind, and strive to do the best he knows how—the main trouble being that he don't know. As a public officer, whose salary we help pay, we have a right to criticise his public doings. Some of them are purely ridiculous, others are blundering, and the whole management of affairs is about as bad as it well can be. We have only one regret concerning what we have said about the Department: our paper goes to nearly all parts of the world, and it mortifies our national pride that the official head of our agricultural interests must be spoken of as unfitted for his position. We are not alone in our desire to have the Department of Agriculture under a head which should make it useful as well as creditable. Here are three opinions of the present Commissioner, from different sources, which came to our notice in one day. At a public meeting held at the Cooper Institute in New York City in December, Doct. Mac-

gowan made the following statement, as reported in the daily papers: "Quite lately he called upon the head of the Agricultural Bureau in Washington, with a proposition to introduce some of the plants and animals from Eastern Asia, and the illiterate Chief of that Bureau didn't know where Eastern Asia was!" The Country Gentleman, in its issue of Dec. 14, in noticing the Report for 1864, says: "Prepared, we presume mainly under the supervision of the late Chief Clerk, Mr. Grinnell, who entered into the duties of his position with a degree of energy and intelligence, which seem only to have procured his abrupt decapitation some months since"—it closes a notice of the report thus: "the volume concludes with reports from the different officials in the Department—which, with a really competent and intelligent man at its head, might be made of much service in the development of our agriculture." At the annual meeting of the Ohio Pomological Society, the following official action was had:

Resolved, That we feel deeply interested in the great Department of Agriculture connected with our Federal Government; that we desire its entire success, and believe it destined to contribute immensely to the advancement of Agriculture in the country; that we earnestly entreat the President of the United States to appoint a competent man to be the head of the Department of Agriculture; the incompetency of the present incumbent being a source of general remark and complaint from the intelligent agriculturists of all parts of our extended country. It is therefore

Resolved, That in the opinion of this convention, a change in the head of the Agricultural Department is imperatively needed for the best interests of the producing classes of the country, and the President of the United States is most respectfully petitioned to listen to the complaints embodied in the foregoing resolutions.

(Signed.) JOHN A. WARDER, President.

M. B. BATEHAM, Secretary.

The whole agricultural community, through the agricultural press, calls for a change in the Department of Agriculture. Mr. Newton and a few relatives wish matters to remain as they are. Which will the President heed?

Some Business Items.

Premiums.—See particulars on page 4.

Club Additions.—To Clubs of subscribers at club prices, additions can be made at any time at the same prices, if the additions begin at the same time as the others.

Back Volumes Supplied.—The back volumes of the Agriculturist are very valuable. They contain information upon every topic connected with rural life, out-door and in-door, and the last nine volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from stereotype plates as wanted, all the numbers and volumes for nine years past, beginning with 1857—that is, Vol. 16 to Vol. 24, inclusive. Any of these volumes sent complete (in numbers) at \$1.75 each, post-paid, (or \$1.50 if taken at the office). The volumes neatly bound, are supplied for \$2 each, or \$2.50 if to be sent by mail. Any single numbers of the past nine years will be supplied post-paid, for 15 cents each.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, show at a glance the transactions for a month, ending December 20th, with other interesting comparative figures.

Table with 4 main sections: 1. TRANSACTIONS AT THE NEW-YORK MARKETS. 2. Comparison with same period at this time last year. 3. Exports from New-York, January 1 to Dec. 16. 4. Receipts of Breadstuffs at Albany, by the New-York Canals from the opening of navigation to Dec. 7.

Gold has been as high as 148 1/2, and as low as 144 1/2, since our last, closing (Dec. 19) 146 1/2. Receipts of pro-

duce have been quite liberal, since our last. The arrivals of new grain and of flour made therefrom have been generally unsound or of inferior quality. The receivers have been eager sellers, and have forced their supplies on the market, thus seriously depressing prices, in the absence of an adequate demand to sustain former values, though there has been some revival in the export trade. At the close, yesterday, flour was very dull. Wheat, firm, but not active. Corn, Rye, and Barley, quite heavy. Oats steady. Stocks of Flour and Grain here are deemed large for the season, in view of the probable moderate wants of the home and foreign trade, through the winter months. The pressure on the storage accommodation of the port has run up storage rates enormously, which must add largely to the cost of carrying supplies over to the spring season, when inland navigation, now closed, will again be resumed, and bring heavy receipts of fresh produce in competition with the stocks on hand here awaiting a market....In the Provision line, the tendency of prices has been strongly downward under the pressure of increasing supplies, and the efforts of speculative holders, especially of llog products, as also of Butter and Cheese, to realize. The demand for the leading articles has been moderate....Cotton has been in good supply and request at variable figures,—closing heavily...There has been more doing in Wool, but at easier prices, some holders having been eager to sell....Seeds have been in moderate request but cheaper....Hay, Hops, and Tobacco have been in fair demand and firm, closing buoyantly.

CURRENT WHOLESALE PRICES.

Table of current wholesale prices for various commodities like flour, corn, wheat, etc., with columns for Nov. 17 and Dec. 20.

New York Live Stock Markets.—

BEEF CATTLE.—Average receipts for the past four weeks, 5343 head per week; average for the past year, 5047; for the previous month, 6386; for the same month last year, 6409. The general quality has been about medium, and until this week quite uniform. Selling prices average about as follows: Extra qualities, 18c@19c per lb., estimated dressed weight; medium to good, 15c@17c; poor to common grades, 10c@13c....MILK COWS.—Average weekly supply, 127. The cows offered have generally been of good quality, and mainly from N. Y. State. The best extra milkers have brought \$100@\$140 each; medium to fair, \$75@\$90; poor to ordinary, \$40@ \$60....VEAL CALVES.—Average receipts for four weeks, 712 per week; for previous month, 1132; for same month last year, 1375; for the past year, 1750. The demand since our last issue has been uniformly active, and prices for good grass-fed calves have ranged \$15@25 each, or 13c@14 1/2c per lb., live weight....SHEEP AND LAMBS.—The market has been rather unsteady, and demand not uniform. The quality of the stock has been about medium, until the present week, when a large number of premium Christmas animals were offered. Average weekly receipts for past month, 15,945; for the previous month, 25,850; for past year, 15,628. Prices average 7 1/2c @8 1/2c per lb. for sheep, and about 1c per lb. higher for lambs....LIVE HOGS.—Average receipts, 19,143; for previous month, 16,092. The second market week of the month, excessive receipts caused a sudden depression in the market, and prices have therefore varied from 10c to 13 1/2c per lb., live weight; standing the present week 11 1/2c@11 1/4c, for Western corn-fed, with indications of a further decline.

Containing a great variety of Items, including many good Hints and Suggestions which we throw into small type and condensed form, for want of space elsewhere.

Many Items are in type, for next month's number, in response to queries, etc., of our readers.

FORTY PAGES.—Though we promise to furnish only 32 pages in each number, yet the pressure of advertisements has been so great that the usual space is much exceeded; but justice to our readers and advertisers demands that we shall not reduce the number of reading pages. Not only do we not decrease them, but for each page of advertisements added, we also add a page of reading matter. This precedent in the first number of the new year we expect to follow throughout the volume. So our readers may reasonably expect several extra sized and extra good papers during the year.

See the Premiums.—Of course we are interested in them, but they are a good thing every way. Excellent articles are easily obtained by many persons, while by means of the efforts to obtain them, thousands of persons are led to profitable reading. See pages 4, 5.

The Rural Annual Delayed.—The transferring of the Office from Rochester to New-York, and other causes have delayed the publication of this valuable volume a little, but it will be ready soon after Jan. 1, and forwarded to those who have sent for it. It will be richly worth the cost to every one (25c. post-paid).

What Books.—At this busy season we have not time to answer numerous inquirers about what books to buy. The list on page 5 gives the titles of most of those issued on Farming, Gardening, etc., with the prices at which they will be supplied at this office.

Walks and Talks over a Genesee County Farm.—Well—we have taken friend Harris' arm and enjoyed a very pleasant walk, over part of his farm, and his talk, so spicy and instructive, has so filled up the time and set us so to thinking about our own place, that we find we have not gone over very much ground after all. It is a pretty fair farm; there is a good deal more to see and talk about upon it; and with his permission we will invite our readers to accompany us on our walk with him month after month through the year, very sure that they will all enjoy it and be greatly profited.

Special to Advertisers.—1st. To ensure admission, early application must be made. Our regular space this month was all engaged before Dec. 1st, and though we attempted to add extra pages enough to accommodate those who were very urgent, but were later in applying, we are still obliged to leave out nearly all who applied after Dec. 10th, amounting to several hundred lines.—2d. No advertisement of Patent Medicines, or any thing of a seeret character is desired.—3d. We want no advertisers who will not do just what they promise to do. We request those unknown to the editors personally or by general good reputation, to furnish such references and other information as will fully satisfy us that they are to be confidently relied upon. The Assistant in charge of this department, is instructed not to admit advertisements from any one whom he would not himself patronize with cash, or orders, if he happened to want the things advertised and at the price asked. This explains why advertisements from distant unknown parties are frequently omitted, though often from good men, doubtless. By living up to these requirements we aim to make our advertising pages of great value both to the readers of the *Agriculturist* and to the advertisers themselves. Circulars, with terms of advertising, etc., are sent to those desiring them.

A Talk with our Readers, about the Advertisements.—A gentleman from Trenton, who called the other day to renew his subscription, remarked that "He was in mercantile business and was not a cultivator, and had no family, yet he took the *Agriculturist* mainly for its advertisements. He had stopped the — a religious journal, because disgusted with its medicinal and other disreputable advertisements, as he considered them, which were constantly flaming out before his eyes." He went on to say that he had observed many hints about his own business, by the diligent study of the varied and various business announcements of other men in different journals, and no other paper gave him so much satisfaction in this line as the *Agriculturist*, because there he met with nothing of an objectionable

character. Of course we esteem such testimony, and shall strive to ever merit it.—The advertising department is valuable to every one. It wakes up and enlarges the ideas of the plainest farmer to scan over such pages as occupy the business columns of this paper, while multitudes find just the things they want, and learn where they are to be obtained, and generally at what prices. Seeds, for example, of all kinds are now readily obtained from any part of the country, as they are conveniently and safely transported by mail at the nominal postage of 8 cents per lb. (2 cents for each 4 ounces or fraction of 4 ounces). There is a large variety advertised in this paper from month to month. We advise our readers to look carefully through the whole of the advertisements, and see what is offered. These winter months are the best time to provide for seeds, implements, trees, plants, etc. Catalogues and Circulars can now be sent for and consulted, correspondence carried on, and orders given, while there is a full assortment to select from.—It is always a source of satisfaction to business men, to have those ordering of them, or sending for their Circulars, Catalogues, etc., to state where their advertisements were seen, and we request our readers to bear this in mind. One of our good advertisers recently informed us that in one mail he received 371 letters which stated that they had seen his advertisement in the *Agriculturist*, and that these letters came from all parts of this country, and the British Provinces. Other mails brought a similar influx of letters, amounting in all to over ten thousand. He thought this journal must have an immense circulation in every nook and corner of the land, among an intelligent and wide-awake class of readers—which is undoubtedly correct.

The Death of Charles Hairs.—The personal friends of this gentleman will be pained to learn of his somewhat sudden death, and even those who only occasionally visited the *Agriculturist* office will miss the pleasant, clear, English face, which they had been accustomed to see here. Mr. H. was from London, England, but was, we believe, without relatives in this country. He had been principal business assistant in the office for more than eight years. While attempting to stop a street car he was struck by another car, which he did not notice was approaching on another track, and the result of the collision was a wound in the head, which though not regarded dangerous at first, had a fatal termination in about two weeks. Mr. H. possessed remarkable business talents, which rendered him valuable in his position, and a geniality of disposition which endeared him to his associates, and rendered him popular with a large circle of acquaintances.

Ohio Cheese Manufacturers' Association.—The second annual meeting of the Ohio State Cheese Manufacturers' Association, will be held in the city of Cleveland, January 24th and 25th. The annual address will be by X. A. Willard. The meeting will be one of great public interest, and a large attendance is expected. Reports will be made from thirty cheese factories, and also from a large number of private dairies. The topics to be discussed are: Improved methods of cheese manufacture; best manner of marketing cheese; uniform style of cheese manufacture for 1866; the best manner of organizing factories—whether by private enterprise, by corporations, or otherwise; best breed of cows for the dairy; summer and winter management of milch cows.

Report of the Department of Agriculture for 1864.—In appearance, and as far as we have looked at the articles, in matter, this collection of essays is a great improvement upon those of former years. The illustrations are numerous, those of birds very good, those of fruit and cattle fair, and those of sheep as presentable as such greasy and wrinkly subjects will admit. Sheep are pleasant animals to look at, but they make ugly pictures. We have seen a great many bad looking blots which professed to be portraits of sheep, but the worst we ever saw is the one facing page 199 in the Agricultural Report before us. This could never have been taken from anything having life; it looks like an animal hewed out of wood and clothed with cast-iron pantaloons. We are sure that Mr. Grinnell, who has shown such good taste in the other illustrations, could never have put this in of himself. We congratulate him on the manner in which he has performed his task; for though the report appears as Isaac Newton's, every one who knows anything about the matter understands that all that is creditable about the arrangement and selection of the articles is due to the late chief clerk Mr. Grinnell. While admitting that in itself the book is a good one, and that it may be useful to the comparatively few who may be favored by their members of Congress, we protest against the whole system of making books of this kind at public expense; against collecting a lot of essays from ready writers and calling them a re-

port. It would be proper, had we a Commissioner who could do it, to publish a volume of statistics and an account of the improvements in agricultural matters, all of which could be condensed into a book one-fourth the size of the present one. But this going outside of the department for brains [warrantable perhaps under the circumstances,] to make up a series of elementary and popular manuals, on cabbages, sorghum, aquaria, etc., publishing them at public expense for the benefit of a few, is a flagrant outrage. The regular Agricultural book publishers are heavily, almost oppressively, taxed for being such. What right has the government to take the heavy taxes they pay, and use the money in publishing free-of-cost books of the same class that they publish? Why not publish school books, novels, or any other class of books as well. In the name of the tax paying community we call upon Congress to put an end to this cheat. There are doubtless some members there who will wink at the thing for the sake of a few copies of the miscalled "Report," but we trust that the majority will see that it is a wicked misappropriation of the public monies.

The French "Bug" Exhibition.—An "exposition" of useful and injurious insects has recently been held in the Palais d'Industrie in Paris, under the direction of the French Minister of Agriculture. Our countryman, Townsend Glover, Esq., attended, and bore off the Imperial gold medal, given by the Emperor for the best contribution to the knowledge of insects injurious to agriculture. The medal has upon one side a medallion portrait of the Emperor, and on the other the inscription "Exposition des Insectes utiles et nuisibles, donnee par l'Empereur." Mr. Glover has for some time been employed by the Department of Agriculture at Washington, and the value of his labors not only in entomology, but in pomology, etc., has long been known to those interested in such matters, and perhaps now that they have a foreign endorsement, the illustrious head of our agricultural affairs may make some use of the talent he has had by his side, but carefully kept under a bushel. The publication of Mr. Glover's work has been recommended by our horticultural societies, and we advise Isaac Newton to look at the gold medal, and if he cannot heed the wishes of the sovereigns on this side of the water to follow the lead of a foreign potentate and do something creditable to his department and the country.

The School of Mines, Columbia College.—From having been one of the most staid and venerable of institutions, Columbia College has become endowed with new life. Its management has fallen into the hands of men who think that there is something worth studying besides Latin and Greek. One of the manifestations of this new order of things is seen in the School of Mines, opportunely founded to meet the great demand for instruction in practical science. Chemistry, Geology, Mineralogy, Mining engineering, Metallurgy and the kindred branches are taught by a corps of able professors. The rooms and facilities of the school are ample and through preparations were made for what was thought a large number of students—seventy—the classes are already full. For information address President F. A. Barnard, or Prof. C. F. Chandler.

Bushels of Ears.—"C. S. W.," whose excellent article on Western Agriculture we published in December (page 374), really intended to say, that the average yield of corn on his farm is, by measurement, 75 to 100 bushels of shelled corn. In a recent note he says: "In speaking of our corn crops, I had no thought of bushels 'of ears,' and such a construction of my statement was unwarranted. With us, and in every other region that I have visited, corn, and all other grain, is always bought, sold or estimated, in large quantities by weight." Several others have written, that he meant shelled corn.

The Southern Cultivator.—Very soon after the close of the war this paper made its appearance among our exchanges, it being the only agricultural paper among the States lately in rebellion that maintained itself during the years of disaster to the South. Its editor, Mr. White, is a well known writer upon southern agriculture and horticulture, and makes a useful paper. While we think the course of the *Cultivator* upon the labor question a mistaken one, we can commend its teachings in other matters to our friends at the South. The address of the editor is Wm. N. White, Athens, Ga. Price \$2.00 a year.

Pleasant Reading.—The Ladies' Diaries, on pages 30, 31, will both amuse and instruct. We have seldom met with a more agreeable advertisement.

The "No Ink Pen." Is a Humbug, engineered by a swindler who attempts to cheat people by assuming part of the name of Mr. A. Morion, the well known gold pen maker, who advertises in our columns.

A Pomological Meeting.—The committee on the Greeley Prizes, the action of which is noticed elsewhere, met on Dec. 12th at the residence of Wm. S. Carpenter, Esq. Several professional and amateur horticulturists were invited to join the committee after their official business had been disposed of, and the arrangement resulted in an exceedingly pleasant pomological soiree. There was upon the tables an exhibition of winter pears, which for extent and perfection of specimens, has seldom been equaled. Much attention is deservedly being paid by pomologists to the late keeping pears, and this collection of over 50 kinds shows that there is a large list to select from. Messrs. Ellwanger & Barry, Rochester, N. Y., exhibited 30 varieties. Messrs. Hovey & Co., Boston, 27. W. L. Ferris, Throg's Neck, N. Y., 7. I. D. Wolf, of the same place, 3. Geo. Bancroft, Newport, R. I., 2. I. Buchanan, Astoria, N. Y., 1. There was a fine display of apples, among the most noticeable of which were the Tompkins Co. King, from Havana, N. Y., and Northern Spy from Battle Creek, Mich. Among the pears eliciting special commendation, were Dana's Hovey and Augustus Dana. Several specimens of native wines from Ohio vineyards, presented by Dr. Warder, included a remarkably fine sample of Delaware.

The Agriculturist Strawberry.

We did not intend to publish any more reports at present concerning the plants we have sent out, but here is one from O. Hunter, Clinton Co., Iowa, which shows so great an increase that we give it as something remarkable:—"I received one strawberry plant on the 15th day of last April; the plant looked pale and out of health. I gave it a good wetting, buried its root and branch in moist earth for the space of 5 or 6 hours, and then carefully set it out in black loam, manured with well rotted barn-yard manure.—In about one week it started to grow, and now I have 452 well rooted plants."

Raspberry Queries.—"P. V. P." It is not easy to tell raspberries from a bit of stem. Yours looks like the Purple Cane.—H. C. Burdick. The Black Cap is propagated by bending down the branches in September, and burying their tips, which will strike root.

Sassafras Sprouts in an Orchard.

W. A. W. is troubled with sassafras sprouting up in his orchard. Thorough grubbing after plowing will clean it out and do the orchard good, and if none of the sprouts are allowed to grow after plowing and harrowing, the sprouts will soon die out. Sheep feed down such brushy growths very well, and a flock, turned in occasionally, and kept there only until they have fed off the grass and sprouts, will not bark the trees.

Ever-bearing Mulberry.—I. A. Pike, Worcester Co., Mass. This variety usually produces staminate flowers enough to fertilize the pistillate ones, and the fact that your tree produces a few berries would go to show that some staminate flowers were present. Our own tree of this variety is not worth the space it occupies, and we shall cut it down. The English mulberry gives a decent crop of better fruit, and is done with it, while this dribbles through a long season, and is not very good when obtained.

Books on Gardening.—D. Buffington. We know of no work especially devoted to market gardening. Watson's Home Garden is one of the best for general directions in cultivation. The secrets of successful market gardening are in getting the earliest possible crops, and to so arrange the rotation of crops as to get the most from the land. An article by Mr. Brill, in October last, will give an idea of the way growers manage with Cabbages, Cauliflower, and Lettuce. Tomatoes, Egg-plants, etc., are started early in extensive hot-beds.

The Greeley Prizes, Decision on Apples and Pears.

It will be recollected that in 1864 the Hon. Horace Greeley offered prizes of \$100 each, for the best apple, pear and grape for general culture, referring the decision to the Horticultural Department of the American Institute. At an exhibition held in the autumn of that year, the committee on apples and pears thought the time allowed was too brief, and they did not make an award. The committee on grapes awarded to the Iowa, but the prize was declined by Dr. Grant, and the whole matter was passed over to another year, and referred to a larger committee, comprising several gentlemen from abroad. Three opportunities were presented for exhibiting fruit for competition in the Autumn of 1865, the last of which was on Dec. 12. The committee had great difficulty in coming to a decision, as they had to consider the healthiness of the tree or vine, and its adaptation to a wide range of localities as well as the quality of the fruit. In October they decided not to award the premium on grapes for the reason that, in their opinion,

no variety now before the public had fully proved itself as meeting the requirements that had been fixed upon, and this prize is still open for competition. On Dec. 12th last, the committee, after a long consultation, decided to award the premium for the best apple for general cultivation to the BALDWIN, and for the best pear for general cultivation to the BARTLETT, on pear stock. The best bushel of each was exhibited by W. R. Ward, of Newark, N. J., and the prizes go to him. While this decision probably will not satisfy every one, we think that, taking all the circumstances into consideration, the committees have made the best possible selection.

An Important Select Fruit List.

The committee on the Greeley prizes at their last meeting fixed upon two varieties each, of summer, fall and winter apples and pears, to recommend for general cultivation. Although this they consider as extra official, we are very glad that it has been done, and our readers will attach much importance to it when they know that it is the result of the deliberations of pomologists of such large experience as Chas. Downing, C. M. Hovey, Dr. J. A. Warder, Dr. I. M. Ward, Wm. S. Carpenter, and others:

APPLES.—*Summer*: Primate and Red Astrachan.
Autumn: Porter and Gravenstein.
Winter: Hubbardston Nonsuch and Northern Spy.

PEARS.—*Summer*: Rostiezer and Manning's Elizabeth.
Autumn: Seckel and Sheldon.
Winter: Lawrence and Dana's Hovey.

Gooseberry Literature.

A friend has shown us a little book which is interesting as an index of how much is made, in England, of some specialties. There gooseberry culture is a favorite pursuit among the working classes, and the cultivators resort to all possible means to bring their berries to the largest size. This hook of 214 pages is called the "Gooseberry Grower's Register," and gives a detailed account of the different Gooseberry Shows held in Lancashire and five other shires in the year 1865. It gives a tabular view of the number of prizes obtained by each sort of berry, and is embellished by a portrait of the "London," which was the heaviest red berry, weighing 33 dwts., 13 grs. (nearly 1½ oz.) The growers of Patterson, N. J., formerly held gooseberry shows, but we have heard nothing of them for a year or two. It continued, we hope to hear about them.

Propagating Lilies.

Mrs. L. Hall, Cumberland Co., N. J. The florists grow them from the scales of the bulb. The outside scales are taken off and stuck in boxes of sand or sandy earth, just as if they were cuttings, the scale being set with the lower end down and about half covered. It is done in a propagating house, where there is a gentle bottom heat. The experiment may be tried in the dwelling and may possibly succeed, though we have never seen it done. A few of the outer scales may be removed without materially injuring the bulb for flowering. The little bulbs require two years to become strong enough to flower.

Plants named.

"C. C. Y. S. R. D.," Trenton, N. J. Not a seed at all, but a portion of the seed pod of *Honesty*, (*Lunaria biennis*).... Irene Cole, White Co., Ind. *Lanium maculatum*. Spotted Deadnettle.... C. H. Randall, Worcester Co., Mass., sends *Sedum acre*, Stonecrop, which is in some places used for garden edgings.... L. M. Carter, Hendricks Co., Ind. *Celastrus scandens*, Wax-work, or Frank Bittersweet, already described and figured.... G. Frank Alvord, Hampshire Co., Mass. The grass is *Eragrostis poaeoides*, for which we know no common name. It usually grows in sandy places, and is considered as worthless.... Philip Ritz, Walla Walla, W. T. The grasses were over ripe when gathered and came in fragments. There appear to be two forms of *Koeleria cristata*, Crested Koeleria. The coarser grass of the three is one we have had several times from the Pacific coast, and think it a variety of *Triticum repens*, or Couch-grass.... M. R. Allen, York Co., Me. No. 1. *Pyrola elliptica*, Shin-Leaf. No. 2. Too spoiled a fragment to make out. No. 3. *Erigeron strigosus*, Daisy Fleabane.

"Topping" Apples and Market Fruit.

Putting the best in sight is practised by most tradesmen and fruit dealers are no exception to the rule. "A Citizen" writes us regarding the manner in which he has suffered: "I can testify to the elevated standard of the *Agriculturist* and to the excellent advice it gives to farmers and others producing articles of food for sale, and I am therefore the more surprised that some of our apple growers should practice such deception in putting up their fruit for the market, as may be seen in nine barrels out of ten, particularly this year. I had occasion lately to purchase 75 bbls. of Newtown Pippins for exportation to England, every apple in which had necessarily to be separately handled, and if fit, wrapped in pa-

per; and out of the entire number there were but four barrels where the fruit was as good at bottom and middle as at the top. City men are called 'sharp,' but if a merchant here were to sell his goods falsely packed as some of our Country friends do, they would be called *Cheats*, and deserve the name! If this thing continues, the old title of *honest farmer* will become a misnomer."

If "Citizen" has read the *Agriculturist* for some years he must have noticed that we have reprehended this practice and that in our "Notes and Suggestions" we have many times advised growers to pack fairly. The fault is not so much the farmer's, as that of fruit dealers, who go about the country and buy the fruit in the orchard and pack it themselves. Our correspondent must not give up his faith in farmers without good cause.

Pelargoniums and Amaryllis.

Mrs. M. T. Brett, Worcester Co., Mass. Keep Pelargoniums at rest during the winter in a cool room, and give but little water; a light cellar will do if dry and safe from frost. In early spring, repot and cut them back severely; they will stand any amount of pruning. Amaryllis formosissima should have been taken up for the winter. The blooming of this, as of other bulbs, depends upon its having made a vigorous growth of leaves the year before. Give it a rich and loose soil in planting next spring.

Large Isabella Grapes.

At our Grape Show two years ago, some Isabellas were presented by Mr. E. Fitch, of Coxsackie, N. Y. The grapes were of remarkable size, and as they presented every appearance of fruit unusually developed by rousing, the committee excluded them from competition. This year Mr. Chas. Starr sends us similar specimens from the same vine, with the assurance that no trick had been practised to increase the size of the fruit. He says that one vine out of several thousands has for several years borne these large berries upon a portion of it, while upon the other part only ordinary fruit was produced. It would be interesting to see how far this peculiarity was retained in vines propagated from the large fruiting portion, and the matter throws considerable light upon the great variability presented by the Isabella in different locations.

Yeddo Grape.

T. H. Grayson, C. W. We believe that this failed to fruit the past year. The year before, we saw a partially ripened cluster and it seemed something like the Delaware, with a looser and longer bunch. Our season is probably too short for it.

Book on Grape Culture.—Subscriber, Carlinville, Ill. Fuller's Grape Culturist gives full directions for training and pruning by the arm and spur method. Price \$1.50. See the Book List elsewhere.

Propagating the Dahlia.

J. Bruland, Iowa. If the roots were taken up last autumn and are kept in a dry and warm cellar, you can multiply them in the spring by dividing the root. Our notes for the month will tell how, at the proper time.

Potatoes and Chestnuts.

In answer to numerous inquiries about Mr. Harrison's potatoes, mentioned in December, we state that he informs us that he has no more for sale. Neither have we any of the chestnuts figured in December. We had only a few, and they were disposed of long ago.

A Large Ricinus.

Mr. C. F. Erhard, Hunter's Point, L. I., sent us a stem of *Ricinus sanguineus*, one of the ornamental varieties of the Castor Oil Plant, which measured nearly a foot in circumference at the base; a remarkable growth for an annual plant.

Tomatoes.

"Reader," N. H. A light rich soil, without much fresh manure is best for tomatoes. The plants may be made stocky, when grown in the green-house, by the use of pots and by pinching.

Sugar Beets and Sugar Production.

Dan'l Lanman, Macoupin Co., Ill. Sugar beets grow excellently well upon the prairies, as we have seen. They contain a large percentage of sugar, and after grinding and extracting the juice, the pulp is nearly as valuable for feeding and fattening hogs and hogs, as the roots unground. The only trouble is that it will require a capital of about \$100,000 to set up a beet-sugar house and make it pay. Capital invested in this way, if judiciously managed, will, we think, pay a larger profit than in almost any other legitimately managed business with which we are acquainted.

Milk Stools.

Those used by T. F. Haynes, Hartford Co., Conn., are 2 feet 3 inches long, 9 inches high, (probably 8 inches wide), three-legged, with mortice holes in the middle to carry them by. They are

made to hold the pails and so keep them clean, although his cows are littered as well as his horses.

Halsted's Hay-fork Traveller.—Lycurgus Dunnaux, Lawrence Co., Ind., writes that from the description we published on page 212, he had one of Halsted's Hay-fork Travellers made and put in operation, and adds: "The result is, it has inaugurated a new era in lifting and conveying hay in this community. Without specifications for the construction, we could not make all the parts so perfectly as we now can; but it works well enough, so that now the great difficulty is in keeping a supply of hay to pitch; formerly it was to get the hay pitched. A particular excellence is, that a man of light muscle can work the fork, if he has brains enough, just as well as any other."

Lice on Cattle.—W. G. Wardenhall, Jefferson Co., Pa., says, that "knowing *larkspur seed* would destroy lice on human beings, he collected a quart of seed, ground it fine, soaked it a week in one gallon of strong vinegar, and then applied it with a sponge to all parts of the animals; has never seen louse or nit since."

T. F. Haynes, Hartford Co., Conn., writes to the *Agriculturist*: "I keep lice off my cattle by keeping sulphur and salt in winter where they can lick it when they choose; my cattle have had none since I practised this."

Remedy for Warts on Cows' Teats.

—Andrew Burfarst, Lewis Co., N. Y., inquires "what is the best remedy for warts on the teats of a cow?" Warts on cow's teats usually extend no deeper than the skin. They should not be removed while the cow gives milk. The most effectual way is to take hold of the end of a wart with pliers and cut it off with sharp shears. The cut should not be deeper than the skin. This remedy will not hurt a cow as much as clipping the skin does sheep when they are being shorn; or a piece of small wire may be twisted around a large wart sufficiently tight to obstruct the circulation of the blood, and left on till the wart drops off, leaving the surface smooth.

How to Make Manure of Weeds, with no Pigs.

—H. M. B. New Haven Co., Conn. Work over your pile of weeds, potato vines, bean vines, lawn trimmings, any thing of the kind, adding a quantity of soil to amount to one-fourth or one-third the weight of the whole. Then let the housemaid pour over it all the chamber ley and wash slops, with the dish water and scraps from the kitchen which you can not profitably dispose of otherwise. The weeds, etc., ought to be cut up with a sharp spade before putting into the heap, and the heap ought to be worked every month or two, except in very cold weather, mixing in some more dirt.

Agricultural Papers.

—"Bob Skinflint," (who has chosen a forlorn *nom de plume*) asks us to recommend to him a first rate agricultural paper. (He takes the *Agriculturist*, of course). Take one published in your own State. One who lives in Maine should, by all means, take the *Maine Farmer*, (Augusta) which is a weekly family newspaper, and teaches sound agriculture as well, which, by the way, appears in new type, an evidence of prosperity we are glad to notice. The same is true of three excellent papers published in Boston, the *N. E. Farmer*, *Ploughman* and *Boston Cultivator*. New Yorkers have quite a choice. There is the *Country Gentleman and Cultivator*, (Albany) a quarto-weekly, famous for its excellent correspondence, and eminently the gentleman farmer's paper. Moore's *Rural New-Yorker* (Rochester) is another weekly. It is a family- and news-paper, with a large and good agricultural attachment, in which the American Merinos are of late made a specialty. We might go on and mention the *Ohio Farmer*, (agricultural and family, Cleveland), the *Prairie Farmer*, (agricultural, Chicago), both well managed and first rate of their respective classes, and so in almost every western State, at least one good monthly or weekly paper, which ought to be well sustained by the reading farmers. We have always found that the farmer who reads one agricultural paper will crave more.

Farmer's Scrap-Book.

—On the study table of a very studious farmer of Westchester Co., N. Y., we examined a system of keeping and classifying all kinds of information gathered from his reading, which is worth copying. He has numerous sheets of stiff brown paper folded once, for use as port-folios, and considerably larger than large letter paper. In these are numerous other half-sheets. The port-folios or paper-covers have written upon them the various subjects which most demand his interest and attention. For instance, one is probably labeled "Sheep," and in this he places all valuable items about sheep, cut out of newspapers which he does not keep whole for binding, even advertisements, hand-bills, circulars, etc. These are pasted neatly upon

the half-sheets, and at the same time classified still further if possible. Then, also, upon writing paper he makes memoranda of facts, or where to find important articles which he meets with in his reading in books or in journals, which he preserves. In the same way he has a cover devoted to each class of stock, to the prominent classes of fruits, vegetables, and other crops, as "Stone Fruits," "Small Fruits," "Apples and Pears," "Roots," "Indian Corn," "Small Grains," "Grass and Hay," etc., and so has always ready for immediate reference a vast amount of valuable information, which would otherwise not be found when most needed.

Lightning Rod Swindlers.

—A Subscriber in Onondaga Co., N. Y., writes strongly of the operations of certain parties, who by plausible statements induce farmers to employ them to put up lightning rods at so much per foot, to be paid in notes. They then contrive to use a great amount of rods, and badger their victims into paying the bills to save further trouble. The notes are sold at the best terms that can be got. In one case \$300 was collected for the rods put on a hog-pen! Over Sixty Thousand dollars have been taken in this way by a single firm of operators. The victims should combine and arrest the swindlers—a collection of the testimony would establish fraud very clearly we think. We have had several good rods put up by professional men, strangers often, but always have had a clear statement and agreement of just what was to be done, and the exact price agreed upon. Twenty-five dollars, and usually a less sum, will pay for ample protection on any ordinary house or barn. If out of business, we would be glad to undertake to supply a thousand dwellings with rods, and warrant them against lightning for ten years, at an average price of twenty dollars each.

Californians, Look out.

—We learn that a set of sharpers upon the Isthmus are engaged in selling to passengers "Greenbacks" at a considerable discount. The seller always has a few dollars left, and as he is going where they will be of no use he is willing to sell them for gold at a great sacrifice. Several who have bought in this way, found upon their arrival at New York that they had bought well executed counterfeits.

A New Dodge—Jewelry Swindle.

—For some time past, sundry parties have sent out circulars offering chances for large prizes in watches, jewelry, etc., to any one sending 25 cents for a ticket. In return for this they sent prize-tickets offering for \$5, or \$5.24, watches, etc., worth \$25 to \$50, alleging that these tickets were drawn. Of course any one remitting the money would hear nothing further from it, except in some rare cases, where a further and larger swindle was in view. A Brooklyn concern, and we know not how many others, are taking a shorter method to get the \$5.24. Thus: They address the same letter to each of ten thousand or more persons at a distance, enclosing ready drawn Prize Certificates, ostensibly for "Patent Illuminating Case Watches," "known as the Army and Navy Watch, beautifully engraved, patent adjusted balance, warranted a perfect time-keeper, etc., and worth \$50."—Another ticket entitles the holder to a "Gold Vest Chain, the latest and most fashionable style, valued at \$25." The letter accompanying these tickets says: "Your letter with 50 cents enclosed is received, for which we send you two certificates. The amount of \$5.24 for each certificate must be returned with the certificates, within 15 days, etc.," and the article called for by the ticket will be sent by mail or express. Of course, the parties receiving these plausible letters have never sent the 50 cents, but the supposition (too often true) is, that the recipient will consider it a capital mistake in his behalf, and will forward the money to secure the prize intended for some one else. The parties sending these tickets can not be found. They get their letters through the P. O. and pocket the money, until they suspect they are watched, and then hide, and reappear under some new name.

Lotteries Again.

—"Yours Sincerely, Thomas Boulton & Co., Box 5713 New York City," though shown up in these columns, are still pestering the people all over the country with their swindling circulars, offering a "private and confidential" good chance for at least \$1200, in the Covington, Ky., Lottery, by sending to them merely \$10 for a ticket sure to draw a prize. They pretend to make this offer to get the influence of the one addressed, who is expected to show his prize money and tell through whom he got it, so as to bring them a large business. This is of course the sheerest lying. They make the same offer to every other man in the same town whose name they can get. Of course no one ever heard from his money after sending it to Box 5713. A great number of Post-masters have sent us samples of these circulars, of which sometimes as many as a hundred or more have come to the same office addressed to as many different parties, but each one is addressed as if he was

the only favored one in the county.—Before this reaches the reader, we hope to have the Police succeed in catching "Yours Sincerely, Thomas Boulton & Co.," or whoever calls for the letters in Box 5713; yet, he knows, none of his dupes will acknowledge their greenness and appear as witnesses, and so he will probably be set at liberty to reappear under some new name and guise. We have had many of these fellows arrested and their business broken up, but often with the above result. The best we can do is to keep on showing them up in the *Agriculturist* as we have for years past. If everybody read this journal, these swindlers would soon be upon short rations. Let us all try to get as many to reading the paper, as possible.

Greasing Boots, etc.

—Charles Booth, of Erie Co., O., takes exception to the item on this topic in the December *Agriculturist*. He infers we have not worn cowhide boots, in which he is mistaken. We "grew" up in them on the farm and greased them too much. He says they will become as hard as wood without frequent greasing, which is the case with poorly tanned leather continually exposed to wetting and drying. But we did advise a "surface coat of oil (or grease) when the feet are likely to be exposed to much water," and we might have added a frequent one, but not so heavy as to entirely saturate and close up the pores. Stout boots of well tanned cowhide, with thick bottoms, are the best for those constantly exposed to water or the damp ground, and pretty free application of grease are useful when one works much on wet ground.

Light sandals, that is, rubber shoes with open tops, having only rubber straps across the top of the feet to hold them on, so as to leave the leather open as much as possible, are preferable to full rubbers. Those sitting still, as in writing, for part of the day, will do well to use these, but only while out on the wet ground. In all cases give the perspiration from the feet opportunity to escape. A dry pair of socks in the latter part of the day, especially when sitting down for the evening, or when going out for evening riding, or work, adds greatly to one's comfort and health.—Mr. B. says he finds our mixture of lard and resin an excellent application to boots.

Gunpowder Rendered Harmless.

—One of the company of English capitalists, who have been travelling in this country, not long since demonstrated the practical character of a recent English discovery before a company of scientific and practical men, in Jersey City. After taking a quantity of common gunpowder and proving its genuineness, he mixed with it three times its weight of powdered glass. He then thrust a red hot poker into the mixture, which caused it to burn up slowly without the least explosion or harm to anything. The effect of the ground glass is purely mechanical, separating the grains of powder and thus preventing a rapid combustion. Mixed with four times its weight of glass, the powder was burned with great difficulty, those grains only burning which were in direct contact with the poker. By the use of a sieve the powder was again separated, in a condition of efficiency—apparently as good as ever. The value of the invention consists in the prevention of accidental explosion, thus securing personal safety and greatly reducing the cost of storage. Some apprehensions have been expressed that the powder, after being thus mixed with the glass, will foul the guns in which it is used: that nothing is said about this, gives ground for the suspicion that it is true.

Measuring Hay.

—There is no rule that will prove at all reliable for measuring fine and coarse, loose and well-packed hay. Some kinds of hay, after being pressed beneath a heavy mow, will weigh a ton per 1000 cubic feet. In a hay loft, it would require 2000 cubic feet of the same kind of hay for one ton.

How much is a Barrel.

—"J. M. P." A barrel of cider, vinegar, and wine, molasses, syrup and milk, is 3½ gallons. A barrel must be made to hold 195 lbs. of flour, or 280 lbs. of salt—the latter larger than for flour. Apple barrels are made the size of flour barrels, though salt barrels well cleansed are used for apples, pears and potatoes. Salt barrels hold more than is required of apple barrels. A barrel should contain not less than 2½ bushels of fruit, or vegetables, sealed measure.

To Keep Rats from Eating Harness.

—"Philomena," of Champaign Co., writes: "I have a remedy that has never failed with me. It is simply salting the rats regularly. I do this by laying salt on the sills and ties of the stable, if that is the place they most frequent; but in fact, they will hunt for it. It will occur to any farmer that sees this remedy, that harness is most cut where the greatest amount of sweat has dried, an indication that salt contained in it is what they want."

Tan and Tonn.

—J. M. Porter, Ross Co., O. Tan is never properly used to express weight, but it is

liquid measure of 253 gallons, and is also used to designate a large cask. Ton is written for quantities by weight. Though both are derived from the same Anglo-Saxon word, the distinction in spelling is a convenient one, and is sanctioned by good usage.

Grain-box for Sheep Feeding.

Thos. B. Powell, of Ontario Co., N. Y., writes: "Last winter I made a box for feeding grain to sheep, which I like well. It holds about half a bushel, is about 26 inches long on the bottom and 23 on the top; the back end square, the front sloping. The front end has a projection or guide (g,) on the lower end to run in and clear the trough; back of this is a partition or false front (p,) still more slanting, the top of which is 5 inches and the bottom 3 inches from the front. In it, in the middle of the lower part, is cut a hole 2 inches wide and about 3 or four inches high. Over this is a slide (s) for opening or closing the hole. Through the bottom, back of the guide, close to the front, is cut another hole, 2x3 inches in size. About half of the top should be covered, as shown in the sketch. To use it, take it by the back end in one hand, the other holding the slide, and shove it along in the trough opening or closing the slide and raising or lowering the back end as may be needed. For oats the hole may be larger."

Is there any Good in Corn Cobs?

"J. W. H."—For our own use we never would grind corn and cobs together. We believe cobs of ripe corn are often productive of bad results; but those of soft corn and nubbins do contain some nutriment and are not so injurious, nor difficult of digestion. There is a vast deal of steam and water power wasted in grinding cobs, but we presume, were the facts known, this would not compare as 1 to 10 with the power wasted in digesting them.

Grain-bin Ventilators.

Every Grain-bin should have ventilators in the bottom. Those of the style figured are easily made, and put in. A bin 12 feet long and 4 wide, should have three ventilators. They may be made of sheet-iron punched full of small holes, or of fine wire-cloth, bent into a conical form. A sheet of iron is cut into semi-circular pieces, of about two feet radius; the holes are punched, the pieces are run between tinners' rollers and the edges riveted or locked together like stove-pipe. The bottoms are turned to form narrow flanges for nailing them to the floor. Holes are then sawed in the floor and the ventilators nailed over them. It is not necessary to make the holes in more than half the diameter of the ventilators.

Subsoil Plow.

"E. B.," Lyon Co., Kansas, inquires where he may obtain one of Mapes' Subsoil Plows? We cannot tell; and if we could we would not recommend such a plow as has formerly been sold by that name. The form of that plow is decidedly objectionable, as it does not raise the subsoil sufficiently high to effect good pulverization. The share is so thin that it runs through the ground, pressing through, and not breaking up its solidity. On page 181 of the *Agriculturist* for 1865 is an illustration of the best form of subsoil plow now in use. The cost is \$10.00 to \$15.00.

How to Catch Horses.

Horses ought to be trained when colts, to be easily caught. When a horse is incorrigibly bad to catch, never turn him loose without a halter headstall on. Then, always carry some oats, roots, meal, salt, sugar, or something else that he likes, and after he has tasted a few times, take hold gently of the halter. Whipping or any harshness immediately after a horse is caught, makes a bad habit worse; but even if hard to catch, reward him when caught.

Stripping.—J. E. Blake's Queries.

"C. C.," of Foxcroft, Me., writes in answer to the queries of Mr. Blake (page 366, December *Agriculturist*) as follows:—I have been a milker for more than forty years, and all that time have noticed that nearly all cows, as the flow of milk abates at the end of the grazing season, fail to yield all the milk continuously to the hand of the milker. If this condition of things is a "habit," allied to vices sometimes observed in cows, I think it one that we shall never see abated. For more than twenty years I have had "a way of my own" to get over the difficulty without any tax on my patience. It is to sit down to paw No. 1 just as though nothing was to happen but a

speedy milking. I draw the milk from all the teats, and when it ceases to flow readily, I move to cow No. 2 and treat her in the same manner. At the end of one or two minutes I return to cow No. 1 and find the milk well down in the udder and ready to be drawn quickly. When done, I find cow No. 2 equally ready to be milked, and thus milk two cows well in less time than one could be by a continuous operation. If but one cow were to be milked I would do something else, after drawing the first milk, and before finishing.... In reply to the other inquiry of J. E. B., I think it best, more agreeable to the cow, as well as easier to the milker, to milk all the teats equally—changing the hands often, so as to relieve the pressure from all parts of the udder evenly.

Farmers' Clubs.—Where the farmers and others interested in the cultivation of the soil, fruit-raising, etc., (and who is not?) can be induced to meet socially (or even formally) for a free discussion of agricultural topics, great good always results to the whole district. There is probably no man in the town who does not think he knows how to do some things better than any body else. Why not get together and each tell his way, his notions, the results of his experiments. If one knows so much now that he is sure he will not learn anything, then it is cruelly selfish for him to stay at home, for he might do a great deal of good; and if one does not know quite so much as that, then he will get good if he goes. Well managed Farmers' Clubs are rare. The Concord Farmers' Club is one, however, as we judge by hearsay evidence. They circulate a printed programme for this winter's work, (if such pleasant employment may be so called) which gives the name of the member at whose house such meeting is to be held, from Nov. 9th to April 19th, with the subjects for discussion at each meeting, addresses and essays to be presented, etc.

Agricultural Colleges.—We have many inquiries about Agricultural Colleges and must answer them in general terms. The only institutions of this kind in actual operation are those of Pennsylvania and Michigan. Of the former we have had but little knowledge since the death of its former president, Dr. Pugh, and know nothing about it beyond what our readers can learn from a circular, which can be obtained by addressing the President of the College, Center Co., Pa. It happens that we know rather more about the Michigan College, being well acquainted with its president and most of the faculty. We know that it presents unusual facilities to the industrious student, and that it deserves to have a much larger number of students, than it has yet received. Those from other States are admitted, but were the institution properly appreciated by the people of Michigan, there would be no room for the students from abroad. An advertisement of the Michigan College appears this month. For those who desire to delve deeper in the sciences which underlie the principles of good agriculture, the courses of instruction at the Sheffield Scientific School of Yale College, the agricultural department of which has received the "Agricultural College Fund," are unsurpassed. Prof. Geo. J. Brush (New Haven) will respond to requests for information.

A Branch Log-Chain.—The illustration here given represents a very convenient and useful chain for hauling timber or logs on the ground. Each piece is about three feet long, attached to a strong ring of an elliptical form. The other ends are provided with "dogs" of the form shown, which are driven into the sides of a log or stick of timber, when it is to be hauled upon the ground. When a chain is wrapped around a log, it makes the draft much harder than if there were no chain beneath it; besides, when a chain cannot easily be put around the log, as it rests on the ground, a branch chain will be found very convenient. The branch chain may be fastened near the lower side of a log, and thus require less force to haul it, than when one chain is used especially if the hitch is on the upper side of the log.

New York State Cheese Manufacturers' Association.

The third annual meeting of the New York State Cheese Manufacturers' Association, will be held at the City of Utica, on Wednesday and Thursday, January 10th and 11th, 1866. The number of persons engaged in cheese dairying in New York alone, and who are directly or indirectly connected with the association, is more than 20,000, and it is believed the meeting will be the largest and most interesting that has ever been heretofore held by the farmers of the State on any special branch of industry. Delegations are expected from the Eastern and Western States and from the Canadas, and subjects of vast importance to dairymen are to be discussed and acted upon. The annual address

will be delivered by X. A. Willard, A. M., of Herkimer County, Wednesday Evening, January 10th. Reports from 400 factories, and a large number from private dairies, are expected, of operations the past season, and various subjects of interest to dairymen will be discussed.

To Prevent Horses Slipping Down.

—We have had a horse shoe engraved to show blacksmiths how to "fit up" shoes to prevent horses slipping down on smooth and slippery pavements. The heel calks should be not less than 1 1/4 inches long from the top of the shoe to the end, and instead of being hammered to an edge like an iron wedge, the ends should be fully 3/8 of an inch wide and broad as the width of the iron. The toe calks should be much stronger than when they are made only 1/2 an inch long. A horse shod with such calks will rarely slip on pavement, nor at all on ice.

The Cattle Plague or "Rinderpest."

—Congress has very wisely and promptly passed a law (the first law of the session) forbidding all importation of domestic animals from Europe. It is right. With so great danger threatening us we ought to take the promptest and most efficient measures. It will be no evidence of undue haste in passing this law, if subsequent consideration of the subject should, as it probably will, lead to an establishment of a rigid quarantine, wherever foreign cattle enter the country. The distress and loss occasioned by this terrible "pest," has not been exaggerated. The losses by death being 80 to 90 in 100 of the cattle attacked, and not under the most skillful treatment from the first. Should the plague come here, what we should do as we are without veterinary surgeons, it is easy to foretell—we should stand by and see the stock die in spite of our best efforts. It is well known that this disease effects both neat stock and sheep, hence the word "cattle" in the law doubtless covers both. The act is as follows:

An Act to prevent the spread of foreign diseases among the cattle of the United States.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that the importation of cattle be, and hereby is, prohibited. And it shall be the duty of the Secretary of the Treasury to make such regulations as will give this law full and immediate effect, and to send copies of them to the proper officers in this country, and to all officers or agents of the United States in foreign countries, Sec. 2. And be it further enacted, that when the President shall give thirty days' notice, by proclamation, that no further danger is to be apprehended from the spread of foreign infectious or contagious diseases among cattle, this law shall be of no force, and cattle may be imported in the same way as before its passage. Passed the House Dec. 11th; the Senate passed it unaltered, and it received the signature of the President December 16th.

Southern Farming—Chances for good Men.

As postal facilities extend over the Southern States, we are constantly in the receipt of letters from our old subscribers and others, which, (however diverse may be the views of the writers in regard to the vexed and important questions of the day, touching the political status of the Southern States and people, of all colors), breathe the same spirit of improved agriculture. We dispute with nobody, who is in favor of better farming. Advancement and improvement in one direction is close akin to that in every other. When we know that the whole South is sprinkled over with such men, anxious, now at least, to try fairly the experiment of more intelligent labor, and of better systems of farming, we can have little anxiety for the future, whatever throes and pains may attend the new birth of half a continent. Surely we will do whatever is in our power to aid men who write such letters as the following, lately received from Charlotte Co., Va.:

"* * * I have unexpectedly been placed in charge of an estate of 3000 acres of fertile land, located as above, and desire to have it cultivated to the best advantage. I have determined to divide it into several farms, and my great need is intelligent and reliable labor and educated and experienced superintendence. The Freedmen are attached to the place, and have warm friendship for their late master, who is so diseased that he cannot attend to his own business; and I am anxious to spare no effort that will benefit them and make them good, orderly and happy citizens. They do not now know their rights or duties and must be instructed in them gradually, and I believe will be most easily informed as to them by seeing honest, industrious and steady laborers from some of the Northern States, working with them or in their vicinity, will learn from them that the interests of employer and employees are identical, and that good order, and a cheerful obedience to lawful orders, are

necessary and not degrading to the employee. I am anxious therefore to employ some 10 to 20 Connecticut Valley laborers, who have been accustomed to the culture of tobacco, to general farm work and care of stock, and also an intelligent man of good character, experienced in the direction of others and who understands the principles and practice of successful farming. I am willing to pay such employees market prices, or give them *finding* and a share of the crops.

"The advantages of soil, climate, healthy location, comfortable buildings, stock and improvements are unsurpassed. We have daily mails by the—R. R., which passes through the estate; ready access to market by this source and by the river; Mills, a country store, blacksmith and carpenter shop on the estate, and schools and churches in the immediate vicinity.

"All this section of country raises fine manufacturing tobacco, which commands a high price; the season is much longer and the climate much more favorable for its culture than in Connecticut. There is a strong desire among many here to see good Northern farmers and laborers come in and settle among us, and if they come, I am convinced that they will soon be much more welcome than the Swedes, Germans and Scotch now being imported. You will much oblige me and I believe much benefit many others, North and South, by calling attention to this part of Virginia. Many fertile tracts—cleared, fenced, stocked, and with good residences and out-buildings, could be bought cheap, or rented for a small sum or part of the crop. Many old owners are unable to conform to the new order of things, have little money and will readily rent it to Northern men, who will have little trouble in getting the freedmen to work."

The South offers few inducements to men of small means, who are not good practical farmers, and pretty well read also in the principles of agriculture; for such the West is better. Neither is the South the place for men who do not like to work. *Work* is to be the order of the day at the South now, and it will be its salvation.

Agricultural Education.

THE FARMER-BOY'S SCHOOL IN THE FAMILY.

In an article on Agricultural Education in the December number (p. 374) we promised to continue the subject there introduced. The farmer-boy's first teachers are his parents, and his first lessons are from those by whom he is surrounded. Up to the time of his birth, the little fellow usually has less intelligent thought bestowed upon him than would have been given to a thorough-bred animal of any kind. Nevertheless, his physical being is subject to almost identically the same laws, and his constitution and quality as a man are often determined long before any proper educational influences are brought to bear upon his unfolding mind. We believe, also, that his mind and heart are, equally with his physical nature, affected by prenatal conditions. Children know a great deal more than we give them credit for; especially do they perceive our emotions, attempts to deceive them, lack of trust in them, lack of truth, not in words only, but in thoughts. So a child towards whom angry feelings are exercised, who is struck or punished in anger, soon becomes passionate, provoking, "ugly" as we say, and the reverse is equally true—love begets love. The love of nature, fondness for flowers, for plants whose use is beauty, or whose beauty is their usefulness, kindness to animals, etc., if exhibited by those about the child, find in it an immediate response. So, also, may habits of helpfulness and industry be almost in-bred, if with his earliest efforts to do anything he is given to understand that his little powers may be exerted to some use. The love of approbation, if gratified and properly met by expressed approval for all those little attempts to work some good, no matter how little is really wrought, effectually establish the tendency to do with the might what the hands find to do, almost before the little fellow is out of leading strings. Too often this is neglected, and then boys have to be *made* to work and kept at it by the hardest. Nevertheless often they do work well, but it is

for the sake of approbation, or as setting an example to hired men, etc., or to see the work get ahead, and without thought and reason, and so it is not relished and enjoyed as if the mind as well as the body was earnest in the work. The love of nature and all natural things, the habit of carefully observing birds, animals, insects and plants, of watching them in all stages of growth and development, of reasoning upon and discussing intelligently, the questions that continually come up about all these things, if encouraged by books and intelligent interest on the part of the parents, will develop into a love for farming, and for farm work even.

Meanwhile, of course, the boy progresses with his schooling. Any father interested with his son's development will read with him, and get him interested in the subjects which we have already alluded to as coming up on the farm, and so not only teach him about his work, but give him time daily to read, not working him so hard that he will be unfit for mental application.

Above all, the parents should be companions for their children, have their confidence and affection, and to accomplish this, they must be interested in them and what they are taken up with, giving them full time for sports and plays, athletic exercises, rambles in woods and mountains, and especially encouraging them to acquire a minute intimacy with nature in all its manifestations, so far as tastes incline them, but not to the interruption of proper preparation for the business of life. A familiarity with the mechanical arts ought to be early encouraged, fostered by visiting neighboring factories and shops, and by instruction in the use of common joiners, and iron worker's tools. A boy under such home influences, rounds out in his physical and mental being, and is interested in home and the farm to such an extent that he will most likely remain, and if he follows farming, will almost surely succeed. Such an education also is as good a foundation for any subsequent business or professional schooling as he can have.

Top-dressing Meadows in Winter.

A thin dressing of clay put upon a meadow, where the soil is sandy, or a sandy loam, or for the most part muck, and not in a very good state of fertility, will sometimes increase the growth of grass so largely, that a meadow hardly worth mowing will yield three tons of excellent hay per acre. Sometimes when grading has been done, or a new fence is built, the earth is scattered in depressions on the sward near by, and the result almost always is a large increase in the growth of the grass. We have frequently observed bunches, and small patches of tall, heavy grass of a luxuriant growth, near stakes and posts, that had recently been set, a small quantity of the earth having been scattered, when the workman was digging the holes. Taking the hint from these, it is easy to see how teams and laborers may be employed profitably, when there is snow on the ground, or it is too cold to engage in labor that requires warm weather. If a man has a sandy meadow yielding but a small burden of grass, it will pay well to haul clay, or almost any kind of earth half a mile to top-dress such ground. When the sleighing is good, a team will haul two tons at one load with ease. If the soil be of a peaty character, two tons of cold stiff clay spread in the winter over an area of four square rods, will usually produce a maximum result. Should the clay be plowed, or spaded up in large clods, let them be spread on the snow or ground, and

the frost and rain will reduce them to a fine and mellow condition before the growing season commences, so that a little labor with a shovel will cover the entire surface with an excellent top-dressing, the good effect of which will be perceived for several years, in the larger quantity of grass and hay, and in the better quality.

An active man with a good team will haul, on an average, one ton of earth an hour half a mile, when the traveling is such that the team may haul two tons per load. And if half a ton be spread on each square rod, it will require eighty tons to top-dress one acre. The expense of the teams for hauling need not be computed, because they must be kept in winter, whether they work or not, and it will be better for them to labor than to remain idle. Then allowing a man one dollar per day, if he hauls only four loads per day, making eight tons, it will cost ten dollars to top-dress one acre. The grass produced by such a dressing over and above what would have grown in a single season, will ordinarily more than pay all this expense. But, in the winter, when farmers have little to do besides their daily chores, they can work a few hours every day at top-dressing in this manner, and it will cost them even less than we have reckoned, as it will be better for both men and teams to labor moderately, than to remain idle. When there is a preponderance of clay in the soil, sand, or sandy loam, or muck may be hauled instead of clay. The frosts and rains will almost surely reduce it fine before the growing season commences, and it will answer the double purpose of a mulch and fertilizer. When the snow is off the ground on a mild day, the lumps, if there are many, may be broken up and spread by a harrow turned upon its back.

Protecting Implements and Machinery.

It is safe to state that more tools and machinery are used up by rust and exposure to the weather, than by the actual wear and tear of use. Very few tools are thrown aside because they are worn out. Harrows are frequently left with the teeth in the ground all winter, and many people think because the teeth are iron, they are not injured. But the scale of rust that sometimes forms on harrow-teeth destroys more iron during the winter, than is worn off by all the harrowing done in one year. The same is true of plows. How often do we see good plows standing in the furrow all winter! Water not only fills the cracks in the wood, but enters every joint, causing the grain of the timber to expand and then shrink in dry weather, and at length rot, before the plow is worn out, and the formation of a scale of rust on the iron where it comes in contact with the soil, rapidly uses up the iron parts, so that implements, not protected, go to destruction with astonishing rapidity, whether made of wood or metal. If the surface is well painted, water will still find its way into the joints, tenons will decay, and the wood about the mortises will often rot in a few years. Wagon wheels that are allowed to stand in the storms and sunshine, even when well painted, rust out faster than they wear out. Water soaks into joints of the felloes and spokes and between the tires and wood, rusting the iron and destroying the solidity of the structure. This is why wagon tires must be re-set so frequently. More iron will rust off sleigh shoes in one season, when they rest on the ground, even under shelter, than will wear off while running all winter in a snow track. The same is equally true of hoes, shovels, and many other tools.

On a farm properly furnished with cellars and sheds, of course all implements should be kept under cover at all seasons. They ought to be off the ground, the wood-work, except handles of tools, well painted, and the iron-work painted or protected by a simple coating of boiled linseed-oil. But the question may be asked how may a farmer protect his implements and machinery, when he has not suitable buildings which can be appropriated to such a purpose. There are several ways in which it may be done very satisfactorily. The farmer on the prairies with no out-buildings or lumber to make them, can set two rows of posts in the ground, about 16 feet apart, and saw off the tops square about three or four feet high, pin a pole on each row of posts for plates, make rafters of poles, and pin them to the plates, and split out thin rails and pin them to the rafters about one foot apart, then cover the whole with straw two feet thick. The straw should be spread on very evenly, and after it has settled down and the surface is wet, raked lightly so as to turn all the straws on the surface down, to carry off the rain. The rafters should have about "one-third pitch." This will be sufficiently steep to carry off all the rain. By nailing or pinning thin rails, like collar beams, from one rafter to another, and making a straw floor, an excellent warm apartment may be made for fowls of any kind. Even geese and ducks will ascend to it, on an inclined plane. Such a frame may also be covered with fence boards, or saw-log slabs, and subserve an excellent purpose for protecting tools. If it should not carry off every drop of rain, it need not be denounced. It is the drying wind and sunshine, not rain alone, that injures implements.

Suspended Bar for Barn-doors.

Large barn-doors are usually fastened to a perpendicular bar one end of which enters a mortise in the beam over head and the other a mortise in the floor. The strength of a man is generally required to take out the bar, or put it up. Our illustration shows a more convenient way to manage the cross-bar. A round iron bolt holds the bar to the middle rail of the door, allowing it to turn freely either way. Two long gains, one in the floor and the other in the beam above the doors, receive the ends of the bar when the door supporting the bar is closed. In lieu of a gain in the beam over head, a strip of scantling is pinned firmly to the under side of the beam, and the upper end of the cross-bar when set erect, comes on the inside of the strip.

Killing and Scalding Hogs.

J. Comfort, writing from Cumberland Co., Pa., gives his process of killing and scalding hogs, which has much to recommend it, as follows:

"I have frequently thought of writing a word on the easiest, quickest and most humane manner of slaughtering hogs. I take any kind of

SCALDING HOGS.

gun that will go "loose," load with, say one third charge of powder and a *plug of hard wood*, about an inch long and the thickness of the ramrod. This I shoot directly into the centre of the forehead of the hog, and he drops at once. The head is not injured, as to meat; there is no danger of the hog biting you. You have no hard tugging and lifting to catch and throw them, both of which are hard and dangerous work, and the hogs will bleed out better, as the nervous system receives so sudden a shock, that they are not able to draw the blood into the lungs, in case the wind-pipe should be cut in sticking. It is easy to picture laying hogs on their backs, but try it one year and try shooting next, and my word for it, your pen will ever afterward be free from squealing on butchering day.

"Now as to our method of scalding hogs. We set two posts about twelve feet long, including two feet in the ground, and about twelve feet apart, and connect them by a beam on top. Under this beam, and near one post, I sink an ordinary half-hogshead in the ground, and place a pulley on the beam directly over it, and another pulley on the side and near the bottom of the adjacent post. A rope is passed through these and attached to the hog's hind leg, and then he may be easily hauled up and dropped into the tub, then taken out to air and clean; and lastly he may be hoisted up and hooked on to the beam by chains to hang. Such beams may be arranged to hang as many hogs as you may wish to slay. A common barrel kettle kept boiling will keep the water in the scalding tub hot enough, by adding hot and taking out cold, to continue scalding an indefinite time; all with little cost, little fuel, little lifting, and the killing with little suffering to the animal. All things considered, this is the best mode I ever saw or used for killing and scalding hogs."

Western Agriculture.

J. Welton, writing from Winnebago Co., Ill., some months since, says: "When I read 'Western Boy's' dashing averments in July *American Agriculturist* of their doings in LaSalle Co., I noticed he failed to tell anything

about the amount of their products per acre in that section of our prolific State. The remarks of 'C. S. W.', of Iowa, in your August number are so important, frank and truthful, that I would offer a few in the same spirit.

"I am constrained to say, that a moiety of the farming operations in Northern Illinois are by far more slovenly and unproductive, than I ever noticed in other Northern States, though our natural resources greatly surpass most of them. Thirty years ago I visited on the banks of the Illinois river, and travelled more or less in LaSalle and Putnam counties. There the weeds were so abundant in some places as to prevent one on horseback, from seeing an ox, when within a few rods, but the pioneers there know how to produce very large ears of corn. Four years since I was again travelling near the Illinois river, in Putnam county, passing an extensive corn-field, in which stalks and weeds appeared much more abundant than ears. I asked three men, who were cutting up and putting it into stooks: 'How much more than twenty bushels to the acre will this field of corn average?' The ready response was: 'That it would fall short of that by more than one half,' with which I fully coincided.

"I have for many years regarded Indian corn as preeminently the Western Farmer's crop, and it will be difficult to find anywhere a soil and climate better adapted to the profitable growth of the stalwart plant, than that of our whole State, and yet, I am fully persuaded, that the two most northerly counties, through which Rock River runs, have not, for the last eighteen years, averaged 25 bushels or even 20 bushels of merchantable corn per acre, counting all the lands each year, that have been planted in corn, though in that time it may have averaged fifty busnel basketfuls of ears and nubbins. Nevertheless, I firmly believe, before ten years shall have elapsed, that all our well-to-do farmers, instead of being satisfied with thirty or forty bushels per acre, will not then publish about their success in corn growing, if it falls short of seventy bushels, and that then more Illinois farmers will tell how much their corn crop exceeded eighty, than can now boast of growing over forty bushels per acre, and that then, instead as now, of growing the smaller varieties, so as to escape a killing frost, they will grow the larger kinds of dent corn, and have their whole fields out of the reach of killing frosts before the 12th of September, whether the seasons may prove wet or dry. Of course, the above assumptions becoming established facts before ten years have passed, most Illinois farmers will have abandoned growing wheat at the rate of from three to thirteen bushels per acre, to send 4000 miles, to exchange for the light fabrics of foreign shops. Therefore:

"Let Illinoisans, whose lands abound in clay subsoils, plow them in the fall not less than eight or nine inches deep, while the ground is warm enough to cause the weed seeds to germinate. Select the eight-rowed corn as early as the first week in September, and by all means (not objecting to have it kiln dried) have it dry, cob and all before any frost can reach it. If such corn ground be prepared in spring and the seed drilled in in good time and in the best manner, rolling the ground if need be, and harrowing and cultivating it sufficiently, with good implements, not using a hoe at all, the farmers may rationally hope to gather more than twice the usual average crop of sound corn, provided always they succeed in having only just a proper number of plants to a given area."

Fig. 1.—METHOD OF HOLDING AN ANIMAL.

Wooden Horn Knobs—How Put on.

The ends of the horns of some cows and oxen are so pointed, that unless mounted with knobs, serious wounds are easily inflicted. We have seen the flesh of neat cattle laid open several inches in length by pugnacious bullocks, and horses and colts with dangerous and even fatal wounds given by the horn of some hooking beast. The small brass knobs which are screwed on the horns, are worth but little, as they are too small. In order effectually to prevent injury, the balls should be as large as a man's fist. Moreover, when vicious cattle have such large knobs on their horns, they will soon get completely over their propensity to hook, and large and small will herd peaceably in a small yard, where it would be dangerous to keep them, were there no knobs on their horns.

Fig. 2.—KNOB.

We once owned a hooking cow with long, sharp-pointed horns, that was a terror to every other animal in the yard, until large knobs were put on her horns, when she shortly became peaceable and harmless as a lamb, permitting small cattle, that once trembled with fear when a rod distant, to feed close by her side. We have been long accustomed to use large wooden knobs, for the horns of every animal more than one year old, if the horns had attained sufficient growth to admit of boring a gimlet hole near the small end, without entering the quick. In the horns of some cattle the quick extends to within half an inch of the tips, until they are, perhaps, two years of age, and the horns of some cows and oxen may be bored, without touching the quick, three inches or more below the ends. To make these knobs, select a few well seasoned, sound sticks of some tough wood, which will not split easily, like yellow locust, iron wood (or horn-beam,) river beech, or pepperidge. A piece two feet and a half long and 4 inches thick in the clear, will make six knobs, 4 inches in diameter and 4½ inches long. They should be shaped like fig. 2, above, and an expert wood-turner will get them out in a few minutes at a

Fig. 3.—REAMER.

cost of about two cents a piece. Soon after they are turned, they should be sawed apart and bored through with a ½-inch bit, to prevent unequal drying and cracking. The pin-hole (seen in the cut) should be bored ¼ of an inch from the tip-end, using a sharp nail bit. Then the hole should be reamed out with a bung-hole borer, shown in fig. 3, making a tapering hole, as indicated by dotted lines in fig. 2, about an inch in diameter at the lower end of the knob. Soak the knobs thus made, several days in linseed oil or coal tar, to prevent shrinking and cracking when on the horns. If the animal to be adorned will not allow its horns to be bored, make it fast by the horns to a bar or pole fastened securely in a gate or doorway,

which has strong posts. Ream out the holes to fit the horns well. Then crowd on the balls, mark each horn on both sides with a square-pointed awl, and, removing the balls, bore the horns half-way through from each side, using a small gimlet having a sharp screw. Use pins of No. 11 or 12 steel wire, 3 inches long, filed to round points. The holes in the horns should be bored "drawing" to keep the knobs from working loose—that is, they should have the effect to spring the pin down in the middle, but not more than one-fourth of its diameter. When the holes are so bored, the pins must be driven in with some force. To do this, a heavy sledge hammer, or stone weighing 20 or 30 pounds, should be held against the knob to pre-

Fig. 4.—WOODEN KNOBS ON CATTLE.

vent all jarring, as cattle are extremely sensitive to any blow upon their horns. Drive each pin about a quarter of an inch beneath the surface.

The Best Ring for a Bull.

The ring we here illustrate is far superior to the circular rings in common use. The circular part is placed in the nose and a strong strap is attached to the straight cross-piece. The ring should be about two inches in diameter, made of ¾ iron bent into a bow, or U shape. In one end of the U, an eye is made, through which a steel bolt passes, having a screw head, and screwing through the other end of the U, in which a thread is cut. The circular portion should be finished perfectly smooth, so as to cause no irritation to the nose of the animal.

The best way to insert the ring is, to lash the head of the bull to a strong post, or to a bar between

BULL RING.

two trees, or strong posts, as shown in another column. Then make a puncture with a white-hot, pointed iron as large as the ring, by thrusting it through the *septum*, or wall between the nostrils, and drawing it out again instantaneously. It will be easier for some, to use a large leather punch, or even an awl, to make the hole. Then insert the ring, screw in the bolt, which should turn in hard, with the strap attached. The strap ought to be of the toughest harness leather and the flap riveted, and sewed besides.

For the American Agriculturist.

How To Raise Turkeys.

"In the first place, select a good kind. The autumn or early in winter is the most favorable time for that—just before the birds are sent to market. Keep them well during the winter; make pets of them if you like. Mine eat from my hand, and answer to my call. In the spring, a few days before they begin to lay (which is about two weeks after moulting), put them in an enclosure, where it is most desirable to have their nests, and where they can not get out. After they have made their nests, they may be set at liberty without any fear of roaming or straying. Next, take good care of the eggs. They should be gathered carefully every day, and placed between layers of flannel or cotton, in a place of uniformly cool temperature, and turned over every day. In spring, after the turkeys begin to lay, it is often cold enough to freeze the ground, when, if the eggs are suffered to lie out, they will become chilled, and will not hatch. In warm weather, it is not so necessary to protect the eggs. As soon as the birds are hatched, feed them warm bread and milk, well peppered, with boiled eggs added; or with loppered milk, thickened with cooked corn meal, or canaille (wheat middlings) which is better. A little care in these matters will repay all efforts. Before I knew how to take care of the eggs, I set 30 eggs one year, and but one of them hatched! The next year I set 40 eggs, and nearly all of them hatched, and the birds lived. At present prices, raising poultry is a much more pleasant and easy occupation than the slavish drudgery of making butter and cheese. At least such is the opinion of a Cayuga Co. FARMER'S WIFE."

Light Stables for all but Fattening Animals.

Light is as essential to the healthiness of the eye, as good food is for the stomach. Light strengthens the eye. Darkness, and especially sudden changes from darkness to light, tend to weaken the vision of both men and animals. When a horse is taken from a dark stable, he walks as if he were blind, and the light that meets his eyes appears to cause pain. Every stable should have glass windows, wherever the climate is too cold to admit of open windows. When it is not convenient to have a glass window in the walls, panes of glass may be fitted to holes sawed in the door; or a sash containing a single row of panes may be set in

a frame over the door. When stock stand in their stalls facing a barn-floor or large feed-room, if their mangers are not boarded up tight, light may be admitted through windows above, or in the barn-doors. But if they stand with their heads to the wall, light may enter at any part of the stable, except in front of them. Farmers often saw round holes through the boards of frame stables before each horse, which are closed by slides, and these allow pure air to enter as well as light. This is a poor plan, but better than nothing. There should be windows at the ends or rear, enough to make the whole stable as light as a family sitting room. They should be capable of being opened for free air in summer, and situated so that draughts of air will not fall upon the bodies or legs of the animals, but circulate above their backs. Perfect ventilation must be otherwise obtained, when the weather is so cold that the windows must be closed. When window glass has been broken out, wooden panes are often inserted, and cobwebs and dust too frequently intercept the light. For the benefit of the eyes of all animals, stable windows should be well glazed and frequently washed. Most of the stables in the country are not provided with suitable windows, while a large proportion have none at all, the stables being almost as dark as midnight. Light and sunshine in winter are essential to healthy vital action of all our animals. But the desirable quiet of fattening animals is better attained in dark apartments, and no perceptible bad effect upon their health is noticed in the few months of stall feeding, which usually precede their sale for slaughter.

The Best Horse Stable.

The best for us and for our horses, is the best we can afford. If one can do no better by his horses than to give them an open shed, then of course the open shed is the best stable his horses can have. So if we can not all afford the *very* best, yet if we know what that is we shall come nearer to it, with what means we have.

It is probable that a horse will take more comfort and do better in a box stall, or "loose box" 10 feet square, (10 x 8 will do very well,) than in any other stall. The floor of such a stall, if made of 3 x 4 joists set edgewise, $\frac{3}{4}$ of an inch apart, and level, over a grouted and cemented floor, inclining toward a drain to carry off the urine, will always be dry, and if covered with a foot of straw will be very soft and comfortable. The droppings may easily be removed with a fork. There should be abundant light, free ventilation, and a feeding box and manger. The manger ought to extend from the floor about 3 feet high, having tight sides, the top protected by an iron rail, or one of wood bound with iron, being two feet from the head of the stall; the front side should be set in 6 inches at the bottom, that is, be 18 inches from the head of the stall. Inside the manger a tight false bottom, 1 foot from the floor, should be placed. This box is to hold dry fodder, and there should be an iron follower (to lie on the hay) 3 feet long and 14 inches wide, made of two rods of half-inch iron, the one toward the front turned at each end, so as to form with the other piece a parallelogram, of the length and width named. There should be two cross-pieces welded in a foot apart, and the ends should extend towards the rear six inches, and each form a hook, by which the follower may be hung on the back of the manger box. There should be an opening at the bottom at one end of the

manger, so as to sweep it out easily. Between this and one side of the stall should be set a box for grain and cut feed, capable of holding about a bushel. This should be at the same level with the top of the manger, and may well be of the same width, and about 1 foot in length, and 1 foot deep, the front and rear sides sloping toward the centre a little. To prevent the horse throwing his feed out, a single rod of iron may be hinged to the back of the feed box to fall across it and rest in a slot in the front. The manger and feed box should be made of 2-inch oak stuff and very strong. There may be, also, an arrangement for feeding without entering the stall, and for a breeding mare it is quite an advantage to have an outside door open into a small yard, where in comfortable weather she can move about and take an airing at pleasure.

Feeding Grain to Stock Profitably.

There is a class of farmers, and perhaps some among them read the *American Agriculturist*, who still question whether it will pay to feed animals the grain which they themselves raise. They have not satisfied themselves by their own experience in making beef, mutton, or pork. If grain be properly fed to animals of a good breed, there is no doubt about its being usually a paying operation; but fed out unground and irregularly, if the animals are ever so good, it seldom pays. There is a difference, also, in the manner of computing the gains which usually accrue from the grain consumed by animals. A good portion of the profits of converting grain into meat of any kind, cannot be realized by the sale of the meat; for many times an animal will not sell for as much money as the grain and hay it has consumed while fattening. In view of this fact alone, feeding grain appears to be a poor practice. Nevertheless, multitudes of the best farmers of our country sell but little grain, others sell none at all, while many purchase much more than they raise on their own land, and feed it all to stock of some kind, and yet derive a paying profit from the business. Others attempt it and fail because they feed poor stock, not well purchased nor selected, or because they do not feed with proper system, nor preserve with sufficient care the solid and liquid manure of the fattening animals. In fact, it is in the manure *alone* that the greater part of the profit of fattening beef, sheep and swine consists, to most of the farmers of the United States, and the rest of the *civilized* world. The more manure, and the better saved, the greater the profit, even in Illinois.

The way to begin is, to get good animals and to put them in fair order on grass. Meat can be made on grass in warm weather more economically than on any other feed. Those persons who attempt to make beef of poor cows and bullocks, or mutton of poor sheep, by feeding hay and grain, without commencing on grass, will never make out well.

When one intends to prepare a lot of bullocks or sheep for marketing in the spring, he should commence feeding a small quantity of grain per head as soon as grass begins to fail, for in passing from grass to hay, they should not be allowed to lose any of the flesh or fat that has accumulated during the grazing season. If by irregularity of feeding, or by exposure to storms, or by short allowances of feed, an animal is required to use up a pound of fat to maintain the heat and to supply the natural wastes of the body, it will take several days to replace the small amount that has been lost

by this bad management. Every animal should be fed enough to keep it improving a little *every day*. Some bullocks require more meal than others, and the same is true of sheep. A dry cow, or a bullock three or four years old, designed for beef next May or June, should receive not less than two quarts of Indian corn meal, or its equivalent in some other grain, during the months of December and January. After this, the quantity may be increased at pleasure, and should always be increased from month to month, according to the feeding capacity of the animal, the calculation being to finish off the fattening with ten to twenty days grazing, without reducing the quantity of grain. In addition to this amount of meal, they should have a foddering of hay, once daily, and one of cornstalks, and a few hours daily in a yard with access to good straw. If a farmer has a power cutter, it is far more economical to chaff the hay, straw and cornstalks, wet it, and mingle the meal with it. Feed prepared in this manner, is better for sheep as well as neat cattle and horses. The use of oil-meal for beef animals must be regulated on the same principles, as a substitute for part of the meal. Wethers and dry ewes should receive nearly or quite one pound of Indian corn or corn meal per head daily, or what is better, half a pound of oil meal and half a pound of corn or of barley meal mixed. It is folly to attempt to make meat in cold weather, without complete protection from cold and wet.

A Needed Reform and its Profitable Practice.

A correspondent in Rhode Island, whose good common sense in farming matters leads him into uncommon good practices, gives us an account of his procedure in a matter in which reform among farmers is especially needed, not only for their own comfort, but for the profit of all whose lands will not be injured by enrichment. Alluding to the well known fact, that the agriculture of the Chinese differs from ours essentially in their employing few or no beasts of labor, and hence, being deprived of their manure, the people economize with care and collect from every source the material which we so much neglect under the name of "night-soil," he says:

"I sympathize with Liebig's Chinaman who applies to each guest for a fertilizing souvenir. That is, I respect the latent motive, the manifestation of which is open to criticism. But how can we judge severely the taste of our antipodes in their most necessary economy, or say, that is made public which should be hidden, when notoriously our own country and village privies are so indelicately conspicuous. I came into the management of such a one a few years ago. No one could enter it without being exposed to the view of passing travellers. Other circumstances combined to render it about as unmanageable a nuisance as could be contrived. I resolved to move it, and a shaded angle formed by carriage house and wood-shed, which stood at right angles to each other, touching at the corners, seemed the most desirable place for it. The buildings were under-pinned at this point about three feet high, making two sides of the vault all above ground. A few bricks made another side, and the back was closed by a light, flat stone, easily movable. Having cut an opening in the carriage room of the size of the front of the privy, it was moved to its place, and then an entry was partitioned off in the carriage house, opening out-side, and large enough to hold a bin that would contain a cartload of *peat*. In

Drag-Saw Machinery.

Some of the subscribers of the *Agriculturist* have inquired for information concerning fixtures for sawing logs into short cuts for wood, staves, wagon spokes, and other purposes. We have engraved a representation of a drag-saw and carriage, with a log resting on it, which a mechanic of ordinary ability will be able to make by the description herewith given. We give the dimensions of one which we used for several years. The sills (*B*) are 14 feet long, 3 x 3 inches square, united by three cross-ties, 4 feet long, framed into them. It is not necessary to make the sills any larger, as the frame may be placed on two planks laid lengthwise, flat on the ground, and thus serve as good purpose as heavier timber, which would make a heavy frame to handle. *D* is the wooden windlass-roller placed at one end, turning freely in wooden boxes bolted to the sills. Upon one end of this

roller there should be a head 8 inches long, and of the same diameter. The bearing near the head should be about 5 inches in diameter, while that at the other end may be 4 inches. The middle part of the roller should be made 10 inches in diameter, and cut out in the middle, as shown in the illustration. On the crowns of the bilges thus made, there are two rows of strong sharp-pointed spikes standing like cog-teeth, inserted at right angles to the roller. They extend about one inch above the surface, and enter the log (*A*) as it rests on their points. *C* is a carriage for holding one end of the log, which should be made to run close up to the roller, so that a log only two feet long may rest on both. The log is kept from rocking by the stiff binding pole (*E*). The pitman (*G*) works on a wrist-pin in the arm of a wheel, or by a crank. Two posts (*H*) are set in the ground, or in a sill staked firmly down. A rope is attached to the pitman (*G*) and passed over a pulley, and by means of it the saw can be raised when in motion. The other end of the rope is fastened to the post, so that the saw cannot drop to the ground after it has cut a log entirely off. A log twice the length of the sills may be rolled on, when, by working the windlass roller, it may be carried endwise in either direction. When the but-end of the log is sawed off, so that the portion behind the truck is the lightest, the end must be raised up and the carriage run back to the end of the sills. In sawing a piece of a log only a few feet in length, it is better not to saw the cuts entirely off, as it can be held more firmly while sawing the last one.

The pitman is sometimes attached to a wheel on the side of a tread horse power, and the saw is bolted to the other end, and this works well. Still, some persons prefer to have one end of the pitman attached to a cross-head, playing on a horizontal way, with another pitman bolted to the saw and attached to the cross-head. With the first arrangement, the saw is worked with a rocking motion, as if used by two men; while with the latter, the saw is driven directly back and forth. When a drag-saw is driven by a sweep power, the pitman must be attached to an iron balance wheel, on a strong frame firmly braced. The wheel should make not less than one hundred revolutions per minute, though one hundred and fifty is none too fast.

Drag-saws, sometimes called "butting" saws,

are made expressly for this kind of sawing. But a light saw-mill-saw, if properly filed, will work well. We once used a small saw-mill-saw worked by a two-horse tread power, which cut off logs of hard wood 26 inches in diameter, in 70 seconds, when driven at ordinary speed.

DRAG-SAW AND CARRIAGE.

A good drag-saw is a great labor-saving machine, as large logs, 30 or more feet long, may be worked up by horse power at very much less expense, than the work can be done by hand.

Sundry Uses for Portable Scales.

On every good sized farm there is very frequent use for large scales of some sort, and none are so convenient and capable of so many applications as the better forms of platform scales. These when possessed are usually appropriated to few purposes comparatively, for lack of thought. Scales marked to weigh 600 lbs., may be employed to weigh advantageously sheep and swine, and even light cattle and horses.

PLATFORM SCALES.

Our illustration shows how a light platform supporting a pen, may be placed upon a pair of scales. The pen is in four pieces, each made of three boards, or rails, and two uprights or posts. Tenons from the latter enter the platform, and the different parts of the pen are kept together by hooks above, as shown. On a platform scale thus provided a single hog or sheep, or several may be conveniently weighed, sheep more easily than if, with their legs tied, they were laid upon the scales. When a horse or cow is to be

weighed, block the wheels; lay on a wide plank, or broader platform, of sufficient length, for the animal to stand upon, supported so that while it is free to move up and down with the scales, it cannot tip more than half an inch, when an animal steps on either end. Then

make a temporary floor of plank around the scales, so that the animal may step without knowing it from the floor upon the scales. By managing gently, a cow or horse may be made to move itself to the proper place and the weight may then be quickly taken. There is seldom any danger in placing upon such scales, if they are good ones, double the weight they are graduated for. A sufficient number or weight of "poises" will not come with the scale, to balance the animal it is desired to weigh. The counter-balance may easily be made with pieces of iron, lead-pipe, or similar known weights, or, what is neater, the heaviest poise may be taken, and after weighing it carefully first, it may be filed smooth and

used as a pattern to cast others by, which may be dressed down to the true weight by filing, or by the cold chisel. Such attachments to platform scales, as we have described, are not only a great convenience, and an aid in trying experiments in feeding, etc., but those who sell animals "on the feet," without knowing their weight, may sometimes lose enough on a few animals to pay for scales and attachments twice. No recommendation of portable scales, or exhibition of the various uses to which they are applicable should lead any one, who can afford it, to dispense with the fixed platform scales of large size, (hay and cattle scales). These when of the best manufacture, are sufficiently delicate for all common purposes, often turning with two or three ounces when moderately loaded. Set under cover, near or in the barn, even on the barn floor, they are most convenient.

How to Make a Strong Sleigh.

There are two ways at least of making the "benches" of all kinds of sleighs and cutters, and one is so much stronger and better than the other that we illustrate it. It will be seen by the engraving that a gain is made on the upper side of the runner where the knee enters it, so that the shoulders of the tenon at the lower end of the knee are let in below the upper edge of the runner; and that the shoulders on the upper end of the knee are let about half an inch into the beam. It is plain that a sleigh made in this manner must be much stronger than it could be, were the shoulders of the tenons not let into the beam and the runner, and that it will better endure the strains, which come in almost every direction. The tenons of a sleigh usually give out first. This fact teaches the importance of putting all the timber together in the strongest possible manner, thus gaining lightness and the same strength as with heavier wood.

The knees should be made of thoroughly seasoned stuff, and should dry for at least one month after the last dressing, as oak and some other kinds of hard wood will shrink a little every time it is dressed, for a long time. The tenons should be made to fit so tightly on every side of the mortise, that a very heavy hammer will be necessary to drive them

in snug. Then if the tenons and mortises are painted, as they always should be, the runners, knees, beams, and raves will be about as strong and durable as if constructed of one solid piece of wood. Gains cut in the under side of the raves or side pieces, greatly increase the strength

CONSTRUCTION OF A STRONG SLEIGH.

of the sleigh. A good coat of paint applied to the shoulders, tenons and mortises, will make the work drive together more easily, exclude all moisture, keep the timber from shrinking, and render the wood-work much more durable than if they were to be put together without the paint.

An Old Poultry Raiser on Spanish Fowls.

Edward Homes, of Rockingham Co., N. H., communicates his experience, especially with Spanish fowls, to the *Agriculturist*, as follows:

"An experience of thirty-three years in raising poultry, has developed some facts worthy of note. In breeding 28 distinct kinds from the little White and Seabright Bantams, to the great Malay, Brahma and Shanghai breeds, I have found in each some very excellent traits. Some possess good laying qualities, but have not well grained and colored meat, and *vice versa*. In others the chicks are very weak, difficult to raise, long in coming to maturity, and costing more than you could realize from them when grown. The whole Game family are good layers, good mothers, and good poultry, yet are so pugnacious before they are fairly fledged, that at five or six weeks old, cockerels begin to see which is "master," battling constantly and barbarously. It is quite expensive to confine them, as they need a wide range, with a fence some ten feet high, in order to prevent their bad habit of roving. Their carriage is beautiful, they are hardy, and if they can have plenty of room to roam, are profitable. But for a limited space, beauty, color, meat, eggs, and profit, I prefer the

Pure White-faced Black Spanish.—The hens weigh 4 to 5 lbs.; the cocks from 6 to 7 lbs., and have large, single, deeply serrated combs standing erect, while those of the hens, in the laying season especially, fall over, nearly covering one eye. They have delicate limbs, very small head, and slate-colored legs. The chicks are hardy, easily raised, taking from six to seven months to attain maturity. They are not large birds; will lay constantly, except during the molting season (about four months), thus giving about two hundred and forty eggs in a year. A variety and plenty of food, with lime, gravel and pure water, should be always accessible. A few meat scraps occasionally in winter are very essential to supply the place of insects which they consume in summer. As to the cost: from the 15th day of February, 1864, to the 25th day of May, 1865, I kept four hens and one rooster in a coop; weighed 23 lbs. of corn, to be exact, and 50 lbs. of barley, and kept it constantly before them, with good pure water and lime, which they consumed during the above mentioned time. This is equivalent to 58 lbs., or

one bushel a year for each fowl, at an average of \$2 per bushel. The four hens were kept separate from all other fowls, commenced laying about the 12th to the 20th of December previous, and continued to lay, showing no signs of sitting, excepting one as late in the season as August. They layed in all ten hundred and twenty-three eggs. One out of the number laid three hundred and three eggs, which was by far the greatest number laid by one hen in one year during my experience. I found last spring that she did not begin to lay as early as the others by some two months. She has laid constantly since then, and is now (Oct. 23d) still laying. The others averaged two hundred and forty eggs each. They are a rare bird, and full bloods are scarce in this country, though many assume the name for effect. I have kept them eleven years, and the foregoing shows them to be at least one of the most profitable kinds of fowls."

A Convenient Bag-holder.

The convenient bag-holder illustrated herewith consists of a standard of hard wood 4 feet long, 2 inches square, having a long slot or mortise through it as represented by the dark line, and the lower end secured to a piece of plank, 1½ inches thick and fourteen inches square, and a sliding rim of iron of the form shown, the shank of which passes through the long slot; where it is secured by the nut at A, having a handle on one side of it. The size of the slide must correspond with the size of the mouth of the bags. A large bag may be attached to a small slide; but a small bag cannot be fastened to a large one. The dotted lines are to represent the slide adjusted for a short bag. There are four sharp, iron spurs in the slide, which are

BAG HOLDER.

not shown in the illustration, to fasten the bag over. Such a bag-holder will be found eminently useful when it is desirable to shovel in any kind of grain, fruit, vegetables, or other material. If bags be small, a large wooden funnel may be placed on the mouth, to prevent grain, or ears of corn from falling outside.

A Novel Poultry House, with other Hints.

A correspondent in New Haven Co., Conn., seeing in the offer of \$300 in prizes for a barn plan, the condition that the plan must include provisions for 300 fowls, writes:—

"Were I owner of a thousand acres and wanted to keep a thousand fowls, I would keep them in houses, containing not more than fifteen each. Each house should be 4 x 9 feet, and 4½ high, no floor; made ornamental or otherwise according to taste and circumstances of the owner. Three feet at one end open lath or lattice work; the remaining six feet has a partition in the center, coming down within one foot of the ground, enclosing 3 x 4 feet. There is no partition between the lathed part and the central part. The enclosed portion is for the roosts and nest boxes. The central part is for feeding,

dusting, etc., and may have roosts and nest boxes also, and glass front if desired. [We think it would be better to enlarge the enclosed part, making it 4 x 4½ instead of 3 x 4.—Ed.] Set the house on wheels or rollers on a nice piece of grass, and move it its length every morning,

POULTRY HOUSE.

giving the fowls new grass every day, and keeping them in the most perfect health and cleanliness. Make nest boxes of sheet iron or tin, and hang them on the walls. Put doors in the ends of the house, to enter for gathering eggs, etc.

FOR NEST EGGS select the handsomest eggs you can find; puncture both ends and blow out the meat, pour into the empty shell two tablespoonfuls of calcined plaster of Paris, mixed in water to the consistence of cream; keep it revolving for a minute when it will be settled on the shell ⅜ inch in thickness, then you will have an "egg" that biddy herself will be unable to tell from the one she laid last.

The house described is in practical operation, and its advantages are perfect cleanliness, consequent health, and contentment of the fowls, the greatest number of fresh eggs secured, and none lost. The fowls get a fresh supply of grass every day, and thrive better in consequence. The house may be moved to any locality on the premises, sheltered or exposed according to the season, S.E. in cold, and N.W. in warm weather, and so in a measure maintain the fowls in the temperature of spring, the egg season. Fowls do better in small than large flocks. When the grass where you started has got to be fine again, move the house back and commence anew. With such houses you can at all times tell the number and condition of your fowls, keep different kinds by themselves, and judge the better of their merits."

NOTES.—We have a few suggestions to make to this excellent idea of a peripatetic poultry house. 1st. The windows may be in the roof—a single row of panes running down like shingles on each side of the roof. They must be protected by wires, or the birds will try to fly out and break them. 2d. A good-sized dusting box should be fastened in the exterior apartment, a little higher than the sills of the house, so as not to deprive the hens of ground room. 3d. The nest boxes in such a house should be separate, and set upon a shelf a foot or more above the ground. 4th. We have used the nest eggs described and found it easier to suck the plaster in than to pour it in.—If they are filled full they will crack.

There may be some difficulty in getting these houses light enough to be moved easily, and yet sufficiently strong and warm, and the size and shape suggested may not be the best.

Walks and Talks on the Farm.

NO. 25.*

The Genesee Farmer.—City Farmers.—Wandering Farmers.—Mickie.—Sows killing Pigs.—Improved vs. common Swine.—Grease for Wool.—Dairying versus Sheep-raising.—Roots and Cabbages for Cows.—The Doctor's System of Feeding.—Soft Corn.—Farrow Cows.—Root Cellars.—Hens on a "Strike."—Sheep's Liver for Poultry.—Draining High Land.—Money invested in Farm Improvements.—Wide Sheds for Animals.—Improving Old Buildings.—Loss of Manure and How to Save It.—Barns, Sheds, and Barn-yards.

"So you have really sold the Farmer," writes John Johnston. "Many will besorry. Will it be continued and shall you write for it?"

I never knew our venerable friend come so near a compliment as this; for like all sensible men he never flatters. After all, you see, he does not say that *he* is sorry.

The *Genesee Farmer*, as such, will not be continued; it has been united with the *American Agriculturist*. I shall continue to write for the *Genesee Farmers*, however, just the same. The thought of writing for the *Agriculturist* with its "hundred thousand subscribers and half a million of readers" may be pleasant enough to those who are accustomed to it, but I confess that it makes me feel a little nervous. I shall try to think that I am writing for the *Genesee Farmer*, and if all our old friends take the *Agriculturist* we shall get along as pleasantly as usual. We may be considered plain country people, but—in these times ten thousand good Genesee farmers and fruit growers are not to be despised. Let us go in a body, and the editors and proprietors of the *Agriculturist* at least will give us a hearty welcome.

"There are many city people who take the *Agriculturist*?" Yes, there are many thousand copies sold each month in New York alone. But what of that; these city gentlemen *who have a taste for agriculture and horticulture*, are about the most interesting and agreeable people I ever met. They are so delightfully enthusiastic, and like to talk over their successes and failures in cultivating their land. With farmers, agriculture is an old story, and when you meet them they seem to prefer to talk politics rather than about what is doing on their farms. But a city man rather likes to be considered a farmer. He has often the genuine love for agriculture, and sighs for the pleasures of country life. Of course there are those who *affect* this, now that farming is becoming fashionable and I should not be surprised if, in their desire to be thought farmers, some city upstarts should wear homespun and dirty boots. In London, a century or so ago, a machine was invented for spattering gentlemen's boots with mud, and for a penny you could be converted into a country gentleman who had ridden into town! This was much cheaper than keeping a horse. And some New York fashionable tailor could get up a suit of farmer's clothes for far less than it would cost to live in the country.

* These "Walks and Talks" are continued from the *Genesee Farmer*, which is now merged into the *Agriculturist*. We have at the *Agriculturist* Office the stereotype plates of the *Genesee Farmer* and can supply the yearly volumes for eight years past, beginning with 1858. Price per volume \$1.25 if bound, \$1, if in numbers. Sent post-paid at the same price. The volumes for 1864 and 1865 contain the first twenty-four "Walks and Talks," of which we here give No. 25. These articles are narratives of actual experience on the farm.

A man called to see me to-day who wanted a job at chopping by the cord. He was a Canadian farmer and quite an intelligent looking man. I asked him what brought him over here. He said, a neighbor told him that in the oil regions he could get \$5 a day, and as this was more than he could make on his farm, he concluded to rent it and started for 'Pithole City!' "But he deceived me; when I got there I could get nothing to do, and board was \$10 a week. So I started home again, but thought I would stop here and chop this winter if I can get a chance."

It is passing strange that so many farmers are willing to leave their homes to engage in some improbable scheme for getting an easier living. If a man has been so unfortunate as to settle in a swamp where there is no chance of drainage he had better pull up stakes and leave. But in almost every other case he had better stay where he is and "fight it out on that line." This man had left a wife and family, because he thought he could make a little more money, and here he is, wandering about, losing his time, and only anxious to get something to do. He is willing to live in a shanty in the woods and board himself. How much more comfortable he would be at home, and even if he should get a little more for chopping, he will find that, after deducting his travelling expenses and his loss of time, he would have done far better to have stayed at home. In this country, wages cannot be much higher, all things considered, at one point than at another. It may be the case for a short time at some place, but the fact soon becomes known and men rush there like air into a vacuum and wages find their level.

A year ago an Irishman informed me he had a friend in Ireland that wanted to come to this country, who could do all kinds of farm work. I told him to come directly here and I would pay him all he was worth. He came and went to work without loss of time. He was a faithful fellow, and I gave him \$15 a month and his board, which I thought good pay for a raw boy not over eighteen. But Mickie had a cousin in "Chickago," as he called it, who wrote him that he could get \$2 a day; and though I endeavored to explain that though he might get such wages for a short time, the probabilities were that during the winter he would be thrown out of employment, and that he would make more, or rather save more, by staying here, he concluded to leave. Poor Mickie. He is like all the rest. He did not know when he was well off. He has gone to "Chickago."

Mickie loved pigs and took capital care of them. He met me at the gate one night as I came home from the city, and I saw from his excitement that something unusual had happened. "The sow has got eleven little pigs, and such beauties!" A happier man than Mickie was not to be found in the town of Yates. He wanted everybody to see his Suffolks. It was a proud day for Mickie. But alas for human joy. Next morning Mickie had to tell me that one of the little pigs was dead. "Oh well, never mind, ten is enough; they will do all the better." But the next night another was gone. The sow had lain on it. "You should not have fed her so much; she is too fat." The next morning Mickie was sadder than ever. "The old haste has killed another," he said. "Well, we must put a stop to it." Sows kill their pigs not by lying on them, but by crowding them against the sides of the pen. We put some poles round the inside of the pen, about one foot from the boards, so that the sow in lying down could not crush the little pigs against the sides, and we had no further trouble. It is a simple preventive, and did not take half an hour's work. Mickie had acquired one good trait on the Irish farm where he had been brought up. He had been

taught to do things at stated times; his last request to his successor was: "Be sure you clean out the pigs and give them fresh litter every Monday morning."

The doctor has often spoken to me about a remarkable pig he has, and to-day I went to see it. He has two pigs that he purchased last spring from different litters. One is a nearly thorough bred Suffolk, and the other has nothing but common blood in his veins. They are of the same age, and both have had the same food and treatment; and yet the Suffolk is nearly or quite as heavy again as the other! Having been fed in the same pen, nothing could more forcibly illustrate the value of good breeding. I think it will weigh 500 lbs. The doctor was not at home, but he has an intelligent "contraband" who does the honors of the establishment, and is evidently proud of the pig. "The Doctor can get a hundred dollars for him, Sah." "I guess not, Solomon; pork is down, and if everybody fed pigs as well as you do, it would stay down." But even if he brings only \$75, he will pay well for the "pudding" and milk he has eaten.

"By the way, Solomon, how do you make this 'pudding' that the Doctor speaks so highly of?" "I put a quart of corn meal into a pail, and pour some boiling water over it and stir it up."

"How much water?"

"About half a pailful. It gets quite thick, you know, Sah, and we fill up the pail with milk to cool it before giving it to the pigs."

Few farm products command a higher price or are more profitable than good butter. In 1861 butter was sold in Rochester for 10c. a lb.; now it brings 50c. At that time, and for a year or two afterwards, nothing was talked about but sheep. Cows were neglected. I urged farmers in the grain growing districts to pay more attention to the dairy. It is a safe rule to do just what others are not doing: to buy when others sell, and sell when others buy. Sheep paid better than cows a few years ago, and everybody went into sheep husbandry. The papers were full of sheep. Books were published on the subject, and we had soon a full blown mania in regard to American Merinos and heavy fleeces. It will not be long before we shall look back in astonishment at the blind credulity which seems to have seized even intelligent farmers. We shall have no such mania in regard to cows, for the simple reason that there is no particular breed that it will pay to get up an excitement about. We have sheep that will produce fleeces weighing 25 pounds, twenty pounds of which is worthless matter, but which, for a time at least, sold as wool. Had we a breed of cows that would give five pounds a day of something that would sell for butter, but which contained only one pound of the real article, we should soon have an excitement that would equal in intensity the severest form of the sheep fever.

But fortunately we have no such breed; and we may now safely feed our cows as much food as they can turn into milk, with the certainty that the butter will more than pay for the little extras that can be given them. There is nothing so good as cabbages to keep up the flow of milk during the early part of winter; and for later use beets and mangold wurzels are invaluable. Of course, you want to feed some grain with them. Considered merely in relation to the amount of nutriment they contain, they are usually worth more to sell in the cities and villages, than they are to feed out on the farm. But fed with corn meal they give tone to the system, and enable the cow to extract more butter from the meal and hay, or corn stalks, than she could do without some such succulent food.

The Doctor adopts a good system. He has only four or five acres of land, but he manages to keep two cows and feed a couple of pigs with considerable profit and with no small degree of satisfaction. He makes pets of all his animals, and usually enjoys seeing them eat. He studies their comfort and nothing disgraces him so much as a farmer whose stock is exposed to cold winds and driving storms.

Whenever I expect a visit from him, I am careful to have my cows all in the barns.

He lectured me a few weeks ago, for feeding corn in the ear. "But it is soft corn," I remarked "in excess." "No matter," he said, "keep it a few weeks, when it will dry, and then you can shell and grind it. Do not let it beseech you fall into this miserable habit of feeding grain whole. You lose one-third its value." I believe he is right; it had never occurred to me that I could shell and grind the soft corn, but on trying to shell it I found no difficulty. There may be an ear occasionally that will not shell clean, but I am satisfied that nine-tenths of what is ordinarily termed "soft corn" if kept in a good airy corn house, or even a crib of rails, for a month or six weeks, can be shelled and ground. It is less trouble to throw it by the basketful to the pigs, and in parts of the West where corn is cheap the practice may not be so objectionable, but in this section we cannot afford to waste grain merely to save a little labor and forethought.

But I was going to tell you about the Doctor's system of feeding his cows. He buys a new milch cow every spring, and keeps her two years. She will give milk all the time, and when he turns her off, she is fit for the butcher and commands a high price. But this is not all; he gets the richest of milk and a good deal of it. "I tell you, it pays," he said the other day, "to feed well. It requires a certain amount of food to support the animal, and the milk and butter is obtained from the food given *in excess* of this amount. To give only just enough to keep the cow alive is of course absurd, as you would get no return at all for the food. It would all be consumed to keep up the animal heat and the vital functions. Now as the milk is derived from the extra food, the more you can get the cow to eat and digest, the more profitable will she prove."

The Doctor got this argument in favor of high feeding from me. It is one of my pet ideas, but I did not interrupt him. "You know," he continued, "I have a large family." "Of course," I said, "all clergymen have." "Well," he continued, "we not only get all the butter and milk we need from these two cows, but we are still packing down butter every week."

On a farm we cannot, perhaps, adopt the system of keeping farrow cows. But in the cities it has many advantages, not the least of which is that you are sure of milk all the year round. When we lived in the city, we had a cow (a thorough bred Devon) that gave milk winter and summer for five years in succession. She did not give much, but all that we needed, and it was very rich. She finally got so fat that, though still giving milk, I sold her to the butcher. But one thing is true of city and country: it pays to feed cows all the food that they can turn into butter.

I need a Root Cellar, adjoining my basement cattle stable. It is almost impossible to get along without one, and farm to advantage. I am fully convinced that we must raise more succulent food, either cabbage, mangold wurzel, sugar beets, rutabagas, or turnips, for our stock in winter; but this system cannot be adopted without a good cellar to store them in, so arranged that they can be fed out with little labor.

Our hens are on a "strike." They refuse to lay a single egg. They have plenty of food, comfortable quarters, a good range, and have had the best treatment we know how to give them, and yet they persistently refuse to go to work! I have not heard a cackle for two months. The grocers are clamorous for eggs, and offer the highest prices, but all to no purpose. If I could ascertain who are the ring-leaders in the combination, they would soon find themselves in hot water.

A city friend, who keeps a few hens and gets all the eggs he wants, suggests that probably my hens are too fat, and that they do not get flesh meat. He had a self-regulating feeding trough, but gave it up as he thought his hens got too much grain. He now feeds them less grain and gives them sheep's

pluck, which he gets for a trifle from the butchers, and the hens lay every day. He puts the plucks in boiling water to coagulate the blood, and then chops them up fine, and the hens eat them with a relish.

Last spring I cut an underdrain through a wet portion of a field. There is high ground on each side of it. This fall I found the land on each side of the drain perfectly dry for a rod or more, but further up the hill it was quite wet, and this was the case for several weeks *before the drain commenced to discharge any water!* I suppose the reason is this: The earth on each side of the drain, last spring, as the water left it, cracked into innumerable little fissures, and these after the rains came in the fall, absorbed the water like a sponge, to the depth of the drain, say three feet. So the surface was perfectly dry, even though no water run into the drain.—In the spring I shall carry some lateral drains up the sides of the hill, for I am satisfied that the high land, on my farm at least, needs draining more than the valleys. If the side hills were thoroughly underdrained, the low land would need little more than a few main drains.

My friend G. W. takes me to task for asserting that good prices of farm produce stimulate agricultural improvements. "Did you ever," he asks, "know a farmer, other than an amateur, who invested his profits in making improvements on his farm?" Yes I have. Last spring I thought of building a shed on the west side of the barn-yard, with a loft for fodder. I thought it would not only be useful in itself, but would protect the barn yard from our severe west winds. One of my neighbors has one twenty-two feet wide, with an alley in front for feeding cows, which are fastened up with stanchions. It is boarded up on both sides and is therefore not properly a shed. I thought of building merely an open shed, as I have an idea that cattle do better when not so closely confined, provided you have a warm, comfortable yard. I went to see our old friend John Johnston and consulted him on the subject. I told him I thought of building a shed twenty-four feet wide. "Don't you do it," he quickly replied. "Never build a shed less than forty feet wide. It is a great mistake. Narrow sheds are little use. The rain frequently drives in eight or ten feet, and the master-cattle stand on the far side, where it is warm, and keep the rest out in the cold. Many years ago, I built some sheds twenty feet wide, but I did not like them. Three or four years afterwards I happened to have a good wheat-crop and *sold it pretty well*, so I pulled down these sheds and built new ones thirty-two feet wide. If I had to do it again, I would build them forty feet. Mr. Swan built his forty feet and they are splendid."

The good wheat crop and the good prices built the sheds; and these sheds have sheltered some of the best flocks of fat sheep that ever graced the New York market. The sheep made rich manure, and the manure made big crops of wheat, and the sheep and the wheat together have made Mr. Johnston rich—without making any one poorer.

I did not build the shed. My wheat crop "happened" not to be very good, and besides I thought that if it needed to be forty feet wide, I had better build a barn with a good shed under it. This I shall do after my land is drained, and I have had two or three of John Johnston's wheat crops. I am looking forward with much interest to the publication of the best plan of a barn, for which such a liberal prize was offered in the *Agriculturist*. I understand that a great many excellent plans have been sent in, and I hope we shall get not only the Prize plan, but several of the others, and then we can all judge for ourselves which plan is best suited to our particular situation and wants.

But after all, what most of us are interested in is, not what is the best kind of barn to build, but how we can alter, improve or add to the buildings we already have. When I bought this farm, there were but two small barns on it, one for grain, with a cattle cellar underneath, and one venerable but

not very picturesque institution standing on the side of the road, designed for horses. It is very convenient for posting bills of Auction Sales, and there is a pump close by that is liberally patronized. The horse litter is thrown out over a fence into the field and forms a loose, smoking, conical heap of brown matter that is a favorite resort for chickens, and which gives off ammoniacal gases that I hope descend on the Deacon's land near by.

The pig pen was at one corner of the barn-yard, as far remote as possible from the cow stable, and still further from the sheep sheds. Now, you know, pigs eat corn and drink milk, and they extract from these articles a small amount of nitrogen and a good deal of carbon which they convert into pork. The remainder, comprising nearly all the mineral ingredients of the corn and about four-fifths of the nitrogen, with more or less water, is left in a finely comminuted state and affords excellent pabulum for cabbages and onions. Well, this material was thrown out, like the horse litter, into a heap by itself, but it is of a cold and sluggish temperament and does not give off any ammonia for the Deacon's use. It is not lost, however. There is considerable water which finds its way into this particular corner of the barn-yard, and after staying a few days, and loading itself with whatever is soluble, wends its way slowly to the brook, and so on to the Genesee river and Lake Ontario, and comes back to us in the shape of a nice pickerel!

Now the Deacon is an excellent neighbor, and pickerel are quite toothsome, but my land needs ammonia as much as the Deacon's, and it is by no means certain that the pickerel will not fall into other hands than mine.

To prevent this escape of ammonia and the loss of soluble ingredients is of the first importance. It can be accomplished with little trouble. The first requisite is to have all the buildings together. In the grain districts, where straw is abundant, it is to my opinion better to have them arranged on three sides of a barn-yard, rather than to have grain barn, horse and cow stables, pig pens, etc., all in one building. A barn-yard surrounded with buildings and sheds on the West, North, and East, and open only to the South, or if more convenient to the South-East, is a pleasant place to winter young stock, store pigs, etc. The centre should be concave, and round this hollow there should be a road, in front of the buildings, wide enough to drive a wagon. This should be dry and firm. The dirt taken out from the centre can usually be disposed of to advantage in raising this road and leveling any inequalities. It should slope a little from the buildings towards the centre, so that the water can run off readily. This is very important. Nothing is so unpleasant as a wet barn-yard, where you cannot go from one building to another without getting ankle-deep in mud. A man with a plow, a dirt scraper, and a pair of horses, can soon do all that is necessary; of course the side towards the gate, where the manure is drawn out, should have only a gentle slope.

Into this hollow, or as it is called in some sections of England, the "mixer," all the manure should be thrown *and mixed together*. This is the essential point. Pig manure is cold and sluggish, and cow dung does not ferment readily, while horse litter and sheep droppings are very active. But in the case of the latter the treading of the sheep prevents any serious loss from too rapid fermentation; but a loose heap of horse manure will soon lose half its value. Let all be mixed together and there will be no loss of ammonia.

The loss from drainage is much more serious than is generally supposed—far greater than from the escape of ammonia. *The buildings should be all spouted to carry off the water*. Then, if we have wide sheds, and the barn-yard is not too large, the manure will absorb all the liquid and the little rain which falls on the surface. But it is better to have a tank in which any excess of liquid there may be after heavy rains, can be preserved, and pumped back when the heap is dry. This is the simplest, the cheapest, and the best method of saving manure I have ever seen.

THE TURKEYS' HOLIDAYS.

Boxes instead of Pots.

A well-known seedsman said to us some time ago, "If you will tell your readers never to sow seeds in pots, you will do them a great favor, and save us many complaints from customers who fail with their seeds, and charge the failure to the bad quality of the seeds, rather than to their own bad management." We quite agree with our friend, that it requires more care than most people can give to successfully start seeds in common pots in ordinary rooms. Those who have no other "glass" than the kitchen or sitting room window, can get quite a start with plants for the vegetable or flower-garden, if they make proper use of the facilities their windows afford. A common flower pot, unless it be of a large size, dries out very rapidly in the warm air of the dwelling. Its sides expose a great surface, and are constantly absorbing moisture from the ball of earth, to be quickly evaporated, and the young plants are alternately soaked or parched every day. Established and hardy plants can endure these changes, but with delicate seedlings the case is different; their root hairs, so fine that they can only be seen by a microscope, do a good part of the work of absorbing; these are so delicate that they wither with any unusual dryness, and the young plant receives a check if it does not die outright. This difficulty may be overcome by setting the pots in a box and surrounding them by moss, sawdust, or other similar material, but this causes a great waste of room, and it is much better to use the box at once without the intervention of pots, unless in the case of cucumbers, squashes, and other large plants, which it is desirable to turn out without disturbing the roots. We have used boxes a foot square and about 4 inches deep, with satisfaction, though the size may be modified to suit the window. It is necessary that the boards be thick, an inch is none too thick, and well nailed to prevent warping. With plants started in this way as with those in hot beds, success depends upon a judicious management of light air and water. An abundance of light is needed, but care must be taken to shield the tender plants from a burning sun. In most dwellings the windows are not very tight, and this is all the better for the plants, as they get in this way a share of ventilation. In all suitable weather the windows should be opened above, taking care to avoid sudden changes of temperature. Many, never having tried a hot-bed, think they can not afford the time and expense, and to such we commend the use of these window boxes.

Our Experience with Tomatoes.

Tomatoes differ much, not only in earliness and productiveness, but in flavor. Last year we planted side by side four varieties, and when the fruit ripened, it was served raw at breakfast and cooked at dinner daily, as long as the season lasted, taking care that each variety was served by itself. In this way we obtained from repeated trials the judgment of others, made without knowing the name of the variety. The kinds were Early Smooth Red, Fejee, Cook's Favorite, and Valencia Cluster, named in the order of their excellence. The Early Red, the

seed of which came from Thorburn's, was solid, juicy, and of superior flavor, and the earliest of any except Cook's Favorite, which came a few days sooner. Fejee is too well known to require description. Its large solid fruit is rather apt to crack and rot in bad weather. Cook's Favorite is productive and the earliest of the four, solid, but not so fine as Early Red. Valencia Cluster bears well, but, with us, is so sour as not to be worth growing. By proper care in selecting

by twisting its long petioles or leaf stalks. The petals are fringed, and this with the peculiarly graceful bend of the spur of the calyx, gives the flower a striking resemblance to a small bird, a similarity which is helped out by the fine canary yellow color, and the pert way, so to speak, in which the flower is set upon its stems. The plant is an annual, and is grown about as readily as the common Nasturtium. The seeds may be planted in May, where they are to grow, or, if started in the house or in a hot-bed, they readily bear transplanting. A warm, light soil suits it best, as it flowers more abundantly than in rich soils. It climbs to the height of 10 or 12 feet, and may be used wherever other climbers are appropriate. It is well to place it in some spot where the singular form of the flowers can be readily seen. The seeds ripen rather slowly, and as there is usually a great temptation to pick the early blossoms, enough should be left to secure a stock of seeds for another year. The name *Tropaeolum*, comes from the Greek word for *trophy*; the leaves of the common Nasturtium resembling a shield or banner, while its flowers are shaped somewhat like an ancient helmet. The specific name of the present species, *peregrinum*, means foreign or exotic. The seeds are sold by all the dealers, under the incorrect name of *Tropaeolum Canariense*, usually at ten cents per package.

CANARY-BIRD FLOWER.—(*Tropaeolum peregrinum*.)

for seed the specimens combining the most desirable qualities, any one can have much better fruit than if no such precautions are taken.

The Canary-bird Flower.

Tropaeolum peregrinum.

If this old flower could only be raised under glass, and were sold for a high price, it would probably be much better known than it now is. It is a great favorite of ours, and we scarcely ever met with a person who had seen it before, or who did not on first seeing it say "how beautiful!" Indeed, we expect that lovers of flowers, when they see our engraving, will make a similar exclamation, for the artist has caught the expression of the plant with great accuracy, and the engraver has faithfully rendered the drawing. This species is a native of New Grenada, and has been in cultivation for more than a half century. It belongs to the same genus, *Tropaeolum*, as the common Indian Cress or Nasturtium, and like that is a climber, clinging

A French Watering Pot.

While the French horticultural implements are many of them inferior to ours, and some are unnecessarily complicated, they occasionally hit upon a good thing as they have done in the matter of the *arrosoir* or watering-pot. Chancing to see the implement in the hands of a French gardener, we took the measurements from which the engraving was made, though the right proportions are not observed. The height is 14 inches; greatest breadth 12 inches; width across the top 3 inches; diameter of rose 8 inches; diameter of spout upon which the rose is placed 2½ inches; length of brace from the rose to top of the pot, 4 inches. The curve of the handle is shown in the drawing; it is cylindrical, as is the brace, which last serves as a handle also. The

advantages of this over the usual form are the greater ease in carrying, and in holding the pot while watering. A skillful gardener uses two at once, and never sets them down while watering. The pots are held by the brace and filled by dipping in a tub or reservoir, and they are carried in this manner to the place where the watering is to be done. By a dexterous movement he lets go of the brace, at the same time giving the pots a slight twist, and catches them by the handles. The long curved handle allows the point at which the hand is placed to be shifted easily, so as to give the pot a proper inclination, which is done with greater ease than with those of ordinary form.

FRENCH WATERING POT.

The Movements of Plants.

In an article last month (December), we noticed the interesting observations made by Mr. Darwin on the manner in which plants climb. It was stated, in reference to those climbers which twine around a support, that the free upper portion of a limb or shoot, had a spontaneous motion, and kept sweeping in a circle or ellipse in search of some object around which to twine. But plants climb in other ways than by twining their stems around a support, and Mr. Darwin's observations upon these are even more interesting than those already alluded to. As our space will only allow of the briefest reference to the matter, we select a point here and there from his account. Many plants cling by means of their leaf stalks or petioles; these, at a certain stage of their development, are very sensitive, and bend when slightly rubbed or

Fig. 1.—CLIMBING SOLANUM.

subjected to a slight continuous pressure, such as that of a loop of soft thread, weighing only $\frac{1}{10}$ of a grain. The upper parts of the shoots of these plants also revolve, after the manner of twiners; this motion brings the petiole in contact with some object, it is stimulated to bend, and by curving around the object thus touched, the plant is held in place. After the petiole has remained thus clasped for a few days, it loses its ability to unbend, and becomes rigid, and usually much increased in size, and strengthened by becoming more woody. Among the plants in which these phenomena may be observed the following are common: *Clematis*, of different species; *Tropaeolum*, or Nasturtium, of the various climbing species, including the Canary-bird flower, figured on page 17; *Maurandia*; *Solanum jasminoides*, figured last month on page 380. The last named is very slow in its movements, but when the petioles have once clasped, they increase much in size, often becoming as large as the stem from which they spring, and their texture becomes woody to a remarkable degree. Fig. 1, shows a petiole of the *Solanum jasminoides*, after it has clasped a stick, and become woody.

Still more interesting are the observations on those plants which have tendrils—organs used exclusively for climbing. Plants thus provided are found in widely separated natural families, and the phenomena they present vary; in some, the upper portion of the stem revolves together with the tendrils, and in others the tendrils alone revolve, and again there is no revolving motion in either stem or tendril. Tendrils are long thread-like organs, usually branched, with

Fig. 2.—TENDRIL.

their extremities more or less curved to form a hook. The sensitiveness, above spoken of as belonging to climbing leaf stalks, is highly developed in some tendrils, which by a very slight rub soon bend, or even coil themselves into a spiral. After the end of a tendril is brought by the revolving motion in contact with some suitable support, it clasps firmly, and taking two or three turns around it holds fast. Then occurs a most remarkable spiral contraction, the portion of the tendril between the plant and the object to which its extremity is attached, coils itself after the manner of a spiral spring. This has the effect, not only of drawing the plant nearer to the support, but of diminishing the chances of its being torn away by the winds; each tendril being elastic, it enables the plant, as the sailor would say, to "ease up" in a violent gale. It is a curious fact that each tendril which has coiled after the extremity has become fixed, has one part of it twisted in one direction and another part in the opposite direction, as is shown in figure 2.

This arrangement prevents the tendril from being weakened by twisting upon its axis, the twist in one direction being compensated by that in the other.—Our common Virginia Creeper has a peculiar mode of attaching itself which is worthy of notice, as it shows how wonderfully this plant is adapted to climbing up a flat surface. The young tendril of the plant is shown in fig. 3. When it meets with a flat surface, all the branches of the tendril turn toward it and bring their hooked tips laterally in contact with it, the branches at the same time spreading widely apart. In about two days after the tendril has thus arranged itself, little disks or cushions begin to form at the tips, as in fig. 4; these, as they grow, fit closely

Fig. 3.—VIRGINIA CREEPER.

to any minute inequalities of the surface upon which they may be, and it is very probable that they exude a small amount of resinous cement which helps render the attachment more complete. Nor is this the only change that takes place; those branches of the tendril that fail to attach themselves, wither and drop off, while the attached ones acquire great strength and by

contracting spirally become highly elastic and well calculated to hold the great weight that we know they sustain. But we have not room for more examples from this memoir so full of interesting facts. We trust enough have been given to show the admirable arrangements with which some plants are endowed, to enable them to lift themselves to the light and air, and to suggest to our readers some instructive observations which they can repeat for themselves upon our common climbing plants. Of those which twine, the Morning Glory, Bean, and Hop are common; the present article enumerates some of the leaf climbers, while the squash family, grape, etc., give common examples of tendrils.

Vines, Roses etc., in Pots, versus "Broad Borders."

A discussion has arisen among cultivators as to the best method of growing vines. While some claim that the best plants are produced by pot culture, others discard pots altogether, and let the roots have abundant room. In August of last year we set forth the advantages claimed by those who adopt the border system, and we now allow the other side to be presented by one who signs himself "A Nurseryman."

Fig. 4.—VIRGINIA CREEPER.

We may remark that the article is from an experienced cultivator, and one who is not especially devoted to grape growing.

"I am and ever have been an advocate of pot culture, not only for vines but for all plants that can be conveniently grown in pots, to ensure exactly what the advocates of the 'broad borders' deery, a cramped condition of the roots, or, to put it more fairly, a *confined* condition of the roots, and it is this condition that I claim as advantageous over vines grown in frames or in the borders of green-houses, where they are huddled together, unstaked, three or four inches apart. I care not with what care they may be lifted, mutilation of the fibres to a great extent must take place, and the growth after planting must in consequence be diminished, while in the pot grown vine you have well ripened *wood* and *roots*, and every fibre intact. Let any one try a corresponding number of each, of one year old plants of Delaware for example, grown by the rival modes and assuredly he will give the 'broad border' plants a wide berth in the future.

"What would we think of any intelligent gardener planting a graperly from vines grown in broad borders? The practice of a century has demonstrated beyond a cavil, that vines grown from eyes, (if not planted out to remain, the season they are rooted,) do infinitely better to be grown in pots, than to be planted out in 'broad' or in any other border.

"Now what is true of grape vines is much more true of roses, for the vine having better recuperative powers, can stand mutilation of the root better than the rose. It is no exaggeration to say that 50 per cent of all roses that are sold, dug from the open ground, die the first season they are planted; that is if they are one year old plants on their own roots; older plants, or budded plants may do better, but in no case will they compare with plants grown in pots, even though such plants are not half the size. In conversation with a western nursery agent the other day, he admitted that no article that he sold, gave him so much trouble as the rose, not a case that he had heard from but the result had been unsatisfactory. In one instance only 15 out of 100 lived, and these were in such a condition that they would not winter over. In roses planted from pots, not one in a thousand need be lost, and a healthy growth and abundant bloom will always be insured.

"But to return to the grape vines, some of the great moguls of the trade have given their fiat, that for reasons given they have entirely discarded pot culture, and now grow exclusively on 'broad borders'. At once a host of small fry, parrot-like, take up the cry and tell us that they too have discarded pot culture and now grow only in 'broad borders.' Now may we ask if there is not some other reason for this very confident and radical assertion? is there not 'a hog in the fence' somewhere to occasion all this liberality and benevolence to the dear public? Of course, the question of cost in the rival modes is unthought of. In case it may be, it might be well to state that a vine raised in the 'broad borders' unstaked and otherwise uncared for, can be grown at a handsome profit at \$10 per 100; while a properly grown vine, in a six or eight inch pot, that has been duly pinched, staked, and shifted, will not very quickly make the fortune of the grower at \$50 per 100. It would be interesting to know if these facts have had anything to do with inducing this rapid and radical change of system with some cultivators.

I am afraid these horticultural products of the 'broad borders' have even more merit than the Yorkshire man's razors, for they are at once made both to 'sell' and to 'shave.'

Winter Greens—The Club-Mosses.

There are many things common enough in the country, for which the city pays a sum that in the yearly aggregate is quite large. During the Christmas holidays New-York City has doubtless paid thousands of dollars for green leaves and bright berries for holiday decoration. For several days preceding Christmas, in the streets around Washington market, it seems as if the principal business were the buying and selling of Evergreens. The Jersey people who live near where the Holly, Inkberry, Laurel, and

other such shrubs grow, reap a rich harvest at such times. Not only are these shrubs brought to market in sloop loads, but great quantities of humbler plants, such as the Pipsissewa, and the Club-mosses, are made up in wreaths and bunches to meet the demand. Of all these greens, none are more delicate in structure, or more vivid and lasting in color than the Club-mosses. Our engraving represents one of the prettiest of these, the *Lycopodium dendroideum*, the Tree-like Club-moss. It is also called Ground-Pine, a name likewise applied sometimes to some of the Horse-tails, (see August No., 1865.) The species under consideration arises from an underground creeping stem, to the height of 6 to 10 inches. The branches are disposed in a graceful fan-like manner and are thickly clothed with minute leaves. At the top of the stem are borne the fertile spikes, which are made up

LYCOPodium DENDROIDEUM.

of scales regularly overlapping one another. These scales stand for flowers, the plant belonging to the series of flowerless ones. In a little sac on the underside of these scales, are contained the spores, or bodies which reproduce the plant and answer the purpose of seeds. An enlarged scale, showing its underside, is given in the lower left hand corner of the engraving. The spores are produced very abundantly, and when collected, form a powder which has a pale yellowish color, and a very smooth feel when rubbed between the fingers. The spores of several of the species are known in commerce as Lycopodium. It is used by druggists to envelope pills to keep them from sticking together, and is also used in theatres to imitate lightning. When the spores are diffused through the air as a cloud of dust they burn with a sudden flash. This species presents considerable variety; the one

figured has the leaves lying close to the branches, while others have them more erect. This one is much valued by the florists to use in making up bouquets, and is brought to New-York City from various parts, some as far as from Lake George. This wildling of our woods is needed to make the exotics of our green-houses more beautiful. Another species of Lycopodium, *L. complanatum*, is much used in making wreaths. It has very long and strong stems, with numerous fan-like branches, which are shorter and coarser than *L. dendroideum*.

Select Chrysanthemums in Flower.

These come in flower so late, present so great a variety of color, and are withal so showy, that they fill a place for which we have no other flowers. They are not nearly as common as they should be, as nothing is easier to raise; clumps of them along the borders or massed in beds of well arranged colors, give the garden a gay appearance even after hard frosts, and there is a richness about them that well accords with the season of ripened fruits and Indian summer suns. Then, for in-door decoration they are most valuable, as they continue in bloom for a long time. While they are yet in bloom, is the right time, to make a selection of varieties for next year. We have two classes, the large flowered, and the dwarf or "Pomponé" varieties, each of which presents us colors from pure white, yellow and rose to deep maroon, with all intermediate shades. The large flowering kinds are better out of doors, while the others are more adapted to pot-culture. When grown in the border, the plants are apt to get too dense, and it is best to let only as many stems remain as can grow without overcrowding. The plant may be grown from cuttings, taken early in August, or from the great numbers of shoots which an old root throws up in spring. Finely shaped specimens may be made for potting, by giving proper care to those in the border, or they may be grown in pots altogether. A good specimen has but a single stem, which is well furnished with short branches; this is produced by pinching out the ends of the shoots to induce the lateral buds to push. In a rich, light soil, the plants will grow with great vigor and be well set with buds by the time frost comes, when those for in-door bloom may be potted. They will wilt at first, but will recover with a few days' shading, and when well established, an occasional watering with liquid manure will increase the strength and beauty of the bloom. When flowering is over, the pots may be set in a dry cellar or shed until spring, when the plants may be started into growth to furnish a new stock.

The thumb and finger lightly rubbed over the foliage of thick-leaved plants, will do much toward destroying the red spider and other insects,

Fig. 1.—AZALEA VISCOSA.

Fig. 2.—EXCRESCENCES ON AZALEA.

Our Native Azaleas.

Many years ago we saw upon the catalogue of a dealer in medicinal herbs the question, more pertinent than elegant in its expression:

“Why send to Europe's distant shores
For plants that grow at our own doors?”

The same question might be asked with reference to ornamental as well as medicinal plants. That we do import largely each year of the very plants that grow abundantly with us in the wild state, is a fact well known to any one who visits the nurseries. It is quite difficult to find anything like a general assortment of American shrubs in our nurseries, and the majority of those they do have are from European nurseries. The reason for this is to be found in the fact that there is not a sufficient demand for these things to induce our nurserymen to raise their own stock of them, and it is cheaper to import the few that may be called for than to be at the trouble of propagating them. Though many of these shrubs may be procured from their wild localities, they, as a general thing, are inferior to nursery raised seedlings, which, having been several times transplanted, are furnished with much better roots. We have endeavored to increase the taste for native plants by making them better known, and giving such engravings as will enable them to be recognized. While we gladly welcome the horticultural productions of every country, we would not have those of our own overlooked, especially when, as is often the case, the native plants are equal in merit to those brought from afar.

What can be more beautiful than our native Azaleas? The Europeans have long prized them, and by seedlings and crossings have sent us back a long catalogue of named varieties, which are among the choicest flowering shrubs.

Of the Azaleas, often improperly called Honeysuckles, we have four native species in the Northern and Middle States. In two of them the flowers appear before the leaves and cover the bushes with a robe of beauty: *Azalea nudiflora*, the Pinxter-flower, has flowers varying from flesh color to purple, and is found from New England to Virginia, while *A. calendulacea*, the Flame-colored Azalea, has orange-colored blossoms which change to flame color, and is found in the mountains of Pennsylvania and southward. In the other two species the flowers appear after the leaves develop: *A. arborescens*, the Smooth Azalea, is found in the mountains of Pennsylvania and Virginia, and has fragrant rose-colored flowers. *A. viscosa*, the Clammy Azalea—more commonly known as Swamp Pink, and White Swamp-Honeysuckle—grows from Maine southward, but is more abundant near the coast. The last named is the one we have figured, as it is the commonest, and if not the showiest, its generally pure white flowers, delicious fragrance, and rich green foliage, render it one of the most desirable. It grows in the borders of damp woods and in swamps, and frequently reaches the height of eight or ten feet. The leaves are dark and shining, with brown bristly hairs on their margins. The engraving shows the flowers of their natural size, though the clusters are often larger than the one here presented; they appear in June and July, are usually of the purest white, though sometimes tinged with pink. The exterior of the flowers is thickly covered with small glandular hairs, which secrete a viscid substance; hence the specific name *viscosa*. This species (as do the others,) shows a great tendency to sport in its wild state, as well as in cultivation, and the native specimens vary much in the color of foliage, and in size and color of the flowers. Some of

the flowers are of the most perfect dead white, others have a scarlet tint with a white border, while in others the border is more or less flesh-colored or tinged with rose. By hybridizing this species with the European *A. pontica*, great numbers of varieties have been obtained, and are known in the gardens as Belgian Azaleas, etc. Plants if removed from their native habitats with care, will do well in cultivation, if not put in too dry a spot, or one too much exposed to the sun. They should have a soil containing plenty of leaf mold or muck. It often happens that the flowers of this species are transformed into fleshy, irregularly shaped bodies, sometimes as large as a pullet's egg. This substance is of a light green color, covered with a bloom, slightly acidulous, and relished by some who eat it, thinking it the fruit of the shrub, and call it “May Apple,” and “Swamp Cheese.” The true fruit is a small dry capsule, while these things, if carefully examined, will often show more or less traces of the shape of the flower, and are evidently an abnormal growth. It is probable, though we believe not exactly made out, that this change is produced by the agency of insects. This growth is not produced upon the flower alone, but the leaves sometimes bear it. Last summer, Mr. A. W. Roberts brought us some very interesting specimens from a locality in which the bushes were loaded with them. The excrescences were generally of a very regular, bluntly conical shape when small, but the older ones became irregular, with, however, a graceful outline. Figure 2, shows a branch with the leaves, having these bodies of the natural size, in different stages of development. Similar excrescences are sometimes found on the Huckleberry. All these need a careful study by some competent observer, to determine their character.

The Sponge Cucumber.

Cucumis acutangulus.

Some years ago a friend sent us from Central America, a substance called "vegetable sponge," which he stated was in common use in that country for washing and scrubbing purposes. It was a mass of interlaced fibres, nearly a foot long, not quite cylindrical, but somewhat angular and tapering, presenting much the appearance of fig. 1. It was recognized as the remains of some Cucurbitaceous fruit, but it was some time before we found that it belonged to the same genus as the cucumber. Of late, the plant has been cultivated by those curious in such matters, and through the kindness of Messrs. Henderson & Fleming, we are enabled to give a drawing of the fruit in its fresh state, fig. 2. The plant is a native of the East Indies, and bears heart shaped leaves and yellow blossoms. The fruit, when young, is eaten in the same manner as cucumbers, and is

Fig. 1. Fig. 2.

also cooked, mashed and dressed like summer squash. The fruit, when ripe, becomes orange colored, with a hard skin, and within is filled with a complex mass of strong elastic fibres. The seeds are black and rough, and quite unlike the cucumber seed in size and shape. The fruit requires a long season to perfect, and the seeds had best be started under glass, after which they may be grown in the open ground. They will probably be advertised by some seed dealer.

Flowers for a Grave.

The question is sometimes asked us, "What flowers are suitable to plant around a grave?" The feeling which leads to the decoration of the last resting place of the loved dead is a natural one, and one which is in accordance not only with good taste, but with the teachings of religion. It has found its public expression in many beautiful cemeteries all over the land, where the art of the sculptor has combined with that of the landscape gardener to beautify the city of the dead, and make its walks attractive to the living. While the general arrangement of rural cemeteries is usually marked by skill and taste, their effect is frequently marred by incongruities in the individual lots, the owners of which often show more zeal than discretion in their embellishment. One of the worst things to put about a grave is an elaborate iron fence, which looks like an ironmonger's advertisement. If the boundary must be marked, let it be done by a low hedge, but we much prefer to see no boundary. In a well ordered cemetery, the planting of trees should only be done under the advice of the superintendent, as these become so large that they soon contribute to the general effect and are as likely to be out of, as in the

proper place. But in these general considerations we are led away from the subject of flowers. In the first place we would avoid all gaudy colors, and in the second place, select those which need but little care. This last may seem an unnecessary caution to the recently bereaved; but we are so constituted that we can not always mourn, and we have seen many instances in which, for good reasons doubtless, these floral decorations fell into a neglect which showed that they were not well chosen. A good green foliage, with white flowers, is the combination most appropriate to a funeral wreath, and is that which we prefer in floral decorations for the grave, though colored flowers are admissible, provided they be of delicate tints. *Deutzia gracilis*, a low shrub, covered in spring with delicate white flowers, will be suitable where climate is no more severe than around New York. *Daphne encorum*, a low evergreen, with pink fragrant flowers and hardy. The Black Hellebore, or Christmas-rose, with large white flowers, blooming in Nov. or March, though not very common, is well suited to the purpose, as is the perennial Candytuft—*Iberis sempervirens*, hardy and blooming freely, full of trusses of white flowers. Among the most appropriate flowers for the cemetery are the bulbs, such as do not need lifting each year. These spring up and flower, complete their growth, and die down, and repeat this year after year, fit "emblems of our own great resurrection." White and bright colored Crocuses, and the Snowflake, are desirable, and bloom in early spring, while the Meadow Saffron—*Colchicum autumnale*, flowers in autumn, with lilac colored bloom. Among the annuals, Sweet Alyssum is one of the best, and it is self-sowing. All these will answer with only occasional attention, but where constant care can be given, a great variety of bedding plants and annuals may be used, avoiding bright yellows, scarlets, and all glaring colors.

THE HOUSEHOLD.

The Ornamentation of Tables and Dishes.

Few are aware how thoroughly the eye and palate are in sympathy, and in how great a measure the appetite is modified by the appearance of our food. The confectioners are aware of this fact, and present their wares in tempting colors, and most of us can recollect seeing an otherwise good meal spoiled by being thrown upon the dishes and set upon a soiled table-cloth. All will admit that neatness and order are essential in the arrangements of a table; these are within the reach of even the poorest. Beyond these there is decoration, ornamentation of our tables for the sole purpose of pleasing the eye, and this is sometimes carried to a great extent. We were once several days a guest at a house where the ornamentation was painfully elaborate, where each day the butter was carved (not stamped) in some new form, and a pie was a work of art which it seemed a pity to destroy. Here the thing was overdone and oppressive, and our readers can make better use of their time than to devote it to anything elaborate. Still, we believe that those of moderate means and in the humbler spheres may with propriety give more attention to the appearance of their tables and the looks of the food upon them, the first great requisite of neatness being complied with. There is no table in the land, from the richest to the poorest, but what would be more attractive for a bunch of flowers. These are decorations that are always in place, and may be set in vases of silver or crystal on the board of the millionaire, or occupy a cracked tumbler by the side of Pat's pork and potatoes. Besides flowers, green upon the table is always pleasing. In the spring

half of the relish of cresses and salads is due to their fresh look, and the fact that they remind us that winter has gone and the season of growth has come. Every garden should have its patch of curled parsley, which will be found useful in ornamenting many dishes, its fine rich green giving an attractive appearance. Just notice the difference in the appearance of a supper table, where in one case the ragged remains of the roast or boiled of a previous dinner are set on, and where the same meat is nicely sliced and regularly laid upon a dish and surrounded by a green border of parsley. This kind of ornamentation is unpretending and always in good taste. A dish of spinach may be made to look really beautiful by having the surface nicely smoothed and then surrounded by a border of slices of hard boiled eggs. Those who wish to attempt something elaborate, can use carrots and beets, these are readily cut into stars, crescents, scrolls, etc., by bending up a strip of sheet tin into the desired shape and using it as a cutter. With these materials a very showy border may be placed around a platter. Of course the extent to which dishes may with good taste be ornamented, will depend upon the occasion and the surroundings. It should never be overdone.

Dangerous Silvering Powders and Liquids, and Tooth Powders.

We cannot too frequently caution the public against certain articles that are daily sold on many street corners in this city and elsewhere, and which are peddled through the country, and even sold by some respectable dealers, unwittingly of course. They have been before exposed in the *American Agriculturist*, and the sale was almost suspended for a time, but is becoming quiet brisk again, judging from what we see and hear. One of these is a "Silvering Powder," often a reddish clay, which rubbed upon a copper cent, or other copper or brass surface, or on some other metals, leaves a beautiful silvery coating. It is simply clay or other substance impregnated with mercury (quick-silver), which gives a temporary bright coating, but will soon tarnish, and what is worse, it will sadly injure the metal upon which it is placed. Mercury dissolves silver and gold and some other metals as readily (not quite as quickly) as water dissolves sugar. So that every application of these powders is spoiling the metals upon which they are placed. Another preparation, equally objectionable, is a "Silvering Fluid." We daily see peddlers with a crowd around them, exhibiting and selling a pinkish material for cleaning and whitening the teeth. An examination of one of these packages showed it to be quite strongly acid. When applied to the teeth it of course cleans them beautifully, by dissolving a little of the outer coating, but every application is eating away the teeth themselves, and thus hastening their early decay.

To Housekeepers.—A Request.

The design of this department of the *Agriculturist* is, to furnish hints and information that will aid our readers in their toilsome work, that will help to adorn their houses, and make them more comfortable and inviting, and also to supply information about various methods, processes, and materials, that will furnish food for thought, and occupy the mind while at work. We often describe and illustrate some common article of food, as Tapioca, Nutmegs, etc. This will be continued from time to time. Household implements also require attention. As a help to this department we will be very glad to receive more letters from our housekeeping readers. Please let us have questions, inquiries, suggestions as to what is wanted or desirable. Information on all departments of housekeeping is solicited. Almost every one has some peculiar mode of cooking, of doing housework, etc., which is not fully known by others. Let us have the particulars. If our readers help us by these ques-

tions and suggestions, we shall be the better able to provide a first-rate Housekeeper's Department.

Minced Beef—An Excellent Preparation.

The following method produces a very convenient, nutritious, and digestible preparation of meat, good for any meal, and especially for the supper table, when any kind of meat is desired at that meal. We published somewhat similar directions for preparing "minced veal" in a former volume of the *Agriculturist* (1860), but later experience, with a little change in the ingredients, shows the method still better for beef: Take say 3½ lbs. of lean beef, without tendons—the crossrib piece is very good for this, but any lean part will do. Before cooking, chop it very fine—a Halc's meat cutter will do it quickly. Mix with it 6 soda crackers, rolled fine; 3 well beaten eggs; 1½ tablespoonfuls of salt; a teaspoonful or less of ground pepper; 1 small nutmeg grated; 4 tablespoonfuls of cream (or milk); and if the meat is free from fat, add butter the size of an egg or so. Mix all thoroughly; make into a loaf, and bake well in a dripping pan 1½ to 2 hours, basting as with other roast meats. It will keep for a week or two at least.

Chapped Hands are annoying always. They may in a great measure be prevented by using very little soap, if any, keeping it on as briefly as possible, washing it off clean, and then finishing the washing with water to which a little vinegar is added—a teaspoonful to a pint of clear water will answer. This neutralizes any alkali of the soap left on the skin, and gives a soft feel, while it stops the destruction of the cuticle, and saves chapping. The dilute vinegar is also good as a final washing after shaving the face, as it both saves the skin and prevents the alkali from bleaching the whiskers.—A little tallow or even lard, thinly applied at night, or when going out into the cold air, to the hands and face, if chapping, and well rubbed off if necessary, goes far toward preventing further chapping, and promotes the healing of cracks already formed.

Delicate Rice Pudding.—One cup of rice cleaned, washed, put into 1 quart milk, set in a kettle of boiling water. Keep the water boiling until the rice is soft, then add the yolks of 3 eggs, putting a very little cold milk to them, that they may not change at once, and a little salt. Bake about one hour in pretty hot oven. Just before taking up, allowing just time to fit it for the table, beat the whites of the 3 eggs to a foam, and add 1 cup sugar; flavor if you wish: when all beaten together, pour over the pudding, which should be baked in a shoal dish, as this is the sauce to be eaten with it. Put in a brisk oven about five minutes, or until this foam begins to brown. There is so much difference in the length of time required in different ovens it is impossible to give exact time for the finishing.

Good Corn Bread, and Pudding.—The same money will purchase two or three times as much nourishment in corn meal, as it will buy in wheat flour, and it is a matter of economy to use as much of the former as can be made palatable. Of the hundreds of Corn Bread recipes we have published in the *American Agriculturist* none we have tried, have given as continued satisfaction as the following: 1 quart of sweet milk; 1 teaspoonful of cooking soda; 1 teacupful of molasses; 2 teacupfuls of salt; 4 teacupfuls of fine corn meal, and 3 to 4 teacupfuls of wheat flour. Mix all well together, and bake slowly for an hour or more. It keeps moist for several days and is relished by most persons. The proportion of flour and meal may be varied to suit the liking.—The above preparation, cooked in a steamer, makes a good pudding, to be eaten with cream or milk and sugar, or butter alone.

Pumpkin Pancakes.—Two cups milk; two cups stewed pumpkin or squash; half a teacupful saleratus; two eggs. Beat the whites to a froth—add flour enough to make a thin batter. This is called very nice by those who have tried it.

BOYS & GIRLS' COLUMNS.

The Game of Checkers or Draughts.

This interesting and scientific game is almost universally played, but few understand the science of it. It is a game entirely of skill, memory, and attention, and therefore not unworthy a place in our columns. We propose to give in successive numbers rules and instructions for playing, accompanied by a game to be played over, and a position for players to study out.

INSTRUCTIONS FOR PLAYING THE GAME.

The game of checkers is played by two persons, on a board of 64 squares, colored alternately, and with two sets of 12 men each, of dark and light colors. Each player in turn moves one of his men, (the black men always move first, each player having the black men every other game,) to the right or left, along the diagonal, on which it stands, and the men can only move forward one square at a time, until they reach the extreme line of the board, when they become kings, and being crowned, can then move either forward or backward to the end of the game, as may be desired by the players.

The object of each player is, to confine the pieces of the other in situations where they cannot be played, or,

THE BOARD NUMBERED.

Black.

White.

Keep this for future reference.

both to capture and fix so that there may be none that can be played, and the person, whose side is brought to this state, loses the game. In the February number we will commence to give the laws of the game.—Beginners in the game, who desire to see the rules more fully, will find works of instruction advertised on another page.

The diagram above, represents the board numbered. This is for convenience of reference, in telling how a game is played, or in solving a problem. The following game can be readily played, by carefully observing the numbers. Fig. 2 shows a position which may often occur toward the close of a game. Next month we shall show how white may win. The illustration of the numbered board should be preserved for future reference.

POSITION NO. 1.

Black.

White.

White to play and win.

GAME NO. 1.—SINGLE CORNER OPENING. (*)			
Black.	White.	Black.	White.
1—11 to 15	22 to 18	11—5 to 14	22 to 18
2—15 " 22	25 " 18	12—13 " 17	18 " 9
3—8 " 11	29 " 25	12—6 " 13	21 " 14

(*) Is so called, because each player in beginning plays from one single corner toward the other.
 (a) A move not generally made by beginners.
 (b) The move that causes the loss of the game.

New Puzzles to be Answered.

No. 183.

No. 183. *Illustrated Rebus.*—A very common proverb.
 No. 181. *Mathematical Problem.* Contributed to the *American Agriculturist*, by C. F. Erhard, of Kings Co., N. Y. A dancing master had some young men, boys and girls for pupils. On arriving for their lesson the following exercises were gone through: 1st EXERCISE.—1. Each young man made a bow to each girl. 2. Each young man made a bow to every other young man, and to the master. 3. Each girl made a bow to every other girl, and to the master. 217 bows were thus made. 2nd EXERCISE.—1. Each boy made a bow to each young man. 2. Each boy made a bow to every other boy, and to the dancing master. 3. Each young man made a bow to every other young man, and to the dancing master. Result, 244 bows. 3d EXERCISE.—1. Each boy made a bow to each girl. 2. Each boy made a bow to every other boy, and to the dancing master. 3. Each girl made a bow to every other girl, and to the master. This amounted to 271 bows. How many Young Men, Boys and Girls?

No. 185.

No. 185. *Illustrated Rebus.*—An excellent motto for all.
 No. 186. *Charade.*—I am composed of 13 letters. My 6, 1, 4, 11, require fire to make them successful. My 11, 6, 12, 4, 3, 11, are useful for blood-letting. My 2, 12, 11, 5, is an ornament to the face, also a useful sentinel. My 1, 4, 11, 12, 2, is a capital crime. My 9, 8, 10, 15, 11, are abundant on Christmas and New Year's. My 6, 12, 4, 3, 11, are in almost every body's mouth. My 7, 12, 10, 5, is relished by most people, is often swallowed, but never eaten. My whole is the name of a very distinguished general.
 No. 187. *Charade.*—I am composed of 12 letters. My 7, 8, 9, 6, 1, 4, 5, 1, is a Christian virtue. My 7, 11, 1, 9, uses his feet in writing. My 2, 6, 4, 1, is what many would like, and what all possess. My 12, 11, 9, 6, 5, 1, is in nearly all newspapers. My 2, 8, 10, 4, 9, 11, 7, is part of a vessel. My 12, 3, 9, 6, 11, 12, is made up by every man, but owned by none. My whole was an effective weapon used in the late war.

Answers to Problems and Puzzles.

The following are the answers to the Puzzles in the December number page 353. No. 181, *Illustrated Rebus.*—2 No one's / fan doll one's are comma'd note sail / der born 2 rule the end and. Or, To know one's self and all one's acts command, denotes a leader born to rule the land... No. 182, *Illustrated Rebus.*—B e z in ever man ner sand mile din words, butts trick tin morals: Or, Be easy in your manners and mild in words, but strict in morals... The following have sent correct answers up to November 6th: Emma Waterman, 178; "Three of us," Maria and Lurana, A. T., Mary F. Judson and Belle Curtis, Addison Miller, Sarah F. Brigham (nearly), "The Yankee Family Nevins," J. M. North and sisters, 179; Wm. W. Fuller, 178; George Ross, E. Jennie Peck, 179; George N. Wilson, 175; Louis and Mary, O. H. Leavitt, J. B. Smith, T. H. Smith, A. L. Smith, F. E. Smith, Jas. Dixon, Emeline Baldwin, Jennie Fletcher, O. Harmon, Edwin Andrews, M. S. and M. Rice, 179; Wm. C. Johnson, 175; E. B. Haskell; A constant reader, W. J. Chamberlin, C. L. Spooner, Emily H. Abbott, 179; Wm. D. Reed, 175; Niobe Robinson and Rowland Robinson, Rebecca Shaw, M. F. and C. Benner, Lizzie A. White, Midford, Wm. H. Paine, 179; Benjamin Heritage, 175; Emilve, Henry Bunn, Alice Bunn and Adda Bunn, M. and M. Troth, Mrs. M. J. Allen, Freddie D. Upton, Mrs. C. B. Carpenter, S. C. Smith, J. E. Smith, Sarah H. Mead, Addie A. Smith, Frank S. Mead, E. Linnie Lockwood, Samuel Dauchy, L. Dauchy, Edith V. Smith, Julia M. Lockwood, Sarah Studwell, Mary J. Studwell, 179; Thomas E. Lockie, James Dickson, 175; J. Marsh, 181; Garret Brodhead, Jr., 181; W. H. Hughes, Jr., 179; George A. G., 179; E. Hart, 181.

\$50 in Prizes for the Ingenious.

The editor of the *Puzzle Department* believes some of the readers of the *Agriculturist* capable of solving every fair puzzle or problem, as none have yet been propounded to them, which they have not finally answered. Among so many ingenious minds there are undoubtedly many capable of constructing interesting puzzles. To draw out this talent and make it available for our readers, we offer the following

CASH PRIZES:

1. For the best *Mechanical Puzzle*, TWENTY DOLLARS. The wire puzzle, Vol. XXIV, page 253, and the string puzzle, Vol. XVIII, page 58, will give an idea of what is wanted. Let us see if an American Puzzle can not be invented which shall equal the celebrated Chinese Puzzle of wires and rings.
2. For the best *Arithmetical Problem*, TEN DOLLARS.
3. For the best *Hieroglyphical Rebus*, TEN DOLLARS.
4. For the best *Riddle or Enigma*, FIVE DOLLARS.
5. For the best *Conundrum*, FIVE DOLLARS.

N. B.—In all cases the name of the author and the answer must accompany each puzzle or problem. All contributions must be received before March 1st; and the sooner the better. A competent committee will decide on the merits of the contributions, and the winners of the prizes will be announced as soon as practicable. No prize will be awarded, unless in the judgment of the committee the best contributions are worthy of publication. The proprietors of the *Agriculturist* are to have the sole right to publish any or all of the matter contributed. Now then, let us have some productions that would have astonished even the ancient Sphinx.

Our Holiday Picture.—(See page 26.)

Let us read and enjoy this beautiful picture together. First there is old Santa Claus, seated on his throne, the ruling spirit of the holidays. He visits most houses on Christmas eve, but we have sometimes known him to wait until New-Year's—perhaps because he could not get around in time, for, you know, he has a world of work to do. How he gets through with it all, we can not tell, but "when there's a will, there's a way," and you can see from his jolly face in the picture, that he has the will to make all the children happy. How delighted are those two little chicks in the corner, who have started up at the first peep of daylight, and are rejoicing at the overflow of good things from Santa Claus' store, right into their bed-room. No yawning, and turning over, and rubbing of eyes this morning, but they'll be out of bed with a spring and a shout. Who's that haggard, care-stricken figure on the left? He looks as though he had seen much trouble. And indeed he has. It is the Old Year, 1865. The small pictures in the corners near him show some of the sights he witnessed. Many a family had to fly from their burning home, pursued by a foe as pitiless as the raging flame. Many a noble heart was stilled forever by the hot strife that treason had provoked, and thousands more languished in hospitals, suffering from wounds aimed at freedom. But that is all past now, and we gladly turn to the other side of the picture, where the bright New Year comes with gladness in his face, to make the world happy. In New-York, and in most large cities in this country, New-Year's Day is celebrated by gentlemen calling upon their friends, as the artist has represented. It is a pleasant custom, and would be still more so, if all would agree to have no intoxicating drink upon their refreshment tables. We can't make a hundred thousand and more calls upon our readers, so we send this our card, wishing them all a HAPPY NEW YEAR, and so far as possible, we shall help to make every home in the land as pleasant as that in the corner of the picture.

The Pear Tree and the Grape Vine.

A young pear tree and a grape vine were planted beside a wall in a garden. Being in an out-of-the-way place, they were left to grow pretty much as they pleased, and according to its nature the grape vine sent out its branches in every direction, and with its finger-like tendrils grasped every object within its reach. Thus it soon looked wild and straggling, and perhaps merited the reproach which the pear tree cast upon it one day. "See," said the tree, "How I am rising into the sunshine, while you grovel on the ground among coarse low-bred weeds." And the vine could hardly help admiring the tall slender shoots, straight as an arrow, growing so vigorously upon the tree; but it quickly replied, "I am not too proud to associate with my neighbors." The tree felt the implied rebuke, and said nothing more at that time. In the fall when frost came, the tree being more exposed, first felt its biting effects; its leaves quickly withered and fell, while the grape vine being more sheltered, yet remained green. Then it taunted the pear tree, "Lowly comfort is better than miserable pride," it said—but its triumph was short, for soon it too was despoiled of beauty. Winter came and the vine, protected by the wall, suffered lit-

tle from cold, but the tender shoots of the tree were severely nipped. One day, however, a terrible storm prostrated part of the garden wall, and the grape vine was fearfully mangled by the falling rubbish. In spring both tree and vine felt humbled, and as they put forth their leaves they gladly greeted each other, and remained firm friends the whole season, so that a new shoot from the vine twined among the branches of the tree, and when autumn came, there hung a rich cluster of grapes beside a beautiful golden pear. One day the gardener noticed this, and calling his son, pointed out to him how the partial freezing of the shoots of the pear and the injury done by the wall to the vine had so pruned their excessive growth, that both had now for the first time borne fruit. Then as he worked with his pruning knife to bring them both to better shape and greater fruitfulness he said, "See how seeming misfortune may prove a real blessing." I was just thinking also replied the boy, how misfortunes will make friendships, for see how the new shoots that bore the fruit both came from the parts that had been most injured; and if some of our thoughtful boys and girls had been there, they would probably have said, that suffering may also teach forbearance and charity, and perhaps they would have thought of other good lessons which this short history conveys.

A Little Boy Moves a Great Ship.

We have somewhere read that at an English dockyard, a great ship was to be launched; an immense multitude assembled to see it glide down the slides that were to carry it into the water. The blocks and wedges were knocked away, but the massive hull did not stir, and there was much disappointment. Just then a little boy ran forward and began to push the ship with all his might. The crowd broke out into a laugh of ridicule, but it so happened that the vessel was almost ready to move, the few pounds pushed by the lad were only needed to start it, and away it went into the water. This teaches an important lesson to every boy and girl. You often think that the little you can do, is of no account. You don't know that. A little word, a kind act, however small, may be, and often is, the turning period in one's own history, and often of great importance in its influence upon others'. A good deed, or the resistance of a temptation, may start up good thoughts in the mind of a playmate, which may suggest other thoughts and deeds. The train of thought in one's mind, is like a train of cars. The little frog or tongue on the track, no larger than your finger at its point, may direct the locomotive upon the right track, or if wrongly placed, it may turn the engine aside and hurl it down a steep bank to fearful destruction. So the smallest word or deed may start the mind on a right or wrong track. Dear young, friends, your little words, little thoughts and little deeds are important. Strive earnestly to be right, noble, generous, at all times, in secret and in public. When in the future we come to see the great map of human actions and influences spread out, it will then be found that you are daily and hourly exerting an influence that is telling upon the character of your brothers, sisters, playmates, upon your parents, upon all you come in contact with. Give a good push at the ship, do a good deed, no matter how trifling, whenever and wherever you can, and trust to God for the result.

An Impromptu Invention.

After Arkwright had invented the spinning jenny, he was much annoyed by the fibres of cotton sticking to the rollers, preventing their running smoothly. Mr. Strutt, inventor of the stocking frame, who was one of the first to properly appreciate the spinning frame, noticed this defect, and Arkwright confessed that he had tried in vain to remedy it. "I think I can cure it," said Mr. Strutt, "but it must be on condition of sharing the profits." Arkwright at once agreed to the terms, and Strutt immediately took a piece of chalk from his pocket, rubbed the roller thoroughly, and asked his companion to try the effect. The success was complete; the clinging of the cotton fibre was instantly at an end. The simple remedy had attained its object, the reward was earned, and thus Strutt became the partner of Arkwright.

Origin of Cast Iron Manufactures.

It is related that about the year 1700, one Abraham Darby, the proprietor of a brass foundry at Bristol, England, experimented in trying to substitute cast iron for brass, but without success until the following incident occurred: A Welsh shepherd boy named John Thomas, rescued a flock of his master's sheep from a snow drift, and later in the same spring, during heavy rain and the melting of the snow, he swam a river to drive home a herd of mountain cattle. Having collected them, on his return he found the stream had increased to a boiling torrent. He nevertheless crossed it on the back of an ox and brought home the whole herd in safety. As a reward for his courage, his master gave him four of the

sheep which he had saved. He sold the wool to buy better clothing, and with the money obtained for the sheep, traveled to Bristol to seek his fortune. To prevent being impressed as a soldier, he requested his master to recommend him as an apprentice to a relative who was one of the partners of Abraham Darby, and he was accordingly sent into the brass works, until he could find better employment. As he was looking on while the workmen were trying to cast iron, he said to Darby, he thought he saw how they had missed it, and begged to try a method of his own. He and Mr. Darby remained alone in the shop that night, and before morning they had cast an iron pot. He was at once engaged to remain and keep the secret, which he did faithfully, although double wages were offered him by other parties. For more than one hundred years after that night, the process of producing iron castings in a mould of fine sand with two wooden frames and air holes, was practised and kept secret at that factory, with plugged key-holes and barred doors.

Witty Temperance Men.

Several clergymen traveling together, were much annoyed by a fellow who had been drinking, but who feigned much of his drunkenness, that he might more readily attack the ministers. Standing near them he remarked, "Well, it's singular, yes it is, that I never get drunk only when in the company of ministers." He repeated something like this, when one of the gentlemen turned upon him, asking "Do you know the reason for it?" "No," replied the fellow, "perhaps you can tell me." "Because," said the clergyman, "when with such company you get all the drink to yourself."—This recalls the anecdote of Horace Greeley, who was once met at a railroad depot by a red faced individual that shook him warmly by the hand. "I don't recognize you," said Mr. Greeley.—"Why, yes, you must remember how we drank brandy and water together at a certain place." This amused the bystanders who knew Mr. Greeley's strong temperance principles. "Oh, I see," replied Mr. G., dryly. "You drank the brandy, and I drank the water." On another occasion the philosopher's wit silenced some of his office associates. Mr. Greeley had given an account of a wine dinner, and wrote that the party had indulged in Heideck and Champagne, these both being names for the same kind of wine. His associates laughed heartily at his mistake, which they pointed out to him. "Did I write it so," said he, with a good natured smile, "well I reckon I'm the only man in this office who could have made such a mistake."

A Sudden Cure.

A professed thief named Dugald McCaul, in the Highlands of Scotland, went out on an excursion one night accompanied by a young man who was learning the same trade. The latter was to take a sheep, while McCaul was stealing kale, and both were to meet in a neighboring church yard, where they would not be likely to be molested, as the place was said to be haunted. McCaul arrived first and sat upon one of the gravestones waiting for his companion. In a neighboring farm-house a crippled tailor happened to be at work, and the conversation having turned upon the church yard being haunted, he taunted some young men present with cowardice, saying that he would readily go if he were not lame. Upon this a young man offered to carry him there upon his back, which the tailor agreed to, and they were soon at the place. McCaul heard them, and supposing his companion had arrived with the sheep, inquired, "Is he fat?" "Fat or lean, there he is for ye," replied the terrified young man, throwing down the tailor and running away at full speed. Upon his return at the farm house, to the astonishment of all, he found the tailor close at his heels—his fright had given him the use of his legs, and his lameness was permanently cured.

"How do You Like It?"

This is a pleasant game for the fireside, and may be played by any number of persons. One is sent from the room, and the remainder of the company select some word. The absent one is then called in, and proceeds to discover the word by asking of each person these three questions: "How do you like it?" "When do you like it?" "Where will you put it?" The word chosen is usually one having two or more meanings, so that the answers may be made as puzzling as possible. Thus: suppose the word to be "Butt," which may mean a hinge, a cask, or a stroke with the head. The questioner asks, how do you like it. "To turn easy," replies one, "Very large," answers another, "Not at all," answers a third.—When do you like it?—"When I am building." "When I am packing," would be correct answers.—Where do you like it?—"On a trunk." "In the cellar," etc. When the questioner discovers the word, the person whose answer revealed it, leaves the room, and becomes questioner, and thus the game continues.

MERRY CHRISTMAS
AND A
HAPPY NEW YEAR

DRAWN BY E. L. STEVENS. — [SEE PAGE 37.]

(Business Notices—\$1 25 per agate line of space.)

A Card.

For the purpose of more fully supplying the wants of the public, and in order to prevent unscrupulous dealers from palming off inferior and worthless goods as the MORTON GOLD PENS, I shall hereafter sell no Goods at Wholesale *excepting only* to duly Appointed and Authorized Agents, to whom a Certificate of such Agency will be given, and who alone shall be able to sell the MORTON PENS in that city or village.

To my Agents I shall give a liberal discount upon their agreeing to supply the public at my published and well known prices.

Jewellers or Stationers will, in all cases, be preferred as Agents

Conditions and Terms for Agency will be stated upon application, by letter or otherwise.

Where no Agency is established, those wishing the MORTON PEN must send to my store, where prompt attention will be given to their orders.

A Circular, with fac-simile Engravings of all Sizes and Prices, will be sent to any one on receipt of their postage.

Address A. MORTON, No. 25 Maiden-lane, New-York.

A Good Washing Machine.

From the Scientific American, Nov. 25th, 1865.

One of the best labor-saving machines ever introduced into a household, is a good washing and wringing machine. No class of patented machines so much interest the good housewife as the washing machine and wringing attachment. The terrors of washing-day exist no longer where a good one is in use, and any of our readers in want of a first-class machine—one that has no rival to our knowledge—are advised to send to Messrs. OAKLEY & KEATING, No. 184 Water-Street, New York, for a circular, and then purchase from them such a size as they may require.

FERDINAND F. MAYER,
ANALYTICAL CHEMIST.

LADIES' COLUMN.

JANUARY.

EXTRACTS FROM MRS. BRIGHT'S JOURNAL.

Have spent a pleasant day receiving New-Year's calls, and a merry hour at its close comparing experiences with my husband. Had the satisfaction of hearing my dress pronounced "stylish," and the pleasure of telling him that I made it myself. Thanks to my Wheeler & Wilson, I know nothing of what somebody calls "the wife's nightmare"—dressmaker's bills! * * *

This week I have given up to the usual calls of "the season." My friends compliment me upon my good health and spirits; and I think the cause of both is the freedom from anxiety resulting from a well-ordered household, which, without vanity, and simply stating a fact, I believe mine to be. The secret of it is that I insist upon having every thing done in its season, and never suffer the work of one month to accumulate upon that of another; consequently, I have few "housekeeper's trials," and can enjoy a leisure hour without the uncomfortable sense of something left undone.

Have just paid my usual evening visit to the nursery; heard the little prayers, given the good-night kisses, and left them to slumber, sure that "all is well" with my darlings. Mine should be "a calm and thankful heart," if a happy home, a loving husband, and sweet, healthful children can make it so.

FEBRUARY.

Went to the concert with my husband. He says that music being my only extravagance, he is obliged to indulge me, in spite of a reproving conscience. This is "his little joke" at my expense; for the extravagance is, to say the least, mutual, and he knows well that I should not enjoy music, or any thing else, if he did not share it with me. Moreover, he holds with me the doctrine that money is well spent which contributes to refine our tastes and beautify our lives. Therefore, the concert and all good music, wherever we meet it, comes under the head of "necessary expenses" in our domestic economy. * * *

A quiet, happy evening at home, put on record for another proof that the simplest pleasures are often the sweetest. A new book read aloud by my dear husband was the only entertainment; and my fingers were busy meanwhile—shall I tell it?—darning stockings! But that homely embroidery fitted well with Herbert Spencer's genial philosophy, and while I gained new ideas about my boy's education, I had a certain satisfaction in feeling that I was making comfortable provision for his toes also. Dear little toes! May the feet that own them stray into no by or forbidden paths.

MARCH.

"A man's work is from sun to sun, and woman's work is never done," says the old adage. But if the woman be wise enough to make herself mistress of a certain little household fairy, whose fingers never weary and never wear out, take my word for it her toil need not outrun the daylight. It is such a pretty little fairy, too, so obedient to all my behests, so swift, and so sure! I take a fancy to ornament little Alice's frock with braiding, and lo! the fairy fingers fly in and out of the complicated pattern, reproducing all its curves and angles with mathematical precision. I want a tucked skirt, and in an hour the spaces are marked, the tucks folded down, the neat stitches set like rows of seed-pearls. I have a dozen handkerchiefs to hem, and before these mortal fingers (not clumsy ones, either) could have finished a single one, the whole set are completed. The greatest charm of this fairy is that it possesses the faculty of multiplying itself indefinitely, so that every woman may command its services for her own household. And for my part, I would dispense with many luxuries for the sake of securing such services, if I were not so fortunate as to have them at command already.

APRIL.

Had a spare ticket for the last Philharmonic rehearsal, and called for Mrs. Blank, thinking she would like to accompany me. Found her up to her eyes in plain sewing—"would like to go dearly, but couldn't possibly spare the time;" which I thought very odd indeed. Her family is no larger than mine; her income no smaller; yet she never seems to have time for the simplest recreation. One is tempted to be uncharitable and ask: What can the reason be, meanness or bad management.

Spent an hour at my sewing-machine this morning braiding a sacque for Charlie. My husband laughs at what he calls my propensity for finery. But if I have a weakness it is to see my children well dressed. Comfortable and neat, of course, they always are; and when I can make their little garments beautiful also, at small cost of time or money, where is the harm? "Solomon, in all his glory, was not arrayed like" the lilies of the

LADIES' COLUMN.

JANUARY.

EXTRACTS FROM MRS. BLANK'S JOURNAL.

Vexed my husband this morning by refusing to receive New-Year's calls. He declares that I grow more unsociable every year, and I dare say it is true; but how can I help it? The new year brings me only new cares, and still I sing "with a dolorous pitch," the same song of "stitch, stitch, stitch." * * *

A call this afternoon from Mrs. Bright. She is no younger than I, and perhaps no prettier, yet I was conscious of a contrast not at all to my advantage. How fresh, and handsome, and happy she looked! How faded, and careworn, and sad I felt. What is the secret of the difference, I wonder! * * *

Am hard at work in mid-winter, upon garments which should have been finished in the first of the season. Poor little Ellie is still wearing her thin Summer flannels, because the older children must at least be made respectable for school, and I cannot do everything at once. I do my best, yet I seem to be always pursuing my work, never able to overtake it. * * *

Little Ellie is sick to-night, tossing in her sleep, hot with fever. I sit by her crib, sewing upon the flannel skirts at last, and feel sorely that the want of them has caused her illness. Yet how could I help it?

FEBRUARY.

Tickets for the concert sent unexpectedly by a friend, but my husband did not come home, so was unable to use them for want of an escort. Got only this, by way of comfort, when he did return: "How could I know you wanted to go? You never go anywhere. And what is the use of my coming home, to sit alone down stairs, when you always stay in your own room? Don't blame me for your disappointment; it is your own fault." Is this true, really, and am I then so much to blame? God knows it is not for my pleasure that I sit alone evening after evening, plying the weary needle; not for my happiness that I know him seeking his enjoyment in his people and things apart from me. Yet what can I do? Is it not a hard alternative when one has to choose between neglecting one's husband or one's children? * * *

Nothing pleasant to record this evening, which is, alas, nothing new. Busy all day with my needle; too tired and dull to welcome my husband at night very cheerfully; considered "cross" in consequence, and tempted to deserve the title by being so in reality. Do marriage and maternity necessarily mean slavery? Taking my daily life for example, the answer would be a bitter affirmative.

MARCH.

Have accomplished little or nothing this week, owing to little Ellie's illness. She has been just sick enough to want continual petting and nursing, and of course it is only I who can do it to her satisfaction. Why is it that children always tyrannize over their mothers, I wonder!

Looked wofully this morning toward the pile of work which has accumulated during Ellie's illness. Stockings to darn, trousers to patch, aprons to mend, frocks to make, shirts to cut out! One pair of weary hands to do it all—one heavy heart to bear all the complaints and annoyance that arise when it is not done. There is a reason for all things, it is said, but I confess I cannot see why my life should be wasted in this hopeless sort of toil. I would not complain if the results were adequate to the labor; but I have so little to show for my day's work; so much more than I can possibly do is left undone. Yet I give myself wholly to these household duties, even to the neglect of what I feel to be better things. My mind is narrowed down to the range of my work-basket, my aspirations confined to the circle of my needle; yet even that poor ambition meets perpetual failure.

APRIL.

Refused an invitation to go to the Philharmonic with Mrs. Bright, who looked surprised when I gave want of time as an excuse. She seems to have plenty of time for going out, though one would think her family cares would confine her as much as mine. Perhaps she neglects her children to take her pleasure! When a mother goes to so many concerts and lectures, reads all the new books, entertains company, and all that sort of thing, it's very apt to be the case that the children's stockings are not darned, nor their petticoats mended! * * *

Worked since early morning and till near midnight on a Spring dress for Annie to wear to school. Had to go to bed at last and leave it unfinished, with the pleasant anticipation of her disappointment to-morrow. "She is so tired of wearing her old merino!" And no wonder. The children are known by one dress before I have time to make them another; although they have no superfluous work on them either. Annie complains sometimes, poor child, of her untrimmed frocks; and I answer her

field; but are not the lilies of the field, and all the other blossoms that God has clothed with beauty, examples in a certain sense, and excuses for personal adornment?

MAY.

A great misfortune happened to day. Poor little Alice experienced her first grief in the loss of a tiny black-and-tan terrier, "Jet" by name, who died suddenly this morning. The little creature has been her pet for a year, and she is heart-broken at his death. Have been trying to devise something for her consolation, and think I will take her with me this afternoon, when I make my donation-visit to the Church Charity Foundation. * * *

Found my idea a good one. Alice was delighted with our excursion, quite falling in love with the poor old ladies and helpless little orphans at the "Home." It is her first glimpse into such an institution, and I was surprised to see the intelligent interest she manifested. One child attracted her special attention—a bright-eyed little thing called Jessie, and, singularly enough, nicknamed "Jet." I saw Alice's eyes fill up at the familiar sound, and presently her little hand stole into mine: "I should like to give her something, mamma; may I?" So allowed her to choose a book from my basket, and watched the presentation, which gave at least as much pleasure to the giver as the recipient.

JUNE.

A delightful afternoon at the Academy of Design—Frank and Alice with me, as they have been every year since old enough to go out with me at all. I think one cannot cultivate artistic tastes too soon in children, so take pains to have mine see pictures, statues, curiosities—everything beautiful that is within our reach; and, from the first, I make a point of teaching them to observe and discriminate, that they may enjoy things intelligently—not merely for show or glitter. The reward of my trouble comes to me already; for Frank's comments and criticisms this afternoon were (without being in the least priggish or unchildlike) so sensible as to make him a most agreeable companion. * * *

Celebrated little Helen's fifth birthday with a doll's tea-party. Invited ten little girls with their dolls, and gave up the afternoon to the entertainment, which passed off without a cloud. Confirmed in my creed that any outlay of time and trouble which goes to make children happy is a profitable investment.

JULY.

Practised industriously for two hours this morning, "making up," as I—mischievously says, "for time lost at the sewing-machine." The "household fairy" has just accomplished, under my supervision, six new shirts for his lordship; not to speak of a host of brown holland aprons for Charlie and Helen, and some stout gingham frocks for Alice—these last for country wear. Which, according to my practical view of things, was time very well "lost!" Still, I must not neglect my music, for I know its value too well as one of "the ties that bind" us in household unity and harmony. * * *

A busy day packing for the country. We have been fortunate enough to secure board so near the city that my husband can attend to his business, and still spend the evenings with his family. My house is in order, my Summer sewing all done, the children provided with everything needful; and I look forward to a happy holiday.

Have arranged our little apartments so that they begin to look homelike. Two or three engravings on the walls, some books, my work-basket, and Alice's canary in the window, give the familiar aspect; while the lovely outside views of woods and river, upland and meadow, atone for all deficiencies within.

AUGUST.

Went down to the river for a swimming lesson to-day. Frank learned to swim last summer, and has undertaken now to teach the children and myself. No great progress as yet; but we all splashed about, and had a merry time. A sudden cloud came up while we were still in the river, and gave us a shower-bath in addition to the plunge. The effect of the rain-drops upon the water, seen from the midst of them, was exceedingly beautiful. * * *

Some new arrivals from the city this afternoon, among them an acquaintance—Mrs. Blank. Met her unexpectedly on the piazza, and had the pleasure of rendering her some little service, which she appreciated almost too gratefully. Am glad of the opportunity to improve my acquaintance with her. * * *

Went up to Mrs. Blank's room, to ask her to join us in a "crabbing" expedition. Found her sewing, as usual, and too busy to go. I discovered at last, however, the reason why she never has time for anything: she attempts to do her family sewing without a sewing-machine! No wonder her work is never done. Gave up the crabbing party, and told her of my experience of the "household fairy," which so astonished and delighted her that she is determined, at any sacrifice, to have one for herself.

with mild moralities about the beauty of simplicity, and the sin of vanity; which silence without satisfying her, and leave me self-reproached for preaching what I would not practice, except through necessity.

MAY.

A most unhappy record to-day. Came down to breakfast, worried and irritable, and found Arthur holding a young canary bird in his hand. "Look, mother," he exclaimed eagerly. "Harry Warren has given me this dear little bird; his mother let me choose the prettiest one in the nest." "And what are you going to do with it?" I asked impatiently, some evil spirit making his happy excitement utterly distasteful to me. "Why, keep it, of course. You'll get a cage for it, papa, won't you? I've wished for a bird so long!" and his imploring look at me should have been enough to dispel the hateful feeling. But not so. I answered hastily: "No such thing. Your father cannot afford to buy cages, while so many things are more needed. Carry the bird back again; I can't be bothered with it." Almost before the speech was ended, I had repented. But it was too late then to recall it. Arthur was too proud to remonstrate, and without a word marched out of the room, coming back no more. My husband gave me one look—that was all. The meal passed in miserable silence; the day has gone by as wretchedly; Arthur avoided me in proud resentment—my own conscience my sorest punishment.

JUNE.

Spent the afternoon shopping on Broadway and Canal street. Getting into the stage, tired and heated, my hands full of small parcels, and my spirits dejected in the recollection of how much money I had spent, and how little I had to show for it, I encountered Mrs. Bright, and two of her children, all three looking provokingly like their name! They were dressed so charmingly in the freshest of spring attire, and had been to the Academy of Design. "Had I visited the Exhibition this year? Was I not delighted with those lovely girl-faces of Wentler's? those delicious little landscapes of Shattuck's?" and so on, and so on, till I felt more dejected than ever in my painful consciousness of a contrast, not to my advantage, that Mrs. Bright's presence always forces on me. She takes life easily. I wish I had her secret. * * *

Poor Ellie gone to bed in tears. She and her doll were invited to Helen Bright's birthday party, but the doll—significantly named Flora McFlimsey—had, like her namesake, "nothing to wear." Ellie would not go without her, and I feel self-reproached for her disappointment. I ought to have dressed her doll long ago; but how can I, with so many human dolls wanting dresses?

JULY.

Bridget's evening out, and I took her place in the nursery, to guard the sleeping children. A feeling, half ludicrous, half pitiful, took possession of me as I sat there sewing; a wish that I was servant instead of mistress, that I might have the privilege of at least one evening in the week to spend as I pleased! Ridiculous, of course; nevertheless it is painfully true that I do not have as much time for recreation as my own servants.

Third of July, and to-morrow the awful Fourth must be endured, with its multiplied miseries of run mad, frightened babies, servants "on a rampage," etc., etc. Wish I could have escaped into the country, as Mrs. Bright did; but, alas! there is a mountain of sewing to be leveled before I can attain to the breezy hills and shady woods that I sigh for. * * *

Baby grows thin and fretful—the heat seems unusually oppressive this summer—and his father is very impatient to get the children out of town. "How long before you can be ready?" he asks almost daily. I am straining every nerve to get through the necessary work, but it will be August before the children can be ready.

AUGUST.

Out of town at last through much tribulation. My husband declared that the children must wait no longer if they went without clothes; so packed up what remained of my work to finish in the country and started off yesterday. The journey very unpleasant, owing to heat and intolerable crowding; but our boarding-house promises to be comfortable, and the country around is beautiful, with ample range for the children. Found (to my advantage) that Mrs. Bright and her children had been here since the 1st of July, and was a favorite in the house. Under her direction much more attention was paid me than I should otherwise have received, and in many ways she has been exceedingly kind. I remember (to my shame!) that I have sometimes had uncharitable thoughts about her. * * *

There is a remedy, we are told, for every evil under the sun. Mrs. Bright asserts, with encouraging confidence, that a Wheeler Wilson is the remedy in my case. I have seen for myself how easily her household cares sit upon her. I have also seen that her children are not neglected, as I once imagined. If a sewing machine is as efficient a helper as her experience seems to prove what price would be too dear to pay for it?

SEPTEMBER.

Have tested an idea which came to me some time ago, and found it worthy of record. It was simply to suggest for Alice a permanent instead of temporary interest in the little orphan Jessie, and show her how to turn it to good account. Which I did accordingly; and it is now one of her chief interests to work for little "Jet." She saves her pocket-money to buy books, or playthings, or small articles of dress for her, and gives up many of her play-hours to sewing for her. What she can do is of course nothing very important in itself, but I encourage it for its influence upon her own character, and see already the good effects. Her sense of responsibility makes her thoughtful and womanly; and where before she was rather inclined to self-indulgence, this new interest has taught her practical lessons of self-denial. May these be only first fruits of a life rich in good works and charity. * * *

Attended a bright little dinner-party last night, at Dr. R—'s. Met several celebrities of the pencil and the pen, who for once were as enjoyable personally as in their books and pictures.

OCTOBER.

Celebrated the anniversary of our wedding-day by a drive in the park, a stroll down the Lovers' Walk, and a row across the Lake. The day was heavenly, with its soft misty sunshine and brilliant Autumn foliage, and our own hearts harmonized with all its loveliness. Thirteen years since we were married, and it seems only yesterday! But such happy, loving years press lightly. On the Lake, floating in one of those fairy-like skiffs among the swans and water-lilies, it—grew poetical, and repeated those four loveliest stanzas of "The Miller's Daughter":

"Look into mine eyes with thine, true wife"

But as for me, I could only think of the sweet old hymn, "When all Thy mercies, O my God!" for one verse had been in my mind all day:

"Thy bounteous hand with wordly bliss
Has made my cup run o'er,
And in a kind and faithful friend
Has doubled all my store."

Paid my annual subscription to the "Association for the Relief of the Industrious Poor." This charity especially interests me, because it is based on a sound principle—employment furnished to the destitute, and full value paid for the labor. Thus self-respect is preserved while distress is relieved.

NOVEMBER.

Another birthday to be recorded; not celebrated by a doll's tea-party—Alice is too old for that—but not less lovingly commemorated. Her father's gift was an engraving of Ary Scheffer's "Temptation," one of a set of scriptural subjects which he is collecting for her, and in which she takes great enjoyment. Frank bought her a dainty copy of "The Children's Garland from the Best Poets," and my own gift was the published record of a beautiful life not long since ended, the "Memorial of Alice B. Haven"—rather mature, for her present age, but she will appreciate and, I trust, emulate its sweet lessons of faith and charity in after years. * * *

A busy and pleasant day, spent chiefly in making up on my sewing-machine a number of garments for Christmas distribution amongst the poor. * * *

An hour at the piano with Frank. It is one of my fancies that the influence of music at home and the power to produce it themselves, goes a great way toward keeping boys out of mischief; so have taken pains to teach Frank carefully, as well as Alice, in anticipation of the time when we can afford masters. * * *

DECEMBER.

A merry evening with the children, preparing decorations for our Christmas tree. The little ones, who still keep faith in Santa Claus, were safe in bed, but Frank and Alice assisted gleefully in making cocked hats, cornucopias, and candy boxes, and even papa condescended to lend a helping hand. We adhere religiously to all the time-honored observances of Christmas; endeavoring to make it not only a merry holiday, but a special occasion for inculcating by precept and example the sacred lessons of Him who came to bring "peace on earth, good-will to men." * * *

Packed and sent away the usual "Christmas boxes"—a gown for Widow McCaulay, a basket of groceries for Mary O'Neil, a doll for little motherless Janie Thompson, and other such simple offerings. With the longing in my heart to do so much more, this encourages me: "A cup of cold water only shall not lose its reward."

To-day brings the close of the year marked with fewer cares than blessings; and the last page of my diary, not always faithful in recounting them. Let the final record at least be one of thankful acknowledgment for the "unnumbered comforts" that have surrounded me. Also, a prayer for the "calm and thankful heart" that is free alike from "murmurs" and "vain confidence."

SEPTEMBER.

Have discussed the sewing-machine idea with my husband, and find, to my satisfaction, that he heartily approves of it. A little economy in other expenditures will enable us to purchase one, and my heart is already lightened, in anticipation of the burden of Fall work. For the last week, at least, I will give myself up to the full enjoyment of these lovely September days, with their misty skies and faintly turning leaves. I will roam the fields with the children, in search of wild grapes, take swimming lessons in the river, join "crabbing parties," and "bob for eels!" Also, I will explore the windings and hidden springs of that laughing brook in the woods, and in some green nook, with rippling water and murmuring leaves about me, I will read Jean Ingelow's poems. Who can tell? Perhaps the time is coming when I shall have leisure to read when I please. Just now, an idle hour with a volume of poems seems the rarest luxury. * * *

Home again, and the burden of household cares dropped for a while, must be taken up once more. Fall sewing, fall house-cleaning, pickling and preserving; sending the children to school, and getting settled generally! But I bring to life task new energy—boon of rest and hope.

OCTOBER.

The important purchase has been made, and I am really the owner of a sewing-machine. I walk around it with a sort of awe, fingering the mysterious hooks and gauges, and wondering shall I ever comprehend and make available its delicate mechanism! Mrs. Bright assures me that I shall, under the careful instructions furnished by Messrs. Wheeler & Wilson. I go this morning to their beautiful rooms on Broadway for my first lesson.

Gave Arthur for his birthday a present which will make him forget my unkindness about the canary-bird. It was, in fact, the same bird, which I look pains to obtain, and for which I bought a pretty cage; denying myself a new pair of gloves that I need in order to do so. A small enough sacrifice to atone for my fault! Hung up the cage in the dining-room window, and laid a little note on Arthur's plate, signifying his ownership. The quick tears in his eyes, the warm color flushing his brow when he read it, expressed everything without words. I knew that he understood all I mean by the gift; and his look of loving gratitude made me able, for the first time, to forgive myself.

NOVEMBER.

Fall sewing almost done; thanks to my invaluable sewing-machine. It has been all that I hoped—more than I dared to anticipate—in the way of assistance; and, indirectly, other advantages flow from it. My husband looks up with a smile when I take my seat after dinner: "Not quite so exclusive as you used to be!" And the children: "Oh! mamma sits down stairs every evening now. Isn't it a great deal nicer, papa?" It is pleasant to feel that my presence is the attraction for all of them; and I inwardly resolved that it shall not be lacking in future. I will "use all diligence" to retain and perfect the family reunion, not forgetting to be thankful for the opportunity to do so. * * *

Played and sang with the children this evening while they practised some Christmas carols for their Sunday-school concert. Looked over my shoulder—hearing a manly base suddenly in the "Three Kings of Orient," and met my husband's eyes, with a look in them that said: "This is what I like." So prolonged our rehearsal till the children's bed-time; and finished the evening with a game of chess, in which I had the satisfaction of checkmating him—purely by accident, as he conceitedly declared.

DECEMBER.

A couplet from Stoddard's charming version of "The Children in the Wood" has fitted through my brain all day:

"And leaf by leaf the rose of youth
Came back to Lady Jane."

Truly I am younger as well as happier, now that the weight of a forever-unfinished task is lifted from me. I shall never cease to be grateful to Mrs. Bright for introducing me to her "household fairy." It has proved to me more than that—a household angel. * * *

"Merric Christmas" is at hand once more, and all hearts are attuned to its gladness. The children are full of important secrets. Mamma has hers also; among them a marvelously-dressed doll that will gladden Ella's heart, and a braided dress that will satisfy Annie's wildest desires. Suspicious-looking parcels are smuggled into the house from time to time, showing that papa has his little mystery, too, and I think I shall not much longer covet that copy of "Melodies and Madrigals!" We do not forget, either, these little children of God in whose homes no Christmas-trees grow. Our good cheer shall be shared with them, for His sake who said, "Inasmuch as ye did it to one of the least of these, ye have done it unto me."

THE NEW YORK TIMES.

ENLARGEMENT OF THE DAILY, SEMI-WEEKLY, and WEEKLY TIMES.

THE LARGEST AND CHEAPEST NEWSPAPER IN THE UNITED STATES.

The NEW YORK TIMES has been enlarged to the size of the LONDON TIMES.

Each number contains eight pages of seven columns each—or FIFTY-SIX columns in all—making it the largest newspaper in the United States.—The TIMES will contain regularly:

- FULL CONGRESSIONAL REPORTS,
- REPORTS OF THE LEGISLATURE,
- Messages and Public Documents,
- REPORTS OF COURTS AND PUBLIC MEETINGS,
- EUROPEAN NEWS IN FULL,
- FOREIGN AND DOMESTIC CORRESPONDENCE,
- NEWS FROM ALL PARTS OF THE WORLD,
- POLITICAL AND GENERAL EDITORIALS,
- LITERARY NEWS, SELECTIONS, AND MISCELLANY,

Every thing possible will be done to make the TIMES the most valuable and interesting Family Newspaper in the United States. Its price will remain unchanged, in spite of the fact that its size and contents have been increased one-fourth.—The following are the prices of the several editions, payable in all cases in advance:

The DAILY TIMES, per annum.....	\$10
The DAILY TIMES (Sunday Edition included).....	\$12
The SEMI-WEEKLY TIMES, one year.....	\$3
The WEEKLY TIMES, one year.....	\$2

These prices are invariable. Club rates are discontinued. We have no traveling agents. Remit in Checks or Post-office Money Orders if possible.

HENRY J. RAYMOND & CO., Times Office, New-York.

The SEMI-WEEKLY and WEEKLY TIMES will be enlarged about the first of January.

Subscriptions in Clubs to the WEEKLY and SEMI-WEEKLY, sent before January 1st, 1863, will be received at the old Club rates.

KNOX'S STRAWBERRY PLANTS.

For many years we have given earnest attention to the cultivation of Strawberries. Our long and varied experience gives us great advantages, in the selection of such varieties as will give the best satisfaction to the grower, whether for home or market purposes; our collection, in variety, quality, and quantity, is unsurpassed, if equaled anywhere. We call special attention to the

JUCUNDA—Our No. 700.

After thoroughly testing this variety for six years, we unhesitatingly say, that for UNIFORM AND LARGE SIZE, BEAUTY OF FORM AND COLOR, ENORMOUS YIELD, LONG CONTINUANCE IN BEARING, GREAT PROFIT, HEALTH AND VIGOR OF PLANT, and other desirable qualities, it is the most valuable strawberry of which we have any knowledge. All who have seen it on our grounds, prize it alike highly.

Extract from the Report of a visit to our place, by Geo. M. Beeler, Sec. of the Indiana State Horticultural Society.

Seven Hundred.—This variety, for large size, productiveness, and perfection of form, stands pre-eminently at the head of the list. In its habit it is very vigorous, upright and hardy. The leaves are from small to medium in size, and of lighter color than Wilson. Its flowers are perfect, and fruitful to an enormous extent. I last year counted trusses that had ninety per cent. of perfect fruit upon them, as compared with the number of flowers. A most remarkable point of value in this variety is the great number of extra large berries. I saw great quantities, ten to twelve berries of which filled a pint. These, you must remember, were not merely a few selected ones for the exhibition tables, but there were bushels of them sold every day in market, which brought one dollar per quart. This is equal to four or five cents each, and may be considered as rather profitable.

THOMAS MEEHAN, Editor of Gardener's Monthly, in an article, written after visiting our strawberry plantation last June, says: "But the greatest of all Knox's Strawberries is undoubtedly the "700." Albany Seedling bears well, but does not equal "700." Triomphe de Gand has a peculiar flavor, preferred by many; more of this has "700." Triomphe de Gand is also solid and firm, carries well to the market, and ends the pressure of kitchen fingers, and so does "700."

And then its great beauty, for the color has a tinge of vermillion in it,—its coming tolerably early in the season, and continued succession to the end, together with its generally large size,—must make it an universal favorite. He seems to have tried it and tested it thoroughly, planting in patches all over the place, and by the side of most other varieties, and it comes off superior to all.

A. W. HARRISON, of Philadelphia, Sec. of the Pa. State Horticultural Society, thus speaks of his impressions on seeing the fruit for the first time on our ground:

"It so much surpassed the best of all the varieties I had carefully cultivated and tested, for many years (over 60 in number), that I at once determined to plant no other, when it could be obtained, and regarded it as the 'Strawberry of the future,' par excellence. " * * * The plant is as thrifty, vigorous and hardy as any I know of, the stout, storky fruit stems bear up a weight of fruit I never saw equaled; and such fruit is worth going miles to see and know. From a critical examination of several hundred plants, then in bearing, I can state that the fruit was the most uniformly large and regularly shaped, of any I have ever seen. I found them, almost without exception, of a true conical form, seldom or never cockscombed. In color they are brilliant scarlet, highly glossy, and bristling all over with golden yellow seeds, standing out prominently from the surface. Flesh, white, with pale salmon centre, firm and solid to the centre, of an excellent flavor, juicy and rich. In a word, I would only add, that to all who have asked for the last three years, my advice what to plant, my invariable reply has been, 'Plant No. 700,' and all my experience to this day confirms that opinion."

"JUCUNDA."—At the meeting of the Ohio Pom. Soc., at Cincinnati, Dec. 6th, 7th and 8th, 1863, the subject of strawberries being under discussion, Mr. BATEHAM, the Sec. said of the Jucunda, "He had seen it in time of ripening at Mr.

Knox's, and had tested it on his own grounds, and could corroborate all that others had said, of its great beauty, size, and excellence of flavor, rendering it much the best of all the foreign sorts known to him. It is also very productive, and seems to be perfectly hardy, and the fruit is sufficiently firm to bear transportation well."—Extract from forthcoming Report.—M. B. BATEHAM, Sec.

"THE JUCUNDA, or 700 STRAWBERRY. —At the recent meeting of the Ohio Pom. Soc., held in Cincinnati, Dec. 6th, 7th and 8th, 1863, the wonderful qualities of this remarkable fruit, were freely discussed, by several gentlemen, some of whom had seen and watched it for successive years. I entirely concur in the statements that were made, as to its great productiveness, its large and uniform size, and its protracted fruitage, but more especially as to its brilliant color, perfect form and extreme beauty, and consider it the most remarkable fruit of its class that has ever come under my observation."—JNO. A. WARDER, President.

Orders for plants, will be filled in rotation as received, at following prices.

AGRICULTURIST.

We have a good supply of superior plants of this popular variety, which we offer at \$1.50 per doz.: \$10 per Hundred.

Golden Seeded, Fillmore, Russell, Triomphe de Gand, Wilson, and all other desirable kinds, at low prices. Our Catalogue giving description of varieties, Select Lists, Prices of Plants, by mail or otherwise, and much other information valuable to growers of this delicious fruit, will be sent to all applicants enclosing 10 cents.

J. KNOX, Box 155, Pittsburgh, Pa.

B. K. BLISS'

Illustrated Seed Catalogue and Guide to the Flower and Kitchen Garden.

TO BE ISSUED EARLY IN JANUARY.

The Eleventh Edition, with supplement enlarged and improved, contains upwards of ONE HUNDRED PAGES of closely printed matter, with many NEW AND BEAUTIFUL ILLUSTRATIONS, and a descriptive list of upwards of TWO THOUSAND VARIETIES OF FLOWER AND VEGETABLE SEEDS, including many CHARMING NOVELTIES, now offered for the first time in this country, with explicit directions for their culture. Also, a list of

Upwards of One Hundred Varieties of French Hybrid Gladiolus,

And other SUMMER FLOWERING BULBS, To which is added a list of a few of the choicest varieties of GRAPES, STRAWBERRIES, RASPBERRIES, and other SMALL FRUITS, BEDDING PLANTS, etc., etc., cultivated at his gardens, with much other useful information upon the subject of Gardening generally, which will be found useful to the experienced amateur as well as those about to commence the delightful occupation of Gardening. In consequence of the very great advance in the cost of paper, printing, &c., we cannot afford it gratuitously (as we have heretofore done,) excepting to our regular customers.

A copy will be mailed, post paid, to all applicants enclosing Twenty-five Cents. Address

B. K. BLISS, Springfield, Mass. Be sure and name the State in bill, as there is a Town or City of the name of Springfield in nearly every State in the Union.

Collections of Flower Seeds by Mail.

For the accommodation of those who love the cultivation of Flowers, but who reside at a distance from where they can be procured, we have selected from our large assortment of Flower Seeds the most showy varieties, and those of easy culture, and put them up in assortments, which will be sent post-paid to any address in the Union at the following prices:

Assortment No. 1—contains twenty choice varieties of Annuals, \$1 00.

Assortment No. 2—contains twenty choice varieties of Biennials and Perennials, \$1 00.

Assortment No. 3—contains ten extra varieties of Annuals and Perennials, embracing many of the new and choicest in cultivation, \$1 00.

Assortment No. 4—contains five very choice varieties, selected from Prize Flowers, of English, Pansies, German, Carnation and Peacock Pinks, Verbenas, Truffaut's French Astors, Double Hollyhocks, \$1 00

Any one remitting \$3.00 will receive the four assortments, postage free.

The above collections have been favorably known in every section of the country for the past twelve years. Those who have tested them, recommend them freely to their friends, and the most satisfactory reports are continually received of their good quality.

The following additional assortments will also be sent at the prices annexed, free of postage.

Assortment No. 5—contains fifteen very select varieties of Green-house Seeds, \$3 00.

Assortment No. 6—contains one hundred varieties of Annuals, Biennials and Perennials, including many new and choice varieties, \$5 00.

Assortment No. 7—contains fifty varieties of Annuals, Biennials and Perennials, \$3 50.

Assortment No. 8—contains twenty varieties of hardy Annuals, Biennials and Perennials, for sowing in the autumn, \$1 00.

Collections of Vegetable Seeds by Mail. For Spring Planting.

15 Varieties, our Selection, \$1.00; 33 Varieties, our Selection, \$2.00; 55 Varieties, in Larger Packets, \$3.50.

The above contain the leading varieties usually grown in our gardens. To those who desire larger quantities, we would recommend our collections at \$30.00, or \$15.00, or \$10.00, and \$5.00, which can be safely forwarded by express to all parts of the world. A list of the contents of each collection will be found in our New Catalogue and "Guide to the Flower and Kitchen Garden." Address

B. K. BLISS, Springfield, Mass.

Connecticut Seed Leaf Tobacco Seed.

Be Sure and Get the Best.

A superior lot raised expressly for the subscriber by one of the most successful cultivators in the Valley of the Connecticut.—Packets with full directions for culture, curing, packing, &c., will be mailed, post paid, to all applicants at the following rates: 1 ounce, 50 cents; 4 ounces, \$1.50; ½ pound, \$2.50; 1 pound, \$4.00. Prices to dealers in larger quantities will be given upon application.

Address B. K. BLISS, Springfield, Mass.

PRIZE CUCUMBERS FOR FORCING.

General Grant.—A new and superb variety either for exhibition or the table, perfect in form, solid and crisp, and of a most agreeable flavor. Many specimens were grown the past summer averaging 24 to 26 inches in length. It succeeds well also in the open ground. Packets containing 10 Seeds, 25 cents. Also the following English and German varieties, at 25 cents per packet, Ayre's Perpetual Black Spine; Cuthill's Black Spine; Ipswich Standard; Weeden's Symmetry; Victory of Bath; Giant of Arnstadt; Roman Emperor; Minister-Abbey; Lord Kenyon's Favorite; No Plus Ultra; Caster's Champion; Colney Hatch. Either of the above varieties will be mailed, post-paid, upon receipt of price affixed. Address B. K. BLISS, Springfield, Mass.

ANOTHER SPLENDID NOVELTY from JAPAN.

Striped Leaved Japanese Maize.

This beautiful and valuable addition to our ornamental foliage plants was obtained in Japan, by Mr. Thomas Hogg, the well-known Nurseryman and Horticulturist, at New York, who sent seeds of it to his brother Mr. James Hogg, in the spring of 1864.

It appears to be a variety of Zea Chinqua, or the Peruvian Maize, as it in many respects differs from the Zea Mays, or Indian Corn, as it is called in the United States. It grows to a height of from five to six feet, and has its foliage alternately opposite; the foliage is from two to three inches wide and about four feet in length. It is beautifully and evenly striped, or ribboned with alternate stripes of green and white, and in its earlier stages of growth is also striped with rose color. It resembles the Arundo donax variegata in appearance, but is of a much more elegant and imposing habit. Nothing in the way of a foliage plant can exceed in gracefulness and beauty; a group of three to five plants of this variety of Zea. The subscriber is happy to announce that he has secured the entire stock of this splendid novelty, and now offers the seeds in packets containing Twenty Seeds at 25 cts. per packet, 5 packets for \$1. The Trade supplied upon the most liberal terms.

Address B. K. BLISS, Springfield, Mass.

CHOICE VARIETIES of the TOMATO.

The following varieties of this valuable esculent will be mailed to applicants upon receipt of the price affixed:

Tilden's New Seedling.—A new and truly valuable variety, oval shaped, the color a brilliant scarlet, skin smooth, glossy, and rarely wrinkled, very productive, an excellent market variety, packet, 25 cents.

Extra Early York, the earliest variety, very prolific, of good size, and fine quality, packet, 15 cents.

The Cook's Favorite.—Fruit of medium size, roundish or oval, smooth, of a rich deep color, fine flavor, very solid and prolific, an excellent market variety, pkt. 15c.

Lester's Perfected, fruit of large size, pinkish red, remarkably solid and of fine flavor, packet, 10 cents.

Mammoth Chihuahua, often weighs 2 and 3 lbs. 25c.

New Erect French, or Tree Tomato, grows upright like a bush, fruit solid and of fine quality, very ornamental, fine for pot culture, packet, 10 cents.

Also, the following varieties at 10 cents per packet:

Early Apple; Pear Shaped; Yellow Plum; Red and Yellow Cherry; Pelee Island; New White; Large Yellow; Strawberry. One packet each of the 15 varieties, \$1.75. Address B. K. BLISS, Springfield, Mass.

POTATOES FOR SEED.

Goodrich's New Seedling:

Early Goodrich.—The experience of many growers the past season has proved this to be the earliest as well as one of the most productive varieties in cultivation.

Calico.—A Seedling of the Garnet Chili, a little earlier than that variety, has a firm crisp flesh, cooks white and dry.

Gleason.—Of good size, fine grain, white solid flesh, very productive.

Garnet Chili.—Large and productive, a good keeper, fine for general crop.

Cuzco.—White flesh, good size and flavor, and enormously productive.

Early Stevens.—A new variety from Northern Vermont, extra early, of excellent quality, very productive.

Extra Early White.—Very early, of large size, flesh very white, fine flavor, a fine market variety.

Early Sovereign.—A favorite early sort, of good quality, keeps well.

Early Wendell.—One of the largest of the early varieties, very productive, and uniformly of good quality.

Delmaboy.—A new second early variety from Ireland, medium size, of excellent flavor, very productive.

Jackson White.—An excellent second early sort, much cultivated in New England, flesh very white and of fine flavor.

New White Peach Blow.—A decided improvement upon the well-known "Jersey Peach Blow," flesh white, floury, of most excellent quality, cannot be too strongly recommended, a first rate market variety.

POTATOES BY MAIL.—For the accommodation of those who reside at a distance from Railroads and Express Offices, we will send a package containing Four Pounds of either of the above varieties by mail, post-paid, upon receipt of One Dollar. No less than \$1.00 worth nor more than one kind in a package will be sent by mail, 6 packages for \$5.00. B. K. BLISS, Springfield, Mass.

Garden and Flower Seeds.

Purchasers of large quantities of Vegetable or Flower Seeds will be liberally supplied by HOVEY & CO., 53 North Market street, Boston.

Prices forwarded on application.

CATALOGUE.

A New Edition of our Descriptive Catalogue of Grapes, Strawberries, Raspberries, Blackberries, Currants, Gooseberries, &c., will be issued early this month, and will be forwarded to all applicants, enclosing 10 cents. Parties wishing to secure the best vines and plants in the spring, would do well to negotiate early. Our stock is very large and superior, but the demand promises to exceed the supply. J. KNOX, Box 155, Pittsburg, Pa.

THE SEWING RIPPER is much liked. Send 50 cents for it to A. C. FITCH, 151 Nassau St., New York City. Every dealer should have them on hand.

Flower and Vegetable Seeds, CHOICE and NEW.

VICK'S ILLUSTRATED CATALOGUE OF SEEDS and FLORAL GUIDE

FOR THE SPRING OF 1866, IS NOW PUBLISHED.

It contains full descriptions of the choicest Floral treasures of the World, and the best vegetables, with plain directions for culture. This is a true Guide in the Flower Garden, and contains about Seventy pages, illustrated with over Fifty Engravings of Flowers, &c., and a

Colored Bouquet of Flowers and Grasses.

Sent by mail, free of postage, to all who apply, enclosing Ten Cents, which is not one half the cost. Sent free without application, to all my customers of last season, as fast as we can get copies ready.

Flowers from Seeds sold by me obtained the First Prizes at the principal State Fairs and hundreds of County Fairs the past Autumn. Address

JAMES VICK, Rochester, N. Y.

THE IONA AND ISRAELLA GRAPES

So greatly surpass all others in excellence and value for all purposes, that it is admitted by all good judges who are acquainted with them, that they are not only able to establish American Grape Culture on a new and sure foundation of excellence, but that they must also in a great measure, displace all others from cultivation, as soon as the vines can be produced to do it.

The ISRAELLA is the BEST and EARLIEST of all BLACK GRAPES, and unlike all of the others, is excellent in flavor and well adapted for late keeping

The IONA is also VERY EARLY, and is at the same time the most beautiful and excellent of all grapes of temperate latitudes, and in open air gives better fruit than Black Hamburg under glass, while it is the most CERTAIN in ITS PERFECTLY RIPENED CROPS of all of our native varieties.

I have a pretty large reserved stock of quality that cannot be equalled, but not sufficient for the full demand of the spring sale. Early orders will be advantageous to buyers.

The wood of the Iona and Israella is now a regular article of commerce, with an upward tendency in price. The produce for one year of good well tended vines will pay their cost.

For the preliminary study of the grape, and to aid those in choosing, who desire to plant one vine or many, I have prepared a pamphlet entitled "Our Native Grapes," containing also the "Present and Future of vine culture in America, with a full account of the origin, qualities, and characteristics of the IONA and ISRAELLA." Sent with revised Price Lists for spring, for a two-cent stamp. It has fine engravings of the Iona and Israella vines in bearing.

For the thorough study of the subject I have prepared the "Manual of the Vines," which is drawn from long and extensive experience in grape culture. It is illustrated with about One Hundred and Fifty engravings, chiefly drawn from life, for the work. I commend it as the most thorough and complete treatise on the vine in the English language. The Illustrated and Descriptive Catalogues are no longer published separately, but both are included in the Manual.

Having the original vines, and abundance of mature wood from established stocks to propagate from, such as no one else can command, besides extensively prepared grounds and other unqualified facilities for the production of the best plants, I am able to offer better and cheaper vines than any other establishment can furnish. Also very cheap vines for nurserymen and propagators. I have also very finely rooted plants grown from green cuttings, at very low rates. These have been often sold the past season for single eye plants. They are well suited for special purposes but not for general planting. My vines are chiefly grown in VERY BROAD BORDERS, but some in large pots for extra price.

Club propositions sent with the pamphlet without charge. These offer most liberal and advantageous terms to all purchasers, whether by dozens, to be sent singly by mail to as many different offices, by hundreds or by thousands. Samples facilities afforded to those who desire to form clubs. The safe reception of the vines is in all cases guaranteed.

C. W. GRANT, Iona, (near Peekskill) Westchester Co., N. Y.

FLOWER SEEDS BY MAIL.—The subscriber raises about one hundred kinds of Flower Seeds, selected from over one thousand varieties, of the most showy and attractive. He will furnish, neatly put up, any 32 kinds on the list for \$1, and send by mail, with postage pre-paid, G. R. GARRETSON, Flushing, N. Y.

FRESH ONION SEED.

Those who wish to purchase seed directly from the grower, can be supplied with Large Red, Early Round Red (very bright colored), Yellow Flat, Early Cracker, and Early Round Yellow Danvers Onion Seed,—all grown by myself from the very best of seed stock and warranted to be both fresh and pure. Also half early Red, grown for me by an honest Quaker. The Danvers will yield a third more than any of the flat sorts, and sell far more readily and at a higher price in the Eastern market.

JAMES J. H. GREGORY,
Marblehead, Massachusetts.

Gregory's Seed Catalogue!

My Seed Catalogue of Garden and Vegetable Seeds, embracing about three hundred varieties, a large proportion of them of my own growing, will be sent out in January.—It will contain some new and rare varieties, not to be found in other catalogues, and will be sent gratis to all. Those who ordered seed of me last season, will receive it without writing for it. I was surprised last season by a degree of patronage that was wholly unanticipated. I have this season consequently increased my working force to meet promptly all orders.

All seed ordered warranted to reach the purchaser.
JAMES J. H. GREGORY,
Marblehead, Massachusetts.

NEW TOMATOES.

Hilden's New Seedling. Large, well shaped, very rich color, remarkably productive, of excellent quality, and keeps well for market purposes.

The Cook's Favorite. Large, apple shaped, very vigorous and productive. Raised by the acre, it brought nearly double the price of other sorts in Boston market this season.

Mammoth Chihuahua. Size enormous, weighing 2 to 3 lbs. each, one of the largest will weigh a quart measure! Quality excellent.

Mexican Tomato. This is a large, round variety of Lester's Perfected. They are as large and as uniformly round as Cook's Favorite, and are prodigious bearers.

Early York. Very early; mostly of a flat round shape, of good market size, of excellent quality and very productive.

Tomato de Lave. The French upright or bush tomato. This variety is entirely distinct and will bear planting eighteen inches apart.

Bate's Extra Early. A remarkably early round variety, of good quality and of good market size.

Either of the above varieties will be forwarded post-paid by me at 15 cts. a package, and warranted to reach the purchaser.

JAMES J. H. GREGORY,
Marblehead, Massachusetts.

Field, Garden and Flower Seeds.

AGENTS WANTED
FOR THE
NEW AND POPULAR WORK, NOW READY,
GRANT AND SHERMAN;

THEIR
CAMPAIGNS AND GENERALS.

BY HON. J. T. HEADLEY,
Author of "Washington and his Generals," "Sacred Mountains," etc.

In One Octavo Volume—over 600 Pages,
With 30 Steel Portraits, Battle Scenes and Maps,

And comprising the Life, Public Services and Military career of
LIEUT.-GEN. U. S. GRANT, the greatest General of modern times.

MAJ.-GEN. W. T. SHERMAN, the Hero of Atlanta and the Carolinas.

MAJ.-GEN. P. H. SHERIDAN, the Hero of Winchester and Five Forks.

MAJ.-GEN. G. H. THOMAS, the Hero of Nashville and Chickamauga.

AND MANY OTHER PROMINENT GENERALS of the Union Army; with thrilling accounts of Battles, Sieges, Adventures, etc., written in Mr. Headley's graphic and limelight style.

Mr. Headley's popularity as a historian, his extensive acquaintance with Government Officials, and access to official documents, place the authenticity of the work beyond a doubt.

It promises to be one of the most popular books which the war has inspired, and the only one that can lay claim to completeness as a panorama of the war.—[Cleveland Leader.]

This book is destined to arouse a greater interest than any other work from the pen of this distinguished author.—[N. Y. Evangelist.]

SOLD ONLY BY AGENTS. To experienced agents and all seeking profitable employment, a rare chance is offered to make money. Send stamp at once for terms and territory.

MICHIGAN STATE AGRICULTURAL COLLEGE.

This Institution is supported by the State, and has been in successful operation for eight years. It possesses an excellent Chemical Laboratory, Farm, Cattle, Sheep and other animals of various and pure breeds, gardens, orchards, philosophical and surveying instruments, Museums of Natural History, &c.

Students are received for a full course of four years, or for a shorter period. Instruction is given in Mathematics and their applications; Chemistry and its applications; Botany, Horticulture, Agriculture, Stock Breeding, History, Mental Philosophy, Political Economy, &c.

Tuition is free to residents of Michigan; to others, \$30.00 a year. Board is at cost. Three hours labor is required daily, for which a moderate compensation is allowed. The labor is classified and made educational, so far as possible. The Term for 1866, commences February 28th, 1866

For further information or Catalogue, apply to the President. T. C. ABBOT, Lansing, Michigan.

THE UNIVERSAL CLOTHES WRINGER

This Wringer has again taken the FIRST PREMIUM in the Great Fair of the American Institute—it has also taken the FIRST PREMIUM at the State Fair of New-York, Vermont, Pennsylvania, Ohio, Michigan, Indiana, Illinois, Kentucky, Iowa, Wisconsin, Connecticut, River Valley Fair, Champlain Valley Fair, and at most of the County and Institute Fairs throughout the country. Over 200,000 have been sold, and are now in use in the United States, and we never heard of one that was not liked.

The UNIVERSAL is superior to all other Wringers, in having large rolls of solid India Rubber, so protected by strong COG-WHEELS that they cannot slip or break loose from the shaft. Its strong wood frame cannot be broken, and does not rust or soil the clothes. Every Universal Wringer is WARRANTED.

We select a few testimonials from persons widely known to the public, who speak from actual experience, and are above suspicion of misstatement.

"My family would as soon give up the cooking-stove as this CLOTHES WRINGER. It cannot be too highly recommended."—[SOLON ROBINSON.

"After a constant use of the UNIVERSAL CLOTHES WRINGER for more than four years in my family, I am authorized by the 'powers that be' to give it the most unqualified praise, and to pronounce it an indispensable part of the machinery of house-keeping."—[REV. HENRY WARD BEECHER.

"This is the first Wringer I have found that would stand the service required of it."—[J. P. HUGGINS, Lovejoy's Hotel.

"We think the Machine more than PAYS FOR ITSELF EVERY YEAR in the saving of garments. We think it important the Wringer should be fitted with COGS."—[ORANGE JUDD, Editor of American Agriculturist.

"I heartily commend it to economists of time, money and contentment."—[The Rev. Dr. BULLOWS.

PRICES—Large size, \$10; Medium, \$8.50. On receipt of the price from places where no one is selling, we will send the WRINGER free of freight charges.

A good canvasser can make money rapidly selling them in every town. Exclusive sale guaranteed and liberal terms given to responsible parties who first apply. Descriptive Circular and terms sent free.

The celebrated DOTY'S CLOTHES WASHER, which has just taken the First Premium at the Great Fair of the American Institute, is sold also by the undersigned.

R. C. BROWNING, General Agent, No. 347 Broadway, New-York.

India Rubber Gloves

are an invaluable protection for the hands in Gardening, Housework, etc., and a certain cure for Chapped Hands, Salt Rheum, etc. Sent by mail on receipt of \$1.50 for Ladies' sizes; \$1.75 for Gentlemen's, by

GOODYEAR I. R. GLOVE MFG CO., 205 Broadway, New-York.

Doty's Clothes Washer AND CHURN POWER.

NOW WARRANTED TO RAPIDLY CLEANSE THE DIRTIEST CLOTHING Without Rubbing!

The Proprietors are happy to announce that their late improvements and the discovery of a more efficient process of washing, enable them now to WARRANT their great Clothes and Labor Savers, already the best and most popular in use—to be capable of enabling a person to thoroughly cleanse even the dirtiest shirts, "STREAKS" included, without a particle of rubbing, without chemicals, with moderate labor, and without danger of WEAR OR TEAR.

Exclusive of heating suds, wringing, rinsing, etc., a week's washing for a family of six persons may be done with our Family Size Washer in HALF AN HOUR!

The DOTY Washer took the FIRST PREMIUM, a large Silver Medal, at the great Fair of the American Institute, just closed.

Read and Reflect!

"It is worth one dollar per week in any family. After a year's use, 'our machine' is thought more of to-day than ever before."—SOLON ROBINSON, Agricultural Editor of The New York Tribune.

Perhaps you will ask how this Washer can clean clothes without wearing them. We answer: In using it, your clothes have the advantage of being cleansed in suds hot and strong enough to dissolve all dirt and grease, hence it has only to rinse them out; whereas, in washing by hand, the hands cannot be borne in suds so hot and strong, and the clothes must necessarily be rubbed and worn to get them clean.

Now can you not better afford to buy a machine than to buy extra clothes that will amount, in a single year to more than double the price of the machine, and to six, eight, yes, ten times its price during the time it will last? How can you make a better-paying investment?

Our Salesmen are DOING GOOD AND MAKING MONEY, and we want a good one in every town. The celebrated UNIVERSAL CLOTHES WRINGER sold also by the undersigned. For further particulars Address

R. C. BROWNING, General Agent, No. 347 Broadway, N. Y.

NOTE.—Persons in Illinois, Wisconsin, Missouri, Iowa, Minnesota, Kansas, Nebraska, and Dacotah, Address the Proprietors,

Stammering

Cured by Bates' Patent Appliances. For descriptive pamphlet, etc., Address H. C. L. MEARS, 277 West 33d-st., N. Y.

The Challenge Washing Machine

Is WARRANTED to wash EASIER, BETTER and QUICKER, and with LESS WEAR to the clothes than any other machine, or process, and to wash CLEAN 4 SHIRTS in 4 minutes; 6 SHIRTS in 7 minutes, and other clothes in proportion. Weights but 30 lbs., costs but \$7 to \$9. Sample machines sent on receipt of price, and money refunded if they fail to give PERFECT SATISFACTION. Clubs of 6 at the price of 5.

We, the undersigned, have used the Challenge Washing Machine in our families, and can truly recommend it. We are likewise acquainted with S. W. PALMER & Co., and know them to be honorable and reliable men, and believe that persons will be perfectly secure in sending them money for Machines. Rev. Wm. Hosmer, Editor of Northern Independent; Rev. Wm. C. Steele, Pastor of North-street, M. E. Church, Auburn; Rev. B. I. Ives, Chaplain of Auburn State Prison; Rev. D. D. Lore, Editor of Northern Christian Advocate; Knapp & Peck, Editors and Proprietors Auburn Advertiser; Rev. Chas. Hawley, 1st Pres. Church, Auburn, N. Y.; Rev. D. A. Wheeler, Bleeker-st. M. E. Church, Udena, N. Y.

Agents wanted everywhere. They are making from \$100 to \$400 per month. Send enclosing stamp for circular, giving full descriptions and 1000 references.

The Challenge Wringer and Ironer combines a perfect Wringer and a perfect ironing machine for ironing WRITING HEAT, and so quickly as the articles would be run through a Wringer. Send for Circular.

S. W. PALMER & CO., Auburn, N. Y.

FLORENCE SEWING MACHINES.

HIGHEST PREMIUM FAIR AMERICAN INSTITUTE, 1865, (Gold Medal). Report of Committee of Awards:

REASONS.

- 1st.—Its simplicity and great range of Work. 2nd.—Its making four different Stitches, viz.: The Lock, Knot, Double Lock and Double Knot. 3d.—The Reversible Feed Motion, operated by simply turning a Thumb Screw, enabling the operator to run the Work to the Right or to the Left, and convenience of Self-fastening the ends of Seams. 4th.—The perfect finish and substantial manner in which the Machine is made. 5th.—The Rapidity of its Working, and the Quality of the Work done. 6th.—Its Self-adjusting Tension.

\$1500 PER YEAR! We want agents everywhere to sell our improved \$30 Sewing Machines. Three new kinds, of new and improved design. Warranted five years. Above salary or large commissions paid. The only machines sold in United States for less than \$40, which are fully licensed by Howe, Wheeler & Wilson, Grover & Baker, Singer & Co., and Bacheelder. All other cheap machines are infringements. Circulars free. Address or call upon SHAW & CLARK, Biddeford, Maine, or at No. 823 Broadway, New York; No. 228 Archer St., Philadelphia, Pa.; No. 14 Lombard's Block, Chicago, Ill.; No. 170 West Fourth-st., Cincinnati, O.; or No. 8 Spaulding's Exchange, Buffalo, N. Y.

DR. GLOVER'S LEVER TRUSS retains and cures more ruptures than any other. It gives perfect ease and comfort. Elastic stockings, belts, bandages, crutches, etc. Send for Pamphlet. No. 11 ANN-STREET. Established 30 years.

\$20. G. & S. CRYSTAL D. P. \$20.

\$1000 A year can be realized gilding and putting up the Crystal Door Plate. Agents wanted. Stock, Tools, and Instructions cost \$20. L. L. TODD & CO., 39 Nassau-street, New-York.

SEND FOR A CIRCULAR.

A NEGLICTED COUGH, COLD, AN IRRITATED OR SORE THROAT, if allowed to progress, results in serious Pulmonary, Bronchial, and Asthmatic Diseases, oftentimes incurable. BROWN'S BRONCHIAL TROCHES reach directly the affected parts, and give almost immediate relief. For BRONCHITIS, ASTHMA, CATARRH, and CONSUMPTIVE COUGHS the Troches are useful. PUBLIC SPEAKERS and SINGERS should have the Troches to clear and strengthen the Voice. Those who overtax the voice, and are exposed to sudden changes, should use them. OBTAIN only the genuine. "Brown's Bronchial Troches," having proved their efficacy by a test of many years, are highly recommended and prescribed by Physicians, and have received testimonials from many eminent men.

"I have never changed my mind respecting them from the first, excepting to think yet better of that which I began thinking well of."

REV. HENRY WARD BEECHER.

GRIFFING & CO., 58 & 60 Courtlandt-st., New-York.

Advertisement for Lansley's Vermont College, featuring a circular logo with text: 'Lansley's Vermont College', 'Courses study more complete and less than elsewhere', 'at any other college', 'Send 10 cts. for prospectus', 'J. H. Lansley, Rutland, Vermont.', and 'of TEACHERS.' with a price tag of \$30.

Phonography, Telegraphing, Painting and Music, by competent Teachers. Between 100 and 200 now in attendance. \$35 pays for 1. \$60 pays for 2.

During Jan. or Feb. is a Good Time to Begin.

Veneer Fruit Baskets.

It is an established fact that the VENEER FRUIT BASKET, represented by accompanying cut, is superior to any other contrivance now used by fruit growers for transporting all kinds of small fruit to market.

It is stronger than any square box of the same weight, because being round it has no corners, and hence no weak spots to be giving out.

The shape of these Baskets is such as to admit of free circulation of air among them when filled, and packed in crates, and being open all round, the fruit is given more thorough ventilation, consequently keeps

its flavor and beauty a much longer time than if put up in tight, or nearly tight, boxes or baskets.

Commission Dealers through whose hands nearly all fruits reach the consumer, now universally admit that in order to have berries keep well and sell high, they must be put up in neat strong baskets, constructed to admit fresh air and plenty of it.

Fruit Growers who wish to secure fame and money both, will consult their best interests by marketing their berries in

Beecher's Patent Veneer Fruit Basket.

Baskets and Crates can be had of Wm. H. Carpenter, 90 Vesey-st., N. Y.; C. B. Rogers, 133 Market-st., Philadelphia, Richard Cromwell, 46 & 43 Light-st., Baltimore, and by Dealers generally throughout town and country.

Manufactured only by

A. BEECHER & SONS, Westville, Conn. 1

By whom Circulars will be sent on application with stamp.

THE AMERICAN FRUIT BASKET!

This favorite Basket for Strawberries, &c., is receiving the highest commendation from every quarter, and is called by very many of our best Fruit Growers and Fruit Dealers, the only perfect article of the kind now in use. It is now adopted by Mr. Knox, of Pittsburgh, Mr. Linsley, of Connecticut, and many others who have had it in use the past season.

PRICES:

Table with 2 columns: Size and Price. Quart size, \$30 per Thousand. Pint, \$35. Crate for 12 quart baskets, \$50 per Hundred. 32 (Iron bound), \$3 00 each. 60, \$3 50. 90 pint, \$3 60.

On orders for Ten Thousand and upwards, a liberal discount will be made.

AMERICAN BASKET CO., Office 313 Chapel-street, New Haven, Conn.

Newell's Patent Fruit Box.

This box has now been so perfected that we have no hesitation in saying, it is the best Box, of which we have any knowledge, for carrying Strawberries and other Small Fruits, to home or distant markets. Light, neat, convenient and cheap, it is every thing that can be desired for this purpose. A circular giving full description of Box, with price, will be sent to all applicants enclosing stamp.

MAPLE SUGAR.

To make the **Best Quality** with the greatest

Saving of Labor and Fuel,

Use the Celebrated

COOK'S EVAPORATOR.

"I think it a great saving in fuel, and a better article of sugar can be made by it than by any other method. I sell my sugar for two cents per pound more than sugar made in the common way. I can recommend the Evaporator as worthy the attention of sugar makers."—DANIEL GOVE, Lincoln, Vt.

"I am confident I saved one-third of the wood, and boiled away six or eight faster, and made sugar worth ten or fifteen per cent. more, than with the same sized pans or kettles set and used in the ordinary way"—P. M. HENRY, North Bennington, Vt.

"I saved half the wood and time, and the sugar and syrup of a purer quality than I had ever made before."—M. C. MORGAN, Bennington, Vt.

The following extract is from a letter from N. B. GREELY, a brother of the Editor of the N. Y. Tribune.

"I have only to say we found no difficulty in using the said Evaporator, and it is far preferable to any thing ever used by us for making maple sugar. We had already commenced sugaring last season when I received your Evaporator, we yet manufactured one thousand pounds with less than two-thirds of our former expense, and the sugar worth two cents per pound more."

"Simple affair, operates admirably, the best apparatus."—*American Agriculturist.*

We have taken great pains to select choice lots of the best varieties of **SORGO** and **IMPERIAL SEED**, and can safely recommend our stock to our friends. To secure seed in time, it is important to send in orders early.

Our **SORGO HAND BOOK**, for 1866, will soon be published, and will be sent on application, free of charge.

Complete directions for building Arches for, and using Plantation Pans, furnished on application.

Parties desiring Agency will please write us immediately.

BLMYER, BATES & DAY,

FRANK LESLIES'

Chimney Corner.

Long experience in ministering to the wants of the reading public, led us to establish one that was evidently greatly needed. An unexceptionable Family Paper, one that would give Tales by Powerful and Skillful Writers, free from that dreary dullness too often inflicted on families, but at the same time spread before the social circle each week matter full of instruction, the latest and value heightened by accurate and highly-finished engravings. In the endless variety to which we shall resort for the instruction and amusement of our readers, we cannot, in an advertisement, embrace all, or indeed much. The first volume, just completed, contains:

- POPULAR STORIES.
- NATURAL HISTORY.
- TRAVELS IN ALL LANDS.
- ADVENTURES BY LAND AND SEA.
- HUNTING.
- MEMORABLE WOMEN.
- MANNERS AND CUSTOMS OF VARIOUS NATIONS AND PERIODS.
- POPULAR SCIENCE.
- GREAT EVENTS IN HISTORY.
- BIOGRAPHY OF SELF-MADE MEN.
- BOYS WHO HAVE RISEN TO FAME.
- THE WONDERS OF NATURE AND ART.
- CAREFUL ENGRAVINGS OF PAINTINGS BY ANCIENT AND MODERN MASTERS OF ALL SCHOOLS.

The CHIMNEY CORNER aimed to supply a want, and its prodigious success, unheralded and unadvertised, has been a proof of its entire acceptance to the thousands of families which now welcome it throughout the land.

But there are many who have never yet chanced to see it, and at the commencement of the New Volume we call attention to its superiority and attractiveness.

With the Second Volume begins a New and Attractive Story, by one of the ablest Lady Writers in America, entitled,

The Nurse's Story.

- Single Numbers.....10 Cents.

Tilden's Seedling Tomato.

THE MOST PERFECT TOMATO GROWN.

Is a Distinct Variety, and Highly Recommended by the Best Authorities in the Country.

This new Tomato was originated by HENRY TILDEN, of Daveport, Iowa, and has been largely grown by him for market, almost wholly monopolizing the trade of that city. He has also distributed seed among the principal gardeners about Boston, New York and Philadelphia, where it has been pronounced a distinct variety, and greatly superior to any other known.

The past season, Mr. Tilden grew two acres, from which he marketed over 1,000 bushels, and received the highest praise and premiums wherever shown at Fairs. The season of picking lasted with him this year over three months.

The editors of THE PRAIRIE FARMER have grown these tomatoes the past year, and fully endorse all that has been said of them for quality, yield and beauty. Read the following testimonials from some of the highest horticultural authorities in the United States:

THOS. MEEHAN, editor of the Gardener's Monthly, says: "We have received from Mr. A. W. Harrison, a basket of this variety, and have tested them in various ways, satisfying ourselves that they are the best tomato out.

"When first before the Horticultural Society this year, we thought we had seen tomatoes as smooth, clear and heavy as these, and we said so; but the testing of them tells more, and as the chief of our culinary bureau urges us to 'plant nothing but Tilden next year,' we suppose she is also of the same belief."

PHILADELPHIA, 11th month, '65.

To HENRY TILDEN—I have grown the past season tomatoes from the seed obtained from thee in the spring under the name of the Tilden Tomato. I consider it a better variety than has yet appeared in this market, being smooth and beautiful in appearance, and more solid and fleshy than any I have met with. Respectfully PASCHALL MORRIS, Seed Grower and Dealer, 1120 Market st., Philad'a.

BOSTON, Mass., October, 1865.—Mr. Henry Tilden:—We have cultivated your Seedling Tomato the past summer, and have been greatly pleased with it. It promises in a greater degree more excellences than any other variety we have grown. It is of good size, round and smooth, a good color, nearly solid, a good bearer, moderately early, and what is of great importance, carries well and handles well for the market. Res'y yours, HOVEY & CO.

The American Agriculturist says:—"This comparatively new tomato is held in high estimation by the cultivators about Philadelphia. It is oval (flatwise) very smooth and solid. It is said to be of superior flavor, a great bearer, and so firm when ripe as to be very good for marketing."

E. A. REUL, of Alton, Ills., writes to the Rural World:—"Last spring I procured some of the seed from Mr. Tilden, and have grown them this season along with five other sorts, the Large Early Smooth Red, Early York, Fejee, Lester's Perfected, and Extra Early Red. The Tilden proved the earliest, (contrary to Mr. Tilden's representations) solidest, most productive, and best flavored of all; and I think so well of it that I shall grow no other next year either for my own use or for shipping."

JONATHAN PERIAM, of Chicago, says:—"I consider this Tomato (Tilden's) to be the best that I have ever grown. It is a heavy bearer, has handsome shape and color, is smooth, solid, containing few seeds, of fine flavor, and bears transportation better than any other variety with which I am acquainted."

N. J. COLMAN, editor of the Rural World, on receiving a box of this Tomato from Mr. Tilden, says:—"They were the largest and smoothest Tomato we ever saw, and their quality even surpassed their appearance."

Mr. Tilden selected the finest and most perfect specimens from more than a thousand bushels, and saved the seed from them, obtaining but a limited quantity, determined that nothing but the best should go out.

Distribution of Seed.

The Publishers of THE PRAIRIE FARMER have purchased from Mr. Tilden the entire lot of this seed at a very large price to distribute to the subscribers to

THE PRAIRIE FARMER.

The distribution will be as follows:

One package to every present subscriber who has renewed

or does renew for 1866, and sends 5 cents, to pay for postage and putting up.

One package to every new subscriber who sends 5 cents in addition to subscription, for postage and putting up.

Each package will contain seed enough to raise from 75 to 100 plants. Fifteen plants, well cultivated, will produce sufficient to supply any ordinary family.

Additional Packages

will be sent to any address, post-paid, on the receipt of 50 cents.

Sample copies of THE PRAIRIE FARMER sent FREE to any one who desires them.

A good agent wanted for THE PRAIRIE FARMER in every neighborhood in which we have not one already.

Terms of paper, \$2.00 per year.

ANOTHER SENSATION NOVEL,

FROM A VERY HIGH SOURCE,

(Intellectually) as any discriminating reader will see before perusing many pages, is

HERMAN:

— OR, —

YOUNG KNIGHTHOOD.

The vicissitudes and changes of human life, in almost every phase, are drawn by the hand of a master in the pages of this graphic work. It cannot be read without leaving a most salutary impression upon every mind and heart. We call it a "Sensation Novel," not in the offensive sense in which the term is frequently applied to the wishy-washy emanations of the press, intended to pander to the most depraved tastes, but in that higher, better and ennobling sense which we apply to the best productions of Scott, Irving or Dickens. Buy it and read it as soon as published, and see if we over-estimate its power. Two handsome volumes. Price, \$3.50. Copies sent by mail, post-paid, on receipt of price.

Every Child on the Continent should have it!
The Best Children's Paper in America.

"Mr. Sewell's Paper already excels every other children's paper that we know of in this country."—Chicago Eve. Jour.

PUBLISHED THIS DAY,—
A New and Beautiful Book.
BRANCHES of PALM.

By MRS. J. S. ADAMS.

This book cannot fail to be welcomed and treasured by all lovers of "the good, the beautiful, and the true." Every one who possesses it will realize the truthfulness of a remark made by one who had the privilege of looking over its pages while in proof: "While I read it seems as though an angel stands by my side and talks to me." Another, in a letter to a Boston paper, says: "It is mostly prose in form, but all poetry in spirit. It is a staff that will support every weary pilgrim of earth that takes it in hand. It tells us how to live better, and die happier. Its pages, all along, reveal the yet unrecognized goodness of God to man. In chastisement, as well as in blessing, it recognizes the guidance of Wisdom. It is a precious book, for it gives the reader food and comfort. It is a book that every one afflicted needs; the wayward need it, the thoughtless need it, the unhappy need it. It is a sweet and holy song to the devoted and devout. The poor, the rich, the ignorant and the wise, will find rich blessings in it, and it will guide the feet of many over dangerous places."

To the weary and worn pilgrims on these shores of time, to those who long for a voice from heaven to speak to them; to those who mourn as well as to those who rejoice—to all of us, journeying through this world of beauty to one yet more beautiful, these "Branches of Palm," will truly prove to be the almoners of many spiritual blessings.

This new work, finely printed, and beautifully bound; is eminently valuable and attractive as

A Gift Book For all Seasons, Persons and Occasions. 1 Vol. 16mo. heavy paper, finely bound in English cloth, Price, \$1.25 a copy; on receipt of which it will be sent by mail, post-paid. ADAMS & CO., Publishers, Boston.

OUR SPECIAL LIST OF PRIVATE ANATOMICAL, MEDICAL, AND PHYSIOLOGICAL BOOKS, intended for those who need them, sent on receipt of stamp. FOWLER & WELLS, New York.

The New-York Tribune.

1866.

Our most momentous, arduous struggle having resulted in the triumph of American Nationality, the utter discomfiture and overthrow of Secession and Slavery, THE TRIBUNE, profoundly rejoicing in this result, will labor to conserve the legitimate fruits of this grand, benignant victory by rendering Liberty and Opportunity the common heritage of the whole American People now and evermore.

Discouraging all unmanly exultation or needless infliction of pain or privation on the upholders of the lost cause, it will insist on the earliest possible restoration of the Southern States to their former power and influence in our Union on the basis of All Rights for All their People.

It will labor in hope to prove that the substitution of Free for Slave-Labor must inevitably and universally conduce to the Increase of Industry, Thrift, Prosperity and Wealth, so that the South, within the next ten years, must look back amazed on her long persistence in a practice so baldf as the chastelizing of Man.

It will labor for the diffusion of Common School Education, Manufactures, the Useful Arts, &c., &c., throughout every portion of our country, but especially throughout the sections hitherto devoid of them, believing that every good end will thereby be subserved and the interest of every useful and worthy class promoted.

It will urge the Protection of Home Industry by discriminating duties on Foreign Products imported, with a view to drawing hither the most capable and skillful artificers and artisans of Europe, and the naturalizing on our soil of many branches of production hitherto all but confined to the Old World, while it will strengthen and extend those which have already a foothold among us.

It will give careful attention to progress and improvement in Agriculture, doing its best at once to bring markets to the doors of our farmers and teach them how to make the most of the opportunities thus afforded them.

It will devote constant attention to Markets, especially for Agricultural Products, with intent to save both producer and consumer from being victimized by the speculator and forestaller.

And, giving fair scope to Current Literature, to the proceedings of Congress, and to the General News of the Day, it hopes to retain its old patrons and attract many new to bear them company.

We rarely employ traveling agents, as so many impostors are habitually prowling in the assumed capacity of solicitors for journals. We prefer that our subscribers shall pay their money to persons they know and of whose Integrity they are assured. Any friend who believes he will do good by increasing the circulation of THE TRIBUNE is authorized to solicit and receive subscriptions. Specimen copies will be promptly sent without charge to those requiring them, and we trust many friends will be moved to ask their neighbors and acquaintances to join in making up their clubs.

TERMS.

WEEKLY TRIBUNE.

Mail subscribers, single copy, 1 year—52 numbers.....\$2 00
Mail subscribers, Clubs of five..... 9 00

NEW-YORK, FEBRUARY, 1866.

NEW SERIES—No. 229.

THE STRICKEN MALLARD. — FROM A PAINTING BY GEORGE LANCE.

The Mallard, called also Green-head, is the parent of all our common domestic varieties of duck of whatever colors,—of the White Aylesbury, as well as of the more gaily colored Rouen. This is the *Anas boschas* of the naturalists, and the type of the natural family to which it belongs,—the duck of ducks. It is familiar to almost every one, from New York southward and westward; in New England and northward it is, however, less common, except as seen in the markets where it is always easy to distinguish between the Mallards and tame ducks by the delicate feet of the wild fowl. They are not easily domesticated, as we understand, being apt to

pine in confinement, and not bearing our summers nor winters well. We often find among our domestic ducks those whose colors approximate very closely to the wild Mallard, and there seems to be no probability that a breed of tame ducks gained from this original stock, would possess any advantages over those we now have. The beautiful engraving we present will be hailed with pleasure as a familiar sight by many a sportsman from Ohio to Kansas, and from the Great Lakes to the Gulf. The distress of the bird, so well depicted, is of short duration, and the sight of a fine bird shot, and perhaps dropping almost into his hands, is a very satis-

factory one to the gunner. This bird has not been shot in the breast, as a novice might suppose; the artist, who knows so well how to depict these wild summersets in the clouds, could not have made that error. The thick plumage which forms a cushion, that in alighting takes the weight of the heavy body, is a defence against any but very large shot at short range. The pair of frightened and screaming companions show from their position, and the direction of their flight, that the gunner waited till he had a rear sight, and could "see the color of the legs," by which convenient measure, duck shooters are accustomed to estimate distances.

AMERICAN AGRICULTURIST.

NEW-YORK, FEBRUARY, 1866.

A month goes by very quickly, and January seems to us always to speed its flight more quickly than other months. Only a few days ago we greeted the New Year with its hopes and promises, now it is already old. The lessons of the new year may be at any time properly laid to heart. We always plan for the future, for improvement, for higher success. We always have the past with its experiences, of prosperity and adversity, of success and failure to draw lessons from. We are now approaching the season of hard work, and he that lays carefully his plans with reference to it, will save himself not only labor, but perplexity and anxiety enough to make all the difference between a life of comparative ease and satisfaction, and one of annoyance and worry. Good plans are the lubricators of a farmer's life. Wheels with well greased axles contentedly "purrr" along the road. Work without plan drags, and like a squeaky wagon distresses even the passer-by. Let us then lubricate,—and if our readers will use our hints as their wagon jack, they may put the running parts of their farm wagons in good order, so that they will not require half the team when the ruts are deep, and before the roads are settled for the season. It is a poor time to stop and grease axles when the team is floundering in the mud.

Hints about Work.

Our effort in these "hints" thrown out from month to month is not to be repetitious. Still there must almost of necessity be a little sameness, and we fear some of our readers avoid these pages with the thought that they contain the same things over and over again. This is a great mistake. Few pages are the result of more thought or contain more valuable ideas. While upon the subject of spring work we are led to consider the

Working Animals.—On these the farmer depends for almost every thing of success. They are as necessary to most tillers of the land on a large scale, as is the soil itself. Their good condition for labor is just so much capital. The abominable farming which still in many parts of the country regards "spring poor" stock no disgrace to their owner, and looks upon the condition of leanness, which many oxen and steers present in the spring, as perfectly natural, cannot come under too strong reprobation. It is not only cruel in the extreme, but damaging to the farmer's own interests to the last degree. Poor stock given out soon in plowing and heavy work. Four oxen will hardly do the work that two should. Pluck and endurance may be accurately measured by condition.

Beef Stock kept stalled, will gain very rapidly as the weather moderates. The meal or oil cake fed should, if any thing, be increased.

Cows which "come in" in the spring should have good hay or cut feed (stalks or straw) with bran upon it, and if possible some roots daily. They at least need warm sheds and sunny yards. Good stabling at night and in cold weather, and warm sheltered yards on pleasant days, will make not only a cow's paradise, but reward the farmer with fine calves, and a better flow of milk. It is especially important that

Sick or accidentally disabled animals be confined away from the herd, as soon as the injury or sickness is discovered. When cows are near their time, an accident to one causing "sinking" will be very likely to cause the same disaster to several. Every stock yard should have one hospital, and many an animal may be preserved from severe sickness by taking it from the herd and changing its diet, blanketing, currying, etc., for a few days. Never "doctor" animals by guesswork. In the anxiety to do something, many are just as apt to do the wrong thing as the right. Consult your family physician in severe cases; if he is a humane man he will think it no unwarrantable liberty; or watch the symptoms carefully and consult the druggist.

Horses.—It is quite common for large horses to have swollen legs in winter, especially if they are not kept in regular use. The same horses in summer, especially if more or less in the pasture, are not troubled in this way. These enlarged legs indicate a weakly constitution. In a system perfectly vigorous, these secretions would work off and leave the limbs clean and smooth. The proper treatment in winter is to keep the horse in fair condition, not fat, and allow him to stand a pair of each day in a roomy box (or large stable) where he can walk about a little. Then he should have regular out-door exercise, not less than an hour daily. The legs should be rubbed dry and clean after each exposure to mud and snow. Indeed, the more "elbow-grease" expended in rubbing the legs, the better.

Brood Mares that are kept tied in stalls, should have an opportunity to exercise every day, either in the yard, or by moderate driving. A liberal supply of water is also essential, as we have known mares to "slink" when they did not get drink for a day or two. Work-horses not required to labor, should be driven moderately at least once a day, several miles. Teams that are worked hard all winter, endure the severe fatigue of plowing, harrowing, etc., much better than if worked but little during the cold weather.

Water for Stock.—When water must be pumped for all kinds of stock, in very cold weather, the weaker ones sometimes fail to get a suitable supply, as the surface freezes over, or the master animals drink the limited quantity that boys and lazy men will draw for the entire herd.

Sheep.—Every animal, whether old or young, that does not get its proper allowance of feed, or that requires a little extra care, should be separated from the flock, and provided with comfortable quarters and better feed than strong and healthy sheep receive. A few old ewes and the weakest lambs may occupy a small apartment together. Mutton sheep, as well as those to be kept over, should have a few roots daily, to prevent the stretches. Ewes that are near yearning should be confined in a spacious, but warm apartment, so that the lambs may not be chilled and lost by exposure to cold. Hemlock and pine boughs are excellent for all kinds of sheep, and are a substitute for roots.

Swine.—Breeding sows require care this month. Do not feed them much meal. They require bulky and light feed. Skimmed milk with bran, or oatmeal and boiled potatoes are the best feed. The best feed for young hogs designed for heavy pork next autumn, is equal quantities of oats and peas, ground and mingled with milk and slops from the kitchen. Let all swine have warm and clean apartments, well supplied with dry straw. Swine will eat a small quantity of light clover hay, and if it be cut two inches long, all the better. Occasional feeds of raw roots of any kind will be good for them.

The Wood Lot receives at this season more attention than at any other. All agree to the desirableness of cutting firewood in the winter, but in regard to felling timber for other purposes, there is considerable dissent. Trees that have ceased to grow rapidly, only cumber the ground. Such are usually recognized with ease, by the peculiar mossiness of their trunks, and the scattered dead limbs, and with a little calculation they may be felled without injuring growing timber. See an article on this subject on page 372, December, 1865. No trees should be cut now for timber, which leaf out early and require only a few warm days to fill them with sap, like the maple, birch, beech, etc. Oak, hickory and ash may perhaps be cut now as well as earlier. Sticks of hard wood for wagon tongues, sleighs, farm implements, etc., may be cut now, and be "sticked up" that is piled with sticks between them, so that the air may circulate among them that they may season uniformly. It is very important that

Fencing Staff especially that for posts, should be split out, peeled, and piled up to season before being set; and the same is true of bean and hop poles, wood for grape trellises, stakes, etc., to insure durability. Good sledging must be improv-

ed to haul timber of all kinds out of the woods, or to and from the saw mill.

Waste of Fuel.—One way in which farmers often waste fuel, is by chopping the logs into suitable length for the stove, instead of sawing them. The waste in chips, as well as labor, is considerable. Another waste comes from allowing the wood, after being prepared for fuel, to lie out of doors for several months, exposed to all weathers. Wood should not necessarily be housed while green; but after the winds of March and April have blown through it, it should be got under cover. Otherwise, it becomes "dozy," and loses much of its value. If housed early, it will remain hard, almost like anthracite coal, and will last very long.

Winter Wheat.—See that no water stands on winter grain. During mild and thawing weather, when wheat sown in drills has been partly lifted out by frost, it will often pay to haul half an inch of dirt with hand hoes over the roots. This will save them from further injury by freezing and thawing. Usually, however, the earliest field work, preceding even that "clearing up" and setting to rights which every farm gets after the weather is settled, is

Seeding to Grass and Clover.—This may often be done in February if the ground is bare and the frost so far out that there is little danger of washing by heavy rains and thaws. Procure the best seed you can of such grasses as you wish to sow; Clover, Timothy, Orchard Grass, Kentucky Blue Grass, etc. Obtain samples of the dealers which you may carefully examine for weed seeds, and the excellence of which may be tested, before buying large quantities. Sow upon winter grain when the ground is stiffened by frost or a light snow.

Spring Grain.—Decide now what you will sow, and secure the best seed possible. If you sow seed of your own raising, select by repeated winnowings the very plump and heaviest kernels, and treat that which you buy in the same way, if you can afford to. Commence also at once to collect

Seeds of all Kinds, concerning which see hints in other parts of this number. During the present month, also, is the best time to secure

Good Farm and Garden Hards.—The prospects, as we judge, are, that there will be fewer applicants than places, even though the war is over and the great armies disbanded.

Work in the Horticultural Departments.

As we write, the mercury without is so far below zero that it seems almost impossible that it should get far enough above, this winter, to allow of much out-of-door work. Yet as we generally have had mild spells in February, it is probable that they will occur this year, and if they do, the notes in January will suggest several things that may be done, which are unnecessary to repeat here.

Orchard and Nursery.

The demand for nursery stock from the Southern States is already large, and will rapidly increase. Trees, etc., to fill these orders have to be sent off as early as possible, as in many southern localities February is the suitable month for planting. In packing and shipping trees at this season, great care must be taken to guard them from freezing during the transit. Those who find the trees frozen when they are received, should bury the roots in earth and allow them to thaw gradually. A mild, damp, drizzly time should be improved to give

Old Trees—and young ones too if they show any signs of bark-louse—a washing with some alkaline preparation. Soft soap made sufficiently thin to work with a whitewash brush is as efficacious as more expensive and troublesome preparations. Go over the tree with this, and the rains will complete the washing. Unless the tree is in a very bad condition, no scraping will be needed after this wash.

Grafting is frequently done too soon. In some parts of the South grafts may be set this month; it is best to postpone the operation until the buds begin to swell. Those who go about renewing

orchards by grafting, may say that it makes no difference how early the work is done, as they wish to make their season as long as possible; but it will be found that where cions remain a long time exposed to the drying winds of spring, their chances of succeeding are much lessened. A correspondent takes exceptions to our advice to bury

Cions in the earth of the cellar, for the reason that the earth there is so impregnated with nitre and other salts as to injure them. In old cellars this objection may exist, but we had in mind such a cellar as we had been accustomed to use for the purpose, where the soil was very sandy and the difficulty alluded to could not occur. Where there is any doubt about the suitableness of the soil for this purpose, the cions may be packed in pure sand or in moss; both these materials should be kept slightly dampened. The ends to be attained are the preservation of the natural moisture of the wood, and a temperature which is so low that the buds will not be excited to swell, and yet not so low as to freeze. The necessity of sending

Orders to Nurserymen as early as possible, was mentioned last month and should be borne in mind.

Fruit Garden.

But little can be done beyond seeing that no injury occurs from heavy storms, from stray quadrupeds and careless bipeds. With many it is the custom to take the "shortest cut" when snow covers the ground, and to go over the snow in a straight line on foot, or with vehicles, regardless what may be under it. The fruit garden should be so situated that there is no need of passing through it, but if this is not the case, take measures to keep any one from trampling on and injuring the beds.

Grape Vines which were neglected last fall, may be pruned in a mild spell, as may

Currants and Gooseberries.—The wood from these may be used for cuttings, as also that of the vine, but it is not as good as that taken in autumn.

Kitchen Garden.

The market gardeners around New York start their hot beds in February, but this is too early by a month for any but professional gardeners. The best time, which will of course vary with the locality, is about six weeks before the season at which plants may be set out with safety. Every thing should be made ready in advance. The manner of constructing frames, etc., is given on another page.

Manure in abundance should be in readiness. It is best to keep it under a shed where it will not be exposed to heavy rains. The heap should be forked over occasionally to prevent the center from becoming dry and overheated; by forking it from one pile into another it becomes uniform throughout, and if too dry it can be watered. Use will now be found for the

Leaves, the gathering of which we have so often advised. By using from one-fourth to one-half as much leaves as manure, there is great saving of manure, and a more uniform and enduring heat to the bed. A rich light and rather sandy

Earth will be needed for the bed, and if this has not been provided for beforehand, take advantage of a thaw to secure it, provided it is not too wet to move. Then the sash will need covering during cold nights, and perhaps during some cold days also. For this purpose nothing is better than

Straw Mats, made large enough to cover a sash. They are easily made by stretching a warp of twine, and laying neat handfuls of straw upon it, butts out towards the edges of the mat, and the tops overlapping in the centre, and lacing each handful in place by means of small twine.

Shutters made of boards fastened together with cleats, are also used. In absence of this an old carpet, or even loose straw thrown over the glass is better than nothing, to prevent loss of heat by radiation during the night.

Cold Frames in which cabbage and other plants are wintering, must not be neglected. Air whenever the weather will allow, and take care that mice

do not destroy the plants. When the ground is thoroughly open, by thawing during a mild time,

Horse radish may be dug for use or market, as may **Parsnips and Salsify,** and thus make the stores in the cellar last longer.

Onions that have frozen should be kept from thawing by covering them with hay. A freezing does not injure them, but frequent freezing and thawing disposes them to decay. Market gardeners do not take the trouble to put brush to their peas, but in private gardens it not only contributes to neatness, but increases the yield, to give all but the very dwarf kinds a support. Lima, and other beans also need something to run upon.

Brush and Poles are best got in winter. Nothing looks more slovenly, than these if cut after the leaves have developed. See last month for hints on their preservation. If one has a green-house, or a warm light room even, a few strong roots of

Rhubarb may be forced to give early stalks. Take up the roots and place them in tubs or boxes of earth in a warm place, and they will soon throw up leaves, at the expense of the roots. Every source of

Manure should now be at work to its fullest capacity, as suggested last month.

Seeds will of course be needed, and this month is the one in which to attend to the matter. For those who are in doubt what to buy, we have given on page 61, a list that will aid them, and all inexperienced gardeners should read Mr. Henderson's excellent hints on page 59.

Flower Garden and Lawn.

In the more genial climate of the Southern States the gardener may proceed with laying out, putting down walks, and edging, and planting, but at the North, he can only think how he will do it when the frost leaves the ground. The injury which trees and shrubs may receive from heavy falls of snow was alluded to last month. Much of the mischief from frost is done in February, when the noontide sun is quite powerful and the temperature sinks low at night. All but the hardiest of the

Broad-leaved Evergreens, such as Rhododendrons, Kalmias, etc., need a partial protection from the sun, where they are much exposed. The pruning of

Shrubbery may be done, but it should only be trusted to some judicious person who knows the nature of the plants he is at work upon. Beware of those jobbing gardeners who go about doing pruning and similar work. They hack away indiscriminately and judge of the thoroughness of their work by the heap of brush they make. Some shrubs have their flower buds already formed, while others produce their bloom upon the new growth of wood, and it is evident that the treatment which would throw the last named into flower, would entirely spoil the other for the season. In pruning avoid all attempt at formality. Remove needless suckers and over crowded growth. Lilacs, Forsythia, Laburnums, Japan Quince, Flowering Almond and Plum, Viburnums, etc., only require judicious thinning. Rhododendrons and Azaleas have large blossom buds, and to remove these now would cause the loss of flowers. If such bushes need to be brought into shape, it is better to wait until they have flowered.

Honeysuckles and similar climbers will do all the better if the excess of wood be thinned out, leaving only enough to cover the trellis. The Hibiscus or

Rose of Sharon, commonly but incorrectly called *Althea*, where allowed to have its own way, makes a straggling weak bush that flowers but poorly. It needs the severest kind of pruning, cutting back, so as to leave only about three inches of the growth of last year. Where annuals are wanted early, and for the half-hardy ones, a hot-bed will be needed, but it is too soon to start it yet, though the preparations suggested under Kitchen Garden may be made. Read about starting seeds in boxes on page 62.

Dahlias and other roots stored in the cellar need to be looked to occasionally. If they shrivel somewhat from dryness, no harm is done, but if there is

any indication of mould or rot, they must be removed to a dryer place to prevent deterioration.

Trellises and all supports for plants may be made and neatly painted of some inconspicuous color.

Green and Hot-Houses.

No matter how variable the temperature is without, the fires should be so managed that the interior of the house is but little influenced.

Insects, as with other evils, success in overcoming them depends in a great measure on beginning in time.

Camellias that have done flowering, may be pruned into shape; shorten straggling branches to a good bud.

Bulbs, and supply them with abundance of water.

Seeds of tender annuals may be sown for early blooming, and a stock of all the needed kinds of Bedding Plants be propagated from cuttings.

Apiary in February.

If the weather continues wintry, follow the directions given last month, especially not forgetting to screen the hives from the influence of the sun after snows, when the weather comes off mild and warm.

First-Rate Premiums. OPEN TO ALL.

With the exception of five articles, which have been largely called for, and of which a new stock is not readily available, we continue the offer of our last month's premium articles.

Most of the premiums offered in the table below, and probably all, will be open for two or three months yet, at least, so that every one will have ample time to fill up lists of names in progress.

Many have received from one to four large premiums, and are getting new clubs, to secure still other articles. We are constantly receiving premium clubs from persons who say they found it quite easy to get up a club when they took hold of the matter in earnest.

We have no special or traveling agents, but any one disposed to do so, can act as voluntary agent, and receive the premium as an acknowledgment of his efforts,

and if it be an article he does not want, he can usually sell it for nearly or quite the regular price, and thus receive a good compensation.

Men and Women of various occupations, Farmers, Gardeners, Post-masters, Merchants, Mechanics, Clergymen, Teachers, Soldiers, Boys, Girls, etc., can engage in the work, and secure good pay for it, in the premium articles, which are all good and desirable.

Table of Premiums and Terms, For Volume 25. Open to all—No Competition.

Table with 4 columns: Names of Premium Articles, Price of each, Number of copies, and Name of author. Includes items like Garden Books, Nursery Stock, and various agricultural guides.

No charge is made for packing or boxing any of the articles in this Premium List. The Premiums, 1, 2, 3, 7, 8, and 13 to 26, are DELIVERED to any part of the United States and Territories, free of all charges.

In the above Table of Premiums, the First Column gives the Number of the Premium. The Second gives the lowest market price, or even less in some cases. The Third Column shows how many subscribers are required if sent at the regular price, \$1.50 a year.

To avoid errors and save immense labor in looking over our books, it is absolutely essential that every name designated for a premium list be so marked WHEN sent in.

Premium 1.—Good Books.—Any person sending 25 or more subscribers, may select Books from the List on this page, to the amount of 10 cents for each subscriber sent at \$1: or to the amount of 30 cents for each name sent at the (ten) club price of \$1.25 each; or to the amount of 60 cents for each name at \$1.50.

The other Articles are fully set forth in the Descriptive List referred to below, and briefly last month.

These Winter Months afford a very favorable opportunity for collecting premium lists. Last year we sent more premiums in Feb'y and March than in Jan.

FULL PARTICULARS about each premium article, etc., are given in a "DESCRIPTIVE LIST," which we mail to any one desiring it. Send for it. The premiums are of a standard class, and enough of each can be obtained to supply all entitled to them.

BOOKS FOR FARMERS and OTHERS.

[Any of the following books can be obtained at the Office of the Agriculturist at the prices named, or they will be forwarded by mail, post-paid, on receipt of the price. These prices are positively good only to March 1st.]

Table listing various books for farmers and others, including titles like 'Allen's (L. F.) Rural Architecture', 'Allen's (H. L.) American Farm Book', and 'American Bird Fancier'.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, show at a glance the transactions for a month, ending January 18, 1866, and the year ending December 31, 1865, with other interesting comparative figures.

1. TRANSACTIONS AT THE NEW-YORK MARKETS. RECEIPTS. Flour, Wheat, Corn, Rye, Barley, Oats. 25 days this m'th, 125,000 31,500 139,000 11,300 10,500 61,000

2. Comparison with same period at this time last year. RECEIPTS. Flour, Wheat, Corn, Rye, Barley, Oats. 25 days 1866, 125,000 31,500 139,000 11,300 10,500 61,000

3. Exports from New-York, January 1 to Jan. 18. 1865 55,237 50,281 63,850 13,419 2,661 184 17,712 43,334 71,530 1,825 141

4. Receipts of Breadstuffs in New-York in each of the last three years: Flour, Wheat, Corn, Rye, Barley, Oats. 1865 3,028,525 8,768,920 15,935,277 800,670 3,230,054 9,831,955

5. Exports from New-York during each of 7 years past: Flour, Wheat, Corn, Rye, Barley, Oats. 1865 1,402,141 2,571,626 4,519,610 108,348 54,567 1,916,592

6. Comparative Stock of Flour in New-York, Jan. 1. 1861. 1865. 1866. Western and State Flour, bbls. 557,057 465,835 703,232

7. Comparative Stock of Grain in New-York, Jan. 1. 1863. 1864. 1865. 1866. Wheat, bush. 4,334,817 5,540,444 1,897,356 2,940,168

8. Receipts of Breadstuffs at Albany, by the New York Canals in each of the last six years: Flour, Wheat, Corn, Rye, Barley, Oats. 1860 1,140,100 1,176,000 14,155,500 322,100 2,867,600 6,490,900

CURRENT WHOLESALE PRICES. Dec. 20. Jan. 18. FLOUR—Super to Extra State \$7 00 @ 8 50 \$6 90 @ 8 40

also be valuable for reference in after years... Gold has been as high as 145, and as low as 136 1/2, since our last closing (Jan. 17) 140 1/2... Receipts of produce, during the past month, have been extremely light, especially in the breadstuff line, yet receivers have been eager sellers, in view of the decline in gold.

New York Live Stock Markets.—BEEF CATTLE.—Average receipts for the past four weeks (ending January 17th), 4,334; weekly receipts for previous month, 5,843; weekly average for past year (1865), 5,250; weekly receipts for same period last year, 4,942.

Some January Numbers Delayed.—An increase over last year of about 20,000 subscribers received between Dec. 20, and Jan. 15, taxed our usual and extra office force to the utmost, exhausted the customary provision of paper and printed numbers, and rendered it utterly impossible to mail the January number to subscribers as fast as their names were received.

Good Advertisements occupy considerable space in this number, and many of them are of peculiar value at this season, when every one is laying out his plans for spring. It will pay to look them all carefully through. We repeat the standing request, that those ordering of our advertisers, sending for circulars, etc., will write where the advertisements were seen.

Containing a great variety of Items, including many good Hints and Suggestions which we throw into small type and condensed form, for want of space elsewhere.

Forty pages Again!—Though the past size of this journal has been 32 pages, which is all we have promised, we are compelled to issue 40 pages, as we did last month. The extra advertising in part meets the extra expense for paper, etc., and thus we are able to add largely to the reading columns, for, it will be noted that for every added page of advertisements, we add at least one extra page of reading matter.

Back Volumes of the Agriculturist for 9 years are supplied neatly bound at \$2 each (or \$2.50 if to be sent by mail); and \$1.50 unbound (or \$1.75 if sent by mail). The German Edition for 7 years past, supplied on the same terms, bound or unbound. Any single number (for 9 years past) sent for 15 cents post-paid.

Please speak of the German Edition.—It may not have been noticed by all, that we issue the Agriculturist in the GERMAN language also, and this has long been the only German paper of the kind in this country, though there are here several hundred thousand German cultivators. Our German Edition contains all the engravings and valuable articles of the English, besides an excellent special department, edited by Hon. FREDERICK MUENCH, of Femme Osage, Mo., who is a

State Senator, a practical cultivator, and a distinguished German writer. This department occupies a portion of the space used for advertisements in the English edition. The German edition is supplied on the same terms as the English, and may be clubbed with it. It ought to have a hundred thousand circulation. Our readers will confer a favor, both upon the Publishers, and upon many Germans as well, by making its publication all character more widely known. Many having German gardeners, farmers, or laborers, take both editions.

Morton's Premium Pens.—We have sent out a good many dozens of these, singly, as premiums, and if they give as much satisfaction as the one we constantly use, they are doing good service. One writes that "the pen is first rate, and the pencil very convenient but it ought to have a magazine for pencil leads."—There is one in every case, with a good supply of leads, found by unscrewing the pen-holder, near the base of the pen.

"Arthur Merton" is the title of a most valuable book, published by J. C. Garrigue & Co., Philadelphia. It details the trials, temptations, fall and reformation of a young man, in a manner calculated to impart instruction to every young person, as well as to all who have the care of youth—to parents, guardians, employers, and teachers of both week-day, and Sunday schools. 12mo., 268 pp. Price \$1.25. Sent post-paid by the publishers as above, or from this office.

Back Volumes of the Genesee Farmer for 8 years past, are supplied at the Agriculturist office. Terms by mail, for bound volumes, \$1.25 each, unbound \$1 each volume. The volumes for 1864 and 1865 contain the first 24 numbers of the "Walks and Talks on the Farm," of which No. 26 is given on (pages 50-1). Each of the back volumes of the Farmer contains much useful information.

Good Advertisements occupy considerable space in this number, and many of them are of peculiar value at this season, when every one is laying out his plans for spring. It will pay to look them all carefully through. We repeat the standing request, that those ordering of our advertisers, sending for circulars, etc., will write where the advertisements were seen.

This is a good Month for Premiums.—A notice in another column (p. 44) announces that the Premiums will remain open for some time yet. Perhaps the present month is the best one in all the year to gather up a large list of subscribers and secure some one or more desirable articles free. Many have not yet renewed their subscription to any paper, and there is still a large multitude who have not even seen a copy of the Agriculturist. This month people are beginning to lay out their plans for the next season's work, and they will be the more ready to receive all the hints and suggestions they can from papers, and otherwise. Please let them have a look at the Agriculturist, and an invitation to take it regularly. Thousands of dollars' worth of premiums have been already sent out, and are giving universal satisfaction. There are plenty more.

A Seed Store in Every Town.—The large number of seed advertisements in this paper, all of them from good, reliable parties, is a specially valuable feature, alone worth the subscription price. The cost of carrying seeds by Mail to the remotest corner of the most distant territory of our country, is only eight cents per pound, or 2 cents for each 4 ounces. This will enable our readers, with our advertising pages before them, to procure good seeds almost as conveniently, and perhaps more cheaply, than if an extensive seed store was located at every one's door.

Rural Annuals.—The Rural Register (30 cents), and the Rural Annual (25 cents), are valuable to every cultivator, and these annual volumes are worthy of being read and preserved for reference. The numbers of both these works for 1866 are now ready.

The foregoing tables have been carefully prepared, specially for the American Agriculturist, from other and other reliable sources, including the notes of our own reporter. They will be found highly interesting, as showing the course of trade and giving a general view of the condition of our breadstuff supplies. They will

delicious as peaches which may be eaten right from the tree." But he is nothing to Luther Sutton, who hails from Wisconsin. Luther has wheat with seven heads on one stalk. Likewise he has seed of the "Western Green Tea," which people must be very green to buy. Moreover, he has "paint seed." A wonderful seed it is too—with both paint and oil in the seed, and as brooms can be made from the tops of this wonderful plant, we don't see why not paint brushes too. Besides all this, the same chap will "doctor for fits, cold sores and consumption, one month on trial for the receipt of 15 cents down," which is cheap. The blasphemous wretch uses the name of the Almighty several times in his circular, and calls himself a "Minister of the Cross of Christ." Will not people learn that seeds, plants, trees and such things of real value, do not first find their way to the public through peddlers, nor through the agency of such circulars as we have described.

Grape Mildew, Remedy Proposed.

Mr. J. Macracken, Secretary of the Hocking Valley Horticultural Society, sends minutes of a meeting held at Lancaster, O., from which we extract the following: "Informal remarks were made by Mr. Fetter's in regard to mulching as a preventive of mildew in vineyards and protection to orchards. He had experienced the benefits by comparing results in portions of his vineyard's mulched and not mulched, and he was well satisfied of the benefits, that he intended mulching his whole vineyard to the depth of eight or ten inches with bagasse (the ground cane of sorghum), thereby protecting the soil from the hot rays of the sun. Dr. Sanders always keeps surface soil wet, believing that rain on hot parched soil creates mildew." Mr. M. states, that while neighboring vineyards were ravaged by mildew, the mulched portion of Mr. Fetter's remained in fine condition. Please send the note on propagating the Delaware.

An Essay on Grape Culture.

We are indebted to Col. B. P. Johnson, Sec. N. Y. State Agl. Society, for a copy of an Essay on Grape Culture in Steuben Co., by Hon. Goldsmith Denniston. This Essay forms a part of the Transactions of the Society for 1865, and is also printed separately in a pamphlet form. Steuben Co., now ranks as one of the great grape regions of the country, and this account of the character of the land devoted to vineyards, and the methods of culture that have proved successful, is interesting and useful. It is fully illustrated by maps, etc. There are doubtless many other localities as well adapted to the growth of the grape, as are those near Crooked Lake, and this Essay will be a useful aid in forming an opinion of them.

The Catawba in Iowa.—Mr. A. Brodt, Lee Co., Iowa, sends us samples of Catawba wine, which shows that the grape ripens with him. The wine, though of a lighter character than that made further South, was exceedingly well made and a very creditable specimen.

Steuben County Grapes.—The neighborhood of Crooked Lake, in Steuben Co., seems to be especially favorable to the growth of the grape, and the brands of Hammondsport, Urbana, Pleasant Valley, and others, have already become well known in the New York Market. On the 12th of December, we saw ten tons of grapes from those places, at the Commission store of C. W. Idell, on West st. The fruit was Isabella and Catawba, in 5 and 10 pound boxes, and in excellent order. It met with a ready sale at 20 cents per pound wholesale.

Keeping Grape Cuttings.—Rev. W. K. Darecy. In a dry cellar in dry sand, the grape wood will be likely to become dry itself. In a cool cellar, they will do well if the sand be kept moist, but if it be both dry and warm, it is better to bury the cuttings out of doors below the reach of hard frosts. By putting some straw or litter over the place, the ground may be kept from freezing so that they can be easily taken out.

Iona and Israella Grapes.—W. S. Waters, Wilson Co., Tenn. We have nothing to add to the opinion given in October last. They are both worthy of trial in your State... I. Mattison, DeKalb Co., Ill. The Iona is not as hard to strike from cuttings as the Delaware. It is easily propagated from cuttings in the open ground, but the wood is just now too valuable to use in that way.

Apples in Wisconsin.—E. W. Daniels, Washara Co. says, that with him the King of Tompkins Co. proves one of the most tender varieties. From his own experience and that of his fruit growing neighbors, he gives the following as the hardiest. Duchess of Oldenburgh, Talman Sweet, Golden Russet, Perry Russet, St. Lawrence, Red Astrachan, Fameuse or Snow, Fall Orange. Sops of Wine and Westfield Seek no further.

Apple for a Name.—J. Osborn, Union Co., N. J. Apparently Victuals and Drink, a favorite variety in some parts of your State, where it is also called Big Sweet, and Pompey.

Crab Cider.—A correspondent wishes to know how the famous Crab Cider of Franklin Co., Pa., is made, and what kind of apples are used. Will some of our Franklin Co. readers respond?

Fruit Drawings.—"F. H. H.," White Marsh, Pa., sends some clever drawings, which he need not be ashamed to put his name to. The large apple is Peek's Pleasant. A fine fruit and good keeper. The other we do not recognize so readily. It may be Jefferis, a Chester Co. variety—but that is a guess only. The other fruit is that of *Celastrus scandens*. See engraving and description in August, 1864.

Forest Trees.—Many correspondents. It is our intention to give more attention to the culture of these than we have heretofore done. No progress can be made with their propagation at this season. If any seeds are on hand, do not let them dry up. Thin shelled seeds should be kept in sand, and those very difficult to start, such as Thorns and hard nuts, should be put into boxes of earth and exposed to the cold of winter. Arbor Vitæ seed may be kept in sand.

European Alder.—J. G. Eisenbrandt, Washington Co., Wis. The European Alder is sold at large nurseries, but at a price which would make it too costly to plant on river banks to keep them from washing. Our native Alders would answer as well, and probably the White Willow would be better than either.

Exterminating Locust Sprouts.—"E. K. T.," Orleans Co., N. Y., writes. "I would be thankful if some person could recommend, through the *Agriculturist*, an effectual way to remove or prevent young locusts growing up from the old roots." The only way is to cut off the sprouts when they are not more than a foot or two high. Young locust trees will give little or no trouble if they are mowed twice every season, close to the ground, when grass is cut for hay.

Late Strawberries.—B. F. Butterfield, Windham Co., Vt. The Georgia Mammoth is perhaps the best of the later varieties, and is a fair fruit, hard enough to bear transportation to market.

Flowering Shrubs.—Mr. H. Allen, Washington Co., N. Y. The shrub with double yellow flowers seen at Central Park was doubtless *Kerria Japonica* (often incorrectly called *Corchorus Japonica*), the Japan globe flower. It spreads greatly by means of suckers and often becomes troublesome. The Rose of Sharon, *Hibiscus Syriacus*, may be had at any of the nurseries.

Washing Seeds.—One of our readers called in to say that the easiest way to wash tomato, cucumber and other slimy seeds, is to tie them in a cloth and then wash them, cloth and all, in soap suds, then rinse and dry. He says that the mucilage is readily removed by this treatment. Make a note to try it next summer.

Poison Ivy.—Joseph Lux. That this plant poisons some persons and is harmless to others is a well known fact. We cannot tell why, any more than we can why cheese, honey, or any other usually harmless things are poisonous to some individuals. The queries propounded by you are without the scope of an agricultural journal, as they refer to obscure points in pathology.

The Practical Entomologist.—We have received two numbers of this sheet, and find it filled with interesting matter relating to insects, presented in a popular form. It may be had by sending 12 cents in stamps, to E. T. Cresson, 518 South 13th St., Philadelphia.

The Potato Trade.—New York enjoys a very large inland and coastwise commerce in potatoes, which has sprung up, or at least immensely increased within a few years. Formerly the seaboard towns of Connecticut, New Jersey, and Long Island were chiefly interested in this trade, and their crops were for the most part calculated for marketing in fall or winter. Now, however, the trade is controlled by dealers who purchase at the West, chiefly along the lines of emigrant travel. They make use in cold weather of the returning emigrant cars in which fires may be kept up if there is any danger from frost; and thus, in the coldest weather, and at an expense quite inconsiderable, compared with the advantage, the crop of the great West is brought to our markets. We learn that this system, which was at first put in operation, according to the *Detroit Free Press* in Southern Michigan, by a Mr. Shoecraft of St. Joseph Co.,

in 1857-8—is gradually extending—as it should. The use of warmed cars should not be confined to potatoes; eggs, apples, and other roots, especially carrots for cattle feed, might be profitably transported in this way. Another result is that eastern farmers who formerly raised winter potatoes now make their crops in mid-summer, or hold them over for spring prices. The former is the best practice, for the land is used for a crop of cabbages, or pickles after the potatoes come off, with great profit if in good condition and well enough tilled and attended.

A New Work on Bee-keeping.—Mr. Quinby, whose work on bee-keeping has long been a standard one, has entirely rewritten the volume, and given the results of an experience of many years. The work is well illustrated, and directions for all the practical operations in the apiary are given. The plates of this work have been ready for some time, and we have only been waiting until the printers should be relieved of the pressure of holiday work to print and issue it. It will be ready during the present month.

The European Timekeeper largely advertised to be sent on receipt of one dollar, in some cases 50 cents, is a form of sun dial on a card, costing the maker perhaps 5 cents, and of little or no practical value. An advertisement of it was offered to the *Agriculturist*, but declined because it was thought the purchasers would not receive the worth of their money.

Victor's Stories, FOR BOYS AND GIRLS, by the writer of "Uncle Paul's Stories," is an excellent book for children. There are 45 of these stories, told in a pleasant manner, and each inculcating some valuable lesson, without being "preachy" in style. The numerous engravings, its printing and binding, are all attractive. Published by the American Tract Society, Boston.

Adobes or Sunburnt Bricks.—N. J. Smith, Mitchell Co., Iowa. We have had some experience with houses built of these, in Northern Mexico. There the climate is perfectly dry for nine months in the year, and there is but very little frost. The houses are seldom more than one story in height, with very thick walls. When covered by a good roof and the outside is protected by a thick coat of plastering, they stand very well, but when, as is usually the case there, the roof is faulty and the walls unplastered, the bricks wash away badly in heavy rains, and they require pretty thorough repairs at the close of the rainy season. We know of no instances in which this material has been used in Northern climates. It strikes us that the great difficulty, in our uncertain climate, would be to get the bricks thoroughly dry. If they retained any considerable amount of moisture, the frost would cause them to crumble. We should be glad to hear from any who have tried this material.

Wire Clothes Line.—Charles Sylvester, of Mercer County, N. J., writes: "We have used a Wire Clothes Line for over five years. It has not been housed at all, and it is just as good as ever. It does not injure the clothes a bit. It is an old telegraph wire about $\frac{1}{4}$ inch in diameter and 'galvanized', (that is, coated with zinc.) The wire was a present to us, so I do not know what it costs, but can assure you it will pay for everybody to get one." [We believe it.—Ed.]

Loosen a Nut Rusted Tight, by holding a hammer or something heavy against one side, then placing a cold chisel as you would to cut the nut through to the bolt; give a few light taps on the chisel, which will expand and loosen the nut and seldom injure it." So says "P. G." of Peekskill, N. Y.

Laurel Poisoning.—Another remedy is proposed by a Farmer of Wickford, R. I., which is salt pork forced down the throat of cattle and sheep that have been poisoned by Laurel. He says that he has tried it with success. Such an inert antidote would indicate that the poison must be very mild, or the medicine useless.

Seeds by Mail.—E. P. Horne, Denver, Colorado. Seeds and plants have a legal right to go wherever there are Post routes and Post Offices, at the same rates in the Territories as in the States. We frequently send and receive such things in this way from Washington, and other Territories.

Plant for Edgings.—D. Noble, Shawanaw Co., Wis. The plant is *Lycopodium complanatum*, and is noticed on page 22. Mr. N. recommends this for edgings, but we do not understand from his letter that he has so used it himself. With us it only grows well in the shade. If Mr. Noble has succeeded with it in cultivation, we will thank him for an account of its management.

Implement Trials, under the Direction of the N. Y. S. Agricultural Society.—

A real stride forward.—The Secretary of the N. Y. S. Agricultural Society has issued a schedule for a trial of mowers and reapers, to take place at some time and place during the coming summer, to be decided upon at the time of the annual meeting (14th of February). The circular, which we have received, gives evidence that the effort will be made to secure as full justice, and as complete a test of all the qualities of each machine as possible. We hope, however, it will not be settled upon as the absolute guide of the committees of judges, without essential modifications. Any one applying to Col. B. P. Johnson, Albany, will receive this circular. (Send postage.) Besides the mower and reaper trial, it is also proposed to try, at the same time, hay rakes, hay tedders, hay presses, threshing machines, fan mills, etc., hay cutters, arrangements for loading and unloading hay, binding grain, also horse powers, and portable engines.

It is intended, also, to hold early in the season a trial of *Plows*, together with harrows, cultivators, spaders, clod crushers, rollers, drills, horse hoes, etc., for which schedules will be submitted at the time of the annual meeting at Albany, at the date above given.

Drag-Saw Questions.—C. T. Logan, Fulton Co., Pa. The drag-saw teeth should be filed to cut in *dragging*, and not in *showing*; for thus the saw is in no danger of bending, it clears better, and in sawing large logs cuts faster, and with less strain to the machinery. A 20-inch stroke is rather short for logs more than 2 feet in diameter; an adjustable crank-pin is often a convenience. You will find 130 pounds rather a light weight for your fly or driving wheel; 200 to 300 would probably be better.

The Cattle Plague.—The most recent accounts from Great Britain seem a little more favorable, yet the great distress and still greater danger is not abated. The shutting off of Canadian sheep and beeves from our markets by the recent law seems at present productive of no good, though it is a wise precaution to make perfectly sure that neither sheep nor neat stock should be allowed to enter this country which by any possibility might bring the seeds of the disease. A fine lot of long wool sheep, imported for breeding purposes, arrived in the harbor in the midst of the cold snap and were refused permission to land. Eight of them died from exposure, and the rest we presume have been reshipped. The government will doubtless make good the loss, for it is quite the same as taking private property for public use.

The Conn. State Ag'l. Society held its annual meeting at Hartford, on the 10th ultimo. The report of the corresponding Secretary is interesting and valuable for the review of the agricultural and stock prospects of the State; and the notice it takes of the Rinderpest, as it exists in Europe and England. The old officers were re-elected, viz.: E. H. Hyde, of Stafford, Pres't.; T. S. Gold, of W. Cornwall, Cor. Sec'y.; Burdett Loomis, Windsor Locks, Recording Sec'y. The N. E. Society is invited to hold its next fair in Connecticut.

The Department of Agriculture.—

The Commissioner of Agriculture, not having made much by threatening the Agricultural papers, has turned the batteries of his wrath towards his subordinates, whom he suspects of being in league with us, and of supplying us with facts in regard to the affairs of that blundersome concern. As usual, Isaac Newton is on the wrong track. Had we any communications from them, which we have not, we should not make use of them, knowing it would place them in an unpleasant relation to the head of the Department. We seldom see any of the gentlemen connected with the Department, and when we do, we have more pleasant subjects of conversation than Mr. Isaac Newton. More than all this, there is not the least need of going to any one in the Department for knowledge of its doings. There are several persons in Washington, outside of his subterranean dominions. If the Commissioner doesn't know that when he visits the other Departments, it is a signal for all the clerks to look out for fun, we will let him know it. We don't propose to let the Commissioner know how we learn about his official doings, but we have a plenty that are not in his report; suffice it to say, they do not come from any one over whom he has any control. For instance, when we wonder at the small results of the propagating garden, which being a government establishment with a most capable horticulturist in charge of it, we know that the fault is not the Superintendent's, but that gentleman does not inform us that his work is all for nought. Other people tell us, that every pear, grape, and other fruit as soon as it shows any signs of ripeness, is picked by the Commissioner or by his orders, and sent to some Senator or other public functionary, and the whole purpose of the garden, that of testing and comparing fruits, etc., is pervert-

ed. When we have a laugh over the hydraulic press blunder, we merely repeat what is told in the Washington circles as "Old Peanut's last." And when we say, that the Department is frittering away the valuable time of the entomologist on work of little use, while his valuable book on insects lies neglected, we only use our own eyes. This much in justice to the gentlemen above alluded to. Almost daily we see in some paper some expression of the contempt in which the head of the Department is held, of which, this from the Washington correspondence of a morning paper will serve as a specimen:

"Among the visitors recently at the White House was the Commissioner of Agriculture, who made a brave speech to the President, assuring him of his sanguine expectation for the early conglomeration of the States through the efforts of the Department of Agriculture:—"The people has laid down their spears and is beginning to take pruning hooks; and although the fields is wasted and the land mourns," quoth Isaac, placing one hand patronizingly on the President's shoulder, "yet we will distribute the seeds of harmony, the fruits of concord and garden sass generally, so as to let the South see the effects of good government and the wisdom of your administration." Upon concluding his remarks a copious dew was observed to be shed over the beaming countenance of Uncle Isaac; but the President preserved his usual equanimity and made no effort at reply. The employes of the department breathed easier upon the Commissioner's report of the effect of his address upon the President, and their appreciation of his abilities experienced no diminution."

The N. Y. State Cheese Makers' Association met at Utica, on the 10th and 11th of Jan.

The meeting was rendered particularly interesting by the addresses of the President, and of Mr. X. A. Wilard, and by the reports of members of the association, who had been investigating the English cheese markets. The quality, size, and color of cheese adapted to foreign markets were discussed. The proposition to establish an American Dairyman's Journal, to be the organ of the society, received some encouragement and some dashes of cold water, and the matter is left pretty much with the secretary. The name of the society was changed, on account of its national character, to

"The American Cheese Manufacturers Association," and officers for the coming year were elected. Wm. H. Constock, of Utica, is President, with ten Vice Presidents from different States and the Canadas, and Geo. Williams, of Utica, Secretary.

The Wool Interest.—There was an important meeting of wool growers and woollen manufacturers held at Syracuse, in December last, which was convened on this wise. The U. S. Revenue Commission called upon the National Manufacturers' Association for information in regard to the action of the present tariff on the wool interests. This body invited the different wool growers' associations to send delegates to meet their executive committee to confer upon the matter. The wool growers it seems did not like this quiet "conference meeting," and so proposed to send as large a number of delegates as would attend from each society, and the manufacturers (in self-defence) called also for delegates from different parts of the country. Thus a very considerable body of substantial and influential men, representing the wool growing and the wool manufacturing interests, were assembled. The only result of the discussion, which is of immediate moment, appears to be that these gentlemen agree and urge upon the Revenue Commission that both these interests should have "equal encouragement and protection" on the part of the Government. Sundry matters relating to the intercourse between wool buyers and users, and wool growers and sellers were made the subjects of the discussion, it is to be hoped, to the mutual benefit of the two parties. This we hope will result in bringing wool growers and manufacturers into more immediate connection, establish fairer rates in the wool market, and fairer practices on both sides. The opportunity thus afforded by the meeting at Syracuse of delegates from so many of the States, was embraced to form a

National Wool Growers' Association.

—This society it seems was born entirely unexpectedly (to outsiders at least) when the wool growers were "caucusing" and planning their mode of procedure before going into convention with the manufacturers. Rather, we may say, as Minerva sprang full armed from the brain of Jove, it was brought into existence by the felicitous thought of the master spirit of the occasion. Of course it elected officers, (it could do no less). Hon. H. S. Randall, of Cortland Co., N. Y., is President; Wm. F. Green is Secretary; and Vice Presidents and an Executive Committee are elected. We hope prosperity and usefulness will attend the new Society, and that it will receive fully, as it has already to some extent, the

endorsement of the wool growers' associations.—Was it to prevent any similar precipitate action on the part of cheese makers and mongers, that the N. Y. Cheese Makers Society changed its name and title to the "American Cheese Manufacturers' Association?"

Spring Wheat—What is the Best Kind to Sow?—

We will publish the votes each kind gets, if we receive them before the 10th of February. Please mention post-office, county and state, and if business letters are written, put the ballot on a separate slip of paper, with or without reasons of preference.

Sheep Labels.—

We are much pleased with Dana's sheep labels, which are advertised in this number. The danger of tearing out is very slight, and they are easily inserted. The position of labels in the ears, together with the lettering and numbers may be made to convey much information about a sheep or lamb. If the rams are lettered instead of numbered, the letter of the ram on any label will indicate the sire, while the dam's number and her sire, may be indicated by a label in the other ear. Every sheep breeder should have some systematic way of labeling his sheep, in addition to very accurate flock records, with full memoranda.

The "Wine Plant" Again.—

The accession of many new subscribers brings us numerous inquiries about the so-called wine plant, which we will endeavor to dispose of briefly. Common garden Rhubarb is sold at a very high price under the name of English and Myatt's wine plant, Linnaeus Plant, Turkish Rhubarb, etc., for the purpose of wine making. The vendors have circulars giving directions for making the so-called wine, stating the number of gallons yielded per acre, and showing how much profit can be made at so much per gallon. Our position in regard to the matter is this: Wine cannot be made from the plant, but a sort of poor liquor can, and that it is a fraud to sell a common and well known plant under a false name. If people wish to grow rhubarb for any purpose, let them do it, knowing that it is rhubarb. One concern in Ohio sends us a sample of their product and intimates, that they shall not get up a club for the paper until they hear a report on their "wine." Our report necessarily is, that it is about as vile a liquid as ever disgraced the name of wine, and if, as is stated, there is a ready sale for it at \$3.50 per gallon, it only shows that some people have very queer tastes.

"Horse Doctoring" Book.—

A man in Maine advertises a book to "cure all the diseases that the horse is heir to." It is by one who calls himself the "Old English Mysterious Horse Farrier" (who ever heard of a cow Farrier), and "the Distinguished Veterinary Surgeon, Dr. Tidball," who gives the "experience of a life-time in the treatment of diseases of horses." This is all in 16 small pages, and consists of rank quackery and unreliable knavish jockeyism. It is a fraud upon the community to publish such a book. Besides the language and punctuation are so poor, one can hardly understand it.

Humbugs—Information Wanted.—

Few days in the year pass, without our hearing from some part of the country about persons losing money sent to this City in reply to somebody's plausible advertisements or private circulars. We have, in the aggregate, traveled scores of miles in trying to help these parties out of their difficulties. We have "shut up" many a swindling concern by aid of the police, and have uttered hundreds of warnings on the subject. If everybody had read this journal for a year or two, the business would be at an end. But this being far from the case, we must keep on with the warnings.—Here is a letter from a town in Missouri, from a man who must know something about the paper, or he would not have written us, though there is no subscriber on our books at his post-office. He says, he and many of his neighbors had been induced to send their money to Hayward & Co., 229 Broadway, and get no return. The last November's *Agriculturist* would have saved them their money, had they read it. We see by the Tribune that a clergyman of Vermont sent \$56 to the same party, who acknowledged receiving the letter, but claimed that the money had been abstracted from it. By such subterfuges, and other means, these various swindlers manage to evade the law, and the police are unable to convict them for want of direct, positive evidence. We have thought of another plan: If we could get from 15 or 20 persons a statement that they had each been defrauded by any one of these rascals, it would probably be considered as sufficient evidence to convict him. We therefore ask, in behalf of the public, that every one who has sent money to any New-York concern, and received no proper return, will send us immediately a full account of it, in as few words as possible, but giving names, dates, etc., fully. We don't want these for publication, but to use as privately as may be, to further the ends of justice. Let no one hesitate

to send on the particulars of his own experience, and that of others which may be reliable. Attested affidavits would be desirable also. Our request includes all classes of swindlers—jewelry dealers, gift enterprises, lotteries, book or map publishers, inkless pens, gift parcels, commission merchants, etc., etc. We have now a Mayor and police officers who will lend a willing hand to a determined effort to stop or curtail the humbug operators, or drive them elsewhere at least.—A SUGGESTION: If every one sending money would send a bank draft, or P. O. order, payable to the order of the party remitted to, the reception and endorsement of the draft would furnish evidence, sufficient to convict any swindler.

Southern Agricultural Journals.

—As an indication of returning prosperity to the Southern States, we are glad to note the appearance of Southern agricultural papers. The Southern Cultivator, published at Athens, Ga., has already been referred to, and we now have the first number of the Farmer, published by Elliot & Shields, Richmond, Va. It is in the magazine form, containing 43 pages besides advertisements, and gives evidence of ability in its management. The Southern Ruralist, a weekly, is edited and published by H. A. Swasey, M. D., at Amite City, La. Its first number is mainly devoted to Southern horticulture. We wish all these enterprises much success.

Catalogues, etc., Received.

—Transactions Illinois State Horticultural Society for 1864.... Illustrated Catalogue and Floral Guide, from James Vick, Rochester, N. Y., a very clever specimen of catalogue making.... Premiums awarded at the Oregon State Fair, 1865; a neat pamphlet containing besides the premiums, several addresses and essays, and all showing a most creditable state of agricultural prosperity in our far-off sister State.... Addresses before the Pennsylvania State Agricultural Society, at its exhibition in 1865, by Hon. Edgar Cowan & Wm. H. Allen, L. L. D. A fine engraving of the Israella Grape, natural size, Doct. C. W. Grant.... Transactions Indiana State Horticultural Society, January 1866.... Journal of the Cincinnati Horticultural Society, September and October, 1865.... Descriptive Catalogue of Fruit Trees, etc., Barnes & Kelly, Coal Creek (Kansas) Nursery.

Plants Named.

—A. J. Nash, Fairfield Co., Conn. The little evergreen is *Lycopodium lucidulum*, one of the Club-mosses, one species of which was described in January.... G. Hurd, Erie Co., Pa. *Dodecatheon Meadia*, American Cowslip or Shooting Star. You are right in valuing it as a garden plant; it is more common at the West.... "Subscriber," Forest Hill. The leaf is apparently that of some *Cassia*; the grass is *Muhlenbergia Mexicana*, Mexican Drop-seed. We never knew it to be troublesome in cultivated grounds. Its strong scaly root-stock indicates that it would be difficult to eradicate. It would probably yield to the treatment advised for Couch grass in November last.

Things we Cannot do.

—We cannot undertake to answer questions about plants or insects which are merely described by our correspondents. They should send good specimens. Nor can we readily determine plants from the leaves only.

Guesses at Plants.

—We have several times requested our friends, who send specimens, to take a little pains with them and give us some material from which to determine the plants. The best we can do with poor specimens and single leaves is, to guess, and it is often the case that not enough is sent to even guess at.—"Subscriber," Philadelphia. Your vine may be *Cynanchum nigrum*, one of the Asclepias or Milk Weed Family. Send the flowers next summer.... A. V. D. B. The leaf looks like what was sent out as Variegated Balm. Never saw the flower and therefore cannot give the botanical name.... T. F. Brady, Minn. We cannot guess what the plants inquired about are.... D. Blair, Huntingdon, Pa. The grass referred to as restraining the blowing sands is probably Sea-Sand-Seed, *Calamagrostis arenaria*, common on our coasts and on the shores of the great lakes. We do not know of the seed being for sale.... Sarah M., North Haven, Conn. Probably the leaf of the Balsam Apple, *Momordica Balsamina*, sometimes cultivated in gardens.

Sending Plants by Mail.

—M. T. Gregory, St. Croix Co., Wis., asks us to call the attention of nurserymen to the importance of better packing the plants they send by mail, and gives several instances in which he received only dried leaves and sticks in return for his money. It is a difficult matter to fix upon the best plan for all plants. In warm weather the plants will heat if kept close, and dry out if exposed. The use of wooden boxes for strawberry plants, when only a few were sent

in each, was quite satisfactory. We recently had some plants from Washington Territory come in good order by mail. They were in a tin box, which had holes punched in the cover, and were packed in plenty of moss. Probably there would be less complaint, if dealers put fewer plants in a parcel and used more moss.

Death of an Agricultural Editor.

—Prof. James J. Mapes, the founder and until quite recently editor of the Working Farmer, died in this city January 10th, at the age of 60 years.

Report of the Department of Agriculture.

—Several inquire how they can get the report. Write to the Commissioner, or to your Representative in Congress, and ask for it.

His "System."

—A contemporary or temporary sheet, has a powerful leader, written to show the superiority of his paper over others. It opens thus: "Our system of making a good practical and reliable agricultural and horticultural paper, is not as some editors do, to refuse to publish anything, unless it comes to them *original!*" That is almost as good as the Portuguese sailor's grammar, when a piratical craft was approaching his ship, he asked: "What do her want of we, us want of her?"

Anonymous Communications.

—Letters giving information of any kind, and especially those criticising articles which we have published, or intended to throw doubt on statements which we have made, ought always to be signed with the true name of the writer. We may wish to write to him and ascertain the facts accurately, for we are always ready to change our views if we are wrong—and to say so if it will do any good. We are virtually debarred from investigation if our correspondents only sign "H. T.," "A. H. S.," or similar initials, or *nommes de plume*.

Invert the Picture.

—All must have noticed and admired the beautiful engravings given last month. The one on page 20 presents a new phase (not intended), on looking at it up-side down. Thus seen, the turkeys appear like soldiers (Turcos,) in line of battle, with the shells bursting in their front.

Fine Sausages.

—A box of sausages, received from Canaan, Columbia Co., N. Y., in season for New Year's day, were as good as the best "country home-made," we have ever eaten—the meat just lean enough—not mixed with lumps of fat—cut fine and very uniformly—well, but not over-seasoned. We would like to publish the directions, though we suppose these will hardly be furnished by the maker, Geo. E. Lovejoy, as we understand he makes a speciality of providing such sausages for the market.

—**Shaver's Pencil Sharpener** is convenient for artists and others, who use pencils with movable leads, also for sharpening slate pencils.

—**Ives' Kerosene Lamps**, of two or three forms, we have found very convenient. In the hanging pattern the lamp is readily drawn down from the chimney, for lighting or trimming, and in the table and wall lamps the chimney turns down upon the side.

Defective Letters of one Day.

—In over a hundred thousand letters received at this office annually, it is not surprising that there should be some errors on the part of the writers, yet it would save us much annoyance, and some unjust discredit, if people would be more careful. Here is one day's record of defects in 583 letters, viz.: 2 letters with money but no signatures; 2 letters with no place of date; 2 with State not given; 1 with no State, and no legible post-mark on the outside; 1 with no post-office; 1 with the County but no P. O.; 1 with the "given" name only, but no surname; 1 with several bills and currency notes all counterfeit; 2 with the letters unsealed but the money safe (a temptation to post-masters); 1 with money said to be inclosed, but left out by mistake, as the envelope had evidently not been opened since first sealed. This is an unusual record (1 letter in 42 defective), but almost every day brings one or more such, and the Publishers are blamed for not responding, when they have no clue to the address of the writer. How many letters miscarry from similar errors in the superscription, the clerks in the Dead Letter Office can best explain.

Do Sign Your Name.

—We never publish a name when requested not to do so, nor when the writer indicates by initials, or otherwise, the signature he prefers to have published; but we often wish to communicate with the writer, and sometimes have articles we

should use, had we the means of identifying the author. A statement has but little value when it comes anonymously. Will "Htery," whose letter is post marked Reading, Mass., let us know who he is?

The S. S. Question Books,

entitled "Lessons for every Sunday in the Year," continue to receive many favorable commendations, and are about equally used by all Christian Denominations. The series is completed—No. 1. On the Four Gospels and Acts; No. 2. On the rest of the New Testament; No. 3. From Adam to Elijah; No. 4. From Elijah to Christ. Price 15 cents each; \$1.50 per dozen; \$12 per 100. If sent by mail, 3 cents each extra, in packages of ten or more; and 4 cents each, when less than ten are sent. Four sample copies (No. 1, 2, 3, and 4), for examination, mailed post-paid, for 65 cents.

Excellent Books.

—The list on page 44 gives the title and price of most of the books published on Farm and Garden work. Many of these are very good.—To sum up answers to a multitude of letters of inquiry, we may say that the following will certainly disappoint no one desiring first-rate books on the topics indicated:—*American Weeds and Plants; Barry's Fruit Garden; Downing's Landscape Gardening and Rural Architecture; Downing's Fruits and Fruit Trees of America; Flax Culture; French's Farm Drainage; Flint on Cows; Flint on Grasses; Fuller's Grape Culturist; Fuller's Strawberry Culturist; Harris' Insects; Herbert's Hints to Horse-keepers; Mayhew's Horse Doctor; Onion Culture; Quibby's Mysteries of Bee-keeping (entirely new edition just out); Rural Register; Rural Annual; Saunderson's Domestic Poultry (new); Skillful Housewife; Tobacco Culture; Watson's American Home Garden; Youman's Household Science, etc., etc.* The prices of these, and of other books, may be found on page 44. Every family, almost, would find the money required to purchase such books a paying investment.

Potatoes Mixing in the Hill.

—Tobias Marten, Mercersburgh, Pa., sends a red and yellow sweet potato, which grew on the same vine, and asks, if they will help decide the question whether potatoes will mix in the hill. It helps very much to decide that they will not mix in the hill, for it disposes of the only argument of the advocates of mixing. The mixers claim that when potatoes of different colors are found in the same hill, it is caused by a mixing through the blossom. Now, here is a case of two distinct colors from a sweet potato, which never blossoms at the North. How will the advocates of mixing explain this? We regard these instances as sports, which are due to some cause which is not understood, and probably never will be any more than why we have white black birds. These sports in color occur in leaves, stems and flowers without exciting any great wonder, or any suspicion of mixing; but when a sport happens to take place below ground, we are asked to accept the most improbable reasons for it.

Potatoes—Planting Single Eyes.

—Abel Stedman, of Herkimer Co., N. Y., says, that for four years he has practised using only large seed cut to single eyes, planted 2½ feet apart each way, 4 inches deep, and cultivated flat. With Garnet Chili his result this season was only one bushel of small potatoes to eleven large, the product of a single hill (one eye) being in one case five pounds, all large potatoes.

Oak "Knots" good for Horn

Knobs.—Hiram Holt, of Windham Co., Conn., writes, that he has been in the habit of using the great black knotty excrescences which grow often on the black oak, and are vulgarly called "nigger-heads," for making horn knobs, and thinks they are much better than if made of any of the woods mentioned on page 13. He saws out rectangular blocks of the right size, turns out the knobs and applies them about as we directed. The knobs outlast the lives of the animals.

Sew and Rip.

—One of the nursery legends told us about the good old lady who "knot all day to hear it purr at night." Many happy possessors of sewing machines in these days are so pleased with them that they would perhaps sew all day, if cloth was not so dear, or if they could rip the stitches out as easily as the old lady unraveled her stockings. This fortunately, perhaps unfortunately, is not the case with most of the good machines, though it can be done with those making the chain stitch, and this is often claimed as an advantage. The matter is of no consequence, however, to any one possessing a little implement invented by W. A. Fitch, which he calls a "Ripper." One of them was tried at home before we accepted an advertisement of it, and has since been used with a good deal of satisfaction. With a little practice it can be run rapidly along a seam and sever the stitches faster than a rapid machine can make them.

Testing Eggs Easily.—Housekeepers know how annoying it is, to have the fifth or sixth egg broken in a dish, prove a bad one, and spoil all the others. With rare exceptions, as in the case of a very thick shell, it is quite easy to know a good from a bad egg, by simply holding it between the eye and a light, as in the annexed engraving. Hold the egg so that the hand will cut off all direct rays of light, except those passing through the translucent egg. If in a dark room, the effect will be all the more striking. Dealers in our markets test eggs in this way very rapidly, as many as three to five dozen a minute, by taking up three at a time in each hand, and passing them quickly between the eye and the candle, in a partially darkened room. It is so easily done, that all dealers ought to test their stock before selling or packing.

Wants to be "Posted."—"D. R.," Keokuk, Iowa, writes: "I am unable to come to any conclusion, as to whether any thing can be done to a dry white oak (or other) post to cause it to stand longer, than it would if set without any preparation. I have set three acres of posts for trellises, and charred some and dipped others in coal tar, but they have not been in the ground long enough to test the question. I shall set 4½ acres more in the spring. I have seen many persons of experience who say, that neither tar nor charring does any good; while others say both are good. It is a matter of much importance, as thousands of acres are being 'posted' every year." The evidence which we have is all in favor of tarring, that is setting the butts of posts in hot coal tar (still better is it to immerse the posts). Charring does very little if any good, except under certain conditions which are not well understood; for some charred posts stand a very long time, while others decay as quickly as if nothing had been done to them. We are always glad of facts that go to prove any thing.

N. Y. State Agricultural Society.—The annual meeting takes place at Albany, February 14.

Manure—Water vs. Salt to Prevent Burning.—C. Killmer, Oswego Co., N. Y., is told that two quarts of salt to the load of manure will prevent burning, and asks our opinion. It will probably have a tendency to prevent burning or "fire-fanging," but water judiciously applied, is a perfectly sure preventive. Make the heap flat and upon such a foundation that water will drain off from it readily; make also a tank or vat to hold the leachings, and then set a pump with which, as often as the heap gets warm, drench it with the leachings, or with fresh water. The labor will be well rewarded. The heat of the interior of the heap may be always known by a hard-wood pole kept thrust several feet into it, which may be occasionally withdrawn and felt of. Such a manure heap may contain two-thirds or more of its weight of straw, salt hay, or muck, and be worth in spring three times as much as if it were only manure.

Woolen Waste.—"S. K." makes the following inquiries through the *Agriculturist*:—"How shall I treat woolen waste in which there are many seeds of weeds, so as to prepare it for manure?" The best way is to put a large handful or so around each hill of Indian corn or potatoes. The seeds of weeds will soon vegetate and can easily be eradicated. If applied in this manner, they will all vegetate during the growing season. If plowed under, a portion of the seed may not vegetate within several years. Woolen waste is an excellent fertilizer for all grains, vegetables, and fruits.

Barn Weevils.—Thos. Maguire, Dauphin Co., Pa. We published last year the only sure cure for barn weevils which we know. It is to burn the barn; but if any one can tell of a plan, even though not so thorough, which will either exterminate or partially destroy this pest, we shall be happy to publish it.

The Selection of a Library is a work which needs high literary ability, good common sense, and business tact. Prof. H. B. Lane, whose advertisement will be found in our pages, possesses eminently these qualifications, and has given great satisfaction in the selection of both private and public libraries.

Fuller's Grape Culturist.—This book at once took the rank of a standard work upon grape culture, as it gives in a plain and concise form not only the practice preferred by the author, but the systems of training followed by others. It is a complete manual, giving

clear directions for every step from starting the plants from the seed or cutting, to the management of the fruiting vine, all fully and excellently illustrated. Price \$1.50

The Prize Barn Plans.

In August last, Mr. David Groesbeck, authorized us to offer \$300 in three prizes for barn plans, on certain conditions then published. Owing to the number of plans received, and the great study which was required thoroughly to understand the ideas of those who submitted them, it has taken longer to complete the examination of them and decide upon the best, than was at first anticipated. We are happy, therefore now to relieve the anxiety to know the decision of the committee by publishing it, and to announce our expectation of being able to give one or more of the prize plans in our next and succeeding numbers. There were 128 plans presented. Of these between 30 and 40 evinced much thought and study. Many were most carefully and even elaborately projected with perspective elevations, tinted in water colors as is usual with fine architectural drawings, and some two or three were elaborately painted in oil or water colors. The plans were boxed and sent to each member of the committee, one after the other; and when all had examined them, the gentlemen met at the Astor House, and after spending the day in examining and discussing the plans, and the points which each deemed essential to a good barn, they submitted the following:

REPORT OF THE COMMITTEE INVITED TO DECIDE UPON

BARN PLANS.

To the Editor of the *American Agriculturist*:—The Committee after mature consideration and discussion together over the plans, agree as given below; although it is fair to say, that they arrive at a conclusion with no little difficulty, because so many of the 128 plans submitted are very meritorious. They find in no one of the plans all those points which they agree upon as essential; nevertheless the majority decide upon the following awards:

The first prize, \$150, to No. 51; [submitted by MYRON B. BENTON, Leedsville, Duchess Co., N. Y.]

The second prize, \$100, to No. 112; [submitted by GEO. E. HARVEY, Cold Spring, Putnam Co., N. Y.]

The third prize, \$50, to No. 120; [submitted by E. BOYDEN & SON, Worcester, Mass.]

[Signed] L. G. MORRIS, R. L. ALLEN, DR. F. M. HEXAMER, SAMUEL THORNE, SAMUEL J. SHARPLESS, Committee.

Mr. Donald G. Mitchell, a member of the Committee, was prevented attending the meeting. He sent, however, a memorandum of his views and preferences, which, it may be stated, do not accord with those of the majority, in respect to the order of the premiums.

Walks and Talks on the Farm.

No. 26.

I wish you had dropped in last evening. Mr. Chase, of the *Agriculturist* was here, and would have been glad to meet you. I believe this is his first visit to Western New-York, and I fear he did not form a favorable opinion of our agriculture. He thought we had very small barns! This, I take it, was a polite way of saying we did not raise as large crops as he had anticipated. We certainly, as a rule, need larger barns, but we need still more to raise larger crops. When a man gets good crops it is not long before he has good barns.

He asked me what was our principal crop, and I could not tell him! What is it? It was formerly wheat, but is it so now? We are sowing far more wheat than we did five or six years ago, and I live in hopes, that the "Genesee country" will in a few years be as celebrated for its wheat as in old times.

At present we are rather in a transition state. Old style farming will not answer, our land needs draining, and we must make up more and better manure. I suppose that while the roots of the original forest were in the ground, they opened a sort of passage for the water to pass through to the porous soil underneath. And this is one reason why land that was formerly dry and produced good crops, is now wet and comparatively unproductive. Then what I call the "natural manure" of our land—the rich deposit of leaves which had been accumulating for ages—is now pretty much used up; we cannot expect it to last for ever. If we manure a piece of land we get good crops from it for two or three years, but as soon as the manure is exhausted we must furnish another dressing. This is a recogniz-

ed fact, and the sooner we realize that the heavy coat of manure that nature kindly put on our land to give us a good start while the country was new, and while we had roads to make, houses and barns to build, everything to do and but little to do it with—the sooner, I say, we realize that this manure is gone, and that we must make more on our farms, the better it will be for the farmers and the country. Drainage and manures are what we most need. This would make our land as good as it ever was—and better. The climate has not changed. Our winters are no colder, thermometrically, nor our summer hotter, than they were forty years ago. The only difference is, that then our farms were protected by extensive belts of timber, while now the severe west winds sweep over us without let or hindrance. This must be remedied as far as possible, by setting out Norway Spruce and other rapid-growing trees for screens. Perhaps narrow fields and hedges running North and South will prove to be what we need. But be this as it may, judicious underdraining, good manure and belts of trees for screens, will give us as good land and as good a climate as we ever had, and there is no reason why we can not raise as good wheat, as good peaches, and as good crops of all kinds, as when the country was new.

Yesterday I found one of my men carding the cows! I have tried, often tried, to get this done, but never could get any one to do it willingly. I cannot account for this sudden conversion, unless it is owing to the fact that this man is fond of reading, and I lent him an English book in which this practice is highly recommended. Books and papers have a far greater influence with such men than is generally imagined; and I really believe that it would pay a farmer to make his men a present of a good agricultural paper, or of some such book as Todd's Young Farmers' Manual. The great drawback to the pleasures of farming, is the miserable class of laborers we too frequently get. I was greatly annoyed with them when I first commenced farming here, but have now only married men that live on the farm, and we get along very much better. They take an interest in what is going on, and that is half the battle. I have the misfortune to be considered as a sort of amateur farmer, and of course have difficulties to overcome which do not fall to the lot of an ordinary farmer of established repute. I had not calculated on this prejudice. I bought such implements as I thought were best. But I do not recollect one that was not pronounced useless. I got some steel plows, and you would be amused if I could recall the objections that were made to them. "They won't stand it on the clay spots," said one. "If you strike a stone where will you be?" asked another. "I don't believe they are steel anyway," said a third, and all agreed that they were very pretty things to look at, but they would not stand hard work. All this, you say, does no harm. But in that you are mistaken. These men are frightfully conceited, and when once they have said that a plow will not work, they consider their reputation at stake, and if you persist in making them use it, you must expect pretty large blacksmith's bills.

I have learned to pity the poor fellows, and, for the time being, yield to their prejudices. I laid aside the steel plows for the time being, and let them use the old ones they had been accustomed to. Then if they ever got short of points, I would tell them they must try and get along with one of the steel plows till we could get some more points. In this way we wore off the varnish, and the prejudice against them assumed a milder form. Still they never take one of these plows if they can help it. It will probably be two or three years before they get accustomed to them—then they will use no other!

The Squire wanted to borrow a plow last fall and I lent him one of the steel ones. A few days ago he asked me for the address of the manufacturers, saying, "It is the neatest and best plow I ever saw, and I must have one of them." He did not know the trouble I had had with them, and I could not but feel grateful for this unexpected testimony

to their value. Such remarks do good. It seems a small matter, but the opinions of one's neighbors have a great influence on the men. If farmers are prejudiced, the men certainly will be. I always feel glad to lend a new implement or machine to some good farmer. The men are afterwards more willing to use them.

"Give the cows a little bean straw," I said the other day.—"They won't eat it," was the reply. "Nothing will eat bean straw, except sheep."—I had had no experience in the matter, and so I yielded the point. But in the afternoon the Deacon called, while we were cleaning up the beans, and remarked that the straw was excellent for milch cows.—"But they say that cows will not eat it."—"They must be different cows from any I have ever kept. My cows eat it with avidity and I think it is nearly as good as hay."

I suppose the origin of the opinion is this: Sheep will eat beans, but cows will not; *ergo* sheep will eat bean straw, but cows will not. The fact is, however, that if beans are ground, cows will eat readily enough, and there is no grain that is more nutritious. But it is more economical probably to feed a little corn meal with it. The latter abounds in carbonaceous or "fat-forming" matter, while the beans are exceedingly rich in nitrogenous or "flesh-forming" matter. The two together are better than either separately. Of course at the present price of beans, it would not pay to feed them out, unless they are unsalable. But peas are very similar in composition to beans, and these, especially if buggy, can be fed out with profit. It is, however, better to feed corn with them. I give my cows corn and peas ground together, and never had them (at this season) give as much milk, or of as good quality. The cows, too, are getting fat. Some people think that a "deep milker" is never fleshy, and that a disposition to fatten is a sure sign of a poor cow for the dairy. But at this season of the year, I like to see cows gain in flesh. It is natural for them to do so. Calving is a great strain on the system, and nature prepares for it. To starve the cow at this season, is as foolish as it is cruel. Give her an abundance of nutritious food, and she will get strong and fat. And the fat is not lost.

"I have a cow," said one of our largest dairy farmers to me the other day, "that gives thirty quarts of milk a day in the summer. It is difficult to dry her off; and no matter how fat she gets in winter, she milks it all off in the summer."

Now, what becomes of the fat? It is not lost. Suppose we had two such cows, and one was turned out to the straw stack and fed barely enough to sustain life, while the other was comfortably housed and fed liberally. Suppose the latter laid on a hundred pounds of fat. If both are fed alike in the summer, and this hundred pounds of fat disappears, what becomes of it? *This fat is turned into butter.* Tallow and butter are, chemically, about the same thing. But the latter, as usually sent to market, contains 20 per cent. of water, while the former contains little or none. One hundred pounds of tallow, therefore, ought to give one hundred and twenty-five pounds of butter. The tallow is worth, say \$15, while the butter is worth \$50 at the prevailing prices.

This is not mere theory. The farmers in the dairy districts have found that nothing pays so well as to feed their cows grain during the winter. The cows are stronger and healthier, the calf is fatter, and the milk if not greater in quantity, is far richer in butter and cheese.

Last spring I bought a new milch cow. She was recommended to me as an excellent milker. She proved to be so, but the milk was little better than water. She was very poor—in fact lighter than a bag of bones. She has been thin all summer, but since we commenced feeding grain, no other cow has improved so much. She is getting fat though still giving milk. I do not care how fat she gets, for I feel assured that I shall get it all back next summer in the form of butter.

"Them's dreadful nice hogs," said neighbor Sloe the other day, "and I must have one on 'em."

"They are certainly very nice pigs," but I told Mr. S. that they were not what he wanted.

"Why, what's the matter with them?"

"They are not thoroughbred."

"No matter, a pig 's a pig for a' that. Give me a pig as good as one of these, and I don't care a rush for his pedigree."

"But you will not get such a pig without resorting to thoroughbred stock. These pigs are good—better probably than if they were thoroughbred. The sow is half Yorkshire, and the boar was a thoroughbred Prince Albert Suffolk. The little pigs have the length of the Yorkshire with the squareness and symmetry of the Suffolk. They are better (for the butcher) than either thoroughbred Yorkshire or Suffolk. This is often so with the first cross, but it cannot be repeated. You must in all cases have a thoroughbred sire."

"What is a thoroughbred?" A gentleman at Richfield Springs asks me this question. He writes: "Are Cheshire hogs a pure breed, and what is there about them to recommend them to farmers at \$75 to \$100 each, at six to eight months old?"

In one sense of the term, there are few if any pure bred pigs. They have all been more or less crossed. The modern English breeds of pigs, such as the Essex, the Suffolk, the Berkshire, the Middlesex, etc., owe their early maturity and fattening qualities to an admixture of more or less Chinese or Neapolitan blood. The original hogs of the counties whose names they now bear, were large, coarse animals, that were difficult to fatten. By judicious selection, and by the use of the Chinese hog, the proportion of offal parts has been greatly reduced, and a pig obtained that fattens readily and matures early. But this has been accomplished in most, if not in all cases, at the expense of size.

Now when the object of crossing with the Chinese and Neapolitan races had been attained—when a hog possessing the right shape, with little offal, and with early maturity and rapid fattening qualities, had been secured, the great object was to keep up the standard. The breeder rejected all hogs not possessing these qualities. By breeding in this way for a number of years—by selecting the best animals to breed from, carefully rejecting all that showed the slightest tendency to degenerate, the breed became established—that is, it had characteristics of its own, and these were uniform.

As I understand the matter, this is all that is meant by pure blood as applied to pigs. We need not go back to their origin. The only questions we need ask in regard to any particular breed of hogs are: (1) Have they the shape, size, quality of meat, early maturity, hardness and fattening qualities that we want; and (2) has the breed been raised long enough to eradicate all tendency to run back, or is it, in other words, fully established? If it is, it is a pure breed. If not, it is a mongrel breed that may give us a good pig, or may not.

"Are the Cheshires the pure breed?" I do not know. In a case of this kind, much depends on the character of the breeder. A pure bred animal, of desirable qualities, does not come by chance. It requires great care, perseverance, close observation, and a rare combination of qualities to establish a new breed of animals. There are few such men in any age or country. I do not say that the Cheshires are not a pure breed. Specimens of this breed (if it is a breed) have been exhibited at our State Fairs for several years, and have attracted notice by their immense size. The first time I saw them was at the State Fair at Watertown, in 1861, where one of these big pigs was shown that weighed 700 pounds. It was then said to be a cross between the Yorkshire and Cheshire. At the next Fair, held in Rochester, another big pig was shown, probably the same, that weighed 800 pounds; and at the State Fair in 1863, at Utica, a "Cheshire" was shown, probably the same, which weighed, or was said to weigh 1,100 pounds!

These Cheshires are undoubtedly the largest hogs in the United States. They have also many good points. They are long bodied, broad on the back, white and handsome, and altogether a very attractive looking pig. But are they pure? I am

inclined to doubt it. They have qualities, however, which could be turned to good account in the hands of some one who had the right capacity, perseverance, and patience, to establish a breed. Until this is done, however, it is hardly worth while to give high prices for these pigs. There is no certainty in regard to them.

Hot-bed Sash and Frames.

In market gardening, much of the success depends upon the earliness of the crops; hence many plants are forwarded in hot-beds, and the skillful gardener has his tomatoes, cabbages, etc., ready to set out by the time his slower neighbor is about to sow his seeds in the open ground. It is of no small importance in the family garden, to be able to add a month or more to the enjoyment of its products, and knowing that but very few out of the whole number of our readers avail themselves of artificial aids in their gardens, we often point out the way in which they can forward their plants and have earlier vegetables than if they kept on in the same old round. On page 61 some excellent advice is given upon sowing seeds in window boxes. This, in many cases, will answer every purpose, but often one has not convenient windows, or his operations are on too large a scale to be satisfied by this, and he must try frames. The choice lies between a cold frame and a hot-bed. The apparatus required is in each case the same. Both require attention and will fail under neglect, but of the two, the hot-bed needs the closer watching. The hot-bed will give plants earlier than the cold frame, and the cold frame will afford them much in advance of the open ground. But our present object is to describe the frames and sash rather than to give the management of them. Next month will be quite early enough for starting plants for the family garden in all northern locations. It is more convenient to have sash of the proper size, made for the purpose, but one can make old window sashes answer nearly as well. One great objection to window sash is, that cross-bars run in both directions, and thus form compartments which hold water. This can be obviated by cutting a piece out of the cross-bars down to the level of the glass, opposite the centre of each pane, and also out of the frame at the lower side of the sash, and thus form channels to let the water off. If sash are to be made, five or six feet will be a convenient length; the width must be governed by the size of the glass to be used. Four rows of 8 x 10, or five rows of 6 x 8 glass may be used. The sides of the sash are 2 inches wide, with bars running lengthwise only. The glass is bedded in soft putty and fastened in by tins, no putty being required upon the upper surface of the glass. Each pane overlaps the one below it, about a quarter of an inch. If the glass overlaps too much, there is danger of its breaking by the freezing of the moisture which collects in the joint. The durability of the sash will be much increased by strengthening it by means of a rod of 3/4-inch iron put across the middle. This rod should have a square head at one end, and a thread and nut at the other, so that it can be screwed up tight. Both the head and nut are countersunk, so as not to interfere with the free sliding of the sash. The sash should be thoroughly painted. The frame is made of a width corresponding to the length of the sashes, and long enough to accommodate two or three of them. It may be a foot high in front and two feet at the back, the end-pieces having a regular slope from rear to front.

Cross-pieces of plank three inches wide extend from front to rear for the sash to run upon; in the center of each of these is nailed a strip an inch wide, to guide the sash as it slides. A cleat will be needed at each end of the frame, to keep the sash from running off. This is nailed on the outside of the upper edge

Fig. 1.—CORNER SEPARATED.

of each end-piece, and extends above it to a distance equal to the thickness of the sash. The front and rear edges of the frame will need to be leveled to allow the sash to run easily. The frame may be made of rough plank, securely nailed together, or it may be made with a view to greater durability. Unless the frame can be taken apart, it is an awkward thing to house when not in use, and if left constantly exposed, it soon warps and decays. The accompanying engravings show a plan for connecting the corners of a frame, given in Thomas' Annual Reg-

Fig. 2.—CORNER UNITED.

ister. Fig. 1 shows a corner separated and Fig. 2 the same put together. When a frame is made to take apart, this method will answer well to secure the corners. The portion of the frame which comes in contact with the earth, may have a coating of gas tar, and the rest be covered with some cheap paint.

Maple Sugar Making.

Our readers, who are interested in making maple syrup and maple sugar, look upon the subject from many different stand-points. With some it has been an important farm occupation at this season of the year, all their lives; with others, sap boiling on a larger scale than for a family supply of molasses, has been only undertaken now and then, when other work did not press; and with many, the whole subject is new. For the benefit of all, we would refer to articles which have appeared in previous years in the *Agriculturist*, particularly in the February number of last year, and to the Report of the Agricultural Department for 1862. Sugar making has received more thought and care in proportion as prices have advanced, and a good "sugar bush," or even a few good sugar maple trees are much more highly valued now than they were a few years ago. During the growing season the maple stores in its wood substances which are converted by the warmth of the spring, coming after the influences of the fall and winter, into a sweet sap. The sugar is "cane sugar," identical with that of the southern cane, but mingled with so few impurities, which incite fermentation and other changes, that it is very easily obtained in condition of considerable purity. The purer it is, the lighter colored; and the more rapidly evaporated, the more it retains the pleasant flavor peculiar to it. Artificial clarification removes this flavor, and the perfectly pure white loaf sugar, which

may be made, cannot be distinguished from that of the same quality from other sources.

It is always desirable to avoid injury to the trees by tapping; the incisions should therefore be made where they will do no damage to the timber, that is, below the cylindrical part of the trunk, where the sap will flow quite as abundantly as at any place above. There is nothing gained by cutting such large gashes, as are sometimes made when trees are tapped. In fact, some of the most thrifty trees when hacked in such a manner, commence decaying, and continue to rot until the body is nothing but a shell. It is unnecessary also to make deep incisions either with centre-bits, gouges, or axes, as sap will flow as rapidly if one or two of the concentric layers of wood are cut through. The best way to tap a tree is, to hew off the dead bark with a sharp ax, making a smooth place about as large as a man's hand. Then with a mallet and wide chisel cut two small convergent channels through the bark and into the wood in the form of the letter V, as shown by the illustration (Fig. 1). Then about two inches below the incision, make a gash with a 1½-inch gouge, and insert a metallic spout made of stiff zinc or galvanized sheet-iron. The spouts may be ten or twelve inches long, and made of strips one and a half inches wide, with one end ground or filed to a sharp edge. Cut a small channel in the bark from the V-shaped gash down to the spout. It is not necessary to cut through the bark when making this channel. The lower edge of the cut should be beveled downwards and inwards, so as to conduct the sap down to the angle. There may be several taps made in large trees, and each yield as much as if there were but one.

The tools needed for tapping trees in this way are, a mallet, a sharp two-inch "firmer" chisel, a 1½-inch joiner's gouge, and a sharp ax, or a carpenter's adze, for dressing off the rough bark. Insert the spouts as low as the top of the sap buckets, that the wind may not blow the liquid over the side of the vessel. When domestic animals are permitted to roam in a sugar orchard, trees must be tapped several feet from the ground and the sap vessels suspended by hooks. (See page 72, March, 1865.) The better way, how-

Fig. 2.—EVAPORATING PAN.

ever, is to keep all such animals in their appropriate enclosures, especially at this time of the year.

The best sugar makers all over the country are employing the sorghum evaporators, which,

with some slight modifications perhaps, are found both economical and convenient. Which of the many kinds in use is best, we cannot say, but "Cook's," one of the best known, is very highly commended. For those who cannot go to this expense, and would still pursue a much better plan than the old kettle swung on a pole, or set in a brick or stone fire-place, we describe a good home-made pan, or pair of pans (fig. 2), one being used as a heater and reservoir of hot sap, and the other as the evaporator. The sides and ends of the pans are made of 1½-inch planks of any kind of wood, (though maple, or beech is preferred,) and the bottoms of iron or zinc. The sides of the reservoir pan should be at least twelve inches, and of the other six inches high. As sheets of iron and zinc are usually made about twenty-six inches wide, the dimensions of the pans should be about one inch shorter and narrower than a sheet of the metal, so that the edges, after the bottom is nailed on, may be turned up with a mallet, and nailed to the outside as well as to the bottom of the wood, as seen in fig. 3. The pans rest at least three inches on brick walls, which are one foot high and eighteen inches apart. Bars of iron, or pieces of old wagon tire, support the bricks at the end. When every thing is made of the size here given, there will be ample room for the fire. The throat of the chimney should be about eighteen inches wide by four in height. This size will correspond with the fire-place. The height of the chimney should be sufficient to carry all smoke, atoms of charcoal and ashes beyond the pans and sap receptacles, as such substances falling into the syrup give it a dark color. A barrel or other closed vessel may stand, supported upon blocks or horses, so that the sap, which is strained into it through straw, may either be drawn directly into the pan; or several barrels or hogsheds being used and set back from the fire, the sap may be conducted in leaders at pleasure, into the large pan, from which it is dipped into the shallow one. Such an apparatus may be erected at a comparatively small expense where bricks and lumber are cheap. Metallic or wooden faucets may be inserted in the ends of the pans for drawing off the syrup, or it may be dipped out, which is the usual practice. There should at least be a shed over the pans, but a more spacious and better built structure, with a tight roof and enclosed, so that the buckets etc., may be locked up in it the rest of the year, is much preferable.

Fig. 3.—BOTTOM OF PAN.

When the syrup is nearly as thick as molasses, take it from the fire, strain it through flannel and let it stand till cold. Then pour it off from the sediment which will separate, and place it in a kettle or deep pan over another fire. As soon as it becomes warm, but not near boiling hot, add a pint of milk or an egg well beaten with ½ pint of water to each pailful of syrup, and stir thoroughly. When it boils, remove all the scum; keep the fire under control, and when sugar will granulate freely in small quantities of syrup (such as would adhere to a stick dipped into it), or when a little cooled on the snow is brittle, it may be removed from the fire, and as it thickens in cooling, dipped into molds, or well stirred until quite dry. "Strained sugar" is not boiled so long, and after it has cooled and granulated, being transferred into false bottomed tubs, and kept at a temperature of about 70°, more or less molasses is drained off from it, and a better quality of sugar obtained,

Fig. 1.—ELEVATION OF COTTAGE.

Small, Convenient, Cheap Houses.

BY NARRAGANSETT.

A very desirable quality in a cottage is *snugness*. Our idea of a *snug* cottage is one that is neat, compact, convenient, presenting within a limited space, a great amount of comfort. A snug cottage must be arranged, that the apart-

Fig. 2.—GROUND PLAN.

ments in most frequent use, shall be so connected that in passing from one to another, there will be no necessity for going through long, cold passages. They must be so brought together, that if occasion require, the genial warmth of one may easily impart itself to another, and one fire gladden all the house. In our climate we have seven or eight months of the year, when it would often be pleasant to have the chill removed from a room, though few families in ordinary circumstances, would feel that they could afford fires in several different apartments. With a proper arrangement of rooms, one fire may serve to cheer, in moderate weather, all the apartments in common use upon the same floor.

With reference to this idea of snugness of arrangement, this cottage plan has been prepared. There are upon the first floor (fig. 2) three principal rooms, the parlor (P), bed-room (B), and

Fig. 3.—CHAMBER PLAN.

kitchen (K), all communicating. If desirable, a door may be placed at C, between the parlor and bed-room. In the hall (H) is a descent to the cellar at A. Opening from the kitchen, is

the pantry (P), which by a slide connects with the sink, in the back entry (E). A large china closet (D) also opens from the kitchen, and a clothes closet is provided for the bed-room. The kitchen, which will serve as the ordinary living room of the family, with a window upon each side, one looking out upon the porch (G), will form a pleasant apartment for many a social gathering around the winter fire. And on a summer evening, after the labor of the day is over, the little porch will have its attractions, equally accessible from the kitchen, or the parlor. A prairie rose, or Virginia creeper, or a fruitful grape vine should be trained against the wall beyond the porch, and carried up and entwined around the chamber window above.

On the chamber floor (fig. 3), are three bed-rooms (B, B, B) with closets (c, c, c), and another closet opening into the entry. These bed-rooms are all of liberal dimensions, and each has direct access to a chimney flue, in case a fire should be required in either of them. At A, over the porch, should be inserted a narrow window, (three panes of 10x12 glass would be sufficient); it may be hung upon hinges, and thus light and air be introduced to the entry.

A Good Kind of Hurdle Fence.

In answer to several inquiries from subscribers of the *Agriculturist*, concerning hurdles, we herewith illustrate a section of fence which can be made cheaply, where timber is not too costly, and which will be found durable and convenient. The panels are made about twelve feet long and three to four feet high, according to the character of the animals to be confined, or fenced against. Each panel consists of two rails of 1 1/4-inch stuff, about 3 inches wide, with pickets 1 1/4 inches in diameter driven into

HURDLE FENCE.

holes bored through the rails 6 to 8 inches apart. The pickets are usually turned out in what is called a "cat-head lathe," with which fork handles, chair rounds and posts are turned out, and ought not to cost more than a cent a piece. Sometimes, however, the holes are bored with a bit that will cut a clean orifice, 1 1/2 inches in diameter, and square pickets are inserted. When constructing a fence of ordinary height, the pickets should extend not more than 8 or 9 inches through the rails. A few of the pickets are nailed to keep the rails a suitable distance apart. The panels are kept erect by passing the end pickets through the rails of two panels, as shown, and setting the panels zig-zag. Such hurdles may be made of basswood, white wood, butternut, sugar maple, or of more durable timber. After the fence is finished, the whole should have a heavy coat of coal tar, which should be worked into the joints to exclude the rain. When set up to remain any considerable length of time, there should be flat stones or bits of board placed under the corner and middle pickets to keep the fence above the

ground and prevent sagging. Such fences will be found convenient for encircling a hay stack. The panels may be set in a straight line with braces to keep them erect, or in a rather contracted circle without braces.

A Good Fodder Rack.

We herewith give an illustration of a fodder rack, to stand under a shed, or in the open yard, which is superior for that purpose, to any other style that we have ever met with. It is portable, requires but little skill to make it, and its

FODDER RACK.

construction is such that it is almost impossible for animals to waste any fodder. The part marked A, represents a box 6 feet square, and 20 inches high, with pieces of 2x3 inch scantling in the corners, which serve also for feet. B, B, represent two pieces of scantling for supporting the main part of the rack. C, C, and D, D, are also 2x3 scantling. They may be larger than this if desirable, or the top ones may be made of round poles. The sides of the rack should be about 3 feet apart, and the rounds set 4 inches from centre to centre. The most expeditious way to make the rounds or slats is to saw them out of hard-wood boards, which are not cross-grained and knotty. Slats 1 inch square are sufficiently large for ordinary racks. P, represents a partition on one side of the rack, the ends of the boards being nailed to a small piece of scantling. With such a partition on each side, a square rack will accommodate 4 cattle very well. The long boards should be about 12 feet in length and extend through, forming the partition on each side of the rack. When such a rack is made without any partition, as shown on the rear side of the engraving, two cattle will seldom feed on one side, as the master animal will usually stand lengthwise, and sometimes haul the fodder out faster than it is eaten. But when a partition is erected, as shown, most cattle will stand side by side facing the rack, and drop the loose fodder in the manger, instead of outside the rack where it will be wasted. The pieces C, C, should be about 8 inches apart, with a board between them, and pieces D, D, about 3 feet distant, and held in place with narrow boards bolted upon the top.

The pieces C, C, and the brace boards on the top being secured by carriage bolts, when these are removed, the rack may be taken off, and knocking off the end boarding, and taking away the partition, the whole affair may be snugly stowed away for the summer under cover, and thus be made to last a great deal longer than it otherwise would. Stationary racks around a yard, unless placed under sheds, are constantly rotting away, and the especial advantage of such a yard-rack as we describe is, that it may be taken down and sheltered, and set up again with ease. All the parts, except the long boards of the partition, may be made so as to be readily packed inside the box.

Cut Feed—Chaffed Hay, Straw, etc.

In these times of high prices, it seems needful to renew the inquiry whether more pains should not be taken to cut feed for stock. Careful experiments show that hay chopped fine affords about a quarter if not a third more nourishment than coarse hay. So then, if the gain is more than equivalent to the cost of the labor, it is good policy to cut hay. The reason cut feed goes so much farther than coarse is this: The woody fiber of the hay, after it is chopped fine, is more easily masticated, and is more intimately mixed with saliva and digested, and so becomes nutritious and fattening. Still more, if the food is steamed, or wet with scalding water, it carries on the process further and better. Now, add a little meal, and the fodder is more nutritious and every way better.

If the foregoing be true of hay, it is more so of straw and corn-stalks, because they contain more cellulose matter, or wood fiber, and less starch and nitrogen. Experiments show that some four-tenths of this woody fiber may be assimilated, and so converted into fat. But to secure this result, it must previously be made fine by artificial processes. Alderman Mechi is reported to have said that 100 pounds of straw cut and steamed is more nourishing than the same weight of Timothy hay not chopped. We suspect his experiments were made with over-ripe hay, and straw harvested "in the milk." Either his hay was not as good as our Yankee hay, or his straw was better. *

For the American Agriculturist.

Superiority of Italian Bees.

The highest test for the purity of Italian bees, is their greatest difference from black bees: namely, the greater prolificness and length of life of the queens; the greater industry and consequently quiet temper of the workers; the greater size and beauty of the drones; all these extreme qualities are found fully developed in each of the distinct kinds of bees in the hive, and they should be preserved to maintain purity. The nearest approach to perfection is obtained in a dry, clear atmosphere, and a continual harvest of flowers. The loss of these points of excellence is in the extremes of heat and cold, and in barrenness, and want of ventilation. By becoming chilled in winter, large numbers of queens become worse than useless.

The great difference then is not that Italian bees are really more industrious, but that they are *more nearly perfect*, and the queens more prolific; and prolificness seems to us to be the best test of perfectness. We have removed one comb daily well filled with eggs from Italian queens, while no black queen we ever tried filled her comb in less than two days. One of their most estimable qualities is the mildness of their temper. Their worst fault is their liability to cross with black bees, which gives an opposite character. In a stock of Italians, black, and cross-bred bees mixed, the half-breeds are first and most easily aroused to anger, the blacks next, and lastly, and with difficulty, the Italians.

When the number of black stocks are increased, they become more and more uneasy; fearing one another, more bees remain at home. With Italian bees it is different, what they do has more definiteness of purpose. To work seems the one law of their existence, whether they have 100 lbs. of honey stored or only 10 lbs. Bees do not store honey in anticipation of

needing it in winter. For if one drives out a stock late in the fall, those remaining will consume the honey gathered in brood raising, and will continue to do so after flowers fail, if fed a moderate allowance daily. Nor does a cold climate increase their stores, except as cool nights check its evaporation, thickening and increasing it. For this cause also, Italian bees being more hardy, and working earlier, gather a greater quantity than the black bees, which are required to collect the less amount which the plant replaces. The reason bees work less in a warm climate is, that the honey gathered, long remains too fluid for sealing. This shows the necessity of ample ventilation during the working season, to carry on this necessary evaporation and thickening of the honey even in a temperate climate, or in a close situation.

We placed several stocks of bees in a close, deep ravine, and found the bees gathered honey faster than it thickened, and consequently left large quantities unsealed, which soured. This sometimes happens in wet and cloudy weather, but less frequently with Italians than black bees. Italian bees are somewhat longer, and reach the honey in deeper flowers, being quicker to go and return, or perhaps, go farther, and living longer, can secure more honey. The Italian queens are of a beautiful light straw-color when young, changing to a deep orange yellow when old, except the extreme tip, which changes with age, from brown to black. All her worker progeny are alike, with long tapering bodies, marked with three bright yellow rings, commencing at the "waist," which are divided by two longitudinal lines of brown, then three rings of black (including the tip), edged with two small bands of yellow down. The drones have but four abdominal rings, the two nearest the waist are of a light, rich yellow, enlivened with the colors of the rainbow. The light yellow of young queens, drones, and workers, by crawling in and out of the cells, becoming smeared with honey, or otherwise, changes to a deep orange, and the brown and yellow down to black. Sometimes their change occurs in early life, but generally in old age.

Minnesota.

BIDWELL BROS.

European Notes on Hop Culture.

One of the most experienced hop-growers of this State, Mr. F. W. Collins, spent the past summer in England, and on the Continent, engaged especially in looking into the culture and trade in hops. Having recently returned, he sends us the following notes which will be read with interest by American hop-growers:

"The districts where hops are grown comprise some of the most beautiful farming country of England. The Hop crop is considered as one of the most paying in England, as it is now one of the most important products of this State, and rapidly increasing in importance, in other States of the Union.

"During a recent tour among the great hop-districts of England, I had the opportunity of freely conferring with the best growers of Kent, Sussex, Surry, Worcester and Hartford, where nearly all the hops in England are grown. The Eastern and Central parts are the only ones in which they are raised, while here, almost every part of our broad country is adapted to their growth even better than England, as will be shown by comparing the product of that country with our own. There was an excise duty and an import duty collected in England for many years, both of which by Mr. Gladstone's

efforts, were removed, about four years since; the official reports show the number of acres and the whole product of the country accurately. The average yield per acre for the last 23 years that are reported, was less than 7 cwt., the greatest average which was in 1850, was 11 cwt. 10 lbs., the smallest average, in 1840, was 1 cwt. 2 qrs. 8 lbs., the number of acres in hops in England, has been for many years about 50,000, and is put by good judges at from 55,000 to 60,000 at the present time, there being but about one-third as many in this country, but the hop crop is rapidly increasing here, and the demand for hops is growing faster than the increase of the crop. Our census report does not give our average; in 1850 less than 3,000,000 lbs. were raised; in 1860 over 11,000,000 are reported, and last year there must have been nearly 18,000,000 lbs. produced. This year the crop is considered a failure, on account of the hop-louse and the blight, yet I estimate the crop at 400 lbs. to the acre, not more than one-half what is wanted for consumption by the trade, and the price is high.

"In England, the crop was good, called by the factors and most of the farmers a high average. I saw them sold at several markets at £5 to £10 (\$25 to \$50) per cwt. Bavarian hops sell much higher than English, some as high as £16 (\$80). The price varies very much in different parts of England. East Kent, Farnham, and Worcester, have a high reputation. I think very much depends on the care used in picking them clean, keeping them whole, and the skill in drying them. The English factors admit the superiority of the American hop to theirs in strength. The new kiln which received a Silver medal at the N. Y. State Fair, is the best system of drying hops yet used, all who have seen the model admit it. It is described in your 'Hop Culture.'

"Within a few years past the system of growing hops on stakes and twine described in the first prize essay in the book you published on Hop Culture, has been used in nearly all parts of this country, where hops are raised, and as far as I have learned it gives satisfaction, it is very economical, not over one-fourth the expense of the long pole system, requires less labor, produces better hops, and in most cases much larger crops, and the hops are gathered without cutting down, which is of great importance in preserving the root, as then no sap is lost by bleeding at picking time. I found this system in use in England in a few gardens, for the first time this season. One plantation had 35 acres on this plan belonging to Messrs. Simmons & Hunt, of Maidstone, Kent; they used it on 6 acres last year with satisfactory results, and said they got as many bushels of green hops per acre, and of a quality and color much superior to any on poles. This process is patented in the United States and England, and also in Belgium, Holland, and Bavaria, and other hop-growing countries on the continent. Austria is a very excellent hop district. The number of acres in it and its dependencies devoted to hops, is about 150,000, and it is said to consume all the produce. The following extract from the correspondence of an English paper of last May, will show the horizontal plan is appreciated.

"In the autumn of last year I drew attention to the importance of preserving the hop vine until the leaves had fallen and the sap had ceased to flow. I advocated the American system of training the plant on strings, stretched from pole to pole, in order that the crop may be gathered without the necessity of cutting down. I have just returned from Kent where

I have inspected a field upon a portion of which this system was tried last year. The field was everywhere subject to the same cultivation, and if any thing the crop was superior upon the strings. The half acre upon which the experiment was made can now be distinguished without the slightest difficulty. Scarcely a plant has failed, and on an average, the new vine is fully one foot higher than in any other part, and is strong and healthy in proportion. It is already well established on the poles, and is from three to four feet high, being at least a fortnight in advance of any garden I saw in my short tour. The experiment will be extended this year, and as it is not yet too late, I would seriously urge an extensive trial by large hop-growers, in the strong conviction that it is most important to reform the present system of picking, which is contrary to every principle of vegetable physiology.

"Your book on 'Hop Culture' (see Book List) should be in the hands of every hop-grower. It contains all the information necessary, it is a perfect manual of instruction for a novice."

Agricultural Education.—The Public or District School.

In an article on page 11 on "The School in the Family" we take it for granted that the farmer's boy can attend school. Happily this is the case almost everywhere in our country, except in the ruder settlements of the West and the less populous parts of the South; but unhappily the character of the public schools in many sections, even in the Eastern States, is very poor, so poor indeed that it is a matter of but little regret that school keeps but four months in the year. Certainly no question should come home to every farmer with more force than the inquiry—"whose fault is it that the district school is no better?" We know it is often very hard to induce a community of little-thinking men to tax themselves any more than they can help for any thing. And if the school is better than it used to be, and the boys are picking up from newspapers and story books, "a better education than their fathers had," any movement to have a better house and better teachers will be very apt to be voted down in town meeting as often as it can be brought up. It is useless to argue on moral principles with the men who are not in favor of giving their children the very best education they possibly can, nor with those who, perhaps, having no children of their own, neither think nor care how those of their neighbors are educated. There is an appeal to personal interest which they will heed. It is not hard to demonstrate by examples almost everywhere, that the thoroughness of the schooling has a great effect, and that very soon, upon the general intelligence and moral sense of the community, the security of property, the value of real estate, etc. Crime is diminished; invention and mechanical ingenuity quickened; better farming obtains, and the general welfare of the whole community is greatly increased. It is, in fact, hard to set bounds to the inevitable and elevating influence of a good district school well maintained for a series of years.

It is every citizen's bounden duty to do not only his share towards maintaining a good public school in his neighborhood, but he should be active and earnest in having it just as good as it can be. It will put money in his pocket even though he be an old bachelor without any expectations, or a day laborer without family. There are always those in every community

who appreciate the value of a good education for their children. Such people are very apt, after some discouraging efforts to have the public school good enough for their children, to send them off reluctantly to boarding schools at a distance, or undertake to have them instructed at home by private tutors. This is a bad practice. It is more democratic and in every way better to have the children of all stations in life, and of families of every grade of wealth, meet on the same level in the public school, the only qualifications for school membership being fair morals, soundness of mind, and personal cleanliness. There is little danger of children well trained at home getting harm at such a school. There is far more danger at boarding schools where boys and girls are separated from the influences of home, especially if they are sent away in tender years.

It matters not how carefully children are kept away from evil influences, they will inevitably meet them at some time and somewhere. Temptations to do wrong will come, if not in company with others, then in their own hearts and when quite alone. Real moral strength comes with meeting and resisting. This the child of six years old is just as well able to do as the grandsire of sixty; and is it not written "as thy day, so shall thy strength be?"

The public school teacher should be possessed of moral power. Do not employ a man of so little force of mind and goodness of heart combined that he has to govern by the rod—much better have a gentle woman with persuasive graces and loving temper. Any teacher who shows anger should be dismissed at once, no matter how much he knows. To govern one's self is more important than to govern the school. Very great learning is seldom a desirable qualification; but, with good general knowledge, great accuracy is. A teacher's language should be easy and correct always, his pronunciation perfect. He should read easily and well, and spell well, and have a fair knowledge of arithmetic. With these qualifications, if he is not lazy, he will be a good teacher who loves his work and loves his pupils. In regard to mere book knowledge, of even those things which he is to teach, as geography, history, etc., he can study faster, read more than, and keep thoroughly ahead of his pupils, if he has only a general understanding of his subjects.

The primary school teacher's chief business is to furnish a child with the means of acquiring knowledge, and a love for it; to give the child a knowledge of written language, so that he can comprehend books and put himself in communication with the thinking world; and to so far instruct him in regard to the world around him that he shall leave school with earnest desires to learn more. So he is instructed a little, and a very little it is, in geography; he gains a little insight into mathematics and numerical relations (learns to count pennies and compute interest perhaps); he studies history of the United States and thinks he understands all very well; and so it is with other things. But most unfortunately neither school-books nor teachers tell their pupils where they can go for fuller knowledge and minute information on these subjects. This great want is in part supplied by good district school or public libraries where they exist, but the desire for such libraries and the use of such as exist might be greatly increased by suitable references in the school-books in general use, to instructive treatises. The subject exceeds our space in the present number, and we must continue it at another time.

The Cultivation of Peppermint.

Occasional accounts appear in the papers of the large sums realized from the peppermint farms of Michigan and Western New York, and these naturally suggest to some of our readers to ask why we do not publish articles on peppermint culture. We are a little shy about saying anything about specialties which shall induce people to engage in undertakings for which they are not well qualified, and which, if commenced, would in nineteen cases out of twenty, result in loss. Mint growing has in many instances proved profitable, but it involves not only cultivation, but the immediate manufacture of the product into oil; a process which though not complicated, yet requires care and skill in a sort of manipulation with which farmers are not familiar, and it is one which to be profitable must be carried on in a large way. If any one wishes to start an enterprise of this kind it would be time and money profitably expended, to visit localities where the culture is established, and where he could in a few hours see and learn more than he could from any detailed description. Another thing to be borne in mind is the fact that the oil of peppermint is an article for which the demand is limited, and that it is one the price of which is subject to great fluctuations. Mint does best in a light, rich and warm soil. It is propagated by sets or parts of old plants. The mint spreads rapidly by underground branches; the old plants obtained by plowing up a field may each be divided to form several sets. The ground is well prepared as for a potato crop, as early as the season will permit, and furrows are marked out from 18 to 24 inches apart. The planter carries a bag of old plants from which he pulls off a portion, drops it into the furrow and covers it with his foot, putting them so thickly in the furrow as to nearly touch one another. During the season the weeds are kept down by the use of the cultivator and hoe until August, and by the latter part of that month the plants will have nearly covered the whole surface. The cutting commences when the plant begins to flower, and is done with a cradle or grass scythe, the mint cocked in the field and allowed to wilt and then taken to the still. The still consists of a strong wooden tub, 4½ feet high, and 6 feet in diameter, with an opening in the top for charging it, which can be made steam-tight. From near the top of the still a tube connects with a condensing worm, and at its lower part is inserted a pipe which conducts steam from a boiler. The tub or still being crowded full of the wilted mint, and the cover fastened steam tight, steam is let on from the boiler, and after the whole mass is heated through, it passes into the worm where it is condensed. The steam carries the oil of the mint with it and both are condensed together, and the water and oil are caught in a receiving vessel where they separate the oil floating upon the water. The first year's crop gives the best quality of oil and the greatest yield per acre. The second year nothing is done but to destroy the few weeds and cut and distil the mint. The third year, the field becomes overrun with weeds and the product of mint is small. The fourth year the field is plowed up to kill the weeds, and enough plants spring up from the broken roots to give a fair crop. The fifth year the field without much attention gives a crop about equal to that of the second year, and after this the land is put in grass, and allowed to recover its exhausted fertility for a few years, when it may be planted again with mint.

Some of the Newer Potatoes.

It may shock our pomological amateurs if we declare that we consider the advent of a new and superior variety of potato, cabbage, or other culinary vegetable, of as much importance as the acquisition of a new pear or grape. Fine fruit is unfortunately only of interest to the few, but a fine potato appeals to every one. We figure some of the newer potatoes, which, if they confirm half of what is claimed for them, will prove valuable indeed.

Early Goodrich.—The late Rev. C. E. Goodrich, of Utica, N. Y., is gratefully remembered for his labors towards the improvement of the potato. He raised 16,000 different seedlings, and this, in the opinion of competent judges, is best of all. It was raised from the seed of the Cuzco, which is itself a seedling from the wild Peruvian potato. The engraving is half the size of an average specimen. The eyes are large and full, skin white and smooth, flesh white. As a table potato, and we have tried it in various ways, it is unexceptionable in

Fig. 1.—EARLY GOODRICH

quality. This variety was, we think, first sent out in 1864, it has been tested in various parts of the country, and all the reports we have seen respecting it are unanimously in its favor. We have not yet grown it, but several of our friends assure us that it will yield from 300 to 400 bushels to the acre, that it is as early as any, and that it is perfectly hardy and free from disease. We are glad that the name of Mr. G. is to be commemorated by so excellent a variety.

Harrison.—This is also one of Mr. Goodrich's seedlings, and it came from the same seed ball as the early Goodrich. It is a handsome white potato, with very small depressed eyes. It was named by Mr. Goodrich in compliment to Mr. A. W. Harrison, of Philadelphia, an account of whose experiments was given in December last. It matured in September and was the most productive of all the varieties tried by him. We have only been able to make a single trial of their quality, and found them to cook mealy and to be of very good flavor.

"Monitor."—This is said to be a seedling raised by Mr. D. A. Bulkley, of Mass., but it appears so much like the Prairie Seedling, that, judging from the tubers alone, we should say they were identical. A comparison of the two in growth will be necessary to settle the question. It is very

Fig. 2.—HARRISON.

large, somewhat flattened, and rather square in outline. It has a pinkish rusty coat and very

deeply sunken eyes. It has the reputation of being a great bearer and of good quality for the table. The figure of this, as well as of the others, is of half the actual size of good specimens. In order to save our readers trouble, we will state that we have heard of none of the

"Fig. 3.—MONITOR."

Harrison being for sale this year, and that the others are each advertised by several dealers.

A Good Rack for Horse Stables.

The illustration shows a rack and manger superior to many in common use. The horses may be fed without entering the stable. Boys can clean out the mangers and feed horses that they dare not approach, nor handle. The rack and manger constitute the partition between the stalls and the feeding room. *B* is the side of the stall. *C* is the flap for holding hay against the slats of the rack. This flap is hung with hinges to the casing below it, with the front edge supported by a small chain, rope or strap (*F*), fastened to a joist above. The upper side should be planed, so that the hay will slide downward readily. After the hay has been laid

RACK AND MANGER.

on the flap, it is raised up until the catch, *D*, attached to the joist, receives the edge. The proper position for the flap is at an angle of about forty-five degrees. Hay will then slide down so as to be reached by the horse. *E* represents the shutter to the manger, which should be so narrow that a horse cannot possibly thrust his head through. The flap on which the hay rests may be buttoned close up against the slats. This feature will be found convenient when thrashing, to exclude dust from the stable. The slats should not be more than three inches apart in the clear. If the spaces are wider than this, horses will pull out hay faster than it is eaten. By having the slats of the rack placed perpen-

dicularly, hay seed and chaff can never fall on the necks and heads of animals, as they otherwise will. This is a good style of rack for neat cattle, when made at the proper height. The correct height of a manger for horses is, a little lower than they ordinarily carry their heads. When a manger is built too high, any animal will waste more feed than if it is made low.

Hollow Logs for Water-troughs, etc.

Hollow logs are often considered worthless except for fire wood, and neglected for this purpose because they are so hard to split. This very quality makes them the more valuable for the purpose we suggest. Select a straight log 8 to 16 feet long, of suitable diameter; cut it squarely at each end. Then cut a notch with an axe or saw about ten inches from each end, and one quarter way through the log, making the notches of exactly the same depth if the log is cylindrical, and accurately corresponding in position. Then take out the wood between the notches, clean out the inside and trim the edges with an adze. Now saw out two pieces of inch or inch-and-a-half board for the ends, which shall be large enough to lap a full inch

HOLLOW LOG FOR WATER-TROUGH.

beyond the hole upon the solid wood; mark out the size of each board upon the ends of the log, and, with a chisel, cut out a rabbet so as to let the board in snug, its full thickness. Now lay in a piece of rope yarn, or a string of oakum in the bottom of the rabbet, drive in the end piece, and nail it in strongly. The seams may be calked with oakum and "paid" with pitch outside and in. It is well also to go over the entire inside with hot pitch. Such a trough will last much longer, bear more wetting and drying, and other wear, than if made of a solid log, and it is besides very much easier to make.

Dike for Reclaiming Salt Marshes.

Correspondents are calling for information upon this subject. We are glad to know that the good seed we have sown in years past has not all perished. We still believe that the most valuable grass lands in our country are the salt marshes that line our shores, and stretch far inland along our tide-water streams and coves.

The dike or embankment is the main difficulty, and here the courage of most rural improvers fails them. Where a railroad runs along the front of the premises to break off the sea, the work is easy, and fortunately there are thousands of acres all along our shores that have this most expensive part of the work done for them. They wait only the enterprising man or company who will yet surely take hold of them and make fortunes by reclaiming them.

But what can be done for the snug little patches, of a dozen acres or less, that lie in countless numbers upon our shore farms? They can be redeemed economically by the style of dike represented in our illustrations. It is well known that the soil of all salt marshes is made up very largely of vegetable matter, and is exceedingly light and spongy when dry. Such a material is entirely unsuited for a dike without additional

Fig. 1.—TIDE GATE AND DIKE.

support. This may be afforded either by planks or by clay, or any heavy soil that will pack well, as represented in the engravings.

In the figure 2 we have a cross section of such embankment with its accompanying ditches. *A*, represents the section of compact soil or clay taken from the adjoining bank or fields, extending perpendicularly from the hard pan to the top of the dike, and along the whole sea front of the marsh to be reclaimed. The left hand side is toward the sea, the right toward the land to be drained. Begin the work by cutting out the section *A*, down to the hard pan, and piling the sods on the edge toward the sea, making a perpendicular wall to support the clay. The muck that is taken out below the surface may be packed on the outside of the sods to support them, and so add to the embankment. After a few rods have been prepared in this way, the clay should be brought and

Fig. 2.—NARROW DIKE.

dumped into the ditch and be packed with a rammer in the most thorough manner, until the excavation is filled to the surface of the marsh. You now want to raise the other section of *A*, above the level of the marsh, and you do this by taking the sods from the ditch *B*, on the inside of the embankment. Sodds enough may be taken to form the support of the clay packing, and the rest be reserved to finish the embankment, presenting a smooth surface of well packed sods at an angle of about 45 degrees.

The breadth of the clay packing is to be determined by the height of the embankment, which of course must have reference to the height of the tides. The dike should be at least a foot above the highest known tide. If the dike is not more than three or four feet above the level of the marsh, a packing eighteen inches thick will be sufficient to keep out the tide. The greater the pressure upon the dike, the thicker the packing, and the higher and broader the embankment should be. In case of very high embankments, a second packing as shown in the illustration (figure 4) may be necessary.

In some locations it may be necessary to expose the embankment to the direct action of the sea. If there is to be violent action of the waves, a sea wall will be necessary. But this

is not usually the case, in those small parcels of marsh land that a farmer would be likely to undertake to reclaim with his own capital. The expediency of cutting a drain on the outside of the embankment is to be determined by the quantity of material needed. It is not in itself desirable. If the inside ditch will furnish material enough it is better to leave the outside unbroken. In digging the inside drain, a rim four or five feet wide should be left between the ditch and the edge of the embankment. It makes the bank stronger, and is an additional safeguard against the burrowing of muskrats. In all cases the banks of the ditches are to be left with a slope. It is found that these sly depredators work much more readily into a perpendicular surface than into a slope.

As to the width of the embankment, it is desirable in all cases to have it wide enough for a cart path, but where the embankment is low, and the pressure of the water is small, this is not necessary. The use of the bank for a path would often be found a great convenience in drawing sea weed and manure, and in removing crops, and it tends, also, to solidify the dike and make it more durable. The inside slope of the bank should be sown with clover and herdsgrass both to its usefulness and permanence.

Fig. 3.—BROAD DIKE WITH CART PATH.

A good example of successful diking upon a small scale may be seen upon the premises of Col. Hanks Head, of Mystic, Conn. We wish our correspondent, and all others who contemplate improvements in their salt marshes, the largest success. No enterprise, we are confident, promises a larger reward.

The limits of a single article will not admit of discussing convenient forms of gates, etc., but the engraving, Fig. 1, at the head of the page will give a good idea of one of the simplest kinds. A trunk 18 inches square passes through the embankment at the lowest convenient level. It is constructed of 2 or 3 inch oak plank, laid in masonry and cement; or it only enters the masonry far enough to gain strength and solidity. On the outside end a gate is hung, as shown, the hinges, nails, etc., being of composition metal, and the bottom of the trunk inside being protected by a sheet of copper to prevent muskrats gnawing holes in it.

Fig. 4.—HIGH AND NARROW DIKE.

The exterior ditch shown is usually seen, especially in cases where salt-hay may be cut outside the dike; it is useful in letting off the water rapidly when the tide falls.

Glanders and Farcy.

With an article on glanders in the October number (page 309) we gave a particular description of this disease, when it attacks primarily the nasal cavity, the bones of the face, and, under some circumstances, however, dependent probably on the condition of the system of the

patient, the lymphatic system is attacked. The vessels immediately beneath the skin become hard and cord-like, and the nodes and glands swelled, hard and sensitive to the touch. These swollen glands, termed "Farcy buds," after a while suppurate and form ulcerous druzo sores; and these, when the affection is localized and intense, become confluent, in a measure.

They exude a pale yellowish white or darker colored, unhealthy matter, quite unlike the pus accompanying healthy granulation, or common sores. The sores not unfrequently remain inert, and sometimes yield to external applications and appear to be healed; but the appearance is deceptive and they break out worse than before.

Farcy shows itself on the sides of the face, neck, body, the inner sides of the legs, and sometimes on the exterior sides. The inner sides of the legs are the most common places for it to show itself, especially if there is a tendency to dropsy or a dropsical enlargement of the extremities. It is usually, at least at first, confined to the inner side of one leg. The accompanying illustration is taken from a picture by a veterinarian, of a case which came under treatment at the Royal Veterinary College, London. It exhibits a confluent condition of many of the ulcers, the skin nearly gone, and the leg swelled and dropsical. Farcy always terminates in glanders, and the symptoms of glanders are commonly observed very soon after the farcy symptoms are well developed.

Inoculation with the virus from these sores produces glanders or farcy, according to the condition of the patient. Accidental infection or inoculation may easily occur in various ways, and may affect either men or horses. Two cases of the death of grooms from glanders have recently been reported in the papers, and we presume others may have occurred and the disease not been recognized. When the activity of the disease is wholly confined to the skin, it affects the rest of the system only through the general debility which supervenes. Farcy is regarded by many veterinary physicians as curable. In fact, the very case from which the drawing we give was taken, is reported to have been permanently restored, by the judicious administration of tonic stimulants, with cantharides. But when the nose and lungs are affected, the case is hopeless and the horse should be shot, and buried at once. The appearance of the nose and the submaxillary lymphatic gland was so recently described in the *Agriculturist* that it is only necessary to say that the inner pink membrane on the middle wall between the nostrils, when affected by the glanders, becomes pale and sickly, sprinkled with small sores, and discharges a sizzly, gluey mucus of a cold or catarrh. Cases of glandered and farcied horses are by no means rare in the country, and every owner of a good horse should be on his guard in putting him into strange stables, or with strange horses.

CASE OF FARCY.

Birds, Insects, and Fruit.

Fruit growing, in the abstract, is a charming pursuit, but practically it is beset by many perplexities. Not only is the cultivator disappointed by unfavorable seasons, but the insects destroy his foliage and the birds eat up his fruit. In a state of nature matters are better arranged, and we do not often find any one insect or bird sufficiently numerous to seriously injure our native plants. The small birds keep the insects in check, while the birds of prey prevent an undue increase of the fruit-eating birds,—bird, insect, and plant have a fair chance in the "struggle for existence," and all goes on harmoniously. Civilization has destroyed this natural balance of things, and now fruit culture is in good part a fight with birds and insects. We have dropped a cog-wheel somewhere in the machinery, and it is running badly. This interference in the natural balance between the different departments of vegetable and animal life found a striking illustration a few years ago, in one of our large cities. New water works were built, and the reservoirs were carefully furnished with strainers to keep out the smallest fish, and no one was in danger of finding a minnow in the tea-pot. All went well for a while; but the water gradually acquired an unpleasant taste, and finally became intolerable. Science took up the microscope, and found the water full of animalcules, little oily fellows, which imparted the taste to the water. These in the absence of their natural enemies, the fish, had bred to an inordinate extent. The obvious cure was to let in the fish, and it proved effectual. The indiscriminate shooting of birds, formerly so common, allowed insects to get a fine start. The agricultural press, ours among the rest, joined in the cry "spare the birds." The appeal had its effect; insects are much less destructive than they were a few years ago. But the birds will eat fruit as well as insects, and now the cultivator is in a dilemma to decide whether it is best to let the insects feast on the foliage of his vines and trees, and thus destroy his crop of fruit; or to allow the birds to check insect depredations and take the fruit for their pay for doing the work. The question comes up: are all birds the fruit-grower's friends, and if not, which shall be killed and which spared? The manner in which birds will dispose of strawberries, grapes, and other small fruits is something astonishing to one who has never seen it. In some places it is impossible to get a bunch of ripe grapes of any of the nicer kinds, for birds are excellent judges of quality in fruit. We are glad to see that the subject is attracting the attention of Horticultural Societies; at a recent meeting of the Alton, Ill., Society, a report and discussion upon birds formed a part of the proceedings. It is hoped that other pomological associations will discuss the matter in order that some general laws may be established. We give the conclusions of the Alton Society, which may serve as a basis for the action of others.

It was voted to destroy the Baltimore Oriole, Cherry Bird, Cat Bird, Jay Bird, Sap Sucker, and his kindred. The Robin was not placed in the list, though he received a very bad name and should take warning. Our own belief is, that he is about as bad as the rest. One gentleman stated that the Oriole had during the past season cost him 250 gallons of wine. The birds reported as not destructive to fruit, and to be fostered, were: Wren, Swallow, Martin, Black Bird, Meadow Lark, Pewee, Blue Bird, Chip, or Snow Bird, Red Bird, King Bird, Cuckoo,

Quail, Owl, Hawk, and Dove.—We notice also that the Massachusetts Horticultural Society has appointed a Committee to consider the case of the robin, and report upon his value, or otherwise, to the fruit grower.

Notes on Grapes and Grape Culture.

In our notes in December last, we alluded to the growing importance of grape culture; and believing it destined to be one of the leading branches of industry in this country, we shall continue to give, from time to time, such bits of information as we consider worthy of being recorded. The interest our readers take in the subject is shown by some 20 letters now before us. Frequently we are asked questions which have already been answered, and it is not always convenient to go over the same ground again. Every one who has only a few vines even, should have some work upon grape culture at hand for reference. We do not answer queries, no matter if marked private and confidential, as to where the best vines may be had. We believe that all who advertise with us intend to deal fairly, and we can not go beyond that. If one wishes to purchase many vines, it will pay him either to visit the nurseries and examine the stock, or to send for samples and order with the agreement that the vines sent shall average of equal quality with the sample. A nurseryman out West wishes us to enter into a combination with him to put down the high prices at which new varieties are sold. We cannot aid in any such undertaking. The thing will soon regulate itself. When a cultivator, after many years of careful trial, succeeds in obtaining a new and valuable variety, he must get his whole reyard for his labor in a short time, as the plant soon passes out of his hands, and is propagated by many others. Those who do not wish to pay his prices, can afford to wait. From the southern States we begin to have correspondence and of course grape queries. There is still much to learn concerning the adaptation of varieties to localities, but the experience of Missouri and Tennessee cultivators shows that as a general thing grapes of northern origin are much improved when cultivated in more southern localities. The practice of high manuring is now abandoned in localities where grapes are grown, for wine, a well drained soil of moderate fertility, giving much better fruit and a healthier growth of vine. We continue our notes from reports of correspondents and other sources.

Creveling.—A cultivator in Central New-York writes as follows:

"Four years' experience with this satisfies us that it is a very excellent grape. Excellent in some respects, though not in all. It ripens early, at the same time as Hartford Prolific and Northern Muscadine, and does not rattle from the stem as both of those sorts do. It is superior in quality to them and to the Concord, and resembles a good Isabella. But the clusters are too loose: sometimes not more than half of the berries set. Perhaps if some other early grape, blossoming at the same time, were planted by its side, its flowers would be fructified, and the clusters be handsomely filled out."

Hartford Prolific.—A friend who grows grapes for market called on us to ask with what varieties he should extend his plantation. We inquired what kinds he had, and were told, Hartford Prolific and Concord, and both fruiting satisfactorily. Our advice was to plant more of the same sort, and also to try some of the Adirondac, Israella, and other of the newer

kinds to test their suitableness of his soil and location to them. Now while we are well aware that either of the last mentioned grapes is greatly superior to the Hartford, it would be unwise in our friend to abandon a variety he has tested, and plant largely of those with which he has had no experience. For a near market there is none of the early grapes more profitable than the Hartford, with all its faults, and though we hope to see it supplanted by better sorts, it will for some years be valued on account of its earliness and reliability.

Main's Seedling.—The Hon. E. W. Bull, with whom the Concord originated, shows pretty conclusively, in the Massachusetts Ploughman, that the grape which has been sold at a high price as 'Main's Seedling,' is nothing but the Concord. The same thing has also been called 'Early Concord' and 'Northern Hamburg.'

Iona and Israella.—F. C. Brehm, an experienced grape cultivator at Waterloo, N. Y., reports to the Country Gentleman, his experience of last season. "Hartford Prolific, Iona, and Israella, stood it best out of the whole lot; ripening their fruit and wood finely. Israella will become a popular market grape, on account of its earliness, good quality, and excellent keeping qualities; it bears early and abundantly, with heavy shouldered bunches, very compact. They adhere very firmly to the peduncle, and will shrivel up or dry into raisins before they will dry or drop off; this makes them valuable for sending to market. Iona will undoubtedly be the favorite for the table and wine, as soon as its merits become known; it is no doubt a seedling of either the Diana or Catawba, probably the latter, which it much resembles in color and flavor, but is much superior to either of them; ripening about the same time as the Delaware.

Montgomery.—This variety has been put forward as a native. We are informed by the gentleman, after whom it is named, that he procured it of a German as a foreign grape, and that he never claimed for it any other origin. Although in favorable localities it will fruit in the open air, he wishes it to be understood that it is an imposition to pass it off as a native variety.

Some Choice Winter Pears.

A richly flavored melting pear on New Year's day is a luxury which is enjoyed by far too few. Most who raise fruit, content themselves with summer and autumn pears, while they might as well prolong the season into February and March. Our late varieties have multiplied largely within the last few years, and they include some of the highest excellence. Some who try them, fail from picking them too early and keeping them too warm. The consequence is, that when they come into eating, they are either flat and insipid, or are shriveled. Of the many specimens brought for our inspection this season, the majority had wilted before ripening because they had not been kept sufficiently cool. The fruit should be left on the tree as long as it receives any nourishment from it; a few light frosts will not injure it. It should, after being gathered, be kept as cool as may be without freezing, and be brought into the condition for eating, by placing it for a few days in a warm room. We append a few notes of those, which we have tested during December and January.

Lawrence.—This was figured and described in December, 1864. If we were confined to but one late variety, it should be the Lawrence. The tree is healthy, vigorous, and productive, and though there are varieties possessing a higher

flavor, the fruit is so generally good and the crop so regularly to be depended upon, that we are disposed to give it a high rank.

Dana's Hovey.—When this pear was first exhibited, it was so small that its lack of size seemed to detract from its good qualities, but as the trees grew older, the fruit became larger, and it is now of sufficient size for a table fruit. We have only seen specimens from Mr. Hovey, who states that the growth, habit and productiveness of the tree are all that can be desired. In quality the fruit is of the very best. It has a russet skin, is very juicy and of an exceedingly rich flavor. Last year it was in eating the middle of December. Mr. Hovey states that ordinarily it keeps until the end of January, and never rots at the core.

McLaughlin.—A fine, large, russety fruit, which originated in Maine, and is not much known out of New England. From the specimens we have seen we should consider it good, and worthy of the attention of cultivators.

Josephine de Malines.—The tree has not a very rapid growth, and it needs age before it will produce good fruit. When in perfection, it is one of the best, and will last until spring.

Winter Nelis.—This fine old variety should not be overlooked in making a selection of winter pears. All the specimens we have seen this year ripened early, but they were very fine.

Vicar of Winkfield.—This is the best of all cooking pears, and when well grown by good culture and proper thinning, is a better table pear than some with a higher reputation. In its best condition it is a very handsome fruit, and it is generally sure to bear a crop.

Besides these there are many old and new varieties, including Easter Beurre, Glout Moreceau, Sieulle, Beurre D'Anjou, Belle Epine Dumas, and others. If winter pears have good culture and the same care in thinning, when needed, that is given to other varieties, we shall not hear so many complaints that the whole class are a failure. The prices that good specimens always bring in market, should be an inducement to fruit growers to give them a fair trial.

Newspaper and Popular Science.

Popular science is too apt to be popular error. It would be a good thing to have children taught the rudiments of the natural sciences as thoroughly as they are those of arithmetic; could we only have capable teachers and suitable text books. Of late what is called Object Teaching has been introduced into schools. The idea is a good one, but to properly carry it out calls for acquirements more varied than will usually be found among our college professors, and are not to be looked for among common school teachers as a class. The American Educational Monthly, not long ago published an "Object Lesson on Iron," in which children are taught that iron is "corrosive." The class being asked what steel is, answer; "The best kind of iron." Teacher.—"That is about correct; it is iron worked into a more perfect form. Can you describe the process?" Class.—"It is made hot and then put into cold water." And so on all through the article a profound ignorance is displayed of the nature of iron and the children are taught errors which they must in time unlearn. It is very unsafe business for those who know but little of any science to undertake to teach those who know less. One of our agricultural cotemporaries in a popular article on chemistry gives chloride of lime as an illustration of a binary compound. Chemically speaking there

can be no such thing as chloride of lime, and if the writer means the article popularly known by that name, he could not have chosen anything farther from a binary compound. When our literary papers affect the scientific, science gets the worst of it. The Home Journal of Dec. 9th last, had an article upon the potato which may have appeared learned to some, but which was a tissue of absurdities from beginning to end. To show up the errors of such an article as this would be labor misspent. Our daily papers have much to answer for in the way of false science, and their articles which treat on scientific matters are so amusing that we for the time forget that Vanity Fair and Mrs. Grundy are dead. The N. Y. Tribune of Dec. 6th, has an article giving "Anecdotes of the Microscope," which is so remarkable a production that we have cut it out and put it among our literary curiosities. It was probably written by one who never saw a microscope. The Tribune is, however, no worse in this respect than the other dailies and, they are all, as far as their treatment of scientific matter goes, melancholy illustrations that "a little learning is a dangerous thing."

Gardening in a Back Yard.

The *Agriculturist* commends itself to those who have small gardens, as well as to the owners of large farms, but we did not know that it was read by those operating on quite so small a scale as the writer of the following who sends his experience over the signature of "Rusinurbe." This queer name is, we suspect, a running together of *Rus in urbe*, the "Country in the City."

"The changes of this changing world found me in N. Y. City, on the cold first of May last taking possession of a city house. It had been engaged for me without my first inspecting it, and upon reaching my new possession, I neglected to look at parlor and dining room, but ran eagerly to the rear to survey the 'grounds.' Imagine how small the smallest kind of a city yard looked to one who had been accustomed to till his acres of garden. Here was all of mother earth that was left to me, scarcely a good sized burial lot. I resolved to make the best of it. When I was gardening on the large scale, I used to read in the *Agriculturist* of wonderful things in small plots of ground, and I recollected with sorrow, the contempt I felt for those potterers in small patches. Here was so much, or rather so little, land to be made the most of. It had already been laid out by a former occupant, a grass plot which two bed sheets would cover, and a border around three sides of the yard. I had 36 feet of border averaging 3 feet wide, and I borrowed a bit from one end of the grass plot to make a little bed 8 feet by 3. A stable at hand supplied manure, and the ground was put in a tolerable condition. Now for my planting. The fence with the warmest exposure was furnished with a trellis of wire and strings, and Lima beans, planted as well for ornament as for beans. Eighteen good Tomato plants were set out along the borders and supplied with trellises. Two egg-plants filled spare corners, while the bed I annexed from the grass plot was devoted to two hills of cucumbers. Then all along the edges of the borders and beds, parsley seed was sown. The results were first shown in a cucumber! Do you believe there was such another cucumber in New-York, and did I not on that day feel pity for those misguided persons who bought the wilted things at the corner grocery? Tomatoes came early, and plenty of

them, all that five persons could eat and quantities to can and pickle green. About a dozen egg-fruit, aldermanic in proportions, and delicious in flavor. Several pickings were made of Lima beans, and the parsley was always pretty to look at, and handy to have. 'And is this all?' some reader of large possessions will ask. No. All those nice things on the table were as nothing to the weeding, the pinching in of rampant cucumber vines, the tying up and cutting up of tomato vines, (how much cutting they do stand,) the fight with insects, the getting the hands dirty, the back tired, and being happy generally. I don't think I can ever have a smaller garden, but if it comes down to a single cubic foot in a candle box, I shall accept it and thankfully read the *Agriculturist* which tells me how to make it yield to the full extent of its capabilities."

Names of Plants and Fruits.

Our horticultural nomenclature is in sore need of revision, and we are glad to see that the subject is being agitated by so influential a paper as the London Gardeners' Chronicle. In a well conceived article in its issue of Dec. 9 last, it protests strongly against the practice, which is becoming too common, of the imposing of names for supposed new plants by those who have only a limited knowledge of botany. It says: "But we put it to all advocates of correct botanical nomenclature, who are not sufficiently educated themselves, whether it would not be more desirable to endeavor to have their plants scientifically and correctly named by qualified botanists than to send such plants out to the public, oftentimes not correctly named, or not unfrequently provided with names of questionable taste." To all of which we heartily say yes, and in turn ask the Chronicle if it would not help the end it desires, to stop calling one of our American trees *Wellingtonia*, which it constantly has done, and does in the very number from which we have quoted. The name *Wellingtonia* was given to it in a "questionable taste," the absurdity of which is only exceeded by that of *Washingtonia*, by which others have called it. But our objection to it is that it is not "correct botanical nomenclature." As our friends do not seem as well up in American botany as they should be, we refer them to Silliman's Journal, and the Pacific R. R. Reports, where they will find it shown that the so-called *Wellingtonia* was discovered, after the fruit became known, to belong to Endlicher's old genus *Sequoia*, and that the proper name is *Sequoia gigantea*. It may gratify national pride to attach a name honored in English history to this wonderful tree, but it should not be indulged at the expense of scientific accuracy. The Chronicle says, "There is some consolation in knowing that the time will soon come round when these so-called names which have been given to plants by unqualified persons, will be discarded for those which have been given by botanists." Though the name *Wellingtonia* was not given by an "unqualified person," it is in the category of those which "will disappear from a position they should never have occupied."

In January 1865 we had some remarks upon the nomenclature of fruits, especially upon the inconvenience which attends the designation of a fruit by a name of several words, such as the pear *Beurre gris d'Hiver Nouveau*. The French pomologists are responsible for most of this redundancy, and we are glad to see that a reform has commenced in the quarter where it was most needed. In the *Nouveau Jardinier* for

NATURE'S MUSICIANS. — Engraved for the American Agriculturist.

1865, the names of fruits have been much simplified, and instead of *Jalousie de Fontenay Vendee*, we have *Poire Fontenay*, or *Fontenay Pear*. The *Beurres* and *Doyennes* are all dropped where it can be done without creating confusion, and there is a general shortening up of titles. While we quite agree with the plan followed in this work, we do not advocate indiscriminate meddling with such matters, as it would lead to inextricable confusion. We hope for a general pomological congress which shall take action to simplify names and adopt rules for naming new varieties, that all pomologists will follow. According to accepted rules, the name by which a fruit is first described in a journal devoted to horticultural subjects, must be adopted.

Birds and Squirrels.

The companionship of these beautiful "children of the forest" about our rural homes is a constant source of pleasure, an educating influence upon ourselves and our children, not to be despised. Squirrels eat a good deal of corn, but rats eat more; some birds pluck the early cherries, but most prefer the insects that do vastly more damage. Squirrels and rats may agree pretty well on the same farm, but birds and insects do not. Both squirrels and birds will become very tame where they have security. Mr. Fuller, of grape and strawberry fame, told us a few days ago of the little pets which he shelters about his hospitable homestead.

Gray squirrels crack their nuts under his eaves, and quails and other birds find his domain a "city of refuge" from the gunners of the neighborhood. How quickly the birds will find out where they are safe! These cold days, a few handfuls of ready cracked nuts, which Mr. Fuller or his wife lay at the foot of the apple tree for their little furry friends, disappear wonderfully fast. Squirrels may be a nuisance sometimes, but there are really few families, in the country even, to which a pair or two of partly domesticated squirrels would not give great pleasure. What pleasanter music to wake up to, of an autumn morning, than the blythe tune of some thrush accompanied by the rattling crackle and chatter of such a pair of nut crackers.

A New Hybrid Pink—"Sarah Howard."

Last autumn we saw in the grounds of one of our florists, a new double white Pink, which was such a profuse bloomer as to readily attract attention. At our request he has given the following description, which we accompany with an engraving of a flowering branch which will show its general character, especially its great profusion of buds and flowers: "This valuable addition to our new plants was originated by A. G. Howard, Florist, of Utica, N. Y., an accurate and close observer in all matters pertaining to floriculture. It is somewhat of a nondescript—evidently a hybrid between a white China Pink, and white Monthly Carnation.—From seed sown in the green house last March, the plants began to bloom about middle of July, in the open border, and continued in wonderful profusion until October, when they were lifted and potted and placed in the greenhouse, and now (middle of December) are literally covered with buds and flowers. The flower is of the purest white, most symmetrical in form, and in the different varieties—for there are many—varying from 2 to 3 inches in diameter; out of 75 plants raised from seed, only two were single, a most unusual feature in Carnations or Pinks of any kind. As a white Pink for continuous summer or winter blooming, it will fill up a blank that has long existed. Mr. Howard informs me that it is quite hardy even at Utica, where the thermometer occasionally marks 20° below zero, or that when sown in January or struck from cuttings it will bloom continuously from July throughout the season, which was well borne out by my experience of it last summer. It seeds freely even from double flowers, roots as quickly from slips as a Fuchsia or Geranium, and is a robust though compact grower. There is little doubt but that it can be easily hybridized by colored varieties of the monthly Carnation, when we may expect a rich treat by the opening up of a new class in this most beautiful tribe."

How, When and Where to Sow Seeds.

[The following article is by Mr. Peter Henderson, of the firm of Henderson & Fleming, of this city, well known seed dealers. It must not, however, be regarded as a seedman's plea, for Mr. H. has been and still is a market gardener and florist on an extensive scale, and gives here the results of long practice. Mr. H. has intimated his intention to give us other articles relating to market gardening, a subject upon which his experience has well qualified him to treat.]

As the season of seed sowing is again approaching, permit me to lay before your read-

ers a few of the conditions necessary for the germination of the different varieties of seeds. The great want of knowledge in this matter is too often the cause of much undeserved censure upon the seedsman, for in nine cases out of ten the failure is not with the seeds,

NEW HYBRID PINK, "SARAH HOWARD."

but results from the time or manner of planting. When the owner of a garden sends his list of seeds to the seedsman, it is generally a complete list of all he wants for the season. They are received and the interesting operation of sowing is begun. First in a hot-bed, if he has one, often as early as the first week in February, (a month too soon by the way,) and in go indiscriminately, at the same date, and under the same sash, his seeds of cabbage, cauliflower, lettuce, and egg plant, peppers and tomatoes. Yet even in the waning heat of this early hot-bed, where a thermometer would possibly not indicate more than fifty degrees, he finds in a week or so his cabbage, lettuce, and cauliflower "coming through," nicely, but as yet no egg plants, pepper, or tomatoes. He impatiently waits another week,—makes an examination and discovers that instead of his tomatoes and egg plants beginning to vegetate, they are be-

ginning to rot. It is now plain to him that he has been cheated; he has been sold old seed, and if he does nothing worse, he for ever after looks upon the seedsman he has patronized as a venal wretch, destitute of principle and honesty. But he must have tomatoes, peppers, and egg plants, and he buys again, from another seedsman, warranted honest. He renews his hot-bed, it is now a month later, and a bright March sun, with milder nights, gives him the proper temperature in his hot-bed—70 or 80 degrees, and his eyes are at last gladdened by the sprouting of the troublesome seed. April comes with warm sunshine inviting him to begin to "make garden" outside. He has yet the balance of his original lot of seeds that he bought in February. But as he is still entirely befogged about the cause of his failure in the first hot-bed, he begins his open ground operations with little confidence in his seeds, but as he has got them they may as well be tried. And again he sows in the same day his peas and Lima beans, radishes and pumpkins, onions and sweet corn. Hardy and tender get the same treatment. The result must of necessity be the same as it was in the hot-bed, the hardy seeds duly vegetate, while the tender are rotted of course. This time he is not surprised for he is already convinced that seedsman No. 1 is a rascal and only wonders how any of his seeds grew at all, so he again orders from seedsman No. 2 for the articles that have failed. Here circumstances continue to favor the latter, for by this time the season has advanced in its temperature and the seeds duly vegetate. Every farmer knows that, in this latitude, he can sow oats or wheat in March and April, but that if he sows his corn or pumpkins at the same time, they will perish; this he knows, but he may not know that what is true of the crops of the farm, is equally true of the garden. Hence

the importance of a knowledge of the season when to sow vegetable seeds or set out plants.

The temperature best fitted for the germination of seeds of the leading kinds will be best understood by the tabular form given below.

Vegetable seeds that may be sown in this latitude from the middle of March to the end of April. Thermometer in the shade averaging 45°.		Vegetable seeds that may be sown in the open ground in this latitude from the middle of May to the middle of June. Thermometer in the shade averaging 60°.	
Beet.	Lettuce.	Lima Beans.	WaterMelon.
Carrot.	Parsley.	Bush "	Squash.
Cress.	Parsnip.	Cranberry	Pumpkin.
Celery.	Onions.	pole Beans.	Tomato.
Cabbage.	Peas.	Scarlet run-	Nasturtium.
Cauliflower.	Radish.	ner Beans.	Okra.
Endive.	Turnip.	Sweet Corn.	Cucumber.
Kale.	Spinach.	Musk Melon.	

Flower seeds of all kinds had better not be sown before the middle of May. There may be a few exceptions but they are hardly of importance enough to be mentioned here. It will

be understood that these dates refer only to the latitude of New York, farther South operations may be begun earlier,—farther North later. So much for the time of sowing; I will now refer to suitable soil and the manner of sowing.

The Choice of Soil, when choice can be made, is of great importance, the best being a light soil, composed of leaf mould, sand and loam; the next substitute for leaf mould being well decayed stable manure, or better yet, decayed refuse hops from the breweries, in short, anything of this nature that will tend to lighten the soil, the point to be avoided being a *weight* of soil, either from the nature or quantity of it. The nature of the soil is not of so much importance for the germinating of large vigorous seeds, as peas, beets, beans, corn, etc. But with the delicate, slow sprouting sorts, as celery, parsnip, egg plant or pepper, it is of much importance. Seeds of nearly every garden vegetable should be sown in rows in width, of course, according to the variety, and of depth proportioned to the size. Very little better information can be given in this matter than the old rule of covering the seed with about its thickness of soil, but this should always be followed up by having the soil pressed closely down. In our market gardens here, we invariably have the ground rolled after sowing, or in frames or hot-beds where the roller cannot be used, after sowing we pat the soil evenly down with a spade. This may not be of so much consequence in early spring, when the atmosphere is moist; but as the season advances, it is of great importance. I have seen many acres of carrots and parsnips lost for want of this simple attention; the covering of the seeds being loose, the heated air penetrates through, drying the seeds to shriveling, so that they never can vegetate. Your farmer readers, no doubt, have had plenty of similar experiences with turnips, where they have been sown broadcast without rolling. Another advantage in rolling after seed sowing is, that it leaves the surface smooth and level, thereby lessening greatly the labor of hoeing.

Sowing in Hot-beds.—It would lengthen this paper too much to give extended directions for sowing seeds in hot-beds. I will briefly say, that after the hot-bed has been formed—say by the first week in March, let soil of the kind recommended be placed on it six inches deep, into which plunge a thermometer three or four inches, and when the temperature *recedes* to 75° or 80°, you may then sow, giving air in mild weather as soon as the seeds begin to vegetate, covering up warmly at night by mats, straw or hay. But many of the readers of the *Agriculturist* never saw a hot-bed, and are perhaps never likely to have one; to such I would say that there is an excellent substitute on hand in most dwellings, in the kitchen or basement windows facing South or East, inside of which is a temperature usually not far from that required for the vegetation of seeds, and where plants from seeds of the early vegetables, or tender plants for the flower border may be raised nearly as well and with far less attention than in a hot-bed. Instead of hot-beds we use our green-houses for the purpose, using shallow boxes in which we sow the seed; these are made from the common soap box cut in three pieces, the top and bottom forming two, and the middle piece, bottomed, making the third; these form cheap, convenient boxes. Fill these nearly full with the soil recommended, and after sowing, press nicely down level, and make the surface soil moderately firm; keep moist, in a temperature in the window of from 60° to 70°,

and your little trouble will soon be rewarded.

In this way seeds should be sown thickly, and after they have made the first rough leaf, should be again planted out into the same kind of box, from one to four inches apart, according to the kind, and placed in the window to receive similar treatment as the seeds, but as the season advances, in mild days they should be set out of doors, care being taken that they are taken in at night, and that the soil in the boxes is never allowed to get dry. And here let me endorse in full the advice given to your readers in the last number against the use of pots in sowing seeds. I know it is usually the first thing the novice in gardening does if he gets any choice seed or favorite cutting; he has some how got the belief that there is some hidden virtue in a flower pot, and he accordingly sows his seed or plants his cutting therein, but in nine cases out of ten they are destroyed, or partially so, by the continued drying of the soil in the porous flower pot. If early in the season, let delicate seeds be sown in the kitchen or sitting room window, in the boxes as recommended, or if late, in the open border; but delicate seeds should never be sown in pots, as even in experienced hands they are much more troublesome and uncertain.

Degeneration of Plants—Wild Oats.

A remarkable instance of the alleged degeneration of a useful grain into a troublesome weed, has been brought to our notice by Solon Robinson, Esq., who placed in our hands a letter containing a specimen for identification from Mr. D. G. Pickett, Winnebago Co., Wis. The letter states that a farmer in Mr. P.'s neighborhood, threshed his oats in the field and burned the straw, but a rain extinguished the fire before the heap was all burned, and the partially consumed straw was spread upon the ground and plowed in. The oat crop was followed by one of spring wheat. In the spring, the plant in question made its first appearance on the ground where the straw was partially burned, and was plentifully mixed with the wheat. Since then it has spread from this field to the farms in the neighborhood, and proves a very annoying weed. So much for the history of its first appearance, which we have condensed from a very detailed and clearly written account. We recognized the plant as the Wild Oat, so celebrated in all accounts of the vegetation of California, where it takes almost entire possession of large tracts of country and affords a valuable spring pasturage. This oat, which is also found abundantly in the grain growing countries of Europe, was formerly considered a distinct species by botanists, and was called *Avena fatua*, while the cultivated oat was regarded as equally distinct and called *Avena sativa*. Recently, however, European botanists of high authority have concluded that the cultivated oat was not a species, but only an improved variety of the Wild Oat, *Avena fatua*, as it had been found to degenerate into the wild state. This Wild Oat has not before, to our knowledge, been found east of the Rocky Mountains, and we must attribute its occurrence in the locality described by Mr. Pickett, either to a degeneration of the loose oats in the straw, or to the seed having been introduced with the seed wheat. The character of the seed of the Wild Oat is such, that we cannot conceive how it could have been sown in any considerable quantity with the wheat without attracting the attention of the sower. The grain of the wild oat is surrounded by a chaff, which is clothed with conspicuous

brownish hairs, and bears upon its back a stout twisted awn or bristle. Figure 2 shows a spikelet of the natural size, and a grain enclosed in its hairy and bristle bearing chaff is given in fig. 1 of double size. We are disposed to accept the account of its origin given above as the probable one, and it would be interesting to know how much the heat to which the grains were exposed in the partial burning of the straw had to do with the sudden reversion of a cultivated variety to its wild state. We have heard of other instances in which seeds have been subjected to unusual heat, but not sufficient to destroy their vitality, and the product from these, when sown, was of a decidedly inferior character. Our friends, who believe in the transmutation of wheat into chess, will, no doubt, seize upon the above as corroborative of their views. They should bear in mind that the plant, which we admit may have changed, remains still an oat, and does not jump at once into a widely different genus. Indeed, it assumes no greater difference than we are accustomed to produce in plants by careful culture and selection. This case is only a sudden throwing off of the habits of civilization and reverting to the state of barbarism. As the occurrence of the wild oat is much to be regretted, care should be taken to prevent its spreading. Unfortunately, the foliage is not to be distinguished from that of the common oat, but in flower the panicle is usually more loose, and the character of the chaff above given will enable it to be readily recognized. The plant being an annual one, if the already infested fields should be put into pasture it would no doubt soon disappear.

Fig. 1. Fig. 2.

Cheap Statuary.

"Friend Brown is very fond of gardens and rural adornment generally. He has pleasant grounds of about three acres in extent, more than half of which are devoted to ornamental purposes. Nothing can be finer than the grass of his lawns, which is kept short and smooth by the scythe and roller. His summer house is a model of beauty, standing upon a knoll overlooking the surrounding country. His fondness for embellishment has led him to procure a sun-dial and several classical vases, which are distributed about the grounds. These vases are of cast-iron, painted in imitation of marble.

"He had progressed thus far in his rural adornments when the rebellion broke out, and then the extremely high price of iron ornamental work put a stop to his improvements, for his purse has narrow limits. He had begun to plan for the introduction of a few pieces of iron statuary into his grounds, but, alas! the cost. A figure of the goddess "Flora," which, before the war, would have cost only \$45, now costs \$100. So, not to be wholly cheated of his enjoyment, he went to the city and engaged an Italian worker in plaster casts, to make him a few, about two thirds the size of life, of classical figures appropriate to the garden. They were statues of "Spring," "Summer," and "Flora," and, at a few feet off, they could not be distinguished from marble. These were placed on

pedestals, painted and sanded to imitate freestone. The statues themselves were painted white, to protect them against the weather. These were carried into an upper loft of his carriage-house in winter, from which they emerged every spring to do duty. They have now served for three years, and bid fair to last at least three years more, by which time Mr. Brown hopes to be able to substitute for them something more substantial. Now, though I do not believe in shams, I must highly commend the course of our friend. It would have delighted him to set up marble statues, if he only could, but as it was a case of necessity, he submitted to plaster. He partially gratified his own artistic tastes, it was a beautiful ornament to his grounds, and it promoted an elevated taste in the community."

[The above comes to us from a correspondent, and we give it place for an entirely different purpose from which it was written. It serves to show exactly what to avoid. A show of painted plaster casts upon make-believe stone pedestals, instead of promoting an "elevated taste in the community," but fosters that taste which leads to the building of wooden Corinthian columns to church porticoes, putting dummy clock-faces on the steeples, cheap jewelry, and a hundred other instances of false appearances, to be found in every community. There are but few places that will bear statuary of any kind, and whoever has such grounds, can afford the real thing. Even this is sometimes used offensively; we know of one place in which statuary and "bustnary" are put about the lawn in such profusion, as to suggest the idea that the owner had retired from the marble business, and had thus made use of the stock which remained on hand. Not only do they fill the lawns, but they run over into the vegetable garden, where they look as much out of place as a pig in a parlor. One classical figure keeps watch over the cabbage patch, and another—probably "Niobe, all tears,"—does a like service for the onion bed, and so on. The "sun dial and several classical vases" of cast iron, alluded to above, are well, but painted plaster casts are very bad.—Eds.]

Seeds for the Kitchen Garden.

Having sometimes published early in the year a select list of seeds of garden vegetables, our letters indicate that it is looked for as a regular thing. It is indeed a matter of the first importance to get the best of each variety. There is as much difference in the quality of vegetables as of fruit, and it takes no more time and care in cultivation to raise a really good variety, than it does an indifferent or poor one. To those who don't care to improve, or who are too lazy to be at a little trouble in this matter, we have nothing to say; they may raise their mongrel squashes and flabby cabbages, while others enjoy delicious Hubbards and Early Wakefields. If it were generally understood, that every one within reach of a Post-Office has as ready access to the best seedsmen, as if he lived in the same town with them, we think there would be a great improvement in the character of the vegetables raised throughout the country. The expense of getting a stock of good seeds is but little, compared with the results. The chief thing is the trouble and forethought. February is the month in which dealers have their catalogues and stocks ready, and we give notice timely and seasonably. Look over our advertisements and send to any dealer that may be preferred, for a catalogue. When the catalogue comes to hand, make a selection and

order the needed supplies at once, before the press of business is upon the seedsmen. "Make a selection," exclaims the reader. "How can I? here are 25 peas, 20 squashes, a dozen radishes and so on, and I don't know one from the other." The object of the following list is to relieve this trouble. The catalogues contain besides all the older and proven sorts, many new kinds, which have not been thoroughly tested, and many which have distinctive names without the plant they represent having any claims to be thus honored. In the enumeration below we give varieties that we know to be good of their kind, and those that, all things considered, we deem suitable for general culture; though there may be others quite as good, we prefer to keep the list for general culture small. Professional gardeners and amateurs can afford to try new and fancy sorts, and this list is not intended for them.

BEANS—DWARF OR BUSH: Early Valentine, for string or snaps, quite early and productive, pods remain green a long time; Newington Wonder, excellent when green and the small drab seeds are valued for soup; Refugee, rather late, but prolific, and the best for pickling and salting; Dwarf Horticultural, for early shelling.—**POLE BEANS:** Large Lima, in warm locations; Small Lima, north of New York.

BEETS.—Early Blood Turnip, an improved variety is called Early Short Top; Long Blood, for main crop; Swiss Chard, fine for greens only.

CABBAGE.—Early Wakefield, and Early Ox-Heart, large and early; Little Pixie, a new early sort; Winningstadt, medium early, large, very hard heads and best for a light soil; Flat Dutch, for Winter; Red Dutch, for pickling; Marble-head Drumhead, very large; Green Globe Savoy, small, late, the richest of cabbages.

CARROTS.—Early Horn, for early table use; Long Orange, for main crop.

CAULIFLOWER.—Early Erfurt, a dwarf variety with large and compact heads; Early Paris; Thorburn's Nonpareil, very fine.

CELERY.—White Solid; Dwarf White.

CORN.—Dwarf Sugar, small ears, for early use; Stowell's Evergreen, larger, for late use.

CUCUMBERS.—White Spined, best for table; Long Green, late, for pickles.

EGG PLANT.—Long Purple, early; New York Purple, later, large and best.

ENDIVE.—Green Curled, for late salads.

KALE.—Green Curled Scotch, winter and spring greens.

KOHL-RABI ("Turnip Cabbage"); Early White.

LEEK.—Large Flag, for soups.

LETTUCE.—Curled Silesian, a variety of which called Early Simpson is much grown here for market; Butter, superior; Victoria Cabbage.

MUSKMELON.—Fine Nutmeg; Jenny Lind, very early; Skillman's Netted; White Japan.

WATERMELON.—Mountain Sprout, productive and early; Ice Cream, very fine; Black Spanish, fine but only where the season is long.

ONION.—Large Red Wethersfield; Large Oval Red; White Portugal; Yellow Danvers.

PARSLEY.—Extra Curled.

PARSNIPS.—Hollow Crowned; the Student.

PEAS.—Daniel O'Rourke, early and fine, 2½ feet; Maclean's Advancer; Tom Thumb, productive, 8 to 10 inches; Mclean's Princess Royal, 1½ foot; Dwarf Blue Imperial, 2½ feet; Champion of England, for main crop, 5 feet; White Marrow-fat, later and fine, 5 feet. Many new sorts are introduced each season, but they need trial here.

POTATOES.—Early Goodrich, productive and

good; Early Cottage, is well recommended; Early Dykeman, much grown around New York.

RADISHES.—Early Scarlet Turnip; Long Scarlet Short Top; Scarlet Chinese Winter, good and keeps as well as a turnip.

SALSIFY or Vegetable Oyster, very good.

SPINACH.—Round Leaved, for early; Prickly, for wintering over.

SQUASHES.—Summer Crookneck, best early; Yokohama, fine, early and late; Boston Marrow; Turban, excellent, autumn and winter; Hubbard, best for late keeping.

TOMATOES.—Early Smooth Red; Fejee, later, fine and productive; Pear Shaped, for preserves.

TURNIPS.—Early Dutch, very early; Red Top Strapleaf, spring and fall; Rutabaga, to keep.

WINTER CHERRY.—For sauce and preserves.

Besides these, will be needed Peppers, Sage, Summer Savory, Sweet Marjoram, Thyme, and other "sweet herbs."

Renovating Old Orchards.

There are multitudes of old orchards throughout the country, too good to cut down, yet bearing fruit only fit for making into cider, or feeding to swine. Their owners frequently and earnestly ask: What shall we do with them?

First: if the fruit is poor, change it by engrafting. It is often the case that pruning should go along with grafting. The tops of the trees which have become thick and matted together, should be thinned out. But in pruning, let no one mount the trees rough shod, and with axe and saw hack away at the lower limbs and those in the interior. Instead of this, thin out the old, decayed limbs, cut out a few of the upper limbs as well as the lower, and try to preserve the symmetry of the tree. In grafting, begin at the top and renew about one-third of the tree each year.

The ground will need renovating, also, by plowing and manuring. The work should be done carefully, without barking the trees or breaking their roots. But so much harm is often done to the roots, we think it best ordinarily to merely scarify the surface with a harrow, and to give it a good top-dressing of barnyard manure, composted with muck, lime, and wood ashes. When the trunks and limbs have become mossy, and so rough as to harbor insects or their eggs, scrape them, and then wash them with weak lye or strong soap suds. A common whitewash brush will answer for applying this mixture.

A Selection of Plums.

Plums can be raised in spite of the curculio, provided one will take the necessary trouble, and whoever sets out trees without the determination to give them all needed care, will find that disappointment is his only harvest. The trees must be jarred early every morning, and the curculio caught on a sheet and killed. The following is Mr. Barry's selection, which comprises most of the best sorts:

For Table.—Imperial Gage, green; Jefferson, yellow with red cheek; Lawrence's Favorite, greenish; Smith's Orleans, reddish purple; Purple Favorite, brownish purple; Purple Gage, violet purple; Coe's Golden Drop, light yellow.

For Market.—Frost Gage, purple; Yellow and Red Magnum Bonum; Washington, green.

For Drying.—Fellenberg; German Prune; Prune d'Anjou; St. Martin's Quetsche.

The Shell Flower.—
(*Phaseolus Caracalla*.)

Our readers are aware that we are fond of old-fashioned plants and have endeavored to keep some of the old border favorites from being forgotten. We now give them an illustration of a green-house vine, so old and so completely crowded aside by later comers, that it has all the rarity of a new thing. The plant is *Phaseolus Caracalla*, which was introduced into England from the East Indies as long ago as 1690. The genus *Phaseolus* is the one to which our varieties of the garden bean belong, and which also includes the Scarlet Runner and other species that are grown for ornament. The present one is a strong climber, with the large compound leaves of three leaflets common to the genus. Its flowers are borne in large clusters and appear in their curiously coiled shape, as well as their texture, so like some kind of shell, that there was no trouble in giving it a common

name. The specific name *Caracalla*, is one by which it is called by the Portugese, and means a hood for the head. Though the flower does not at first sight appear much like that of the bean, yet when the two are compared, it will be seen to have all the parts that the bean flower has, only much larger, and all having a strong spiral twist. The color is white, shaded with lilac, and the flower is one not only singular in appearance, but of great beauty, to which is added a charming perfume. It is grown as a green-house plant, and we do not know of any attempt to cultivate it in the open air. The plant from which our specimen came, had its roots under glass, but the branches ran outside of the house. It flourishes in the open air in the South of France, and would probably do so in some of our Southern States.

The Mountain Laurel.—(*Kalmia latifolia*.)

Last summer we visited the ground of an enthusiastic lover of plants and saw many interesting things that he had recently imported from Europe. When we had seen most of his novelties, with the air of one who saves the best wine till the end of the feast, he took us behind a screen of evergreens and with much satisfaction said, "look there!" We did look and

THE SHELL FLOWER.—(*Phaseolus Caracalla*.)

saw several very thrifty plants of laurel, which under the name of *Kalmia*, had come all the way from England, and were so evidently the

separates in plates; the young growth of a bright green. The shape of the shining green leaves is shown in the drawing; these differ somewhat in size according to the vigor of the plant. The flowers appear in May and June, and are produced in the greatest profusion, in clusters often much larger than the one represented in the engraving. The flowers vary in color from nearly pure white, to rose color, and the appearance of the shrub in flower has in some localities given it the name of Calico-bush. The buds are very symmetrical and pleasing in form, being marked by ten regular projections. The peculiar arrangement of the stamens mentioned, when describing the Sheep-laurel in August last, is much more readily observed in this species, as the parts are much larger. The ten projections seen upon the bud, are found, when the flower opens, to be caused by a corresponding number of depressions of the corolla. In each of these is caught an anther which being held in this position bends the stamen over like a bow; a slight touch liberates the anther and the stamen springs up toward the pistil with considerable force. The fruit is a small, nearly globular, 5-celled dry capsule, containing many minute seeds. The wood is very hard and may be used for turning small articles. It is said that the Indians used it for

MOUNTAIN-OR BROAD-LEAVED LAUREL.—(*Kalmia latifolia*.)

carving spoons and other utensils; hence the name Spoon-wood, sometimes applied to it. The stems are a favorite material for use in the construction of rustic chairs and other similar work. The leaves are said to be equally poisonous with the Sheep-laurel, to cattle and sheep. We have before alluded to the fact that our native shrubs when found in the nurseries are usually imported plants. A considerable quantity of this rather common one is annually imported. We have seen no successful transplanting of large specimens from their native localities, but have known those of moderate size to do well when thus removed. Select plants from open places in preference to those growing in the woods, in early spring take them up with a ball, and set them in better soil than that from which they are taken. A light, moist soil, with a plenty of vegetable matter suits them best; we have succeeded in a very sandy soil, with which a good share of well weathered muck was incorporated. The plants need a partial shade either from trees or buildings. In nurseries the Laurel is raised both from seeds and by cuttings. Seeds are sown in sandy peat in a close frame, the young plants potted when large enough, and kept in the close air of a frame until well established, when they are very gradually exposed to free air. Cuttings of the young wood are placed in pots of similar soil and kept covered with a bell glass, in the shade, until they take root. This beautiful genus commemorates the name of Peter Kalm, a Swedish botanist who visited this country about the middle of the last century, while its specific name, *latifolia* designates that it is broad-leaved. The narrow-leaved species, *Kalmia angustifolia* was illustrated and described in August last.

The New "Foliage Plant."
(*Achyranthes Verschaffeltii*.)

The value of plants with strongly marked or colored foliage, for decorative purposes, is well established, and every addition to their number is regarded with interest. By the judicious use of these, brilliant effects may be produced, and as they are more permanent, they are often more satisfactory for certain uses than are flowers. The latest novelty in this line is *Achyranthes Verschaffeltii*, of which we have seen glowing accounts in the European journals, and now have the satisfaction of figuring it from a specimen sent us by Mr. G. Marc, of Astoria, L. I., who was the first to bring it to this country. The plant is from one to two feet high, branching freely, and with a natural tendency to assume a globular shape. The leaves are of the form shown in the engraving, but our drawing was taken from a young specimen, and does not show them as large as they are upon the older plants; they are entirely smooth, as is the stem with the exception of a ring of hairs at each joint. As far as the form of the several parts goes, we have no difficulty in giving our readers a correct idea of the plant, but what shall we do for color, the quality upon which its whole value depends? We can only ask them to im-

NEW FOLIAGE PLANT—ACHYRANTHES VERSCHAFFELTII.

agine all the light portions of the drawing to be of a lively carmine color, and the shaded portions, blackish red or maroon. There is no green about the plant, but the stem, branches and leaf-stalks are all of a beautiful carmine, while the leaves are very dark with strongly marked carmine veins, which give the whole a very lively appearance. It is said to stand extremes of

INDIA RUBBER—(*Siphonia elastica*.)

wet and dry with ease, and to be less sensitive

to frost than *Coleus*. We hope that the plant will do as well in this country as it has done in Europe, and have no doubt that it will in that case become exceedingly popular. This *Achyranthes* is from the River Plata, and is also a native of Peru. It unfortunately has already two names, the one we have given it above, which is that under which it was first distributed; and *Irosine Herbstii*, a name it has in some of the English journals. Which name is the true one can only be determined from the structure of the flowers and fruit, which it has not produced in Europe, though it probably will be induced to flower in our warm summers. As there is a question about the name, we use the one by which the plant is known to our florists, without committing ourselves to its correctness.

HOUSEHOLD.

About India Rubber.

Forty years ago, India^a rubber was merely known as a curious body, the only use of which was to erase pencil-marks from paper. Now we should hardly know how to do without it, in so many forms does its utility manifest itself. It serves for car springs and coat buttons; it covers our feet in water proof and smooths our hair with the best of combs. It is elastic where elasticity is required, and firm when we wish firmness. But this is not telling what India rubber is. Several trees have a milky juice, which, upon drying, leaves the peculiar substance we know as India rubber. As it was first obtained from a tree of the East Indies—*Ficus elastica*, often grown in green-houses—it received its appellation of India or Indian, though the great supply of commerce comes from South America. The tree which furnishes most of it, is called *Siphonia elastica*, a twig of which is shown in the engraving below. This tree belongs to the Spurge Family, of which we have some minor representatives as weeds, which also produce a milky juice.

The *Siphonia* abounds in the Brazilian forests, and it is not likely that the supply will fail. The collectors of the product, cut holes in the trunk, and place vessels beneath to receive the juice as it runs out. The fresh juice appears quite like milk, and if bottled and carefully corked as soon as it is collected, it may be kept for a long time unchanged. It is sometimes imported in bottles as a curiosity, and for chemical investigation, but the mass of that which we obtain has been through a rude process of manufacture. It comes in large flat masses, and in bottles, as they are termed; these are globular vessels of various sizes and thicknesses, made by fixing a ball of clay upon the end of a stick, dipping the clay in the milk and drying the coating thus formed, over a fire. When one coating is dry, the dipping and drying are repeated, and thus a bottle of any required thickness is obtained. Then the clay mould is broken and the fragments are shaken out at the neck, which is of course where the stick joined the mould. The imported shoes which were formerly so much worn, were made in a similar manner upon clay lasts. Though naturally adapted to many uses, the difficulty of working it, together with the readiness with which it is hardened by cold and softened by heat, rendered it unavailable for many of the purposes for which we now employ it. The remarkable discovery of the "Vulcanizing" processes was mainly due to our countryman, Goodyear. They consist essentially in combining the rubber with sulphur and exposing it

to heat, and have the effect of rendering it insensible to changes of temperature within all reasonable limits, and allowing it to be worked with great facility. Another process produces the hard or bone rubber, which is now much used to make articles for which bone, horn, ivory and glass were formerly employed. India rubber is often called Caoutchouc (pronounced Ko-chook), a name of Indian origin; and also gum-elastic, a term in part descriptive of one of its most striking properties; though it exudes from a tree, it is not a gum in the proper meaning of the word, but a peculiar substance.

Fig. 1.—SIRLOIN ROASTING PIECE.

How to Carve Roast Beef.

There is probably no meat which is so much changed in quality, not to say flavor, by the manner of carving, as Roast Beef. The choice roasting pieces, according to our American notions, are cut from the Sirloin. Englishmen prefer for their national dish a cut from the fore-quarter, just back of the shoulder blade, called by the butchers the "middle rib roasting piece," in which all the meat lies upon the outside of the ribs. The Sirloin roasting pieces contain portions of the powerful muscles of the loin upon the top of the ribs, and of the tenderloin which lies beneath them and close to the backbone. All parts are well interlarded and coated with fat, of a very delicate quality. The quantity of tenderloin is less than that of the other meat, but the proportion increases as we approach the "flat bone." This portion is usually cut up into what are called in New-York Porter-house steaks. For real juiciness and high flavor no good judge of beef prefers the tenderloin, but there are many who do on account of its tenderness.

When the beef comes to the table, the tenderloin may be easily removed by turning the joint a little to one side, and passing the knife close to the ribs over the tenderloin, which, being drawn out, may be sliced lengthwise or crosswise, as the carver prefers. This is the only part of the beef not seriously injured by cutting it in the same direction with the fiber, that is, lengthwise.

Roast beef should be done through, so that no soft purplish red spot can be found when it is carved, but it should be so slowly roasted, thor-

Fig. 2.—MIDDLE-RIB ROASTING PIECE.

oughly basted, and constantly turned, that, while the outside is only of a delicate dark brown

color, the clear, almost scarlet red of the beef shall be disclosed by the knife close to the surface. So roasted, the beef is tender, juicy and toothsome as possible. The joint should be taken from the spit or bake pan and placed, after any little trimming it may need, upon the previously warmed platter, and sent directly upon the table. Not a drop of the drippings should be poured over it, but they should (if sent to the table at all) be thickened, made into a rich gravy, and served in a gravy boat.

The carver needs a sharp-pointed knife with a keen edge extending quite to the point, otherwise he will find difficulty in cutting thin slices, and in separating them from the attachment near the backbone. He begins to cut at one end, cutting in the direction the ribs run, which is exactly across the grain of the meat, removing as thin slices as he conveniently can. If the knife is sharp, it will not press out much of the juice of the meat, but if dull, the carver will be obliged to lay out the more strength, which will not only necessitate the cutting of thicker slices, but will squeeze out much "red gravy," and leave the pieces thick and ragged. The red gravy will flow freely enough at any rate, if the meat is rightly cooked, and a portion of it should be served to each guest, a spoonful or two being poured over the slice of beef when placed upon the plate.

When beef is cooked so that the juices will not follow the knife freely, it is nearly spoiled for us, unless we can get an outside piece to which the juices have been drawn during the roasting, and have dried there, rendering it, if not over-done, very rich and high flavored.

Each guest should have, unless preferences be otherwise expressed, a slice of rare meat, with a portion of the fatter and usually better done part toward the flank, with a piece of tenderloin, and, as already said, a spoonful of gravy from the dish, which, for this reason, ought to contain no drippings whatever. This red gravy, which is the very essence of the beef, will not flow from any parts not thoroughly cooked, nor from those over-cooked, and it is greatly enjoyed by many who can not eat or digest grease or greasy gravy in any form.

For any one who appreciates this quality of juiciness in roast beef, on which we dwell so much, it is enough to know that when the beef is cut with the fiber, it exhibits very little of it. The juice remains in the fiber, and, strange enough, even mastication does not seem to develop it. The beef is a different article. The thorough enjoyment of food is promotive of health and good feeling. Those who neglect their food, or who eat for the sake merely of filling their stomachs with something, lose much real pleasure, and usually have finally bad digestion and consequent poor health.

Borden's Condensed Beef.—Mr. Gail Borden, who perfected the process for condensing milk, has for a long time been at work upon condensing beef. He has associated with him Mr. J.

H. Currie, a well known manufacturing chemist, and S. L. Goodale, Esq., for a long time Secretary of the Maine State Board of Agriculture. Their establishment is at Elgin, Ill., where they procure the best fresh beef and prepare an extract with the greatest care. It is put up in packages of 2 ounces, each case representing 2½ pounds of beef. A sample was referred to "the Bachelor," who has not of late appeared in our Household Department, and he reports as follows: "Gail Borden should be called the 'Great Condenser.' He evidently has designs upon the bovine race, as he began by squeezing a quart of milk into the smallest possible compass, and now he has brought the old cow herself to terms. Two and a half pounds of beef are condensed to the size of, and appear and feel

very much like a stationer's cake of Indian-rubber! We used, in war times, to laugh at the tale told

of the Richmond people, who went to market with their money in the market basket, and brought their meat home in the pocket book. This would have been possible had Gail Borden been on the other side of the line. But he was on this side, and thousands of soldiers have blessed him for his condensed milk, and now thousands of others shall bless him for beef tea. Were you ever sick away from home, and needing beef tea? The demand was answered by a dubious liquid, upon which floated a covering of melted tallow. With Borden's condensed meat, beef tea becomes possible even in a country tavern, the worst place in which a man was ever sick. Slice off a little from the cake, dissolve in a cup of boiling water, salt and otherwise season, and you have a clear, greaseless liquid with the full flavor of the richest beef. But few persons know what a restorer beef tea is after great fatigue. Some years ago one of the Diplomatic corps in Washington did a sensible thing, and at the same time made an innovation upon established customs, by presenting each guest, as he left the house after a prolonged party, with a cup of strong beef tea. They do the same thing in San Francisco. If there is any thing exhausting, it is an evening party, and if any thing can restore one after being a few hours in rooms crowded with stupid people, it must be beef tea. Then such soup as can be made with this! I tried it and know that nothing outside of Delmonico's can be half as good. Most people make a greasy porridge of rice and vegetables with just a suspicion of meat, and call it soup. Boil a carrot and a bit of celery in water until done, have an onion roasted until brown, and boil this in the liquid until it imparts a rich brown color. Put in half an ounce of the condensed beef to the quart of water, salt and season as may be desired, strain and serve. You have a soup as clear as wine which has the only fault that it is so good that it takes off the edge of the appetite for the rest of the dinner. Gail says the condensed beef will keep forever, 'for he has tried it twice.' I don't believe it, for I had a cake and it didn't keep but two days—reason: the soup was so good the first day, that it had to be repeated."

Excellent Lemon Pies.—As usually made, lemon pies, however palatable, are indigestible and not to be recommended. The pieces of lemon rind in them are as bad for the stomach as so many gravel stones. The following directions furnished for the *American Agriculturist*, have been several times tried, and we find the pies both digestible and delicious: For two pies, take two lemons, grate away the outer yellow coating and chop the rest *very fine*. Into two teacupfuls of hot water, stir well two tablespoonfuls of corn starch, and boil; add two teacupfuls of white sugar; when cool, add the beaten yolks of four eggs; then add the chopped lemons with their juice, stirring the whole well together. Line two tin or earthen-ware pie plates with pie crust, pour in the material and bake until the crust is done. Beat the whites of the four eggs to a froth, adding five or six tablespoonfuls of white sugar, and pour over the pies while hot; return them to the oven, and bake to a delicate brown. We have never eaten anything of the pie kind superior to the above preparation.

Soda-Ash, Saleratus, etc.

A correspondent says, "Will you please tell me the composition of Soda Ash, Carbonate of Soda, Saleratus, and Sal soda. What are they made of?" Questions like these are easily answered if the inquirer has some knowledge of chemistry, and are rather difficult if he has not. However, we will try. When wood is burned, all the combinations of potash with organic acids are converted into carbonate of potash, which remains in the ashes. The ashes are leached and the carbonate of potash, together with other soluble matters, are dissolved out and form a ley, which, when evaporated and the resulting dry mass melted, forms the potash of commerce. If the ley be simply boiled to dryness, without melting the mass, and this be exposed to heat and air sufficient to burn out some coloring

matters, pearlash is the result. Pearlash consists of carbonate of potash with some impurities. If the pearlash be exposed to an atmosphere of carbonic acid, such as is given off in fermentation, or in burning charcoal, it combines with more carbonic acid than it before contained, and becomes a more or less complete bi-carbonate of potash, or saleratus—aerated salt. Plants growing near salt water contain soda instead of potash, and by burning give an ash, which, when treated in the same way as wood ashes, gives soda ash or barilla; the soluble part of this dissolved in water and crystallized, yields sal soda, which is a crystallized carbonate of soda, and this exposed to carbonic acid would form a bi-carbonate of soda, corresponding to saleratus, but containing soda instead of potash. This was formerly the way of obtaining these soda compounds, but of late years they are made from common salt by a process too complex for description here, but the resulting products are the same.

BOYS & GIRLS' COLUMNS.

Game of "Tag," with Variations.

Probably every boy and girl of ten years old knows how to play the old game of "tag." It is so old that the children of the Roman empire used to play it, thousands of years ago; the name "tag" comes from their language, *tago*, or *tango*, as it was written in later times, meaning "I touch." Several variations may be made to enliven the game. Thus in *Cross Tag*, when one boy (A) is running after another (B), a third one (C) crosses between them, then A must endeavor to tag C; if another boy (D) crosses between them, A must pursue him, and so on, until he touches the last boy who crossed before him. *Change Tag* is a new style of the play. The pursuer or "catcher" as he is called, while chasing a boy, calls out "change," then all the players must imitate the "catcher" if he hops, they must hop; or he may commence jumping on both feet, or running with a skip, or with his hands behind him, or change his gait in any way he thinks best, to embarrass the others, and make it easier for him to catch them. Any boy who takes more than one step without changing after the catcher calls out, must become catcher. If two or more fail to make the change at the right time, the catcher may select his successor from them. This mode of the game will keep the wits as well as the legs of all the players in motion.

A Lively Game in the Snow.

When the snow is newly fallen, select a level spot and run out a circular track, with cross paths, as in the accompanying engraving. It may be of any diameter, about thirty feet is a convenient size. The round space (H) in the middle, should be large enough for all the boys joining in the game to stand in without crowding. This spot is called "Home." In playing this game, one boy is selected for "Fox," and he endeavors to touch any one

of the others when they are not at "Home," and the one so caught then becomes fox. Every "Chicken" must run only in the marked paths; if one steps outside the ring, or away from the paths, he must take the place of "Fox," until he can thus catch some one else. This is a capital game for boys and girls in cold weather.

A Just Reward.

When Napoleon I. sailed on his expedition to Egypt, the ships accompanying him were crowded with troops. It frequently occurred that a man accidentally fell overboard, and at such times Napoleon is said to have manifested the greatest interest in rescuing the unfortunate soldier from his peril, although when in battle, no general ever showed greater indifference to the wholesale slaughter resulting from his orders; there the certain loss of thousands of lives never deterred him from pursuing a plan which promised success. On the occasion referred to, he stimulated the sailors to watchfulness and exertion, by liberally rewarding all who helped to rescue a drowning soldier. One night a loud splash was heard near one of his ships, and immediately the cry was raised "man overboard!" The vessel was instantly put about, the boats lowered, and for a long time, the search continued, until at length the sailors succeeded in saving—a quarter of beef, which had slipped from a noose at the bow of the ship. Of course a good laugh followed, but Napoleon ordered that a larger reward than usual be paid,

as the sailors had exerted themselves, though unsuccessfully, as much as would have been necessary to save life.

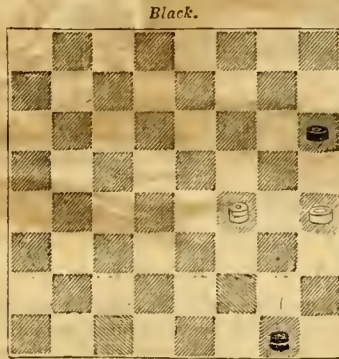

The Game of Checkers or Draughts.

HISTORICAL.—In America the game is commonly called *Checkers*; in Great Britain, *Draughts*; in France, *le jeu de dames*; in Italy, *Dama*; in Germany, *Damen*, from the idea that the game was especially fitted for women. The origin of the game is uncertain. It is supposed to have preceded chess and certainly is of great antiquity. It has been played in Egypt for more than 4000 years; as appears from the monumental paintings, it was a common amusement in the reigns of the Osirtases, 2000 years B. C. It made its appearance in Europe only three or four centuries ago, when there was much intercourse between Southern Europe and Alexandria and other Egyptian ports, before the passage to India round the Cape of Good Hope replaced that through the Isthmus of Suez. It was played as now, with pieces all of which on the same board were alike in size and form, though in different boards they varied in shape, some being small, others large and rounded on the top, or carved in likenesses of human heads.

LAW OF THE GAME.—(Continued from page 26.)

1. The standard board must be of light and dark squares, not less than fourteen inches, nor more than fifteen inches across the squares.
2. The standard men, technically described as White and Black, must be light and dark (say White and Red, or White and Black), turned round, and not less than one inch, nor more than one and one-eighth inches in diameter.
3. The board shall be placed so that the bottom corner square on the left hand shall be black.
4. The men shall be placed on the black squares.
5. The Black men shall be invariably placed upon the real or supposed first twelve squares of the board, the White upon the last twelve squares.
6. Each player shall play alternately with the Black and the White men, and lots shall be cast for the color only once, viz.: at the commencement of a match, the winner to have the choice of taking Black or White.

POSITION NO. 2.

White.

White to play and win.

(Known by expert players as "Sturges' first position.")

Solution to Position No. 1. (See January number, p. 26.) The position should have been given as all kings. Three kings win against two, whenever the two are in the double corners. Young players should study this, and they will see that it is a forced win, in a few moves.

White.	Black.	White.	Black.
18 to 15	6 to 1	9 to 6	28 to 23
14 " 9	24 " 28	19 " 24	5 " 1
23 " 19	1 " 5	24 " 19	and wins.

In the game last month (page 26), the 14th move of black should have been printed 10 to 17, instead of 10 to 11.

GAME NO. 2.—OLD FOURTEENTH OPENING. (*)

Black.	White.	Black.	White.
1-11 to 15	23 to 19	15-8 to 12	(f) 24 to 19
2-5 " 11	22 " 17	16-15 " 31	26 " 22
3-4 " 8	17 " 13	17-12 " 19	22 " 8
4-15 " 18	24 " 20	18-14 " 17	21 " 14
5-11 " 15	28 " 24	19-10 " 17	8 " 3
6-8 " 11	26 " 23	20-7 " 10	25 " 21
7-9 " 14	(a) 31 " 26	21-17 " 22	(g) 20 " 16
8-6 " 9(b)	13 " 6	22-10 " 14	16 " 11
9-2 " 9	26 " 22	23-21 " 26	11 " 7
10-1 " 6(c)	32 " 28	24-6 " 9	13 " 6
11-3 " 8	(d) 30 " 26	25-14 " 17	21 " 14
12-9 " 13	19 " 16	26-22 " 25	29 " 22
13-12 " 19	23 " 16	27-28 " 1	7 " 2
14-13 " 17(e)	22 " 13	and the game is drawn.	

- (a) 30 to 26, or 32 to 28, loses the game.
- (b) 11 to 16 is the move generally made by young players; because they are afraid to break up their king row, but it is the move that loses the game.
- (c) 9 to 13 would lose here.
- (d) 22 to 17, black wins.
- (e) 8 to 12, or 14 to 17, white would win.
- (f) 23 to 22 also draws.
- (g) 3 to 7, black wins.

(*) Is so called from its being familiar to players as the 14th game in Sturges' original work. He wrote a treatise on the game of draughts about sixty five years ago.

Answers to Problems and Puzzles.

The following are the answers to the Puzzles in the January number, page 26. No. 183. *Illustrated Rebus.*—On st is the best poll I see, or Honesty is the best policy. ... No. 184. *Mathematical Problem.*—Left open for another month, as no correct answers have been received. ... No. 185. *Illustrated Rebus.*—C on T in D in hole in S, or Continue in holiness. ... No. 186. *Charade.*—Andrew Jackson. ... No. 187. *Charade.*—Emancipation.

The following have sent answers up to the date of Jan. 8th: Mattie A. Goffe, 181; A. Jackson, 180, 181; Lida Newnan, 179; H. Johnson, 180; J. M. S., 183; May Kalbfus, 186, 187; Hen. M. Young, 183, 185, 186, 187; Sol. Beard, 186, 187; Jas. D. McGiffert, 186, 187.

New Puzzles to be Answered.

No. 188. *Arithmetical Problem.*—The Scramble.—Contributed to the *Agriculturist* by J. D. McGiffert, Columbia Co., N. Y.—A, in a scramble, seized on 2/5 of a parcel of sugar-plums; B snatched 1/5 of it out of his hands, and C laid hold on 3/10ths more; D ran off with all A had left, except 1/7th, which E afterwards secured slyly for himself; then A and C jointly set upon B, who in the conflict let fall 1/5 he had, which was equally picked up by D and E.—B then kicked down C's hat, and to work they went anew for what it contained; of which A got 1/4, B 1/5, D 2/7ths, and C and E equal shares of what was left of that stock; D then struck 1/5 of what A and B last acquired, out of their hands; they with difficulty recovered 1/5 of it in equal shares again, but the other three carried off 1/5 a piece of the same. Upon this they called a truce, and agreed, that the 1/5 of the whole, left by A at first, should be equally divided among them. How much of the prize, after this distribution, remained with each?

No. 189. *Illustrated Rebus.*—Not new, but ingenious, and contains very excellent advice.

No. 190. *Mathematical Problem.*—Contributed to the *American Agriculturist*, by James Dickson, Olmstead Co., Minn.

Give the rule for the following: Any dividend being given, to find a divisor which added to its quotient shall make a sum equal to the dividend.

No. 191. *Anagrams.*—Contributed by "Susanne." 1. Pain's mother. 2. Tub's diary. 3. Under a vest. 4. To start Cain. 5. Bad in Creoles. 6. Soon in camp. What single words can be formed of the foregoing?

No. 192. *Spelling Exercise.*—A correspondent says, the word "scissors" can be spelled in 720 different ways, of course not correctly, but so that the sound will be the same, by using the vowels a, e, i, o, u, and y. Is this so?

No. 193. *Riddle.*—Green, white, pink and black; large as a hump on a camel's back; soaking wet like a dropsical sponge; into its heart a knife I'll plunge; then from its body take a slice; smack your lips and say it is nice; skin and bones I'll throw away; what its name is I priethee say.

No. 194. *Illustrated Rebus.*—Proverb in a new dress.

No. 195. *Puzzle.*—When there's a will, there's a way. The above curious picture gives the answer.

THE TRUANT'S REVENGE. — Engraved for the American Agriculturist.

The story in this picture is very plainly told by the artist. A "good for nothing," truant boy, as some would call him, is lying in wait for his unsuspecting schoolmate who told the teacher about his "playing hookey," that is, keeping away from school without leave. His heavy shoe is the only convenient weapon he could find, and with it he intends to make a sudden and severe attack. The faces of the two boys are especially worth studying. Which do you like best? Probably most would prefer that of the pleasant looking boy. His present expression is certainly more agreeable, but his features indicate some things as unworthy those as shown in the hard lines of the other face. He looks like a deceitful boy, who would appear very good when his teacher was looking, and who would be likely to try and win favor by telling tales of others. The truant has some strong manly traits that all admire. He is firm, persevering, active and resolute. He has more stuff in him of which to make a man, than could be found in half a dozen of the other sort. His worst side is turned out, and he generally acts as he feels; he is no hypocrite. Both these boys may be educated to fill a useful place in society, but the truant, properly trained, will take the higher place. No boy is "good for nothing," naturally, but many become so by neglect, or by being despised and maltreated. If you know any "hard case" among your companions, one who is often in disgrace at school, do not make him worse by harsh usage; find out the good in him and encourage its growth; thus you may help to save him.

Difficulties of Lawyers.—A testy lawyer in court found himself bothered with a knotty witness who wouldn't explain, as he desired, the difference between the "thick" and "long" kinds of whalebone.—"Why, man," said he, "you don't seem to know the distinction between thick and long."—"Ya'as I dew."—"Explain it, then."—"Wa'all you'r thick-headed, but you ain't long-headed, no how!" said he.....Another one was non-plussed in the following conversation.—*Lawyer.*—Did the defendant knock the witness down with malice pre-

ference? *Witness.*—No, sir; he knocked him down with a flat-iron. *L.*—You misunderstand me, my friend; I want to know whether he attacked him with any evil intent. *W.*—Oh! no, sir; it was outside the tent. *L.*—No, no, I wish you to tell me whether the attack was at all a preconcerted affair? *W.*—No, sir; it was not a free concert affair, it was in a circus.

Pharaoh's Serpents.

Passing along Broadway, some weeks ago, we saw the sign of "Eggs of Pharaoh's Serpents for sale here." "What kind of eggs could those be," thought we, and went in to ascertain. Queer looking eggs they were, little bright cones, not much larger than the one shown in the figure, all nicely packed in a box with cotton. We purchased one box of eggs and took them home to hatch. It always requires heat to hatch eggs, and these, being serpents' eggs, rather more than the usual amount of heat. The directions were to place the egg upon a plate and light the small end. Rather a strange way to hatch an egg, but we followed the directions and applied the match—a little blue blaze flickered for an instant and that was all. Perhaps there was not heat enough, so we tried again, and the serpent was this time fairly warmed into life. It poked out its head and looked about, writhed and coiled itself, and kept coming and coming as if it never would stop. The people all shouted with astonishment, and we who don't often allow surprise to get the better of us, were in as much wonderment as the rest. Out of that tiny cone came a snake-like body several feet long. The illustration gives but a poor idea of the size, as it has to be upon such a small scale. "How could such a serpent be hidden in such a small egg?" our young readers will ask. It wasn't hidden there at all, but was formed out of the material the egg or cone contained. The so-called egg, is a little case of tin foil filled with a powder which, on burning, leaves a remarkably bulky substance. Upon lighting the cone, this powder gradually burns, and what is formed in the burning sticks together and makes a long slender body, which

looks much like a serpent. "What is the powder?" We have been expecting that question, and if we tell you that it is the Sulpho-cyanide of Mercury, perhaps you will not be much wiser. That it is a curious compound, consisting of Mercury or quicksilver, sulphur and cyanogen is about all that we can teach you about it. What cyanogen is, or how the sulpho-cyanide of mercury is made, can only be understood by those who have more knowledge of chemistry than boys or girls are supposed to possess. No more amusing toys have been introduced, and they have but two faults, they are a little expensive and somewhat dangerous. The first we bought cost 50 cents for three tin foil "eggs." As to the danger, the

substance from which they are made is poisonous, and they ought never to be trusted in the hands of young children who might be tempted to taste them; and, when they are burned, it should be done either in the open air, or in front of an open fire place, where the draft will carry off the poisonous fumes.—The name, Pharaoh's serpents, is given from the idea that the Egyptian magicians may have produced their snakes thus, but they could hardly have known enough of chemistry for that.

(Business notices—\$1 50 per agate line of space.)

OF THE LIFE OF HORACE MANN, just published by WALKER, FULLER & CO., Boston, the Atlantic Monthly says: "It is a sterling Biography, which no educated American can afford not to read. It is only partial praise to call the book deeply interesting, It vivifies and inspires."

THE IONA AND ISRAELLA GRAPES

Surpass all others in excellence and value for every purpose.

The ISRAELLA although BEST and EARLIEST of all BLACK GRAPES of good size, is also one of the very best for late keeping.

The IONA, also VERY EARLY, has all of the delicacy, purity and refinement in flavor, uniform tenderness of flesh and transparent beauty, that characterize the best European varieties, and surpasses them in RICH VINOUS SPIRIT, while in HARDINESS and CONSTANCY of PRODUCTION and PERFECTION of RIPENING, it is unequalled among our most enduring natives.

For a full account of the characteristics of these seedlings, with their origin and history, see Pamphlet with engravings, representing the vines in bearing, which contains other important matter concerning grapes. It is sent for a two-cent stamp.

A beautiful colored representation of a bunch of the Iona, with branch and leaf, will be sent for \$1.50.

The same will be sent to agents of clubs for \$1.00. Plain Lithographs of the same, twenty cents. Club propositions and price lists sent with Pamphlet, when requested, without charge.

The "Manual of the Vine" is sent for 50 cents. It contains about 150 engravings, and is intended to be the most practical thorough and comprehensive treatise on the vine in the language. It contains an important chapter on propagation with many engravings.

All interested in grapes are invited to visit Iona, with assurance, that endeavors will be made to render the visit pleasant and profitable. See advertisement on page 70.

C. W. GRANT, Iona, (near Peekskill), Westchester Co., N. Y.

Delaware Grape Wood

For Sale by PARSONS & CO., Flushing, N. Y.

Fort Edward Collegiate Institute.

Spring and Summer Term begins March 22d. \$55 pays for Board and Common English. For eleven years the best sustained Boarding Seminary in the State. Commodious brick buildings. 16 Teachers. A graduating Course for Ladies. All the facilities of the Best Commercial Colleges with Telegraphy. The ablest instruction in Ancient and Modern languages, the Sciences, in Music and Painting.

Address for Catalogues or for Rooms, REV. JOSEPH E. KING, D. D., Fort Edward, N. Y.

THE "METHODIST QUARTERLY," in an elaborate review of WENDELL PHILLIP'S SPEECHES, says of them:

"No ancient oratory was ever more brilliant with keen sarcasm, splendid invective, or destructive satire, scattered like diamonds, handfuls in every direction. We commend this book to the perusal of all, but especially of our young men. It is throughout a noble lesson."

The Speeches, etc., are published in one elegant 8 vo. Vol., with an exquisite Steel Portrait of Mr. Phillips, by WALKER, FULLER & CO., Boston, Mass.

"It is an excellent work."—Publishers of the Scientific American.

"Should be in the hands of every teacher."—S. P. Bates, Department Public Schools, Penn.

"I am much pleased with The Herald of Health."—George H. Windship, the Strong Man.

MILLER, WOOD & CO., No. 15 N. 4th St., New York.

THE HORTICULTURIST.

A Monthly Magazine for every one who has a grape vine, a city yard, an acre lot, a garden, a vineyard, an orchard, a country-seat, a Farm, who has a house to build, out-buildings to erect, or a home to beautify.

Splendidly illustrated with designs and plans and all new fruits, flowers, etc.

1866, \$2.50; 1865, bound and post-paid, and 1866, \$4.50; 1864, and 1865, bound and post-paid, and 1866, \$5.

The Horticulturist is now entering on its twenty-first annual volume. It was originally edited by the late A. J. Downing, and still maintains its high reputation. In all departments it commands the best talent in the country.

I. The Horticulturist for March, April and May will contain the Spring advertisements of all the leading Nurseries in the Country.

II. If you wish to know where to buy Grape Vines, Fruit Trees, Evergreens, Flowers, Seeds, Agricultural Implements, and Household Articles, consult the advertising columns of The Horticulturist.

III. If you wish to know how to prune and train your Grape Vines, take every monthly number of The Horticulturist.—Two dollars and fifty cents per annum.

IV. If you wish to know how to plant and cultivate your garden, take The Horticulturist.

V. If you wish to know how to grow good fruit and plenty of it, take The Horticulturist.

VI. If you wish to know all about flowers and their cultivation, take The Horticulturist.

VII. If you wish to know all about ornamental trees, take The Horticulturist.

VIII. If you wish to know how to plan and construct your Country Houses, take The Horticulturist. In it you will find good plans for Farm Houses, Barns, Gates, and Outbuildings.

IX. If you wish to lay out and make attractive and valuable the grounds about your country Home, take The Horticulturist. It treats the subject of Landscape Gardening thoroughly.

X. If you wish to know how to build and manage your Greenhouses, Conservatories, Orchard Houses, etc., take The Horticulturist.

XI. If you wish to know how to grow Fruits, Vegetables, etc., for profit, and all other things worth knowing about the Orchard, Vineyard, Garden and Nursery, consult The Horticulturist.

KNOX'S SMALL FRUIT CATALOGUE FOR SPRING of 1866, IS NOW ISSUED,

and will be sent to all applicants enclosing 10 cents.

It contains **Descriptions and Illustrations** of the leading varieties of

Grapes, Strawberries, Raspberries, Blackberries, Gooseberries, Currants, &c.—Select Lists of Fruits, made up with great care:

Letters from Eminent Fruit Growers, and Reports of various Committees, who have visited our grounds, including the Report of the Ad Interim Committee of the Ohio Pomological Society, 1865, written by the President, DR. JNO. A. WARDER, from which we extract:

"Four things struck all the visitors as especially worthy of note: The modes of propagation and culture of the soil, the varieties under culture and trial, the wonderfully abundant product of magnificent berries, and the excellent and successful mode of harvesting and marketing the fruit, all of which may properly be introduced into this Report for the benefit of our fellow members."

Much valuable information, in each of these prints, is contained in this Report, and other parts of the Catalogue.

JUCUNDA---OUR NO. 700 STRAWBERRY.

After thorough trial, we have no hesitation in saying that for **UNIFORM AND LARGE SIZE, BEAUTY OF FORM AND COLOR, ENORMOUS YIELD, LONG CONTINUANCE IN BEARING, GREAT PROFIT, HEALTH AND VIGOR OF PLANT,** and other desirable qualities, this is

**The most Valuable Strawberry of
which we have any knowledge.**

See page 32 of AGRICULTURIST, Jan. No. 1866, and the **NEW EDITION** of our Catalogue.

J. KNOX,

Box 155, Pittsburgh, Pa.

FORTY ACRES OF SMALL FRUITS.—If you would know how to plant, cultivate and market, send for my **DESCRIPTIVE AND RETAIL CATALOGUE.** If you wish to purchase largely, to plant or sell again, send for my **"WHOLESALE LIST."** **3¢** Stamp not refused, yet not required. STRAWBERRIES, Blackberries and Raspberries, all the best and newest varieties. Catalogues gratis. SAMUEL L. ALLEN, Cincinnati P. O., N. J.

THE

IONA AND ISRAELLA GRAPES

Greatly surpass all others in excellence and value for all purposes. It is admitted by all good judges who are acquainted with them, that they are not only able to establish American Grape Culture on a new and sure foundation of excellence, but that they must also in a great measure, displace all others from cultivation, as soon as plants in sufficient number can be produced to do it.

The **ISRAELLA** is the **BEST** and **EARLIEST** of all **BLACK GRAPES**, and unlike all of the others of this class, it is excellent in flavor, adhering firmly to the bunch, and well adapted for late keeping.

The **IONA** is also **VERY EARLY**, and is the most beautiful and excellent of all grapes. In pure delicacy and refinement of flavor, and in uniform tenderness of flesh, it sustains comparison with the Best European kinds of temperate climate advantageously, and surpasses them in spirit. It is able to bear comparison in *spirit and flavor* with the famous **MUSCAT of Alexandria**, which is the severest test to which any grape can be subjected. The **IONA** in open air gives better fruit than Black Hamburg under glass, and is the most certain in its perfectly ripened crop, of all our native varieties.

In anticipation of a great demand for plants of these kinds of best quality, (No. 1, Extra, and Best Selection,) I took the utmost possible care in propagating to provide a large stock to be able to meet the most extensive wholesale orders, as well as those for retailing. Fall orders have exceeded expectation.

For the supply of **CLUBS** and for **RETAILING**, I have reserved a supply of quality that can not be equalled, and for moderate orders at wholesale, I have still remaining, plants of nearly all of the most desirable grades, but not nearly enough for the full supply of the spring sales, judging from the fall demand, and the present call for plants. A few classes are already exhausted. (See revised list before ordering.)

I desire to disseminate the best quality of plants of these new kinds in gardens and vineyards, as widely as possible, and shall make unusual effort to diffuse the knowledge of them. In furtherance of this, I have with the utmost care produced a stock of vines that will maintain the reputation of the **Iona Establishment**, which in facilities for producing the best class of vines is not equalled in the world.

Before sending out the **IONA** I made extensive provision for a supply of the best of wood to propagate from, to avoid the need of "*coazing unsuitable buds to make feeble vines,*" by which so many buyers of new kinds have been disappointed. (SEE AMERICAN AGRICULTURIST, LAST VOLUME, PAGE 379, ALSO PAGE 392.)

Having the original stock of vines and abundance of mature wood from established stocks prepared especially to propagate from for the production of the best and most hardy of plants, and such as no other Establishment can command, I am able to offer plants which, for cheapness and quality, are worthy of the attention of every purchaser.

I have a class not equal to best No. 1 for the garden, that can be confidently recommended as cheap and excellent for vineyards. They are well supplied with strong and fibrous roots, not merely "*root buds,*" which are expected "to furnish fibres next season." I have others still cheaper that are good plants, and well furnished with actual fibres—such as have suited intelligent investigating buyers the past season to the extent of many thousands of plants. I invite all interested to call and make thorough examination of plants and prices, and methods of production.

My plants from "green cuttings" will be found to be very cheap and good of their class, but not nearly equal to first-rate single-eye plants in hardness and other qualities. Samples of all grades sent on application.

I would invite attention to my great stock, and especially to plants of **Adirondack, Rogers' Hybrids, and Allen's Hybrid.** The latter, from its excellence, beauty and extreme earliness, deserves a place in every garden. It is the best White Grape. I have some desirable Delaware Vines still unsold.

I have prepared a Pamphlet of about thirty pages, which, besides other important matter, contains a full account of the characteristics of the **IONA** and **ISRAELLA**, with their origin and history, and the opinions of many well qualified to judge of their merits. It has also accurate representations of **IONA** and **ISRAELLA** vines in bearing. It is sent for a two-cent stamp.

For the thorough study of the subject I have prepared the "**MANUAL OF THE VINE,**" which is drawn from long and extensive experience in Grape Culture. It is illustrated with about one hundred and fifty engravings, chiefly representations of vines of my own training. One well qualified to

judge says: "The Chapters on 'The Ripening of Grapes,' and 'The Progress of Taste,' are of importance to every one interested in good grapes, and are worth the price of a large volume." The Manual is sent for Fifty cents.

For nearly a decade, many thousands have yearly followed the directions of the Manual, in all parts of the country, and I do not know of one that has found them erroneous or defective. Readers of the Manual will learn the proper use of "Pots" and "Borders" in propagation, and how to judge of the quality of plants.

Club propositions sent with the pamphlet without charge. These offer most liberal and advantageous terms to all purchasers, whether by dozens, to be sent to one address, or singly by mail to as many different offices, or by hundreds or by thousands. Samples of vines sent on application, and engravings and other facilities afforded to those who desire to form clubs. The safe reception of the vines is in all cases guaranteed.

C. W. GRANT, Iona,

(near Leekskill) Westchester Co., N. Y.

P. S.—A fine Engraving of a branch of the **ISRAELLA** with three bunches natural size, sent for Fifty Cents.

A fine Colored Plate of a bunch and branch of the **IONA** sent for \$1.50. The same sent to Agents for Clubs, for \$1.00. Plain Lithographs of **IONA** with branch and leaf, Twenty Cents. C. W. G.

HENDERSON AND FLEMING'S

GARDEN SEEDS, CROP OF 1865.

Most of our Vegetable Seeds have been grown by us, and are such as are used as the

Best and most Profitable Sorts

In our extensive Market Gardens near Jersey City, where for nearly twenty years, we have grown to supply the New-York market. Our Florist's Business, also, has long been, and is now one of the largest here. So from this experience as

Practical Market Gardeners and Florists,

we believe we are well able to judge of the quality of either Flower or Vegetable Seeds.

We sell no seeds without testing their germinating qualities, and all such as fail, or even partially fail, are rejected. From this practice, we assure all purchasers that there can be no failure of Seeds bought from us, if properly planted.

Our Best Early Market Tomato

Is the EARLY SMOOTH RED—our growth—ready here by middle of July.

Price 30 cents per ounce; \$3 per pound.

Our Best Market Egg Plant

Is the NEW YORK IMPROVED.—Large purple, most abundant bearer.

Price 75 cents per ounce; \$10 per pound.

Our Best Market Onions

Are the RED WETHERSFIELD and YELLOW DANVERS, ready

from seeds in August, and from sets in the middle of July.

Seeds 25 cents per ounce; \$3 per pound.

Sets 50 cents per quart; \$15 per bushel.

Our Best Early Market Radishes

Are the "FRENCH SCARLET TURNIP," and "SHORT TOP LONG."

Price \$1.50 per pound.

Our Best Early Market Lettuce

Is the CURLED SIMPSON, an improved Silesia, of our own growth, marketable here the middle of May.

Seeds 50 cents per ounce; \$6 per pound.

Our Best Early Market Beet

Is the "SHORT TOP ROUND," an improved strain of our own growth, marketable here middle of June.

Price 25 cents per ounce; \$1.50 per pound.

Our Best Early Market Cabbage

Is the true JERSEY WAKEFIELD, ten days ahead of all others. Seeds of our own growth.

Price 25 cents per packet; \$1 per ounce; \$12 per pound.

Our Best Early Market Cauliflower

Is the DWARF ERFURT, a large headed, compact growing variety. We grow 15,000 heads per acre, which are sold every year before the 1st of July, in the New York markets.

Seeds 50 cents per packet; \$2.50 per ounce; \$30 per pound.

CHOICE SEED.

I would again invite the attention of the public to my Annual Catalogue of choice and reliable garden seeds, embracing over two hundred varieties, over one half of them of my own growing. I would invite particular attention to the following list of new, rare, or very desirable vegetables. Marbled Mammoth Cabbage, (the king of all cabbages, sometimes weighs 60 lbs., and averages 50 lbs. by the acre. No cabbage will grow so large in the hot south as this. My seed are grown from the very largest and best of heads. I was the original introducer of this, and of a number of the varieties in the following list.) Stone Mason Cabbage, (a very large drumhead, remarkably reliable for heading, very profitable for market; heads very hard and very tender. Put up in half oz. packages, or sold by the pound.) Burdell's King of the Dwarfs, (the earliest of all cabbages, new, just from England, very fine and sweet flavor.) Richmond's compact Brussels Sprouts, (new, from England; selected for its very dwarf and compact habit.) Mammoth Sweet Corn, (the largest sort known, weighing two to three pounds to the ear; very sweet. It took the first prize at the Annual Exhibition of the Mass. Hort. Socy., of 1864.) Mammoth Egg Plant, (grows to size of long purple, striped with yellow purple and white; quite ornamental, edible.) Ornamental Kale, (several varieties in one package. Fine for either the Flower or Kitchen garden.) New Alma Cauliflower, (a new English variety; it has given great satisfaction.) Leucomanni's Mammoth Cauliflower, (a new French sort, which promises to be the largest and most reliable variety grown.) Early Paris Cauliflower, (imported seed; a standard sort.) Ward's Nectar Melon, (pure; the richest and spiciest of all the green fleshed varieties.) Caterpillar Plants, several varieties in one package; a curious oddity from France.) Vegetable Snails, (another vegetable curiosity used by the French cooks to garnish their dishes.) Striped Leaved Japanese Maize, (a new and beautiful plant from Japan, with foliage striped with green and white, and at times with rose.) Snake Cucumber, (a long, coiled, snake-like curiosity.) Vilmorin's new wrinkled edible fodder Pea, (the first wrinkled kind yet known, the pods of which are eaten.) Each of the above forwarded by mail, post-paid by me, at 25 cents a package. Also Early Cracker Onion, (a flat variety, the earliest of all the yellow sorts; quality very superior. See my Treatise on Onion Raising, page 13.) Early Red Danvers Onion, (an early, round red variety, of a fine bright color.) Early Extra Flat Turnip Beet, (has a very small leaf top; quality excellent.) Red Castelnary Beet, (a famous French variety, in France it has a nut-like flavor; flesh deep purple, very tender, sweet and rich flavored.) Giant Ovoid Mangel Wurtzel, (a new French sort, characterized by its firm, solid flesh, large size and symmetrical growth.) Dilliston's Extra Early Pea, (of 116 varieties tested in England, this proved to be the earliest; seven days earlier than Daniel O'Rourke.) Tom Thumb Pea, (very early; ten inches high; very productive.) Drew's New Dwarf Pea, (new; very dwarf, peas mostly oblong, each plant forms a bushy growth, but one pea being required to about a foot of row.) Brown's New Dwarf Early Marrowfat Pea, (a new variety, which may be relied upon as both the earliest and most dwarf Marrowfat grown.) McLean's Advance, (new; dwarf, wrinkled, very early and productive; an improvement on Napoleon.) Princess Royal, (new English pea, very productive. These two varieties have been selected as best out of over 20 new sorts.) Hair's Dwarf Mammoth, (this is a larger

pea than the Champion of England, grows but about half as high, is sweet and excellent.) Scarlet Flowering Bean, (an English bean, quite ornamental; grows about two feet high.) Extra Long Casheknife, (a very vigorous and productive variety; has given great satisfaction.) Concord Bean, (the earliest pole bean I have found; in quality resembles Horticulturalist, but yields much better.) Indian Chick Pea, (the best string pole bean known; always in condition for stringing.) Yard Long Bean, (follage highly ornamental; bean a curiosity.) Jet Cranberry; Mottled Cranberry, (each of these are an improvement in health, vigorous growth and productiveness, on the old-fashioned Cranberry or Tery bean.) Tilden's New Tomato; New Mexican Tomato; Mammoth Chihuahua Tomato; Cook's Favorite; French Upright; Early York, and Bates' Extra Early Tomatoes, (for particular description of these, see my advertisement in another column.) Bates' Extra Early Sweet Corn, (earlier than Darling's Early, a variety of the sweet wrinkledkerneled corn, excellent for the table.) Golden Seed, (early, tender, sweet, with a rich flavor, peculiarly its own.) Sweet Mexican Corn, (the sweetest and tenderest variety I have yet found.) Late Red Cob, old-fashioned eight-rowed sweet corn, (the ears of these two varieties grow to a very large size; quality sweet and very tender, keeping a long time in condition for table use.) Chufas, (very prolific; taste very much like a fine Coconut.) Hubbard Squash, (the driest, sweetest, and richest flavored of all winter squashes. I introduced this seed pure.) Yokohama Squash, (this new variety from Japan, has the finest grain of all squashes, with a rich, marrow-like taste.) Boston Marrow, (I consider my variety to be the purest in the United States; it took the first premium at the last Annual Fair of Mass. Hort. Society.) Para or Polk Squash, (a bush squash for late fall and winter use; in quality it resembles a rich Crookneck. My seed stock came from Para, and is perfectly pure.) Swiss Chard, (the best of all the Beet family for greens, the leaf stalks are used as Asparagus.) Chinese Sugar Cane, (imported seed; pure.) Oshetian Cane, (by some preferred to all other varieties for cultivation in the North.) Covent Garden Radish, (very long, of extra bright scarlet color; Market Gardeners try this!) Surry White Wheat, (a new English sort, highly recommended for poor and elevated soils; less subject to blight and rust than other varieties, and has yielded 15 per cent. more than every variety with which it has come into competition.) Fejee Bean, (warranted to be both the earliest and the hardiest of all bush beans.) Improved Green Globe Savoy Cabbage, (as reliable for heading as my Stone Mason, the quality of the Savoy is superior to all other varieties for table use.) Mammoth Mallet, (extra tall heads, largest of all.) True Boston Curled Lettuce, (the most ornamental lettuce known.) Neapolitan Cabbage Lettuce, (this is one of the finest Cabbage Lettuces yet introduced.) Six choicest varieties of Cabbage Lettuce, (the six finest native and foreign sorts, in one package.) White Japan Melon, (very early, remarkably sweet, very popular.) Allen's Superior, (quality very superior; by some called "King of Melons.") Orange Watermelon, (new; when fully ripe the skin peels off like that of an orange.) Early Sebce Potato, (new; has all the characteristics of the excellent Jackson White, but is ready for market from ten days to a fortnight earlier. A decided acquisition.) Early Chenery, (a new, very early, dry potato, becoming quite popular in Boston Market.) Goodfield's Seedling, (new, quite early and productive.) Garlic Chili, (remarkable free from rot; large, solid, very productive; an excellent keeper.) Chick Pea, (used on the Continent of Europe as a substitute for coffee.) Yellow Lupins, (extensively used in Europe for snobolling; highly recommended in U. S. Agricultural Report.) Improved Long Green Cucumber, (extra long; very fine.) New Jersey Hybrid Cucumber, (one of the largest and best varieties cultivated.) Ornamental Gourds, (many varieties in one package, including Dipper Gourd.) Sutton's Students Parsnip, (new, originated in England; de-

FRESH ONION SEED.

Those who wish to purchase seed directly from the grower, can be supplied with Large Red, Early Round Red (very bright colored), Yellow Flat, Early Cracker, and Early Round Yellow Danvers Onion Seed,—all grown by myself from the very best of seed stock and warranted to be both fresh and pure. Also half early Red, grown for me by an honest Quaker. The Danvers will yield a third more than any of the flat sorts, and sell far more readily and at a higher price in the Eastern market.

JAMES J. H. GREGORY,
Marblehead, Massachusetts.

Gregory's Seed Catalogue!

My Seed Catalogue of Garden and Vegetable Seeds, embracing about three hundred varieties, a large proportion of them of my own growing, will be sent out in January.—It will contain some new and rare varieties, not to be found in other catalogues, and will be sent gratis to all. Those who ordered seed of me last season, will receive it without writing for it. I was surprised last season by a degree of patronage that was wholly unanticipated. I have this season consequently increased my working force to meet promptly all orders.

All seed ordered warranted to reach the purchaser.

JAMES J. H. GREGORY,
Marblehead, Massachusetts.

NEW TOMATOES.

Tilden's New Seedling. Large, well shaped, very rich color, remarkably productive, of excellent quality, and keeps well for market purposes.

The Cook's Favorite. Large, apple shaped, very vigorous and productive. Raised by the acre, it brought nearly double the price of other sorts in Boston market this season.

Mammoth Chihuahua. Size enormous, weighing 2 to 3 lbs. each, one of the largest will heap a quart measure! Quality excellent.

Mexican Tomato. This is a large, round variety of Lester's Perfected. They are as large and as uniformly round as Cook's Favorite, and are prodigious bearers.

Early York. Very early; mostly of a flat round shape, of good market size, of excellent quality and very productive.

Tomato de Lave. The French upright or bush tomato. This variety is entirely distinct and will bear planting eighteen inches apart.

Bates' Extra Early. A remarkably early round variety, of good quality and of good market size.

Either of the above varieties will be forwarded post-paid by me at 15 cts. a package, and warranted to reach the purchaser.

JAMES J. H. GREGORY,
Marblehead, Massachusetts.

SEEDS—Fresh, Genuine and Choice Garden and Flower Seeds.

JOHN VANDERBILT, 23 Fulton Street, New York,

WHOLESALE AND RETAIL DEALER IN

FARM AND GARDEN IMPLEMENTS AND MACHINES.

GARDEN, FIELD, FLOWER, BIRD AND TREE SEEDS OF EVERY VARIETY.

GUANO, BONE DUST, PHOSPHATES, POUURETTE, PLASTER, ANIMAL MANURE.

PLANTS, TREES, SHRUBS AND ROOTS.

The following Seeds will be promptly sent by Mail, Postage free, on receipt of Prices Annexed :

In respectfully soliciting orders from the readers of the AGRICULTURIST and others, I would state that fully appreciating the importance of reliable seed to secure a profitable and satisfactory return to the cultivators of the soil, it is my constant study and care to furnish such only as are pure, reliable, and the very choicest of their kind. My supply is obtained from the sources where the climate and soil are best adapted to bring the particular seed to its greatest perfection—and from the most reliable growers in this Country and Europe. The list presents only the more favorite and well-known varieties. I will supply almost any other kind required, and will select for those who do not know the peculiarities of the different varieties, when desired.

Table listing various seeds such as Artichoke, Asparagus, Beans, Beet, Brussels Sprouts, Broccoli, Cabbage, Cauliflower, Celery, Chervil, Chicory, Colewort, Corn, Cress, Cucumber, Egg Plant, Endive, Kale, etc. with prices per oz. and per p'kt.

JOHN VANDERBILT, 23 Fulton-street, New-York.

B. K. BLISS'

Illustrated Seed Catalogue and Guide to the Flower and Kitchen Garden.

The ELEVENTH EDITION, with supplement for 1866, enlarged and improved, contains upwards of ONE HUNDRED PAGES of closely printed matter, with many NEW and BEAUTIFUL ILLUSTRATIONS, and a descriptive list of upwards of TWO THOUSAND VARIETIES OF FLOWER and VEGETABLE SEEDS, including many CHARMING NOVELTIES, now offered for the first time in this country, with explicit directions for their culture. Also, a list of

Upwards of One Hundred Varieties of French Hybrid Gladiolus,

embracing many new varieties not before offered, and other SUMMER FLOWERING BULBS. To which is added a list of a few of the choicest varieties of GRAPES, STRAWBERRIES, RASPBERRIES, and other SMALL FRUITS, BEDDING PLANTS, etc., etc., cultivated at his gardens, with much other useful information on the subject of Gardening generally, which will be found useful to the experienced amateur as well as those about to commence the delightful occupation of Gardening. In consequence of the very great advance in the cost of paper, printing, &c., we cannot afford it gratuitously (as we have heretofore done), excepting to our regular customers. A copy will be mailed, post-paid, to all applicants enclosing Twenty-five Cents. Address B. K. BLISS, Springfield, Mass.

Seeds of Florists' Flowers.

The attention of AMATEURS and FLORISTS is invited to the following list which have been carefully selected from the stocks of several of the most successful European and American growers, and are believed to be superior to any ever before offered in this country. Mailed, post-paid, upon receipt of price affixed, to any address in the Union.

Table listing various flower seeds such as ANTIRRHINUM, ASTERS, AUCUBA, BALSAMS, BELLIS PERENNIS, CALCOPOLARIAS, CINERARIAS, COCKSCOMBS, CARNATION, HOLLYHOCKS, GERANIUMS, PELARGONIUMS, GLADIOLUS, GLOXINIAS, LANTANA, MIMULUS, PETUNIAS, PORTULACA, PRIMULA SINENSIS, STOCKS, WALL-FLOWERS, etc. with prices per packet.

Collections of Vegetable Seeds by Mail, For Spring Planting.

15 Varieties, our Selection, \$1.00; 33 Varieties, our Selection, \$2.00; 55 Varieties, in Larger Packets, \$3.50.

The above contain the leading varieties usually grown in our gardens. To those who desire larger quantities, we would recommend our collections at \$20.00, or \$15.00; or \$10.00; and \$5.00, which can be safely forwarded by express to all parts of the world. A list of the contents of each collection will be found in our New Catalogue and "Guide to the Flower and Kitchen Garden." Address B. K. BLISS, Springfield, Mass.

Collections of Flower Seeds by Mail.

For the accommodation of those who love the cultivation of Flowers, but who reside at a distance from where they can be procured, we have selected from our large assortment of Flower Seeds the most showy varieties, and those of easy culture, and put them up in assortments, which will be sent post-paid to any address in the Union at the following prices:

- Assortment No. 1—contains twenty choice varieties of Annuals, \$1.00.
Assortment No. 2—contains twenty choice varieties of Biennials and Perennials, \$1.00.
Assortment No. 3—contains ten extra varieties of Annuals and Perennials, embracing many of the new and choicest in cultivation, \$1.00.
Assortment No. 4—contains five very choice varieties, selected from our Prize Flowers, of English Pansies, French Carnation, and Picotee Pink, Verbenas, Truffaut's French Asters, Double Hollyhocks, \$1.00.
Assortment No. 5—contains fifteen very select varieties of Green-house Seeds, \$3.00.

- Assortment No. 6—contains one hundred varieties of Annuals, Biennials and Perennials, including many new and choice varieties, \$5.00.
Assortment No. 7—contains fifty varieties of Annuals, Biennials and Perennials, \$2.50.
Assortment No. 8—contains twenty varieties of hardy Annuals, Biennials and Perennials, for sowing in the autumn, \$1.00.

ANOTHER SPLENDID NOVELTY from JAPAN.

Striped Leaved Japanese Maize. This beautiful and valuable addition to our ornamental foliage plants was obtained in Japan, by Mr. Thomas Hogg, the well-known Nurseryman and Horticulturist, at New York, who sent seeds of it to his brother, Mr. James Hogg, in the spring of 1864. It appears to be a variety of Zea Chrysga, or the Peruvian Maize, as it in many respects differs from the Zea Mays, or Indian Corn, as it is called in the United States. It grows to a height of from five to six feet, and has its foliage alternately opposite; the foliage is from two to three inches wide and about four feet in length. It is beautifully and evenly striped, or ribboned with alternate stripes of green and white, and in its earlier stages of growth is also striped with rose color. It resembles the Arinda, donax variegata in appearance, but is of a much more elegant and imposing habit. Nothing in the way of a foliage plant can exceed in gracefulness and beauty, a group of three to five plants of this variety of Zea. The subscriber is happy to announce that he has secured the entire stock of this splendid novelty, and now offers the seeds in packets containing Twenty Seeds at 25 cts. per packet, 5 packets for \$1. The Trade supplied upon the most liberal terms. Address B. K. BLISS, Springfield, Mass.

Seeds for the Farm & Garden.

The following seeds, the purity and vitality of which can be confidently recommended, will be mailed, post-paid, to any address in the United States, upon receipt of the price affixed.

Table listing various farm and garden seeds such as BEETS, CABBAGE, CAULIFLOWER, CELERY, CARROT, CORN, EGG PLANT, KOHL RABI, LETTUCE, MUSKMELON, WATERMELON, PARSNIP, PEAS, PEPPER, RADISH, SALSIFY, SPINACH, SQUASH, TURNIP, LENTILS, SAGE, etc. with prices per bushel or pound.

New White Dielytra.

Dielytra (Dicentra) Spectabilis alba. Another year's trial confirms what we have previously said of this charming novelty. Its delicate blossoms, graceful habit, and beautiful foliage, will cause it to become a general favorite, and no garden, however small, will be complete without it. It forms a pleasing contrast with the original variety, and as a decorative plant for the cemetery it stands unrivaled. Strong and well rooted Pot Plants will be ready for delivery about the first of April, and will be mailed post-paid to

any address in the Union upon receipt of the price. One Plant, \$1; Six Plants, \$5; Twelve Plants, \$9. A few one year old ground roots for propagation, \$5 each. Address B. K. BLISS, Springfield, Mass.

CHOICE VARIETIES OF the TOMATO.

The following varieties of this valuable esculent will be mailed to applicants upon receipt of the price affixed: Tilden's New Seedling.—A new and truly valuable variety, oval shaped, the color a brilliant scarlet, skin smooth, glossy, and rarely wrinkled, very productive, an excellent market variety, packet, 25 cents. Extra Early York, the earliest variety, very prolific, of good size, and fine quality, packet, 15 cents. The Cook's Favorite.—Fruit of medium size, roundish or oval, smooth, of a rich deep color, fine flavor, very solid and prolific, an excellent market variety, pkt. 15c. Lester's Perfected, fruit of large size, pinkish red, remarkably solid and of fine flavor, packet, 10 cents. Mammoth Chihuahua, often weighs 2 and 3 lbs. 25c. New Erect French, or Tree Tomato, grows upright like a bush, fruit solid and of fine quality, very ornamental, fine for pot culture, packet, 10 cents. Also, the following varieties at 10 cents per packet: Early Apple; Pear Shaped; Yellow Plum; Red and Yellow Cherry; Fejee Island; New White; Large Yellow; Strawberry. One packet each of the 15 varieties, \$1.75. Address B. K. BLISS, Springfield, Mass.

POTATOES FOR SEED.

Goodrich's New Seedlings.

Early Goodrich.—The experience of many growers the past season has proved this to be the earliest as well as one of the most productive varieties in cultivation. Price per bushel: \$1.50, \$3.00, \$12.00. Culeo.—A Seedling of the Garnet Chili, a little earlier than that variety, has a firm crisp flesh, cooks white and dry. Price per bushel: \$1.00, \$3.00, \$7.50. Gleason.—Of good size, fine grain, white solid flesh, very productive. Price per bushel: \$1.50, \$5.00, \$12.00. Garnet Chili.—Large and productive, a good keeper, fine for general crop. Price per bushel: 75c, \$2.00, \$5.00. Cuzeo.—White flesh, good size and flavor, and enormously productive. Price per bushel: 75c, \$2.00, \$5.00. Early Stevens.—A new variety from Northern Vermont, extra early, of excellent quality, very productive. Price per bushel: 75c, \$2.00, \$5.00. Extra Early White.—Very early, of large size, flesh very white, fine flavor, a fine market variety. Price per bushel: 75c, \$2.00, \$5.00. Early Sovereign.—A favorite early sort, of good quality, keeps well. Price per bushel: 75c, \$2.50, \$5.00. Early Wendell.—One of the largest of the early varieties, very productive, and uniformly of good quality. Price per bushel: 75c, \$2.00, \$5.00. Delmahoy.—A new second early variety from Ireland, medium size, of excellent flavor, very productive. Price per bushel: 75c, \$2.50, \$6.00. Jackson White.—An excellent second early sort, much cultivated in New England, flesh very white and of fine flavor. Price per bushel: 75c, \$2.00, \$5.00. New White Peach Blow.—A decided improvement upon the well-known "Jersey Peach Blow," flesh white, floury, of most excellent quality, cannot be too strongly recommended, a first rate market variety. Price per bushel: 75c, \$2.00, \$5.00.

POTATOES BY MAIL.—For the accommodation of those who reside at a distance from Railroads and Express Offices, we will send a package containing Four Pounds of either of the above varieties by mail, post-paid, upon receipt of One Dollar. No less than \$1.00 worth or more than one kind in a package will be sent by mail, 6 P's for \$5. Address B. K. BLISS, Springfield, Mass.

PRIZE CUCUMBERS FOR FORCING.

General Grant.—A new and superb variety either for exhibition or the table, perfect in form, solid and crisp, and of a most agreeable flavor. Many specimens were grown the past summer averaging 24 to 30 inches in length. It succeeds well also in the open ground. Packets containing 10 Seeds, 25 cents. Also the following English and German varieties, at 25 cents per packet, Ayre's Perpetual Black Spine; Cuthill's Black Spine; Ipswich Standard; Weeden's Spine; Cuthill's Black Spine; Giant of Amstedt; Roman Symmetry; Victory of Bath; Giant of Amstedt; Roman Emperor; Minister-Abbey; Lord Kenyon's Favorite; Ne Plus Ultra; Caster's Champion; Colney Hatch. Either of the above varieties will be mailed to applicants upon receipt of price affixed. Address B. K. BLISS, Springfield, Mass.

NEW CROP ONION SEED.

The following varieties will be mailed post-paid, during the months of January and February, upon receipt of the prices affixed: Prices for larger quantities upon application. per oz. 4 ozs. 7 lbs. 1 lb. Large Red Wethersfield, 30 cts., 75c., \$1.15, \$2.00. Large Yellow Dutch, 25c., 80c., \$1.25, \$2.25. Yellow Danvers (true), 25c., 80c., \$1.50, \$2.50. White Portugal, 35c., \$1.20, \$2.00, \$3.75. Potato Onion Sets, per quart, 50c. Address B. K. BLISS, Springfield, Mass.

SAML C. DECOU, Recklesstown, Burlington Co., N. J.

Iona Grape Wood.

Of Iona wood grown from vines had of C. W. GRANT—the originator—the subscriber offers for sale a few thousand well matured buds, such as are suitable for grafting old vines and for general propagation. In the hands of a good propagator each bud will produce a good vine. By proper grafting, all worthless but thrifty vines now fully established in garden or vineyard can be made to produce good crops of the best fruit in two seasons. Cuttings can be shipped safely in the coldest weather, and kept in the cellar in earth or sand until wanted for use.

Cuttings will be sent by mail securely packed and post paid, on receipt of price. Orders should be sent in before March 1st. No orders received for less than two dollars worth. Prices as follows. Less than 50 buds, 20 cents each; 50 to 100 buds, 18 cents each; 100 or upwards, 16 cents each. Also 10,000 Delaware buds of good quality, at \$7.50 per 1000.

Plattsburgh, N. Y.

Feb. 1st, 1866.

VENEER FRUIT BASKETS.

Beecher's Patent May 31st, 1864.

These Baskets are thoroughly ventilated, and when packed in Crates, are warranted to transport safely to all markets, Strawberries, Raspberries, Blackberries, and all other small fruits that are marketable.

For style, convenience in picking and handling, and for profit to Fruit Growers and Commission dealers, they have no equal.

The First Prize was awarded these Baskets at the Horticultural Exhibition of the American Institute, held at Cooper Union, last season; and recommendations from many of our most prominent and successful fruit men throughout the country endorse this decision.

Baskets and Crates can be had of W. H. Carpenter, 90 Vesey-st., N. Y.; C. B. Rogers, 133 Market-st., Philadelphia; Richard Cromwell, 46 & 48 Light-st., Baltimore; and by dealers generally throughout Town and Country.

Manufactured only by
A. BEECHER & SONS,
Westville, Conn.
By whom Circulars will be sent on application with stamp.

A Rare Opportunity!

The Proprietors of the American Fruit Basket (for the transportation of Strawberries, &c.) will sell their patents for a given number of States, both for that popular Basket and a most ingenious Machine for making Baskets. This is an enterprise which can not fail to interest any energetic business man, however good his present employment. For particulars address

AMERICAN BASKET COMPANY,
Office 813 Chapel-st., New-Haven, Conn.

TO FARMERS.

80,000 Barrels of Lodi Poudrette

For sale in lots to suit purchasers. This Poudrette has been on the market for 25 years, and has held its place among all other fertilizers as the **Best and Cheapest**, being sold for \$49 per ton less than other fertilizers, with just as good results. It is manufactured from the night soil of New York City, which the subscribers have the exclusive contract for removing to their works. Its chief recommendations are its economy, the quick growth it gives to the plant, ripening a crop from two to three weeks earlier, and an increased yield of 50 to 100 per cent. It is used most extensively upon Corn, Tobacco, Potatoes, and Garden Vegetables. Is perfectly inodorous, harmless to vegetation, can be applied directly to the seed without injury, and yet is as powerful as Peruvian Guano, and unlike Guano, does not leave the soil in an exhausted condition. A pamphlet with the experience in its use of several hundred farmers in different parts of the United States, some of them having used it for over 20 years, will be sent to any person applying to our address.

Price—\$2.00 per Barrel of four Bushels.

G. C. HALSTEAD, 52 Murray-st., New York.

Doty's Clothes Washer
AND
CHURN POWER.

NOW WARRANTED TO RAPIDLY CLEANSE
THE DIRTIEST CLOTHING
Without Rubbing!

The Proprietors are happy to announce that their late improvements and the discovery of a more efficient process of washing, enable them now to WARRANT their great
Clothes and Labor Savers,

already the best and most popular in use—to be capable of enabling a person to thoroughly cleanse even the dirtiest shirts, "STREAKS" included, without a particle of rubbing, without chemicals, with moderate labor, and without danger of WEAR OR TEAR.
Exclusive of heating suds, wringing, rinsing, etc., a week's washing for a family of six persons may be done with our Family Size Washer in HALF AN HOUR!

The DOTY Washer took the FIRST PREMIUM, a large Silver Medal, at the great Fair of the American Institute, just closed.
Read and Reflect!

"It is worth one dollar per week in any family. After a year's use, 'our machine' is thought more of to-day than ever before."—SOLON ROBINSON, Agricultural Editor of The New York Tribune.

Perhaps you will ask how this Washer can clean clothes without *wearing* them. We answer: In using it, your clothes have the advantage of being cleansed in suds hot and strong enough to dissolve all dirt and grease, hence it has only to *rinse* them out; whereas, in washing by hand, the hands cannot be borne in suds so hot and strong, and the clothes must necessarily be rubbed and worn to get them clean.

Now can you not better afford to buy a machine than to buy extra clothes that will amount in a single year to more than double the price of the machine, and to six, eight, yes, ten times its price during the time it will last? How can you make a better-paying investment?

Our Salesmen are DOING GOOD AND MAKING MONEY, and we want a good one in every town.
The celebrated UNIVERSAL CLOTHES WRINGER sold also by the undersigned. For further particulars Address

R. C. BROWNING,
General Agent, No. 32 Courtlandt-st., N. Y.

NOTE.—Persons in Illinois, Wisconsin, Missouri, Iowa, Minnesota, Kansas, Nebraska, and Dacotah, Address the Proprietors,

DOTY BROTHERS,
JANESVILLE, WIS.

BROWN'S BRONCHIAL TROCHES!
A NEGLECTED COUGH, COLD, AN IRRITATED OR SORE THROAT, if allowed to progress, results in serious Pulmonary, Bronchial, and Asthmatic Diseases, oftentimes incurable. BROWN'S BRONCHIAL TROCHES reach directly the affected parts, and give almost immediate relief. For BRONCHITIS, ASTHMA, CATARRH, and CONSUMPTIVE COUGHS the Troches are useful. PUBLIC SPEAKERS and SINGERS should have the Troches to clear and strengthen the voice. Those who overtax the voice, and are exposed to sudden changes, should use them. OBTAIN only the genuine, "Brown's Bronchial Troches," having proved their efficacy by a test of many years, are highly recommended and prescribed by Physicians, and have received testimonials from many eminent men.

"I have never changed my mind respecting them from the first, excepting to think yet better of that which I began thinking well of."

REV. HENRY WARD BEECHER.

Sold by all Druggists and Dealers in Medicine in the United States and Foreign countries, at 35 cents per box.

Is the greatest invention of the age. Every ruptured person should read his pamphlet. Sent Free.

The Challenge Washing Machine

IS WARRANTED to wash EASIER, BETTER and QUICKER, and with LESS WEAR to the clothes than any other machine on process, and to wash CLEAN 4 SHIRTS in 4 minutes; 6 SHIRTS in 7 minutes, and other clothes in proportion. Weighs but 30 lbs., costs but \$7 to \$9. Sample machines sent on receipt of price, and money refunded if they fail to give PERFECT SATISFACTION. Clubs of 6 at the price of 5.

We the undersigned, have used the Challenge Washing Machine in our families, and can freely recommend it. We are likewise acquainted with S. W. PALMER & CO., and know them to be honorable and reliable men, and believe that persons will be perfectly secure in sending them money for Machines. Rev. Wm. Hosmer, Editor of Northern Independent; Rev. Wm. C. Steele, Pastor of North-street, M. E. Church, Auburn; Rev. B. I. Ives, Chaplain of Auburn State Prison; Rev. D. D. Lore, Editor of Northern Christian Advocate; Knapp & Peck, Editors and Proprietors Auburn Advertiser; Rev. Chas. Hawley, 1st Pres. Church, Auburn, N. Y.; Rev. D. A. Wheeldon, Bleeker-st., M. E. Church, Utica, N. Y.

Agents wanted everywhere. They are making from \$100 to \$100 per month, send enclosing stamp for circular, giving full descriptions and 1000 references.

The Challenge Wringer and Ironer combines a perfect Wringer and a perfect ironing machine for ironing WITHOUT HEAT, and as quickly as the articles would be run through a Wringer. Send for Circular.

S. W. PALMER & CO., Auburn, N. Y.

THE

This Wringer has again taken the FIRST PREMIUM in the Great Fair of the American Institute—it has also taken the FIRST PREMIUM at the State Fairs of New-York, Vermont, Pennsylvania, Ohio, Michigan, Indiana, Illinois, Kentucky, Iowa, Wisconsin, Connecticut River Valley Fair, Champlain Valley Fair, and at most of the County and Institute Fairs throughout the country. Over 20,000 have been sold, and are now in use in the United States, and we never heard of one that was not liked.

The UNIVERSAL is superior to all other Wringers, in having large rolls of solid India Rubber, so protected by strong COG-WHEELS that they cannot slip or break loose from the shaft. Its strong wood frame cannot be broken, and does not rust or soil the clothes. Every Universal Wringer is WARRANTED.

We select a few testimonials from persons widely known to the public, who speak from actual experience, and are above suspicion of misstatement.

"My family would as soon give up the cooking-stove as this CLOTHES WRINGER. It cannot be too highly recommended."—[SOLON ROBINSON.]

"After a constant use of the UNIVERSAL CLOTHES WRINGER for more than four years in my family, I am authorized by the 'powers that be' to give it the most unqualified praise, and to pronounce it an indispensable part of the machinery of housekeeping."—[REV. HENRY WARD BEECHER.]

"This is the first Wringer I have found that would stand the service required of it."—[J. P. HUGGINS, Lovejoy's Hotel.]

"We think the Machine MUCH MORE THAN PAYS FOR ITSELF EVERY YEAR IN THE SAVING OF GARMENTS. We think it important the Wringer should be fitted with COGS."—[ORANGE JUDD, Editor of American Agriculturist.]

"I heartily commend it to economists of time, money and contentment."—[The Rev. Dr. BELLINGS.]

PRICES—Large size, \$10; Medium, \$8.50. On receipt of the price from places where no one is selling, we will send the WRINGER free of freight charges.

A good canvasser can make money rapidly selling them in every town. Exclusive sale guaranteed and liberal terms given to responsible parties who first apply. Descriptive Circular and terms sent free.

The celebrated DOTY'S CLOTHES WASHER, which has just taken the First Premium at the Great Fair of the American Institute, is sold also by the undersigned.

The Gutta Percha Cement Paint. The cheapest and best preservative Paint in the world, for wood and metals of all kinds, and for painting and repairing Tin and other Roofs.

It has been tested eight years, is always ready for use. **Manufacturers of Agricultural Implements will find**

The Black Diamond Varnish equal to the best for all purposes where a quick drying, lustrous varnish is required. It costs only one quarter as much.

The Gutta Percha Cement Roofing costs half as much as Tin, and can be applied by any one. **THE JOHNS & CROSELY MANUFACTURING CO.,** Sole Manufacturers, No. 78 William-street, cor. Liberty, New-York.

AMERICAN ROOFING COMPANY. GREEN'S PATENT.

This Company is now prepared to furnish one of the best articles of ROOFING ever introduced, consisting of a STOUT MATERIAL made WATER-PROOF by a COMPOUND of INDIA RUBBER, hardened by a coat of METALLIC PAINT, prepared expressly.

The WHOLE FABRIC has been thoroughly tested, is entirely WATER-PROOF, and unaffected by changes of weather.

It rolls up and unrolls like a piece of Oil Cloth. It is designed for covering RAILWAY CARS, STEAM-BOATS, DWELLINGS, BARNs and SHEDS. It can be laid down by any sensible working man.

It is cheaper than any known roofing of equal durability. It can be seen in use and samples had by applying at the Office of the Company, No. 94 Wall-st., New-York.

HENRY SMITH, Agent.

The Alexander Spring Seat.

This Seat for Farm Wagons is unsurpassed in style, comfort, simplicity, cheapness, and durability; the Farm Wagon without it is incomplete. Agents and manufacturers wanted in every town and city. All the material, except the wood, furnished on liberal terms, with full directions for making. County and State Rights for sale. Send for Circular and Terms. THOS. J. ALEXANDER, Westville, Franklin Co., O.

TERRITORIAL RIGHTS, County and State, for Whitcomb's popular Wheel-lake—simple, efficient and cheap. Address ELBERT WHITE, Stamford, Conn.

Fairchild's Patent Corn and Pumpkin Seed Planter.

This machine is a perfect success, and should not be judged by others, that have failed to give satisfaction. It plants corn and pumpkin seed, both at the same time if desired, or either separately, and will also plant beans, doing its work evenly as though by hand, and leaving the seed covered. It can be altered to plant more, or less seed in a hill, as may be desired, and will do the work of three or four men, being made of Iron and Steel. It is very durable, and will work in stony soil without receiving injury. It will not clog, or get out of order, and is free from the objections of other machines, of which any one will be satisfied on examination. No farmer can afford to do without it; as it saves three-fourths the labor of planting; and the use of it for one season will more than repay its cost. It weighs 6½ pounds, and costs but \$8, if purchased directly of the makers, PORTER, DE LONG & CO., Binghamton, N. Y., or, VAN NOSTRAND & LYON, 119 Nassau-st., New York.

GOOD BUSINESS for Farmers and Farmers' boys. To introduce several new Agricultural Implements of great merit. Send for Illustrated Circular and Terms, to PEEKSKILL PLOW WORKS, Peekskill, N. Y.

Every Child on the Continent should have it!

The Best Children's Paper in America.

"Mr. Sewell's Paper already excels every other children's paper that we know of in this country."—Chicago Eve. Jour.

\$100 CASH WILL BE GIVEN By the Publishers of MERRYMAN'S MONTHLY FOR THE BEST ORIGINAL PUZZLES!

MERRYMAN'S MONTHLY is a well established, first class Magazine, intended expressly for Home reading. It is a humorous publication, but is entirely free from the objectionable features so common in "Comic" periodicals. Among its contributors during the past year were Orville C. Kerr, Frank Bellow, (Triangle) George Arnold, Frank Beard, Artemus Ward, Chas. Dowson Stanley, Ed. Mullen, and numerous others. During the coming year an array of talent equally brilliant, will be given; we aim, however, more to gratify and amuse our readers than merely to secure celebrated writers. The Puzzle Department is a popular and instructive feature; it furnishes agreeable and interesting occupation for leisure hours, and while it amuses, also develops the mind. To increase the "fun" GREENBACKS ARE DISTRIBUTED EVERY MONTH!

Every number is illustrated with from 50 to 100 Engravings, and contains Stories, Sketches, Humorous Adventures, Quizzical Concoits, Letters from Correspondents, Poems, Games and Amusements, and Innumerable Attractions. Examine it for yourself; it speaks for itself. It is a great favorite with Ladies and Children, though all will like it.

Price 15 cents. Sold by all Newsdealers. At this season, Interesting and Attractive reading is particularly desirable, and we ask you for your own sake as well as ours to give MERRYMAN a trial. We will send it three months to any address for 35 cents, club of three \$1.

YOU CAN GET IT FREE!

If you will show this advertisement to your friends and neighbors, and get us a club of three, you will be entitled (by asking) to a copy free of the price. By getting six you will receive a copy six months. Take advantage of this offer now. Specimens sent (only) on receipt of price. Address J. C. HANEY & CO., Publishers, No. 109 Nassau Street, New York.

English Magazines, Periodicals and Newspapers.

WILLMER & ROGERS, 47 Nassau-street, New-York, (Established 1844), supply on subscription all English Magazines, Periodicals and Newspapers. New Price List for 1865, now ready.

A VALUABLE PREMIUM!

"We think she should be patronized by all."—Catesville, Pa. Union... "It contains excellent reading matter."—Al. Jay Herald... "We believe no one can invest a quarter better than by sending it to Cousin Lizzie."—N. Y. Dispatch... "It is well deserving the success it has met with."—Providence Advertiser... "The fact that 'Cousin Lizzie' is a decidedly pretty girl, we presume, will not injure her chances of success in her literary undertaking."—N. Y. Trades Advocate.

Piano Study and Practice is Made Attractive

By the System adopted in "RICHARDSON'S NEW METHOD." No long dry lessons, nor wearisome exercises, but SPRIGHTLY STUDIES throughout, and CHARMING MELODIES for practice, at every step. No one who has used this book will ever use or recommend any other. It is all that can be desired, sold by all music dealers. Price \$3.75. Sent post-paid on receipt of price. OLIVER DITSON & CO, Publishers, Boston.

THE GREAT FAMILY NEWSPAPER.

NOW IS THE TIME TO SUBSCRIBE.

THE NEW-YORK WEEKLY TRIBUNE

IS printed on a large double-medium sheet, making eight pages of six columns each. It contains all the important Editorials published in THE DAILY TRIBUNE, except those of merely local interest; also Literary and Scientific Intelligence; Reviews of the most interesting and important New Books; the Letters from our large corps of correspondents; the latest news received by Telegraph from Washington and all other parts of the country; a Summary of all important intelligence in this City and elsewhere; a Synopsis of the Proceedings of Congress and State Legislature when in session; the Foreign News received by every steamer; Exclusive Reports of the Proceedings of the Farmers' Club of the American Institute; Talks about Fruit, and other Horticultural and Agricultural information essential to country residents; Stock, Financial, Cattle, Dry Goods and General Market Reports; making it both for variety and completeness, altogether the most valuable, interesting and instructive WEEKLY NEWSPAPER published in the World.

The Full Weekly Reports of the American Institute Farmers' Club, published in THE WEEKLY TRIBUNE, from which the INSTITUTE'S OFFICIAL REPORT IS MADE UP, would each year make two large volumes of over 500 pages each, if printed in book form.

Stock-Growers will find in THE TRIBUNE a vast amount of profitable and interesting information.

Fruit-Growers will find the discussions of Fruit Growers published in THE WEEKLY TRIBUNE, of great value.

Wool-Growers is a prominent feature in the Agricultural Department of THE TRIBUNE.

THE NEW-YORK TRIBUNE.—THE TRIBUNE is an Institution. We regard it as the most valuable of our exchanges. It is the best daily in the nation. Not that it is larger, or costlier, or more pains-taking than some others, but it has more principle. It is one of the few public journals which seem to be conducted in the interest of right. Occasionally in bravely striking at wrong it proves to be mistaken, but we admire the courage with which it deals its blows when we cannot approve the direction it gives to them.

[Northern Independent.

N. Y. TRIBUNE.—There is no other paper published that is of more value to any one than THE NEW-YORK TRIBUNE. It is ably edited, and to the Farmer, Mechanic or Merchant, is of great benefit. Probably no other paper in the country wields so much influence, and however much we may disagree with some of the peculiar theories advocated, it is still worthy a place in every household.

[Republican, Red Wing, Minn.

THE NEW-YORK TRIBUNE.—This radical journal, advertises its prospectus for 1866 in our columns. THE TRIBUNE contains during the course of the year a vast amount of valuable and useful information. No paper, perhaps, in the country devotes so much space to the interests of the working men and Farmers as does THE NEW-YORK TRIBUNE.

[Daily Press, Louisville, Ky.

NEW-YORK TRIBUNE.—This paper is one which should be well patrolled. It abounds with useful information for the Merchant, Mechanic and Farmer, beside being well stored with news from all parts of the world, and known as the staunchest champion for the freedom and progress of the human race.

[New Era, Fort Smith, Arkansas.

TO ADVERTISERS.

Merchants, Manufacturers, Inventors, Real Estate Owners, Schools, and all others who Desire to reach Customers in all parts of the Country, as well as in the City, will find it to their interest to

ADVERTISE IN

THE NEW-YORK TRIBUNE.

THE Circulation of THE TRIBUNE is larger than that of any other Newspaper, and it is read by the most enterprising, thrifty, and industrious classes. Advertisements inserted in each of the Editions of THE TRIBUNE—DAILY, SEMI-WEEKLY, and WEEKLY, will be read by nearly a million of people, and no investment pays a business man so well as the money he spends in judicious advertising. The investigation by the Mayor and Comptroller of the City resulted in naming the DAILY TRIBUNE as being one of the two papers having the largest daily circulation, and its weekly edition is acknowledged to be far greater than that of any other Newspaper.

THE DAILY TRIBUNE is read by enterprising and intelligent business men and their families, and those who make known their wants through its columns will reach the very best classes of buyers.

Rates of Advertising in The New-York Daily Tribune.

Ordinary Advertisements, classified under appropriate heads, FIFTEEN CENTS per line each insertion.

(ABOUT EIGHT WORDS AVERAGE A LINE.)

THE WEEKLY TRIBUNE.

ONE DOLLAR per line each insertion.

SEMI-WEEKLY TRIBUNE.

TWENTY-FIVE CENTS per line each insertion.

Opinions of Advertisers.

Effect of Advertising in The Tribune.—“A word about advertising in THE TRIBUNE. When I lately offered in its columns my present home for sale, letters of inquiry began at once to pour in upon me, from North, South, East, and West—a perfect deluge, and I would advise all who do not wish to spend most of their time answering let-

ters, not to use THE TRIBUNE as an advertising medium, or if they do, to be a little more liberal than I was, and pay for a few more particulars. Had I done so, much trouble might have been saved. For instance, by merely saying my place was small, or specifying the number of acres, many who wrote letters would have been saved the trouble of writing, and I should have escaped a great many inquiries and saved trouble and expense. I would not, if to do again, spare words.”

B. W. STEERE, Adrian, Mich.

BROOKLYN, 26th Dec., 1865.

TO THE PUBLISHER OF THE NEW-YORK TRIBUNE,
 Dear Sir,—In November last, I wrote an article headed, “Ho, for Tennessee,” which was a description of the Cumberland Table. It was published in THE NEW-YORK DAILY TRIBUNE of Nov. 25th, and again in the SEMI-WEEKLY issue of Nov. 28th. The object of the article was to call the attention of your readers to the advantages of that location, more particularly so as concerned men of small means, and those who were suffering from ill health, two classes which my benevolence led me to wish to benefit. I did not write that article because I had, or expected to have land for sale, but because I believed many would thank me for the information thus communicated; yet, although I had no land for sale, I knew of those who had, at a moderate price, and perfect title, and was convinced that every man who bought of it might be benefited thereby. Not feeling justified in withholding my information from the public, I prepared and inserted an advertisement in three of the leading newspapers of New-York City, in which I promised to give definite information concerning the Cumberland Table of Tennessee, to any person who should apply to me for it, personally, or by letter. That advertisement appeared several times in each of the journals alluded to, of which THE N. Y. TRIBUNE was one. As a matter of justice to your own journal allow me to state the result—from the readers of each of the other two alluded to, I have had two applications—from readers of THE TRIBUNE I have had so many that I found it utterly impossible to write answers to them, even by devoting my time from early morning until midnight of each day, six days in the week, and that I might fulfill the promise made in my advertisement, was compelled to print nearly all that I desired to say to applicants, by which course, with unremitted industry on my part, I have been able to fulfill my promise. Applications come to me every day from readers of THE TRIBUNE, from Maine to Minnesota, inclusive, and the interest which has been excited does not seem to abate in the least degree.

If THE N. Y. TRIBUNE, viewed as an advertising medium, for such an object has so great advantages over others, I think it but fair and just to yourself, and the Public, that it should be made manifest—you are therefore at liberty to make any use of this communication which you think proper, as it is simply a statement of facts made voluntarily for the benefit of all concerned.

Yours, Very Respectfully,

W. W. POWELL,

76 Court-st., cor. State, Brooklyn, N. Y.

Drafts on New-York, or Post-Office Orders, payable to the order of THE TRIBUNE, being safer, are preferable to any other mode of remittance. Address

TERRIERS.—FROM A PAINTING BY BEARD, ENTITLED "GUARDING THE PRISONERS."—Engraved for the American Agriculturist.

We have had permission to copy this spirited picture, exhibiting in one group three of the most valued breeds of terriers, namely: the Scotch, the Black-and-tan and the Bull. These little dogs combine many good qualities, and their instinct is so strong for pursuing small animals,—woodehucks, rabbits, weasels, rats,—that they usually entirely ignore birds, and follow their game only upon the ground or in their burrows, whence they derive the name terrier, from *terra*, the earth. The characteristics of the terriers are great intelligence, pertinacity, pluck, watchfulness, faithfulness, vivacity and affection. They are especially useful to farmers and others, as indoor guards, stable dogs, and ratters; they may also be

trained to drive sheep and cattle, but are rather small for this purpose, except perhaps the Bull terrier, which was originally a cross between the Black-and-tan or "English terrier" and the Bull dog. These dogs, Bull terriers, are, however, too "sharp" and pugnacious. Their jaws are very strong, their bite savage, and as they are large enough to kill sheep, we can hardly recommend them. The white dog is of this breed. The Scotch terrier is a shaggy, wirey-haired, yellow or ash-colored, active, sprightly animal, usually weighing 20 to 35 pounds. It possesses in a high degree all the good qualities of the Terriers, and is, perhaps, most uniformly the best ratter. One of these dogs, trained, will often kill 100 rats in 7 minutes, and a pair of them

in a barn will usually clear out the rats in the space of a few days. The Black-and-tan terrier is usually black, with tan spots over the eyes and tan colored legs; perfectly smooth, clean limbed, round barreled, and handsome. As a guard, ratter, and companion, he is just about as good as his shaggy comrade, and is so much neater and easier kept clean, that he makes the more agreeable house dog. Two such dogs, one kept in the barn and the other in the house, are great protection, for if prowlers come about, they will be sure to communicate with one another. A big dog, out of doors, is coaxed or poisoned easily.—Mr. Jas. H. Beard, whose painting of animals are remarkable for their expression, is the artist of this picture.

AMERICAN AGRICULTURIST.

NEW-YORK, MARCH, 1866.

The first month of the spring is the last of the winter in many places, and of all the months in the year, not only is March the most variable, but none has such different characters in various localities. At the South the woods are full of blossom. The yellow jessamine hangs in festoons from the trees, or wreathes the hedge-rows and blackened stumps in the cleared grounds, with golden chaplets, while the purple flowers in the wild land reflect the color of the peach blossoms about the plantations, where gardening is the order of the day. Horses and cattle there are luxuriating in the cane brakes, the young shoots of which form so palatable feed before the grasses are sufficiently forward—this, while the frozen North is still held in icy fetters, Maine woodsmen are felling their timber upon 3 or 4 feet of snow, or just beginning the sugar season; but all around our larger towns and cities, as soon as the snow leaves the ground bare and we have a few days of sunshine, the market gardeners show great activity. The sun is reflected from the bright sashes of thousands of frames, and the patches of green spinach and parsnips, and the blue salsify brighten up under the spring-tide influences, and soon yield their crops of roots or leaves to the ever-hungry market.

Hints about Work.

Following the natural order of things, farmers generally plan to have the increase of their flocks and herds take place chiefly in the spring time, and the careful herdsman gives especial attention to animals heavy with young.

Brood Mares that will foal this spring, if worked, should be driven with caution, never overheated, nor put to their speed, nor given drink when hot, nor lack water when thirsty. Light work will not hurt them, even before the plow and harrow. If not worked, give them good room. See hints in January and February. It is equally important that

Milk Cows, soon to calve, should not be too much confined in stables. Exposure to the weather when it is not wet, in dry yards and lawns where they can take some exercise, but not where they will be subject to the annoyance of quarrelsome cattle, will be of essential benefit to them. If their stables are kept scrupulously clean and sweet, and they have good feed of hay and some roots, they will pass this critical period successfully. Cows very near their time, may be recognized by their distended udder, and such should be placed every night in well littered box stalls. Should the bag become hard, tender, and feverish before calving, it is sometimes necessary to draw the milk, and rub and wash the bag with warm suds, and perhaps with diluted tincture of arnica. Use the same treatment after calving if necessary. It is often desirable to milk young cows for some weeks or months after calving, three times a day (once in about 8 hours), so that the tendency to milk secretion shall be increased in every way; for the same reason give succulent food, mashes of oil-cake and bran, and plenty to drink. Steaming the fodder is also well.

Calves.—When calves are to be brought up by hand, which is the economical way, we are decidedly of the opinion that it is the most humane practice to remove the young animal from the dam at once; the more the cow has to do with it, the harder will be the parting. When provision has been made for having enough roots for new milk cows to take the place of grass, it is very desirable to have the calves dropped early. As veal, they are much more valuable, and if they are to be raised, they are able to take care of themselves in the pasture much earlier, and require little care when other farm labors are pressing.

Sheep and Lambs.—It is on the whole seldom desirable to have sheep yean very early. Yet early lambs of the mutton breeds meet with a quick market and high prices at green-peas time, and when such flocks have first-rate care, it is not un-

common that the male lambs pay all the expenses of the flock, leaving the wool and the ewe lambs clear profit. Mutton sheep should have their daily feed of grains and roots increased. Ewes that will soon yean, ought to be separated from the flock, and given dry comfortable quarters, and an extra allowance of roots, peas or beans.

Working Oxen and Steers that have not been much used this winter, must be gradually accustomed to hard labor. There will be light work enough that may be distributed among them, to get their necks toughened and the muscles and wind strengthened before the hard labor of plowing and harrowing comes on. Oxen scarcely less than

Horses, and indeed all animals shedding their coats, should be thoroughly and carefully curried and brushed; it greatly promotes health and good looks, and makes the feed go further. Work horses should be exercised daily by doing some work. There is wood to saw, straw to cut, clover seed to clean, or there may be other machine work to do. Such work ought to be kept along for the good of the teams, and not dashed off at one grand "spurt," crowding the teams and wearying them in their present condition, fitly demoniated "soft."

Painting may be done in dry weather to excellent advantage, because there is little or no dust flying, the sun cracks are not gapping open as in summer; they will be covered more smoothly, and there is less liability of the heat of the sun blistering the half-dry paint; surfaces to be painted must be thoroughly dry, however, or paint will be apt to peel.

Repairing.—In the lull of other work, which a cold snap, or rain may occasion, the time may well be employed in making alterations or repairs in the barns and out-buildings, or in preparing to do so when the cattle are at pasture, and the mows and bays are clear of fodder.

Manure may be hauled with much less labor to both men and beasts, on runners than on wheels. So it will often pay well, though a little of the value of the manure may be lost, to haul out that destined for the most distant fields, where it is to be plowed in as soon as the frost is out. We do not believe in top-dressing with animal manures in the spring. Plaster, ashes and bone may be applied very well, but even these are better put on in the autumn. Leave the manure in compact heaps, spread it when the frost is coming out of the ground, but not where it is wet, or springy, or liable to wash away. The present is a good time to prepare

Compost Heaps for corn, etc.—Use muck, if you have it, with any good yard manure, mingling with it any manures you can find, as the waste of factories, breweries, chandleries, etc. The lime and similar alkaline wastes should not be mixed with animal manures, or with others containing nitrogen, unless great quantities of muck or soil are used.

Seed, Grain, etc.—See articles in the present and in the January number on this subject. The careful selection of seed for other crops is equally important, and not less so the early preparation for raising a good supply of seed, which, after a little experience, may be made very profitable, for there is almost always a quick sale for reliable seeds of all kinds.

Field Work.—There is work enough in the meadows and pastures at this season when the ground is loosened by the frost; stones may be raised, picked up and hauled off, or thrown in heaps; fences righted up, and the posts reset or renewed. Furrows should be plowed to draw off surface water, and water furrows in grain fields opened anew. Wherever

The Wash of the Highways can be turned upon the meadows and pastures it should be secured, and when the current is not very strong, or may be easily spread, it is very valuable on any land. This is especially true of snow-water.

Delays often happen which cannot be guarded against, but these are few compared with those which come from our own ignorance, indolence, or misjudgment. When the land is fit to plow, then is the time; before that, there are a thousand and one things to be done, and which may just as well be done before, and a great deal better.

Winter Grain is often greatly benefited by a light dressing of some fertilizer. Where gas-house liquor (ammoniacal water) can be obtained, if it can be showered upon the grain from a liquid manure distributor, like a city watering cart, it produces excellent effects both upon grain and grass, as do likewise ashes and plaster, either or both; bone-dust also, and superphosphate of lime, if good.

Grass Seeding, if done well, will be successful; use a little more than enough seed, and have the ground well prepared. On grain it should be sown while the ground is still loose and open from the ceasing frost. In either case roll after sowing.

Weeds.—At this season, in meadows and pastures, and along the fence rows a great many of the biennial weeds may be easily seen and destroyed. A few men and boys armed with what we have heard called "spuds," which are strong sticks tipped with chisel-like, steel points, will cut up a great many mulleins, teasles, thistles, docks, etc.

Work in the Horticultural Departments.

The time for planning has well nigh passed, and the lengthening and milder days indicate that work may now soon begin in earnest. If there be any who intend to plant, and have not ordered their trees, or who intend to sow and have not yet looked after their seeds, we counsel them to do it forthwith. Do not order every novelty that is advertised or noticed in the papers, but let the main selections, whether for fruit, vegetables, or flowers, be of established sorts, with only a few of the newer things for a trial. Better plant a dozen sorts of apples or pears, known to succeed in your neighborhood, than fifty sorts known only by report. We do not at all object to the trial of new things, but encourage those who have the means to test them, and fortunately there are plenty of such, who are ready to pay any price for a novelty. But to those who wish trees for fruit, vegetables for the table, and flowers for enjoyment, and whose space and means are both limited, we advise caution and moderate investments in unknown things.

Orchard and Nursery.

As soon as the frost will allow, the nurseryman takes up his young trees and heels them in, ready to fill orders. Buyers are apt to judge of the tree by the top, and more is the pity. A small clump of roots is readily taken up, is easily packed, and to the majority of people answers as well as a large mass of unmutilated roots. A moderate shortening of the roots would not be of so much consequence, if the purchaser would only cut back the top to correspond. Most of the buds will produce leaves; every leaf increases the evaporating surface, and if this is out of proportion to the absorbing surface of the roots, the consequence is that each bud shows a sickly tuft of leaves, makes no growth, and if the tree does not die outright, it might as well, for it will be a long time in recovering. The moral of all this is,

Prune at Planting, not only to keep matters square between root and leaf, but also to shape the tree. Get all the roots that the nurserymen can be induced to give, trim all that have been severed, with a smooth cut sloping from below upwards, then shorten at least half of last year's growth. Do not look upon a young tree for what it is, but what it will be when the buds have grown to limbs. The last bud left on the limb will become the leader, and it should point outward, or to the right or left, as is needed to shape the tree, but seldom, or never, inward. If necessary to cut two or three buds below the one preferred, in order to find one that points in the right direction, do it. Cut near to, but not too close to the bud, and never leave a stub above the bud, to decay. Also cut out all useless branches, and those which will cross. Have every thing in readiness to set out trees as soon as they arrive. As soon as the ground is settled and can be worked, set out

Cuttings of currant, gooseberry, quince, etc. Crowd the earth well around the base of the cut-

tings. Where rabbits and mice are plenty, there will frequently be

Girdled Trees, which a little timely care will save. If the inner bark is not entirely destroyed, put on a generous plaster of cow dung and clay, and bind it there with old cloths; but if the girdling is completely made through to the wood, then small twigs, of the same kind, may be used to bridge over the space. The twigs are to be somewhat longer than the girdled band, whittled to a thin chamfer at each end, and inserted under the bark both above and below the wound, in a cut made as for budding. As many may be inserted as can be without too much injury to the bark. Tie securely, put on grafting wax or clay, and shorten the limbs. It is at the North too early to do

Grafting, but cions may be cut as heretofore directed, and grafting wax or clay made ready. If the eggs of the tent caterpillar have not been attended to, read what was said in January under

Insects, and see how many rascals can be tipped in the bud, or egg, which is practically the same.

The Trunks of old orchard trees may be treated to the soft soap wash, as suggested in February. Home-made soap is better than "boughten," and ley or a solution of 1 lb. of potash to 4 gallons of water may be used instead. In these warm days of March the moths which are the parents of the

Canker Worm ascend the trunks. Whatever protection is used, its value depends upon being well applied, and carefully looked after. If there is any space between the protection and the tree, the insects will find it and pass through. If tar be used, it must be kept fresh and sticky. If tongs containing oil, see that neither dust, straws, nor dead insects form a bridge to travel over. The protector of Mr. D. Lyman is simple and readily constructed; it was figured in December last.

Stocks budded last fall, may be cut to within 3 inches of the bud, provided that appears to be alive.

Fruit Garden.

To those who propose to set a portion of ground apart for a fruit garden, we say, if the land is not properly prepared, better wait until autumn before planting small fruits, and devote the season to fitting it for their reception. Drainage is usually needed. Deep working and manuring can both be accomplished by growing some highly manured hoed crop. Sweet potatoes require a treatment that will leave the land in excellent condition. Autumn planting is for many things preferable. One of the first things needing attention is the

Grape Vines, which in the autumn pruning had an extra bud left; these buds may now be cut away. Plant new vines as early as the soil is fit, and whatever style of pruning may be adopted, allow only one cane to grow from a young vine the first year. When the season is sufficiently advanced, uncover the vines that have been protected by a coating of earth, by lifting them with a fork.

Grape Cuttings of those varieties that will root readily in the open ground, are to be put out as soon as the soil has settled. Make a trench with the spade, deep enough for the cuttings, set them 4 inches apart, press the earth firmly about their lower ends, and fill up the trench so that the upper bud of the cutting will be just at the surface, or but slightly covered. Cuttings of

Currants and Gooseberries are treated the same; the bushes may still be pruned, and cuttings used.

Blackberries and Raspberries should be taken up early, as the young shoots are easily destroyed when they have made much growth. Prepare beds for

Strawberries, using old manure, and be ready to set them as soon as plants can be had.

Dwarf Pears and Apples are the largest trees allowable in the fruit garden proper, and these should be kept as compact bushes or pyramids. To get trees perfect in form, they must be taken only a year from the bud, or graft, and they can then be kept perfectly under control. See article on this subject with illustrations in January, 1865.

Kitchen Garden.

One of the things to which especial attention must be given this month, is the forwarding of plants under glass for transplanting as soon as the weather serves. Small operations may go on in window boxes, as described in February on page 62; but the hot-bed or cold frame will be needed by many. The apparatus in both cases is the same, and sufficient directions for its construction were given last month. Those who hesitate about the expense should remember that in all closely settled communities there is a demand for early plants, and the expense of fixtures may soon be defrayed by the sale of cabbage, tomato, pepper, and other plants. Mr. Henderson, on another page, shows how market gardeners manage with their sashes. Cold frames will do in most cases instead of hot-beds, but to get earliest results with many plants,

Hot-beds must be used. The position of the bed is of importance; the ground should be dry, easy of access from the house, and, above all, sheltered from cold winds by a fence or building—the exposure being South-east or South. Supposing the frame and sash are ready, and that one has a generous heap of stable manure, long and short together, already deposited near the site of the bed—with a fork, take the manure from the heap and build it up into another, close along side of where the first one stood. Shake out the lumps and mix long and short together as equally as may be, and if it appears dry, wet it as the heap is built up. Build up the pile in a regular cone, and if the weather is cold, lay some boards, corn-stalks, or other material against it, to keep in the heat. In three or four days thrust a stick into the center of the heap, and if it feels quite warm when withdrawn, repeat the operation of rebuilding the pile. In this second turning over, endeavor to bring the manure that was outside, to the inside of the heap. If the manure heats up well, in three or four days it is ready to make the bed, but if not, then turn it again and continue to do so until the whole is brought into a state of active fermentation. The bed is built wholly above ground, or partly in an excavation. When the ground is well drained, make an excavation a foot in depth and one foot larger each way than the frame. Drive stakes, 3 feet high, at the corners of the excavation, and then put in the manure, a forkful at a time, distribute it evenly, and in layers, beating each layer down with the back of the fork. As the manure is piled above the surface, keep the edges even, and be careful to have the mass equally compact throughout. The bed of manure is made from two to three feet in thickness, and the heat will be more gradual and lasting, if one-fourth to one-half its bulk of forest leaves be mixed with the manure. For a bed above ground, drive the stakes and build up the manure in the same manner. Put on the frame, and place in it about six inches of good light, rather sandy soil, put on the sash and rake off the edges of the bed of the manure to remove loose straw. The next day the heat will probably be so great that the finger, when thrust into the earth, cannot be held there for a long time. Raise the sashes during the day, but close at night, and when the heat is steady at about 75°, sow the seeds in drills about 3 inches apart. Cabbages, cauliflowers, etc., may go under the same sash, and egg plants, tomatoes, peppers and other things, requiring more heat, may be put together. Keep the bed from becoming overheated, by lifting the upper end of the frame, and securing it by a block. When the plants are up, they must be aired in the day time and be kept from burning by the sun, or from getting too dry. Where only a gentle heat is needed, a foot or so of fermenting manure may be placed in an excavation, the frame placed over it, and earth put upon the manure to receive the seeds. Tomatoes, egg plant, winter cherry, and peppers need more heat than do cabbage, cauliflower, lettuce, celery, etc.

Inverted Sods are very convenient for all plants difficult to remove. Cut a tough sod in pieces about 3 inches square, place these in the hot-bed or cold frame, grass side down, and sow cucumbers, melons, early squashes, and Lima beans on the

earth side. When the plants are removed, they are set out with the sod, and the roots are not disturbed.

Early Crops of hardy things may be sown in a sheltered border, such as beets, carrots, radishes, cress, and turnips. By all means have a

Seed Drill, if the garden is large. They are made to sow seeds with satisfactory regularity and save much back-ache. For laying out drills a

Marker, made like a coarse rake with wooden teeth, is useful. There may be several with teeth 12, 15 and 18 inches apart, or one with adjustable teeth.

Winter Covering over asparagus, spinach, etc., may be removed whenever the weather will allow. Rake the coarse manure from the asparagus and rhubarb beds, and fork in the finer portions.

Soil should never be worked when it is wet. Wait until it will crumble when forked. If any part of a garden is slow in coming to this condition,

Drains are needed. All gardens should be drained, but wet ones are eminently in need of it.

Rhubarb may be forced, as directed last month. Make new plantings early, before growth begins.

Leeks may be sown in rich soil in rows a foot apart.

Onions, of the potato variety, may be put out. The small sets are put about 4 inches apart in 15-inch rows, and if cold, throw over a little litter.

Parsley and Celery for early, sow in a cold frame.

Parsnips and Salsify may be dug for use.

Flower Garden and Lawn.

Many of the things indicated last month will lap over into the present one. If the grass of the lawn did not have a top-dressing in autumn, put on one of rich compost, early in the season, and reseed thin places. Happy is he who last fall planted generously of bulbs, for he now is rewarded by a sight of the green spires of the Crocus, and the Snow-drop and Hyacinth are full of promise, if not present enjoyment. Continue the

Pruning of Shrubs, as suggested last month, and as soon as the soil can be worked, take up and divide such clumps of

Herbaceous Perennials as have become too large. The Irises, herbaceous Spiræas, Dicentra, Columbines, Phloxes, etc., are apt to increase so that they take up too much room, and do not flower as well as smaller plants. Set the divided roots as needed, and be generous with the surplus and give them to less fortunate neighbors.

Hardy Annuals, such as Candy-tuft, Larkspur, and all that are known to come readily from self-sown seeds, may be sown as early as the frost will allow. For plants of the choicer

Tender Annuals, provision must be made by sowing in boxes in the dwelling, or green-house, or in a hot-bed, if wanted early. Cannas, Cypress Vine, and sub-tropical things generally, need considerable heat to forward them rapidly.

Flowering Shrubs of all the hardy kinds, roses included, do best if planted early, but roses that have been started in pots, must not be put out yet. The number of flowering shrubs is so large that we must refer to the catalogues for names. For early flowering, Forsythia, Wiegela, Japan Quince, and the finer Lilacs, are all readily procurable.

Edging and Hedges may be set. Box is generally used for edgings; if old and straggly, reset it. Moss-Pink, Thrift, and other perennials, have been more or less used as substitutes. A great many shrubs not generally used for the purpose, may be made, with proper care, to form a hedge. Privet, Buckthorn, and Barberry, are among the most common deciduous shrubs for garden hedges. They may be set early. Hemlock and Arbor vitæ are in all respects preferable, but they are put out later.

Trees for the lawn, yard, and roadside, should receive the same care in the selection of specimens, careful planting and soil, that is given to fruit trees. A tree is very difficult to kill, but many who set them out for ornament, very nearly succeed in doing it. If wild trees are used, select them from the edges of the woods and exposed situations, and choose those of moderate size.

Hardy Climbers have claims which ought not to be overlooked. The Virginia Creeper, Trumpet Creeper, Wistaria, the Honeysuckles, Climbing roses and many others will cover an unsightly wall with a mantle of beauty.

Green and Hot-Houses.

The amateur florist will be glad to find, after a winter of more than usual severity, that the sun now does a good share of the heating. Ventilate all that the weather will allow at mid-day, but shut the house early in the afternoon, and be prepared to give fire heat whenever it is needed. Much of the utility of a small house is in preparing plants for summer blooming out of doors. Aside from keeping tender things through the winter, it serves to prepare an abundance of

Bedding Plants. The propagation of Verbenas, Antirrhinums, Lantanas, Heliotropes, etc., may be pushed rapidly. A single plant of a new sort, procured now, will make 6 to 10 plants by planting time.

Bulbs, such as Tuberoses, Japan and other Lillies may be forwarded in pots, to be turned out for early bloom, and the

Tender Annuals may be sown in boxes or pans. Oranges, Lemons and other

Shrubs, if they have grown straggling, are to be brought into shape by heading back.

Azaleas and Camellias, the one just blooming, the other pushing its new growth, need more water.

Dahlias may be set in where they will start, and rare sorts be propagated from cuttings.

Repot those plants about to make a new growth, which need it, and if the pot is already large enough, shake out the old earth and repot with fresh.

Cold Grapery.

Open the doors and ventilators, in order to keep the house cool, as it is not generally desirable to uncover and start the vines until next month. Woodward's Graperies (see Book List) gives plans for both cheap and expensive structures, and a description of a simple grape house was given in our issue for March, last year.

Apiary in March.

Prepared by M. Quinby—By request.

If any bees are to be transferred to the new beehives, or any change of stands whatever is yet to be made this spring, it should be attended to without delay, before they commence work. Loss of bees will be greater as the changes occur near the working season. When moved a mile or more, and the stands are put down not nearer than six feet apart, the loss will be but little at any time. Very good stands are made by laying scantling on the ground, on which to nail boards wide and long enough for the bottom of the hive. A separate roof for each one is best. The first warm day of spring, when the bees fly freely, is a critical time, especially if there has been any change of stands. The bees of a queenless hive will often desert, and join some hive more fortunate. Others that have a queen will sometimes issue in such haste as to fail to mark their own, and in their confusion enter strange hives on their return. Occasionally the greater portion of a half dozen families will unite with one strong one, crowding it entirely too much for its prosperity, while the others are too much weakened to defend themselves against robbers or the moth. A strong colony in early spring is most valuable—but excess here, as in other things, produces evil—extremes should be avoided. Examine all the hives closely the next morning. The weakest one—if it has a queen—should be changed to the stand of some strong one, the strong to the weak one, etc. Endeavor to get all equalized in this way within the first few days after they begin to fly. Another method may be adopted when one or two are left with only a few bees and their queens. Drive from the over populous colony enough for a good swarm (not quite as many as would constitute a good swarm in July) into an empty box, let them remain

until you are satisfied that they have no queen, which is known by their uneasy movements. Then they may be introduced to the weak hive, setting it close to the stand of the strong one; or it may be kept in a dark room a few days, after which it may be set anywhere else. Should there be too many bees left in the strong hive, for profit, take out bees for another stock or two in the same way. In case a movable comb hive becomes over populous, it may be simply divided, making two, by putting half of the combs with bees attached into an empty hive, and setting them each side of the old stand, leaving a space of two feet between them. Give to that half which is destitute of a queen, one of the small colonies, and fill out both hives with the combs from the weak one. In moving bees from their winter quarters in the cellar or dark room, let each hive occupy its old stand, as far as practicable; bring out six or eight at a time, and put them on stands as far apart as possible; two hours afterwards put out as many more on stands between the others, and separated like them.

The value of flour as a substitute for pollen, depends very much on the early flowers in the neighborhood. If there is an abundance of alder, and swamp willow, and not a great many bees, there will be a full supply of pollen the first few warm days. But if many bees and few flowers, they need some substitute. Rye, ground close and unbolted, is probably best. Make a floor a few feet square, put a curb round it three inches high, to keep it from wasting, and spread a few quarts at a time on this—locate it as much as possible out of the winds. Simple flour should be mixed with sawdust, cut straw, or some thing to keep it from adhering too much to the bees. Begin with the first warm days, and sprinkle small quantities on and near the floor. After the bees have tasted it, putting it on the floor is sufficient. They will carry off two or three lbs. per hive, before real pollen is obtained. Much more than this on an average, might be detrimental. Should any pollen be obtained before the flour is offered, it is doubtful if they can be made to notice it. After they begin to fly, the needy ones may be fed by putting honey in the chamber of the hive. Robbing will commence if at all on the first real warm days. Look among them at sundown, any at work then, will indicate it. Put the hive that is attacked in the cellar, till a few warm days are past, and then return to the stand. The surest guarantee against robbing is, to have no weak colonies.

As good as our Word.—Thirty-two pages this month, and (as usual now-a-days) eight extra ones—or 30 in all. Some kind contemporaries have stated that the *Agriculturist* is a 40 page quarto. Not so; we do not wish to sail under false colors or mistaken compliments. We promise 32 pages. If our advertisers need more room, we accommodate them by adding more pages, and for each page so added give also an extra page of reading. Is not that fair all around?

A Fine Engraving.—In republishing Downing's Landscape Gardening, the original steel plate of the author's portrait could not be found. We have had a new portrait engraved from the only existing daguerreotype. The work was entrusted to Mr. H. W. Smith, who has produced a most satisfactory likeness and an excellent picture. For the accommodation of the friends of Mr. Downing we have impressions on India paper, suitable for framing, which will be sold at \$1 each.

Haymaking and Harvesting Implements.—Do not procrastinate. There are several excellent mowers and reapers. If farmers wait to learn which will get the prize this year at the great New York trial, or at any other, they will be sure to fail in getting the one they want, for the orders will be so far ahead of the ability of the manufacturers to supply, that they will be obliged to take the best machine they can get, which will very likely be one which they would not think of choosing. We know farmers who have mowed by hand, or hired the grass cut by machines these ten years just because they could not tell which machine to buy. There is a good chance yet for several farmers to get the Buckeyes which we offer as premiums. There will be no delay in this case, for the machines are now made and subject to our order. We have this day ordered one No. 2, which will be shipped and received before this paper reaches the subscribers.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, show at a glance the transactions for a month, ending Feb. 15, 1866, and the exports of Breadstuffs from this port thus far, since January 1:

Table with 3 main sections: 1. TRANSACTIONS AT THE NEW-YORK MARKETS. 2. Comparison with same period at this time last year. 3. Exports from New-York, January 1 to Feb. 15.

CURRENT WHOLESALE PRICES.

Table of current wholesale prices for various commodities like flour, wheat, corn, etc., with columns for Jan. 15 and Feb. 15.

Business in produce and merchandise has been checked by the declining tendency of gold. The difference in the closing prices of gold this month, and last, is nearly two percent, in favor of buyers. Flour and grain has been more freely offered, and the tendency of the market has been generally downward. This is particularly true of grain. Medium and finer grades of flour close firmer on an improved home demand.

New York Live Stock Markets.—BEEF CATTLE.—The supply for the past four weeks (ending Feb. 13th) has been good and full for the season, averaging 5399 per week. Prices declined somewhat at the last market and stood: Extras, 10 1/2c @ 15c per lb., estimated dressed weight; medium to good, 13c @ 14c; poor qualities, 10c @ 12c. MILK COWS were in light demand. Veals.—Weekly average on the increase. Good veal brings 12c @ 14c per lb., live weight. Sheep.—Average supply, 18,757. Prices declined at last market to 5c @ 6c per lb. Live Hogs.—Supply averaged 10,567. Prices, according to quality, 10 1/2c @ 11 1/2c per lb., live weight.

BOOKS FOR FARMERS and OTHERS.

[Any of the following books can be obtained at the Office of the Agriculturist at the prices named, or they will be forwarded by mail, post-paid, on receipt of the price.]

Extensive list of books for sale, including titles like 'Allen's Rural Architecture', 'The American Farmer', 'The American Gardener', etc., with prices listed.

Book Orders Delayed.—There are a few books on our list, new editions of which are now in press, having been delayed by the difficulty of getting good paper. Orders for them will be filled very soon.

Todd's Young Farmer's Manual—No. 2.—In answer to inquiries about this work, which has been announced by its author for sometime past, we reply that Messrs. Orange Judd & Co., recently purchased the entire work, plates and copy-right. But on a full examination it was deemed best to give it a thorough editorial revision, pruning it of its crudities, and arranging its materials in a far more systematic order than they were left by the author. As it contains many valuable hints, the revision will make an excellent work of it. This course involves the re-setting and stereotyping of the book, and it will not be ready for some time yet.

SPRING WORK Is Coming on,

And many persons who just begin to think about the work in their Garden and Orchards, and on their Farms, will feel the need of hints and suggestions just such as they will find in the Agriculturist. This is therefore a good time to fill out the list of subscribers for Premiums already under way, and to gather names for new lists. The premiums will be open for three months yet, and all subscribers obtained for this volume (25th) will count on any list. More than One Thousand Persons have obtained good premium articles this year from the list below, and a thousand or more may yet obtain them. We have only room this month for the Table. For regulations and descriptions, see the January and February numbers, and especially the large Descriptive Sheet which is forwarded free to all desiring it. Send for it.

Table of Premiums and Terms, For Volume 25. Open to all—No Competition.

Table listing various premium articles such as 'Good Books', 'Garden Seeds', 'Nursery Stock', etc., with columns for 'Names at \$100 each' and 'Names at \$100 each'.

No charge is made for packing or boxing any of the articles in this Premium List. The Premiums, 1, 2, 3, 7, 5, and 13 to 26, are DELIVERED to any part of the United States and Territories, free of all charges. The other articles cost the recipient only the freight after leaving the manufactory of each. Every article offered is new and of the very best manufacture.

* Premium 1.—Good Books.—Any person sending 25 or more subscribers, may select Books from the List on this page, to the amount of 10 cents for each subscriber sent at \$1; or to the amount of 50 cents for each name sent at the (ten) club price of \$1.25 each; or to the amount of 60 cents for each name at \$1.50. This offer extends only to clubs of 25 or more names. The Books will be sent by mail or express, prepaid by us.—This is a good opportunity for the farmers of a neighborhood to unite their efforts and get up an Agricultural Library for general use.

A Talk about Sundry Humbugs.

Our suggestion last month has been so largely responded to, that already (Feb. 12th) we have a large basketful of letters, detailing the operations of swindling concerns. Most of these are from new subscribers, those who have not read our frequent warnings. There is abundant evidence that had the *Agriculturist* been read in every family in the country, for a single year, the aggregate saving in money paid to swindlers, would have far exceeded our entire subscription receipts for five years past. From the attention we have recently given to the subject, we think the daily receipts of these swindlers range from five to ten thousand dollars a day! We have the names of over thirty different concerns, though several of them are run by the same individuals, under different names. Their circulars are scattered throughout the whole country, from Nova Scotia to California. By various means, they have gathered the Post-Office addresses of perhaps two millions of persons; and to these they are continually forwarding their ingenious schemes to trap the unwary. It costs but four cents to prepare these documents and send them very confidentially as a post-paid letter; and if the bait takes with one in a hundred, so as to bring them five or ten dollars, they make a large profit; for very few of them give even the smallest return for the money received. (And here we desire to say, in answer to sundry hints and inquiries from some subscribers, who wonder where their names were obtained, that no one has ever had access to our mail books or list of subscribers, on any pretense, or for any purpose whatever. We have been so cautious on this point, that when referring to any correspondent, we give only his county, omitting his town and Post-Office, to save him the annoyance of receiving a host of humbug circulars; nor do we ever allow any kind of circulars to be enclosed in the *Agriculturist*. They get names from Post masters under false pretenses, and by special offers to persons who privately send them the names of a hundred or more persons in a town.)

One of the worst features of the business is, that the swindlers are adepts at evading the laws. We have consulted with the Mayor and our City District Attorney. We found Mayor Hoffman ready and anxious to do what he could, yet greatly trammelled by the want of specific laws to reach the cases of certain of these operators. For example, our State laws entirely prohibit dealing in lottery tickets, yet the dealers contest the application of these laws, claiming that their U. S. license is above State laws. This matter is in litigation and not yet decided. While waiting this decision, and the results of other efforts, we must do what we can to warn people; and we beg our readers to talk over the matter, and get these warnings and exposures as extensively known as possible. For this purpose alone it would be desirable to have the *Agriculturist* still more widely circulated.—Show this page to the Post-master, and ask him to warn people against sending letters to any of these names, or to others of like character or pretensions. Every Post-master would find it to his advantage to subscribe for the "U. S. Mail," a monthly journal, edited by J. Gayler, New York, and furnished at \$1 a year. Besides its great amount of information about all Post-Office matters, it is severe on the class of swindlers operating through the mails. The Feb. No. contains an excellent suggestion to Post-masters about fraudulent concerns.

An important Bill is now before Congress in reference to excluding these humbug circulars from the mails. It ought to pass at once.—We here group together a number of humbug operators:

"Hayward & Co."—The villain operating under this name, and sundry aliases, has done an extensive and successful business. We have letters concerning his operations from all over the country. Some time since we found him in a small room at 229 Broadway, in an upper story, with less stock than could be put into a carpetbag, aside from the immense numbers of circulars he was sending out with the aid of clerks. Yet he has distributed a circular with his name emblazoned upon a picture of the whole front of the building, which is occupied by more than fifty business offices. Very few of the occupants of these offices even know that there is such a person as Hayward in the building. He pretends to have bought great stocks of watches and jewelry of "a large number of Importers," etc., who have failed by the decline in gold. There have been no such failures.—For a time he offered tickets at 25 cents a piece, or less. Latterly he has sent the tickets at once, pretending to have received the money for them. These tickets call for various articles, watches, diamond rings, chains, gold pencils, etc., etc., valued from \$6 to \$250 each, on paying \$5.24. Sometimes, as a bait, he sends out gold pens, etc., where there are many to be caught. This takes, and back come a lot of \$5.24 letters, which he pockets. Usually

no answer can be obtained from him. He generally denies the receipt of these letters, but when sharply cornered, or caught by a registered letter, he pretends the money had been abstracted before it reached him, or that he has forwarded the article. He puts on a patronizing air, and tries to avert suspicion by pretending to caution people against other swindlers. His dodges, as described to us in a multitude of letters, are "too numerous to mention"—we cannot now answer further inquiries.

D. W. Hammond & Co., 162 Montague-st., Brooklyn, is of the same ilk as Hayward & Co., probably the same party. The circulars are every way alike, except the different headings, and address, of Hayward & Co. and Hammond & Co.—the type-setting, and orthography, and even broken letters showing them to be printed from the same type or stereotype.

E. G. Horton, Danville, N. J., "Manager of the California Manufacturing Jewelry Association," is another like Hayward & Co., if not the same.

I. E. Loomis & Co., Warren, R. I., of the same class. "Dr. Freeman" and his "Journal of Science," have been too often denounced as humbugs, to need more than the mere recording of his name in this list.

Chidester & Co. belong to Dr. Freeman's class of wonder-doing pretenders.

Jason H. Tuttle, Flatbrookville P. O., N. J., imitates Hayward & Co. (if not the same party); but offers large things—Rosewood Pianos, etc.—for \$2. We hear of multitudes taken in by him. An unmitigated swindler.

Chester M. Wakeman, of Jersey City or N. Y., started a "Mutual Protection Union," a pure swindle, directing his letters sent to Danville, Me.; but thinking he had got the Post-master there to assist him, he "caught a Tartar." He uses fictitious names, etc., on his grand scheme. The Danville P. M. will attend to his case, if he will call there. There are three other schemes of the same kind, differing only in some of the names used.

Everett E. Morgan is one of those chaps we have often described, who offers to lie a ticket through a bogus concern. Of course he lies everybody out of money, who trusts him.

W. H. Morgan, same class as E. E. Morgan.

George Y. Hoffman, same class as C. M. Wakeman.

James P. De Wolfe, same class as E. E. Morgan.

Mr. H. H. Colfax, same class as E. E. Morgan.

The above are a variety of the names used by a comparatively few parties. They will, as heretofore, continue to change name and P. O. address from time to time. If our readers will cast aside every tempting bait offered in printed circulars and advertisements proposing to give anything by chance drawings, or to furnish any thing at less than its legitimate value, there will be half a million at least, whom these swindlers cannot reach.

BEWARE of "No Ink Pen," which don't exist; of Photographic apparatus offered cheap by unknown parties; of sending money for Maps to be published at some indefinite future time; of (Rev.) Jos. T. Inman, etc., etc.

LOTTERY TICKETS.—We can not, in these days of intelligence, greatly sympathize with those who lose money in any kind of lottery schemes. Yet we can not but pity those who suffer from any deficiency of judgment or discretion. If there were no such persons, we should cease to "have the poor always with us."—We have received hundreds of lottery schemes, forwarded by subscribers. The following are among the most prominent operators at present, who, under the plea of a U. S. license, and other subterfuges, manage to evade the laws. That they are successful, our observations at the Post Office delivery furnish abundant evidence.

No. 1. Fletcher Bros., Box 5549, P. O., N. Y. City.

No. 2. T. Seymour & Co., Box 4259, P. O., N. Y. City.

No. 3. Hammett & Co., Box 2100, P. O., N. Y. City.

No. 4. A. Buck & Co., Box 232, Washington, D. C.

No. 5. P. Hoffman & Co., Box 224, Washington, D. C.

No. 6. W. J. Elliott & Co., Box 4609, P. O., N. Y. City.

No. 7. Egerton Bros., Box 4196, P. O., N. Y. City.

No. 8. Thos. Boulton & Co., Box 5713, P. O., N. Y. City.

These eight parties all use precisely the same printed lottery schemes, except that the headings and signatures are changed to correspond with the several names. Each incloses a printed envelope directed to himself. Each sends a "private and confidential" lithographed letter, resembling a written letter. All these letters greatly resemble each other. No. 4 and No. 5 are exactly the same, except heading and signature. No. 1, 2, 3, 6, 7, 8, are essentially alike, except the names, and a little variation in the prizes—\$2000 in one, and \$1200 in the other two. No. 6 varies the form, talks about doing away prejudices against Lotteries by getting for some one \$5000 (not a mere \$1200 or \$2000, but \$5000!) They all appear to emanate from the same mind, and all operate alike. An explanation of one answers for the whole. Thus:

Hammett & Co. write to the person addressed, that they are agents (with U. S. license) for a Covington legal lottery, and send grand schemes for prizes; that they

want to do a large business, and that accidentally meeting the name of the addressed party, they were led to think him just the one to help them. They therefore offer to send him, for the bagatelle of \$10, a "certificate of a package of tickets," (not the tickets themselves) "lucky," for \$1200 to \$3000; that from long experience they know how to select lucky numbers; that they do this because the party receiving them is expected to show his prize to many, and make known the character of the said Hammett & Co. as sellers of lucky tickets, and they thus will get a large business, while the prize money will come out of the pockets of the lottery managers. There is a lot more of stuff, such as the offer of other tickets free, inquiries how to forward the money, etc., etc.

It seems strange to many that there should be persons unsophisticated enough to bite at such a bait, yet there are, and it is the duty of those who are wiser, to do what they can to enlighten the ignorant and credulous; to inform them that these swindlers make the same "private and confidential" offer to every person in the same town, whose name they can get; that any lottery is a fraud, even if the chances are made equal. For from the money distributed large sums are deducted for expenses, profits, etc.; that if a lottery be fairly conducted, it is a fraud for any one to claim the ability to select lucky numbers; while, if not fairly conducted, every investor is likely to be defrauded; that these "lucky agents" would keep and draw sure lucky tickets themselves. For example, would T. Seymour & Co., instead of keeping a ticket sure to draw \$2000, be likely to send it to you as an advertisement of themselves, when they would have to sell in your neighborhood *Thirteen Hundred* \$10 tickets, in order to realize \$2000 as the commission of 15 per cent. on the tickets, to say nothing of postage, printing, etc.? Finally did anybody ever hear of a prize drawn by these "private and confidential" agents, who send \$10 each?

We have thus devoted unusual space to this subject, because it seems to be needed. Until we can get the strong arm of the law to crush these pests of society, who fatten upon the ignorance and simplicity of the people, we shall keep on uttering warning after warning. We have on hand and are constantly receiving accounts of other swindling operations, which will receive attention. Some of them are under investigation.

A Look into a Swindling Shop.—

In this city, and elsewhere, especially in large cities and towns where a new flock of victims can be constantly secured, there have lately sprung up a great number of establishments, at which are offered a lot of articles, all at \$1 each, with a chance for a "splendid prize" thrown in. In order to study the *modus operandi*, we took a dollar (leaving the pocketbook behind for safety), and dropped into one of these "splendid prize" shops, up Chatham-st. There was a fine array of silvered ware, tea sets, etc., all numbered and marked as prizes, with cases full of articles for sale at \$1 each, and apparently fully worth that sum. We invested \$1 in a "Ridgewood Case," the usual price for a well-made article being \$2 to \$5.—Ours probably yielded a profit at \$1. But the "splendid prize" was what we were after. A large box of envelopes was handed out, from which we drew one containing ticket No. 232. That gave us a "gift locket," costing less than a one cent, and worth 0. (We noticed that out of 300 numbered prize articles, 200 were these "lockets," about 80 were other shawny but valueless things, and about 20 were things worth apparently from \$1 to \$50.) We were told that by paying half-price (50 cents), we could draw again, and for effect, we showed a partial willingness to do so. While this was going on, two men came in, and each paid fifty cents for a chance. They both drew "lockets," and tried again at fifty cents. The second time one drew a pretty gilt bell, for which the operator immediately paid him \$1, and the other got a fine silvered butter plate with ornamental cover, for which the operator paid him \$5. They went on drawing rapidly, now lockets, then costly articles, and selling them back. They were apparently having grand luck, and making lots of money. They were of course "stool pigeons," to dazzle our eyes, and by means of privately marked envelopes, and slight of hand in changing numbers, got any articles desired. We received numerous invitations "to try our luck," but after learning enough, we left to write out this item. The above shows one of the ways these concerns take in the unwary.

Oil Swindles.—An old comrade in the Agricultural laboratory at Yale College, who has for many years resided in south-eastern Ohio, (except while absent in command of an Ohio regiment during the war,) sends us a familiar letter, from which, though a private one, we take the liberty to publish the following extract: "...I think you were wise in excluding from the *Agriculturist* all advertisements of oil companies. From my location, and other reasons, I have practically been obliged to study oil in its geological relations more than

any other geologist in the country, and I know that a very large part of the oil companies are a swindle—their lands being worthless. Buying stock in them would be like buying a lottery ticket at ten prices, and finding at last that the ticket itself was bogus. There is a little oil to be found almost everywhere in the West—just enough to delectate—but good locations are only in limited areas."

Containing a great variety of Items, including many good Hints and Suggestions which we throw into small type and condensed form, for want of space elsewhere.

Several Pages of Basket Items, are crowded out of this number, by the press of matter, for which we hope to find room soon.

TAKE NOTICE!—All Subscriptions begin with the Volume, unless otherwise desired and specified when subscribing. All subscriptions received up to June 15th are entered down for the entire volume, and the numbers from January 1st are forwarded. We keep on hand, or print as needed, from our stereotype plates, the entire numbers of the volume, to supply to subscribers, and to others desiring them. Subscriptions received after June 15th, begin at the middle of the volume, unless otherwise desired or specified.

Letters and Money—Who For?—Here are two letters addressed to the Publishers of the *Agriculturist*, but they are without date, place, signature, or other mark to show whom they came from. One has \$3.60 for three subscribers, and is signed Postmaster (names J. A. Alt, V. Myers, H. Dupont)—the other is an order on some one for several hundred trees, grape vines, etc.—probably for R. G. Hanford. (Where?)

The Large Display of Good Advertisements, are worthy of general attention, and will be found a source of much information. Business men seem to understand where they will find an immense number of wide-awake enterprising readers. Please reciprocate their compliment by letting them know when and where their advertisements were seen and read.

Of the Agriculturist Strawberry Plants we have none to supply.—So many subscribers applied for a plant or two last autumn, that we nearly stripped our entire plot, and the urgent requests for them early in the winter, to be sent in spring, can not be all met, though we shall clear the ground so thoroughly as to leave but few plants for home fruiting. This is the case with many dealers, though a few small lots may perhaps be advertised—possibly in this paper.

Seed and other Orders.—Wm. Simmons, Oregon. Publishing the *Agriculturist* and Agricultural books occupies all our time, and though we should be glad to accommodate our friends by taking their commissions, it is quite impossible for us to do so. Our advertising pages contain the names of numerous dealers in seeds to whom orders may be sent direct. If we procured seeds for you, we should go to any of the dealers whose advertisements are admitted by us.

Broom Corn Seed for Sheep.—A. C. Hayes, Washington Co., Iowa, inquires if "Sorghum and Broom corn seed will make good feed for sheep, for a change?" Mixed with Indian corn or oats and ground, it makes excellent feed.

Grape Cuttings in the open Ground.—J. Macracken, Esq., Secretary of the Hocking Valley (Ohio) Horticultural Society, gives us the following account of the method of one of the members, Mr. Fetters, of treating cuttings of the Delaware and other grapes: "Mr. Fetters reported his success in propagating the Delaware grape from cuttings as certainly very encouraging, being due, no doubt, to the favorable season, but largely, he thinks, to the *modus operandi*. He makes his cuttings, say three eyes long, then removes with a sharp knife all the bark from the lower end of the cutting close up to the first eye, and as fast as thus prepared he puts the peeled end to soak in a slush of fresh cow manure. They are laid in the ground at the usual angle, as in the ordinary practice. The weaker cuttings are cut into single eyes and laid in a common hot bed. Nine of out ten grew, and transplanting them in about five weeks, he found they had roots two and three inches long. Two thousand five hundred and sixty

Catawba cuttings were prepared in the same manner as the stronger Delaware, and planted in the vineyard 7 by 9 feet apart, two to each stake, and of the lot so prepared and planted, over 2500 grew, showing a growth of new wood on July 5th, 4 to 10 inches long."

The Rinderpest.—At the annual meeting of the N. Y. State Agric. Society, this subject was discussed and referred to a committee, Messrs. O. Judd, Jas. O. Sheldon, Saml Thorne, Gen. C. S. Wainwright and Hon. A. B. Conger. They made a somewhat lengthy report and recommended the Society to authorize the Executive Committee to take the subject into careful consideration, and use any needful measures to obtain information etc., at home and abroad. The report was unanimously adopted; and at a subsequent meeting, the Executive Committee appointed the following gentlemen to gather information and prepare for publication a report upon the character of the disease, remedies, preventives, etc., viz.: Hon. Jno. Stanton Gould, Hudson; Hon. A. B. Conger, Haverstraw; Dr. J. T. Williams, Dunkirk; Prof. Luther H. Tucker (of Country Gentleman, Albany), and Col. Mason C. Weld (of the *American Agriculturist*, New York). It is to be hoped that this committee will take early and vigorous action.

Mr. Bolmer's Peach Orchard.—At a recent meeting of the Cincinnati Horticultural Society, Doctor Warner read a long communication from Mr. Lewis Bolmer, of the Great Miami Valley, giving an account of his success with a new method of peach culture. The trunks are kept surrounded by a mound of earth and the limbs have winter protection also. We have not space to give an abstract of this interesting document now, but will endeavour to do so hereafter.

Fruit Query.—Henry Hunt asks, if seedlings of fine cherries grafted on Morello stocks will produce fruit like that of the cherry from which the seed came. Seedling fruits are not apt to be like their parents, and grafting these seedlings into any stock will not change the result. The fruit may be better or worse than the parent: there is little chance of its being just like it.

The American Pomological Society.—The President of this association, the Hon. Marshall P. Wilder, writes that Tuesday, the 4th of September next, is appointed for the commencement of the next session, at St. Louis, Mo. We learn that it is the intention of western pomologists to make this the most attractive, and it will undoubtedly be the largest meeting held in many years.

Clapp's Favorite Pear.—J. Coombs, Westchester Co., N. Y., and others. There is such a pear as the Clapp's Favorite. It has been chiefly grown near Boston, and held at a rather high price. We have not seen the fruit, but Mr. Hovey informs us that it has not fulfilled the expectations which were held regarding it.

Evergreens from the Forest.—Every year large quantities of Arbor Vitae and other evergreens are exposed for sale in the streets of New York. Large trees of this kind are not as likely to live as those grown in the nursery, but small ones are more sure to grow. These forest seedlings are frequently bought by nurserymen at a low price, and after a few years in the nursery, they make salable trees. We had occasion to buy a large lot of these young trees for a relative at the West some years ago, and though a considerable number died, enough were saved to make the investment a profitable one. These trees are generally sold by vendors on the streets, and if there are any regularly engaged in the business, they should let it be known by advertising. The only place we know of to get these forest trees of first hands, is at Bangor, Me. Mr. Henry Little of that place has for some years been engaged in furnishing trees, and is prepared to fill orders.

Doolittle's Black Cap Raspberry.—R. W. Woodville, Rice Co., Minn., asks what is the difference between the Doolittle and the common Black Cap. It is only a more prolific variety, bearing larger and better fruit, just as the New Rochelle, Kittatany, etc., are better forms of the common blackberry.

Sex of the Tribune Strawberries.—"Subscriber," Westchester Co., Pa. The Monitor, Col. Ellsworth and Brooklyn Scarlet have perfect flowers, and will need no other kind set with them to fertilize them.

Substitute for Glass.—S. P. Miller, Logan Co., Ohio, asks about the use of oiled muslin and paper for hot-bed sash. The thing is not new, and has been more or less used these many years. A frame covered in this way will be better than no hot-bed, but it will

not be cheaper in the end; the cloth is easily torn, and sags with changes of temperature and the weight of rain or snow. Besides, considerable light is obstructed.

Fall Planting.—"C. J. B.," Bethany, Mo., set out a vineyard last fall, and now has fears that he did wrong, and wishes to know if he had better plant over again without waiting to see the result. We should certainly not plant over again, as the vines are quite likely to do well, if they were properly set. Some of our best vineyardists prefer autumn to spring planting.

Models of Fruit.—J. H. Luhnig & Co., 556 Broadway, N. Y., have left at our office samples of porcelain models of fruit, made under the direction of the Thuringian Horticultural Society. These are intended for pomologists as standards of comparison. The catalogue includes European varieties mainly, but we understand that it is the intention of the society to publish models of American fruits as fast as they can be procured.

The Snow Apple.—A New York subscriber traveling in Michigan, sends us a drawing and description—both very good—of the Snow Apple, which he was told was native there. It is the old Pomme de Nèze, or Fameuse, believed to be a native of Canada. It is much grown in Michigan and in other Western States, where it is deservedly prized as a very pleasant autumn apple.

A Movable Trellis.—C. C. Smith, Marshall Co., Iowa, sends us a drawing of a grape trellis which is pinned to permanent posts and so arranged that it can be laid over. It is said to be patented, but the same thing has been in use for other vines than the grape. We doubt its utility for any but young and slender vines.

A "Flowering Willow."—H. L. Southworth, Utah Co., Utah Territory. We cannot tell what this is without specimens. Send a bit when in blossom. All willows flower, but some are more showy than others.

N. Y. State Agricultural Society.—Annual Meeting.—New Officers.—We were present through the two days, but have room only for an item. The officers elected for 1866 are: *President*: Hon. J. Stanton Gould, of Hudson; *Vice-Presidents*: 1st District, Thos. H. Faile, jr., New York; 2nd, Samuel Thorne, Dutchess Co.; 3rd, Adin Thayer, jr., Rensselaer Co.; 4th, G. A. T. Van Horne, Montgomery Co.; 5th, James Geddes, Onondaga; 6th, Joseph McGraw, Tompkins Co.; 7th, H. T. E. Foster, Seneca Co.; 8th, Horace S. Huntley, Cattaraugus Co., *Cor. Secretary*, Col. B. P. Johnson, Albany. *Rec. Secretary*, Erastus Corning, jr., Albany. *Treasurer*, Luther H. Tucker, Albany. *Executive Committee*: Geo. H. Brown, Dutchess Co.; J. T. Williams, Chautauqua Co.; H. W. Dwight, Cayuga Co., Solon Robinson, New York; C. J. Hayes, Otsego Co.; T. L. Harrison; Gen. C. S. Wainwright, and Isaac H. Cocks.

The American Cattle Breeder's Association, hitherto mainly confined to New England in its operations, held its Annual Meeting at Albany, Feb. 15, simultaneously with the N. Y. State Society's Meeting, with the object of enlisting more general interest, and extending its influence to a wider sphere. A considerable number of new members were enrolled, a friendly discussion took place, and officers and committees for the year were chosen. For want of room, this number being already made up on our return, we must defer the names, etc., until the next paper.

Catalogues, etc., Received.—Hargis & Sommer, Star Nurseries, Quincy, Ill. Catalogue... A. M. Purdy, South Bend (Indiana) Nursery... J. M. Thorburn & Co., 15 John St., N. Y. Catalogue of Vegetable and Agricultural Seeds... Frost & Co., Genesee Valley Nurseries, Rochester, N. Y. Catalogue for Spring of 1866... Willits Bros., Buchanan, Mich. Catalogue of Small Fruits, with Metcalf's Early Seedling Strawberry as a specialty... Alfred Bridgeman, 876 Broadway. Catalogue of Kitchen Garden Seeds... James J. H. Gregory, Marblehead, Mass. Catalogue of Garden Seeds, including several specialties... John Vanderbilt, 23 Fulton St. Garden, Flower and Field Seeds, Implements, Manures, etc... Comstock, Ferris & Co., Wethersfield, Conn., (Hartford P. O.). Catalogue of products of their Seed Farm and Gardens... John S. Collins, Moorestown, N. J. Catalogue of Small Fruits... B. K. Bliss, Springfield, Mass. Catalogue for 1865 and 1866, a large and well illustrated pamphlet, which contains descriptions and directions for culture of flowers, vegetables, etc... R. G. Hanford, Columbus, Ohio. Descriptive catalogue of the Columbus (Ohio) Nursery, illustrated... Constitution and By-laws of the Hocking Valley (Ohio) Agricultural Society... Transactions of the Massachusetts Horticultural Society, 1865.

DR. HARTMAN'S SAFETY BRIDLE AND REINS.—Engraved for the American Agriculturist.

Sheep for Illinois.—Lewis Britain, Menard Co., Ill. We certainly doubt not that at present it will pay best to raise wool rather than mutton. The Spanish-American sheep require less care and are generally hardier. The best way to get a flock is undoubtedly to procure good sound, heavy fleeced rams of the Spanish Merino or American Merino breeds, and to use them upon young native ewes of good size and shape, selected from healthy flocks. Keep up the flock, by using only good rams.

Making a Ewe own a strange Lamb.—A. P. Taft, Trumbull Co., Ohio, writes as follows: "When you find a ewe with a dead lamb bleating piteously and mourning over it; if you wish to make her adopt another, catch the ewe, milk her own milk upon the lamb, then removing the dead one out of her sight, step back out of the way and witness the joy of the mother at the supposed restoration of her offspring."

Laurel Poisoning again.—"H." writes that the Sheep Laurel or Lamb-Kill (*Kalmia angustifolia*) is injurious even when dry. He had some sheep poisoned by eating hay containing it, and thinks its effects worse than when eaten fresh. He finds the most efficacious remedy to be a strong decoction of senna, to be given in repeated doses until the bowels are moved. We are glad to record at least one remedy that has an appearance of efficacy. "H." further remarks that if lambs have plenty of milk and succulent food, such as turnips, young grass etc., they are not apt to eat enough laurel to hurt them. Here is an excellent chance for some veterinary student to make valuable investigations. If the real action of the poison were well understood, the poisoning could be treated intelligently.

Runaways and Kickers Mastered.

Horsemen have long known that no horse can bear a strong pressure by the bit against the corners of the mouth; and they have employed a cord or reins or a pair of reins passing from the hands (through the rings in the harness) through rings in the headstall and to the bit, in connection with an ordinary pair of reins, to check runaway horses, or to control vicious or kicking ones. These contrivances were so bungling, that they never came much into use, and spirited horses, fit for much better things, were broken in spirit by the lash, and set to some kind of drudgery or tread-mill work, where they soon wore out both pluck and life. Dr. S. B. Hartman, of Millersville, Lancaster Co., Pa., has an invention which gives, in a very pretty and convenient pair of reins, all the ability to stop a runaway horse, to check a hard-mouthed one, to arrest a kicker at the first symptom, just as effectually as the old bungling contrivance alluded to, and very much easier. The above spirited picture shows the effect of these reins upon a horse. The head is thrown up, the eyes lifted so that he cannot see the ground, the weight of the body thrown completely off the fore feet, so that kicking is out of the question, and the animal being thrown upon its hanches, of course must stop; he cannot even back, for the Doctor says, and though we have not tried this, it seems true, that a horse may be made to sit down squarely on his rump. The bit is a simple

snaffle, or plain bar bit, attached to the headstall in such a way that the check strap (not buckled into the bit ring, but running through it), may be shortened up almost indefinitely by a pull upon the safety reins. These are attached to the check strap, passed up through the bearing or check rein swivels (the rein being removed) and joining the direct reins at the saddle or hames rings, from this point, they pass back to the hands, through the centre of the round driving reins, and terminate in loops and straps. While driving with two hands, the loops may be held by passing the fore fingers loosely through them, and when the driver wishes to use only one hand to drive, the straps of the safety reins hang down in front of his knuckles, and may be seized by the whip-hand at any instant that he wishes to apply their latent power. The safety reins are not borne upon at all in ordinary driving. We have tried them somewhat ourselves, and have placed them in the hands of several experienced horsemen, who agree in their good opinion of them. "Atlanta" is a rather famous trotting mare owned in this neighborhood, so hard-mouthed as to be entirely unmanageable with common reins and bits—with the safety bridle she was driven not only with safety, but with ease, and in her horse way owned "beat," for the first time in her life. In Lancaster County, where the reins have been in use a year or two, we learn that they are regarded with high favor, ladies and children driving horses considered entirely unsafe before they were applied.

Walks and Talks on the Farm.

No. 27.

The 'Squire wants me to put some rotten manure for a foot or two round the trunks of the apple trees. I told him I did not see how it could do them much good. The roots probably extend for ten or fifteen feet on all sides of the trees, and it is principally from the extremities of the roots that the tree gets its food.

To this he replied, "Because in the spring all rain runs down the trunk of the tree and so along the roots to the extremities, and if manure is put around the trunk, the water will carry its fertilizing ingredients to the fibrous roots." Is there any truth in this idea? Our best pomologists recommend enriching the whole land, and so far as I have read, agree in the assertion that manure applied merely for a foot or two about the trunk can do little good. And yet the practice of putting a little manure at the base of the trees is very common. Is there any truth in the 'Squire's explanation?

I must confess that I do not exactly see, in case the whole surface is manured, how the manure gets to the roots. Where orchards are plowed, the roots must be five or six inches below the surface, and it would seem from all the experiments of Way, and confirmed by Liebig, that manures, unless employed in too excessive quantities, do not descend far into the subsoil. We might make the surface soil rich for six inches without furnishing to all the roots of the trees beneath, any nourishment.

If this is true, it follows that the benefit of cultivating the soil among trees is due not so much to its enriching the soil, as to its keeping from the subsoil the roots of plants that would take up the moisture and plant-food that are needed for the roots of the fruit trees. We know that a grain or grass crop seriously checks the growth of young trees, while cultivating the surface of the land favors the growth and fruitfulness of the orchard. If we had some crop whose roots did not go more than two or three inches into the soil, I do not see that its growth would injure the trees. Perhaps beans come as near it as anything we have

I hear that our school-teacher says that Mr. B. told her that "*larnin'* and *farmin'* don't go together."—This is unkind in Friend B., but it does not hit me. Some years ago the workmen of Rochester determined to vote for no one who was not one of their number. They would not have a professional man on their ticket. After the slate was made up, it was discovered, to their consternation, that they had nominated a young lawyer for the office of district attorney. "Oh well, never mind," said their leader, "he is not lawyer enough to hurt him." It is so of my *larnin'*. I think "me and my neighbors" are perfectly safe. If *larnin'* is the only drawback to successful *farmin'*, it will be hard to beat us.

I am not surprised at the prejudice that exists against "book farming." There is good reason for it. As the *Agriculturist* said last month, "Popular science is too apt to be popular error." I have just been reading an article in one of the leading agricultural journals of England, in which the writer betrays an ignorance that is inexcusable. It is a review of the "Sixth Annual Report of the Board of Agriculture in Victoria," one of the Australian colonies. The writer says they are trying "to render the practice of agriculture in strict accordance with modern science, instead of adopting the ruinous system of working the land out by incessantly cropping it with cereals, as is the practice in America." Further on we are told that "the colony at present does not grow wheat enough for its own consumption!" Had we followed the advice of this writer, the same would have been true of America. We may have erred in growing too much grain. It would have been better had we paid more attention to keeping up the fertility of the soil. But those people who are continually harping about "the exhaustion of the soil in Amer-

ica" do not know what they are talking about. The most that can be said is, that we found a soil that had been heavily manured by nature, and that we have grown wheat and other grains till this manure is pretty much exhausted. This is all. The soil is not exhausted. We have hardly as yet made any draft upon it.

But this is not what I was going to speak about. It seems that the great enemy to the wheat plant in Victoria is the rust, and a chemist has been employed to analyze the soil, in order to discover the cause. He found, according to our English critic, that in the sections where the rust was most prevalent, the soil was deficient in phosphates. Some of the soils, he says, contained no phosphate at all. If so, there would have been no wheat to rust: for wheat cannot grow without phosphates—and the same is true of grass. I know of no ordinary plant, even a weed, that does not contain phosphates, and if such plants grow on a soil it is proof positive that there are phosphates in the soil, whether the chemist can detect them or not.

On some of the soils he found 0.71 per cent. of phosphates, and these are the only figures given. The writer says "with such a deficiency of the most essential elements of a good wheat soil, it is not surprising that a failure should occur, but rather that wheat should grow at all." Now an acre of soil twelve inches deep would weigh about 3,000,000 lbs., so that if it contained only 0.71 per cent. of phosphates, an acre would contain 21,300 lbs.

A crop of wheat of fifty bushels per acre contains, in grain and straw, about 70 lbs. of phosphates; so that this land, which is said to be so deficient in phosphates, contains enough for three hundred successive crops of wheat of 50 bushels per acre. And this is assuming that the straw is removed from the land and no manure of any kind is applied to the soil! Truly, as Friend B. says, *larnin'* and *farmin'* do not go together. — Mark you, I do not say that a deficiency of phosphates or of lime is not the cause of the rust in wheat. All I claim is that an analysis will not show the fact. The only way it can be ascertained is to apply some phosphates, or some lime, to a portion of the land, and see if it prevents the rust.

In this section, last season, our wheat rusted badly, and had the crop been attacked a week or ten days earlier, the damage would have been quite serious. As it was, except on low, wet land, the rust was confined pretty much to the leaves, and did not appear before the grain was so far advanced that the juices in the straw were sufficient to mature the grain. In the Western States rust very frequently proves a serious enemy to the wheat crop. There is no known remedy. In this case, as in the case of the midge, the great aim should be to get the crop as early as possible.

Why cannot we burn our own lime? On nearly all farms in this section we have abundance of limestone, that by burning makes excellent lime. The cost of a kiln is but little, and on many farms there is enough rough wood that cannot be sold, to burn all the lime needed to manure the land. I am satisfied that we must use more lime. Except in a few localities the practice of liming is almost unknown in our agriculture. I know many people think that where the rocks are principally limestone there is no necessity of liming. But while this may be true in individual cases, it is by no means true as a rule. Land in England that rests on the chalk (which is a soft limestone) is found to be greatly benefited by the application of lime. In the few cases where I have heard of lime being used hereabouts, it has had an excellent effect, the only drawback being its great cost. They ask 25 to 30 cents a bushel for it. In England it is estimated that the farmer can quarry six tons of limestone and burn it, for \$4.00, including interest on capital, tools, etc. These six tons yield about 100 bushels of lime, so that the cost is only four cents a bushel. Where larger and better constructed kilns are used, the cost of burning is much less, though the first outlay is greater. Even supposing it cost us three times as much as this, I believe we could use 60

to 100 bushels per acre with profit. For grass, clover, peas, and barley, there is nothing like lime. The grass is thicker at the bottom, sweeter, heavier and more nutritious. The weeds and moss are choked out, and white clover and valuable grasses take their place.

Relatively to wheat, barley is now lower than it has been for many years. The *Agriculturist* last month quotes barley in New York at 85 cents to \$1.15; and red and amber wheat at \$1.02 to \$2.25; in other words, wheat is worth as much again as barley. Two years ago I predicted* that this would be the case. In 1860, at this time, the best red wheat was worth in New York \$1.30, and the best barley 85 cents. In 1861 red wheat was worth \$1.40 and barley 80 cents. Before the close of 1862 the best red wheat sold for \$1.45, and barley for \$1.60.

Barley is sold by weight at 48 lbs. per bushel and wheat at 60 lbs., so that at the above prices 100 lbs. of wheat and barley were worth:

	Wheat.	Barley.	Wheat.	Barley.
1860 ..	\$2.16 ..	\$1.77 ..	1862 ..	\$2.41 ..
1861 ..	2.33 ..	1.66 ..	1866 ..	4.25 ..
				2.40 ..

As compared with other grains, except wheat, barley still commands a good price. It is higher here than in England, and we ought to be able to grow it with a profit. The Canadian farmers beat us in raising barley, and yet their soil and climate are no better than ours. They take more pains with the crop. It seems strange, but is nevertheless true, that thousands of bushels of Canadian barley are sent to the large cities of the West. The last number of the *Prairie Farmer* quotes barley in Chicago at from 30 to 60 cents for common to good grades, and \$1.20 to \$1.30 for choice grades of Canada. It would seem from this, that the West does not raise good barley. If the "Reciprocity Treaty" with Canada is not renewed, the probabilities are, that barley of prime quality will command a high price next fall, and we shall be safe in putting in a good breadth this spring.

The great difficulty in raising barley is, to get it in early enough. The land should be rich, and as mellow as a garden. A good, strong loam, if thoroughly pulverized, produces heavier crops than the lighter soils. But a light, warm, dry, sandy loam, if rich enough, generally produces the best barley, for the reason that it is difficult to get the heavier soils in fine tilth early in the season. On the light soils, a little artificial manure, if it can be obtained of good quality and at a fair price, can be used with great advantage to the barley crop. It will increase the yield and improve the quality—and it is quality that should be the principal aim. Think of common barley selling in Chicago at 30 cents per bushel, and choice at \$1.30! I think 100 lbs. of genuine Peruvian guano, mixed with 200 lbs. of a good superphosphate, would, in a fair season, on dry, well prepared land, sown early, give us from 40 to 50 bushels of barley per acre.

One of my neighbors was telling me yesterday, that he intended breaking up an old meadow this spring, and summer following it for wheat. I advised him not to do it. I did the same thing two years ago; I broke up an old meadow in June and summer-fallowed it at considerable expense, and did not get as good a crop as I did from wheat sown after barley. A farmer near Canandaigua says he observed the same thing. John Johnston also writes me on the subject. He says: "I noticed some time ago, that you stated your wheat was not so good on your old sod-fallow as on your barley stubble. I often thought to write that I never got a really good crop of wheat on old sod fallowed, but have had good crops on old sod by plowing only once, and keeping the surface mellow with the cultivator and harrow. But a better way is, to take a summer crop from old sod and fallow the following year. This is almost sure to give the very best wheat crops. My practice for over 27 years was to keep my best wheat land in fallow and wheat alternately—sowing clover among the

* "Walks and Talks" in *Genesee Farmer*, 1864, p. 203.

wheat in spring, pasturing lightly in autumn, and heavily with sheep the next spring, till I got it plowed. In this way I did well.

"Fallowing is the true way to raise good wheat crops, at least on clay soil. Still, if manure enough can be obtained, it is more profitable to take a barley crop and sow the stubble with wheat—the barley crop getting the first chance of the manure. Wheat does not require much manure, but I never yet gave spring barley too much. I had nearly 40 bushels of spring barley per acre last year."

It is not common to apply manure directly to the barley crop, except artificial manure; it is not convenient to do so. Barley is usually sown after corn, and the manure is applied to the corn. I presume this is the plan adopted by Mr. Johnston. He puts the manure on the grass the fall previous, and then plows up the sod in the spring and plants corn, followed by barley and then wheat. It is not considered a good plan to grow three grain crops in succession, but if you can manure highly enough, and cultivate the corn thoroughly, there is no objection to it. If the land is not rich, however, better seed down the barley in clover and let it lie one or two years, and then break it up for wheat. If you like, the wheat can again be sown with grass and clover, or it may be followed with barley.

Clover is our great renovating crop. We cannot sow too much of it. We should grow our own seed, and sow it as often as possible. One of my neighbors threshed his clover seed a few days ago and got 12½ bushels of clean seed from 2½ acres. From the same land, before letting the clover grow for seed, he cut 14 good two-horse loads of clover hay. Such a crop pays better than wheat. All he did to it was to sow a bushel of plaster per acre on the clover last spring.

One of my horses sprained the muscles on the inside of his thigh. He was quite lame, and apparently in considerable pain. The leg became hot and swollen, and I was afraid he would be laid up for several weeks. It is a bad place to get at. Knowing that there is nothing so good for a sprained ankle as pouring cold water on it, I got the hydropump and forced a stream of ice cold water on to the inside of the thigh. It seemed to relieve the pain at once. I repeated it every few hours, and in three days the horse was entirely well and at work again! Great are the virtues of cold water.

I have just sold one of my little pigs. They are not quite four months old and the one I sold weighed 117 lbs. Is not that pretty good? I got \$17.50 for her, while a farmer in the neighbourhood sold some of his last month that are about the same age, at \$7.00, and thought he had got a good price. So much for a little blood.

In the neighborhood of large cities, where fresh pork is in demand, the small breeds of pigs, such as the Essex and Suffolk, are more profitable than the large breeds. I question if we can compete with the West in the production of heavy hogs for packing or for bacon. Dressed hogs the past season have not brought in Rochester over half a cent a pound more than in Chicago, while the corn on which they feed is twice as high. In most of the interior towns in the far West, corn is not worth over 20 cents a bushel, and in some not over 10 cents, while here it is from 75 to 80 cents. Can we feed hogs and compete with the West? In raising nice, fresh pork for the butchers in spring and summer, we are not brought in competition with the West, and this is the kind of hog-raising that will pay. You want a breed that will fat at any age, from six weeks to six months, that you can have ready at any time the butcher needs them.

In the *Agriculturist* last month there is a table showing the amount of produce exported from New York during the last seven years. It seems that in 1859 the total amount of wheat exported was only 297,587 bushels. The next year we exported over thirteen million bushels! and in 1861 nearly twenty-nine millions. Have we ever exported so large a

quantity in any single year before? In 1862 we again exported twenty-five millions, and in 1863 fifteen millions; in 1864 twelve millions, and in 1865 only two and a half millions. This is a great falling off as compared with the four years previous, but it is more than I expected. I think most of it must have been exported early in the year and is in reality a part of the crop of 1864 rather than of 1865.

But is it not remarkable, that during the four years from 1861 to 1864, while we were engaged in a most gigantic war, we were able to spare, and did spare, over 82,000,000 bushels of wheat, besides flour equal to 50,000,000 bushels more; or in all, 132,000,000 bushels of wheat! These figures show how much the country was indebted to its agriculture for the means to carry on the war.

The export of Indian corn last year was over 4½ million bushels as compared with 846,831 in 1863. The English farmers are beginning to appreciate our corn as a food for fattening stock, and doubtless the demand will continue. One of the leading English agricultural papers recently asserted, and unquestionably with truth, that Indian corn is the cheapest food the farmers can purchase, and that there is no sense in their paying \$55 per ton for oilcake, when a ton of corn can be had for \$33. There is an unusually large quantity of corn in warehouses and in the hands of farmers, and we can meet any demand that can be made upon us. With the high price of meat, however, it would be well to feed it out at home more liberally. What a shame it is to send lean cattle to market when good beef is so high, and the means of fattening it so abundant. In Chicago, inferior cattle are sold as low as 3¼ cents per pound, while choice fat cattle bring from 7½ to 8 cents. A steer weighing 1200 lbs. in the one case would bring \$96, while one weighing 1000 lbs., if sold at 3¼ cents, would bring only \$32.50. Now, I do not say that the addition of 200 lbs. of flesh and fat would convert one of these "scallawags" into choice beef, but it would certainly go far towards it.

We must pay more attention to breeding cattle. There is a crying necessity for well bred stock. Greatly as our cattle have improved within the last fifteen or twenty years, it is still difficult to find a good well bred steer. The majority of animals are so ill bred, that it is impossible to fit them till they are four or five years old. Now how much does it cost to keep a steer two years? It seems to me, that this sum, varying in different localities, say from \$40 to \$75, is the difference in the profit of feeding a good and a poor animal. Is there any error in this statement? I do not ask for thoroughbreds, only for grades. It may cost fifty cents or a dollar more to obtain such a calf, but will it not pay?

I do not know of a first-class Shorthorn bull in this county. A few years ago a liberal-minded gentleman purchased one from Mr. Sheldon, and kept him a year or two; but the farmers begrudged the extra 50 cents, and the gentleman sold his bull in disgust. Had he kept him a few years longer, until his calves showed their superiority, he would have been appreciated.

"But the Shorthorns are not good for milk!" Some of them are not. They have been bred for beef. But a cross with our so-called "native" cows often produces excellent milkers, and if any of them prove poor, they can readily be disposed of to the butcher. I was talking to Lewis F. Allen about this matter the other day, and he says he knows no way in which we can so readily and so surely obtain a good herd of dairy cows. Use a thoroughbred Shorthorn bull, raise all the calves—and they can be raised on very little milk—and then if the heifers prove good milkers they will be very good. If they do not, fat them for beef.

I saw a statement the other day in an English paper, of a farmer who lives in a dairy district, that bought the calves from his neighbors when a few days old, and raised them by hand. By buying them at different times, he said he had raised as many as fifteen calves on the milk of one cow. He gave them a little new milk for a few days, and af-

terwards skimmed milk, with the addition of linseed tea, scalded meal, etc. This practice might be adopted here. Get a good Shorthorn bull, and then buy the calves when a few days old. It would pay.

Something that Will Pay.

Every cultivator ought to raise enough first-rate seed of all his staple crops to at least supply his own needs. But comparatively few will give the extra care in cultivation, selection, etc., necessary to secure a prime article, and hence choice samples always have a ready demand, at top prices. Here is an opportunity for some one in every neighborhood to make money. Select some one or two staple articles, and make a specialty of raising them for seed. Each year, sow or plant none but the best, place it under the most favorable conditions possible, as to exposure, soil and cultivation, and in a few seasons by judicious management a grade may be reached and a reputation be made that will give a rich return. Whoever could to-day offer 500 bushels of oats, barley, or spring wheat acknowledged to be the best of their kind in the country, could command his own price, within reasonable limits, and perhaps a little beyond.

The Uses and Management of Cold Frames.

BY PETER HENDERSON, JERSEY CITY.

We use cold frames for preserving cauliflower, cabbage and lettuce plants during the winter and the forwarding of lettuce and cucumbers in spring and summer.

To make the matter as clear as possible, we will suppose that the market gardener, having five or six acres of land, has provided himself with 100 of 3 x 6 feet sashes. The cauliflower, cabbage or lettuce plants which they are intended to cover in winter, should be sown in the open garden from the 10th to the 20th of September and when of sufficient size, which they will be in about a month from the time of sowing, they must be replanted in the boxes or frames, to be covered by the sashes as winter advances.

The boxes or frames we use, are simply two boards, running parallel and nailed to posts to secure them in line. The one for the back is ten or twelve inches wide, and that for the front seven or eight inches, to give the sashes, when placed upon them, pitch enough to carry off rain and to better catch the sun's rays. The length of the frame or box may be regulated by the position in which it is placed; a convenient length is fifty or sixty feet, requiring eighteen or twenty sashes.

Shelter from the North-west is of great importance, and if the ground is not sheltered naturally, a board fence six feet in height is almost indispensable. The sashes should face South or South-east. Each sash will hold five hundred plants of cabbage or cauliflower, and about eight hundred of lettuce. These numbers will determine the proper distance apart, for those who have not had experience. It should never be lost sight of that these plants are almost hardy, and consequently will stand severe freezing without injury; but to insure this condition they must be treated as their nature demands, that is, that in cold weather, and even in clear winter days, when the thermometer marks 15 or 20 degrees in the shade, they must be abundantly aired, either by tilting up the sash at the back, or better still, when the day is mild, by stripping the sash clear off. By this hardening process, there is no necessity for any other covering but the sash. In our locality, we occa-

sionally have the thermometer from 5 to 10 below zero for a day or two together, yet in all our time we have never used mats, shutters, or any covering except the glass, and I do not think we lose more than two per cent. of our plants. Some may think that the raising of plants in this manner must involve considerable trouble, but when they are informed that the cabbage and lettuce plants so raised and planted out in March or April, not unfrequently bring a thousand dollars per acre before the middle of July, giving us time to follow up with celery for a second crop, it will be seen that the practice is not unprofitable.

But we have not yet done with the use of the sashes; to make them still available, *spare* boxes or frames must be made, in all respects similar to those in use for the cabbage plants. These frames should be covered up during winter with straw or leaves in depth sufficient to keep the ground from freezing, so that they may be got at and be in proper condition to be planted with lettuce by the end of February or 1st of March. By this time the weather is always mild enough to allow the sashes to be taken off from the cabbage and lettuce plants, and they are now transferred to the spare frames to cover and forward the lettuce. Under each sash we plant fifty lettuce plants, having the ground first well enriched by digging in about 3 inches of well rotted manure. The management of the lettuce for heading is in all respects similar to that used in preserving the plants in winter; the only thing to be attended to, being to give abundance of air, and on the occasion of rain to remove the sashes entirely, so that the ground may receive a good soaking, which will tend to promote a more rapid and luxuriant growth.

The crop is fit for market in about six weeks from time of planting, which is always two or three weeks sooner than that from the open ground. The average price for *all* planted is about \$4 per hundred at wholesale, so that again with little trouble our crop gives us \$2 per sash in six weeks.

I believe this second use of the sash is not practised outside of this district, most gardeners having the opinion that the winter plants of cauliflower, cabbage or lettuce, would be injured by their complete exposure to the weather at as early a date as the first of March. In fact, here we have still a few old fogies among us, whose timidity or obstinacy in this matter prevents them from making this use of their sashes, and thereby causing them an annual loss of \$2 per sash, and as some of them have over a thousand sashes, the loss is of some magnitude.

In my own practice, I have made my glass do double duty in this way for fifteen years; the number when I first started being fifty, increasing to the present time, when I have in use fifteen hundred sashes. Yet in all that time I have only once got my plants (so exposed) injured, and then only a limited number, which I had neglected to sufficiently harden by airing.

We have still another use of the sashes to detail. Our lettuce being cut out by middle of May, we then plant five or six seeds of the Improved White Spine Cucumber in the centre of each sash. At that season they come up at once, protected by the covering at night. The sashes are left on until the middle of June, when the crop begins to be sold. The management of the cucumber crop as regards airing, is hardly different from that of the lettuce, except in its early stage of growth it requires to be kept warmer; being a tropical plant, it is very impatient of being chilled, but in warm days airing

should never be neglected, or the concentration of the sun's rays on the glass would raise the temperature to an extent to injure, if not entirely destroy the crop. This third use of the sashes I have never yet made so profitable as the second, although always sufficiently so to make it well worth the labor.

There are a few men here who make a business from the use of sashes only, having no ground except that occupied by the frames. In this way the winter crop of cauliflower or cabbage plants are sold at an average of \$3 per sash, in March or April; the lettuce at \$2 per sash in May, and the cucumbers at \$1 per sash in June, making an average of \$6 per sash for the season; and it must be remembered that these are wholesale prices, and that too in the market of New York, where there is great competition. There is no doubt that in hundreds of cities and towns of the Union the same use of sashes would double or treble these results.

Cotton Planting by Northern Men.

There has been a great mystery thrown about cotton culture by some of the writers on the subject, and this is in some measure seen in the only manual on that subject, by Turner. (See Book-List.) The fact is, cotton is just as easy to cultivate as corn, and nothing like so hard to grow as tobacco.

It needs a deep, well-worked soil, moderate enrichment, and clean culture. It is a hardy, vigorous plant, bearing almost any amount of neglect if it gets a good start, and even when quite small—a mere seed-leaf plant—is no more delicate than beans. Were the planting left altogether to unthinking workers, (no one knowing whether one seed in twenty would grow, or that all would not,) they would be very likely to drop handfuls of seed where a dozen would answer, or scatter them in the drill as if they were distributing a fertilizer. This they did, and it is no wonder that the puny crowded plants, left weeks without being thinned out, convinced "Massa" that he had a very delicate and tender plant (or *weed*, as they call the cotton plant at the South) to deal with.

The land should be such as is capable of good tilth—that is, such as will become somewhat mellow, at least friable when well plowed and harrowed. Very light sandy land is unsuitable, unless it be compacted by a considerable amount of vegetable matter, as a sod of young grass and clover, the growth of the fall and winter, and such land may be well plowed in the spring and not in autumn, in order that this vegetable growth may be secured. On ordinary loams the plowing ought to be done in the winter to save time, but with good plows, put down quite as deep or a little deeper than former tillage has gone, spring plowing will do equally well. If possible, follow the plow with a sub-soil plow, running once in each furrow, for the cotton plant sends down a strong tap-root into the subsoil, and it is desirable that the way should be opened, especially in compact soils. The ground being plowed and harrowed, and allowed to settle awhile, a short time before planting it is marked off in squares, or ridged for seeding.

Should the land be in poor heart and stable manure or compost be at hand, this should be spread and plowed in at the first plowing as for corn; in fact, the soil should receive much the same treatment as for a corn crop, bearing in mind always, that while corn is a very rank feeder and will bear any amount of manure, cotton is apt to run to leaf and stalk and not to

fruit if too much stimulated. If manuring is to be done in the drill, the drills should be opened full four inches deep, the compost spread evenly and then covered by a broad surface furrow cast from each side upon it, forming a flat ridge upon which to plant the seed. Any good compost will be available here, such as bone dust, ashes, cotton seed (which has been fermented to prevent germination), guano, superphosphate, etc., either alone, or such a mixture as one has made by mingling with vegetable mold or soil to secure even distribution.

The seed should be tested before planting, in order to know with some accuracy what percentage of it will germinate. To do this, count out ten parcels of 100 seeds each and sow them in cigar boxes or similar things, sinking them in the warm earth on the south side of a white fence or wall, in March or early in April; cover them with a board in case of soaking rains, but give them the benefit of all the sunshine. It is very important to have a good sort, but it is still more so to have seed that will grow, and new comers will be very likely to be imposed upon.

The distance at which the rows should be, varies as much as does the distance at which we plant corn at the North, and it depends upon the strength of the soil and the length and moistness of the season. The beginner must be guided, more or less as his judgment dictates, by the customs of the country. The aim is, to have the plants when they get their growth, cover the ground, and interlock on all sides somewhat, but not enough to prevent getting about amongst them easily. On some land they will do this if planted 4 feet each way, while in other places the rows are three feet apart and the plants 15 to 20 inches in the rows. Only one plant is left in a place, though half a dozen or more seeds are planted. The planting may be done by any good corn planter, if the land is cultivated flat, but if in ridges or "beds," the seed must be dropped by hand, or with the hand corn planter, which, if the seed is clean, and especially if soaked in brine or urine and rolled in plaster or lime, will work very well. Poorly ginned seed, which is covered with fur, must of necessity be dropped by hand.

The planting ought to be done, as a general rule, in April, though good crops are often made if planting be delayed until May. The plants ought to get a good start before hot weather, for the drouths do not check them, if the tap-roots are well down in the moist subsoil.

As soon as the plants appear, the field should be gone over, and any grass or weeds close to the plants taken out, and the plants themselves thinned to about three in each place. The grass will soon start and must be kept down at all hazards. There are seedling grasses, which during the moist weather of spring start up with white clover everywhere that the soil is broken, and are very damaging to any crop. We advise the use of good steel-toothed cultivators, followed by sharp, light bladed hoes. Light harrows would do good service also, especially the pole harrow, and indeed any of the implements for corn would answer well for cotton. The principle is the same, viz.: *Clean Culture*.

Our own prejudices are much in favor of flat culture on dry land; and where hands are scarce, we surely would plant so as to run the plow and cultivator each way. Each time it is plowed or tilled by horses, it should be gone over with hand hoes, to make sure that plants are not covered up and that grass is not left among them. After the first or second hoeing, as the case may be, only one plant is left in a place,

provided it has by that time gained sufficient woodiness of stalk to resist the attacks of the wire worms, which are sometimes annoying. The subsequent culture of this important crop may properly be the subject of articles later in the season. In the meanwhile, any hints from those interested in this matter, which will be of benefit to our readers, will be gladly received.

Board Fences.

The questions proposed in the November *Agriculturist* (page 336) have been kindly responded to by several experienced fence builders. Some have answered the questions; others have given figures and descriptions of fences. We here call attention to some of these plans.

Fig. 1.

Mr. H. T. Richmond, of Chenango Co., N. Y., presents two, represented by figures 1 and 2, which he describes as follows:—"Fig. 1 is a straight board fence, 4½ feet high, and the advantages I claim over the common board fence are as follows: It is substantial, tasteful, economical, easily built, easily moved, and any length may be taken out like a pair of bars. If the posts heave out, they can be driven down again. No nails are driven through the boards, consequently the lumber is not injured for any other purpose; and on flowed lands the boards may be taken out in the fall, and put in again in the spring. The materials are as follows: Boards, chestnut or pine, 11 feet long, 6 inches wide; posts, chestnut or oak, 7 feet long, round or half-round, split or square, sharpened and driven 2½ feet into the ground, 10 feet apart; cleats, chestnut or oak, 4½ feet long, 2 inches wide, 1½ inch thick; nails, one six-penny nail to each board.

"Fig. 2 is a straight picket fence, 3 feet 10 inches high, tasteful and economical. Posts, 6 feet long, 10 feet apart; rails, 11 feet long, 2×3 inches; pickets, 3 feet 10 inches long, 3 inches wide, 1 inch thick; 2 seven-penny nails to each length. To rebuild either of these fences where decayed, split open the old rotten posts to get the nails, and then set up the lengths and fasten them with nails and cleats to the new posts."

Mr. Wm. Day, of Morris Co., N. J., sends a sketch of a fence (figure 3), and writes: "In

Fig. 2.

answer to your queries about fences, I send the following as the result of my own experience and observation, combining, in my judgment, economy, durability, and neatness for a farm-fence, in a remarkable degree. I would have what is called with us, a running or strip fence.

"Posts.—In our section of country, chestnut timber for posts is preferred to any other. The posts are sawed 7 feet long, 4×5 inches at the bottom, and 3×4 at the top, and all set 4 feet 2 inches above ground, 8 feet apart. They should be cut in winter when the sap is down, for they will thus be lighter to cart and handle, and dry out quicker. They may be set as they grew, or reversed, whichever way they will saw to the best advantage. I never believed there was gain enough in durability, secured by inverting posts, to balance the necessary waste in sawing.

"Boards.—For strips we employ hemlock, sawed one inch thick and 16 feet long. Two courses of 7-inch strips at the bottom, 5 inches apart, and two courses of 5-inch strips, 8 inches apart, starting 5 inches from the ground, will make the fence 4 feet 2 inches high, as required. A cap rail or strip is not necessary for strength, but gives the whole a neater appearance. If used, it may be sloped to turn rain more readily. No fixed rule is necessary for this. Each board will require 6 ten-penny nails, driven 1½ inches from the ends and edges. Break joints by all means, to secure strength, and I hold a batten to be absolutely indispensable."

Mr. Peter H. Storm, of Columbia Co., N. Y., writes as follows, sending fig. 4 as the style of fence he prefers: "The questions proposed could be more readily answered, if the nature of the soil were specified, whether stony or liable to be thrown up by frost. My experience is that common post and board fence is the best in every particular. It costs least both in materials and labor; lasts longest with the least repair, and if properly constructed, will turn any stock usually kept on a farm. If the soil does not throw up by frost, I usually take for

Fig. 3.

posts good straight rails, 13 feet long (chestnut preferred), and saw them in two. These cost here about \$10 per hundred, which is 5 cents per post, or 10 cents per length. Sharpen them and drive with a flat-faced sledge 2½ feet in the ground, after making a hole with a crow-bar. Some of them may require a little trimming in order to present a good face to nail upon, which is readily done with a common axe. In one day two men can make as much and quite as durable fence as eight men can in the same length of time, if working in the ordinary way of digging the holes, etc. Let each man have a hammer, with the spaces marked on the handle, so that no mistake may occur in placing the boards. I do not batten the ends of the boards, nor for common field fence do I cap the same, but I think the latter will well repay the trouble of sawing the posts off, which should be done at an angle of about 70°. I use the narrow hemlock fence board, which varies from 4 to 8 inches in width, putting the widest at the bottom, about 8 inches above the ground. I use fence 8-penny nails, six nails to the board.

"The very best time to cut the posts is, I think, in the month of June, when the bark peels off very readily; they should stand to

season until the next spring; but if sharpened when cut, and the points placed upward in the sun, they will dry sooner and will answer for fall setting. I do not usually prepare the posts, though I think charring would pay were sufficient care exercised to prevent the points being injured for driving. After the line of fence is made, take a plow and turn a few furrows on either side of the fence, to make a ridge

Fig. 4.

to fill the 8-inch space under the lowest board. The ground should be compressed with the foot, and if necessary the shovel should be used, in order to raise a good ridge. It is best, I think, to reverse the posts, which should be attended to in the sharpening. From 40 to 60 rods can be made by two men in a single day. Should the soil be inclined to heave by frost, raise the bank 20 inches, or more if necessary, after the posts are driven; and put but three boards to the length. This will make a very pretty as well as lasting fence. The lowest board should be close to the ground, as the bank will settle."

Reclaiming Salt Marshes—Tide-gates.

In the February *Agriculturist* we had an article upon reclaiming salt marshes, dwelling especially upon making the dikes. Now, the dike is very important, but good for nothing without a good gate. A Tide-Gate is one constructed in connection with a flume of some sort, so that when the tide is out, the fresh water which may have accumulated, may easily flow off, but which will be closed tightly by the rising tide, so that no salt water can flow back upon the meadow. The size of the flume and gate should be sufficient to let off, in a short time, all the water that will ever be likely to accumulate during severe storms or thaws; and concerning this, one may easily judge by estimating the surface of country drained, and the amount of water which flows from springs and brooks discharging into the ditches of the reclaimed marsh. This may be more easily done by causing all the water to flow through a trough or other contrivance, while the dike is being built. Stone culverts are better than wooden trunks, because the muskrats do not follow stone work, while they are almost sure to burrow along by the side of, or under wood, often letting in the salt water in

Fig. 1.

a ruinous way; and as these are the great pests of the reclaimer of salt marshes, it is best economy to provide fully against them.

We represent in the accompanying illustrations longitudinal sections of three different kinds of tide-gates. The first, fig. 1, shows a stone culvert supposed to be about 18 inches high, and of the same width. It is built of faced stone, laid in cement, and upon a good foundation bedded in the hard-pan bottom, or

GROUP OF TWO-YEAR-OLD AND YEARLING COTSWOLD EWES

upon a "puddling" of clay; clay is also well packed about it. The exterior end of this culvert receives a trunk of 3-inch oak plank about 3 feet long, solidly cemented in. The gate is hung upon the exposed end by heavy yellow-metal butts screwed upon the top of the trunk or flume, and let into the inner face of the gate, which is made of two courses of plank placed crossways and fastened by copper or composi-

Fig. 2.

tion nails. The end of the flume is made slanting so that the gate shall naturally shut close when the tide is down. The objections to this form are that sticks, etc., sometimes prevent the gate shutting tightly, and the hinges being half the time under water rust out in time, need to have the bolts renewed frequently, and are otherwise subject to corrosion from the salt water.

The second illustration (fig. 2,) represents a deep open flume, in which is a swinging gate, having a wooden hinge high above the water. The flume is supposed to be about 18 inches or two feet wide, and 5 or 6 feet high (as high as the top of the embankment.) It is made of heavy planks, the sides being nailed upon the

outside of frames made of 6×4-inch studs, and the floor being laid upon the top of the framesills. The uprights of one of the frames, in this case the middle one, rise to the height of several feet (6) above the flume, and upon these the gate is hung so that it shall shut snugly against the posts and the inner course of floor planks, on which a thin sill may be spiked. Gates of this kind work very well, but should be well protected against the muskrats burrowing under them. The seams are made tight by caulking and pitching if necessary. One especial advantage of this form of gate is, that a grating or perpendicular paling at each end of the sluice will exclude drift wood, hay, etc., from clogging the action of the gate. Figure 3, shows a combination of the two plans, the posts upon which the gate swings being set in the ground or in masonry. A gate like this may be hung in a flume against the mouth of a trunk, that is, a flume for the protection of the gate may be erected on the outer end of a culvert, or box flume like figs. 1 and 3, and the gate may then be suspended as shown, a plan we are inclined to prefer, though we have never observed it in actual operation as we have the other forms.

All these gates must be protected against the gnawing of muskrats, by sheathing the exposed parts with copper. The rats will enter the sluices from the inner side and gnaw the bottoms of the gates, and the contiguous parts of the box; they will probably also gnaw upon the outside. Strips of copper ship-sheathing a few inches wide, nailed on over the end of the box near the bottom, and upon the lower part of the gate to match, will form an efficient guard, and this should by no means be neglected.

Fig. 3.

Long-Wooled Sheep.

We frequently have occasion to refer to the long-wooled sheep as making excellent crosses with common ones, for heavy mutton and early lambs. The breeds best known in this country are the Leicesters and Cotswolds. The Lincolns are another breed of this group which were introduced some years ago into this country, a flock having been kept and highly esteemed in Duchess County in this State, 30 or 40 years since; but they have been allowed to run out, and we have heard of no recent importations. They are probably the largest sheep in the world, and are hardy, but not so well formed, nor so good feeders, as the improved Leicesters, and the Cotswolds. We present an engraving of a group of beautiful Cotswold two-year-old and yearling ewes, from the flock which swept all the prizes in several classes at the New England fair last autumn. They are the property of Mr. Burdett Loomis of Windsor Locks, Conn., who has recently added to the value of his flock by the importation of some very excellent sheep and rams. The Cotswolds are large sheep, often attaining very great weight. (We saw at Christmas time the carcass of one which came from Canada, and was killed by Bryan Lawrence of Centre Market, the dressed weight of which was 243 lbs.) They fat easily; the wool is long, not fine compared with the felting wools, but delicate and silky, and in great demand, selling now at a higher price than common merino fleeces. It is very free from oil, hence the sheep should have shelter and good care. The fleeces weigh 6 to 10 lbs., rams' fleeces sometimes reaching 18 lbs. These sheep are moderately prolific, adapted to rich pastures, and the fat is much better distributed upon the carcass than is the case with some other long-wooled breeds. The quality of the mutton is inferior to that of the South-Downs and other middle-wool sheep, but rich, juicy, and always has a ready market.

Spavin, Curable and Incurable.

Every agricultural editor has almost constantly sent to him for publication, *cures for spavin*, attested in all sorts of ways. Some writers give descriptions of their mode of procedure, and of the very satisfactory results attained; others send simply recipes. We know it will be very hard to convince a horse owner, who has "doctored" his own and perhaps his neighbors' horses for what he calls spavin, and *cured* them, that true spavin is an utterly incurable disease. It seems as if every disease of the hock were called spavin, without any discrimination whatever, whereas this name is properly applied to only one. Spavin is an enlargement of the bone or bones on the lower, inner and front side of the hock joint, or an ankylosis,—a growing together of these bones without enlargement of the joint—as in occult spavin. This growth of bone, gradually in many cases, increases until the entire joint, except in its articulation with the leg-bone (the one above the joint), becomes perfectly inflexible, in fact, almost as one solid bone.

There are ten bones composing this joint, which corresponds with the heel in man; they are all capped or enclosed with elastic cartilage, which protects them from concussion and friction; and between and about the bones thus covered, lies the synovial membrane, the office of which is to secrete a fluid to lubricate the joint, so that the machinery shall play smoothly. Over the joint in several places pass the strong tendons of muscles, which move the leg below the hock, and these are bound down to the joint by very strong investing ligaments, under which they glide freely.

Severe pulling, leaping, wrenching of the leg, and other causes, may bring on an inflammation of this structure, which, being neglected and communicating to the bone, causes osseous enlargement. In some cases it is at once indicated by lameness, or by an inability to carry the foot naturally, when first taken from the stable; at others it can only be seen or felt when carefully observed. In any case it is dangerous, and may grow worse, even when consisting merely of what the horse dealer will call a "juck," that is, a little enlargement on the inner side of the hock, or upon the head of one of the splint bones. (One of these splint bones may be seen as a slender pointed bone, large at the hock, and extending more than half-way to the fetlock—sound, in fig. 1, and much diseased in fig. 2.) Any enlargement of the bones of this joint is liable to cause lameness, because they are so crossed and pressed upon by tendons; but the lameness thus caused is always most evident when the horse is first taken from the stable, and often disappears entirely after the animal warms up with exercise. For this reason a spavined horse, if for sale, is

Fig. 1.

Fig. 2.

never shown in the stable, but always upon the road, and after he has been driven awhile.

By examining the two engravings we present, the nature of the disease may be distinctly comprehended. The drawings were made with great care from specimens kindly loaned to us from the museum of the N. Y. College of Veterinary Surgeons, on Lexington Avenue. Fig. 1 shows the bones sound and healthy; fig. 2 represents a very bad case, of course. Spavin prevents the free flexion and extension of the limb. The front of the shoe is usually unnaturally worn off, and often the toe of the hoof is worn by dragging. For any inflammation or heating of the hock, whether obviously spavin or not, give rest, good food, not of a heating quality; bathe the joint in cold water, either simple or containing saltpeter or sal-ammoniac in solution, keeping it constantly wet and cool. Should bunches appear and not subside under this treatment, the usual practice is to excite the skin by liniments or blisters, and to apply subsequently an ointment containing Iodine, or some of its compounds. But if a veterinary surgeon of ability is within reach, by all means consult him. If not, talk with your family physician, and exercise common sense.

Spavin does not render a horse useless for a long time, but it makes him unsalable, and is so hereditary that a spavined mare ought not to be used for breeding, and certainly no spavined stallion should be employed as a stock getter.

Occult Spavin begins with an inflammation, leading to ulceration and ankylosis of the joint; exterior signs are obscure, but the horse manifests extreme pain. The treatment is rest in a sling, so that all weight is taken from the joint, and such external appliances and diet as common sense, in the absence of a good veterinary surgeon, will dictate. We have no experience and shall not attempt to prescribe. The disease is unhappily both frequent and distressing, in some cases resulting in the union into one solid mass of the four little bones which rest upon the tops of the metacarpal (cannon and splint) bones. Of course permanent and incurable lameness is the result.

Bog Spavin.—This disease is recognized by the formation of a sack of liquid on the front of the hock-joint, and is caused by an unnatural increase of the synovial fluid, which, as we have said, lubricates the joints. It is unsightly, but does not ordinarily cause lameness. With good usage it is sometimes, though rarely, absorbed, and this may be expedited by the application of an elastic bandage over the part, when the horse is at rest. This puffy swelling, usually caused by strains and wrenches, is not for a moment to be confounded with true spavin. "Blood" spavin is a misnomer.

How to Clean Seed Wheat.

There are sometimes seeds of charlock, winter-cress, cockle, chess, dock, pigeon weed, oats, and some other kinds among seed wheat. Besides the seeds of weeds, the small shrunken and immature kernels should be separated, and the largest and fairest only retained. The small shriveled grains may vegetate as readily as the plump ones, but the ears will not be so long and large, nor the kernels so plump and fair.

If a person has nothing but a common fanning mill for cleaning seed wheat, the sieves can usually be arranged to separate every thing from the best grain. If there be nothing but charlock, cress, or dock seed among the wheat, by carrying the grain out on the screen board so far that

it will fall near the upper edge of a coarse screen, every kernel of small wheat and seeds of weeds will fall into the screen box, and the choicest grain will be delivered on the floor, or in the appropriate grain-box. After such seeds have been separated, should there be oats among the seed wheat, a sieve made of perforated tin, or zinc, should be placed in the lower gain of the shoe, and the wheat put through the mill again. The perforations in the zinc should be just large enough to allow the largest kernels of wheat to drop through, while the oats being longer than the diameter of the holes, will slide over them and be collected in a box or on the floor by themselves. Perforated zinc, or pressed wire cloth for sieves, may be obtained at hardware stores, and be fitted to any mill. Repeated winnowing with a strong blast will, each time it is repeated, separate additional light grains, and improve the quality of the seed grain.

Coal Tar on Fence Posts.

The subject of preserving fence timber, though often discussed, is still one upon which the light of new facts and experience is always welcome. Mr. Gilbert J. Greene, of Rensselaer Co., N. Y., writes:—"I have been requested by several readers of the *American Agriculturist*, to make a short statement of my experiments and experience in preserving fence posts, water pipes, making roofs, floors, etc., by the use of coal tar. As your room is too valuable, perhaps, to give an extended notice of my various experiments, I detail them only so far as preserving fence posts is concerned. In the spring of 1853 I had occasion to build a short piece of fence, which required forty posts. I could not procure such timber as I wished, and was compelled to use hemlock posts, 4x5 inches square, and surely could not have selected worse ones of any description. Many of my neighbors said they would rot off before cold weather set in. Thinking it a good opportunity to test the coal tar, I treated the posts in the following manner: Twenty posts were coated with it for a distance of three feet from the bottom, and into this a quantity of fine, dry sand was rubbed or sprinkled; the bottom of the post was thickly coated with tar and sand. Three days afterward the posts were brushed off with a broom, and another coat of tar and sand was applied, as before. They were left exposed to the sun for three days, and were then set thirty-two inches deep. *Ten* of the other posts were merely coated with coal tar, and no sand applied; *five* were charred in a fire and set without tar, and *five* were set without any preparation whatever.

On my return from the war in May last, I examined these posts, and found that the five that were set without any preparation had rotted entirely away, and had been replaced by others in the spring of 1862. Three of those that were charred were also replaced at the same time, the other two a year later. The ten that were coated with coal tar without the sand, had rotted, and were replaced in 1864. The twenty that were coated with tar and sand are still standing, as sound, I think, as when they were put there, and I would have no hesitation in guaranteeing them to stand for the next fifteen years. Above ground the posts were planed and well painted."

Mr. Greene accounts for these results by the fact that a thin coating of coal tar is not impermeable to air and moisture, while the thick coating of sand and tar is perfectly so. He adds:—"If I was to build a fence where the

posts were not to be painted, I should coat them all over with *tar and sand*, and I would not care much whether the posts were hemlock, oak, or chestnut, for I believe if the job were well done, they would last as long as any portion of the fence. It would cost but little, not two cents a post. The posts should be clear of bark, and clean, and then a man could prepare three hundred of them in a day by having a trough, not unlike, an ordinary hog trough about eight feet in length. He should put sufficient tar in this to cover a post; put in the post, and see that it gets thoroughly covered, then set it up to drain for a short time, in such a way that the tar from it will run back into the trough. He should have a quantity of very fine and dry sand at hand, and roll them in it when the tar has pretty well drained. After a few days I would have the posts swept off and that portion which is to enter the ground receive a second coat, taking care to coat the ends thoroughly, and if the tops were to be sawn off after being set, I would coat these again."

Plowing Ground without Dead Furrows.

Dead furrows are a nuisance, especially where hoed crops are cultivated; and when land is stocked down for meadows, deep dead furrows make an uneven surface for the mowers and horse rakes to work over. When a field is plowed in lands beginning on the outside, turning all the furrows outward, and finishing the plowing in the middle of the field, there will be a dead-furrow from every corner to the middle dead-furrow of each land, and a strip of ground eight or ten feet

Fig. 1.

Fig. 2.

wide on one side of every dead furrow will be trodden down firmly by the teams when turning around. Plowing a field without dead furrows is simply commencing at the middle and turning the furrow slices all inward. If the plowing be done with a right-hand plow, the teams will "gee around," always turning on the unplowed ground. When a field is plowed in this manner, there are no ridges or dead furrows, and the surface is even, so that the operation of any machine is never hindered. When sod ground is plowed in lands, there is always a strip of ground beneath the first two furrow slices at every ridge, that is not broken up. This is to a great extent avoided when the whole field is plowed as one land, and may be entirely avoided, if back-furrowed.—The accompanying diagrams will show how to plow a square field, or one of irregular boundary, commencing in the middle and finishing at the outsides.

Fig. 3.

Figure 1, shows a rectangular field. The plowman finds a point equally distant from three sides, measuring of course at right angles to the sides, and sets a stake. Then he finds the point equally distant from the three sides at the other end, and sets another stake. From these

Fig. 4.

two stakes to the corners of the field he turns two furrow slices together, and then plows the field, being guided by them, and occasionally measuring to the outside to see if he is keeping his furrows of equal width at setting in and running out, and on each side. In fig. 2, a four-sided lot where the angles are not right angles, precisely the same rule is followed. In the case of the triangular field, the plowman begins by plowing about a single point, which, though awkward at first, may be executed with ease after a few trials. In the case of the irregular five-sided lot, represented by fig. 4, it is a little more difficult to start exactly right, but the ruling gives a clear idea of how the furrows run, and it is always well to pace off frequently to the outside of the lot—or rather from the fence, starting at right-angles to it—to be sure that the portion remaining unplowed on each side, and at each end of each side, remains always of a corresponding width, as the plowing progresses.

The Rinderpest.—State Action Needed.

The use of the German name for this cattle plague is becoming common, not because it means any more than *cattle plague*, but probably because there are other murrains and cattle diseases which have been considered cattle plagues in their day. We have already published (last vol. p. 267) the symptoms attending the disease, as given by high English authority, and have since noticed its rapid spread over England, and the distress it occasions. The timely and, it is to be hoped, efficient action of our government with regard to excluding all foreign cattle, is known to our readers, and we can do nothing now, except to keep diligent watch for the appearance of any contagious or epidemic disease among our neat stock or sheep, that its character may be ascertained as soon as possible. Doubtless the hides of slaughtered animals have been shipped from Europe to this country, though that is now perhaps stopped, and there are many ways in which it may be possible for the disease to reach here. In view of this, we deem it important that the State Legislatures should take immediate action, and pass laws requiring town or county officers to report at once to the Governor or other State officers the prevalence of anything like epidemic or endemic disease among cattle and sheep—cattle owners, keepers, or drovers being obliged under heavy penalties to report monthly the number of animals dying in their herds, together with the whole number of each herd. Such a record would be exceedingly useful, besides affording a great safeguard against the introduction and extensive spread of any such pest as this rinder-pest before we should be aware of it. Such a law as we suggest might be framed so as to be efficient and yet no great burden to any one, and it should be accompanied by legislation, empowering or requiring steps to be at once taken by town or county autho-

rities to isolate diseased herds; railroad and other transportation companies, the keepers of market-yards, etc., in or near our great cities being brought under some such restraint, it might aid essentially in freeing our markets from diseased meats. An idea of the distress prevailing in England, may be gathered from the following extract from an article in the *Mark Lane Express* of London:

"The fatal rinderpest which threatened us in 1855 is now amongst us, and we see around us a verification of the picture Virgil drew of the effects produced by the same pest some 20 centuries ago. The cattle are dying around us by hundreds, at the rate of 7,000 a week. The outbreak commenced from June, and it was hoped that the cool weather of autumn would check, and that the frosts of winter would extinguish it; but throughout the autumn it has increased, the rains have laden the air with heavy vapor, which seems to have lent it facilities for transport, and we are now admonished to dread the winter for rinderpest, as we should hail it were we suffering under the scourge of cholera. Visitors can talk of scarcely anything else but how it started in London; how it spread with fatal rapidity, until now there is scarcely a county in England that can show a clean bill of health; how for a time it was confined to cow-stock, but in true keeping with its known character quickly struck down the store cattle in the field, or the fattening stock in the homestead. There is no escape: everything of the order *ruminata* goes down before it. The perplexed farmer is not allowed to place his trust in sheep—they, too, have proved themselves mortal. The cure, as yet, seems to fail us, and so endurance comes in as the only alternative. Some people want the Government to interfere with a strong arm, that can operate more effectively than by merely giving power to local authorities to carry out measures that may happen to be approved in any particular district over which they preside. Others are filled with the gravest apprehensions. The disease, they maintain, will run its course for years, as it did once before; and then it will stop, not because there are no more animals to die, but because there are no more cattle in a condition favorable for receiving and developing the germs of infection which reach them by one way or another. And everybody tells you to exert all possible vigilance in shielding cattle from contagion, and enforcing respect to the laws of hygiene in farm premises. All very wise and prudent, but almost impossible to be carried out properly, with open yards soaked by excessive rainfall, the beasts standing and lying upon manure like a sponge, and straw for daily fresh litter being scarce during foggy and drizzly weather for thrashing."

WORKING THE GROUND WHILE IT IS WET.—

The temptation is often great, to use a fair month for the preparation of the soil for crops before the water is sufficiently dried off, or drained out of it, to warrant its being stirred at all. Thus the gain of forty-eight hours in time is often a serious detriment to the field for the entire season. Light sandy loams are not injured in this way, but every clayey loam is, and as a general rule, so is any soil which ever dries in lumps. The plow presses the furrow slices into clods, which often dry like pressed bricks, and the treading of the teams in harrowing makes bad worse, though the harrow tears them up somewhat. Even heavy loam may be worked into a light, porous, warm seed-bed if in proper condition for plowing before being worked.

The Groesbeck Prize Barn Plans.

We propose to publish in consecutive numbers of the *Agriculturist* the three plans to which the committee awarded the prizes offered by Mr. Groesbeck. This month we give the one taking the first prize of \$150, and can not do so without briefly expressing our own views concerning it. It must be borne in mind that cheapness was no part of Mr. G.'s conditions, but of course *economy* of every thing is essential in any good plan. With large expenditures of money in building, labor and care must be saved, the comfort and health of the animals, the security of fodder, and the protection of the manure provided for. Economy of labor is just as important as economy of money. The importance of, and comfort attending the ability quickly and easily to oversee one's establishment, to know that every man does his duty, that every animal is well cared for, that the manure is properly taken care of, that the various implements, etc., are all in place, can hardly be overestimated. It is almost equally important to be able to control the men, so that they shall find it easier to do just right than to neglect their duties. For this the barn should be planned; also that the men, each having his own responsibility, shall not interfere with one another. We hold also, that it is most important to centralize operations, so that the bulk of fodder, grain, roots, etc., cut up, ground, or chopped, may be easily concentrated upon the feeding floor, so as to be mixed, or cooked, and distributed to the stock, to be again collected as manure in one or two places, properly prepared for this purpose. The manure cellar under the barn, which is recommended, we object to utterly. The ground plan provides for no warm sheltered yards. These may indeed be made by erecting sheds and fences, but shelter which the barn should give against the prevailing winds, is from its shape chiefly lost; there is no chance for a good stock-yard, except one independent of the barn. The use of stanchions for cows may indeed be very well, if necessary, that is, if the quarters are contracted—as in old barns, or where cows are bought and kept for their milk alone, but for cows whose progeny is to be retained upon the farm, we hold that the animals' comfort is the owner's profit, and stanchions are undesirable. There is no provision for water, either in the barn or outside. Neither is there provision for manure, except the suggestion of a cellar. On the whole then, we must say that while we publish this plan as the *best* in the judgment of a majority of the committee, it has our approval in but very few particulars. In many points, however, it is very commendable, well worthy of study and of comparison with the plans we expect to publish in subsequent numbers.

Design for a Barn.

BY MYRON H. BENTON, LEEDSVILLE, DUCHESS CO., N. Y.

The main building in this design is 46 x 66 feet, with 25-foot posts. The two wings are each 28 x 36 feet, with 15-foot posts. The roofs slope at an angle of 30 degrees, making the ridge one-

third the breadth of the building above the plates. The exterior is covered with vertical inch-boarding (planed and battened) as high as the eaves; but each gable is covered with clapboarding, which projects 8 inches beyond the other boarding. A verge-board overhangs the

Fig. 1.—PERSPECTIVE ELEVATION OF BARN.

roof at the gable, and the rafters project into view at the eaves. The roof extends 20 inches from the sides. A ventilator is in the center of the main building, and projects square from the roof, but is finished in octagonal form. This needs only to connect with the open space of the interior, as the shoots for hay would serve as flues from the lower story. The arrangement of the yard is of course greatly modified by the situation and surroundings of the barn, and nothing definite could be specified without studying the site. The poultry-house is supposed to face the south; and the carriage-house and horse-stables should be the

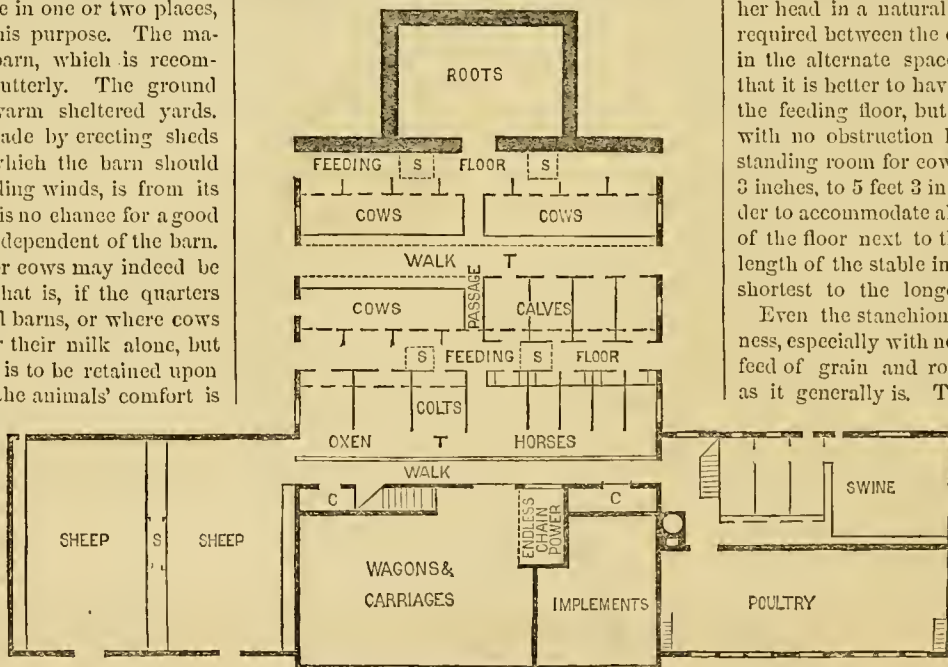

Fig. 2.—GROUND PLAN OF BARN.

in the bank—the other opening upon a level into the stables. The roof is double, the outside being plank, tongued, and grooved, which forms the bridge into the second story.

The *stables* are brought together into one portion of the building in such a way as to adapt the barn very well for a manure cellar. A slight natural hollow under this part would give every facility for making one. The entrance to the stables would be entirely upon one side, and the other would be graded so as to admit a team into the cellar. This would be an important attachment, as saving labor, promoting cleanliness, and preserving manure. There are 21 *stanchions* for cows, and 4 pens, mostly for young cattle. It is believed that stanchions, if rightly constructed, are easy for the animal, and have many advantages not given by other methods. It is very important that there should be no projection near the floor upon the face of the stanchion, as is often made,

to the constant torment of the cows when lying down. Even where there is no such obstruction there is scarcely room for her knees. If we observe a cow when lying down in the yard it will be readily seen that the line of a perpendicular stanchion will not give room for her doubled up knees without interfering with the natural position of her head. To remedy this, the hinge of the stanchion and the other uprights may be secured to the edge of a plank about 8 inches wide, which is placed horizontal (or somewhat sloping away from the cow), and is some 8 or 10 inches above the floor. This will give ample space for her knees, leaving her head in a natural position. No division is required between the cows except at their heads in the alternate spaces. I find by experience that it is better to have no manger divided from the feeding floor, but both on the same level with no obstruction between. The length of standing room for cows should vary from 4 feet 3 inches, to 5 feet 3 inches. A good way, in order to accommodate all sizes, is to have the edge of the floor next to the drain slant the whole length of the stable in a straight line from the shortest to the longest measure.

Even the stanchion does not secure cleanliness, especially with new milch cows under high feed of grain and roots, if the drain be made as it generally is. This is generally the case with dairies which supply milk to cities in winter. Even the limited motion which the stanchion allows a cow does not prevent her from stepping back and forth with her hind feet into the drain, if it be a shallow one. The secret, I find, in preventing this is, to have the drain quite deep—from 12 to 18 inches. It may perhaps be thought that this would be liable to trip the cows when going out and into their places; but this is not the case when they get accustomed to it. The walk should be of earth, and its level only half the height from the level of the drain to that of the stall flooring.

The pens for young cattle are boarded 5 feet high, with doors to the walk. There are also doors from the feeding floor into their mangers, into those of the horses, and also of the oxen.

most convenient of any to the farmer's dwelling. The main building would stand with one end against the bank, if a root-cellar is required. If one is not needed it would be better to have the barn stand clear of any side wall; but the entrance should always be as high as the second story. Even if the ground is level, the increased convenience well repays grading. The slope need not be more than 30 or 40 feet in length.

PLAN OF THE FIRST FLOOR.—The *root-cellar* is thirteen by twenty feet, with three sides

The space given to *sheep* is 28 x 36 feet, and is divided into two enclosures by a rack into which a shoot opens. Still further divisions may be made—and several yards could be enclosed convenient to them—if this should be desired.

A narrow passage crossing the walks and stables gives convenient access for the farmer to the different departments. There is a broad doorway from the wagon room into the horse-stable, admitting a team in harness. The walk shown in the plan is for the use of the attendant alone, and is raised 6 inches above the stable. Where the floors join, is a gutter for drainage of the liquid portion of the manure, which conducts, with pipes from both the other drains, to a cistern. *C, C,* are closets for harnesses, ox-yokes, &c. The main stairway also opens from this walk, and conducts to the roof of the barn. *T, T,* are trap-doors in the floor above; and *S, S, S, S, S,* are shoots for bay, etc.

The room for *wagons and carriages* admits six or eight vehicles. The room for *implements* is large enough for a mowing machine, horse-rake, etc., besides sundry smaller tools.

The *poultry room* upon the first floor is 14 x 35½ feet, and is connected with a small room, with a set-kettle for preparing their food, as well as that of the hogs, whose pens also adjoin.

The largest pen is 14 x 16, and there are three smaller ones. If more ample accommodations are required for swine, the accompanying plan for a *Detached Piggery* should be adopted.

A permanent endless-chain power is provided, to which the horses can be led directly from their stable. This occupies but little room, and a belt might connect it with a saw in the yard, for sawing up firewood. The pulley of the horse-power is also connected by a belt directly with the shaft of the thrashing machine above.

PLAN OF THE SECOND FLOOR.

The *machinery* connected with the horse-power is placed at one end of the main passage. The floor, *C,* is 7 feet above the second floor of the barn, and upon this stands the thrashing machine, *A.* The hay-cutter can also stand upon this floor, if it is desired to cut up large quantities of feed at once; or, it can be placed below, nearer the bays containing the most of the forage. The separator (which is removed when not in use) is over *B.* The arrangement gives considerable space for the grain as it is thrashed—as there would probably be little advantage found in a thrashing and cleaning machine combined. The latter, if separate, stands upon the main floor, and can also be connected with the power. Lay a flooring from the floor, *C,* as far as the stairway when needed.

The *poultry rooms* occupy the whole second story of one of the wings. There are small rooms fitted with nests, and the main room is provided with roosting poles at each end, with troughs beneath, and there are stairs to the lower room, for the use of the poultry. These rooms can be divided as well as the poultry yard, if different kinds and breeds are to be kept separate. The building is lighted and warmed from the windows, and could be further warmed by a stove if necessary. Beside nests and poles for roosting, there are few special fixtures required in a poultry-house. It should be as light and airy as possible, and yet warm. There should be no floor to the lower story, and the

fowls should be well supplied with gravel, ashes and water, besides plenty and variety of feed. All the rooms should be completely plastered, that they may be occasionally whitewashed, and whatever fixtures are put up for the fowls should

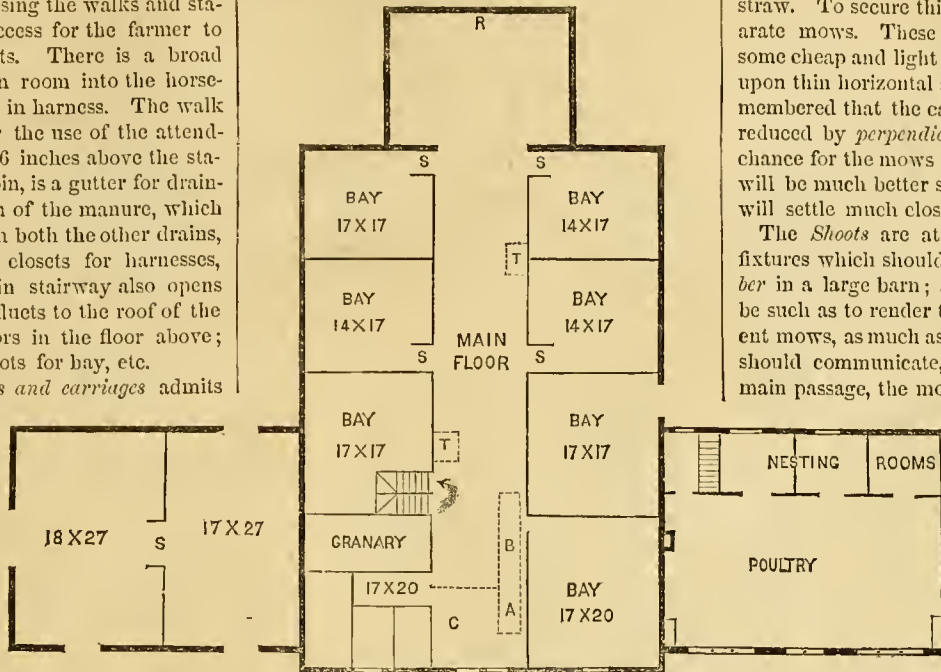

Fig. 3.—SECOND STORY OF BARN

be movable, that they may be readily cleaned. There is a large garret in this building which connects with the stairway. The flues for ventilating the poultry rooms can go through this to an opening in the gable.

It will be noticed that in this design the barn is divided into numerous small bays. In most

lar sorts to the different kinds, etc. Thus, he will want within easy reach every day of the foddering season, the several kinds of fodder, from coarse to fine—the clover, timothy, corn-stalks, etc., besides the different varieties of straw. To secure this end they must be in separate mows. These can be partitioned with some cheap and light vertical boarding, fastened upon thin horizontal scantlings. It must be remembered that the capacity of the barn is not reduced by *perpendicular* divisions, which give chance for the mows to settle. As the contents will be much better stowed in small bays, they will settle much closer.

The *Shoots* are at *S, S, S, S, S.* These are fixtures which should never be stinted in number in a large barn; and their position should be such as to render them available from different mows, as much as possible. And while they should communicate, if convenient, with the main passage, the mows should be independent of the barn floor for their connection with the feeding floors of the first story. In this way the whole barn, including the central passage, can be filled nearly solid, and yet there be no difficulty in getting all the different sorts of forage to the stock below. The benefit of

such an arrangement is very manifest, yet it is very seldom attended to. The whole barn will hold more than 125 tons of hay and grain.

The trap-doors in the main floor are at *T, T;* and there is also a trap-door through the bridge at *R,* for filling the root-cellar.

DETACHED PIGGERY.

On many accounts, especially in fattening, accommodations separate from any other farm building would be preferred; for, with the utmost care in cleanliness, the hog seldom falls much short of being a nuisance. A plan for one is thus given to accompany this design. The building is 25 feet square, with various sized apartments, which are all convenient to a small room in the center, furnished with a set-kettle for cooking their food. The pens are made as airy as possible in warm weather—the enclosure being 4 feet high, and above that with shutters which can be opened the full width of the pen. The hinges are upon the upper edge, and they can be fastened up overhead. A garret gives room for storing food; and a manure cellar under the whole building to be well supplied with dry muck or some other absorbent, would be a good addition.

An old Farmer's Experience.

The following bits of experience are worth making a note of. There is only one point in which we disagree with our venerable friend. It is in regard to the degeneration of wheat, oats and potatoes. If we save the seed of small grains, in the ear or head, and especially if we give drill culture, extra care and perhaps hoeing to the grain we wish for seed, and select the heaviest kernels from the earliest and largest heads, small grains will not degenerate any more than corn. Our friend writes:

"I have farmed 46 years for myself and ever since 1831 have taken two agricultural papers. I have been greatly benefitted by their instruction, although there are many things published

Fig. 4.—ELEVATION OF PIGGERY.

large barns the room for storing hay and grain is left in large spaces. When we consider the variety of forage which every farmer produces, and the manner in which he may wish to feed it out, it is easy to perceive that such an

Fig. 5.—GROUND PLAN OF PIGGERY.

arrangement is extremely inconvenient. Large mows bring only a few kinds upon the top. Many of the sorts it is impossible to get at when they are wanted. The judicious farmer, however, wants every kind of forage in his barn available at all times—as well to give a constant variety of food to his stock, as to give particu-

in them that never ought to be. Allow me to give you a few facts.... Fruit trees should never be trimmed in February, March or April; the time is, when they are in blossom.The time to cut timber, to have it last, is in January and February, July and August.... One load of manure hauled out in the fall after the sun crosses the line, and spread, is worth two to four loads hauled out in the spring, any way that you can fix it.... Fall-plowing is beneficial on clay loam or muck soil, and on sandy and gravelly soil if you can plow before there is any frost.... Some men say that corn will degenerate and run out. My father got a kind of yellow 12-rowed corn in the year of the great eclipse 1806, which I remember very well. I took it from him in the spring of 1820 and have it now. It is an early, sound corn, very easy to husk. I can raise 80 bushels of shelled corn to the acre with no extra labor, planting 3½ feet each way. I have another kind of 8-rowed yellow corn, which I got in 1828, which will grow and ripen in 90 or 100 days.... Wheat, oats and potatoes will degenerate and wear out [with ordinary culture: Ed.]. We do not harvest our grain and cut our hay early enough in this country.... When I commenced farming I was closely watched by my neighbors, who said I plowed too deep, cut my hay too early, and cut my grain too green. I have farmed on 12 different farms, and the result has been, I have tripled the crops on an average. I have drained three farms pretty thoroughly within the last 20 years, and am now President of the County Agricultural Society."

Barn-Door Fastenings.

Several plans for barn-door fastenings are sent in by readers of the *Agriculturist*, who use them and prefer them to the perpendicular suspended bar, which was illustrated in the January number. Of these we select two which have real merit. Figure 1 is suggested by Wm. W. Fish, of Clinton Co. The fastening consists of two bars of wood (A and B), each a little more than half the length of the door. These are held in their

Fig. 1.

places by three flat staples (c, c, c) through which they move easily. The bars are shown shoved out, as when the door is fastened. By raising the lower bar (A) until the middle staple will enter the notch (d), the upper bar may be dropped down and will rest on the shoulder (f). In both the above positions the bars are held snugly in their places.

The other plan is offered by "J. J.," of Bainbridge, Chenango Co., N. Y., not as any thing new, but as convenient and secure. B, B are two bars secured by iron staples to the upper and lower cross-pieces of the door. They are attached by pins to a lever, A, which is fastened to the centre cross-piece by the bolt C. The

Fig. 2.

points of attachment of the bars upon the lever are equally distant from the fulcrum bolt (C), so that any motion of the lever will move each bar equally up or down. The opposite door may be fastened in the same way, or by a simple wooden bolt. These fastenings may be operated from the outside, if a pin be set in either of the bars to go through the door and move in a slot.

The Comparative Yield of Potatoes.

Doct. F. W. Hexamer, of Westchester Co., has given us the results of his last year's experiments with different kinds of potatoes. They were grown upon the same field, succeeding a crop of corn and without manure, with the following results.

Bushels per acre.		Bushels per acre	
Cuzco.....	360	White Mercer.....	189
Garnet Chili.....	290	Fluke.....	160
Pink-eye Rusty Coat.....	280	Prince Albert.....	160
Peach Blow.....	240	Early June.....	150
White Peach Blow.....	230	White Rock.....	130
Prairie Seedling.....	230	Early Dykeman.....	120
Blue Mercer.....	220	Early Cottage.....	110
"Buckley's Seedling".....	210	Early Sovereign.....	80
Buckeye.....	200	Rough and Ready.....	56

Experiments were made with reference to the value of large or small seed; equal areas of land being planted with the largest potatoes, cut once lengthwise, and with small potatoes. In planting cut potatoes many insist on the necessity of placing the cut surface down, an operation requiring much care on the part of the planter. Doct. H. planted his cut pieces in both ways with the result of showing that it is a useless waste of time to place the cut side down.

Peach Blows, small seed, gave 160 bushels of marketable size and 40 bushels small, per acre. The same with large seed, 200 bushels large and 40 bushels small.

White Peach Blows, small seed, gave 170 bushels marketable, and 40 bushels small, while large seed cut in two, gave 190 bushels marketable and 40 bushels small, in those planted with the cut side up, and 35 bushels of small ones, where the cut side was put down. With those planted cut side up, or down, no difference was observed in the time the plants appeared, and the yield shows that the position in this respect is a matter of little importance.

Agricultural Education.--The Public School.

In our remarks upon this subject in our last issue (p. 55), we alluded to the fact that few school-books give any intimation that the knowledge imparted by them is the merest outline, the barest skeleton of the subjects on which they treat. It is surely not desirable to bewilder the child with the idea that knowledge is so vast and that the hill of science towers so high above him that he can never hope to clamber higher than its very base; yet it is important when he manifests especial interest in any one branch of knowledge, to be able to tell him where and how he may follow this bent, and perhaps even find himself investigating subjects upon which the wisest know but little. We consider this unfortunate impression, so often gained by school children, that if they know all that is in their books, it is enough, as one great reason why after leaving school so many give up all effort to acquire knowledge. The difference between teachers in respect to the desire to learn more, which they implant in their pupils, is very great. This is certainly the best thing a child or youth can be taught.

With the strong desire to learn he will learn. With the will, a way will be. If the best teacher the District will get is stupid, and cannot inspire the love of knowledge in the children, then the efforts of the parents to accomplish the same end must be stronger, and this part of education not be neglected, for with its neglect comes plodding mediocrity, or stupid listless life, or a life of drudgery and money-getting, the only aim being to add field to field, or dollar to dollar, and to receive the obeisance of those who bow to wealth. This object, however, is rarely accomplished, and usually for the mere lack of knowledge, that is, the reasoning ability, or clear-headedness, which comes of a love for knowledge.

The farmer's business is so varied, and touches so many branches of knowledge, that he may well stand aghast at the contemplation of them all. In common with the rest of the world, he is interested personally in all that affects the arts of comfortable living, the business relations of men, politics, religion, social life, etc. Besides, he has a great deal more to interest him and his children. He is in close contact with nature and her workings, and should know that thousands of the best minds in the world are studying the natural laws which have a bearing upon agriculture. Some study the relation of the soil to solvent influences, its ability to gain and retain fertility, its relations to moisture and drouth, to the action of the air, to manure, etc. Others devote themselves to gaining a knowledge of plants of all the different kinds, of vegetable physiology or plant structure, of the diseases of plants, of the changes which cultivation may affect. Others still, apply themselves to the study of animals in health and sickness, the principles of breeding, feeding, fattening, etc. Others study the weather and its relations to full harvests and scant ones, and to gain the ability to know beforehand and take advantage of whatever may come. And so in such different departments of the farmer's interests, wise men devote thought, zeal, and even life itself, to the fuller understanding of laws and facts which he may apply to his profit. Should he not know something about all this? Shall our boys grow up as ignorant of subjects which will enlarge their views and make them better men and better farmers, as the very oxen they fodder?

Let us see to it then that our farmer boys, with that thorough groundwork of good knowledge of the English language and of the cardinal rules of arithmetic and other general knowledge, gain also the knowledge that there is a great deal more to learn about things which will be very interesting and instructive, and which will add not only to their satisfaction of life, but to their wealth in this world's good.

Italianizing and Swarming.

BY BIDWELL BROS., MINNESOTA.

The method generally adopted by the best apiarians in both countries is, to compel the bees to replace the queen removed, from worker eggs or larvæ—Nature having provided that in case bæes accidentally lose their queen, they can reproduce one from that source, and the queen so made, possesses force, soon after to acquire nearly the size and standard of anatural queen; so a worker of diminutive size, when emerging from an old comb, lined with even 100 cocoons, will gradually mature to an average sized bee. The requisites necessary to success, are best obtained in a prosperous colony, during the working season, viz: eggs or larvæ to convert into queens, honey and pollen from which

to make and fill queen cells, and young bees or wax workers to make those cells. Where these are most abundant, success is the more certain; a want of young bees causing the production of smaller and shorter queens; and larvæ of unsuitable age, in case eggs are wanting, will furnish imperfect queens, if any.

In Italianizing stocks in common box or straw hives, we would recommend early in spring to feed the stock containing the Italian queen, by pouring one tablespoonful of honey into the hole in the top of the hive, morning and evening, to hasten the production of drones and brood, being careful to cover the hole to exclude other bees. When the drones have appeared, blow a little smoke into the entrance, invert the hive (hive A), placing over it an empty one (hive B), then drum on the lower hive (A) 15 minutes, or until the queen and bees have gone up, (this can be ascertained by first making a large hole or several small ones in the top of the empty hive (B), which should be covered with wire cloth, or glass to observe when the bees ascend), then remove the hive with bees, placing it temporarily on the stand of the parent hive (A). Remove the drummed hive (A) to the stand of the stock (C) you wish to Italianize, removing it (C), and also driving out its bees and queen, which shake out on a cloth in front of the first drummed hive (A), that you have previously placed on their stand. As the bees go in, catch and kill the black queen. They will then raise an Italian queen from the Italian brood in the hive. Place the hive (C) containing black brood on the old stand of the Italian bees (A), shaking them in front. After ten days, drive out the Italian bees (that is the stock A in the hive of C) with their queen, again exchanging this stock with another until all are Italianized. On the first three pleasant days after the 12th, counting from the time the Italian queen is removed, contract the entrances to the hives containing black drones. Should any queen meet black drones, which can be known by their imperfect worker progeny, they should be again treated as black ones.

Another method, when frame hives are used, is, early in the spring to remove all the frames containing drone comb from the black stocks, replacing worker combs, and giving the stock containing the Italian queen one or more frames of worker comb. When the drones mature, remove the honey board that covers the frames, and place over an empty hive or cap, and drum up the bees and queen, exchange as in the case of the box hives, repeating it every ten days if necessary. If the stocks are numerous, ten days after the queen has been removed from any hive, the new queen cells will all have been sealed. Then carry the hive to a room and divide the combs, putting one, two, or three frames with the adhering bees into empty hives, and at one side, being careful to give each at least one comb of maturing brood, and one of the largest and longest sealed queen cells. If the sealed queens happen to be all on one comb, a piece of comb an inch or two in size, containing a queen cell, can be cut out, and inserted into a similar hole cut in another comb, being careful not to chill or injure the queen larvæ. Place the hives containing the combs, one on the old stand, and each of the others on the stands of stocks containing black queens, removing them away. When the workers fly out, they return to their former stand and enter these hives, and if the season is not far advanced, all will increase to good colonies. If practised early, this will answer for swarming; if late, the stocks may afterward be strengthened from stronger stocks.

We have adopted the following plan, which we consider the most perfect system of swarming, using frame hives: Early in the spring, when the stocks become populous, we lift out the two outside combs, placing them near the centre of a similar but open bottomed hive, then crowd the combs in the old hive to the outside, replacing empty ones near the centre. Then we place over this the open bottomed hive, filling up with empty frames. In this way the majority of the stocks can be employed filling hives for the new swarm, while a few can be raising queens in the natural way. Such should not have additional room, but should be examined every ten days, and when sealed queens are found, they may be removed, on the frames, to the upper hives, which should then be shifted with the adhering bees and combs to the stand, the lower hive being removed, but that only a foot or two away. Little time is thus lost to either the old or new colony. A few of the best queens are selected for queen raising; their hives should also contain drone combs, the others, none. In this way all the better qualities of the Italians can be preserved, and perfect purity be easily and safely maintained.

Effect of Shelter on the Health of Stock.

The comfort of stock is greatly promoted by good shelter. How different do the sleek and contented cattle and sheep in a well protected barn-yard look, from the poor, rough-haired, pinched-up stock in an open field! On entering such a yard, the first thought is: How comfortable the creatures look! Now, "the looks of things" should not be disregarded.—Then think of the economy. It may cost something to put up sheds and high, tight fences; but in the long run, it costs more to feed half-starved cattle. Before any animals can fatten, a certain amount of food must be expended in keeping them comfortably warm. If healthy neat stock and sheep have as much good food as they can eat, they will perhaps go through the winter in about as good health as they would if well housed or with the best shed room, even though they be exposed to all the rigors of the climate, but the amount of fodder they will consume is immense, and if they are not quite well to start with, or get short of fodder, it will go hard with them. Cows will sink their calves, sheep will die, the lambs will be born dead, and other evils almost surely follow. Close stalls or rooms for cattle and sheep cause disease of the lungs, indigestion, colds, fevers, cutaneous disease, etc., the tendency to these disorders being increased by lack of cleanliness, by improper food, etc. Fresh air, not necessarily cold, but much better cold than not fresh, is a prime necessity. For breeding sheep or any but those rapidly fattening, the exposure of half open sheds is not objectionable, but for all kinds of neat stock and horses it is better if possible to provide warm quarters. Health of stock and profit in feeding are so closely connected with good air, warmth, cleanliness, good food etc., that they all ought always to be aimed at.

Too Much Land.

The desire to own a very large farm is natural, but often proves unwise in its results. When a man wishes to practise a mixed husbandry, and his present acres are too few and unsuitable, it is doubtless wise to annex more territory. Neighbor Jones has twenty acres of meadow land, which is suitable only for hay, or grain, or

hoed crops. But as he finds a small dairy would be profitable, and sheep would bring in good returns, it would be advisable for him to buy several acres of rolling or hilly land adjoining. But this accomplished, let him stop, and be careful to buy no more than he actually needs for his special purpose. For, this new land will have to pay taxes, will have to be fenced, and may need other expenses laid out upon it. At any rate, it will add to his cares, and perhaps will bring in no adequate return.

We know a farmer who, ten years ago, owned 150 acres, and was doing very well; he now owns five hundred, and is worse off than before. And why? Because this large farm is a great bill of expense to him; he cannot afford to keep it up in good condition, and it hangs a millstone of care about his neck. His wife and children, both sons and daughters, are obliged to work hard to keep the great machine a-running. We presume his boys declare they will leave home as soon as they are old enough; and the girls say they will die before they will marry farmers. Neither sons nor daughters are educated as they deserve to be; they cannot be spared for this from work on the big farm.

Now we declare that such a farm is a curse to its possessor and his family, and an injury to the whole agricultural interest. If that man wants to save himself and his household, he should sell at least one half of his land, improve the remainder to make it more productive, release his children from bondage, and try to make his home a place of comfort. He will live longer, lay up as good a property, and will train up a more intelligent and a happier family.

The Camels on the Pacific Coast.

It must be well known to most of our readers that these strange and wonderful animals, natives of the East, and with which we associate only Oriental ideas and scenes,—the Arab's Ship of the Desert—the Tartar's wealth in peace, and strength in war,—the Turk's drudge and the Persian's glory—in two distinct species are domesticated upon our great Western plains and deserts. Having seen in the possession of Prof. W. H. Brewer, of Yale College, a striking sketch of a group of Bactrian camels on the Humboldt desert, Nevada, latitude 40°, we obtained permission to copy it, and he has favored us with some notes of his observations of the camels on the Pacific coast, where he has lately been.

Camels were introduced into the United States at several times, both under government auspices and by private enterprise, but the most considerable importations were made by or under Jeff. Davis, while U. S. Secretary of War. Both, the large Arabian one-humped camels or Dromedaries, and the smaller two-humped Bactrian camels, were imported, the former we believe from northern Africa, and the others from western Asia. One of the native keepers that came over with the latter, was "Yuseph Badra," made somewhat famous by J. Ross Brown, who had already seen him in his "Crusade in the East." Nearly or quite all of the camels were put first on the *Southern deserts*, that is on "the plains" of Texas, New Mexico, Arizona and California, and none were used north of the northern line of Arizona until after 1859 or 60. Although high hopes were entertained of their usefulness there, the sequel has thrown much doubt over their availability for our uses.

Of the wonderful power of endurance, the strength and fleetness of the camel, it is un-

CAMELS UPON THE AMERICAN DESERT. — Engraved for the American Agriculturist.

necessary here to speak. On the southern deserts they at first bade fair to succeed. They crossed with ease those desolate stretches that were very trying to horses and mules, but while they could go longer without water, the "alkaline water" of the American desert seemed as fatal to them as to other animals. They obtain from the stunted shrubs, where there is little or no grass, a larger proportion of their food than horses or mules; and it is stated that they will even eat sparingly the stinking "Creosote bush" (*Larrea Mexicana*) of the Colorado and Arizonian deserts, a plant no other animal will touch.

Various causes induced the sale of government camels, and we believe none are now owned by the government, but that all were sold in California, and are now scattered over that state and Nevada. We have heard of no camels in Texas since the beginning of the recent war.

They were a losing speculation to government, selling at only one-fifth of their original cost, or even less, for it is currently stated that camels which cost the United States \$1,800 each, sold at an average of about \$150. Some of the Bactrians that were imported privately, proved a better speculation, we believe.

The dromedaries are the largest, and some were fine animals compared with the miserable caricatures we see in menageries. The strength of one of them which was detailed for use by the United States California Boundary Commission, in 1860, while at Los Angeles in Southern California, was tested by some of the reckless employees. He was packed with a load of 2,300 pounds, while kneeling; he rose and walked about the corral with that enormous load and did not appear to be injured. He was killed a few nights later by one of his mates that got loose and attacked him with his ponderous

feet (their weapons of offence). The heavy blows could be heard nearly a mile, while the drivers dared not interfere. The skeleton of this animal was sent to the Smithsonian Institute, where we suppose it is now to be seen.

It is a curious fact that horses and mules are very much afraid of these animals, until they become accustomed to their appearance and odor. A grizzly bear does not inspire so great terror, as does a camel. Sometimes the horses seem perfectly frantic even before they can see the animals, simply from smelling them.

The newspapers stated that at one time, about 1859, the town of Brownsville in Texas passed an ordinance declaring camels a nuisance, and prohibiting their being driven through the streets, owing to their effect on the horses; and California newspapers contain many accounts of runaway horses in the various towns where camels are seen, incited by this same cause. Nevertheless, when horses and mules become accustomed to them, they appear very much attached to their homely comrades.

A few camels are now scattered over California, but most of them are in Nevada, where they are used mainly in packing salt from the deserts for use in the processes of silver extraction; the usual load is about 600 to 800 pounds. We have no means of knowing the actual number of camels now alive in this country, but as before stated, their numbers are decreasing, although some have been born here.

There are several causes which combine to render the success of camels in the United States more than doubtful. Our deserts are unlike those of Asia and Africa, they are more covered with shrubs, and often the surface is strewn with sharp, cutting fragments of volcanic rocks. We have much greater daily ex-

tremes of heat and cold, and at times heavy rains and snows. At these times, the feet and backs of the camels are apt to get very sore. An Arab can wait; he is never in a hurry; if he can find feed, a few weeks more or less is not of much matter. Not so with the American, he is in a hurry, he can not wait, even to save his camel. Furthermore, in Asia camels are abundant, so that if one gets sore and the caravan is in haste, the animal is sold or traded for a sound one. A few weeks' rest will recruit him, and he is ready for a new journey. But here he is used as long as he can go, then thrown aside for new animals. They seem ill adapted to the habits of Americans, especially that class who have long used mules for packing on our western plains.

"The last camels I saw," says Prof. Brewer, "were near Virginia City, Nevada. Their backs had not been cared for, and they had been used in packing heavy loads of salt from the deserts. Salt water and alkali had accumulated in the long hair of their humps, their pack-saddles had galled them, and great loathsome sores nearly covered the parts touched by the saddle. A pitiless snow squall was sweeping just then over this inhospitable region, and those miserable beasts having fallen into bad hands, and in a bad climate, looked sadly enough. Late California papers relate that soon after opening the last addition to the Pacific Rail Road in that State, the locomotive demolished a camel that had strayed upon the track. Who he belonged to, or how he came there remained unknown. The merciless steam-car knocked him aside to give place to a more truly American favorite. We have more hopes in the success of the Pacific Rail Road, than in camels, be they one-humped or two-humped."

The Japanese Striped Corn.

Every one knows the old striped or ribbon grass of the gardens, in which the leaves are marked with white stripes, and like the marks on the showman's zebra, are "nary one of them alike." This new corn is much like the ribbon grass, magnified; its leaves present the same contrasts of color, and quite as great a variety in their markings. Very rarely an occasional plant with variegated leaves will appear in a field of common corn, but we never knew one of these sports to be perpetuated. The Japanese, who have a great fancy for horticultural stripes and speckles, have succeeded in establishing the peculiarity so that it is perpetuated with great certainty by the seed. Our friend Thomas Hogg sent home the seed of this novelty to his brother, who planted about $\frac{1}{4}$ of an acre with it. We saw the piece when the plants were about a foot high, and failed to find any in which the leaves were not marked. At that age, the leaves were striped with rose color as well as white, but we learn that this disappears as the plants get older. From its habit of growth Mr. Hogg thinks that it belongs to a species of *Zea*, different from our ordinary Indian corn (*Zea Mays*). We judge that it will prove very effective when placed in ornamental groups.

Dr. H. Schroeder's New System of Treating the Grape Rot.

To the Editor of the American Agriculturist:

Much is said and written in regard to that most dreadful disease, the Grape Rot. Under-draining, ditching, subsoiling from 18 to 36 inches deep, long and short trimming, sulphur, lime, and sulphate and phosphate of lime—indeed almost everything is tried to prevent or to cure the Grape Rot; but all have failed. New varieties, it was hoped, would not be liable to the rot, but these also have failed in most cases. The vine that has rotted the most, is the celebrated Catawba. Wherever the Catawba will ripen, and is perfectly free from disease, it is a splendid grape—spicy, showy, aromatic and vinous, and makes a superior wine, a wine that speaks to our heart. Pity, that the Catawba, in consequence of the awful rot, became so much discarded; but I do not blame its opponents amongst vineyardists, as they have suffered so much under its culture. Years ago I noticed that the first crop on Catawba vines was not injured by the rot, observing this to be the case in other peoples' vineyards, as well as in my own. I shall never forget the sight of my first Catawba crops. When the fruit on my neighbors' vines was rotting, mine stood there in perfect health and glory. This I noticed on all my first-fruiting Catawbas, as my vineyards were planted in successive years. I further noticed, that the fruit on my old-wood layers, which I used to make every year, were free from rot. I then laid down several old-wood layers, and cut them off from the mother vine in the fall, and found last year that the fruit on these new vines was perfectly healthy, while the fruit on older vines rotted entirely.

This last year was the hardest year for Catawba vineyardists, and the loss can be counted at very near two millions of dollars, in the West alone. I want to say, to prove the truth of my system, that the Catawba vineyards bearing for first time here, (Mr. G. Lange's and Mr. Schonebeck's) were a perfect exhibition of

NEW JAPANESE CORN.

grapes, when older vines close by rotted entirely. Years ago it was said Nauvoo, Warsaw, and Alton, in our State, had a peculiar soil to perfect the Catawba. But I always denied it in our public horticultural gatherings, and it has been found that the Catawba will rot as badly there as in Cincinnati and Herman, or elsewhere. The islands in Lake Erie, it was said, were entirely free from rot, but the demon went there too, and will be worse next year when the vines will have become older. All the facts above referred to, finally led me to a new system of grape culture, which I claim as my own discovery.

REMEDY.—After preparing the land for the vineyard, plant with good strong layers or first-

rate cuttings, set from 8 to 12 feet apart in a square, in the usual manner. When the vines come to bear the first full crop, say the third or fourth year after planting, take one strong cane of the bearing vine, raised for this purpose; and close to the root of the vine open a little ditch in the row with the hoe or spade, from

4 to 6 inches deep, between your two bearing vines to a point midway between the two. Lay down the cane in this, the end sticking out of the ground, and after covering the ditch, cut the cane off at one foot above the ground. This I will call the *first reverse*. Let grow from this, three strong unchecked vines; two of these are for fruiting the next year, and can be cut long, to give a good crop of fruit. The third cane is for the *second reverse*. In the spring cut your first reverse loose from the mother vine and let the mother vine bear a good crop, or *two* if you choose, as the case may be; then chop it away to give room for the second reverse or third reverse. Take the third cane of the first reverse, lay it across the row to the centre of the space as before described, 4 to 6 inches deep, and one foot above the ground cut it off. Now you have instead of one, two rows of vines. Let again three canes grow on the second reverse (two for fruiting and one for the third reverse). The *third reverse* is made by layering the cane of the second reverse in the new row up to the center of the interval in that row; treat it in the same way as the other reverses. Take the *fourth reverse* made by taking a cane (in the second year after fruiting), from the first reverse, and after chopping out the original vine, lay it to take the mother's place. One-third (or one-fourth as the case may be) of the vines are removed every year, by chopping out and thus making room for another reverse, and so on. There will be in this way, by very little labor and without any doctoring, always a new and vigorous vineyard free from disease and paying well for labor, in superior fruit and superior wine. It may be that in some slower growers than Catawbas or Concords, the reverses can be made only every two years; but good healthy vines in good soil and locality, will stand the reverses almost every year.

This is mainly recommended for Catawba, and other varieties of great value but inclined to rot. Whenever a variety proves free from disease, grow it as long as you please *profitably* without reverses. But one thing is sure, the *finest fruit grows with me on young vines*.

I hope that every one who grows a Catawba vine, or any other vine inclined to rot, will give my new system a fair trial and report publicly the result. Any thing not plainly understood, I will explain on application with the greatest pleasure. My object is only to save good varieties of fruit (inclined to disease) for the benefit of my fellow-men, and to help the often discouraged, poor, hard-working man; and if this my new discovery shall do them good, it will make happy your friend

DR. H. SCHROEDER.

Bloomington, Illinois, Dec., 1865.

We are happy to place the Doctor's views and practice before the country, and commend them to the attention of grape growers.—ED.

Notes on Grapes and Grape Culture.

Pots vs. Broad Borders.—Last August we set forth, as fairly as we could, the advantages which the advocates of border culture claim for their

Fig. 1.

method of growing young vines, and in January last, "A Nurseryman" presented the case for the advocates of pot culture. These two articles have called forth several others, which, as they are only re-assertions of former statements, we are obliged to decline publishing. What is wanted now, is the results of actual experience with both kinds of vines in the vineyard, in the same soil, and under the same treatment.

A Neat Garden Trellis.—A correspondent, "N. C. C.," at Dracut, Mass., makes a very neat and durable trellis by the use of old steam or gas pipe, 1½ inch in diameter. He buys second-hand pipe at a cheap rate, and inserts pieces of proper length in large stones bedded for the purpose. A hole of the proper size is drilled in the stone, and the pipe cemented in by means of melted brimstone. Holes about a foot apart are drilled in the pipe to receive telegraph wire which runs from post to post. Mr. C. wishes to know if such a trellis would be safe near the house, as some of his neighbors tell him that there is danger from lightning on account of it. We should say it is perfectly safe, and not half so dangerous as the partly insulated tin roofs which probably some of them have on their houses.

Training upon Arbors.—While the practice of growing vines upon arbors is not to be commended as the best, yet there are many instances where the foliage is desirable as a screen, and it is often wished to cover the naked side of a building with a vine. When vines are grown in such places, they generally produce but a moderate quantity of inferior fruit, and if neglected, soon become a matted mass of weak shoots.

Fig. 2.

By beginning right, and judiciously pruning each year, the vine may be made both to serve

as a screen and give a fair amount of fruit. To effect this, Mr. Husmann, the distinguished vineyardist of Hermann, Mo., gives a very good plan: The first step is to get a strong vine; plant it in rich soil, and grow but a single cane the first year. This is in autumn cut back to three buds, each of which will throw out a strong shoot the second spring, and in the following autumn will present the appearance of fig. 1. These three canes are to be pruned, leaving three buds upon each, as indicated by the cross-lines. The third year, 9 strong canes will grow, and at the close of that year the vine will be in the condition represented in fig. 2. There are now three principal divisions or branches, each of which bears three canes. The pruning at the close of the third year is done at the points indicated by the cross-lines. One of each of these three canes is cut back to two eyes; the other two are shortened, according to their strength, and tied up. The fourth summer the buds from the canes which were severely shortened, will produce strong shoots to continue the spreading of the vine, while the buds upon the long canes will produce numerous side branches, which, during the summer, must be kept tied in and evenly spread over the trellis. At the end of the fourth year, the appearance will be

Fig. 3.

like that of fig. 3, which, to save space, shows only half of the vine. In pruning at this time, the growth of the season is cut back to one, two, or five eyes, the weakest branches being cut back the most. By the use of judgment in pruning and supplying the vine with plenty of nourishment, a large space may be kept covered with new and healthy wood, which will give a dense sheet of foliage, and at the same time a supply of fruit, though of a quality inferior to that from vines grown expressly for fruit.

The Rot.—The disease which is known as the grape rot, has proved thus far more untractable than the mildew. Some have ascribed it to an unhealthy condition of the root of the vine. This would seem to be Doct. Schroeder's view of the matter, and he proposes, in a communication which we print elsewhere, a constant renewal of the root by layering. Doct. S. is a great enthusiast in grape-culture, and being an extensive cultivator, every thing that he writes will be sure to command general attention.

The Fruitgrowers' Society of Western New York took a vote upon the best varieties of hardy grapes. Thirty-one persons voted, and those grapes which had over ten votes were, in the order of the number of votes they received, as follows: Delaware, Diana, Isabella, Hartford Prolific, Concord, Creveling.

Do You Have Salsify?

"How many of the readers of the *Agriculturist* know Salsify by sight, and how many, or rather how few of them have it in their gardens?"—"I wonder if potatoes and turnips were as long in making themselves popular as are Salsify, Cauliflower, Savoys and other good things."—"Why don't you tell people what a nice vegetable it is?" was a part of the talk over some delicious salsify soup. We have had something to say about this vegetable, and now figure it, so that our readers may know what it is like. It is one of the few articles of food furnished by the great family of Compositæ. It is a biennial, with narrow leaves, and produces the second year a solitary flower on a stem 2 or 3 feet high. The flower is shaped somewhat like that of the Dandelion, but is purplish. The seeds are nearly an inch long, ribbed, and are not to be relied upon after they are two years old. The treatment is the same as for Parsnips. Sow in May, in drills 15 inches apart, and thin to 4 or 5 inches in the row. The usual size of the roots is about a foot long and an inch in diameter, but larger ones may be had in a rich mellow soil. The roots may be used whenever they are large enough. Sufficient for use during the time the ground is frozen, may be taken up and buried in the cellar; it will keep in the ground in

SALSIFY.

the same manner as a parsnip, and is fit for use in spring until the flower-stalk commences to push. This plant unfortunately has received the name of oyster plant, or vegetable oyster, which doubtless prejudices many against its use. As singular as it may seem to those living near the sea, there are many persons away from the points where oysters are common, who look upon them with aversion. It is not necessary to compare salsify with anything else, for to our notion it is good enough in itself, and probably any one fond of parsnips, and many who are not, would esteem this as a valuable addition to their variety of vegetables.

The Hepatica or Liver-leaf.

The disappearance of the snow is the signal for the true lover of nature to commence his rambles in the woods. He does not wait for the trees to be in leaf, for he knows that there will be an abundance to interest those who have appreciative eyes—even though to the dull observer the woods still appear wintry.

The twigs of the Red-Maple are ruddy with their bursting buds; the Ash begins to show its flowers, so inelegant, yet welcome because they are flowers; the golden buds of the fragrant Spice-bush are cautiously opening, and at our feet the pale blue flower of the Hepatica gives assurance that spring has come. The violet may serve in Europe as the emblem of spring, but with us, the Liver-leaf, albeit its name is unpoetical, must stand as the herald of the season. Rising from the cluster of last year's leaves, come the hairy stems, each bearing a single flower, which has no petals, but to compensate for their absence, the calyx is delicate in texture and color, and to those who do not look at plants with a botanical eye, is to all appearance a corolla. Just below the flower are three small leaves forming an involucre which appears much like a calyx. The leaves are produced later than the flowers, and grow quite thick, and they remain during winter until after the new ones are formed. In the dark ages it was believed that plants, by the form and markings of their leaves and other parts, furnished an index to their medicinal qualities. Accordingly, the three-lobed leaf of this plant being supposed to bear a resemblance to the

shape of the human liver, it was considered that nature intended it should be employed as a remedy in liver complaints, and for a time it had a medicinal reputation. Though quite as absurd things are believed now, we have got over the "doctrine of signatures," as it was called, and though our pretty little plant has lost credit as a medicine, it bears evidence of its former reputation in its generic name, *Hepatica*, which is derived from the Latin for the liver—and in its common name of Liver-leaf. The plant is also sometimes called Liverwort, a name, however, which properly belongs to some humble plants related to the mosses.

We find some plants with the lobes of the leaves pointed, like those in the engraving, but more commonly the lobes are rounded and blunt. Some consider these as distinct species, while others regard them only as varieties. The ordinary form with rounded lobes is *Hepatica triloba*, and the sharp-lobed one is called *Hepatica acutiloba*, by those who regard it a distinct species. We have found specimens with the leaves split up into several narrow divisions. In the wild state the flowers vary in color, giving us purple, blue, pink, and even white. In cultivation there are double flowers of all these shades, except white, which has not yet we believe been produced in the double form. This wildling of the woods does very well in the garden: it should have a light soil with plenty of vegetable mold, and a partial shade. The double varieties are much grown by florists. They may be planted in the open border, or if early flowers are wanted, they are set in cold frames. Planted in pots and kept in a cold frame until early spring and then brought into the green-house, the double varieties flower profusely, and are very ornamental. It is a common spring flower in the London markets, but is not much known with us, except by the florists, who use a considerable quantity of them in making up bouquets. The plants are multiplied by dividing the roots.

Select Pears for General Culture.

The list of fruits recommended for general culture by the committee on the Greeley prizes,

LIVER-LEAF—(*Hepatica acutiloba*.)

was published in January. This committee comprised some of our most distinguished pomologists, from different parts of the country, and their object was to present a selection of fruits which are adapted to the widest possible

ROSTIEZER PEAR.

range of climate. It is quite difficult to fix upon any one or any dozen varieties which will be suited to every situation, and we believe that the selection of the committee will give as general satisfaction as any that could be made.

From the inquiries we have had, it would seem that some of the pears in the list are but little known to our readers; especially the summer varieties, Rostiezer and Manning's Elizabeth.

The early pears commonly cultivated are usually of indifferent quality; if it were generally known that there were really good sorts that ripened in August, they would be much sought after. This decision of the committee has called general attention to the above named sorts, and we comply with several requests in giving illustrations and descriptions of them, as we have room. In the present issue we can only find space for the

ROSTIEZER.—The precise origin of this variety is unknown. It was first introduced to the notice of American pomologists by the late Mr. Manning, who obtained it under its present name from a nursery in France. The tree is healthy, and when young produces vigorous upright shoots, which in the old tree are somewhat drooping, and if the tree is not shaped by severe shortening while young, it will assume an irregular spreading form when left to itself. It grows well on both pear and quince stocks. The engraving represents the fruit of natural size and shape. It is rather below the medium size, of a regular

pyramidal form. The stem is remarkably long and slender; calyx open, in a shallow basin. The skin is slightly rough, of a dull green, often somewhat russety, with a dull red tinge on the sunny side. It is a very juicy, melting, sweet pear, with an excellent flavor; a great bearer, producing its fruit in clusters. Hovey says of it: "As a summer or early autumn pear, it is scarcely equaled in its spicy and luscious flavor, partaking much of the character of the Seckel. Like the latter variety, it is a small and somewhat indifferent looking fruit, but, from its other fine qualities, holding the highest rank among the choicest pears." The other pears recommended were, (in addition to the Bartlett, which took the premium as the single pear, best suited for general cultivation,) the Seckel, Sheldon, Lawrence, and Dana's Hovey. These are all good and reliable varieties, but there are others which, in a collection of moderate size, we would not willingly omit, such for example as: Buffum, Howell, Duchesse d'Angouleme, Beurre Bosc, Tyson, Beurre d'Anjou, etc.

The Process of Fertilization.

It has long been established that a grain of pollen, when it falls upon the stigma of the pistil, pushes out a prolongation or pollen tube, which continues to extend through the substance of the pistil until it comes in contact with the ovule, which after this contact begins to develop an embryo and becomes a seed. That so minute a body as a grain of pollen should be able to throw out so long a tube—sometimes several inches in length—has been a mystery which could only be solved by supposing that the pollen grain received nourishment from the pistil, and that the prolongation of the tube was an actual growth. That such is the case, and that growth really does take place, has been shown by the researches of Dr. P. Martin Duncan, quoted by the London Gardener's Chronicle.

CLEMATIS LANUGINOSA.

Dr. D. has shown that the pollen tube is not a continuous tube, but consists of a series of cells formed successively, growing through the tissues of the pistil,—in the Tiger Flower, at the rate of one inch in six hours—and this even when the upper end of the tube is destroyed. He also observes that the pollen tube does not penetrate the embryo sac, but that nevertheless the contents of the tube enter to the embryo sac, after which the embryo commences to form.

The Finer Sorts of Clematis.

The climbing species of Clematis are general favorites, and some of them, such as *Clematis Flammula*, *Viticella*, etc., have been known in the gardens these hundred years, and our native late flowering *C. Virginiana*—always admired in its wild state, both in flower and fruit—should be seen much oftener in cultivation than it is. This wild species, known as Virgin's Bower, and Traveller's Joy, is found in rather moist places and may be transferred to the garden. But these old varieties are quite eclipsed by their newer relatives from China and Japan,

which have come to us within a few years. Still they are not as common or as well known as they should be. *Clematis patens*, from Japan, and *C. lanuginosa*, from China, have given origin to some varieties, the flowers of which are of enormous size, and of great delicacy of texture and color. They are perfectly hardy, grow about six feet high, and will succeed in any soil not too heavy and wet. In June and July, they are covered with flowers like those represented in the engraving—which gives that of *C. lanuginosa*, one of the largest. It is impossible for us to represent in an engraving the delicacy and softness of the bluish lilac color of this flower. There is a variety *pallida* which is of a much lighter shade. The flowers of *Clematis patens* are nearly as large as the above, and of an azure blue, with brown stamens; it has in the gardens and catalogues sometimes the names *C. cerulea*, and *C. azurea grandiflora*. This species has produced several named varieties, among which are: *Amelia*, pale lilac, with yellow stamens; *Helena*, flowers at first greenish, but becoming pure white; *Sophia*, white, bordered with violet; *Louisa*, yellowish white, with brown anthers; and *mon-*

strosa, with partly double pure white flowers, which are smaller than those of the other varieties. The plants should be set in a sheltered place, as their large and delicate flowers soon have their beauty destroyed by any violent winds. *C. florida* is also a Japanese species, which has been a long while in cultivation. It climbs to the height of 12 or 15 feet, and bears a great profusion of large white flowers. There is a double variety, which is also white, and a purple one called *C. Sieboldii*, which was formerly grown only as a green-house plant, but which has proved tolerably hardy. All of the above should, in cold localities, be laid down and covered with earth, and they will bloom all the finer if this be always done. Like many choice things, these varieties are multiplied slowly. They are grown from layers and cuttings, and the choicer sorts are mostly propagated by grafting upon the root of some of the more common species of Clematis. The nursery catalogues have them at 50 cents and upward, according to their rarity. We have only noticed those which may be had in our nurseries; there are several fine varieties advertised by European florists, which are not yet offered here.

THE HOUSEHOLD.

Home Attractions. --- Tea, Coffee, Smiles and Baby Prattle.

The greatest safeguard a man can possess, the well nigh irresistible charm against ale-house allurements and other evil, is an attractive, happy home of his own. The contented and loving wife has sundry valuable auxiliaries at hand, which judiciously employed will add not a little to the potency of her own smiles and cheerful temper. Among these we give good tea and coffee a high place. But these beverages must be good, full of aroma, and hot; not necessarily strong, though sometimes strength is a very good thing. There is a vast deal of very poor tea consumed, and a great deal that is good spoiled in making; and if this is true of tea, it is ten times more of coffee, if indeed the decoctions of roasted seeds, grains, roots, etc., which are so much drank, may be called at all by that name of so aromatic memory.

There is no evidence, so far as we can judge, that pure tea, or coffee used in moderation, produces any but pleasant effects upon adults. They each contain a highly volatile oil, which gives the pleasant flavor and is dissipated entirely by boiling. So the more either tea or coffee are boiled, the poorer they are. The alkaloids, *thein* in tea, and *cafein* in coffee, are dissolved only by boiling hot water. So the "drawing" of tea for about five minutes for green, and 10 minutes for black, as is well known, extracts both of the desirable ingredients; and the percolation of hot water through freshly burned and ground coffee attains the same result for this beverage. The tea must be good and the coffee must be pure, if the wife would be sure of spending a pleasant evening with her refreshed and reinvigorated husband.—See in our picture, the baby boy has caught sight of "papa" as he is coming home across the fields from his day's work, and in his joy has well nigh wrought a catastrophe.

To Retain the Aroma of Coffee.—

Baron Liebig gives the following simple directions: "The berries of coffee, once roasted, lose every hour somewhat of their aroma, in consequence of the influence of the oxygen of the air, which, owing to the porosity of the roasted berries, can easily penetrate. This pernicious change may best be avoided by strewing over the berries, when the roasting is completed, and while the vessel in which

it has been done is still hot, some powdered white or brown sugar. (Half an ounce to one pound of coffee is sufficient.) The sugar melts immediately, and by well shaking or turning the roaster quickly, it spreads all over the berries, and gives each one a fine glaze, impervious to the atmosphere. They have then a shining appearance, as though covered with a varnish, and they in consequence lose their smell entirely, which, however, returns in a high degree as soon as they are ground. After this

Household Items for "Men Folks."

The following hints, much needed by some men, and especially by many half-grown boys, we find going the rounds unaccredited. The style is rather too much of the "slang" order, but we pass this by, for the sentiment. No one whom they do not hit, will take any offence: "Do men folks ever think how much work they make a woman by going into a house with muddy boots? It would

take but a moment for them to use the scraper and leave outside the dirt which they track over the floor, oil-cloth and carpet, and which they leave on the stove-hearth or fender—all of which must be mopped, scraped and wiped off. If your wife, mother or sister fail to clean up the mess, you great big boy or man have made, what a howl you raise because 'the things about the house look so!' And when you go home at noon or night, do you ever notice how you act? Of course not, or you would not do such careless tricks. You enter the door—with a slam it half closes, and some woman must shut it after you. Your overcoat is thrown on a chair in one corner of the room—your hat sails away in another corner to light upon a stand or under it, gloves are thrown on a table, neck-wrapper hung on the first handy chair, and down you sit in the center of the room where every one must go around you. After you have been two hours in a house, the place resembles the ground of a cat squabble. Hat, boots, coat, newspapers, overcoat, gloves, books, jack-knife, hair brush, and all articles you may have in your hands are scattered as though a hurricane had swept through the room; books, papers, magazines, almanac and memorandum book, are routed from their place. And when you have to leave, what a time is there! No one knows where your things are. 'Where is my hat?' 'Where is my overcoat?' 'Who had my gloves?' Every one in the house is put upon the witness stand, and it is more trouble to get you started

"PAPA IS COMING."

sugar-coating, they are to be taken quickly from the roaster and spread on a cold plate of iron, so that they may cool as soon as possible. If the hot berries are allowed to remain heaped together, they begin to sweat, and when the quantity is large, the heating process, by the influence of air, increases to such a degree that at last they take fire spontaneously. The roasted and glazed berries should be kept in a dry place, because the covering of sugar attracts moisture."—Devices have been patented for preserving the aroma in ground coffee. They depend upon mingling small quantities of gum or mucilage with the coffee, or pressing it into cakes and coating them with the same.

down town than to launch a steamer or to start a new stage coach. Then after you are gone, the women must spend a quarter of a day, more or less, in picking up things which you have scattered. The trouble is, you 'don't think.' It would take but a moment to hang up your coat and hat, to put your gloves in your coat pocket, to draw your neck-wrapper through the sleeve of your overcoat, and to cultivate your bump of order. It takes but a moment to put an article in its place and then you know where it can be found. The woman who takes care of the house has enough to do, without choring after large boys or waiting on a lot of men all day. A woman's work is never finished.

You expect her to keep the house neat and tidy. If it is not so, you run to a saloon. You expect her hair to be always smooth, her dress always in order, her stockings always neat, your clothing always in order, the dust swept from its thousand gathering places, something good to eat three times a day besides lunches, and her to be as neat and attractive as she was the night you popped the question. How can she be all this, if she has to spend half her time picking up what you carelessly throw down? If your wife, mother or sister be neat, you should be; if not, teach her neatness by good examples."

About Arrowroot.

The Doctor orders a patient to be fed on "Arrowroot gruel," and you go to the store to buy it, and are served with neither arrow nor root, but only a white powder, and wonder why that starchy looking substance should be called Arrowroot. The origin of many of our names for things in common use, is often quite difficult to trace; but in the present case the tradition is preserved; the ar-

ARROWROOT.

ticle in question takes its name from the root that furnishes it, and that root was so called because the natives of Jamaica were in the habit of applying it, bruised, to the wounds made by poisoned arrows. The plant is a native of the West Indies, and is botanically named *Maranta arundinacea*; the first, or generic name being in honor of an Italian botanist named Maranti, and the other name means reed-like. Several species of *Maranta* are cultivated in hot-houses for the beauty of their foliage, which is sometimes marked with different colors. The present species grows two or three feet high, and has the form given in our engraving, which also shows the small white flower and the large scaly root, or tuber. The plant is cultivated in the West Indies, particularly in Bermuda, and before the war its culture had made some progress in Georgia and a few of the other States in the South. The Arrowroot of commerce is starch prepared from the tubers of this plant, by grating them on a wheel rasp, and then carefully washing away the fibers and all other matters except the starch, which is then thoroughly dried and packed in boxes and casks for exportation. It is a lumpy powder—more white and glistening than other forms of starch, and is superior to them on account of its great purity. It is free from any peculiar odor or taste, is easily digestible, and well suited to the diet of invalids. It may be used for puddings, blanc-mange, etc., in the same way as corn starch. Potato starch is sometimes falsely sold as Arrowroot, but it has not such a dead white appearance, and can usually be detected by its odor, though sometimes

it is necessary to make use of the microscope to detect the fraud. The grains of potato starch are larger than those of arrowroot, and have different markings. A tablespoonful of arrowroot, first mixed with a little cold water and then added to a pint of boiling water, will, when cool, form a nearly transparent jelly, which, flavored with sugar, lemon, etc., makes a pleasant sick diet. With the same quantity of milk a blanc-mange is produced.

About Potatoes and Cooking Them.

Excepting wheat, no article is so largely used for food as the common potato—called the "Irish," and at the South the "Round" potato to distinguish it from the sweet potato. 4 pounds of potatoes contain about 3 lbs. of water and 1 lb. of solid matter, taking the average of the different varieties. Fresh lean beef contains just about the same proportion of water. A large part of the solid portion of potatoes, is starch, as is the case with wheat, corn, and indeed most vegetable substances consumed as food. 400 lbs. of potatoes yield about 300 lbs. of water; 64 lbs. of starch; 15 lbs. of sugar and gum; 9 lbs. of protein or nitrogenous compounds which furnish direct nutriment for muscles or lean flesh; 1 lb. of oil or fat, and 11 lbs. of woody fiber. If dried and burned, the 400 lbs. of potatoes yield nearly 4 lbs. of ashes. These 64 ounces of ashes consist of about 35½ oz. of potash; 8 oz. of phosphoric acid (which enters largely into the composition of bones); 8¾ oz. of sulphuric acid (oil of vitriol); 4½ oz. common salt; 2¾ oz. of silica; 3¼ oz. of magnesia; 1½ oz. of lime, and nearly 1½ oz. of soda.—It will thus be seen that the potato is a very good article of food. The starch, sugar, gum, and oil, meet a great want of the animal system, giving material for respiration and the formation of fat. The protein compounds supply muscles, and the salts in the ashes afford material for bones, etc. A pound of potatoes furnishes as much material for fattening and warming the body, as a pound of beef, while costing scarcely one-tenth part as much.

COOKING.—The starch in potatoes exists as little grains, 10 or 12 of them together, in cells. Heating the potato by boiling, steaming, or baking, causes these cells to burst, and the water unites with the starch grains, swelling them. If all the water contained in the potato thus unites with its starch, the potato cooks dry and mealy. If only part of the water is absorbed by the starch, then the potato is watery. The best mode of cooking this esculent is by baking, which drives off all the water that does not unite with the starch. If boiled, cook them rapidly, and when just done, pour off the water, and dry them out; then they are improved by mashing fine to free them from indigestible lumps; this, of course, can be done by the teeth of those who prefer their potatoes "undressed." Frying them, dries up the starch, leaving it similar to charcoal, and when done brown they are almost as indigestible as so much charcoal or wood.

A New Discovery—The Ague Plant.

The "ague plant" has recently been discovered,—not the plant that cures ague, but the one that causes it. Here is one plant, at least, that we can notice without being overwhelmed with applications for seed. To be sure it is a little thing, and takes a good eye, aided by a good microscope, to find it, but when found, it can not be said it "is no great shakes," for it is the "genuine Shaker seedling" itself. Doct. I. H. Salisbury, of Cleveland, Ohio, announces in the American Journal of the Medical Sciences, that fever and ague is caused by a minute plant, which is found where stagnant water has just dried away. The spores, or reproductive dust of this microscopic plant, are diffused through the night damps, and being taken into the system by breathing, are the cause of that wide spread scourge, the ague. The habits of these minute plants completely accord with what was before known of the occurrence of miasm, and that they are the real cause of it has been shown by taking boxes of earth containing them, to places

where an ague was never known to occur. In about two weeks after the ague plant was taken there, well marked cases of the disease appeared. This discovery does not as yet increase our knowledge of the means of ridding ourselves of the plant, but it will probably lead to that—just as one if he can only find out "how he got such a cold?" is already half cured. The spores only rise in the night, and then to a height varying with the locality, of from thirty to one hundred feet. This explains why night air brings on ague, and why elevated localities are free from it. After the ague seed is taken into the system, the plant is propagated there, and the patient becomes a sort of animated hot-bed.

Youmans' Household Science.—This valuable book we have recommended in former times, and call attention to it again now. It treats somewhat fully of the science of living, especially of cooking, the why and wherefore; of the various kinds of food, beverages, clothing; of heat, light, air, cleansing, etc., etc., in nearly 500 pages. The first part may be rather scientific for the unlearned reader, yet no one can go through the book, or read any part of it, without learning much that will be practically useful in household work, and gaining many ideas that will furnish food for thought and interest one's mind while engaged in the most common operations of daily labor in the house. We should be glad to see a copy owned, read, and studied in every household—by men as well as women. It is sent post-paid by mail for \$1.75.

Hints on Cooking, etc.

Plain Pies, etc.—A lady contributes the following to the *Agriculturist*:—"I send a recipe for a pumpkin or squash pie-crust, that I think will be new to most of your readers. At the present high prices of lard and butter, many perhaps will feel like eating pies made in this way, that would rot in any other; it is simply this: Thoroughly grease a platter and while warm, sprinkle it with dry Indian meal to the thickness of an ordinary crust, then pour in your squash prepared in the usual manner. It soaks the meal sufficiently to form a crust hard enough to cut a piece out well, and tastes somewhat like a baked Indian pudding; no one perhaps would suppose it could be fit to eat, but try it.

"One reason why pies are considered so injurious is, that the fluids of the stomach cannot act on so much grease. One of the first chemists in the country once told me, that fruit sowed up in a bladder would give as much nourishment as if encased in pastry as rich as you will find in many houses. A much more healthful article is a crust raised like biscuits, or made with an alkali (either soda or saleratus,) and an acid, as cream of tartar, sour milk or cream, or buttermilk; an under-crust raised thus answers nearly as well as the usual kind.

Molasses Gingerbread.—One cup hot water, piece of butter half size of an egg, one cup molasses, teaspoonful ginger, cloves and saleratus. Mix the whole so thin that it will pour easily.

"The above are plain cheap and simple, but knowing your paper is intended for all, I send them. In most of the lady's books the recipes are so costly and require so much skill in making as to be but little used only by the rich."

Pressed Chicken.—Boil the chicken with the giblets until the bones can be easily pulled out. Then season to taste, with salt and pepper (a little thyme is a great improvement), and mince quite fine; after which put it in a dish or pan, with weights enough upon it to press it firm; set it away to cool, and when turned out, it makes a nice side dish for dinner, or relish for tea.

Welton Veal.—Boil 4 eggs hard; slice thin; place round the bottom of a 2-quat bowl; lay over these a layer of uncooked veal cut very thin; then a layer of cooked ham cut very thin; fill the bowl with these alternate layers; cover it closely with a plate, and put a weight on the top of the plate, and cook in a steamer three hours. Set it in a cool place till the next day, when it will be jellied.

BOYS & GIRLS' COLUMNS.

The Sweet-Brier and her Neighbors.

A sweet-brier grew thrifflily in a tangled hedge, on the border of a field where the owner had planted corn and potatoes. Until that year the ground had not been plowed for a long time, and grass, dandelions and daisies, with here and there a thistle and dock, were the only acquaintances the sweet-brier had met, excepting the braebies and elders that ramble with her through the hedge. So, when the bright green spires of corn and the dull-faced potato tops showed themselves, the sweet-brier watched them with much interest. "See how straight and prim he pushes up, and how handsomely he dresses," she whispered to her neighbor, the bramble, pointing to a thriving stalk of corn that stood near. "He may well do that," replied the bramble, "for you never saw such a greedy fellow. He is not contented with the rich deposits I saw the farmer leave for him, but he must send out his roots into our bank here, and I hardly know how I am going to live this summer." The corn, however, pushed ahead without seeming to notice these remarks, though I think it made him somewhat vain, for he soon added a handsome knot of silk to his green sash, and set a waving feather jauntily in his cap. He was certainly proud of his wealth, for afterward he changed his dress to yellow and brown, and hung a heavy purse at his girdle, through the meshes of which you could see the beautiful color of shining gold.

The potatoes were a mystery to their neighbors. They seemed content to dig away and mind their own business, the mole told the bramble that they were rich too, for he had stumbled over some of the stores they had hid; they certainly might be, for they dressed shabbily, spent nothing except for mere necessities, and seemed satisfied to live in the very lowliest manner.

The sweet brier, although she was amused by what was going on around her, was too kindly tempered to criticize severely; she contented herself with making the best use of her own means, spreading perfume around her for the enjoyment of others. She was pained when in autumn she saw the corn robbed of his glittering wealth and left to shiver in the chill blast, and felt some little sympathy for the fate of the potatoes, whose treasured stores, hidden with such miserly care, were dragged to light and taken away. And when, one day after a shower, the farmer attracted by her sweetness, transplanted her to twine around the window of his best room, she seemed in no wise elated by the promotion, but only grew more beautiful and gave out more abundant fragrance in return for the richer soil of her new home.

A Small Loss—A Great Misfortune.

"I have lost more than one hundred thousand dollars to-day," said a gentleman in New-York City to a friend who was spending the evening with him, and who related the circumstance to the writer. "How did it occur?" was asked.—"Stocks which I have on hand, are worth that amount less than they were yesterday," was the reply. He was a broker, doing a very large business in Wall-st. He must have felt very sad over such a serious loss, one would naturally think. Not at all, at least not that any one could discover. He talked and laughed as cheerily as usual, and probably slept not an hour less that night on account of it.—After leaving the broker, our friend on his return home while crossing the park, met a boy crying bitterly. "What is the matter?" he asked.—"I—I—lost—my money!" sobbed the little fellow. It must have been a large amount, judging from his passionate grief. "How much did you lose?" was asked. "Two cents!" and he burst out crying afresh—his whole capital was gone. Of course, his fortune was soon repaired, and the two cents which he received, without doubt gave him more real pleasure, than would the recovery of the larger sum by the rich broker.

An Amusing Toy.

Procure a large sized piece of pith from a ripe corn-stalk, and with a sharp knife carve out a small image of a man or woman. The face can be properly colored with red and black ink. Hollow out the back part of the head and insert a small bullet, which should be concealed by pasting in over it a shaving of pith. Make the feet a little rounding on the soles. Thus prepared the image will persist in standing on its head, and cause much amusement to the little ones.

The Prize Puzzles.

Many contributions in competition for the prizes offered in the January number, have been received up to the present date, Feb. 21, but, so far, only a few original ones. It was distinctly stated in the offer that the name of the author must accompany each puzzle or problem; but as

the matter seems not to have been fully understood, the time for reception is extended until April 1st. Only original contributions can compete. The offer made, is:

- 1. TWENTY DOLLARS for the best Mechanical Puzzle.
2. TEN DOLLARS for the best Arithmetical Problem.
3. TEN DOLLARS for the best Hieroglyphical Rebus.
4. FIVE DOLLARS for the best Enigma or Riddle.
5. FIVE DOLLARS for the best Conundrum.
There is yet time for somebody to win each of these.

The Game of Checkers or Draughts.

HISTORICAL.—(Continued from page 67.)—The kind used by King Rhameses, 1300 B. C., who is represented on the walls of his palace, playing Draughts with the ladies of his household, resembled small nine-pins, and seem to have been about 1 1/2 inches high, standing on a circular base of half an inch in diameter. Some have been found of ivory, 1 1/2 inches high, and 1 1/4 inches in diameter, with a small knob on the top. The opposite sets of pieces were distinguished, sometimes by their form, one set being black and the other red or white, or one set round and the other square tops. It is uncertain how the Egyptians played the game, though from the position of some of the pieces in the paintings, it would seem they played it the same as played now.

LAWS OF THE GAME.—(Continued from page 67.)

- 7. The first play must be invariably made by the player having the Black men, and that alternately to the end.
8. At the end of five minutes, (if the move has not been previously made,) time must be called by the person appointed for that purpose, in a distinct manner, and if the move be not completed on the expiration of another minute, the game shall be adjudged to be lost through delay.
9. When there is only one way of taking one or more pieces, time shall be called at the end of one minute, and if the play be not completed within another minute, the game shall be adjudged lost through improper delay.

POSITION NO. 3.

Black.

White.

Black to play and win.

(Known to experts as "Anderson's second position.") Solution to Position No. 2. (See February No., page 67.)

Table with 4 columns: White, Black, White, Black. It lists various game positions and their outcomes, such as '1-20 to 16', '2-16 to 11', etc.

GAME NO. 3.—CROSS OPENING (*)

Table with 4 columns: Black, White, Black, White. It lists various game positions and their outcomes, such as '1-11 to 15', '2-8 to 11', etc.

(*) So called, because the second move is played across the move of the first one. It is formed by the first two moves. (a)—26 to 23 draws. (b)—10 to 14, draws, 9 to 13, White wins. (c)—6 to 3, draws, 14 to 18, White wins. (d)—11 to 16, White wins. (e)—3 to 7, White wins. (f)—11 to 16, White wins. (g)—11 to 16, White wins. (h)—26 to 23, Black wins. (i)—18 to 22, White wins. (j)—24 to 20, Black wins. (k)—14 to 23, White wins. (l)—15 to 15, Black wins.

Answers to Problems and Puzzles.

The following are the answers to the puzzles, etc., in the February number, page 67. No. 188. Arithmetical Problem. Only one answer received; left open for another month. (This is the best thing we have seen for a long time.)...No. 189. Illustrated Rebus.—"Be above meddling in a family between man and wife."...No. 190. Mathematical Problem.—Rule: From the square of half the given dividend, subtract the said dividend; to the square root of the remainder, add half the said dividend, and it leaves the required divisor... No. 191. Anagrams.—1. Misanthrope; 2. Absurdly; 3. Adventores; 4. Attraction; 5. Considerable; 6. Companions... No. 192. It is allowable to use Z, instead of S, in the different spellings... No. 193. Riddle.—Watermelon... No. 194. Illustrated Rebus.—Where there's a will, there's a way... No. 195. Illustrated Rebus.—Where there's a will, there's a legatee (leg-at-tee)... No. 194.—Mathematical Problem.—(Jan. No., p. 26)—8 boys, 9 girls, 10 young men.

The following have sent answers up to the date of Feb. 21: Wm. D. Barnhart, Schuyler Duryea, Wm. F. Sherman, Eugene M. Cole, E. G. Studley, Reuben E. Cronkrite, 184; G. S. Comter, 186, 187; Wm. F. Sherman, 186, 187; A. M. C., 189; Thos. O. Falver, 193; E. G. Studley, 186, 187; Clara Pratt, 183, 184, 185, 187; William C. Johnson, 183, 184; J. Cotton, 189, 191, 193, 195; E. R. Taber, 184, 186, 187; M. S. F. and L. H. F., 184, 186, 187; Marshall T. Bryan, 184, 186, 187; Mary Randall, 184, 186, 187; Abner Stocking, 184, 186, 187; Theodore A. Funk, 184, 186, 187; Wm. O. White, 184, 185, 186, 187; R. Ellis, 184, 186, 187; Reuben E. Cronkrite, Addie Miller, 186, 187; Carrie S. Begby, 186, 187, J. C. Bell, 186, 187; Augustus Heunter, 186, 187; Mary Kate Tutthill, 186, 187; Brooklyn Girl, 187; Edward P. Hascall 183; A. Jackson, 186, 187; Frank Howard, 194; E. G. Studley, 188, 193; Frank W. Lawin, 103; Lloyd T. English, 186, 187; Cornelius Hoagland, Jr., 184, 193; S. M. Close, 184; Hattie M. B. McIntosh, 186, 187; Frances L. Hine, 193.

New Puzzles to be Answered.

No. 196. Charades, by two little girls at Springfield, O.—1st. I am composed of 15 Letters. My 10, 12, 14, 13 is a penalty. My 5, 14, 12, 10, 1, 3, 4 distinguishes an officer. My 9, 3, 8, 11, 14 is what all good children try to do. My 15, 7, 14 is a dull color. My 6, 1, 4 was "The Piper's Son." My 10, 2, 14 tells for what we wrote this enigma. My whole is a book recently published by a popular author.—2d. I am composed of 15 letters. My 10, 7, 1 is a wise little insect. My 3, 5, 9, 2, 13, 7 is one of Tennyson's poems. My 11, 13, 3, 1 is a vegetable not hard to beat. My 1, 4, 6, 3 is what everybody should be. My 8, 5, 9 is the smallest mark ever made. My 12, 3, 7, 8 is enjoined in the new Testament. My whole is often read around myself.—3d. I am composed of 15 letters. My 3, 4, 9, 7 is what nobody should be. My 5, 11, 14, 10 distinguished some of Pharaoh's cattle. My 2, 11, 7, 8 is the dwelling place of an Arab. My 5, 3, 7, 2 is a church fast. My 5, 12, 1, 2 means hark! My 13, 4, 9, 5, 15 is a name often applied to a newspaper. My whole is a busy day at the Post-office.

No. 197. Word Puzzle, by Lizzie V. Hess, Centre Co., Pa.—I am an article of agriculture; behold me and I am what is produced by motion; behold again and I do that without which we could not live; behold again and I am a preposition; take off my head once more, nothing is left but a common drink. No. 198.

No. 199. Illustrated Rebus—Something growing at the West, which is said to be very terrible to Swine.

No. 200. Picture Puzzle.—The above picture is much like the next one below. Please explain the resemblance.

No. 201. Illustrated Rebus.—Very good advice for all.

No. 201. Conundrum.—Of what color is this page?

TICK! TICK! TICK!—Engraved for the American Agriculturist.

Two wonderful playthings! The child listens with astonishment and delight to the "tick, tick," of the watch—the grandfather's smile of happiness, shows the pleasure he enjoys with his precious little plaything, the baby. The child may well be interested by the wonderful instrument; it is a triumph of ingenuity, requiring the efforts of many men for a long period of time to make it so nearly perfect. It appears almost like a living thing; but it must be wound up every day, and at last it will be worn out and useless. The child is animated by a power that will never cease. It will keep the body in motion for many years perhaps, just as the main spring causes the wheels and the hands of the watch to revolve. You can feel the "tick" of this life clock, by placing your hand upon the wrist, or over the heart. At some time those cunning fingers that now grasp the plaything, the eyes that are lit up with pleasure, the lips moving with winning words, will be stilled by death, but the main spring, the spirit, will yet be active; it is wound up for eternity.—Nothing in this beautiful picture is more interesting, or more clearly shows the skill of the artist, than the likeness of the two faces. Although many years are marked in deep lines on the cheeks of the old man, a heart full of love has kept his features pure and bright. No selfishness, or evil passion is there; it is a face that any child would trust, and when the spirit that has made it so attractive passes away, who can doubt that it will be beautiful, and fitted to live in a brighter world?

Expansion by Heat—Exception.

We can hardly explain why, but it is a fact that almost every thing is expanded or made larger by heat. The blacksmith makes the wagon tire a little smaller than the wheel, and then heats it. The heat expands the iron

and makes the tire so large that it will easily slip over the rim of the wheel. He then cools it quickly, so as not to burn the wood, and it shrinks up with great power, binding the felloes, spokes and hub together very strongly. The iron rails of the railway expand so as to touch each other in warm weather, and contract so much in very cold weather, that you can almost put your finger between the ends of the rails. The clock pendulum becomes longer in warm weather and swings slower, while it shortens in cold weather and goes faster; so with a watch spring. A dish of water even full when cold, will expand so as to overflow when heated, even far below boiling.—But between $39\frac{1}{2}^{\circ}$ and 32° , water expands. Seven quarts of water will expand so much by freezing that it will make eight quarts of solid ice. This is a very remarkable exception to the general rule that heat expands and cold contracts bodies, and we can see the wisdom of the Creator in so ordering it. If water kept contracting down to the ice point (32°) it would of course grow heavier and sink to the bottom, and the consequence would be that our rivers and lakes would become solid masses of ice, which would not thaw out in a whole summer. Instead of this, the expanded, lighter ice floats on the surface, and being a non-conductor of heat, it protects the water below it from giving off much heat, and thus keeps it from freezing. As the water in freezing becomes one-seventh part lighter, one-eighth part of a cake of ice will float above the surface. So if we see an iceberg, or a cake of ice, we may know that there is seven times as much ice in the water, as there is above it.—*Questions.* If an iceberg is one mile square and rises 100 feet above the surface, (1) How many cubic feet of ice are there in all? (2) How many pounds does it weigh, allowing a pint of water to weigh a pound, and one gal-

lon to measure 231 cubic inches? Remember to calculate for the expansion of the water in freezing.

Brains are the Best Tools.

Many of our readers will remember how the mammoth steamer Great Eastern was saved from shipwreck a few years ago, by the skill of an American engineer who happened to be a passenger on board. Some derangement of the rudder had occurred during a severe storm. The huge structure became unmanageable, and was being helplessly rolled about like a log by the furious waves. The ship's carpenters had exhausted their ingenuity in trying to remedy the defect, and the case seemed almost hopeless, until Mr. Towle, the American referred to, contrived a very simple apparatus by which the sailor were enabled to control the ship's movements, and bring her safely to port. He had learned how to use his brains.—A young man lost the use of his right arm, by paralysis; but his brains are left, and right serviceable he has made them. They have furnished the industry, perseverance and pluck, by which his left hand has been trained to guide the pencil and brush of the artist, and his name already ranks high in the profession. The *Agriculturist* owes some of its finest embellishments to his talent.—A blind man invented one of the most successful attachments to the reaping machine; another by his observations on bees, awakened an interest on the subject that has led hundreds of sharp-eyed investigators to make their curious habits a study, adding important ideas to the world's knowledge, and luxury and wealth to its stores. The list of such is too long to recount here, but it is by no means yet complete; many as yet unknown are preparing to enter it; your brains, young reader, rightly used may help to swell the number.

(Business Notices \$1.50 per Agate Line of Space.)

NOTICE.

**TO YOUNG MEN from the Farms--
MECHANICS--SOLDIERS---MID-
DLE-AGED MEN who desire to bet-
ter their condition in Life---and
to PARENTS who would make
their Sons successful, useful Men.**

I have suggested the best Course of Study and System of PRACTICAL Training for preparing Young and Middle-aged Men for active, successful life, ever adopted in this or any other country.

My course for Farmers' Sons and Mechanics is the best in the world, it being the most useful, the shortest and most comprehensive.

Such is the popularity of my System of Practical, Useful Education, that my College at Poughkeepsie, N. Y., on the Hudson, has become the largest Educational Institution on the continent—enjoying patronage from all sections of our own country, South America, Europe, Cuba, Mexico, and the Canadas, and exerting more power and influence for Practical, Popular Education than all Commercial or Business Colleges in this country combined.

Such was the extended patronage from the West, that it became necessary to establish an Institution at Chicago—under the principalship of Prof. E. P. Eastman,—where this system of Education could be enjoyed, and its success has no parallel in the history of Schools and Colleges, it being to-day the largest Educational Institution in the West.

Mechanics who would be successful, Young men from the Farms who can devote the winter to study, Men of Middle-age who desire to change their present employment for something more remunerative, and Returned Soldiers and others who desire lucrative, honorable situations in business, can enjoy advantages here not to be found elsewhere.

Graduates are assisted to such situations as they merit, through the College Agencies in the different cities. References are given to more than 200 in Government Departments at Washington, and more than 400 in the City of New-York alone, who owe their success to this Institution.

The prescribed Course of Study can be completed in three months, at a total expense for tuition and board of from \$85 to \$100. Those wishing to become members will be admitted any week day in the year. There are no examinations at commencement.

The Illustrated Paper of 16 pages, giving full information of the Course of Study, and the Eastman system of Training, is sent free of charge to all who desire it.

Applicants will apply in person or by letter to
H. G. EASTMAN, L. L. D., Prest.,
Poughkeepsie, N. Y.

Or, for Western Institution to
E. P. EASTMAN, Prin.,
Metropolitan Hall, Chicago, Ill.

A CARD—To those Desiring Situations.
PRESIDENT'S OFFICE,
Eastman National Business College,
POUGHKEEPSIE, N. Y., ON THE HUDSON,
January 15th, 1866.

To Patrons and Applicants:—I have the honor to announce the continued and increasing prosperity of this Institution and the growing favor of my system of PRACTICAL BUSINESS TRAINING.

The demand for Young and Middle-Aged Men for Spring and Summer Business has not been so great in any preceding year as at present.

I am now prepared to furnish all graduates of merit, with first-class business positions, either in the North, West or South. Those entering upon the Course in March can qualify in time for Spring and Summer business. Those completing the Course in the Spring and Summer will enjoy the attractions of our beautiful City and its surroundings.

In no place in the United States can a student spend the few months necessary to complete his Commercial studies with so much profit and pleasure as here, and in no other place are expenses so reasonable. The Institution is represented largely in the Spring and Summer by those who have been engaged teaching during the Winter, or attending Literary Institutions. Situations can be furnished those who desire them any time during the Summer or Fall.

Farmers, Mechanics, and Young and Middle-aged Men of any calling, who desire to improve their present condition in life, will be assured of success by mastering the practical branches of this Institution. Reference can be given to those who have been aided to honorable and lucrative situations in Government Departments in every City of the Country.
H. G. EASTMAN, L. L. D., President.

THE GREAT AMERICAN TEA CO.'S SECRET!

The great secret of the unparalleled success of THE GREAT AMERICAN TEA COMPANY is in the fact that their rate of profit is based upon ENORMOUS SALES with a small percentage.

The Company have leased extensive warehouses in the most central locations, and fitted them up in a style of magnificence very far surpassing anything ever before known in this country.

The Company continue to sell at the following prices: OOLONG, 40c., 50c., 60c., 70c., 80c., 90c., best \$1 per pound.

MIXED, 40c., 50c., 60c., 70c., 80c., 90c., best \$1 per pound.

ENGLISH BREAKFAST, 50c., 60c., 70c., 80c., 90c., \$1, \$1.10, best \$1.20 per pound.

GREEN TEAS, 50c., 60c., 70c., 80c., 90c., \$1, \$1.10, best \$1.25 per pound.

YOUNG HYSON, 50c., 60c., 70c., 80c., 90c., \$1, \$1.10, best \$1.25 per pound.

UNCOLORED JAPAN, \$1, \$1.10, best \$1.25 per pound.

IMPERIAL and GUNPOWDER, best \$1.25 per pound.

These Teas are chosen for their intrinsic worth, keeping in mind health, economy, and a high degree of pleasure in drinking them.

COFFEES ROASTED & GROUND DAILY.

GROUND COFFEE, 30c., 35c., 40c., 45c.—best 40c. per pound. Hotels, Saloons, Boarding-House keepers and Families who use large quantities of Coffee, can economize in that article by using our FRENCH BREAKFAST and DINNER COFFEE, which we sell at the low price of 80c. per pound, and warrant to give perfect satisfaction.

Consumers can save from 50c. to \$1 per pound by purchasing their Teas of the

Great American Tea Company,

Nos. 31 and 33 VESEY-ST., corner Church-st.

No. 640 BROADWAY, corner Bleeker-st.

No. 503 EIGHTH AVE., near Thirty-seventh-st.

No. 205 FULTON-ST., BROOKLYN, corner Concord-st.

Country Clubs, Lland and Wagon Peddlers, and small stores (of which class we are supplying many thousands, all of which are doing well), can have their orders promptly and faithfully filled; and in case of clubs, can have each party's name marked on their packages as directed by sending their orders to Nos. 31 and 33 Vesey-st. We return thanks to parties who have taken an interest in getting up clubs.

CLUBS ordering more than Thirty Dollars can have the goods sent by Express, and pay the expenses on delivery of the goods. Orders for less than Thirty Dollars had better send Post-Office Drafts, or money with the order.

For the purpose of showing parties how to get up clubs, we append an order received a few days since—and it is only one of a great many, which vary in amount from \$50 to \$500—with the reply in answer to our request for permission to publish:

ERIE RAILWAY TRANSPORTATION OFFICE, } DUNELAK, Jan. 29, 1895.

The Great American Tea Company: Dear Sirs:—Yours of the 29th of January is received and duly considered; in answer I would say that I have not the least objections to your publishing my order in full or otherwise, as you may wish; in fact I should prefer that you would; it may be the means of bringing before the working class the advantage to them of forming themselves into clubs, and purchasing their Teas and Coffees at the Great American Tea Company's Store. We still remain, yours, etc., Box No. 363, New York, N. Y. W. COOPER.

Table listing various tea and coffee items with prices, including Oolong, English Breakfast, Gunpowder, and Young Hyson.

Total. Received Payment for the Great American Tea Co. \$146 25

The following was received from another Club. It tells its own story.

CUBA, NEW-YORK, Feb. 1st, 1895. TO THE GREAT AMERICAN TEA COMPANY.

Gents:—Yours of 29th came to hand, and in reply would say publish any thing you please as regards my order for Tea, and furthermore, the Tea gives perfect satisfaction and is as healthy as one of my neighbors thought it might be.

With all due Respect, Yours truly, PHIL. CARRIER.

CHOICE SEED.

I would again invite the attention of the public to my Annual Catalogue of choice and reliable garden seeds, including over two hundred varieties, over half of them of my own growing.

The following list of new, rare, or very desirable vegetables, Marbled Mammoth Cabbage, (the king of all cabbages, sometimes weighs 60 lbs., and averages 30 lbs. by the acre. No cabbage will grow so large in the hot south as this. My seed are grown from the very best of the best of the best.)

Standard sort.) Ward's Acacia, (a new French sort, which promises to be the largest and most reliable variety grown.) Early Paris Cauliflower, (imported seed; a standard sort.) Ward's Acacia Melon, (pure; the richest and spiciest of all the green fleshed varieties.) Caterpillar Plants, several varieties in one package; a curious oddity from France.) Vegetable Snails, (another vegetable curiosity, used by the French cooks to garnish their dishes.) Striped Leafed Japanese Maize, (a new and beautiful plant from Japan, with foliage striped with green and white, and at times with rose Snake Cucumber, (a long, coiled, snake-like curiosity.)

Vilmorin's new wrinkled edible fodder Pea, (the first wrinkled kind yet known, the pods of which are eaten.) Each of the above forwarded by mail, post-paid by me, at 25 cents a package. Also Early Cracker Onion, (a flat variety, the earliest of all the yellow sorts; quality very superior. See my Treatise on Onion Raising, page 13.) Early Red Danvers Onion, (an early, round red variety, of a fine bright color.) Early Extra Flat Turnip Beet, (has a very small leaf top; quality excellent.) Red Castlemain Beef, (a famous French variety, in France it has a nut-like flavor; flesh deep purple, very tender, sweet and rich flavored.) Giant Onions, (a new and beautiful variety, with a bushy growth, but one ear will weigh about 10 lbs.)

William's Extra Early Pea, (of 116 varieties tested in England, this proved to be the earliest; seven days earlier than Daniel O'Rourke.) Tom Thumb Pea, (very early; ten inches high; very productive.) Drew's New Dwarf Pea, (new; very dwarf, peas mostly oblong, each plant forms a bushy growth, but one ear will weigh about 10 lbs.) Brown's New Dwarf Early Marrowfat Pea, (a new variety, which may be relied upon as both the earliest and most dwarf Marrowfat grown.) McLean's Advance, (new; dwarf, wrinkled, very early and productive; an improvement on Napoleon.) Princess Royal, (new English pea, very productive. These two varieties have been selected as best out of over 20 new sorts.) Hair's Dwarf Mammoth (this is a larger,

pea than the Champion of England, grows but about half as high, is sweet and excellent.) Scarlet Flowering Bean, (an English bean, quite ornamental; grows about two feet high.) Extra Long Casheknife, (a very vigorous and productive variety; has given great satisfaction.) Concord Bean, (the earliest pole bean I have found; in quality resembles Horticulturalist's much better.) Indian Chief Bean, (the best string pole bean known; always in condition for stringing.) Yard Long Bean, (foliage highly ornamental; bean a curiosity.) Jet Cranberry, Mottled Cranberry, (each of these are an improvement in health, vigorous growth and productiveness, on the old-fashioned Cranberry or Tery bean.) Tilden's New Tomato; New Mexican Tomato; Mammoth Chihuahua Tomato; Cook's Favorite; French Upright; Early York, and Bates' Extra Early Tomatoes, (for particular description of these, see my advertisement in another column.) Bates' Extra Early Sweet Corn, (earlier than Darling's Early, a variety of the sweet wrinkled kerneled corn, excellent for the table.) Golden Sweet, (early, tender, sweet, with a rich flavor; peculiarly its own.) Sweet Mexican Corn, (the sweetest and tenderest variety I have yet found.) Late Red Cob, old-fashioned eight-rowed sweet corn, (the ears of these two varieties grow to a very large size; quality sweet and very tender, keeping a long while in condition for table use.)

Chafas, (very prolific; taste very much like a fine Cocoonut.) Hubbard Squash, (the driest, sweetest, and richest flavored of all winter squashes. I introduced this seed pure.) Yokohama Squash, (this new variety from Japan, has the finest grain of all squashes, with a rich, narrow-like taste.) Boston Marrow, (I consider my variety to be the purest in the United States; it took the first premium at the last Annual Fair of Mass. Hort. Society.) Para or Polk Squash, (a bush squashes, for late fall and winter use; in quality it resembles a rich Crookneck. My seed stock came from Para, and is perfectly pure.) Swiss Chard, (the best of all the Beet family for greens, the leaf stalks need used as Asparagus.) Chinese Sugar Cane, (imported seed; pure.) Otahetian Cane, (by some preferred to all other varieties for cultivation in the North.)

Everett Garden Radish, (very long, of extra bright color; for heading as my Stone Mason, the quality of the Wheat, (a new English sort, highly recommended for poor and elevated soils; less subject to blight and rust than other varieties, and has yielded 15 per cent. more than every variety with which it has come into competition.) Fejee Bean, (warranted to be both the earliest and the hardiest of all bush beans.) Improved Green Globe Savoy Cabbage, (as reliable for heading as my Stone Mason, the quality of the Savoy is superior to all other varieties for table use.) Mammoth Millet, (extra tall heads, largest of all.) True Boston Curled Lettuce, (the most ornamental lettuce known.) Neapolitan Cabbage Lettuce, (this is one of the finest Cabbage lettuces yet introduced.) Six choicest varieties of Cabbage Lettuce, (the six finest native and foreign sorts, in one package.) White Japan Melon, (very early, remarkably sweet, very popular.) Allen's Superb, (quality very superior; by some called "King of Melons.") Orange Watermelon, (new; when fully ripe the skin peels off like that of an orange.) Early Sebce Potato, (new; has all the characteristics of the excellent Jackson White, but is ready for market from ten days to a fortnight earlier than the best.)

Early Chenery, (a new, very early, dry potato, becoming quite popular in Boston Market.) Goodrich's Seedling, (new, quite early and productive.) Garnet Chili, (remarkably free from rot; large, solid, very productive; an excellent keeper.) Chick Pea, (used on the Continent of Europe as a substitute for coffee.) Yellow Lupins, (extensively used in Europe for substituting in high quality.)

Improved Long Green Cucumber, (extra long; very fine.) New Jersey Hybrid Cucumber, (one of the largest and best varieties cultivated.) Ornamental Gourds, (many varieties in one package, including Dipper Gourd.) Sutton's Students Parsnip, (new, originated in England; desirable.) Chinese Rose Winter Radish, (decidedly the best of all the winter sorts; an acquisition.) Hood's Dwarf Imperial Purple Celery, (a new variety from France.)

Each of the above will be forwarded, post-paid by me, at 15 cents per package, and warranted to reach the purchaser. Catalogues sent gratis to all.

JAMES J. H. GREGORY, Marblehead, Massachusetts.

NEW TOMATOES.

Tilden's New Seedling. Large, well shaped, very rich color, remarkably productive, of excellent quality, and keeps well for market purposes.

Cook's Favorite. Large, apple shaped, very vigorous product. Raised by the acre, it brought nearly double the price of other sorts in Boston market this season.

Mammoth Chihuahua. Size enormous, weight 2 to 3 lbs. each, one of the largest will weigh a quart measure! Quality excellent.

Mexican Tomato. This is a large, round variety of Lester's Perfect. They are as large and as uniformly round as Cook's Favorite, and are prodigious bearers.

Early York. Very early; mostly of a flat round shape, of good market size, of excellent quality and very productive.

Tomato de Lays. The French upright or bush tomato. This variety is entirely distinct and will bear planting eighteen inches apart.

Bates' Extra Early. A remarkably early round variety, of good quality and of good market size.

Either of the above varieties will be forwarded post-paid by me at 15 cents, a package, and warranted to reach the purchaser.

JAMES J. H. GREGORY, Marblehead, Massachusetts.

My Onion Seed.

What they Say of It!

"Des Moines, Iowa, Oct. 1865. Mr. J. J. H. Gregory,—Dear Sir,—I feel it my duty to return you my sincere thanks for the good and genuine seed of different kinds I bought of you. There was considerably over one hundred dollars worth, all true to name, and excellent. The Onion Seed was the best I ever bought, and I have had a good deal of experience with different seedmen. Some of my Danvers Onions measured sixteen inches in circumference. ROBERT GIBSON."

Mr. Israel Whitcomb, of Hingham, Mass., writes: "I bought seed of you last season, and am satisfied. I think I shall harvest from 1500 to 2000 bushels, and I have not seen one scallion as yet."

I have grown a fine lot of Early Round Yellow Danvers, (this yields enormous crops.) Large Red, Early Red Globe, Yellow Flat or Straburg, and Early Cracker Onion Seed. I invite all who want seed that is reliable in every respect, to send for my Onion Circular for prices and detailed description of varieties, which I send gratis to all. Why run any risk of losing so valuable a crop through poor seed? I have published a thorough Treatise on Onion Raising, of 32 pages, with 13 Illustrations, which I send to any address for 30 cents. JAMES J. H. GREGORY, Marblehead, Mass.

CRANBERRY PLANTS.—MORE OF THE same kind, by

DR. B. H. STEVENS, Essex, Conn.

KNOX'S VINES AND PLANTS.

Grapes, Strawberries, Raspberries, Blackberries, Currants, Gooseberries, &c., &c., of every desirable Variety, and best quality.

OUR GRAPE VINES

are propagated from wood, taken from our own bearing vineyards, of twenty one acres, and are so produced as to secure the most healthy and vigorous growth. We are now able to furnish, of the best quality, the following varieties:

Concord, 1, 2, and 3 years old; Delaware, Hartford Prolific, Creveling, Union Village, Cuyahoga, Allen's Hybrid, Rebecca, Taylor, Anna, Alvey, Elsinburg, Rogers' Hybrids, Nos. 4, 15 and 19, Martha, Black Hawk, Iona, Israella, Adirondac, &c., &c.

Our stock is large and superior, but the demand promises to exceed the supply.

Send Ten Cents for the
NEW EDITION

OF OUR

Descriptive and Illustrated Catalogue

which gives Select Lists, Prices of Vines, Instructions for preparing the soil, planting, pruning, and much other valuable information, &c., &c.

STRAWBERRIES.

We claim that no one has given the Strawberry more earnest attention than we, and that our collection embraces every variety, worthy of culture.

At the very head of the list we place,

JUCUNDA---OUR NO. 700,

which in point of SIZE, BEAUTY, YIELD, LONG BEARING, SHIPPING QUALITIES, VIGOR OF PLANT, PROFIT, and other desirable qualities, IS FAR IN ADVANCE of any other variety, of which we have knowledge. A few acres of it, in the neighborhood of any good market, would be quite a fortune.

Dr. JNO. A. WARDER, says: "It is the most remarkable fruit of its class that has ever come under my observation." A. W. HARRISON, after first seeing it on our grounds, says: "I am once determined to plant no other, and regarded it as the Strawberry of the future, *par excellence*." Mr. E. BATEHAM, says: "Could corroborate all that others have said of its great beauty, size, and excellence of flavor." Geo. M. BEELER, says: "I saw great quantities, ten or twelve berries of which filled a plat. * * * Bushels of them sold every day in market, which brought one dollar per quart." THOMAS MEEHAN, says: "But the greatest of all Knox's Strawberries is undoubtedly '700.'" These gentlemen all formed their judgment of this remarkable fruit, from seeing it on our grounds, some of them, for several successive years. We might also give much other similar testimony, from Rev. Jas. Colder, of Harrisburg, Pa., W. H. Loomis, of Indianapolis, Ind., A. Thompson and Geo. W. Campbell, of Delaware, O., S. B. Marshall, Massillon, O., J. R. Miller, Springfield, O., A. B. Buttle, Columbus, O., Dr. E. Edwards, St. Louis, Mo., and many others. For further description of this Strawberry; also of the AGRICULTURIST, FILLMORE, GOLDEN SEED-ED, RUSSELL, GREEN PROLIFIC, GEORGIA MAMMOTH, LADY FINGER, LENNIG'S WHITE, TRIOMPHE DE GAND, WILSON, FRENCH'S SEEDLING, &c., &c., modes of planting, growing, gathering, marketing, and much other valuable information, send 10 cents for our **DESCRIPTIVE and ILLUSTRATED CATALOGUE.**

RASPBERRIES.

We have a large supply of **Hornet, Pilate, Souchet, Improved Black Cap, Philadelphia, Miami, Purple Cane, &c.** Descriptions and Illustrated Select Lists, Prices, &c., contained in

CATALOGUE,

for which send 10 cents.

BLACKBERRIES.

In addition to the valuable old varieties, **Rochelle, Dorchester and Newman**, we can furnish superior plants of **Wilson's Early and Kittatinny**. Enclose 10 cents for **CATALOGUE**, containing description, illustrations, Select Lists, Prices, &c.

CURRANTS.

Having given much attention to the selection of a good stock of Currants, we are able to furnish, in any quantity, all the old and new kinds, including **Cherry, White Grape, Versailles, Fertile d'Angers, Fertile de Palluan, Victoria, Black Naples, &c.**

We are constantly receiving very many letters of inquiry, in reference to the culture of **SMALL FRUITS**. The information sought after, is contained in the **NEW EDITION** of our **CATALOGUE**, which will be sent to all applicants enclosing 10 cents.

It is furnished at less than cost, and is worth ten times the amount to all interested in the subjects of which it treats.

J. KNOX,

Box 155, Pittsburgh, Pa.

HENDERSON AND FLEMING'S

VEGETABLE AND FLOWER SEEDS, CROP of 1865.

HENDERSON & FLEMING,
Seedsmen, Market Gardeners & Florists,
67 Nassau St., cor. of John St.,
New York.

HOVEY & CO'S Illustrated Catalogue of Seeds for 1866.

Our present Edition (the 30th) is greatly improved and enlarged to more than 100 pages of small type, and illustrated with upwards of

50 New and Beautiful Engravings,
of the most popular and showy, with a full description of more than **2,500 Flower and Vegetable Seeds,** accompanied with full practical directions for the amateur cultivator, is now ready.

The Catalogue now offered to our numerous customers, is one of the most complete ever published, containing all the information necessary for the amateur, for the successful growth of the most beautiful Flowers and Plants. In consequence of the increased cost of paper, and the great expense of publication, we shall make the nominal charge of 25 cents each, and all applicants enclosing that amount will receive the Catalogue.

Address **HOVEY & CO.,**
53 North Market-st., Boston.

Collections of Kitchen Garden Seed for Private Families.

In order to introduce our vegetable seeds as extensively as possible, and make it an object for every person who cultivates a vegetable garden to test their merits, we shall continue our former very liberal inducements to purchasers, sending:

- 20 Varieties for..... \$1.00
 - 45 Varieties for..... 2.00
- These Collections are put up expressly for sending by mail, and contain choice seeds of the most desirable varieties in cultivation for general use. They will be forwarded post-paid, to any address upon receipt of price. We also put up larger Collections for \$3, \$3, \$15, \$30, and \$25. These Collections are for sending by Express, and contain only the most approved varieties. They are arranged on a liberal scale, and cannot fail to give the highest satisfaction. For List of these varieties see our Illustrated Seed Catalogue. Price 15 cents. Address **McELWAIN BROS.,** Springfield, Mass.

OUR ANNUAL ILLUSTRATED

Seed Catalogue for 1866, is now ready, and will be forwarded to all applicants enclosing 15 cents.
Address **McELWAIN BROS.,** Springfield, Mass.

Para, Turban, Hubbard, Yokohama!

As the original introducer of the Hubbard Squash, I am prepared to supply every cultivator with **PURE** seed. The Hubbard is the driest, sweetest and richest of all WINTER squashes, and will keep till April. The Turban is the driest, sweetest and richest of all FALL squashes, and will keep till March. Many of my correspondents are extravagant in their praise of this squash—"Why will people longer raise the coarse, watery summer varieties when they can get such a squash as the Turban!" The Yokohama, a new squash from Japan, has given great satisfaction this season; it is exceedingly fine grained, very sweet, and of a peculiar marrow-like taste. The Para is a bush squash from South America, for fall and winter use; keeping till February. It resembles in quality a very fine crookneck. My seed stock came directly from Para and is **PURE.** All these varieties yield abundantly. Ten tons of Hubbard and eight tons of Turban have been raised to the acre.—Packets of seed of each of these varieties, sent post-paid to any address for 15 cts. Hubbard sent by the lb. for \$2.25. Turban sent by the lb. for \$3.50.
JAMES J. H. GREGORY, Marblehead, Mass.

Double Tuberose Bulbs.

1st. Quality—extra strong, \$1.50 per dozen; \$9.00 per 100.
2nd. Quality (all flowering Bulbs), \$1 per doz.; \$6 per 100.
Sent by mail, post-paid, with my Illustrated Essay on their cultivation General Descriptive Catalogues of Plants and Seeds now ready, mailed on receipt of 10 cents.
PETER HENDERSON, 67 Nassau-st., New York.

Solamm Jasminoides.

(For description see Dec. No. of the Agriculturist, p. 380.)
1000 well rooted plants (ready March 1st, 1866), price 50 cents each, or \$ for \$1.25. By mail, pre-paid, Address **J. MASON,** Agt., Sign of the "Good Samaritan," 42 State-st., Hartford, Conn.

Lilium Lancifolium.

20,000 strong Bulbs Japan Lily for sale by single bulb, hundred, or thousand.
FRANCIS BRILL,
Newark, N. J.

LINNEUS RHUBARB.—

3000 Plants, \$10 to \$15 per 100.
Very fine. Warranted true.
Address **A. M. HALSTED,** 68 Pearl-st., New York.

THE TILDEN TOMATO.

We have the pleasure of offering Seeds of this very valuable variety, raised by us from seeds received of Mr. Tilden, of Iowa, the originator. It has been universally commended by all who have raised it, and it has received the highest premium by our Horticultural Societies. Its great merits are beautiful form, fine color, solid flesh; and an early and very productive sort. It also carries well to market. Packages of seeds 25c. each, and mailed to all who enclose the amount.
HOVEY & CO., 53 North Market-st., Boston.

Amateur-Cultivator's Guide to the Flower and Kitchen Garden, is now Ready.

This work is intended as a complete guide to the Amateur-Cultivator, for both Flower and Kitchen Garden, it contains a list of all Flower and Garden Seeds worthy of cultivation; (embracing over **2,000 varieties,**) with full and explicit descriptions and directions for cultivation, to which is added a list of all the most important novelties which were flowered for the first time in Europe last season, many of them illustrated. It will also contain a descriptive list of

121 Finest French Hybrid Gladiolus, and other Summer flowering bulbs. Also plans for laying out small grounds in a tasteful manner. This will contain over one hundred pages of closely printed matter, fully illustrated with one beautiful colored plate, and

Over Fifty Engravings.

The whole work is executed in elegant style, and will be forwarded post-paid, upon receipt of Twenty-five cents, to any address. Address

WASBHURN & CO.,
HORTICULTURAL HALL,
BOSTON, MASS.

Sugar Cane Seed.

A large and excellent Stock. Selected with great care. This Seed was examined while growing, and purchased in the head, from fields yielding the best and greatest quantity of Syrup. We warrant its purity and correct nomenclature. Large and Early Sorghum, Liberman Nee-a-za-na sta-hi-tan, and all the leading sorts. The Trade supplied at a reasonable discount. Send for Price List, and Illustrated Sorgo Hand Book to accompany "Skinner's" Adjustable Cane Mills, Horse Powers and Evaporators. Address **E. W. SKINNER & CO.,** Madison, Wis.

SUGAR TROUGH GOURD AND LIBERIAN

SUGAR CANE SEED by mail, post-paid, at 25 cents per package, each, the two to one address, 40 cents. The Gourd grows to an average size of four gallons, though I have raised many that held over seven gallons. Excellent for Sap Buckets, and for many household purposes.
The **LIBERIAN SUGAR CANE** was recommended by the Ohio Sorgo Convention, as yielding more than twice as much as any other variety.

It Never Falls Down.
I raised from 2 ounces of seed 30 gallons of good, thick syrup. I will send four ounces in a package.
Address plainly, **WALDO F. BROWN,** Oxford, Ohio.

SMALL FRUITS

AT LOW RATES.

We will send out strong, well rooted plants packed so as to go to Maine or Kansas, safely. **Charges pre-paid.**

STRAWBERRIES.—Following varieties: Jennie Lind, Downer's Prolific—both very early and indispensable. Wilson's Hooker, Chillian and Crimson Cone, 20 cents per dozen, \$1 per 100. Fillmore, (very fine and delicious,) Shaker, Bartlett, Peabody, Russell (one of the best), Wizard of the North, Buffalo, Cutter, Scarlet Magnate, Ward's Favorite, and French—the last, undoubtedly one of the finest and most profitable early sorts grown, on account of yielding the bulk of its fine, beautiful crop so early. 30 cents per dozen; \$2 per 100. **Green Prolific.**—We agree with Francis Brill, of New Jersey, who says of this variety: "This we place first on the list of tried varieties. Its originator, Seth Boyden, places it for general cultivation, above his famous 'Agriculturist,' and so do we. We do not claim this as a perfect Strawberry, for such does not exist, but we do say, it possesses a greater combination of good qualities than any other before the public." Plants that we set last spring have formed the most enormous and astonishing "stools" that we ever saw, and the same produced more fruit last season than the Wilson's Albany set the August before, 50 cents per dozen; \$3 per 100. **Agriculturist,**—\$1 per dozen; \$5 per 100. **Triumph** sort, including White, and New Jersey Scarlet, \$1 per dozen. **Jucunda,** or Knox's "700," \$2 per dozen.

RASPBERRIES.—**DOOLITTLE'S BLACK CAP.** Double the size and yield of the common Black, \$1 per doz.; \$4 per 100. **NIAMA BLACK CAP.**—Equal to the last in every respect, but 2 weeks later, \$1 per dozen; \$4 per 100. **GOLDEN CAP.**—Same as the last, except of a beautiful golden color, \$2 per dozen; \$12 per 100. **FRANCIS BRILL'S**—The best "everbearing" sort we know of, bearing Raspberry grown—the strong, stocky bushes hanging literally loaded with fruit of a purplish, red color, and having the delicious flavor of the wild Red Raspberry, we do most emphatically pronounce it the best and most productive Raspberry grown to our knowledge, \$1 per doz.; \$5 per 100. **CATAWISSA.**—The best continuous crop of large, delicious, purplish, red fruit, late in the season, for a number of weeks, when no other small fruits are to be had, thereby making it indispensable for table use, \$2 per doz.; \$12 per 100. None of the above send up "sneakers," but all are increased by layering the tips of the new growth, and neither has ever winter-killed with us, notwithstanding the thermometer has stood 30 degrees below zero.

BLACKBERRIES.—New Rochelle or Lawton, rows containing 40 plants have yielded 6 to 8 bushels of fruit with us, \$1 per dozen; \$4 per 100. **Dorchester High Bush,** fruit delicious, long, glossy black, yields heavy crops early, and gone by the time the "Lawton" gets fairly to bearing, \$1 per doz.; \$5 per 100.

CURRANTS.—Cherry, the largest and finest red sort, \$2 per dozen, White Grape.—The finest and most productive White sort, \$2 per dozen. Houghton Seedling Gooseberry—Never milder, \$1 per dozen.

GRAPES.—All strong roots and true to name.—Concord and Hartford Prolific, 40 cents each, \$3.50 per dozen. Diana and Delaware, 50 cents each, \$5 per dozen. Iona, Israella, and Adirondac, \$2 each, 1 of each for \$5.

CRANBERRY PLANTS, 50 cents per 100; \$4 per 1,000; 10,000 for \$30.

Sweet Potato Plants in their season at low rates. Send for my "Descriptive Catalogue."—It gives instructions for garden and field culture—also for gathering and marketing the fruit. If you wish to plant largely or to buy to sell again, send for my "Wholesale List." Stamps not returned. Remember that I *prepay charges on all cash orders,* and that not less than 6 of each sort will be sent at the dozen rate, or less than 50 of each sort at the 100 rate. Remittances can be made by mail in National Currency. Post Office Orders, or Drafts on New York, or Chicago.

Address **A. M. PURDY,** South Bend, Indiana.

KIT-TA-TIN-NY—Its Chief Points are:

1. Very largest size.
2. Enormous productiveness.
3. Most delicious flavor.
4. Uniform ripening.
5. No hard core like Lawton.
6. Sweet enough without sugar.
7. Retains color after picking.
8. Earlier than New Rochelle.
9. Fit for Market when Ripe.
10. Very hardy, has never winter-killed.
11. Tested by 3 to ten years trial.
12. Admitted the Best Blackberry known by the highest authority, viz. Chas. Downing, Wm. S. Carpenter, Peter B. Meade, Editors Agriculturist, and every one who has tasted it. My 2 year old plants will furnish berries of medium size this season, if carefully transplanted and attended to. Order early to prevent disappointment. 1-year plants by mail, \$1.50 each; p. doz. \$12, by exp. less. For Testimonials, &c., address **E. WILLIAMS,** Montclair, N. J.

GRAPE VINES.

Evergreen and Deciduous Trees.

15,000 Delaware Grape Vines, No. 1, \$25.00 per 100. We are confident these will suit purchasers, as no pains have been spared in the course of propagation. Some No. 2's at \$15.00. Montgomery, Union Village, Rebecca, Allen's Hybrid, Catawba, Rogers' Hybrids Nos. 3, 9, 15 and 83, and some other varieties at equally low rates. Wilson Strawberry plants, \$5.00 per 1,000.—Norway Spruce, 4 to 7 feet high, \$20.00 per 100. White Corsican, and other Pines, 4 to 7 feet high, \$30.00 per 100. American Arbor Vite, 3 to 6 feet high, \$20.00 to \$30.00 per 100. Siberian Arbor Vite, 2 to 3 feet high, \$50.00 per 100. Larch, French Mountain Ash, fine, White Ash, Elm, Linden, and Maple, 8 to 10 feet high, \$15.00 per 100. Turkey and English Oaks, 5 to 6 feet high, \$12.00 to \$15.00 per 100. Will be delivered at cars or boat. Packing charges reasonable. Also, Extra Early Smooth Red, and Cook's Favorite Tomato seed mixed, the earliest, best, and most prolific of all varieties. Several bushels for sale at \$3.00 per pound. P. O. charges, 8 cts. per lb. **FERIES & CATWOOD,** Po'keepsie, N. Y.

GRAPE VINES.

Evergreen and Deciduous Trees.

Vines two years old, \$1.50 each; \$15 per dozen.
Vines one year, \$1 each; \$10 per dozen; \$50 per hundred.
Also a few hundred strong 2 year old Creveling, \$1.50 each. **EDWARD S. ROGERS,** Salem, Mass.

Adirondac Grape Nursery and Vineyard.

Wholesale and retail. We can furnish superior Vines in large quantities to the trade, of the following: Adirondac, Allen's Hybrid, Concord, Creveling, Cynthiana, Delaware, Diana, Hartford Prolific, Iona, Israella, Maxataya, Miles, Northern Muscadine, Rebecca, Rogers' Hybrids, Sherman and Union Village. Also the best Foreign Varieties, carefully packed and forwarded by Express, or by Mail, pre-paid. Send for Descriptive and Priced Catalogue.

Feb. 1st, 1866. **JOHN W. BAILEY & CO.,** Plattsburgh, N. Y.

THE AMERICAN FRUIT BASKET!

This favorite Fruit Basket for Strawberries, &c., is receiving the highest commendation from every quarter, and is called by many of our best Fruit Growers and Fruit Dealers, the only perfect article of the kind now in use. It is constructed so as to equalize the weight of the fruit—can be packed in less space—and when filled with fruit is exceedingly attractive in appearance.

Having the advantage of superior machinery, the Baskets are sold at a less price than any first class Basket now in market. **AMERICAN BASKET CO.,** Office No. 313 Chapel-st., New-Haven, Conn.

VENEER FRUIT BASKETS.

Beecher's Patent May 31st, 1864.

These Baskets are thoroughly ventilated, and when packed in crates, are warranted to transport safely to all markets. Strawberries, Raspberries, Blackberries, and all other small fruits that are marketable.

For style, convenience in picking and handling, and for profit to Fruit Growers and Commission dealers, they have no equal.

The First Prize was awarded these Baskets at the Horticultural Exhibition of the American Institute, held at Cooper Union, last season; and recommendations from many of our most prominent and successful fruit men throughout the country endorse this decision.

Baskets and Crates can be had of **W. H. Carpenter,** 50 Vesey-st., N. Y.; **C. B. Rogers,** 133 Market-st., Philadelphia; **Richard Cromwell,** 45 & 48 Light-st., Baltimore; and by dealers generally throughout Town and Country.

Manufactured only by **A. BEECHER & SONS,** Westville, Conn.

By whom Circulars will be sent on application with stamp.

The Olmstead Revolving Landside and Adjustable Mould - Board

The most perfect Agricultural Implement ever invented. It has taken **First Premiums** at the State Fairs of both New York and Pennsylvania, for 1865—and at **all** the County Fairs at which it has been Exhibited—**over Twenty.**

We can safely **Guarantee** it to save from **20 to 40** per cent. in Draft over **any Plow** in the United States—to be **equally durable**, and to do **Better Work.**—It will more than save its cost the first season of using it.

ITS GREAT POINTS ARE:

1st. It saves largely in friction both on bottom and side.—**2nd.** It is held easier by the plowman—saving human as well as brute labor.

- 3d.** A child can move it from place to place, in the Barn or Shed.
- 4th.** A shoe is not necessary in running it from field to field.
- 5th.** It is perfectly simple—having no cumbersome machinery—and by a simple movement of the Mould-board (accomplished by turning a single nut), it can be adjusted to do any kind of work, with either a fast or a slow team.

We also Manufacture the **Revolving Landside Plows** with **Stationary Mould-board**, more suitable for **Heavier Work.**

Our **PLOW** does its work so much easier than other Plows, that a man and team can accomplish **much more** in a day. A saving of say only 20 per cent. In Six months plowing, will amount to at least **\$75**—and we can safely **Guarantee** to do more than this.

Circulars with full particulars will be sent by mail. Our Plows can be obtained of R. H. ALLEN & CO., 189 Water-st., New York; GRIFFING & CO., 58 & 60 Courtlandt-st., New York; J. VANDERBILT, 23 Fulton-st., New York. **AYRES, VERPLANCK & CO., Binghamton, N. Y.**

BUY THE BEST!

Awarded the Highest Premium, Grand Gold Medal, by the American Institute, at the Great Field Trial in July, 1865, of which the American Agriculturist says:

"We were present at the trial, and hesitate not to say that we never knew or heard of Mowers being put to so severe and fair tests."

Among the great number of First Premiums awarded to the **BUCKEYE** during the season of 1865, may also be mentioned the following prominent State Agricultural Societies:

Ohio, Kentucky, Michigan, Pennsylvania, Missouri, Vermont, New England, and the Massachusetts Charitable Mechanics' Association.

Farmers who wish to secure the

BEST MACHINE,

should send in their orders at once, and avoid the delay and disappointment they may meet if they wait until the time for using Machines, when the Manufacturers are greatly overcrowded with orders.

FOUND AT LAST.

RAYMOND'S PATENT HAY AND STRAW ELEVATOR will work successfully in every substance which the farmer ordinarily handles with a fork. All kinds of Hay, Salt Marsh included, Straw, Loose Grain, Headed Wheat and Even Chaff, Sorghum, Refuse, Straw Manure, &c. It is double, opens four feet in width, grasps its burden, scatters little, and in discharging the substance is left loose and not bound together, and is easily removed with a hand fork.

The arrangement of pulleys and rope is such that it travels out and in between the load to be moved and the rear of the mow or stack, and at the same time one horse will operate it where two would be required to elevate the same weight with any other Horse Fork. It is used to carry from Stack to Threshing Machine, also to take up the straw again for stacking. It is valuable where hay is pressed, in unloading and carrying to press. It can be applied to a variety of uses and is capable of being of more service to the farmer than any other implement designed for a similar purpose.

A dealer wanted in every county or town, to whom exclusive rights of sale will be granted on favorable terms. Liberal discounts to dealers and purchasers in clubs.

Send for Price List and Illustrated Circular.
CHAPMAN, HAWLEY & CO., Utica, N. Y.

INGERSOLL'S IMPROVED HORSE AND HAND POWER HAY AND COTTON PRESSES.

These machines have been tested in the most thorough manner throughout this and foreign countries to the number of over 3000.

The Horse Power is worked by either wheel or capstan, and in many respects possesses unequalled advantages. We invite those wanting such machines to write for a catalogue containing full information with cuts, prices, &c., or call and examine personally.

Orders promptly attended to, by addressing
INGERSOLL & DOUGHERTY, Greenpoint, Kings Co., L. I.

Agricultural Implements.

Cross Cut or Drag Sawing Machine,

Manufactured by

G. WESTINGHOUSE & CO., Schenectady, N. Y.

The Subscribers are manufacturing a superior Cross Cut or Drag Sawing Machine, and invite the attention of those having large quantities of wood to cut, to it. It has several important improvements over the ordinary machines of this kind, some of which are as follows, viz:

The Saw always runs on a line with the center of the crank wheel, and can therefore be run rapidly without bounding.

The Saw can be raised instantly after finishing a cut, by means of a lever, without stopping the machine, and the same lever can be made to counterbalance the saw arm and thus regulate the cut of the saw in different sized logs.

It has the simplest and best arrangement for drawing the log forward, in use. By simply stepping upon a lever, the log is drawn forward after each cut, without loss of time.

The labor of one man is saved by the perfect arrangement of our machine.

They may be driven by the ordinary Two Horse Railway Powers, or 5 to 4 Horse Lever Powers, and good operators will saw 3 to 5 cords per hour.

We also manufacture Lever and Railway Horse Powers, Threshing Machines, Clover Hullers, Circular Wood Saws, &c. Send for a Circular of above. Address
G. WESTINGHOUSE & CO., Schenectady, N. Y.

ONIONS IN HILLS.

I will send Machines for sowing Onion Seed in hills, two rows at a time, boxed ready for transportation, for \$13 each. When sown by these Machines a large crop of carrots is raised on the same ground between the hills of onions. They are extensively used by the great onion cultivators of Long Island. **JAMES J. H. GREGORY,** Marblehead, Mass.

DOTY'S

CLOTHES WASHER,
THE MOST POPULAR, BEST, AND
Cheapest Washing Machine
EVER INVENTED.

It is easy to operate, sitting or standing; takes but little room; injures no garments; finishes its work in from two to four minutes; is durable, convenient, and the only Washing Machine ever known that is **LIKED THE BETTER, THE LONGER IT IS USED.**

Recommended as the **Very Best** by Solon Robinson, Orange Judd, Prof. Youmans, and many other prominent men.
At the Great Fair of the American Institute, Oct., 1865, where all the principal Washers in the country were ably represented, it was awarded the FIRST PREMIUM.

On receipt of \$20 from places where no one is selling, we will send the Washer and the famous **Universal Clothes Wringer** (and pay the freight if within 200 miles of New York.) The Washer alone will be sent for \$12. Wholesale Terms Circular sent free. Exclusive right of sale given to the first responsible applicant from each town. **R. C. BROWING, General Agent,** 32 Courtlandt-st., N. Y. (Opposite Merchants Hotel.)

ALLEN'S RAILWAY BUTTER WORKER.

With this apparatus a girl 12 years old can work from 1 to 20 lbs. of butter at a time, **MORE THOROUGHLY, MORE EASILY** and more than twice as quickly, as in the ordinary way. It leaves the butter in the best condition for moulding and stamping. It is simple, durable and cheap. Price \$5.00. State and County rights for sale. Address **HANNUM & WALKER,** Belchertown, Mass., or J. A. ALLEN, Deerfield, Mass.

FLORENCE

SEWING MACHINES.

505 Broadway, New-York.

HIGHEST PREMIUM FAIR AMERICAN INSTITUTE, 1865, (Gold Medal). Report of Committee of Awards:

REASONS.

- 1st.—Its simplicity and great range of Work.
- 2nd.—Its making four different Stitches, viz.: The Lock, Knot, Double Lock and Double Knot.
- 3d.—The Reversible Feed Motion, operated by simply turning a Thumb Screw, enabling the operator to run the Work to the Right or to the Left, and convenience of Self-fastening the ends of Seams.
- 4th.—The perfect finish and substantial manner in which the Machine is made.
- 5th.—The Rapidity of its Working, and the Quality of the Work done.
- 6th.—Its Self-adjusting Tension.

THE GREAT FAMILY SEWING MACHINE.

GROYER & BAKER'S

HIGHEST PREMIUM

Elastic Stitch

SEWING MACHINE.

495 Broadway, New York.

The Universal Clothes Wringer

WITH COG WHEELS

Has again taken the first premium at the great Fair of the American Institute; also at the State Fairs of New York, Vermont, Pennsylvania, New Jersey, Ohio, Indiana, Kentucky, Michigan, Illinois, and Iowa.

Over two hundred thousand have been sold, and every purchaser will testify that they save their cost in clothing every year, besides saving half the labor of wringing.

Send for Wholesale and Retail Terms Circular.

R. C. BROWNING, Genl. Agent, 32 Courtlandt-st., (opposite Merchants Hotel), N. Y.

WHEELER & WILSON

LOCK STITCH

SEWING MACHINES.

"Woman's Greatest Boon.—We would advise a man to forego a Thresher and thresh wheat with a flail, rather than to see the wife wear her health, vigor and life away in the everlasting 'stitch, stitch, stitch,' when a Sewing Machine can be obtained. The WHEELER & WILSON is an invaluable aid in every household. We have had several different kinds on trial, and after a six year's service, the WHEELER & WILSON has taken the precedence as the best, where all kinds of sewing are to be done in a family."
[American Agriculturist, Jan. 1865.]

PARLOR ORGANS.

The HIGHEST PREMIUM, a SPECIAL GOLD MEDAL, was awarded to us by the late great Fair of the AMERICAN INSTITUTE over all competitors for the best instruments.

A Gold Medal was awarded to **CARHART & NEEDHAM,** for the best Reed Instrument on exhibition—a most just testimonial.—WATSON'S Art Journal.

"I can speak of them in the highest terms."—G. W. MORGAN.

"The finest instruments of the class I ever saw."—GEO. F. BRISTOW.

"The best Instruments of their class."—WM. A. KING.

"The tone is incomparable—far in advance of any other instrument of a similar kind."—CHARLES FRAEDEL.

Illustrated Catalogues sent by mail.

CARHART & NEEDHAM,

No. 97 East Twenty-third-st., New-York.

AMERICAN ROOFING COMPANY.

GREEN'S PATENT. This Company is now prepared to furnish one of the best articles of ROOFING ever introduced, consisting of a STOUT MATERIAL made WATER-PROOF by a COMPOUND of INDIA RUBBER, hardened by a coat of METALLIC PAINT, prepared expressly.

The WHOLE FABRIC has been thoroughly tested, is entirely WATER-PROOF, and unaffected by changes of weather. It rolls up and unrolls like a piece of Oil Cloth. It is designed for covering RAILWAY CARLS, STEAM-BOATS, DWELLINGS, BARNs, and SHEDS. It can be laid down by any sensible working man.

It is cheaper than any known roofing of equal durability. It can be seen in use and samples had by applying at the Office of the Company, No. 94 Wall-st., New-York.

HENRY SMITH, Agent.

80,000 Barrels of Lodi Poudrette

For sale in lots to suit purchasers. This Poudrette has been on the market for 26 years, and has held its place among all other fertilizers as the Best and Cheapest, being sold for \$10 per ton less than other fertilizers, with just as good results. It is manufactured from the night soil of New York City, which the subscribers have the exclusive contract for removing to their works. Its chief recommendations are its economy, the quick growth it gives to the plant, ripening a crop from two to three weeks earlier, and an increased yield of 50 to 100 per cent. It is used most extensively upon Corn, Tobacco, Potatoes, and Garden Vegetables. Is perfectly inodorous, harmless to vegetation, can be applied directly to the seed without injury, and yet is as powerful as Peruvian Guano, and unlike Guano, does not leave the soil in an exhausted condition. A pamphlet with the experience in its use of several hundred farmers in different parts of the United States, some of them having used it for over 20 years, will be sent to any person applying to our address.

Price—\$2.00 per Barrel of four Bushels. Address THE LODI MANUFACTURING COMPANY, 66 Courtland-st., New-York.

To Farmers, Market Gardeners, Vineyardists, Orchardists, Nurserymen, Florists and Stock Growers.

The Silver Medal of the American Institute awarded to the Boston Milling and Manufacturing Co., for their Pure Flour of Bone (from unburned bone), as a superior fertilizer, and for feeding cattle. Pamphlets containing analysis, testimonials and directions for use, sent free.

Tribune Office, Dec. 11th, 1865. MR. CHAS. H. GARDNER.—It will give me pleasure to do or say anything which will increase your sales of the Flour of Bone. Ever since its character became known to me by examination and use, I have persisted in its recommendation as the most economical concentrated fertilizer that Farmers can purchase, and I feel that if I can induce them to use the article more extensively I shall be doing them a much greater favor than I shall the Boston Milling and Manufacturing Co. or you as their Agent. I therefore authorize you to make such use of this note as you may think will promote these mutual interests. Respectfully, &c. SOLD BY ROBINSON,

Agricultural Editor of the N. Y. Tribune. 2,500 Tons now ready and for sale in lots to suit purchasers by CHAS. H. GARDNER, Agent, 16 Courtland-st., New-York.

Or of BIGGS BROS., Rochester, N. Y. Agents for Western N. Y., and Canada.

AMMONIATED PACIFIC GUANO.

The attention of Farmers and Agriculturalists is called to this article, as superior to anything else offered in the market. Equal to Peruvian Guano, and costing much less.

We offer this fertilizer in lots to suit all purchasers. A liberal discount made to the Trade.

Pamphlets with copies of Analysis by Dr. Liebig, of Barmittore, and Dr. Jackson, Massachusetts State Assayer, and testimonials from Agriculturalists, showing its value, and directions for use, can be obtained from

J. O. BAKER & CO., SELLING AGENTS, 131 Pearl-st., New-York.

"GUANO."

No. 1 Peruvian Guano, also Baker's Island and other Phosphatic (Bone) Guanos of the richest quality, genuine as imported, and pure article. Also Manipulated Guano, consisting of No. 1 Peruvian and Baker's Island Guano, making a very rich and substantial fertilizer. For sale in quantity to suit purchasers by J. B. SARDY, 58 South-st., cor. of Wall, New-York. (A fair deduction made to Dealers.) For further particulars send for Circular.

No. 1 Peruvian Guano,

of recent importations, for sale by CHAPMAN & VANWYCK, 170 Front street, New-York.

Guano! Guano! Guano!

Pure No. 1 Peruvian Guano now in the market and sold by GRIFFING & CO., 53 & 60 Courtland-st., New-York.

A NEGLECTED COUGH, COLD, AN IRRITATED OR SORE THROAT, if allowed to progress, results in serious Pulmonary, Bronchial, and Asthmatic Diseases, oftentimes incurable. Brown's Bronchial Troches reach directly to the affected parts, and give almost immediate relief. For BRONCHITIS, ASTHMA, CATARRH, and CONSUMPTIVE COUGHS the Troches are useful. PUBLIC SPEAKERS and SINGERS should have the Troches to clear and strengthen the Voice. Those who overtax the voice, and are exposed to sudden changes, should use them. Only the genuine "Brown's Bronchial Troches," having proved their efficacy by a test of many years, are highly recommended and prescribed by Physicians, and have received testimonials from many eminent men.

"I have never changed my mind respecting them from the first, excepting to think yet better of that which I began thinking well of."

Rev. HENRY WARD BEECHER.

Sold by all Druggists and Dealers in Medicine in the United States and Foreign countries, at 35 cents per box.

Send for Description of the finest THOROUGH-BRED, CHESTER WHITE PIGS, and Imported Fowls in America, L. B. SILVER, Salem, Ohio.

(Business Notices—\$1 50 per agate line of space.)

**Pure and Reliable Garden Seeds—By Mail, Postage Paid,
On Receipt of Price Annexed,**

**JAMES SHEPPARD & CO., SEED MERCHANTS,
214 Pearl Street, New York,**

Will forward any of the following Seeds, by mail, postage paid, to any part of the United States or Territories, affording all an opportunity to obtain Pure and Genuine Seeds at a very reasonable price.—Ten per cent. Discount allowed on all orders exceeding Twenty Dollars.

AMERICAN AGRICULTURIST,

FOR THE

Farm, Garden, and Household.

"AGRICULTURE IS THE MOST HEALTHFUL, MOST USEFUL, AND MOST NOBLE EMPLOYMENT OF MAN."—WASHINGTON

ORANGE JUDD & CO.,
PUBLISHERS AND PROPRIETORS.
Office, 41 Park Row, (Times Buildings.)

ESTABLISHED IN 1842.

Published also in German at \$1.50 a Year.

{ \$1.50 PER ANNUM, IN ADVANCE.
SINGLE NUMBER, 15 CENTS.

{ 4 Copies for \$5; 10 for \$12; 20 or more, \$1 each.

Entered according to act of Congress in the year 1865, by ORANGE JUDD & CO., in the Clerk's Office of the District Court of the United States for the Southern District of New-York.

VOLUME XXV—No. 4.

NEW-YORK, APRIL, 1866.

NEW SERIES—No. 231.

HEAD OF BARON OF OXFORD.—DRAWN FROM LIFE BY EDWIN FORBES FOR THE AMERICAN AGRICULTURIST.

This is an excellent portrait of the head of one of the best Shorthorn bulls in this country or the world. The Oxford family was selected by Thomas Bates, of Kirkleavington, who achieved for the Duchess family of Shorthorns their unrivaled reputation, as the best for a cross to give fresh blood and to avoid too close and too long continued in-and-in breeding. Baron of Oxford was bred by, and is the property of Samuel Thorne, of Thorndale, Washington Hollow, New York. He is 10 years old, but in full vigor,

though in only moderate flesh. He is by Duke of Gloucester, out of Oxford 13th, by 3d Duke of York, and own brother to several famous animals sent out to England, by Mr. Thorne.

Wherever Shorthorns have been introduced, there has been an immediate increase in the cash value of whole herds—often of 50 per cent. This is permanent, *provided* the use of thoroughbred males is kept up; but if farmers can not resist the temptation to raise very promising grade calves, and use them as stock get-

ters, progress not only ceases, but a positive retrogression is at once observed. No one can rely on the progeny of a grade bull. The balance of nature has been disturbed in him, and it will show in his progeny. Not so in the use of full-blooded bulls upon grade cows, or upon those of mixed blood; in these cases the positive blood of the sire makes its mark with unerring certainty, and the animal may even excel his sire in beef qualities—including form, size, early maturity, aptitude to lay on flesh rapidly, etc.

AMERICAN AGRICULTURIST.

NEW-YORK, APRIL, 1866.

The sun has passed the equinox, and already the earth warms with solstitial anticipations. The fields, though they early lost their snowy blankets, and were exposed to the furious and cold blasts of March, tardily indeed, but still surely, are, one after another, putting on their garments of verdure. Whatever fate befalls the Fenians, we all can unite in their chorus, "God save the Green." Whatever February and March may do to brown and blast the grass and grain, the warm sun and showers of April always save the green. It matters little how much work may have been anticipated, and with how much so ever forethought and industry the preparations for April work may have been made, there is always just as much to do as can be attended to. He that has been thoughtful, and is ready for work, will keep up with it, but otherwise he will be driven by it, and loose opportunities that might well be those tides in his affairs, which, if taken at the flood, would lead to fortune. Our readers would do well to run over the hints for previous months, especially about planning beforehand for all kinds of work, stock and crops. Keeping no accounts and working without plan, no wonder some say they have had luck. The results of work without plan may well be called luck,—with plan and knowledge, they may be anticipated with a great degree of accuracy.

Hints about Work.

Working Stock.—All kinds of stock ought to come through the winter in good condition, but animals that are to be put to hard work should come out in a little better order than they went in. Every ton of hay sold is money out of pocket if it prevents this result.

Oxen.—It may be a very pleasant thing for a man whose cattle have lost 100 or 200 pounds of flesh the past winter, to say that "they are just in good working order." But if cattle or horses are running down in flesh, they are in just the worst condition for being put to hard work. They must be well fed now at any rate, and thoroughly groomed. Give a pair of cattle a peck of corn meal daily upon hay or corn stalks, cut up and soaked 8 to 12 hours, with all the good hay they will eat. Allow them a long nooning, water regularly three times a day; see that the yokes do not pinch or gall them, and if they do, or their necks are tender, first wash and then lay or bind folded cloths, wet with cold water, upon the spots for an hour or two after work. The same treatment is good for galls upon

Horses.—Those that have not been much exposed during the winter should be blanketed when out of the stable, kept out of draughts, and rubbed down well if wet, with even greater care than is used at any other season. While the animal is renewing his coat he is particularly sensitive to changes of weather, and liable to take cold. Feed liberally and groom well, and this rather critical period will pass quickly. Horses turned into the fields for exercise, enjoy it so thoroughly that it is a great temptation to turn several loose together. Do not do it. They often strike or kick one another upon the head so as to produce swellings, diseases of the bone, or other permanent deformity. For hints about

Brood Mares, see previous numbers. Colts, if drop-

ped thus early, may be left chiefly to the care of the mares, kept clean, early accustomed to wearing a halter headstall, and taught to lead so that at a few weeks old they may be led by the sides of their dams on the road or at the plow.

Cows and Calves.—Cows that have had to "rough it," if fed a little corn on the ear, or perhaps simply have the quality of their feed a little improved just before calving, notoriously pass this period successfully, while the better attended animals often have a hard time. The reason lies in the well cared for cows having too little air, sunshine, exercise, etc.,—perhaps in being made too fat. Give cows the tonic of the wind and the light, plenty of sweet hay, clean stables, the card with a few roots daily, if you have them, and a handful or two of ears of corn if you please, (which some of our friends consider a specific against slinking), and the calves will come along in good condition, and the flow of milk will be abundant. If there are signs of caking or feverishness in the bag, bathe with warm soap suds, and afterwards wash with dilute tincture of arnica.

Bees intended for grazing, should be kept constantly on the gain by feeding corn meal or oil meal upon cut straw, wet up.

Sheep need dry, well-littered sheds and yards, with a feed of roots daily, if possible. Boughs of hemlock or pine thrown to them two or three times a week, promote the health of the flock. Yearning ewes should have close, well ventilated sheds, littered with straw cut 8 inches long, and warm yards. The long tags of wool should be clipped off around their teats, so that there will be no difficulty in the lambs finding them. Should the lambs become chilled, bring them into the kitchen, near a good fire; if badly off, give warm baths, rub them dry, wrap them in blankets, and feed fresh ewe's milk, warmed. A few spoonfuls of mild milk punch (say one tablespoonful of proof spirits in a teacup of milk, sweetened) will often revive them at once.

Swine.—Raw roots fed daily before farrowing, is one of the surest preventives of constipation, and consequently of that depraved state of the stomach and bowels which leads a sow to eat her own young. See "basket" item on sows overlying the pigs. Look out early for a good stock of pigs, or store hogs for manure makers. The markets are dull now on account of the hog panic about the trichina disease, which is described on page 147.

Poultry.—Whoever will give proper care to early chickens, may set the hens as early as the first of April. Early chickens are particularly useful as insect killers, for the first insects are the parents of future swarms. Give seldom more than 13 eggs. Select those of perfect form, of medium or not extra large size, and strong shells. Mark each egg with a lead pencil, and on several put the date at which they are put under the hen. Let hens lay in movable boxes, so that when they begin to set they may be removed away from the laying hens. Feed regularly, and keep water always before them. Feed may always be kept before sitting hens if rats are not troublesome. Turkeys should be confined and made to lay at home in a low box or basket, where they can be controlled, so that when their young hatch they may be kept in doors for a week or ten days, as they are very apt to die if they get wet. Set Ducks' eggs under hens. Geese take care of themselves, but should not be forced to go far for food while sitting.

Birds.—Wren and Bluebird houses should be put up early, but those for the different birds kept apart, they quarrel. Robins, though they are great thieves, may be attracted, if it is desirable, by making a basis for a nest in the crotch of a tree, and putting a board a few inches above it for protection. Prepare for only one robin's nest in one part of the grounds. The quarrels of robins, too, are annoying, and occupy their time which should be spent in killing insects. Cat-birds can't be coaxed by nesting places, but will perversely find their own in hedges, etc. Let them severely alone, and one will have no better friends.

Field Work.—The farmer should begin each day with a clear notion of about what, and how much each man and team will do if it remains clear, or if rain comes. He must be his own judge of when rain is severe enough to stop work, and when men and teams will receive no harm. In

Hauling out manure, it is best to spread and plow it under immediately, though a day or two of fair weather will not injure it. Rain, however, washes it, and the crop will show where the heaps stood. There is danger, too, that rain may render the soil for several days unfit for

Plowing, which should only be done when the ground will crumble, and after the water is so much out of it that the furrow slices will not dry and bake into hard clods. In breaking up grass land turn an absolutely flat furrow. Increase the depth of the soil just as fast as it is safe to do so when plowing for all hoed crops, and on dry or well drained land, the subsoil plow will be found to pay well. Get in

Spring grain of all kinds as early as the ground can be well worked. See several items on this subject in the present number, and that for March.

Flax should be sowed in very well-prepared soil, as soon as it is thoroughly warm. Our readers who are interested in the culture of

Onions, or of *Flax, Hops* or *Tobacco,* can not do better than to consult the pamphlets on these crops, which we publish. We have received the thanks of hundreds for having furnished so much information in so convenient and cheap a form. See Book list on another page.

Carrots and Parsnips may be sown as soon as the ground is thoroughly worked and warm. Barely cover the seed and they will come up much sooner than otherwise, and are then out of danger. So far as our experience goes, mild frosts do not hurt parsnips; they germinate very slowly, and so if wet weather comes, (and such is almost sure to come in May,) the seed rots. We prefer sowing quite early if the land is dry and warm. Put carrots on lighter soil than parsnips, if you can choose, and for both crops work the land deeply and thoroughly, and manure it well.

Potatoes.—Plow deep. Manure with a good compost, and with leached ashes in the drill, or use any manure not in a condition of rottenness. Plant early and 4 or 5 inches deep, using large seed cut in quarters. Plant no small potatoes of any kind, but if you wish to make the seed go as far as possible, cut to single eyes, plant not quite so deep, and give better care.

Pastures.—Keep every hoof, large or small, off them; pick off the stones, cut the brush, clear up the fence rows, reset the fences if necessary, and sow grass seed, ashes and plaster on thin spots. Treat in the same way the

Mowing lands, conducting upon them the road wash. Apply any saline manure at hand, as ashes, plaster, sulphate of ammonia, crude saltpetre, guano, either in fine composts or sowed on, or if soluble, by the liquid manure distributor.

Orchard and Nursery.

Trees will have a hard time of it this month. Rudely taken out of the ground, carelessly handled in transportation, dried up by being long in transit, stuck into the holes with only enough care to keep them right end up, and then left to begin life anew, their treatment is often such as to excite pity in those who care for living things. Trees have life, and a great deal of it, or they would never survive much of the rough usage they get. If they only had consciousness, with what grim satisfaction might they in after years listen to the grumbling at their unfruitfulness. Nurserymen have blame enough that they deserve, but all trouble with trees is not chargeable to them. They must do all the mischief that the tree can get at their hands in a very short time, while the purchaser can spoil the tree at his leisure. When trees are received from the nursery, if not ready to proceed immediately to planting, open a trench in a convenient place, unpack the trees and heel them in, covering the roots

well with moist earth. If, as sometimes happens, the tops are dry and the bark shriveled, bury the whole tree for several days. In planting, have the holes large enough, trim all mutilated roots with a cut sloping from below up, and shorten the branches as directed last month. Fill in with good surface earth, but do not put manure around the roots.

We have been looking over the letters relating to orchards, that have lately accumulated, and find many complaints which may all be summed up in

"*What ails my apple trees?*" As far as we can judge from the description of the diseases, we should say, wet feet and starvation—one or both.

There are but few of these unfruitful orchards, or those in which lack of size and fairness in the fruit is complained of, that would not be greatly helped by draining or manuring, or both. Put down large tile or other drains between the rows; and this may be done without difficulty in orchards where the trees are large. Give a good dressing of composted manure and plow it in, and if the trees are not very large, some hoed crop, such as beans, may be planted, not for the crop, but just as an inducement to use the hoe. Lime often has a strikingly beneficial effect on an exhausted orchard.

A very old and neglected orchard, unless the trees seem to have a good deal of promise in them, will not pay for much trouble and expense. It is better to set out a new orchard in a good place.

Grafting is oftener done too early than too late, and much of the lack of success is due to setting the cions long before growth begins, and thus exposing them to the drying influence of the winds. Cions put in just as the buds on the stock are ready to burst, are more likely to take than those worked in March. In late grafting, more care is required, as then the bark parts readily from the wood, and bad wounds may be made in carelessly sawing the limbs. The stock should be more advanced in growth than the cion, though some claim equal success with cions cut at the time of inserting them. Any one who can whittle, can graft, and every farmer's boy should know how to do both. The operation was fully described and figured in March, 1864, and we have not space to repeat. Those who wish to raise their own

Stocks for hudding or grafting, should get the seeds in early. The pits of peaches and other stone fruits that have been kept buried during winter, start very early in spring; and if they are found to have germinated, will require careful handling. It is the practice with some to allow the seeds to germinate, and then to pinch off the young root before planting, with a view to forming a more branching root. Apple and pear seeds need to be sown in a finely worked soil, enriched with well-rotted manure, ashes and lime.

Quinces are most welcome as a fruit, but they are seldom much thought of or cared for as a tree. The trees have a slow growth when young, but, when they come into fruit, are profitable. The young tree should be trained to a stake until it gets strong, and pruned so as to form a regular head, at about four feet from the ground. They may be grown as pyramids, with fruit branches near the base, but the leader must be kept tied up to a stake. The Orange or Apple variety is the one most cultivated. Rea's seedling is highly spoken of, but it seems to be scarce. We are sometimes asked why we say no more about

Plums.—If one will give the time to fight the curculio and black knot, he may be tolerably sure of success, but without this, all planting of plum trees is useless. A selection of varieties was given in the February *Agriculturist*, page 62.

Peaches succeed best in hilly districts, and upon land not before occupied by a peach orchard. Land, suitable for a good grain crop, will do for peaches. Eighteen to twenty feet is the usual distance. The orchard is cultivated to potatoes or buckwheat between the rows. On a subsequent page a novel method is given for treating a peach orchard. Another plan recommended for their treatment is, to cut the young trees back at planting to 18 inches, and thus induce them to grow in a bush form. The

varieties mostly grown for the Eastern markets, are:—Troth's Early, Honest John, Crawford's Early, and Old Mixon. Hale's Early receives commendation everywhere, as the earliest good peach. Crawford's Late, Smock, Heath, Ward's Late, Morris White, and other late sorts are grown.

Fruit Garden.

The suggestions given last month as to preparation of the soil and planting, will for the most part be appropriate now. Many of the hints given under Orchard and Nursery, are equally applicable to the Fruit Garden. Planting of all kinds should be done as early as the ground can be worked, or the plants procreed.

Dwarf Trees are the only ones admissible in the fruit garden, and these can be kept as small and compact as is desired, by root pruning, or if space will allow, they may develop into medium sized trees. One great trouble, especially upon pears, is

Insects on the Bark.—The scale and woolly Aphis if not checked in time, will often completely cover the bark. The first is a little brown scale, shaped somewhat like a miniature oyster shell, and the other is a little louse, with a copious covering of white wool which makes him quite conspicuous. Soft soap, made sufficiently thin, and applied all over the limbs with a stiff brush, rubbing moderately hard the while, will usually do for them. A friend of ours is using petroleum for this purpose, but we await the results before recommending it. We have an article elsewhere on cultivating the

Fig.—A few trees are worth growing as curiosities, if nothing more. In a sheltered situation with proper care, they will usually bear fruit.

Almonds are also interesting, and it is well to have a tree for the novelty of the thing. They will flourish wherever the peach will. Nothing makes a finer show than a

Quince Tree, laden with its golden fruit, and it is also handsome when in flower. See hints for training, under Orchard and Nursery.

The Currant is, so to speak, one of the most flexible of fruits. Neglect will bring small fruit from large varieties, and pruning and manuring will induce the small sorts to swell to a respectable size with gratitude for the attention. The moral of which is, manure the currant bushes.

Gooseberries should not be overlooked. The Houghton and American Seedling are better than no gooseberries. We do not see why Downing's Seedling is so generally overlooked. It is a much better fruit than either of the others. Why don't some one get up a gooseberry as hardy as the Houghton and as good as the Whitesmith?

Raspberries and Blackberries have their cultivation sufficiently treated of on page 145, and with other things have quite crowded out our notes on

Grapes.—Varieties have been so fully discussed during the past year, that but little can be said about them until the growing season. Of course many thousands of vines will be planted, many without proper care will fail, and the nurserymen, the variety, or the season, will be blamed. Unless the soil is naturally drained, drain it. Work the soil well to the depth of 18 or 20 inches. Use no other than vegetable manure at planting. Make the hole large, put in fine surface soil so as to form a flat mound. Set a stake 6 or 8 feet high, place the vine beside it, and spread its roots evenly in all directions. The point from which the roots start, should be about 4 inches below the surface. Cover the roots carefully with fine soil, fill up the hole, and press the earth moderately with the foot. Allow but one cane to grow the first year, and that should be from the strongest shoot that pushes. Any vines remaining covered, should be lifted, and tied to the trellis.

Strawberries, as soon as winter is well over, are to be uncovered, parting the straw so as to expose the plants, but leave the ground covered. New beds are to be planted as early as possible. For the garden, beds 4 feet wide, with 2 feet walks between them, answer the best. Set the plants in three

rows, one in the center and the others 18 inches from it, and the plants 18 inches apart in the row. Spread the roots, and set as deeply as can be done, without covering the center of the plant. Some prefer to set the plants a foot apart each way, but for varieties that form large stools, in hill culture, 18 inches is none too great a distance.

Kitchen Garden.

The notes for the month of April need to be made with a larger margin than those of any other month, as the differences in localities are more manifest than they are a few weeks later. It is impossible to give directions which will not require some discrimination on the part of the reader. As a general thing, many seeds are planted too early; for all but the very hardy plants it is better to wait until the ground is well warmed. Shelter is of great importance to the garden, and a close fence or a thick belt of evergreens, to ward off the prevailing winds, will bring things forward much earlier than when the winds have full sweep. It may be that there are some who have not yet made their selection of seeds; such will do well to consult the list given on page 63, Feb. For convenience of reference we place our notes this month in alphabetical order.

Asparagus.—Remove the coarser portions of the litter with which the beds were covered, and then go carefully over the bed with a fork and turn up the surface, taking care to work gently around the plants and not injure either buds or roots. New beds may be made if roots can be procured. The soil should be moderately light and very rich, and there must be such natural or artificial drainage, as will ensure a dry subsoil. In family gardens it is best to plant in beds, five feet wide, with alleys between them, as this allows of cutting the crop without trampling the beds. The beds are prepared by spading 18 inches or 2 feet deep, working in a great abundance of manure. The best way is to trench the bed thoroughly, working the manure in to the bottom of each trench. Set three rows of roots in the bed, one row in the center, and the others one foot from the edge, putting the plants a foot apart in the rows. The plants should have their roots well spread, and their crowns three or four inches below the surface. Keep the bed free of weeds. If plants are to be raised from seed, sow them in drills, a foot apart, in rich soil. An ounce of seed will produce about a thousand plants. When well up, thin to three inches. Salt is considered beneficial to Asparagus, and a dressing is frequently applied in the spring. It is certainly useful in destroying weeds and worms, but whether directly beneficial to the Asparagus, is a point on which experimenters differ, the majority favor it.

Artichoke.—The true artichoke is but little known in this country, and is not much esteemed except by a few. It is a plant with large thistle-like heads, which are the eatable portion. The seed is sown this month in drills, a foot apart. Where there are old plants, suckers may be taken off next month.

Beans.—It is too soon in most places for any but the English or Broad Beans, which are not much favored by Americans. These can be planted in strong clayey soil, as soon as the frost is out, in drills about 2 feet apart. Limas may be sown on inverted sods in the hot-bed, as described in March.

Beets.—Sow the early sorts in a rich, light and finely worked soil, in rows 15 inches apart. Soak the seed in warm water for 24 hours, turn the water off and keep the dish covered in a warm place until the sprouts show themselves, then roll the seed in plaster and sow. An ounce of seed will be enough for about a hundred feet of drill.

Broccoli.—A plant much like cauliflower, but quite inferior to it. Treat the same as cabbage.

Cabbages.—Plants, wintered in cold frames, may be put out if not already done. Those started early in hot-beds, are to be transplanted when large enough and the weather is suitable. The plants should be previously hardened by free exposure to the air. Sow seed in the open border in drills, about 4 inches apart. An ounce of seed will be

enough for 40 square feet of bed. The young plants, whether under glass, or out of doors, are apt to be injured by the Cabbage flea. We have used ashes, freely sprinkled over the plants, with success. Others recommend Scotch snuff, soot, and lime. Cabbages need a very rich soil and thorough cultivation. One of our best cultivators informs us that the free use of lime will prevent club-foot, and that, by using it, he grows cabbages on the same land, year after year indefinitely.

Carrot.—For early crop sow in a warm place, the Early Horn. The Early Forcing is small, but very early. Soak the seed for 24 hours in warm water, dry off with plaster, and sow as directed for beets. An ounce of seed sows 150 feet of row.

Cauliflower.—The treatment of plants raised under glass, is the same as for cabbage. Set out 2 to 2½ feet apart; sow for late crop in open border.

Celery.—Sow in a gentle hot-bed or cold frame for early, and when the plants are large enough, transplant to another frame, setting them 3 inches apart. Sowings in the open ground should not be made until the soil becomes thoroughly warmed. Treat Celeriac, or Turnip-rooted celery, the same.

Chives.—An old-fashioned member of the onion family, figured and described in June, 1864. It is sometimes used for edgings to beds. Set the bulbs about 6 inches apart.

Cress (Peppergrass).—Sow thickly, in shallow drills, 6 or 8 inches apart, at intervals of one or two weeks.

Cucumbers.—Sow in cold frames, which are to be carefully closed at night and aired during the day. Keep the plants from being burned by the sun when the sashes are on. Some weeks may be gained with cucumbers by starting the seeds on bits of inverted sod, as described last month. These may be placed in a frame under glass, or set in a box in the kitchen window. When the plants are well up, leave only two to the piece of sod, and when they have made four rough leaves, pinch out the growing end. In this way, strong plants will be ready to set out when the weather is warm enough.

Egg Plant.—Sow in hot-bed. Those already up are to be transplanted, as soon as large enough to handle, into another bed with a gentle heat. Don't let them get chilled, as they are slow to recover.

Garlic.—This is propagated by breaking up the old bulbs into cloves or sets, and planting these six inches distant, in rows a foot apart.

Horse-radish.—This is a profitable crop near large cities. It needs a rich deep moist soil. It is propagated from bits of the root about 2 inches long; these are put in with a dibble about 6 inches deep, in rows 18 inches apart, and 9 inches in the rows. The planting is done as early as possible. Some put the rows two feet apart, and sow early beets or carrots between the rows. In either case the surface should be kept clean.

Herbs.—Under this general term are included those plants grown for seasoning. Sage, Thyme, Savory, Marjoram, and Basil are the common. Sow in cold frame or in open border when soil is warm.

Hot-beds and Cold Frames.—The plants in these will need close attention. They must have all the air possible without danger from sudden changes of temperature; when the sash must be kept on during a cool day, see that the sun does not burn the plants. Put on the sash in the afternoon, before the air becomes cool. Give water as may be needed, always taking the precaution to warm it to at least the temperature of the bed. Pull up weeds as they appear, and if the soil becomes hard between the rows, break it up with the finger. Thin out the plants before they become too crowded, and if desirable to save the thinnings, set them out in another bed. If the heat of a bed declines sooner than is desirable, place linings, as they are called, of hot manure around the old manure. As the time for removing the plants approaches, keep the plants exposed as much as is safe, in order to harden them off.

Kohl-Rabi.—Sow and treat the same as cabbage.

Leeks.—Sow as soon as the ground is in order, in

shallow drills, 15 inches apart, if they are to grow where they are sown, and but 6 inches apart if to be transplanted, which is the better way.

Lettuce.—Plants in cold frames need an abundance of air, and in warm rains, remove the sash entirely. Sow in a sheltered spot as soon as the ground is open. The Silesia is the hardiest and best for this purpose. Sow very thinly, in shallow drills, about 8 inches apart. Plants from seeds sown under glass may be transplanted to very rich soil; set them a foot apart, each way.

Mustard.—Sow for salad as directed for cress.

Melons.—Seeds for a few early hills may be forwarded on sods as directed for cucumbers.

Onions.—Put out Potato and Top onions and onion sets, in rows a foot or 15 inches apart, and the bulbs 4 inches distant. Onions from the seed, or "black seed" as growers call it, are not usually successful much south of N. Y. city. Wherever they are grown, they should be sown early in highly manured soil. Hen manure is found to be very serviceable for this crop. Get the soil in the finest possible tilth, and, in the garden, it is a good plan to burn brush over the bed to destroy weed seeds. Be sure to get good and fresh seed, and sow it in drills 15 inches apart. An ounce will sow about 200 feet of drill. For field culture our excellent pamphlet gives full details. See Book List.

Parsley.—Soak the seed for 12 hours and sow in drills a foot apart. It is a long while in coming. An ounce of seed to 200 feet of row.

Parsnips.—Sow as early as may be, in deep rich soil, in drills 15 inches apart. Be sure of last year's seed. An ounce to 200 feet. Allow some of finest of last year's roots to produce seed.

Peas.—A light dry soil that has been manured the year before, is better than one recently enriched. Sow as early as possible, putting the seeds three inches deep and an inch apart. It is customary to plant double rows 9 inches apart. Set the brush between the rows. In the market gardens the rows are 3 feet apart, and as the peas grow, they are earthed up, without any brush. But in gardens neatness as well as productiveness require that the vines be supported. Soak before planting.

Peppers.—Sow in hot-bed or frame, if not already done. Treat the plants as directed for Egg Plant.

Potatoes.—Early potatoes are the only ones to be grown in the garden, where drills answer better than hills. Open drills 2 feet apart and 6 inches deep, and drop good-sized seed 9 to 12 inches apart.

Radishes.—Any spare space in the frames may be occupied by radishes. Sow early in the open ground, in light rich soil, in drills 10 inches apart. Sow every 10 days or 2 weeks, for a succession.

Rhubarb.—Fork in the manure placed on the bed last fall. Make new plantings if the growth has not started too much. Force a few roots by placing a barrel, without heads, over each, and surrounding it with hot manure.

Salsify sow this month or next; see last month.

Sea-Kale.—A vegetable little cultivated in this country. Plants are raised from seeds sown this month. The after-treatment is as for asparagus, except to ridge earth over the plants in autumn.

Spinach.—Remove litter from the wintered crop, and loosen soil around the plants. Sow the round-leaved sort in 15 inch drills, in very rich soil.

Squashes.—Some plants of the early bush sorts may be forwarded as directed for cucumbers.

Seeds.—Those who save their own seeds, should get their roots, etc., out early. Use only the best shaped and best kept onions, turnips, carrots, cabbages, etc., and set them out in well manured soil. It is not well to attempt to raise the seed of more than one variety of each within the limits of a moderate garden. Never set a cabbage stump for seed, but a whole plant, and the very best, and then allow only a few strong central stalks to grow.

Swiss Chard.—This is a variety of beet, the leaves of which afford an excellent substitute for spinach in mid-summer. Sow and treat the same as beets.

Sweet Potatoes.—Where only a few plants are want-

ed, it is cheaper to buy than to raise them. The shoots are started in hot-beds. The potatoes are split lengthwise and laid flat-side down, and covered about two inches deep, with rich compost. After the shoots push up through this, another inch is added. Watering and airing are to be attended to. When the shoots are well rooted, the potato is taken up, and all the well rooted plants of sufficient size are slipped off, and the potato put back in the bed to give the others a chance to grow. A bushel of potatoes, it is said, will yield five thousand plants, when well attended to.

Tomatoes.—Seeds may still be sown under glass, or in the house. Those sown early, will need to be transplanted to other beds or potted in small pots. When the roots are crowded in pots, the plants come into flower very early. By pinching off the stem above the first cluster of flowers, the growth is directed to the side shoots, which may in turn be pinched, and thus the plant be kept quite dwarf and stocky, and the fruit will thus be improved.

Turnips.—Get the seed in as early as possible, in drills 12 inches apart, that is for early table turnips.

Flower Garden and Lawn.

The notes of the last two months will give hints for some work that may yet be done. The covering of bulbs and tender perennials may be removed and the soil of the borders carefully forked over. A spade should never be used for this purpose. In a well kept garden, the walks should always be in perfect order. Dress the gravel, add fresh where needed, and roll. Coal ashes will pack loose gravel. No plants are more satisfactory than

Flowering Shrubs, and we have from time to time given notices of the best native and exotic species. Syringas, Persian Lilacs, Japan Quince, Wiegelas and several of the Spiræas, are readily obtainable by a small outlay. Then there are

Roses, always the one plant that must be in the garden. Buy only those on their own roots. In planting out the perpetuals, cut them back to three or four buds. Climbing varieties may be introduced where there is a place for them, and such a place can usually be found. We are very partial to

Climbers of all sorts, and if there is no place which needs covering, we would set up cedar or other posts, and train climbing roses, Wistarias, Honeysuckles, Trumpet Creepers, etc., to them.

Hardy annuals that were started in the house or hot-bed, may be put out as soon as the ground is ready; the tender ones not until cold nights are over. Seeds of Balsams, Asters, and other tender kinds may still be sown in doors or under glass. Candytuft, Whitlavia, and all such hardy annuals may be sown early in the open border, but the majority of flower seeds are best kept out of ground until the soil gets thoroughly warm.

Perennial Herbaceous plants need, as a general thing, to be reset about once in three years, reducing the clump by dividing with a sharp spade.

Biennials, such as Hollyhocks, Foxgloves and Sweet Williams, should have been transplanted from the seed bed in autumn, but it may be done now.

Plants in pits, such as tender Roses, Carnations, etc., are to be freely exposed during the day to harden them, and then to be turned out into the border when frosty nights are over.

Peonies should not be disturbed in the spring if it can be avoided, as it is pretty sure to prevent their blooming. The proper time is in the fall. Do not be in a hurry with

Bedding Plants.—These have been in the warm air of the propagating house, and ought not to go out until the soil is warm and the weather settled.

Bulbs of Gladiolas and Japan Lilies are hardy, and may be set as soon as the ground is in order.

Green and Hot-Houses.

The Green-house will now do without fire heat, and the plants should have abundant ventilation, when not too cold, to harden them for removal.

Shrubs, including Camellias, that are making a new growth, may be pruned into good shape and

be freed from insects. If any plants stand in need of more pot-room give them a shift to larger pots.

Plants in flower need to be kept near the light, and the usual precautions taken to keep them clear of insects. Much of the time of the gardener will be occupied in

Propagating a quantity of bedding plants for use in the borders. As soon as they are rooted, pot into small pots, and when the roots become pot-bound, either shift to larger pots or shake out the earth from the ball and repot in the same pots.

Fuchsias are readily multiplied from cuttings of young wood; they make good plants in a short time.

Delicate Annuals, such as Lobelias and Salpiglossis, and fine seeded things, may be sown in pots.

Dahlias may be brought into a warm place where they will sprout, after which they may be divided. A spent hot-bed answers very well for this purpose.

Cold Grapery.

The time for uncovering the vines is of course governed by the locality and season, but it is usually done early in April. If the vines were put in place at once, the upper buds would break first and get so much the start of the lower ones that the growth would be very unequal. This is remedied by suspending the vine temporarily in such a manner that the upper end will bend downward, and it is kept in this position, changing the point of suspension if necessary to make the buds break evenly, until the shoots are 2 or 3 inches long. When the vines are uncovered, fork up the inside borders and syringe the house thoroughly. If the vines show cracks and begin to bleed, it indicates that the wood was not well ripened, or that the vines have suffered from the cold of winter. If the trouble proves serious, and the upper buds do not start well, the vine must be cut back. When the lower shoots have grown to about 18 inches, select a strong one and cut the vine back to it. This shoot is to be trained in place of the one that was cut away. The temperature of the house should be about 65° until near the end of the month, when it may reach 70° or 80°, when all parts of the house and the vines should be wetted by using the syringe morning and evening. Avoid drafts and sudden changes of temperature.

Apiary in April.

Prepared by M. Quinby—By request.

When all the stocks in an apiary are strong, and have sufficient stores, there will be little to do through the spring, for there will not be the least danger of robbing, nor danger of extensive injury from the moth. This state of things shows that they have prospered, and is a guarantee of success in the future. There will be some moth worms to be found on the floors of the hives, except in the hives of the Italians, during this and next month, until the bees cover the combs. Sweep out and destroy them. All moths and worms remote from the bees have been frozen to death in the winter, and as the perpetuation of the pest depends upon those few now to be found; this is a great inducement to destroy as many as possible. Put up the wren boxes now as near as possible to the bees. It is not to be expected that every hive in a large apiary will be No. 1. Some may have abundance of honey and but few bees; another, bees enough and a scarcity of honey; others will lack both bees and honey. These are poor hives, and one or two such require more attention through the spring, than one hundred that are in good condition. It is necessary to inspect closely to know which they are, and what is the matter. See to it on warm days that no robbing is done. Do not wait to see the bees fighting before any measure is taken to prevent pillaging. Hives are often robbed without any contention whatever. Close the entrance, allowing room for only one bee to pass at once. Light colonies must be fed just before they starve, for although they may be bringing in pollen daily, most observers cannot tell whether they are getting sufficient honey to prevent starving, before

clover appears. If you have honey in the comb,—taken from healthy hives, or boxes part full, you may feed on the top of the hive—protecting from other bees by a good cover; it will be taken down as required. Bees should be fed in small quantities, two or three times a week, or oftener. When syrup and sugar or strained honey is used, put it on the top in a saucer or similar dish, and lay something around it that they may creep into it readily, and scatter cut straw on the surface to keep them from drowning. Candied honey should not be fed without first adding water—a pint to six or eight pounds—scalding and skimming. There seems to be an increasing desire to transfer bees to the movable-comb hives, and some of the new readers of the *Agriculturist* would like specific directions. The present month is perhaps the best time. Straight combs are preferable. Get a new box of the size of the hive from which the bees are to be transferred, and make it comfortably warm inside, by setting it in the sun or a warm room; then invert the hive, which should contain a strong colony; drive, by pounding on the hive, all the bees that will go into the box. Now pry off one side of the hive, cutting the attachments of comb at the side and top, as may be necessary. Take out the first comb and lay it carefully, without bruising, on several thicknesses of folded cloth. Lay over it the frame in which it is to be fitted, and mark or cut the comb to the exact size. It may be held in the frame by winding twine several times around. Fine wire is better, or the splints may be used as recommended in the revised "Bee Keeping." Keep the frame perpendicular, that the comb may rest on its edge. Be careful to put all the combs in the same relative position as before, that the brood may be all together. When all is arranged, the bees may be shaken out upon the top of the frames and covered with a close box, or set in a perfectly dark room to keep them from flying until they find their way among the combs, and take up all dripping honey. Then they may be returned to the stand. Avoid opening the movable comb-hive on a morning in the open air, or in cool weather, lest the brood be injured. Better bring it into a moderately warm room.

Take advantage of the first stormy days to repair any old hives or boxes that have been neglected. Scald and scrape clean the inside of old hives, and they will answer to use again. If any painting is to be done, it should not be delayed. It is very difficult to make new swarms stay in a hive newly painted, or one painted a dark color, when in the sun.

Catalogues, etc., Received.—Third Annual Report of the Proceedings of the West Jersey Fruit Grower's Association for 1865.... Report of the House Committee on Agriculture of the State of New Jersey, for 1866, from Hon. I. P. Trimble.... Catalogue of Erie Commercial and Benton Nurseries, J. A. Plattman, Proprietor, Erie, Pa.... List of Strawberries, Monitor Potato, etc. Ed. Wheeler, Kalamazoo, Mich.... Catalogue, Central Nurseries, E. J. Evans & Co., York, Pa.... Catalogues of Trees, Green-house and Bedding Plants, Flower Seeds, etc. Frost & Co., Genesee Valley Nurseries, Rochester, N. Y.... Catalogue, Reading (Mass.) Nursery, J. W. Manning, Proprietor... Seed List of Wm. Hacker, Philadelphia, containing several specialties among grains, etc.... Catalogue of Vegetable, Flower, Fruit, Herb and Field Seeds, R. H. Allen & Co., 189 and 191 Water St., N. Y.... Catalogue of Small Fruits and other Nursery Stock of Pomona Garden and Nursery, William Parry, Cinnaminson, Burlington Co., N. J.... Catalogue of Vegetable and other Seeds, Brill & Kumerle, Newark, N. J.... Knox Fruit Farm and Nurseries, Pittsburgh, Pa. A catalogue of small fruits, etc., and which contains, besides the business matters, a great deal of interesting reading.... Montclair (N. J.) Small Fruit Nursery, E. Williams... McElwain Bros., Springfield, Mass. Illustrated General Seed Catalogue.... Descriptive and Illustrated Catalogue of Agricultural and Horticultural Implements, Griffing & Co., 58 and 60 Courtlandt St., N. Y.... Hovey's Illustrated Guide to the Flower and Vegetable Garden, Boston, Hovey & Co.

Locality for a Plum Orchard.—"D. B. G." Hannibal, Mo. With a good strong and well drained soil we should not be particular about the aspect. The trees are not especially tender, but the failure of the crops is generally due to curculio and black knot.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, show at a glance the transactions for a month, ending March 16, 1866, and the exports of Breadstuffs from this port thus far, since January 1:

TRANSACTIONS AT THE NEW-YORK MARKETS. RECEIPTS. Flour, Wheat, Corn, Rye, Barley, Oats. 24 days this month, 117,000 13,700 161,000 8,400 93,000 131,000

CURRENT WHOLESALE PRICES. Feb 15, March 15. FLOUR—Super to Extra State \$6.85 @ 8.40 \$6.70 @ 8.20. SUPER TO EXTRA SOUTHERN. 8.85 @ 15.50 8.65 @ 15.50

The heavy fall of full 8 per cent. in gold since our last, reaching 129 1/2 at one time, has lessened the demand for all kinds of Produce and Merchandise, and seriously depressed prices. The inquiry for the principal Breadstuffs was quite limited through the month, neither shippers nor the home trade having been disposed to operate, in view of the steady downward tendency of gold.

New York Live Stock Markets.—BEEF CATTLE.—The supply has been below an average, for a month past, but quite enough for the demand, which has been unusually light during the Lent season.

Like gold, the value of cattle has gradually fallen. The present rates are equivalent to 14c@17c per lb., dressed weight, for medium to first quality; a very few extras, 18c@19c; poor grades, 12c@13c. MILK COWS have constantly tended downward in prices. Good to extra good, \$65@90; a few fancy animals, a little higher; poor grades, from \$50 down to \$35, according to quality.

Plenty of Premiums Yet Remain for All

who want them, and at least two months more remain in which to secure them. Let the premium clubs already started be filled up and the premiums be called for. New lists may also be started.—"It speaks for itself," writes one who began a new club last month, "your splendid engravings, and large amount of good reading matter please everybody, and I have only to show the paper and point out what is in it, to get every one I meet with to subscribe. My \$55 premium has cost me just 18 hours time, or over \$3 an hour, and most of that in evenings."

Table of Premiums and Terms, For Volume 25. Open to all—No Competition.

Table with 3 columns: Names of Premium Articles, Price of Premiums, Names at \$100 each, Names at \$10 each. 1—Good Books—See terms below. 2—Garden Seeds for a Family (40 kinds). \$5 00 14 37

No charge is made for packing or boxing any of the articles in this Premium List. The Premiums, 1, 2, 3, 7, 8, and 13 to 25, are DELIVERED to any part of the United States and Territories, free of all charges. The other articles cost the recipient only the freight after leaving the manufactory of each. Every article offered is new and of the very best manufacture.

BOOKS FOR FARMERS and OTHERS.

[Any of the following books can be obtained at the Office of the Agriculturist at the prices named, or they will be forwarded by mail, post-paid, on receipt of the price.]

Allen's (L. F.) Rural Architecture. \$ 1 50. Allen's (L. L.) American Farm Book. 1 50. Allen's Diseases of Domestic Animals. 1 00. American Bird Fancier. 30. American Rose Culturist. 30. American Weeds and Useful Plants. 1 75.

Containing a great variety of items, including many good Hints and Suggestions which we throw into small type and condensed form, for want of space elsewhere.

FORTY-FOUR PAGES!—The pressure upon our columns, compels us to issue 44 pages, instead of the regular 32; and with the good advertisements and good reading matter still left over, we would gladly have made it 48 pages, only that it would increase the weight to double postage, and make trouble with all who pay postage by the year. The weight is still not above the 4 ounces, and no one has a legal right to charge over 3 cents per quarter postage. This increase of advertisements enables us to give sixteen extra columns of reading matter, which our subscribers will appreciate.

Erratum.—By an error in printing, in a few only of the first copies of this number, some of the page-figures are wrong on one side of the middle sheet.

Over One Hundred Thousand!

The first regular edition of this number, printed for subscribers, will exceed One Hundred Thousand copies; and we shall continue on printing further editions from the electrotype plates, so long as needed. The number of subscribers received up to this time, exceeds the receipts of the same date last year, by 27,500; which indicates a total of over 125,000 for this year. This large increase and the enlarged size, have prevented the prompt mailing of all the copies so early as formerly; but this difficulty will be remedied next month, by the addition of more presses—so that we shall be able to accommodate all who may come, up to half a million, if necessary. By the way, a subscriber informs us that his paper is regularly loaned around, so that twenty-three persons actually read every number, and that it thus gets about worn out. This is the case in a less degree, generally, so that our readers really amount to a full million!

An Excellent Assortment of selected business items, conveying much useful information, will be found in our advertising pages. We only regret being compelled to leave out several other good advertisements that came in after our pages were full. We believe it will pay every reader to look all through the advertising pages, and see what is offered, at what prices, and by whom. As remarked last month, "business men seem to understand where they can find an immense number of wide-awake, enterprising readers. Please return their compliment, when writing for circulars or catalogues, or sending orders to them, by letting them know when and where their advertisements were seen."

Read the "Hints about Work."

At the present season we have such a flood of queries that, though we have given a large space to Basket matter, it is impossible to reply to a fourth of the questions individually. In making up the Hints about Work, we endeavor to meet as many of these questions as possible, and this month a number of letters are there answered.

Humbugs—Seventy Swindling Concerns!

—Since our broadside upon humbogs last month, letters have continued to pour in from all parts of the country, mostly from those describing frauds upon themselves or their neighbors. The extent to which these operations are now carried, would astonish any one who had not previously looked into the subject. We have just been over a package of 214 of the last letters received, and in these alone find over seventy different concerns referred to, many of them run by the same operators, under different names. These letters came from all parts of the country. As this journal goes to nearly every Post Office in the whole country, we hope the attention thus called to the subject, may be of extensive influence. Let every reader talk the matter over in his town, and especially with his postmaster; and this will do something to put people on their guard.

This week, we have visited several of these swindling offices, in the guise of a green countryman seeking to collect some of the numerous "prizes" called for by tickets sent to us; and the immense business we have seen doing, up in these attic rooms, was astonishing even to our experienced eyes. The "business" consisted mainly of sending out circulars, and opening great stacks of letters containing remittances of \$1, or \$2, or \$5.15, or \$5.24, or \$10, etc., etc. We saw no "prizes" going out, and but few on hand anywhere to send out. In three places alone there were eleven men directing envelopes and enclosing circulars, and there were at least fifty thousand of these circulars piled up ready to be forward-

ed. In two places the chief man, or "head center," was "out," but would be in soon, and our tickets could not "draw" until said boss came in—the story always told to callers. At another place, a "splendid hunting-case watch, marked \$50," our ticket called for, was shown, but \$5 would not fetch it—we must pay \$3.75 for the tickets. As we could get plenty of such watches at \$3 a piece, we saved our \$8.75.... We visited an up-Broadway depository of merchants and others (so-called), with a million or less "gifts" to be distributed. From the description sent out, this should be one of the most splendid establishments on the whole street; we found, in the basement, only a contemptible "gift shop," like the one "looked into" last month (p. 86, last column), but with more silver-covered lead ware. See about "Plated Ware," on pp. 147-148 of this paper.

Had we time and room we could give a dozen pages of descriptions of the fifty odd swindling concerns in this city. Nassau street, and certain parts of Broadway abound in them—the lotteries, the (brass) gold pens and jewelry, the pianos and melodeons sold at \$2 each, the cheap valueless photographic apparatus, the prize packages, the cigar machines, the cheap, or rather low-priced sewing machines, etc., etc. There are plenty of similar concerns in other cities and towns. The misdirected express parcel humbug is run by J. C. Smalley, at Hope, N. J.; and by others elsewhere. Here and elsewhere are Eye Doctors, offers of great wages to Agents, Love Perfumeries, Journal of Medical Science, Magic Monitor, Paris Lotteries, etc., etc. "Albert Hall & Co." (no place) ask \$10 through the mail for a sewing machine sold by others for \$5.... We judge by what we have seen, that tens of thousands of circulars are sent out daily as letters. Most of these parties make no return for money received by mail. When found, and called on personally, they furnish something; but in the numerous applications with the "prize tickets," we could not find a single thing worth the money asked.

A few hints is all we now have room for. There is not an article of gold or silver to be bought in this city at less than its coin value. The great failures described in so many of the circulars, have nowhere occurred. Believe no statement, however plausible and well told, that comes to you by circular through the mail. There is not a single gift enterprise that is not directly or indirectly a swindle. The fellows that advertise obscene books, instruments, or medicines, are, without exception, swindlers. Every watch or similar thing offered to be sent by mail, is not worth sending for, even if you are sure to get it, which, in nine cases out of ten, you will not. Most of these parties, on being followed up, pretend that the money sent them has been lost by mail. We know that there is not a single establishment in the country that offer articles or money for distribution by tickets, that is not a downright cheat.

A Petroleum and Land Advertisement

is for the first time admitted to these columns, though many thousands of dollars worth of "Oil Company" advertisements have been previously offered and rejected. This is done now, not so much for the pay it brings, (plenty of other good advertisements were ready to fill the same space,) but because we had become sufficiently impressed with the prospects of the Reno Company, to make a small investment of our own; and we could not well refuse to place the matter before our readers, that they may also investigate, and if they then desire to do so, they can also take an interest. Our own inducements to subscribe were derived from what we learn of the character of the parties interested, and from the large profits that may be derived from the small sum actually risked in the investment. Should the enterprise not prove as profitable as it promises, and we wish to withdraw the money, the utmost loss on \$1000 will be \$50, and the interest of the money until withdrawn. So it looks to us, but we do not urge any one to see with our eyes.

Special to Advertisers.

—As we are so far into the volume as to be able to know about the regular circulation, the advertising rates are now fixed for the rest of this year (see headings of Advertising pages). The minimum terms are based upon one cent per line for each thousand readers; that is to say, it costs only about \$1 to place an advertisement of 100 lines, or 7½ inches, before each full thousand of our readers. A consultation with any printer will show that separate cards of a few lines, or even of a whole page in size, would cost more than the same number of cards printed in this journal, where they are fixed and sent out, one to a family, while the loose cards could only be distributed at great extra expense, and a large proportion of them would be lost.—In a journal of this kind, the advertising cards are before the reader at least a month, while many thousands of volumes are preserved for permanent reference. With the care exercised in admitting advertisements, as noted below, they have a peculiar value in the *Agriculturist*. All things considered, this journal is un-

doubtedly by far the *cheapest* medium of advertising anywhere to be found, even at our highest rates. The circulation certainly exceeds that of any other journal in this country, if not in the world, except perhaps the N. Y. Ledger, and that admits no advertisements.—So well is this understood by our oldest advertising patrons, that they continue year after year to be our largest customers. Several of these, who had engaged space for the first five or six numbers of this year, have withdrawn their cards from the present number, simply because they have already sold the whole stock they had provided for the entire spring trade.—So much for the value of these columns to advertisers; and to secure these advantages, we require something more of them than mere pay for space. Advertisers unknown to the editors personally, or by good repute, must furnish good references or other evidence that they are reliable—that they have both the *disposition and ability to do just what they promise*. Our aim is, to admit no advertiser to whom we would not ourselves unhesitatingly send money or orders, if we chanced to want what he advertises, and at the price asked. No patent medicines, or secret remedies are admitted, and no advertisement deceptive either in form or substance. By living up to these requirements, we aim to make the advertising pages very valuable to the reader, as well as to the advertiser.

The Officers of the Cattle Breeder's Association

for the current year, 1866, are: President: E. H. Hyde, Stafford, Conn. Vice Presidents: J. F. Anderson, South Windham, Me.; J. O. Sheldon, Geneva, N. Y.; Burdett Loomis, Suffield, Conn.; J. W. Freeman, Troy, N. Y.; E. D. Pearce, East Providence, R. I. Secretary and Treasurer: J. S. Allen, East Windsor, Ct.

The Committees on Pedigrees and Stock Registry are as follows: On Shorthorns: S. W. Buffum, Winchester, N. H.; S. W. Bartlett, East Windsor, Conn.; P. Sledman, Chicopee, Mass.... On Devons: H. M. Sessions, South Wilbraham, Mass.; E. H. Andrews, Waterbury, Conn.; E. H. Hyde, 2d, Stafford, Conn.... On Ayrshires and Herefords: George B. Loring, Salem, Mass.; Thomas E. Hatch, Keene, N. H.; W. Birnie, Springfield, Ms.... Alderneys: John Brooks, Princeton, Ms.; C. L. Hayes, Unadilla, N. Y.; Jonathan Forbush, Bolton, Ms.

The Committee on Devons commence a new volume of the Amer. Devon Herd-book, for which they are now receiving pedigrees. Those wishing these recorded, should apply to the President, or Chairman of this Com.

Wall-Builder and Stump-Puller.

—Mr. Packer, of Mystic, Conn., in working among the rocks of New London County, found the necessity for a machine to lift heavy rocks, transport them, and deposit them in walls, or wherever needed. So he invented one, —a pair of shears, on strong wheels, held apart by two powerful curved reaches, giving room for a stone to be swung high between them. For a wall layer, when large stones, say from 1 to 10 tons, are to be moved, it is doubtless an excellent thing, and has done first rate work in New London County. As a stump-puller, it must demonstrate its own excellence.

Rivers' Miniature Fruit Garden.

—We have in press a reprint of this charming little book on the garden culture of Fruit Trees. Ready early in April. Price 75 cents.

Garden Manures.

—J. Haines, Tazewell Co., Ill., wishes to know what to put on a sandy garden. Muck, composted with lime or ashes, is one of the best applications to a soil of this kind. Gas lime is not safe to use until it has been long exposed.... D. B. Graves, Clinton Co., Pa. There is much difference of opinion as to the value of salt as a manure; but it is used with apparent benefit on Asparagus, Cabbages, Beets, and such plants as naturally grow near the sea, at the rate of five or more bushels to the acre.

Plants Named.

—J. M. Shaw, of — Co., Maine. No. 1 is the common Crab-grass, *Panicum Sanguinale*. No. 2 is a Beard-grass, *Andropogon furcatus*. ... W. Mand, Mill Co., Wis. The specimens appear to be unusual forms of the Red Cedar, which, when young, has long and sharp leaves; and it is not unusual to find on old trees limbs which bear leaves quite different from those on the rest of the tree.... "Subscriber," Auburn-dale, Pa. The grass from the North of Italy is the Feather grass, *Stipa pennata*. It is hardy in the gardens around New York. The seed is sold at the seed-stores, but it requires heat to start it. The plant is perennial.... Israel Sanborn. The seeds sent as Japanese Wheat are evidently of something closely allied to Sorghum, Guinea Corn, etc. We cannot tell precisely what, from the cleaned grain. A whole fully grown, but not over-ripe, cluster or head is needed to determine it.... "K." The leaves probably of Tree Houselack, *Sempervivum arboreum*; it needs to be quite old to flower.

Fertilizer for Lawns.—One bushel gypsum, two bushels ashes, one bushel fine bonedust (sifted). Sow about one peck of the mixture to the square rod.

Compost for Corn in the Hill.—Take hen manure 1 bbl., bonedust 1 bu., dry muck 2 bbls., chamber-ley 3 pailsful. Soften the dry hen manure with the urine, and mash the lumps—then mix thoroughly with the bone and muck; 1 handful to the hill. Worth more than best poudrette. Good also for any root crops.

Compost for Common Garden Crops.—For surface dressing, to be raked in after thorough manuring. Hen manure one bushel, mix with chamber-ley or stable liquor, and soften, add half a bushel plaster and half a bushel ashes, mix intimately, adding at the same time one bushel of good soil or fine muck. Use within three days, or add 2 bushels more of muck.

Fertilizer for Potatoes in the Drill.—Bone-dust or good bone meal, mixed with oil of vitriol, $\frac{1}{2}$ water, and well stirred three days, then dried with leached ashes and muck, equal parts. The proportions being about one bushel bone, ten pounds acid, twenty pounds water, one-half bushel ashes, and one-half bushel dry muck. This preparation is good also for corn.

Quick Acting Composts.—("J. D. B.," Summit Co., Ohio, and others. Materials are within easy reach of most people that, judiciously compounded, will make first-rate fertilizers for the garden, for field crops in the hill, for the lawn- or for top-dressing mowing-lands or grain. There are some which every one has on his own place; others he must buy. Almost any man this side of the Grand Prairie can afford to pay for good hardwood ashes as many cents a bushel as hay is worth dollars a ton. There are other things, like gypsum and lime, that it will always pay to have on hand. Soapuds, chamber-lev, and many articles of household waste, are often lost, which might, if collected, make many dollars worth of rich fertilizers in the course of the year. See other items for several recipes for cheap composts, which are not specific, but good for the uses suggested.

Substitute for Swamp Muck.—Swamp muck, or peat, so far decomposed as to fall to powder, is one of the most useful articles about a farm or garden to save and increase the value of the manure, form part of composts, or the chief bulk of stable manure, being used instead of litter to a great extent, and to prevent burning in the mass, and to absorb all liquids. A very good substitute may be made by throwing sods from the road sides or fence-rows together, spreading upon them about one bushel of slacked lime to the cubic yard.

A Seed Drill.—Several inquire about a seed drill. We have tried the Wethersfield, and found it quite satisfactory. It will sow anything from turnip seed up to beans. We have seen no better ones in use.

Orion on Beets.—A very good article is offered in the dialogue form, an attractive one—but it takes two or three times the space of a succinct account of the matter. We should be glad of more concentrated articles.

"The Deep Arcana of Facts."—Congress called for a report from the Commissioner of Agriculture—a "statement in detail" of the disbursements and expenditures of the Department of Agriculture. We are indebted to the Hon. Mr. Washburn for a copy of the official document. We find a great many figures, and get some insight into how the money goes, though not in all cases a very clear one. Of course the report closes with the usual amount of self-laudation, which, if it were expressed in good taste, might be endured, but when we learn from the Commissioner that certain labor of the department opens "the deep arcana of facts," we turn for relief from the literary portion of the report to the figures, which, if not poetical and "hifalutin," are at least suggestive. In perusing these many columns, we are struck with the wonderful amount of horse hire, and are tempted to add up how much it costs to "run" the department in this way. Aside from buying a pair of horses for \$225, we find for horse hire and horse-keeping in a little over 3 years, \$3,428,00, and this is so lumped in sums ranging from \$3.00 to \$400, that we are at a loss to know which is cheapest—to keep a horse or hire one. Surely the Department might give us some statistics on this point. This report is very great on little things, but very unsatisfactory on large ones. Every individual man and woman who has received \$3 or upwards, for making seed bags, is put down in full with the amount, and we are told distinctly who gets the money; but when it comes to the large sums, all is lumped, and we find that "Isaac Newton *et al.*" are down

for thousands. Perhaps the people will like to know who *et al.* are, and we are quite sure that some of the "watch dogs of the treasury" will look into the matter. Then we find Isaac Newton, Jr., *et al.* were paid \$4000 in one year. We are glad to know that there is an Isaac Jr., and that he has an *et al.*, and that they get well paid. There are more interesting items which we must reserve for another time, such as where the seeds come from, how much is paid for the long drawn articles in the so-called reports, what it costs to write a preface to one of those precious volumes, etc. etc.

Staking Trees.—When young trees have the proper balance of root and top, there is seldom need of staking them except in very exposed places. But there are cases in which it is necessary to do it, especially where large trees are moved. Two firm stakes are

Fig. 1.

Fig. 2.

placed opposite each other in the direction of the prevailing winds, and about a foot from the trunk of the tree, or one stake only may be used. The figures show two methods of securing the tree. In figure 1, a straw rope is put around the tree, twisted until it reaches the stake, and then passed around it and fastened by a nail. In fig. 2, the tree is kept in place by two straps of leather or stout canvas, which are secured to the stakes by nails.

Phenomena of Plant Life.—A neat little volume, published by Nichols & Noyes, Boston, and containing a series of popular essays by Geo. H. Grindon, of Manchester, England. When we take up a book of this kind we feel pretty sure of being bored. Essayists and preachers are generally careless as to their science; but here is a writer who can present the phenomena of plant life in its moral and aesthetic aspects, without violating scientific accuracy, or being tediously preachy. We do not quite agree with the author's description of the embryo; but he is, withal, so genial and so readable that we are not disposed to find fault with him, and we commend the book as one that can not fail to please the thoughtful reader. Handsomely bound in beveled boards, 94 pages. Price \$1, by mail.

Book on "Land Drainage," by John H. Klippart. We have recently placed this book on our list, and can recommend it to our readers. Those who already have the work of Judge French on the same subject will find this, in some degree, a new presentation of the same facts and conclusions, but besides containing much that is of especial value, not touched upon in that. The Secretary of the Ohio Board of Agriculture adapts his work especially to the wants of the Western farmer, while the Judge views his subject more from a more Eastern stand-point. Price, \$1.50.

The American House Carpenter, by R. C. Hatfield, is a new book upon our list. It treats of the principles of carpentry, and is calculated to supply a want which our correspondence indicates is felt by many of the readers of the *Agriculturist*. The work will be valued, we think, by every carpenter who makes a study of his trade, as the mathematics of architecture are made simple; and with the aid of tables and very numerous diagrams and illustrations, strength of materials, framing, drawing and shadows, practical geometry, and the principles of architecture are ably discussed. An appendix contains numerous convenient tables and a glossary. Sent by mail, post-paid, for the price, \$3.50.

Turner's Cotton Planter's Manual.

—In answer to inquiries for works on cotton growing, we wish we were able to recommend a better book than this. But as this is the only work, as far as we know, on the subject, we keep it in print to supply the demand. It is a compilation of essays by different well known Southern authors, and it contains much useful information, good, as it is, but would be more available were it more systematically arranged. Price \$1.50, by mail.

Boussingault's Rural Economy.

This is not, as its title might imply, a handbook of directions for the management of rural affairs, but a discussion of the principles involved in agricultural operations. Its author is one of the first chemists France has produced, and this work embodies his views of chemistry as applied to agriculture. It is a work which should find a place in the libraries of agricultural societies and clubs, as well as in private collections of the best works on agriculture.

Grape Culture in Steuben Co.

—Our notice of the essay by the Hon. Goldsmith Denniston, has called out so many inquiries for it, that we have procured a number of copies, and can supply them at 40c. post-paid. It is a neat pamphlet of 24 pages, with maps of the famous grape localities, and illustrations of the methods of planting followed in one of the noted grape regions of the country.

Farm Book-Keeping.

—There are a number of rather expensive forms of farm account-books which are offered to farmers. All that we have seen contain some good ideas; but to give a plain, straightforward knowledge of business ways, and to lead the farmer into keeping accurate Debt and Credit accounts with himself, his farm, his animals, and those with whom he deals, we really know of no better guide than *Mayhew's Practical Book-Keeping*, with the accompanying *Sample Account Books*. It is calculated for the use of schools, but needs no explanation. We would be glad to be instrumental in placing it in the hands of every farmer's boy in the land. Price of the volume, 90c.; of the set of account books, \$1.20.—Sent post-paid.

A Good Story.

—"Luke Darrell, the Chicago Newsboy," advertised in our columns, is a live, wide awake story, which will lead boys to love truth, courage, and manliness. The young will be quite sure to read it, if it comes within their reach. We can forward it post-paid on receipt of price, \$1.50.

Breck's New Book of Flowers.

Breck's Book of Flowers has long been a standard work on floriculture. The author having for the most part rewritten it, it is now called the *New Book of Flowers*. It describes all the favorite annual, biennial, and perennial plants of the garden, as well as the flowering shrubs. Its chief value consists in its giving the experience of the author, who is well known as one of our most successful and devoted cultivators of flowers. Aside from its practical directions, there is an amount of quaint gossip about plants, and personal reminiscences, that make it a very readable, as well as useful, book. Ready in April. \$1.50.

Field's Pear Culture.

—Manuals upon specialties are rapidly taking the place of large volumes upon general culture. This manual upon the pear commends itself to pear growers only, and its scope is modestly set forth in the author's own words: "Its design is to answer in a clear and intelligible manner, the oft repeated questions of the novice: 'What kind of Pear Trees can I plant most profitably?—and how shall I treat them, to insure a return of the investment?'" \$1.25.

Cow Milker.

—To several inquiries we answer, that we have no evidence that any machine for milking cows has ever been tried and given satisfaction. The one advertised last month may be the best of them, but we have no evidence about this that will establish its claims to favor. Until satisfied of its real value, we can not give it the endorsement of further admission to our advertising columns.

Dog and Moon.

—Judge Olin, of Vermont, being badgered at a dinner by a young sprig of the Law, made no reply. A friend asked why he did not squelch him. The Judge simply responded, that "In his neighborhood, there used to be a little dog that would sit for hours and bark at the moon"—and resumed his eating. "Well, Judge," resumed his friend presently, "what about the dog and moon?" "Oh," said the Judge, "*the moon kept on!*" We commend this incident to one or two captious cotemporaries, who cavil at very small matters, and wonder why the *Agriculturist* does not stop to bandy words with them.—Advertising, \$2 a line.

Wheat from California.—A correspondent of the *American Agriculturist*, James Cass of Lagdon Valley, California, sends us a sample of wheat which he has raised for eight years, and wishes us to tell him its true name. He discovered a few heads of it growing in one of his fields, and carefully saved the seed. On cultivation, it proved to be much affected with smut, but with him, as with us, blue vitriol (sulphate of copper) proved a perfect preventive. He has raised as much as eighty bushels per acre. Straw tall and stiff; berry long, not very plump, thin skin, and uncommonly white and handsome. Has obtained 42 lbs. of excellent flour from a bushel of wheat. We do not know the variety. If he will send us three or four lbs. by mail in time for sowing the coming fall, we will give it a trial, and can then tell something about it. The postage is only eight cents a pound.

Drilled Wheat vs. Broadcast.—J. C. tried the experiment of drilling in his seed wheat, vs. sowing broadcast. At first, the drilled wheat looked much the best, but at harvest the broadcast came out far ahead. This is sometimes the case, but in four cases out of five, drilling is the better practice. It saves seed, deposits it more evenly, and at uniform depth, and in a dry autumn you can put the seed down into the moist earth, whereas if sown broadcast, much of it will remain in the dry surface soil, and will not germinate until it rains.

Hoe the Wheat.—To admit of which it must be drilled. We ought to have a machine to do this, but until we have, we should hoe the weediest portions by hand. It will pay in many cases. It is not so much work as many imagine. Try an acre this spring, as early as the ground is dry enough to work well, but not before. Many farmers spend more time in pulling up red-root when it is in flower, and after it has robbed the wheat of much nutriment, than would suffice to hoe over the whole surface in the spring. In many cases a light harrow will destroy the weeds among the wheat, and at all events will stir the soil and favor the growth of the crop. One need not be afraid of the harrow, even if a heavy one, injuring the wheat, if the ground is dry. It may pull up a plant here and there, and to a casual observer the wheat will appear badly cut up, but it soon revives.

Broom Corn.—Considerable interest is manifested in regard to this crop by numerous correspondents. We propose to give it more attention in the May number, and now only say, that it does well on swards turned over last fall, and on grass land broken up in the spring, if the soil is rich, and the furrows flat, and it can be manured in the hill. It thrives on any good corn land, but pines on wet soil, or on heavy clays.

Vetches or Tares.—D. F. Spaulding, Iowa. The "Vikker," as you write it, which the Germans and Scandinavians in your neighborhood talk about, is the Vetch.—Wicke in the German language. Vicker in Swedish. The plant has been cultivated to some extent in this country, but without marked success. It is of a nature, agriculturally, between peas and clover, an annual crop, good for hay, delighting in deep clayey loams in good tillth. There are both spring and autumn varieties, and they ought to have a good trial in this country. It does not thrive in very dry localities, nor on sandy soils. The seed may probably be got of our seed importers, or they will get some out for you for next autumn's or spring's sowing, if you wish.

About Fine Bone Dust.—A Caution. To several recent inquiries, we answer: Bones are undoubtedly a very valuable fertilizer. For fruit trees and vines, the whole bones, or those coarsely broken, decompose slowly and afford nourishment as needed, over a long series of years. A little fine bone dust added, is well, to produce immediate effects, while the larger pieces are getting into a state of decomposition. For immediate effect upon crops, the finer the bones are powdered the better. The fine bone dust which has been long in use, is largely decomposed and used during the growth of any crop. The claim that bones ground to flour, are worth twice as much as the fine ground bones, is hardly tenable. Suppose we invest one sum in one ton of flour of bones, and as much more in two tons of the simply fine ground bones. In the former, we get most of the effect immediately; in the latter, we get the early benefit of say a ton of the finest portions, and still have left a ton of the coarser portion for further future effect in the soil.—Some two years ago we examined a sample of fine ground bones, sold in the market, and found a large percentage of plaster so intimately mixed as not to be recognized without careful inspection. We caution our readers to be on the lookout for such frauds on the part of manufacturers, and especially of unscrupulous sellers, who can easily adul-

terate the originally pure article. The finer the bone, the greater the chance for deception. The fraud can usually be detected with a strong magnifying glass, by the form of the fine particles. By stirring a quantity of it in water, the heavier plaster will settle first to the bottom, where it can be easily seen. Plaster is easily detected by burning a little of the material, dissolving the ashes in a pure hydro-chloric (muriatic) acid, and adding a solution of nitrate of baryta. A heavy precipitate of sulphate of baryta, in the form of a white powder, (or sediment,) which is insoluble either in acids or in much water, would show the presence of plaster (sulphate of lime,) in the bone powder.

Testing Soil for Lime.—A gentleman describes to us a process, by which he proposes to test a soil for lime, to see whether it would be benefited or not by the application. For his information we would state, that the soil might be half lime-stone, and one would not discover it by his test. The point we would make, however, is, that a little knowledge is a dangerous thing, and any chemical test, which a farmer, who is not a chemist, might apply, would be likely to mislead. Besides, the soils most benefited by lime, often have an abundance of lime in them for the use of plants, as great benefit frequently comes from the action of the lime in its freshly slacked state, in promoting decompositions and solutions of plant food in the soil, and in its changing more or less the mechanical character of the soil.

Sorghum Sugar.—The culture of Sorghum is making advances now-a-days, and there is really some prospect, that a marketable article of brown sugar will be produced. It seems from statements brought out by the comparison of views and practice at the recent Sorghum Conventions, that the early cut, even unripe canes, yield the most cane sugar with great uniformity. Improvements in evaporating and in drying the sugar are introduced or suggested also, of which we shall endeavor to keep our readers informed.

Let the Horses Rest Occasionally.

—We know a physician, in large practice, who is frequently compelled to drive his horses hard. He formerly drove the two together, and used them up in a few years. He now drives them singly, and as far as possible on alternate days. They are now, though working harder, invariably healthy and strong. He attributes this to the fact that if a hard drive strains any of the muscles, they have time to regain their tone the next day. Were the horses driven every day, a slight sprain would produce a little stiffness; the parts would rub against each other; inflammation would set in, and the horse be lame—perhaps incurably so. Farm horses are not so liable to injury in this respect, as those driven fast over hard roads. But a day's rest occasionally will help them materially. At all events do not work them Sundays. Or if any are driven far to church, or for any pressing emergency, make it a rule and adhere to it scrupulously, to let such horses rest Saturdays, or Mondays. Man and beast must rest one day in seven, or pay the penalty. Better work harder and rest longer.

Every One should "Insure his Life."

—There is an unwarrantable prejudice on the part of some persons in respect to Life Insurance. The practical operation of all good companies amounts to this: A thousand or ten thousand persons, more or less—the more the better—unite together, and say that, as all our lives are uncertain, we will each contribute annually a small sum to a general fund, to be drawn upon by the family of the first one taken away by death, then by the next, and so on—in proportion to what each has subscribed. The small sums thus gathered, form a large fund which is constantly increased by being placed securely on interest. By long extended observation, it is known to a certainty what will be the average length of life of the whole company, and how much must be annually contributed to secure \$1,000, more or less, to every one of the company, at the time of his death. A very small additional sum furnishes funds to pay a few officers or managers, and to have a little surplus against emergencies. So safe are the calculations, and so well have such companies been always managed, that they have been the most substantial of all joint companies formed in this or any other country.—We esteem it the duty of every man having a family, or creditors, likely to be affected pecuniarily by his death, to have at least a small sum of ready money sure to come to them at his decease. He may be independent to-day, but riches often take to themselves wings and fly away. Every month's observation shows that the best established properties may become involved, if not by the want of judicious care on the part of the proprietor, at least through the rascality of others. A millionaire of our acquaintance went to bed last night assured of a million and a half dollars, in good U. S. securities, in his strong safe box. To-day we learn that

the thief's hand has spirited them all away.—The farmer has his land nearly paid for. He dies, and the confusion of his affairs, or the want of good management on the part of his family, or successors, may involve the loss of the whole; while a few hundred, or a few thousand dollars of ready money at his death, may save a homestead for them, free from incumbrance. And so of every other calling. That a man is strong, and belongs to a long-lived family, gives him no certain tenure of life. The weak or sickly are likely to take most care of themselves, and thus prolong life. We always think of the operations of death, as those of an enemy who stands at a distance, and shoots a poisoned arrow at random into a large crowd. It is as likely to strike the young as the old, the strong as the weak. It is well therefore for every one to be always ready for the fatal shaft, both as respects this world and the next.—We believe a Life Policy really tends to "insure" and prolong life. Thus: A man is sick, and the anxiety of mind, as to how he will leave his family, aggravates his disease, and often does shorten a life, which would have been saved could the man have rested easy in the feeling that his insurance policy would place his worldly affairs in a safe position in the event of his death. So, we say, let every man devote a small sum annually to securing a convenient safe guard to his family or others, in the event of his death.—We write as we have long practiced, and not in the interest of any company. (We chance to be insured in three different ones.) Several good companies are from time to time admitted to our advertising columns. Sent for their circulars and statements, which are furnished free, and give full particulars, and then choose the one most in accordance with your views. They are all of them safe, and differ but little in the ends to be secured. The larger the company, the less is the percentage for expenses, and the less their liability to fluctuations in their operations; and the chance loss of a large amount by pestilence or otherwise, will tell less upon the aggregate.

The Death of George M. Beecher.

—Just as we are closing up this paper the sad news comes to us of the death of the Secretary of the Indiana Horticultural Society, Mr. George M. Beecher. Though only in his 25th year, Mr. B. was well known, not only in his own State, as a nurseryman and orchardist, but to the pomologists of the country for his devotion to their pursuits. A friend who knew him well, writes: "Modest and unassuming, but, from his merits, put forward prominently among his fellows,—Secretary of the State and County Horticultural Societies since their organization, and always devoted to their interests,—liberal, and anxiously seeking information everywhere, he attended other societies, both East and West, and thus became widely known among horticulturists, by whom he was everywhere considered the rising man. Young as he was, his opinions upon all practical points were highly valued. He died as he had lived—at peace with all, and with an abiding Christian hope and confidence."

Osage Orange Seed.

—Now that this long wanted seed is again offered for sale, we have questions as to how to sprout it, and if it is to be planted in place, where the hedge is to stand. It should be frozen before sowing; but as it is now too late to do that, the seed must be soaked. Pour scalding water, as hot as the hand can bear, over the seed, and let the whole stand in a warm place, repeating the operation every day for five days. Then drain off the water, and keep the seeds covered in a shallow vessel in a warm room until they begin to sprout, when they may be sown. As the plants are liable to be thrown out by the first winter's frosts, it is necessary to raise the plants in a nursery. Rich land in fine tillth is marked out with drills, about two feet apart, or wide enough to work with the cultivator; sow the seed thinly, about an inch apart, and cover two inches deep. Keep carefully cultivated the whole season. Warder's Hedges and Evergreens—see Book List—gives the various methods of forming hedges.

Honey Locust Seed.

—We know that this plant, properly cut back, will make a good hedge. It is objected to it that it is naturally a tree, and cannot be cramped into a hedge plant. So is the Osage Orange, and so is the Hawthorn. It is useless to look for a plant that will make a hedge of itself. Even the Beech may be grown as a hedge, if properly clipped. The seed of Honey Locust will often grow without preparation, but as seed is bought at the stores it is safest to scald it before sowing. It is best sown in nursery drills, when the soil is warm—about the time for planting corn.

Laurel Poisoning Again.

—"C." Richmond, R. I., gives to a lamb five to ten teaspoonfuls, and to a full-grown sheep two to four ounces of salts [epsom, we suppose] dissolved in new milk. If the pain does not appear to subside in a reasonable time, he repeats it. He thinks if the poison is not thrown off from the stomach it must be removed by moving the bowels.

How to milk.—John K. Busted, a milker of 25 years' experience, says he always milks his cows in the same order, and that is the order of their calving, so that each cow knows her turn. He wipes the teats off with dry hands, and taking hold X-fashion, milks two teats dry; then takes the others—always keeps his hands dry, and never has any trouble about the cows holding up their milk. He thinks the practice of changing from one cow to another (or from one pair of teats to the other), gets both milker and cows in bad habits....E. Doble practises very much in the same way, never changing his hands to the other teats before the first two are milked dry, except in stripping....The philosophy of this practice seems to be that as the cow gets no relief or but little before the second pair of teats is partly milked, until that time at least, she will not withhold her milk.

Feeding young Calves is attended with some difficulty, because they will knock over the pail unless it is held. Mr. M. Hester, Huron Co., Ohio, has pieces of hollow logs, cut one foot long, into which he sets the pails firmly about half way.—A good idea.

Long Cut Feed better than Short. A correspondent reasons as follows: When a boy, we were taught to cut straw and hay for horses as short as possible, and the reason assigned was, that horses would eat it sooner, and with greater avidity. In after life, we observed that it was not so good for the horses. Straw and hay cut one inch long, for animals that do not chew the cud, is far better than if cut to one-fourth inch. When straw is cut very short, much of it goes into the stomach without being crushed. For this reason, a great deal of it does not digest, though the juices of the stomach would have dissolved it, had it been properly masticated. When a horse begins to eat, the salivary glands send a stream of saliva into the animal's mouth, to moisten and soften the feed and to prepare it for more easy digestion. Therefore it is important that every piece of straw or hay should be crushed and macerated between the teeth, and the saliva thoroughly mingled with whatever is eaten before it is swallowed. As saliva is a powerful solvent, the organic structure of all feed should be broken up by the teeth, and the saliva and all the small fragments brought in contact with the liquid.

Feed Sheep Regularly.—"Sheppard," writing from Berlin Heights, Ohio, truly says: "We who have the care of domestic animals, cannot be too particular with them, especially in regard to set times of feeding." He adds: "Let any one who has had no regular time for feeding sheep, now commence, and see if there will not be at once an improvement in the disposition and condition of the flock. Regularity of feeding sheep is an essential point in keeping them in a thriving condition, but one which is overlooked or unheeded by many. Sheep fed at irregular times know not when to expect their food, they therefore wander about and are uneasy, not quiet and peaceable as they should be and will be if treated in the right way, and fed mornning and evening a perfectly regular hour.

How Crows Kill Lambs.—Mr. L. P. Maynard, an old farmer, says: He was living on Fisher's Island (in Long Island Sound off New London) some 25 years since, and often found young lambs dead, all of them with their eyes out, and could not account for it, but supposed the eyes were picked by the crows after the lamb had died. One day, however, he saw a sheep with a lamb just dropped by her side, when a crow marched up, and before he could interfere, picked out both eyes of the live lamb. Of course the lamb died, and Mr. M. has known of the same thing occurring repeatedly since. Several farmers, to whom we have mentioned this, substantiate it, from their own or their neighbors' experience.

Albany, New York, and Boston Live Stock Markets.—"Subscriber." New York and Boston are terminal markets, so to speak. Albany, however, is not, and a large number of the animals offered there, or sold there perhaps, are reshipped to New York and Boston; in fact they do not leave the cars.

Wool or Grease.—"We can't raise wool for less than 75c. a lb." So say the Ohio Wool Growers, in Convention assembled. Is it possible? To this complexion have we come at last? Where are the "Improved American Merinos?" Have the manufacturers learned to "discriminate?" Won't they pay as much for grease as for wool? There is something wrong somewhere. Were we not told that if we would pay a thousand or fifteen hundred dollars for an Infanzola, we could raise wool for little more than the expense of shearing. It is not two years ago that, at one of the meetings for Discussion in the Evenings during the N.

Y. State Fair at Rochester, Lewis F. Allen cautioned farmers against rushing thoughtlessly into sheep speculation, saying that he had known wool sold for 25c. per lb., and probably it would not be many years before we should witness the same thing again. Whereupon up rose an Honorable gentleman from Iowa, and remarked "Well, we can raise wool for twenty-five cents a pound." Is he of the same opinion still, or does it cost more to produce grease than he calculated?

Sows Lying on their Pigs.—It may be well at this season to again remind the readers of the *Agriculturist*, that all danger from sows lying on their young can be obviated by simply fastening poles on the sides of the pen, say a foot from the sides, and a foot from the floor. The sow rarely, if ever, lies on her young, she crushes them against the sides of the pen. The poles, by keeping the sow a foot or so from the sides, prevent all danger. It is a simple matter. Any one who can cut down a pole in the woods, and knows how to use a saw and a hammer, can spike them together and to the sides of the pen, and the thing is done. It is exceedingly annoying to lose two or three little pigs out of a nice litter, when half an hour's work would have prevented it. It is not merely the loss now. Next fall they will be worth \$20, \$30, or perhaps \$40 a piece, at little cost for keeping.

Contrivance to Prevent "Interfering."—We have noticed in use upon the Third Avenue Railroad in this city the contrivance illustrated below to prevent horses interfering with their fore feet.

It consists of a piece of oak board, $\frac{3}{4}$ inch thick, of about the shape indicated, bound with an iron hoop, and with the center cut out for lightness. This is of a width sufficient to go easily between the fore-legs; yet to touch both and be a perpetual hint to the horse to carry his feet further apart. This piece of wood is suspended upon the martingale strap, as shown, and connected with the girth by two small straps, kept about two inches apart by a bit of hoop iron riveted to each. The martingale strap, or a broad strap connecting it with the collar, is attached to the opposite and forward end. In use, this is allowed to swing freely a few inches below the breast, and is said to be very effectual in preventing interfering.

Ashes and Plaster.—"G. H. L. H." has 12 acres upland grass land, from which he cut 25 tons of first quality Timothy last year. He wants to top-dress it with ashes and plaster, but neither knows how much nor in what proportions to apply them. As to the proportion of the two, hardly two farmers will agree, or have the same reason for preferring any particular proportion, while all agree that such an application will add often half a ton to the acre. As to quantity, he can afford to pay as much for this manure as the additional value of the crop will amount to,—because its effect will be seen for years.

Nepaul (Naked) Barley.—Mr. Henry Fleming, of Canada West, sends us the following interesting collection of facts about naked barley: "In May, 1862, I obtained of the *Agriculturist* some of the 'Nepaul Barley.' From that small amount of seed I have now, by repeated sowings, upwards of 200 bushels of most beautiful barley. Will you not state why it is not more cultivated. I find it weighs 61 pounds per bushel. If this be the 'naked barley,' or 'wheat barley,' described in 'Johnson's Farmers' Encyclopedia,' you will find he says: 'The six-rowed naked barley is cultivated in various parts of Europe, and is greatly esteemed for its fertility. In some parts of Germany it is regarded as the most valuable kind of barley, and by the French, on account of its supposed productiveness, it has been termed 'celestial barley,' or 'heavenly barley.'—M. Mazuceo, in a French paper, earnestly recommends the more general cultivation of naked barley, as he states that it weighs as much as the best wheat, and its quality resembles them so much that it may be used for the purpose of making good bread, and also for pearl barley. In mountainous countries its produce is twenty-four to one.—Warten Hastines said, after twelve years' experience in the cultivation of naked barley, that it is of the greatest importance to promote the culture of this sort of grain. 'It is,' he adds, 'the corn that, next to rice, gives the greatest weight of flour per acre, and it may be eaten with no other preparation than that of boiling. It requires little or no dressing when sent to the mill, having no husk, and consequently produces no bran. It is gathered into

the barn, and may even be consumed, when the seasons are favorable, in about 80 or 90 days after being sown; and there is no species of grain better calculated for countries where the summer is short, provided the vegetation be rapid.' 'Naked barley, or wheat barley, is so termed in consequence of the grain separating readily from the chaff when thrashed. It is a native of the north, and will bear sowing early in the season; it makes strong malt, and is excellent for the fattening of hogs and cattle.' The above description corresponds very well with my 'Nepaul Barley.' It is very prolific and hardy, stands drouth well, and is not attacked by insects, smut, or other diseases. It makes good mush, bread, etc."

Wheat Chaff for Packing Ice.—"S. L. P." of Gloucester Co., N. J., writes: "I have seen at different times in various agricultural journals, materials recommended for keeping ice, such as saw-dust, turning shavings, tan, salt hay, etc., but among them all I have never seen, I believe, wheat chaff recommended. I have tried that for the past three years, and prefer it to any of them; it is readily obtained, especially by all farmers; is light and easily handled, and not good for much else, excepting to throw in the barn-yard as an absorbent, which can be done with it after it has done its office in the ice-house, so it is not lost in this respect. With a common dung fork the house is easily cleaned out much easier than where saw dust is used. Those who try it, will, I think, find it much more satisfactory than saw dust, shavings, or tan. My plan is, to cover the ice well with it early in the spring, and as the ice melts away from the walls of the house, I push down the chaff all around as solid as I can. After I have succeeded in getting it down solid in this way, I find the ice wastes quite slowly by melting, even in the warmest weather. I prefer the chaff of bold white wheat, as it has no beards on it, but the other will answer admirably.

Moles Eating off Young Trees. (2)—H. R. A., Steinsburg, Pa., writes: "I have a nice lot of young apple trees, two years old, and moles attack them and eat them entirely off below the surface. Please give hints for destroying them." It is not moles, but probably borers that eat the stems, and the moles, if in the soil near the trees, are there to eat some of the insects, which may be living on the roots of the trees, or which are ready to ascend when the warm season comes.

A Cellar above Ground.—Mr. Pfeffer, of Shelby Co., Iowa, asks how he can build a good, cheap cellar on the flat prairie. We presume he cannot get good drainage and so his cellar must be above ground for the most part. If one can dig two feet and still secure a dry bottom, it is easy to use the earth for walls, and making them some 3 feet thick (2 at the top and 4 at the bottom), have a cellar 6 or 7 feet in the clear—cool in summer and warm in winter. We saw in Richmond Co. (Staten Island) last summer, on a low part of the island, an ice house and milk house together, almost altogether aboveground, the whole of which was covered with several feet of earth, beautifully sodded, and looking very much like the bomb-proof of a fort.

Building Stone Fences.—In a recent conversation with the Hon. John McLean, of Wheeland, one of the most experienced farmers in the State, he remarked that he formerly had trouble with his stone fences being thrown down by the frost, but since he had adopted the plan of building them on a ridge thrown up a foot or eighteen inches high, they had stood very well. The plan has a double advantage: The soil thrown out from the side of the wall lowers the ground, while at the same time it raises the fence, and thus saves stones and expense in building. Knowing the importance of details in all such operations, we should be glad if he would be kind enough to write them out for the *Agriculturist*. And at the same time, we should like to hear from others.

Grain Drill or Broad-Cast Sower. J. C. S., Fond du Lac Co., Wis. We certainly recommend to you to buy the drill rather than the broadcast sower. Except on very rough or stony land, our common grains are better drilled than sown broadcast. The distribution is more uniform: the depth is accurately gauged; the amount of seed required is less, the stand is more even, and the yield better.

To draw a rusted Nail or Spike.—First drive it in a little which breaks the hold, and then it may be drawn out much easier.

Chloride of Lime.—"Cayuga Co. School-girl." This term is used to express the Bleaching powder in common use and correct enough, but in a chemical nomenclature is incorrect. If your text book employs it thus, so much the worse for the text book.

Chicken Doctoring.—The hit or miss style of medicinal practice has some advantages. Not the least is that it brings occasionally pleasant surprises. "Aconitum" writes, that hearing that "arsenicum had been successfully used as a preventive and cure of Rinderpest in horses" (horses never have the disease) he tried tincture of Aconite to cure a paralysis in the leg of a chicken. This drug was used "as answering best to the totality of the symptoms." Three drops were given in a teaspoonful of water, and the paralysis was soon cured. The principle of *similia similibus* finds a double application—a little more Aconite would have caused a paralysis *in toto*; 3 drops caused a *total cure in pedo*.

Ale for Chickens.—We recommended bread soaked in ale for chickens with colds or attacked with the roup. A correspondent asks for a recipe by which he can make a small quantity of ale. It cannot be done; but where ale cannot be obtained, *lager beer* will do very well, and we have administered rum and water (and probably any other spirituous liquor would do as well.) with the very best effects, graduating the dose in proportion somewhat to the strength of the medicine.

Transportation of Eggs for Setting.—So many disappointments occur when eggs are carried a great way, that many of our best poultry fanciers and dealers refuse to sell eggs to go far. They are wise, for several reasons—principally on account of the hard feelings occasioned, and secondarily, because they can make it more profitable to raise the chickens.

Chicken Literature.—Why hens should inspire our comic writers we do not exactly see; but they are made the excuse for a great deal of nonsense. Even the religious papers, such as the Independent, have occasionally a funny column devoted to chicken talk. The writer of the following, who signs himself "Chittagang," has evidently been reading the Independent:

"*Chicken on the Brain.*—The best time to set a Hen is when the Hen is *reddy*—I can't tell yu what the best breed is, but the Shanghai is the meanest—it costs as much to bored one, as it does a stage Hoss, and yu might as well try to fult a fanning mill by runnin Oats thru it. There aint no profit in keepin a Hen for his Eggs if he laze less than won a day. Hens is very long lived if they dont contract the throte disease. There is a grate many goes to pot every year by this melankoly disease. I kant tell exactly how tew pick out a good Hen, but as a general thing the long geared ones I kno are least apt to scratch up a garden. Eggs packed in equal parts of salt and Lime water, will keep from Twenty to Thirty years if they are not disturbed. Fresh Beefsteak is good for Hens. I serpose 4 or 5 pounds a day is all that a Hen would kneed at furst. I shall be happy to advise with you at any time on the Chicken questhion, and take pay therefor in Eggs."

Canary Seed.—A single firm in this city has sold 15,000 bushels (60 lbs. each) of canary seed within the past two years. So far as we know this is used exclusively for bird feed, and indicates the extent to which caged birds are kept in this country. Sales of other large houses have very likely been equally great.

Broom Corn.—Jas Graham, Cuyahoga Co., O., inquires for the best machine for planting broom corn.

Tomatoes and the Agriculturist in his Colorado Terr.—A subscriber in Colorado gives us some account of his gardening operations, in figures which look rather large. Last year he kept a strict account of the product of half an acre. He sold, in fruit, \$2046.39; in cans, \$350, and in catsup, \$87.50; in all \$2483.89. The sales of tomatoes commenced at 75 cents per lb., and closed at 20 cents. The writer attributes much of this success to having seen the *Peejee* noticed in the *Agriculturist* as a good variety. He, like an enterprising man, sent for the seeds, and thinks that this variety has in two years been worth from \$1500 to \$2000 over the common kind. We suspect that to be the greatest amount of good the *Agriculturist* ever did to any one half acre.

Pure Air Everywhere.—One of our most distinguished physicians informed the writer a few days since, in speaking of the health giving influences of pure air and light, that for ordinary patients he would rather have the protection of a tent fly, the south side of a hedge or fence, than the best house that could be built, or to that effect. To illustrate how much attention educated, wealthy, thoughtful people give to this subject, we publish a statement which comes to us from a wide-awake traveller and church-goer who recently visited Vermont on business, and of course went to church. It was not 1000 miles from Bennington. He says: "The Church referred to have just put their meeting house,

erected in 1807, or thereabouts, in complete repair. The church was originally built over a portion of the cemetery; since then there have been some burials under it, though not for several years. Excavations have been made near the ends for furnaces, and a passage way has been dug between them; and the removal of earth disturbed several graves, and the bones were removed and reinterred in the cemetery. Those not disturbed remain there still. The air for warming the church is taken from this vault, the outside air being generally excluded. After being breathed by the congregation, it is returned to the furnaces and rewarmed, as is frequently done in other churches. This church and congregation are highly intelligent and wealthy, and are probably as careful in regard to ventilation as most of the New England churches outside of Boston. How many congregations would relish breathing the air from an old burial vault, I don't know, but it is a fact, that nine-tenths of New England are breathing constantly an almost putrid atmosphere in their own houses, change of air not being provided for."

"Designing Wall Paper."—"Reader." We know of no book on the subject. There is a "School of Design for Women" connected with the Cooper Union. Doubtless the Secretary of that Institution will know if the branch is taught there.

Seed Queries.—S. H. Cowles, Onondaga Co., N. Y. The necessity for changing seed or obtaining it from a different locality, is a subject about which there has been much discussion. It is mainly a question of the adaptability of varieties to particular soils and situations. Where a variety retains all its characters and is equally productive year after year, there is no need of changing the seed, but where it shows a tendency to degenerate, then get seed from a locality better adapted to it. There is no probability that apple and pear seeds will produce fruit like the stock from which they came.

Swine—Essex, Berkshire, etc.—There is a good deal of inquiry where to get well bred hogs of various breeds, especially of the kinds named. Those breeders who have them should advertise more freely.

New Jersey vs. Long Island Lands. Our veteran correspondent "S. W."—referring to our remarks on portions of the "Barren Lands of Long Island," (May *Agriculturist*, 1866,) to the effect that their coarse subsoil would not hold water enough for dry seasons—thinks that late experiments on the "same sand and gravel formation in New Jersey" have proved that with green-sand marl these lands yield crops of clover, etc.—The comparison fails, because on the New Jersey lands referred to, the coarse sand and gravel do not come very near the surface, but there are several feet of soil sufficiently compact to hold water, or conduct it upward to the surface.

Profitable Bees.—D. C. Hunt, of Orange Co., Vt., writes to the *Agriculturist*, that he made over \$300 net, besides six new stocks, out of 26 stocks of bees in (Langstroth's) movable frame hives the last season.

How to keep Machine Oil Liquid in Cold Weather.—When sawing fire wood, or timber by machinery, at a distance from the dwelling house, or when thrashing grain, or running any kind of machinery in cold weather, the most convenient way to keep oil or other lubricating substance in a thin, liquid state, is to heat a piece of hard wood plank, or a slab of marble in an oven, wrap it in a thick blanket and carry it to the woods, field, or barn, keeping the oil can, grease vessel, or dinner pail even, in close proximity. A piece of plank a foot or more square will retain sufficient heat to keep such articles warm for several hours in a very cold day, thus avoiding much trouble. Moreover, oil kept warm by this means, will not be injured by being heated too hot. In the absence of other materials, two or three bricks thoroughly heated will retain sufficient warmth, nearly as long as a plank of hard wood.

Interesting Meteorological Facts.

—Mr. H. T. Haviland, of Brooklyn, who has for many years observed and recorded the temperature at 7 A. M. in winter and 6 A. M. in summer, exhibits the following figures, showing that the mean temperature of two opposite months (January and July for instance) is a very close approximation to the mean temperature of the year. Thus it appears that the mean temperature of January for 19 years at 7 A. M. is 28° Fahrenheit, that of July for the same period at 6 A. M. is 67°—the mean of these two, being 47½°, while the general average for the whole 19 years is 47°. The average of Feb'y (28°) and August (66°) is 47°. That for March (34°) and September (59°) is 46½°; April (43°) and October (50°) give 46½°; May (52°) and November (41°) give 46½°, and June (63°) and December (32°) give the average 47½°. Mr. H. thinks

that were the observations more numerous and more accurate, the mean temperature of any two opposite months would represent accurately the average temperature of the climate at any place.

Peat Land.—"Subscriber," Clark Co., Ill., has a 160-acre bed of peat drained, and dry (so that several acres took fire and burned up, leaving some feet in depth of ashes). The question is, how to fill it. It is covered with thistles. The best way to manage it, might be to plow deep, cross-plow, and so dry the top; then burn this off, mingle the ashes with the rest by plowing and harrowing, and then it would probably sustain a good growth of timothy and red clover, or bear corn. Such peat is a very valuable manure for sandy land, and will pay to haul on any sandy land that it will pay to fence; and the sand is equally valuable upon the peat.

How to Set Smoothing Planes.—"C. H. E.," Rockingham, N. H., in a note describes a "trick" well known to all joiners, but which may be useful to those who lack professional skill. He says: "It is frequently found difficult to adjust the 'cap' and 'iron' of the smoothing plane, so that both shall retain the desired position. When the plane iron is struck to start it forward, the 'cap' does not move forward with it, but a slight blow upon the forward end of the plane will start both forward together, thus bringing down both irons in the proper manner upon the work."

"Gunpowder Rendered Harmless."—In an item in the January Basket an account was given of a plan for rendering gunpowder less readily combustible, by mixing it with powdered glass. A friend, who knows all about great guns and gunpowder, writes us that the invention has no practical value. That the great danger from powder is during its transportation, and that a slight jolting causes the mixed powder and glass to separate. He says: "Take a tin pan and make the mixture perfectly; stick in your red hot poker, and it will not burn much. Reheat the poker, give the pan a few sharp raps on the edge with the hand, and reinsert the poker—if you dare."

A Mild Winter in Oregon.—David D. Prettyman sent from Salem, Oregon, on Dec. 4th, specimens of grass and strawberries in flower, and a rose, in proof of the mildness of the winter on the Pacific coast. He then had violets in bloom and radishes in his garden.

Citric Acid in Cancer.—The cooling and tonic effects of lemon juice are well known. Citric acid is to all intents and purposes crystallized lemon juice, and is often used as a substitute for lemons in making lemonade, etc. An Italian physician, Dr. Brandini, finding that a patient, with a cancer of the tongue, received great relief in eating lemons, was induced to try the effect of citric acid on other cancer patients, which he did much to their relief. In a case of hopelessly incurable cancer, under our own observation, it has been used with the happiest results, and afforded a greater relief from pain than any other application that has been tried. We found that this use of citric acid was not known to the physicians of our acquaintance, and we give it for the benefit of our medical readers. The crystallized acid is used, one part by weight, to 90 parts of soft water. The weight of a common nickel cent to a pint of water comes sufficiently near. The solution is applied by moistening a piece of lint, and renewed when the pain returns.

Cutting Notes and Bank-bills in

Two.—A subscriber asks: "Is it against the law to cut a note in two parts, and send one half at one mail and the other the next, so as to guard against thieving on the way." This practice is very common in England, where the notes are arranged to encourage it, the numbers and letters being duplicated on the opposite sides, and probably also the laws, or decisions of the courts, make it easy to collect on one half if the other is lost. This custom does not prevail in this country and it would be hard to collect on half a note.

Notices of the Agriculturist.—The

notices of the *Agriculturist* by Agricultural and other papers have not been unappreciated because unnoticed. We were especially gratified at most favorable mention of this sheet in that excellent paper, the Canada Farmer, which is, by the way, one of the best of our agricultural exchanges. The N. Y. Citizen is a paper devoted to the difficult task of reforming the abuses of city government. Its chief editor, "Miles O'Reilly," is widely known for his poetical contributions, and his paper is one of the most independent and outspoken in the country. The following is an extract from the Citizen's estimate of us: "Nothing gets a place in the paper that has not an object of practical utility or instruction; and yet so genial and

unobtrusive is the spirit presiding over the whole, that we never feel lectured, or as if we were being taught in some art by a pedagogue who desires us to realize that he is, and that we are not, already familiar with the subject. Each number of the *Agriculturist* contains about forty pages, of which some thirty are reading matter and the balance advertisements—these latter being selected with care, and only such as the editor is willing to vouch for the good faith being admitted. This notice—it may be requisite to add in these days of "puffing"—is a sincere tribute of admiration from The Citizen to a pleasant and instructive contemporary—having no other object than to call the attention of our readers to a publication which we think it may be for their interest, as it has certainly been for our pleasure, to study.—This describes what we aim at doing.

How to write for a Newspaper.—

Rev. Dr. Hallack, the veteran editor of the Amer. Tract Society, says: "Contrive to say the most possible in the least space. Pitch right into your subject. Contrive to make the title and first sentence so that it *must* be read; and so of the second, no matter what has preceded, or is to follow."—Strict attention to these simple rules would reduce the number and dimensions of our 'blanket-sheets,' speedily bring down the present high price of printing paper, and relieve many a weary and perplexed editor of the disagreeable necessity of rejecting numerous otherwise well-written and desirable articles.

The Northwestern "Agriculturalist."

The first number of a paper with the above name, issued in Chicago, makes its appearance among our exchanges. A very fair looking sheet and a generally creditable beginning. Only, Mr. Agriculturalist, you should spell your name according to good usage, and when you take things from the *Agriculturist*—without the *at*—you should get in a way of giving credit. You are a beginner and we merely offer a bit of friendly advice.

"Across the Continent," an account of a Journey to the Pacific, by Samuel Bowles, Editor of the Springfield Republican, is one of the most readable books of the season, and valuable because it has all the interest of the best novel, and will therefore be read through by young as well as old, while it gives a large amount of information at the same time. Price \$2.

The Department of Agriculture.

It is too bad that the head of the great "National Seed Shop," just as spring trade is opening, should be subjected to so many annoyances. Congress has put its meddling finger in and asked what has been done with the money. It is the business of Congress to appropriate money, and the members ought to take what "books with the pictures all mixed in" they can get, and such parcels of that old lot of seeds as are not yet disposed of, and keep quiet. Then the papers are meddling with what is none of their business. The Country Gentleman does not like it, because a man was sent to China for the purpose of ascertaining how to make sugar from sorghum, and because said messenger found out that John Chinaman only grew sorghum for "chewing and sneaking the stalks," he must pitch into the Commissioner. Isn't that result as well worth knowing, as that alligators' blood will not kill insects on orange trees—a bit of information that a former government agricultural official obtained by sending a man to Florida to try it. What would you have? Then there is the Maine Farmer, which is in the main a quiet and dignified sheet; it must interfere. Hear what it says: "We have it from a source eminently to be relied on, that the Commissioner was engaged in writing a statement respecting sugar cane seed, and being called away from his desk for a few moments, one of the clerks made a glance at his unfinished manuscript, and found he had written it *Shuger can seed!*" Well, Mr. Farmer, we should like to know if that don't spell sugar cane seed, what it does spell? besides, it's phonography, and moreover do you expect *officials* to write like Down East Schoolmasters? The Philadelphia North American is also interfering with the business at the seed shop. Its Washington correspondent says: "But the practice of purchasing miscellaneous seeds by the ton, and forcing members of Congress to act as seedsmen in general to their constituency, is a nuisance which calls for abatement." Then to add to all these annoyances, which most seriously interfere with the equanimity necessary to a successful competition with the one-horse seed shops all over the country, the big screw is lost! The excellent press of Hicock has been replaced by a real hydraulic press. The Commissioner, when he first saw it, at once detected a defect, and asked "where's the screw?"—Evidently the screw is missing, and if any one has found a screw belonging to a *hydraulic* press, they will either give notice through the press, or express it to the Depart-

ment, as it is very necessary it should be there before the press of the spring trade. It is bad enough to have a screw loose, but to have one gone altogether is "most tolerable and not to be endured."

The Rinderpest.

This terrible scourge still holds almost undisputed sway among the herds of Great Britain, so far as it has progressed. The latest reports give over 13,000 cases per week, as known by the government officers. The inoculation and other remedies prove ineffectual. Efforts to prevent its spread have been imperfect and weak, while the cupidity of some individuals, and the heedlessness and ignorance of others, has spread the seeds of the contagion far and wide. There was abundant knowledge in the country how to stop the disease, but their government was afraid to act with energy, and all that has been done is sheer trifling. In the year 1857, the Royal Ag'l Society of England, with the Ag'l Societies of Scotland and Ireland, and receiving the co-operation of the Foreign Office of the Government, sent Professor Simonds, of the Royal Veterinary College, to the Continent, to investigate this disease. The very fullest opportunities were afforded him, and he made an extended and valuable report. The conclusions at which he arrived are of especial interest to us now that we, as a nation, are exactly in the same condition that England was then.

He found the disease restricted to comparatively narrow limits this side of the Steppes of Russia, from whence it occasionally escaped in the ordinary course of cattle traffic into Austria, Hungary, Galicia, and Poland, where it is usually, as they say, "stamped out"—being surrounded by a military cordon, and all traffic in cattle stopped within or out from the district thus shut up from the rest of the world. This practice is so perfectly effectual where the disease is understood, that Mr. Simonds regarded it as entirely improbable that the disease would ever afflict the English farmer. He says: "That no fear need be entertained that this destructive pest will reach our shores. Its present great distance from us would of itself afford a fair amount of security; but when we add to this, that no cattle find their way thence to the English market; and that in the event of the disease spreading from Galicia, it would have to break through hundreds of military *cordons*, one after the other, before it could possibly reach the *western side* of the German States; and moreover, that for years past, commerce has been unrestricted, with regard to the importation of skins, hides, bones, etc., of cattle from Russia, and elsewhere, all alarm, we believe, may cease with reference to its introduction into the British Isles."

This is very instructive—showing us our great danger—and warning us not to rest in fancied security, as did our brother farmers of England, until herd after herd is swept away. It does not prove that this cordon principle is *not* effective, but only that some carelessness allowed the escape of diseased animals, or in some way the transit of the disease from the countries where it is domesticated, to the coast, and to England. The fact remains, that perfect isolation of the diseased and of infected cattle, and of all persons, animals, and things which have been in close proximity to them, or their excretions, is perfect security against the disease. And we want the Legislatures to empower the Executives of the different States to act with all power and promptness, should any case occur in this country, even to the using of the militia.

American Dairymen's Association.

To the Editor of the *American Agriculturist*.

In your February number you print an item respecting the late Convention of Cheese and Butter Makers, held at Utica, which contains two errors. The newly adopted name of the society is the "American Dairymen's Association," and the undersigned is Secretary and Treasurer.

It was formed in January, 1864; its purpose being to advance the interests of dairymen in every way—mainly, however, in furnishing a medium through which improvements in the science of cheese making can be best disseminated; in encouraging proper emulation in this department of agriculture, and in aiding and urging experiments in the various processes of cheese and butter making. Dealers at home and abroad admit that great improvement has been made in American cheese during the last five years. And yet we are very far from perfection. Many phenomena remain unexplained, and the causes of many objectionable things in making and curing cheese, are not at all understood.

For instance, the questions "what makes cheese porous?" and "what effect has a large amount of rennet upon the flavor of cheese?" will receive answers as various as the number of dairymen questioned. We need a substitute for rennet. A substance that would replace this not over-agreeable article would be worth tens of thousands of dollars annually to the dairymen of America.... We need a preparation which, when added to milk that is sweet, but near the point of souring, will prevent any change until sufficient time elapses to convert the milk into cheese; it would be invaluable.... We need an article which, when applied to the vat of curd and whey, will indicate instantly and precisely the degree of acid which exists, or how rapidly the changes induced by the rennet are progressing.... We need to know in what way all the cheese can be obtained from the milk. It is conceded that the 10 to 11 per cent. which we now get ought to be increased to 12½ or 14 per cent.... We need to know why, when American cheese is analyzed, and shows most butter, and English Cheddar most water, the English article is nevertheless better; and how the 5 to 7 lbs. of water per 100 lbs. of cheese, which we lose, can be saved and yet the cheese be the better for it.

The association is composed of members in all parts of the dairy regions of America. Many of them, keen, practical men, are experimenting and thinking of these and other matters, and doubtless every year notable progress will be made. The society ought to have sufficient funds to be able to employ the best scientific talent of the land to work out important problems, some of which have been suggested; but the inexplicable apathy of the great mass of dairymen in regard to this matter renders this, as yet, impossible. The propriety of sending an agent to Europe the coming season, for the purpose of studying closely the processes of making Cheddar and Cheshire cheese, as well as the defects of American cheese and the style demanded for that market, the diseases of herds there, etc., etc., was discussed at the recent convention. It is not improbable that X. A. Willard, Esq., of Little Falls, a practical dairyman and able writer, who has doubtless had more opportunities for observation, and is better informed respecting American cheese making, than any other man, will go on this errand—starting in April. Very respectfully, yours,

Verona, Oneida Co., N. Y. GARDNER B. WEEKS.

Practical Hints on Cotton Raising.

BY A. N. DEERJW.

MESSEURS, EDITORS: I send a few items for the *American Agriculturist*, gathered from my experience. Upland and lowland cotton are raised from the same seed. Upland is land never subject to overflows, and is generally of an uneven and rolling surface; its substance is a reddish porous clay. (I speak of Vicksburg and vicinity.) The lowlands, or bottoms, are deposits from overflowing rivers, and are generally dark, of a sandy, loamy, mucky nature. The upland produces from one-third to three-fourths of a bale per acre, and the lowlands from one to two bales, of 400 lbs. each per acre. Upland cotton grows from three to five feet high, and lowland six to seven feet. The lowland fibre grows coarser than the upland, hence the difference in value.

Plowing can be done all winter, but the nearer it is done to planting time the better, as the rains beat down the earlier plowing. It is necessary, however, on large plantations, to commence early, and we adopted the following plan which we were told was first practiced by a neighboring planter, who was considered one of the most successful cotton planters in the State. Besides other advantages, it saves one-fifth, or nearly so, of the plowing, which is a great object where hundreds of acres are to be plowed. (We plant upland in rows four feet apart, and lowland five and sometimes six feet apart.) Every four, five, or six feet, as the case may be, plow two furrows together, leaving a portion beneath the two unplowed. When the ground is all plowed thus, then commence what they term "breaking out," which consists in plowing the ground left between the rows, and turning the furrows toward the plowed ridges. If late, one gang can break out and another follow and plant.

A ridge, or row, is four or six furrows turned together, and the seeds are planted on the center of this ridge. This ridge is harrowed with a harrow about the size of a five-tooth cultivator, which has handles, similar to a cultivator. After harrowing, a small plow is used to make a crease or furrow in the ridge in which the seeds are planted. (We—Yankee-like—improved on the harrow by putting a large cultivator tooth about one foot in the rear, in the center. It did the business as well, and saved one half the labor.)

One peck of good seed will plant an acre; but being generally in abundance, two to five bushels are used, being scattered in the furrow by hand. As cotton grows, each fibre is attached to the seed, and in ginning the fibre is broken off; hence the seeds have a coat of short cotton, so that they might be made into a ball like snow. When seed is scarce, it is wetted and rolled in dust, and then it can be dropped as readily as corn. The harrow is used by many for covering the seed, but a slab drag was thought to be the best. It is made of a piece of hard wood log, which is half round, or slab-shaped, about 30 inches long, 18 inches wide, and 8 thick, with handles, set in the bark side. The bottom is flat, with a notch 6 inches wide, 3 inches deep at the front, and running back lengthwise, about 1 foot on the bottom, in a point. The shape of this notch tends to draw the dirt over the seed, and the flat surface following, pulverizes and presses it like a roller.

Cotton, like most other seeds, requires that the ground should be warm before planting. The 10th of April is sufficiently early, and we have had fair cotton planted the first of June.

I found the young plant nearly as tender as a potato vine grown in the cellar. This was the case whether it came up singly or in clusters. After the plant is well up, a scraper is run on the rows each side of the plant, and merely scrapes off the weeds. Next a hoe is used to thin out the cotton plants, leaving one or two plants together, and these ten or twelve inches apart. When the plants are about a foot high, "a stand" is made, which is simply leaving one plant in a place, and three or four feet apart.

Hoeing now commences in earnest. Hilling up is best in a dry season. We found nothing but the plow and cultivator used to assist in hoeing. This is the most critical time with cotton, and if the weeds get the start, it is much injured, and perhaps lost. Hence it is best to have the most improved implements at hand. The best horse hoes for cotton, hoe both sides of a row at once.

Picking follows hoeing. A bag is hung at each side, rather back, to be out of the way, and picking is done with both the hands. The cotton pod, or bole, is in form somewhat like a small lemon, and if opened whilst green, will divide in 3 to 5 sections, like a peeled lemon or orange. Cotton with the seed in, is called "seed cotton," and that with the seed out, is ginned cotton, or lint cotton. It takes 1200 to 1400 lbs. seed cotton to make a bale of 400 lbs. of lint cotton. Ginning machines, plows, nigger hoes, bagging and rope, may be found in any village in the region of cotton raising, but at Cincinnati or St. Louis they could be bought much cheaper for the Mississippi Valley, (and so at New York or Philadelphia for the Atlantic States.) Plantation-supply Stores make reasonable advances and take the crop, but it is much better to have means to operate independently.

In conclusion, cotton-raising is as simple as corn raising. To raise one hill, it is—plow, plant, hoe, gather and sell; and to raise a thousand acres it is but one hill many times. The product of a hand is ten bales, but some will raise twenty bales. Cotton is not a sure crop, as I had formerly supposed. The Army Worm, Boll Worm, Blights, Mildew, etc., are some of its enemies. Of 300 acres which we cultivated in 1864, the Army worm left us but 19 bales, and from 200 to 300 bales had been raised on the same ground in good seasons. Three good crops in five is as much as can be safely counted on. There is hardly a negro in the cotton region but knows how to raise cotton by the common method, but enterprising and ingenious men may make vast improvements.

Coal Tar for Preserving Timber. — Valuable Experiments.

Fourteen years ago I read in an English journal the result of various experiments made by some scientific gentleman or association, to test the preservative qualities of coal tar; these experiments led to the opinion that no decided benefit could thus be derived from its use. Not satisfied with their experiments, I tried the following: I procured four pieces of 4-inch pine joist, about two feet in length; No. 1 received no tar at all; No. 2 was boiled for half an hour in coal tar; No. 3 and No. 4 were coated with hot coal tar with a brush. I set them up to dry, but No. 4 fell down into a heap of sand, and before it could be got out, was completely covered with sand. It occurred to me that this might possibly be a benefit; so in a few days, I gave it another coat of tar and sand. I buried

the four sticks in the garden, covering them about four inches in depth, and two feet apart; they weighed, when buried, about as follows: No. 1, 6½ lbs.; No. 2 and 3, about 7 lbs. each; No. 4, 7½ lbs. Two years afterward I dug them up. No. 1 weighed 11 lbs.; No. 2, 8 lbs. 3 ozs.; No. 3, 9 lbs.; and No. 4, 7½ lbs. Five years afterward, they were dug up again; No. 1 weighed 9½ lbs., and showed decided signs of decaying; No. 3 was also slightly decayed, and weighed 10½ lbs.; No. 2 was sound, and weighed 8½ lbs.

At the end of nine years, they were again examined. No. 1 (without tar), had rotted away and disappeared; No. 3 (coated with tar), had also rotted very much, but still retained its form; No. 2 (boiled in tar), showed signs of decay, and weighed about 11 lbs; the one coated with tar and sand, was still sound, and weighed 8 lbs. 1 oz. They were examined again a year ago, (13 years in the ground); no trace of the one coated with tar could be found; the one boiled in tar crumbled in pieces; but the one coated with tar and sand was to all appearances as sound as when placed there, weighing about 8 lbs. 4 oz. The tar and sand had not hardened into stone as I had hoped, but still the sun did not soften it when exposed for a long time to its rays. I have buried it again, confident that it will remain in its present condition for many years; in fact, if decay is superinduced by moisture mainly, I see no good reason why this stick should rot at all, for it is thoroughly coated with the tar and sand, through which the moisture can with difficulty penetrate. That it has done so in a slight degree, is, however apparent from its increase in weight, but then this is very slight in proportion to what the others absorbed.

About the same time I prepared four similar blocks of wood in the same way, and placed them in an exposed position on the roof of an outbuilding, standing them on end; it was summer, and the one coated with tar and sand, lost the greater portion of its covering by its running off, and in autumn it was coated again. Two years afterward I found that the one coated with tar and sand, had decreased in weight about two ounces; the one boiled in tar, about an ounce; the one coated with tar, nearly one pound; and the one without tar, a pound and three-quarters. Five years after they were examined, and all appeared sound. The one without tar weighed two pounds and a quarter less than when placed there; the one coated with tar about the same; the one boiled in tar, a pound less; and the one coated with tar and sand, a quarter of a pound less. Nine years after their being placed on the roof, the one without tar was partially decayed and weighed nine pounds; the one coated with tar was decayed almost as much, except that it retained its shape; the one boiled in tar, was to all appearances sound; and the one coated with tar and sand, was certainly so. They were examined at the same time the others were last year. The one without tar had rotted and blown away; a portion of the one coated with tar still remained, but rotting rapidly; the one boiled in tar, was slightly decayed and weighed ten pounds; the one with tar and sand, was perfectly sound and weighed seven pounds, about its weight when placed there.

From these and various other experiments I have made, I have come to the conclusion that, while coal tar may contain little by itself that will preserve timber from rotting, it may be so mixed and combined with other substances as to prevent moisture from penetrating the pores of the wood, thereby preventing or arresting decay

Hints on the Management of County Agricultural Societies.

These are among the most important helps to agricultural reform. When a society is well managed, its influence is felt in every house, and in almost every school district of the county, stimulating the minds of farmers to better methods of husbandry. The annual fair is a great educator, bringing thousands of people together, with the results of their industry, and giving them the opportunity to study each other's improvements, and to compare notes. Most of these county societies have been organized within the last dozen years, a very few only go back forty years. They have done a great and good work for the country, and during the war we have reaped the fruits of their labors, in abundant harvests, though hundreds of thousands of laborers were withdrawn from the farm, because machinery and horse-flesh have so largely taken the place of human sinews, and because the soil is more skillfully cultivated. Now that the war is over, so far from slackening our zeal in husbandry, we should renew our efforts to keep up these societies, with their annual fairs, and to form new ones where none have been organized. There are yet many counties where they might be established and do a good work in improving agriculture.

The need of them is already felt, and there are multitudes with willing hearts and hands to assist, if they only had leaders. The first requisite in organizing a county society is, to have a few spirited individuals to go ahead and take the responsibility. There is no better season than the present to talk the matter over, to organize, and make arrangements for the fair next fall. The greatest obstacle to starting a society is the apprehension that the thing cannot be made to pay. To meet this difficulty, the society may be furnished with a permanent income from the sale of life memberships, annual memberships, and tickets at the fall fair. A committee should be appointed in each town to canvass for members. If the life memberships are put at five dollars, and the annual at one dollar, and the canvass is spirited, a thousand dollars or more may be raised from these sources alone. Common inducement held out to secure memberships are the privilege of competing for premiums, and several tickets to the fair. It will be safe to offer half the sum raised in premiums.

The place of holding the fair is matter of considerable importance. A city, or large vil-

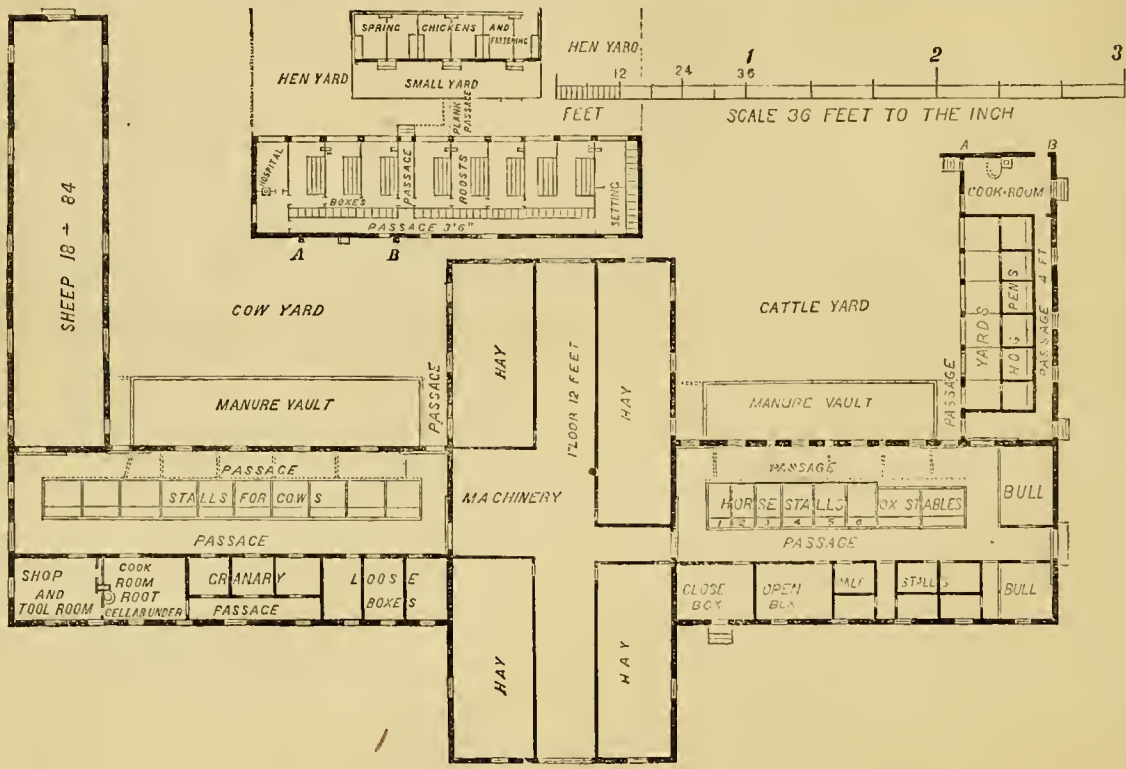

lage is generally selected, and if it be at a railroad center or steamboat landing, it is all the better. It not only favors the gathering of the people, but what is quite as important, the transportation of stock, fruits, vegetables, and manufactured articles for the exhibition. Frequently such cities can be induced to subscribe liberally for the sake of having the fair in their vicinity. The bargain is usually a good one, for a fair with its ten thousand visitors brings a good deal of trade to the place. Another reason for such a location is the facility it offers for the exhibition of other articles than the products of the farm. The seat of our large manufactories is usually found in these places, and it is exceedingly desirable that the products of the loom and of the anvil, and indeed every branch of human industry should be represented by appropriate specimens at the agricultural fair.

The organizing and managing of a county society involves a good deal of labor, but there are a good many to share it, and it brings an ample reward to every lover of husbandry. We say then to our friends where no Society has yet been started, take it up and make a beginning.

increased without altering the plan. The arrangements for manure are very complete, and only objectionable, because, if it is not thoroughly well taken care of all the time, bad odors will penetrate the stables, especially if a south wind blows. The manure shed also excludes the sunlight from the stables, which, though never so light, ought, at some time of the day, to get the full light of the sun into the windows. It greatly promotes the health of the cattle.

The plan lacks any provision for the carts and wagons, plows, harrows, mowing machines, and other implements. It seems hardly possible that this could have been an oversight on the part of the designer, but we conclude that he intended to have located a shed in the yard for this purpose, still, this is a great blemish in the plan, for such things ought to be close at hand, and if possible, under the same roof with the animals. They are then, of course, left in their places when done with, because that is the easiest for the men. It is a great thing to have a barn so arranged that the men can do right easier than they can do wrong. It saves a great deal of scolding and annoyance.—An excellent

feature of this plan is that the proprietor can taking a hasty look, even, into his establishment, see every animal (except, perhaps, the pigs and poultry),—how the stables have been cleaned out, if the foddering has been properly attended to, etc., and all at a glance. In such a place, shows, and of course, all will be kept in place much more surely than in one where angles and byways, afford good places to tuck away tools,

GROUND PLAN OF FARM BUILDINGS.

The Groesbeck Barn Plans.

We present this month the plan taking the second prize (\$100), with the specifications, or rather, notes accompanying it. It needs, however, a few words to call the attention of the reader to some of its many points of excellence, as well as to some of its defects.

In the first place, then, the barn is a very roomy and convenient one, though entirely upon one level. The great mass of the fodder is in the center, and the stock are so situated as to make the distribution of the feed of all kinds quite convenient and direct, supposing that cars (or boxes on wheels), may travel from one end to the other through the wings, on a tramway. Such an arrangement also places the granary, root-cellar, and cook-room, in direct communication with all the stock. There are lofts above the sheep and hog wings, ample for the storing of litter, etc., and the room here might easily be

pieces of harness, brooms, and rubbish of various kinds. The barn floor going through the building, is excellent. So too, are the spacious warm yards for the cattle. It is also a feature which ought not to be overlooked, that by slight modifications involving the shifting of the sheep or swine further off, there might be two or three times the number of cattle or horses accommodated that the proposition of Mr. Groesbeck called for, or that are here provided for.

The poultry establishment is made very large in order to accommodate the 300 hens that the proposition called for. In our engraving of it, we have reduced the size of the yards to bring it within a convenient space. It will be noticed that the Poultry-house is designed to go on the end of the Hog-house, the letters A, B, on one, matching the same letters on the other. The Poultry-yards for such a number of fowls ought to cover an extent of not less than an acre of ground, and this, cut up into smaller yards.

Plan of Farm Buildings.

BY G. E. HARNEY, OF COLD SPRING, PUTNAM CO., N. Y.

The engravings represent the front and rear views of the barn, and also a plan of the whole.

MAIN BARN.—The Hay and Grain Barn is the center, with wings projecting from each side for distributing fodder conveniently to animals from the principal Hay Bays. It may be taken in trucks running on rails through the feeding passages, and crossing the floor of the barn. These trucks may be simply large boxes running on small cast iron wheels. The Main Barn measures 44 by 96, with 16-foot posts and a hipped roof. This form of roof gives greater room for hay with the same height of post and ridge than the usual slant roof. The frame is pine throughout. The Thrashing-floor is 12 feet wide, runs through the whole length, and has large double doors at each end, 12 feet wide and 12 feet high. Over the thrashing floor and about 16 feet above it is a loft. On each side the bays are boarded up to the height of three feet from the floor, with common ceiling boards. The floors of the bays are of 1½-inch floor plank, and 2-inch plank is used for the thrashing floor.—All the roofs are covered with hemlock boards and shingled.

THE COW STABLE.—The wing on the left for 20 cows, etc., is 34 × 80 feet. Running through the center is a feeding passage 6 feet wide, with a door at each end 6 feet by 8 feet, made to slide along the partition. Each stall measures 7½ × 7½ feet, and will accommodate two cows. The passage behind the stalls is 5 feet wide, and communicates with the cow-yard in the rear. There are 3 loose boxes, each measuring 8 feet by 12 feet, on the other side of the passage; and occupying the rest of the space are:

Work Shop and room for the storage and repairing of tools, measuring 12 × 15 feet; a *Cook Room* for preparing food for cattle, with a large *Root Cellar* underneath; and a *Granary*, 12 × 26 feet, fitted up with bins, etc., for grain. The entire floor of this wing, including stalls and passages, except in the *rooms* indicated—should be floored with paving stones, laid in cement, and the interstices filled with the same.

SHEEP SHEDS.—Projecting at right angles from the cow wing is the sheep shed, 18 × 84 feet, with a gravel floor rammed hard, and a loft above for Hay. From this there are five doors each 5 × 8 feet opening into the yards. If desired, a portion of this shed may be partitioned off for straw and bedding for the cattle.

THE HORSE AND OX STABLE, ETC.—On the

right of the main barn is another wing, 34 × 72 feet, arranged with stalls for oxen, and pens for calves and bulls. The center passage is 6 feet wide. Three of the stalls are 5 × 9½ feet, exclusive of rear passage, and three are 6 × 9½ feet. The ox stalls are 8 × 7½ feet. The Bull pen No. 1, is 12 × 16, and No. 2 is 12 × 12 feet. There are six calf pens, each 6 × 8 feet, an open or loose box 12 × 14, and a close box of same size.

MANURE.—At the rear of both wings are manure vaults, one 14 feet, the other 12 feet wide, the bottom of each sunk 2 feet below the level of the stable floors, and paved in cement, or grouted so as to be perfectly tight. Into these all the liquid flows, and all the solid manure from the stock is put. Its outer walls are 4½ feet above the ground, and between that and the roof plate

FRONT ELEVATION OF BARN, FACING NORTH.

is an open space for the free circulation of air.

HOG PENS.—At right angles with the Horse stable is a wing for swine. Six pens, each 6 by 8 feet, with a yard opening from each, and a passage way in front along the whole range. Beyond this is a room for preparing the food, with a chimney so arranged that the extra heat from the boiler and flue may be taken into the hen coops beyond. This room has bins for food placed along the side, and should be supplied with all the necessary or useful fixtures.

REAR ELEVATION OF BARN.

THE POULTRY HOUSE opens from this room and is divided into apartments, as in the plans, for the several breeds or groups of fowls. Each apartment, 8 × 16 feet, contains nests and roosts, and other conveniences, as feed boxes, ash boxes and water troughs. Separate rooms are supplied for setting hens, and separate coops in the yard for spring chickens and for fattening fowls. The whole is 20 × 78 feet, with posts 9 feet high. The hen yard may be extended indefinitely.

THE CATTLE YARDS at the rear of the barn may be made as large as is desirable. All this range of buildings is designed to be built of wood on a stone foundation, the sides to be covered with vertical boarding and battened, and the roofs covered with shingles or slate.—There are two large *ventilators* on the top of the main

barn, two in the ends, and several are placed at different points on the ridges of the wings.

Houses of Unburnt Brick--Adobes.

On page 47, we asked for information from any who had employed this material in building at the North, and receive in response the following letter from W. F. Pack, Hamilton Co., Ohio. The subjoined responses, in numbered paragraphs, are in answer to several questions which were proposed to him by us after receiving his first communication.—He writes:

"From a wish expressed in the February number, I give my experience with houses built of unburnt brick. We have lived in one for the last four years, and find it very warm and com-

fortable, in almost every respect. The house is two stories and a half high, the walls twelve inches thick, with a rough fair casting of mortar on the outside. It has eaves projecting four feet, and is 40 feet square.

The rough casting which covers the walls on the exterior seldom comes off, and when it does, the broken place is easily mended, by mixing a little *coarse* mortar and spattering it on, without any other preparation. The house has stood fourteen years, and seems likely to stand three times as many more. Such is our experience; and we sincerely hope this (if you think it worth a place in the *Am. Agriculturist*) will be of some benefit to those desiring to build such houses.

1st.—The manner of making the brick is not different from the manufacture of the common burnt brick; only they are fourteen inches in length, 6 inches wide, and 4 inches in thickness.
2d.—The brick for *this* house were made in August, and the erection of the build-

ing was commenced in the succeeding autumn.

3d.—The foundation of stone is raised about eighteen inches from the ground all around, so that there is no possibility of water soaking into the brick. The rough casting on the outside also prevents any dampness from entering. A wet brick might crack to pieces if frozen, but an *unburned* brick will not absorb *near* so much water as one that is *burned*.

4th.—The walls are neither stayed nor studded, nor built in a frame of any kind, and are merely put together with mud mortar. Neither sand nor lime being used. The rough casting, however, is of very *coarse* sand, and strong lime. Very much must depend upon the excellence of the rough casting, and the wall should be left rough that it may hold on.

Walks and Talks on the Farm.

No. 28.

An agent of the Boston Milling and Manufacturing Co. called on me to day in reference to their "Flour of Bone."—It seems that they have invented a mill—designed originally I believe for crushing quartz—which will reduce bones to a much finer condition than any other mill hitherto employed for this purpose. He showed me two samples of the bone dust, one about as fine as coarse bran, and the other as fine as ordinary wheat flour. I have seen calcined bones reduced nearly as fine, for the purpose of making a choice specimen of superphosphate; but never supposed it possible by any mechanical means to reduce unburnt bones to such an extreme state of subdivision.

Since the agent was here, it has occurred to me that the coarse sample may contain an undue proportion of the fleshy matter of the bones, obtained at the expense of the finer sample. But in this I may be mistaken, for I see from a pamphlet he left with me that Dr. Liebig, of Baltimore, found in the "Flour of Bone" 4½ per cent. of ammonia, and 50 per cent. of phosphate of lime. This would show that it is a pure sample of the best quality of bones, if the analysis be of a fair average sample of all sold. The agent, who is a very intelligent man, commenced to explain why fine bones were better than coarse, but I thought this was a point on which nothing need be said. I told him I had such a high appreciation of their invention, and thought so much of fine bone dust, that I would take ten tons delivered at Rochester at \$40 per ton. Two years ago I bought ten tons of coarse bone dust for \$18 per ton, and I thought I was making a liberal offer now. But the price he said was \$70 per ton *in Boston!*

Horticulturists who raise high priced plants and vegetables, or those who care more for the pleasure of raising good crops than for the profit, may perhaps be able to pay such a price for manure, but farmers, except in rare cases, cannot afford to do so. We must bring up our land by slower methods, such as raising clover, and feeding more stock.

I would like to use more artificial manures. High as they are, I would not willingly give them up. There is a fascination about them, that those who have never used them can not appreciate. They are so easily applied, and so quick in their action, that to me they constitute one of the chief pleasures of farming. Agriculture is proverbially slow. In the majority of cases you have to wait some years before you get the *full* benefit of any improvement. But with a *good* artificial manure you see the effect in a few days. It may be in Boston or New York to-day, and before snow flies you may have the whole of it in your barns or cellars in the shape of golden grain or big potatoes. But we cannot afford to pay too much for mere pleasure. We farm for a livelihood. It is pleasant to see a big crop, but if it costs more than it comes to, we shall soon get tired of it.

Manufacturers would do well to bear this in mind. We want their manures. We will take all they can make. There is no limit to the demand. But they *must* be sold at such a price that their use will directly or indirectly afford a *profit*. We want them principally to give us a start in our efforts to bring up the fertility of the soil. We can afford to pay a little more for them, for this purpose, than they are actually worth, but if manufacturers consult their own

interest, they will sell at the lowest rates possible.

When I told the Squire I had offered to pay \$400 for ten tons of bone dust, he shut one eye and remarked internally: "You are a bigger fool even than I thought you were." "Give me plenty of barn-yard manure," he said aloud, "and you are welcome to all your bone dust and guano." I am used to this kind of talk, and pay no attention to it. The fact is, I think *more* of barn-yard manure than he does. The principal object I have in using artificial fertilizers is, to enable me to make more and better barn-yard manure.—The latter costs more than most people think. Ellwanger & Barry, who draw an immense quantity of stable manure from the city to use on their nursery land, tell me that they find that every load of *well rotted* manure, by the time it is spread on the land, costs them five dollars—and they certainly know how to get work done as cheaply as you and I can hope to do it.—Frost & Co., of the Genesee Valley Nurseries, say it costs them \$3,000 a year for manure. Now what is a ton of well rotted manure worth? It contains, say:

10 lbs. soluble phosphate of lime, worth at 6c. per lb.	60
12 lbs. insoluble phosphate of lime, worth at 2c. per lb.	24
15 lbs. polash, worth at 4c. per lb.	60
20 lbs. ammonia, worth at 12c. per lb.	240
	\$3.84

These are all the really valuable ingredients of a ton of manure. The carbonaceous matter has little manurial value, or if it had, it can be obtained on almost all farms at a nominal sum. Apply these figures to a ton of bone dust. It would contain, say:

1000 lbs. insoluble phosphate, at 2c.	\$20.00
90 lbs. ammonia, at 12c.	10.80
	\$30.80

The manufacturers of the "Flour of Bone" may claim that, owing to its extreme fineness, the phosphates soon become soluble in the soil, and should be estimated at 6c. instead of 2c. per lb. Were this the case, a ton would be worth \$70 instead of \$30. But bone phosphate is *not* soluble; and how far this extreme fineness, by accelerating decomposition, favors solubility—or perhaps more correctly speaking, availability—is a matter yet to be tested. I have known mineral phosphate ground *very* fine, but they have little more immediate effect than so much sand. But dissolve them in acid, and they make an excellent manure. All things considered, I think my off-hand offer of \$40 per ton is about the fair thing. It may prove to be worth more—that is to say, the ingredients may be more readily available to plants—but this is a matter which must be tested in the field. I have estimated it liberally so far as chemistry throws light on the subject.

I am inclined to think the best way to use bone dust is, to compost it with barn-yard manure. In "piling" the manure in the spring, put a layer of manure on the ground six or eight inches thick, and then scatter a little bone dust over it, say at the rate of a bushel to what will make a ton of manure when well rotted. Then throw up another layer of dung, and scatter another bushel of bone dust over it, and then another layer of manure, and so on, until the heap is finished. Let it be turned over in August, and by the latter part of September, after you have got in your winter wheat, it will be in splendid condition for applying to grass land. There is no better top-dressing than this for permanent meadows; or if you intend to break up the meadow the following spring for corn, no better system can be adopted.

The way I pile my manure is, to throw up directly on to the heap all the manure that is

near it, and for that which is too far off to be handled readily in this way, I use a one-horse cart, or an ox cart with a yoke of cattle. In fact, I use both, as in this way you can keep two men loading the cart all the time. Three men and two carts will soon pile up a big heap of manure. Drawing the manure in a cart on to the top of the heap in this way, consolidates it and prevents all danger from too rapid fermentation. Carts are better than wagons, because they are not only handier, but the manure can be dumped.—I piled my manure in this way last spring, but did not use it in the fall. I am now drawing it out on to a corn stubble for potatoes. I draw it while the ground is frozen. I do not think it is usually desirable to plant potatoes after corn, but this is an orchard of apple trees just coming into bearing, and I want to take two hoed crops in succession, and manure the land at the same time for the benefit of the trees.

I know that there is a general impression that manure increases the rot in potatoes, but if it is thoroughly decomposed, I have no fears on that score. I never knew artificial manures to increase the rot. In fact, in an experiment I made some years ago on a warm sandy soil, where I had eight or ten plots dressed with different fertilizers, the plot which suffered most from the disease was that where no manure of any kind was used. I think manure is usually more needed, and will pay better, on potatoes than on almost any other crop. We may just as well raise three hundred bushels per acre as one hundred. Rich, warm, dry soil; early planting; a good variety; and thorough cultivation; these are all that is needed.

In this section, potatoes are said to do best on a clover sod turned over just previous to planting. The usual way is, to plant whole potatoes in hills three feet apart. Planting in hills is less labor than planting in drills, and you can use the cultivator both ways, and thus keep the land clean and mellow with little hand hoeing. It is also less labor to dig them. On the other hand, I think there can be no doubt that planting in drills gives the largest yield, and if the cultivator is used as soon as the rows can be distinguished, and is used once a week as long as there is no danger of disturbing the young tubers, the land can be kept clean with very little hand hoeing.

The fact is, we must give up hand hoeing. A good steel-toothed cultivator, with a strong, steady horse, and a careful driver, is worth a dozen hand hoes among either corn or potatoes. I dislike to see a man putting round a hill of corn with a hoe, going through a set of motions that have been handed down from the days before cultivators were invented. They may have been useful then, but are now entirely unnecessary. There is work enough to be done on a farm without wasting time in such a tedious performance. Let the land be well plowed, and the surface be harrowed and *rolled*, until it is as mellow as a garden before planting, and little hand hoeing will be needed.

I think an improvement could be made in the form of our cultivators. If the outside tooth, that runs nearest the hill, had a straight steel blade with a knife at the bottom turned inside, and a little backwards, so as to cut off the weeds, the cultivator could be run within an inch of the young corn without disturbing it, or throwing up any dirt. Such horse hoes or "scuffles" are used in England among the rows of turnips, and can be guided much straighter than anything we have. With an ordinary cultivator tooth, or even with the inverted mould-board on

the Remington Horse Hoe, it is not easy to see how close you can run to the hill without disturbing it.

A gentleman called here to-day from Cortland County, inquiring for a farm. He had sold his and wanted another in the "fruit region." He had been to look at one in this neighborhood, but the buildings and fences were too much out of repair to suit him. It costs so much to build now that farmers appreciate, as never before, improvements of this kind. I have never known so many inquiries for farms as the present spring. I do not think land has advanced so very much, but it is certainly easier to sell farms than before the war. This man sold his farm for \$80 per acre. He had a dozen cows which he sold at auction, and they averaged \$78 a head!

Milch cows are higher than beef cattle—that is, a cow with a calf will sell for more than the same cow would if well fattened. They are fully 20 per cent. higher than at this time last year. No other branch of farming has paid so well during the last two years as dairying. Instead of buying cows at these extreme rates, however, it will be better to feed those we have more liberally, and see if we cannot get as much butter from six cows as we ordinarily do from ten. If the six cows were fed with *extra* food costing less than half what we should have to pay for four new cows, I feel sure that they would produce more butter than ten cows kept in the usual way.—I can see no reason why it will not pay to feed cows meal, even when they have good pasture. We may not get more milk, but if the cow is a good one, it will certainly be richer. I am feeding my cows, and have been all winter, three quarts of corn and pea meal a day, and propose to continue it after they are turned to grass.

I know there are those who think corn meal is too heating for milch cows—that it will dry them up, or that the cream will be rosy. If the cow has plenty of succulent grass, however, I do not see why such should be the case. It is only adding the nutritious matter which is ordinarily deficient in poor grass. You say corn contains a large quantity of oil and starch, and but little nitrogen and mineral matter. This is true, but let me tell you a fact which I cannot now stop to explain: Poor, rank grass contains more nitrogen and more mineral matter than rich sweet grass. I mean it contains a higher *percentage*. It does not really contain more, but having less of starch, oil, etc., the percentage of nitrogen and ash is higher. It does not contain too much nitrogen, but too little starch and oil. Corn meal will supply these.

You don't understand this? You can't see why poor grass should contain more nitrogen than good grass? Perhaps not. Such, however, is the fact. The same is true of poor wheat. It contains more gluten (nitrogen) than good wheat—that is, a higher percentage. It is deficient in starch. If you should take two sheep, exactly the same weight, and kill one while it was thin, you would find it contained a higher percentage of nitrogen and mineral matter (bones) than the other sheep kept till it was quite fat. Of course there would be just as much nitrogen and bones in the latter, but the *percentage* would be less—simply because there is much more fat. It is so of lean grass, and lean wheat. You have the bones and the skin, (the ash and the nitrogen), but you lack the fat.

It would undoubtedly be better to make the grass fat than to try to furnish the fat by giving the cows grain; but you cannot make rich, fat

grass in a month, and unless you have the very best of meadows, you had better feed a little grain till you can improve your grass land. The Doctor feeds his cows meal, shorts, etc., all summer, and gets large returns. I suppose he "slops" them; at least he makes the meal into "pudding" with hot water. This is undoubtedly the better way, but merely steeping the meal in cold water for 24 hours is a great improvement over feeding it dry, or of wetting it just at the time.

If it turns out, however, that corn meal is too heating, I will substitute crushed oats. But I have great faith in corn meal. Many object to feeding horses corn meal in summer on account of its "heating" properties, and yet at the West horses are fed almost exclusively on this grain, and the Third Avenue R. R. Horses in New York are fed more corn meal than hay—if I recollect right, about 17 lbs. of corn meal and 15 lbs. of ripe timothy hay, chaffed. After repeated experiments, it is said this proves to be the best daily diet for a hard working horse. Such may be the case with cows; corn may be heating simply because it is very nutritious.

It is said, you know, that the celebrated Oaks cow, the first year after she was purchased, gave on ordinary food 180 lbs. of butter in the season. The next year she had 12 bushels of corn meal and then gave 300 lbs. of butter. The next year she was allowed 35 bushels, and gave over 400 lbs. of butter! According to this, a bushel of corn meal gave 6 to 10 lbs. of butter. This, at present prices, will give a handsome profit, as butter is high and corn meal very low.

According to the last Census, the yield of butter per cow in the Middle States was only 87 lbs. a year, and in the New England States 75 lbs., and in the Western States only 58 lbs.! Low as are these figures, the returns in 1850 were lower still, showing an improvement. During the last two or three years the high prices of butter and cheese have unquestionably stimulated production. We are feeding higher than ever before, and I never knew so much butter produced as during last fall and early winter. In my own case, we made three times as much butter after October as during the same period the year before.

It is a little risky buying cows at present prices. I am aware that a good cow is worth \$100 at the present price of butter and cheese, and it would pay to purchase freely, *provided* the same cow be worth \$100 next spring. If, however, we should lose \$25 or \$50 on the cow, it will take out a large slice from the profits. In this, as in many other operations, we get a big interest, but lose half our capital. Our safest policy is, to feed the cows we have liberally rather than to buy more.

"But supposing you have more grass than your cows will consume?" Reserve a portion of it for hay. Probably cows will be cheaper next fall and you will be then in a condition to purchase to advantage. If you cannot mow your meadows, keep more sheep. If I mistake not, sheep will be bought reasonably after next shearing. The "gas-tar" Merino fever is abating. The rage is now for dairy cows. But do not be carried away with it. We live in uncertain times. Prices are inflated; they will subside till they find their level and probably go below it.

Think of it. In the fall of 1861, in the dairy districts of this State, old cows were bought by the hundred at from \$8 to \$15 a head, and slaughtered *for beef!* It was at this very time that I urged farmers in the wheat districts to buy cows and pay more attention to the dairy. We need more stock to make manure, and I

thought, and still think, we can make more money from dairy cows than from sheep. But, as I said before, just for the time being it may pay better to buy sheep than to buy cows.

For one, I shall be very thankful when things find their natural level, and we have done with these violent fluctuations. A farmer now-a-days has to study financial questions as much as a stock jobber—in fact more, as he must look farther ahead. I am tired of it, and long for a settled condition of affairs. Then I will keep a good dairy of cows. I believe, on most farms, we can raise as much grain (not as many acres) as we now do and keep ten head of cows on the hundred acres. We shall also raise our own cows and keep a few mutton sheep and some nice "porker" pigs into the bargain.

I have learned one thing the past winter. It is not a difficult matter to fatten cattle if you have plenty of hay and grain. But without hay or roots, no matter how much straw and corn stalks you have, a liberal allowance of grain will not, to state it mildly, fat an ill-bred ox rapidly.

In this section hay, in proportion to nutriment, is an expensive food. Corn is usually much the cheaper article. I do not mean cheaper to raise, for such is not the case, but cheaper at the price at which the two articles are usually sold. In other words, we can sell our hay for more than it is worth—or rather we can use cheaper food. But doing so, however, we should soon impoverish our farms.

If we had plenty of turnips, rutabagas, or mangold wurzel, we could turn out lots of good cattle without hay, and I am satisfied we must raise more roots before we can fit cattle in winter to the best advantage. Strap-leaf, or some other late sown and easily raised variety for use till Christmas; then rutabagas; and in spring mangolds or beets. But we need good cellars and convenient arrangements for gathering, storing and feeding them. They are a heavy crop in proportion to nutriment, and unless the arrangements for handling them are convenient, the labor will soon eat up their value.

I am inclined to think that beets, mangold wurzel and cabbage, are the best "roots" for us to raise in this climate. I raised two thousand head or more of cabbage last year, and propose to raise more this. They are admirable for milch cows in the fall and in the spring. They are about as nutritious as rutabagas, but do not taint the milk, and you can grow, provided the land is rich enough, a far greater weight per acre.

Four or five ounces of seed, sown early in a bed of two or three square rods, will give plants enough for an acre. They need not be set out till all other planting is over. Let the ground be made rich with well rotted manure, and when the plants are set out, put a teaspoonful or so of superphosphate or plaster in or about the hole to give the plants a good start. Nothing so good as superphosphate for cabbage, especially in the seed bed. All the cultivation that is required after the plants are set out is a free use of the horse hoe. This is the main point. You cannot cultivate them too frequently. A horse hoe will stir the ground deeper and more thoroughly than it can be done by hand, and consequently cabbage can be grown as a field crop far cheaper than in a garden. Fresh soil is best, as there is less danger from insects, club-foot, etc. It is said that a rather heavy loam is desirable; but I am going to try them on some recently drained mucky land, and expect a good crop, as the soil is certainly rich. A good dressing of wood ashes would help. It is said to be the best preventative for club-foot.

Fig. 1.

Fig. 2.

To Prevent Cisterns Overflowing.

We are indebted to "E. W. L.," of Schenectady, for the following suggestion, which, though directly applicable only to few cisterns perhaps, nevertheless indicates a good means of preventing the overflow of water from cisterns not provided with discharge pipes. Our correspondent says of it: "It costs but a trifle, and is of great value to any one who has had to get up at night to turn off the water pipe of his cistern, knowing the consequence of an overflow would be a great injury to the cistern at least. A conductor leads from the roof of the house into the cistern box, B, and directly under this conductor, and inside of the cistern-box, is a little tin gutter 14 inches long, 3 inches wide, and 2 inches deep, that is fastened as seen in fig. 2, by a hinge to the curb, in such a way that the water flowing into it from above may be turned into the cistern, (fig. 1,) or into a trough on the outside, (fig. 2,) according as the little trough is tilted one way or the other. This tilting is effected by a rod having a float at the end hung upon the underside of the trough, as seen in fig. 2. The weight of the rod and float when the water is low, turn the flow into the cistern, but when the water rises to the full height, the rod being of exactly the right length, the float will rise and turn the water off. The float is a gallon can thoroughly painted."

Fig. 2

LEACH'S EVEN BLAST FAN MILL.

fan when the fan is in motion, the opening being conical. 3d, That the fans being set upon a solid disk, the current of air which enters from one side can not mingle with that from the other side, and so create uneven currents in the blast. The result of this simple structure is, that the blast is an uniform, even one, like the smoothly flowing water of a mill race, while that in an ordinary fan-mill more resembles the turbulent stream which constitutes the wake of a paddle-wheel steamer. The arrangement of screens and sieves differs in no essential particular from those of mills in common use, and any ordinary mill may be altered with comparatively small expense to one of the improved kind.

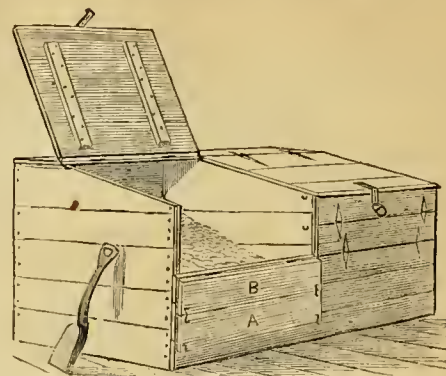

Now let us consider the advantages. 1st, The work is done better; that is, all the common work of cleaning grain for market. 2d, In selecting seed grain, or grass seed, the results are very marked, when reasonable care is taken. The separation of different grains, wheat from oats, being effected, of course no chaff would be left with the seed, and no cockle, thistle seed, mustard, or charlock. This is not all done by the blast, or all at once, but the separation of the larger seeds is effected by it. The inventor asserts his ability to separate from clover seed every seed of red sorrel, and of course dock,

aster, and other lighter seeds. This alone is a very great advantage. 3d, The selection of the heaviest and plumpest grains only for seed, is accomplished with great accuracy. From a lot of wheat, which weighed 58 lbs. to the bushel, we believe, Mr. Leach selected for seed a quantity which weighed 65 lbs. to the bushel, passing it through with a strong blast several times. We have seen enough of the operation of the machine to be satisfied that we do not overstate the matter. It was shown at Albany, at the annual meeting of the State Agricultural Society, and elicited high commendation, and greatly pleases practical men of our acquaintance who have it in use. The inventor is Mr. George Leach, of Owego, Tioga Co., N. Y.

Convenient Grain Bin.

We noticed, at Thorndale, last month, grain bins which recalled painfully the strains of body, and rushes of blood to the head, that are very often experienced, in getting grain, or meal from a deep bin when the supply runs low,

because in these bins, all such trouble is avoided. We have seen bins in which the top

GRAIN BIN.

one of the front boards was hinged to be let down, when the grain got below it; but in these *two* boards were hinged, as shown in the cut, being fastened up by hooks at the ends, and let down one after the other, as desired. The front edge of the bin was about 4½ feet high.

How to Catch Gophers—Traps, etc.

We of the East only know gophers by reputation. They do things on a big scale out West, and the gopher is the Western improvement on our little blind mole. The improvements—patent, if not patented—are: 1st, in size, the animal being nearly as large as a muskrat; 2d, in sight, for he sees well by day or night; 3d, in amount and quality of food, for instead of eating insects, he eats corn and other grains, and vegetable products; 4th, in his ability to carry off that which he does not eat, for which the 'beastie' is provided with cheek pouches that will together hold nearly a teacupful of grain. He digs burrows, and "ravages" in proportion to his size. It is of course very desirable to know how to destroy these pests, for when numerous, as they are in many localities, they are a serious nuisance, and being nocturnal in their habits and very shy, they are hard to take. For this purpose there have been several devices sent to us. Mr. John W. Barnett, of Pierce Co., Wis., is successful in the use of the common steel trap, arranged as in fig. 1. He digs down a square hole so as to cut a gopher gallery (A), a few feet from where it comes out to the light, cleans out all the dirt, and making a depression in the track, sets a steel trap in it, and fastens it with a chain, covering it over with firm dirt. Then he covers the hole with a board (B), and throws

Fig. 1.—STEEL TRAP SET FOR GOPHERS.

earth over it to exclude the light. He speaks confidently of it and says, "just so sure as there is a gopher in that hole you will catch him."

A form of trap or snare for gophers is described and figured by Mr. G. W. Smizer, St. Louis Co., Mo. This is shown in figs. 2 and 3. It will be seen that the apparatus consists of a spring pole (k), to which is attached a cord and noose (i and j), and a string with a trigger (h and g). This is set in the following manner. A place is dug as wide as the breadth of the spade, and an inch deeper than the gallery. The face of the excavation next the hole is made even and per-

An Improvement in Fan Mills.

One of the most valuable improvements in farm machinery, which has recently been brought out, is one in Fanning Mills which has come under our notice within a few weeks past. Our illustrations exhibit at first sight little that would strike one as peculiar, a closer view, with a little explanation, will show the principles involved. In an ordinary Fan-mill blast the out-sides of the current move so much faster than the interior, that eddies of air are caused, and even reflowing currents, so that the separation which is effected is of a very imperfect character. In the invention under consideration, the structure of the fan is such, 1st, the middle portions of the fan-blades being broader than the ends, that the ends will not throw a stronger blast than the middle. 2d, That the air from either end has free access to the middle of the

pendicular; then, four inches back the spade is set in until it comes through into the gallery, and after working it a little back and forth, it is lifted carefully out. The hole is then cleared of all earth that may have crumbled down, and

Fig. 2.—GOPHER TRAP.

the wire snose inserted through the cut made by the spade, and spread wide. A stake (D), 2 feet in length, and having a pin (E) through it, and a notch (F) about as indicated in fig. 2, is then driven a little in front of the hole. The board, C, which is about 20 inches long, is then suspended, by the hole B, upon the pin in the stake, close against the perpendicular face, shut-

Fig. 3.

ting the hole. The pole is then bent down, the cord (i) attached to the wire loop, and the trigger, the string being made the right length, is inserted between the notches a in the board, and f, in the stake. The gopher touching the board with his nose will release the trigger, and be caught around the body by the snose. Mr. Smizer says: "I have tried many ways to catch gophers, and this is simple, cheap, and sure to catch and kill them, and is the best I ever tried. I caught 45 last spring with three traps; and the whole cost was not 25 cents."

J. B. Quinby, of Davis Co., Kansas, describes his way of killing gophers as follows: "Armed with a weapon something similar to a fish spear, visit the ground infested by them early in the morning (before sunrise), or a little before sundown, and with as little noise as possible, search until you find one of their holes opened. Take your stand back of it, holding your spear within a foot of the hole, and ready poised for action. Soon you will hear the gopher at work, and directly he will come to the surface, pushing his load of dirt before him. As soon as you can see his shoulders, pin him with your spear, and look for more holes, and my word for it, if they are plenty, you can bag more game in an hour than you can with all your traps. Gophers seldom come to the surface of the ground in pleasant weather, excepting for an hour or so morning and evening, and they seldom show more than part of their bodies. After opening a hole a few minutes suffices to throw out what dirt they wish, and they immediately close it up. A little practice will make experts of most any one."

The Weeds of the Flax Field.

The flax crop is liable to be infested by the ordinary field weeds, and besides these, there are two which seem to be quite peculiar to it, the False Flax, and Flax Dodder. It is probable that the seeds of these weeds, being introduced with imported flax seed, vegetate freely, and flourish the first year, but do not perpetuate themselves to any considerable extent in our climate, as do the majority of foreign weeds.

Indeed several of the English writers have recommended the use of American seed as one means of ensuring freedom from these weeds.

FALSE FLAX, also called Wild Flax, and by the rather extravagant name of Gold of Pleasure, is *Camelina sativa* of the botanists. It was formerly supposed that flax degenerated into this plant, just as some persons suppose that wheat turns to chess, or that potatoes mix in the hill. This plant is still more widely separated from flax than the chess is from wheat, and only those persons ignorant of plant structure believe

Fig. 1.—FALSE FLAX.

in these sudden transformations. The False Flax belongs to the *Cruciferae*, or Mustard Family, and in the structure of its flowers closely resembles the Mustard. It is an annual, growing about 18 inches high, with its smoothish stem leaves sessile upon the stem, and having an arrow shaped base. The figure shows the upper portion of a stem somewhat reduced in size, and at the left hand a seed pod of the natural size. The pods are somewhat pear-shaped and bear a sharp point at the top. The seeds are reddish yellow in color, and, in the plant as it grows in this country, not very numerous.

Fig. 2.—FLAX DODDER.

FLAX DODDER, *Cuscuta epilinum*, is a much worse weed than the other. It is a plant of

peculiar habit; starting from the seed in the ground, it pushes up a slender, thread-like, leafless stem, which branches freely and entwines around the flax plant, entangling the plants together. This is not all the mischief it does; wherever the Dodder comes in contact with the flax stem, it pushes out small suckers or feeders, by means of which it draws nutriment from the flax, and is able to grow and flourish even if its root be destroyed. The flowers are very small, and are produced along the stem in small dense clusters of a white color. Figure 2 shows the Dodder of the natural size, with clusters of flowers and fruit. This is one of the most injurious weeds of the flax crop, and the estimation in which it is held in England, is shown by the vulgar, but rather expressive names of "devils' guts," and "hell-weed," there applied to it. These weeds being introduced with the flax seed, the cultivator should take pains to select pure seed. A sample of flax seed when spread out thinly upon a piece of white paper, allows the naked eye to see if any foreign seeds are present. Figure 3, gives a seed each of Flax (largest), False Flax, and Dodder, equally magnified, the Dodder the smallest, and rough. Properly adjusting the fanning mill, and passing the seed through several times, cleans it quite well.

Fig. 3.

Leading Staff for a Bull.

A great deal depends upon having a safe leading staff when a man handles a bull. Bulls have a way of being very gentle and docile at times, thus throwing their keepers off their guard, and then they very often take a notion to have a little rough play, if it may so be called. The result may be, and has often been, that a man has been killed or greatly injured, perhaps by a young animal he had not the least fear of. Mr. Thorne, of Shorthorn fame, has never had serious accidents of this kind occur, because he believes in "making assurance doubly sure," and never trusting a bull at all. The leading staffs used by his herdsman struck us as needlessly secure at first sight, but we were assured that long experience had proved that spring clasps, though never so well made, did occasionally give way, and that in using the staff with the clasp attached by three

or four links of chain, a bull would sometimes get the advantage, and crowd his groom most dangerously. They have adopted, therefore, a staff tipped with a strong hook of the best iron, wrought in the shape shown, and closed by a screw passing through both the shank and the tip of the hook. The thread on the screw is first cut the whole length, and then it is turned or filed off in the middle portion, leaving the shaft of the screw a plain bolt, except at the ends, as seen in the left-hand figure. When the hook is to be opened, a few turns are sufficient to allow the screw to slip back, and it can not fall out, being prevented by the threads at the end.

Agricultural Education—Work

That the book worm will make a poor farmer, as a general rule, every body knows. However, he has certainly little wisdom who discards book-gained knowledge. To be a successful farmer the boy must be early trained to independent observation and judgment, to a reliance upon himself, and to see that success or failure results from causes, which, if he knows enough, he may regulate. This can never come satisfactorily without a thorough knowledge of work. Every farmer will agree with us in this, and we have rarely known one who did not put the *work* theory into practice—and often with most indiscreet energy. Boys are ambitious and delight in praise. They begin tough and hearty;—they scorn the light work very soon;—they aspire to do “the work of a man”—to be worth more to their fathers than any men they can hire;—they learn quickly how to do every kind of work. They hoe, and rake, and bind, and swing the ax, and fodder the stock, and look after the hired men; they save the farmers many steps, for—the boys never get out of breath, or never say so. They do harder work, and aspire to do the hardest. At 16, they take their places with the mowers: at 17, they are expert cradlers, and pitchers, and do every kind of work so well that their praise is on every body's lips, and the horny handed men look on in astonishment to see the feats of strength and endurance which they show. The result is in a *majority* of cases that the boys break down; they strain themselves and grow out of shape, have fits of fainting in the field, headache, giddiness, blindness; grow thin and pale, and take to their books, perhaps to novel reading; lose interest in the farm, and so after all their brilliant promise, go into some other business, or make very poor farmers. We can name a score of very much such cases.

There is a remedy—and it is a simple one, namely: more *brain-work* and less *hand-work*.

This is easier stated than carried out, for the ambition of a good boy to work is constantly excited on the farm, by the results of what work does, continually before his eyes, and by the presence of laborers who will inevitably encourage the greatest outlays of energy and strength on his part. He has no such incitements to study on the farm, and in fact, much work and much study are entirely incompatible. The weary body demands rest, in which the mind must participate. Nevertheless, the evil of over-working boys is so great that we must, even again and again, caution parents, and the boys themselves, against it, as one notable cause of so many inferior farmers.

But very few farmers can afford to give their sons anything more than what is called “A Common School Education”—that is, as regards book learning. Almost none, however, are so straightened in means that they can not have good books and papers. They can throw upon their sons the responsibility of learning what other people think and say about this or that crop, or practice, or way of treating crops, or about the insects which may annoy them, and about a thousand-and-one things which may be made the subjects of investigation upon the farm.

Besides, a farmer needs a knowledge of many other kinds of work—not straightforward farming—and the young farmer's winters can hardly be spent to better advantage than in acquiring familiarity with one or more trades. The writer well remembers the months spent in the cabinet maker's shop in learning the use of tools. He

was not of much use to the cabinet maker, but the knowledge gained has been worth a great deal to him ever since. We advise any young farmer who can get such a place to give two or even six months labor gratuitously to the blacksmith in his shop, or to the carpenter, or to the saddler, or to the wheelwright, and to do so every winter, until a good insight is gained of these trades. In a stony country, where wall laying is an important accomplishment, time should be taken to learn this, and there is some opportunity almost every season, to learn practically the principles of framing houses, or joiner work. The use of this practical education in different kinds of work does not make a farmer a “Jack-of-all-trades,” but it makes him at least a better judge of other men's work, and a much better and “handier” farmer.

Temperature at which Seeds Germinate.

The celebrated Swiss botanist, M. A. De Candolle, has published an account of numerous experiments upon the temperature at which seeds will germinate. We give a few of his results, with respect to well known plants, reducing the temperature to the Fahrenheit scale. The seed of common White Mustard will germinate at or a little below the freezing point. While white clover remained dormant at 41½°, it germinated when the temperature was raised only one degree above that. Indian corn would not start at 42°, but germinated at a temperature very near 48°. Melon seeds refused to germinate at 55°, but did below 62½°. While there is a limit of temperature below which each particular seed will not germinate, there is also a limit in the other direction, and seeds fail to start when the temperature is too high—the point, as in the other case, varying with the species; the greater part of some seeds of white clover did not germinate above 82½°. “Thus seeds only germinate between certain limits of temperature, and those which can only do so within narrow limits are least able to extend themselves geographically.”

General View of Southern Agriculture.

BY JOSEPH B. LYMAN, RECENTLY OF NEW-ORLEANS.

[NOTE.—The interest manifested by many of our subscribers to know more of the Southern States, with a view to going thither to make there homes for themselves and their children, induces us to publish the following letter, repeating our own opinion, previously expressed in the *Agriculturist*, that it is very desirable for Northern families to locate in groups of several together, for the sake especially of society, schools, postal facilities (taking turns to go for the mails), neighborhood libraries, and religious exercises, and last, not least, for the maintenance of a healthy public opinion, at least, among themselves. Northern men will encounter some acrimony and bitterness of feeling, expressed in looks, words and deeds, but with good principles and kindness, they will live it down.—Eds.]

The advantages that are presented to the farmer and the capitalist, through the recent social changes that have occurred in eleven great States of this Union, are a matter of constant inquiry. What class of lands have been opened by the action of the war and its settlement, the price of good lands in that region, the productions for which it is best suited, the climate and salubrity of various sections, are subjects of great interest to our young men, the disbanded soldiers who are exchanging the

musket for the plow, and to the emigrants who constantly swarm upon our shores.

However the social and political status of the African may be affected by Congressional action, or by the vote of States, two great changes have been wrought by the destruction of slavery, whose influence upon the future of these States in the increase of material welfare, and all the elements of prosperity, are incalculable.

First.—The dishonor that has hitherto attached to manual labor, as the badge of social degradation, has been forever wiped out.

Second.—The great system of centralization and monopoly, that massed the lands of the South in farms of from five hundred to five thousand acres and more, if not wholly broken up, has suffered such a change, with the change of the labor system, that it must decay, and the lands be divided, as in the more Northern States, into farms that average from 60 to 80 acres. With the ownership of the soil by the intelligent laborer, erecting there his permanent home, the most beneficial changes in the economy of agriculture will be introduced. The slave-working planter felt little or no attachment to the soil from which he derived his revenues. Land with him was like the plow, something to be used, worn out, and then thrown away. Under the new system, based on sounder ethics, the soil will be regarded as it is in England, and in the most advanced parts of this country, as something to be kept, improved, not abused, and handed down to descendants in such a condition that by their labor and economy it may continue to yield its successive and abundant harvests.

By looking at a map, it will be seen that a little below the southern line of Tennessee there is a dividing ridge, north of which the waters make their way to the Ohio, and toward the South the region drains into the Gulf of Mexico. This line represents the cotton zone, north of which, generally speaking, cotton is not a profitable crop, at common prices, and south of which it is the ruling staple, and in some parts, almost the sole agricultural product. But nearly half the area of the Southern States, and more than half the population is north of the cotton zone. In other words, one half of the Southern States is a grain-growing and stock-raising country, where the agriculture does not differ in any essential respect from that of other parts of the country. The immigrant from the Northern States to this region, is not a pupil, but a teacher of the old resident. He brings improved methods of culture, labor-saving machines, and a far better system of economy.

The chief advantage that he can enjoy in the southern latitudes, is the mildness of the climate that requires so much less provision in order to winter his stock, and the corresponding length of the summer, that enables him to take, in many instances, two crops from the same soil. To obtain the best conception of the climate of the grain-growing parts of the South, you are to conceive of a New-England winter, with the months of December, January and February left out. Take the weather of our November and our March, and you have the winter of Southern Kentucky, Tennessee, Northern Virginia, and North Carolina. It is a winter in which two months of feeding will suffice for sheep and young cattle, a winter which allows of work on the face of the soil, in clearing, fencing, ditching, and hauling of manures every month, and frequently every week, from the time the leaves fall until grass comes again. The longer summers allow a crop of corn to mature, if planted at once after wheat harvest in June.

Thus the southern farmer can, if he will, labor the whole year round, on the face of his farm, instead of having it locked from him by five, and sometimes six months of frost and snow; and the amount of stock he can keep is limited by the extent and fertility of his pastures, rather than by the crops of hay and roots which he raises, for every acre he has in good meadow, will at least winter one horse or cow.

As a general rule, very few southern lands have ever been developed by any but the rudest and most wasteful agriculture. Out of a farm of 200 acres, as a general rule, about 100 have at some time been partially cleared and plowed, the other 100 is covered with primitive forests.

In Tennessee, the population is about one-fourth as dense as in New York. In Kentucky and Virginia, the ratio is a little higher, but in Arkansas and Texas, much lower. In short, the South can support a population five times as great as now exists upon it, before the density on an average reaches that of New York. Five millions of free laborers, on fertile soil, and with the advantage of genial climate permitting farm labor almost the whole year round, can find employment, homes, and competency, as the reward of labor on the soil just cleared of a national curse by the national arms.

The Cultivation of the Fig.

Last autumn we mentioned the receipt of some fine figs which were grown in the open air, and since then we have had several requests to know how to cultivate the fig tree. While in the warmer States it will grow as a standard, in the colder ones it must be kept so dwarf that whoever would sit under his own fig tree must take a rather low seat. In any case the fig can not be fruited at the North without a certain amount of trouble, and it will only find a place in the grounds of those who are willing to give it the necessary care. Plants are to be had from the nurseries, or they may be grown from cuttings of the last year's wood, 8 or 10 inches long, taken with a small piece of the wood of the previous seasons growth at the base. These grow readily in a moderate hot-bed, and with tolerable certainty in the open air if put out after the ground is well warmed, and in a shaded situation. The fig strikes readily from layers, and early fruiting plants may be obtained in this way. A good mellow soil that is not too moist or highly manured, suits the fig better than a very rich one. It should be trained as a low branching bush, with the branches not so crowded as to deprive the leaves of plenty of air and light. The great tendency to make a luxuriant growth of wood is checked by root pruning, an operation which tends to keep the tree dwarf and render it more fruitful. Root pruning is done at the time when the trees receive their winter protection, for unless properly secured from the severe cold of winter, the trees will be killed down to the root, if not entirely destroyed. One method is to cut a circle with a sharp spade at a distance of 18 inches or two feet from the trunk, severing all the roots, then lay the tree down and cover the whole, root and branch, with several inches of soil. Another plan is to cut around the tree and remove it with a ball of earth to the cellar, where it will winter in safety, care being taken that the roots do not become dry. In either of these modes of protecting, the root is annually pruned. Where a barrel or hoghead is placed around the tree, as is sometimes practised, and filled in with earth—or in milder localities with

straw, the root pruning should not be neglected. The roots tend to run to a great distance, and if they remain uncut, will not only rob other plants but cause an undue growth of wood. The manner of the fruiting of the fig is not generally understood. It is popularly believed, and is so stated in some books, that the fig does not flower. This idea comes from the fact that the flowers are hidden, as they are very small, and produced on the inside of a hollow branch or receptacle, as was explained and illustrated in Oct. *Agriculturist*, 1864. The fruit grows, at the axils of the leaves, one or two appearing at the base of each leaf. The branch continues to grow throughout the season, and the buds produced on the lower portion of that growth attain a considerable size, and form what is called the second crop. These seldom ripen, and though they survive the winter if properly protected, they shrivel up and fall off in spring. On the other hand, the buds on the upper portion of the branch being small, survive the winter, and it is from these that the crop, or first crop, of the next season is produced. As in cold climates only one crop can be procured with any certainty, and this is only to be had upon the growth of the previous season, it is necessary to remove all the young fruit that appears upon the wood of the present season's growth—not all of the buds, but all those which manifest a disposition to grow. When these are removed, other buds are formed in their places, and at the end of the season the buds are all small enough to pass the winter in a dormant state. The fig is well suited to pot culture, and may be grown in large pots or tubs, which may be removed to the cellar for the winter. A number of varieties are sold, among the hardiest of which are, the Brown Ischia, Brown Turkey, and White Ischia. The usual nursery price is from seventy-five cents to \$1.00 each.

The Burning Barn.—[See next page.]

There is something so terrible in uncontrolled fire, that no one can contemplate the bare possibility of its gaining sway in his own or his neighbor's buildings without a shudder. In fact, men too often, in the presence of such a calamity, shrink back oppressed with the feeling of their own powerlessness, and in vague horror, witness the destruction which they think they can not hinder. Or they rush to battle with the flames, fighting them with water, snatching objects from their scorching embrace, and in hand to hand conflict, proving how little the might of man can do to stay their progress.

We sincerely hope that no reader of the *Agriculturist* may ever hear the alarming and heart-sickening cry, "Our barn is on fire!" but, fires will occur, and our readers will be there to help the sufferers. So as we always mean to take a practical view of things, we will of this.

When a barn is discovered to be on fire, there is something to do; and what is done must be quickly done. The point is, to do exactly the right thing, and to do the best thing first. In the very incipency of the fire, there is some possibility of putting it out, but after it has acquired any headway, it must have its sweep through the building in which it originated, at any rate. This is true in 99 cases in 100. In a barn, fire does not smoulder and creep along under floors, between partitions, etc., as in a house, but it leaps from floor to rafters, and runs along the mows and wraps the whole interior in sheets of flame, in less time than it takes to write about it, after it first becomes of notica-

ble proportions. The stables are usually so situated that they may be entered from side doors, and are likely to be the last to be thoroughly on fire. So the first thought should be the stock. Neat cattle, sheep, and hogs, need only to be released and turned loose. They will get out of the barn quickly enough, and look after themselves. It requires, however, both coolness and daring, to enter the cattle stalls, and to be efficient when there. Many a man is in such a hurry that he can do nothing, he can not untie the simplest knots, nor cut the ropes, nor open the stanchions, and so the poor beasts burn to death. In many cases, it is essential to safety, that a wet cloth (part of a sheet is best, though a thin blanket will do,) should be thrown over the head so that the heat may be borne, and the smoky air be breathed with impunity.

Horses, however, can not be trusted to leave the barn alone. They will, indeed, often not budge an inch, but stand and be burned to death, though free to go, and they will sometimes, (and several instances have fallen under our own observation), after being led away from the barn and turned loose, in their excitement turn back and dash in again never to come out. After the fire has gained exciting headway in the vicinity of the stable, those who release the horses should take with them blankets, or cloths of some kind, which should be wet, if possible; but don't wait long to wet them. Then these being thrown over their heads, they may be usually led away without difficulty. If any do not start then, take the twist on their upper lips with a rope or halter, and bring them to their senses with pain—whipping and kicking will do little good. The horses must be left in a lot with a high, tight fence, or in a neighbor's barn, or yard, and some one ought to watch them. While the stock are being saved, the women and those not engaged, should get ready all the old carpets, blankets, buckets, etc., at hand, and with these protect the house if it is in danger, and to this the attention of the men should next be turned. In some cases this is the first thing to do, but usually there is little danger, until the roof of the barn falls in, and a very great heat is thrown out. Then, should the wind be toward the house, there will be danger from sparks, and some one should be constantly upon the roof with water and a dipper, to put out sparks and brands that may fall, and others should watch the cornices and eaves from adjacent windows, to dash water where the wood begins to scorch, or hang over wet carpets.

Next in order of importance, usually, the feasibility of controlling the spread of the flames to other buildings, is to be considered. Sheds, fences, etc., which connect the burning building with others should be at once cut and cleared away. Do not attempt to pull over a shed until all the posts are cut off. A few good ax men will do this very soon, and then a pair of cattle or two with a chain properly attached, will drag it over and haul it out of the way. Fire hooks are of course not to be had, but a strong plow, with the coulter off, is not a bad substitute. The point may be jammed into a roof or into a mass of timber so as to hold as well, and be much more easily attached than a chain could be. If a stack is in the way, and there is help enough, it may be torn down and carried off by hand toward the wind, and away from buildings in a very short time. Detached buildings may be saved by wetting, by blankets, carpets, etc.

Whoever goes to a fire in the country should take an ax, a bucket, and a horse blanket, or piece of carpet. These are the things of most use.

The Christmas Rose.—(*Helleborus niger*.)

There are some plants which possess a hardiness truly remarkable. Among these is our common Chickweed, which, with its delicate and thread-like stem, will withstand the severest cold, and only needs warmth enough to melt the snow which covers it, to induce it to open its tiny blossoms. Similar to the Chickweed in respect to its winter flowering is the Christmas Rose, a plant which has been in cultivation for more than two centuries, and is yet so little known that it has all the rarity of a novelty. We have derived so much gratification from a clump of this plant during the past season, that we are induced to bring it to the notice of our readers, for it is certainly not deserving the general neglect into which it has fallen. The proper stem of the plant is beneath the surface, and from it arise the large leathery evergreen leaves of the shape shown in the engraving, which is only about *half* the natural size. The flower stems also arise from below ground, and they bear from one to three large white flowers, which afterward are tinged with pink. The showy part of the flower is in this case the calyx, the petals being very small, and to a careless observer hardly to be distinguished from the stamens. It succeeds best when partially shaded from the intense heat of summer. It is propagated by dividing its roots in the spring. The name Christmas Rose is given to it as indicating the time at which it flowers in England. In this country its blossoming is determined by the severity of the winter. It will sometimes bloom in November, and again its buds will lie dormant until March, and not unfrequently mild weather in midwinter will induce it to open.

Select Pears—Manning's Elizabeth.

The two summer pears recommended for general cultivation by the Greeley Prize Committee were, Rostiezer and Manning's Elizabeth. The Rostiezer was described and illustrated last month (page 103). Manning's Elizabeth, though first brought to notice in this country, is really of foreign origin. About 30 years ago Messrs. Kendrick and Manning, well known horticultural pioneers in Massachusetts, received from Doct. Van Mons, of Louvain, a stock of cions from his unnamed seedling pears. The original trees from which these cions were taken, were soon afterward destroyed, and the whole stock remained in the possession of Messrs. Kendrick and Manning. The pear under consideration was produced from one of the cions thus obtained, and it was named Elizabeth Van Mons, by Mr. Manning, but the name that has been

adopted by common consent is Manning's Elizabeth. For a figure and description of this variety, we are indebted to Hovey's elaborate work, the Fruits of America, in which the standard

remarkably beautiful, with a deep yellow skin, and a bright red cheek. Often it is peculiarly marked; when about two-thirds of its size, one-half of the pear,—the blossom end,—in most of the specimens, assumes a thick russet covering, which usually terminates in a complete circle around the middle of the fruit, and it generally retains this color, even at maturity. It is a most profuse bearer, being literally loaded with pears: It succeeds well as a dwarf upon the quince, and comes into bearing early.

"Fruit, small, about 2 inches long, and 2 in diameter: Form, obovate, very full around the crown, tapering to and ending obtusely at the stem: Skin, fair, little rough, rich lemon yellow, brilliantly suffused with crimson on the sunny side, through which appear deeper colored specks, becoming pale in the shade, the end next the crown often covered with thick russet: Stem, medium length, about three-quarters of an inch long, rather slender, and slightly inserted in a shallow cavity: Eye, small, open, and a little sunk in an open, shallow basin: Segments of the calyx short: Flesh, yellowish, coarse, melting and juicy: Flavor, sugary, rich, and pleasantly perfumed: Core, large: Seeds, rather large, brown. Ripe from the middle to the last of August."—A very desirable pear.

The Eggs of Insects.—Resisting the Cold.

One of the essentials in successful warfare, is a knowledge of the strategy of the enemy. Insects vary so much in their habits, that it is necessary to closely study each particular kind, in order to know at what period it may be most readily destroyed. Some of the most destructive insects, such as the cankerworm, pass the winter in a chrysalis state, hidden in the earth or elsewhere, and deposit their eggs upon the twigs only a short time before they are hatched. Hence no amount of scraping and washing the trunk will affect insects like these. The curculio and apple-moth can not be readily destroyed in the egg. These insects deposit their eggs either upon, or in, the young fruit, and they can only be attacked in their perfect or winged state, or while they lie dormant in the chrysalis. But our object was to call attention to the remarkable property, possessed by the eggs of some insects, of resisting the effects of low temperatures. In some cases, the crop of insects is provided for in the eggs which are laid the year before. These, as in the tent-caterpillar, figured in January, (p. 3), are usually deposited on the young twigs, where the newly hatched insects will find their food close at hand. In this exposed situation, the eggs, the contents

CHRISTMAS ROSE.—(*Helleborus niger*.)

varieties of fruit are well represented in colored plates. These plates are accompanied by detailed descriptions of the fruits thus illustrated,

MANNING'S ELIZABETH.

and by interesting bits of pomological history. "The Elizabeth is a very fine early pear;

of which are semi-fluid, pass the severest winter without loss of vitality, and what is more remarkable, without rupturing the shells by the freezing of their contents. The eggs shown in the engraving are those of the katy-did, or some allied species of grasshopper, and are represented about one-fourth larger than the real size. These are of a slate color, and are deposited with great regularity in two rows, each egg

overlapping its neighbor; and they have not the mutual protection which the crowded ones of the tent-caterpillar afford one another. Those in this specimen, though it had been exposed to a cold of 10° or 15° below zero, were perfect, and will doubtless hatch in the spring. It is well known that liquids expand in freezing and with great force. It is also known that water, if kept perfectly quiet, may be cooled to several degrees below the freezing point, and still remain liquid, but that the slightest disturbance will cause water thus cooled to assume the solid form at once. One of our naturalists—Prof. Wyman, we believe it was—has shown that the contents of the eggs of insects remain liquid during the most severe cold, as long as they are undisturbed, but if, while at a low temperature, the shell be punctured by a needle, they immediately become solid, expand, and a portion is projected out through the orifice thus made. With regard to the eggs above figured, we have never known them to be very abundant. The katy-did and its relatives of course eat something, but they more than compensate for that by their summer nights' song.

Setting up and Preserving Insects.

BY DOCT. F. HODGE, HUDSON, OHIO.

[The following very practical directions have been furnished by Doct. Hodge, and will be acceptable to those who desire to make a collection of Entomological specimens. The present article refers to the preservation of butterflies and moths only, but we hope to have the manner of preserving other insects described.]

"If the moth sits with its wings roofed, a touch near the head with a brush or swab soaked in chloroform will drop him—Use a camel's hair pencil with the brush cut short, or, what I prefer, a small hickory stick with saddler's silk bound upon the end after the manner of a broom, the ends cut off even, and the strands of silk combed out with a pin. This makes a durable swab, which the chloroform will not spoil very soon. Then take the moth under the

Fig. 1.

wings between the thumb and first finger, and insert a needle, dipped in a solution of Cyanide of Potassium, under the chin, and run it lengthwise through the body, taking care that it does not strike out; recharge the needle and repeat the operation until the moth is dead.—The solution is made with one drachm of the Cyanide

of Potassium in one ounce of water. It is well to recollect that this is highly poisonous. The needle used for applying the solution is a largest

Fig. 2.

sized sewing needle, and for the largest moths, a large darning needle. Drive it *point first* into a small wooden handle. Use the blunt eye-end for the piercer; it will kill in half the time that the point would, as it makes a larger hole, and carries more poison. The large moths and sphinxes will oftentimes refuse to die under the above treatment, but it is the best we can do for them, unless their bodies can be stuffed. Butterflies and moths that rest with their wings folded together, will need no chloroform. Take such insects carefully between the thumb and fore-finger, and proceed at once to poisoning.

STUFFING.—With small, straight surgeon's scissors, cut open the abdomen and a small portion of the thorax; with forceps, remove the eggs and other contents, and then with small pledgets of cotton, swab out what remains carefully and delicately. Make the stuffing by rolling between the thumb and finger an oblong ball of cotton, one-third smaller than the abdomen was before it was opened, wind it with

Fig. 3.

thread to preserve its form, roll it freely in powdered arsenic (arsenious acid), and insert it carefully, pulling up the sides with the forceps, or a pin head. Then put in two or three stitches with a fine needle and thread, each stitch separate, cut off each stitch as inserted, leaving the ends of good length, and tie none until all are in. Tie the middle stitch first, cut off the ends close, and then do the same with the others.

SETTING UP.—For large-bodied moths, have a pine board, with a groove not over one-third the diameter of the body of the moth. For butterflies, and a great many moths, I prefer the plain, flat board, with no groove. If the groove is too deep, it gives a bad unnatural look to the wings. Bore a small hole with an awl or knife blade in the bottom of the groove, or where the pin is to go, say one-eighth of an inch deep, but not through the board. This hole (see fig. 2) is used, in order that, when the specimen is dry and placed in the cabinet, the body and all may stand away from the cork or board in which the pin is inserted. In putting the pin through the moth, be careful to have it perpendicular, with the point coming out on the under side, nearer to the extremity of the abdomen than the place of its insertion, or top, as in figure 1. Introduce the pin into the awl hole in the board and press it in firmly. Figure 2 shows the body of the insect as placed for drying, and fig. 3, the same when dried and placed in the cabi-

net. Spread the wings with pins. With the Lunas and most of the large moths, introduce the pins in the fore-wings in the sort of hard band or edge of the wings. The back wings of the large moths will almost always tear when bringing them to place, but with proper care this will do no harm. The tearing can be prevented somewhat by inserting the pins slanting forward as is shown in figure 4, which represents an Atlanta butterfly set up for drying. When the moth is dry, in two weeks or *more*—never less—turn the pins, used in the wings, around in their holes, before attempting to draw them out; this prevents tearing the wings, and leaves as small a hole as possible. All the large

Fig. 4.—ATLANTA BUTTERFLY.

moths and sphinxes should be stuffed, but if successful in killing the sphinxes at the first trial, they may very likely be successfully dried without stuffing, especially those which have been captured, but not so likely with those that have been raised. If thorough poisoning does not kill the insect, stuff it by all means. Removing the contents of the abdomen and stuffing with arsenic, is certain to kill them *dead*. When the body is stuffed, be careful not to leave any open rings upon the back; if by bad handling there should chance to be one or more, try to smooth them out, by careful pressure with the cylinder of a lead pencil, or by placing the finger upon the extremity of the abdomen, and shortening it up. Figure 5 is Saturnia Io, showing the

Fig. 5.—SATURNIA IO.

manner of using a grooved board for large bodied moths. The antennæ, of large moths especially, should be propped up by a strip of blotting paper, half an inch wide and bent into the form of fig. 6. This paper is secured to the board

Fig. 6.

by pins, and the antennæ are supported upon it. This should be removed the third day, before the antennæ become so dry as to be brittle."

Raspberries and Blackberries.

It is pleasing to notice that a share of the enthusiasm that has attended the culture of the strawberry and grape, is being diverted to the raspberry and blackberry. And well it may be, for they are the fruits that bridge over the interval between the strawberry and the early grapes. For a selection of the best varieties of raspberries, we gave three years ago the following: Hornet, Franconia, Brinckle's Orange, and Belle de Fontenay. These are all excellent and well known sorts; the first three require covering in winter. A variety called the Philadelphia is very popular among the growers in New Jersey. It probably does better upon their light soils than elsewhere. Near New-York it has not proved valuable. Mr. Parry, of Cincinnati, N. J., a grower of large experience, prefers it to all others as a market variety, and states that he had a yield of 220 bushels to the acre the second year after planting. At the West the Purple Cane is the favorite red variety, where it is considered the best for market, and does not require covering in winter. The improved varieties of the Black-Cap have now become so popular, that nurserymen find it difficult to keep up with the demand. They have indeed valuable qualities; they need no covering in winter, do not send up any suckers, are great bearers, and the fruit is so firm that it reaches market in good condition, and it finds a ready sale. The Black Caps, and the crosses of them also do not produce suckers, which in the ordinary red sorts causes them to multiply rapidly, but are propagated by layering the tips of the new growth in September, or whenever it becomes firm. We recently saw a communication in the London Gardeners' Chronicle, in which a cultivator complained that some choice seedlings obtained by a cross with the Black Cap were likely to be lost, as they would not be propagated. Above is a Yankee trick which is commended to our brothers over the water. Doolittle's improved Black Cap is the one most cultivated. Miami Black is said to keep in bearing two weeks later, and the Golden Cap, a yellow variety, is also grown. Of Blackberries the New Rochelle and Dorchester are the best known. The Kittatiny, a new sort, has every good quality of the New Rochelle, keeps longer in bearing, and is a better fruit. Wilson's Early is another new variety which finds favor with those who grow for market, both on account of its earliness, and the fact that it ripens up its crop at once. Both these new sorts are rather too scarce, as yet, to allow of setting large plantations of them, but they are well worthy the attention of fruit growers. Good soil and good culture are needed for both the raspberry and the blackberry. In gardens, blackberries do well against a fence, and they can be made to form a barrier which marauders will respect. It is common to grow them in stools set 6 or 8 feet apart each way, and train the canes to a strong stake. Raspberries are set in rows six feet apart and the plants three feet apart in the rows. Fall planting is preferable, but plants may be set early in the spring before they have made much growth. The following, from A. M. Parry, a fruit grower at South Bend, Ind., gives his method of field culture. It came too late for insertion in October, the month for which it was intended:

"Our objection to setting in the spring is, that the young and tender sprouts which start so early are apt to get broken off. We prefer setting in October, and pass over the ground

early in the spring and loose up the ground with a fork down to the roots, which will cause every root to send up their sprouts and make a full growth the first season. We set rows 6 to 8 feet apart, and 3 to 4 feet in row. In August cut off the tip of the new growth, which causes them to branch out, and if branches grow too spindling cut them off also. Cut out all old wood in the fall and mulch heavy with corn stalks, straw, or any coarse litter to protect from the drouth. We have lost hundreds of dollars buying different sorts of raspberries, but find none that will stand through our changeable winter but the Black Cap family, Purple Cane and Catawissa. These possess all the desirable qualities sought for in a raspberry. As to blackberry, if there are any varieties that are better than the New Rochelle or Lawton and Dorchester High Bush, in every respect, we are yet to find them."

A Troublesome Weed—Bur-grass.

(*Cenchrus tribuloides*.)

Among the specimens sent us last year for determination, we find the Bur-grass, of which we give an engraving. Though not as common as some other weeds, it is in sandy places, especially near the sea coast and the shores of the great lakes, often abundant and troublesome. The engraving shows only a small branch of the natural size; the plant is very branching, and spreads to the diameter of one or two feet, each branch terminating in a spike of several prickly heads, or burs. Each of these burs is a sort of hardened cup, or involucre, which encloses several flowers, and is armed on the outside with numerous curved prickles. One of the flowers, removed from the bur, is given at the bottom of the engraving. The prickly nature of the bur, joined with the fact that, when ripe, it is readily detached from the stem, renders it an exceedingly annoying plant, as the burs catch upon the clothing, get into the hair and wool of animals, and make their

presence manifest in the most disagreeable manner. We well recollect the trouble this plant gave us while we were traveling in the far West; its burs would work into our blankets, and it was almost impossible to remove them. It is very fortunate that this ugly customer is an annual, and though its prickles provide it with unusual facilities for spreading, it may be kept in subjection, if sufficient care be taken. Our illustration will enable any one to recognize the plant when young, and destroy it before its seeds ripen. In some parts of the country it is called Hedgehog-grass, and at the South, where it is more common than at the North, it is frequently called Cockspur-bur.

Mr. Bolmer's Peach Orchard.

In a very long communication, Mr. Lewis Bolmer, of the Great Miami Valley, presented to the Cincinnati Horticultural Society, his method of managing peach trees. As the article in question is very much in detail, we extract the essential points from his report. After giving an account of his early experiments and failures, Mr. B. states the following as the manner in which he has successfully and profitably treated an orchard of 1300 trees:

"In setting out his trees, Mr. Bolmer plants shallow. In light soils, that are sandy and gravelly, he digs the holes a foot deep; in light loam, six inches; in heavy clay he plants on the surface, unless it be on a hill-side, when he makes a slight excavation; in wet places, or hollows, he raises the ground a foot or more for the trees before planting; the trees are all surrounded with mounds of earth; this applies to all sorts of fruit, and while it protects them from the frosts and winds of winter, it also deters the rabbits from injuring the bark.

The branches are formed at two feet high, which is the top of the first mound. The second year this is raised another foot, covering the lower parts of the limbs, and making the hillock three feet high. No other protection is needed, as the extremes of wet or dry, heat or cold, are regulated by this mass of earth, if it be properly made, and kept smooth and sharp at the top. The worm cannot gain access, and neither man nor beast can injure the bark nor split down the branches, neither can the wind blow the tree over. The third and fourth years the mound is made still larger, so that when finished they will be between 4 and 5 feet high.

For older trees—if more than three or four years—he advises cutting back pretty freely as a preparation for this earthing process, which is aided very much by plowing both ways toward the rows, thus preparing the soil and leaving so much less work for the shovel.

In this case mulching should be freely applied, to protect the roots from the sun. The work may be done at any time when the ground is not frozen or the tree laden with fruit, and even then if the earth be brought to the tree from beyond the roots.

This banking up of the soil exposes it to the action of the frost, and it is thought that the mounds freeze solid to the tree, and remain frozen until spring, especially if well mulched, and the buds are kept back until late in the spring, and escape untimely frosts. It is claimed for this plan, also, that there is a vastly increased surface exposed to the heat and air for their happy influence. It is found that the earth is literally filled with fine fibrous feeding roots by the third or fourth year, which are ready to make the most of the 'situation.'

WINTER PROTECTION FOR THE BUDS.

Sometimes he bends the lower limbs to the earth, and puts a weight upon them to keep them there; very often the snow furnishes the needed covering, and in northern climates this will be found sufficient. But in our less snowy latitude, where we often have great depression of temperature without any such covering to the earth, we need some artificial protection. For this purpose, Mr. Bolmer uses long open boxes, supported by four legs of the requisite height, say from two to five feet, to adapt them to the different parts of the trees. Into these the branches are gathered and crowded and pressed down, and covered with straw, with a little earth or something else to keep them in place. This is done in November, and they are left until late in March or April, when the exposed part of the tree is in full bloom; these protected buds are then beginning to swell, and they will be two or three weeks later in their blossoming, and may thus escape a spring frost that might destroy the earlier bloom and fruit. Mr. Bolmer cuts back his peach trees every second year, or if they bear too full, he shortens them every season, to thin out the fruit, taking off say one third of them, so as to increase the size of those that are left. This he considers a very paying operation, on account of the increased size and corresponding price of the fruit; nor is it a very expensive operation, if, as he says, one man can trim from fifty to one hundred trees a day. To recur to the mounding work, he does not give the absolute expense of the operation, which each must calculate for himself, reckoning local cost of labor, etc., but he claims that it pays, and that it preserved the longevity of his trees, while other orchards in his neighborhood have died out and disappeared.

The original tree upon which he first operated, now twenty-seven years old, is still living. Though not able to give the cost per tree or per acre, Mr. Bolmer feels satisfied that the expense will compare favorably with the constant plowing, and tending, and worming of a peach orchard, attended with uncertain results and frequent failures, because mounds once made are a permanent protection from the worms and insure a crop, so that he considers his plan the cheapest and most profitable method of growing fruit that has yet been discovered, and

he claims that fruit produced in this way is worth one-third more on account of its superior flavor, size and color."

A Brilliant Bedding Plant.

(*Gazania splendens*.)

Of late years many plants formerly considered as only suitable for green-house culture, have been found to grow with perfect success when placed in the open ground, and even attain a luxuriance of growth, and give a profusion of

GAZANIA SPLENDENS.

bloom, far in advance of any results that can be reached in pot culture. These bedding out plants are in great demand, and the establishments devoted to producing them are, so to speak, regular plant factories, where the specimens are turned out by hundreds of thousands. One of the plants which has been thus popularized and removed from the exclusiveness of green-house society to the promiscuous assemblage of the border, is *Gazania splendens*, of which we here give an engraving. The plant branches freely, its weak stems laying prostrate upon the ground; the leaves are rather thick in texture, and of a dark green upon the

upper surface, while below they are very nearly white. The flowers are produced singly upon long stalks, and are of the size and shape shown in the engraving. It will be seen that this flower belongs to that very large family, the Composite, of which the Sunflower and Marigold are common representatives. The rays in this flower are of a rich yellow color; each one of them has, near its base, a spot of purplish brown, so dark that it appears to be black, and upon each one of these dark spots is a clear white marking. These spots together form a

circle or crown of exceeding brilliancy. A great merit in this plant is the long duration of its flowers; they open only in a strong light, and close at night and on dark days. The same flower will open and display its beauties day after day, for about a week. The plant is a native of the Cape of Good Hope, and though tender, is not destroyed by the first light frosts of autumn. With this, as with other bedding plants, cuttings should be made during the growing season for a stock to keep through the winter. It succeeds well in ordinary garden soil. The name, *Gazania*, is said to come from the Persian word for *riches*, while the specific name, *splendens*, is so near the corresponding English word as to need no translating. The botanical name is not inappropriate, for the plant is both rich and splendid.

Forest Trees for Shelter.

The importance of sheltering fruit trees from the violence of winds, is shown by the attention given to the subject by the Western Horticultural Societies. At the last meeting of the Illinois State Horticultural Society, the merits of the different forest trees were discus-

sed almost as fully as those of fruit trees, and a list of those best for shelter adopted with equal formality with the lists of fruits. We enumerate the trees selected, placing those first which the Society consider most valuable. Black Walnut, Hickory, Butternut, Wild Cherry, Silver Maple, Elm, Ash, Sugar Maple, Ash-leaved Maple, Basswood or Linden, Honey Locust, Oaks (Red, White, and Bur), Larches, Red Mulberry, Catalpa, Chestnut, Lombardy Poplar, Silver Poplar, and Osage Orange. The Cottonwood, and White and Yellow Willows, were recommended, if nothing else could be had. The Evergreens recommended were:

Arbor Vitæ, Red Cedar, Norway and White Spruce, White, Scotch, Austrian and Stone Pines, and Hemlock. The nut-bearing trees have generally so long a tap-root that they are difficult to transplant, and it is recommended to plant them where they are to grow. They are best planted in autumn, or in early spring, if they have been kept through the winter in sand. It unfortunately happens that with the exception of the Evergreens, few of the seeds of the trees in this list are to be had of the dealers. Ash, Larch, Catalpa, Honey Locust, Linden, and Sugar and Ash-leaved Maple, we find in the catalogue of one of our principal seedsmen. The seeds of the Silver Maple and Elm are ripe the latter part of May, or early in June, and should be collected and sown at once.

The seed of Evergreens is best sown in a bed surrounded by a frame, and so arranged that it can be shaded; no heating material is required, but the soil should be fine, light, and rich. The shading is best done by a slat-work of laths. If sown in an open bed, cover the surface with leaves or light hay, which is to be removed as soon as the plants are up. The requisite shade may be given by sticking leafy brush upon the south side of the bed. The seeds should be covered with but a very slight layer of fine soil.

THE HOUSEHOLD.

Parasitic Animals in Pork.

(*Trichina spiralis*.)

BY THOMAS HAIGH, M. D.

[Various accounts have recently appeared in the daily, and other papers, of a disease, caused by eating pork that was infested by a microscopic animal. Under the head of Trichinosis, and Trichina disease, some alarming and somewhat sensational statements have been made. As these have abundant foundation in fact, and thinking it best that our readers should know just what causes the disease in question, we present an account of the Trichina, prepared at our request by Doct. Thomas Haigh, of the N. Y. College of Physicians and Surgeons.—Eds.]

To the Editor of the American Agriculturist:

Your request for a popular account of Trichina is cheerfully complied with. The daily papers have already made the public acquainted with the fact that in some parts of Europe, in Germany especially, the Trichina disease has prevailed to an alarm-

Fig. 1.—TRICHINA CYSTS.

ing extent, and the number of cases reported in this country show that it exists here to an extent, which, though not to a degree to cause alarm, is sufficient to demand attention. The disease is caused by a microscopic animal, and the points which interest your readers are, what the animal is, how it is introduced into the system, and how it may be avoided. The existence of the animal has long been known, and it has been found in the flesh of persons who had died of widely different diseases, and in whom, before death, its presence had not been suspected. The animal is called *Trichina spiralis*, and has been noticed by Owen, Virchow, and other European writers, from time to time during the last thirty years. The most complete account of it will be found in a paper by Prof. John C. Dalton, of the N. Y. College of Physicians and Surgeons. This paper was published in the Transactions of the N. Y. Academy of Medicine, and I am allowed by its author to use his drawings in illustrating this article.

The Trichines are found in the muscles of man and of swine, enclosed in small sacs, or cysts, which

Fig. 2.—MAGNIFIED TRICHINA.

are imbedded among the muscular fibres. These cysts are 1-30th of an inch long, and 1-100th of an inch broad; they taper at each end, and are usually prolonged at each extremity into a very fine thread-like appendage. Figure 1 shows these cysts as they appear in a magnified fragment of muscle. Each sac, or cyst, contains a single Trichina,—rarely two,—coiled up in a spiral form, making about three turns, so that the head is nearly opposite to the tail. It is a round worm 1-28th of an inch long, and 1-620 of an inch in thickness. When magnified about 200 times, it appears as in fig. 2, which shows its structure so clearly, as to require no further description. As far as is known, the animal is sexless. The cyst which contains the animal is believed to be formed from a minute blood vessel, which by the presence of a foreign body like this parasite, becomes changed and mostly obliterated. The cysts in the human muscle do not always have the long appendages of figure 1, but appear like figure 3.

The number of these animals is sometimes astonishing. They have been found so abundantly in ham that the number was estimated at 85,000 to the cubic inch, and they have been found to be nearly as numerous in human muscle. This brief description, with the figures, will give a sufficiently clear idea of the parasite, as it is found in the human muscle and also in the swines' muscle.

The manner in which it is introduced into the human system, is this: When pork, infested with Trichines, is taken into the stomach in a raw, or imperfectly cooked state, the sac containing the little worm is broken up by the process of digestion, and the animal is liberated from its imprisonment. It awakes from its dormant condition, rapidly develops, and in a period of 8 or 10 days it brings forth its young alive. The young Trichines, which are produced in great numbers, immediately penetrate the walls of the intestines, and getting into a blood vessel, are conveyed along by the blood to all parts of the body. They are finally lodged in the capillary blood vessels, where they gradually become encysted, or closed in, by the change in the vessel, as already noticed, and in this condition they lie dormant for an indefinite length of time. The perforation of the intestines by such a multitude of worms, as well as the presence of so many minute foreign bodies in the minute blood vessels produce serious disturbance, though not always fatal consequences.

The Trichina is an animal which only develops and, as far as yet known, reproduces itself in the intestines of, and afterwards lies dormant a long

time in the muscles of man and of swine. It now remains to show how it finds his way into the flesh of swine. It is believed that of those which develop in the human intestines, only a small part bring forth their young, but that a large share of the full grown ones pass off in the feces, and are thus enabled to find their way to the stomach of the pig, where they produce young, which are distributed through the muscular tissue of that animal, in the same manner as they are introduced into that of man.

Trichines, then, come into the human system through eating pork, and as that meat forms a large share of the animal food of our laboring population, it becomes important to know how to distinguish infested meat from that which is free. Unfortunately this can be done only by the aid of a microscope, or at least a good magnifier. Where the animals have been for a considerable time encysted, they may be seen more plainly than those recently introduced, as the cysts become white from a deposit of calcareous matter. The figures show the appearance of well defined cysts, but the recently introduced parasite can only be found by those accustomed to microscopic observations.

Unfortunately the salting and smoking of meat do not destroy the Trichines, and most of the cases of sickness caused by them have been traced to the eating of raw, smoked ham. It is probable that the parasite cannot live when long exposed to the temperature of boiling water. When a ham is boiled whole, it is probable that the interior of it does not become heated to the boiling point, and that the Trichines in the center may remain alive. Broiling and frying, as they are generally done, do not heat the meat through with sufficient thoroughness to destroy the parasite. As a precaution, all who eat pork in any form should take especial care that it is *thoroughly* cooked. The only positive security is, to obtain from pork altogether. From what has been said of the manner in which the parasite finds its way into the stomach of the pig, it will be seen that swine kept in pens run much less risk of becoming diseased than do those which are allowed to range at will.

About "Plated Ware."

When silver is dissolved in nitric acid and mixed with cyanide of potassium, a clear liquid is produced which contains the silver in the form of cyanide of silver. If the two wires from a galvanic battery be inserted into this liquid a little distance apart, the current of electricity that passes through the liquid from one wire to the other, decomposes the cyanide of silver. The pure silver metal goes to one of the wires and is deposited on it in a solid form. This takes place at every point where the wire touches the fluid containing the silver in solution. The silver is deposited in inconceivably small atoms, innumerable millions of them in every second. In a single minute enough of these atoms will be laid on to present to the eye a perfect coating of pure silver, that will completely hide the ware. If a larger piece of metal, as a fork, spoon, or teapot be attached to the wire and immersed instead of the wire, every point of the larger metal touched by the liquid will receive the coating of silver. As long as the article is in the solution and the battery in action, the depositing of the silver will go on.

The practical point we wish to bring out is, that the silver is deposited in such small particles, or "atoms," that the coating will appear perfect, though the thickness may be thinner than the ten-thousandth part of the thickness of a sheet of paper. To the eye the appearance will be the same, whether the silver coat be only a millionth part of an inch in thickness, or a heavy coat that will endure hard wear for months, or years. A wholesale dealer of this city, who supplies manufacturers of plated ware with materials, noticed that one of them was buying a great quantity of lead, and inquired the reason. The answer of the purchaser was, that he made plated ware for the gift enterprise men, (such as we described on page 86 of the March *Agriculturist*, under the head of a "Swindling Shop"). The lead is moulded into form, and then

Fig. 3.—TRICHINA CYST.

dipped for a minute or two into the galvanic silvering solution, giving it a perfect but very thin coat.

The truth is, that a very large proportion of the plated ware sold, is but very slightly coated. A silver dollar can, by the above plating process, be so spread out as to give an actual silver covering to thousands of yards of surface, while by a continuation of the same process, it may all be deposited on a square inch. The thickness of the layer depends wholly upon the will of the manufacturer. Silver deposited at the rate of half an ounce (50 cents) on a gross (144) Teaspoons, will allow burnishing the same as pure silver. The ordinary cheap plated ware runs 1/2 to 1 ounce to the gross. Common fair plate is 2 ounces to the gross. Good plate 4 ounces. The best plate, or "Sheffield Plate" is at the rate of 8 ounces of silver to 12 dozen teaspoons. This, on white metal, will wear next to solid silver; and as the work is but slightly increased in making the best, this is by far the cheapest to purchase.

The plain inference from the above is, that it is only safe to purchase such ware of men well known for integrity and reliability. In this, as in all other departments of trade, integrity and genuine Christian principle are of the highest importance to the business man himself, and to his customers.

In buying plated ware, it is important not only to obtain a good thick plate that will endure wear, but also to secure the body or base metal as near like silver as possible. The best plating will in time wear off at the corners, or at points where it is most exposed. If the base metal be copper, brass, or inferior German silver, the least abrasion of the silver coat will be shown; while on a white base, the loss of the silver coating will not be noticed, except upon careful inspection. A white metal, well plated, is only second in value to a solid silver article. The same remarks apply to gilded, as to silvered articles. (The Tea Sets, in our Premium list, were offered with the greater confidence, because we know the manufacturer, and because they are plated upon a very white metal.)

Teach the Children to Draw.

Nearly all children show a propensity to make pictures on their slates, or on pieces of paper. This should be encouraged. It should not be allowed to engross time devoted to other school lessons, but should come in rather as recreation. Their pictures will doubtless at first be rather uncouth—houses top-sided and topsy-turvy, trees stiff and dead, the men and women any thing but ideals of grace and beauty. You may smile at these rude beginnings, but don't discourage them. One or more of these children may develop into artists of eminence; and all of them may at least become men and women of taste and judgment.

This fondness for drawing should be guided by a teacher. Give the pupils a few elementary lessons. First, teach them to draw straight lines, and then to connect them into squares, triangles, etc. Next, teach them to make curves, circles, etc. Proceed from this to making fences, houses, trees, animals, rocks, and the like. The majority of the pupils will not care to go any further in "the fine art." A few, however, will go on, and go beyond the lead of parent and school-teacher; they will need no further encouragement; indeed, you cannot hold them back. Watch the career of such, and you ere long may perhaps hear of the exploits of a Cole, a Durand, a Kensett, or a Huntington.

Yet it is not so much after all for these geniuses that we would urge giving attention to drawing, as for the majority, who will thereby learn to observe, will cultivate their ideas of proportion, fitness and beauty. The mechanic, the farmer, every man of business, has frequent occasion to make drawings of objects, and it is of great value to him to be able to do so without employing a professional draughtsman. Almost every body travels now-a-days, and it is very useful and pleasant to be able to make sketches of the scenery through which one is passing, even if it be but in outline. By all means, let the children draw, and teach them how to do it.

Vinegar from Sorghum.

J. S. Coles, of New Jersey, writes to the American Agriculturist: "Some five or six years ago I raised a lot of cane for the purpose of making molasses, but as we had no Evaporators here then, we did not succeed in making a good article. I let one barrel (38 1/2 gals.) of the juice as it came from the cane remain in the barrel for nearly a year without examining it, when I found it to be fair vinegar; the next summer it was a splendid article. We put up our pickles, peppers, tomatoes, etc., with it, and it kept them well. We have been using it ever since with equal success; for table use we weaken with water, as it is too sour of itself."

Cellars Poisonous.—At this season of the year, it should be specially remembered that the cellar of a dwelling house is very likely to be a source of disease to the whole family. The remnants of vegetables stored during the winter begin to decay on the approach of warm weather, and the exhalations from these, with the chilly dampness, are liable to produce sickness. Many a family has attributed to "Providence" the disease caused by the poisonous miasms arising from the neglected cellar. Every cellar should at all times be kept clean by the removal of all vestiges of decaying vegetables, fruits, and food. A coat of strong lime white-wash upon the walls and ceiling, at least once a year, or better twice a year, will add greatly not only to the healthfulness of the cellar, but will also make it much lighter and more cheerful.

Unbolted Flour the Most Healthful.—Having been raised in a good wheat country, we can not well overcome an early attachment to "mother's nice white bread." Yet science plainly teaches that the most healthful bread is made from wheat ground without separating the bran. The coarser portions of the bran keeps the finer particles of flour separated, so that the gastric juice of the stomach more readily penetrates and dissolves the mass, and hence is better for digestion. These coarser particles also promote the healthful action of the intestines, and prevent constipation, which is one of the prolific causes of disease in these days. It would be far better, doubtless, if every flour bolt were removed from our grist-mills, and people consumed the meal of the whole wheat kernels, just as the several parts are combined naturally. Taste depends mainly upon habit; those accustomed to the unbolted flour eat it with a relish.

Value of Apples as Food.—Liebig says: "The importance of apples as food has not hitherto been sufficiently estimated or understood. Besides contributing a large proportion of sugar, mucilage, and other nutritive compounds in the form of food, they contain such a fine combination of vegetable acids, extractive substances, and aromatic principles, with the nutritive matter, as to act powerfully in the capacity of refrigerants, tonics, and antiseptics, and when freely used, at the season of ripeness, by rural laborers and others, they prevent debility, strengthen digestion, correct the putrefactive tendencies of nitrogenous food, avert scurvy, and probably maintain and strengthen the power of productive labor."—The same qualities are found in most other ripe fruits.—SUGGESTION. To day we bought at a fruit stand an apple of moderate size and of fair eating quality, for which we paid five cents. Will it not pay to plant more apple trees, so long as the short supply enables retailers to get half a dime apiece, even in scarce seasons?

Cranberry Sauce.—To 3 quarts cranberries carefully picked over, well mashed and drained, and placed in a kettle, add 2 quarts of crushed or best Santa Cruz sugar; add 1 quart boiling water; stew them quickly till they are thoroughly cooked; turn them into moulds, if you choose. Do not stir them while cooking, but shake the kettle round. Put alternately fruit and sugar. It is a great mistake to cook them till they lose their splendid color.

BOYS & GIRLS' COLUMNS.

The Game of Checkers or Draughts.

HISTORICAL.—(Continued from page 107.)—The modern Egyptians, who use pieces similar to their predecessors, play the game as in this country and Great Britain. By the Greeks, the invention of Draughts, as well as of dice, and many other things, was poetically ascribed to Palamedes, one of the heroes in the expedition against Troy, 1193 B. C. Plato, however, attributes the invention to the Egyptian, Theuth. Homer, in the Odyssey describing Minerva's arrival at the palace of Ulysses, in Ithaca, says: "There she found the haughty suitors, some of them were amusing themselves before the gates, with Draughts setting upon the hides of oxen they had stolen."

LAWS OF THE GAME.—(Continued from page 107.)

10. After the first move has been made, if either player arranges any piece, without giving intimation to his opponent, he shall forfeit the game; but, if it is his turn to play, he may avoid the penalty by playing that piece, if possible.

11. After the pieces have been arranged, if the person whose turn it is to play, touch one, he must play it or forfeit the game. When the piece is not playable, he forfeits according to the preceding law.

12. If any part of a playable piece be played over an angle of the square on which it is stationed, the play must be completed in that direction.

POSITION NO. 4.—TO BE WORKED OUT.

Black.

White.

White to play and win.

Solution to Position No. 3. (See March No., page 107.)

Table with 4 columns: Black, White, Black, White. It lists moves for a checkers game, such as 1-1 to 5, 2-5 to 9, 3-9 to 14, etc., up to 21-19 to 24.

(a) It requires every move made in the solution to win. Various stages of this position frequently occur, but this is placed far back purposely.

GAME NO. 4.—LAIRD AND LADY OPENING (*)

Table with 4 columns: Black, White, Black, White. It lists moves for a checkers game, such as 1-11 to 15, 2-8 to 11, 3-9 to 13, etc., up to 19-1 to 6.

(*) Is so called from the fact of its being the favorite of Lord and Lady Cathar, of Scotland, over seventy years ago. It is formed by the first five moves. (a) 23 to 19, draws. (b) 15 to 10, or 32 to 28 draws. (c) 30 to 25, draws. (d) 12 to 16, White wins. (e) 21 to 17, draws. (f) 23 to 25, Black wins. (g) 27 to 24, draws. (h) 27 to 23, draws. The move in game (27 to 24) loses.

Puzzles for Sharp Eyes.

Men think they can trust their eyes to tell them the truth, and they are generally right, but an educated eye will discover many things which an unskilled one would not see; so that the eye needs much training to make it tell "the whole truth, and nothing but the truth." A sailor accustomed to watch from the mast head for objects at a distance, will readily see things not visible to a landsman. An artist, who has long made a study of pictures, will detect faults or beauties in a painting or engraving, which most people would not notice. So a Naturalist will perceive curious things in flowers, leaves, insects, stones, etc. One needs to look at many things from different positions, before all which they contain can be perceived.—Two pictures, fig. 1, the "Singular Sign," and fig. 2, "An Enemy in Camp," very well illustrate this fact. The first one looks like only a mixture of lines and blots; yet it contains information which has

Fig. 1.—THE SINGULAR SIGN.

probably proved beneficial to many of our readers, being the sign of a well known firm in this city. Fig. 2 plainly shows that the poultry are alarmed, and careful eyes will find what frightens them. Next month we will make the matter plainer for those who fail to see it.

Good Mottoes.—A youth of our acquaintance has the following, written in large, plain letters, and pasted up in his sleeping room where it can be plainly seen while dressing, and an earnest prayer is always offered at the bedside, for help to keep the resolutions:

"(1.) I will endeavor this day to do nothing which I believe I ought not to do.—(2.) I will omit nothing which I ought to do.—(3.) I will not parley with temptation, and thus allow it to get the better of me, but will be careful to be on the right side, following the first intimations of conscience, and avoiding what may PERHAPS be wrong."

Another motto which is pasted up by an older friend, in like manner, reads: "WATCH and PRAY—which implies that I am first to Watch myself, to do all I can to act right, and to avoid wrong doing; and then God, if I seek His help, will supply what strength I have not; He will not carry me, but He will always aid me."

How Shot are Made.

This morning, for the twentieth time perhaps, we went out to gratify a country friend, who had a great curiosity to see one of the "Shot Towers" of New-York, and it occurred to us that many of the boys of the great *Agriculturist Family*, and perhaps some of the girls, as well as men and women, would like to know a little more about how shot are made.—First, then, there is a high brick tower, like a great tube set on end, with circular stairs running around the inside, all the way to the top, leaving an open space down the center four or five feet across. There is a hoisting arrangement on one side of this for carrying lead and coal up to the top. At the bottom of this opening is a large vessel of water; and at the top a place for melting lead. The lead is melted and poured into a pan with holes in the bottom, like a tin colander or sieve. The melted lead runs through and drops in little round globules which

fall down into the water. Small shot require to fall 60 to 70 feet; the largest size, 150 to 175 feet. When they reach the water they are so cold and hard as not to flatten. Some drops are long, and very often two or three run together, and some hit the sides of the tower and are flattened, so that the mass in the water is a mixture of round shot of various sizes, and irregular pieces of lead. These are dipped out and dried, and then poured upon the upper end of a long table made of several boards set inclined or "slanting," each board a little lower than the one next above it, and with a small space between the ends of the boards. The round shot roll rapidly down, leaping across the open spaces, and fall off the lower end into a box. The irregular pieces of lead, and the shot not quite round, go slower and fall into the openings, or ledge on the table and are swept off. The round shot are put into the upper drawer of a swinging box or cabinet, with sieve-bottom drawers, one above the other. The top box, No. 1, catches all the shot of one size; the next catches those one size smaller, and so on down to the bottom, where are found the finest shot, no larger than mustard seed, indeed some of them look like fine sand. The different sizes of shot are then put into cylinders with some black lead, and the cylinder revolved for 15 or 20 minutes, which polishes the surface and gives the shining black coat we see on them. They are next put in strong bags and are ready for market. It is a curious fact, that while pure lead will not run in drops, but in streams, the addition of only one pound of metallic arsenic to about 600 pounds of melted lead, makes it flow readily and fall in beautiful drops.

How to find an Unknown Number.

The following tables will enable a person to discover any unknown number not larger than 63, in the following manner: Let some one think of a number and inform you in which of the columns of the table it is contained. Then by adding the figures at the top of those columns you will have the desired number. Thus, suppose you ask a young lady of 35, to show you in which columns

1	2	4	8	16	32
3	3	5	9	17	33
5	6	6	10	18	34
7	7	7	11	19	35
9	10	12	12	20	36
11	11	13	13	21	37
13	14	14	14	22	38
15	15	15	15	23	39
17	18	20	24	24	40
19	19	21	25	25	41
21	22	22	26	26	42
23	23	23	27	27	43
25	26	25	28	28	44
27	27	29	29	29	45
29	30	30	30	30	46
31	31	31	31	31	47
33	34	36	40	48	48
35	35	37	41	49	49
37	38	38	42	50	50
39	39	39	43	51	51
41	42	44	44	52	52
43	43	45	45	53	53
45	46	46	46	54	54
47	47	47	47	55	55
49	50	52	56	56	56
51	51	51	57	57	57
53	54	54	58	58	58
55	55	55	59	59	59
57	58	60	60	60	60
59	59	61	61	61	61
61	62	62	62	62	62
63	63	63	63	63	63

her age is found. She answers, in the 1st, 2nd, and 6th. The numbers at the top, 1, 2, and 32 added, make 35.

Alphabet in one Verse.—The following contains all the letters of the alphabet, and may be used as an exercise for children in tracing their letters:

"God gives the grazing ox his meat,
And quickly hears the sheep's low cry;
But man, who tastes his finest wheat,
Should joy to lift his praises high."

No. 202. *The Silver Puzzle.*—Though not new, this will afford much amusement to those who have never seen it. Lay a ten-cent piece upon the table-cloth between two half dollars, and place a tumbler upon the larger coins, so as to cover the smaller one. The puzzle is to remove the ten-cent piece without displacing either of the half-dollars, or the glass. You are not allowed to touch the coin with the hands or anything else, nor must you blow it away.—How is it done?

No. 203. *Bible Questions.*—1. How long was the ark on Mt. Ararat? 2. Joah was the son of Zeruiah, what relation was Zeruiah to Joah.

No. 204. *Mathematical Problem.* contributed to the *American Agriculturist* by James Dickson, Olmstead Co., Minn.—Give the rule for the following: Any dividend being given, to find a divisor, which added to its quotient shall equal the dividend.

No. 205. *Illustrated Rebus.*—An acknowledged truth.

Answers to Problems and Puzzles.

The following are answers to the puzzles, etc., in the March number, p. 107. No. 196. *Charades.*—1st. "Our Mutual Friend."—2d. "The Round Table."—3d. "St. Valentine's Day"....No. 197. *Word Puzzle.*—Wheat....No. 198. *Illustrated Rebus.*—Cincinnati...No. 199. *Picture Puzzle.*—Both are pictures of the "grub" which makes the butterfly....No. 200. *Illustrated Rebus.*—Be not weary in well doing....No. 201. *Conundrum.*—The page is dun (done)....No. 188. *Arithmetical Problem.*—(Feb. No., page 67.)—A's share, 2863; B's, 6335; C's, 2438; D's, 10294; E's, 4950.

The following have sent in correct answers up to the date of March 8th. To save space, the numbers of the problems answered, are omitted: C. J. Lorah, J. S. Dobbins, James D. McGiffert, F. M. Whiting, Cross Cut, Pa., H. H. L., John K. Hallock, Henry J. Blodgett, Morris P. Wright, M. M. C., Edwin C. Woodruff, Henri W. Young, John N. Chadsey, D. Herbert Jeffery, Samuel J.

Bassford, John F. Holmes, L. V. N. P., L. M. Marston, G. Clarence Cooper, Mary E. Storm, Georgia A. Smith, Etta Smith, Annis A. Saggendorph, (a class in school, from 11 to 12 years old, answered the "Scramble" problem.) Wm. F. Sherman, D. Paul, G. T. Reeves, Mrs. Emma J. Huntling, Peter W. Teightmeyer, Edward R. Browne, Wm. C. Johnson, T. G. Lawrence, George H. Gilbert, E. A. Williams, J. S. Stiles, Fidelia E. Quin, John Slater, Kiah, Chester H. Dakin, John F. Holmes, Jas. P. McCurdy, Anthony B. Strother, C. C. Hyndman, Luman F. Parmenter, Hattie R. Quinn, John Dobell, S. P. Stewart, J. M. Jordan, Mary Agney, Zenas Condit, Joseph Taylor, James E. Eshleman, W. E. Alexander, C. Van Warner, Nelson G. Hull, D. W. Williamson, John A. Driggs, Aaron Oscar Ream, A. G. Tillinghast.

Fig. 2.—AN ENEMY IN THE CAMP.—WHERE IS HE?

THE YOUNG RUNAWAY. — Engraved for the *American Agriculturist*.

Oho, Master Lillypet! a fine time you are having; while mother and sister are running up stairs and down, and out into the garden, looking behind the currant bushes, beside the hay-stack, among the rubbish in the wagon-house, where they once found you asleep, searching in every nook and corner, even looking fearfully down the well, to see what can have become of their dear troublesome little pet—"lillypet," as he names himself, for he can not talk plain yet. How they will punish him with kisses when they find the "little mischief" sailing his shoe in the brook, thinking of the stories he has heard his father tell about ships on the ocean, and, as you can see by his face, half afraid there is something wrong in it, but sure he is having "such a nice time." Every one of our girls and boys will feel like saying, be gentle with him. His clear blue eye has no malice in it, and what a beautiful picture he makes, looking like a charming flower, over which even the stern old trees seem to bend lovingly. Such little ones are favorites not only on earth: He who coming from Heaven once lived among men, and now has returned to his home among the angels, loved children, and said "their angels do always behold the face of my Father," and He and they will love such as gently care for the lambs of His flock.

Happy will it be for every child who early learns to fully trust One who is always so loving and true.

Landed at the Wrong Place.

What boys desire to be, and to have, when they become men, can not be possessed by *wishing*; it must be *worked* for. A young man, lately from the country, passes our office almost every day. He is hoping to become a rich merchant. He is now only an entry clerk in a large store. If he will work hard enough for it, by taking care of his spending money and his spare time, he may do as hundreds have already done, become a wealthy business man. But his spare change is divided among tailors, hatters, confectioners, theatre-managers, cigar makers, and others who please his fancies and his senses. Many of his leisure moments are given to story books and papers, instead of reading that which would inform him about his business. If he keeps on this way he will not be the man he expects to become. Ten years hence will find him, perhaps a poor dandy, perhaps a ruined sot, or at best only a poor clerk. Another lad we know, goes on errands as though his boots were filled with lead. He stops to look at every showy window, and takes a scolding on his return as something which he expected. At such a rate, he will always be a poorly paid drudge.... The captain of a ship sailing for England, a few days after starting, found two men stowed away among the cargo. They had hid there to steal a passage across the Atlantic. The ship

was too far away from land to send them ashore, and the best that could be done with them was to make them work their passage. As the vessel happened to be short of hands, the captain was not sorry to have this addition to his crew; but although the men wanted to get over, the one to Ireland, where the vessel was to touch, and the other to England, they refused to work. They were punished by being put on short rations, by confinement, and various other methods, without avail. Finally, when the ship arrived at her destination they were landed where they did not want to go; the Englishman on the Irish coast, and the Irishman at Liverpool. This punishment was light, compared with that which many a thoughtless youth will receive, who starts for successful manhood, but is not willing to *work his passage*. Jails and Almshouses are full of those who started fairly on their voyage, but have landed at the wrong place.

A Curious Plaything.—Cut out a circular piece of card board, say two inches in diameter. In the middle of it insert a quill, or small tube, so that the end shall be even with the upper surface of the card. Over this lay another circular card of nearly the same size, with a pin run through, to drop into the hole. Place the quill upright in the mouth and blow off the top piece—if you can.

(Business Notices \$2.00 per Agate Line of Space.)

Every Child on the Continent should have it!
The Best Children's Paper in America.

Fighting against
Wrong, and for the
Good, the True, and
the Beautiful.

The Neatest Thing Yet.

SIX IMPLEMENTS IN ONE.

Patent Sewing Ripper Improved.

Recommended by Orange Judd.

The Patent Sewing Ripper has just been greatly improved so that it will Rip a Seam easier, quicker, and more safely than any other implement can. It cuts a button-hole of any size nicely. It is the best thing with which to Scratch Gathers. Every lady wants it for these purposes, and gentlemen as well, will find it a neat and complete Paper Cutter and Folder. A convenient Letter Opener. An excellent Eraser for removing blot and errors from writing. It is this a most useful companion for the Work Table and the Writing Desk. Price 35 cents, 3 for \$1, or \$3 for one dozen. Liberal discount by larger quantity. Will sell rapidly. Ask your storekeeper for it, or send 35 cents and receive it by mail. Address A. C. FITCH, 151 Nassau St., New York.

1,000

AGENTS

GOODYEAR I. R. GLOVE MFG CO., 205 Broadway, New-York.

MATTICE & PENFIELD'S TILE MACHINE.

This Machine has been before the Public seven years, and has been subject to the severest tests, both by use in various portions of Ohio, Indiana, and Michigan, and at the Fairs of the States, coming in competition with the best Machines ever introduced in the United States, and in every Instance where properly tested, has proved itself to be the most Practical, Durable, Labor-Saving Tile Machine, ever yet introduced.

This Machine grinds the Clay, molds and places the Tiles on the drying boards.

It is so constructed, also, that a screen can be used to catch stones, roots, &c., when desired.

It is capacitated for three revolutions per minute, Two-Horse Power, and two men to tend, one to feed the Clay, and one to set the Tile away.

When run to its full capacity, it is capable of making from ten to twelve thousand Tile per day.

For further particulars, Address J. W. PENFIELD, Willoughby, Lake Co., Ohio.

Mead's Conical Plow.

Endorsed by hundreds of practical farmers as the BEST NEW PLOW in the market; and having received from numerous New England Fairs, Plowing Matches and Exhibitions, FIRST PREMIUM AWARDS and DIPLOMAS, it is confidently commended to all farmers who desire the Best Plow. Plows or particulars may be had from the following manufacturers, for Eastern, North Eastern, and South Eastern New England: Wm. E. Barrett & Co., Providence, R. I. For Western, Central, and North Western New England, Belcher & Taylor, Agricultural Tool Co., Chicopee Falls, Mass. For South Western New England, and elsewhere SOLOMON MEAD, New Haven, Conn.

RARE and BEAUTIFUL FLOWERS.

SELECT VEGETABLES,

B. K. BLISS,

Importer and Grower of GARDEN VEGETABLE & FLOWER SEEDS, Springfield, Mass.,

Would invite attention to his large and well selected assortment of the above, comprising the newest and most approved varieties, both of European and Home Productions, the quality of which can not be surpassed.

For a List of which, see his

Illustrated Seed Catalogue and Guide to the Flower and Kitchen Garden.

The ELEVENTH EDITION, with supplement for 1896, enlarged and improved, contains upwards of ONE HUNDRED PAGES of closely printed matter, with many NEW and BEAUTIFUL ILLUSTRATIONS, and a descriptive list of upwards of TWO THOUSAND VARIETIES of FLOWER and VEGETABLE SEEDS, including many CHARMING NOVELTIES, now offered for the first time in this country, with explicit directions for their culture. Also, a list of

Upwards of One Hundred Varieties of French Hybrid Gladiolus,

embracing many new varieties not before offered, and other SUMMER FLOWERING BULBS. To which is added a list of a few of the choicest varieties of GRAPES, STRAWBERRIES, RASPBERRIES, and other SMALL FRUITS, HERBING PLANTS, etc., etc., cultivated at his gardens, with much other useful information upon the subject of Gardening generally, which will be found useful to the experienced amateur as well as those about to commence the delightful occupation of Gardening.

A copy will be mailed, post paid, to all applicants enclosing Twenty-five Cents.

RELIABLE SEEDS.

Farmers and Gardeners in want of Seeds that can be depended upon, are requested to look at our advertisements in the March No. of the Agriculturist under the following headings.

Connecticut Seed Leaf Tobacco Seed.

Be Sure and Get the Best.

A superior lot raised expressly for the subscriber by one of the most successful cultivators in the Valley of the Connecticut—Packets with full directions for culture, curing, packing, &c., will be mailed, post paid, to all applicants at the following rates: 1 ounce, 50 cents; 4 ounces, \$1.50; 1/2 pound, \$2.50; 1 pound, \$4.00. Prices to dealers in larger quantities will be given upon application. B. K. BLISS, Springfield, Mass.

ANOTHER SPLENDID NOVELTY from JAPAN.

Striped Leaved Japanese Matze.

For a full description of this beautiful Plant, with an engraving, see the March No. of the Agriculturist. The subscriber is happy to announce that he has secured the entire stock of this splendid novelty, and now offers the seeds in packets containing Twenty Seeds, at 25 cts. per packet, 5 packets for \$1. The Trade supplied upon the most liberal terms. Address B. K. BLISS, Springfield, Mass.

Lilium Auratum.

New Golden Banded Lily.

A splendid novelty from Japan, thus described by Dr. Lindley, editor of the London Gardener's Chronicle:—"If ever a flower merited the name of glorious, it is this, which stands far above all other Lilies, whether we regard its size, its sweetness, or its exquisite arrangement of color. Imagine, upon the end of a purple stem no thicker than a ramrod, and not above two feet high, a saucer-shaped flower at least ten inches in diameter, composed of six spreading, somewhat crisp parts, rolled back at their points, and having an ivory-white skin thickly strewn with purple points or studs, and oval or roundish, prominent, purple stains. To this add in the middle of each of the six parts a broad stripe of light satiny yellow, losing itself gradually in the ivory skin. Place the flower in a situation where side-light is cut off, and no direct light can reach it except from above, when the stripes acquire the appearance of gentle streamlets of Australian gold, and the reader who has not seen it may form some feeble notion of what it is. From this delicious flower there arises the perfume of orange blossoms sufficient to fill a large room, but so delicate as to respect the weakest nerves."—Strong flowering. Bulbs, mailed post-paid, to any address upon receipt of \$5.00. Address B. K. BLISS, Springfield, Mass.

New White Dielytra.

Dielytra (Dicentra) Spectabilis alba.

Another year's trial confirms what we have previously said of this charming novelty. Its delicate blossoms, graceful habit, and beautiful foliage, will cause it to become a general favorite, and no garden, however small, will be complete without it. It forms a pleasing contrast with the original variety, and as a decorative plant for the cemetery it stands unrivalled.

Strong and well rooted Pot Plants will be ready for delivery about the first of April, and will be mailed post-paid to any address in the Union upon receipt of the price. One Plant, \$1; Six Plants, \$5; Twelve Plants, \$9. A few one year old ground roots for propagation, \$3 each. Address B. K. BLISS, Springfield, Mass.

The Best and most Hardy Hedge Plant.

HONEY LOCUST, OR THREE THORNED ACACIA.

Fresh Seed with directions for culture, will be mailed to any address, at the following prices: 1 oz., 15 cents; 4 ozs., 35 cents; 1 pound, \$1.00. Prices in larger quantities will be given upon application. B. K. BLISS, Springfield, Mass.

Goodrich's Early Potatoes.

Our stock of this variety is exhausted. We still have a supply of all the other varieties advertised by us, in March No. of the Agriculturist. B. K. BLISS, Springfield, Mass.

Chicory Seed.

The Great Substitute for Coffee.

A supply of the genuine article just received by the Subscriber, and will be mailed, post-paid, to all applicants upon receipt of price affixed. Packets containing 1 ounce, 20 cts.; 8 ounces, 80 cents; 1 pound, \$1.50. Directions for culture and curing accompany each package. Address B. K. BLISS, Springfield, Mass.

NEW SEED.

Farmers! do you want New-England grown seed left at your doors as cheaply as it is sold in Boston, New-York, or Philadelphia? I have introduced my Hubbard Squash, Marblehead Mammoth Cabbage, and a score of other new vegetables to thousands of farmers, and am ready to send them to thousands more. Catalogue sent gratis to all who apply. It contains a list of nearly three hundred varieties of Garden Seed, (many of them new and rare, and not to be found in any other Catalogue,) a large portion of which are of my own growing. Never fear to order my seed, as I warrant all to reach the purchaser. Send early before the great rush comes. JAMES J. H. GREGORY, Marblehead, Mass.

Para, Turban, Hubbard, Yokohama!

As the original introducer of the Hubbard Squash, I am prepared to supply every cultivator with PURE seed. The Para is the sweetest, richest and richest of all winter squashes, and will keep till April. The Turban is the sweetest, richest and richest of all FALL squashes, and will keep till March. Many of my correspondents are extravagant in their praise of this squash—"Why will people longer raise the coarse, watery summer varieties when they can get such a squash as the Turban!" The Yokohama, a new squash from Japan, has given great satisfaction this season; it is exceedingly fine grained, very sweet, and of a peculiar marrow-like taste. The Para is a bush squash from South America, for fall and winter use; keeping till February. It resembles in quality a very fine crookneck. My seed stock came directly from Para and is PURE. All these varieties yield abundantly. Ten tons of Hubbard and eight tons of Turban have been raised to the acre.—Packets of seed of each of these varieties, sent post-paid to any address for 15 cts. Hubbard sent by the lb. for \$2.25. Turban sent by the lb. for \$3.50. JAMES J. H. GREGORY, Marblehead, Mass.

ONIONS IN HILLS.

I will send Machines for sowing Onion Seed in hills, two rows at a time, ready for transport, for \$15 each. When sown by these Machines a large crop of carrots is raised on the same ground between the hills of onions. They are extensively used by the great onion cultivators of Long Island. JAMES J. H. GREGORY, Marblehead, Mass.

FLOWER SEEDS BY MAIL.—The Subscriber

raises about one hundred kinds of Flower Seeds, selected from over one thousand varieties, of the most showy and attractive. He will furnish, neatly put up, any 33 kinds on the list for \$1, and send by mail, with postage pre-paid, to G. R. GARRETSON, Flushing, N. Y.

Philadelphia Raspberry.

Two strong plants, \$1; 12 plants, \$1; by mail. Agriculturist Strawberry, 12 strong plants, \$1.25; 100 plants, \$5. Also, GRAPE VINES, for sale by THOS. S. FLETCHER, Delaoco, Burlington Co., N. J.

STRAWBERRIES, Blackberries and Raspberries, all the best and newest varieties. Catalogues gratis. SAMUEL L. ALLEN, Chumamisson P. O., N. J.

Open Page Advertisements, \$1.50 per line of space.

Send for Catalogue. **EDWIN MARSHALL, Po'keepsie, N. Y.**

PACKER'S PATENT STUMP PULLER AND WALL BUILDER.

This Machine differs from all other machines for these purposes in its convenience for transporting Stumps, Stone, Cannon, Shafts, Castings, or any heavy weights. After having lifted them with its immense purchase, and strongly trussed frame. The combination of the arched reach with the truss, gives ample room for the load, while the wheels are of common size. The load being on 4 wheels, is easy on the team; and the machine may be worked by either oxen or horses. The superlarity of this Machine as a wall builder, makes it deserving of especial notice. The stone after being lifted out of the ground can be drawn alongside the wall to the end, and the machine turned so as to bring the load directly across the wall, in which position the heaviest stone can be deposited with ease, either at the bottom or top of the wall, and the machine may then be turned back, leaving the stone in place. For particulars, Address **PACKER & FISIL, Mystic River, Conn.**

CROFUT'S PREMIUM WEEDING HOE.

The most simple and complete Hoe for weeding Onions, Strawberries, and smaller crops, also, for various kinds of works. It is easily adjusted to any required light or angle, by means of a key, and is not liable to get out of order. Manufactured by **ARNOLD & CROSMAN,** Westport, Conn., and for sale by **A. C. ARNOLD,** Norwalk, Conn., **J. VANDERBILT,** 23 Fulton-st., New York, and **R. H. ALLEN & CO.,** 189 Water-st., New York.

MEAD'S PATENT CONICAL PLOW.

The Conical is undoubtedly the best Plow for all kinds of work, that has ever been offered to the Public, and we are now prepared to furnish them to Farmers and the Trade at same prices that much poorer ones are offered, and warrant them in every particular. Send for a Price List. **W. E. BARRETT & CO.,** Providence, R. I.

HORSE HOES.

We also manufacture Shares Patent Horse Hoes for the N. E. States. One season's trial will convince any Farmer that this is well worth the price of ten for working among Corn, Potatoes, and Root Crops. Send for Circular. **W. E. BARRETT & CO.,** Providence, R. I.

CLEMENT'S ARTIFICIAL LEG.

Harrisburg, Pa., January 24, 1865.
Richard Clement, Esq.:
Dear Sir—Your limb sent me has been received, and fits perfectly. I am satisfied that it is a good job. Many here wearing other limbs, strongly intimate, seeing this one, getting substitutes from you. I am dancing about on my pins as brisk as ever. Grateful for the service you have rendered me, I remain, Truly yours, **GEORGE W. ROBERTS,** Fiftieth Co., Second Battalion, V. B. Corps. **CLEMENT'S NEW PATENT ARTIFICIAL LEGS** accurately adjusted at his Branch Office, at Marsh & Co.'s Radical Cure Truss Office, 2 Vesey-st., Astor House, New York, and **S. N. Marsh, Corlies & Co.,** 3 West Fourth-st., Cincinnati, opposite the High Steeple.

THE CHARTER OAK CO., Guarantees Annual Dividends of 25 to 30 per cent. NO OTHER COMPANY DOES THIS.

The Charter Oak Life Ins. Co.

Commenced business in October, 1850, and has been remarkably successful. It has issued over 19,000 policies, covering insurances to the amount of over \$49,000,000. It has paid losses to the families of about 500 of its policy-holders, and in the amount of \$1,000,000, and in no instance has a claim been litigated. The editor of "The Insurance Monitor and Wall-St Review," says in the January, 1866, issue of that Journal, in regard to the losses paid by this company:

"And all this has been done freely, without delay or the litigation of a single claim by the company. No orphan, no widow has thereby had her sensibility wounded afresh, or poignancy added to her sorrow by being compelled to dispute and wrangle for her rights.

"This conduct does honor to the heart and speaks volumes in favor of the liberal policy of the officers of the "Charter Oak." They could not have adopted a better or wiser course. What man is there who would not prefer to invest his savings in such a company as theirs, which, he is assured, will put his heirs to no needless trouble or expense, and scorn to avail itself of any quibble in order to evade the payment of the fruit of his hard earnings to those he may leave otherwise unprovided for, and desolate."

Extraordinary Security

Is offered by the Charter Oak Co., as its well-invested capital of \$200,000, is pledged to the insured, in case of unusual mortality or other causes, producing severe losses. The Stockholders and Directors thus have a great interest in the proper management of the company, while the insured have all the benefits of a solely mutual company, being entitled to all the profits of the "With Profits," (or Mutual) Department, while the Stockholders can only receive eight per cent. dividends on the capital stock.

The Annual Dividend Plan,

WHICH ORIGINATED WITH THE CHARTER OAK CO., IS THE GREAT POPULAR FEATURE of Life Insurance at the present time. By this plan the insured receives a Dividend at the second payment of premium, while in most Companies no dividends are paid until the FIFTH PREMIUM IS DUE. THE CHARTER OAK CO. has already paid two dividends upon the annual plan, viz: those of April 1st, 1864,

The following are the Agents for the principal cities not mentioned in the General Agents list:

J. T. POMPILLY, Agent for New York, office 151 Broadway.
 ARTHUR MERRILL, Agent for Boston, office 27 State-st.
 S. W. T. HOPPER, Agent for Baltimore, office 69 Second-st.
 HILLIARD BROTHERS, Agents for Phila., office 419 Walnut-st.

THE CHARTER OAK LIFE INSURANCE CO.,

ORIGINATED THE SYSTEM OF ANNUAL DIVIDENDS to the insured, and has already paid two dividends upon that plan.

No other Life Insurance Company has yet PAID LIFE DIVIDENDS. But it is the only just course to the assured.

and 1865. In connection with this system, this Company has combined the Tri-ennial dividend plan, by which every three years the accumulated surplus is distributed to the insured. At the time of the declaration of the triennial dividend, a much larger distribution of surplus is made, than could be prudently made annually. Those who insure at any time before the 31st of March, 1867, will participate in the Tri-ennial Dividend of April 1st, 1867!

Insure This Year,

and at the second payment of premium, you will receive the largest Dividend ever yet paid by any Life Insurance Co., to those insured for a single year. The success of The Charter Oak Co., and its excellent condition, warrant this statement. Other companies have promised to pay annual dividends, and doubtless will ere long, but THE CHARTER OAK IS THE ONLY COMPANY WHICH HAS PAID SUCH DIVIDENDS.

The State Reports,

which are made annually to the Insurance Commissioners of New York and Massachusetts, show that in all the features, which constitute a safe, and every way excellent Life Insurance Co., THE CHARTER OAK stands in the first rank, and the public are most cheerfully referred to those standard reports, for proof of the assertions herein made.

The Tables of Rates,

adopted by this Company, are upon the several plans now in use, and are as low as is consistent with prudent management. Among the tables are the following. FOR POLICIES PAYABLE AT DEATH. Premiums payable annually during life. Premiums payable annually for ten years, (no payments required after ten years.) FOR POLICIES PAYABLE ON ARRIVING AT A CERTAIN AGE, OR SOONER IN CASE OF DEATH BEFORE THAT AGE IS ATTAINED. Premiums payable annually, during the continuance of the Policy. Premiums payable annually for ten years. These are the chief tables, but others are given in the books of the Company.

Life Insurance is an Investment,

of the safest and most profitable description. The man who holds a Life Insurance Policy for \$5000, has just as good property to leave to his family, as he who owns stocks or land of equal amount, for it is an absolute representative of cash due at a fixed

The General Agents

of this Company are comprised in the following list: A. M. WARD, General Agent for State of New York. Utica, N. Y.

N. B. STEVENS, General Agent for Connecticut, Rhode Island, and Western Massachusetts. Hartford, Conn.

J. W. GODFREY & BRO., General Agents for Missouri and Indiana. St. Louis, Mo.

WM. H. WELLS, General Agent for Illinois. Chicago, Ill.

J. M. SCOFIELD, General Agent for Mass., East of Conn. River. Worcester, Mass.

H. P. COON, General Agent for California. San Francisco, Cal.

HAYDEN & DOUGLAS, General Agents for Ohio. Cincinnati, O.

SPRAGUE & TREDWAY, General Agents for Wisconsin and Iowa. Madison, Wis.

LON WESTON, General Agent for N. Hampshire and Vermont. Concord, N. H.

S. H. McALPINE, General Agent for Maine. Portland, Me.

L. N. CLARK, General Agent for Michigan. Detroit, Mich.

E. H. BERRY, General Agent for Minnesota. St. Paul, Minn.

F. E. GOODELL, General Agent for Western Pennsylvania. Pittsburg, Penn.

E. H. BLAIR, General Agent for Eastern Pennsylvania. Reading, Penn.

time, or at the death of the person insured by it.

The safety of Life Insurance Companies is too well known to require any proof. It is enough to say they are safest financial institutions in the world.

As a Profitable Investment,

Life Insurance presents many advantages. It is certain to return the amount of premiums paid with a good rate of interest, even to those who live to a good old age, while to those who fall short of the "term of expectation," there is a very large gain above premiums and interest thereon.

To Persons having Small Incomes,

which leave some surplus, but not enough to use in profitable investments, Life Insurance affords a most valuable aid. A man thirty-two years of age, who can lay aside but a little over fifty dollars a year, can make sure of \$4,000 as a legacy to his family, or of about the same amount for his own use on arriving at the age of sixty-five years. A Life Insurance Co., which will not require more than fifty dollars cash for premium of such policies as above named, will make investments of the same for the insured, and ensure him good returns.

Life Insurance is Valuable to All.

Large numbers of the "merchant princes" of our large cities have effected insurances of considerable amounts for their families, for they are well aware that their wealth, which depends so much upon their own continuance in life and health, and upon absence of financial panics, is not unlikely to be swept away in time of pestilence, or crises like those of 1837 or 1857. In such cases the avails of Life Insurance Policies would become the entire dependence of families unused to labor. Tens of thousands of all classes among the sober and prudent have become Policy holders in the Life Insurance companies, whose annual receipts and gross assets, rival those of the Fire Insurance companies of the country. The time is rapidly approaching when neglect to insure one's life, will be deemed ample proof of the lack of ordinary prudence.

Information,

concerning this company, its plans, rates, etc., may be obtained by addressing any of the agents named in the above lists. The general agents of the Company will also receive applications for local or traveling agencies in their respective localities. Men of good address and character are wanted for such positions in all the States named in the General Agent's list, and such will find The Charter Oak Co. a most desirable one for which to work.

AGRICULTURAL, HORTICULTURAL, AND HOUSEHOLD BOOKS,

PUBLISHED BY

ORANGE JUDD & COMPANY.

41 PARK ROW, NEW-YORK.

American Bird Fancier, Paper, \$ 30
Containing full directions with reference to the breeding, rearing, feeding, management, and peculiarities of Field, Cage, and House-Birds, etc. By D. T. BROWSE. 12mo, 107 pp.

American Farm Book, 1 50
OR A COMPEND OF AMERICAN AGRICULTURE; Being a Practical Treatise on Soils, Manures, Draining, Irrigation, Grasses, Grain, Roots, Fruits, Cotton, Tobacco, Sugar Cane, Rice, and every staple product of the United States; with the best methods of Planting, Cultivating, and Preparation for Market. Over one hundred Engravings. By R. L. ALLEN. Cloth, 12mo, 325 pp.

American Weeds and Useful Plants, 1 75
An Important Work for every Cultivator, Farmer, Gardener, etc.: being an Enumeration and Description (with accurate illustrations) of the WEEDS and PLANTS found in American Fields and Gardens, which meet the observation, or require the attention of Cultivators, with practical suggestions for their Eradication when needed. While practical in its character, it includes both the common and botanical names, and characters of the Weeds and Plants, with a Popular Account of the Structure of Plants. By WM. DARLINGTON, M. D., and PROF. GEORGE THORACA. Illustrated with 277 Engravings. 12mo, 499 pp.

Breck's New Book of Flowers, (In Press), 1 50
In which are described the various Hardy Herbaceous Flowers, Annuals, and Shrubby Plants, with Directions for their cultivation. By JOSEPH BRECK, former Editor of The Horticultural Register. Cloth, 12mo.

Buist's American Flower-Garden Directory, 1 50
Containing Practical Directions for the Culture of Plants in the Flower Garden, Hot-House, Green House, Rooms, or Parlor-Windows. FOR EVERY MONTH IN THE YEAR; with descriptions of most desirable Plants, soils, transplanting, erecting a Hot-House, a Green-House, laying out a Flower Garden, etc. By ROBERT BUIST, of Philadelphia. Cloth, 12 mo, 342 pp.

Buist's Family Kitchen Gardener, 1 00
An excellent Practical work, containing Plain and Accurate Descriptions of all the Different Species and Varieties of Culinary Vegetables, with their Botanical, English, French, and German names, alphabetically arranged; with full Directions for the best Mode of Cultivating them in the Garden or under Glass. By ROBERT BUIST. Cloth, 12mo, 216 pp.

Dadd's Modern Horse Doctor, 1 50
CONTAINING PRACTICAL OBSERVATIONS ON THE CAUSES, NATURE, AND TREATMENT OF DISEASES AND Lameness of Horses; embracing the most recent and approved Methods, according to an enlightened System of Veterinary Practice, for Preservation and Restoration of Health. Illustrated. By GEO. H. DADD, Veterinary Surgeon. Cloth, 12mo, 432 pp.

Dadd's Anatomy and Physiology of the Horse, 3 50
A VERY LARGE OCTAVO, CONTAINING TWENTY FULL-PAGE ANATOMICAL ILLUSTRATIONS; with Instructions in Dissections, and mode of making Anatomical Preparations, and a Glossary of Veterinary Technicalities, Toxicological Chart, and Dictionary of Veterinary Science.

Dadd's American Cattle Doctor, 1 50
A work giving the necessary information for preserving the Health and Curing the Diseases of OXEN, COWS, SHEEP, and SWINE, with a great variety of original Recipes, and valuable Information on Farm and Dairy Management. By Geo. H. DADD. 12 mo. 3:9 pp.

Downing's Landscape Gardening and Rural Architecture, 6 50
The most complete and valuable work ever issued on Landscape Gardening in North America, for the Improvement of Country Residences, containing full directions for every thing connected with Laying out and adorning the Rural

Home, the Grounds, the Gardens, the Buildings, the Trees and Plants, etc., with principles of taste so stated as to adapt the work to all classes. Splendidly Illustrated with many Steel and fine Wood Engravings, and a new and excellent portrait of the Author on STEEL. By the late A. J. DOWNING. Enlarged, Newly Illustrated and Revised, with Supplement, by HENRY WINTROP SARGENT. Octavo, 534 pp. Extra cloth, gilt, beveled boards.

French's Farm Drainage, 1 50
The Principles, Process, and Effects of Draining Land with Stones, Wood, Drain-Plows, Open Ditches, and especially with Tiles; including Tables of Rainfall, Evaporation, Filtration, Excavation, Capacity of Pipes, cost and number to the acre. With over 100 illustrations. The best work on Draining published. By Judge FRENCH, of New Hampshire, President of Mass. Agricultural College. Cloth, 12 mo, 381 pp.

Fuller's Grape Culturist, 1 50
This is the latest and most practical work issued on the Culture of the Hardy Grapes, with full directions for all departments of Propagation, Culture, etc., with one hundred and five excellent engravings, illustrating the various operations of Planting, Training, Grafting, etc. By ANDREW S. FULLER, Practical Horticulturist. Cloth, 12mo, 262 pp.

Fuller's Illustrated Strawberry Culturist, paper, 20
A new, practical little work, meeting with universal favor. It gives a full list of varieties, down to the latest valuable seedlings. 12mo, 48pp.

Herbert's Hints to Horse-Keeper, 1 75
This is the best practical work on the Horse prepared in this country. A COMPLETE MANUAL for HORSEMEN, embracing: How to Breed a Horse; How to Buy a Horse; How to Break a Horse; How to Use a Horse; How to Feed a Horse; How to Physic a Horse (Allopathy or Homeopathy); How to Groom a Horse; How to Drive a Horse; How to Ride a Horse, etc., and Chapters on MULES and PONIES, etc. By the late HENRY WILLIAM HERBERT (Frank Forster). Beautifully Illustrated throughout. Cloth, 12mo, 4:5 pp.

Hop Culture, paper, 40
PRACTICAL DETAILS fully given from the Selection and Preparation of the SOIL, SETTING and CULTIVATION of the Plants, to PICKING, DRYING, PRESSING, and MARKETING the Crop. Plain Directions by Ten Experienced Cultivators. Illustrated with over forty engravings. Edited by PROF. GEORGE TAUBER, Editor of the American Agriculturist. 8vo, paper.

Onions: How to Raise them Profitably, 20
Being the Practical Details, from Selection of Seed and Preparation of Ground to Harvesting and Marketing the Crop, given very plainly by Seventeen Practical Onion Growers of long experience, residing in different parts of the country. No more valuable work on this subject was ever issued. Octavo, 62 pp. Neat paper covers.

Quinby's Mysteries of Bee-Keeping Explained, 1 75
Newly written throughout, containing the results of thirty-five years of successful experience, with full, plain, and practical Directions for all details of Bee Culture; including also a Description of and the Manner of Using the Movable Comb and Box-Hives, with the most approved modes of Propagation and Treating the Italian Bee, etc., etc., with numerous illustrations. By M. QUINBY, Practical Bee-keeper.

WHAT THE PRESS SAYS OF IT.
"This treatise is from the pen of a practical bee-keeper, and the subject is treated in a most thorough manner."—Philadelphia Inquirer.
"With its curious, minute and trustworthy information about this wonderful little worker, it is an entertaining book for those even who are afraid of bees, and only love the honey."—Hartford Press.

"The text is furnished with abundant illustrations, and the work is systematic, comprehensive, and valuable. Mr. Quinby says a few square miles in his vicinity have, in some favorable seasons, furnished for market over 20,000 lbs. of surplus honey. He has endeavored to be practical, rather than scientific; preferring that the merits of the book should be in its simplicity and reliability."—Salem Register.

Randall's Sheep Husbandry, 1 50
With an account of the different Breeds of Sheep; Selecting the Best for Wool and for Mutton; Rules for Crossing; Practical Details for Rearing; Summer and Winter Management; Treating Diseases; with New Chapters by Henry S. Randall and G. W. Keidall on Sheep Husbandry in Texas, with Portraits of different Breeds, Illustrations of Sheep Folds, and other Articles in Sheep Husbandry. Octavo, 333 pp.

Saunders's Domestic Poultry, 60
A New Practical Treatise on the Preferable Breeds of Farm-Yard Poultry, their History and Leading Characteristics; with Complete Instructions for Breeding and Fattening, including Preparing for Exhibition at Poultry Shows, etc. Very fully illustrated. By SIMON M. SAUNDERS. 12mo, 104 pp. Paper, 30c.; cloth, 60c.

Skillful Housewife, 75
Or, Complete Guide to Domestic Cookery, Taste, Comfort, and Economy, embracing 659 Recipes, with many valuable hints pertaining to household duties, the care of health, Education of Children, Gardening, Birds, etc. By Mrs. L. G. ABELL. Cloth, 12mo, 216 pp.

Tobacco Culture; Full Practical Details, 25
This is by far the most useful and valuable work ever issued on this subject. It contains full details of every process from the Selection and Preparation of the Seed and Soil, to the Harvesting, Curing, and Marketing the Crop, with Illustrative Engravings of the operations. The work was prepared by Fourteen Experienced Tobacco Growers, residing in different parts of the country. It also contains Notes on the Tobacco Worm, with Illustrations. Octavo, 48 pp., in neat paper covers.

Todd's Young Farmer's Manual and Work-Shop, 1 50
The most valuable and practical work before the public as a guide to the various Farm Operations, including the mechanical part of agriculture, farm implements, edge tools, and how to put them in order, fencing, gates, building, etc., etc. By S. EDWARDS TODD, a practical farmer. Thoroughly illustrated with engravings. Cloth, 12mo, 4:9 pp.

Warder's Hedges and Evergreens, 1 50
This is the only book wholly devoted to the cultivation, pruning, and management of plants suitable for American hedging, especially the Macura, or OSAGE ORANGE; illustrated with engravings of plants, implements and processes; to which is added a Treatise on Evergreens, their varieties, propagation, culture, etc. By J. A. WARDER. 12mo, 291 pp.

Mayhew's Practical Book-Keeping, 90
Embracing SINGLE and DOUBLE ENTRY, Commercial Calculations, and the Philosophy and Morals of Business.
"Deliver all things in number and weight, and put all in writing that thou givest out or receivest in."—Ecclesiasticus xlii, 7.

By IRA MAYHEW, A. M., Author of "Means and Ends of Universal Education."
This is the best book for general use on Book-Keeping that we have ever examined. Boston, Published by Samuel F. Nichols.

Mayhew's Blanks to Book-Keeping, 1 20
A complete set of six Account Books, carefully prepared, to accompany The Practical Book-keeping, of sufficient size for entering all the Examples for Practice contained in that work.

RENO OIL AND LAND COMPANY.

GEORGE H. REA, Esq., ST. LOUIS, MO.
President of Second National Bank of St. Louis.

TRUSTEES OF THE FUND.

Hon. **JOHN J. CISCO**, New York City, of John J. Cisco & Son, Bankers, and late Assistant Treasurer of the United States at New York.
DENNING DUER, Esq., New York City, of James G. King's Sons, Bankers.

The estates of the Reno Company consist of TWELVE HUNDRED ACRES of valuable territory IN THE HEART OF THE OIL REGION OF PENNSYLVANIA. They were selected by Hon. CHARLES V. CULVER, the present Representative in Congress from the Venango district, Pa., and the senior member of the Banking House of CULVER, PENN & Co., New York City. He purchased the lands some years since, being convinced of THEIR GREAT VALUE AS OIL TERRITORY, and as the site best adapted for building the great central commercial town of the oil regions.

Believing the property to be of immense value, and yet unwilling to place a stock upon the market which might involve even the possibility of loss to stockholders, it has been determined to issue a

GUARANTEED STOCK.

The subscriber to the stock pays one hundred and five dollars for each share. Of this, one hundred dollars will be placed in the hands of Trustees, for deposit in the UNITED STATES TREASURY, or invested in GOVERNMENT SECURITIES, thus to be held as a pledge for the redemption of the stock; and five dollars will be placed in the Treasury of the Company as a contribution to the working fund. Five dollars on each share make

The Working Fund \$500,000,

the largest of any Company ever organized, and sufficient to develop the entire territory. It gives an assurance of success that has never been afforded to the stockholders of any other Company.

Hon. JOHN J. Cisco, the late Assistant United States Treasurer at New York, and DENNING DUER, Esq., both

prominent and well-known Bankers and gentlemen of the highest character and position, have been selected by the Directors as Trustees of the Fund. They hold the money thus deposited and invested, to be returned, if called for by the Stockholders, at any time. It remains in the hands of the Trustees until the stockholder shall have received in dividends from the earnings of the Company the full par value of the stock—that is, one hundred dollars for each share. It will then have proved its great value, having paid for itself once, and will need no further guarantee. The stockholder will continue to own his stock, only without the guarantee for its redemption.

Stock Always Redeemable at Par.

It will be seen that the return on demand of one hundred dollars for each share of the stock sold is secured beyond a contingency, and that the risk of the stockholder is confined entirely to the five dollars paid by him on each share of his stock, and the use of his capital until he sees fit to withdraw it. He receives, however, all the dividends declared while he holds his stock, and enjoys all his rights and privileges as a stockholder.

The Property of the Company.

The property of the Company is situated at Reno, upon the right bank of the Alleghany river, in Venango County, Penn., in the centre of the oil district in that State. It embraces **Twelve Hundred Acres of Land, and includes the site of the town of Reno,** together with all the buildings and improvements thereon; all the wells upon the property producing and being sunk; all the structures, fixtures, engines, machinery, tools, and personal property of every description connected with the premises.

The lands extend back from the river, nearly two miles, including, for the whole distance, the valley of Shaffer creek and its tributaries, and, for the greater part of the distance, the valley of Bannon run, making about **Four Miles of Boring Territory,** producing every feature of oil lands—hill, stream, low land, and ravine.

Reno has a front upon the Alleghany river of eight thousand feet—a little more than a mile and a half. This frontage is of great value, as the channel is deep, and steamboats can lie along the entire length.

No Reno Well has Failed to Yield Oil.

A few test wells have been sunk in different parts of the estate, with uniform and encouraging results. **Not a Well has been sunk which has not produced Oil in Paying Quantities,** yielding a permanent and a steady supply of a superior quality, while in some of the most productive localities in the oil region scores of wells have been sunk without the smallest show of success.

The Revenue Commission, in its report to the Treasury Department, February, 1866, showed that there were 197 oil farms in Venango county. But four farms report every well producing, and of these four the largest number of wells is on the Reno property. There is room on the Reno estate for

ONE THOUSAND WELLS,

without interfering with each other.

One hundred wells, yielding only ten barrels a day each, at six dollars a barrel—a price much below the average price of oil at RENO—would give one million eight hundred thousand dollars a year of income, making a net profit of probably fifteen per cent. over all expenses and taxes of every kind. If large flowing wells should be found, A SINGLE ACRE OF THE TERRITORY MAY YIELD THE ENTIRE CAPITAL WITHIN TWO YEARS. The Company has contracted for putting down fifty wells, and the work is already commenced. It is the intention to sink **Three Hundred Wells,** as soon as practicable, or as many as may be necessary to fully develop the property.

The Company is subject to no rental. It is the absolute owner of the property, and receives the entire product of its wells.

Another Mode of Selling the Stock.

By the payment of ten dollars, any person may have a share of stock put aside for him until April 1st, 1867. At any time before that day, he may procure a full-paid share of guaranteed stock, by the payment of an additional sum of one hundred dollars. This "option," or right, enables the purchaser to await further developments of the Company before investing the amount required to purchase full-paid shares. He may have his money otherwise invested, or so placed that he can not readily realize, and a year's time will give him the opportunity. The options may rise in value, and become as marketable as any other stock. The option aids in the development of the property of the Company, as one half of the price is placed in the Working Fund. The purchasers of these options will be enabled to use their means for an entire year, and yet retain the right to take the stock by paying par for it, even though within the time it may be worth two hundred dollars per share.

The dividends of the Company are to be made semi-annually, in the months of May and November of each year. The first dividend day will be the third Wednesday of November next. If the property is rapidly earning money, the holders of options can, if they desire, before that date, pay for the stock and secure the first dividend, or they can wait the result of the development until the first day of April following, before deciding to take the stock.

In addition to the oil lands, the company owns the

Thriving Town of Reno,

with its lots, leases, water fronts, etc. They are now being sold and leased for business purposes and dwellings. The entire property belongs to the stockholders. They will receive the large revenue to be derived from the sale.

The sale of intoxicating liquors is prohibited in all contracts for lots sold by the Company. Oil refining and oil mining are not permitted within the built-up district. The natural scenery is pleasant and unsurpassed. There are springs of fresh water in the hills beyond the town, abundant for all the domestic purposes of the people. Streets are graded, and sidewalks will be built. Sites have been set apart for churches, public schools, municipal buildings, and parks. A liberal endowment has already been made for a public school of high character.

The water front is so much in demand, that portions of it have already been sold at the rate of more than a half million dollars for the whole. The landing is the best on the Upper Alleghany. The town is the terminus of the Reno Oil Creek and Pithole Railway. It is one of the principal stations on the Atlantic and Great Western Railway, and in a year will be the intersecting point of several other roads now being built. A large and increasing business now centres at RENO, and it must become the METROPOLIS OF PETROLEUM, as Chicago has become the metropolis of grain, Reading of coal, New Orleans of sugar and cotton, and San Francisco of gold.

The Reno stock is virtually

A Legal-Tender Oil Stock.

It becomes one of the safest investments in the market. No panic, no effect of fire, flood, war, or change, can diminish its value. So long as the Government's Treasury is sacred, so long as the Government's securities represent the honor and the wealth of America, so long will Reno stock be the SAFEST INVESTMENT IN THE WORLD. Every stockholder not only has the security of his capital, but the chance of participating in the most successful business of this generation, and receiving immense profits. No other American stock has so many elements of profit and security. The guarantee of the trustees makes each stockholder's money sure as a deposit. The certainty of petroleum being in the Reno lands makes the money safe as a business. The right of immediate redemption makes the stock convenient as a legal-tender. The absolute ownership of the lands, of the wells, the river, wharfage and railroad privileges, together with the town, gives every stockholder an interest that MUST BECOME MORE AND MORE VALUABLE EVERY YEAR. IT IS IN REALITY A NATIONAL PETROLEUM STOCK, AND MUST TAKE ITS PLACE IN THE MARKETS OF THE WORLD WITH THE BEST AMERICAN AND FOREIGN SECURITIES.

Subscriptions will be received by agents, and by the principal banks and bankers throughout the country. Prospectuses and other information will be furnished by agents, and by

SAMUEL T. HOWARD, Subscription Agent, No. 21 Nassau St., New York.

Subscriptions will also be received by HENRY A. SMYTHIE, Esq., at the CENTRAL NATIONAL BANK, New York; Messrs. WINSLOW, LANIER & CO., Bankers, No. 52 Wall street; and Messrs. CULVER, PENN & CO., Bankers, No. 19 Nassau street, New York.

TO FARMERS.

Poudrette! Poudrette!

80,000 Barrels of Lodi Poudrette

For sale in lots to suit purchasers. This Poudrette has been on the market for 26 years, and has held its place among all other fertilizers as the **Best and Cheapest**, being sold for \$40 per ton less than other fertilizers, with just as good results. It is manufactured from the night soil of New York City, which the subscribers have the exclusive contract for removing to their works. Its chief recommendations are its economy, the quick growth it gives to the plant, ripening a crop from two to three weeks earlier, and an increased yield of 50 to 100 per cent. It is used most extensively upon Corn, Tobacco, Potatoes, and Garden Vegetables. Is perfectly inodorous, harmless to vegetation, can be applied directly to the seed without injury, and yet is as powerful as Peruvian Guano, and unlike Guano, does not leave the soil in an exhausted condition. A pamphlet with the experience in its use of several hundred farmers in different parts of the United States, some of them having used it for over 20 years, will be sent to any person applying to our address.

Price—\$2.00 per Barrel of four Bushels. Address THE LODI MANUFACTURING COMPANY, 66 Courtlandt-st., New-York.

Sayer's Patent Horse Hoe.

This is the latest invention, and best HORSE HOE in the market. Sold at GRIFFING & CO.'S Agricultural Implement and Seed Warehouse, 53 & 60 Courtlandt-st., New York.

THE CELEBRATED MOHAWK VALLEY Steel Clipper Plows.—The best in the market. GRIFFING & CO., 53 & 60 Courtlandt-st., New York.

Garden Work for Spring, and for Every Season of the Year. A vast Amount of Rural Information. ONE HUNDRED AND THIRTY ENGRAVINGS. Price only 30 cents, by mail post-paid. LUTHER TUCKER & SON, Cultivator Office, Albany, N. Y.

FLORENCE SEWING MACHINES.

505 Broadway, New-York.

HIGHEST PREMIUM FAIR AMERICAN INSTITUTE, 1865, (Gold Medal). Report of Committee of Awards:

REASONS.

- 1st.—Its simplicity and great range of Work.
- 2nd.—Its making four different Stitches, viz.: The Lock, Knot, Double Lock and Double Knot.
- 3d.—The Reversible Feed Motion, operated by simply turning a Thumb Screw, enabling the operator to run the Work to the Right or to the Left, and convenience of Self-fastening the ends of Seams.
- 4th.—The perfect finish and substantial manner in which the Machine is made.
- 5th.—The Rapidity of its Working, and the Quality of the Work done.
- 6th.—Its Self-adjusting Tension.

THE IMPROVED ELLIPTIC

LOCKSTITCH SEWING MACHINE

IS UNEQUALLED FOR SIMPLICITY, SPEED, EASE OF OPERATION, QUIETNESS OF MOTION, RANGE OF WORK.

Its attachments for Hemming, Braiding, Binding, Cording, Quilting, and for Sewing on Trimmings of any width, are unrivaled for simplicity of adjustment and perfection of work. Liberal discounts to Shippers. A. H. SUPLEE, 531 Broadway, New York.

THE "HOWE" SEWING MACHINE

For Families and Manufacturers.

For some years I have been actively engaged in increasing the facilities for manufacturing my Sewing Machine, and have succeeded in organizing a most complete system, combining perfection of workmanship with the largest production at the smallest cost. In order to obtain these results, time, labor, money, and the experience of my life as a practical mechanic have been freely contributed, and I believe, with success. Further to facilitate manufacture and sale of my machine, "The Howe Machine Co." has been organized, and the business will be carried on in the name of that Company under my supervision. I shall endeavor to sustain and do nothing to imperil the reputation already achieved. The enviable reputation of my machine has induced persons to use my name in connection with machines of an inferior description, and I have, therefore, to protect myself and the public, adopted as an especial Trade Mark a medallion, having in the centre the profile of the inventor surrounded by the legend "ELIAS HOWE, JR., INVENTOR and maker, New York, U. S. A." This medallion is embedded in each machine, and none are the productions of myself or the "Howe Machine Co.," unless they bear this distinguishing trade mark.

ELIAS HOWE, JR.

The HOWE SEWING MACHINES are celebrated for doing the best work, using a much smaller needle for the same thread than any other machine, and by the introduction of the most approved machinery, we have so increased the production of machines and perfected the parts, that we are now able to meet all demands, and supply the very best machines in the world. These machines are made at our new and spacious Factory at Bridgeport, Conn., under the immediate supervision of the President of the Company, ELIAS HOWE, JR., the original inventor of the Sewing Machine. THE HOWE MACHINE CO., 629 Broadway, New York.

Lane's Purchasing Agency, 151 Nassau-st., New York.

Iona and Israella Vines, \$18 per dozen. The choicest Stock of Seeds, Vines and Plants constantly on hand. Orders carefully packed and sent by mail or Express.

IMPORTANT TO AGENTS.

AGENTS WANTED in every town throughout the land, to sell my new and popular MAPS and CHARTS. This is a rare chance for all out of employment to procure a pleasant and profitable occupation. I have the best assortment of Maps and Charts for traveling agents published in the United States. My Agents are making from five dollars to twenty dollars per day selling my Lincoln, Johnson, and Our Patriots' Charts. Send for a Catalogue giving full particulars. Address

Successor to PHELPS & WATSON, 16 Beekman-st., N. Y.

DOTY'S

CLOTHES WASHER,

THE MOST POPULAR, BEST, AND

Cheapest Washing Machine

EVER INVENTED.

It is easy to operate, sitting or standing; takes but little room; injures no garments; finishes its work in from two to four minutes; is durable, convenient, and the only Washing Machine ever known that is LIKED THE BETTER, THE LONGER IT IS USED.

Recommended as the Very Best by Solon Robinson, Orange Judd, Prof. Youmans, and many other prominent men.

At the Great Fair of the American Institute, Oct., 1865, where all the principal Washers in the country were ably represented, it was awarded the FIRST PREMIUM.

On receipt of \$20 from places where no one is selling, we will send the Washer and the famous Universal Clothes Wringer, (and pay the freight if within 200 miles of New York.) The Washer alone will be sent for \$12. Wholesale Terms Circular sent free. Exclusive right of sale given to the first responsible applicant from each town.

R. C. BROWING, General Agent, 32 Courtlandt-st., N. Y. (Opposite Merchants Hotel.)

The Universal Clothes Wringer WITH COG WHEELS

Has again taken the first premium at the great Fair of the American Institute; also at the State Fairs of New York, Vermont, Pennsylvania, New Jersey, Ohio, Indiana, Kentucky, Michigan, Illinois, and Iowa.

Over two hundred thousand have been sold, and every purchaser will testify that they save their cost in clothing every year, besides saving half the labor of wringing. Send for Wholesale and Retail Terms Circular.

R. C. BROWING, Genl. Agent, 32 Courtlandt-st., (opposite Merchants Hotel), N. Y.

CHALLENGE WASHING MACHINE.

Warranted to Wash EASIER, QUICKER AND BETTER, and with LESS WEAR to the clothes than any other machine of process.

WARRANTED to wash SIX SHIRTS in SEVEN MINUTES, FOUR SHEETS in FOUR MINUTES, and other clothes in proportion.

Weights but 30 lbs. Costs but \$7 to \$9. Sample machines sent on receipt of price, and money re- funded if they fail to give

ENTIRE SATISFACTION. Six Machines sent to one address for the price of five.

Challenge Wringer and Mangle,

OR IRONING MACHINE IN ONE. A PERFECT WRINGER.—Self-adjusting—Malleable iron frame—White Rolls, and a

Perfect Ironing Machine for Ironing WITHOUT HEAT, and as quickly as the articles would be run through a Wringer.

AGENTS WANTED everywhere. Send enclosing Stamp for Circular, giving 1000 references and full description.

**NEW DWARF ARBOR VITÆ.
TOM THUMB.**

A new dwarf variety of the AMERICAN ARBOR VITÆ, originated on our grounds a few years ago; remarkable for its slow growth and compact symmetrical habit.

We have no hesitation in recommending it as an acquisition of much value in the class of small hardy Evergreens, for the decoration of Gardens, Lawns or Cemeteries, where large trees may not be admissible.

The above cut is a portrait of a specimen five years old, 15 inches in height, and 18 inches broad, drawn from nature by Mr. Geo. Frauenberger, of this city. We now offer it for sale for the first time, at the following prices:

Large Plants, 12 to 18 inches high, and about the same in breadth\$3 each.
Smaller Plants, say 6 to 8 inches, strong and well rooted, \$2 each; \$18 per dozen.

**ELLWANGER & BARRY, Mount Hope Nurseries,
ROCHESTER, N. Y.**

FOREST TREES.

A new and much improved edition of Michaux & Nuttall's "North American Sylva," complete in 5 Imperial Octavo volumes, with 277 beautifully Colored plates, true to nature, accompanied with letterpress description of all our "North American Forest Trees." The most elegant and scientific work ever published on this subject. Experienced Agents wanted to sell valuable illustrated works in all parts of the United States.
Address RICE, RUTTER & CO.,
525 Minor-st., Philadelphia.

**First Class Osage Orange
Hedge Plants,**

Wholesale and Retail. Fruit Trees, Evergreens, Shade Trees, large and small sizes, Wilson's Early Blackberry, Dahlias, Gladioli, Tuberoses, New Roses.

Send red stamp for Greenhouse and Bedding Plant Catalogue, just issued. F. K. PHENIX, Bloomington, Ill.

KIT-TA-TIN-NY—Its Chief Points are:

1. Very largest size.
2. Enormous productiveness.
3. Most delicious flavor.
4. Uniform Ripening.
5. No hard core like Lawton.
6. Sweet enough without sugar.
7. Retains color after picking.
8. Earlier than New Rochelle.
9. Fit for Market when Ripe.
10. Very hardy, has never winter-killed.
11. Tested by 3 to ten year trial.
12. Admitted the Best Blackberry known by the highest authority, viz: Chas. Downing, Wm. S. Carpenter, Peter B. Meade, Editors Agriculturist, and every one who has tasted it. My 2-year old plants will furnish berries of medium size this season, if carefully transplanted and attended to. Order early to prevent disappointment. 1-year plants by mail, \$1.50 each; p. doz. \$12, by exp. less. For Testimonials, &c., address E. WILLIAMS, Montclair, N. J.

Choice Pear Trees at a Sacrifice.

2,500 Dwarf Bartletts, Louise Bonne de Jersey's and Duchesse de Angouleme's, four to twelve feet high, three to seven years old, in bearing condition, at \$10 per 100, as my Orchards must be thinned out.

WILLIAM Y. BEACH,
Wallingford, New Haven Co., Conn.

Hale's Early Peach.

This magnificent Peach is what the Bartlett is among Pears in popularity. Ripens 2 weeks earlier than any known variety. Send for Circular.

B. H. MACE,
Newburgh, N. Y., (adjoining Chas. Downing)

**IONA AND ISRAELLA
VINES.**

I am still able to furnish vines of best quality for garden planting, to Clubs, and to individuals.

For a statement of the great advantages of purchasing by Clubs, see Club propositions, and also revised Price List for spring of 1865.

The extremely low price at which these vines are sold to Clubs will place them within the reach of the most moderate means, and the money obtainable at the end of the first season from propagators for the cuttings will repay the cost of their purchase. These vines will not be in less demand than at present, until the country is supplied, and may be expected to afford an increasing revenue in this way for years to come.

Wherever they become known there is no person that has place for them to grow, that will be without enough to furnish grapes for a generous family supply during at least four or five months of the year.

The Iona and Israella grapes are admitted by all good Judges to be greatly superior to all other native grapes, but the radical and important difference between the Iona and our heretofore leading kinds is fully understood only by those who have made themselves well acquainted with both, by actual trial in immediate comparison.

The past fall this trial was made in thousands of instances with the best Catawbas, and always with the same result. No one who has made the trial has ever said that the Iona has been or can be overpraised.

Many have conjectured that a grape of such surpassing excellence as the Iona could not be very hardy. The extreme severity of the past winter has added a vast amount of "cumulative evidence," to the already demonstrative proof from all quarters, of its surpassing hardiness.

I have prepared a Pamphlet of 24 pages, with fine Engravings of the vines in bearing, that gives an accurate description of the character of these grapes, with their origin and history, also some of the opinions of Judges and Committees that have examined them the past three years, and of some that have known them thoroughly for eight years. It is sent with Price List for 2-cent stamp. Colored Engravings of the Iona sent for \$1.50. To all purchasers for \$1.00, and to Club Agents for 75 cents. It is a handsome picture for framing or for portfolio. "Manual of the Vine," a thorough and extensive treatise sent for 50 cents. It contains about 150 illustrative and chiefly original engravings, with much important matter that cannot be found elsewhere.

I have some selected vines not described on my list that are very cheap for Vineyardists, Nurserymen or Dealers.

C. W. GRANT, Iona,
(near Peekskill) Westchester Co., N. Y.

PARSONS & CO.

offer for the Spring Trade at low rates the choice varieties of
GRAPE VINES.

Send 2 Red Stamps for Catalogues, Address

F. K. PHENIX,
Bloomington, Illinois.

CHOICE SEED.

I would again invite the attention of the public to my Annual Catalogue of choice and reliable garden seeds, embracing over two hundred varieties, over one half of them of my own growing, would invite particular attention to the following list of new, rare, or very desirable vegetables. Marblehead Mammoth Cabbage, (the king of all cabbages, sometimes weighs 60 lbs., and averages 30 lbs. by the acre. No cabbage will grow so large in the hot south as this. My seed are grown from the very largest and best of heads. I was the original grower of the number of the following varieties in the following list.) Stone Mason Cabbage, (a very large drumhead, remarkably reliable for heading, very profitable for market, heads very hard and very tender. Put up in half oz. packages, or sold by the pound.) Burnell's King of the Dwarfs, (the earliest of all cabbages, new, just from England, very fine and sweet flavor.) Richmond's compact Brussels Sprouts, (new, and one of the earliest selected for its very dwarf and compact habit.) Mammoth Sweet Corn, (the largest sort known, weighing two to three pounds to the ear; very sweet. It took the first prize at the Annual Exhibition of the Mass. Hort'l Socy, of 1864.) Mammoth French Squash, (weighs from 100 to 200 lbs.) Mammoth Chicory, (an improved French variety; largest of all.) American Turban Squash, (the driest, sweetest and richest flavored of all fall squashes. My seed [introduced this] are the purest in the country.) New York Improved extra large purple Egg Plant, (this is of larger size and of a deeper purple than the common large purple.) Striped Guadalupe Egg Plant, (grows to size of long purple, striped with yellow, purple and white; quite ornamental, edible.) Ornamental Kale, (several varieties in one package. Fine for either the Flower or Kitchen garden.) New Alma Cauliflower, (a new English variety; it has given great satisfaction.) Lenormand's Mammoth Cauliflower, (a new French sort, which promises to be the largest and most reliable variety grown.) Early Paris Cauliflower, (imported seed; a standard sort.) Ward's Mammoth Cauliflower, (the earliest and spiciest of all the green headed varieties.) Caterpillar Plants, several varieties in one package; a curious oddity from France.) Vegetable Snails, (another vegetable curiosity used by the French cooks to garnish their dishes.) Striped Leaved Japanese Maize, (a new and beautiful plant from Japan, with foliage striped with green and white, and at times with rose.) Cucumber, (a long and thin, cucumber-like curiosity.) Vilmorin's new wrinkled edible fodder Pea, (the first wrinkled kind yet known, the pods of which are eaten.) Each of the above forwarded by mail, post-paid, by a flat variety, the earliest of all the yellow sorts; quality very superior. See our Old Marrow Fat Pea, (the best.) Red Danvers Onion, (an early, round red variety, of a fine bright color.) Early Extra Flat Turnip Beet, (has a very small leaf top; quality excellent.) Red Castelnaunder Beet, (a famous French variety, in France it has a nut-like flavor; flesh deep purple, very tender, sweet and rich flavored.) Giant Ovoid Manzel Wurtzel, (a new German sort, characterized by its firm, solid flesh, large size and a somewhat growth.) Dillston's Extra Early Pea, (of 16 varieties tested in England, this proved to be the earliest; seven days earlier than Daniel O'Hourke.) Tom Thumb Pea, (very early; ten inches high; very productive.) Drew's New Dwarf Pea, (new; very dwarf, peas mostly oblong, each plant forms a bushy growth, but one pea being required to about a foot of row.) Brown's New Dwarf Early Marrowfat Pea, (a new variety, which may be relied upon as both the earliest and most dwarf Marrowfat grown.) McLean's Advance, (new; dwarf, wrinkled, very early and productive; an improvement on Napoleon.) Princess Royal, (new English pea, very productive. These two varieties have been selected as best out of over 20 new sorts.) Horn's Dwarf Marrowfat Pea, (the best pea than the Champion of England, grows but about half as high, is sweet, and excellent.) Scarlet Flowering Bean, (an English bean, quite ornamental; grows about two feet high.) Extra Long Caseknife, (a very vigorous and productive variety, has given great satisfaction.) Concord Bean, (the earliest pole bean in the country, in quality resembles Horticulturalist, but yields much better.) India Chute, (the best string pole bean known; always in condition for stringing.) Yard Long Bean, (foliage highly ornamental; bean a curiosity.) Jet Cranberry; Mottled Cranberry, (each of these are an improvement in health, vigorous growth and productiveness, on the old-fashioned Cranberry or Tery bean.) Tilden's New Tomato; New Mexican Tomato; Mammoth Gualanua Tomato; Cook's Favorite; French Upright; Early York, and Bates' Extra Early Tomatoes, (for particular description of these, see my advertisement in another column.) Bates' Extra Early Sweet Corn, (earlier than Darling's Early, a variety of the sweet wrinkledkerneled corn, excellent for the table.) Golden Sweet, (early, tender, sweet, with a rich flavor, peculiarly its own.) Sweet Mexican Corn, (the sweetest and tenderest variety I have yet found.) Late Red Cob, old-fashioned eight-rowed sweet corn, (the ears of these two varieties grow to a very large size; quality sweet and very tender, keeping a long while in condition for table use.) Chufas, (very prolific; taste very much like a fine Cocoonut.) Hubbard Squash, (the driest, sweetest and richest flavored of all winter squashes. I introduced this seed pure.) Yokohama Squash, (this new variety from Japan, has the finest grain of all squashes, with a rich, marrow-like taste.) Boston Marrow, (I consider my variety to be the purest in the United States; it took the first premium at the last Annual Fair of Mass.) Hort's Green Back, (a long, of extra large, light greenish color; Market Gardeners try this.) Spry White Wheat, (a new English sort, highly recommended for poor and elevated soils; less subject to blight and rust than other varieties, and has yielded 15 per cent. more than every variety with which it has come into competition.) Feeje Bean, (warranted to be both the earliest and the hardest of all bush beans.) Improved Green Globe Savoy Cabbage, (as reliable for heading as my Stone Mason, the quality of the Savoy is superior to all other varieties for table use.) Mammoth Millet, (extra tall heads, largest of all.) True Boston

Curled Lettuce, (the most ornamental lettuce known.) Neapolitan Cabbage Lettuce, (this is one of the finest Cabbage lettuces yet introduced.) Six choicest varieties of Cabbage Lettuce, (the six finest native and foreign sorts, in one package.) White Japan Melon, (very early, remarkably sweet, very popular.) Allen's Snapper, (quality very superior, by some called "King of Melons.") Orange Watermelon, (new; when fully ripe the skin peels off like that of an orange.) Early Sebce Potato, (new; has all the characteristics of the excellent Jackson White, but is ready for market from ten days to a fortnight earlier. A decided acquisition.) Early Chenery, (a new, very early, dry potato, becoming quite popular in Boston Market.) Goodrich Seedling, (new, quite early and productive.) Garnet Chili, (remarkably free from rot; large, solid, very productive; an excellent keeper.) Chick Pea, (used on the Continent of Europe as a substitute for coffee.) Yellow Lupins, (extensively used in Europe for sabbolging; highly recommended in U. S. Agricultural Report.) Improved Long Green Cucumber, (extra long and fine.) New Jersey Hybrid Cucumber, (one of the largest and best varieties cultivated.) Ornamental Gourds, (many varieties in one package, including Dipper Gourd.) Sutton's Students Parsnip, (new, originated in England, desirable.) Chinese Rose Winter Radish, (decidedly the best of all the winter sorts; an acquisition.) Hood's Dwarf Imperial Purple Celery, (a new variety from France.) Each of the above will be forwarded, post-paid by me, at 15 cents per package, and warranted to reach the purchaser. Catalogues sent gratis to all.

JAMES J. H. GREGORY,
Marblehead, Massachusetts.

SEEDS! SEEDS! SEEDS!

BRILL & KUMERLE,

151 & 153 Broad-street, Newark, New Jersey,

GROWERS AND DEALERS

In Best Quality Vegetable,

Crass and Flower Seeds.

Embracing everything desirable in both Vegetable and Flower Seed Department. For sale in quantities to suit purchasers at the lowest market rates. Descriptive Priced Catalogues furnished gratis, and all information as to prices, for larger and stated quantities, promptly given on application.

BRAZILIAN POP CORN BY MAIL. This corn has been acclimated and raised two years in Ohio. For expansiveness, softness when popped, fine flavor, and productiveness it is very much superior to any other. Soil and cultivation being good it yields from six to fifteen ears to the plant, the stalks bearing like the main stalk. For twenty-five cents directed to J. A. HATHAWAY, Cincinnati, Ohio, one hundred and fifty grains, and for fifty cents four hundred grains will be sent post-paid.

My Onion Seed.

What they Say of It!

Mr. J. J. H. Gregory—Des Moines, Iowa, Oct. 1865. I feel my duty to return you my sincere thanks for the good and genuine seed of different kinds I bought of you. There was considerably over one hundred dollars worth, all true to name, and excellent. The Onion Seed was the best I ever bought, and I have had a good deal of experience with different seedsmen. Some of my Danvers Onions measured sixteen inches in circumference. ROBERT GIBSON.

Mr. Israel Whitcomb, of Hingham, Mass., writes: "I bought seed of you last season, and am satisfied. I think I shall harvest from 1500 to 2000 bushels, and I have not seen one scallion as yet." I have grown a fine lot of Early Round Yellow Danvers, (this yields enormous crops.) Large Red, Early Red Globe, Yellow Flat or Strasburg, and Early Cracker Onion Seed. I invite all who want seed that is reliable in every respect, to send for my Onion Circular for prices and detailed description of varieties, which I send gratis to all. I have no risk of losing so valuable a crop through poor seed? I have published a thorough Treatise on Onion Raising of 32 pages, with 13 illustrations, which I send to any address for 30 cents. JAMES J. H. GREGORY, Marblehead, Mass.

Connecticut Seed Leaf Tobacco Seed.

WARRANTED GENUINE.

1 ounce, 25 cents; 4 ounces, 75 cts.; 1/2 pound, \$1.25; 1 pound, \$2. By mail, post-paid. J. MASON, Agent, Sign of the "Good Samaritan," 42 State-st., Hartford, Conn.

10,000 POUNDS CABBAGE, CARROT,

GARDEN AND FLOWER SEEDS BY MAIL,

pre-paid, including all the really valuable old sorts with many new and fine varieties. Priced Catalogues will be sent to any address. Agents Wanted. B. M. WATSON, Old Colony Nurseries and Seed Establishment, Plymouth, Massachusetts.

Solanum Jasminoides.

For illustration and description, see Agriculturist for December. 1000 well rooted plants, price 50 cents each, or 3 for \$1.25. By mail, post-paid. J. MASON, Agt., of the "Good Samaritan," 42 State-st., Hartford, Conn.

American Roofing Company.

This Roofing is the lightest known, weighing fourteen ounces in the yard, yet is warranted permanent, and as tight as any Roofing ever made.

It rolls up and unrolls like Oil Cloth, is perfectly pliable and elastic in any weather, and is a ready roofing, furnished ready for use, and can be laid down by any sensible working man according to directions furnished by the undersigned. It is not destroyed by putting down, when no longer required in one place, can be taken up and be put down elsewhere as good as new.

The American Paint, manufactured originally only for use on the Patent Roofing, has been tried extensively on other Roofs, and on Walls, Fences, Carts and Cars, and has given such extraordinary satisfaction, that it is now extensively sold for such purposes. It dries with a smooth, glossy surface, of a beautiful Maroon color, becomes very hard by exposure, and will not blister or crack either from heat or cold. Printed Circulars and other information can be obtained from HENRY SMITH, Agent, 94 Wall-st., P. O. Box, 1319, New York.

Improved Roofing,

Is the Lightest and Cheapest Roofing in use It can be applied by any one and can be made any color

Improved Preservative Paint, Is the best Preservative Paint in the world for wood and metals. It is always ready for use

Improved Roofing Cement for repairing all kinds of Roofs. Send for descriptive circulars to H. W. JOHNS,

successor to The Johns & Crosley Manufacturing Co., 73 William-st., corner of Liberty-st., New York.

THE BEST FERTILIZER.

The Ranford Chemical Works offer for sale, 1,200 tons of Wilson's Patent Ammoniated Superphosphate of Lime. This valuable Fertilizer is made entirely from bone, and nitrogenous substances, and oil of vitriol, and is compounded from them in such proportions as to make the best possible Fertilizer.

Orders from any part of the country, except Maryland, for any quantity, will be promptly filled, if accompanied with the money, or satisfactory references.

Citizens of Maryland should address their orders to Hon. Robert Turner, Baltimore.

This Fertilizer always produces superior crops of Grass, Corn, Wheat, Oats, Barley, Rye, and Buckwheat, of Potatoes, Turnips, and Beets, and is most excellent for Trees, Shrubs, and Vines.

Price at the Works, for 10 Tons, or less, \$50 per Ton. A liberal discount to dealers.

GEO. F. WILSON, Treasurer, Nos. 53, 59 and 60 South Water-st., Providence, R. I.

H. B. LANE, 151 Nassau-st., Agent in New York City.

GUANO.

FARMERS, READ!

The Excelsior Poudrette and Fish Guano Works, Office and Depot, 195 Water-st., New York.

RICARDO & CO., Proprietors.

We are making an extra fine Improved quality of Poudrette this season, composed of Night Soil, Urine, Butcher's Blood, Offal, and Fish Guano, and guarantee it superior in quality to any other Fertilizer in Market, and at a much lower price. Farmers and Gardeners, study your interest, and use it. Price \$2.00 per Barrel, and 33 cents per Bushel. Call and see us or send for a Circular. Address or call on RICARDO & CO., 195 Water-st., near Fulton, New York.

P. S.—Beware you get the "EXCELSIOR." "BEWARE OF FRAUDS AND MISREPRESENTATIONS."

FERTILIZERS.

Our superior Fish Fertilizers are worthy of trial by every farmer. They have been long known and extensively used by the farmers of Long Island, and Connecticut, and they alone, have realized the advantageous results of these fertilizers. Our pure ground Fish Guano, containing about 9 per cent. of Ammonia, will nearly equal in result the best Peruvian Guano. Our Pure Fish Scrap, containing a like proportion of ammonia, and about 20 per cent. of moisture, will prove correspondingly advantageous.

We also prepare a very valuable Concentrated Fish Fertilizer, which we offer at the low price of \$2.00 per Barrel. Try it in your Corn or Cabbage hills, the result will satisfy. Samples of Fish Guano sent by mail. Address PECK & GLOVER, Southold, N. Y.

TASKER & CLARK,

MANUFACTURERS OF SUPER-PHOSPHATE OF LIME!

Which they are now offering at the reduced price of \$50 per ton of 2000 lbs. Also, Meat and Bone Compost—a superior article for spring crops, at \$40 per ton. A liberal discount to Dealers. Address TASKER & CLARK, 8th and Washington-sts., Phila. N. B.—The above for sale also by Dealers generally.

AMMONIATED PACIFIC GUANO.

The attention of Farmers and Agriculturists is called to this article, as superior to anything else offered in the market. Equal to Peruvian Guano, and costing much less.

We offer this fertilizer in lots to suit all purchasers. A liberal discount made to the Trade.

Pamphlets with copies of Analysis by Dr. Liebig, of Baltimore, and Dr. Jackson, Massachusetts State Assayer, and testimonials from Agriculturists, showing its value, and directions for use, can be obtained from J. O. BAKER & CO., SELLING AGENTS, 131 Pearl-st., New-York.

INDIAN CORN,
ITS
Value, Culture and Uses.

BY EDWARD ENFIELD.
1 Vol. 12mo. 308 pages. Price, \$1.75.
Sent free by mail on receipt of price.
"The importance of the subject, and the absence of any work especially devoted to it, is deemed a sufficient apology for the appearance of this book. For a number of years the author has given much attention, both theoretically and practically, to the culture and uses of Indian Corn, and has, during that time, accumulated a considerable amount of materials relating to the subject, and mainly derived from the experience of farmers in various sections of the country. The aim has been to condense within a small compass all needed and useful information, and to state facts, opinions, and results, as clearly and concisely as possible."—*Extract from Preface.*—It contains nearly fifty useful tables of the highest value to Farmers, and of these more than thirty are new and original, having never before appeared in print.

CONTENTS:

Extent and value of the Corn crop.	Practical Mode of Testing the Soil.
Adaptation to Varieties of Soil and Climate.	Manures.
Certainty of the Crop.	Enemies of Corn.
Average Yield.	Preventives and Remedies.
Limit of Production.	Diseases of Corn.
Improvement of Varieties.	The Stalk Crop.
Introduction of new varieties.	Cost of Production.
Seed for Planting.	How to Obtain a Large Yield.
Time to Plant.	Uses of Corn.
Soil and its Constituents.	Products of One Acre.
The manufacturing interest in its relation to Agriculture.	Corn Culture at the West.
	Market Price of Corn.

Specimen Pages and circular giving particulars are ready. Address Rev. W. T. WYLLIE, care J. B. ROGERS, 54 North 6th-st., Philadelphia, or Publishers, SCHERMEHORN, BANCROFT & CO., 130 Grand-st., New-York, 512 Arch-st., Philadelphia, 6 Custom House Place, Chicago.

There's no such Girl as Sally.

A New song with Pianoforte Accompaniment. Words by PHILANDER JONES. Music by FELIX KRUPPER. The most popular and "taking" humorous song published, combining sense and sentiment, love, life and laughter. The leading vocalists throughout the country are placing it in their budgets of good things, and delighting their audiences with it nightly. Our homes will soon be ringing with its melody. It will be sung everywhere—in fact, sung, whistled, hummed, drummed, Brass-Banded and Hand-Organized, as no song has been since the days of the venerable Tucker. The song, the dance melody, and that unique echo, *ad lib.* of "Sally, Sally, Sally," are making a most successful raid upon the popular taste. Price 30 cents. Sent by mail, post-paid.
ADAMS & CO., Publishers, Boston.

GEMS OF SACRED SONG.

A New Volume of the Choicest Pieces of the Best Composers, with Piano Accompaniments; a beautiful collection of popular music, uniform with the previous volumes of the "Home Circle Series," now consisting of seven volumes, the whole forming the most complete and valuable library of Piano Music published, to which will soon be added " Gems of Sacred Song," now in press. Price of each, 1/4 \$1.50; Cloth \$3.00; Cloth, full gilt, \$4.
OLIVER DITSON & CO., Boston.

Parts 1 & II. 25 cts. each part of 12 Cards. Every Card involves an artistic problem, requiring study and keen observation for their solution, and thereby cultivating the eye to artistic forms, and affording most charming entertainment for young and old. Sold by all Bookstores or sent on receipt of price by the Publishers.
FRANK & CO., 159 Washington-st., Boston, Mass.

THE PHRENOLOGICAL JOURNAL and LIFE ILLUSTRATED is a "first-class" work, in its 42d vol. devoted to PHRENOLOGY, with "Signs of Character," PHRENOLOGY, the Natural History of Man; PHRENOLOGY, and the Temperaments; PHYSIOLOGY, the Laws of Life and Health; PSYCHOLOGY, the Science of the Soul. Amply illustrated. Monthly, \$3 a year; sample Nos. 20 cents. Address Messrs. FOWLER & WELLS, No. 389 Broadway, New York.

THE HOG BREEDER'S MANUAL sent to any address free of charge; every farmer should have it. Address N. P. BOYER & CO., Gum Tree, Chester Co., Pa.

A BOOK FOR EVERY FARMER'S HOUSEHOLD!

A New Poem by Whittier!

TICKNOR & FIELDS

PUBLISH FEB. 17.

SNOW BOUND:

A WINTER IDYL,

BY

JOHN G. WHITTIER.

Author of "MAUD MULLER," &c., &c.

In one beautifully printed Volume, with a fine portrait of the author, and an illustration of his birthplace, the scene of the poem. Price, \$1.25.

Nothing that has ever appeared from our favorite New England poet will have a closer home-interest than this admirable production. It tells the story of his own boy-life on a farm, amid the hardships and pleasures of that stormy season of the year, so full of vicissitude and danger to the dwellers on our rocky coast. Thousands of readers will thank anew the poet who can make them feel

"The winter joys their boyhood knew."

With Whittier's own beautiful lines at the close of the poem, all those who peruse *Snow-Bound* cannot fail to sympathize.

"And dear and early friends—the few Who yet remain—shall pause to view These Flemish pictures of old days;

Sit with me by the homestead hearth,

And stretch the hands of memory forth

To warm them at the wood-fire's blaze!

And thanks untraced to lips unknown

Shall greet me like the odors blown

From unscen meadows newly mowed,

Or lilies floating in some pond,

Wood-fringed, the wayside gaze beyond;

The traveller owns the grateful sense

Of sweetness near, he knows not whence,

And, pausing, takes with forehead bare

The benediction of the air."

Sent postpaid to any address on receipt of advertised price.

124 TREMONT-ST., BOSTON.

Send for Description of the finest THOROUGH-BRED CHESTER WHITE PIGS, and Imported Fowls in America. L. B. SILVER, Salem, Ohio.

FOR SALE at GREAT SACRIFICE to close an Estate, a Farm of 93 acres, near the R. R., 30 miles south of Philadelphia, 60 acres under fence, balance timber, dwelling house and barn. Price \$3,000, \$1,000 cash, balance in 10 years. J. H. COFFIN & CO., Franklinville, N. J.

VINELAND

FARM AND FRUIT LANDS, in a mild and healthful climate. Thirty miles south of Philadelphia by Railroad, in New Jersey, on the same line of latitude as Baltimore, Md.

The soil is rich and productive, varying from a clay to a sandy loam, suitable for Wheat, Grass, Corn, Tobacco, Fruits and Vegetables. This is a great fruit country. Five hundred Vineyards and Orchards have been planted out by experienced fruit growers. Grapes, Peaches, Pears, &c., produce immense profits. Vineland is already one of the most beautiful places in the United States. The entire territory, consisting of forty-five square miles of land, is laid out upon a general system of improvements. The land is only sold to actual settlers with provision for public adornment. The place on account of its great beauty as well as other advantages has become the resort of people of taste. It has increased five thousand people within the past three years. Churches, Stores, Schools, Academies, Societies of Art and Learning, and other elements of refinement and culture have been introduced. Hundreds of people are constantly settling. Several hundred houses are being constructed, and it is estimated that five hundred will be built during the summer. Price of Farm land, twenty acre lots and upward, \$25 per acre. Five and ten acre, and Village lots for sale.

Fruits and Vegetables ripen earlier in this district than in any other locality north of Norfolk, Va. Improved places for sale.

Openings for all kinds of business, Lumber Yards, Manufactories, Foundries, Stores, and the like.

For persons who desire mild winters, a healthful climate, and a good soil, in a country beautifully improved, abounding in fruits and possessing all other social privileges, in the heart of civilization, it is worthy of a visit.

Letters answered and the Vineland Rural, a paper giving full information, and containing Reports of Solon Robinson, sent to applicants.

Address CHAS. K. LANDIS, Vineland P. O., Landis Township, New Jersey.

From Report of Solon Robinson, Agricultural Editor of The Tribune: It is one of the most extensive fertile tracts, in an almost level position and suitable condition for pleasant farming that we know of, this side of the Western Prairies.

MARYLAND FARMS.

GOLDSBOROUGH & HALL,
REAL ESTATE AGENTS,
Easton, Md.,

Have for Sale 300 Farms on the Eastern Shore, 100 of which are situated in Talbot, the most fertile and best watered county in the State: its rivers and the arms of the Chesapeake Bay, which encompasses it on three sides, enabling most of the farmers to ship their produce directly from their own shores, and giving to the inhabitants in proximity the luxuries of GAME, FISH, OYSTERS, CRABS, TERRAPINS, &c. The climate is remarkably healthy, and

Early Fruits and Vegetables are here produced at least two weeks earlier than in the most favored sections North of us.

Our daily communication with Baltimore by Steamers, and by RAIL-ROAD (shortly to be in operation) with Philadelphia and New York will give to PRODUCERS every facility for shipment.

PEACHES are produced with but little care, in the greatest profusion, and the productiveness of the trees continues for many years.

The native GRAPES of all the finer kinds, as well as all the smaller fruits flourish here in the most luxuriant manner, being free from rot, blight, or mildew.

For general crops of **GRAIN AND GRASS** the soil is unsurpassed by any portion of the country, while the price of the land is from 1/4 to 1/2 that of inferior lands in less favored sections.

Farm LABORERS can be had in abundance from \$3 to \$12.50 per month.

Catalogues mailed free. Communication from Baltimore daily by Steamer, and from the Delaware Railroad at Bridgeville Depot, daily, by Stages.

Satisfactory titles guaranteed.

NURSERY FARMS.

There being a great demand for fruit trees, vines, &c., in this and the adjoining counties, we offer for sale several tracts of land eminently adapted for that purpose from soil, situation, and proximity to Rail Road and Steamboat transportation.

GOLDSBOROUGH & HALL,
Easton, Talbot County, Maryland.

ALL GOING WEST

SOON OR BY-AND-BY, to purchase Land, should write to the undersigned for Circulars giving full particulars about the **500,000 Acres of Prairie, Timber and Coal Lands**, for sale in Northern Missouri, on the most liberal terms, by the **Hannibal & St. Joseph R. R. Co.**

An advertisement of any reasonable length cannot tell the whole story; therefore send for our gratuitous advertising documents. Extra copies are cheerfully furnished to such as wish to induce others to emigrate with them. A sectional Map, showing the exact location of all our lands, is sold at thirty cents. Address GEORGE S. HARRIS, Land Commissioner, Hannibal & St. Joseph Railroad, Hannibal, Mo.

Maryland and Virginia Farms for Sale.

Owing to the Civil War, fine Southern farms are now offering for sale at reduced prices, in the most fertile portions of Maryland and Virginia. The mildness of the climate and variety of productions offer peculiar inducements to Northern Farmers.—The subscribers have constantly on hand Farms improved and unimproved with them, Fruit and Grazing Farms, Country-Seats, Coal and Timber Lands, in all sections of Maryland and Virginia.

Also Residences and Building lots in and around Baltimore and Washington. Faithful and accurate descriptions can be had by addressing JOHN GLENN & CO., 59 Second-st., Baltimore.

FOR SALE

The Residence of the late John Rankin, Esq. This very desirable Property is situated in the beautiful Village of Canandaigua, Ontario Co., N. Y., and contains sixty-three acres, or thereabout, of excellent land, mostly underdrained, and in a high state of cultivation. The House, which is large and commodious, stands on rising ground one mile north-east of the Post Office and Railway Station, and commands a delightful view of the Lake and part of the Village. The Garden and Orchards are well stocked with choice fruit, and adjoining the immediate surroundings of the house, is a fine Grove of about 15 acres.

For particulars apply to the Subscriber on the premises. MRS. M. RANKINE.

For Sale.

A valuable Farm, containing 110 acres, near Princeton, N. J., opposite the residence of Ex-Gov. Olden. The site is one of the finest in the country on which to erect a country-seat;—near Churches, Colleges, Schools, &c. Only two hours distant by railroad, from New York or Philadelphia. Trains arrive and leave for either city several times daily. Will be sold cheap and on accommodating terms. Apply personally or by letter, to FRESSE & SWAYZE, Bankers and Real Estate Brokers, Trenton, N. J.

600 Maryland and Virginia Farms and Timbered Lands.

Catalogue of Maryland and Virginia Lands, with Geographical description of Maryland, for sale by R. W. TEMPLEMAN & CO., Land Agents, 37 Lexington-st., Baltimore City, embracing a description of the soil and products of Maryland. Sent 25 cents for a copy of Catalogue.

SUPERIOR FARM LAND.—20,000

Acres, Franklin Tract, at Newfield, Gloucester County, New Jersey, on the Railroad running from Philadelphia to Cape May, 30 miles South of Philadelphia—adjoining the Vineland Tract, and 2 miles North of the Vineland Station—for sale at low prices and on easy terms, in lots to suit purchasers. Circulars, with reports of Solon Robinson, Hon. William Parry, and others, with full information, sent to applicants, free. Address JOHN H. COFFIN & CO., Newfield, Gloucester Co., N. J. Improved Farms also for Sale.

WANTED—A FIRST CLASS GRAIN and grazing Farm of 100 acres or more, situated in Central or Western N. Y., with good Buildings, plenty of Fruit, well watered, free from stone, near Railroad or water communication. P. D. HULST, Brooklyn, N. Y. Give description, price &c.

(Business Notices \$2.00 per Agate Line of Space.)

A Curiosity for Ladies.

There is on exhibition at the salesroom of Messrs. Wheeler & Wilson, No. 625 Broadway, the first sewing-machine, (No. 1) made by that Company, the present number being about 220,000. Let the interested compare the machine sold in 1851 for \$125 with those now offered for \$55. The former owner of this machine gives its history as follows:

"This machine was finished early in 1851, and I learned its use from Mr. Wilson himself. I was thus, you see, the first to work the Wheeler & Wilson Machine, and learned on the first machine they ever manufactured.

"In 1854 I earned with the machine \$295, beside doing my own housework and taking care of my baby. In 1856 we came to Davenport and brought the machine with us. I believe it the first machine ever brought to Iowa.

"I ran that machine almost constantly for more than fourteen years, on all sorts of work, from the finest dressmaking to the heaviest tailoring; I quilted a full sized white bedspread with it, which has been exhibited three times at the Fair. It took me three weeks to do it with my other work; but it could not have been done by hand in as many years. I have even stitched leather with it, and at the time I exchanged (in 1865) it for 193,320, it worked just as well as when made.

"It is perhaps unnecessary for me to add that I believe the Wheeler & Wilson to be vastly superior to any other machine made.

Yours, respectfully, P. E. B.

Time tries all things. Use only furnishes the final test. Opinions of the skillful may be of value, but time is needed to confirm them. All failures have had their advocates. It is noteworthy that the Sewing-Machine for which the highest premium was awarded at the World's Fair here in 1853 long since sunk into merited oblivion. The past fifteen years has seen numerous machines, with high sounding pretensions, rise with a flourish, confound the simple, and vanish. So will it be while credulity lasts.

The Wheeler & Wilson Company fixed upon the "Lock-Stitch" as the one best suited to the general purposes of sewing, for beauty, permanence, elasticity and economy of thread, and experience has confirmed the preference. It was at liberty, then as now, to make a chain-stitch machine, and even now, at a cost of less than 10 cents each, can adapt its lock-stitch machine to make the chain-stitch as well as the lock-stitch, but not believing in the stitch, has steadily refused to give it any kind of indorsement.

While this Company has given to the public the best fruits of inventive genius, it has guarded it from a multitude of traps. Attachments have been added for various purposes, as hemming, binding, braiding, cording, &c.; but it has been kept free of all useless complications. Simplicity of parts, and adaptation to the widest range of work, has been the constant aim. Instead of boasting of a variety of useless stitches and movements, it claims to make but one kind of stitch, and that with the fewest movements possible. Hence the machine may run constantly for fourteen years, like the No. 1, above mentioned, or a lifetime, even, and work just as well as when new. With a complication of parts and movements it would require monthly repairs and adjustments. As the purchase of a sewing-machine is or may be, an act for a lifetime, care should be had in getting what time and use have approved.

THE GREAT FAMILY SEWING MACHINE.

HIGHEST PREMIUM Elastic Stitch SEWING MACHINE.

495 Broadway, New York.

JUCUNDA--Our No. 700 Strawberry Plants By Mail.

GOOD INVESTMENT.

We will send by mail, post-paid, and guarantee their safe carriage, 25 good strong plants for \$5; 60 for \$10.—By express 100 plants for \$15; 1000 for \$100. Each plant, with ordinary care, will produce 100 additional the first season. An outlay of \$5 will secure in six months 2000 plants—\$10, 6000 plants. As but few plants of this remarkable Strawberry have been disseminated, the demand, for some years to come, at high prices, will be very great. The most PROFITABLE time to secure valuable new varieties, is when they are FIRST INTRODUCED.

THE GREAT AMERICAN TEA CO.'S CIRCULAR.

As many parties throughout the country wish to avail themselves of the advantage of obtaining their teas at WHOLESALE PRICES, we have made extensive arrangements for supplying that demand. Our profits are based upon the sale of ONE THOUSAND CHESTS PER WEEK.

All the goods we sell are warranted to give perfect satisfaction, or they can be returned at our expense and have the money refunded. This makes it perfectly safe to parties ordering, as no one can have any doubt of our responsibility.

Parties will see by the examination of the following price-list that we are selling very much below any regular country dealer.

RETAIL PRICE LIST.

- OOLONG, 40c., 50c., 60c., 70c., 80c., 90c., best \$1 per pound. MIXED, 40c., 50c., 60c., 70c., 80c., 90c., best \$1 per pound. ENGLISH BREAKFAST, 50c., 60c., 70c., 80c., 90c., \$1, \$1.10, best \$1.25 per pound. GREEN TEAS, 50c., 60c., 70c., 80c., 90c., \$1, \$1.10, best \$1.25 per pound. YOUNG HYSON, 50c., 60c., 70c., 80c., 90c., \$1, \$1.10, best \$1.25 per pound. UNCOLORED JAPAN, \$1, \$1.10, best \$1.25 per pound. IMPERIAL and GUNPOWDER, best \$1.25 per pound.

These Teas are chosen for their intrinsic worth, keeping in mind health, economy, and a high degree of pleasure in drinking them.

COFFEES ROASTED & GROUND DAILY.

GROUND COFFEE, 20c., 25c., 30c., 35c.—best 40c. per pound. Hotels, Saloons, Boarding-House Keepers and Families who use large quantities of Coffee, can economize in that article by using our FRENCH BREAKFAST and DINNER COFFEE, which we sell at the low price of 30c. per pound, and warranted to give perfect satisfaction.

Consumers can save from 50c. to \$1 per pound by purchasing their Teas of the

GREAT AMERICAN TEA COMPANY,

- Nos. 31 and 33 VESEY-ST., corner Church-st. No. 640 BROADWAY, corner Bleecker-st. No. 503 EIGHTH AVE., near Thirty-seventh-st. No. 205 FULTON-ST., BROOKLYN, corner Concord-st.

Country Clubs, Hand and Wagon Peddlers, and small stores (of which class we are supplying many thousands, all of which are doing well), can have their orders promptly and faithfully filled; and in case of clubs, can have each party's name marked on their packages as directed by sending their orders to Nos. 31 and 33 Vesey-st.

Parties sending Club or other orders for less than thirty dollars, had better send Post-Office drafts, or money with their orders, to save the expense of collections by express; but larger orders we will forward by express, to collect on delivery.

Our friends are getting up Clubs in most towns throughout the country, and for which we feel very grateful. Some of our Clubs send orders weekly, some not so often, while others keep a standing order to be supplied with a given quantity each week, or at stated periods. And in all cases (where a sufficient time has elapsed) Clubs have repeated their orders.

We append the second order from our Washington Treasury Department Club:

TREASURY DEPARTMENT, WASHINGTON, D. C., March 2, 1866.

L. CASS CARPENTER, Fourth Auditor's Office, Treasury Department.

MEADVILLE, Pa., March 6, 1866. DEAR SIRS:—Your Tea and Bill received. All right. All perfectly satisfied with the article, and would say to others go and do likewise, thereby saving themselves from 75 to 100 per cent. Yours truly, E. H. BRIGGS.

WOONSOCKET, R. I., March 8, 1866. GREAT AMERICAN TEA CO.—GENTLEMEN:—I have the pleasure to inform you that I got the Tea and Receipt all right, and I have made inquiries from all that sent, and I find that it gives good satisfaction in every case. It just cost us 2 1/2 cents per pound to get it here, so I say we saved 37 1/2 cents per pound, and got a better article. I have had many inquiries about it, and they all say I must let them know when we send again. I am sure we shall have a very large Club next time. I remain yours, truly, JAMES WOODHOUSE.

LITTLE PRAIRIE, Wis., March 4, 1866. I have noticed your advertisements frequently in the papers, but seeing you advertised in the AMERICAN AGRICULTURIST, GIVES ME AN ASSURANCE THAT YOU ARE JUST WHAT YOU PRETEND TO BE. I want a caddy of your best Gunpowder Tea, say 20 lb at \$1.25, and 1 caddy of Uncolored Japan at \$1.10, say 15 to 20 lb. Send them by Express. Yours, truly, M. P. BISHOP, P. M.

50 PER-CENT SAVED BY USING

NEW-YORK, MAY, 1866.

NEW SERIES—No. 232.

PRIDE AND HUMILITY. FROM A PAINTING BY GEORGE COLE. (Goupil & Co., Broadway, New-York.)

Without stopping to discuss the moral traits of the largest and proudest of domesticated fowls, and the humblest and most abused of domestic beasts, nor to point out the merits of a fine painting well reproduced in wood, we improve the brief space left here to say a word in favor of the ass—the "unmitigated ass." Europe abounds in donkeys—so to speak, pony asses. They attain considerable size, and in fact the line between the donkey and the full sized ass is as hard to draw as between a pony and a horse. They are very cheap, easy to

keep, not liable to disease, cleanly, harder hoofed and less vicious than horses or mules, willing, capable of strong attachments, having a good deal of stupid intelligence, very sure footed and careful of themselves, long-lived and willful but not malicious. "Where there's a will, there's a way" to get along without rousing it to one's disadvantage as a general rule, and we have never seen a balkey ass that had not abundant provocation. Their bray is the only really annoying thing about them. There is good use for the both donkey and the ass in

this country—the former as a poor man's beast of burden and draught, especially in the neighborhood of large and small towns where vegetables and fruits are brought in a few miles for sale upon the streets; and were they once common, many other uses would be found for them, churning for instance. Besides, there would be a considerable sale for them as children's pets, to which purpose they are especially adapted, being smaller and much more trusty than ponies, and not so liable to stumble, bite or kick, that is, if not made vicious by bad treatment.

Back Volumes Supplied.—The back volumes of the *Agriculturist* are very valuable. They contain information upon every topic connected with rural life, out-door and in-door, and the last nine volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from stereotype plates as wanted, all the numbers and volumes for nine years past, beginning with 1857—that is, Vol. 16 to Vol. 24, inclusive. Any of these volumes sent complete (in numbers) at \$1.75 each, post-paid, (or \$1.50 if taken at the office). The volumes neatly bound, are supplied for \$2 each, or \$2.50 if to be sent by mail. Any single numbers of the past nine years will be supplied post-paid, for 15 cents each.

AMERICAN AGRICULTURIST.

NEW-YORK, MAY, 1866.

Our date comes unfalteringly, though the bland airs and sunshine of spring were this year so tardy in their advent. This lateness of the season crowds the labors of the past month into this one, making its duties, which are always responsible, unusually arduous. There is need of system and definiteness of plan to accomplish any thing well. Hard work alone will not do it, and it will break down both man and beast. System will enable the farmer to give his hands and his teams a full hour a day of rest more than they would otherwise have, to get more labor and better labor from men and animals, and to maintain in himself and his family those cheerful tempers which promote good digestion and health in all respects. It is easier for every body, if only one works with system, and if the farmer himself will not, this need not prevent others systematising their work. Thoroughness should especially characterise the work done this month; poor plowing, slack preparation of the ground, or of the seed, imperfect sowing, or neglect of crops that need early hoeing and weeding, may be fatal to any thing like remunerative husbandry. If an average crop just pays expenses, (as in fact it very rarely does), then it is the few bushels of grain or roots, or the few pounds of hay or straw above the average in which any profit lies. The labor to secure an average crop is about all that most farmers calculate to lay out, and they hope that Providence will do so much better by their crops than they do themselves, that they will have a better than average returns. They are disappointed, of course, except in some rare cases. Those who show a better faith by their better works are "in luck" almost all the time. Their disappointments are few, and are then usually traced by them to faults of their own judgment, plans or execution.

Hints about Work.

The Stock.—"Between hay and grass" is a proverbially hard time for cattle and stock of all kinds. One's calculations are so apt to come out a little short in regard to how much it will take to carry the stock well through the winter, that it is the exception rather than the rule that farmers can feed hay, grain and roots as liberally in the spring months as the needs of their animals demand. Milch cows that have just come in, or that drop their calves during this month, before they can be turned to pasture, need first-rate care and feeding, or the flow of milk for the whole season may be essentially diminished. Young cows especially should be fed in a way to develop as much as possible every milk-producing quality, for this will influence their value throughout their lives. The renewal of their coats is a great tax upon the vital force of neat cattle and horses, and at this season they are more benefited by regular and thorough carding than at any other. When a supply of roots has been kept through till now, feed them out, so that the transition from dry fodder to grass will not be too sudden and produce scouring. When cows are first turned to pasture, give them a little less than their usual feed morning and evening, putting them in the pasture a few hours only in the middle of the day. They will do much better for it. The same is true of heaves, which will fatten rapidly as warm weather comes on, if gradually accustomed to grass, their meal and hay being kept up just as usual. Otherwise they are apt to scour and fall off considerably. Calves if kept in warm comfortable and clean quarters and fed regularly, will increase in weight very fast. All their food should be cooked, even the hay; at least all the meal shorts or bran which is mingled with the skimmed milk, should be thoroughly cooked. When calves are fattened upon the cow, it is a fact worth remembering that it is not the cows which give the richest milk, that will bring up the most calves or fatten them the most rapidly. When milk cannot be sold, it is often very economically

disposed of by putting two calves to a good cow, and "messaging" them twice a day besides. Calves will seldom quarrel, so it is best to allow a week or fortnight's difference in their ages.

Sheep.—We are strong advocates for shearing sheep unwashed. They may thus be sheared much earlier; there is little danger of their taking cold; the coolness of the weather is supposed to influence a more rapid renewing of their covering, and by the time the summer's sun beats down hot and scorching upon their backs, they are sufficiently protected not to be blistered, as sometimes happens in late shorn flocks. All flocks ought to be dipped (see directions in Basket item, p. 172) after shearing. Unless the ticks or lice are very thick, the dipping should be postponed till warmer weather than we usually have in May. The gradual accustoming of sheep to grass is quite as important as the same treatment for neat cattle. Do not withhold the grain, but keep it up until after the flock is well established upon grass. They should also be turned to grass gradually, two or three hours a day, in addition to their full regular feeding of hay, etc. No one should overlook the great value of his stock as manure makers. This will in many parts of the country make it very remunerative to have the cows all yarded or stabled at night, and the sheep folded. The farmer rarely classifies his

Swine as Beasts of Labor; yet when the best use is made of them, they do an immense amount of hard work in the course of the summer in roofing over and mixing the manure and compost heaps, converting weeds, etc., into manure. Corn scattered over the heap now and then will encourage diligence, and a few handfuls dropped here and there into holes 20 to 30 inches deep, will secure a great upturning and mixing, which would otherwise have to be done by the fork.

Poultry.—All kinds of young poultry should have good care, especially when very young. One of the best attachments to a poultry yard is a low shed 8 feet wide, open to the south, and closed by light lattice work that will not keep the sun out. Here young turkeys and chickens may safely spend a few weeks. The hens being cooped under the sheds. The ground should of course be dry, and covered with ashes, and the surface shoveled off and the ashes renewed frequently. One secret of success with chickens is, keeping them dry; this, in connection with cleanly quarters, scalded or cooked food and pure water always before them and always fresh, will secure fine healthy flocks.

Grass and Grain Fields may receive top-dressings of liquid manure and other fertilizers, if applied early. See items in last number. Little, however, can now be done, even upon spring grain, on which timely manuring, and sometimes rolling after the ground has settled after hard rains, may be of great service. The attention of the farmer must however be chiefly directed to his

Hoeed Crops.—No hurry or lateness of the season should be allowed to cheat the crops out of well prepared and manured soil. There are several articles on corn in the body of this number, to which we refer the reader. Sorghum and Broom Corn are cultivated on the same general principles. Potatoes should be put into the ground as early as possible. Late sorts for the main crop and for winter use should not be planted with rank fermenting manure, it induces a succulent growth and a predisposition to the blight and rot. Leached ashes is excellent manure for potatoes. As a rule, plant three or four inches deep, and harrow thoroughly when the tops first appear above ground. This kills a crop of weeds, does the potatoes good, and saves work.

Sugar Beets and Mangel Wurtzels.—Every good farmer ought to plant some of one or the other of these roots for his milch stock. Sow when the ground is warm, in deep rich soil in good tilth, putting the drills 24 to 30 inches apart. They may be thinned out during the summer, and afford excellent green fodder to any kind of stock "kept up." Other root crops, Parsnips, Carrots, may be sowed in the same way, the drills closer, however.

Onions.—Old onion raisers will have looked out

for good seed long before this. There is little beside fresh seed in the country, but the demand for this renders it necessary to be on one's guard to get good. On rich land, in good tilth and not weedy, the crop is a very profitable one. Sow early in rows about 14 inches apart; it requires garden culture, and leaves the ground early for late cabbages, etc.

Tobacco ground must be prepared this month, by thorough manuring and plowing, and harrowing, to kill weeds. The seed beds may need watering with guano water, or other liquid manure, to bring forward slow growing plants, ready for transplanting before the middle of June. There should also be beds prepared in warm sheltered spots for

Cabbages.—Sow seed of late sorts for field culture (Drumheads, Flat Dutch, etc.) any time this month; sprinkle beds freely with ashes to repel insects.

Peas and Oats.—There will be many oats sowed this year in May, though below latitude 41° it is seldom advisable to sow oats alone after May 1st. When the ground is in fair heart, sow oats with the peas any time before the middle of the month in common seasons. Sow two bushels of each seed, plowing in the peas lightly and harrowing in the oats. Peas alone may be sowed as late as the 25th, and the later crop, though not so large, are free from the attacks of the pea weevil.

Implements, etc.—If not already provided, and you can pay for them, order a mower, horse-rake, and horse-fork immediately. It is very difficult to choose between the few best mowers, there is not choice enough to warrant waiting a week. Wooden toothed horse rakes do the best work, and pick up least dirt, moss and grit. Horse-forks are numerous, and most of them good; in selecting one regard lightness, strength, durability, and the ease with which it is tripped or opened. The self-raking attachment is a very valuable one in reaping machines, and when much grain is cut, it is indispensable to economical work. In providing good implements for hand labor, do not forget that

Handy Tools make work light. Good hoes, light, sharp, and strong, are best, by far, in any but very cloddy, heavy soil, and the same is true of most other tools, rakes, forks, etc.

Manure.—Our counsels are often repeated in regard to manure saving and making. The importance of the subject is our excuse, if we weary any reader. Save and buy dead animals, old horses, etc., skin them, cut them up on a load or two of muck, covering them well with the same material, or with good soil. Lie in wait o' nights to add dogs to the heap; they make excellent manure, and you save your sheep at the same time. Collect bones, paying children 15 to 25 cts. per bushel for gathering. Prepare the privy vault so as to save every thing, mixing it with muck or dry soil, getting it out and working it over once a week. It will not be offensive in the least, if well treated.

Buildings, etc.—Painting should be done when the surface is dry, but before the wood is so thoroughly dried that it will rapidly absorb the oil. Paint thus applied after moist weather, holds better and forms a much better surface than in a dry season. Level the sills of out-buildings, if thrown up by the frost. Clean out chimneys by burning or brushing during wet weather before the dry season.

Work in the Horticultural Departments.

The notes of last month were intentionally made with a wide margin, to lap over into May. In the crowded condition of our space, we are obliged to avoid repetition as much as possible, and shall this month make brief mention of, or omit altogether, those things that were sufficiently discussed in these columns last month. It is always best to look back a month or two and see if some previous suggestion is not worth acting upon now.

Orchard and Nursery.

Planting is generally well over by this time, but if any remains to be done, do it faithfully, according to hints previously given. The later the season,

the more chance of trees drying or heating in transportation, and the more care they will need before planting. Last month we mentioned the burying of trees to restore them if dried. We have seen this work wonders, on apparently hopeless cases. We once received a large box of trees, which had been long packed, in warm weather, and the buds had pushed out shoots several inches long. The trees were cut back almost to walking sticks, and planted. They all lived, and in autumn were well furnished with vigorous limbs.

Grafting may be continued, recollecting that when the tree has started to grow, the bark is easily wounded, and slips easily. Set root-grafted stocks out in nursery rows, if not already done, and

Budded Stocks, that were worked last year, need cutting back, provided the bud looks fresh and the union appears to have been formed. The stock is not to be cut at first close to the bud, but about three inches above it. This leaves a support to which to tie the rapidly growing shoot. Rub off all the buds except the one that was inserted.

Seedling Stocks that were heeled in last winter, are to be set in rows to be budded at the proper season, first shortening the tap root. If seeds for stocks are not planted, lose no time in putting them in, and weed them when they come up. The benefits of

Mulching are so great, that it will pay to be at some trouble to apply it around newly planted trees. Straw, bog or salt hay, sawdust, chips, or any similar material will keep the earth from drying, and if a dry time comes will save the necessity of watering. An account of the regular practice of mulching on a large scale was given in an article on pear culture on page 314 of last year.

Plowing, when done in the orchard, should only be entrusted to careful hands. Use short whiffletrees to the plow or cultivator and pad the ends. It is customary to put in carrots or some hoed crop between the rows of a young orchard. The war with

Insects will begin this month. If the canker worms have ascended the trees, we know of no help for them. The tent-caterpillar is more manageable, for that hangs out its sign, and it can be readily seen where he is to be found. Remove every nest, not only those found in the orchard, but from the wild cherry trees which they are apt to infest. A recent (English) Journal of Horticulture gives the following new remedy for the

Bark Scale.—A strong solution of soft soap is mixed with clay and made as thick as it will work with a brush. The whole tree is painted over with this, and it is said that the animal is unable to survive the application. We think this worth a trial, as we have seen Indians rid themselves of another kind of parasite, by plastering their hair up with clay, and wearing it in this way until dry.

Evergreens succeed better when planted this month than if removed earlier. Nursery trees are quite sure to live, provided their roots are never allowed to dry. When practicable, have the trees removed on a lowery or damp day. If they are to go any great distance, the roots should be covered with damp moss as soon as they are lifted. If the roots of any kind of an evergreen once get dry, it is a doubtful case. In setting, give good soil, and if any addition to it is needed, let it be well decomposed leaf mould or muck. Never prune off the lower branches of an evergreen, if the upper ones overhang the lower, shorten them, and endeavor to keep the tree well furnished to the base and a perfect pyramid. A few large stones placed over the roots are better than stakes. Give well established evergreens a dressing of rich compost.

Seedlings of evergreens and all other forest trees must be shaded, as noticed last month, on page 146.

Fruit Garden.

If the planting of dwarf trees is still to be done, observe the precautions mentioned under the head of Orchard and Nursery, last month, as well as this. But few persons in this country have the courage to make good shaped trees, for to do this requires a more severe treatment of the young tree, as it comes from the nursery, than most are equal to. In

the finest dwarf pear orchard we have seen, the trees were all cut back the first year to about 18 inches; of course quite young trees were planted. To meet this want of proper treatment of dwarfs, we have published Rivers' Miniature Fruit Garden, noticed elsewhere. A general outline of the course to follow to produce a fine pyramidal or bush shaped dwarf tree we described in Jan., last year.

Grape Vines may yet be planted. Brief directions were given last month. In most localities the vines are already tied to the trellis, but where there are late frosts it is better to leave them on the ground, where they can be protected. In putting them up after the buds have started, there is great danger of injuring the young shoots by careless handling. We get many letters asking how to train the vine. We have in previous volumes given the principal methods, and cannot repeat the same articles from year to year. Any one who has only a few vines, even, should have some good treatise upon the subject. We refer to April and November, 1863, and April, 1864, for illustrated articles upon the subject. Whatever may be the "system" upon which a vine is to be trained, it must first be prepared for the operation, and the attention of the cultivator must be devoted to getting a strong plant to work upon. The proper way to do this is, to let a young vine grow only one shoot the first year. The second year two buds are to be permitted to grow. Those who begin thus will have a vine upon which they may practice any kind of training they please.

Layers may be put down, and cuttings of such varieties as can be propagated in the open air may be set in a well prepared nursery bed.

Raspberries and Blackberries should have been planted last month. An article will be found on page 145, April. If the canes that fruited last year were not removed, then do it now, and thin out those which grew last year to three or four to each stool, reserving the strongest, and tie up to stakes. This of course does not apply to Black Caps. Keep down weeds and suckers, and if not done last fall, dress with manure.

Currants will do all the better if the plants are well mulched before dry weather. At the first sight of the currant worm, sprinkle the bushes with powdered white hellebore. See "Walks and Talks."

Insects will of course be a source of trouble. See some hints under Orchard and Nursery. For the Rose-bug, often so destructive to grape flowers, we know of nothing so efficacious as hand picking; indeed this is a very sure way with all the larger insects in a small garden; an hour daily devoted to this business, will be time well invested.

Strawberries.—The earlier these are in the better, but as there are cases where it is better to plant now than not at all, refer to the directions given last month. Where the plants are properly mulched, pull up the coarse weeds that find their way through the mulch. Beds coming into fruit should be mulched before the fruit gets of much size. Straw, rough hay, or corn stalks are used.

Kitchen Garden.

We here again follow an alphabetical arrangement, and refer to last month for articles not mentioned here, as well as for the earlier treatment of those here noticed. See select list of seeds given in February, and see advertisements for novelties.

Asparagus.—Do not cut from a bed less than three years planted. In cutting, care is required not to injure the plant, or the buds that still remain dormant. Slip the knife down between the shoot and the plant and cut with its edge slanting from the plant. That which is sent to market is put in bunches 6 or 8 inches in diameter, tied with a string near the top and bottom, and the lower ends cut square. Keep moist to prevent wilting.

Beans.—Plant Early Valentine and other bush sorts as soon as frosts are over. Nothing is gained by planting in cold soil. Limas are still more tropical in their habits and need hot weather. For these, and all other pole beans, set the pole first; let the soil be rich, and put a half dozen beans, with the eye down, around each pole. Those started

under glass, or in-doors, are to be set out when the weather is settled and warm. Poles six or seven feet out of the ground are tall enough. The middle or last of the month is quite early enough for Limas, in most places.

Beets.—Thin and weed those sown early, and sow early sorts as directed last month.

Broccoli and Brussels Sprouts.—Same as cabbage.

Cabbage.—Sow seed of the medium and late sorts in the open ground. As soon as the plants appear, they are liable to the attacks of the "flea," an insect which in some places renders it very difficult to raise them. A sifting of ashes, air slacked lime, or soot will be of some use. Plants raised under glass are generally ready to be put out. In transplanting, reject such as have malformed roots, or appear unhealthy. Set the smaller kinds two feet apart each way. Well enriched soil (lime with the manure is useful) and frequent hoeing are essential to success. A bit of paper, or a leaf put around the stem at setting, will keep off the cut worm and is worth trying where the number to be set is not large.

Capsicums or Peppers may still be sown under glass. Do not set out plants until settled warm weather, and then give them a favorable exposure.

Carrots.—Sow Early Horn for first crop. Weed and thin those sown last month. As soon as the rows of young carrots can be seen, pass a weeding hoe between them. Thin to four or six inches.

Cauliflower.—The general treatment is the same as cabbage. They need a very rich soil. Those already planted should have frequent hoeings. For the late crop, seed may be sown in the open ground.

Celery.—Sow seeds in the open ground. Thin young plants started under glass and shade during the heat of the day, until they get hardened.

Cress or Pepper-grass.—Sow for succession.

Corn.—The principal crop should not be put in until "corn planting time," but a small patch of an early sort may be planted to take its chances.

Cucumbers.—Plants started in pots, or on sods, are to be set in hills when frosty nights are over. Have at hand some kind of box, or cover, to protect them during the night. A box covered with any open fabric will keep off the bugs. A few hills may be planted in the hot-beds or cold frames as soon as other things are out, and they will come forward rapidly. Sow in open ground when well warmed.

Egg Plants.—If those in the hot-bed get too large before it is safe to put them out, pot them or transplant to another bed. A warm rich place should be chosen, and planting out only be done when there is prospect of continued warm weather.

Herbs.—Sow all sorts of seasoning stuffs.

Kohlrabi.—Treat like cabbage.—*Leeks.*—See April.

Lettuce.—Transplant from frame or seed bed into rich soil, a foot each way. Sow seeds in open border.

Martynia.—The pods of this are fine for pickles. Sow in hills three feet apart at corn planting time.

Melons.—Treat as cucumbers. Manure in the hills, which should be at least 6 or 8 feet apart.

Nasturtium.—Sow in warm soil, and when the plants are up, give them brush to climb upon.

Okra.—The dwarf does best at the North. Sow where it is to stand, in rows two feet apart, and thin to two feet in the rows. Do not sow until June, unless in a very warm place.

Onions.—If the sowing is not already done, attend to it the first thing. See last month.

Parsley.—Sow as directed last month.

Parsnip.—Sow fresh seed early in deep rich soil.

Peas.—Hoe and draw the earth towards them. Supply brush before they fall over. Sow late sorts and put in a row of dwarfs when there is space.

Potatoes.—Finish planting. Hoe those that are up.

Radishes.—Sow seed every two weeks for succession. Give a sifting of ashes or soot to the young plants, if there are any signs of insects.

Rhubarb.—Plants set last fall or this spring need all their leaves. Pull from established plants only. Do not eat the leaves, but remove them with a

quick, but not violent pull in a sidewise direction. A few trials will make one quite expert at it.

Salsify.—Sow early and treat like carrots.

Spinach.—Hoe, thin and weed the early sown, and put in seed for succession.

Squashes.—The bush sorts are treated the same as cucumbers and melons. In planting the running kinds, the whole land should be rich, as these get much nourishment by roots thrown out at the joints. Plant when the weather is warm, and give the young plants every protection against the striped bug. A free sifting of air slacked lime will help keep off the striped bug. The black squash bug that comes later must be hand picked.

Sweet Potatoes.—The cultivation of these at the North is now very general. If plants were raised as directed last month, they should have free ventilation, and for some time before setting out, be exposed entirely, to harden them. Plants may be bought from those who advertise them, and they will go safely by express, a long distance. The time of planting varies from the middle of May to the middle of June. A good soil and plenty of manure, are essential, and the plants may be set in rows or hills. Planting in rows is generally preferred in the garden. Spread a bountiful dressing of manure and then by means of the spade, or plowing two furrows together, form a ridge over it about ten inches high, a foot wide at bottom and three or four inches wide at the top. Upon this ridge the plants are to be set 16 inches apart. Set them by making an opening with a trowel, and inserting the plant down to the first leaf. Water the holes if the soil is not moist. Where there are more rows than one, they are made 3 feet apart from center to center.

Tomatoes.—Those under glass are to be transplanted as directed last month, or put out—according to the weather. A slight frost will kill the plant. We have given, in a basket item, a kind of shelter that may be employed in the garden; a newspaper tied over a stick, so as to form a shelter will keep off a moderate frost. A French plan of training the tomato is given in the same article.

Turnips.—Early turnips are among the most difficult vegetables to have good. They are generally sown too late. Sow as soon as the ground can be worked. Dress with ashes or soot as soon as up, and thin and hoe as soon as large enough.

Winter Cherry.—Treat the same as tomatoes.

Weeds.—Begin early if you would be master of the situation. It is much easier to destroy a young weed than an old one. There is but one specific to destroy weeds, and that is, a judicious mixture of hoe and "elbow grease."

Flower Garden and Lawn.

Those who have garden spots in cities or villages must have noticed what a sudden increase there is in the number of gardeners each spring. These chaps, "garners" they call themselves, go about "making gardens," and usually know about as much about it as the spade they carry with them. They can do a wonderful amount of mischief in a short time in a border containing perennials. They break up and scratch over the surface, leaving it so that it looks neat, charge a round price, and depart, taking along with them any nice plants that can be carried off, which are sold at the next place where they do a job. There are some decent men in this spring gardening business, but we have known many worthless vagabonds. On page 188 we have said something about

Annuals.—The limited list there given contains only the indispensables. For other varieties consult the catalogues of the seedsman. In sowing, it is well to reserve a part of the seed, to guard against failure. The sowing of the remainder at a later day will prolong the flowering season of those things which do not keep long in bloom.

Edgings are required to give a neat look to the garden. Edging tiles, so much in use abroad, are but little known here. Box is the generally used material, but is not hardy far north of New York. Old box is to be reset when it gets too ragged, or

thin below. Break the old plants up so as to leave a bit of root to each, and set anew, leaving the tops about 3 inches above the surface. Cuttings are sometimes used, but as all are not sure to grow, it is not safe to make edging from them. It is better to leave the cuttings in a nursery bed for a year, and then use the rooted ones. Ivy may be trained to make a neat edging, and Thrift, Moss Pink, and Stone Crops are used more or less.

Bedding Plants will, for the most part, go out this month. Every one must have Verbenas, Salvias, and Heliotropes. The number of plants now sold by florists as bedders, is large, and we refer to their catalogues for the list. In sowing seeds do not forget to provide for the future in the way of

Perennials and Biennials.—These are best sown in a reserve bed, where they will be out of sight, but not out of mind. Delphiniums, Pentstemons, Aquilegias, Phloxes, Foxgloves, Hollyhocks, and others, are easily raised in abundance, and there is always the chance of getting some new variety among the seedlings. Among the

Bulbs for spring planting, Japan Lilies, and Gladioluses, are the most used, and with them alone a great show may be made. Then there are the brilliant Tigridia, or Mexican Tiger Flower, the Amayllis or Jacobean Lily, Oxalises, and other desirable bulbs sold at this season. Not forgetting the

Tuberose, the most fragrant of all garden favorites. Bulbs that have been well kept, should be set in rich soil. Plant offsets by themselves to make flowering bulbs for another year. One is surer of flowers if he buys bulbs forwarded in pots.

Label everything, but especially those bulbs and roots that are to be taken up in autumn. A smooth pine stick smeared with white lead and written with a lead pencil will last for a single season. Do not neglect to seize upon every favorable place to set

Climbers.—If too late to put out perennial ones, sow annuals, such as the finer Ipomeas, Cypress Vine, Sweet Pea, Canary Bird Flower. It is rather late to start Cobaea, Lophospermums, and Maurandias from the seed, but small plants may be had of the florists.

Dahlias are to be started if it has not been already done. Put in a hot bed or frame, and cover the roots with earth. If there is no glass, put in a warm spot out of doors and cover over at night to keep them warm. When the buds start, divide the roots so as to have a root to each bud.

Spring Bulbs, as they pass out of flower, should not be disturbed so long as their leaves continue green and vigorous. When they fade, lift them.

Roses.—The slugs must be syringed with whale oil soap, and the bugs picked by hand. Turn the tender sorts from their pots into the borders.

Lawns will need to be mowed as soon as the grass is long enough to be cut by machine or scythe, and *Evergreen trees* may be planted upon the lawn and in the grounds, as directed under Orchard and Nursery.

Green and Hot-Houses.

The amateur should be in no haste to bring his plants out of doors. The time for doing this must be governed by the character of the season, and it is better to be much too late than a little too early. If the plants are properly inured by abundant ventilation, they will be prepared for the change, and will not mind it. The hardiest things, such as roses and the bedding plants, should come out first. There are many things that may be turned out of their pots, others do better to have the pots plunged in the border up to their rims. When a pot is plunged, put some coal ashes at the bottom of the hole, to prevent worms from finding their way into the pot. The house, in summer time, too often presents a desolate and neglected appearance. With a slight shade and abundant ventilation there are many things that do better if left in the house. Among the things to turn into the border, are

Fuchsias. These are very fine when grown to a tall stem for the purpose of ornamenting the border. They will, of course, require stakes. Likewise *Abutilons, striatum* and *venosum*, make fine plants

in the garden; the only trouble is, they are apt to get too large, but they are so easily continued from cuttings that small plants can always be had.

Lantanas, grown with a tree-like head, are always among the showiest things in the garden. These are usually treated as bedding plants, but the best way is to grow them to a single stem, pot in the fall, and winter in a green-house. Most of the

Cactuses bloom in summer, and they make a great show when plunged in a sunny place in the border.

Sedums of all kinds, including *Crassula*, *Rochea*, and *Sempervivum*, as well as *Mesembryanthemum*, and other plants of like character, may be made to produce a most grotesque effect, if planted out on a rock work. They stand any amount of dryness.

Cuttings should be made, to keep up a good stock of young and thrifty plants. Hard wooded plants, that are difficult to strike from mature wood, will often do so easily from the young growth.

Whatever plants are left in the house should have daily attention as to watering, syringing at night, and ventilation.

Cold Grapery.

The manure placed over the outside borders last fall, is to be forked in, and if the dressing of manure was omitted then, give one now. The manner of suspending the vines while breaking, was described last month. The time for starting them must be governed by the season, as it is not desirable that they should commence their growth until it can be continued without interruption by cold weather. Warmth and moisture cause the buds to start, and these conditions are under the control of the cultivator. If the outside temperature continues unfavorable, keep the house cool by ventilation. When growth begins, the temperature of the house may gradually reach 85° at mid-day, opening only the upper ventilators. Keep sufficient moisture in the air by syringing the vines, and sprinkling the floor. When the shoots have sufficiently advanced, select the best for fruiting and next year's wood, and rub out the rest—observing that all handling of the vines must be done with great care, now that the new growth is young and tender.

Apiary in May.

The season is a notably late one, and so the flowerers, that supply honey which the bees rely upon for bringing out their early swarms, will not appear at the usual time, and swarms will be late. Many of the counsels given for the past month will be found applicable to the early part of this, and it will be well to continue feeding light stocks up to the time of abundant bloom. Unfavorable weather at the time of the blossoming of fruit trees may cut off the supply of honey from this source, and though bees may be in no danger of perishing, yet the raising of brood may be suspended, and the drones, should many have been raised, may be killed, in order to save stores. This would only occur in strong hives which commenced the season with abundant stores, and which in a time of dearth of bee pasturage would consume large amounts of honey. Such hives should be fed if they need it, especially if drones appear, for if it is necessary to kill the first stock of drones, swarming is greatly delayed.

Swarms may be thrown off in the latter part of the month, if the weather is very favorable. Have nice clean hives prepared—not freshly painted—and at least be ready to have them should any come. The full blossoming of white clover is the usual warning of the approaching of the swarming season. The combs ought to be frequently examined to discover queen cells, which look very much like peanuts, and entirely different from any other cells. They may be found upon edges of comb, or upon edges of holes in the plates of comb up among the brood. The old fashioned hives being inverted after quieting the bees with smoke, the combs may be quite thoroughly examined without much trouble. In the movable comb hives the whole interior is easily examined. When discovered, the queen cells are the surest indication of a swarm soon to come. There are usually several, and the discovery of one not sealed over, is no indication

that there are not sealed ones nearly ready to hatch.

Swarms issue during the warm part of the day, any time after the bees get well at work in the fields. When the queen leaves, she takes all the old and mature young bees that are about the hive at the time, leaving those at work abroad to return and keep up the establishment. It is the old queen that leaves, and she does so as soon as a new one is ready to take her place, which she knows by a peculiar piping sound made by the young queen for a few hours before her *debut*. A swarm, if let alone, will usually settle close by on some tree or bush, and unless the sun comes to shine upon it, will rest some hours, giving ample time to have it. A bag or box may be held under it, and the bees being very heavy with honey may be easily jarred off and into the receptacle, whence they may be poured out upon a sheet and guided into the hive. There is little fear of their stinging, and one may handle them carefully with bare hands and with impunity.

When hived, all the bees should be made to enter, the hive carried immediately to its stand, and a shade of some sort put up to screen it effectually from the sun. It is much more work to have in the movable combs than the box hive. It is usually the least trouble to put the swarm in a light box or box hive, and transfer to the other, towards evening. To get straight combs, elevate one end of the hive 30°—with the bottom board of course—keeping it perfectly level the other way. When the combs are started the whole length of the frames, it may be let down. Many who use movable combs will prefer artificial swarms. The idea that such are not as good has probably arisen from dividing before the stock was sufficiently strong, thereby not seeming as many bees as are usual in a natural first swarm.—Surplus honey boxes may be put on when apple trees are in full bloom; seldom earlier.

Four Premium SEWING MACHINES! Take Your Choice.

In order to concentrate the business as much as possible, we have hitherto limited our offers for Premium Sewing Machines to two or three kinds. Many have desired other machines, not offered. We take pleasure in announcing that we have now made arrangements to offer four double-thread machines, viz.: the **Wheeler & Wilson**, the **Florence**, the **Elias Howe**, and the **Grover & Baker**. We have had each of these machines in use in our own family, and can endorse every one of them as good. They have each their peculiarities, which are set forth by the manufacturers from time to time in our advertising columns, and in the circulars, etc., which they furnish; but they all work so well, that if we owned any one of them only, we would give ten dollars to exchange it for any other one.

We say further, that we would not part with the last one of the four, whichever kind it might chance to be, and have no machine, for \$500.—Does this look like a wild statement? Let us see: The \$500 could be invested in U. S. Bonds, and bring perhaps \$36 a year interest. The sewing in one large family can seldom be done by two full days a week of steady hand sewing, or 4 months in a year. But with any one of these machines a woman can sew at least eight times as fast as by hand, but allowing for all the basting, etc., call it only four times as fast. Then with a sewing machine three out of four months sewing can be easily saved! Can any one hire and board a seamstress three months for \$36? We know, that any one of our \$55 to \$90 sewing machines pays for itself every year, with us.—Then, there is another important consideration. The cramped chests, the rounded shoulders, the deformed spines, the injured eyesight, all so common among those who sew much with the needle, are avoided by those who use a machine. The benefit in this respect by far outweighs the cost of the machine.

So much for what we think and know about sewing machines. The kinds named above have been used in turn, and have all increased in favor.

Many may get a Machine free!—We always advise every man who asks our opinion, to get some good machine for his house, even if he has to sell an acre of land to do it. Our Premium offers have furnished a great number of machines without cost to the recipients, and many more *may still get them*. Every now and then somebody sends in a list of 70 names, saying it was gathered in far less time than expected.—There are many credits on our premium book, of partly names enough, which might be filled up this month. Any energetic person can raise an entirely new club, and get a sewing machine in a week or two. The paper is good enough and beautiful enough, to induce people to take it, and many will subscribe to help out a premium club. The money sent from each of a thousand neighborhoods to the humbugs we have this year exposed, would have paid for a large club of subscribers.—Let many of our readers take hold of the sewing machine or other premium this month. The 70 names will soon be gathered. At this season of the year we shall not be strenuous about the chance lack of a name or two from the 70 required.

TWO MONTHS

yet remain for all who want any of the general premiums in the table below, to secure them. During April several entirely new lists have been made up, and many lists under way have been filled. A thousand others can do the same this month. We have several hundred partially completed lists on our Premium Record, waiting for a few more names only. With the five numbers of this volume to show what this paper is, it will not be difficult to secure subscribers. One subscriber informs us that the exhibition of that poultry picture, on page 149 of April number, created so much interest in a company where he happened to be, that he started a club at once, and soon added names enough to secure a desired premium. A notice elsewhere announces a choice of four Sewing Machines.—We can not spare room to describe the premiums which are all very good, but will send a full **Descriptive Sheet** free to all desiring it.

Table of Premiums and Terms, For Volume 25. Open to all—No Competition.

Names of Premium Articles.	Price of Premiums.	Names at \$1.00 each.	Names at \$1.50 each.

No charge is made for packing or boxing any of the articles in this Premium List. The Premiums, 1, 2, 3, 8, and 13 to 25, are DELIVERED to any part of the United States and Territories, free of all charges. The other articles cost the recipient only the freight after leaving the manufactory of each. Every article offered is warranted new and of the very best manufacture.

Premium 1.—Good Books.—Any person sending 25 or more subscribers, may select Books from pages 200, 201, 202, 203, to the amount of 10 cents for each name sent at \$1; or to the amount of 30 cents for each name sent at the (ten) club price of \$1.20 each; or to the amount of 60 cents for each name at \$1.50. This is only for clubs of 25 or more. The Books sent by mail or express, prepaid by us,

[Only for May and June, 1866.]

Special..... Extra
PREMIUMS

FOR

One Subscriber.

Everybody can get one of These.

One Hundred Thousand Subscribers was, until recently, our highest aim, but that point was easily secured some time ago, and we are going so rapidly towards 150,000 that we have set that down as the figure for this Quarter Century Volume. We intended to make it a superior volume, and the general testimony of our readers is, that this is being splendidly accomplished. The first five numbers contain 204 pages, instead of the standard 160, and the engravings are certainly large, beautiful and instructive, while so far they count up nearly 200, large and small. The character and style of many of these engravings is scarcely equaled by any of the Illustrated Journals in the Country. Well, why should not the cultivators of our country have a beautiful and tasteful journal, as well as a practical one.—We think our readers will agree that the reading matter has been valuable so far.—We mean to make the rest of the volume at least equally valuable. Do we say too much then, in asserting by advertisement or otherwise, that this 25th volume will be abundantly worth the small subscription price to every one who can be informed of its character and persuaded to subscribe for it?

But about the 150,000 subscribers. A single name more from each of a small part of our present readers will do the work. The paper will pay those induced to take it. Will the reader please send one of these names?

As an acknowledgement of any such favors, we propose to send one of the following books (whichever may be desired) to any one who will forward the name and pay of one subscriber for this volume. (This is only for names received between May 1st and June 30th—none before or after—and we can only send to those who specify which book is wanted for each name.) The books, one for each subscriber, will be delivered at our office, or sent free (post-paid) wherever desired. Of course two names will be acknowledged by any two books desired, three books for three names, and so on. These names can not count in the general premium list (on page 169). That list will also be continued to June 30.

- * * * * *
- Premiums (Post-paid.) For all of 1866—\$1.50.
- A—The Rural Annual for 1866.....For One Subscriber
- B—The Rural Register for 1866.For One Subscriber
- C—American Bird Fancier..... For One Subscriber
- D—American Rose Culturist.....For One Subscriber

- I—Hop Culture, Complete.....For One Subscriber
- K—Onion Culture, Complete.....For One Subscriber
- L—Our Farm of Four Acres..... For One Subscriber
- M—Richardson on the Dog..... For One Subscriber
- N—Tobacco Culture, Complete..... For One Subscriber
- * * * * *

The above are all neatly bound in colored paper covers. The Rural Annual and Rural Register are wanted in every family. The eleven others are each wanted by a large class. The books on Flax, Hops, Onion, and Tobacco Culture, are the best works on these several subjects that ever have been produced, and are very valuable to every one growing the smallest quantity of any one of these crops. See further descriptions of the above books, in the list on pages 201, 202, 203. We have electrotype and stereotype plates of all these works, and can supply all copies called for.

Here then is an opportunity for everybody who desires one or more of these to get them without expense, by simply soliciting the subscription of a neighbor or acquaintance. The back numbers of this volume of the Agriculturist, of which new editions are now in press, will be sent to all subscribers, as soon as the names are received, and the premium books will be promptly sent to the address given for them.

New York Live Stock Markets.—

BEEF CATTLE.—The supply, though variable, has been about an average one, and prices are just about the same as a month ago, or equivalent to 15c@16c per lb. dressed weight for good cattle, and from that down to 12c@13c for poor grades. Some very good, 17c@18 ... **MILK Cows** still tend downward; few are willing to pay \$70 for a good cow, with the high price of feed and danger of the Rinderpest. Prices range from \$30@40 for poorest to fair; \$50@65 for medium to pretty good; \$65@80 for really good milkers with calf by their sides, and a few extras at higher rates. ... **Veal Calves** are coming in very freely, and prices are down to 6c@11c per lb. live weight for poor to very good. "Bobs" are only sold on the sly. ... **Sleep and Lambs** have been in full supply and are lower; shorn 6½c@8c per lb. live weight, according to quality; woolled sheep 1c@1½c higher. Spring Lambs bring \$5 to \$8 each, according to size and quality. ... **Live Hogs** are in excess of the demand; prices, 9c@10½c per lb live weight, according to quality. For other Markets and Prices, see page 194.

Containing a great variety of Items, including many good Hints and Suggestions which we throw into small type and condensed form, for want of space elsewhere.

The "One Subscriber Premiums," on this page, are worthy the attention of every one. A book or two, or more, can be obtained without expense, while doing a good thing for others—for any one led to become a reader of a journal like this will surely be benefited. If we had the money in subscriptions, which has been sent to swindlers the present year, and which would not have been sent had the swindled been readers of this journal, we should now be printing at least 250,000 copies.

Beware of Stranger "Agents" for the Agriculturist.—We hear from a few distant towns that certain strangers have appeared in some localities, representing themselves as the employed "traveling agents" of this and other journals, and exhibiting forged certificates and receipts from the publishers, giving them authority to act. They exhibit samples of the papers obtained through news agencies.—We send out no traveling or other agents, and authorize no one to sign receipts outside of the office, and allow no one to take subscribers under the regular rates.—Whenever any such swindler appears, he should be promptly arrested and brought to account. Our only agents are those who voluntarily raise premium clubs where they are known so well as to be trusted. Our premiums are open to all alike.

Soiling Cattle.—The best treatise that has ever been published on this subject in this country, is the Essay of Hon. Josiah Quincy. It has been for some time out of print, but we are happy now to have it in our power to recommend it to our readers and to supply them too. It is neatly bound together with a biographical sketch of the author by Edmund Quincy. Price \$1.25.

Book on Manures.—Prof. S. W. Johnson, as Chemist to the Connecticut State Agricultural Society, thoroughly investigated the various commercial fertilizers offered in the markets of that State. He gave in his reports very clear and succinct statements of the theory of manures, and rules for judging of the quality of those offered for sale, and of the quality of articles of manurial value which an agriculturist may be able to obtain. These reports are published in an octavo volume of 178 pages, and contain a great amount of valuable information on manures, peat, muck, etc., which can be obtained from no other source. Price \$1.50.

Valuable List of Books.—A nearly complete list of all the books published in this country, on Agriculture and Horticulture, and some others, will be found on pages 200 to 203 of this paper, with brief descriptions of a part of them. (This has been in type for several months, but set aside to make room for the advertisements of others.) The list will not only be a valuable aid in selecting books for present use, but also worthy of preservation for future reference.—The prices are not nearly so high as the cost of paper and labor would demand, these being at least double former rates, while the average advance on the books in the list referred to is not 25 per cent., or one-quarter, above the lowest old prices.—One can hardly make a better investment than to place before his family a stock of good books referring to his own business. Five, ten, twenty-five, or fifty dollars worth of books put into a boy's hands will fill his head with

ideas, set him to thinking, and do more toward his future success in life, than a thousand dollars laid up on interest for him. The latter may give him more capital to start on, but with a good stock of ideas and a developed mind, he will do far better in life with a much smaller money capital to begin with. "It is the mind that makes the man," and the store of thoughts, and the exercise of the thinking and reasoning powers, are what make the mind. What would be the effect upon the great farming and gardening and fruit growing interests of this country, if every cultivator had one acre less, and its value laid out in a library of books about his business. Would it not often keep his boys out of bad company, and tend to their refinement? Would it not dignify the calling in the eyes of his family and of himself, furnish food for thought while engaged in daily toil, and by the hints and suggestions derived, promote the profit of his labors? The subject is worthy of consideration.

New Book on Peat.—Peat is exciting much interest, both in regard to its use as fuel, and to its great value as a manure, for an amendment to soils, and as an ingredient in composts; and we are happy to announce as in press a compact, practical and popularly scientific treatise covering this whole subject, by Prof. Samuel W. Johnson, of the Sheffield Scientific School, Yale College. It will probably be ready June 1.

Country Life, by Robert Morris Copeland. This is a handsome volume of over 900 pages, printed on fine paper and well illustrated. Its scope includes farming, gardening, green-house and grapery culture, window gardening, and in short there seems to be scarcely a subject connected with rural life that is not treated upon. It is valuable as a work of reference for any of these subjects, and so far as we have examined it, its teachings appear to be plain and sound. The present is the fifth, and greatly enlarged edition. Price by mail \$5.

Hours at Home.—This valuable magazine, valuable because instructive, interesting, and at the same time a safe one for every family, has added to its already long list of first class contributors, the names of "Ik Marvel," (Donald G. Mitchell), "Timothy Ticombe," (Dr. J. G. Holland), and Rev. Dr. Boshnell. See p. 199.

My Vineyard at Lakeview.—This is the title of a new work upon Grape Culture, and gives an account of the failures and successes of a novice in grape growing. Works that give us the personal experience of the writer have a charm about them that no abstract treatise can possess, and while in this work personal matters are not given an undue prominence, there is sufficient of narrative to be interesting. The author has no pet theories or systems, but gives a straightforward account of what he did and how he did it, and tells the whole in a style which is at the same time clear and pleasing. The author withholds his name in order to avoid the annoyance of correspondence, to which every one is subjected who allows his name to appear in print as the raiser or cultivator of any thing. We may state that he is a cultivator of experience, and is perfectly familiar with the manner in which grapes are grown in the successful vineyards of the West. He gives us a clear account of the methods actually practised in those localities where vines are grown for their fruit. The method of pruning and training is illustrated by engravings. We predict a wide popularity for this little work, as it is just the book many have been looking for. Price \$1.25.

Sundry Humbugs.—Here again we have a fresh lot of hundreds of letters, from all parts of the country, especially the distant West, detailing the loss of money, enclosing circulars, "confidential" letters, grand lottery schemes, tickets for magnificent prizes, etc., etc. The requests for answers are so numerous that it is utterly impossible to write to a quarter of those who ask us to do so, and they will please accept this excuse. The tickets drawing splendid prizes, sent to us for collection, usually for our own benefit, would, if genuine, give us a profit of a clear hundred thousand dollars. Suffice it to say that after repeated trials we have not found a single one of these "tickets," or "certificates" worth paying for. Take an example: A subscriber sends us \$5.25 with a ticket that calls for a splendid "English Patent Time Keeper." We call again and again on the operator, but the "boss" is never in—"has stepped out a minute or two, but will soon be in." We wait an hour at a time but he never comes,—rather the real swindler, with whom we are really talking, never acknowledges himself the party. But by a little subterfuge we ascertain that this "time-keeper" is a little card with figures and lines, etc. The thing may cost a dime, and is worth nothing.—Another ticket calls for a "sewing machine" on payment of \$5.25. After repeated calls, as before, we find it a little, almost or quite worthless thing, offered by another dealer for \$2.50.—Another \$5.25 ticket calls for a "large

silver Butter Cooler with Revolving Dish"—a leaden mass with hardly a six-pence worth of silver covered over the article. (See page 147 of April *Agriculturist*.)—Here is another case, just like scores we have looked after: "Charles K. Park & Co.'s Watch and Jewelry, 81 Nassau Street, New York," sends out very plausible circulars and tickets for sundry articles, watches, etc. Sundry subscribers send us the required sum (\$1.72) to get the prizes drawn, and we go often there. Result: There is nobody at 81 Nassau St. who will acknowledge the name Chas. K. Park & Co., and no sign of any such party in the whole building. This is the case with at least three-fourths of the letters, complaints, circulars, etc., sent to us.—We repeat that: IT IS NOT SAFE TO SEND MONEY TO ANY PARTY ADVERTISING BY CIRCULARS AND OFFERING TICKETS OF ANY KIND, NO MATTER HOW SPLENDID THE OFFERS MAY PRETEND TO BE.—Some of the swindlers are noticed in other items in this paper; we have not room for further particulars.—We will only ask our readers to continue to talk about this subject among their neighbors, and show them what is published in this and especially in the previous two numbers. If the people can be generally enlightened, the swindling tribe will be compelled to stop their nefarious operations for want of patronage.—The immense amount of business they have been doing the past few months is almost beyond credence. Millions of circulars have been sent out, and among the multitude reached, enough simple hearted, trusting persons have been found to pay all expenses and give large profits. On an average not one dollar's worth has been returned for each hundred dollars forwarded to them!! We speak understandingly.

"How did they get my Name?"

This question is frequently asked, by the hundreds who send us samples of circulars, "confidential letters," etc., they have received from swindling concerns in this city and elsewhere. Some write that their names are recorded no where else in this city but on our books, and must have been obtained therefrom. This is a mistake; we allow no one except those writing the mail wrappers to have access to our letters and books for any purpose whatever; and we may add, that any circulars or other documents ever found put into the *Agriculturist*, are put there after the papers have gone into the mails, usually at the place of delivery.—The fact is, there is a class of men engaged in gathering names from all over the country. (We have before us an offer to furnish us a list of the names and P. O. addresses of "25,000 practical, responsible farmers in different parts of the country, at \$2 per 1000.") Duplicate lists of these names are sold to all who will buy them, and thus the humbug operators secure all the names they desire. One operator printed 1,200,000 swindling circulars of the same kind, indicating that his collection of names must be a pretty large one. One swindler often runs several schemes, sending his different circulars, at different times to the same person; but coming from another locality and address, and for a different object, the deception is not noticed. We recently heard of a case where two swindlers agreed to trade lists of some twenty thousand names, and then quarreled about the terms. Pity they don't all fall out and have a "Kilkenny Cat" war.

The Dead at Andersonville.—The N. Y. Tribune Association has done a special favor to the friends and relatives of the Thirteen thousand soldiers who perished in the terrible prisons at Andersonville, Geo., by issuing in neat but cheap form (25 c.) a record of the names of all who died and were buried there. Of these, 12,367 died in 1864, and 653 in 1865. The names are arranged alphabetically in States, for convenient reference—the regiment, company, rank, and also the immediate cause of death being given with each name.

What are Seeds?—Official Decision.

—A gentleman of this city wished to send some Hickory nuts to a friend at the West, and attempted to mail them at the N. Y. City Post-office. They were refused on the ground that they were not seeds, and an appeal was made to the P. O. Department at Washington, which sustained the remarkable decision of the N. Y. Postmaster. We quote from the reply of the Department: "The case as submitted by you, in which you claim that 'Hickory Nuts' should be classed as seeds under the 20th Sec. of the Act of 1863, has been carefully considered, and the Department is of the opinion that such cannot lawfully be classed under the sec. and act referred to: that said act includes such seeds as are distributed by the Agricultural Bureau of the Interior Department, and none other."—This strikes us as a most extraordinary decision, and it will interest our friends at the West, who are making every endeavor to clothe their treeless prairies with forests and wind-breaks, to know that the seeds of the most use to them are not seeds at all in the eye of the law. Nuts are shut out of the mail because they are not

distributed by the Agricultural Bureau! Who ever knew the Agricultural Bureau to send so useful a thing as tree seeds?—But as this is the standard by which the law is to be interpreted, why don't the national seed shop send out a catalogue, and let us know what are seeds and what are not. Antiquated peas, well known squashes, and all such things may be sent *ad libitum*. A friend of ours down in New Jersey gets a good share of chicken feed from the Agricultural Bureau, and all through the mail, but tree seeds to be sent West, are refused!

Knox's 700-Strawberry.— "Novice." We have not seen this plant in fruit, but the testimony of good judges is altogether in its favor. Aside from that, we place great reliance upon the judgment of Mr. Knox himself, whose business is to grow fruit as well as plants, and he only grows the varieties which pay.

Bugs in Peas.—C. Conant, Barnstable Co., Mass. The bug in the pea comes from an egg laid in the pea when it is young. The egg hatches out a grub, which finally changes to a beetle. Scalding the peas, before planting, will kill beetles.

Flax and Hop Growing.—By far the best practical treatises on these subjects are those issued in cheap, condensed form, containing everything connected with their culture, curing, etc., with many illustrative engravings. Flax culture will be sent by mail, post-paid, for 50 cents, and Hop Culture for 40 cents.

"Eye Sharpeners."—There are sundry articles advertised under this and similar names, and several write to ask our opinion of them. Our opinion is, that the less people tinker their own eyes and watches the better it will be for both delicate instruments. If one has a valuable watch he is quite careful to place it in the hands of a skillful workman, and we advise them to pursue the same course with their eyes.

A Great Waste—Save the Bristles.—Tons of bristles, for which many thousands of dollars would be gladly paid by brush manufacturers, are annually wasted throughout the United States. Here is a chance for farmer's boys to "do good and make money." Whenever a hog is slaughtered, pick out the bristles, tie them in a bunch, the but-ends all one way, and sell them to the country store-keeper, who will find a ready market for them in this city. See advertisement for them.

"Free Martins" are twin heifers with with bull mates. There are numerous instances of their breeding, but as a rule they are barren.

The "Reno Oil and Land Company."—"Accidents will sometimes happen in the best regulated families," says Dr. Lore, Editor of the Northern Christian Advocate, in speaking of our admission of the above company's advertisement last month.—Well, it was a little singular, to say the least, that after rejecting many thousands of dollars from petroleum advertisements, the very first company we did admit, failed before the paper was fully printed. Happily, however, no one lost a dollar by that advertisement. Every dime invested by outsiders was carefully refunded by the projectors of the enterprise who went into it in good faith, and with the best prospects. We greatly regret that causes entirely outside of the merits of the enterprise itself, led to a suspension of operations, for had it gone on, we are confident that all of us who had a share in it, would have reaped a rich harvest. The truth seems to be, that neighboring enterprises, jealous of the large plans and excellent prospects of the Reno Company, combined to produce an unexpected run upon the banking house of Messrs. Culver, Penn & Co., who were most largely interested in the Reno Company, which, with the sudden fall in the value of oil, and of property connected with it, led to the suspension of the new enterprise. The funds of the Company were kept separate, however, and as stated above, every investor received back all he had paid in. This confirms what we stated last month with regard to the good character and honesty of the men we had to deal with, which was the basis of our confidence.

Plants Named.—We have several times requested those who send plants to be named, to take a little care with the specimens. Often several specimens are put into an envelope without any paper between them, and reach us a mass of fragments, which it would puzzle the most ardent "reconstructionist" to put together. Hereafter we shall throw all such specimens aside, as we cannot waste time in trying to make them out.... F. P. Le Fevre, Union Co., Pa. *Malva viscosa arborea*, sometimes called *Achania*, a very fine greenhouse shrub.... Mrs. J. B. Davis, Ashtabula Co., O. The

purple flower is Spiked Willow Herb, (*Epilobium angustifolium*), the other too much broken.... M. E. Wake-man, some species of *Eupatorium*, but the lower leaves are needed to determine which one.... L. P. B., Weston, Vt. *Potentilla fruticosa*, or Shrubby Cinquefoil, yellow: *Gentiana quinqueflora*, the Five-flowered Gentian, blue, and the other probably *Spiranthes cernua*.... L. T. Prill, Decatur Co., Ind. The white flower is *Chelone glabra*, or Turtle-head, the red one *Monarda didyma*, Bee Balm, and the other is *Hibiscus militaris*.... W. S. Draper, Osage Co., Kansas. Two species of *Enothera*, or Evening Primrose. *E. speciosa*, the small one, and *E. Missouriensis*, the large one.

Transactions of the Illinois State Horticultural Society, 1865.—Proceedings of the 16th Annual Meeting.—This neat volume of 66 pages gives the discussions of the wide-awake horticulturists of Illinois, and is useful as embodying their present views of fruits and kindred matters. The western horticulturists are a genial people, and when they get together, many sound and some sharp things are said, all of which are faithfully recorded in this volume. Price, by mail, 50 cents. We have ordered some for our readers.

Field Culture of Strawberries.—The following plan is practised in Burlington Co., N. J., as given in the Report of the West Jersey Fruit Growers' Association: "The old plan of planting and cultivating is still the only one which meets with approval here. It is that of setting in rows five feet apart, and from ten to eighteen inches in the row, according to the vigor of the variety, and training into beds from three and a half to four feet wide, and covering in the early part of winter with fine stable manure. After picking they are sometimes cleaned and allowed to fruit a second season, though it is becoming common to pick them but a single year, it being considered less expensive to raise a new than to clean an old bed, and that the former will yield a larger crop; though the Lady Finger is reported in Beverly to pick far better at its fourth fruiting, if well cared for, than in any previous year."

Lime Wash for Out-Door Use.—"Chamberlain," of — County, Pa., writes: "I want a lime wash for fences, buildings, etc., of a neutral color. We are enveloped in black cinder here, and whitewash makes too glaring a contrast, severe on the eyes in summer."—A good whitewash is made by diffusing through the milky lime a *lime-soap*, which is insoluble in water. To make it, slake the lime, and while at the hottest add a small quantity of tallow, or other grease, and stir thoroughly. Half a pound to the peck of lime is enough. To such a wash any common coloring matter might be added—as ochre, burnt umber, lampblack, Prussian blue or a mixture to suit the taste.

In-Door White-wash.—To lime for a pailful of white-wash add, while slaking, ½ pint common linseed oil and a handful of fine salt. Good for out-doors also. Another in-door wash is: 2 lbs French white, 1 oz. best white glue. Soak the glue in cold water, and dissolve it, heating the water carefully, to rather thin gluey consistency; add this to the whitening, stirred up in hot water, and thin for use with hot water also.

The Best Carrot for Stock.—J. B. Hallet. We prefer the Long Orange. Plow deep. Sow in rows 30 inches apart; thin 6 to 8 inches apart; cultivate with horse hoes or cultivators, and keep free from weeds. You do not give your State. If you are located at the East, it would probably be best to put the rows 20 inches apart, for you will be likely to give more hand culture. The soil must be in prime order.

The Early Horn Carrot.—The Long Orange Carrot is out of place in the garden; it should give place to the Early Horn, which is also known as the Dutch Horn and Early Dutch. It is of the best quality for the table, is early, and from its shape is readily pulled.

Plants to Grow in the Shade.—All the broad-leaved evergreens will do in the shade of trees, provided the roots of the trees do not exhaust the soil. Kalmias, Rhododendrons, Daphne, Tree Box, Ivy, Vincas, etc. Sweet Violet, Hepaticas, some of the Campanulas, Dicentra, Bloodroot, and several of the herbaceous Spiraeas and Saxifrages will do well.

Caterpillars Nests.—W. Batty, Delaware Co., Pa. The nests sent are those of the Basket or Drop worm, figured in Nov. 1864. The eggs mentioned and illustrated in the January *Agriculturist* belong to an entirely different and usually more abundant insect, the Tent Caterpillar. Cutting the nests off and burning them, is sound in theory, and efficient in practice.

Soiling Cows—Will it Pay?—James Burgess, of Ontario Co., N. Y., has a small farm, and wants to make the most of it, and to have as few interior fences as possible. He calls for the testimony of those experienced in soiling cows. We hope it may be given in detail. Our own experience has been irregular and only goes part way, consisting in cutting and feeding clover, lodged oats nearly ripe, also other grain, and corn sowed for fodder, during some weeks, including most of July and August, for several seasons. The cows were kept up and had the range of a yard a few hours daily, and the fodder was cut so as to have at least some hours' sunning if practicable before feeding, being fed occasionally two or even three days after cutting. The results were very satisfactory, and we have seen fine dairy herds that never browsed grass in the field in their lives.

Peat as Fuel.—On page 179 will be found an interesting article on this subject, in which, however, our correspondent in his enthusiasm is led into some inaccuracies of statement, especially in regard to the value of Dr. R.—'s 15 acres of peat. The best uncondensed peat can hardly be estimated as worth more than good fire wood cord for cord, and peat shrinks in drying, so as to occupy but $\frac{1}{2}$ to $\frac{1}{3}$ its original bulk. The richer the peat, the more it shrinks. Throughout the article the distinction between compressed and simply dried peat is much lost sight of, hence the statements are loose. This note should have followed the article in question.

Trichina in Pork and in Newspapers.—In the N. Y. Daily Times of Feb. 5th, 1864, there appeared an account of the death of one person and the illness of three others, from eating ham infested by *Trichina spiralis*, and the statements of the article fortified by the sworn testimony of several physicians. The N. Y. Evening Post during the month of February, 1866, quoted two articles from foreign journals giving accounts of "great consternation in Germany," and particulars of the de-population of a German town by *Trichina* disease. On February 18th, 1866, the Chicago Sunday Times published an article with a displayed heading, reminding one of the dispatches after a great battle. Parts of this heading were: "Alarming Microscopic Revelations." "Terrible Fatality of the Disease," etc. The article was evidently made up by a person not familiar with the subject, and contained, among other engravings, one of a full-grown *Trichina*, extruding its young alive from an orifice near its head. Then in the N. Y. Tribune of March 10, 1866, we have an elaborate article to which especial attention is called by an editorial in the same issue. This essay was a careful posting up of the subject, apparently by a foreigner, or at all events by one who ignored all American facts and writers. Aside from those above referred to, articles of minor importance, and containing truth and error in varying proportions appeared in the Agricultural and other papers. That such accounts should have an effect upon the public mind is not strange, and the readers of the *Agriculturist* began to present their requests that we should tell them the facts in the case. Last month we gave them a plain, unsensational account of the whole matter, by a thoroughly competent physician. It was presented as a collection of established scientific facts, without any reference to what its effect might be upon any business interest. It seems that the pork interest has been affected by these accounts, and interested parties are trying to make it appear that the whole thing is a humbug, and that there is no such thing as *Trichina* disease. We know that the *Trichina* does exist, and we believe that it is best for people to know just what it is, rather than to have their fears excited by some partly understood evil. Measly pork has long been known, and is equally to be avoided with that containing *Trichinae*, yet a writer who cautions people against that form of diseased meat, may do so without suspicion of wishing to bring down the price of pork. From our article upon the subject we have nothing to retract, because it had no other object than to present facts; but two of the daily papers seem to take a different view of their publications. The Daily Tribune of March 24th says: "It is pretty evident that interested parties have had much to do with the story of diseased pork." Which shall we believe, the Tribune of March 10th or March 24th, and which of its statements are "interested"? — The N. Y. Times of March 26th has an article, the chief characteristics of which are flippancy and unfairness, the object of which is to turn the whole thing into ridicule. As the writer seems less desirous of giving the public facts than of helping the pork trade, we have only to say that the ham which produced the fatal results so graphically described in the Times in 1864, was an American ham. Ten cases of *Trichina* disease, one of which proved fatal, are recorded by medical authorities, as having taken place in N. Y. City, and the names of the physicians under whose observation they occurred, will be given to the Times' writer if he wishes to verify our statement. This

we deem sufficient warrant for the remark in our article of last month, that "the number of cases reported in this country show that it exists here to an extent, which, though not to a degree to cause alarm, is sufficient to demand attention." We have thus given the subject the "attention" our readers had a right to expect, and until some new developments appear, we may dismiss it.

Tick Remedy for Sheep.—An experienced English shepherd, after looking about our city markets, hands us the following: I see among the many sheep that come to market here, many that have loose tags of wool hanging from their coat. On examining them, I find them infested with ticks. This causes the sheep to bite themselves, which loosens small portions of the wool at the root, and contact of the sheep with one another rubs it out. There is an excellent remedy for this evil, which I have long used and will give: **SHEEP DIPPING COMPOSITION.**—For 100 sheep or lambs, take 3 lbs. of white arsenic pulverized, boil it well in 40 or 50 quarts of soft water, with as much as 15 or 20 lbs. of soft soap. Whea well boiled and stirred together, add water enough to make the whole 200 quarts, which is two quarts for each sheep.—As soon as the sheep are sheared, the ticks will generally go upon the lambs, therefore it is important to dip the entire flock, and I can assure all flockmasters it will repay them tenfold. The best way to perform the dipping is to have a tub made for the purpose, about 5 feet long and 2½ or 3 feet high; let it be narrower at the bottom than at the top. Provide a lid that will fall back upon two stakes driven in the ground, and rest in a sloping position. On these lids there should

be slats about $\frac{1}{4}$ of an inch square, nailed about two inches apart. One man takes the sheep by the head and fore legs, another by the hind legs, and they dip it into the tub which contains sufficient liquid to submerge the sheep. The head is carefully kept from going into the bath. Here the sheep is held for about half a minute, and it is then thrown out upon the lid, and rubbed backward and forward over the slats, and the locks of wool wrung, so that the liquid shall as far as possible drain off and flow back into the tub.

Medical Advertisements—A Horrid Business!—On no rational ground, except that of sheer ignorance, can we explain the fact that many professedly religious journals, and others that claim to be respectable, continue to admit a certain class of medical advertisements. Some of these published in leading religious papers even, covertly advertise the worst possible "private medicines." A subscriber, in a recent note to the *Agriculturist*, well remarks "that the medical quacks do not receive their due share of attention. There is probably no one thing so readily seized upon as the prospect of, or an offered remedy for disease. The suffering invalid, with his judgment impaired perhaps by disease, becomes a ready dupe, and the more terrible or probably incurable the disease, the more eagerly he swallows the bait."—But passing by the general run of quack medicines, we refer now to a specific class. In a chance number of one of the most respectable N. Y. Dailies, or one so considered, and patronized by a large class of respectable people, we find under the head of "Medical," half a column, or thirteen advertisements, of which at least ten are really of the worst possible character. For example, the first one is addressed to "Married or Single Ladies," professing to "remove all stoppages or irregularities, from whatever cause," etc. (We only quote what is placed before your families every day in the year, in at least half the journals printed.) The 4th, 5th, 6th, 7th, 9th, 11th, and 12th advertisements, are of very similar character, some more hidden in their expressions, but all indicating what they are aiming at. These cost for one insertion \$19.00, and there is an average of as many on each of 350 days in the year, or over \$6,500 a year paid to one paper, with much larger sums paid to others. We name far less than the actual sum, when we say that \$150,000 are paid yearly by this single class of advertisers, for publicity alone. Of course they must have a large patronage or they would not continue the advertising.—What of their patrons? One of two things. Many of them send useless medicines at enormous prices. Of course none of the purchasers expose themselves by exposing the swindlers. But some of them at least do send med-

icines that attempt to effect what they propose. The result is not only "the murder of the innocents," but, in almost all cases, of the mothers themselves; or if not producing direct death, they leave a shattered constitution to drag out a miserable existence worse than death. Stung by guilt, the poor patient seldom betrays even to her companion if married, or to her most interested friends if not, the cause of her suffering. Let us say to all who put any faith in the statements of this class of murderers, for such they really are, that the pretences put forth for these medicines and operations, are FALSE, as every good physician well knows. We regret that a regard for the feelings of our readers, especially the youth, compels us not to speak more plainly. This much we could not longer refrain from saying.

Turning the Tables on Humbugs.—The course of sin, like that of true love, does not always run smooth. To pass by the weightier matters of police interference, expenses, etc., they get some sharp letters. A "soldiers widow," whom they tried to cheat by professions of great interest in her class, and the offer of a splendid prize on receiving barely \$10, accepts their generous offer with many thanks, merely requesting them to retain the \$10 out of the great sum to be sent her.—Some cute chaps at Port Deposit sent Hammond & Co. a bogus check rather ingeniously but not very modestly signed, which the said H. & Co. accepted in good faith, and presented it for collection. Of course it was returned to them with nearly \$2 costs.—An "official" out west received a very flattering offer of some thousands of dollars, on receipt of \$10 for expenses, to which he responded as follows:

IOWA STATE AGRICULTURAL SOCIETY.
Secretary's Office, Fairfield, Iowa, March 1, 1866.
Messrs. Fletcher & Co., box 2763 P. O., New York City.
MY DEARLY BELOVED FRIENDS: Your truly magnificent offer, couched in your truly refined epistle of February 23d, is just at hand. I congratulate myself that I have secured additional evidence of my theory of the doctrine of "disinterested benevolence." I thank the lucky fortune which has given you my address, and has enabled you to fix upon myself as every way qualified to aid you in your enterprise. You certainly must be Freemasons, Old-fellows, Good Templars, and members of the Christian church. Your magnificent benevolence almost caused me to shed tears, especially at this time, when I need a new suit of clothes, a new fence about my lot, a demijohn of whiskey, and my family needs—in one word—everything. You may send by draft on New York, which will be readily cashed at our bank here. Fifteen hundred dollars will be all that you need send now. The draft will be safer, than to send "greenbacks" by mail. Everybody has a hankering after greenbacks—postmasters not excepted. I apprehend, however, that no postmaster would steal my money from you, for they must all know of your astounding benevolence, and would scorn to interrupt any of the good ends which you have in process of accomplishment. I inwardly chuckle when I think what a good joke you will play on the Lottery Managers, when I receive the \$1500! I dare say they will appreciate it, and will be ready to make merry over it. Of course "I will show the money," then won't my friends open their eyes in astonishment, and stand agape at the recital of my good fortune? Won't every man in the neighborhood run after a similar chance, and won't we all be rich! You hit! But I can do more than "show the money." I can, if I choose, speak of your magnificent liberality, in my Annual Report on the condition of agriculture. I can publish the name and locality of your firm, and millions will address you for a share in such good fortune. Afterwards, I can publish the list of lucky men—just before, or included in our Premium Classes 18 and 19, (Jackasses and Mules.) Won't that be a big thing? Send me the \$1500, less the \$10 you ask of me, and 3 cents for postage stamp to return this answer. I will "show the money" when I get it, and show you up to the best of my ability. I am no mean writer, having read Godfrey's Cordial, Mc'Guffey's 1st Reader, and the book that tells how John Rogers had his stake burnt with one small child and nine at the breast. You bet, I'm a scholar! Patronize me, and believe me, your's fraternically,
— J. M. SHAFFER, Secretary.

Lotteries—How even a Genuine one Works.—The Arithmetic of the Thing.—Of the many vendors of lottery tickets in this city, at least nine out of ten are bogus, swindling concerns, in which the investors have no chance at all, and a man must have uncommon discernment and discretion to ascertain which is the tenth or genuine one.—But supposing all were genuine, let us see what chance a man would have in one. For example, take the "Royal Havana Lottery," said to be honorably conducted "by the Spanish Government, under the supervision of the Captain General of Cuba." We called at the Agency in this city, and learned the entire *modus operandi*. Take the drawing No. 756, for May 9. There are 437 prizes ranging from one hundred and sixty of \$200 each, to one of \$100,000. Total amount of Prizes, \$360,000 in gold—or equivalent to about \$450,000 in our Currency. The deductions before the prizes are paid amount to 12 or 15 per cent., or say \$50,000. This leaves \$400,000 to be distributed among the ticket holders. But there are just 30,000 tickets at \$40 each, which must all be drawn from; that is, the ticket holders pay \$1,200,000 for the privilege of drawing \$400,000, the other \$800,000 all going to the lot-

tery operators, agents, etc. It is just the same as if six men put a dollar each into a box to be drawn out by lot. If they draw the whole with perfectly fair chances, they would stand an equal chance of getting their money back, but if the holder of the box takes out and puts in his own pocket \$4 of the money, and leaves the whole six men who put in a dollar each, a sixth of a chance at only \$2, their chance would be a slim one and hardly on the square. Yet this is just what is done in this "Royal Havana Lottery" to those who buy their tickets here at "\$40 for whole tickets; \$20 for halves; \$10 for quarters; \$5 for eighths, and \$2.50 for sixteenths."—You pay your share of \$1,200,000 for the privilege of a chance share in \$300,000.—And this is about the chance one has in any lottery, however much the managers may mystify their figures, and it shows how they make such enormous profits, and why they run such risks and struggle so hard against just laws. The ticket buyers really have a very slim chance at best, or hardly a third of a chance when they pay for a whole one—yet the foolish hope that they may be successful, and so keep on investing money, because somebody somewhere has drawn a prize.—A word more. What is a man's chance in the above drawing, for example. Only 437 persons in 30,000 can by any possibility get any prize, that is one person in sixty-nine. To pay \$40 for one sixty-ninth of a chance to get even \$200 is not a very promising investment.—Again, there are only 44 of the 30,000 ticket buyers, or about 1 in 700 who can by any possibility get over \$500.—Surely a man must have large faith in his luck to put down \$40 for only one chance in 700 to get one of the prizes.—Unfortunately, it is only those who have always been "unlucky," and are likely to be, and those who do not or can not look into the arithmetic of the thing, that will and do patronize lotteries.

About "Doctors."—Old subscribers are well aware of our position concerning advertising "doctors," but as we get many letters asking about this or that one, we presume that our many new readers do not understand it. We put all those who set forth their own abilities in print—who give accounts of remarkable cures, and who propose to treat cases by mail, in one class. They are persons whom we would not employ, nor would we advise any one else to do so. We know nothing of them individually, for they are not the kind of people whose company we seek, and they are very sure to keep clear of us. A personal application by letter can only bring the reply: we know nothing of the person.

Fitting the Journals to Balance Wheels.—A balance wheel which it is necessary to take off from its journal, should have its hub bored out and the hole made tapering. The journal should have a corresponding taper, and a nut on the end for securing the wheel, instead of a key fitting a slot. The taper should correspond with the hole and should not be more than one-eighth of an inch in the diameter of the hub.

More Ditching Plows.—Those who have good ones should advertise them; we have numerous inquiries. They are little used at the East, and we are not sufficiently familiar with the best modern ones to recommend any particular plow.

Caloric Engines for Farm Use.—Dr. "C. H. R." Springfield, Ill. We value so highly a steam boiler on a farm that for our own part we would hardly think to inquire into the merits of an engine which ran without a boiler. However, for some farms, where the steaming of fodder, cooking of hog feed, etc., is not now considered desirable, the case is different. If any one has used a caloric engine for farm purposes, we shall be glad to hear from him concerning its merits. It certainly has the advantage of greater portability.

Stacking Geer for Horse Forks.—J. P. Dudley, San Jose, Cal. We figured an arrangement for stacking with a horse fork, (p. 177, June,) in the last volume of the *Agriculturist*. There are other good plans, however, one of which is simply a pair of tall shears, guyed so as to have a play each side of the perpendicular of a few, say 4, feet. Two tall poles are chained together at the top where the fork is hung, and the butts are spread 12 to 15 feet apart. Oak pins are thrust through the butts, about 6 inches from the ends, so that they may easily be shifted along with a crowbar, a few feet at a time, as the stack grows. Some 8 feet in length of the stack is made at once; then the shears are shifted. This makes a long stack.

Corn Markers.—These implements are almost always home-made. So we give some hints about them almost every year, for corn ought to be planted in very true rows. We gave an engraving and description of an excellent one last year (p. 149, May). An improvement is suggested by P. L. Thompson, of Morris Co., N.

J. The marker consists of three runners, the outside ones being movable on the cross pieces, to mark rows different distances apart. A pole is hinged in the middle and falls on either side, and to this a chain is attached, where it will mark the path of one of the outside runners in coming back. Mr. T. suggests that the chain track ought to be made for the middle runner to follow, for the driver in this case would have only to look ahead.

A Convenient Tool Sled.—Every farmer should have one or more tool sleds, according to the number of teams employed on the farm, as they are far more convenient for transporting plows, harrows, and many other implements to and from the field, than wheeled vehicles. The illustration herewith given represents one of these sleds. There are two pieces of hard wood scantling, two inches wide, four inches thick, and eight feet long, with the forward ends dressed off on the under side like a sleigh runner, and chamfered as shown at the rear end, so that the sled will pass over

obstructions more easily than if the bottom were straight. Hard-wood planks, 1½ inches thick and three feet long, are pinned, bolted, or spiked to the runners, and upon these 2x3 strips (raves) should be nailed. Four or five carriage bolts should pass through the runners, planks and raves on each side, and as the wood shrinks, the nuts should be screwed up tight. A clevis may be taken from a plow and attached to the forward end, as shown by the illustration, or a clasp and ring may be bolted on rigidly. When making such a sled, those parts of the runners, planks and raves, which are brought in contact with each other, should be well smeared with coal tar to exclude water, which will cause rapid decay if permitted to enter the seams. The advantages of such a sled over a wagon, or cart, are, that it can be employed for hauling stones, stumps, sods, and manure for short distances, and boys can load plows, harrows, or bags of grain on it, when they would not be able to put such things on a wagon or cart; and more than all, the injurious exposure of wheeled vehicles to storms and sunshine is thus avoided. When a team is driven to the field to plow, no vehicle is more convenient than such a sled for carrying all necessary tools, extra plow points, the water jug, etc.

The Miniature Fruit-Garden.—By Thomas Rivers.—This is a reprint of a work by one of the most widely known fruit-growers in the world. It has been reproduced entire from the 13th London edition. Every one who grows fruit trees in the garden will find in this some useful hints, and it contains the most complete directions for treating dwarf trees as dwarfs, of any book with which we are acquainted. Price, \$1.00.

Garden Culture of the Tomato.—Tomatoes grown in field culture, lie about without any supports, but in the garden the plants pay well for the trouble of training. In former numbers we have given several trellises and supports, and we now give the plan followed by the French gardeners, which they claim gives very early and large fruit, as well as abundant crops. The plants are started in the usual way under glass, and at the proper season are set out, each one being furnished with a single stake about six feet high. The plant, as it grows, is tied to the stake. When the first cluster of blossom buds appears, the lateral shoots which appear in the axil of each leaf below it, are carefully pinched out, leaving but a single stem, surmounted by a cluster of flowers, and a bud which will serve to continue the stem. This bud will develop three leaves and a cluster of flowers, and all the axillary shoots upon it are removed, and the stem is kept carefully tied up; and so on. The vine is kept to a single stem, without branches, and bearing only leaves and clusters of fruit. The writer who describes this method in the *Revue Horticole*, states that he gets an

average of 60 large tomatoes from each plant, and that their greater earliness brings him a price which pays well for the increased trouble over ordinary culture. The same writer has a plan for covering his plants, when first put out, to protect them from late frosts and cool nights, which will be readily understood from the figure. A double handful of straw, with the butts evened, is placed around the stake in the form of a cone, tied, and the upper ends bent down and tied again. This, when closed, forms a shelter which may be opened in the day time toward the south, and closed at night.

Milk for Children—Not always Good.—We have long thought it not best to use, especially for young children, the milk from breeding cows. Analysis, by Lassigne, showed that as cows approach calving time, their milk is essentially changed in its constituents, being deficient in casein and milk sugar, and abounding in albumen and uncombined soda. From what is well known in regard to the human subject, we might well infer that milk of breeding cows is not wholesome. Our own practice, for ten years past, has been to keep a farrow cow specially for supplying milk for our children. A second rate, but healthy cow, one not too valuable to slaughter, is kept for this purpose, and after 6 to 10 months, according to her milking capacity, she is dried up and fattened for the butcher, and a new milk cow substituted. The fattened cow about pays for the fresh one, so that this involves little extra expense, and the result upon the little ones certainly seems to be favorable. This is of course more important where infants are wholly brought up by hand, and we commend the subject to those thus situated. The matter is discussed more fully in the *Agriculturist* for February, 1856 (Vol. XV, page 117).—Unfortunately we have not a copy of that date to supply.

Coal Tar on Walls.—E. C. Hubbard, Erie Co., N. Y. Coal Tar on the outside of a brick wall, will not prevent its absorbing water from below. But probably in laying a brick wall, coal tar might be so incorporated with the mortar, that a few courses laid in this tar mortar would be an effectual barrier to the ascent of moisture from the ground. Perhaps, even bricks might be dipped in tar and laid so as not to weaken the wall. Asphaltum has been used for mortar ever since the town of Babel was built—at least it was used there, and has stood very well, considering the circumstances.

The Practical Entomologist.—This little sheet is very cleverly conducted, and endeavors to be, as its name indicates, "practical." It was started by some enthusiastic naturalists upon the plan of sending it free to all who would remit postage. Its circulation being much larger than was anticipated, and involving an unexpected amount of labor, its publishers have wisely concluded to charge 50 cents a year hereafter. Send subscriptions to E. T. Cresson, 518 South 13th-st., Phila.

Vegetable Queries.—"A. L. G." Jasper, Tenn. *Martynia* is exclusively for pickles, the ripe fruit being used. The plant is figured on page 113, and directions for pickles given on page 104 of the *Agriculturist* for April 1864. Chervil. Of this there are two kinds, the common Chervil, of which the leaves are used for flavoring in the same manner as Parsley, and the Parsnip Chervil, which has an eatable root and is cooked like the potato. This last is sown in September or October, the same as carrots, and is ready to harvest the next year in August. Cauliflower is raised like cabbage; the head is boiled tender in water, and dressed with drawn butter.

A Musical People.—Music in the household is something more than a luxury. It refines, elevates and soothes, while affording unexceptionable pleasure. A growing taste for it is an encouraging indication of healthy growth in civilization. The Internal Revenue Taxes, returned by the principal manufacturers of Cabinet Organs, Harmoniums, Melodeons, and similar instruments, for the months of October, November and December, 1865, are of interest as showing the amount of business done in a single branch of the trade. The whole aggregate of Pianos and other musical instruments sold annually in this country must be immense. The total taxes paid were reported as follows: Mason & Hamlin, \$6,382.92; Geo. A. Prince & Co., \$3,139.86; S. D. & H. W. Smith, \$2,522.76; Cahurt, Needham & Co., \$2,177.16; Estey & Co., \$1,218.18; X. Spang, \$987.42; Taylor & Farley, \$933.07; B. Shoninger Melodeon Co., \$925.66; Peloubet & Son, \$898.14; Jewett & Goodman, \$771.72; Treat & Linsley, \$769.29; Kinnard, Dreher & Co., \$498.72; A. C. Chase, \$436.08; H. R. Phelps, \$343.80, or a total of over \$22,000 paid by these firms alone on melodeons. This is 5 per cent. on \$440,000. The value of Pianos made is of course vastly greater.

Walks and Talks on the Farm.

No. 29.

Last Sunday morning (March 18), just as I was getting ready to go to church, Sprightly asked me to come and look at the sheep. Five of them were down, and trembling all over. They were ewes, with lambs two or three weeks old. We had them in the bay in the barn, and fed them with pea straw and a little over half a pint of corn, each, a day, giving them water regularly at noon. They did uncommonly well, the lambs were strong and healthy, and the ewes were in fine condition. Saturday was a very cold day, and during the night the west wind pierced through any ordinary protection. Still the lambs stood it admirably, but the ewes were all of them drooping, and five were down and unable to get up. I immediately got some warm gruel, and ginger, essence of peppermint, and whiskey. By the time this was ready, two of them were dead. I drenched the other three, but one of them died in an hour or so, and the other two during the afternoon. In the meantime two more were taken. I gave them warm gruel, with a wine glass of whiskey each. One of them recovered, and in an hour or two was as well as ever. The other I kept alive for thirty-six hours, with heavy doses of brandy, but she died some time during the second night.

A *post mortem* examination showed no organic disease that I could discover. The only unusual symptom was that the large stomach was full of water. The man who has charge of them is faithful and reliable, and he says he watered them regularly every day. Otherwise I should account for their loss in this wise: The sheep were fed grain and dry food, and, as they were giving milk, would require considerable water. Now, should it happen that they were allowed to go without watering for a day or two, and were then given a liberal supply, it is probable that some of them would drink more than was good for them. The water was cold, and the sheep, being already chilled by the cold night, their nervous system would receive a shock from which it could not recover. This is just what happens when persons die in summer from drinking a large draught of cold water.

I do not say that my sheep had not been watered, but if such were the case, and they were then given all they would drink on Sunday morning, the probabilities are that they would be prostrated by it, and show all the symptoms manifested on this occasion. Many people think sheep do not require water, and this absurd notion has a bad effect. Farm men, not to say farmers, who are especially opposed to what they call "theories," are more than all others influenced by any erroneous notion they may adopt. The Doctor would say that this is the result of "Adam's Fall." Error is more natural to our minds than truth, just as thorns and thistles grow more freely than wheat and potatoes—and more especially on vacant, uncultivated ground. With the mind, as with the field, a smothering crop is the easiest way of getting rid of such weeds and notions. Sow the seeds of truth thickly, and keep sowing, and if errors are not eradicated they will be greatly weakened.—"I hear you have lost some sheep." said one of my neighbors, "what was the matter with them?" "They drank too much cold water." "Very likely," he replied, "too much water is bad for sheep." There you see this absurd notion cropping out again. I did not explain, but of course the cause was not giving them too much water, but giving them too little.

Had they had water freely at all times as they needed, they would not have drank too much.

The Squire and neighbor B. heard that an alarming epidemic had broken out among my sheep, and came over in the afternoon. Before I saw them they had time to investigate the matter, and had agreed on their verdict. "Have you been feeding these sheep buckwheat?" they asked. "Yes," I replied, "I have fed it to them occasionally, (here they exchanged significant glances), *but it is over a year ago.*" "Have you given them any this winter, sir?" asked the Squire in the tone of a lawyer cross-questioning a witness. "Not a grain; I only feed it when it is cheaper than corn, and this winter it sells for more than corn." "Do you suppose," I asked, "that the buckwheat I fed a year ago could have produced the death of these five sheep, for if so I shall probably lose the whole flock, for they all had it?" After a few moments' hesitation the buckwheat theory was given up and "grubs in the head" adopted. "Perhaps so," I replied, "but it is curious that the grubs should 'eat through,' as the saying is, all at the same moment, and still more curious that the whiskey should have cured one of the sheep that was affected."

Just as they went away I heard them say: "Been feeding too much corn." I let it go at that. I have been feeding liberally, but cannot for a moment believe that this is a cause of the sudden death of the sheep. If it was apoplexy, it is not likely that six or seven should be attacked all at once, with none before or after. I am raising the lambs for the butcher, and feed the ewes liberally all winter, knowing that this would produce rich milk and fat lambs. And it is a fact that, as the *Agriculturist* said some time since, "a little grain fed to the ewes will make the lambs grow like weeds." But blessed is that farmer who attends to his own stock, or who at least has a fixed habit of seeing daily that their wants are regularly supplied.

I think I am improving in this respect. The absolute necessity of constant supervision is a truth soon brought home to any one who attempts to gain a living by farming. I believe in liberal feeding—both plants and animals. But this is by no means all that is necessary to insure success. If you manure land, it should be evenly spread, and if you feed grain, it should be fed regularly. Animals, to thrive well, must be kept quiet and comfortable. They must be easy in their minds. A harsh word should never be spoken to them. They should be petted. But who ever found a farm man that would do it? I have had men who would shout at cattle so loud that you could hear them half a mile, and they evidently thought it manly to speak to even a gentle cow as though they would take her head off. The reason why so few amateur farmers, so called, succeed, is the want of attention to details. General plans, general directions, however excellent, will not answer. It is the little foxes that spoil the grapes.

Frost is a great pulverizer. It beats Crosskill's clod crusher. If our clay soils are underdrained and fall-plowed, so that the frost can act upon them, they will become as friable as marl, and produce far heavier crops than those of a more sandy character. Our dry, hot summers are also favorable to working stiff soils. You shake your head. But it is so. I am aware that wet clay lands will bake, in our climate, as hard as bricks. But that is not the fault of the climate. It is the best climate in the world for an enterprising, intelligent farmer who keeps ahead of his work. When I came to this

country first, nothing astonished me more than to see the ease with which even clay land could be made mellow and friable. I wish all our grumblers could have a year's experience on an English clay farm, in a mild winter and a wet summer. They would be better able to appreciate their privileges, and perhaps would be induced to avail themselves of the opportunity afforded by our splendid, hot summers, for cleaning, working and mellowing the soil. I have no patience with a man who lets his corn or potatoes grow to weeds. Keep the cultivator going, and it will not only kill the weeds, but make the soil as mellow as a garden. I cultivated some of my corn, last year, over ten times, and will do it again this year. It pays—pays on the corn and pays, even more, on the future crop.

It is a great mistake to think that weeds cannot be killed. They can, and if farmers really believed it, and would go to work vigorously, commencing early in the season, and sticking to it as long as a weed showed its head, we should soon see cleaner land, productive farms.

How much easier it is to dig ditches in the spring than in autumn! The ground is wet and soft, and a man will dig fully one-third more ditch now than in the autumn, when the ground is dry and hard. You can, too, commence to dig much earlier in the spring than is generally imagined. My main open ditch, that I cut a year ago, was not deep enough—the water set back and stopped, or at least impeded the discharge of water from the under-drains running into it. I was determined to deepen it. There was a considerable amount of water running into it, especially from the surface. I thought the best time to do it would be on frosty days, when the surface water was frozen. We had just the right kind of weather the latter part of March. The water in the ditch prevented the bottom from freezing, but the loose soil that had fallen in from the sides was just hard enough to enable us to throw it out in cakes. I told the 'Squire I was going at it. "You can't get any men," he said, "that will go into a ditch at this season of the year." But he was mistaken. I went at it myself, and got four men to help me, and in three mornings the job was done. Nothing like trying. I did not ask the men to work at it all day. It is continuous cold that tells on the system. You can stand it very well for half a day, and if you work with a will you can do nearly as much in half a day as in a whole one. I felt proud of the ditch when it was finished. We got it a full foot lower than the tiles.

In cleaning out and deepening such ditches, most people use a long handled shovel. Give me a good Ames' spade. A shovel is an Irishman's tool, and should not be tolerated in a ditch, except to clean out the bottom. "You can tell a workman by his chips," and you can tell a good ditcher by the clean, square, unbroken spadeful he throws up. In cutting under-drains, a skillful ditcher will take out the soil clean to the depth of the spade, and will leave very little loose earth, and what he does leave will be trodden down in taking out the next layer. There is no necessity for shoveling out till you come to the bottom, and then a long handled scoop will clean the drain, ready for the tiles, better than any other implement.

I am inclined to think that, except on springy land, we need fewer under-drains than are found necessary in England. We have more rain at all seasons of the year than they have in England, but fewer rainy days. It this country, "it

never rains but it pours." A great portion of our rain, coming in such heavy showers that the ground cannot absorb it, passes off on the surface, whereas, in England, it comes so gently that nearly all enters the ground, and must be carried off by under-drains. Besides, in this section, the land is frozen for three or four months, and when we have a sudden thaw, the snow melts rapidly, while the ground is still frozen underneath, and passes off over the surface. Hence the great importance of surface ditches in this country. In England, where the land is thoroughly underdrained, surface ditches are of little use, the rain coming so gradually that it has time to soak through the soil to the drains.

This matter is worth looking into. I admit that it is a new idea to me. I have always supposed that, on account of our greater rainfall, we needed *more* drains than in England, and this may be true on farms where the damage is from springs, but where there is nothing but surface water to contend with, I think we can get rid of it with less trouble and expense than in England. We must provide the means for getting it off rapidly, *before it enters the soil*. By plowing the land with special reference to this point, an immense amount of water can be carried off during the thaws in winter and early spring, that would otherwise soak into the lower parts of the farm, and keep them saturated until the middle of May or June. The principal objection to this plan is, that the surface water carries off the rich, fine particles of the soil, and to counteract this we should look out for some land that could be kept in meadow, and on which this surface water, from the upland, could be used for irrigation. Of course it would be necessary to provide drainage for the low land. Irrigation is of immense benefit on grass land that is well drained, but would do more harm than good on land that is already surcharged with water.

I do not want you to misunderstand me in this matter. I believe in underdraining with all my heart. It is the one great necessity of American agriculture. But we have *so much land*, and so little labor and capital, that it is desirable, for the time being, to get rid of all the water we can in the cheapest and simplest manner possible. I am satisfied that millions of dollars are annually lost by the farmers of the United States, for want of a little care and attention to surface drainage. Last year I had a crop of oats seriously injured by water. You know it was a very hot season. I plowed the field into narrow lands, with deep dead-furrows. It was plowed across the field. In some parts of the field the water lay six or eight inches deep in the furrows, after the oats were in ear! The land was an old sod, and had been summer-fallowed for the oats. They grew very rank on the crown of the ridges, but of course along the margins of the dead-furrows, where the water lay, the oats were either killed outright or seriously injured. Now, on this same field I found, the present spring, that a few furrows, with a little use of the hoe, would have let off all this surface water, and would have saved the crop. A span of horses and two men, besides myself, (say two more,) let off an immense quantity of water in half a day, and a few hours two or three days afterwards, which, when the ground settled, made the field dry, and provided conduits for the water from subsequent rains. There is nothing more fascinating than letting off water, and every farmer should give his boys a holiday occasionally, to be very profitably spent in this delightful employment.

There is one thing about letting off surface water that will surprise any one who has had no experience in the matter. You will frequently meet with a spot from which, apparently, there is no fall. But go to work and make a channel through the lowest land surrounding it, and, in nine cases out of ten, you will find that you can let all the water off. The fact is, there is very little land that cannot be drained. Only go at it with this conviction, and a little common sense, and you will be astonished at the result. Remember, too, that it takes a great deal of heat to evaporate a gallon of water, and at this season of the year the land needs the full force of the sun to warm it. Two or three degrees of heat in the soil, in April or May, will make all the difference between a good and a poor crop.

A subscriber of the *Agriculturist* writes me in regard to Whiteside's Corn and Bean Planter, that I mentioned last year. He wants to know my *private* opinion of its merits, and whether it "comes up fully to all that is claimed for it." Did you ever know any machine that did? I have used a good many machines, but never yet found one that was in all respects perfect. It is so with this Corn and Bean Planter. It plants beans as well as can be desired, but planting corn is a more difficult matter. Beans, in this section at least, are only cultivated one way. The rows are about 3½ feet apart, and the beans are dropped in the rows in hills about eighteen inches apart. Now, so long as the rows are straight one way, it does not much matter whether the hills are deposited at regular distances or not. An accidental variation of two or three inches makes no difference. A wheel, running over the ground, will gauge this with sufficient accuracy, but with corn the matter is entirely different. We want the hills as near straight as possible *both ways*. It is an easy matter to make the rows straight in the direction the machine goes; but the difficulty is to drop the seed at equal distances apart, so that the rows shall be straight the other way. No machine has yet been invented that will do this. It might be done on the smooth Prairie soils of the West, if anywhere, but I believe it is admitted that this work cannot be done by machinery. It is comparatively easy to get the right number of kernels in the hill, but it is exceedingly difficult to deposit the seed at the exact spot where the hill is required. This part of the work must be done by hand. The land is marked, and when the spout of the machine crosses the mark, a spring is touched which lets down the seed. A steady slow horse and a boy to drive him, with a man that has a quick eye and active fingers, who will give his whole attention to the work, can accomplish the object on smooth land with a good degree of success. I planted about forty acres with it last year, and intend to use it again this season. With proper care I can plant the corn with it *better* than I got it planted two years ago by hand. A good man will of course plant corn better than any machine; but that is not the question. Good men are very scarce, and when you have a large field to plant—that must be all got ready and marked one way before you can commence—it is desirable to get it in as soon as possible. Men, boys and women are pressed into the service. The old men will tell stories and get careless, the young men will want to race and make bad work, while the women, though better than the boys, *sometimes* talk a little more than is compatible with accurate and rapid planting.

I have planted twelve acres a day with this machine, and where the ground was not rough, we had no difficulty whatever in cultivating the corn both ways. Between planting by hand or planting with a machine, I am decidedly in favor of the latter. But I am not certain that it is not just as well to *drill* in the seed, and give up the practice of planting in hills. This practice is growing more in favor every year. The best piece of corn I saw last season was drilled in—the rows being 3½ feet apart, and the plants in the drill about nine inches apart. The ground was thoroughly cultivated (of course only one way), and was remarkably clean, though scarcely any hand hoeing had been given. You certainly get more stalks from drilling, and I think more corn if the land is rich enough, and is *thoroughly cultivated*. If land is poor and weedy, better plant in hills and cultivate both ways.

Can corn be raised at present prices? It sells for only 60 cents a bushel. If you get 70 bushels per acre it will pay. But a crop of 25 or 30 bushels, which is much nearer the average, will *not* make any one rich.

The truth is, that wages are now entirely beyond the price of produce. Farmers cannot pay them. The Deacon tells an anecdote of a Dutch farmer who lived in this neighborhood. He had a hired man, also a Teuton, who worked for him a good many years, and as money was scarce, he took pay in stock, land, etc. One year in settling up, the farmer had to give him the sheep, when an idea seemed to strike him, "Hans," said he, "I want to make a bargain with you. You work for me a year or two, till you've got the farm, and then you shall let me work for you, till I've got it back again."

The Horticulturist has an article on the currant-worm. It is not the kind that is most troublesome in this section, though the means of destroying them are the same in either case. We have both of them here. One comes from a moth, and the other from a saw-fly. The latter are by far the most numerous. We killed the flies last year by the hundreds, soon after the bushes were leaved out. The flies at first seem to deposit their eggs on the leaves of the young suckers growing from the bottom of the bush. By cutting out these suckers, after the eggs are deposited, you can destroy an immense number of potential caterpillars. The suckers ought to be removed, in any case, for the good of the bushes. Many of the young shoots on the branches can also be cut out, and those that are left for future wood should be pinched to two or three leaves. You will be astonished how such treatment will increase the size of the fruit. The bush will be open, and there will be no useless growth. But you must kill the caterpillars, or they will cut off the leaves, and the fruit will be worthless. If taken in time, this is not as much trouble as is generally supposed. We all need a little recreation. Take it in killing the flies and the eggs. Half an hour, morning and afternoon, will accomplish wonders. But if you wait till the eggs are hatched, it is almost impossible to save the fruit. White hellebore powder, dusted from a dredging box on the bushes in the morning, while the dew is on, is the best remedy yet discovered. I have used it for years. I would not depend on it alone. Kill the flies and destroy the eggs, and then use hellebore to finish the caterpillars that escape. In this way, if your bushes have had good culture, and are well pruned, you will have a splendid crop of fruit.

When I bought this farm I found a lot of straggling currant bushes growing all round the garden by the side of the fence. The grass had been suffered to grow round them. The bushes had run wild, and were as high as the fence. There was little except long, straggling branches, with a mass of suckers at the bottom and a dense growth on top. Of course, they produced little fruit, and what there was, though they were good varieties, was very small and sour. I had the ground dug around them. I cut out more than half the branches and headed in the rest. The suckers sprang up by the score from the roots, and these I stripped off, and kept the ground free from weeds. I pinched in the young shoots during the summer, and it was surprising how much it increased the size and quality of the fruit. Of course, if I was going to set out new bushes, I should train them on a single stem, but these old, neglected hedge-row currant-bushes need not be given up. A little care and thorough pruning will renovate them much quicker than you can raise new bushes.

On strong, loamy soil the best mulch for strawberries is the hoe, till the fruit is set; then place a little new mown grass, such as the clippings of the lawn, around the plants to prevent the escape of moisture, and to keep the fruit from getting soiled. On light, sandy ground the mulch should be put on earlier, and thick enough to keep down the weeds.

The Deacon says he is in the habit of giving his cows a mess of sliced, raw potatoes every day, for two weeks, before calving. He thinks nothing is so good for milch cows. I have a quantity of small potatoes that I propose to give to the cows, but I think I shall grind them up with the cider mill and mix the pulp with meal. I have never tried it, but of late years the English farmers have adopted the system of pulping their roots for pigs, etc., instead of cooking them. I see no reason why a cider mill is not just the thing for the purpose.

Manuring Corn in the Hill.

When manure is scarce and the greatest effect is demanded the first season, or when corn is on a good sod, and a little start is wanted at first, or when the land is rather cold and the season uncertain, it is best to manure in the hill for corn. If one has a fine compost, say of swamp muck and manure, containing $\frac{1}{4}$ of the latter, after marking out, a good shovelful may be distributed to three or four hills, and the corn dropped directly upon it. If, however, the compost is made up of ashes, superphosphate, guano, poudrette, etc., singly or mingled, it must be mixed with soil and covered with a little earth besides, or the seed may be killed by coming in contact with it. Such active fertilizers, and the list is large, must always be used with care, not to have the seed injured. Yet they are needed close at hand, for the encouragement of the young plant as soon as it starts. Superphosphate, ashes, gypsum, soda-salt-peter, etc., may be applied upon the hill after the corn is up, or, at least, after planting, with quite as good effect as if put in the hill.

The list of concentrated manures which may be made on the farm, or bought, is quite large, and if any person visits the manufactories of various kinds in his vicinity he will often be able to secure much that is of value to himself, and do the shoemaker, soap boiler, brewer, tanner, butcher, or glue boiler, a favor also.

Fig. 1.—CREVECOEUR COCK.

French Varieties of Fowls.

On page 216, of the last volume of the *American Agriculturist*, we published an engraving of three varieties of French fowls. The favor with which these new breeds have been received in England is not greater than their promise in this. The little work of Mr. Saunders, (see our Book List,) which contained the above-mentioned engraving, has been revised,

Fig. 2.

Fig. 3.

and the new edition contains a number of interesting engravings, and a good deal of new matter of value. Among other subjects the French fowls are enlarged upon. As it will interest our readers, and in order to call attention to the work, we present some of the illustrations herewith. We now know of at least two poultry fanciers who have obtained birds of the Crevecoeur breed—one at the East and one at the West—and find them all that has been claimed for them. They are excellent table fowls, being plumper, fattening easier, and having better flesh than the Black Spanish. The hens are constant layers, like the last named, but do not produce so large eggs. They are hardy.

The French lay great stress upon the peculiarities of the combs of these breeds, the Crevecoeur being always horned, as in the figure of the cock; but the horns being of many different shapes, as in Figs. 2 and 3, resembling stags' horns or goats' horns. Fig. 4 exhibits the head

Fig. 4.—HOUDAN COCK.

of a Houdan cock, with its branching half double comb, while Fig. 5 shows the comb of the La Fleche, marked by the little spur, like

a rhinoceros' horn. These breeds have all a great reputation as layers, and this is not surprising. Considering the immense production of eggs in France, it is natural that she should give rise to prolific breeds.

All will notice a similarity to half bred Polands, or Polands crossed with Black Spanish. It is not impossible that these breeds may remotely have had some such origin, but their great hardiness and vigor of constitution certainly does not favor the idea. In the British poultry shows French fowls are assigned to distinct classes, and prizes awarded as to the most favored.

Fig. 5.

Field Corn.

Every man has a definite notion of what field corn is—yet how different are these ideas. To the Canadian or Maine reader it means a little 5-foot variety, with 8-inch ears, and 8-rowed; the kernels usually yellow as gold, and hard as flint. He plants it in rows, 3 feet apart, and in hills 20 to 24 inches apart in the rows. It may be planted in June, and cut up in 90 days. To the Connecticut Valley and New York farmers, field corn is larger, coarser, taller, of larger ears, of more various colors and qualities—planted in hills 3 to 3 $\frac{1}{2}$ feet apart, usually in May and harvested in September, allowing 110 to 120 or more days for it to mature enough to be cut up. As we go West and South, the size of the plant and the length of season required for its development and perfection increase; 4 and 5 feet apart is no unusual distance to find the hills, and the ears, instead of being 8-rowed and 12 to 14 inches long, as in the Middle and Eastern States, are short, thick, and 12 to 20 rowed, while the kernels lose the flinty character, in a measure, and gain a certain mealiness, and in shape resemble a gourd seed or horse's tooth. The varieties of corn are almost infinite, (if we may use the expression), and yet it is remarkable that the plant is everywhere governed by the same rules of culture, and instructions good for Maine will apply in Louisiana.

Corn needs a deep and rich soil, or especial manuring, and the ground must be dry and warm. The culture should be thorough previous pulverization, with the dissemination of manure throughout the soil, by plowing and harrowing, unless, indeed, the corn be planted on a good sward, turned under, in which case manuring with a good compost, stable manure, or some concentrated fertilizer in the hill is desirable on soils which need manuring to ensure a good crop. After planting, the culture should consist in keeping the weeds down, and the surface free and open, for the action of the air and the absorption of dew and other moisture.

The stalks should not be so crowded that they cannot mature well; and, if the culture be thorough, farmers generally err in putting the drills too far apart and letting too many stalks stand in each hill. It is much more economical of space to plant in drills; the stalks a foot apart, and the drills 30 inches to 4 $\frac{1}{2}$ feet, according to the variety—this distance being a little less than half the height of the stalks, on an average. Never allow more than 4 stalks to a hill. If all the culture is to be done by horsepower, it pays to sacrifice a little of the land to convenience, and put the corn in hills equally distant, and in true rows, running both ways.

Fig. 1.—TEAZLES IN FLOWER.

The Cultivation of Teazles.

The Teazle (*Dipsacus Fullonum*) is a product which can be cultivated by only a few farmers, because were many to be raised, the market would be overstocked, and the prices fall below what would pay for the labor of raising them; besides, few farmers will favor a crop which occupies the land two years—i. e., two summers.

The best Teazles are produced upon stiff, clayey loams, made friable and mellow by thorough tillage and enrichment. Nevertheless, on such soils, Teazles are apt to winter-kill, probably by the "heaving" of the frost, where the ground is not well protected by snow. Good wheat land is good enough for Teazles. The seed is sowed like carrot or parsnip seed, and at the same time of the year, that is, during April and May—only the rows are put farther apart for the first crop. A common way is, put the rows three-and-a-half feet apart, and the next spring sow other rows between them, making the rows of one and two-year old plants, 21 inches apart. Some other root crop may be sowed with the Teazles the first season. In Europe, Teazles are often sowed in beds and transplanted to the field; and it is perhaps advisable to sow a bed so as to have good strong plants to replace any of those that may fail.

The ground should be kept loose and free from weeds. The plants are thinned to 8 to 10 inches apart, and grow freely, each forming a broad flat mass like a bull thistle. The second year they are hoed, missing plants are early replaced, and they are left to grow. They make tops 4 to 6 feet high, and heads as shown in figs. 2 and 3. Those upon the main stems, and the branches, blossom and mature at different times.

The product of an acre varies from 100,000 to 200,000 heads, 130,000 being perhaps an average. The dressing of a single piece of broadcloth is estimated to consume 1500 to 2000 heads. So an acre will answer for 60 to 100 pieces of cloth.

The heads are cut with a hooked knife, the stems being left eight inches long, the men and boys who cut them being protected with leathern gloves; the cutting of 10,000 is a good day's work. The heads are spread upon seafoolds, frequently stirred and turned to promote drying,

and assorted into three sizes. "Kings" are the largest, which grow upon the main stem; these are stiff and coarse.—"Middlings" are the next in size, and grow on the ends of the branches; these are the most valuable. "Buttons" are the smallest, and are used for very fine cloths.

Before the Teazles can be used, the "spurs" which are the stiff involucre segments seen at the base of the head in fig. 2, must be clipped off, leaving the heads as seen in fig. 3. This can be done by women and boys on the farm, and makes a difference in market of 25 cents per thousand. The price now is \$2 to \$2.75 per thousand, and they are marketed in boxes, made of ½ boards, about 3 ft. 4 in. square by 6 ft. long.

The culture of Teazles is by no means so precarious in this country as it is in England, where damp weather in August fills the heads with water and causes them to rot before they mature. We are inclined to think that they might be made a very profitable article of export, for our season is generally very dry, just when theirs is most hazardous to this crop. We now import a great many, chiefly from France, and these being better grown and better assorted than American Teazles generally are, are preferred by manufacturers. We make the following extracts on this subject from a letter to the *American Agriculturist* from Mr. Chester Moses, an experienced cultivator of teazles in Onondaga County, New York:

"There is but little advantage in transplanting later than August, for the roots will not get strength to stand the winter. Rank manure makes teazles spongy and weak in the hooks. One man can tend four to eight acres the first

Fig. 2.—A "KING" TEAZLE.

year. The second year one thorough cultivating, or running through with a light plow, and

a good hoeing in May, is all the care the crop requires before cutting. In cutting it requires two or three men to one acre. The heads should be cut as soon as the blossoms are off, a small section being left for one or two weeks, for seed, but the teazles suffer by remaining on the stalks after the blossoms fall. The seed makes good feed for sheep, but is so bitter that it needs to be fed with corn or oats, until the sheep relish it. Teazles should not be planted year after year on the same ground. The crop is profitable, quite so, when the price per thousand is equal to the price of wheat per bushel. Our average product is about 150,000 to an acre. The producers sold the crop of 1864 at \$5 per thousand, and that of 1865 at \$2 per thousand, the teazles being unclipped."

Fig. 3.—A "BUTTON."

Several Plans for Destroying the Barn Weevil.

Our jocose suggestion of an expedition and certain cure for this pest, together with a sober call for information how to do the work less expensively, (p. 50, Feb. *Agriculturist*), has brought us in a fine array of testimony. This insect is a beetle, belonging to a family of the curculios or weevil, (*curculionidae*). Its Latin name is *Calandra granaria*, which means barn or granary weevil, and it is never found except where grain is stored. Wheat, rye and corn are commonly attacked by it, and some times oats, although it is thought, upon what

BARN WEEVIL.

evidence we know not, that it will live in other seeds if they are large enough. This is, probably, a mere supposition, founded upon the fact that they are sometimes very hard to starve out. The grain weevil is nearly one-sixth of an inch long, and of the proportions shown in the accompanying figure, though the size varies considerably. The color varies somewhat from dark reddish brown to nearly black. The snout-like proboscis is a marked feature, and placing the insect under a magnifying-glass, eighteen punctured furrows may be seen upon the wing covers, and scattered oval dots on the thorax. They are very active in their motions, and, when alarmed, quickly hide themselves, or if touched, "play possum"—feigning dead.

The female lays her eggs upon the surface of the kernels of grain, (not in holes made by her beak, as has been stated). When they hatch the little worms bore directly into the kernels, and there grow and undergo their transformations, the grain, meanwhile, becoming lighter and lighter until the perfect beetle emerges, leaving the kernel a mere shell. This takes six to eight weeks. In the winter time the

weevils hibernate, seeking the warmest cracks and corners they can find.

They are often so numerous in grain store-houses and ships as to blacken the walls and grain heaps, and of course detract greatly from the value of grain. Vessels so infested are used a few trips in the salt trade, or the weevils are otherwise starved out. In elevators and granaries, after thoroughly cleansing the buildings, quick lime, finely slacked to a dry powder, is scattered about everywhere, brushed into cracks and corners, etc., and so a riddance is often effected. In barns, the afflicted say, it is much more difficult to clear them out.

Our correspondents suggest three systems for getting rid of the weevil. *First, starvation.*—The barn of D. Steck, Lycoming Co., Pa., was exceedingly full of them. "Keeping all grain out of the barn for one year" effected a perfect cure....G. L. Hale, Franklin Co., Pa., reports that persons in his neighborhood who were troubled, put up sheds, under which to stack their grain, a few hundred yards from their barns, and after keeping the grain out of the barns for two or three years "they would be pestered very little with them."...Artemus J. Gridley, Hartford Co., Conn., being greatly troubled, cleared his barn not only of grain but of every particle of straw, and put no grain nor straw in it for two years;—the cure was complete....A neighbor of Joseph Huston, Monroe Co., Iowa, rid his barn entirely of the weevils, which were very thick, by erecting scaffolds, four or five feet above the ground, in his barn, storing the grain upon these and keeping his sheep beneath.

The *second* plan advocated is the use of *salt* or *lime*, or both. J. G. Coles, Camden Co., N. J., writes, "my plan is simply to put hay (green enough to dissolve salt) in the barn first, and salt it well. It will kill or banish certain. I filled my mows nearly half full of hay and stored the grain on top." He suggests, also, stacking the grain one year and filling the barn with salted hay....T. Cole, Fairfield Co., Ohio, says: "before mowing away your grain dust finely slaked lime throughout the barn, on the sides and bottoms of the mows, and sprinkle a small quantity over every layer of grain of a foot in thickness, as it is mowed away. At threshing time sprinkle lime about the granary in the same way, and, if thought best, sprinkle a small quantity over the wheat pile as it fills up. A bushel of lime would be enough for granary and mows holding 500 bushels."...Thomas C. Mount, Monmouth Co., N. J., says: "In July, 1864, my barn being empty of grain, but occupied by millions of weevils, I took a bucketful of salt and sowed it in the barn broadcast, in every nook and corner which had bad grain in it. Ever since threshing time last year I have had grain in the barn but not one weevil has been seen."...J. C. Rinchart, Carroll Co., Md., leaves some chaff, etc., upon the floors until near haying time, then, on a rainy day, sweeps all out as clean as possible, turning over loose boards, etc. Then, when he gets his grain in, mixes two parts air slaked lime and one part fine salt, and sows one pint on each load of grain. Thus he gets rid of them.

The *third* plan proposed was carried out by Austin Rowe, of Patchogue, L. I. His barn was infested with the weevil, so he cleared it out and swept it; then taking some bags he went to the woods and found some large ant hills. With these he filled his bags—five bushels in all, sand, ants, etc., and taking them to his barn poured them out on the floor. The

ants immediately set to work devouring the weevils, and in a week's time all were gone and he has seen none since. The grain in the sheaf was not removed from the barn. Other farmers have tried this plan with the same result. The ants do no harm, but, after doing their work, depart into the earth.

Comparative Industry of Black and Italian Bees.

There is one lesson to be learned in bee culture that ought to be known to every one; neither the queen nor the majority govern, but every working bee acts under this law, "whatsoever I find to do that do." Such is the condition of a prosperous colony that where there is honey to gather and a place to store it, they work incessantly until they expire—building comb at night to contain the honey gathered during the day.

By weighing a new swarm morning and evening, for 20 days, we found they consumed at night about one-third of that collected during the day. But, alas, how great is their mortality. Late in the season, July 1, we selected ten similar empty frame hives and weighed each, and filled each with empty worker comb, and after again weighing gave each a new swarm of black bees, containing no drones. We then removed five of the black queens and gave five other young straw colored Italian queens. We also removed the five other *old* black queens, and substituted new ones. July 15 we examined each, and found the Italians had filled all their nine combs with sealed blood, while the black queens had only five full combs each; from the 20th to the 25th, the young bees emerged in great numbers from the Italianized hives, the young Italians outnumbering the old black bees, and by the 10th of August, less than six weeks, scarcely one hundred black bees remained; nearly all had become Italian save a few old ragged winged ones. During their conversion into Italian bees, the temper of the stocks gradually changed, becoming more mild, making smoke and a bee dress unnecessary in handling them. Careful handling does not disturb their labors. Even the queen continues laying, though removed on a comb and carried away. (The queen is really the greatest laborer in the hive). As a general rule, black bees, particularly those containing young queens, if you give them plenty of room, will not swarm; but two of the Italian hives swarmed once, and one twice, the second swarm issuing thirteen days after the first; hence the stock must have been without a queen during that time. Indeed, Italians work as well without a queen as with. We removed the queens and brood from two new swarms, and they filled their hives with sixty-one pounds of honey in twenty-four days, losing more than one-half their number during that time. Until the middle of August the bees experienced no destructive cold winds nor sudden showers, and flew less than one-half a mile, gathering buckwheat honey principally. Then the golden rod commenced blooming, which was occupied by black bees, gathering honey and building combs as yellow as gold; while the Italians passed over and flew nearly a mile beyond, gathering thistle honey almost as colorless as water. It will be observed, in the annexed tabular statement, that while the bees were engaged in raising brood they gained little or no honey—merely the weight of the young bees. Most crops of flowers bloom in less time than brood matures, so, unless other flowers fol-

low, the accumulated strength of the stock is wasted. Here lies the only secret to successful bee keeping: Keep your bees at work during any periods of short forage.

No. 7.	21½ lbs.	8 lbs.	Aug. 12, from 4	14½	53½	15	86	
No. 8.	14½ lbs.	6 lbs.	Aug. 23, from 4	34½	21½	58½	
No. 9.	15½ lbs.	6½ lbs.	Aug. 23, from 3	55½	58½	
TOTAL GAIN WITH ITALIAN QUEENS.....								1025 lbs.

As 5,376 black bees are calculated to weigh one pound, allowing six weeks as their length of life, it requires the lives of 278,476 black bees to gather 547 pounds of honey, or 509 bees to each pound gained. Taking the issues of the Italian queens, which were composed wholly of Italian bees, and allowing 5,123 bees to the pound and eight weeks as the length of their life, it requires only 249 Italian bees to gather a pound of honey—less than one-half the number of the black bees.

BIDWELL BROS.

October 6, 1865.

Broom Corn Culture.

The culture of broom corn is usually conducted with profit, and attended by no greater difficulties, if so great, as that of maize. The remarks made in other articles in this number, with reference to the preparation of the soil for Indian corn, manuring, etc., are equally applicable to this crop. With regard to *seed*, it is a question we cannot decide as to which is best, the tall or the dwarf variety. The testimony indicates that when the very best dwarf seed can be obtained, the crop is superior to the tall, (easier to handle and the brush finer and quite as elastic and valuable.) Yet there are many persons who have been greatly disappointed in changing from the tall to the dwarf kind.

Land which is very grassy should be avoided, for almost any weeds are preferable to grass, with this crop; and localities visited early by the frosts of autumn are most undesirable, as the earliest varieties are not secure from injury by frost, even in favorable localities. After plowing, harrow and bush the ground smooth, or roll it. Plant with a seed drill in rows three feet apart, dropping the seeds on an average two inches apart, depositing some fertilizer in the drill with the seed. Superphosphate mingled with an equal quantity of gypsum, at the rate of 300 pounds to the acre, has done well. A good drill will sow both seed and fertilizer. May 20th to the 1st of June is a good time to plant broom corn in this latitude, for it will not grow much until the weather is hot. Cover very lightly. Just after what is called "corn-planting time" is a safe rule, though in our practice we are inclined to delay this, so that it would be a little late for the broom corn. Cold, wet weather and frosts are more injurious to broom corn than to maize. After it is up a liberal surface dressing of ashes upon the hills or rows is often an excellent application.

Early Planting of Corn—Preparation.

In the Northern States, May is often a cold, wet, rainy month, and corn planted early, either does not come up at all, or it drags out a poor, yellowish, dwindling life, until the warm weather of June, while the farmer has to wage a steady battle with the weeds in order to see his corn rows at all. This is often the case at least, and we very much prefer to do other work in the early part of the month, meanwhile keeping the ground open by occasional harrowings, so that perhaps, two or three crops of weeds, will start up and be killed before the 20th or 25th, at which time we prefer to put in the main crop. An early maturing kind is best, and this cannot be too much insisted on both at the East and West; and we prefer not to go far out of the neighborhood for it, if we have not enough of such seed as we want of our own raising.

Take perfect ears with small cobs, and well filled out. Use only the perfect kernels. If the ear is perfect and thoroughly ripe, all the kernels may be used; but if the ear is misshapen and the kernels at the tip not so ripe and hard as the rest, plant only from the middle of the ear. Soak the corn twelve hours, then change the water, adding that which is as hot as one can bear his hand in. To this add a little pine tar, and stir the whole until the corn is all thinly coated with tar. Pour off the water and roll the corn in slaked lime. Plant within twelve hours, covering only about half an inch deep.

Grass Land, How to Improve It.

If you ask this question of many farmers, the only reply will be, break up and sod down afresh. Others will hesitate before giving this uniform answer. They will insist on looking at the land first, or at least will wish to know what is the matter with the present grass crop. Is some part of the field mossy or boggy? or does it grow certain coarse grasses which indicate undue moisture at the bottom? If so, their eyes will be opened, and they will reply, in medical language, that "underdraining is indicated." Nothing does the land need so much as this; nothing will do it material good, until this is first attended to. Plowing and manuring will be nearly all useless, so long as the land is clogged with surface water.

If this is not the trouble, they will enquire whether foul weeds have got possession, to the exclusion of wholesome grasses. If not, but the trouble is simply an impoverishment of the surface by long cropping, they will advise to scarify the sward in the fall with a heavy harrow, tearing up the mosses, and disturbing the soil a little, so that it will receive fresh seed. Then they will sow from 10 to 15 quarts per acre of clear Timothy and Red Top in equal parts, and cover the same with a light harrow. We should have said, too, they will apply a good coat of old manure, before the seed sowing. In this way repeating the manuring once in two years, many a meadow or pasture can be brought up to a high state of productiveness. If, however, the land is infested with white daisy, dock, or thistle, the only way will be to break it up thoroughly, cultivate it five years with crops and grain, and finally seed down again. Manuring should go along with this cultivation, of course. When seeding down, be not sparing of seed, but use half a bushel of Timothy and the same of Red Top. If Red Clover is desired, it should not generally be sowed until in the spring, as it is apt to winter-

kill. If our farmer is a progressive man, perhaps he will enquire whether the grass crop could not be improved by irrigation. We believe that much is to be realized from this practice during the next generation.

New Enterprise—Don't Sell Peat Swamps.

There is at present a growing interest being awakened among scientific and practical men, that may prove advantageous to many farmers. Owing to the speedy decrease of our woodlands, and the heavy expense attending the carriage of coal from distant points to the place of consumption, many parties have been trying to discover a substitute for those articles as a fuel. Their attention was directed to Peat, which is so well known as a fuel in Ireland. The great objection to its use was the expense of working it into a suitable form. The people of Europe who use it, cut it in square cakes, like large bricks, setting it up in piles to dry in the sun. This makes a great deal of handling, and in this country would be too expensive in practice. The attention of inventors was directed to the getting up of a machine that would compress the crude peat into a dry, dense, and easily transported shape.—Five or six machines have been recently patented for the purpose, some of which are worked by horse power, and some by steam. It is not my purpose to draw comparisons between these machines, nor to particularize them. But I wish to call the attention of farmers to the fact that many of them have valuable beds of peat on their farms, and that speculators are now engaged in buying up available property of this description. They try to obtain the beds, on various pretexts, for as little as ten dollars per acre, and have sometimes succeeded. Others have given more, and they should all pay good large prices. I will relate a few instances of the speculation. One party, in Northern New York, has been offered \$400 per acre for a fine bed. One, in New Jersey, was offered \$25,000 for a bed of 28 acres—but, knowing its value, the owner refused.

That the reader may understand the value of this property, let me state the particulars given by a member of a company owning one of the best machines. He says an acre of peat, if ten feet deep, will yield 5,000 tons of fuel. The cost of manufacture is less than three dollars per ton. It will sell at \$6 to \$8 per ton, leaving a nice little profit of from \$15,000 to \$25,000 per acre. Eighty to ninety tons can be made by one steam engine, and ten or twelve men, per day.

There is one company, recently started in an adjoining county, that, instead of buying the bed, have bought the peat at ten cents a cart load. Three cart loads make a ton of the pressed fuel. Therefore, at these figures, they are paying at the rate of \$1,500 per acre.

It may be said that this fuel will not bring such prices. It does certainly do so, and will doubtless compete very seriously with coal. Before the Society of Arts, a Mr. Newton stated that peat, "if properly used, gave a calorific power greater than coal; but the use of peat in manufactures was of greater importance than simply as a fuel for heating purposes. Every iron manufacturer knew that if he could get peat to stand the blast, it was infinitely superior to coal for their purpose, for the simple reason that it contained no sulphur. They could produce iron by peat, from the worst brands, which would almost equal the best Swedish or Russia iron, simply owing to the absence of these deteriorating chemical agents which exist in coal."

Mr. P. F. Murray read, before the Society of

Engineers, at Exeter Hall, a paper relating to this subject, and stated that "at an assumed average of twelve feet, an acre would produce about 3,500 tons of dried peat." This is by the wasteful method of sun drying in vogue there. "Trial of condensed peat has been made by Mr. B. Fothergill, on a river steamboat, in which 12 cwt. were consumed in 2 hours and 20 minutes, the ordinary consumption of coal being 12 cwt. an hour. It saves half the time of getting up steam, and will do double duty as compared with coal. The absence of smoke and clinkers, and the preservation of the grates and fire-boxes from the effects of sulphur are important additional advantages."

According to the Syracuse Journal, a trial was made on the New York Central Railroad, a short time since, of peat as fuel for locomotives. "The usual amount of fuel consumed by coal burning engines being a ton to every twenty miles, but, on the trial, it only took half a ton of peat fuel to run engine No. 106 twenty miles."

Gas has been obtained from peat, in some respects superior to, and nearly as much in quantity as that produced from coal, oil or resin.

Dr. R.—, residing near Syracuse, estimates that fifteen acres, at an average depth of eight feet, will produce 40,836 cords. One cord is worth at least a cord and a half of hard wood—that will make it equal to 54,448 cords of hard wood to the acre. Estimating wood at \$6 per cord, and allowing two-thirds as cost for producing, there will remain a net profit of \$108,896 as the produce of fifteen acres of peat.

Now, brother farmers, you can see for yourselves what an immense enterprise this is. The writer was called upon by parties desiring to purchase his "muck swamp," under the pretense of cultivating cranberries. He, however, succeeded in drawing forth from one of them a slight hint on the subject, and, following out this hint, he has made investigations that have resulted in the above. Feeling it a duty to his fellow workers to let them also "into the secret," he has chosen the columns of the *American Agriculturist* as being the best vehicle for carrying this information to those whom it ought to benefit in preference to the speculators.

FIELD.

Oil the Harness

And have it repaired if necessary, before a drier season sets in. Wash it thoroughly with warm soft water and castile soap, and brush out every particle of dirt before putting on the oil. This is the important point. Better not oil at all than to apply it on dirty leather. The harness should be taken apart and the pieces washed and oiled separately. Rub on the oil while the leather is softened with the water. It can be applied at once if the leather is rubbed a little with a dry cloth. It should be soft, but not too wet. After applying the oil hang up to dry for a few hours, till the oil is absorbed. Old harness, that has been neglected, and is dry and hard, had better not be oiled. It will do no good. The evil is already done. The fibres of the leather have lost more or less of their tenacity, and oil will not restore it. In fact, by softening the leather it only weakens it—just as a wet sheet of paper will tear more easily than a dry one. Oil does not add to the strength of leather; it merely softens it and keeps it from cracking. It is a preventive of decay—not a restorer. Harnesses are now so high that it is more than ever important to take good care of them. Never let them suffer for want of oil; kept in good repair, they will last as long again.

The Groesbeck Barn Plans.

We present herewith the third and last of the prize plans. This too has its merits and its faults—and besides having many excellences in common with the one last published (p. 134, April), it fills some important deficiencies noticed in that plan, while lacking some meritorious points of that and the first prize plan (page 96, March.)

In most barns where the flooring above the stock is of loose boards, or only a floor of rails, the objections to the fodder being stored above the cattle stalls, are perfectly valid—but where the floors of the hay mows are made of matched stuff, the breath and exhalations from the animals can not come in contact with the fodder, and so, with fair ventilation,

there can be no injury to it from this cause. It becomes then a matter of some doubt, whether the cheaper construction, which the cattle wings, built as in this plan, admit of, is any real advantage, in connection with the loss of room above the stock. Storage space, for both fodder and litter for bedding, would indeed require more expensive and stronger buildings. It would, however, add considerably to the comfort of the cattle, by making the stables warmer in winter and cooler in summer. In every barn there ought to be straw shoots and hay shoots separate, as this will save steps, if straw is used for litter. We strongly object to manure under the stock and having it half under them is just as bad. A few years ago there was a general advocacy of barn cellars for manure. We will not say that manure *can* not be kept in a barn cellar under the stock, in a way to be perfectly harmless, in a sanitary view; but we must say that it *will* not be. In this plan, however, the only place to keep manure under cover is the cellar, and there is no adequate provision made for all that

the stock might make. The open yard is no place for it; so sheds away from the barn would be needed. This is very well, for a capacious shed with a bottom well constructed, is as good a place as can possibly be to preserve and make manure. The profit of farming throughout the Eastern States, and westward, to and almost throughout Ohio, may be measured, other things being equal, by the quantity of good

manure made. Hence, in our own view, there is no one thing of greater importance than convenient and abundant facilities for making manure. To this we would make many other things bend, if necessary. The prime thing in good farming is, good manure and plenty of it.

When cattle stand upon a floor over a basement or cellar, there is a constant dripping, more or less, especially after the buildings have been

plans. The construction of the wings may be plainly seen by reference to the section in fig. 2.

Design for Farm Buildings.

SUBMITTED BY E. BOYDEN & SON, ARCHITECTS, NO. 14 CENTRAL EXCHANGE, WORCESTER, MASS.

Having in the course of a professional experience of many years, been called upon to furnish designs for barns to suit a variety of localities, and to answer the requirements and tastes of many different minds, we have embodied our ideas on the subject in the accompanying sketches. Of course we labor under the great disadvantage of not knowing the locality in which the barn is to be erected, whether in New England, the far West, or in the immediate vicinity of New York City. We have therefore embodied some favorite ideas of

our own, suitable to any ordinary locality. One very important principle is the entire separation of the stock from the store of food. We deem it as essential for animal health as for human health, that the food should be pure and wholesome; and we do not believe it possible to keep it so, if, as is usual, the cattle are kept underneath the hay scaffolds, with a tight, warm barn cellar below, for it will be impossible to prevent the ammonia from rising up through the barn and affecting the hay. Ventilation

will do something toward diminishing the evil, but ventilation has never yet been made perfect, and even when used, the gases are usually allowed to pass up through or come in contact with the fodder on the way to the point of exit. Let any one go in the morning from the open air to a good warm barn where stock have been kept over night, and with even good ventilators on the building, they will detect a strong odor both of ammonia and exhalations from the body, which can not be of any benefit to the food stored above or in the same build-

Fig. 1.—ELEVATION OF BARN, FACING NORTH.

in use a year or two. The liquids soak into the wooden gutters, no matter how well tarred, or cemented, finding their way by capillary attraction over and through obstructions, and are ever oozing and dripping down upon whatever is below. No stock ought ever to be kept under the stables of others, nor in the close vicinity of manure. Hogs are the only exception to this rule, and the less we discuss where they find their food and make their beds, the better for our appetites, if we eat much pork.

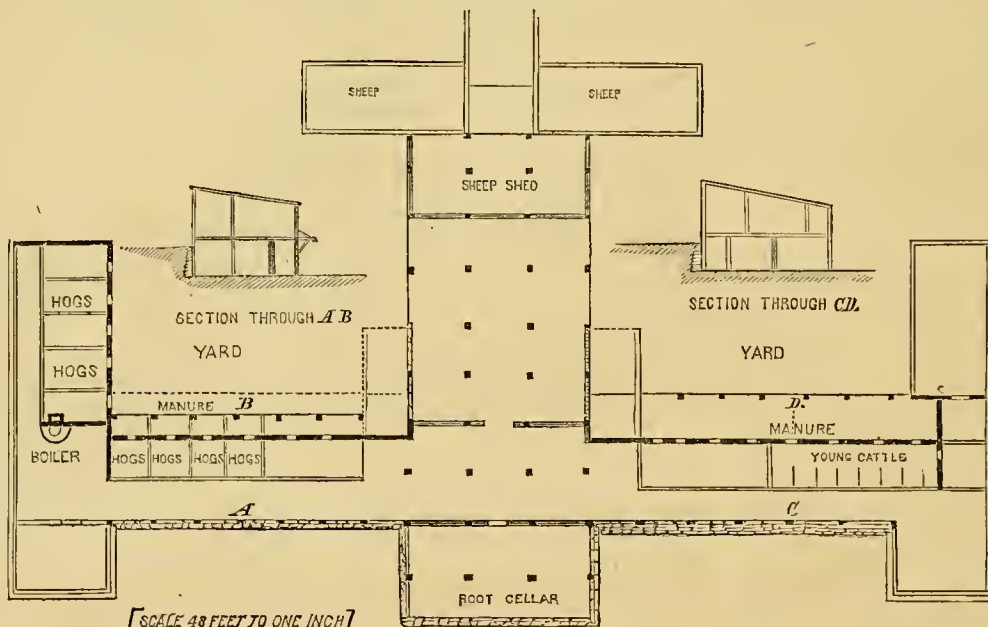

Fig. 2.—PLAN OF CELLAR.

The general arrangements of this plan are good.—The extensive root cellar, cart and tool shelters, most commendable,—the provision for shutting off the wings entirely from the main building, a great security in case of fire, and so there are many good points which will commend themselves to our readers. The yard-room is abundant, sunny, and sheltered from winds, the sheep yards being represented on the

ing. Any man of ordinary intelligence would not think of keeping his own food, for the season, in the apartment where he sleeps, and why should he keep his cattle's food in a place as unwholesome as that would be for his own.

In our design we have made the *Main Barn* for the hay and grain. This we have calculated to be large enough to hold 100 tons of hay, and the framing we would so construct as to be well

adapted for the use of the 'Horse fork.' For size and general arrangement see plans. This might be enlarged or reduced, and much expense saved by enclosing it with boards only laid edge to edge instead of being jointed and matched, as is usual, and necessary to make the barn tight and warm enough for cattle in winter.

THE CATTLE STABLES we design for low one story buildings made tight and warm, with good ventilation as is shown on the elevation. We would so construct them that the hay may be placed upon a truck and passed through the feeding corridors before the cattle, with ease. One space next to the main barn on each side we leave open for a passage through to the yards in the rear. The roofs may be made low and flat, or raised sufficient to slate or shingle as may best suit the locality.

We propose to have every other one of the arches in front, open with sliding doors, if need be, for a part of the season, and to draw an open lattice work over the opening as is represented in the elevation. The cow stables we make wide enough to place the calf pens in the rear of the cow stables as represented on the plan. For young cattle we propose two arrangements: one, to place them in a wing back from the cow stables and on the same floor, and the other, to put them in a basement under the cows as is represented on the cellar and basement plan. In case they are placed in the basement, then the wing may be left off, or it may be used as a cart shed. The oxen are placed in the left wing that they may, if need be, have a separate yard for the cows.

A Carpenter or Repair Shop is shown at the end of, and in front of cow stables. The Farming Tools we would place in a room in front of main barn, and we propose to use a part of the cellar or basement under the rear of the main barn for cart sheds. The Grain room on the right, corn cribs in a room over these two, as shown on second floor plan of the barn.

THE HORSE BARN and Carriage Room, we think will not need other explanation than is shown by plans. We have provided for a Harness room and Hostler's room; and adjoining this, we design our Poultry House, with yard in the rear. The Swine we propose to place in the basement under this wing, as shown on basement plan, providing a set kettle for cooking their food. The Vegetable cellar we place under the front part of main barn.

THE SHEEP BARN we propose to place in the rear of the main barn, with low shed-building one story high, with the roof so constructed that it may be entered from the main barn, and hay dropped down the racks.

In the construction of our low buildings we claim that they may be built with much lighter timber above the floors, such as scantling frames, and consequently may be constructed more

cheaply than may at first appear from the extent of the building. We claim some consideration in favor of this plan, as in case of fire, by closing the sliding doors, separating the main barn from the stables, the fire might be kept back until the stock could be removed.

yet by breeding with a view to beef-producing points, the great milking property has been lost, inasmuch that it is rare at this day to find a milker among them; some families of them, it is said, show the old milking characteristic more than others, and a cross with a good native has

occasionally developed this trait in a marked degree, but, of course, without any security of transmitting it to the progeny. Now, I think you will agree with me, that within striking distance of the great markets, say within two hundred miles of New York, it will not pay for farmers to breed principally for beef purposes. Within the section named, butter commands too good a market to justify us in wasting our forces competing with the great West in raising beef. Butter and milk are the products from cattle that we who

For the American Agriculturist.

A Plea for the Alderney.

BY A. W. F., OF BERGEN CO., N. J.

Not the plea, Mr. Editor, of the fancy farmer for his pet, without regard to actual merit, but I would present the claims of a breed of cattle whose true position is not properly recognized in this section of the country. In choosing stock we should have regard to the uses and purposes for which we need them. If we would breed for the shambles, there are probably no cattle that can compare with the Shorthorn; but if we would breed for the pail, we must look elsewhere, we must either establish a blood in which the milking property predominates by a succession of generations and the use of the arts of the skilled breeder, or select from some established breed possessing this trait, and perpetuate it by judicious breeding with reference to this end. You cannot expect to represent in

Fig. 4. LOFT OF MAIN FLOOR

Fig. 5.—SECTION THROUGH MAIN BARN.

the same blood the good milker and the great beef-producer. The history of the Shorthorns illustrates this. The Teeswater cattle, from which the Shorthorns are said to have sprung, were angular in shape, and make good milkers,

live near cities are most interested in. For this purpose, and the general uses of the farm, I hold the Alderney is the stock we should keep. I claim for the Alderneys, good size, a fair yield of milk, and that of exceeding richness.

Unless my observations and experience have been exceptional, the reproach of "little Alderney" is undeserved. The opinion that the pure breed is one of dwarfs, is a mistaken one, that is, so far as the stock has been developed in this country. Careless selections have doubtless been made in many importations, while some importers may have thought it necessary to select the smallest specimens to gratify the existing prejudice; change of soil, climate, and good care, may have tended to develop growth of bone and muscle above that characteristic of them on their native isles; but the fact exists that the Alderneys that have come under my observation are of good size. My small herd contains one cow imported by Richardson, and others with pedigree as good, and all of good size; weight I cannot give, but the farmers in my neighborhood consider them good-sized cattle. I have seen a number in this State answering this description. My neighbor's imported bull, at four years of age weighed a few pounds short of twelve hundred (1200) pounds, his only feed being grass in summer, and clover hay in winter, without any grain. Those of this blood that I have seen, at least equal the Ayrshire in size. The Alderney gives a fair yield of milk, and carries a large flow for a long time. My imported cow, up to the time of my purchase, had been accustomed to go dry but a week or ten days. Of course I allow her more leeway now. The Alderney with her second calf, will give from twelve to twenty quarts daily, when fresh. My Alderney heifer "Flora," with her first calf, now three weeks old, is giving twelve quarts. My imported cow "Nellie" gives, when fresh, from fifteen to sixteen quarts daily. There are doubtless deep milkers among them. I have seen an im-

ported Alderney whose bag indicated a capacity of from twenty-five to thirty quarts, and this opinion was shared by the owner, though he had never accurately measured the yield. Wm. Brooks has testified in a published affidavit, that during the summer of 1853, an imported Alderney, owned by Wm. C. Wilson, of Baltimore, in charge of Brooks, gave thirty-six (36) quarts a day for some time.

The milk of the Alderney is exceedingly rich. Five quarts of milk (on good feed), churned with the cream on it, will yield, I believe, a pound of butter.—My experiments in churning the milk with the cream have been very unsatisfactory. Bridget has never been able to seize the moment when the milk is in the proper condition for churning. "They never churned the milk in the ould country, sure, only the crame." Hence I have been able to get more butter from the cream of the milk, than from the cream and milk churned together. My imported cow made a pound of butter from the cream of less than six quarts of milk, speaking accurately, from the cream of five quarts and fifteen-sixteenths of a quart; this in the latter part of November, upon the following feed: four lbs. of clover hay, and one peck of turnips in the morning; at noon, three pounds of cut cornstalks (in bulk one bushel), moistened and mixed with one and-a-half pounds of wheat middlings—in the evening the same in substance and quantity as at noon. Last summer, an Alderney heifer with her first calf, then owned by me, while giving fourteen quarts of milk on ordinary pasture, made a pound of butter from the cream of six and-a-half quarts of milk. I mention these, not as exceptional cases or to vaunt my cattle as superior to other Alderneys, but as the result of exact experiments made to satisfy my own mind of the truth or falsity of the stories current as to the remarkable butyaceous properties of Alderney milk. Let your readers try the experiment, and they will find that it is a good native cow, twelve quarts of whose milk will make a pound of butter. Zadock Pratt reports, as his first year's experience in the dairy, that it took twenty quarts to make a pound of butter. In the course of three or four years, by improving his herd and discovering the best kind and quantity of feed to give, and with the most complete appliances for making butter, together with the skill acquired by practice in the business, he was able to make a pound of butter from about eleven quarts of milk.

The opinion of all I meet who have this stock, sustains me in the conviction of their great superiority over all other cattle for the dairy. My estimate of their great merits amount almost to an enthusiasm, yet I have tried to make my pen yield strictly to facts. I have occupied more of your valuable space than I intended, and will close my letter with my opinion, expressed in brief, as derived from reading, observation, and experience, of the comparative merits of the three following breeds of cattle. If you would grow beef, breed the Shorthorns; if cheese or milk for the city market be the products you value most, the Ayrshire is the stock to keep, but if you would grace your table and the market with golden butter and secure a golden lining for your pocket, the deer-like Alderney steps forward and claims to be the cow *par excellence*, to fill the full measure of your desires.

LATE SOWN CLOVER.—It is commonly desirable to sow clover and grass seed as early as the ground can be prepared for them—but this need prevent no one from sowing in May—for in this

month the seed "catches" better, and on well prepared ground the plants get sufficiently well rooted to bear a good deal of scorching in June and July, and do better than with grain.

An Interesting Fact in Sheep Breeding.

AN INCREASE OF 400 PER CENT. PER ANNUM.

His Excellency, Senor Don D. J. Sarmiento, Minister of the Argentine Republic, widely known for his interest in the cause of Education, Arts and Agriculture, favors the readers of the *American Agriculturist* with a letter from his sister—the widow of a large land owner, whose estates lay in one of the interior Provinces of the Argentine Republic, S. A.—to whom he wrote for the facts concerning a remarkable flock of her late husband's. She responded as follows, under date San Juan, Nov. 9th, 1865:

* * * "1. There was a sheepfold of ewes in which all brought forth two lambs twice a year.

"2. My husband, Don Mareos Gomes, formed the flock in this manner: He bought a small flock of about twenty ewes, and with them one very old breeding ram. When they began to multiply, one or two had twins; the first male twin he destined for a breeder, and when he was serviceable, the old ram was killed; the ewes then began to bring forth various twin ewes. By this circumstance, he observed that it was because the ram was a twin, and he proposed to mark all the twin yearling ewes, and to set them aside for breeding, and every ewe that brought forth one lamb only was killed.

"3. There were many black ewes in the fold, and also white ones, though in less numbers, but both colors propagated themselves equally.

"4. At the end of four years, or less, not one of the original ewes of the fold remained. This being the case, he made another observation, namely, that among these twin ewes, (products of a twin ewe and of a twin ram,) from time to time, some produced from one to three lambs, and that (in the case of having triplets,) they suckled two and discarded one, and it was necessary to bring in these deserted ones and raise them on cows' milk, till they were in a condition to turn loose in the flock.

"5. They continued bringing forth from one to two at each yearning, during ten or more years, and no tendency to return to the primitive type was noticed, care always being taken that all the breeding rams should be twins.

"6. The sheepfold lasted until the death of Don Mareos Gomes, for after his death they were killed or sold until the fold was exhausted.

"7. The flock numbering, perhaps, from 400 to 500 ewes, furnished meat for all the laborers, and he sold many lambs. They were not allowed to increase, because there were few pastures upon the estate."—In connection with these interesting statements, we can not forbear to enforce a parallel fact, viz.: That the bearing of twins is found inconsistent with the largest size of the sheep. Twins are, therefore, not regarded as desirable, by those who maintain any breed in perfection.

The application of the principle brought out in the flock of Don Mareos Gomes, which we would suggest, is, that for raising mutton sheep, or lambs, it would be well to employ twin ewes so far as practicable, and to use with them twin rams of some improved mutton breed, South Downs, Cotswolds, Leicesters, etc. Twin rams of these breeds, may, we think, often be bought at less prices than others, on account of their smaller size, and if it be found that they may be relied upon to produce a considerable num-

ber more of twins than other rams, it would pay to use them in breeding for the shambles.

A Bit of Chemical History.

The Working Farmer for February, contains a long obituary notice of the former editor and founder of that paper, Prof. J. J. Mapes. Of course the present editor has a right to hold the services to agriculture of his predecessor in whatever estimation he chooses, and as long as it is an opinion, we have no fault to find. But when history is completely ignored, and statements are made which have not a shadow of foundation, we think it due to the cause of truth, that these errors—to use the mildest term—should not be allowed to go out without some notice. The following will serve as a specimen of the looseness of statement by which this article is characterized: "He (Prof. Mapes) was the first man to make known that plants take up Carbonic acid from the atmosphere, and that ammonia is valuable only in assisting inorganic constituents to become more soluble in water. These facts were subsequently confirmed by the investigations of Liebig, the great agricultural chemist." That is history according to the Working Farmer; now let us see what other people have done. In 1754, Charles Bonnet published a work, the translated title of which reads, "Researches upon the uses of the leaves of plants, and upon some other subjects relative to the history of vegetation." In this work is found the first notice of the fact that air was emitted from the surface of leaves, and this air was afterward recognized by Priestly to be oxygen. In 1779, J. Ingenhouz, in a work called "Experiments upon Vegetables, discovering their great power of purifying common air in the sunshine, and of injuring it in the shade at night," showed that the presence of sunlight was necessary to the liberation of air from leaves. In 1783, J. Senebier, of Geneva, proved that the oxygen eliminated by the leaves came from the decomposition of Carbonic acid. All this took place in the last century, and these results were confirmed by the researches of De Saussure, published in 1804. As we learn from the same article that Prof. Mapes was born in 1806, we leave the Working Farmer to cypher out the age at which he must have made the discovery of the relation of plants to Carbonic acid. We dismiss the Working Farmer article with one more quotation: "A truth does not cease to be a truth after it appears in print," which would be applicable to some of its statements if it read: "an error does not become a truth, after it appears in print."

About Seasoned and Unseasoned Wood.

S. D. Newbro, of Ingham Co., Mich., writes to the *American Agriculturist* the following effect: That by careful experiment, he finds green beech and maple wood cut in the winter, and kiln-dried, or thoroughly seasoned, to lose three-eighths of its original weight; that a cubic foot of either kind in the green state, weighs about 60 lbs. on an average, there being a difference between the butt end and top ends of a log, and some trees are closer and firmer grained than others; that a full cord of such green wood, weighs about 7,680 lbs., but if 1,680 lbs., i. e., a little over one-fifth, be deducted for the open spaces in wood as usually corded, it leaves 6000 lbs. as the weight of a cord of four-foot green wood, or 4500 lbs. for three-foot wood, or 2250 lbs. for 18-inch wood. Practically,

the experiments show that *five cords of green wood are as heavy as eight dried; that it requires as much physical force, man and horse power, to move 50 cords of green wood as 80 of dried wood,—and that the man who carries into his house 10 cords of four-foot green wood, carries in with it over 11 tons of water.* Sixty lbs. of green wood will warm a room the same as 38 lbs. of dried; and the 60 lbs. of green wood, while burning, discharges into the fire in the form of vapor just 23 lbs., or 2 gallons and 3 quarts of water, which, in changing to steam, carries off a great amount of heat in a latent, useless state.

Our Native Grapes.

BY F. C. BREHM, WATERLOO, N. Y., (LAT. 42° 55' NORTH.)

[The following arrived too late for April, but we give it now, as embodying the valuable experience and opinions of one of our successful cultivators. Many will dissent from some of Mr. Brehm's views in regard to varieties, but it is only by comparing notes of cultivators in different parts of the country that we can reach any just conclusions as to the real status of varieties.—Eds.]

To the Editors of the American Agriculturist.

It has been a pet theory with some to enrich the soil with strong, stimulating manures before setting out the vines; also to go to a large expense in trenching and working the soil to a depth of three feet and more. This I have tried, and found to be worse than money thrown away, especially the heavy manuring, which resulted in positive damage to me. Isabella vines, which had always borne large crops of fair grapes that uniformly ripened, refused to do anything after being stimulated with strong manure, and I find that I am not the only one that has been misled by these theorists.

Stimulating the vines with strong manures, causes a rampant growth of wood, which hardly ever ripens, and is very liable to be winter-killed. The fruit does not set well, ripens very uneven, and not as early, by nearly two weeks, and is very liable to mildew and rot, especially if there is much rain in July and August.

Working the soil 20 inches, is deep enough for all practical purposes, especially in the Northern States. In countries where they have a hot climate and long Summers, without rain for long periods, like California, Spain, Italy and Portugal, this deep working is no doubt beneficial and necessary to protect the vine from intense heat and long droughts. But for our short Summers, where we have frequent rains, we want to keep the roots of the vine as near the surface as possible, and be out of the way of the cultivator and get the benefit of solar heat and light. Working 20 inches deep is about right, so far as my experience has shown. I use a clipper plow or strong sub-soil plow, having a sub-soil attachment behind that can be raised or lowered at pleasure, and by which you can loosen the sub-soil six inches below the point of the plow, and not throw it up on top. Take a furrow, from six to eight inches wide, and go twice in a furrow. If the soil is very stiff it should be cross plowed. It will require three span of horses or oxen to do it well, and if the soil is heavy and stiff, four span. Oxen are best, being steadier and less liable to break the plow in stiff soil. This method will break up and loosen the soil from eighteen to twenty-four inches, which is sufficient. Three yoke of oxen and two men can plow one acre per day unless the soil is too stiff.

The requisites for successful grape culture are, first, a favorable location, one exempt from late spring and early fall frosts, and a judicious selection of varieties, adapted to the locality.

Second, the soil should be thoroughly drained, (unless it be on a deep, gravelly soil, where there is a good natural drainage); the drains not less than three feet deep, nor more than twenty feet apart, nor should tile be used less than three inches wide—three-inch horse-shoe tile, laid on boards, make a very good drain. Vines planted on wet or springy soils are more liable to rot and mildew, and will not perfect their fruits so well nor ripen as early as vines planted on a dry, warm soil. We cannot get our soil too warm and dry, especially for this latitude. This is an important fact, and should be remembered by those about engaging in grape culture. Third, the soil should be neither too light nor too heavy. Any good, well drained soil, that will produce from 15 to 20 bushels of wheat per acre, is rich enough for our strong growing natives, especially Isabella, Catawba, Diana, etc. Delaware requires a richer soil, and is an exception to the general rule. Fourth, exposed lands, sloping to the south or southeast, are best, although land that is level is not by any means to be despised, provided, however, that it does not lay too low, in a basin or deep valley, as such locations are more subject to frosts and fogs. If possible get near a large body of water, as such location has shown the best results, near some of our numerous inland lakes for instance. Vineyards in their immediate vicinity seem to be exempt from spring frost and mildew.

If the wind blows strongest from the west make the rows east and west; if from the north or south, then make them north and south, so as to offer the least resistance to the wind.

ANNA, a white grape, seedling of Catawba. Bunch and berries medium size; good quality and high flavor, where it ripens. Too late for this latitude, may do well further South, or where Catawba ripens well. Hardy.

ALLEN'S HYBRID, a white grape. Hybrid, between a native and foreign grape, Isabella and Chasselas, I believe, originated with Mr. J. Fisk Allen, of Salem, Mass. This fine grape is, in my estimation, the best white grape I know of. Ripens with Delaware, or middle of September. Bunches large, shouldered and compact. Quality first best. Vine a little tender, and more suitable for the garden than vineyard, and should rank among the six best varieties.

ADIRONDAC, is an excellent early grape, ripening with Hartford Prolific and Israella, but too subject to mildew in some localities, to be of much value for general cultivation or vineyard planting, except in localities where it has been tried and found to succeed. Were it not for its liability to mildew and tenderness, it would be a desirable grape to plant for early marketing.

CONCORD, a black grape. This has been, and is still, with some, a popular grape, especially at the West, where it seems to do better than in the Northern States. Bunches and berries large and fine looking. Ripens about the 20th of September, or ten days before Isabella. Quality ordinary. It is foxy, tender skinned, and berries frequently crack open and drop off in shipping to market—sometimes on the vines. Rotted badly this season. It is now superseded by better sorts; would not advise planting largely of it. Vine hardy and productive.

CREVELING, a black grape of good quality. Ripens early, or about September 5. Bunches medium size. Does not set fruit well, bunches very loose, the only objection to it. Hardy.

DELAWARE, a red grape; one of our finest table grapes, ripening from 10th to 15th September. Quality first best. Very hardy and productive. Bunches and berries medium size, shouldered

and very compact. Should be planted on a rich, dry soil to do well. Its only faults are too great compactness of bunch, berries frequently bursting. Birds generally are very fond of them. Bees sting the berries and disfigure the bunches. It should have good cultivation.

DIANA, a red grape, seedling from Catawba. Bunches large, shouldered, compact. Ripens with Concord, or 20th September. Quality first best. Is a splendid keeper,—can be kept until Spring with less trouble, than any other grape I know of. It is a superior wine grape, and in my estimation better than Delaware, making a wine that commands the highest price, and superior to any Rhine or Hock wine. It should be planted on a light, dry, warm soil or sandy loam. Does poorly on heavy soils; should not be allowed to overbear when young. Productive and strong grower, as hardy as Isabella.

ELSINGURGH, a small black grape. Bunches large and somewhat loose. An excellent grape for table. Not suitable for vineyard planting on account of its small size. As hardy as Isabella. Ripens a few days before Isabella.

HARTFORD PROLIFIC.—Ripens early, or about Sept. 1. Very productive; hardy; quality poor; foxy; should be picked about three-fourths ripe, when it will bear shipment better and taste less foxy than when fully ripe. Not desirable where Israella and Creveling can be had.

ISABELLA, is now supplanted by earlier and better sorts. There are, however, localities where it can be successfully grown for market with profit. It does best on a gravelly soil of ordinary fertility. I have dug all mine up and planted earlier varieties.

IONA, a red grape. This splendid grape ripens same time as Delaware, or September 15th to 20th, sometimes earlier. Bunches and berries large. Quality first best. Some think it superior to Delaware, especially those who like the Catawba. It is tender and sweet to the center, having no toughness or pulp when ripe. Is a good keeper, and will no doubt be one of our best grapes for wine. For table it has no superior. Is productive, and, so far as I have tested it, hardy, having fruited it two years. I regarded it so highly that I planted two acres, and shall plant two acres more this spring.

ISRAELLA, a valuable acquisition to our early varieties, combining earliness with good quality, and very productive. It can be kept till spring with little trouble. Ripens about Sept. 1, or same time as Hartford Prolific. Bunches large, compact, shouldered. Quality good. Hardy, and will no doubt rank as our best early market grape when it becomes better known. Very desirable.

REBECCA.—Vine rather a shy bearer until it gets well established. Bunches medium size, compact. Quality best. Vine tender and liable to sun scald. Suitable for garden only. Ripens about one week before Isabella.

ROGERS' HYBRID, No. 19. Quality good. Productive. Ripens about Sept. 10th. Is a good keeper, hardy, and will no doubt prove to be a popular market grape.

ROGERS' HYBRID, No. 4, is very similar to No. 19, but not so early and not so well flavored. These two, I think, are the best of the lot of Mr. Rogers' hybrids, and deserve a fair trial.

TO KALON.—Bunches and berries large. Quality good. Strong grower. Sometimes rots badly. Requires a good warm soil of moderate richness. A desirable grape for garden. Ripens a little before Isabella. Moderately hardy.

UNION VILLAGE.—This grape, when well grown on established vines is the largest, showiest and most beautiful in appearance of all our native grapes, often producing clusters weigh-

GROUP OF PLANTS WITH ORNAMENTAL FOLIAGE. — *Designed and Engraved for the American Agriculturist.*

ing as high as one and one-half pounds. Bunches and berries very large. Ripens a little before Isabella. Quality ordinary, or like Isabella. Strong grower. Not very hardy. Should be laid down and covered in Winter, and, let me add here, that were all of our varieties laid down and covered in Autumn it would be found to well repay the cost and trouble of so doing. You thus ensure a crop of grapes for next year—no buds are frozen. They all start uniformly in the Spring, and the fruit will ripen a few days earlier. This has been my experience. I cover all my vines without regard to the variety.

SELECTION OF VARIETIES.—My experience with the above-mentioned varieties, and a large number of others not named in this article, that I have under cultivation is, were I to select six varieties for this locality, I should name Iona, Diana, Delaware, Israella, Rogers' Hybrid No. 19, and Allen's Hybrid. Iona, Diana and Delaware for wine and table; Israella and Rogers' Hybrid No. 19, for early marketing, and Allen's Hybrid as best white grape for table. Should I be confined to three varieties I would name Iona and Diana for wine, table and long keeping; and Israella for best early grape, of good quality, for table and long keeping.

Cultivators should bear in mind that it takes no more ground nor costs any more trouble

to cultivate good varieties than poor, worthless foxy trash, and should be careful in their selections, and plant only those of high quality, that have proved themselves hardy, productive and healthy, as fruit produced from such vines will always command an extra price and find ready sale, when poor, foxy kinds will drag in the market and bring a much less price. A few dollars extra cost in the purchasing of vines of good quality will be found money well invested, and better than to plant vines of inferior grades and quality at half price. It is better to pay a good, fair price for an Iona, Diana or Delaware, than to have a Hartford Prolific, or even Concord, given to you, as the one will make good wine, in case the market gets glutted, while the other will, if they cannot be sold, be a dead loss, or, even at best, make good vinegar. It is of the utmost importance, therefore, to plant only those varieties that, in case they are not sold, (which may occur at some time or other, judging from the immense quantities being planted), they can be made into a good article of merchantable wine, that will command a ready sale and put money into the pockets of its owners. A vineyard, if properly planted and taken care of, will last a lifetime. Therefore, make a good and judicious selection, as on this depends your profits.

The Decoration of Small Front Yards.

The *Agriculturist* has a large circle of readers whose landed possessions do not exceed one or two city lots, and we like occasionally to have an article especially for these. Most of them, whether living in city or village, have a small space between the house and the street, which they wish to turn to the best account, as it is constantly in view not only of passers by, but from the windows of the dwelling. Where the soil and situation are favorable, these little patches may be kept gay with flowers during the whole season, provided a reserve stock of plants be kept in pots in the back yard, ready to replace those which go out of bloom. We have seen these little flower gardens kept up very nicely; but more generally they promise well in spring, languish in summer, and by autumn are sad pictures of desolation. One who would keep a place of this kind looking well all the season, has to persevere against difficulties. The soil is usually poor and shallow, and the heat and dust are so destructive to flowers, that any but the most ardent enthusiasts are too apt to be discouraged and give up in despair.

Those who wish to give the front yards a comely look, and are unable to have a well kept flower bed, will be glad of some suggestions to

this end. A neat bit of close and well kept turf, is always pleasing, and upon this, one or more evergreen shrubs, according to the size of the spot, will be in good taste, and give a cheerful look summer and winter. But to have even this, the soil must be looked to. Often the rubbish left by the builders is just covered with soil, and the place fit for nothing but weeds. Among the shrubs suited for such places, the Norway Spruce and Arbor Vitæ are the most readily attainable, and they stand rough treatment better than most others. Though they are naturally trees, they may be kept as shrubs. Select those well furnished to the base with branches, and then keep them small and dense by the use of the knife. The Siberian, Golden, and other varieties of Arbor Vitæ, make beautiful specimens treated in this way. The Dwarf Pine, or some of the Junipers, may be planted with good effect. If the place is somewhat shaded, some of the broad-leaved Evergreen shrubs may be used. The Tree Box, Japan Euonymus, or even the Rhododendron, may be made to grow, though these are not recommended where the winters are severe. For such situations the French use plants with ornamental foliage to an extent of which we have no conception. Some of their florists publish especial catalogues of plants remarkable for the elegance of their leaves, which comprise many species that it would be difficult to obtain in this country. A group of these plants, with fine leaves, can be made to produce a pleasing effect, and there are enough readily obtainable at our florists, to allow those who wish, to make the attempt. Our artist has drawn a group of plants of this kind. The center of the bed is occupied by various species of Canna, around which is planted a row of *Caladium esculentum*, with its enormous leaves, and outside of this a border of *Centaurea candidissima*, with cut leaves, of a very pale, almost white, color. A group of this kind has a very tropical look. Roots of the Canna and Caladium, from which the foliage shoots up very rapidly, and plants of the Centaurea, are sold by the principal florists at moderate prices. The Canna will grow about six feet, the Caladium about two or three, and the other not more than a foot high.

A very brilliant planting can be made with *Coleus Verschaffeltii* in the center of the bed, with a border of Centaurea; the deep purple of the Coleus contrasting strongly with the Centaurea. The plants of Coleus may be put about a foot apart, and as they grow, shorten the branches to make a compact mass.

Those who can wait for annuals can use the finer varieties of the Castor Oil Plant, the Striped Japanese Corn, Perilla, and others.

Side-Saddle Flower.—(*Sarracenia purpurea*.)

The engraving represents a curious plant,—not an exotic that can only live in the atmosphere of the hot-house, but a hardy native of our own cold swamps. Though it is not rare,

and when in flower is quite conspicuous, if not elegant, and there are many exotics grown in our hot-houses with great care, that are less wonderful and less interesting than this singular and rather common native plant. The leaves are all produced in a cluster frequently a

foot across, at the surface of the ground; the engraving, which so well shows their shape, gives them in a position more erect than the natural one. In the living plant they are filled with water, and rest on the ground with the mouth and wing-like portion uppermost. The beauty of the leaves is much increased by conspicuous purple veins. From the shape of the leaves and the fact that they contain water, the plant bears the names of Pitcher Plant, Huntsman's Cup, and Forefather's Cup, in some places. However these names may suggest the possible uses of the leaves, no one would be tempted to drink from them after seeing the number of dead insects, and oftentimes living larvæ, that they contain. The plant is one of those puzzles with which we sometimes meet, and it is difficult to see what purpose is served by the peculiar shape of its leaves. As it only grows in wet places, the plant apparently does not need the water contained in their cavities, and it is not easy to see of what use the insects can be to the plant; yet it seems to be made for the express purpose of trapping them, the lip-like portion of the leaf being furnished with stiff hairs pointing downward in a manner to effectually hinder an insect from crawling out. The flowers are produced singly upon stems, a foot or more high, and are nodding; they are of a dark reddish brown color. Their general form is shown in the engraving, but it would need a dissected drawing to describe their structure clearly. The calyx is darker than the corolla, and the parts of the

SIDE-SADDLE FLOWER

the plant is not often seen, as its places of growth, the peaty bogs and wet margins of ponds, are of a character not very tempting to others than botanists and anglers. Last sum-

Fig. 2.

mer we took a large specimen to a country hotel at which we were stopping, and found it to be an object of as great curiosity to the congregated villagers as a growing pineapple would have been, and though the plant grew in great abundance within a few miles of the place, no one appeared to have ever before seen it. The plant is at any time sufficiently striking to arrest at-

latter curve inward and cover a very large and umbrella-shaped stigma, two points of which are shown. The name, Side-Saddle flower, is said to be from the resemblance of the stigma in shape to an old-fashioned pillion. Breck, in his New Book of Flowers, states, that by taking the plants up with a ball of earth, they will grow if planted in a moist part of the garden. We have grown them in the house by merely setting the plant in a bowl or vase with moss, and keeping it thoroughly wet. Treated in this way it will flourish and make an attractive ornament to the sitting room. The genus was named in honor of Doct. Sarrazin, a French Physician, who first sent specimens from Canada to Europe. It contains several other species besides the present one. *Sarracenia flava* is common at the South, where it is popularly called Trumpets, a name suggested by its long, erect, trumpet-like leaves, which are sometimes

two or three feet long. This species is found as far north as Virginia, while *S. purpurea* grows all through the Northern States, and in cold places among the mountains, Southward.

Some time ago we saw in an English periodical some engravings showing how the leaves of the *Sarracenia* could be made useful in the arts of design. We had two of the subjects copied, and regret that we have forgotten the name of the artist, or we would give him credit for them. Figure 2 is an ingenious adaptation of the leaf in a design for a gravy boat. Fig. 3 shows how this form may be adapted to a vase, or by turning the lip outward, it might serve as a pitcher. If those who design patterns for furniture and utensils, as well as those who make figures for carpets and wall paper, would take a few hints from nature, we should be surrounded by more pleasing forms than at present.

Since the above was in type, we have seen in American journals, which ought to know better, an article from the English papers, giving an account of this plant as a specific cure for small pox.—This thing started in Nova Scotia several years ago, and we supposed it had died out. Suffice it to say that direct experiments in hospitals have shown it to be without any efficacy whatever as a remedy in small pox.

Insects and Fertilization.

BY PROF. ASA GRAY, CAMBRIDGE, MASS.

[The part played by insects in the fertilization of flowers. i.e., in the carrying of the pollen or fertilizing dust from the anther, which produces it, to the stigma, or that part of the pistil designed to receive it, is a subject now receiving much attention at the hands of naturalists. It not only affords an interesting study to the curious observer, but the fact itself is of importance to the cultivator, as some of our products depend upon the aid of insects for their perfection, and probably the fruitfulness of many of them is largely influenced by the abundance or scarcity of bees and other honey and pollen seekers. Professor Gray, of Harvard University, the distinguished botanist, has consented to give us in a series of articles, his observations upon the relations of insects to plants, which we are sure our readers will accept with pleasure.—Eds.]

Fig. 1.—FLOWER OF THE DUTCHMAN'S PIPE, *Aristolochia Siphoc.*

Far the greater number of flowers are hermaphrodite, i.e., have the stamens and pistils together. And the anthers, which contain the pollen, are placed so near the stigma, which is

to be impregnated, and often in such position in respect to it, that it seems evident that Nature intended the stigma to be acted upon, in general, by the pollen of the same flower. *Self-fertilization*, as we may call it, seems to be very generally and very surely provided for in the case of hermaphrodite blossoms. Indeed, special pains appear to have been taken, in a great variety of cases, to make this result certain. Take a pea-blossom, for example, and all the flowers of that numerous family, where the anthers and the stigma are shut up together in a sort of pocket made of the two front petals. Or the showy *Dicentra* of the gardens, and all flowers of that family, where the anthers and the stigma are placed close together in a little sac made of two spoon-shaped petals, the bowls placed face to face, and united at the tip. Or the Dutchman's Pipe, shown in fig. 1, where the anthers grow fast to the stigma, and are secluded in the bottom of a long, crooked, and narrow-mouthed tube. We might mention *Orchis*-flowers, also; but their parts look so different from those of ordinary blossoms, that they are not so readily understood by those who are not botanists. But take such a familiar flower as that of any *Iris*, figures 3, 4, and 5. Here the stigmas are three little plates, one under each of the three petal-like branches of the style which occupy the center of the blossom, and curve over in front of the three outermost and largest leaves of the flower. And close to each stigma is a stamen, its long anther almost touching the stigma behind it. Here surely, one would say, the pollen shed from the anther must be intended to fall upon the stigma, which it is almost in contact with. This seems to be the very purpose of the arrangement. But closer inspection reveals a difficulty. The anther opens and sheds its pollen only on the face which is turned away from the stigma. On the other hand, the face of the broad stigma which alone can receive the pollen, is the one which looks from the anther. The couple are sitting close together, but, with back turned to back, they are not upon such cordial terms as outward appearances led us to suppose.

The case of the *Aristolochia* or Dutchman's Pipe is quite as unpromising. The anthers are stuck fast to the column formed of the three united stigmas, but below and behind the pollen-receiving surface or real stigmas;—in such a way that let the flower hang in whatever position it may, not a grain of pollen can ever fall on to the stigma. Fig. 2. And the crooked, narrow-mouthed tube which encloses the whole, effectually prevents all chance of the wind's blowing the pollen from the one to the other. So in *Orchises*, the pollen is all tied fast by delicate threads to a sort of stalk, and placed very close to the stigma; but in such a way that it can rarely fall on the stigma; in most cases it would never reach the stigma of itself. These are a few of the more striking or familiar cases out of hundreds that might be mentioned. What do they mean? Here on the one hand, as in pea-blossoms and the like, are such nice adaptations that the pollen shall reach its stigma. On the other hand, quite as many cases, apparently evincing the same intention, but where closer inspection shows something to prevent this purpose from being carried out. Nature appears to be at cross-purposes. Does she really contradict herself, or thwart her own designs?

Well; those who know something of these matters will be ready with an answer. Plants are helped out of these difficulties by the aid of

insects. To be sure, most flowers are feeding places for insects. These feed upon the nectar or honey which all such flowers produce. The

Fig. 2.—LONGITUDINAL SECTION OF FLOWER OF DUTCHMAN'S PIPE. a, a, ANTHERS UNDER THE LOBES OF THE STIGMA, b, b.

plants are essential to the insects, affording the entire sustenance of large classes of them. Is the reciprocity, as Sir Boyle Roche says, all on one side? Or are insects so attracted to flowers, of any use to the plant? We should suspect so, when we consider that the much greater number of flowers yield nectar, that many have sacs or pits, or hollow tubes which hold the nectar; and that this sweet matter which flowers so generally produce, is, so far as we know, of no

Fig. 3.—FLOWER OF AN IRIS OR FLOWER-DE-LUCE. a, a, TWO OF THE THREE OUTER PETALS; b, b, b, THE THREE INNER PETALS; c, c, TWO OF THE BRANCHES OF THE PETAL-LIKE STYLE.

direct use to the plant. That insects, in visiting flowers for honey, accidentally or incidentally aid in fertilization, by carrying pollen from anther to stigma, is familiarly understood. That they are necessary, or at least are the principal agents, in the case of such flowers as those of *Willows*, where the stamens and pistils are borne by different trees, is also familiar. And in these curious hermaphrodite flowers that

Fig. 4.—IRIS FLOWER WITH THE PETALS REMOVED; a, a, a, THE PETAL-LIKE BRANCHES OF THE STYLE WITH THE STAMENS b, b, b, JUST BENEATH THEM.

we are considering, we cannot resist the conclusion that the aid of insects is, so to say,

counted upon; that the blossoms are furnished with honey *in order* that they may attract insects. And it is easy to see that insects, in visiting these flowers, may help the pollen on to the stigma in cases where it would seldom if ever get there of itself. For instance, in the flower of Dutchman's Pipe, shown in figs. 1 and 2. A small insect, crawling into the flower and to the bottom of the tube, where a little nectar is secreted, could hardly fail to get some pollen on his feet or legs on the way out, and would be very likely then to pass over the stigma and leave some pollen upon it. It is interesting to see how admirably adapted to insect action the flower of Iris is, and to watch a bee or bumblebee in his visits to it. The only access to the nectar in the bottom of the flower is between one of the outer recurved leaves of the flower (which in most species bears either a crest or beard), and the petal-like branch of the style directly over it; for the intermediate spaces are occupied by the three inner leaves or petals, which are upright and curve inward, so as to bar access in that quarter. The insect, alighting on the crest or beard, thrusts his head under the petal-like part of the style, and thence by his proboscis, or sucker, reaches the nectar below. In so doing he rubs the top of his rough and hairy head against the outer or open side of the anther, and gets it well covered with the loose pollen. On withdrawing it, he would never leave any on the stigma, for this faces the other way; but on entering anew this plate or shelf

FIG. 5.—A LONGITUDINAL SECTION OF FIG. 4, TWO OF THE BRANCHES OF THE STYLE BEING CUT THROUGH SO AS TO SHOW THE PLATE-LIKE STIGMAS *a, a*, WHICH LOOKS FROM THE ANTHERS *b, b*.

of stigma, projecting a little forward, is hit by the head of the bee, and in such a way that the pollen-powdered head rubs against the proper surface of the stigma, where it is pretty sure to deposit some of the pollen. A moment's examination of the flower itself will make the whole operation clearer than a long description.

So the puzzle is explained. Such flowers are arranged for the visits of insects, and the species depend upon them for their fertility, that is, for their continued existence. Insects are as needful to them as they are to the insects which they nourish. So many cases of the kind are now well known, so many flowers that cannot fertilize themselves at all, and so many more that cannot make a sure thing of it without help, but which are visited by insects and do seed regularly, that we must conclude they are intended to depend upon insect aid. But when we think of it, another puzzling question arises. Are we to believe that in such flowers (as that of Iris for example), the pollen is placed near the stigma, but where it cannot reach it of itself, nor by any ordinary chance, *in order that an insect may overcome the difficulty?* That the anther and the stigma of Iris, which, if they faced each other, would do their own work, are turned from each other *in order that a bee, seeking its food, may carry some of the pollen from the one to the other?* We can not believe that. We have not yet got to the bottom of this matter.

The Peach-tree Borer.

The fourth number of the Practical Entomologist is occupied by an essay on Borers, by its associate editor, B. D. Walsh, Esq., of Illinois. He pictures the various troublesome insects, the larvæ of which bore for a living, and describes them in a popular and readable style. We give his engravings of the perfect insect of the Peach-tree Borer, and condense the following from his account. This borer generally works a little below the surface of the ground; it lives only one year in the larva state, and the perfect insect comes out in July

Fig. 1.—MALE.

and August. The following are the various remedies and precautions that have been proposed.

1st. *The Corn-cob and the Knife.*—In autumn remove the earth from the base of the trunk, and rub the bark vigorously with a corn cob. This kills the larvæ before they burrow under the bark. In spring use a knife to reach them.

2d. *Hot-water.*—Pour it on the part attacked; it kills the larvæ without hurting the tree.

3d. *The Hoe Cure.*—In June bank up the trees a foot high, and in autumn before the frosts set in, level down the bank. This exposes the larvæ to the frosts and birds.

Preventive 1st.—Remove the earth from around the base of the trunk, and surround it with a strip of roofing paper a foot or more wide; tie it on with strings, taking care to have at least two inches of paper under ground. See that no larvæ or eggs are there before using the paper.

Preventive 2d.—Remove the earth, and surround the base of the tree by a bundle of straw to the thickness of two inches; tie it securely and cover the butts of the straw with earth.

Preventive 3d.—Place a heap of tobacco stems around the butt of the tree in June. The smell is offensive to the parent insect. In using any of the preventives, the borers, should they already be in the tree, are to be probed with a knife or wire. Their presence is indicated by exudation of gum from the wound they make.

Fig. 2.—FEMALE.

Evergreens for Wind-breaks.—Willows.

Under this title we have a communication from Mr. S. J. Frost, Hudson River Institute, Claverack, N. Y., which sets forth at some length the advantages of shelter from the prevailing winds, and the superiority of evergreens for this purpose. As we have frequently advocated the use of shelters of this kind, for the house, and barns, and for the orchard and garden, we can not give room to our correspondent's arguments in their favor. His practical advice is however timely and may be followed by those who live in localities where young trees may be had from the forests. Those who live where there are no native evergreens must depend upon the nurseries, which furnish young Norway Spruce, Hemlock, and Arbor Vitæ, at moderate prices. Mr. F. says:

"For planting evergreens, May is the most suitable month. They are very easily taken up, since the roots grow in a close knot about the stock. For a wind-break, Hemlock is the best and most hardy; but Pine, and Flat Leaved

Cedar (the Arbor Vitæ of the nurseries,) will also answer to the purpose. Go to a pine or hemlock grove with a team, select the smaller trees or shrubs, cut with a spade, or better an old axe, a circle large enough to include the most of the roots, and the tree may be lifted out very easily. The dirt will cling to the roots, and their growth will hardly be checked. The great trial for evergreens, taken from the woods, is the sunshine, to which they have not been accustomed. But if they are set thickly and in considerable numbers, only a few will die. Those obtained from the nurseries are acclimated and do not suffer in this way, but they are more expensive. Evergreens are not suitable for shade. Except a few low, choice specimens, for ornament, they should not appear in the front yard. They will form a hedge in almost every kind of soil, and this is their proper use. But if the soil is very wet, a willow hedge will make a good wind-break. Willow (the common yellow) twigs or rods set closely, say from one to two feet distant, will soon grow into a beautiful summer hedge, and even in winter be a fine protection against winds. If set in this way they will not grow too large, and the dry limbs will afford the best of light fuel for kindling and oven-wood. The canes of the willow when dry, are tough and substantial, notwithstanding the brittleness of the green bough. My neighbor obtains his whole supply of oven-wood—no unimportant consideration—from the dead limbs of a willow hedge set to resist the washing of a stream. Nothing more is necessary than to sharpen the end of the stakes and thrust them into the soft soil."

Peas and their Names.

Those who are accustomed to look over seedsmen's catalogues and advertisements, especially the English ones, cannot help being amused with the great number of new peas that appear every spring,—as numerous as spring styles of calico. The sellers of these so-called novelties show a commendable amount of ingenuity in selecting attractive names, and we have: First Crop, Express, Ringleader, Surprise, Advance, Wonderful, Victory, etc., of the different dealers. A committee of the London Horticultural Society, in 1865, procured all the varieties offered for sale, and planted them in their garden at Chiswick, alongside of the old and well known varieties, and carefully watched and timed their periods of blossoming and maturing, and compared the old and the new in all respects. The committee's report has been recently published, and is quite interesting to all but the seed growers who have pet peas, as it shows that but few of the new sorts have anything novel about them except their names. Thus, Carter's First Crop, Dickson's First and Best, and Sutton's Ringleader, all prove to be identical with Dillistone's Early, an old and well established early kind. Turner's Wonderful, Carter's Prince of Wales and Princess of Wales, and Yorkshire Hero, are all alike, and the same as McLean's Favorite. The Horticultural Society have done well in showing up this early pea business, and such trials not only protect the public from imposition, but they benefit the honest seed raiser whose varieties, if really valuable, are thus brought into notice and commended. When will our Department of Agriculture give us one bit of positive information like this? Under its present management it will of course prefer to continue in the seed business and send out peas under wrong names.

The Flowering Raspberry.

(*Rubus odoratus*.)

Those who have been along the rocky banks of the Hudson in summer time, must have noticed the abundance of, what appeared at a little distance to be, small purplish roses; upon closer inspection these flowers would probably have been turned out to be those of the Flowering Raspberry. All raspberries flower, but this has so much larger blossoms than any other native one that it has received this popular name. It has numerous stems, and when growing with plenty of room, makes a large clump, from three to five feet high. The leaves are not compound, like those of the common raspberry, but are large, simple, and lobed. All the young growth, as well as the flower, flower stalks, and unexpanded flowers, are covered by numerous hairs that exude a sticky secretion, which makes the plant clammy to the touch, and which has a peculiar odor. The flowers, which are produced nearly all summer, are about two inches across, of a rich purplish crimson color, and of a delicate texture. They are succeeded by a broad, flat fruit, which is of very good flavor, but which is not produced in sufficient abundance to make it worth while to cultivate the shrub for its fruit. As an ornamental shrub it is worthy of more attention than it has received, as it is hardy and of easy culture. By cutting out the old wood occasionally, and shortening the new, the plant may be kept from growing unshapely. It does best in a partial shade, as the hot sun soon destroys the beauty of the rather delicate flowers. We do not find this shrub generally kept in the nurseries, but it is not rare in rocky places in the Northern States, and is readily transplanted.

Something about Annual Flowers.

There are those who discard annual flowers altogether, as they are troublesome to start from the seed, and generally rather late in coming into flower, and many of them, when they are just in their prime, are cut off by the frost. We would not have our garden all annuals, any more than we would have it all bedding plants, or all perennials, for each fills a want not satisfied by the other. A number of things formerly grown in the greenhouse, as bedding plants, do very well when treated as annuals, such as the *Petunia* and *Salpiglossis*, and it is proposed by some of the English florists to grow the *Verbena* as an annual, as the rust makes it so difficult to keep it over the winter. Those who have established homes can enjoy their well chosen collection of perennials; those who have money can

buy all the bedding plants; but there is a large class who must depend upon annuals. These are, after all, the popular plants, and even the poorest, whose garden is confined to a box in the window, can give a few cents for seeds and gather a large crop of flowers and enjoyment. A seed catalogue is, now-a-days, a bewildering thing. Our seedsmen must keep up with the

FLOWERING RASPBERRY. (*Rubus odoratus*.)

times, and their catalogues become respectable sized volumes. The seeds introduced each year as novelties, are accompanied by the descriptions given by their European growers, and the novice is quite sure to be influenced by these highly colored descriptions, and order untested things at 25 and 50 cents per paper. He may get enough good plants to satisfy him with his outlay, but the chances are that he will be dissatisfied, and will throw all the blame on the innocent seedsmen. If he had ordered old and tried things, at 5 and 10 cents a paper, he would have been much better pleased. We like novelties, and favor their introduction, but wish them to be bought only by those who are willing to test new things, and there are, fortunately, a plenty of such. The general public—and it is for them that this article is written—can afford to wait until amateurs have established the value, in our climate, of these new plants. No task is more difficult than to make out a list of the best annual flowers. If confined to two, four, or six varieties, there would be no difficulty, but the embarrassment increases in proportion as the number is added to. If confined to only two annuals, we should unhesitatingly choose *Mignonette* and *Candytuft*. *Mignonette* is, to our notion, the annual of annuals—on account

of its fragrance. We have met a few—very few—persons who disliked it, but it is a general favorite. *Candytuft*, or, as some writers have it, *Candytuft*, is hardy, keeps long in bloom—all the longer if often cut, is good for bouquets, and may be had in white, crimson and purple colors. With these two plants one can have an elegant and fragrant bouquet every day. To

make a show in place, nothing exceeds *Drummond's Phlox*, and it may be had in all shades, from white to the deepest crimson. Equally brilliant is a bed of *Portulacas*. They do well in poor soil, and when the sun is out are always gay. Then for plants to be grown as single specimens, the *Camelia-flowered Balsams*, and the finer sorts of *Asters*, the last almost innumerable in variety, and all fine. Both of these should have plenty of room. The *Everlastings* are favorites of ours, as they all look well in the garden, and if picked when first expanded, and carefully dried, they may be enjoyed all winter. The best of these are *Rhodanthe*, *Acroclinium*, *Xeranthemum*, *Ammobium* and *Helichrysum*, in their different varieties. *Double Zinnia* and a *Dwarf Marigold*, called *Tagetes signata pumila*, are among the novelties of a few years ago that have become established favorites. The *Dwarf Convolvulus* makes a great show. *Whitlavia*, *Leptosiphons*, *Gilias*, *Collinsia*, and the *Nemophilas* are all neat and pretty, and should be sown early, or in a partially shaded place, as they do not like our hot suns. Then there are some

odd things that one likes to have, such as the *Ice Plant*, with its dew-spangled stem and leaves; and the *Sensitive Plant*, the irritable foliage of which is a constant source of amusement. If one has the room, the *Castor Oil Plant* may be grown for its tropical look, and *Cannas*, elsewhere described, will do well from the seed. In sowing annuals in the open ground, do not sow too early nor too deep, as it is from a neglect of these precautions that the majority of failures come. Wait until the soil is well warmed, sow in finely pulverized earth, cover the seeds about their own depth, and press the soil down firmly upon them. When the plants are up, and large enough to handle, thin freely, to get strong plants to transplant.

PROPAGATING HOUSE OVER A KITCHEN.—*Joannes*. A small propagating and green house might be built in the place described, but it would not be practicable to heat it from the kitchen fire. Water tanks are made of narrow plank with painted joints. As you have never seen a propagating house, you would do well to visit one, as it would save much expense in constructing one on a small scale. Some hints may be got from page 314, Oct. last, but the method of heating is different from that shown there.

THE HOUSEHOLD

Household Hints.

[Constant contributions to this department of the *American Agriculturist* are solicited from our readers.]

A WRITTEN LIST of all the articles in the house will take but little time, and will often be very useful. A housekeeper writes to the *Agriculturist* that she frequently lost articles, supposed to be stolen by servants, but when it became known that she had begun to keep a list of everything—of handkerchiefs, collars, pillow-cases, indeed of everything, even to chairs, dishes of all kinds, brooms, pails, dish-towels, sad-irons, etc., etc., and that she now and then compared the articles with the list, there was a wholesome fear of that record; mysterious disappearances ceased, and breakages were much less frequent. A separate page was devoted to noting down all breakages and by whom, with the date against each article. Another family, having such a list, saved it when the house was burned, and was thus able to get a much larger sum from an insurance company than could otherwise have been done. These little items count up largely in a valuation. The date of purchase and cost of every article was always recorded.

TO HAVE SUNSHINE IN THE HOUSE.—Put the children to bed *early*, with light suppers, that they may sleep well. They get up bright-eyed, clear-headed, sweet tempered, with sun-light on their countenances. Try it—and take a little of the prescription *yourself*. The effects are magical. So writes one who has tried it. She says that with well rested brains and limbs she does more in twelve hours than she used to accomplish in eighteen, and finds far less friction in the household movements now than then. She finds her own feelings and spirits are contagious. Try two extra hours of sleep for a week, and note the results.

NEVER HIRE: (1) a girl who talks about the defects of her last employer. She has a bad tongue, will be a complainer in your family, and ever make trouble, and will talk about you to others.—(2.) Never hire one who professes to know everything. She will know few things, if anything, well.—(3.) Never hire one who begins by inquiring what she has to do and not to do. Everything you ever listen to of this kind will make trouble afterwards.—(4.) Never hire one who talks much about how her former mistresses did this and that. Say firmly, but calmly, "Every housekeeper has her own way of doing things, and that way is best for her; I have my way, and expect that to be followed."

A BILL OF FARE is supposed to be appropriate only to hotels, restaurants, and the like. A lady writes to the *Agriculturist*: "I used to be worried about what to get for meals to keep up a variety, and often racked my brain, when weary, trying to think what to get for the next meal. Often, after a meal was nearly ready, I thought of something else I wished I had planned for. Two years ago I wrote down on a card a list of the things convenient to get at all times; another list of 'occasional' dishes, and another list of things that may sometimes come in for a change, or as a rarity. Against some I have marked, H. F. B. (Husband's Favorite Breakfast); others, H. F. D., and H. F. S. (His Favorite for Dinner and Supper). Some are marked E., for economical, etc. A glance over this has been a great help to me often, and I would on no account be without it. It contains a list of the sweetmeats on hand, of the several kinds of cake, etc. Of course, I have my recipe book, in which are written down all cake and other recipes, for constant reference whenever memory fails me. I began this plan of systemizing from some hints given in the *Agriculturist*, and it has done a great deal to lighten my cares."

PAIRING THE NAILS TOO CLOSELY is the prolific cause of most of the trouble with them. If the corners are cut down too much, the flesh grows over them, producing soreness. Always cut the

nails only a little rounding, leaving the corners projecting above the flesh, which they are designed naturally to protect. If the nail inflames at the corners, don't pair it off, but raise it with a bit of cotton, protect it from pressure, and let it grow out over the flesh, when the inflammation will cease.

ORNAMENTAL STRAWBERRY PIN-CUSHION.—A lady at Lockport, N. Y., sends us a very pretty strawberry, which, at a little distance, looks like the real fruit, but of a size (4 to 5 inches in diameter) that overshadows even the great "Agriculturist" berry. It is so ornamental, and so readily made, that it is worthy of imitation. The cone is covered with scarlet merino; the seeds very naturally represented by stitching through it with yellow sewing silk. The calyx is made of green velvet. A circular piece of pasteboard, inside of the base, keeps it in shape, and makes it stand firmly. The filling may be of any convenient material. Small specimens, filled with emery, are useful as needle cushions, the emery sharpening, or at least keeping the needles bright.

FOR CHAPPED HANDS.—Mrs. A. B. Edwards recommends rubbing a little honey on them while wet from washing, and then drying it in.

NEVER READ OR SEW with any light from the window or a lamp falling directly upon the eyes. Millions have lost their good eyesight from non-observance of this simple rule. It is founded on scientific principles which we will not take room to explain at length. The light direct upon the eyes contracts their pupils, so that not enough rays are admitted from the printed pages or fabrics sewed, to make them plain to the sight. Always sit so that the light from the window or lamp shall fall *over the shoulder*, usually over the left one as it will not then be obstructed by the right hand in sewing. Another advantage, and a great one, is, that when facing the light, one naturally inclines forward to save the eyes. This cramps the chest and lungs, and is injurious to the health; but with the light from the side, or over the shoulder, one inclines to sit in a much more upright and healthful position. Every one who follows this suggestion, will find it conduce to comfort, health, and good vision.

Fig. 1.

A Safe and Sure Mouse Trap.

The accompanying illustrations were sent us by "D. J. T.," of Essex Co., Mass., with a statement of such good success in its use, that every housekeeper ought to know how easy he or she can make a good mouse trap. A piece of sole leather is bent, as shown in Fig. 2, and the ends tied to-

Fig. 2.

gether, far enough back to allow them to be sprung apart, and a bit of cheese or other bait inserted.

This is placed under the edge of a bowl, as shown, the bowl resting on the curve of leather, so that a little movement of the leather will cause it to slip in and let the bowl down. It should be set upon a plate or pane of glass. When the mouse is caught the bowl may be inverted, right side up, and filled with water, or immersed in a bucket of water, and so the mouse be drowned.

Household Hints for the "Men-folks."

A lady writes: "Pray do print the enclosed slip, which I cut from the *American Agriculturist*, years ago, and which I suppose both you and a good part of your old readers have long since forgotten. When it came out, husband said you meant it all for him, but, as you did not call his name, he could not take it as a personal affront. We have kept the slip neatly, as you see, and every word has been heeded. It abolished all dull shears, knives, etc. I beg you to print it for the half million or more of new readers, and suggest to every housekeeper to show it to her husband the first time she finds him in a particularly pleasant mood."... [We defer to the judgment and wishes of our fair correspondent, and give the items. The husband who reads it will of course not understand this as aimed at *him*—we are speaking of "another man."—Eds.]

On a recent evening we happened into his house, (the other man's house), and saw his wife trying to cut out a garment; or, possibly, it was a patch for a coat for her boy or her husband; but it was hard work, and a ragged edge was left. She made sundry efforts, and, by clipping several times, it seemed to come into about the desired shape. The fact was, the rivet was loose, and as for a cutting edge, that was worn off months ago. We noticed that she looked at her thumb and fingers to see if they were blistered. Three minutes with a hammer, to head the rivet, and a grindstone, whetstone, or even a file, to give a cutting edge, would have made all right, saved the wife several hours of time in the course of each week or month, and enabled her to do her work much more easily, and to patch more neatly. But her husband was a "hard working man," and hadn't the three minutes' time. Having some business with him, we found him at the store, sitting in his *accustomed* place on the counter.

The wife went to fix up the wood fire, and attempted to lift up a brand with the tongs, but the legs would turn and slip by each other. After several vain trials she *pushed* up the fire, and swept up the coals that had scattered from the falling brand. One minute's time, with a hammer, would have tightened the joint and made the legs meet square.

A daughter was trying to cut hash or mince meat, but the thug, thug, indicated that the dull knife was only mashing and not cutting the meat. The tired girl showed plainly that she had been at it for an hour or more. Three minutes with the grindstone, or whetstone, or a file, once a month, would give that knife a sharp edge, and save many a pound of elbow grease, many wearisome hours, give that daughter a little extra time to read the *American Agriculturist*, (only the other man "don't take it"), and the finely cut tough meat would be far more digestible than when swallowed hurriedly in large pieces. (A Haje's meat cutter, costing \$4, would cut the hash for a large family in four minutes, or in less time, and do the work excellently.)

One Monday we took dinner at the house of this "other man." The bread was not in smooth cut slices, but appeared as if haggled off from the loaf with the back of a scythe. The dried beef, instead of being in nice thin shavings, nice to look at, and nice to eat, was in thick, seraggy pieces, as if chopped off with a very dull hatchet. The table knives appeared to have been sharpened on the iron shovel handle, or on the stove edge, so long, and were so rounded off that, except from the shape, it would have been difficult to tell on which side the edge *had* been. Five or ten minutes with the grindstone would have given a good edge on one side of every knife in the house. How much work it would have saved in the kitchen, in preparing meals, cutting up meats paring potatoes,

etc., the reader may figure up. (If the writer was the wife of this "other man" he would take a few lessons on knife-sharpening and be independent.)

Glancing through the open kitchen door, we saw Bridget trying to stop an old leak in a boiler, with a plaster of dough, but it would come off, and the water would run on to the stove and over the hearth. A drop of solder would have saved all this trouble and vexation. If the "other man" had read the *Agriculturist* for November, 1859, page 342, he would have known how to apply the solder himself in less than three minutes.

Beef Steak.

A rich, juicy piece of steak is as delicious a morsel as a hungry man can close his lips upon, yet how few know what it is. We presume nearly half those who eat beef steak at all in this country, fry it; certainly on the Continent of Europe a broiled steak is rarely or never seen. The Europeans in this country surely stick to Fatherlandish customs in regard to steaks and chops, with a tenacity worthy a better cause. English and Americans broil their steaks; nevertheless, they make a very poor job of it in most cases. The fat drips into the fire and smokes, and flames and scorches the meat; the heat burns the edges to a coal, and the poor little thin steak curls and writhes on the gridiron as if it were alive with torture. Now and then it is put upon a plate and pricked and pressed to get a little juice out, which is preserved to be salted and buttered and watered, to make a little gravy. Finally, the burnt parts are scraped off, butter, salt, and pepper, administered, and it is sent to the table, soaking in a lukewarm gravy, on a cold platter.

A friend who has taken great satisfaction in beef steak properly cooked, sends us the following article cut from *The Homestead*, which was formerly published in Connecticut. We endorse it entirely, only we must say that a little nice butter, even if it does cost 75 cents a pound, does not, to our taste, either disguise or injure the flavor of the beef:

"When you are so lucky as to get a beef steak, don't spoil it in the cooking. It should be cut nearly an inch in thickness, and divided—by the natural divisions where practicable—into pieces the size of your hand, or thereabouts. Cut away the most of the fat. If you happen to have such a thing as a "beef-steak-pounder" in the house, put it into the fire and burn it to a coal,—the wood it is usually made of furnishes capital coals for broiling; but any coals will do, if they are hot enough.

"The best gridiron is the double one of wire, which you can shut your meat into and turn without a fork to let the juice out, but any gridiron will do if it is clean. If you have much else to see to, besides the steak, you had better have something else for breakfast, for it is a sin to put a beef-steak over the coals and leave it to warp and squirm, and dry up, until it is as tough and tasteless as the sole of an old shoe. But if you have a conscience void of offence with all men, and are able to concentrate your entire energies upon the business, put your steak over the fire. Now you know that the outside of a broiled piece of meat must be crisp, and [Turn it.] the inside juicy, to make it the most palatable and [Turn it.] nourishing. If you allow it to rest long with one side to the fire, [Turn it.] the juice and flavor rise to the surface and are lost. The great art [Turn it.] is to expose the meat at the start, for a moment, to such an intense heat that [Turn it.] the severed fibers may be seared in such manner as to seal up (so to speak) the moisture. [Turn it.] Steak can be cooked in this way until it will not only look bloody when cut, but [Turn it.] will satisfy fully those who like "rare" beef, without offending [Turn it.] such as prefer it "well done." Butter is worse than wasted,—of course [Turn it.] you'll have it on the table for such as wish to disguise the taste of beef, as well as pepper and salt. [Turn it.] Your motto is beef and fire. If your fire is a hot one, the steak is nearly done. It may not be considered impertinent to suggest [Turn it.] that, the potatoes being just done, too, the family may gather round the ta-

ble, so as to receive the steak upon their hot plates directly from the fire. There will be time for "grace," before eating, and you'll be thankful after, whether it is customary or not to say so."

Hints on Cooking, etc.

Queen of Puddings.—A new pudding, with this name, recently furnished to the "*Agriculturist Household*," by Mrs. Wm. Morehouse, of Buffalo, N. Y., has been tried with very satisfactory results: Into one quart of sweet milk, put one pint of fine bread crumbs, butter the size of an egg, the well beaten yolks of 5 eggs; sweeten and flavor as for custard; mix the whole well together. While the above is baking, beat the whites of the 5 eggs to a stiff froth, and add a teaspoonful of powdered sugar; pour it over the hot pudding when cooked, return it to the oven, and bake to a delicate brown. We like the above without addition, but some prefer a layer of jelly, or canned peaches or other fruit, over the pudding before the frosting is added.—No sauce is needed. It is not only delicious, but light and digestible.

Nice Gingerbread.—The following directions are furnished to the *Agriculturist* by one we know to be a good housekeeper—who has a healthy family as evidence of good cookery—with the remark that "they make a gingerbread equal to the best article from the professional bakers." To 2 teaspoonfuls of molasses, and 20 tablespoonfuls of melted lard, are added 7 teaspoonfuls of soda dissolved in 8 tablespoonfuls of boiling water, 2 teaspoonfuls of crushed alum dissolved in 3 tablespoonfuls of boiling water, 1 tablespoonful of ginger, and a little salt if the lard is fresh; the whole well stirred together. Then 4 teaspoonfuls of cream of tartar are mixed thoroughly with a pint or so of flour, and stirred in quickly, with enough more flour added to make a dough as soft as it can be conveniently rolled. Bake in a quick oven. Some may object to the alum, but a teaspoonful or two in a large milk-panful of cakes is but a homeopathic dose at most, and no more "mineral" than the salt used in all food. It gives the gingerbread the peculiar lightness of that made by bakers. Those who eschew alum must buy nothing at Bake Shops.

Corn Pudding.—Cheap but good. 1 quart of milk to 4 tablespoonfuls of meal. Boil the milk, stir in a little molasses and ginger into the meal, and stir the boiling milk into the meal and let it get perfectly cold. Bake an hour and a half. This is an excellent pudding, but the directions must be exactly followed.

The Justice's Pudding.—2 quarts of bread cut thin; 1 quart of milk, poured boiling on the bread; let soak an hour or two; add 1 quart of stoned raisins; 1 teaspoonful of syrup. Boil four hours in a box or bag, and serve with cold sauce.

Mince Pie without Meat.—Prepare the pie-crust and apples the usual way, when seasoned and in the pie pans, fill the top of the apples with custard, prepared the same as for custard pie. Then put on the top crust and bake. It is a good imitation and preferable to mince pie.

"Boiled Flour: A Light Supper Dish."—Under this head we find the following strongly commended in Mrs. Warren's (London) *Work on Economy in Living*: "Prepare a small calico [muslin] bag a quarter of a yard square, and sew it well all round; stuff into it as much flour as it will hold, so that it shall be packed almost as hard as a stone. Tie securely, put it into a saucepan of boiling water and boil four hours, filling up the saucepan with more water as it boils away. Then take it up, peel off the skin, crack or break the ball of flour into pieces, roll it with a rolling pin on a pasteboard; then sift it, and, when it is cold, put into dry tins, such as tea, coffee, or mustard tins [boxes]. This is quite equal to maizena, or Oswego corn flour, and may be made as arrowroot custard, only it must be boiled. Costs not one-third of maizena. It is strengthening and very delicious."—[There is less difference in the cost of

flour and maizena, or corn starch, here than in England, but the above is worthy a trial. Please let us have the result.—ED. AMERICAN AGRICULTURIST.]

Boston Crackers.—Will some one having experience please send directions for making them.

Stale Bread Fritters.—Cut stale bread in thick slices and put it to soak for several hours in cold sweet milk. Then fry it in sweet lard, or butter the slices and fry them, and eat with sugar or molasses, or a sweet sauce. To make it more delicate, remove the hard crust before using.

Boiled Parsnips.—Parsnips are cooked as carrots, but they do not require as much boiling, and are sometimes served differently, being sliced lengthways, dressed with butter and pepper, or mashed with a little cream, some butter, and seasoned with pepper and salt. They are excellent fried, also made into a stew with pork and potatoes.

Wings of Geese, Turkeys, etc., so convenient as dusters, may be kept for a long time thus: Thoroughly dry them and place them, flesh-end down, in a tub, keg, or any thing convenient, and fill with dry sand.

BOYS & GIRLS' COLUMNS.

Was he Mean?—True Courage.

It is very customary among bad boys, as well as among bad men, to try to persuade others to join them in folly and sin—to pull them down to their own level—by appealing to their courage. When a man challenges another to fight a duel, it requires greater courage to stand up boldly and say I will not be a murderer, than it does to face the weapon of his challenger. When a boy is challenged to engage in a bad enterprise, it usually requires a higher, nobler courage to withstand the jeers of his tempters, than it does to set aside the good will of his parents and friends.—Here is an excellent illustration of true courage, as told in the Children's Prize. Read the story carefully and act upon the lesson it teaches:

A new scholar came to Rackford school—a well-dressed fine-looking lad, whose appearance all the boys liked.—There was a set of boys at this school who immediately invited him to join their "larks." Boys know pretty well what that means. They used to spend their money in eating and drinking, and often ran up large bills, which their friends sometimes found it hard to pay. They wanted every new scholar to join them, and they contrived by laughing at him, or reproaching him, to get almost any boy they wanted into their meshes. The new boys were afraid not to yield to them.—But this new scholar refused their invitations. They called him mean and stingy—a charge which always makes boys very sore.—"Mean!" he answered, "and where is the meanness of not spending money which is not your own? And where is the stinginess in not choosing to beg money of your friends to spend it in a way which they would not approve? For, after all, our money must come from our friends, as we haven't it, nor can we earn it. No, boys, I will not spend one penny that I should be ashamed to give account of to my father or mother, if they asked me."—"Eh! not out of your leather strings, then? Afraid of your father; afraid of ~~knocking~~ your mother? Won't she give you a sugar-plum? What a precious baby?" they cried in mocking tones.—"And yet you are trying to make me afraid of you," said the new scholar, boldly. "You want me to be afraid of not doing as you say. But which, I should like to know, is the best sort of fear—the fear of my school-fellows, which would lead me into what is low; or fear of my parents, which will inspire me to things noble and manly? It is very poor service you are showing me, to try to set me against my parents, and teach me to be ashamed of their authority."—The boys felt that there was no headway to be made against such a new scholar. All they said hurt themselves more than it hurt him, and they liked better to be out of his way than in it—all the bad boys, I mean. The others gathered around him, and never did they work or play with greater relish than while he was their champion and friend.—"That new scholar is a choice fellow," said the principal, "and carries more influence than any other boy in school. They study better and play better where he is; you can't pull him down. Everything mean and bad sneaks out of his way."

The Unknown Number Puzzle.—*Answer and correction.*—The top figures of the columns containing the numbers sought, add up just that number thus: 55 is in the first three and last two columns and 1+2+4+16+32 equal 55, and so of any other number up to 63.—[In the 3d column, 61 should be 63. Please mark your paper with this correction.]

The Game of Checkers or Draughts.

POSITION NO. 5.—Black to play and win.

White.

GAME NO. 5.—WILL O' THE WISP OPENING (*)

Table with 4 columns: Black, White, Black, White. It lists moves for a game of checkers, such as 1-11 to 15, 2-9 to 13, etc., ending with a draw.

(*) Is so called in Anderson's Treatise on Draughts, because of the peculiar positions that occur in playing the game. It is formed by the first three moves, (a) 26 to 23 draws, (b) 5 to 9, or 7 to 11 draws, (c) 27 to 23 draws, (d) 11 to 15 draws, (e) 22 to 18 draws, (f) 22 to 17 Black wins, (g) 31 to 27, or 30 to 25 Black wins, (h) 30 to 25 Black wins, (i) 15 to 19 draws.

Solution to Position No. 4. (See April No., page 146.)

Table with 4 columns: White, Black, White, Black. It lists moves for a game of checkers, such as 1-32 to 27, 2-20 to 23, etc., ending with 30 and wins.

Puzzles for Sharp Eyes.

Under this title we presented last month (page 149) two illustrations entitled "The singular sign," and "An ene-

A PORTRAIT.

my in the camp," with the promise to make them plainer for those who failed to discover the meaning. Figure 1 can be read after a few trials, by holding the page nearly on a level with the eye; then looking from the bottom you may see the words "Orange Judd & Co." Turn the page so as to look from the right hand side, still keeping it on a level with the eye, and you will find "American Agriculturist, No. 41 Park Row." In Fig. 2, "An enemy in the camp." Look steadily at the white part from a distance, and you may find a fox represented, that has seized the dark-colored chicken on the right, by the neck. If it be not perceived in this way, lay a thin piece of paper over the picture, and with a pencil trace the outline of the white part in the middle of the picture; then you can soon discover it.—We present herewith another picture puzzle, presenting a portrait of a singular looking genius, with whom no doubt you would like to become acquainted. He does not appear at first sight, but will be discovered by careful observers.

The Courageous Minister.

At the beginning of the civil war in England, Parliament had forbidden clergymen to read the liturgy or service of the Church, under the severest penalties. Dr. John Hacket, rector of a Church in London, continued to read the daily service as before. One Sunday a sergeant, accompanied by a soldier, rushed into the Church, and with a loud voice commanded him to desist, but he with a steady voice and intrepid countenance continued. The soldier pointing a pistol at his head, threatened him with instant death, unless he should cease reading. The undaunted minister calmly replied,—"Soldier I am doing my duty, do you do yours!" and read on. The sergeant and soldier, abashed, left the Church.

A Witty Ferryman.

Before a certain bridge was built in Lancashire, England, passengers were ferried over by an eccentric boatman living near the bank. A nobleman who used to cross frequently, was accustomed to give the boatman a shilling, although the regular fare was only a penny. One day when crossing he determined to surprise the boatman, and accordingly on reaching the opposite shore he stepped ashore and walked away, without even putting his hand into his pocket. The ferryman, in great astonishment looked after him a moment, and then called out "My lord, if ye have lost yer purse, remember it was not in my boat." The nobleman immediately rewarded his wit with double the usual fee.

Whistles that Imitate Birds.

Every boy that has a knife will soon be hunting up the twigs of linden (basswood), willow, etc., to form whistles, as the bark will soon "peel."—What makes the sound of a whistle? Strike a piano wire, or jar a violin string with the rough horse-hair bow, and the string will shake or vibrate. The vibrations produce waves in the air which extend to the drum of the ear and shake that, and we feel what we call sound. Short, light strings make quick small vibrations, which we call high sounds, though they are really no higher than the slow wide vibrations of a long heavy string. We merely call them high and low for convenience, or by association with the lines of the musical scale on which they are expressed in characters.—In wind instruments, like the organ, flute, horn, bugle, whistle, etc., we have a column or tube of confined air, which stands in place of the piano or violin string. We vibrate the air column by blowing across one end of it (not directly into it). In the flute for example, we make faster or slower vibrations or sound waves, (higher and lower we say,) by opening or shutting little holes along the tube to shorten or lengthen the air column, and this causes it to vibrate faster or slower.—Unstop the lower end of a whistle and put it into water an inch or two. The pressure of hard blowing drives the water down, and lengthens the air column and makes a lower sound. Bubbles of the air out at the bottom interrupts the sound, making a trilling sound. The flowing in of the air shortens the tube and gives a more shrill sound. With a small long whistle, like one made of a goose-quill, one can, by a little practice, very nearly imitate a canary bird, or bobolink, etc.—Just now there are along our city streets many vendors of little glass tube bird whistles, like our engraving, or a little larger. The whistling part is made with a beveled cock just above the hole in the middle. It is used with the lower end in a tumbler or cup of water. The upper end is long for convenience, but this is not necessary. Any small whistle the boys can make will answer if the lower end be left open. Different sizes and lengths give different sounds. One the size of a small goose-quill gives the best canary-bird sounds,

The Prize Puzzles.

Several hundred contributions of puzzles, etc., in competition for the prizes offered have been received, and considerable time will be required to decide upon their merits. This part of the paper is sent to press too early in the month to enable us in this number to announce the names of the successful competitors. It will be done in June, when we expect also to publish one or more of the best puzzles.

Answers to Problems and Puzzles.

The following are answers to the puzzles, etc., in the April number, page 149. No. 202. The Silver Puzzle.—Gently scratch on the table cloth in front of the coin to be removed, and three or four inches from it; it will be gradually moved out from under the tumbler... No. 203. Bible Questions.—1, The ark was three hundred cubits long, 2, Zeruiah was mother to Joah. (Query.—Why was her name mentioned, when, in Bible history, the name of the father is usually given?)... No. 204. Mathematical Problem.—By an oversight this problem has been inserted twice. The answer is found on page 107... No. 205. Illustrated Rebus.—"To many wealth would only add evil, but only few refrain from its pursuit."

The following have sent in correct answers up to the date of April 5th, when this page must go to press. Arthene A. Bush, Lillie K. Blunt, Josiah W. Winslow, Moses R. Gochnour, J. K. Marry, C. H. Davis, Henry P. Armsby, Chas. H. Thorp, Wm. H. Cusack, Jennie Bay, Mary N. Charlton, Annie H. Charlton, J. H. Hoff, P. D. Putnam, W. H. Straub, Frank B. Bourne, Mattie J. Nesbitt, Lloyd T. English, Helen M. Hunter, A. H. Carter, Fred. Husted, Willie R. Balch, John S. Adelsberger, Mollie Reid, Sylvester W. Peters, Cornelius Houglund, Jr., W. L. Reed, Harvey Bell, J. C. Bell, Theo. W. Fowler, "Abraham," Howard Co., Ind., Alice Harriet Hascall, J. G. Barker, Franklin D. Hotchkiss, Mary M. Barker, Andrew Jackson, W. Wilson, Will Fair, Francis Whitney, Egbert Benjamin, Charles Talcott, T. L. Norton, Frank A. Morris, "Portland," West Va., Francis L. Hine, Amelia Wright, "Western Calculator," D. Wiley Miller, Flathus Winthrop, Augustus J. Tucker, Frank Curtiss, E. K. Northup, Fannie T. Cole, J. C. and A. M. Barnard, E. L. Bonton, J. A. Patterson, James Diltz, Abby Hurd, G. W. Frense, Warren Davis, Thos. H. McMullin, Maria Loomis, J. Henry, Edwin Andrews, H. Martin Kellog, Theodore A. Funk, C. W. Curtis, Walter T. Jones, Edward and Elizabeth, J. A. Ross, George S. Coover, Frank W. Sawin, Thos. P. Crane, Joseph Woodroffe, G. T. Reeves, George W. House, "D. L.," Y. G. W. Littlefield, Geo. W. Sibley, J. Rosentiel, John T. Harrington, Edwin A. Shepard, Alfred G. Nason, Emma J. Nettleton, Hattie M. B. McIntosh, John Y. Shindel, Anstin Leonard, Millie Minden, John Savage, N. Gager, Minard R. Bice, Silas Bice, Storrs Barrows, jr., B. Frank Hull, Olive Bacon, E. W. Day, Henry Fairwell, Jonathan H. Lindley, George F. Weeks, Mollie A. Rorer, Bayard W. Purcell, Lois D. Green, P. Jansen, M. T. Haines, Sallie Bonsall, A. W. Kapr, Mark M'Arran, S. Lockwood, Lottie C. Fox, Chas. D. Sutton, Alonzo P. Charlton, Thos. Benton, William Millard, W. H. Kenney, Theodore A. Funk, Sarah B. Pullman, Mrs. J. S. Coles, J. S. Siles, L. B. and C. H. Augustin, Ellen A. Carpenter, Wm. Van Slyke, S. Hitch, William Damon, Martha Dennison, E. B. Messmer, H. L. Drachir, B. H. Chapman, Fannie Goff, John Goff, Mrs. C. C. Corbett, Sarah L. Goff, Nathaniel Edwards, L. M. Kirk, Lizzie Laughlin, J. W. Price, James E. Eshleman, Samuel N. Stubbe, Bayard W. Purcell, S. P. and O. S. Flanders, Franklin Fox, Herbert F. Robinson, May E. Whiting, Belle S. Ward, John W. Stimmler.

New Puzzles to be Answered.

No. 206. Enigma.—My whole is my second, and with it I made my first. What is the word?

No. 207. Illustrated Rebus.—Very good advice. No. 208. Conundrums.—1. When are two kings like three miles? 2. Why is a butcher like a bold thief? 3. Why are the stars like old astronomers? No. 209.—PRSVRYPRFCTMNVKPKTHSPRCPT STN is inscribed under the coin and means, in the chancel of a church in England, and only one letter is wanting to make good English of it. The letter is to be used as often as needed. What is the letter, and what will it read?

AFTER DINNER. — FROM A PAINTING BY MEYERHEIM, BERLIN. — Engraved for the American Agriculturist.

Here is an easy lesson for girls and boys to study, though it may be a hard one for some to learn. The picture shows a hateful little monkey, and a noble looking Newfoundland dog. As they are only animals, we can talk very freely about them, and probably hurt nobody's feelings. If it were the picture of boys or girls, one of them showing selfishness, distrust, and spite, the other good nature, kindness, and confidence, then George or Susan, or Henry, might think we were showing their faults or their virtues to the rest of our great family. "What does *distrust* mean?" asks little Fanny. To be afraid of another without any good reason for it. Selfish people are almost always distrustful. The picture of the monkey shows how unlovely such a feeling is. His feelings come out into his face, and make it hideous. Depend upon it, that monkey has not been well educated; probably he is a pet, accustomed to have his own way, and that you know is enough to spoil any little monkey! But there is something on the table that may partly account for his ill-nature. Perhaps he has been tasting some of the drinks from the bottles as well as stealing a plate of fruit—one of the bottles is upset and empty—that might be enough to spoil even a pleasant animal. You

can see that the dog is too trusty to take anything from the table, however tempting to his palate. He is honest, as well as kind, and you may be sure *he* would trust his companions if they were worthy. *He suspects no evil because he is innocent.* That is a good lesson to learn by heart, and we think no pleasanter way of studying it can be found than by examining the above beautiful picture.

About Gold Leaf and Gold Beaters.

Our youthful readers, who have all seen the gilding on the backs of books, may like to know how it gets there. A little piece of gold is made into a very thin sheet, by passing it many times between steel rollers—so thin that 800 of the sheets would only make one inch in thickness. These are cut into about inch square pieces, which are then placed between layers of thin vellum, or "gold beaters' skin," as it is called, made from the intestines of oxen. These are 4 or 5 inches square, with the inch squares of gold sheet between them. A pile of 100 to 150 layers is made. The beater with a convex face, heavy hammer, beats away at this pile for hours, part of the time with the right and part with the left hand to rest each. The gold spreads out into sheets as large as the vellum.

The thin leaves of gold are then taken out and each piece is cut into four squares, and a new pile made with these, and the beating repeated. They are then cut again, and the process repeated until the original thin sheet is spread out over hundreds of square inches, and the gold leaf is so thin that a million sheets piled up would not be more than five or six inches in thickness. These gold sheets are placed between the leaves of little paper books, 25 to the book, the edges trimmed to about 3 inches square, and they are then ready for sale. For filling teeth, and for plating metals, the gold leaf is left thicker. —To gild book covers, the binder puts a little sizing or glue, on the place where he wants the gilt letters or pictures, and spreads a piece of thin gold leaf over it. The type, or stamp, made of brass, or some metal that will not melt readily is then heated and pressed upon the gold leaf, which fastens it to the sized leather, or muslin book cover, wherever it is touched by the hot type or stamp. A sponge or cloth then rubbed over it takes off all the gold leaf not fixed by the hot metal, and leaves the distinct gilt letters, or other device. The edges of books are pared even and smoothed, then gold leaf is laid on and burnished or rubbed fast, with a smooth tool made for the purpose.

(Business Notices \$2.00 per Agate Line of Space.)

AGRICULTURAL IMPLEMENTS FOR THE SOUTH AND WEST.—For the convenience of Dealers and Farmers the DODGE & STEVENSON MFG CO. have established a branch in New York to supply their well-known OHIO REAPERS and MOWERS. A most successful SELF-MADE REAPER for the harvest of '65 is perfected. The undersigned is also agent for LOWE'S PATENT SAWING MACHINE. Having used it, Wm. C. Childs, of Indiana, says:—"I want another of your Shingle Machines. It is as good a machine as ever was. I can cut from 16,000 to 18,000 shingles per day of hard wood." Stafford Cultivator for Corn and Cotton; Tree Felling Machine; New machine for Hulling and Cleaning Coffee and Rice; Cotton Gins; Cotton Presses, &c. &c. For Circulars apply by mail or otherwise to S. J. AHERN, Manufacturers Southern supply Agency, 83 Wall-st., N. Y.

Neat Yankee Trick, But No Trickery.

The NEATEST "YANKEE TRICK" is the WORK TABLE and WRITING-DESK COMPANION. Recommended by Orange Judd, Solon Robinson, Mine. Democrat, N. Y. Independent, and hundreds more who use it daily. IT COMBINES

- 1st.—A Patent Sewing Ripper which takes out a seam faster than a sewing machine can make it.
2d.—Gathers Scratcher; just the thing for it.
3d.—Paper Cutter and Folder, always handy.
4th.—Eraser for removing blots, errors, etc.
5th.—Letter Opener for men of Large Business.
6th.—Nail Cleaner and Trimmer for everybody.
In short, it is a Universal Yankee Blade, and costs only 35 cents—3 for \$1. Liberal discount by the quantity. Ask your storekeeper for it, or send price to A. C. FITCH, 151 Nassau-st., New York.

Photograph Clubs---A Good Idea--

Messrs. H. H. LLOYD & CO., of 31 John-st., New York, the celebrated map publishers, are delivering the best card photographs, of every description, at any Post Office, free of postage, to clubs ordering one hundred or more, for \$6 a hundred. Any lady or gentleman can send for an assortment at once, or send for a catalogue and join their friends in ordering from it. This is a rare opportunity to fill the Albums with choice pictures. Ten photographs are added to every hundred for the getting up of the club.

"We have already spoken favorably of the reliable character of the house of H. H. LLOYD & CO. Notice that the initials are H. H."

We publish hundreds of kinds of Maps, Charts, Prints and Steel Engravings. Thousands of Photographs, and THE ILLUSTRATED BATTLE HISTORY OF THE REBELLION.

Travelling Agents Wanted. H. H. LLOYD & CO., 21 John-st., New York.

TAKE YOUR CHOICE!

We have already given away more than TWO HUNDRED Sewing Machines, as premiums for getting subscribers to the New York Observer. 15 new subscribers will secure a \$35 Sewing Machine, either Wheeler & Wilson, or Grover & Baker. See Agriculturist for March and April. Sample copies and Circulars sent to any address free. Terms, \$3.50 a Year in Advance. SIDNEY E. MORSE, JR., & CO., 37 PARK ROW, New York.

WHEELER & WILSON

SEWING MACHINES.

"WOMAN'S GREATEST DOOR.—We would advise a man to forego a Thresher and thresh wheat with a flail, rather than to see the wife wear her health, vigor and life away in the everlasting 'stitch, stitch, stitch,' when a Sewing Machine can be obtained. The WHEELER & WILSON is an invaluable aid in every household. We have had several different kinds on trial, and after a six year's service, the WHEELER & WILSON has taken the precedence as the best, where all kinds of sewing are to be done in a family."

THE GREAT FAMILY SEWING MACHINE.

HIGHEST PREMIUM Elastic Stitch SEWING MACHINE.

495 Broadway, New York.

LOVE, COURTSHIP, and MARRIED LIFE.—Whom to Marry, When to Marry, and Whom not to Marry; Likes and Dislikes; Adaptation; Right Age to Marry; Marrying Cousins; Jealousy, its Cause and Cure; Useful Hints to both Married and Single; with Physiognomy, Ethnology, Physiology, and Psychology, in the PHRENOLOGICAL JOURNAL for 1865. The most magnificent flower of modern times. Over 130 varieties. Beginning from middle of May to end of June. Roots of 3 superb named varieties, or 6 not named, sent post-paid for \$1. Address GEORGE SUCH, South Amboy, N. J.

The Best Children's Paper in America.

Fighting against Wrong, and for the Good, the True, and the Beautiful. A First-Class Monthly Paper, of 16 Pages, for BOYS and GIRLS. \$1.00 a Year in advance.

Specimen Copy sent for Ten Cents Address,

ALFRED L. SEWELL, Publisher, Chicago, Ill.

Forney's Philadelphia Daily Press says of it: "THE LITTLE CORPORAL is destined to become the great children's paper of America."

THE LITTLE CORPORAL is the most interesting and instructive monthly in the Union.—Louisville Democrat.

THE LITTLE CORPORAL is universally admitted to be the best juvenile paper now in existence.—Dubuque Daily Times.

It is the cleverest thing of its kind yet realized in America.—Roxbury (Mass.) Journal.

After a careful examination, we can cheerfully say of THE LITTLE CORPORAL, that it deserves all the praise that has been lavished upon it by the press everywhere.—Philadelphia Episcopal Recorder.

The Little Corporal for one year will do your children more good than a Quarter's Schooling.

Important to Cider Makers.

THE JERSEY POWER APPLE GRINDER.

(BUTTERWORTH'S PATENT.) For grinding Apples, Peaches and other kinds of fruit. See Advertisement in May No., and send for Circular. Manufactured and for sale by

E. BUTTERWORTH, Trenton, N. J.

B. T. BABBITT'S

LABOR-SAVING SOAP.

This Soap is made from clean and pure materials, contains no adulteration of any kind, will not injure the most delicate fabric, and is especially adapted for woolens, which will not shrink after being washed with this Soap. It may be used in hard or salt water. It will remove paint, grease, tar and stains of all kinds. One pound warranted equal to two pounds of ordinary family soap. Directions sent with each bar for making three gallons handsome soft soap from one pound of this Soap. Each bar is wrapped in a circular containing full directions for use, printed in English and German. Ask your grocer for "B. T. Babbitt's Soap," and take no other.

B. T. BABBITT,

Nos. 64, 65, 66, 67, 68, 69, 70, 72, and 74 Washington-st., N. Y.

B. T. BABBITT'S

STAR YEAST POWDER.

Light Biscuit or any kind of Cake may be made with this "Yeast Powder" in 15 minutes. No shortening is required when sweet milk is used. Nos. 64 to 74 Washington-st., New-York.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, show at a glance the transactions for a month, ending April 14, 1866, and the exports of Breadstuffs from this port thus far, since January 1:

Table with columns for RECEIPTS, SALES, and EXPORTS for various commodities like Flour, Wheat, Corn, Rye, Barley, and Oats. Includes sub-sections for transactions at New York markets and exports from New York from January 1 to March 15.

Gold fell to 125, rallied again to 125 3/4, and is now 125 1/2. There has been a better inquiry for the principal Breadstuffs during a month, and holders not eager to realize, especially on sound flour and grain. The home trade have been the principal buyers of flour and wheat, which has been held above the limits of foreign orders. There has been a good export inquiry for Corn and Rye, and for Oats, for shipment to London. Unsound Wheat, Corn, and Oats continue to arrive most freely at the seaboard, though in little favor. River and lake navigation is now fully resumed, and the canals of this State will probably be in working order by May 1st. There has been more doing in Provisions at irregular prices for hog products, but at firmer rates for beef, beef hams, butter, and cheese, the last two articles closing heavily, under freer arrivals. New butter is coming in pretty freely, and is tending downward. The consumption is much restricted by the high rates. Cotton has been in good supply and less request, middlings recoded, at one time, to 35 @ 37c, but have since rallied to 37 @ 39c, per lb. The estimated stock now here is 223,000 bales. The trade in Wool has been on a very limited scale, though prices have favored buyers, decide lly. The demand has been exclusively for manufacturing purposes, and has been confined to small lots. Hay and Straw have been more freely offered at lower prices, but have not been in much request, save for local use. Hops and Seeds have been in fair demand, and generally buoyant in price. Tobacco has been quiet and depressed.

Table titled 'CURRENT WHOLESALE PRICES' with columns for 'March 15, 1866' and 'April 15, 1866'. Lists prices for various commodities including Flour, Corn, Wheat, and other agricultural products.

Advertisements, to be sure of insertion, must be received BEFORE the 5th of the preceding month.

PUTTING DOWN CARPETS. This back-aching and laborious work is now shorn of its hardships by the use of the GREENLEAF CARPET STRETCHER. It is an admirable arrangement, stretching the whole length of the carpet, and holding it firmly to be tacked down at leisure. It can be used by the most delicate female, for the labor is reduced to simply driving the tacks. The trade supplied on liberal terms. E. S. & J. T. BUREY, sole Agents, 72 Maiden Lane, New-York.

FANCY FOWLS for sale—Dorkings, Poland, Hamburgs, Game, Brahmas, Lechorns, Spanish, Sebrights and other Bantams, China and Toulouse Geese, Ronen and other Ducks, Fancy Pigeons, &c., &c. Also their eggs for setting, fresh, and nicely packed. From \$2 to \$1 per doz. For Circular address with stamp, R. H. HAINES, Box 58, Elizabeth, N.J.

PARLOR ORGANS. The HIGHEST PREMIUM, a SPECIAL GOLD MEDAL, was awarded to us by the late great Fair of the AMERICAN INSTITUTE over all competitors for the best instruments. A Gold Medal was awarded to CARHART & NEEDHAM for the best Reed Instrument on exhibition—a most just testimonial.—WATSON'S Art Journal. "I can speak of them in the highest terms."—G. W. MOR-GAN. "The finest instruments of the class I ever saw."—GEO. F. BRISTOW. "The tone is incomparable—far in advance of any other instrument of a similar kind."—CHARLES FRAEDEL. Illustrated Catalogues sent by mail. CARHART & NEEDHAM, No. 97 East Twenty-third-st., New-York.

A. E. THOMPSON'S CHORAL ORGAN,

MANUFACTURED ONLY FOR T. S. BERRY, To whom all applications for ORGANS or AGENCIES should be addressed. WAREROOMS AND WHOLESALE DEPOT, 593 BROADWAY, Bet. Prince and Houston-sts., NEW YORK.

It is admitted by all MUSICIANS who have examined the CHORAL ORGANS, that they combine more desirable qualities than any reed instrument ever before made. By a combination of arrangements, peculiar to the CHORAL ORGAN alone, the tone EXCELS in fullness, purity, and richness, and in the general mechanical arrangements of the instrument, it surpasses all others of its class.

The patent Graduated Swell is controlled entirely by the feet, while blowing, requiring no change of position of hands or feet, thereby enabling the performer to produce all those beautiful effects for which the Organ is so eminently adapted.

This SWELL is not a LOUD PEDAL only, but, as its name indicates, a SWELL, by which you glide from the PIANISSIMO to the FORTISSIMO at will, or instantly change from one to the other. This is peculiar to the CHORAL ORGAN.

The voicing of the Reeds is done with the greatest care, in order to free them from the HARSHNESS often heard in reed instruments; and no one who listens to the CHORAL ORGAN but is attracted by the melodious sweetness of its tones. None should purchase an instrument of this class without first inspecting the CHORAL ORGAN at the

GENERAL DEPOT, 593 BROADWAY.

CHORAL ORGANS. PRICE LIST.

Table listing prices for various Choral Organ models, including 'BLACK WALNUT OIL FINISH' and 'ROSEWOOD, POLISHED' options. Models range from 5 Octave Single Reed to 5 Octave Double Reed with various stop configurations.

A Liberal Discount to Clergymen and Sabbath Schools. THE TRADE SUPPLIED AT SPECIAL RATES. Agents wanted in all the large Towns and Cities.

The Lamb Family Knitting Machine.

The Lamb Knitting Machine Company, Springfield, Mass., hold the exclusive right to manufacture, sell and use this Machine in the following States: New York, (all East of the Counties of Cayuga, Seneca, Schuyler and Chemung,) Maine, New Hampshire, Vermont, Rhode Island, Connecticut, New Jersey, Pennsylvania, Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia and Alabama.

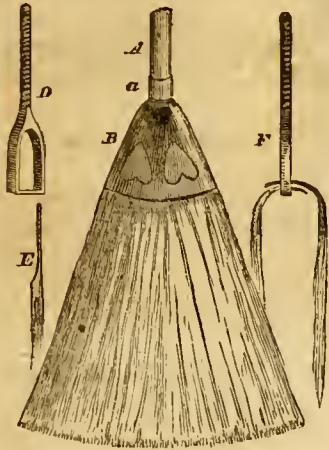

The Machine manufactured by this Company received the highest premium, A GOLD MEDAL, at the Fair of the American Institute, in New York, and at the Exhibition of the Mass. Mechanic's Charitable Association, Boston. It has also taken the highest premium at all the various State and County Fairs where it has been exhibited, eclipsing all others. It is really the only Family Knitting Machine invented, as no other has a range of work that entitles it to be called a Family Machine.

For Stockings, as it knits the heel and narrows off the toe, making any size required, it is the greatest labor-saving Machine ever brought before the public, being in this respect far in advance of its great rival the Sewing Machine. It knits any and everything in the way of Fancy and Staple worsted articles that the ingenuity and taste of the operator can devise. Every Machine warranted perfect. PRINCIPAL OFFICE AND SALESROOM, UNION BLOCK, Main-st., Springfield, Mass.

OFFICE IN BOSTON, 63 Court-st. Our Agents in New York State are located as follows: Albany—E. M. BURNS. Troy—E. WATERS & SONS. Utica—W. S. TAYLOR & CO. Syracuse—JOHN H. FOWLER. Binghamton—H. M. BUSH. Greene—F. L. MARTIN. Potsdam—O. E. BONNEY. Plattsburg—A. G. CARVER. Send for a Circular describing more fully the Machine, enclosing stamp. Address LAMB KNITTING MACHINE CO., Springfield, Mass.

Silver's Patent Excelsior Broom

Will soon Supercede all Others.

This is the simplest, best, and most beautiful Broom in the world. We will pay \$3000 for a better. Ladies who have tried this Broom say they will never use any other.—Every one who sees it recommends it.

The Scientific American of March 17, 1866, says: "Silver's method of constructing a Broom makes a much better article than the old-fashioned one, for the shank is stiff and held fast, thus obtaining a spring or elasticity which is valued by housekeepers." "The head is made of Polished Sheet Brass, or German Silver, and will last for years when properly used, and the Broom can easily be refilled at any time when worn out."

This is the Only Patent Broom adapted for City as well as country use.

Send \$2 for one of these beautiful Brooms, or enclose stamp for Circular to

SILVER'S PATENT BROOM CO., 119 Nassau-st., New-York, Room 2.

Do you want to make money? then secure your County or State for this Broom.

WANTED—\$500,000,

For which we invite orders for PORTABLE or STATIONARY ENGINES, CIRCULAR SAW MILLS, FEED'S & BUCKINGHAM'S PATENT PORTABLE FRENCH BURR GRIST MILLS and BOLTS, SUGAR-CANE MILLS and SUGAR PANS. Our works are the oldest and most extensive in the country. All of our machinery is of modern construction and guaranteed.

Our portable mills are so complete and perfect that our millwrights erect and set them to running in two days' time. Orders promptly filled, and deliveries made in any of the principal cities of the United States.

For information or illustrated circulars, address

C. & J. COOPER,
Mount Vernon, Ohio.

IMPORTANT TO CIDER MAKERS.

The Jersey

POWER APPLE GRINDER.

(BUTTERWORTH'S PATENT.)

For grinding Apples, Peaches and other kinds of fruit. This Machine has been thoroughly tried in different sections of the country, and is warranted to be, both in point of economy and durability, greatly superior to every other kind of Cider Mill.

With an ordinary Two Horse Power, it will grind fine and uniform, one hundred bushels and upwards of Apples per hour—is so constructed that it can not be injured by the stones—needs very little, if any repairs, and by the superior manner in which it does its work, one month's use will pay for the Mill. Send for Circular. Manufactured and for sale by
R. BUTTERWORTH, Trenton, N. J.

THE PREMIUM MACHINE.

Best in America.

The Railway Horse Power that is unequalled for ease of team, amount of power. The Combined Thresher and Cleaner that cleans equal to any Fanning Mill, fit for Mill or Market. Threshers, Separators, Fanning Mills, Wood Saws, Seed Sowers and Planters, &c. All of the BEST in market. Send in orders early, as we are governed by "first come, first served." For further information send for Circular. Address **R. & M. HARDER,** Cobleskill, Schoharie Co., N. Y.

HANSON'S

Patent Hydraulic Ram.

This Ram is capable of raising water to a greater elevation than any other with a given head and supply by more than fifty per cent.

HANSON'S

Self-Acting Pressure Pump,

For raising water to the upper stories of city houses, where the pressure is not sufficient, and is worked by the water that is drawn in the basement, requiring no attention except a few drops of oil once a week.—This Pump can be used to great advantage in the country, where there is a small running stream not sufficient to supply a Ram, but will work with any quantity applied, and will raise its proportion to heights required, the greater the fall, the greater the proportion raised, it will also raise spring water by the use of brook water. The working parts of this machine are made of brass, consequently will not rust, and may be left unworked for any length of time without detriment. For further particulars send for Catalogue, or apply to the inventor and patentee,
THOS. HANSON, 291 Pearl-st.,
3 doors above Beckman-st., New York.

Also an assortment of Brass Force Pumps for Green-houses, &c. &c.

MEAD'S PATENT CONICAL PLOW.

The Conical is undoubtedly the best Plow for all kinds of work, that has ever been offered to the Public, and we are now prepared to furnish them to Farmers and the Trade at same prices that much poorer ones are offered, and warrant them in every particular. Send for a Price List.

W. E. BARRITT & CO., Providence, R. I.

HORSE RAKE WIRE

Of best quality and lowest rates, for sale by

JOHN W. QUINCY,
98 William-st., New York.

Fairechild's Patent Corn and Pumpkin Seed Planter.

This machine is a perfect success, and should not be judged by others, that have failed to give satisfaction. It plants corn and pumpkin seed, both at the same time if desired, or either separately, and will also plant beans, doing its work evenly as though by hand, and leaving the seed covered. It can be altered to plant more, or less seed in a hill, as may be desired, and will do the work of three or four men. Being made of Iron and Steel, it is very durable, and will work in stony soil without receiving injury. It will not clog, or get out of order, and is free from the objections of other machines, of which any one will be satisfied on examination. No farmer can afford to do without it, as it saves three-fourths the labor of planting; and the use of it for one season will more than repay its cost. It weighs 6½ pounds, and costs but \$8, if purchased directly of the makers, POIKER, DELONG & CO., Binghamton, N. Y., or, VAN NOSTRAND & LYON, 119 Nassau-st., New York.

GALVANIZED WIRE

FOR GRAPE ARBORS, FENCES, TRAINING FLOWERS AND VINES. Also Small Staples, Nails, &c. These are always clean, do not soil the hands, or rust and stain the painted woodwork, for sale by **LEFFERTS & CO., 100 Beekman-st., New York.**

All kinds of Iron Work Galvanized to order and promptly returned, galvanized sheet iron of all sizes constantly on hand.

Gibbud Bro.'s Magic Grain Binder,

for binding Wheat, Rye, Oats, Corn Stalks, &c. With this Binder one man can do the work of two, and it is also a great saving in grain. Price in large quantities \$1.25 per 100. A sample and Circular with particulars will be sent to any one sending us 15 cents. Send early that your orders may be filled in time for harvest. Address **GIBBUD BROS., Waterbury, Conn.**

Valuable Patent for Sale.

The entire patent for the U. S. of Halsted's Improved Horse Hay Fork. Already successfully introduced, and selling well. For particulars address **A. M. HALSTED, 63 Pearl-st., New York.**

5000 Triomphe de Gand, \$1 per 100.
BENJ. HAINES, 27 Courtlandt-st., New York.

CHINESE SUGAR CANE.

Imported Seed.

In consequence of so much of the seed of this valuable plant that is raised in this country being deteriorated by hybridization with other varieties, we have just imported a supply from Messrs. Vihooria & Co., of Paris, grown from the original stock, which may be relied upon as perfectly pure. It will be mailed to any address post-paid, at the following rates: 4 ounces, 25 cents; 8 ounces, 41 cents; one pound, 75 cts. Address **B. K. BLISS, Springfield, Mass.**

EXTRA ORANGE CARROT.

This variety originated in this country several years since, and is rapidly gaining favor wherever known, and is now almost the only variety grown by farmers in this section. It resembles the "Long Orange" in shape, but is superior to it in every respect, being larger, better flavored, of a deeper orange color, and more sure to produce a crop. Post-paid by mail as follows: 4 ounces, 50 cents; 8 ounces, 80 cents; one pound, \$1.50. Address **B. K. BLISS, Springfield, Mass.**

A NEW FORAGE PLANT.

Bromus Schraderi.—A new forage plant from Australia, particularly recommended for resisting the drouth better than any other variety, and will thrive on any soil except where there is superabundance of moisture, yields two to good crops in a season, and is much liked by cattle who will walk over everything else to reach it, and will eat it down as close as they can bite. One ounce packet for trial, 25 cents. Per pound, \$2.50. **B. K. BLISS, Springfield, Mass.**

OSAGE ORANGE SEED.

A fresh supply just arrived from Texas, \$2 per quart, by mail, \$2.25. **B. K. BLISS, Springfield, Mass.**

A PERFECT WRINGER.—Self-adjusting—Malleable iron frame—White Rolls, and a **Perfect Ironing Machine**

for ironing without heat, and as quickly as the articles would be run through a Wringer.

AGENTS WANTED everywhere. Send enclosing Stamp for Circular, giving 1000 references and full description.

S. W. PALMER & CO., Auburn, N. Y.

American Roofing Company.

This Roofing is the lightest known, weighing *fourteen ounces* to the yard, yet is warranted permanent, and as tight as any Roofing ever made.

It rolls up and unrolls like Oil Cloth, is perfectly pliable and elastic in any weather, and is a *ready roofing*, furnished ready for use, and can be laid down by any sensible working man according to directions furnished by the undersigned.

It is not destroyed by putting down; when no longer required in one place, can be taken up and be put down elsewhere as good as new.

The **American Paint**, manufactured originally only for use on the **Patent Roofing**, has been tried extensively on other *Roofs*, and on *Walls, Fences, Carts and Cars*, and has given such extraordinary satisfaction, that it is now extensively sold for such purposes. It dries with a smooth, glossy surface, of a beautiful Maroon color, becomes very hard by exposure, and will not blister or crack either from heat or cold. Printed Circulars and other information can be obtained from

GUANO.

FARMERS, READ!

The Excelsior Poudrette and Fish Guano Works,
Office and Depot, 195 Water-st., New York.

RICARDO & CO., Proprietors.

We are making an *extra fine Improved* quality of Poudrette this season, composed of *Night Soil, Urine, Butcher's Blood, Offal, and Fish Guano*, and guarantee it superior in quality to any other Fertilizer in Market, and at a *much lower price*. Farmers and Gardeners, study your interest, and use it. Price \$2.00 per Barrel, and 33 cents per Bushel. Call and see us or send for a Circular. Address or call on

**RICARDO & CO.,
195 Water-st., near Fulton, New York.**

P. S.—Be sure you get the "EXCELSIOR." "BEWARE OF FRAUDS AND MISREPRESENTATIONS."

"GUANO."

No. 1 Peruvian Guano, also Baker's Island and other Phosphate (Bone) Guanos of the richest quality, genuine as imported, and pure article. Also Manipulated Guano, consisting of No. 1 Peruvian and Baker's Island Guano, making a very rich and substantial fertilizer. For sale in quantity to suit purchasers by

J. B. SARDY, 53 South st., cor. of Wall, New York.

(A fair deduction made to Dealers.)
For further particulars send for Circular.

AMMONIATED PACIFIC GUANO.

The attention of Farmers and Agriculturalists is called to this article, as superior to anything else offered in the market. Equal to Peruvian Guano, and costing much less.

We offer this fertilizer in lots to suit all purchasers. A liberal discount made to the Trade.

Pamphlets with copies of Analysis by Dr. Liebig, of Baltimore, and Dr. Jackson, Massachusetts State Assayer, and testimonials from Agriculturalists, showing its value, and directions for use, can be obtained from

FERTILIZER.**

Made by Mr. Duncan Bruce, is for sale to the Trade, by
GEO. E. WHITE & CO., 55 Cliff-st., New York.

BONE

For Sale by the Manufacturers. Pure Bone Dust and Fresh Bone Superphosphate of Lime. Address

**A. LISTER & BROTHER,
Ceres Mills, Newark, N. J.**

TO FARMERS.

Poudrette! Poudrette!

80,000 Barrels of Lodi Poudrette

For sale in lots to suit purchasers. This Poudrette has been on the market for 25 years, and has held its place among all other fertilizers as the **Best and Cheapest**, being sold for \$40 per ton less than other fertilizers, with just as good results. It is manufactured from the night soil of New York City, which the subscribers have the exclusive contract for removing to their works. Its chief recommendations are its economy, the quick growth it gives to the plant, ripening a crop from two to three weeks earlier, and an increased yield of 50 to 100 per cent. It is used most extensively upon Corn, Tobacco, Potatoes, and Garden Vegetables. It is perfectly inodorous, harmless to vegetation, can be applied directly to the seed without injury, and yet is as powerful as Peruvian Guano, and unlike Guano, does not leave the soil in an exhausted condition. A pamphlet with the experience in its use of several hundred farmers in different parts of the United States, some of them having used it for over 20 years, will be sent to any person applying to our address.

Price—\$2.00 per Barrel of four Bushels. Address
**THE LODI MANUFACTURING COMPANY,
66 Courtlandt-st., New-York.**

THE BEST FERTILIZER.

The Rumford Chemical Works offer for sale, 1,200 tons of Wilson's Patent Ammoniated Superphosphate of Lime. This valuable Fertilizer is made entirely from bone, and nitrogenous substances, and oil of vitriol, and is compounded from them in such proportions as to make the best possible Fertilizer.

Orders from any part of the country, except Maryland, for any quantity, will be promptly filled, if accompanied with the money, or satisfactory references.

Citizens of Maryland should address their orders to Hon. Robert Turner, Baltimore.

This Fertilizer always produces superior crops of Grass, Corn, Wheat, Oats, Barley, Rye, and Buckwheat, of Potatoes, Turnips, and Beets, and is most excellent for Trees, Shrubs, and Vines.

Price at the Works, for 10 Tons, or less, \$60 per Ton. A liberal discount to dealers.

**GEO. F. WILSON, Treasurer,
Nos. 53, 59 and 60 South Water-st.,
Providence, R. I.**

H. B. LANE, 151 Nassau-st., Agent in New York City.

BONE TA-FEU!!

It is manufactured for and used as a substitute for Peruvian guano, and judged by many to be fully equal to it. It is sold at the low price of \$40 per Ton.

Manufactured only by the
**LODI MANUFACTURING COMPANY,
66 Courtlandt-st., New York,
to whom all orders must be addressed.**

No. 1 Peruvian Guano,

of recent importations, for sale by

J. CHAPMAN & VANWYCK,

Maryland and Virginia Farms for Sale.

Owing to the Civil War, fine Southern farms are now offering for sale at reduced prices, in the most fertile portions of Maryland and Virginia. The mildness of the climate and variety of productions offer peculiar inducements to Northern Farmers.—The Subscribers have constantly on hand Farms improved and unimproved, Dairy, Fruit and Grazing Farms, Country Seats, Coal and Timber Lands, in all sections of Maryland and Virginia.

Also Residences and Building lots in and around Baltimore and Washington.

Faithful and accurate descriptions can be had by addressing
**JOHN GLENN & CO.,
59 Second-st., Baltimore.**

SUPERIOR FARM LAND.—20,000

Acres, Franklin Tract, at Newfield, Gloucester County, New Jersey, on the Railroad running from Philadelphia to Cape May, 30 miles South of Philadelphia—adjoining the Vineland Tract, and 2 miles North of the Vineland Station—for sale at low prices and on easy terms, in lots to suit purchasers. Circulars, with reports of Solon Robinson, Hon. William Parry, and others, with full information, sent to applicants, free. Address **JOHN H. COFFIN & CO., Newfield, Gloucester Co., N. J.** Improved Farms also for Sale.

600 Maryland and Virginia Farms and Timbered Lands.

Catalogue of Maryland and Virginia Lands, with Geographical description of Maryland, for sale by **R. W. TEMPLEMAN & CO., Land Agents, 37 Lexington-st., Baltimore City**, embracing a description of the soil and products of Maryland. Sent 25 cents for a copy of Catalogue.

FOR SALE.—A NOBLE CHANCE TO CULTIVATE Cranberries; 30 Acres, with 20 inches of Peat, very easily cleared. fine stream of water running through it. Enough vines on the property to plant the whole. Price \$2,500. **J. H. COFFIN, Franklville, Gloucester Co., N. J.**

VINELAND

FARM AND FRUIT LANDS, in a mild and healthful climate. Thirty miles south of Philadelphia by Railroad, in New Jersey, on the same line of latitude as Baltimore, Md.

The soil is rich and productive, varying from a clay to a sandy loam, suitable for Wheat, Grass, Corn, Tobacco, Fruits and Vegetables. This is a *great fruit country*. Five hundred Vineyards and Orchards have been planted out by experienced fruit growers. Grapes, Peaches, Pears, &c., produce immense profits. Vineland is already one of the most beautiful places in the United States. The entire territory, consisting of forty-five square miles of land, is laid out upon a general system of improvements. The land is only sold to actual settlers with provision for public adornment. The place on account of its great beauty as well as other advantages has become the *resort of people of taste*. It has increased five thousand people within the past three years. Churches, Stores, Schools, Academies, Societies of Art and Learning, and other elements of refinement and culture have been introduced. Hundreds of people are constantly settling. Several hundred houses are being constructed, and it is estimated that five hundred will be built during the summer. Price of Farm land, twenty acre lots and upward, \$35 per acre. Five and ten acre, and Village lots for sale.

Fruits and Vegetables ripen earlier in this district than in any other locality north of Norfolk, Va. Improved places for sale.

Openings for all kinds of business, Lumber Yards, Manufactories, Foundries, Stores, and the like.

For persons who desire mild winters, a healthful climate, and a good soil, in a country beautifully improved, abundant in fruits and possessing all other social privileges, in the heart of civilization, it is worthy of a visit.

Letters answered and the Vineland Rural, a paper giving full information, and containing Reports of Solon Robinson, sent to applicants.

Address CHAS. K. LANDIS, Vineland P. O., Landis Township, New Jersey.

From Report of Solon Robinson, Agricultural Editor of The Tribune: It is one of the most extensive fertile tracts, in an almost level position and suitable condition for pleasant farming that we know of, this side of the Western Prairies.

"FARMS on the Eastern Shore of Maryland. Circulars sent free. Address REA & HUTCHIN, Cambridge, Dorchester Co., Maryland."

WORKSHIP IN THE SCHOOL-ROOM.

What it is.—A hand-book of devotion for Schools and Families.

What it contains.—254 Lessons; Each Lesson presents a Bible doctrine, or Christian duty. Illustrated and enforced by selections of Scripture; also appropriate Psalms and Hymns, with music adapted to each.

254 Prayers.—Each written for the lesson it accompanies, by eminent and earnest Christian Educators.

Who want the work; Teachers, in all our Colleges, Academies, Day Schools, and Sunday Schools.

Parents, who would add a new charm to the devotions of the family circle.

Pastors, who would study the spirit of scores of well and widely known contributors.

How to get it.—Apply to the Publishers, SCHERMERHORN, BANCROFT & CO., 130 Grand-st., New-York, 512 Arch-st., Philadelphia, 6 Custom House Place, Chicago.

For Circular, giving full explanation of work, and specimen pages, address Rev. W. T. WYLIE, 54 North 6th-st., Philadelphia. Price \$2.50.

Persons remitting for 15 copies \$45, will receive an extra copy for one year.

DAILY TRIBUNE.

\$10 per annum; \$5 for six months.

TO ADVERTISERS.

Having widened the columns of THE TRIBUNE we are under the necessity of charging more, per line, for advertisements. In consideration of this and the fact of the steadily growing circulation of THE TRIBUNE, we have decided to increase our rates to correspond with the increased length of the lines, and with our increased circulation. Our advertising customers very well know that THE TRIBUNE circulates among the best classes of our citizens, those most likely to prove good customers; and we believe the past experience of advertisers, who have availed themselves of THE TRIBUNE as a medium through which to reach customers both in City and Country, will warrant them in paying the small increase in our rates. Our new scale of prices will be:

DAILY TRIBUNE.

ORDINARY ADVERTISEMENTS, classified under different heads, 20 cents per line.

SPECIAL NOTICES, on fifth page, 30 cents per line.

BUSINESS NOTICES, 50 cents per line.

ITEM ADVERTISEMENTS, under head of "City News," 60 cents per line.

Book Notices and Literary Items will appear on the second page, to be followed by the Book Advertisements. We believe that THE TRIBUNE has always been considered the very best medium in which Publishers could advertise, and this arrangement will add even to its previous value.

Advertisers, will see that, by the changes in making up the paper, their announcements will be presented more conspicuously to the reader. Friends, we have hitherto given you the worth of your money, and we shall continue to do so.

Advertising—The Fruits of it in The Weekly Tribune.

A few weeks since "The Manchester Land Company" inserted their advertisement in THE WEEKLY TRIBUNE, and in six other papers in this State and New-England. Under date of April 5, 1866, Mr. Brown writes to one of the editors of THE TRIBUNE as follows:

DEAR SIR:—That advertisement has done wonders. I have received nearly a thousand letters from all the States from Maine to Iowa, inquiring about the Manchester lands, asking terms, requesting a pamphlet, etc., and nine-tenths of them commence with the words, or their equivalent: "Having seen your advertisement in THE TRIBUNE, and having also read Solon Robinson's descriptions of West Jersey, I write for further information."

The result of advertising in your paper has been so satisfactory, that I have concluded it the best economy to continue it in THE WEEKLY TRIBUNE, however large the expense, and discontinue it in all other papers.

The project of settling the wilderness of New-Jersey is a success in which THE TRIBUNE may congratulate itself, as others soon will, for the good work in this cause.

Respectfully yours, LEWIS E. BROWN.

THE WEEKLY TRIBUNE has a circulation larger than that of any other newspaper, and a large proportion of its subscribers take no other journal. The space in this sheet allotted to advertisements is necessarily limited, so that each has the advantage of being easily seen, and all are generally read with as much interest as news-matter. There is—as those who have tried it know—no advertising medium in the country so cheap, because there is none so profitable to the advertiser. The paper circulates among the industrial and thrifty classes—the Farmers, Manufacturers, Merchants and Mechanics of the country—and is carefully read by their wives and daughters. It is safe to say that each advertisement in it is read every week by not less than half a million of the most intelligent of the people. He who makes his business, his merchandise, or his manufactures, known to this immense number, scattered all over the loyal States, cannot fail to do so to his own manifest and great advantage.

ORDINARY ADVERTISING—\$1 a line each insertion.

ITEM—In The News Column—\$1.50 a line each insertion.

NOTHING INSERTED FOR LESS THAN \$5.

No less by the quarter or year.

Address THE TRIBUNE, No. 154 Nassau-st., New York.

Over one hundred engravings. Cloth, 12mo, 325 pp.
- Boussingault's Rural Economy, 1 60
Rural Economy in its relations with Chemistry, Physics, and Meteorology; or CHEMISTRY APPLIED TO AGRICULTURE in the Principles of Farm Management, the Preservation and Use of Manures, the Nutrition and Food of Animals, and the General Economy of Agriculture. By J. B. BOUSSINGAULT, Member of Institute of France, etc. Translated, with Introduction and Notes, by GEORGE LAW, Agriculturist. Cloth, 12mo, 507 pp.
- French's Farm Drainage, 1 50
The Principles, Process, and Effects of Draining Land with Stones, Wood, Drain-Plows, Open Ditches, and especially with Tiles; including Tables of Rainfall, Evaporation, Filtration, Excavation, Capacity of Pipes, cost and number to the acre. With over 100 illustrations. The best work on Draining published. By Judge FRENCH, of New-Hampshire, President of Mass. Agricultural College. Cloth, 12mo, 384 pp.
- Johnston's Agricultural Chemistry, 1 75
LECTURES ON THE APPLICATION OF CHEMISTRY AND GEOLOGY TO AGRICULTURE. New edition, with an Appendix, containing the Author's Experiments in Practical Agriculture. By the late JAS. F. W. JOHNSTON, M.A., F.R.S.S. L and E., etc., etc. This is an American edition of the large and extensive English work. Cloth, large 12mo, 709 pp.
- Norton's Elements of Scientific Agriculture, 75
A valuable and popular treatise on the Connection between Science and the art of Practical Farming. By the late JOUN P. NORTON, M.A., Professor of Scientific Agriculture in Yale College. Cloth, 12mo, 218 pp.
- Our Farm of Four Acres, and the Money we made by it, 30
From the Twelfth London Edition, with an Introduction for the American Edition. This work has already had an immense sale, both in England and in this country. It is written by a lady, and while conveying many useful suggestions, it has almost the interest of a romance. 12mo, 126 pp. New Edition. Price in neat paper covers, 30c.; bound, 60c.
- Pedder's Land-Measurer for Farmers, 60
A convenient Pocket Companion, showing at once the contents of any piece of land, when its length and width are known, up to 1500 feet either way, with various other useful farm tables. Cloth, 18mo, 144 pp.
- Todd's Young Farmer's Manual and Work-Shop, \$1 50
The most valuable and practical work before the public as a guide to the various Farm Operations, including the mechanical part of agriculture, farm implements, edge tools and how to put them in order, fencing, gates, building, etc., etc. By S. EDWARDS Tonn, a practical Farmer. Thoroughly illustrated with engravings. Cloth, 12mo, 459 pp.

On receipt of the price, any of the above books will be sent, pre-paid, to any Post-Office in the United States or Territories, excepting at present, those points which are only reached by the Overland Mail to the Pacific Coast.

Orange Judd & Co., Agricultural Book Publishers, 41 Park Row, New-York.

Flax Culture..... 50

A new and very valuable work, consisting of full directions, from selection of ground and seed to preparation and marketing of crop, as given by a number of experienced growers. 8vo, paper.

Flowers.

American Rose Culturist, (including the Dahlia,)..... 30
Being a Practical Treatise on the Propagation, Cultivation, and Management of THE ROSE, to which are added full directions for the treatment of the Dahlia. In neat paper covers. 12mo, 96 pp.

Breck's New Book of Flowers,..... Entirely new. Illustrated, 1 75
In which are described the various Hardy Herbaceous Flowers, Annuals, Shrubby Plants, and Evergreen Trees, with Directions for their Cultivation. By JOSEPH BRECK, Seedsman and Florist, former editor of *New-England Farmer*, and *Horticultural Register*. Cloth, 12mo, 395 pp.

Buist's American Flower-Garden Directory,..... 1 50
Containing Practical Directions for the Culture of Plants in the Flower-Garden, Hot-House, Green-House, Rooms or Parlor-Windows, FOR EVERY MONTH IN THE YEAR; with descriptions of most desirable plants, soils, transplanting, erecting a Hot-House, a Green-House, laying out a Flower-Garden, etc., etc. By ROBERT BUIST, a practical Nurseryman and Seed-Grower of Philadelphia. Cloth, 12mo, 342 pp.

Fruits.

Chorlton's Grape-Grower's Guide,..... 75
INTENDED ESPECIALLY FOR THE AMERICAN CLIMATE; being a Practical Treatise, with Engravings, on the Cultivation of the Grape-Vine in each Department of Hot-House, Cold Grapery, etc.; with Plans for the Construction and Heating. By WM. CHORLTON. Cloth, 12mo, 204 pp.

Cole's American Fruit Book,..... 75
Containing Directions for Raising, Propagating, and Managing Fruit-Trees, Shrubs, and Plants, with descriptions of the best varieties of fruit, etc. 18mo, 288 pp.

Elliott's Western Fruit-Grower's Guide,..... 1 50
The previous Edition of this Work was Thoroughly Revised; embracing all the new and valuable Fruits, with the latest improvements in their Cultivation; especially adapted to the wants of Western Fruit-Growers; full Illustrations. By F. R. ELLIOTT, of Ohio. Cloth, 12mo, 503 pp.

Field's Pear Culture,..... 1 25
THE PEAR GARDEN; a Treatise on the Propagation and Cultivation of the Pear Tree, with instructions for Management from the Seedling to the Bearing Tree. By THOMAS W. FIELD. Illustrations. Cloth, 12mo, 256 pp.

Fuller's Grape Culturist,..... 1 50
This is the latest and most practical work issued on the Culture of the Hardy Grapes, with full directions for all departments of Propagation, culture, etc., with one hundred and five excellent engravings, illustrating the various operations of Planting, Training, Grafting, etc. By ANDREW S. FULLER, Practical Horticulturist. Cloth, 12mo, 262 pp.

Fuller's Illustrated Strawberry Culturist,..... paper, 20
A new, practical little work, meeting with universal favor. It gives a full list of varieties, down to the latest valuable seedlings. Paper, 12mo, 48 pp.

My Vineyard at Lakeview,..... 1 25
An account of the failures and successes of a Western grape-grower. The work is in the pleasing form of a narrative, and describes the methods practiced at the West in a clear and easily understood manner. 12mo.

Pardee on Strawberry Culture,..... 75
A Manual for the Cultivation of the Strawberry; with a Description of the Best Varieties. Also, Notes on the Raspberry, Blackberry, Currant, Gooseberry, and Grape. By R. G. PARDEE. Cloth, 12mo, 157 pp.

The Miniature Fruit Garden,..... 1 00
By THOMAS RIVERS. This is a little treatise by the veteran English promologist; it is a clear and minute account of the methods followed in the garden culture of all kinds of dwarf fruit trees. Carefully reprinted from the thirteenth London edition, with all the illustrations. 12mo. Pp. 132. Cloth, with beveled boards.

Gardening.

Buist's Family Kitchen-Gardener,..... 1 00
An excellent Practical work, Containing Plain and Accurate Descriptions of all the Different Species and Varieties of Culinary Vegetables, with their Botanical, English, French, and German Names, alphabetically arranged; with full Directions for the Best Mode of Cultivating them in the Garden or under Glass. By ROBERT BUIST. Cloth, 12mo, 216 pp.

Cobbett's American Gardener,..... 75
A Treatise on the Laying Out and Management of Gardens. By WILLIAM COBBETT. Though an old work, it is one which will find a place in every considerable library, as the production of a remarkable man. While it is marked by the author's peculiarities, it is so full of plain common-sense, that it is worthy of being kept in print. Cloth, 12mo, 230 pp.

Schenck's Gardener's Text-Book,..... 60
Directions for the forming and management of the Kitchen Garden, the culture and use of Vegetables, Fruits, and Medicinal Herbs. Cloth, 18mo, 306 pp.

Green and Hot-Houses.

Leuchars' How to Build Hot-Houses,..... 1 50
GREEN-HOUSES, GRAPERIES, etc., etc., and how to Ventilate them. Illustrated with numerous engravings. By ROBERT B. LEUCHARS, Garden Architect. This is the only work published in this country, especially devoted to this subject. Cloth, 12mo, 366 pp.

Hedges, Etc.

Warder's Hedges and Evergreens,..... 1 50
This is the only book wholly devoted to the cultivation, pruning, and management of plants suitable for American hedging, especially the Maclura, or OSAGE ORANGE; illustrated with engravings of plants, implements, and processes; to which is added a *Treatise on Evergreens*, their varieties, propagation, culture, etc. By J. A. WARDER. 12mo, 291 pp.

Hogs.

Youatt and Martin on the Hog,..... 1 00
A treatise on the breeds, management, and medical treatment of Swine, with directions for salting pork and curing bacon and hams. By WM. YOUATT, V.S., and W. C. L. MARTIN. American edition, edited by Ambrose Stevens. Illustrated with engravings. Cloth, 12mo, 231 pp.

Hop Culture,..... (New,) 40

PRACTICAL DETAILS fully given, from the Selection and Preparation of the SOIL, SETTING and CULTIVATION of the Plants, to PICKING, DRYING, PRESSING, and MARKETING the Crop. Plain Directions by Ten Experienced Cultivators. Illustrated with over forty engravings. Edited by PROF. GEORGE THURBER, Editor of the *American Agriculturist*. 8vo, paper.

Horses.

Herbert's Hints to Horse-Keepers,..... 1 75
This is the best practical work on the Horse prepared in this country. A COMPLETE MANUAL for HORSEMEN, embracing: How to Breed a Horse; How to Buy a Horse; How to Break a Horse; How to Use a Horse; How to Feed a Horse; How to Physic a Horse (Allopathy or Homoeopathy); How to Groom a Horse; How to Drive a Horse; How to Ride a Horse, etc., and Chapters on MULES and PONIES, etc. By the late HENRY WILLIAM HERBERT (Frank Forester.) Beautifully illustrated throughout. Cloth, 12mo, 425 pp.

Dadd's Modern Horse-Doctor,..... 1 50
CONTAINING PRACTICAL OBSERVATIONS ON THE CAUSES, NATURE, AND TREATMENT of Diseases and Lameness of HORSES; embracing the most recent and approved Methods, according to an enlightened system of Veterinary Practice, for Preservation and Restoration of Health. Illustrated. By GEO. H. DADD, M.D., Veterinary Surgeon. Cloth, 12mo, 432 pp.

Dadd's Anatomy and Physiology of the Horse,..... 3 50
A VERY LARGE OCTAVO, CONTAINING TWENTY FULL-PAGE ANATOMICAL ILLUSTRATIONS; with Instructions in Dissection, and mode of making Anatomical Preparations, and a Glossary of Veterinary Technicalities, Toxicological Chart, and Dictionary of Veterinary Science.

Orange Judd & Co., Agricultural Book Publishers, 41 Park Row, New-York.

Stewart's Stable Book,..... 1 50

A treatise on the management of horses, in relation to stabling, grooming, feeding, watering, and working, construction of stables, ventilation, appendages of stables, management of the feet and of diseased and defective horses. By JOHN STEWART, Veterinary Surgeon. With Notes and Additions, adapting it to American food and climate. By A. B. Allen, former Editor of *American Agriculturist*. Cloth, 12mo, 378 pp.

Youatt and Spooner on the Horse,..... 1 50

The Structure and Diseases of the Horse, Remedies, Rules to Buyers, Breakers, Shoers, etc. Youatt's work somewhat simplified and brought down by W. C. Spooner, M.R.C.V.S.; to which is prefixed an account of the Breeds in the United States and Canadas, by Hon. Henry S. Randall. Illustrated with numerous Engravings. Cloth, 12mo, 483 pp.

Cole's American Veterinarian,..... 75

Diseases of Domestic Animals, showing the *Causes, Symptoms, and Remedies*, and rules for *Restoring and Preserving Health* by good management, with directions for *Training and Breeding*. By S. W. COLE. Cloth, 18mo, 288 pp.

House-Keeping.

Skillful Housewife,..... 75

Or, Complete Guide to Domestic Cookery, Taste, Comfort, and Economy, embracing 659 Recipes, with many valuable hints pertaining to household duties, the care of health, *Education of Children*, Gardening, Birds. By Mrs. L. G. ABELL. Cloth, 12mo, 216 pp.

Landscape Gardening.

Downing's Landscape Gardening and Rural Architecture. 6 50

The most complete and valuable work ever issued on Landscape Gardening in North-America, for the Improvement of Country Residences; containing full Directions for every thing connected with Laying out and adorning the Rural Home, the Grounds, the Gardens, the Buildings, the Trees and Plants, etc., with principles of taste so stated as to adapt the work to all classes. Splendidly Illustrated with many Steel and fine Wood Engravings. By the late A. J. DOWNING. New Edition, Enlarged, Newly Illustrated and Revised, with Supplement, by HENRY WINTHROP SARGENT. Octavo, 534 pp. Extra cloth, gilt, beveled binds.

Manures.

Dana's Muck Manual,..... 1 25

A Manual for Farmers; treating of Soils, Manures, Composts, etc., and especially of the important subject of using MUCK, the great natural fertilizer of the country. By SAMUEL L. DANA. Cloth, 12mo, 312 pp.

Onion Culture.

Onions: How to Raise them Profitably,..... 20

Being the Practical Details, from Selection of Seed and Preparation of Ground to Harvesting and Marketing the Crop, given very plainly by *Seventeen Practical Onion Growers* of long experience, residing in different parts of the country. No more valuable work of its size was ever issued. Octavo, 32 pp. Neat paper covers.

Rabbits.

Bement's Rabbit Fancier,..... 30

BREEDING, REARING, FEEDING, AND GENERAL MANAGEMENT of Rabbits: their Diseases and Remedies; Full Directions for the Construction of Hutches, Rabbitries, etc.; Recipes for Cooking and Dressing for the Table. Numerous Illustrations. By C. N. BEMENT, author of *Poulterer's Companion*, etc. 12mo, 101 pp., in neat illustrated paper covers.

Sheep.

Randall's Fine-Wool Sheep Husbandry,..... 1 00

Giving Prominent Characteristics of Different Breeds; Principles of breeding correctly; practical and concise rules for Selecting the Best, and making the best Crosses for Wool and Mutton. By Hon. HENRY S. RANDALL, LL.D. 12mo, 189 pp.

Randall's Sheep Husbandry,..... 1 50

With an account of the different Breeds of Sheep; Selecting the Best for Wool and for Mutton; Rules for Crossing; Practical Details for Rearing; Summer and Winter Management; Treating Diseases; with New Chapters by Henry S. Randall and G. W. Kendall on Sheep Husbandry in Texas, with Portraits of different Breeds, Illustrations of Sheep Folds, and other Articles in Sheep Husbandry. Octavo, 338 pp.

Youatt on Sheep,..... 1 00

With details for Breeding and Rearing; Notes on Different Breeds; Summer and Winter Management; Characteristics of different Kinds of Wool, with Portraits of different Breeds of Sheep. Octavo, 160 pp.

Tobacco.

Tobacco Culture; Full Practical Details,..... 25

This is by far the most useful and valuable work ever issued on this subject. It contains full details of every process from the Selection and Preparation of the Seed and Soil, to the Harvesting, Curing, and Marketing the Crop, with Illustrative Engravings of the operations. The work was prepared by *Fourteen Experienced Tobacco Growers*, residing in different parts of the country. It also contains Notes on the Tobacco Worm, with Illustrations. Octavo, 48 pp., in neat paper covers.

Weeds and Plants.

American Weeds and Useful Plants,..... 1 75

An Important Work for every Cultivator—Farmer, Gardener, etc.; being an Enumeration and Description (with accurate illustrations) of the WEEDS and PLANTS found in American Fields and Gardens, which meet the observation, or require the attention of Cultivators; with practical suggestions for their Eradication when needed. While *practical* in its character, it includes both the common and botanical names and characters of the Weeds and Plants, with a Popular Account of the Structure of Plants. By WM. DARLINGTON, M.D., and PROF. GEO. THURBER. Thoroughly illustrated with 277 Engravings. 12mo, 460 pp.

SUNDAY-SCHOOL BOOKS.

Messrs. Judd & Co. publish editions of the new and popular series of Sunday-School Lesson Books entitled, "LESSONS FOR EVERY SUNDAY IN THE YEAR"—No. 1; No. 2; No. 3; and No. 4. Each number contains 52 lessons. These have met with great favor among all denominations of Christians, nearly 200,000 copies of the first issued (No. 1) having already been called for. 18mo, 112 pp. Price, 15 cts. each; \$1.50 per dozen; \$12 per 100. (Postage, 3 cts. each.) Four sample copies (Nos. 1, 2, 3, 4,) sent by mail, post-paid, for 65 cts.

On receipt of the price, any of the above books will be sent, pre-paid, to any Post-Office in the United States or Territories, excepting, at present, those points which are only reached by the Overland Mail to the Pacific Coast.

(Business Notices \$2.00 per Agate Line of Space.)

THE GREAT AMERICAN TEA CO.'S SECRET!

The great secret of the unparalleled success of THE GREAT AMERICAN TEA COMPANY is in the fact that their rate of profit is based upon ENORMOUS SALES with a small percentage. The extent of business done enables them to buy Teas by the cargo, and, by "OUR CLUB SYSTEM," as appears below, to sell them at the usual cargo prices, thereby saving from three to five profits to the consumer, or about ONE HUNDRED PER CENT. The retail trade of the Company is based upon a sale of 1,000 chests a week.

The Company have leased extensive warehouses in the most central locations, and fitted them up in a style of magnificence very far surpassing anything ever before known in this country. It has been the aim of the Company to select localities that cannot fail to convene all sections of the metropolis and surrounding cities. The prices being uniform, customers can select either of our stores mentioned below, as may best accommodate them. By examining our list of prices, consumers of Tea and Coffee will see that they have been **Paying Enormous Profits.**

The Company continue to sell at the following prices:
OO LONG, 10c., 50c., 60c., 70c., 80c., 90c., best \$1 per pound.
MIXED, 40c., 50c., 60c., 70c., 80c., 90c., best \$1 per pound.
ENGLISH BREAKFAST, 50c., 60c., 70c., 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
GREEN TEAS, 50c., 60c., 70c., 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
YOUNG HYSON, 50c., 60c., 70c., 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
UNCOLORED JAPAN, \$1, \$1.10, best \$1.25 per pound.
IMPERIAL and GUNPOWDER, best \$1.25 per pound.

These Teas are chosen for their intrinsic worth, keeping in mind health, economy, and a high degree of pleasure in drinking them

COFFEES ROASTED & GROUND DAILY.

GROUND COFFEE, 20c., 25c., 30c., 35c.—best 40c. per pound. Hotels, Saloons, Boarding-House keepers and Families who use large quantities of Coffee, can economize in that article by using our **FRENCH BREAKFAST and DINER COFFEE**, which we sell at the low price of 30c. per pound, and warranted to give perfect satisfaction.

Consumers can save from 50c. to \$1 per pound by purchasing their Teas of the

GREAT AMERICAN TEA COMPANY,
 Nos. 31 and 33 VESSEY-ST., corner Church-st.
 No. 610 BROADWAY, corner Bleecker-st.
 No. 503 EIGHTH AVE., near Thirty-seventh-st.
 No. 205 FULTON-ST., BROOKLYN, corner Concord-st.

Country Clubs, Hand and Wagon Peddlers, and small stores (of which class we are supplying many thousands, all of which are doing well), can have their orders promptly and faithfully filled; and in case of Clubs, can have each party's name marked on their packages as directed by sending their orders to Nos. 31 and 33 Vessey-st.

Our friends are getting up Clubs in most towns throughout the country, and for which we feel very grateful. Some of our Clubs send orders weekly, some not so often, while others keep a standing order to be supplied with a given quantity each week, or at stated periods. And in all cases (where a sufficient time has elapsed) Clubs have repeated their orders.

Parties sending Club or other orders for less than thirty dollars, had better send Post-Office drafts, or money with their orders, to save the expense of collections by express; but larger orders we will forward by express, to collect on delivery.

We return thanks to parties who have taken an interest in getting up Clubs.

Hereafter we will send a complimentary package to the party getting up the CLUB. Our profits are small, but we will be as liberal as we can afford.

The following extracts are from letters taken from our daily correspondence: CASTALIA, Iowa, March 4, 1866.

THE GREAT AMERICAN TEA COMPANY:
 GENTLEMEN: Yours of the 24th ult. to hand, and the Tea also in good order. The Tea has given good satisfaction to all the Club. Perhaps you are curious to know what we save by getting Tea from you. The quality is better than our merchants sell for \$2 per lb.

We have distributed your Hand-bills, and can and will recommend your goods. Wishing you success in your enterprise, we remain yours, respectfully,

THE CLUB

Per John M. Martin.

We append the second order from our Seville Club:
 SEVILLE, Ohio, March 25, 1866.

To THE GREAT AMERICAN TEA COMPANY:
 GENTLEMEN: The Tea you sent on the 7th of this month arrived in good condition, and gives general satisfaction to the Club. I send you the present order of \$84, to be "paid on delivery." I have scattered your Circulars far and near; and I believe, if you continue to deal honestly by us, you will have a good order from this place at least once a month.

Please send as before, by express, to Seville, Medina Co., O. This is a larger order than before, but I suppose you make your boxes to suit your orders.

Yours respectfully,
 ALFRED YOUNG.

PURELY MUTUAL LIFE INSURANCE. NEW YORK LIFE INSURANCE COMPANY. ESTABLISHED 1845.

Home Office, Nos. 112 and 114 Broadway, New York.
ASSETS, OVER \$5,000,000—SECURELY INVESTED.
 (See 21st Annual Report April No. Agriculturist.)

This is one of the OLDEST, SAFEST, and most SUCCESSFUL Life Insurance Companies in the United States, and offers advantages not excelled, and in some respects NOT EQUALLED, by any other. Its Trustees in New York city are of the very first and most reliable names.

It is Strictly Mutual, the Policy-Holders Receiving the Entire Profits.

Special care in the selections of its risks—strict economy—and a safe and judicious investment of its funds—emphatically characterize the management of this Company.

Dividends are, and always have been Declared Annually.

The mortality among its members has been proportionately less than that of any other Life Insurance Company in America—a result consequent on a most careful and judicious selection of lives, and one of great importance to policy-holders. It offers to the assured the most abundant security in a large accumulated fund, amounting now to over

FIVE MILLIONS OF DOLLARS.

It accommodates its members in the settlement of their premiums, by granting, when desired, a credit at once on account of future dividends, thus furnishing insurance for nearly double the amount, for about the SAME CASH PAYMENT as is required in an "all-cash company."

The Annual Income, exclusive of Interest on Investments, NOW EXCEEDS

TWO AND A HALF MILLIONS OF DOLLARS.

THIS COMPANY ORIGINATED AND INTRODUCED THE NEW FEATURE KNOWN AS THE NON-FORFEITURE PLAN,

which is rapidly superseding the old system of life-long payments, and HAS REVOLUTIONIZED THE SYSTEM OF LIFE INSURANCE IN THE UNITED STATES, and which has been adopted (generally in a less favorable form) by all Life Companies; thus attesting the force of public opinion in favor of a system so favorable to policy holders as that established by the NEW YORK LIFE for the benefit of its members.

It has received the unqualified approval of the best business men in the land, large numbers of whom have taken out policies under it, purely as an investment.

AT THE END OF TEN YEARS

ALL PAYMENTS CEASE ENTIRELY.

By the table on which this class of policies is based, a person incurs no risk in taking out a policy. Insuring to-day for \$5,000, if he dies to-morrow, the \$5,000 immediately becomes a claim; and if he lives ten years, and makes ten annual payments, his policy is paid up—nothing more to pay, and still his dividends continue, making

HIS LIFE POLICY,

A SOURCE OF INCOME TO HIM WHILE LIVING.

The only weighty argument offered against Life Insurance is that a party might pay in for a number of years, and then, by inadvertence, inability, etc., be unable to continue paying, thereby losing all he had paid. The "NEW YORK LIFE" have obviated this objection by their

TEN YEAR NON-FORFEITURE PLAN.

A party, by this table, after the second year, CANNOT FORFEIT ANY PART OF WHAT HAS BEEN PAID IN,

Thus, if one insuring by this plan for \$10,000 discontinues after the second year, he is entitled to a PAID-UP POLICY, according to the number of years paid in, viz.:

Second year, two-tenths of \$10,000 (amount insured), amounting to \$2,000, with dividend on same for life.			
Third year, three-tenths of " " " " " " " "	3,000	"	"
Fourth year, four-tenths of " " " " " " " "	4,000	"	"
Fifth year, five-tenths of " " " " " " " "	5,000	"	"

And so on, until the tenth annual payment, when all is paid, and dividends still continue during the life-time of the assured.

This feature, among others, has given to this Company a success unparalleled in the history of Life Insurance. Persons desiring information, or Policies, or to be connected with the Company as Agents, will please apply to the Home Office, either personally or by letter.

There has been Paid to the Widows and Orphans of Members of this Company an Aggregate Sum Exceeding \$3,500,000.

The Dividends Paid (Return Premiums) Exceed \$1,700,000.

THE "FIRST PROOF SHEET"—GUTTENBERG AND FAUST.—PAINTED BY HILLEMACHER.

"Proofs" are the first impressions which are taken from types after they are set up, so that the matter may be read, and corrections made, previous to printing. A *proof* was a great deal more than that at the moment selected by the artist for the above picture. Think, what were the first impressions of John Guttenberg and John Faust, in that rude printing office at Mentz, in 1450, on examining the *first proof-sheet taken from t-y-p-e-s.*—It was indeed a proof.—It assured them of success, of fame, of honor, and perhaps it showed them some dim foreshadowing of the results to the world of the art

of printing. Guttenberg, the poor mechanic with his great genius, had struggled along since 1438 alone, until he found in Faust a genial, appreciative, liberal patron. Faust's face glows with surprise, pleasure, and interest at the demonstration of the problem. To Guttenberg, however, it is the moment of modest triumph, the culmination of his hopes and labors. He offers to his friend and patron the proof that his claims are just. The lever that will move the world he places in his hands. Think of what this first "proof" meant. Yet with true inventive instinct Guttenberg apparently takes no

pride in it, but is intent on pointing out some little defect, and is already planning to do better. There are two other characters in the picture: one a sturdy laborer, who thinks "What fools there are in the world!" The other is Peter Schæffer, the scribe, whose facility with the pen rendered him valuable to Guttenberg in selecting styles for his type, etc. He takes in the whole, and it was he who first cast metal in moulds to form type. Guttenberg first used *moveable* types of wood or metal, and made them up in forms for printing.—The above is from a fine engraving at Goupil's, on Broadway.

AMERICAN AGRICULTURIST.

NEW-YORK, JUNE, 1866.

Every year we wonder to see the effect of a few warm, moist days in June—things push forward their growth with such vigor—even the soil seems to teem with life. The air has lost that oppressive languor which it imparted during the first hot days, of spring, and now, though warmer, it, the rather, inspires us to work. There is work enough for man and beast. Farmers careful to take advantage of opportunities, are well ahead with their work, so that even if the corn has to be replanted to some extent, and other delays occur, they will be ready for the proper June work in its time.

The weather is at times cold and wet, for which there is at this time no remedy, but drainage at the proper season will place the soil out of danger from excess of water. At other times this month is a dry one, and now and then a June drouth is very disastrous. The remedy for this is deep working, and frequent stirring and pulverization of the surface. Almost every section of the country has its own tools for this work, and most of them answer a very good end. The desirable points being lightness, ease of handling, steadiness in the ground, and the cutting or stirring evenly the whole soil. For hood crops, a small A-harrow, with plow handles does very well; or a larger one, with the front teeth taken out, to run astride the rows of corn, etc. Besides, one of the best ways to keep a crop from suffering from drouth, is to run a subsoil plow through near the rows, but not near enough to disturb them or their roots. For this purpose the Mole subsoil plow is the best. This goes by several names, Mapes', Knox's, etc., but it is a very old invention, and consists simply of a flat, wedge-shaped share, like a spear head driven through the ground, being attached to a plow beam by one or two standards, the steel ones are preferable.

Hints about Work.

At this time of the year, when the stock is chiefly in pasture, and the barns and granaries are comparatively empty, time should be taken for

A General Clearing out.—All the buildings should be swept out thoroughly, the hay, feed, etc., cleared out, and also all the scattered grain, with the insects it may contain, and the whole of the premises put in order for the reception of the new crops.

Old Hay ought not to be left to form the bottom of the mow, but put somewhere, where it can be got at conveniently at any time. At this time, also, do any necessary repairs of those parts which were covered up when much hay and grain were in store; and in rainy days

Repair the flooring to cattle stalls, etc., making sure that all liquid and solid manure shall be saved.

The Cattle in the pasture should be looked to daily, that they do not lack water, and good feed, and to see that none are ailing.

Pastures not in real good heart, may be greatly benefited at this season, by shutting the stock out of them for a few days, and giving them a light dressing of ashes, bonedust and plaster, or of good superphosphate or guano.

Sheep.—Look out for dogs—put poisoned meat about in the pastures near where the dogs would enter, if you suspect dogs of chasing and worrying them. The way to do it is this, take pieces of meat as large as a dog can easily swallow, run a knife blade half way through, and then pressing the meat so as to open the hole, drop into the center of the meat a few grains of the poison, 3 grains is enough. Let the druggist weigh out a few doses and put them in separate papers, one can readily guess near enough after that. It is policy to wash wool so as to get the dirt out, but not remove all the grease—thus the fleeces will weigh heavier, and so long as manufacturers will not discriminate between cleaned and half cleaned wool, it is not unfair. The best washing is done by washing some of the greasiest fleeces which are not very dirty, in

tubs, so that the water becomes quite soapy (they should first be wet so as to soak the fleece some time before washing). In this water other sheep may be washed, and almost the whole of the grease removed with comparative ease, the fleece being subsequently rinsed clean in pure water. This system of washing sheep affords a considerable quantity of very valuable manure in the water used, which may be applied by watering carts, or by being distributed upon the grass or other crops, by the pailful. See item in *Hints for Work*, last month, about shearing sheep unwashed, ticks, etc.

Peas and Oats may be sown together any time during this month, using, on soil well prepared by repeated harrowings at intervals of several days, to kill weeds, about 2 bushels of each seed well mixed and drilled in deep: or, drill in the peas three inches deep and sow the oats broadcast and harrow them in the same way the drills run.

Millet, as a fodder crop, to cut before the seed ripens, is highly esteemed by many. The large kind is sowed in drills or broadcast, in good light soil. Weeds check its growth disastrously at its first starting, but if the ground can be stirred, it soon takes care of itself even in rather weedy soil. The small variety known as

Hungarian Grass, affords an abundant crop of good hay on land in good heart, and bears a drouth well. It should be cut soon after flowering, because the bristles, which surround the mature grain, produce bad effects in the stomachs of horses and perhaps other stock, which gives this fodder a bad reputation. Sow after the middle of June, employing the previous time to clear the ground of weeds, using about 1 1/2 bushel (20 to 24 lbs.) of the seed to the acre, and brushing it in if the ground is not very dry, in which case it should be lightly harrowed. It is valuable to cut green.

Butter.—The secret of making good butter is cleanliness and thoroughness, and the time for the most profitable exercise of the art of buttermaking is June. The grass is abundant, the cows in full milk, the weather favorable. The milk should not be kept too cool, though this is rarely a fault in dairies. It is enough if it be kept as cool as 60° Fahrenheit, though 55° is not too cool. Cream will rise at about this temperature better than at any other, and the same is best at which to churn. Milk should stand where the air is sweet and fresh, odors from the kitchen or from the stable, or odors of any kind, indeed, except that of fresh air, should be carefully excluded. Stone floors are desirable, for these can be kept constantly moist and so cooler than others, and the air ought to circulate freely over and under the pans. Shallow pans are better than deep ones. Work out the buttermilk without touching the hands to the butter, using as little water as possible, or none at all. If the buttermilk is all out, and with it all the milk, sugar and cheesy portions of the milk, butter will keep with very little salt. The more imperfect the working, the more salt is required. In keeping cream several days, put it where the temperature will be uniform and cool, and stir well if more is added.

Beans.—The white field bean may be sown with profit any time during the month. Plant in drills 2 feet apart, the hills being a foot apart. The Blue Pod and White Marrow are the best, the latter ought not to be planted later than the 25th.

Fowls.—Give hens as much space as possible, if confined, throwing them fresh sods daily, as at this season grass will be a good part of their living. Provide clean gravel and lime, and a good dusting-box, and lime-wash the houses, nest-boxes and roosts frequently. A hen with chickens will do little scratching if each foot is tied up in a little bag or toe of an old stocking, and the brood will do much good in the garden.

Corn.—Much corn is not planted until the first week in June, and yet good crops are secured. If planted late, of course only the earliest maturing kinds should be used. In its cultivation horse power should take the place of the hand-hoe, as far as possible, and on many soils it will be found hardly necessary to hoe at all, if the horse cultivation be thorough, and the rows run both ways.

Corn Fodder.—Dry weather may suddenly cut short the pasturage, and without a good supply of corn fodder many a farmer would find his milk running very low. Corn should be sowed on ground in good heart, in drills 3 feet apart, manured in the drill with compost if need be. About 3 or 4 bushels is the usual seeding for an acre. The ground should be cultivated between the rows with a horse-hoe or cultivator once or twice.—

Sorghum may be used instead of corn, but it is not nearly so good. Still the seed costs much less.

Clover Seed.—Don't forget that red clover on good land, cut early, will produce a crop of seed as good, or better than you can buy. Cut before it would otherwise be best to do so,—early in June,—and leave the stubble even as possible. If you can put on a light dressing of lime muck and ashes compost, you will see the advantage in it.

Peas sowed after the 15th of May, north of latitude 41°, will be free from the Pea Weevil or Pea Bug. South of this latitude, peas sown earlier by several days or weeks, will usually be found free.

Root Crops.—We hope none of our readers will neglect to plant roots. Mangel wurtzels should have been planted in May, but will make a crop in good soil now. The soil for Rutabagas should be rich and mellow, and 200 or 300 pounds of a good Superphosphate, or an equal quantity of bonedust will do the crop nothing but good. Sow with a good drill 24 inches apart, and thin to a foot apart in the drills, or 16 inches in very rich land.

Cabbages do well on soil rich in organic matter, such as reclaimed swamps, in fact they will flourish on any rich soil. They need good previous tillage of the soil, and constant culture, that is, enough to secure an open, weedless soil so far as practicable. They take the place of roots perfectly in feeding, and impart but very little flavor to the milk, provided no decayed leaves are fed. The seed of the Drumhead, Flat Dutch, Mason, and other late sorts may be sowed now in seed beds, and by and by the plants set in the field 2 feet apart in rows, 30 inches to 3 feet apart according to the usual size of the variety. Cabbages produce an immense quantity of food per acre on good ground.—One great use of hoed crops is to destroy the

Weeds.—Very weedy land may be cleaned completely by diligently allowing no weeds to grow large, and frequently stirring the soil so as to cause new crops continually to sprout. Wet weather should be taken advantage of to

Pull deep-rooted Weeds both among grain and grass, where these crops can be entered without injury, and also in the corn field.

Tobacco.—Set plants about the 2nd and 3d week in June in this latitude, and northward. The soil must be rich, in good tilth, the rows 3 feet apart, and the plants 2½ feet in the rows. Shelter from the sun by dropping a little freshly mown grass upon the plants, keep close watch for grubs and cut worms, and reset as fast as plants fail, up to the second week in July.

Orchard and Nursery.

He who has planted trees has done well, but he who has watched them and cared for their early growth, has done better. There would be very little to be said about pruning, were the young trees properly looked after. The rubbing off of a superfluous bud here, pinching a rampant shoot there, and the judicious use of the pocket knife as occasion required, would soon put a young orchard in the way it should go. But as people will let trees have their own way until they need

Pruning, we are obliged to accept pruning, the cutting off of large limbs, as one of the operations that must be done. This and the next are the months in which to do it, as now in the growing season the wounds heal over "kindly." Never cut a limb from a tree unless something is to be gained by it. Indiscriminate hacking merely because it is the pruning season, is not to be commended. If the head is too crowded and there is not room for the light and air, thin it; if one branch grows so

near another as to chafe it, take it out; if the tree is disposed to grow one-sided, balance it. Use a saw with a wide "set," never an axe, though sometimes a heavy chisel driven up from below, will prove efficient. Leave a smooth cut, by paring carefully with knife or chisel if need be. The wound will heal over all the better if covered from the air. The old solution of shellac in alcohol is an excellent application, but the price of materials is too high to allow of their general use, and

Grafting Wax, applied warm with a brush, is a very useful substitute. One part tallow, two of wax, four of rosin, melted together and applied while warm, will answer the purpose. The composition may be made harder or softer by altering the proportion of tallow. In shaping

Young Trees, to form low heads, if only for the protection the overhanging branches afford to the trunk.

Grafts set this spring will now show whether they have "taken." In common cleft grafting there are usually two cions put in, but seldom more than one is needed. Cut off the superfluous one, and if the upper buds of the one allowed to grow are disposed to starve the lower ones, shorten them by pinching. In short, treat a graft as if it were a newly planted young tree. Keep the wax or clay closely applied, until the wound is well covered.

Insects will demand much of the attention of the fruit grower at this time. One of the most conspicuous of these is the Tent Caterpillar. If, as we advised in season, the eggs were looked for and removed, the number of tents will be sensibly less. We have probably a dozen letters giving the writers' method of treating this caterpillar; they all result in destroying the nest and killing the inhabitants. Kerosene on a swab, soft-soap on a swab and a torch of kerosene to burn them out are among the remedies proposed. As good a way as we have ever seen, is to pull off the nest and trample on it, wearing gloves if you are squeamish about caterpillars; or, if the nest is, as is often the case, on a small twig, cut it off, but don't omit the trampling. Fires in the orchard at night will attract and destroy many moths, and some place lamps or lanterns in large pans of water. The insects strike against the glass and fall into the water and are drowned. Now is the time to be on the guard against

Borers.—See article on page 187, May number.

Buds set last year will now be pushing a growth so vigorous, that there is great danger that it will be broken down by winds, or by its own weight. It should be tied to the stump of the stock left for that purpose, or if necessary to a stake. All

Suckers, whether they appear on budded, or grafted stocks, or on established trees, should be rubbed off when they first appear. If the

Black Knot appears on the plum or cherry tree, cut it off and burn it. This is a regular fungous growth and should not be laid to insects who have enough other mischief to answer for. It has been ignorantly charged to the account of the

Curculio, which will perhaps deposit its eggs in it in default of finding fruit. Treat the curculio in the only practical way. Jar every tree early in the morning, catch the insects that fall, upon a sheet, and burn them. As soon as the new growth of shrubs gets firm enough,

Layers may be made. Put the layer down in rich soil, and if at all disposed to dry out, cover the surface with a mulch of moss, or other material.

Seed-beds of fruit and other trees will need weeding, and thinning, and often, especially in the case of forest and evergreens, need shading. If seedling evergreens are disposed to damp off, sift over the bed an inch or so of dry sand.

Evergreens may still be transplanted, if the roots are properly kept from drying. They may also be pruned into shape. Always keep the upper branches from overhanging the lower. They bear the free cutting, and may be dwarfed or shaped at will. Clean culture is as necessary for shrubs and trees as for corn and potatoes, and pays as well, therefore destroy

Weeds, by the use of the cultivator, hoe, rake, or hand, weeding as circumstances require.

Kitchen Garden.

Most people have a time of "making garden," and then let the thing take its chances, and we often see a better crop of weeds than of anything else. In a well kept garden a weed is never allowed to get larger than can be killed by a rake. Much of the tillage may be done with a good steel rake frequently applied. Still, the hoe must be used, and in large gardens the horse cultivator kept moving between the rows. The time to perform these operations is just before the ground needs weeding. By working frequently early in the season, all the seeds of weeds that are near the surface, are made to germinate, and the young plants are destroyed. Those who have had their early plantings destroyed by cold rains, or who have neglected to sow many things they would like to have, should not let the lateness of the season deter them. There are but few things that will not make a crop if planted the first of June. Things that are soon over may have their duration much prolonged by sowing again.

Asparagus.—Do not continue the cutting too long. When peas come, give the asparagus bed a rest, and keep off all weeds until the tops cover it.

Beans of the bush sorts may be planted for succession, and for dried beans. It is not too late to plant Limas and other runners. The White Runner is sold in many places as the Lima; though a very good bean, it is inferior to the Lima, and may be distinguished from it by its greater plumpness, and more shining surface.

Cabbages, Cauliflowers, and Broccoli.—Plants of these may still be set out. The growing ones need to have the soil frequently stirred, and they will be greatly forwarded by the use of liquid manure. Find the holes of the cut worms and destroy them; kill caterpillars when young, and if lice are troublesome, sift on air slaked lime or ashes.

Beets.—Hoe and thin freely those that are growing, and sow the Long Blood for the main crop.

Carrots.—Keep ahead of the weeds by working the ground as soon as the plants can be seen. Thin to six inches. It is not too late to sow seed.

Celery.—Set early plants in well manured trenches, or if flat culture be preferred, in rows three feet apart, the plants six inches distant in the rows. Plants for a late crop should be watered as needed, and be cut back to make them grow stocky.

Corn.—Good sweet corn may be had until frost comes, by planting a patch every two weeks.

Capsicums.—These, like all other plants of tropical origin, need a warm exposure and rich soil.

Cucumbers.—Plant as directed last month. Besides the striped bug, there is a yellow bug with spots like the lady bug, that is most destructive. Fortunately they are not numerous; the only remedy we know is hand picking early in the morning. When the sun gets warm they are very lively, but in the cool of the morning they are quiet.

Egg Plants.—Forward them by all possible means, rich soil, warm exposure and frequent hoeing. Draw the earth towards the stems to support them.

Endive affords an acceptable substitute for lettuce in the hot months. Sow and thin, or set out the plants so that they will stand a foot apart each way.
