The German aviator, Otto Lilienthal, up to 1901 attained the greatest success in flying. In construction his machine was very closely modeled after the characteristics of birds. The apparatus had outspreading wings, which were made in imitation of the spreading pinions of a bird, and was constructed of light wooden frames covered with cotton drilling. In flying, the legs of the operator were free, thus enabling him to start by running or from elevations much like the larger birds. The construction was such that he was suspended safely within the lower part, leaving the body and limbs quite free to move, and in this way he was permitted, at least to some extent, to direct the course to be taken. On a number of occasions he soared to heights far above the starting point and moved over considerable distances. Dr. Danilewsky, of Charkov, Russia, completed and used a flying machine in 1898, which combined with aviation the principle of a balloon, and gave rise to the newer *dirigible* balloons. In the meantime the United States appropriated \$25,000 for experiments relating to aerial navigation. The investigations were instrumental in obtaining a number of improvements, such as combining steam, electric, gas, and compressed-air motors with the machines to secure motive power. At the same time many screw and fan devices to guide and propel were invented. On July 2, 1900, Count Zeppelin, a German cavalry officer, made a

AEROPLANE FLIGHT FROM A WARSHIP.

Eugene Ely, in a Curtiss biplane, starting from the deck of the United States steamship *Birmingham*, at Hampton Roads. He reached the shore safely.

successful flights with his dirigible balloon, which combines the principles of a balloon and a flying machine. Later he improved on this form of an airship so he was able to sail with safety at the rate of forty miles per hour, which he did in 1908.

Henry Farman, the French aëronaut, won the Deutsch-Archdean prize of \$10,000 with his flying machine in 1908. It sailed at a height of about fifty feet at the rate of 25 miles an hour and was under perfect control during the entire time. This machine, like the *hélicoptère* or screw flyer of Santos-Dumont, is heavier than air and is one of the earliest types of this class. Another machine of this pattern is the air ship of M. Le Baudy, which has a record of sixty miles in two hours and 46 minutes. At the head of the list of successful inventors stand Orville and Wilbur Wright,

SANTOS-DUMONT'S HÉLICOPTÈRE.

H, H, Lifting propellers; P, Driving propeller; G, Rudder; M, Motor; S, Aëronaut's seat.

two American aëronauts, whose aëroplane, the *Bird of Prey*, demonstrated much capacity for flying in 1908 and since. This machine, together with the operator, weighs about 700 pounds. They were the first to demonstrate that a machine, when mounted on light bicycle wheels and driven along the surface of the ground, can be made to rise in the air. See illustration on following page.

**FLYING SQUIRREL**, a species of the squirrel family, about five inches long, having a fold of skin extending along each side between the fore and hind legs. The tail is about four inches long and has two horizontal rows of hair, which aid to direct its motion and support the body in the air. It does not fly, but sails through the air as a parachute, getting its momentum by springing from a tree at a considerable height, descending obliquely until very near the ground,

when it glides upward and usually alights at about one-third of the height from which it started. It has a brownish-gray color. The food consists chiefly of the young shoots of trees, nuts, insects, and small birds.

**FOG**, a thick mist at or near the earth's surface, resulting whenever the temperature of the air is reduced slightly below the dew point. The minute drops of water that form fog, though 800 times heavier than air, are prevented from settling rapidly by the resistance of the atmosphere. This is rendered possible by the minute size of the drops, which are much smaller than the relatively heavier dust particles common in the air and wafted about by the wind. Fogs disappear on the approach of warm winds. Off the banks of Newfoundland the warm, moist air of the Gulf Stream is cooled by the cold air of the Labrador ocean current, hence frequent and almost constant fogs arise.

**FOG SIGNALS**, the signs communicated in foggy weather by sounding a whistle, ringing a bell, firing guns, or by other methods in order to avoid collisions and prevent vessels from running upon places of danger. Light and other signals cannot be seen, so notice can be given only by sound. The steam siren fog-horn invented by Cagnard de la Tour, now employed by the United States lighthouse board, is the most effective signal used, and can be heard a distance of twenty to thirty miles.

A class of fog signals are used on railways to indicate a safe distance at which trains may approach each other, or to indicate points of danger on the track, such as broken rails, landslides, and defective bridges. They are in the form of small torpedoes in which a detonating powder, when they are struck by the wheels of the engine, makes a loud report.

**FOLKLORE** (fōk'lōr), a term used to signify the scientific study of popular customs, tales, superstitions, and primitive belief and usages. The term was compounded from several German words employed to designate this study, such as *Volkslied* and *Volksfest*. Though many trivial matters are taken into cognizance, the study has marked value in that it throws light on the origin and development of political and religious beliefs and ceremonies, as well as different ideas regarding the relationship between

racés. It is this feature of folklore that has made it of special value to historians, sociologists, and writers on ethnology. Besides, through its study more comprehensive views have been formed. The science owes its origin to the Grimm Brothers, who began collecting stories as told by peasants, and after a research of more than twelve years published their collection. Soon after intense interest was aroused in the establishment of folklore societies, the founding of journals, and the publication of various books relative to these researches.

ORVILLE AND WILBUR WRIGHT'S AÉROPLANE.

The American Folklore Society was founded in 1888 at Cambridge, Mass., and has directed its energies largely to the publication of books and periodicals relative to the folklore of North America. Its official publication is the *Journal of American Folklore*. Such institutions as Johns Hopkins University have given their energies to the furtherance of interest in the science. North American folklore has been extended largely within recent years, and now represents an interesting fund of knowledge relative to the Indians, Aztecs, and

Eskimos. Institutions having a like object are maintained in the countries of South America and Eurasia. By means of extensive research it has been possible to add a very useful and extensive fund of knowledge to the history of primitive races.

**FOND DU LAC** (fōn dû lāk'), a city in Wisconsin, county seat of Fon du Lac County, on the Fon du Lac River, about sixty miles northwest of Milwaukee. It is on the Wisconsin Central, the Chicago and Northwestern, and the Chicago, Milwaukee and Saint Paul railroads. Being on Lake Winnebago, it has communication with the Great Lakes by the Fox River. It is surrounded by a fine farming and dairy region. Among its principal buildings are an opera house, the county courthouse, the high school, the public library, and Grafton Hall, an Episcopal school for girls. The manufactures include flour, ironware, woolen goods, furniture, machinery, and utensils. The municipal facilities include street railways, gas and electric lighting, pavements, waterworks, and several parks. It was settled in 1836 and incorporated in 1852. Population, 1905, 17,284.

**FONTAINEBLEAU** (fōn-tān-blō'), a town in the department of Seine-et-Marne, France, near the Seine River, about 37 miles southeast of Paris. It is a clean, quiet place with broad streets, and owes its fame chiefly to the palace of the kings. This is one of the most beautiful palaces in France. It was founded by Robert the Good in the 10th century and has been greatly improved by many succeeding kings. The chateau, or park, in which it is situated is a magnificent expanse of forest, in which are fountains, statues, flowers, and artificial lakes. Napoleon detained Pope Pius VII. as prisoner at Fontainebleau for two years. He signed his abdication here in 1814 and again in 1815. The town manufactures porcelain and wines and, owing to its extensive pleasure grounds, ranks as a favorite resort for visitors. Population, 1906, 14,381.

**FONTENOY** (fōnt-nwä'), a village in the province of Hainaut, Belgium, five miles southeast of Tournay. It is celebrated on account of a battle, on May 11, 1745, between the allied forces of Austrians, Dutch, and British and the army of France, each side numbering about 60,000 men. The French were commanded by Marshal Saxe and the allies by the Duke of

Cumberland. The result was a forced retreat of the allies with a loss of 7,000 on each side.

**FOOCHOW** (foō-chou'), or **Fu-Chow**, capital of the province of Fo-Kien, China, situated on the Min River, about 25 miles from its mouth. Massive walls surround the city, while its streets and buildings show more than the ordinary Asiatic progress. In 1843 it was thrown open to foreign trade, since which time it has developed large manufacturing and commercial enterprises. It has extensive dockyards and an arsenal, which are under the direction of European influences. The city is the seat of several scientific societies and numerous missionary organizations. Population, 1908, 638,250.

**FOOD**, any substance that, being taken into the body of animals or plants, serves, through organic action, to build up normal structure or replace the waste of tissue. Plants feed on the carbonic acid gas of the atmosphere and a series of chemical compounds found in the soil. The living plants change the soluble air foods into plant tissues, cells, and granules under the influence of sunlight. Certain materials fitted to become the food of man or animals are stored in various parts of the structures, notably the roots, stem, and seeds, of which such as fats, sugar, starch, and proteids constitute the most noteworthy. Animals of the higher scale do not possess the power of changing the compounds of the soil and air into animal tissues. For this reason they feed directly upon the products of plant growth, or indirectly by eating flesh of other animals, and build up the complex animal muscle, fats, starches, and proteids, which are suitable for the food of man.

Liebig classified foods into those that serve for nutrition of organized tissue, or flesh-formers, known as *nitrogenized elements* of nutrition, and those which are consumed in respiration, or heat-givers, called *nonnitrogenized elements*. These elements exist in some form of combination in almost every substance known as food, and are subservient to the function of organic action in the process of digestion. The list of diets of most peoples includes fats and oils, the vegetable oils in the warm regions and the fats in the cold and temperate. Milk contains all the necessary food elements in the best form. Nitrogenous food-stuffs are found principally in the flesh of birds, animals, and fish; in milk, cheese, and eggs; in barley, wheat, oats, corn, and flour; and in beans, peas, and vetches. They are formed exclusively in plants, and undergo but little alteration when consumed as food and stored up by animals.

Fats are derived principally from milk, the bodies of birds and animals, and the blubber of

sea animals. The oils are obtained mostly from the olive, the palm, the cocoanut, the rape, cotton seed, and fish. Corn and some other grains contain more or less oil substances and these, like most vegetable oils and fats, resemble those of animals. Starchy foods are of much importance in a normal diet. The starchy substances are derived mostly from the vegetable kingdom, and constitute the principal portion of the food of people who live in the tropical and temperate regions. The starches of the tubers, roots, grains, fruits, and milk embrace this class. These and other vegetable products contain hydrogen, oxygen, and carbon, but they differ in physiological properties from the oils. Water and salts are as essential for healthy nutrition as the proteid class, the former constituting 68 per cent. of the human body. It is one of the important constituent parts of many articles of food. Besides, there are accessory foods, such as vinegar, coffee, tea, relishes, and spices, which are used more or less habitually, though the exact nutritive value of many of them is not known definitely.

The body needs a variety of food to support the different tissues. In the economy of growth it is required that both the carbonaceous and nitrogenous elements be taken in sufficient quantities. The very instinct of man suggests the blending. Bread is eaten with butter; macaroni is prepared with cheese; rice is boiled with milk; pork is baked with beans, and other food articles are mixed similarly. Food is oxidized in each cell of the body, though only a small portion of the albumen eaten is required in their reconstruction; the remainder, and the fats and sugars, are oxidized without becoming a part of the living cells of the body.

The average man, in order to repair the waste caused by the oxidation of the cells, and to supply the requisite amount of heat and energy, must assimilate daily about four ounces of albumen, four of fat, and five of sugar or starch. To oxidize this it is necessary to breathe 24 ounces of oxygen. The weight of the body is increased by albumen being changed to fat, which occurs when more food is eaten than this amount of oxygen can oxidize. An increase in the breathing capacity enables the body to oxidize more food and lessens the bad effects of overeating. Too much food causes plethora, while depriving the body of one kind of food for a considerable time causes it to suffer. When plain food is eaten slowly, hunger and taste are the most reliable guides as to quantity.

The subject of pure food has received much attention in the leading governments of Europe and America the past decade. This movement

was brought about by widespread adulteration of medicine, beverages, and articles of food. The Federal food and drug act which went into effect on Jan. 1, 1907, is the most important legislation of this class enacted in the United States. This law made it unlawful to manufacture or sell within any territory of the Union, or to engage in the interstate or foreign commerce of any article of food or drug, which is adulterated or misbranded. This law requires that the weight marked upon a package shall be the actual weight, not an approximate weight. If drugs are imitations, they are held to be *misbranded*. Pure food laws have been enacted generally in the states of the Union and in the provinces of Canada.

**FOOLS, Feast of**, a festival celebrated for several centuries in a number of countries of Europe, especially in France and Spain. It was a season of Christian merrymaking and partook of a childish character. The festival was celebrated more or less during the entire period between Christmas and Epiphany (Jan. 6), but belonged especially to Innocent's Day (Dec. 28). It resembled the Roman Saturnalia, and the chief participants included the subdeacons and laity. In the exercises they chose a mock bishop, archbishop, or pope, who presided at the meeting in the church, and the rites of Christianity were gone over in the ceremonies. Dancing, the singing of commonplace songs, and the wearing of masks and disguises were practiced. The Protestant Reformation counteracted the extravagancies of these festivals and put an end to them in Germany and England, but they survived in France until 1644.

**FOOT**, a unit of linear measurement, containing 12 inches. A surface, each side of which is 12 inches, is a square foot, and is equal to 144 square inches. A cube whose sides are 12 inches is a cubic foot and contains 1,728 cubic inches. The foot unit was derived from the human foot. It is used extensively as a common measure, though its length varies in different countries. In music and poetry, a foot is a term used to denote a melodic figure of notes with only one accent, or a succession of accented or unaccented syllables, which, being repeated, produce rhythm. The four principal feet in England poetry are the anapest, the dactyl, the iambus, and the trochee.

**FOOT**, the extremity of the leg below the ankle, and on which the body is supported. In man the foot is composed of seven tarsal and five metatarsal bones, so arranged and connected as to form an arch from the extremity of the heel to the ball of the toe, and the phalanges. The bones, where they articulate with

one another, are covered with a considerable layer of elastic cartilage. Between the bone at the heel and the ends of the metatarsal bones is a heavy ligament known as the *plantar ligament*, which not only holds the bones together in the form of an arch, but protects the blood vessels, nerves, and muscles that lie above it in the hollow of the foot. Another very strong, elastic ligament holds the heel bone and the central bone of the arch together. The head of the key bone, upon which the tibia sits, rests upon this ligament. The different motions of the foot are effected by five muscles. They include the *calf*, attached to the thigh and leg and below by the tendon of Achilles to the heel bone, which is the largest tendon in the body and sustains its weight in walking; the *posterior tibial*, attached at one end to the tibia and the other to the instep bone (scaphoid); the *short fibular*, attached to the fibula at one end and to the outer metatarsal bone at the other; the *anterior tibial*, which raises the toes and turns the foot outward; and the *third fibular*, whose tendons pass in front of the ankle on either side of the foot and raise the inner or outer border of the foot. The bottom of the foot is padded with fat and covered with a strong, tough skin. It forms the *sole* of the foot.

**FOOT AND MOUTH DISEASE**, an infectious disease common to domestic animals, especially swine and cattle. It occurs most frequently in Europe and Asia, but sometimes spreads to Africa and other continents. During a wide-spread attack of the contagion, it sometimes affects sheep, goats, and man, being conveyed to the last mentioned by the use of milk or meat from diseased animals. It is often fatal to young animals, but in adults it partakes of a lighter form, usually as a fever or constitutional weakness. The bacteria which causes the disease is not well understood, but it is known that the period of incubation is from three to six days, and that the virus may be destroyed by exposure to sunlight or antiseptics, such as formaldehyde and carbolic acid. Animals affected have symptoms like those of pneumonia and bronchitis and their feet, mouth, and other parts are subject to eruptions from which virus exudes. The treatment recommended is that affected animals be separated from others and quarantined, and the affected parts may be treated with antiseptic solutions.

**FOOTBALL** (fōot'bāl), a popular game played by pupils in the higher grades of the public schools and by students of colleges and universities, especially during the colder season of the year. It is an ancient game, having been popular during the prosperous eras of ancient

STADIUM OF HARVARD UNIVERSITY.

Here, in 1910, 40,000 people witnessed the Yale-Harvard football game.

Greece and Rome. The northern countries of continental Europe adopted it about the time of the Roman invasions, while the Danes popularized it in England where it became famous as a Shrove Tuesday sport as early as the 12th century. Though popular for centuries, it has taken a wider hold on the world of sport within recent years and is played with an ever-increasing fervor. Among the numerous and widely known associations are those called Rugby Association, Australian, and American Intercollegiate. Each of these and many others have definite rules, under which the members practice in the art of playing, and at specified times engage in competitive games with other associations. The associations organized at Harvard, Princeton, Yale, and the University of Pennsylvania have been known as the *Big Four*, while similar association ties have been accorded to the Western, Canadian, Indian, and other groups of organizations.

The game is played by teams of from 11 to 22 players, upon a level field. Scoring is possible in the field of the opposing side, either by getting the ball through or over a goal, or by passing it over a certain line. Each side, therefore, with the view of scoring, sends the ball in the direction of the opponents' end of the field. This may be done in two ways—by kicking and running, or by advancing it in any way except by running. The field is usually 160x330 feet, and the ball is made of leather, having a large ellipsoidal form. Among the officials are two linemen, an umpire, and a referee. The losses and advances on either side are watched by the linemen, fouling is prevented by the umpire, and the referee keeps account of the ball. In most associations the entire time of the game is 90 minutes, divided into two portions of 45 minutes, with an intermission of 10 minutes intervening. The principal rules are known as the *Association Rules* and the *Rugby Rules*.

**FOOT ROT**, a disease common among sheep. The most prevalent form is due to an unusual growth of hoof, which causes the margin or toe to turn downward and ultimately crack, thus causing openings in which dirt and sand readily lodge. As a consequence the feet become swollen and ultimately ulcerated between the toes, where proud flesh forms and causes decay.

**FORAGE** (fōr'āj), a term used to designate any food suitable for horses, cattle, and sheep, including such as hay, straw, and ensilage. Among the forage plants cultivated extensively are clover, orchard grass, alfalfa, timothy, corn, broom corn, and sorghum. However, the straw

and chaff of many cereals, such as wheat and oats, are important animal food products. The species of plants cultivated for forage depend upon the temperature and aridity quite as much as upon the different kinds of soil. In many portions of the West native grasses still constitute an important forage crop, while in the East and the arid regions of the far West forage plants are grown with a high degree of care. In the West and Southwest, where moisture is supplied by irrigation, the larger forage plants are cultivated extensively, such as alfalfa, sorghum, and millet.

**FORAMINIFERA** (fō-rām-ĭ-nĭf'ĕ-rā), a group of small animals, classed with the mollusks on account of having beautiful shells. However, a few of the species are naked, while many have very complicated and remarkable coverings. They belong to the protozoan group and, like them, reproduce in all three ways common to that form of life. The species are widely distributed, but are most common in salt water. Fossils of these animals are very numerous, and vast beds of rock are constructed almost entirely of their shells. The chalk cliffs of England and the Silurian beds of Russia are examples of fossils of these animals.

**FORCE** (fōrs), an exertion or influence that, if made to act on a body, has a tendency to affect or stop it if in motion, or to move it when at rest. Light, heat, gravitation, electricity, motion, cohesion, magnetism, and chemical affinity are thought to be manifestations of the force from which originate all phenomena of the material world. Mechanical force originates from life, gravitation, and the sources of heat, light, and electricity. Two systems are used for measuring force, the Metric system and the English system, the dyne being the standard of measure in the former and the poundal in the latter. To measure the effect produced by any mechanical force it is necessary that three things be known—the point of application at which the force acts, the direction in which the force acts, and the intensity with which it acts. When two or more forces act in the same direction, the resultant is equal to the sum of the forces. If two equal forces act in opposite directions, thus opposing one another, the body acted upon remains at rest, but, if the forces acting are unequal, it moves in the direction of the greater with a force equivalent to their difference. Two forces acting at an angle with each other produce a resultant in an intermediate direction, the force of which equals the mean of the two acting forces. The *resolution* of a force is the separation of it into the components which produce

that force, and the *composition* of forces is the combining of two or more into one.

Various terms are used to designate forces according to their nature and the manner in which they act. The most common classification includes parallel forces, constant forces, accelerating forces, resultant forces, uniform forces, and variable forces. By *parallelogram of forces* is meant the method of determining the direction and intensity of two forces, while *unit of force* implies a single force, whose terms being known, serves as a unit to ascertain the amount of any other force. The force exerted in a direction outward from the center, by a body moving in a circular path, is called the *centrifugal force*, while the *centripetal force* is exerted from without toward the center. Since the centrifugal force is a consequence of the rotation, it ceases when the centripetal force ceases, and the body moves in a straight line known as a *tangent*. The area in which a force acts is called the *field*. Centrifugal force is proportional to the mass and to the square of the velocity of the rotating body. If the mass of the rotating body be doubled, it requires twice the amount of force to prevent it from moving away from the center of motion, and, if the velocity be doubled, four times the force is necessary for it to retain its position. The motion of the planets around the sun affords good illustrations of centrifugal and centripetal forces. These bodies constantly tend to move away from the sun by reason of the motion originally given to them, while the attraction of the sun holds them in an almost circular path.

**FORCE BILL**, the name applied to several bills passed by the Congress of the United States. In 1828 a protective tariff act created much discontent and South Carolina claimed that the State had power to nullify objectionable Federal enactments. Congress passed a bill to enforce the tariff law in 1833, known as the Force Bill or the Bloody Bill. A bill for the enforcement of the Fourteenth and Fifteenth amendments to the Constitution became law May 31, 1870. It made punishable by fine or imprisonment all attempts at intimidation, bribery, or hindrance in the matters of registration and qualifying for voting. A much more stringent law was enacted in 1871 to put down the conspiracies against civil rights by the Ku-Klux Klan. The name Force Bill has been applied to the Lodge election bill which passed the House July 2, 1890, "to amend and supplement the election laws of the United States, and to provide for a more efficient enforcement of such laws." This bill was defeated in

the Senate by a combination of those who favored the adoption of free coinage legislation.

**FOREST** (fōr'ĕst), a large tract of land covered with a natural growth of trees and underbrush, though often with intervening spaces of open ground. The countries of Europe have provided protection by law, by which it is designed to preserve the forests for judicious use and prevent wholesale and needless destruction. Such acts of preservation operated to preserve many desirable tracts in Austria, Germany, France, and other countries, of which Epping Forest, near London, is a good example. Similar laws have been passed in Canada and the United States, and, besides, there has been legislation aiming to extend rather than abridge the forest area. The timber-culture law passed in the United States in 1872 remained in force 21 years, and provided that 160 acres of the public domain could be acquired by cultivating ten acres of trees for a period of eight years. Under this act about 50,000,000 acres of trees were planted and cultivated in the great prairie regions of the West. The Nebraska State board of agriculture in 1874, under the suggestion of J. Sterling Morton, recommended that a day be dedicated each year to the planting of trees. This suggestion was acted upon by all the states and territories, not only through individual effort, but by the formal effort of public schools. As a consequence many trees and tracts of timber have been planted and cultivated on private and public property. See **Arbor Day**.

Natural forests are found widely distributed where moisture is abundant and the temperature is favorable to plant growth. The forests of the Torrid Zone are the most luxuriant and cover vast areas along the streams and bodies of water, even to a considerable height above sea level. As we proceed north and south from the Equator we find the forests gradually decreasing in density and size of trees up to the higher latitudes, where they finally become rare and gradually disappear. The most extensive forests of the world are found in the valleys of the Amazon and Orinoco; the lake region of Africa, and in the southern parts of Eurasia. The higher altitudes, even in tropical countries, are destitute of forest growth, though plant life thrives in such regions at a much higher elevation than in the Temperate Zone and extends far into the higher latitudes, even to regions having much soil perpetually below the freezing point of water.

The forest area of the United States is placed by the Department of Agriculture at about 500,000,000 acres. Alaska has excellent timber and

AMONG THE GIANT REDWOOD TREES IN THE MARIPOSA GROVE OF CALIFORNIA.

comparatively little of it has been put on the market. The output of lumber in the United States is 30,500,000,000 feet annually, of which the largest part is obtained in Wisconsin, Michigan, Minnesota, and on the Pacific coast. About one-fourth of the output is obtained in Michigan, Wisconsin, and Minnesota, which states yield an excellent quality of pine, hemlock, and the hard woods. Pine, fir, and spruce lumber is obtained in large quantities in Oregon, Washington, and California. The product is used chiefly in manufactures, railway construction, fencing, for building purposes, and for fuel. While there is danger of the visible supply decreasing beyond legitimate limits, the

mer. Their roots penetrate the soil and facilitate the entrance of water after rains and the shadow of their branches retards evaporation. In this way they extend the surface of moisture and visibly affect rainfall. This point of advantage is further accelerated by the fact that forests prevent accumulated snows from melting rapidly, thereby counteracting floods, such as result where the forest area is robbed of its timber. Where forests do not abound, the rainfall rapidly runs off the surface and finds its way back to the ocean. Besides causing floods, this tendency visibly influences temperature and productiveness.

The forest areas in the United States equal

larger use of steel for construction purposes is relieving notably the demands annually made upon the forests. Besides, the consumption is affected by the increased use of coal, gas, and electricity for motive and heating purposes.

Forests are the natural home of many birds and wild beasts and have marked utility for their influence upon the occupations of man. They supply material for dyes, medicines, and numerous articles of value in the arts. The soil is enriched by the decaying trunks and foliage of trees. They furnish shelter from winds and storms in the winter and are a protection against the scorching heat of the sum-

mer. Their roots penetrate the soil and facilitate the entrance of water after rains and the shadow of their branches retards evaporation. In this way they extend the surface of moisture and visibly affect rainfall. This point of advantage is further accelerated by the fact that forests prevent accumulated snows from melting rapidly, thereby counteracting floods, such as result where the forest area is robbed of its timber. Where forests do not abound, the rainfall rapidly runs off the surface and finds its way back to the ocean. Besides causing floods, this tendency visibly influences temperature and productiveness.

about one-third of the area of the country, exclusive of Alaska. About seven-tenths of the timbered area is between the Mississippi and the Atlantic coast. Of the entire forest wood 75 per cent. is coniferous, which requires about three-quarters of a century to grow to maturity. Timber of much value is obtained from the Philippines, where the forest areas exceed 40,000,000 acres. Canada has about a million square miles of standing timber and contains the largest white pine areas in the Western Hemisphere. The annual production of lumber aggregates \$80,000,000 per year, about one-third of which is exported to the United

States. Russia has the largest forest areas in the world, a total of 812,640,600 acres, three-fourths of which belong to the government. Forest fires and the clearing of the ground for cultivation are prolific sources of forest destruction. Great carelessness has been displayed in lumbering and in setting fires to brush left on the ground after the more valuable trees have been cut. However, the government has displayed much wisdom in protecting the forests and in encouraging schools of forestry.

**FORESTERS, Ancient Order of**, a fraternal organization founded in Yorkshire, England, in 1745. Though it has been maintained continuously since that time, its material growth dates from the early part of the 19th century. The first court was established in America in 1832, at Philadelphia, Pa., and since then it has spread rapidly in Canada and the United States. In 1908 it had about 9,500 courts, with 1,000,000 members, of whom about 50,000 were in Canada and the United States. Courts are maintained in 36 countries. It is one of the largest beneficiary societies of the world. The benefits distributed annually aggregate \$5,000,000.

**FORESTERS, Independent Order of**, a society founded in 1874 at Newark, N. J. It was reorganized in 1881 and maintains courts in Canada, the United States, Great Britain, Australia, and other countries. The society has about 5,000 local courts, which are under the direction of high courts, and the general government is vested in a supreme court. The order is both fraternal and benevolent, has 240,000 members, and has disbursed in benefits about \$19,500,000 since its organization.

**FORESTERS OF AMERICA**, a benevolent and fraternal society, reorganized under its present name in 1895. It originated from the Ancient Order of Foresters (q. v.), introduced in America in 1832, but separated from the mother organization in 1889. In 1908 it had 1,750 courts and 250,000 members. The annual payments as benefits approximate \$1,125,000. Since its organization about \$13,500,000 has been disbursed.

**FORESTRY**, the management and preservation of trees in communities. This branch of economic study is concerned with the planting of trees and the utilization of both cultivated and native forests with the view that the best possible good may be obtained. Man has been the worst enemy of forests in America since the discovery of this continent. Lumbering has greatly lessened the visible supply, but forests are also destroyed by insects, fungous diseases, drought, forest fires, and the grazing of ani-

mals. Attention has been directed to forestry both with the view of planting new forests and preserving old ones, and it is designed to prevent ruthless destruction as well as to utilize to the best advantage the supply of timber for fuel and for construction.

Forestry has been a branch of study in the institutions of Europe for many years, especially in Germany, whose foresters are considered the best prepared and most skillful in the world. The need of some rational system of forest management is recognized by the leading nations. Canada has forest reserves of about 12,500,000 acres and has a well-disciplined corps of officials to aid in diffusing knowledge of forestry and protecting the forests on the public lands. The Bureau of Forestry, established in 1901 under the Department of Agriculture, is an important branch of the government in the United States. The chief aim is to develop scientific forestry. In literature sent out by this bureau the benefits of studying forestry are shown, which include an investigation of climatic influences upon shrubs and trees.

Among the advantages of forests are that they conserve moisture and thereby increase rainfall. They temper hot and cold winds and are useful in reclaiming tracts of almost barren land. The benefits of wind-breaks are seen on the great prairies of Canada and the United States, where innumerable hedges and groves have been planted. Parks and clusters of trees furnish covering for birds and add to the enjoyment of man. The schools of forestry aid in studying the adaptation of various trees to particular localities, especially as they are influenced by soil, moisture, and temperature, and much valuable information has been given in regard to the selection of land for reforestation and the care to be given growing trees.

The interest in forestry is promoted not only by the general government, but likewise by the several states and minor subdivisions. In 1885 New York created a forest commission, and that State has a reservation in the Adirondack and Catskill regions amounting to 1,250,000 acres. Constitutional provisions for forestry have been made in many states, while in others the regulations are by legislative enactments. Colleges of agriculture have placed forestry in the regular courses and the American Forestry Association has promoted interest by holding meetings and issuing reports.

**FORGE** (fōrj), an open fireplace or hearth with forced draft for heating iron, steel, or other substances. The term is also applied to a workshop where metals are hammered and shaped by the aid of heat. Forges were for-

merly made of brick, with a large leather bellows to furnish the blasts of air, but at present are made largely of iron and the blast of air is obtained from a rapidly rotating fan wheel. All heavy forging is done by hammers run by machinery. In the great Krupp works at Essen,

BLACKSMITH'S FORGE.

PORTABLE FORGE.

Germany, is the largest forge hammer in the world. It is constructed so skillfully that it can be manipulated to gently crack a small nut or sufficiently forceful to crush a thick bar of iron.

**FORGERY** (fôr'jēr-ÿ), in law, the act of falsely making or materially altering a writing or written instrument, with intent to defraud. Forgery consists essentially in making a false instrument appear to be legal and genuine. It is a grave offense, punishable by fine or imprisonment in the penitentiary. The national governments of all countries provide punishment for forgery by legal enactments, and additional protection is provided by laws in the states and provinces. In most countries the Federal government has exclusive jurisdiction of cases which arise from forging, uttering, or publishing as true any papers relating to the nation, while the states and provinces have jurisdiction of those arising under their laws. The false making or altering of papers with intent to defraud are not the only offenses that come under the head of forgery, but such offenses as changing records and altering brands or stamps are included.

**FORGET-ME-NOT** (fôr-gět'mē-nöt), a genus of plants generally diffused over the North Temperate Zone. The flower is small and is blue in most species. It has five petals and a salver-shaped corolla. On account of its brilliancy of color, and, being the emblem of constancy in friendship and love, it is a favorite flower in most countries. The dark blue forget-me-not of the Azores is cultivated extensively. The present name is from the German *Vergiss-mein-nicht*, while the former English name, *scorpion grass*, is rarely used at present.

**FORKS.** See **Cutlery.**

**FORLORN HOPE** (fôr-lôrn'), a military term applied to a body of men selected from an army for the performance of some exceptionally dangerous duty, such as leading the assault upon a fortress or heading a perilous charge in battle. Those who undertake such a task usually are volunteers, and a liberal reward is generally given to those who survive.

**FORMIC ACID** (fôr'mik), a simple fatty acid of organic chemistry, so named from its being found in the bodies of ants. It is prepared artificially by dissolving sugar, starch, or tartaric acid in water, then adding sulphuric acid, and distilling the mixture on peroxide of manganese. Pure formic acid solidifies at a low temperature, forming a crystalline mass. It is strongly acid, colorless, and transparent, and has a pungent odor. It is very corrosive and, when placed on the skin, causes intense irritation.

**FORMOSA** (fôr-mō'sà), or **Taiwan**, an island lying off the eastern coast of China, in the Pacific Ocean. It is separated from the province of Fo-Kien by a strait about 85 miles wide. The island has a length of 240 miles, an average breadth of 72 miles, and an area of 13,418 square miles. The surface is mountainous, especially in the interior. Mount Morrison is the culminating peak, having a height of 14,360 feet. A part of the surface is made up of barren clay hills, but the plains and valleys are fertile. Among the principal products are sugar, rice, silk, tea, tobacco, camphor, vegetables, coal, and fruits. The climate is favorable and healthful and the rainfall is abundant. Formosa was opened to foreign trade by the Treaty of Tien-tsin in 1858, when Takow, Tainan, Anping, and Tamsui were made free ports. Japan, China, and Great Britain have the principal part of the trade. Camphor, salt, and opium are controlled as government monopolies. About 450 miles of railways are open to traffic and a number of others have been projected.

China undertook to explore and settle Formosa as early as 603. The Dutch controlled a large portion of the island in the 17th century, but it remained a Chinese territory the greater part of the time. About 500,000 Chinese immigrants settled in the western portion during the Chinese occupation of the island. They greatly modified the industries which prior to that time were under the exclusive control of the Malays. After the war between China and Japan, in 1895, it was ceded to the latter country by treaty, and now constitutes a Japanese possession. A native revolt occurred in 1897, but it

was suppressed by the government, and local officials were enjoined to show a spirit of fairness and benevolence in the administration of public affairs. Many schools and public institutions have been established by the Japanese. The native inhabitants are chiefly Hakkas and the aboriginal tribes and clans. Population, 1906, 3,081,962.

**FORT DEARBORN.** See *Dearborn, Fort.*

**FORT DODGE**, a city of Iowa, county seat of Webster County, on the Des Moines River, about 85 miles northwest of Des Moines. It is on the Chicago Great Western, the Illinois Central, the Minneapolis and Saint Louis, and other railroads. Intercommunication is by electric urban and interurban railways. The chief buildings include the post office, the county courthouse, the public library, the high school, the First National Bank, and a number of fine churches. Among the manufactures are flour, ironware, clothing, oatmeal, tile, pottery, stucco, and machinery. The surrounding country is fertile, possesses extensive dairy interests, and is rich in coal, gypsum, and fire clay deposits. Among the municipal facilities are paved streets, waterworks, electric and gas lighting, and a system of sanitary sewerage. It has a large trade in cereals and merchandise. Population, 1905, 14,369; in 1910, 15,543.

**FORT DUQUESNE** (du-kān'). See *Pittsburg.*

**FORT ERIE.** See *Erie, Fort.*

**FORT FISHER** (fish'ēr), a fortress below Wilmington, N. C., at the entrance to Cape Fear River. General Butler led a force of 6,000 men against the fortress in December, 1864, and was aided by Admiral Porter with a fleet of ironclads. The project of taking the fortress was abandoned after two days, but on Jan. 13, 1865, a second attempt was made by General Terry and Admiral Porter, which resulted in its capture. The Union army took 2,000 prisoners and 170 heavy guns.

**FORTH**, a firth and river of central Scotland, formed by the confluence of the Dhu and Duchray in Perthshire. The river is 170 miles long and merges into the Firth of Forth, a body of water extending fifty miles east from Alloa to the North Sea. It has important salmon and herring fisheries. The celebrated Forth Cantilever Bridge, a railway viaduct at Queensferry, is 4,000 feet long. This bridge is 8,295 feet, or about a mile and a half long, and the cantilevers cover about one mile. It was completed in 1889 at a cost of \$13,000,000.

**FORTS HENRY AND DONELSON**, two forts erected by the Confederates in Tennessee, near the border of Kentucky. Fort Henry was

located on the Tennessee River, about twelve miles from Fort Donelson, which was on the Cumberland River, being about forty miles from where these rivers flow into the Ohio. They were strongly manned in 1861 and constituted important strategic points, since they controlled the entrance into the Southwest by means of the Cumberland and Tennessee rivers. General Grant, assisted by a river fleet under Commodore Foote, decided to attack Fort Henry on Feb. 2, 1862. On the 6th Commodore Foote made a vigorous attack and compelled the surrender of the works, but the Federal military forces were delayed and the Confederate garrison meanwhile escaped to Fort Donelson. General Grant made a vigorous attack upon the latter on Feb. 13, 1862. Two days later General Buckner addressed a communication to General Grant in which he requested that a commission be appointed to settle upon terms of capitulation. To this Grant sent his famous reply: "No terms except unconditional and immediate surrender can be accepted. I propose to move immediately upon your works." The terms were accepted by Buckner, who surrendered 14,000 prisoners.

**FORTIFICATION** (fôr-tī-fī-kā'shŭn), a military defensive work, erected for the purpose of strengthening a place or position. The term also applies to the science of fortifying a position in such a way that it may be held by a body of men much inferior in numbers to their assailants. It implies a knowledge of the resistant power of materials as well as advantage in positions, so the construction may be devised in a manner that the enemy in attacking must of necessity suffer great loss. Defensive works are either regular or irregular as to construction, and, with respect to time, are distinguished as *permanent* and *temporary*, or *field*, fortifications.

The history of fortifications is as old as that of offensive and defensive warfare, though the process of construction has undergone numerous modifications, which were necessitated largely by the modern improvements in the implements of war. The student of history finds numerous references to defensive fortifications as the different peoples are studied. Thus, we recall the story of Troy, in which it is related that the city stood safely against the Grecians until the colossal wooden horse was taken within its walls against the admonition of Laocöon. The walls of Babylonia were 32 feet thick, 100 feet high, and strengthened by great towers. The walls of Jericho resisted the invading hosts of Israelites, and, according to the Scriptures, crumbled before them only after

divine aid was extended. Many ancient walls of Asiatic cities still remain. Though having answered a good purpose in resisting the attacks with battering rams and ancient implements, they serve but illy when brought to a test against modern ordnance.

Soon after gunpowder became known to the Europeans, the modern nations began to devise new implements of war, and likewise sought to counteract their effect by powerful works of defense. The Italians began in the 15th century to construct bastions, while the French engineer, Sébastien de Vauban (1633-1707), who served under Louis XIV., developed the *bastion system* to such an extent that it still prevails in France as the general type of fortifications. However, this system has given way largely in most countries to the German *polygonal system*, which is sometimes called the *caponiere system* on account of employing numerous caponieres to span ditches, thus utilizing them instead of bastions for defensive purposes.

In constructing field fortifications, engineers take advantage of position with the view that the enemy will be exposed to fire and cross fire in making the attack. The general plan aims to require a hazardous march across an open field, in which those within the line of fortifications may at an advantageous time send forth detachments to make counter charges. Among the field fortification works are the *redan*, which forms an angle in front of the enemy. It has two parapets protected by a ditch; the *redoubt*, an inclosure with a parapet and ditch encircling it; and the *lunette*, a redan construction with numerous short flanks. These works are so constructed that they flank each other within the range of rifle fire, and are further strengthened by entrenched camps and by a series of rectangular or square redoubts. In case the time to construct is limited, such simple entrenchments as shelter trenches are speedily thrown up. These temporary forms consist of earth thrown toward the front, back of it being a ditch in which the rifleman lies securely protected from the fire of lighter implements. An abatis of felled trees and barbed wire fences is effective in impeding the advance of the enemy. Barbed wire has been used extensively for this purpose within recent years.

The fortifications of seaports are quite different from those constructed for the defense of interior positions. Heavy ordnance which throw dynamite shells and other powerful explosives a distance of six or eight miles have made it necessary to greatly revolutionize defensive warfare. The largest guns obtainable are securely

mounted, and by means of them the enemy's ships can be reached by the most powerful explosives and leaden balls. For additional protection the enemy's ships are watched with the aid of powerful electric lights and swift steamers are utilized to scout. In many instances torpedoes plow under the water, by which it is aimed to strike the enemy's ships from below. The outer defensive works consist of submarine mines, which are set off by the enemy's ships, or by means of electric connection from the shore.

*Permanent fortifications* are constructed of massive stone and iron works and are designed to defend important cities or strategic points. It is doubtful whether any fortress can be built that would form a serious obstacle to a modern land and naval attack, if the assailants were supplied with the most powerful modern guns. The greatest fortress in the world is the celebrated stronghold of Gibraltar, on the coast of Spain. It is considered impregnable to military assault, though this is due to its natural situation rather than to its artificial strength. Since modern guns have been able to obliterate practically all the older forms of fortresses, the newer are designed for offensive action rather than great strongholds of defense. They are constructed on the spherical plan, supplied with guns of the heavier caliber, and designed for special effect against ricochet firing. Places permanently fortified are inclosed by *ramparts*; the upper surface, called the *terreplein*, serves as the location of troops and cannon. *Parapets* or *breastworks* protect the terreplein against the fire of the enemy, while *embrasures*, through which the guns are fired, pierce the parapets at convenient intervals. *Ditches* about twelve feet in depth are excavated outside the rampart, often filled with water, and rendered serviceable in delaying the enemy's advance, along with wire fences and by other obstructions. The United States has permanent seacoast defenses at about forty localities. They include Hampton Roads, Va., Boston, Mass., New York, N. Y., Washington, D. C., Charleston, S. C., Key West, Fla., New Orleans, La., Galveston, Tex., San Francisco, Cal., and the mouth of the Columbia River, Ore. and Wash. Many cities and seaports of Canada are protected by fortifications, of which those at Quebec, Quebec, Esquimaux, British Columbia, and Halifax, New Brunswick, are the most noteworthy. Indeed, Halifax is the chief naval station of the British in North America. It is defended by eleven forts and batteries, one of which, the Citadel, is counted, next to Quebec, the strongest fortification in America.

**FORT MADISON** (mäd'i-s'n), a city in Iowa, county seat of Lee County, on the Mississippi River, eighteen miles southwest of Burlington. It is on the Chicago, Burlington and Quincy and the Atchison, Topeka and Santa Fé railroads. Among the chief buildings are the county courthouse, the State penitentiary, the Catermole Memorial Library, and the high school. The manufactures include furniture, machinery, woodenware, flour, boots and shoes, paper, and leather. It has electric lighting and other public utilities. The city has an important trade in farm produce and merchandise. It was settled in 1832 and incorporated in 1836. Population, 1905, 8,767.

**FORT MIMS, Massacre of**, an assault during the Creek War, Aug. 30, 1813, at Fort Mims, about 35 miles north of Mobile, Ala. The fort was a temporary stockade under command of Dixon Bailey and about 550 persons had assembled there for protection. Weathersford, a half-breed, made an attack with a force of Indians. The fort made a vigorous defense, but was overpowered by superior numbers, and only fifteen escaped, all the others being massacred.

**FORT MONROE** (mün-rō'), or **Fortress Monroe**, the strongest fortification in the United States, situated on Hampton Roads, Virginia. It was erected for the defense of the Norfolk navy yard, on the coast of Virginia, and occupies a fine site at Old Point Comfort. The plans and construction were completed under a French engineer. It is on a reservation of 282 acres and has within it detached buildings for workshops, barracks, officers' quarters, storehouses, and an artillery school. Many tourists visit the place, owing to its fine climate and extensive hotel, railway, and steamboat connections. In the Civil War it was an important Confederate stronghold. Jefferson Davis was imprisoned for two years at Fort Monroe after the war closed.

**FORT MOULTRIE** (möl'tri), a fortification situated on Sullivan's Island, near the entrance to Charleston harbor, South Carolina. The fort was originally constructed of earth and logs, but was afterward rebuilt in masonry. A British fleet made an unsuccessful attack upon it in 1776. It was then known as Fort Sullivan and was defended by 6,500 Americans, of whom 435 were stationed at the fort. The British fleet under Sir Peter Parker and a force of regulars under Sir Henry Clinton made a combined attack, but they were compelled to abandon the invasion of the South. However, it surrendered to the British on May 7, 1780. The name was changed during the

Revolutionary War to Fort Moultrie in honor of Col. William Moultrie, who defended it at the beginning of the war. In December, 1860, it was abandoned by Major Anderson, when it fell into the possession of the Confederate forces.

**FORT NIAGARA** (nī-äg'ä-rä), a fort near the mouth of the Niagara River, on the American side, located by La Salle as a fortified trading post in 1669. This was afterward destroyed and abandoned and Fort Niagara was built on the same place by the French in 1725. The English under Sir William Johnson captured it during the French and Indian War, in 1759, hence the French were cut off from all their posts in the interior. During the American Revolution it was a center of British influence, whence many expeditions were sent to points farther south. It was evacuated by the British in 1796 as provided in the Treaty of 1783 and became the seat of an American garrison. In 1813 it was captured by the British, who crossed over from Canada and made a night attack upon the fort, but in 1815 it was again surrendered to the United States. It ceased to be a fort in 1826, when the Federal garrison was withdrawn.

**FORT PICKENS** (pik'enz), a fort in Florida, on Santa Rosa Island, at the entrance of Pensacola Harbor. A Federal force under Adam J. Slemmer was in possession of the fort at the beginning of the Civil War, and was besieged by the Confederates under Braxton Bragg. In April, 1861, reënforcements were sent to relieve the fort and it was held by the Federals throughout the war. Fort Pickens is a defense to the United States navy yard at Warrington.

**FORT PILLOW**, a fort on the Mississippi River, in Tennessee, forty miles north of Memphis. It was so named from General Pillow, under whose direction it was constructed by the Confederates in 1862, but a small Federal force captured it soon after. General Forrest made an attack upon it April 12, 1864, and the garrison was reduced after stubborn resistance. It was asserted that many of the Federals, about half of whom were Negroes, were massacred after they had surrendered, but this charge was denied by the Confederates on the ground that the garrison conducted a reckless defense, hence many of the soldiers were killed after resistance was futile.

**FORT SCOTT**, a city in Kansas, county seat of Bourbon County, on the Marmaton River, 98 miles south of Kansas City. It is on the Missouri Pacific, the Missouri, Kansas and Texas, and other railroads. The surrounding

country is fertile and contains valuable deposits of cement rock, flagstone, and bituminous coal. A system of street lighting, electric railways, a public park, and a city library are among the facilities. The public buildings include a United States courthouse and post office, a high school, an academy for girls, and a normal college. The manufactures include woolen goods, beet sugar, cigars, clothing, flour, machinery, soap, vehicles, and sorghum. It was settled in 1838 and incorporated as a city of the first class in 1886. Population, 1904, 14,081.

**FORT SMITH**, a city in Arkansas, county seat of Sebastian County, on the Arkansas and Poteau rivers, 130 miles northwest of Little Rock. It is on the Kansas City Southern, the Saint Louis and San Francisco, and other railroads. The chief buildings include the county courthouse, the United States customhouse, the high school, and the public library. It is the seat of a United States district court. The manufactures include cotton seed oil, cigars, furniture, ice, cotton goods, and machinery. Electric lights, rapid transit, pavements, and waterworks are among the improvements. It was settled in 1838, incorporated as a town in 1842, and chartered as a city in 1886. Population, 1900, 11,587; in 1910, 23,975.

**FORT STANWIX** (stān'wīks), a fort built by the English under Brigadier Stanwix in 1758, on the site occupied by Rome, N. Y. It was an important strategic point, owing to its location on the principle route between Canada and points in the State of New York. In 1768 Sir William Johnson made a treaty at this place with the Six Nations, who surrendered title to a large part of the region now included in West Virginia, Kentucky, and Pennsylvania. It was rebuilt in 1776 and named Fort Schuyler. The following year it was attacked by a British force under Saint Leger, who had advanced from Canada. See **Oriskany, Battle of**.

**FORT SUMTER** (sūm'tēr), a fortification situated at the entrance to Charleston harbor, South Carolina, and named after Thomas Sumter, an American leader in the Revolutionary War. South Carolina seceded in December, 1860, and Major Anderson, the commanding officer, abandoned the adjacent forts and occupied Fort Sumter with 100 men and 52 light guns. General Beauregard led an attack on the fort April 12, 1861, and two days later it was compelled to surrender. This event was the beginning of the Civil War, and the news of it immediately spread the fire of enthusiasm over the entire North and brought that sec-

tion to arms. The Confederates held the fort until after the evacuation of Charleston, but surrendered it on April 14, 1865, four years after its capture. Soon after the loss of Fort Sumter to the Confederates, Richmond was evacuated, the Confederate forces surrendered, and their cause was entirely abandoned. Since the Civil War it has been rebuilt and greatly improved.

**FORT WAYNE** (wān), a city of Indiana, county seat of Allen County, on the Maumee River and the Wabash and Erie Canal, about 150 miles southeast of Chicago, Ill. It is on the Wabash, the Pennsylvania, the Lake Erie and Western, the Lake Shore and Michigan Southern, the Grand Rapids and Indiana, and other railroads, and is the converging center of several electric interurban railways. Among the noteworthy buildings are the county courthouse, the Carnegie public library, the Federal building, the Concordia College (Lutheran), the Indiana School for Feeble-Minded Youth, and a Roman Catholic academy. The architecture is modern and substantial, including many tall office, bank, and hotel buildings. It is surrounded by a productive farming country and has a large wholesale and jobbing trade. Among the chief manufactures are agricultural implements, furniture, steam engines, car wheels, electrical apparatus, leather, stoves, woolen goods, and hardware. It has extensive systems of sewerage, stone and macadam paving, waterworks, and gas and electric lighting. Fort Wayne was so named from Gen. Anthony Wayne, who built a fort here in 1794, and a monument has been erected to his honor. It was chartered as a city in 1839 and became prosperous in 1840, after the completion of the Wabash and Erie Canal. Population, 1900, 45,115; in 1910, 63,933.

**FORT WORTH**, a city of Texas, county seat of Tarrant County, at the junction of the Trinity, Clear, and West rivers, about 170 miles north of Austin. It is on the Fort Worth and Denver, the Texas and Pacific, the Chicago, Rock Island and Pacific, the Gulf, Colorado and Santa Fé, and other railroads, and is connected with Dallas, thirty miles east, by an electric railway. The Clear River and numerous artesian wells furnish an ample supply of water for manufacturing and sanitary purposes. An extensive street railway system penetrates all parts of the city, while electric lighting, waterworks, public libraries, and an excellent school system are among the general facilities. It is the seat of the Natatorium, a bathing establishment costing \$50,000. Among the educational institutions are the Fort Worth

University, the Polytechnic College, the Fort Worth Medical College, and a Roman Catholic academy. The city hall, courthouse, high school, and chamber of commerce building are convenient and costly edifices. It has manufactures of wire, flour, hardware, jute, clothing, cotton and woolen goods, leather, and machinery. Fort Worth has a large trade in farm produce, live stock, and merchandise. It was settled in 1849 and incorporated in 1872. Population, 1900, 26,688; in 1910, 73,312.

**FORUM** (fō'rūm), in Roman history, a public place or square in a city where markets and public assemblies were held and where justice was administered. The most noted in Rome was the Forum Romanum, situated between Mount Palatine and the Capitoline Hill, which was adorned with exquisite statuary and magnificent buildings, and beautified by foliage, flowers, and walks. The government of Italy has recently made excavations and is preserving the more valuable relics for study. Legally, the term *forum* implies a court where an action may be instituted.

**FOSSILS** (fōs'sils), the organic bodies that were buried in past ages by deposits of earth, and which preserved their form or substance so as to be capable of identification. The term is also applied to indentations made by animals on rocks while forming, as the imprints of birds walking on pasty deposits. Some fossils consist of vegetable and animal parts in a good state of preservation, as the trunks of trees or the bones, teeth, and horns of animals, and the shells of mollusks. The process of fossilization is due to the decomposition of the least permanent in the organic structure and its replacement with some mineral matter. In some cases new material is substituted for the entire decomposed mass, while in others the organic remains are preserved in an almost perfect state. Shells, wood, and other substances are frequently changed into various siliceous fossils by subjecting the organism to the action of water containing silica in solution. Similar results take place when the mineral matter is iron oxide, pyrite, or calcium carbonate, while in rare cases barite and fluorite have a like effect. When the organic portions pass away in decay, the mineral matters slowly take their place.

Fossil footprints of extinct animals have been discovered in the Triassic and Carboniferous rocks of Eurasia and in the Cambrian, Silurian, and Carboniferous of America. The imprints are largely those of birds, reptiles, mollusks, fish, and insects, and were made either by the feet in walking or by the body in

making impressions in the mud after death. Fossil botany now includes many extinct plants, among them those of the Dakota group of cretaceous deposits, found in America; those of the Fayette formation, and those of the Florissant, found in Colorado, each of these including a large number of species. Among the recent publications on this subject are F. H. Knowlton's "Catalogue of Cretaceous and Tertiary Plants of North America" and A. C. Seward's "Fossil Plants for Students of Botany and Geology."

**FOSTORIA** (fōs-tō'rī-à), a city of Ohio, in Seneca County, about twelve miles west of Tiffin. It is on the Lake Erie and Western, the Baltimore and Ohio, and other railroads, and has a large trade in produce and merchandise. The surrounding country is fertile, producing cereals and fruit, and gas and oil fields are worked in the vicinity. Among the noteworthy buildings are the high school, the city hall, and the Ohio Normal University. The manufactures include flour, cigars, machinery, glass, and utensils. Gas and electric lights, street railways, waterworks, and fine school buildings are among the improvements. Fostoria was named from the father of Charles Foster, who was Governor of Ohio. The present charter dates from 1889. Population, 1900, 7,730.

**FOUNDRY** (found'rĭ), an establishment which is supplied with the necessary machinery to melt and mold cast iron and other metals on a large scale. Foundries are usually located near the blast furnaces, or have such furnaces within the main or adjacent buildings, and from these the products of pig iron are obtained for the second fusion, which is the special object of the foundry. The process of shaping metallic figures is done by pouring the molten materials into molds in which it cools and solidifies. This operation is called *found-ing* or *casting* (q. v.). The mold used is usually in two parts, one containing the pattern, which is surrounded by a fine molding sand, and the other part is tightly fitted to it. When the pattern is completely packed, it is removed carefully, leaving the sand so it forms a perfect mold for the object to be cast. The molten metal is poured into ladles, by which it is transmitted into the mold through small holes made through the sand. Much care is required in founding complicated parts of machinery. The manufacture of stoves, hollow ware, and various castings for machinery comprise the more important products of foundries. See **Casting; Furnace.**

**FOUNDLING HOSPITAL**, an institution

for the reception and support of deserted children. Two classes are maintained, those supported by the government and those depending for support on private or sectarian aid. Abandoned children are known as *foundlings*, and the cause of their desertion is in most cases illegitimate birth, though quite a number are abandoned, as a result of poverty or unhappy wedlock. Formerly the county poor farm was the only place provided for foundlings, but more recently better provisions have been made, especially in the larger cities, where foundling hospitals are very essential. The death rate in these institutions on an average is about 75 per cent., though it is frequently much higher. This is due to the circumstance that children received there are not in a good state of health, or are weakened by the anxiety and poverty of the mother. Children receive careful medical treatment and those that survive are usually placed in homes. The first foundling hospital was established in Milan, Italy, in 787. Soon after they became common in many cities of Europe. At present private or public institutions of this kind are maintained in many of the great cities of the United States and in some of the cities of Canada.

**FOUNTAIN** (foun'tin), an artificial basin containing water for drinking or other useful purposes, and connected by an arrangement of pipes through which water is forced to specific heights in ornamental jets. The pressure of the water at the head of the pipes is sufficient to cause it to rise to almost the same height at the orifice of issue. Many of the larger cities maintain elaborate fountains in public parks and squares for refreshing and ornamental purposes, while very beautiful effects are seen in connection with them at the great expositions. Among the most noted fountains are those at Rome, Berlin, and Paris. Those in Paris are mostly at the Place de la Concorde and at the Tuileries. The fountains seen at the international expositions are beautifully illuminated by electric lights, by means of which it is possible to secure elaborate color effects at night. Fine examples of these were furnished in the *Fountain of the Republic*, at Chicago in 1893; the fountains of *Man, Nature*, and *Progress*, at Buffalo in 1901; and the *Cascades*, at Saint Louis in 1904.

**FOUR-CORNERS**, a locality in Elgin County, Ontario. General Proctor was stationed at this place with a British force and was attacked by the Americans under General Harrison on Oct. 1, 1813, a short time before the Battle of the Thames. The Americans were repulsed at Four Corners.

**FOUR-O'CLOCK** (fōr'ō-klōk), an ornamental flowering plant native to Peru, but naturalized extensively in all the continents. It is so called because it blooms from about four o'clock in the afternoon until the next morning. Many varieties of colors have been obtained by cultivation. Most species are cultivated extensively in flowering beds and gardens. The calyx is often mistaken for a corolla, from its brilliance and calyxlike involucre.

**FOWL**, a term formerly used as a synonym of bird, but now restricted more particularly to the genus of birds known as *Gallus*, of which the East India jungle fowl is thought to be the original. The domestic fowl, including the cock and hen, belong to this class. That the domestication of fowls is of great antiquity is attested by figures on Egyptian monuments and the traditions of the Chinese, according to which they received their poultry from western countries as early as 1400 B. C. Among the best known species are the Leghorn, Spanish, Hamburg, Cochin, Brahma, Bantam, Plymouth Rock, Langshan, and Dorking. See **Poultry**.

**FOX**, an animal which is allied to the dog, having a long, bushy tail and erect ears. The pupil of the eyes is vertically elliptical. In all species the skull is rounded, the nose is very pointed, and the limbs are slender. However, they differ in size, color, and weight, but all exhibit the same artifices in obtaining prey and escaping danger. Foxes are so cunning that they are not easily caught in a trap. They burrow in the ground and live on animal food, unless pressed with hunger, when they feed on vegetable substances, especially seeds. Among the best known American species are the red, gray, cross, and Arctic foxes, which are hunted and trapped for their furs. The Arctic fox is smaller than the common fox, is pure white in winter, and abounds in the far north of the continent. It is gregarious and much more easily tamed than other species. Several species of the fox are found in Eurasia and Africa, though those common to the high latitudes are almost universally smaller in stature than those which frequent the warmer countries.

The cunning of the fox has caused it to enter largely as a popular figure into stories and fables. Some of these stories, especially those relating to its skill in getting food and in evading its enemies, are so remarkable that they are not universally believed. It is thought that this cunning developed as the result of the inherited experience of many generations. The cry is a yelping bark, but older ones learn to

imitate the voice of other animals and use this means to decoy their prey. Some species live out in the woods, but most of them burrow in the ground, or select a deserted nest of a rabbit or a badger. The home of a fox usually consists of several rooms or compartments, such as an outer room or hole, a supply room, and an apartment for sleeping. The male generally occupies the outer room, while the female and the young are back in the part which is best protected from intruders. In most cases the litter consists of from four to six, brought forth in April. During the day the fox remains in hiding, but it comes out at night and

**FOX**, the name of two rivers that rise in Wisconsin, though both are also known by other appellations. The Fox, or Pishtaka, has its source in Waukesha county, flows in a southerly direction and joins the Illinois River at Ottawa, Illinois. The Fox, or Neenah, rises in Green Lake county, makes a bold turn toward the west and north, after a tortuous course passes into Lake Winnebago, and thence flows northeast into Green Bay. Its entire course is about 250 miles. Near its headwater it approaches within two miles of the Wisconsin River, with which it is connected by a canal at Portage City, thus providing a union between Lake Michigan and the Mississippi River.

**FOX BAT**, the general name of any large bat, or flying fox, which is characterized by its habit of eating fruit. Seventy species have been catalogued, all of which are native to Asia, Africa, and the Malay Archipelago. The species are mostly large and tailless. They have large eyes and pointed teeth, and have the color of the red fox. They do much damage to mango and cocoanut plantations. In habit they are nocturnal, coming out at night in search of food. Their flesh is eaten by the natives.

**FOXGLOVE**, the common name of a genus of plants known as *Digitalis*, which includes a number of species that are native to Europe and Asia. The common foxgloves have erect stems with numerous large leaves at their bases. At the upper end of the stems are racemes of variously colored flowers. Several of the species have been greatly improved by cul-

tivation and are grown as flowering plants in gardens and parks. They thrive best in light, rich soil. The drug known as *digitalis*, which is obtained from a species of foxglove, is a bitter substance and has sedative and narcotic properties.

**FOXHOUND** (föx'hound), one of several breeds of dogs which are of value in fox hunting. It is noted for its fleetness, perseverance, physical strength, and fine scent. Its average height is 21 inches. The foxhound is supposed

HOME OF THE FOX.

moves about rapidly, often committing havoc among the poultry. The fox chase is looked upon as a favorite sport in England, where this animal is protected by law, except at a specified period, when it is pursued with dogs and horses which are trained especially for this purpose. The sport consists of seeing the cunning methods by which the animal seeks to avoid capture. It will often feign death and endure rough treatment, seeking thereby to make good its escape.

ÉMILE LOUBET, EX-PRESIDENT OF FRANCE.

Clément Armand Fallières was born at Mézin, France, November 6, 1841. He practiced law and in 1876 was elected to the Chamber of Deputies. He served as Minister of the Interior in 1882, 1883 and 1887 and was several times elected to the Senate, of which body he became its president in 1899. He succeeded Emile Loubet as President of France in 1906.

ARMAND FALLIÈRES, PRESIDENT OF FRANCE.

to be a cross between the staghound and the bloodhound.

**FOX INDIANS**, a tribe of North American Indians belonging to the Algonquin family. Formerly it occupied portions of Iowa, Nebraska, and Kansas, but now only few remnants remain in these states and in Oklahoma. Many of these Indians are industrious and progressive, having acquired both educational advancement and financial stability. See **Sacs and Foxes**.

**FOX SPARROW** (spär'rō), a handsome species of sparrow native to Canada and the United States. It has a rusty red plumage, but the breast is whitish. The eggs are thickly spotted and are laid in thickets or in tufts of grass. The song is loud and cheerful, resembling that of a thrush. It is migratory, passing far into the north of Canada to breed.

**FOXTAIL GRASS**, the name applied to several grasses with brush-like spikes which resemble the tail of a fox. Several species abound in meadows and pastures. They possess nutritive qualities, though some, from their hardy nature and remarkable tendency to multiply, are obnoxious weeds in cultivated lands. A number of species are naturalized in North America and are cultivated as forage plants.

**FOX TERRIER** (těr'ri-ēr), a small dog which is useful in following the fox to its habitation. The weight is about eighteen pounds. Its spirit is keen and lively, and it is adapted in every way for companionship and service in the hunt.

**FOYLE** (foil), a river in Ireland, formed by the junction of the Finn and Mourne. It forms the boundary between Donegal and Londonderry counties and flows into Lough Foyle, an inlet on the northern coast of Ireland, four miles below the city of Londonderry. The entire length is about seventy miles. It is famous for its salmon fisheries.

**FRACTION** (frāk'shūn), in algebra and arithmetic, an expression of one or more of the equal parts of a divided whole, or an expression for an unexecuted division, originally invented to represent a quantity less than a unit. The dividend number is called the *numerator*, because it numbers how many parts are taken, and the divisor is called the *denominator*, because it names the parts, thus, in the fraction  $\frac{3}{4}$ , 3 is the numerator and 4 is the denominator. A fraction is said to be *proper* when the denominator is greater than the numerator, and *improper*, when the numerator is greater than the denominator. In the former case the value is less and in the latter more than 1.

If both terms of the fraction are equal, it represents 1, or unity. A decimal fraction is one whose denominator is 1 with zeros annexed, in which the denominator is not written, but is understood from a point being prefixed, with zeros if necessary; thus, .086 for  $\frac{86}{1000}$ . All the fundamental operations in arithmetic, that is, addition, subtraction, multiplication, and division, may be performed in fractions, but the denomination must be the same. In decimal fractions the denomination depends upon the position of the decimal point, as .1, .01, .001. Common fractions are reduced to a *common denominator* by multiplying both terms of each fraction by the denominator of the other fractions.

**FRAMINGHAM** (frā'mīng-hām), a town of Massachusetts, in Middlesex County, on the Sudbury River, twenty miles west of Boston. It is on the Boston and Albany and the New York, New Haven and Hartford railroads. Among the chief buildings are a State normal school, a hospital, a public library, and a home for the aged. The manufactures include chairs, woolen cloth, rubber goods, and boots and shoes. The first settlement, made about 1647, was known as Danforth's Plantation. It was incorporated in 1700. Population, 1905, 11,548.

**FRANC** (frānk), a silver coin of France, divided into ten decimes and 100 centimes. It was first coined in 1795 and was adopted by Belgium in 1833 and by Switzerland in 1849. It corresponds in coinage to the cent of Canada and the United States, in that it is issued in different denominations, such as 1, 2, and 5 franc pieces. The value of a franc is about  $9\frac{1}{2}$  pence in English money and a little over 19 cents in the money of Canada and the United States.

**FRANCE** (frāns), a republic of Western Europe, located between latitude  $42^{\circ} 20'$  and  $51^{\circ} 5'$  north and longitude  $4^{\circ} 48'$  west and  $7^{\circ} 31'$  east from Greenwich. It is bounded on the north by the English Channel, the Strait of Dover, and the North Sea; east by Belgium, Germany, Switzerland, and Italy; south by the Mediterranean Sea and Spain; and west by the Atlantic Ocean and the English Channel. Its greatest breadth from east to west is 552 miles, and its length from north to south is 605 miles. In size it ranks fourth among the countries of Europe. The numerous coast indentations afford many good harbors, thus rendering the country capable of supporting an extensive maritime system. Numerous islands abound off the northwestern shore, the largest of which are Ré, Belle Isle, and Oléron. The total area is 207,107 square miles. This in-

cludes Corsica and a number of small islands, which have a surface of 3,700 square miles.

**DESCRIPTION.** The eastern portion of France is traversed by numerous mountain chains, of which the Pyrenees, Cévennes, and Vosges are the most prominent. These mountain ranges form the principal watershed, the rivers flowing from them to the west and north toward the Atlantic, and on the opposite side to the south and east into the Mediterranean. Vignemale, the highest peak of the Pyrenees in France, has an altitude of 10,792 feet. Mont Blanc, height 15,781 feet, is the culminating peak of the Alps, and is on the line between France and Italy, near Switzerland. The interior of France is marked by several volcanic groups known by the general name of Auvergne, while the coast region along the English Channel is largely level and exceedingly fertile. The Pyrenees separate France from Spain and have a general altitude of 9,000 feet. Passes for railroads are located at both ends of the range, near the coasts, but few highways cross these mountains. The Alps separate France from Switzerland and Italy, with celebrated passes and railway tunnels in the vicinity of Mont Cenis. The Jura Mountains are between France and Switzerland, and the Vosges extend from the western border into Germany. Corsica, where Monte Cinto has an elevation of 8,900 feet, belongs physically to Italy rather than France, and is united with it by a submarine plateau.

Many important river basins are formed by the foothills and mountains, through which flow numerous navigable streams. The entire number capable of navigation is about 200, and the total length of interior navigation aggregates 6,000 miles. Among the larger streams are the Rhone, the Loire, the Garonne, and the Seine. The largest of these is the Rhone, which passes from Switzerland through a gap between the Jura and the Alps into France, receives the Saône, another tributary, and flows southward into the Mediterranean by a delta. The Garonne rises in Spain, flows through a mountainous section in the upper course, and discharges into the Atlantic through the estuary of the Gironde. The Loire and Seine likewise discharge into the Atlantic. Other streams include the Isère, Durance, Dordogne, Mayenne, Eure, Charente, and Sarthe. Lake Geneva is the most important inland water, but a portion of it lies in Switzerland. Bourget and Annecy are other lakes of the Rhone Basin, and aside from those mentioned there is none of considerable size. A number of lagoons are located along the coast.

**CLIMATE.** As a whole the climate is favorable and among the most healthful in Europe. The isothermal lines of France indicate a normal temperature of about 50°. The regions in the southeast are the warmest and those in the northwest are the coldest, though all portions, except the most elevated mountain ranges, are susceptible to profitable cultivation, and are marked by atmospheric brightness and salubrity. At Paris the temperature averages 36° in January and 65° in July. The rainfall averages about thirty inches for the whole country, ranging from ten inches in the elevated northern plains to forty inches along the sea coast and in the Cévennes.

**FLORA AND FAUNA.** France has a flora quite like that of the other countries in continental Europe, except in the more recently formed summits, where lichens and mosses abound. Forests of ash, oak, pine, and spruce characterize the regions of medium elevation, and the chestnut and mulberry are common to the less elevated sections in the south of France. Nutritious grasses are very common. Wild animal life is not abundant, owing to the country having been settled a long period of time. The chamois is found in the mountains, the mouflon is met in Corsica, and the fallow deer and wild boar are preserved in private estates and on reservations. Many birds of song and plumage are common, and waterfowls are numerous along the coasts. The fisheries yield many valuable catches, including oysters.

**MINING.** Valenciennes, in the northeastern part, is the center of productive coal fields, which are estimated at about 2,250 square miles. The deposits consist chiefly of a good grade of bituminous coal, valuable in manufacturing, but anthracite is found in the department of Isère and lignite coal occurs in the Pyrenees. Iron ore is obtained in considerable quantities, especially in the Jurassic rocks and in the Pyrenees, but the output is not adequate to the demand. Some copper is obtained near Lyons. Other metals include zinc, nickel, silver, lead, and antimony. France is rich in building material and quarry products. Granite, limestone, and sandstone are abundant, and a fine grade of marble is quarried in the Alps and the Pyrenees. Roofing slate is quarried in the Ardennes and phosphate rock occurs in several localities. The latter is used in the manufacture of fertilizers.

**AGRICULTURE.** France is distinctly an agricultural country, being favored by a mild climate and general fertility of the soil. The methods employed by the peasants are modern and til-

lage is conducted with great care. About 6,750,000 people are employed in agricultural pursuits and fifty-eight per cent. of the land is under cultivation. Wheat, rye, barley, and oats are the staple cereals. In the production of wheat France exceeds all countries of Europe, except Russia. Beets are grown extensively for the manufacture of sugar. The government has a monopoly in the cultivation of tobacco. Other products include flax, maize, potatoes, rape, hemp, and buckwheat. Vegetables are produced in all sections, while fruits abound extensively, though they are grown most successfully in the southern portion, where the peach, pear, orange, lemon, fig, and citron thrive. The adaptable condition of the soil for the production of forage crop has caused France to rank as a leading country in the rearing of cattle, horses, sheep, and goats. However, it is necessary to import meat, but eggs, honey, and dairy products are exported. Dairying is an important industry and in many sections is associated more or less with the rearing of swine. The culture of silkworms receives marked attention in the warm portions, where it is fostered on a large scale. The vineyards are especially prolific and about one twenty-fifth of the whole surface is planted to vines.

**COMMERCE.** France has fostered a policy of tariff protection, especially during the period following the War of 1870-71, but more liberal rates have prevailed since 1882. Raw cotton, wool, raw silk, timber, cereals, and coal and coke are the chief imports, while the exports include leather, cotton and silk textiles, metal goods, chemical products, wine, and clothing. The nations that have the largest share of foreign trade are Great Britain, Belgium, Germany, Algeria, and the United States in the order named. The foreign trade has an annual value of \$2,250,000,000 and the exports slightly exceed the imports. Foreign trade is promoted by an efficient merchant marine, which consists of about 1,500 steamers and 15,000 sailing vessels.

**MANUFACTURES.** France ranks as the fourth manufacturing country, being exceeded only by Great Britain, Germany, and the United States. In the output of textile fabrics, especially silk goods, it has long held a prominent place. The textile fabrics center largely at Lyons, Rouen, and Paris. Cotton and woolen goods are made in large quantities at Rheims and Amiens; lace and gauze, at Saint Quentin; tapestry at Paris and Beauvais; and carpets, at Abbeville. Large quantities of safes, files, hardware, jewelry, and optical instruments are manufactured for exportation. In the manufacture of wine France has held a foremost position many cen-

turies, and its cognac is still the leading product of the kind in the world. It likewise has taken a foremost position in the manufactures of engines, motors, and automobiles. Fruit canning is carried on extensively and the fisheries yield many products employed in manufacturing. Special mention may be made of the tunny, anchovy, oyster, mackerel, and sardines, all of which are cured and canned.

**TRANSPORTATION.** Extensive railroad and canal facilities make it possible to carry on a vast interior commerce, and to bring the products for shipment to the principal seaports. The railways are largely under direct government supervision and in efficiency take a peculiarly high rank. They aggregate a total of 28,750 miles, hence Germany and Russia are the only European countries that have a larger mileage. Paris is the converging center of all the railway systems of France, with the exception of one line. The canals aggregate 2,975 miles and the navigable streams have a length of 5,500 miles. In addition there are many electric railways throughout the more populous sections of the country, and the highways are generally in a good condition. The canals connect the various river basins and facilitate transportation to the Atlantic Ocean, the North Sea, and the Mediterranean. Among the most important of the canals are the canal of Languedoc, which connects the Garonne with the Mediterranean; the Rhone and Rhine canal; and the canal of Bourgogne. Telegraph and telephone lines are everywhere manifest and efficiently managed, and, like the canals and railroads, are largely under direct government supervision and ownership.

**GOVERNMENT.** The government of France is a constitutional republic, in which three departments of government are recognized, and dates from Sept. 4, 1870, when the second empire was overthrown as a direct result of the Franco-German War. Its legislative authority is vested in two chambers, the Chamber of Deputies and the Senate. Representation in the former is elective and in the latter it is appointive by officials of the departments. In the Chamber of Deputies are 584 members, chosen for four years, and the Senate is composed of 300 members, elected for nine years, one-third retiring every three years. The entire country is divided into 87 departments. Each of these is divided for election purposes into *arrondissements*, and these are subdivided into smaller divisions for the purpose of local government. The system of justice, like that of Canada and the United States, originates in inferior courts, and, after passing through courts of appeals,

terminates in the supreme court of the state, which has its seat at the capital. Cases of attempt against the safety of the state or of plotting to change the form of government are tried by the Senate, which is then constituted as a high court of justice. The president is elected for a term of seven years by the two chambers, a majority of both bodies being necessary to a choice. He has the appointment of civil and military posts, and is assisted by twelve ministers whom he appoints. The ministry consists of ministers of the interior, finance, war, justice and public worship, marine, colonies, public instruction, foreign affairs, commerce, agriculture, public works, and labor.

**EDUCATION.** Educationally France occupies a high position among the countries of South-western Europe. The minister of public instruction, who is appointed by the president and is a member of the cabinet, has supervision of all the branches of education and is assisted by an educational council. Primary, secondary, and high schools are maintained under appropriate courses of study, and they are supplemented by colleges and universities devoted to industrial art, law, theology, literature, and medicine. All the communes are required to have primary schools, but, where the population exceeds 500, the schools for boys and girls are separate. In the capital of each department and some other cities are institutions of higher learning, the whole number being about 275. In 1908 the secondary schools were attended by 127,642 and the universities by 34,368 students.

**DEFENSE.** Military service is obligatory on every Frenchman from the age of 20 to 45 years, who is not declared unfit for military duty. The present peace footing is 575,000 men and officers, though the entire war strength, including the colonies, aggregates 3,500,000 men. France occupies a high position in the naval administration, which is divided into three marine divisions. The number of men and officers in the navy is placed at 54,350. It has 44 battleships completed or in the course of construction and a proportionately large number of protected cruisers, torpedo boats, and torpedo boat destroyers. The principal sources of revenue are land taxes, registration, customs and excises, railroads and telegraphs, and licenses. The total national debt is larger than that of any country in the world, being about \$6,800,000,000, and the revenue and expenditures are correspondingly large.

**INHABITANTS.** More than a million of the inhabitants of France proper are foreigners, mostly of European birth, while the rate of increase in population is very small, but there is a small

preponderance of births over deaths. However, the increase of the last several decades may be attributed to immigration. The three chief religious denominations are Roman Catholic, Lutheran, and Jewish in the order named. Religious worship has been free since the adoption of the Organic Articles in 1802, but the three churches named were subsidized by the state until 1905, when the law which separates the church and the state came into force. About two-thirds of the people are nominally Roman Catholics. Fifteen cities have a population of more than 100,000. Paris, the capital and largest city, is one of the most important centers of population in the world. The other cities of importance include Lyons, Marseilles, Bordeaux, Lille, Toulouse, Nantes, Saint Etienne, Havre, Rheims, Roubaix, Rouen, Rennes. The population of France, exclusive of the colonies, in 1906, was 39,252,267.

**COLONIES.** The colonial possessions of France have an area of 4,055,150 square miles and a population estimated at 56,675,000. They are variously distributed in Asia, Africa, America, and Oceania, and have been the means of greatly increasing foreign trade and influence. The larger part of these possessions is African and the colonies of Oceania are not particularly valuable. The latter include New Caledonia and a number of dependencies.

The French colonies of America are Guiana, Guadeloupe, Martinique, Saint Pierre, and Miquelon, and those of Asia include Indo-China, Annam, Cambodia, Cochinchina, Tonkin, and Laos. The African possessions embrace Algiers, French Congo, French Guinea, Comoro Isles, Dahomey, Ivory Coast, Mayotto, Madagascar, Somali Coast, Réunion, Senegal, Niger, Senegambia, Tunis, and Western Sahara.

**LANGUAGE.** Before the Romans occupied Gaul, Celtic was the chief dialect spoken in the region now occupied by France, and that language is still spoken in Brittany. The French language is classed with the Romanic group, of which it is the most important dialect, the other languages of this group being the Spanish, Italian, Portuguese, Provençal, and the Wallachian or Romanic. After Roman occupation the Gallic, Celtic, and other local dialects gradually became modified by the introduction of new elements, and by the 8th century a marked distinction existed between the popular language of France and the classic Latin. They were distinguished by the names *Romana* and *Latina*, and, when the new Romance tongue became generally adopted, it was named *French*. Louis the German in 842 took an oath in the Romance tongue in Strasburg, and this is re-

garded the oldest written document in that dialect extant. Francis I. prohibited the use of Latin at court in the beginning of the 16th century, since which time French has been recognized as the national language. French is spoken generally throughout the country, but Flemish and German are used locally on the border of Belgium and Germany, and Italian is spoken in the southeastern part. It has been the language of diplomacy, cookery, fine art, and the European aristocracy since the Middle French period. Its greatest popularity was attained in the reign of Napoleon, though it is now the language of about 50,000,000 people, and its literature is exceptionally rich.

**LITERATURE.** The literature of France is both extensive and valuable, embracing many products of a large number of eminent writers. It may be said to begin with the 11th century, when numerous poems were collected and published. These poems embrace at least three classes, including those that relate to the achievements of Charlemagne and his descendants; those relating to ancient history, particularly Alexander the Great; and those detailing the life and achievements of King Arthur. Philippe de Comines (1445-1509) is one of the first historians of eminence, dealing with the life and times of Louis XI. and his contemporaries, but the writings of Froissart (1337-1410), which include a collection of poems and tales of the chivalry of the 14th century, are perhaps the most popular productions of the early period. French literature was greatly modified by the revival of classical learning, when public thought was directed to classical study and sacred history. The humorist Rabelais (1490-1553) belongs to the same period, as also does the essayist Montaigne (1533-1592). In that period the great theological work of John Calvin, entitled "Institution of the Christian Religion," exercised a wide influence upon the public thought of France, and was the cause of inducing many writers to turn with renewed vigor to works in prose. Clément Marot (1495-1544) wrote numerous witty poetic productions, while Margaret of Navarre issued popular tales, and Jodelle (1532-1573) gave an impetus to tragedy.

With the advent of Louis XIV. came the golden age of French literature. At that time Pierre Corneille (1606-1684) wrote his masterpieces, entitled "Horace," "Cid," "Cinna," and "Polyeucte;" Pascal (1623-1662) created interest by his "Provençal Letters;" and Racine (1639-1699) wrote his "Iphigenie Phedre," "Athalie," and other noted comedies for the stage. Fine works in prose were added to the

general writings by Jean Louis Balzac (1594-1654) and Voiture (1598-1648), while Descartes produced works of high philosophical value. Molière wrote his familiar plays, "School of Women," "Misanthrope," and "Tartufe," and elegant sermons were added to French literature by Massillon, Bossuet, and Bourdaloue. Other writers of the 17th century include the historians, Cardinal de Retz and Madame de Sévigné; the biographical writers, Saint Evremond and La Rochefoucauld; and the miscellaneous writers, Le Sage and Bernard Fontenelle (1657-1757).

Many works of philosophical value were added to the literature in the 18th century, but that period likewise produced much of value in other essential lines. Voltaire not only wrote valuable works in philosophy, but also holds a high place as a historian, dramatist, and poet, and for more than half a century stood at the head of French letters. The satirist, Montesquieu, is the author of "Persian Letters" and of many historical and general works, including "Spirit of the Laws." As a writer of elegant style and profound thought Rousseau stands next to Voltaire, his chief works being "Nouvelle Heloise" and "Confessions," while his "Social Contract" and "Emile" continue to exercise a wide influence in education and politics. The "Encyclopaedie," an extensive review of general subjects, though quite hostile to religion, was published by Diderot and D'Alembert. Other works of importance include Prevost's "Manon Lescaut," Saint Pierre's "Paul and Virginia," Beaumarchais' "Barber of Seville," and Buffon's "Natural History." Helvetius, Lamettrie, Condorcet, and Condillac may be mentioned as other writers of note.

The 19th century produced a large number of writers, owing largely to the brilliant achievements of Napoleon and the general establishment of schools and institutions of higher learning. In that period rose the so-called Romantic School, of which Victor Hugo, Alfred de Vigny, and Alexandre Dumas are leading representatives. "Les Miserables" is the masterpiece of Hugo, while "Cinq-Mars" is the best novel from the pen of De Vigny, and "Three Guardsmen" and "Count of Monte Cristo" are popular works by Dumas. Among the novelists of eminence are Honoré de Balzac, who belongs to the so-called Realistic School, George Sand, Eugène Sue, Gustave Flaubert, Victorien Sardou, and Octave Feuillet. Jules Simon, Bastiat, and De Tocqueville rank among the eminent writers on political economy; Guizot, Thiers, Victor Duruy, and Henri Martin among the historians; Victor Cousin, Auguste Comte, and Lamennais

among the philosophical writers, and Cuvier and Saint-Hilaire among the scientific writers. Stanislas Julien and Burnouf added much of value to Oriental knowledge; Leconte de Lisle, Gautier, and Theodore Aubanel to poetry, and among the essayists and literary critics are Gustave Planché, Théophile Gautier, and Paul de Saint-Victor.

The beginning of the 20th century witnessed unusual activity in French literature. It is evident that the century will be unusually prolific and that the productions will excel in number and value those of the previous period. Among the eminent historians are Ernest Lavisse and M. Rambaud; among the poets, Henri de Régnier and Paul Verlaine; among the critics, Charles Bernard Renouvier and Edgar Quinet; and among the general writers, Emile Zola, Marcel Monnier, Alphonse Daudet, Emile Faguet (born in 1847), and Frederick Masson. For several years at the beginning of the century much was written upon social and political events, owing to the long discussion of the Dreyfus affair. Such writers as Émile Zola and Anatole France wrote much on the side of Dreyfus, while Bourget, Barrès, and Brunetière took a position in opposition to the influences created by the affair. The period has been especially prolific in the field of fiction and the drama.

**HISTORY.** Julius Caesar, who wrote regarding his invasion and conquest in 59 B. C., furnishes the first authentic history of France. The Roman name was Gallia, while the early English was Gaul, and the people were largely Celtic in race, though other settlements were maintained, especially by the Aquitani and Belgae, with here and there tribes of Germans and Greeks. At that early period it contained parts of Switzerland, Germany, and Belgium, as well as the whole of France. The name France was derived from the Franks, a Germanic tribe that made settlements in Gaul after the decline of the Roman Empire. By the 2d century A. D. it was Romanized in civilization, language, and religion. Under the Roman rule it advanced materially in civilization and refinement and the population increased rapidly. Gradually agriculture and manufacture took the place of the simpler arts of the semisavage people.

The Franks by the end of the 5th century made themselves masters of nearly all of France and conquered adjacent territory east of the Rhine. In 481 Clovis, a descendant of Merovig, established the first dynasty, called the Merovingian, with his capital at Paris, and reigned until his death in 511, when his kingdom became divided among his four sons. The country was

subsequently divided among other rulers under a general law of inheritance, by which numerous principalities rose. The last of the first dynasty terminated in 752, when the Carolingian arose, its greatest representative being Charlemagne, who was the second ruler. At that time there was no real kingdom of France, for the reason that the first dynasty was Germanic, and Charlemagne founded a German rather than a French empire.

The true founder of the French monarchy was Hugh Capet, who established the Capetian dynasty in 987, and added the fiefs of Orleans and Paris to the monarchy. For two centuries the Capetian dynasty endeavored to reconquer former prerogatives from vassals, and strained its powers in resisting English pretensions to the crown of France. The first branch of Capetian kings became extinct with the death of Charles IV., in 1328, for the reason that the Salic law excluded female succession. At that time the crown passed to Philip of Valois, who ascended the throne as Philip VI., which led to a series of wars with England on account of the claims made by Edward III. to the throne, and these continued for 125 years. The most important battles occurred at Crécy in 1346, Poitiers in 1356, and Agincourt in 1415. All of these resulted more or less favorably to England and gave that country many of the best provinces, while the Treaty of Troyes, drawn shortly after the Battle of Agincourt, recognized the succession of Edward III. to the crown of France. The animation of the French, due to the noble deeds of Joan of Arc between 1429 and 1431, caused a complete change and drove the English from the country, the only possession remaining to them being Calais.

Louis IV. laid the foundation of a great monarchy in 1461, largely restored internal peace, and brought back a feeling of nationalism. The Valois-Orleans branch of the Valois line succeeded to the throne in 1498, but in 1515 the crown reverted to another branch of the house of Valois in the person of Francis I. This sovereign carried forward the attempts to conquer Italy begun by previous monarchs, and became involved in five great wars with Germany, which terminated in the loss of some prestige and the transfer of Savoy and Piedmont by the Treaty of Cateau-Cambresis, though this loss was at least partly balanced by securing Calais, the last possession of the English in France. Francis II. reigned only in 1559-60, but during this brief time the Catholic house of Guise attained power, while the opposing movements for the reforms were led by the house of Bourbon. The religious wars

of this epoch shed much blood and retarded the industrial growth of France. Within this period occurred the massacre of Saint Bartholomew, and the great national debt which weighed upon France more than two centuries was fastened upon the country. The religious wars terminated only when Henry IV., previously King of Navarre, went over to the Catholic Church from the leadership of the Huguenots.

Louis XIII. succeeded to the throne in 1610 and inaugurated a new policy by siding with Richelieu, a Protestant prince, in a reformation. At his death in 1643, Louis XIV. began a memorable reign, which was marked by a still more vigorous policy and led to the highest power and widest influence attained by the French monarchy. Under his wise direction French literature, art, and science developed to a higher plane than before known, education flourished, and the borders of France were extended to the Rhine. The efficient service of the military engineer, Sébastien Vauban (1633-1707), strengthened French fortifications, while its ministers secured advantageous commercial treaties. Louis XV. added Corsica and Lorraine to France by the Treaty of Paris. However, in 1763 French colonies were largely ceded to England on account of misfortunes in war.

The weakness of Louis XVI., the success of the American Revolution, and the great spirit of unrest that marked the closing of the 18th century led to the revolution of 1789. War raged with all its horrors and cast an unfortunate people into a great sea of bloodshed, which finally led to the execution of Louis XVI., in January, 1793. This was followed by a treaty of peace and the general amnesty of 1795. The French Republic was recognized by the Treaty of Basel in the same year, while a new constitution was formulated by the convention, which finally dissolved in October. The scheme of government provided a chamber of 500 to propose laws, the chamber of ancients to approve them, and the executive of five members called the Directory. Napoleon Bonaparte soon became the most prominent man in France. His successes led to the overthrow of the Directory and the establishment of the Consulate, himself being appointed first consul for a term of ten years. The brilliant victory won on the battlefield of Marengo and the extension of France to the Rhine led to the proclamation in 1804, by which he became emperor, and was soon after confirmed by a popular vote of the people. Pope Pius VII. consecrated Napoleon emperor at Paris, and crowned him King of Italy in 1805.

Though an extensive coalition was formed

against Napoleon by European powers, they were unable to check his career and France became the greatest power of Europe. The great Battle of Austerlitz in 1805 caused the King of Naples to be dethroned, Holland became a vassal kingdom, and Prussia was humiliated. At that time the kingdom set up by Napoleon extended from Naples to Denmark and the capitals were Amsterdam, Paris, and Rome. The Russian invasion of 1812 cost France 300,000 men, but the allied forces were defeated in the Battle of Leipzig in 1813. In 1814 the allied armies drove the French from Germany and captured Paris, on March 30. Napoleon was required to abdicate and retired to Elba as a mere prince. Louis XVIII. became King of France and concluded the Peace of Paris, but was soon driven from power by the return of Napoleon, who assumed authority without resistance. The allied powers reorganized, brought on his final defeat at Waterloo in 1815, and sent him a prisoner to Saint Helena.

The long line of French kings ended with Louis Philippe, who was driven into exile by the revolution of 1848, and a republic was proclaimed with Louis Napoleon as the president. By a vote of the people he was made emperor in 1851, with the title of Napoleon III. The growing discontent of the people caused him to declare war against Germany in 1870, which resulted in a disastrous loss to the French army upon every battlefield, and the empire ended with the capture of Napoleon and 83,000 men at Sedan. As a war indemnity France was required to cede Alsace and a part of Lorraine to Germany and pay \$1,000,000,000 in gold. Civil war broke out in Paris under the leadership of the Commune, which was put down with difficulty.

The second republic having been organized, M. Thiers was chosen the first president. With the overthrow of the administration in 1873 came the election of Marshal MacMahon, who resigned the presidency in 1879, and was succeeded by Jules Grévy. The last mentioned was followed in the presidency by Sadi Carnot in 1887. After the assassination of Carnot in 1894, Jean Casimir-Périer succeeded to the presidency, and, when the latter resigned in 1895, Felix Faure attained the election. President Faure died on Feb. 16, 1899, and was succeeded by M. Loubet. In 1906 Clément Armand Fallières was elected president by the liberal party. The present republic has enjoyed a long era of prosperity, an epoch in which France has become the seat of great expositions and larger industrial enterprises, and has taken a high rank in the arts of peace.

**FRANCHISE** (frän'chiz), a special privilege granted by government to individuals or corporations, and which do not belong to the citizens of the state or country by common right. In a political sense the term franchise denotes the right of suffrage and is commonly called the *elective franchise*. However, it is generally applied to special privileges granted for the purpose of constructing improvements for profit, such as the establishment and operation of toll bridges and ferries. Towns and cities grant franchises to gas, water, heating, and electric light companies, and the alleys and streets are used for the purpose of promoting the business in which such concerns are interested. Formerly franchises of this kind were granted by the town or city council, but in most states and countries such privileges can be obtained only by a direct vote of the majority of the people, the proposition to make the grant being submitted to the electors at a regular or special election. A common instance of a franchise or charter is one granted by the state or province to certain persons, which authorizes them to engage in business as a corporation. Franchises of this kind as well as those granted by towns and cities to operate and control public utilities are in most cases subject to a special tax.

**FRANCIS MOUNTAINS**, a group of the White Mountains, in New Hampshire, from which they are separated by the White Mountain Notch. Mount Lafayette, height 5,295 feet, is the highest peak. Many beautiful lakes, steep precipices, and natural forests give the region a grand and beautiful aspect.

**FRANCO-GERMAN WAR**, a military contest between France and Germany, caused chiefly by the jealousy of Napoleon III. of the growing importance of Prussia. Bismarck had determined to place Prussia at the head of a united Germany, owing to which Austria was excluded after the war of 1866, when the growing sentiment for German nationality threatened to isolate France. The crown of Spain was offered by General Prim to Leopold of Hohenzollern, a prince of the reigning family of Prussia, which excited the jealousy of Napoleon, who demanded that Leopold should retire as a candidate. Although the King of Prussia refused to demand this of Leopold, the latter declined the Spanish crown voluntarily, when Napoleon insisted that the King of Prussia should furnish a guarantee that the refusal would be final. This demand was of course refused, hence the French government formally declared war on July 19, 1870.

Both countries entered upon the prosecution

of the war with marked enthusiasm, but France was comparatively illy prepared for the conflict. While that country had about 250,000 men ready to move forward in August, 1870, it had few available reserves. On the other hand, the North German Confederation was able to put 450,000 men into the field at once and had nearly that number of reserves available for active service. Napoleon had hoped that the South German States would refuse to join Prussia, but these, enthused with the sentiment of nationality, threw their influence against France. Three armies moved upon French territory, the first under General von Steinmetz at Trèves, the second under Prince Frederick Charles in Rhenish Palatinate, and the third under the Crown Prince of Prussia on the frontier of Baden.

The German armies, after winning successes at Weissenburg and at Wörth, succeeded in separating the two divisions of the French army under Marshals Bazaine and MacMahon. The former was repulsed in the Battle of Mars-la-tour, after which he took a position at Gravelotte, where he was defeated on August 18th by an army of 200,000 Germans. Bazaine now fell back upon Metz, where he was besieged until in September, when he was compelled to surrender with an army of 175,000 men. In the meantime MacMahon was surrounded at Sedan, where he was defeated on September 2d and surrendered with an army of 83,000 men. Both Napoleon and MacMahon were among the prisoners of war.

The capture of Napoleon caused a revolution in Paris, where the republic was proclaimed two days after the fall of Sedan. However, the victorious armies marched upon Paris and placed it in a state of siege. Although efforts were made to relieve the capital, it was forced to surrender in February, 1871. The preliminary terms of peace with Germany were arranged by Thiers in the same month, and they were approved by the national assembly in March. France was required to cede Alsace and a part of Lorraine and pay a war indemnity of \$1,000,000,000. It was provided in the treaty that German troops should occupy certain departments until the entire sum was paid. The final treaty of Frankfort was signed in May, 1871. As a result of the war, Germany was consolidated into an empire and France became a republic.

**FRANCOLIN** (frän'kō-lin), the name of several species of birds related to the partridges, native to Asia and Africa. The plumage is variegated, but in most species it is a yellowish brown with black and white mark-

ings and the bill and tail are long. The flesh is much esteemed for food, hence these birds are hunted as game. When alarmed, they conceal themselves in the brushwood or run with considerable speed, taking wing only when they are in danger. They feed early in the morning and late in the evening, when they search for grains, insects, and bulbous roots. Their flight is accompanied by a whirring sound, and their cry, uttered chiefly when in search of food and at pairing time, is something like a shrill laughter.

**FRANKFORT** (fränk'fürt), a city in Indiana, county seat of Clinton County, on Prairie Branch River, forty miles northwest of Indianapolis. It is on the Lake Erie and Western, the Vandalia Line, and other railroads, and is surrounded by a rich agricultural, dairying, and fruit-growing country. Among the noteworthy buildings are the county courthouse, the public library, the high school, and a number of fine churches. It has electric and gas lighting, street paving, and a sewerage system. Among the manufactures are pottery, carriages, flour, cigars, machinery, and ironware. It has extensive railroad machine shops. Population, 1900, 7,100.

**FRANKFORT**, a city of Franklin County, Kentucky, capital of the State and of Franklin County, on the Kentucky River, sixty miles east of Louisville. It is on the Louisville and Nashville and the Chesapeake and Ohio railroads, in the center of the blue grass region, and occupies a fine site on both sides of the river, which is spanned by a suspension bridge 700 feet long. The chief buildings include the State capitol, the State arsenal, the Governor's mansion, the State prison, an institution for feeble-minded children, and the State normal school for colored students. It has several fine monuments, including those erected to the soldiers who died in the War of 1812 and the Mexican War. The State library contains over 100,000 volumes.

Frankfort has manufactures of pottery, twine, barrels, lumber products, vehicles, whisky, cotton goods, and machinery. It has extensive systems of electric street railways, sewerage, and public lighting. Franklin Cemetery, on one of the hills near the city, contains the grave of Daniel Boone. Frankfort was founded in 1786 by Gen. James Wilkinson, and became the capital of the State in 1892. Population, 1900, 9,487.

**FRANKFORT-ON-THE-MAIN**, a city in the province of Hesse-Nassau, Germany, twenty miles northeast of Mainz, on the Main River. The older part has narrow streets and many buildings in which the high gables project over the walls, but the newer section is modern and

has many fine residences and tall structures of steel and stone. Ziel street is the chief thoroughfare and merges into Kaiserstrasse. The market place, or Römerberg, is in the heart of the older part of the city. Many tourists are attracted to the house where Luther lived, the one in which Goethe was born, and the noted Rothschild Library. Besides the public schools, it contains the Städel Art Institution, a museum of history, and many important societies of literature and art. In its squares and public parks are numerous statues of celebrated citizens, among them those of Gutenberg, Goethe, and Schiller. The most prominent of its buildings include the Cathedral of Saint Bartholomew, the public hall, the opera house, the courts of justice, and the central railroad station, the depot being one of the finest in Europe. Frankfort is one of the wealthiest cities of modern Europe and contains the ancestral home of the Rothschilds. It holds high rank as a center of manufacturing and in the volume of its jobbing trade. The streets are generally paved with stone and asphalt and traversed by electric street railways. Systems of sewerage, waterworks, and gas and electric lighting are operated by the municipality. Among the manufactured products are perfumery, ironware, soap, chemicals, clothing, sewing machines, leather goods, and fabrics. It received its name from Charlemagne, who made it the seat of a political and religious council in 794. The city became Protestant as early as 1530. It was the place of meeting for the German diet in 1816-36. In the 13th century it became a free city and after 1562 it was the place of election and coronation of the German emperors. Here have been concluded many important peace treaties, among them the treaty closing the Franco-German War, which was signed in May, 1871. Among the banking and money markets of Europe Frankfort takes very high rank. Population, 1905, 334,978.

**FRANKFORT-ON-THE-ODER**, a commercial city in the province of Brandenburg, Germany, on the Oder River, about fifty miles southeast of Berlin. Several railroad lines connect it with the national capital and the cities of Central Europe. The noteworthy buildings include the Church of Saint Mary, the Reformed Church, the city hall, or Rathaus, the theater, and the railway station. Among the manufactures are leather, machinery, fabrics, clothing, chemicals, pottery, furniture, toys, and porcelain. The river is navigable and is connected by canals with the Elbe and Vistula, thus giving ample outlet for its manufactured products, jobbing trade, and passenger traffic. Telephones, elec-

tric railways, a public library, the gymnasium, waterworks, and an extensive system of gas and electric lighting are among the public utilities. The city became a free municipality in 1253 and was important as a member of the Hanseatic League. It suffered greatly during the Thirty Years' War. Nearly all the inhabitants are Protestants. Population, 1905, 64,304.

**FRANKINCENSE** (frānk'in-sēns), a gum or resin, which, when burning, yields aromatic fumes and is used extensively as an incense in religious services. The Greeks and Jews, as well as other ancient peoples, employed olibanum, the product of a tree found in India, and it is still employed chiefly in the East. In Europe and North America it is more common to use the exudations of certain coniferous trees, such as the silver fir, which are resinous products. They exude from the trees and harden by exposure to the air. The taste is balsamic and the odor when burning is pleasant.

**FRANKING PRIVILEGE**, the right of sending letters and packages by mail free of charge. This privilege was extended in England to members of Parliament by the Postmaster-General and later by statute, but it was abolished in 1840. Official correspondence and public documents are transmitted through the mails by officials of the government free of charge in most countries, though this privilege pertains only to business which is related strictly to certain officers of the Federal departments. The United States granted the franking privilege to soldiers of the Revolutionary War, but individuals have not had privilege to send mail in this way since 1873. Envelopes and wrappers of packages used for official purposes are marked *Official Business*, both in Canada and the United States, and in some countries stamps bearing the imprint *Official* are used. Persons not entitled to the privilege of sending mail in such wrappers or under such stamps are subject to a heavy fine in case they procure and use them.

**FRANKLIN** (frānk'līn), or **Frankland**, the name of a proposed State formed by the inhabitants of what is now Tennessee. They revolted from the control of North Carolina in 1784, framed and ratified a constitution, elected a Legislature and State officers, and undertook to conduct a civil war against North Carolina. John Sevier, the Governor of Franklin, raised an army, but was defeated in an engagement and taken prisoner. In 1788 the Legislature of North Carolina pardoned the offenders in Franklin, and two years later the territory was ceded to the United States government, hence the disturbance was quieted.

**FRANKLIN**, a large district in the northern part of the Dominion of Canada, including the Arctic Archipelago. It is located chiefly north of the Arctic Circle, only a small portion of Baffin Land extending farther south. The chief islands are Grinnell Land, Prince Albert Land, North Devon, Melville Island, and Baffin Land. Animal and vegetable life are very scant and the inhabitants, consisting chiefly of Eskimos, are not numerous. Important fisheries and minerals abound. The area is about 500,000 square miles.

**FRANKLIN**, a city of Indiana, county seat of Johnson County, twenty miles south of Indianapolis, on the Cleveland, Cincinnati, Chicago and Saint Louis and other railroads. It has several fine county buildings and is surrounded by a fertile farming region. The manufactures include flour, cigars, ironware, and machinery. It is the seat of Franklin College, a Baptist institution. Electric lights, waterworks, and a system of drainage are among the improvements. Population, 1900, 4,005.

**FRANKLIN**, a town of Massachusetts, in Norfolk County, 25 miles southwest of Boston, on the New York, New Haven and Hartford Railroad. It has a public library and a number of fine schools. The Dean Academy, a coeducational institution, is located here. The manufactures include pianos, clothing, and cotton and woolen goods. Franklin was incorporated in 1778. Population, 1905, 5,344.

**FRANKLIN**, a city of New Hampshire, in Merrimac County, 95 miles northwest of Boston, Mass., on the Boston and Maine Railroad. It is located at the junction of the Winnepesaukee and Pemigewasset rivers, which form the Merrimac at this place. Water power for manufacturing is utilized extensively and the industrial enterprises are well established. Needles, hosiery, machinery, paper, woolen goods, and clothing are the manufactures. Waterworks and electric lights are included among the public utilities. Franklin is the seat of the New Hampshire Orphans' Home, and is noted as the birthplace of Daniel Webster. It was incorporated in 1828 as a town and its city charter was issued in 1895. Population, 1900, 5,846.

**FRANKLIN**, county seat of Venango County, Pennsylvania, on the Allegheny River, about seventy miles north of Pittsburg. It is on the Erie, the Pennsylvania, and other railroads, and has a large trade in farm produce, coal, and merchandise. The county courthouse, the public library, and the high school are among the chief buildings. It has two public parks, street pavements, and sewerage and waterworks sys-

tems. Among the manufactured products are machinery, flour, fabrics, oil, vehicles, and cigars. Valuable deposits of mineral oil and coal abound in the vicinity. Franklin was settled in 1753 and incorporated in 1795. Population, 1900, 7,317.

**FRANKLIN, Battle of**, an engagement of the Civil War in America, at Franklin, Tenn., on Nov. 30, 1864. General Hood, to counteract Sherman in his march to the sea, had taken a large force of Confederates into Kentucky and Tennessee, and was threatening an invasion of the states farther north. General Thomas, who had been with Sherman's army was sent north to Nashville, and General Schofield operated with a Federal force against Hood's army. Schofield strengthened his position at Franklin, on the Harpeth River, where he was attacked by the Confederates, who made desperate assaults, but were beaten back each time with considerable loss. The Federals withdrew to Nashville during the night, where they joined the army under Thomas. The Federals engaged in the Battle of Franklin numbered 25,000, while the Confederates had about 40,000 men. Both sides fought with remarkable gallantry.

**FRANKS**, the name of a number of German tribes that inhabited the regions of the Lower Rhine in the 3d century. They defeated the Romans in Gaul and controlled France from that time until the rise of the Capetian dynasty in 987, giving to that country the Merovingian dynasty, from 481 to 987. For security against hostile tribes, they lived in villages. They committed their laws to writing, were industrious, and gave France the Salic laws. The descendants from these peoples now form the chief Germanic element of northern France and the western part of Germany.

**FRANZ JOSEPH LAND** (fränts yō'zěf), an island archipelago in the Arctic Ocean, north of Nova Zembla. It was discovered by the Payer-Weyprecht expedition in 1873 and was named in honor of the Emperor of Austria, Francis Joseph I. The group includes about sixty islands, many of which are separated from each other by deep and narrow fiords and channels. They include Zichy Land, Wilczek Land, and Alexandra Land. The surface is generally rocky and level, from 150 to 500 feet above the sea, and several peaks have an altitude of 2,800 feet. Grass, mosses, and lichen are the chief plants. Polar bears, foxes, seals, and wild fowls are plentiful. The islands are not inhabited by man.

**FRASER** (frā'zēr), the largest river of British Columbia, rises in the lake region of the Rocky Mountains. It has a general course to-

ward the south, and, after flowing 740 miles, discharges into the Gulf of Georgia. The Fraser is navigable for more than 150 miles, contains valuable salmon fisheries, and flows through a mineral country rich in gold and silver deposits. Its principal tributaries are the Stuart, Thompson, and Chilcote rivers. The lower valley, which is very fertile, is traversed by the Canadian Pacific Railway. Among the towns on its banks are New Westminster, Hope, Yale, and Lytton.

**FRATERNAL SOCIETIES** (frā-tēr'nəl). See **Benefit Associations**.

**FRATERNITIES**, the name applied to various organizations of students in the colleges and universities of the United States. They are frequently termed College Secret Societies, or Greek-letter Fraternities, and members of them are sometimes spoken of as *Frats*. The names are taken from several letters of the Greek alphabet, as *Phi Beta Kappa*, and from these the secret motto of the fraternity is remembered, since these letters are the beginning of the words in the motto. The fraternities are composed of chapters, the latter being branches in the various colleges that belong to a particular fraternity. The largest proportion of the members belong to the academic departments, though all students in the different collegiate courses are eligible to membership. Conventions are held annually or biennially by each fraternity, which is usually composed of from two to eighty chapters. Some of the fraternities are strictly professional, as those of law and medical institutions, but the greater number are maintained for literary advancement and social enjoyment.

The first Greek-letter society was organized at the College of William and Mary, Virginia, in 1776, and named *Phi Beta Kappa*. Its purpose was announced to be friendly intercourse and literary advancement among scholars. However, the present fraternity system of the United States originated in 1825, when a number of students of Union College, New York, organized the *Kappa Alpha*. Similar organizations which are maintained by young women who attend colleges and universities are known as sororities. The first of these, known as *Kappa Alpha Theta*, was organized in 1870 at De Pauw University, Indiana. Since then many others have been established. The members who attend college are styled *active* and afterward they become known as *alumni*. Catalogues, magazines, and song books are published by many of the fraternities and a large number maintain chapter houses. Though opposition to societies of this kind has sprung

up, they are defended by many leading educators, who have generally expressed their belief in the practical utility of college fraternities.

**FRAUD**, in law, any cunning or deception used to cheat or deceive another. It is essentially a false representation of some matter of fact, and is intended to deceive another as to his legal injury. The law distinguishes a false representation of fact, which is necessary in committing a fraud, from a mere expression of opinion. Frauds are classed as either actual or constructive. An *actual fraud* is one in which the perpetrator is guilty of dishonest intention. *Constructive fraud* consists of acts which may not be dishonest in intention, but which are considered in law as being in bad faith. The case of a person charged with the duty of selling property for another, in which he himself is the purchaser, is considered constructive fraud, since it is assumed that he will make the purchase at the best price possible. A party who is guilty of fraud may be punished under the criminal code and at the same time be required in a civil suit to return the goods or settle the damages sustained by the owner.

**FREDERICK** (frĕd'ĕr-ĭk), a city in Maryland, county seat of Frederick county, 32 miles northwest of Washington, D. C. It is on the Pennsylvania and the Baltimore and Ohio railroads. The surrounding country is agricultural and contains rich deposits of iron, copper, slate, and limestone. It is the seat of a fine school system, Frederick College, and a State asylum for the deaf and dumb. Among the noteworthy buildings are the county courthouse, the Emergency Hospital, and the public library. It has manufactures of flour, coaches, tobacco and cigars, machinery, and woolen goods. The public utilities include waterworks, sewerage, and street paving of stone and macadam. The two battles of South Mountain and Monocacy occurred near the city. Francis S. Key was a native of the county and is buried in Mount Olivet Cemetery. Frederick was settled in 1745 and incorporated in 1817. The first Methodist church in America was organized here by Robert Strawbridge in 1764. Population, 1900, 9,296.

**FREDERICKSBURG**, a city in Spottsylvania County, Virginia, about sixty miles north of Richmond, on the Richmond, Fredericksburg and Potomac and the Potomac, Fredericksburg and Piedmont railroads. It is surrounded by a hilly but productive country. The site is on the Rappahannock River, which is

crossed by several bridges, and is noted for its beautiful Confederate and Federal cemeteries. It has a public park, a fine high school, and a library. The manufactures include cigars, leather, flour, silk and woolen goods, and machinery. It was incorporated in 1782. Population, 1900, 5,068.

**FREDERICKSBURG, Battle of**, one of the important battles of the Civil War. It occurred at Fredericksburg, Virginia, on Dec. 13, 1862. General Burnside had resolved to march upon Richmond, and, accordingly, moved his troops to the heights opposite Fredericksburg, on the north side of the Rappahannock. His army consisted of 125,000 men, the right wing of which was commanded by Sumner, the center by Hooker, and the left by Franklin. The army under General Lee numbered 80,000 men, with Jackson as commander of the right wing and Longstreet of the left. The Federal forces crossed the river by three pontoon bridges in the two days preceding the battle. It was planned that Burnside should make the chief attack and hold the road, while Sumner and Hooker should carry the stone wall which ran along the foot of the hill and ultimately storm the heights. An insufficient number of troops had been assigned to Franklin to effect the object intended. The attacks made by Hooker and Sumner were unsuccessful, but failed largely for want of support from Franklin. The Confederate loss was 5,250, while the Union army lost 12,350, and the entire battle proved disastrous to the Federals. Two days later Burnside withdrew from Fredericksburg, and he and Franklin were relieved of their commands shortly after. General Hooker was appointed to succeed Burnside in command of the Army of the Potomac.

**FREDERICTON** (frĕd'ĕr-ĭk-tŭn), a city of Canada, capital of New Brunswick and of York County, on the Canada Eastern, the Canadian Pacific, and other railways. It is located on the Saint John River, 60 miles northwest of Saint John, 84 miles from the Bay of Fundy. It has broad and well-improved streets and is important as a commercial and manufacturing center. The chief architectural structures include a hospital, the legislative library, a customhouse, several schools, and the Parliament buildings. It is the seat of an Anglican bishopric and of the New Brunswick University. Among the manufactures are lumber products, leather, machinery, and boots and shoes. The domestic and foreign trade is important, owing to its convenient location on railways and on the Saint John River, which is navigable for large vessels to this

point. It was founded as Saint Anne in 1740. The name was changed to Fredericton in 1785, and two years later it became the capital of New Brunswick. Population, 1901, 7,117.

**FREDONIA** (frê-dō'nī-à), a town of New York, in Chautauqua County, 45 miles southwest of Buffalo, on the Dunkirk, Allegheny Valley and Pittsburg Railroad. It is the seat of a State normal school. Among the enterprises are machine shops, canneries, nurseries, and an electric light plant. It has a public library, waterworks, and several fine schools. The first settlement in its vicinity was made in 1803 and it was incorporated in 1829. Population, 1905, 5,148; in 1910, 5,285.

**FREE CHURCH**, the general name of a religious denomination which originated from an established church. The most important are the Free Church of England and the Free Church of Scotland. The former is a Protestant Episcopal organization founded in 1844. While the ritual is practically identical with that of the national church, it is free from state control, and claims the liberty of establishing a liturgical service on an evangelical basis. The Free Church of Scotland became a separate body in 1843, when it organized as a branch of the Presbyterian church, as distinct from the Established Church. The separation was brought about by a law of the general assembly passed in 1834, which provided that a majority of the male heads of families, who were full members of the church, could veto or bar the appointment of a minister who was not acceptable to a parish church. This act of legislation caused a conflict between the civil and ecclesiastical powers, but the House of Lords, in 1839, set aside a decision of the civil courts which had annulled the act, hence a large number of members, under the leadership of Chalmers and Candlish, established the Free Church of Scotland. While it renounced the benefits of establishment, it maintains the doctrine and discipline of the Church of Scotland.

**FREE CITIES**, a name applied to cities that form independent governments or states by themselves. At the time of the French Revolution there were about fifty free cities in Europe, mostly members of the German Confederation, but at present there are only three, the cities of Lübeck, Bremen, and Hamburg, and they retain their privileges under the reconstituted German Empire. All others lost their special privileges on account of international political changes.

**FREEDMEN'S BUREAU** (frêd'menz bū-rō), formerly a branch of the War Department

of the United States, organized by an act of Congress in 1865 with the view of providing for the needs of liberated slaves, and to aid in fitting them to become self-supporting citizens. Gen. O. O. Howard was appointed commissioner. The bureau was discontinued in 1870. In the five years of its existence it handled a fund of nearly \$20,000,000, which was raised by grants, bounties, and prizes, and gave valuable assistance to the freedmen during temporary need.

**FREELAND** (frē'land), a borough of Pennsylvania, in Luzerne County, 38 miles south of Wilkesbarre, on the Lehigh Valley Railroad. It is surrounded by a farming and anthracite coal mining region. The manufactures include hardware, machinery, cigars, and clothing. It has a growing market in merchandise, coal, and produce. Population, 1900, 5,254.

**FREEMASON** (frē'mā-s'n), a member of a secret fraternity known as the Freemasons, which dates from the Middle Ages. Originally membership was limited to skilled artisans, but now it includes a far wider range, and the fraternity has branches and lodges in all civilized countries. The present form of organization was adopted in 1717, when the fraternity was reorganized on the avowed principles of charity, brotherly love, and mutual assistance. According to the legends of the craft, it is traced back through the centuries to the building of Solomon's temple, and according to some to the tower of Babel and the building of Noah's ark. Many interesting details are given as to its early organization. Its slow but steady development is traced from the times of Solomon, Hiram, King of Tyre (II Samuel v., 11), the Pharaohs, the ancient Roman nation, and lastly the Knights Templar.

The modern fraternity of Freemasons has its true source in the building corporations maintained in the mediaeval period, when members of those organizations passed to different portions of Europe to hew stone and construct massive and durable forms of architecture. Certain signs and passwords were used by the skilled workmen, which served as a sign of fraternity, efficiency, and worthiness, such signs being kept a secret among the craft. The most distinct types of production by the stonemasons are found in the monasteries and other massive edifices of Germany. In England they date from 926, when a conference of masons was held at York, attended by King Athelstan. In the 12th century they proceeded to Scotland, of which fact many massive abbeys give evidence. The reorganization of 1717 occurred at London, while branches were es-

established in France in 1725; America, in 1730; Russia, in 1731; Germany, in 1740; and later in all civilized countries. From the first branch lodge established in New Jersey sprang many thousands of others, until at present there are sixty grand lodges in the United States and British America, about 12,000 subordinate lodges, and a membership of 1,198,845.

Findel's "History of Freemasonry," translated into the English in 1889, is the most scientific and complete work on the subject of Freemasonry. It contains an intensely interesting account of the growth and development of the fraternity. At various times, like other secret societies, it has been declared useless and harmful by divers religious councils. In the United States and elsewhere there are numerous degrees, to which applicants are initiated under a system of instruction and tests.

The election of new members is by ballot and various signs, passwords, and grips are given, by which members in need of assistance and succor may be tested before more than ordinary or usual benefits are extended. The grand and subordinate lodges elect officers by ballot, who are eligible to reelection. Careful study of a suitable course is incumbent upon the members and officers, in order to secure the greatest degree of efficiency and skill in conducting the business appertaining to the fraternity.

**FREE METHODISTS**, a Protestant sect organized at Peking, N. Y., in 1860. It is an outgrowth of the Methodist Episcopal church, and was formed by the followers of two ministers who did not approve of the decisions of a conference held at Genesee, N. Y., on points of Christian practice. In the main Free Methodists agree with the Methodist Episcopal church on points of doctrine. They do not recognize the office of bishop, but instead have an elective superintendent, who serves four years. The singing in churches is strictly congregational, without instrumental music, and the seats in the church are free. They insist upon plainness of dress and simplicity in living, approve of and practice freeness in prayer and testimonial meetings, and encourage extemporaneous preaching. The doctrine of Christian perfection is insisted upon. The church has about 32,500 members, 1,200 church buildings, and promotes religious work through Sunday schools and protracted meetings. Missions are maintained in all the continents. The *Free Methodist*, published in Chicago, is one of the leading church journals.

**FREEPORT** (frē'pōrt), a city and the county seat of Stephenson County, Illinois, 108 miles

northwest of Chicago, on the Pecatonica River. It is on the Illinois Central, the Chicago and Northwestern, and the Chicago, Milwaukee and Saint Paul railroads, and has communication by electric railways. The chief buildings are the courthouse, the public library, and the Saint Francis Hospital. Besides having a fine public school system, it is the seat of Freeport College, a Presbyterian institution founded in 1872. Among the manufactured products are carriages, flour, bicycles, farm machinery, vinegar, hardware, and cigars. Douglas and Lincoln had a noted debate at Freeport in 1858, when the former declared a doctrine regarding Dred Scott case which afterward became known as the *Freeport heresy*. The vicinity was settled in 1835 and Freeport was chartered as a city in 1885. Population, 1910, 17,567.

**FREE PORTS**, a name applied to ports at whose wharves vessels of all nations are permitted to load, reload, or unload free of commercial charges and customs duties, paying only a nominal harbor fee. Free ports were established in the Middle Ages for the purpose of attracting trade to certain cities, and these enjoyed special advantages when prohibitive or protective customs went into effect in other commercial centers. Since 1888 the free port cities have become greatly limited, among the few remaining in Europe being Hamburg, Bremen, and Trieste. Those not European include Hongkong, Singapore, Livingstone, in Guatemala, and several others.

**FREE-SOIL PARTY**, a political party of the United States, organized at Buffalo, N. Y., in 1848. It maintained an opposition to the extension of slavery as its cardinal principle. At first it was made up of different minor parties, such as the Barnburners, Liberty party, Whigs, and Abolition party. The first candidate for President of the Free-Soil party was Martin Van Buren and its last was John P. Hale, the former in 1848 and the latter in 1852. As neither candidate received a considerable number of votes, the party was merged into the newly formed Republican party in 1856.

**FREETHINKERS** (frē'thīnk-ērz), a term originated in England and applied to a class of deists in the 17th and 18th centuries, who held tenets in favor of natural as against revealed religion. In the time of Frederick the Great the term began to be used in Germany. In France it was applied to such writers as Diderot, Voltaire, and Helvetius, and in England it had reference to a class which included Hume and Lord Bolingbroke. At present the term is common among Christians as well as others, since it is taken to designate rationalism.

**FREETOWN**, a city of West Africa, capital of the British colony of Sierra Leone, about five miles from the Atlantic coast. It is located on the Sierra Leone River, 32 miles by rail from Songotown, and is surrounded by a low tract, which is separated from the inland by a chain of mountains. The chief buildings include a mission house, a supreme court, a cathedral, and a number of schools. It is an imperial coaling station and has a large export trade in palm oil, hides, India rubber, and fruits. The city has only about 200 European inhabitants. Population, 1908, 38,063.

**FREE TRADE**, the term applied to national and interstate commerce when it is unrestricted by tariffs or customs. Advocates of this system hold that commerce among the nations should be as unrestricted as the trade among the various states of the Union, or among the provinces of Canada, though some think that duties should be levied, but only to obtain revenue and without regard to the effect on domestic industries. Among the advantages argued in favor of such a system are that it is the method of nature, by which every individual has a right to buy in the cheapest market and sell in the dearest, and that attempts to check this right result sooner or later in an artificial commercial condition and cause financial disaster. It is held that the right of property implies freedom for every one to do the best he can with his own, so long as he does not infringe on the rights of others, and that protection benefits only a minority of a nation at the expense of a great majority. As to protecting infant industries, it is held by free traders that long experience has demonstrated that individuals benefited by a tariff system continue to advocate taxation for their personal gain, and that the institutions meant to be matured after years of paternal assistance never reach maturity. In 1846 Great Britain made a step toward free trade by opening the ports to the unlimited and untaxed admission of grain, and since then has gradually extended the free list until the commercial policy is practically one of free trade.

No great political party of the United States has yet advocated an absolute system of free trade. The free list has been enlarged greatly by placing on it commodities and raw materials not produced within the country, largely through the advocacy of a policy of *tariffs for revenue* only, thereby making the object rather one of collecting revenue than for the limitation or prohibition of imports. The principle of free trade is in direct opposition to a system of stimulating industry by *bounties* or lim-

iting importation by so-called *protection* or a protective tariff system. It is claimed on one hand that nations like England, consuming more of the principal products than they produce, thrive under a system of free trade, while, on the other hand, the countries producing largely the food and apparel products can be benefited best by a partial free list and limited tariffs, though local conditions largely tend to modify or restrict the particular legislation which is most essential to the common weal. In this respect the experience of Germany, where high tariff rates are maintained, furnishes numerous examples.

**FREE WILL**, the power to choose between two courses of conduct without external compulsion. The freedom of the will has long been a subject for discussion in theology and psychology. This controversy hinges upon the question whether the will is free to choose, or whether it is limited by various circumstances that make free choice impossible. Those who think the will is not free to act believe that it is influenced beyond control by various conditions and circumstances, that it acts in accordance with the natural law, that it is governed by previous activity and experience, and that these, acting separately or in unison, make free choice between alternatives impossible. On the other hand, it is argued that the will enables man to select for himself his own course of action and put forth force or effort for the execution of the course he has chosen. However, it is necessary to make choices and put forth effort in accordance with the fixed laws of nature. Only when man is conscious that he makes a free choice and acts accordingly, it is possible for him to feel responsible for his actions. According to this view, he may be prevented from executing his volitions by human interference, but in the matter of making the choice he is not subject to limitation.

**FREEWILL BAPTISTS**, a denomination of evangelical Christians founded by Benjamin Randall (1749-1808). He was a member of the Baptist church in South Burwick, Me., but began to differ from that denomination soon after entering the ministry. In 1780 he founded a new church at New Durham, N. H. The distinctive tenets of the Freewill Baptists are the doctrines of *free salvation* and *open communion*, as opposed to those of *election* and *closed communion*. This denomination is represented by organizations in Canada and the United States and has about 100,000 members. It is strongest in New England. Bates College at Lewiston, Me., is one of its many educational institutions. It has about 1,600 churches

and promotes missionary work through Sunday schools and numerous missions.

**FREEZING** (frēz'ing), the changing of a liquid into a solid under the influence of cold. A large body of water cannot be cooled below the temperature of 32° Fahr., since, when brought to that condition, the entire mass changes to ice. During the change from water to ice heat is liberated from the water, the amount being correspondingly greater than any other substance liberates in cooling. Consequently, an equal amount of heat disappears when ice is changed into water. All liquids solidify at a given temperature, known as the *freezing point*, which differs in the different liquids. Thus, water solidifies at 32°; mercury at -39°; sulphuric acid, at -40°; and alcohol, at -203°. The terms *melting point* and *point of fusion* are used interchangeably with the term *freezing point*.

Advantage is taken of the cooling produced by the solution of solids to obtain low temperatures, and freezing mixtures are made by combining solids, or liquids and solids, which, when mixed, dissolve and cause a reduction of temperature. A simple mixture of this kind consists of 33 parts of common salt and 100 parts of snow, with which a temperature as low as -5.8 Fahr. can be obtained. The most powerful mixture known, which will make alcohol of the consistency of oil or melted wax, is made by dissolving solid carbonic acid, or solid nitrous oxide gas, in sulphuric ether, giving a temperature of -120° to -200° Fahr. When matter passes from a liquid to a gaseous state, heat is again liberated, the degree of cold varying with the rapidity and extent of evaporation. See **Ice**.

**FREIBERG** (frī'bērg), a city of Germany, in the kingdom of Saxony, 35 miles southwest of Dresden. It is situated on the northern slope of the Erzgebirge, and is surrounded by a productive mining country. Commerce is facilitated by important railway and electric railroad lines. The manufactures include woollens, leather, fertilizers, machinery, and clothing. In the districts adjacent to the city are numerous smelters, which utilize the silver, lead, and copper mined in the vicinity. Freiberg is the seat of a gymnasium, a celebrated mining academy, and chemical and assay laboratories. It has a fine Gothic cathedral constructed in 1490, and contains the castle of Freudenstein. Gas and electric lighting, stone and asphalt paving, sewerage, waterworks, and a public library are among the municipal improvements. The city was made a part of Saxony in 1485. Population, 1906, 30,806.

**FREIBURG** (frī'bōōrg), a city of Baden, Germany, on the Dreisam River, 32 miles northeast of Basel. It has several beautiful specimens of Gothic architecture, the most important being the Gothic cathedral, which is built of red sandstone and rivals the noted Minster of Strassburg. This edifice has a tower 380 feet high and is remarkable for lightness and elegance. It was begun in 1122 and completed in 1513. It is the seat of the University of Freiburg, founded in 1457 by the Archduke Albert of Austria. This institution has 1,500 students and a library of 275,000. Other noteworthy buildings include the Ludwigskirche, the Rathaus, the Merchants' Hall, the grand ducal palace, and several theaters and museums. It has manufactures of clothing, potash, tobacco, paper, chicory, textiles, and machinery. Several railroads and electric car lines furnish ample means of communication, while many modern municipal facilities abound, such as telephones and electric lights. Freiburg was founded in 1090 and became a free city in 1120. It has belonged to Baden since 1806. Population, 1905, 74,098.

**FREIGHT** (frāt), the general name of merchandise in the process of transportation, either on ships or on railway cars. Originally the term was applied to the cargo carried by a vessel, and later it came to be used to designate the price paid to the charterer of a ship for the carriage of goods. Now it is used to describe the goods carried on land as well as on water. The conditions of carriage are usually set forth in a bill of lading, which is issued by the party receiving the freight to the shipper, and is evidence that the goods were received in the proper condition for carriage and delivery at some particular place. See **Carrier**.

**FREMONT** (frē-mōnt'), a city in Ohio, county seat of Sandusky County, on the Sandusky River, thirty miles southeast of Toledo. It is on the Lake Erie and Western, the Lake Shore and Michigan Southern, and other railroads, and has transportation facilities by electric railways and by navigation on the Sandusky River, being at the head of river navigation. Among the chief buildings are the county courthouse, the Birchard public library, and the high school. It is the seat of a normal and business college, and has city waterworks and gas and electric lights. The manufactures include flour, boilers, butter and cheese, woolen fabrics, machinery, and vehicles. It was a trading post as early as 1785 and became Fort Stephenson in 1812. The name was changed to Fremont in 1850, in honor of General Fremont. Population, 1900, 8,439.

**FREMONT**, a city in Nebraska, county seat of Dodge County, on the Platte River, 35 miles west of Omaha. It is on the Union Pacific and the Chicago and Northwestern railroads. The surrounding country is fertile and noted for its production of cereals and domestic animals. Among the chief buildings are the Fremont Normal School, the courthouse, the public library, and the high school. It has sewerage, electric lighting, graded and paved streets, waterworks, and telephone connections. The manufactures include flour, cigars, woolen goods, ironware, cured meat, machinery, and dairy products. It was settled in 1857 and incorporated in 1871. Population, 1900, 7,241.

**FRENCH AND INDIAN WARS**, the name usually applied to four wars between the French and the English in America. They occurred in the period of exploration and settlement, in the 17th and 18th centuries, and were due in part to conflicting claims in America and partly to divergent interests in Europe. The French had settled chiefly on the Saint Lawrence and Mississippi, and based their claims upon the theory that a settlement at the source of a river gave title to all the basin, while the English held the view that settlement on the Atlantic coast extended their right across the continent to the Pacific. Migration, induced by an expansion of the colonies toward the west, caused the rival claimants to build forts on the frontier, which soon brought on active hostilities.

1. *King William's War*, the first of this series, began in 1689, when William and Mary ascended the throne of England. War was declared between England and France and at once spread to the colonies. Governor Frontenac of Canada, in 1690, sent three expeditions against the English frontiers. These expeditions included many Indians, who killed and scalped a large number of the settlers. Sir William Phipps was sent with a fleet and 1,800 men against Acadia and Port Royal, both of which he captured, but they were retaken by the French in 1691. In 1696 the French took possession of Newfoundland and captured Andover and other points in Massachusetts, but the Treaty of Ryswick, in 1697, ended the war.

2. *Queen Anne's War* began in 1702, when the War of the Spanish Succession commenced in Europe. James Moore of South Carolina, with a force of whites and Indians, destroyed several Spanish settlements in Florida. The French made an attack upon Charlestown in 1706, but were repulsed. A body of Canadians and Indians obtained possession of many points in New England and punished the English

severely at Deerfield, and Haverhill, Mass. Three expeditions were sent by the English into Acadia, and the last of these, in 1710, proved successful. In 1713 the war was ended by the Treaty of Utrecht, which ceded Acadia, Newfoundland, and the Hudson Bay territory to England.

3. *King George's War* began in 1744, when the War of the Austrian Succession commenced in Europe. An attack was made by the French upon the northeastern settlement and privateers from Louisbourg, in Cape Breton, harassed the coast of New England. William Pepperell of Maine was sent with a force against Louisbourg, which was captured on June 17, 1745, after a siege of two months. Another expedition was organized against Quebec, but the Treaty of Aix-la-Chapelle terminated the war in 1748. By the terms of this treaty Louisbourg was restored to France, and the territorial conditions remained as they were before the war.

4. The *French and Indian War* was the American phase of the Seven Years' War, and was the final struggle between France and England for the possession of North America. France claimed the region west of the Alleghenies as part of the basins of the Mississippi and the Saint Lawrence, and had about 80,000 whites and the friendship of many Indians. The English had about 1,100,000 white colonists, but their people were divided into thirteen discordant governments. George Washington with a force of Virginian volunteers made an attack upon Great Meadows and was soon after compelled to surrender at Fort Necessity, a strategic point erected to defend the western frontier. In 1755 the English sent an expedition under Braddock against Fort Duquesne (Pittsburg), but they were attacked and completely routed. Other expeditions were made by way of Champlain and Fort Niagara with the view of capturing the French posts near Nova Scotia, but these proved unsuccessful. The English were defeated in all their projects until William Pitt became the head of the ministry in England, in 1757, when a general scheme was formed to conquer America. The following year Wolfe and Amherst captured Louisbourg, Forbes reduced Fort Duquesne, and Bradstreet captured Fort Frontenac. Ticonderoga and Crown Point were captured by Amherst in 1759 and Niagara was taken by Prideaux in the same year. General Wolfe captured Quebec as a result of the Battle upon the Plains of Abraham, in the same year, and the following year Montreal fell, thus completing the conquest of Canada. By

the Treaty of Paris, in 1763, France ceded all lands east of the Mississippi to England, and all the lands west of the Mississippi were ceded to Spain, while Spain ceded Florida to England. This war enforced the necessity of union upon the colonists and left Spain as the only rival of England in America.

**FRENCH BEAN**, a twining annual plant with alternate leaves, whitish flowers, and seeds more or less kidney-shaped. Several species are cultivated, the most common being the *Lima bean*. They are native to the East Indies, whence they were brought to Europe by the French, but are now grown very extensively in all countries.

**FRENCH BROAD**, a river of the United States, rises in Transylvania County, North Carolina, and flows through that State and Tennessee. It joins the Holston River four miles above Knoxville, after a course of about 200 miles. The country through which it passes is famed for its scenery, especially from Asheville to the Tennessee border, where many deep and beautiful gorges characterize the banks, some of which are 300 feet high.

**FRENCH CONGO** (kõŋ'gõ), a large colonial possession of France in West Africa, bounded on the north by Wadai; east and south by Egyptian Sudan and the Congo Free State; and west by the Atlantic, Kamerun (Cameroon), and Nigeria. It extends north to Lake Tchad and is separated from the Congo Free State largely by the Congo, the Uvangi, and the Welle rivers. The area is estimated at 590,000 square miles. A number of bays and many lagoons diversify the coast. The southeastern part is in the valley of the Congo, which is fertile and well timbered. Among the principal rivers are the Gabun, Sanga, and Ogowai. Although the country is valuable for its minerals and fertility of soil, the climate is unhealthful.

The native inhabitants are chiefly savage, engaging in hunting, fishing, and rude forms of agriculture. Among the exports are caoutchouc, ebony, palm kernels, coffee, redwood, ivory, palm oil, elephants' teeth, and drum opal. The French title to this possession is based on the explorations of M. de Brazza. He obtained concessions from the natives and occupied Gabun, a region along the coast which is now included with the colony. The country possesses valuable timber, fertile soil, and is susceptible to material development. Libreville, on the Gulf of Guinea, is the capital, whence the colonial government is administered under the direction of France. Other cities

are Mayumba, Baraka, Lambarene, Brazzaville, and Franceville. Population, 1906, 12,480,000.

**FRENCH GUIANA** (gě-ä'nà). See **Guiana**.

**FRENCH GUINEA** (gřn'ě), a colonial possession of France, on the western coast of Africa, between Sierra Leone and Portuguese Guinea. It extends inland to Senegal and the French territory in the Sudan. The area is about 106,200 square miles. It is largely a mountainous country, but has a favorable climate and valuable forests. The drainage is partly by the Niger and partly toward the west by the Grande. Among the chief productions are live stock, cereals, ivory, palm oil, India rubber gum, and sesame. The region was explored by the Portuguese at an early date, but the French have carried on a trade since 1685 and took possession of the country in 1869. It was made a separate colony in 1890. Konakry, on the island of Tombo, is the capital and chief port. It is connected with the mainland by a bridge. The estimated population, in 1908, was 1,460,500.

**FRENCH INDO-CHINA**. See **Indo-China**.

**FRENCH LANGUAGE**. See **France**.

**FRENCH REVOLUTION**, the political and military contest of France which overthrew the old feudal *régime* and the Bourbon monarchy. It began in 1789 with the meeting of the States-General and ended in 1799 with the establishment of the consulate, of which Napoleon Bonaparte was proclaimed consul for life in 1802. Previous to the Revolution, France was disturbed by a great spirit of unrest, which was intensified by the success of the American Revolution and the weakness of Louis XVI. The distress of the people had increased rapidly and the state of the finances became more desperate. Prominent men and women, who discussed political abuses and their remedies with dangerous fluency, crowded the royal palace and the salons of Paris. The government finally yielded to a general clamor for the reassembling of the States-General, and the election of members for the states took place with indescribable tumult. Meanwhile Paris was flooded with pamphlets upon the absorbing theme, and when the States-General met at Versailles on May 5, 1789, it ended the monarchy and was the immediate cause of the Revolution.

Great pomp was displayed when the States-General convened and much was expected from that body. It first undertook to settle the question of method in voting, which had formerly been by class instead of by poll. Under

this plan the clergy and nobles, acting together, had a decided advantage over the third estate, or the commons. Five weeks were spent in useless parleys, when the commons decided to be the national assembly, and proceeded to deliberate upon the affairs of the state without reference to the other bodies. Louis XVI. now suspended the meetings and convened a royal sitting, at which he ordered the members of the States-General to assemble in their respective rooms. The clergy and nobles obeyed, but the commons refused to have the Assembly dissolved and through Mirabeau declared: "We are here by the will of the people, and nothing but the bayonet shall drive us hence." This signaled the loss of the royal authority, and the clergy and nobles joined the third estate.

The royal authority having failed, no resource but submission or the bayonet was open to the king. The first wave of intense excitement passed over the country on July 12, when it was reported that Necker had been dismissed and troops were rapidly collecting at Versailles. Two days later the Bastille was stormed by an immense crowd, and many of the prisoners were murdered and their bleeding heads were borne on pikes along the streets. It was the first scene in the tragedy of the Revolution. Soon after the Assembly abolished all feudal rights and privileges and adopted a Declaration of the Rights of Man, which outlined the leading principles of a limited monarchy based upon a constitution. This was followed by the organization of the National Guard, but the Commune of Paris was fast getting control of the Revolution. A mob of men and women made an attack upon Versailles, where the royal guards were put to death, and the king and queen were required to return to Paris.

Although the king had taken an oath to support the new constitution, his sincerity was under suspicion, since concerted efforts were made by the émigrés (q. v.) to secure assistance from foreign powers as a means to end the Revolution. The king and queen escaped from Paris in 1791, but were arrested at Varennes, about seventy miles from Paris, and were forced to return. In 1791 the National Assembly had declared its members ineligible to reelection, which body was now succeeded by the Legislative Assembly. This body was made up of three powerful factions; the Girondists, who were republican; the Feuillants, who supported the constitution; and the Mountain, a party that was made up largely of demagogues and anarchists. Louis

unwisely dismissed the Feuillant ministry and appointed a Girondist cabinet, and war was soon after declared against the empire by Prussia and Austria.

The campaign against foreign enemies proved a failure, causing the breach between the king and the Assembly to widen. He soon dismissed the Girondist ministry and sought an alliance with friendly princes, but the Jacobins and Girondists instigated an insurrection. On June 20, 1792, a mob made an attack upon the Tuileries, but the leaders were persuaded to disperse the people. The second attack upon the Tuileries took place on Aug. 10, which was sacked and plundered by the frenzied mob. Louis threw himself upon the mercy of the Legislative Assembly, which was compelled by the mob to put him in prison and suspend him from office. On Sept. 20 the National Convention, as the next Assembly was called, met to take up the government. It included some of the most violent revolutionists, such as Danton, Marat, Camille Desmoulins, and Robespierre, and immediately abolished royalty and proclaimed the republic. The extremists finally carried a measure to confiscate the property of the nobles and priests, and promoted a policy favorable to the annexation of Belgium. A German army had previously invaded France, but was defeated by Dumouriez at Valmy. Louis was accused of plotting against the liberty of the people, and after a stormy debate was declared guilty and sentenced to die. He asked for a respite of three days, but was refused and executed while the crowd shouted *Vive la République!* This aroused the nations of Europe and a concerted organization was affected by Holland, England, Spain, and Germany to strangle the Revolution, which threatened to overthrow the royalties and aristocracies of Europe. The Austrians defeated Dumouriez, who soon after joined the allied camp against the revolutionists.

The government now organized the Committee of Public Safety and France was thrown into the Reign of Terror. The Jacobins, under the lead of Robespierre, ordered the Girondists arrested, and those who escaped were outlawed and pursued with unrelenting vengeance. All the prisons were crowded, some of the most illustrious citizens were condemned, and the guillotine was kept at work in every part of France. Among those executed were Madame Roland, Philippe Egalité, and Queen Marie Antoinette. Lavoisier, the chemist; Bailly, the astronomer; and De Noailles, the marshal of France, were among the many il-

lustrious persons who were hurried to the scaffold. Many churches and convents were plundered, tombs were rifled, Notre Dame was converted into a Temple of Reason, and red caps were worn to indicate that liberty had been enthroned. At length the terrorists were divided and Robespierre, who had been the most conspicuous figure among them, was beheaded on July 28, 1794. The Reign of Terror was now at an end, the Jacobin Club was disorganized, thousands of prisoners were released and the Terrorists were disarmed. Many defenders of the new republic volunteered to protect the frontiers against foreign invasions. The States-General was organized into two houses, the Council of Five Hundred and the Council of the Ancients, the former to propose and the latter to pass or reject laws. Executive power was lodged in a directory of five persons. Napoleon Bonaparte was called to defend the Tuileries. He planted cannon that swept the insurgents as they came within range of his pitiless guns, thus ending the last insurrection of the people.

**FRENCH SOMALILAND** (sō-mä'lê-länd), a colonial possession of France in the north-eastern part of Africa, bordering on the Gulf of Aden. It is bounded on the north by Eritrea, east by the Gulf of Aden, south by British Somaliland, and west and southwest by Abyssinia. The area is 45,000 square miles. The surface is hilly along the coast and much of the interior is an elevated plateau, ranging about 4,000 feet above sea level. Gold, coffee, ivory, and fruits are exported; and foodstuffs, machinery, tobacco, and cotton and silk textiles are imported. Jibuti, the chief port, is connected with the interior by a railway and is the seat of colonial government. A part of the possession has belonged to France since 1855, when Obok was made a French port. Subsequently the boundary was moved inland and treaties were made with Italy, England, and Abyssinia in the period of 1887-96, definitely fixing the boundaries. The government is administered by a governor, who is assisted by a general council of six members. Galla and Danakil races constitute the larger portion of the natives. Population, 201,500.

**FRENCHTOWN**, a village in Michigan, the site of which is now occupied by the town of Monroe, about 22 miles southwest of Detroit. It was the scene of a battle on Jan. 14, 1813, when an American force of 650 men under Colonel Lewis defeated a force of British and Indians under Major Reynolds. A second engagement occurred at the same place on Jan. 22, 1813. The British under Colonel

Proctor made an attack upon General Winchester, who now commanded at Frenchtown, and the Americans were compelled to surrender. Many of the latter were massacred by the Indians, hence the affair is sometimes called the Massacre of the Raisin River.

**FRENCH WEST AFRICA**, a territorial possession of France, including nearly all of the Sahara. It was made a governor generalship on Oct. 17, 1899, and in 1902 was divided into Dahomey, Ivory Coast, Senegal, French Guinea, Senegambia, and the military territory of the Niger. Government authority over all of these possessions is exercised by the governor general of French West Africa, who has his seat at Saint Louis, in Senegal.

**FRESCO** (frēs'kō), the art of painting with water colors on fresh plaster, or on a wall covered with mortar not entirely dry. The most satisfactory results are obtained when the plaster is laid on as the painting proceeds, since the unhardened fresh plastered walls permit the color to sink and form a more satisfactory surface. It was highly developed as an art by the ancients, and is now generally employed for large pictures on walls and ceilings. Numerous well-preserved frescoes are to be seen in many of the temples. Splendid specimens of ancient frescoes were found in Pompeii, Egypt, India, and Mexico, though the art was not brought to the greatest perfection until the rise of the finer Italian art in the 16th century. Many of the ancient paintings were executed in what is called *fresco secca*, which is quite distinct from genuine fresco, since it is executed on dry walls and ceilings, previously moistened with limewater.

**FRESNO** (frēz'nō), a city of California, county seat of Fresno County, about 40 miles north of Tulare Lake and 200 miles southeast of San Francisco. It is on the Southern Pacific and the Atchison, Topeka and Santa Fé railroads. The noteworthy buildings include the Carnegie public library, the Federal building, the county courthouse, and the high school. It has systems of waterworks, electric lighting, pavements and electric street railways. Among the manufactures are flour, furniture, agricultural implements, ironware, cigars, and wine. The surrounding country is fruit, cereal, sheep, and mineral producing. An abundance of water power is drawn from the falls of the San Joaquin River, about 30 miles distant. Population, 1900, 12,470.

**FRIAR**, a member of a monastic brotherhood, especially one who belongs to such mendicant orders as the Dominicans, Franciscans, Carmelites, and Augustinians. The term is

commonly used to distinguish members of modern religious communities in the Roman Catholic church from the older title of monk, which has special reference to the Benedictines and their branches. In reference to the clothing worn, the Dominicans were formerly called *Black Friars*; the Franciscans, *Gray Friars*; and the Carmelites, *Barred Friars*. The monks are generally called friars in Ireland.

**FRICTION** (frīk'shūn), in mechanics, the resistance arising when two or more bodies move while the surfaces are in contact. It is usually classified as *sliding* or *rolling*, the former being exemplified by the sliding of a sled or skate and the latter by the friction of the wheels of a wagon on the ground. All bodies have elevations and depressions, more or less prominent, and the projecting points of one body render movement more difficult by entering the cavities of the other. However, the intensity of friction depends to some extent upon pressure and slightly upon adhesion. Friction is greatest when a body at rest begins to move, thereby making it difficult for a force to displace the body, owing to its inertia being influenced by friction. The inertness is greatest in large and heavy bodies. Oil and other lubricants are used to lessen friction in machinery and instruments. Friction is a retarding force in nature, and gives stability to bodies which otherwise would be easily displaced. Since friction generates heat, it is one of the chief means of developing electricity.

**FRIDAY** (frī'dā), the sixth day of the week, following Thursday and preceding Saturday. It occurs on the same day as the Mohammedan Sabbath and is the day for general fasts and obligation in the Anglican, Greek, and Roman churches. Friday was named from Freya (q. v.), a Scandinavian goddess.

**FRIENDLY ISLANDS**, or **Tonga Islands**, an island group in the South Pacific Ocean, about 250 miles southeast of the Fiji Islands. The islands, about 150 in number, are divided into three groups by two narrow channels and have a total area of 390 square miles. Tongatabu, having an area of 125 square miles, is the largest and contains Nukualofa, the capital. About 30 of the islands are inhabited by friendly natives. They are partly of volcanic and partly of coral origin and have a fertile soil. A number of the volcanoes are active, including Tofoa, height 2,785 feet, and Late, height 1,790 feet. Copra, sponges, coffee, wool, and tropical fruits are the chief products. Manufacturing is in a primitive state, the

products including rude machinery, pottery, and wearing apparel used by the natives. Christian missionaries began active work in 1877, since which time the Christian cause has secured many adherents, schools have been established, and a general advance has been made in moral and intellectual development. The government is directed by a native Christian chief and is administered under a constitution, which provided for a representative parliament and a well-established judiciary. European customs, education, machinery, and utensils have been introduced to a large extent. The island group was discovered in 1643 by Tasman. It was visited in 1777 by Captain Cook, who applied the present name. The islands were declared neutral by the Declaration of Berlin in 1886, but Germany, Great Britain, and the United States held special treaties. In 1899, with the assent of Germany and the United States, Great Britain proclaimed a protectorate. Population, 1906, 21,661.

**FRIENDS, Society of.** See **Quakers**.

**FRIGATE** (frīg'ât), a name applied originally to a class of long vessels common in the Mediterranean, navigated with sails and oars. It is now used to designate warships that have a high speed and great fighting power. Many of the largest men-of-war belong to this class and carry from twenty to forty guns, sometimes more than that number.

**FRIGATE BIRD**, a tropical web-footed bird, related to the pelican and sometimes called frigate pelican and man-of-war bird. It is so named from its fierce attack upon other birds, especially when they are carrying articles of food. The bill is longer than the head, the tail has twelve large feathers and is forked, and the extent of wing is about seven feet. Birds of this kind have great power of flight and are frequently seen a thousand miles from land. They often fly in flocks so high that they are scarcely visible, but are very awkward in moving about on the land. These birds are common to the intertropical coasts of the Atlantic and Pacific oceans, and are rarely found north of South Carolina.

**FRISIANS** (frīzh'anz), an ancient German race that dwelt in the northwestern part of Germany, between the Rhine and the Ems. The Romans under Drusus made them tributary, but later they instigated several revolutions on account of Roman oppression. Subsequently their district was reduced to Friesland, but in the 9th century they obtained their independence, which they maintained until 1498, when their history became merged into that of Germany and Holland. They are an industrious

people, have a fine literature, and include a number of eminent historians, poets, and scientists. Modern Frisian is usually divided into East and West Frisian, but both branches have been influenced very largely by the German, especially by the *Platt Deutsch*.

**FROBISHER BAY**, an inlet on the southeastern coast of Baffin Land, about 20 miles wide and 200 miles long, and marked by precipitous, rocky shores. It is located about midway between Hudson Strait and Cumberland Sound, west of the southern point of Greenland, and at its entrance is Resolution Island. The fisheries are valuable, but the catching season is short on account of extremely cold winters.

**FROG**, a tailless amphibian animal which belongs to the leaping *Batrachians*. It has four legs, a flat head, a rounded nose, a very large

gelatinous mass with minute, black globules. By the end of April they have enlarged and hatched, the young being known as *tadpoles*. The tadpoles breathe by means of gills and have a tail, swimming about like small fish. Their hind legs appear first, later the fore legs, after which they remain dormant and the tail is absorbed, when they are said to "live on their tail." Soon after they quit the water and begin to breathe by lungs instead of gills. The process of breathing is carried on by the action of the muscles of the throat and abdomen.

All species of frogs are destitute of ribs. They make a loud, croaking sound, especially the bullfrog of North America, which grows to a length of fifteen to twenty inches. While frogs are usually green in color, they often have stripes or spots of dark-brown on the back, and the throat is yellow. The eggs of the frogs, like those of fishes, are fertilized after they are laid. Many people consider the hind legs of the American bullfrog excellent food. Several species known as wood frogs live in timber districts, frequenting the trunks and limbs of trees in search of food.

**FRONDE** (frônd), the name of a political faction in France which headed an insurrectionary movement during the latter part of the minority of Louis XIV. It was so named from *frondeurs*, meaning slingers, since their attacks upon Cardinal Mazarin were said to resemble the act of boys throwing stones with slings. The movement started in 1648, when the Parliament refused to register certain objectionable royal edicts that followed the breaking up of the

feudal system, and, when the king compelled that body to register, the people rose in defense of their rights. The struggle continued until 1652, by which time the nobles had won great constitutional reforms, but they had no definite object except selfish profit and were not directed by a strong leader, hence Mazarin regained his former power. As a whole, the War of the Fronde may be classed as a useless political and military contest, since the loss of advantages that had been gained temporarily contributed to make Louis XIV. an absolute monarch.

**FROST** (fröst), the minute crystals of ice formed directly from the vapor of water. At a temperature of 32° Fahr. the watery vapor becomes so cold that it cannot condense into water, but falls to the earth in the shape of frost instead of dew. This is known as *white* or *hoar frost*. The name is often applied to

METAMORPHOSIS OF THE FROG.

1, egg; 2, egg partly incubated; 3, newly hatched tadpole; 4, tadpole with gills; 5, outside gills replaced by internal ones; 6, tadpole with hind limbs; 7, tadpole with four limbs; 8, tadpole with rudimental tail; 9, adult frog.

mouth, and teeth on the upper jaw and palate. The hind legs are very long and stout and the feet are webbed. On the hind feet are five toes, while the front feet have only four. The tongue is thick and fastened in front to the lower jaw so the back part may be thrown out of the mouth very quickly, thus enabling it to catch insects, bugs, and various other forms of life on which it feeds. It swims by means of its hind legs and lives much of the time in the water. However, an adult frog cannot live wholly in the water, having lungs, thus being required to come to the surface at intervals to breathe. In winter it lies burrowed in the mud, and its harsh *croak* may be heard in spring as soon as the sun has loosened the frost.

The female frog lays from 600 to 1,200 eggs, usually in March or April, which consist of a

moisture hardened by cold after it has fallen in the form of dew, or to the inside of window panes in a warm room. Frost is very destructive to plants, as the water in the juices expands when it freezes and thereby bursts the vesicles. Clouds and smoke act as a covering to check radiation. Winds bring fresh masses of air into contact with the cold objects and prevent frost, which accounts for dew and frost falling most abundantly at night when there is little movement in the atmosphere. *Black frost* is caused by cold so severe that plants freeze and change color without showing any signs of hoar frost. A *frostbite* is a state of numbness of any part of the body of an animal, but especially of the extremities, by exposure to extreme cold. In like manner plants partially frosted are said to be frost-bitten. Slight frostbites in animals often cause chilblains, which are annoying but not very dangerous, but in severe cases gangrene may set in or they may result in permanent injury or even death. Rubbing and applications of snow or cold water are recommended as soon as the injury is discovered.

**FROSTBURG** (fröst'bûrg), a town of Maryland, in Allegheny County, in the western part of the State, on the Cumberland and Pennsylvania Railroad. The location is on a fine plateau between Dan's and the Savage mountains, about 2,150 feet above the sea, and the surrounding country has extensive coal mines and deposits of fire clay. It is the seat of a State normal school. The manufactures include brick, machinery, clothing, and cigars. Frostburg is popular as a summer resort. Population, 1900, 5,274.

**FRUIT** (früt), in botany, a mature ovary of a plant, which contains the seeds, especially such plant products as are pleasant to the taste and eaten by man and animals. Other parts of the flower, most frequently the calyx, sometimes remain after the flowering is over, undergo a further development, and form part of the fruit. All that is external to the seed in ripe fruit is called the *pericarp* and is the edible portion, except in such berries as grapes, gooseberries, and others, whose pulpy matter is formed from the placentas of the seeds. The value of fruit to man exceeds that of all other parts of plants. Among the more important fruits in the temperate climates are apples, peaches, plums, cherries, melons, apricots, mulberries, strawberries, raspberries, and others, while with those of the warmer regions may be included the dates, olives, figs, grapes, oranges, bananas, nuts, etc. Fruit is grown very extensively for the market, both in Canada and the

United States, although the latter country has a wider range of climate and produces a greater number of species than Canada. See **Horticulture**.

**FUCA**, Juan de (hōō-än' dâ fōō'kâ), a strait between the United States and British America, separating Vancouver Island from the State of Washington. It connects the Pacific Ocean with Puget Sound and the Strait of Georgia, the former lying south and the latter north of its eastern extremity. It is from 15 to 30 miles wide, about 100 miles long, and contains a number of islands. The Strait of Juan de Fuca was so named from Juan de Fuca, a Greek navigator, who discovered it about 1592.

**FU-CHOW**. See **Foochow**.

**FUCHSIA** (fū'shī-à), a genus of flowering

FUCHSIA.

shrubs native to Mexico, South America, and New Zealand, and so named from the discoverer, Leonard Fuchs (1501-1566), a German

botanist. About seventy species have been described. The calyx is funnel-shaped and four-parted, with the four petals set alternately, the style is long, and the stigma is capitate. Popularly they are called *ladies' eardrops*, from the appearance of the pendulous flowers. They are favorites as house and garden plants and thrive in a light, rich soil, though growing best in a mixture of loam and peat. New plants may be developed from young cuttings set in sand or loam.

**FUEL** (fū'ēl), the material with which a fire is fed, including various forms of carbonaceous matter, such as gaseous, liquid, and solid substances. The phenomenon of heat arises by combining fuel with oxygen, as by combustion, and forms an essential element for manufacturing and domestic purposes. Natural gas, common coal gas, and acetylene gas are used very extensively for heating, lighting, and manufacturing. Among the liquid fuels are alcohol, creosote, petroleum, shale oil, and various vegetable and animal oils. Each of these is employed with success for divers purposes, though petroleum and creosote constitute the principal kinds used in the large manufacturing establishments. Crude petroleum has come into extensive use on locomotives as well as steamboats. Alcohol is a valuable fuel where a small volume of heat, which can be easily regulated, is wanted for small manufacturing enterprises and in experiments. Among the solid fuels are wood, coal, peat, wood charcoal, and coke.

In pioneer settlements and countries destitute of mineral fuel, wood and its products are the principal forms used, though coal and its products constitute by far the most important fuel used in the great centers of manufacture, ocean navigation, railroad operation, and for heating purposes. The extensive natural gas deposits in America and Eurasia are having a marked influence, not only in propelling machinery, but in smelting and refining. Within recent years lighting by electricity has displaced the consumption of fuel for street illumination and largely as material for house lighting, especially in large centers of population. At the present rate at which electricity is coming into use for heating purposes, it is not improbable that some plan will be devised to displace many other forms by this inexhaustible agent.

**FUGITIVE SLAVE LAW** (fū'jī-tīv), the statutes of the United States which provided for the return of the slaves who escaped from the State in which they were held in servitude. The surrender of slaves that had escaped to another State was a matter of mere comity un-

der the colonial government as well as under the Articles of Confederation. Though the word *slave* is not used in the Constitution of the United States, a clause in Article IV. directs that escaped slaves be returned to their masters. In 1793 the first law of Congress was passed under this provision, and it directed that escaped slaves and criminals be returned. The provision imposing on magistrates of the states certain duties under Federal statutes led to some complications, but an attempt in 1818 to amend it failed. A new and more stringent law was provided by the Compromise of 1850, under which the refusal of the marshal to execute writs under the act subjected him to a fine. He was made liable for the value of slaves escaping from his custody, and those obstructing an arrest or attempting a rescue were made subject to a fine together with imprisonment. A commissioner who investigated and adjudged the prisoner a slave was allowed a fee of \$10.00, but only \$5.00 was paid to him, if the person was set free, and the testimony of the person claimed as a slave was never taken. These provisions caused a large number of free Negroes in the North to be kidnapped. Many northern states passed personal liberty laws, by which the breach preceding the Civil War was widened. The fugitive slave laws were not repealed until 1864.

**FUJIYAMA** (fō-jī-yā'mā), or **Fuju-San**, the highest elevation of Japan, situated on the island of Hondo, in the province of Suruga, about 60 miles west of Tokio. Its crater is 500 feet deep. The mountain was active at numerous times prior to 1707, but since then has been dormant. It has an elevation of 12,365 feet above sea level. The Buddhists hold it sacred and wander in large companies to its higher places of interest from July to September, when the snow is melted under the more direct rays of the sun. Many shrines and temples are maintained at different elevations.

**FULAH** (fōō'lā), a race of Negroes native to Africa, found chiefly in the basin of the Senegal River, but distributed more or less widely throughout the Sudan. The color is light brown; the stature, medium; the head, long; the speech, Negroid; and the hair, woolly, but not frizzled. They give evidence of considerable shrewdness and intelligence, and are skilled in manual labor and the manufacture of native clothing and utensils. In the eastern part of the Sudan they are mixed largely with the Ethiopian races.

**FULLER'S EARTH**, a kind of greenish-white clay found in many parts of Europe. It is formed chiefly from alumina, with which are

mixed lime, silica, and several other ingredients. This clay is much used by manufacturers in cleansing the oil from woolen fabrics, since it is much cheaper than soap.

**FULMAR** (fŭl'mär), a species of aquatic birds belonging to the petrels, native to the island of Saint Kilda and many of the Arctic coasts. These birds are about the size of a domestic duck. They feed on whale blubber, fish, and putrid animal matter. The fulmar is valued for the oil obtained from its stomach and for its feathers and eggs. The natives gather the eggs, considering them excellent as food. Several species of the fulmar are found in the Pacific Ocean, though they are larger than those native to the Arctic regions.

**FULMINATION** (fŭl-mĭ-nā'shŭn), the sudden decomposition of bodies by percussion or heat. It is accompanied by light and a loud report. Fulminates or fulminating compounds are explosives formed by preparing fulminic acid with gold, silver, platinum, mercury, or other bases. The percussion caps contain fulminate of mercury, which forms the priming. Fulminating powder is a mixture of niter, sulphur, and potash.

**FULTON** (fŭl'tŭn), a city of New York, in Oswego County, 25 miles northwest of Syracuse, on the New York Central and the Lackawanna railroads. It is located on the Oswego River and the Oswego Canal. A public library, waterworks, electric lighting and pavements are among the public improvements. It has an academy, a hospital, and several fine churches. The manufactures include cutlery, flour, condensed milk, and machinery. The first settlement on its site was made in 1791 and its present charter dates from 1902, when the villages of Fulton and Oswego Falls were united. Population, 1905, 8,847; in 1910, 10,480.

**FUNCHAL** (fŭn-shäl'), a city in the island of Madeira, of which it is the capital. It is located west of Morocco and southwest of Gibraltar, and is important as a Spanish coaling station. The chief buildings include an opera house, a cathedral, a museum, and the government building. Its site rises abruptly from the sea, hence many of the streets are narrow and steep, but they are nicely lighted by electricity and improved by grading. The harbor is well fortified and is the only port in Madeira that can be reached by large steamers. Its favorable climate has caused it to be popular as a health resort. Population, 1907, 20,986.

**FUNCTION** (fŭnk'shŭn), the term applied in the study of animal or vegetable life to designate the specific office or work which any organ or system of organs is intended to per-

form. The vital functions are those which are necessary to life. In the higher animals they consist of the specific office or work of the heart, brain, and lungs. The functions relating to the external world, such as voluntary motion and the senses, are called animal functions. On the other hand, the processes of assimilation, respiration, absorption, digestion, and expulsion are called natural or vegetative functions.

**FUNDY** (fŭn'dĭ), Bay of, an inlet of the Atlantic, separating Nova Scotia from New Brunswick. It is 165 miles long and has an average width of 35 miles. At its upper extremity it branches into Chignecto Bay and Minas Channel and Basin, which are separated from the Gulf of Saint Lawrence by a narrow isthmus. Navigation is rendered dangerous by tides that rise and fall rapidly from fifteen to seventy feet. Grand Manan and other islands are at the southern entrance. The Saint Croix and Saint John rivers flow into the bay. A ship railway connects Chignecto Bay with Northumberland Strait.

**FUNGI** (fŭn'ji), a large group of flowerless plants, which, in their different forms, are known as mushroom, toadstool, blight, mold, rust, smut, mildew, and by other appellations. Fungi are closely akin to the lichen, but are a lower order and occur in different situations, chiefly drawing their food from the objects on which they are found. Their structure is cellular and they are propagated by spores. Some species grow in green pastures and others on decaying trees, or on grasses or grains, which they destroy. Many thrive on books and other objects when they are stored in damp places and some are found on man and animals in certain diseases. Fungi are present wherever decay is going on. Many species grow very rapidly, springing up in a single night and dying as quickly, and some grow very slowly, adding to their main body year by year. Various forms of fungi are so small that they can scarcely be seen, while others measure several feet in circumference. Several species are used for food and some are valuable for medicine.

Fungi occur in all parts of the earth where it is not too cold for vegetable growth, but they are most plentiful in moist, temperate climates. Edible mushrooms, well-known species of fungi, grow wild in Europe and America, and are largely cultivated for food. Some species are grown in great quantities for the market. Truffles are fungi growing under ground like the potato and are used for flavoring sauces and meats. They commonly grow about a foot under ground in loose soil, where they are located by dogs trained to search for them as they do

for game. Truffles are about the size of a hen's egg, white or brownish in color, and rough and warty on the outside. They are native to Eurasia, but are grown in America. Mildew, rust, and smut grow on plants and destroy them, and are dreaded by gardeners and farmers. There is scarcely any plant that is entirely free from affection by fungus growths, the condition of climate having much to do with their effect. Mold grows on bread or cheese, while mildew appears under certain conditions on cloth or paper, destroying the fiber.

**FUR**, the short, soft coat of hair which covers the skin of many mammals. In some species the fur proper is found next to the skin and under the hairs, which are longer and coarser. Fur, in its usual trade acceptation, is a dressed skin containing the short, fine hairs and from which the long hairs have been pulled. Before it is fit for use, a skin must be thoroughly cleaned, steeped, and scoured in a bath of meal, alum, and salt, after which it is washed in soap and soda, cleaned and dried. Other methods are used to prepare for tanning. Furs are often colored, the fur of the seal being commonly changed from a dirty yellow to a rich brown. All the chief fur-bearing animals, such as the sable, marten, mink, ermine, beaver, and otter, are treated in special articles, which see. The use of furs or fur pelts for covering the body is coeval with the earliest history of all northern nations or tribes. Subsequently it grew into an article of barter and trade, first among themselves and then with their neighbors of more temperate climes, where it became an article of fashion, ornament, and luxury.

The fur trade, in the early history of America, gave rise to vast commercial ventures on the part of individuals and companies, who operated to facilitate settlement and the discovery of unknown wealth. Russia extended its dominion over Siberia to secure the rich fur trade. Practically the same motive induced the Dutch East India Company to turn its attention to America. The French, after establishing trading posts at Montreal and Quebec and exploring the Great Lakes, battled against England many years to retain possession of the region rich in fur-bearing animals. The Hudson's Bay Company, organized in 1670, had exclusive trade with the Indians nearly 200 years, but the royal grant was taken from it in 1868. Since then there have been private collectors and dealers throughout Canada, who compete in the open market for a share of the trade. This likewise is true of Alaska and other regions which are rich in furs. London and Leipzig are the most important fur markets of the world. The enterprise

in the United States, although quite extensive, has been conducted by individuals rather than corporations. The Alaska Fur Company holds two of the Aleutian Islands with exclusive right to kill not to exceed 100,000 fur seals yearly. New York City has the largest fur trade in America.

**FURLONG** (fûr'lông), meaning furrow-length, an English measure of 40 rods, perches, or poles, equivalent to one-eighth of a mile, or 220 yards.

**FURNACE** (fûr'nâs), a chamber in which fuel is burned for the production of heat. The heat generated in such structures is commonly utilized in steam engines, melting ores or metals, warming houses, baking bread, and making pottery. While there are various forms of construction, they should be so built that a perfect combustion of the fuel may be possible, and to apply effectually the greatest possible amount of heat. Unless the plans are carefully made, the heat will dissipate without being concentrated directly on the substance to be acted upon in the process of heating. The constructor must likewise aim to supply means whereby an operator can easily control at pleasure the degree of heat necessary. Furnaces are variously designated according to the draught applied. Those in which the draught is natural are called *air furnaces*, those into which a strong current of air is injected by artificial means are termed *blast furnaces*, and those in which a low arch roof is utilized to turn the flame upon the object against which the heat is to be directed are termed *reverberatory furnaces*.

Several classes of furnaces are in use for heating residences and other buildings, such as hot air, hot water, and gas furnaces. In hot-air furnaces the heat is radiated through large pipes into the apartments to be warmed, while in hot-water systems the pipes are connected with radiators in the different apartments, which are filled with water, and this is induced to circulate by applying the heat to a definite portion of the system, thus causing hot water to pass to the different rooms and the colder to flow back into contact with the heater. Heating by steam requires practically the same kind of apparatus. Gas furnaces are those in which gas is utilized for fuel. They are constructed in a manner that either hot air or hot water can be applied. In electric heating the current is obtained from a dynamo, which is propelled by steam generated through the agency of a furnace, or by water power. The outer framework of an electric heater is commonly of thin cast iron, having projections to radiate the heat. Coils of resistance wire, from which the heat of the elec-

tric current radiates, are within the framework. From five to twenty amperes are necessary to produce an equable amount of heat on a three-foot heater, on a 110-volt circuit. The heaters are placed where required, connected by wire, and so constructed that the current may be turned on or off by means of a switch, as in an incandescent lamp.

**FURNEAUX ISLANDS** (fûr-nō'), a group of islands between Australia and Tasmania, so named from Tobias Furneaux (1735-1781), who discovered them in 1773. They are located at the east end of Bass Strait. Flinders Island, the largest of the group, is 10 miles wide and 35 miles long. Cape Barran Island, the second in size, is separated from Flinders Island by Franklin Strait. These islands, for the purpose of local government, belong to Tasmania.

**FUR SEAL**, or **Sea Bear**. See **Seal**.

**FÜRTH** (für't), a city in Bavaria, Germany, six miles northwest of Nuremberg, at the junction of the Rednitz and Pegnitz rivers. It is a prosperous city and has extensive railway and electric railroad facilities. The chief buildings include the Church of Saint Michael, the public library, the Rathaus, and several secondary schools. It has a large trade in hops and merchandise. Among the manufactures are jewelry, toys, machinery, lead pencils, and scientific instruments. Gustavus Adolphus occupied it in 1632, but was defeated by Wallenstein at Alte Veste, three miles southwest of the city. Fürth has belonged to Bavaria since 1806. Population, 1905, 60,635.

**FUSAN** (fō-sän'), or **Pusan**, a city and seaport of Corea, on the southwestern coast of the peninsula, seven miles from the mouth of the Nan-tong River. It is connected with Seoul, the capital, by a railway and has a safe and commodious harbor, which is protected by Deer Island and several others. Many of the inhabitants are foreigners, chiefly Japanese, to whom the place is known as Kan (the post). It has a large trade in rice, fish, cotton, hides, and merchandise. Fusan has been an open port since 1876. Population, 1907, including Tong-nai, 39,865.

**FUSE** (fūz), or **Fuze**, a tube or casing filled with combustible material and used for igniting a charge in a mine, for blasting, and in discharging a hollow projectile. Fuses were invented as soon as hollow projectiles came into use, and are made in various forms appropriate to the purpose for which they are designed. In mining, blasting, and for submarine purposes a cord or tube which contains a slow-burning

composition is used, thereby allowing the operators time to get to a place of safety before it burns down to the charge. Many of these, such as the *Bickford fuse*, are covered with pitch, contain gunpowder, and burn at the rate of one yard in seventy seconds. *Percussion* and *concussion* fuses are used for hollow projectiles. The former contain a capsule charged with fulminate, which is exploded with a plunger, or its equivalent, when the projectile strikes, while the concussion fuse is designed to explode the charge when the shell strikes the object. Time fuses and mechanical fuses are used in some forms of torpedoes with dynamite, gun cotton, and other powerful explosives, and are adapted to burn at different times by cutting off a portion of the cord, or are timed by the character of the composition used. Electric fuses are used extensively in the newer implements of war and methods of blasting, and are adapted to ignite by passing an electric spark through them, thereby bringing the current in contact with the explosive composition within.

**FUSEL OIL** (fū'sěl), a heavy, inflammable product formed during the fermentation of molasses, potatoes, corn wort, beet roots, and the juice of grapes. In the rectification of spirits it is separated and occurs as an acrid, or oily, liquid, in the last stages of distillation. It has a peculiar odor, a pungent taste, and is poisonous, producing nervous depression and headache. Its presence in brandy, whisky, and other beverages can be detected by rubbing them on the hand, when ethyl alcohol will evaporate and the fusel oil may be readily recognized.

**FUSING POINT**, the degree of heat at which any substance begins to melt or liquify. Every substance can be fused at a certain temperature, which is the same in a given substance, if the pressure is constant and uniform, but is very different in different metals and substances. Whenever the fusing commences, the temperature of the body ceases to rise, no matter what the intensity or the source of the heat, and the temperature remains constant until the body is completely fused. On the Fahrenheit thermometer the fusing or melting point of mercury is placed at  $-37.80^{\circ}$ ; ice,  $+32^{\circ}$ ; butter,  $+89.6^{\circ}$ ; phosphorus,  $+109.4^{\circ}$ ; sulphur,  $+237^{\circ}$ ; tin,  $+395^{\circ}$ ; lead,  $+619^{\circ}$ ; zinc,  $+680^{\circ}$ ; antimony,  $+809^{\circ}$ ; silver,  $+1,832^{\circ}$ ; gold,  $+2,282^{\circ}$ ; and iron,  $+2,732^{\circ}$ . The term *vitreous fusion* is applied in the case of substances that melt gradually and have no definite point of fusion.

**FUSIYAMA**. See **Fujiyama**.

G

GADFLY

**G**, the seventh letter and the fifth consonant in the English alphabet. The Greek name *gamma* is an adaptation of the Canaanite term *gimel*, meaning camel. It has two sounds, the hard and soft, and is formed by placing the tongue against the roof of the mouth, then lowering the tongue and giving utterance to voice. The hard sound occurs before a, o, and u, as in *gate*, *god*, and *gun*; before the consonants l and r, as in *gloat*, and *groan*; when preceding e and i in beginning a word, as in *get* and *give*; and when final, as in *big*. The soft sound was unknown in Anglo-Saxon. It corresponds to ch, as in *church*, and is represented by g before e, i, and y, as in *gem*, *gin*, and *gymnasium*. G is silent before n, as in *gnat*. As a symbol it represents the seventh of the Dominical letters. In music it is the fifth note of the normal scale of C, called *sol*, and the lowest note of the grave hexachord.

**GABELLE** (gä-běl'), a French term derived from the German word *Gabe*, meaning gift or tribute, and applied to the duty imposed upon salt. It was first levied in 1286 as a means to protect the trade in salt, which was made a government monopoly. This tax was very unpopular, since it carried with it the provision that every family was compelled to purchase a certain amount of salt per week, and officers intrusted with the enforcement of the law collected it directly from the people. The law was finally repealed in 1790, owing to a widespread rebellion in some of the provinces.

**GABLE** (gä'b'l), the upper, exterior part of a wall at the end of a building, which receives the roof. It is triangular in form, the roof sloping from the ridge to the eaves, and comprises the gable end of the wall. In classical architecture, such as the Greek temples, it forms the pediment. During the Middle Ages the gable was usually narrow and pointed, owing to the construction of steep roofs. In Gothic

architecture it became quite ornamental, because of the introduction of various decorative features, including tracery and other ornamentations. Gables continue to be a prominent feature of residential buildings, especially in Europe, but in the newer buildings of cities they have been displaced largely by the walls in continuous blocks.

**GABUN** (gä-bōon'), or **Gaboon**, an estuary near Libreville, on the western coast of Africa, articulating with the Gulf of Guinea. It is fifty miles long and from seven to ten miles wide. The Comó and several other rivers flow into it and it is sufficiently deep for the largest vessels. The country surrounding it was formerly known as the Gaboon territory, which now forms a part of the French Congo. See **French Congo**.

**GADFLY** (gäd'flī), or **Horsefly**, the common name applied to various two-winged flies found in the woods and elsewhere during the

1, GADFLY; 2, BOTFLY.

hot weather. These insects are smaller than the botfly (q. v.). They suck the blood of man and animals and cause a large lump, which forms a tumor and secretes pus, wherever they feed for some time. The eggs are deposited in the skin of animals, and the young subsist upon the pus that exudes from the tumor. The mouth has six sharp needles. These constitute

a proboscis, or sucker, with which they penetrate the thickest skin. Many species have been described, including the common black gadfly. Another species, the mourning horsefly, has a greenish head and golden eyes.

**GADSDEN** (gădz'den), county seat of Etowah County, Alabama, on the Coosa River, sixty miles northeast of Birmingham. It is on the Southern, the Louisville and Nashville, and the Chattanooga Southern railroads. The surrounding country produces fruits, timber, and minerals, especially coal and iron. It has a number of fine schools and county buildings. The manufactures include flour, machinery, iron-ware, cotton goods, and tobacco products. Gadsden was settled about 1845 and incorporated in 1867. Population, 1900, 4,282; in 1910, 10,557.

**GADSDEN PURCHASE**, a tract of land which is now included in New Mexico and Arizona. It embraces an area of 45,535 square miles, and is bounded on the north by the Gila River, on the east by the Rio Grande, on the south by an arbitrary line, and on the west by the Colorado. The average width from north to south is 120 miles. It was purchased from Mexico in December, 1853, for the United States by Gen. James Gadsden for \$10,000,000, and the treaty was ratified the following year. The sale of this territory was opposed by many Mexicans and caused Santa Anna to be banished in 1855.

**GADWALL** (găd'wəl), or **Gray Duck**, a water fowl found in the northern part of both hemispheres, but confined chiefly to bodies of fresh water. It is smaller than the mallard and is a bird of passage. The flesh is highly prized as food. In autumn it moves southward, but returns early in the spring to breed in the northern part of the United States and the southern section of Canada. The color is black and white, but the feathers are variously shaded with brown, giving it a grayish appearance.

**GAEL** (gāl), or **Gail**, the name of the northern and western branch of the Celtic family of nations. They inhabited the highlands of Scotland, the Isle of Man, and Ireland. Those of the latter country were generally known as Gael of Erin and the others as Gael of Albion. The term Gaelic is now generally applied to the dialect spoken in the highlands of Scotland, which is a branch of the Celtic language, while the people of Ireland and the Isle of Man speak the Irish and Manx, respectively.

**GAETA** (gă-ă'tà), a fortified seaport city of Italy, on the Gulf of Gaeta, about seventy miles northwest of Naples. The city is located on a promontory, which is crowned by the tomb of

Manatius Plancus, who was a friend of Augustus. This structure, known as the Torre d'Orlando, is 160 feet high and is 158 feet in diameter. Gaeta was originally occupied by the Greeks, who constructed many fine public buildings, but it was later conquered by the Romans, who improved and fortified it. Later it was made a part of the Byzantine Empire, was annexed to Sicily in 1184, and was finally captured by the forces of Victor Emmanuel in 1861. Its importance is based largely upon its fortifications, though it has some industries and is visited by tourists for its historical associations. Population, 1906, 5,638.

**GAG RULE**, a name applied to any concerted effort to suppress the exercise of the right of a citizen, especially the right of petition. It originated in 1836, when Congress adopted a rule that all petitions be laid on the table unnoticed. This action was caused by many petitions for the abolition of slavery being presented to Congress. The gag rule was the result of a motion made by John C. Calhoun, but it tended to increase the desire to file petitions, and John Quincy Adams upheld the anti-slavery principles in Congress during ten years. The gag rule was finally rescinded on Dec. 3, 1844.

**GAINES'S MILL** (gānz'ěz), **Battle of**, one of a series of battles occurring in Hanover County, Virginia, during the peninsular campaign conducted by McClellan. A part of the Federal army crossed the Chickahominy under command of McClellan, while Fitz-John Porter occupied a position on the north bank of the river with a force of 35,000 men. Generals Lee and Stonewall Jackson made an attack on Porter, June 27, 1862, with a Confederate army numbering 55,000 men. The Federals were driven back with much loss after a two hours' struggle, and were finally forced to give way before superior numbers. Porter crossed the Chickahominy in rapid retreat, burning bridges behind him. His total loss was 6,387 men and 22 guns, and the Confederate loss was somewhat larger. The Battle of Cold Harbor was fought in the same vicinity two years later.

**GAINESVILLE**, a city in Texas, county seat of Cooke County, about eight miles south of the Red River and sixty miles north of Fort Worth. It is on the Missouri, Kansas and Texas and the Gulf, Colorado and Santa Fé railroads. The surrounding country is agricultural and stock raising. It has a county courthouse, a public library, a high school, and several fine churches. Among the manufactures are soap, ice, brick, flour, brooms, machinery, and utensils. It was settled in 1851 and incorporated in 1873. Population, 1900, 7,874.

**GALÁPAGOS** (gà-lä'pä-gös), an archipelago of volcanic islands in the Pacific Ocean, about 650 miles west of Ecuador, of which they comprise a possession. The group includes twelve islands of considerable size, of which Albemarle is the largest. The total area is 2,400 square miles. Much of the surface is mountainous, but the soil is productive. The climate is healthful and favorable to occupation by Europeans. Sugar, fruits, cattle, and goats are the principal products. The islands are remarkable for the presence of many birds, though the flora is limited. Many species of turtles and porpoises prevail and lizards and snakes are well represented. These islands were discovered in 1570 and Darwin explored them in 1836. The government of Ecuador has made a number of attempts to colonize the larger islands, but they are very sparsely settled. Population, 1909, 415.

**GALATIA** (gà lä'shī-à), the name anciently applied to an extensive region of Asia Minor, so called from a large number of Gallic inhabitants, who settled there about 277 B. C. The Gallic invaders of Greece in the 3d century B. C., under Brennus, not only took possession of Byzantium, but crossed the Hellespont, and subdued a large portion of Phrygia and Troas. Later they were confined to certain districts by Attalus, King of Pergamus, the settlements being bounded by Phrygia, Lycaonia, Pontus, Cappadocia, Paphlagonia, and Bithynia. The Galatians retained their old Celtic language more or less distinctly for several centuries, were twice visited by Saint Paul, and produced numerous scholars. In government they were divided into three tribes and twelve tetrarchies, each being under a chief. Saint Paul addressed one of his epistles to the churches in Galatia.

**GALATIANS** (gà-lä'shānz), **Epistle to the**, a book of the New Testament, addressed by Saint Paul to the churches of Galatia. Many Hebrew converts belonged to the churches of Galatia and they had incorporated Jewish rites with the ordinances of Christian worship. Paul recalls them to the simplicity of the Gospel in this epistle, in which he vindicates his apostolic commission, urges the doctrine of salvation as the cardinal truth of Christianity, and concludes with exhortations and a benediction. It is thought that this epistle was written earlier than those addressed to the Thessalonians.

**GALATZ** (gä'läts), or **Galacz**, a city of Rumania, in Moldavia, on the Danube River, 85 miles above the Sulina mouth. It is situated between the mouths of the Perth and the Sereth and is important for its railroad and river transportation facilities. The trade consists chiefly

in grain, tallow, wine, cheese, wool, and fruits. Among the manufactures are clothing, earthenware, machinery, cigars, and leather. It is the seat of a bishop and several schools. Among its principal buildings are a convent, a hospital, several Greek churches, and a number of large bazaars. It has been the scene of many battles between the Turks and Russians. In 1883 it was made a free port. Population, 1907, 65,503.

**GALENA** (gä-lē'nà), or **Lead Glance**, the sulphurate of lead, the ore which furnishes most of the lead of commerce. Pure galena contains 13.3 per cent. of sulphur and 86.7 of lead, but it is usually mixed with a small proportion of copper, silver, zinc, antimony, or selenium. The color resembles that of lead, but it has a metallic luster. It is usually found massive, but sometimes granular or crystallized. The fragments are cubical, into which it is easily broken. It is found in beds, veins, and imbedded masses, frequently accompanying other metallic ores. *Argentiferous galena* is the name applied to deposits that contain a large proportion of silver. Deposits of galena occur in many parts of Canada and the United States, especially in the Rocky Mountains. It is mined near Galena, Ill., in Missouri, Colorado, Wisconsin, British Columbia, and other sections of North America.

**GALENA**, county seat of Jo Daviess County, Illinois, on the Fevre River, eighteen miles southeast of Dubuque, Iowa. It is on the Chicago, Burlington and Quincy, the Illinois Central, and the Chicago and Northwestern railroads. The noteworthy buildings include the county courthouse, the public library, the Federal building, and the high school. Grant Park contains a statue of U. S. Grant. The surrounding country is agricultural and produces zinc, lead, and other minerals. Among the manufactured products are furniture, ironware, boots and shoes, machinery, brick, cigars, dairy products, and woodenware. The city has electric lighting, a sewerage system, and waterworks. Ulysses S. Grant resided in Galena a number of years. It was settled in 1827 and incorporated in 1839. Population, 1910, 4,835.

**GALENA**, a city in Cherokee County, Kansas, in the southeastern part of the State, seven miles west of Joplin, Mo. It is on the Missouri, Kansas and Texas, the Saint Louis and San Francisco, and other railroads, and is surrounded by a lead and zinc producing country. The chief buildings include a public library and several fine public schools and churches. It has a foundry, grain elevators, and several smelters. The vicinity was first

settled in 1877 and owes its development largely to its mineral interests. Population, 1900, 10,158; 1905, 6,449.

**GALESBURG** (gālz'bürġ), a city and the county seat of Knox County, Illinois, about 163 miles southwest of Chicago, on the Chicago, Burlington and Quincy, the Atchison, Topeka and Santa Fé, and other railroads. The surrounding country is agricultural and dairying, and contains an abundance of bituminous coal deposits. It has a fine county courthouse, a public library of 25,750 volumes, and a park. The institutions include Knox College, Lombard University, Saint Joseph's Academy, and the Ryder Divinity School. Among the municipal facilities are paved streets, gas and electric lighting, electric street railways, and a system of city waterworks. The manufactures include flour, brooms, carriages, tobacco, steam engines and boilers, and farming machinery. Population, 1900, 18,607.

**GALICIA** (gā-līsh'ī-ä), a province of Austria, whose boundary is formed by Russia on the north and east, and by Bukowina, Hungary, and Silesia on the south and west. It has an area of 30,315 square miles. The Carpathians trend between it and Hungary. Its chief rivers are the Dniester and several tributaries of the Danube and Vistula. Among the principal products are cereals, beef and dairy cattle, horses, poultry, fruits, silk, and divers manufactures. The minerals include coal, alabaster, copper, rock salt, iron, marble, and calamine, of which iron and rock salt are the most important. The inhabitants consist chiefly of two Slavic peoples, the Poles and Ruthenians, but they include many Germans and Greeks. A well-organized public school system is maintained, which terminates in the celebrated universities of Lemberg and Cracow. Lemberg is the capital. Among the other important cities are Cracow, Przemyśl, and Tarnopol. Extensive lines of railroads and navigable streams facilitate commercial intercourse. Owing to its productive soil and other natural resources, the province holds a position of importance in the Austrian commonwealth.

Galiccia was originally inhabited by Germanic peoples, but the Poles and Ruthenians immigrated in large numbers in the Middle Ages. In the 12th century it was made an independent state, but it soon became tributary to Poland. In 1772, at the first partition of Poland, it was annexed to Austria. It has been the scene of many revolts, but still remains a crown land of the house of Hapsburg. Population, 1906, 7,412,399.

**GALILEE** (gāl'ī-lē), the name applied an-

ciently to one of the four Roman divisions of Palestine. It was bounded by the Jordan River on the east, by Samaria on the south, by the Mediterranean and Phoenicia on the west, and by Syria and the mountains of Lebanon on the north. The northern portion is wooded, but the lower part is level and exceedingly fertile. In the time of Christ the former was usually called Upper Galilee and the latter was known as Lower Galilee. At present the whole of Galilee is included in the vilayet of Syria. Within this region were situated the twenty towns given by Solomon to Hiram, King of Tyre, as compensation for his assistance in building the temple.

Galilee was the early seat of Christian influence and its four towns, Nazareth, Capernaum, Nain, and Cana, are closely associated with the life and travels of Christ. The inhabitants consisted chiefly of Greeks, Syrians, Phoenicians, Arabs, and Jews, and occupied themselves largely as fishermen. They were held in contempt by the educated Jews because of their simplicity of manner and lack of education, on account of which the name Galileans was early applied to Christians. Galilee became the seat of the Jewish doctors of law after the destruction of Jerusalem, and Jewish learning centered largely at Tiberias. Numerous ruins still exist in some portions of Galilee, though most of the region is populated by a destitute people and the towns are stricken with poverty and indolence.

**GALILEE, Sea of**, an inland lake of Syria, also called Sea of Tiberias, Lake of Gennesaret, and Sea of Chinneroth. It is situated on the east central boundary of Palestine. The surface is 682 feet below the Mediterranean sea. Its extent from north to south is twelve miles; width, seven miles; and general depth, 825 feet. The basin is of volcanic origin, the water is fresh and cool, and the northern and eastern coasts are precipitous and barren. It receives the inflow from the Jordan and several other streams, abounds with edible fish, and is known for its association with many important events connected with Christ and the apostles. The region surrounding the lake was densely populated in the time of Christ, though at present there are only the remains of ruined towns, including Capernaum, Magdala, Tiberias, and several others of minor importance. A railroad line connects the lake region with the Mediterranean Sea, and offers assurance that at least a limited amount of prosperity will come to the people within the next few decades on account of increased commercial, fishing, and manufacturing enterprises.

**GALION** (gāl'i-ŭn), a city of Crawford County, Ohio, eighty miles southwest of Cleveland, on the Erie and the Cleveland, Cincinnati, Chicago and Saint Louis railroads. The surrounding country is cereal, fruit, and stock producing. It has a public library, a fine high school, and several costly church and business buildings. Among the manufactures are vehicles, ironware, flour, pottery, brick, tobacco, and machinery. It is well improved and has many modern facilities, such as electric lighting and street pavements. The place was platted in 1831 and incorporated in 1878. Population, 1900, 7,282.

**GALLAS** (gāl'lās), or **Oroma**, a race of Ethiopian people who inhabit the eastern part of Africa, chiefly south and east of Abyssinia. They seem to hold an immediate place between the Negroes and the Arabians. Their color is dark brown, their hair is strong and frizzled, and their eyes are small. In stature they are generally large and well formed, the lips are moderate, and the nose is quite straight. Some writers think the Gallas among the best developed races of Africa. They are engaged chiefly in agriculture and stock raising. A majority are pagans, but quite a number belong to the Mohammedan faith and to the Christian church of Abyssinia.

**GALL BLADDER**, a pear-shaped sac attached to the liver, lodged in a groove on the lower side of that organ. It contains the bile, which is stored for a brief time, or as needed for use in digestion. The bile enters through the cystic duct into the gall bladder, where it becomes viscid and of a darker color, and passes from it to the gall duct when the food enters the small intestines. Three coats compose the walls of the gall bladder: the inner or mucous coat, the intermediate or muscular coat, and the serous or outer coat. The sphincter muscle, which opens and closes the opening into the duodenum, is subjected to a reflex movement when the bile is discharged. See **Bile**.

**GALLEY** (gāl'ly), a vessel formerly used extensively in the Mediterranean. It is low and flat-built, has one deck, and is navigated with sails and oars. The length varied from 100 to 200 feet, the medium sizes being known as half galleys and the smallest as quarter galleys. On each side were twenty oars, which were worked by several men, and there were two masts covered with lateen sails. The *gal-leasses* were the largest in size. They had beams thirty feet long, carried three masts and about twenty guns, and were propelled by about 250 rowers. In the reign of Charles VI.

they were introduced into France, but were abolished in 1748 by Louis XV. These vessels were used for offensive and defensive warfare, and in the time of peace served in furthering commercial enterprises. Similar vessels were kept by the ancient Greeks and Romans for war purposes, but during the time of peace they aided in commerce and colonization along

· VENETIAN GALLEASS.

the seacoast. In printing, a galley is an oblong tray, used to receive the type from the composing stick, and which serves to arrange it in a column or page. The galley has a flange, about one-half an inch in height, on both sides and at one end. After being taken from the galley to the imposing stone, the type is arranged in a chase.

**GALLIPOLI** (gāl-lēp'ō-lē), a seaport city of European Turkey, in the vilayet of Adrianople, 125 miles southwest of Constantinople. It is located at the northern end of the Dardanelles and was once strongly fortified, but its commerce has declined and the fortifications are in a dilapidated condition. The streets are irregular and poorly paved, but it has a number of fine bazaars and many mosques. The manufactures include cotton and silk goods, leather, clothing, and utensils. The town was of great importance in ancient times, since it commands the entrance into the Sea of Marmora. The Turks captured it in 1354 and in 1854, during the Crimean War, it was the landing place of the allied forces. Population, 1906, 28,590.

**GALLIPOLIS** (gāl-lī-pō-lēs'), a city of Ohio, county seat of Gallia County, 56 miles southeast of Chillicothe. It is located on the Ohio River and on the Toledo and Ohio Central and other railroads. The surrounding country contains valuable coal deposits. The manufactures include stoves, furniture, leather, and machinery. Waterworks, electric lights, and sewerage are among the improvements. It is the seat of Gallia Academy, has a public library, and contains several fine schools and

churches. It was settled by French colonists in 1790 and was chartered as a city in 1865. Population, 1900, 5,432.

**GALLIUM** (găl'li-ŭm), a chemical element discovered in 1875 by the French chemist Lecoq de Boisbaudran. It resembles aluminium in the character and composition of its compound, and is obtained in a number of zinc blends, especially on the Rhine. It has a gray color and a brilliant luster, and may be hammered into thin plates that do not break easily by bending. See **Chemistry**.

**GALLON** (găl'lŭn), a measure of capacity used in measuring liquids. The standard gallon, sometimes called wine gallon, contains 231 cubic inches and is used in the United States. It is equal to 8.3388 avoirdupois pounds, or 3.7853 liters. A gallon contains four quarts and is equal to eight pints, or thirty-two gills. The English imperial gallon contains 277.274 cubic inches and is equal to ten pounds avoirdupois of distilled water.

**GALLS**, or **Gallnuts**, the abnormal growth produced on growing plants by a number of insects or closely allied mites. These insects deposit their eggs in the bark or leaves, and within the galls that subsequently develop are nourished and developed the young in certain stages of their growth. The deformities vary in form, color, and texture, ranging from the simple pouchlike bulging of the leaf to the most imperfect and complicated structure. Many gallnuts are important as articles of commerce, especially those obtained from the dwarf oak in Western Asia. They are brought to America principally from Syria and Asia Minor, and vary in size from that of a pea to that of a nutmeg. Those gathered when of good size, but before the insect by which they are caused has eaten its way out, are the best commercial product. They are known as *black* or *blue galls* and are rich in gallic acid, which is used in medicine and for the manufacture of ink and dyes. Those gathered after the insect has escaped are called *white galls* from their lighter dingy color. Those engaged in the enterprise of cultivating trees for their galls examine them carefully about the season of gathering, in order that they may be collected in their best condition. Gall insects are very numerous. They include the gadfly, the sawfly, and some species of mites, aphides, and spiders.

**GALLSTONES.** See **Bile**.

**GALT** (gălt), a city of Ontario, in Waterloo County, on the Grand River, 54 miles from its entrance into Lake Erie. It is on the Canadian

Pacific and the Grand Trunk railways and is surrounded by a fertile region. Waterworks, electric lighting, and street pavements are among the public utilities. The manufactures include flour, woolen goods, ironware, edge-ware, and machinery. It has a considerable trade in produce and merchandise. Several educational institutions, including a collegiate institute, are located here. It was named from John Galt, the Scotch author. Population, 1901, 7,866.

**GALVANIC BATTERY** (găl-văn'ik), or **Voltaic Battery**, a combination of two metals in a liquid chemically acting upon one to a greater extent than the other. The discovery is due to Luigi Galvani (q. v.), from whom the name was applied. In experimenting with the legs of recently killed frogs he noticed that, when hung up against an iron balustrade and the large nerves of the frogs' legs were brought in contact with the metal, they twitched as violently as in life. This phenomenon was due to bringing the muscles into electric connection.

He ascribed the action to a vital fluid, which he thought came out of the nerves and flowed through the iron to the muscles. The experiments attracted the attention of Volta, a distinguished physicist of Pavia, who showed that these movements were caused by electricity and constructed an arrangement called a *voltaic battery* or *pile*, by which powerful continuous currents could be readily produced.

The simplest form of the voltaic cell consists of a plate of zinc and a plate of copper immersed in water containing sulphuric acid. The accompanying illustration shows a single voltaic cell and a battery of two cells, showing the method of coupling up the plates of continuous cells. No action takes place, if the zinc is pure, until a complete circuit is made by connecting the plates with a wire, but the plates must not come in contact with each other in the liquid. The action occurs between the liquid and the zinc, and hydrogen gas is seen to escape in mi-

nute bubbles from the copper. This gas, being produced by the current of electricity, continues to flow in the circuit as long as the chemical action continues. In this simple voltaic cell the end of the projecting copper plate is the positive pole or terminal, and the corresponding end of the zinc plate is the negative pole or terminal.

Many forms of voltaic cells are in use, but usually they are arranged in two classes—single-fluid cells and double-fluid cells. In the former only a simple electrolyte is employed, and in the latter two different electrolytes are used, one for each element of the voltaic couple. Ordinary zinc is impure and, when the circuit is broken, is wasted by the electrolyte acting upon it. This tends to weaken the strength of the current when the circuit is replaced. The waste may be averted by amalgamating the zinc, which is done by dipping it in acid and then rubbing mercury over its surface. A battery consists of two or more voltaic cells so connected as to secure a stronger current than can be obtained from a single cell. By constructing a battery with a large number of cells it is possible to overcome a powerful resistance or to supply a strong current.

**GALVANISM** (gäl'vâ-nîz'm), the branch of electric science which treats of current electricity arising from chemical action, as distinguished from that generated by heat or induction. The term came into use from Galvani, the discoverer of animal electricity. See **Galvanic Battery**; **Electricity**, etc.

**GALVANIZED IRON** (gäl'vâ-nîzd), the name given to iron which is covered by a coat of zinc, with or without galvanic deposition. Properly galvanized iron is a sheet of iron first plated with tin and then immersed in a sal ammoniac and zinc mixed fluid, which forms another coating. Less properly the iron is cleaned by diluted acid and friction, heated, and, without any galvanic current, is plunged into a bath of melted zinc covered with sal ammoniac and stirred until the surface becomes coated with zinc. Articles made of galvanized iron, such as household utensils, fencing wire, roofing sheets, and water pipes, are proof against corrosion as long as the iron is covered with the coating.

**GALVANOMETER** (gäl-vâ-nöm'ê-tër), an instrument used for measuring or indicating delicate currents of electricity. Many forms of this instrument are in common use, but all of them take advantage of the force exerted by currents on movable magnets in their neighborhood. The common form consists of an electromagnet, on which a magnetic needle is balanced. The direction of the current is indicated as the

needle is turned toward the right or the left, and a scale of degrees indicates the strength of the current as the needle moves. In the tangent galvanometer, which is used to measure stronger currents, the conducting wire is carried in the circumference of a circle entirely around the needle so that its diameter is ten or twelve times the length of the needle. The current in these instruments is proportional, not to the angle through which the needle turns, but to the tangent of the needle.

**GALVESTON** (gäl'vës-tün), a city of Texas, county seat of Galveston County, on Galveston Island, at the entrance of Galveston Bay. It is on the Southern Pacific, the Missouri, Kansas and Texas, the International and Great Northern, and other railroads, and has direct steamboat connection with the leading ports of America and Europe. The bay is from ten to twenty miles wide and about thirty miles long, and the island has a width of three miles and a length of about thirty. An extensive breakwater has been constructed to protect the harbor, which affords unexcelled anchorage for the largest vessels. Intercommunication is by a network of electric railways, with which are connected several suburban and interurban lines. The city is protected from overflows by a sea wall of cement and concrete. This structure, completed in 1904, is 17,595 feet long, five feet wide at the top and sixteen feet at the base, and is seventeen feet higher than the mean low tide.

The city has an area of about fourteen square miles and is built mainly toward the inland side of the island. It has well-improved streets, especially the newer part, where much has been done to raise the surface by grading. Among the noteworthy buildings are the county courthouse, the customhouse and post office, the Ball High School, the Rosenberg Library, the Masonic Temple, the Y. M. C. A. building, and many business houses and hotels. It is the seat of the medical department of the State University, two Roman Catholic academies, Saint Mary's Hospital, two orphan asylums, and other institutions. A railroad bridge nearly two miles long connects the island with the mainland.

As a cotton market Galveston is one of the most important centers in the United States, while its trade in lumber, wool, live stock, and cereals is correspondingly large. Among the manufactures are flour, ironware, beverages, cotton-seed oil, clothing, fabrics, and machinery. It ranks second in exports among the exporting cities of the United States and its exports of cotton are paralleled only by those of New Orleans. The municipal improvements, such as

gas and electric lighting, waterworks, sewerage, and pavements, are well established. Galveston was settled in 1837 and incorporated in 1839. General Magruder captured it for the Confederates in 1863. In 1900 a large part of it was destroyed by a severe storm, but it was rebuilt with an enterprise equaled only by the activity of its business men. Population, 1910, 36,981.

**GALVESTON BAY**, an inlet on the southeastern shore of Texas, extending about thirty miles inland from the Gulf of Mexico. It is separated from the latter by Galveston Island, which is connected with the mainland by a railway, whose terminus is at Port Bolivar, opposite Galveston. The area is about 450 square miles.

**GALWAY** (gäl'wä), a seaport city of Ireland, capital of Galway County, 120 miles west of Dublin. It is located at the mouth of the Corrib River, on the northern shore of Galway Bay, and has a large export trade in wool, fish, marble, and agricultural produce. The manufactures include flour, canned fish, ironware, and spirituous liquors. The older part of the town has crooked streets, but the newer part is well platted and built of substantial material. Among the chief buildings is the Church of Saint Nicholas, founded in 1320. It has a fine county courthouse, five nunneries, and three monasteries, and is the seat of Queen's College. The city has railroad and electric railway facilities, waterworks, and gas and electric lighting. The Irish language is spoken by many of the people. Population, 1906, 13,634.

**GALWAY BAY**, an important bay on the western coast of Ireland, extending inland from the Atlantic, between the counties of Clare and Galway. It is from six to twenty miles wide and thirty miles long, and at its entrance are the Arran Islands. Galway, a seaport of western Ireland, is situated on the northern shore.

**GAMBIA** (gäm'bī-ä), the oldest and most northerly British colony on the west coast of Africa. It has an area of 69 square miles. The surrounding sphere of influence tributary to Gambia comprises with it a colony and a protectorate of 3,061 square miles. Rice, cotton, corn, hides, beeswax, and rubber are exported. The district contains some exceedingly fertile tracts of land, though much is unproductive. As a colonial possession it is important mainly on account of commanding the Gambia River, which furnishes extensive means for interior navigation and trade. The government is administered through a local executive and a legislative council. Bathurst, situated on the island of Saint Mary, is the chief town and has 7,500 inhabitants. Only a comparatively few

of the inhabitants are whites, about 200, and a majority of the natives are Mohammedans. A considerable missionary work has been done by the Christian churches. The slave trade was abolished in 1906. Population, 1906, of the colony, 13,945; of the protectorate, 77,284.

**GAMBIA**, an important river of Western Africa, rises in the mountains north of Liberia, flows in a northwesterly direction to the Atlantic, and has a total length of 725 miles. The estuary has a width of 25 miles some distance from its mouth, but at the place where its waters join the Atlantic it is only about two miles wide. The lower valley is overflowed in the rainy season, leaving rich alluvial deposits, which greatly enhance the annual productions. Vessels navigate the river for 650 miles from June to November, but large craft sail only about 90 miles inland.

**GAMBLING** (gäm'blīng), the practice of playing a game of chance for pecuniary profit. It was the custom in very early times to exercise some legal control over the sports and pastimes of the people, especially those involving an element of game or gambling. Certain games were reserved for people of the higher classes in society, or were prohibited altogether. In modern times legislation has been directed toward suppressing the games that are considered dangerous to life, as well as those in which gambling is made the direct object. *Betting* is a form of gambling and is prohibited in most countries, though prizes are permitted, such as those awarded to the winner in a foot race or to the successful side in a game of ball. The laws of England and the United States provide a penalty for those who keep a gambling house as well as for those who actually engage in gambling.

**GAMBOGE** (gäm-bōōj'), a gum resin used in painting and for lacquer work. It is obtained from the gamboge tree, which is native to the East Indies and Southern Asia. It grows to a height of forty feet and has oval leaves, small flowers, and clusters of edible fruit. The gum resin is obtained by making an incision in the tree, when the gamboge exudes as a yellowish juice, and after exposure to the air becomes hard. It is collected in earthen vessels and left to thicken, or is poured when semi-fluid into the hollow joints of the bamboo, thus giving it the form of cylindrical sticks. The finer quality of gamboge is brittle and of a reddish-orange color, has no odor, and is acrid to the taste. Powdered gamboge has a bright yellow color. Several species of trees in Mexico yield gamboge, but the quality is inferior to that obtained from Asia.

**GAME**, the general name applied to birds and animals that are hunted for their flesh or for various commercial purposes. These animals are pursued and captured by some persons as a vocation and for purposes of recreation. *Game laws* have been enacted to regulate the hunting of game, otherwise many species of useful animals would be exterminated by useless destruction. At first legislation was directed more particularly to prevent hunting for a brief period during the breeding season, but now the laws are more stringent and either prohibit killing some animals at any time, or limit the hunting seasons to a short period each year. In some countries it is required that a license be taken out before any kind of game can be killed, while in others hunting under any circumstances is prohibited. The ruthless destruction of the buffalo and elk has exterminated them in the hunting grounds and they are found at present only in parks and reservations. Such animals as the quail, deer, duck, goose, brant, and grouse may be hunted only at certain seasons, depending upon the locality and the habits of the species.

*Game preserves* are grounds set apart for breeding and protecting of game. They are either private or public. Private preserves are very numerous in Europe, where the wealthy maintain them to breed and hunt useful species. Such estates are the property of the nobles, especially in Germany, Austria-Hungary, and Great Britain. Many large preserves are maintained in Canada and the United States, in which it is aimed to protect the primeval scenery as well as many species of game. The Roberval Club of Canada has a preserve of 500 square miles in the Laurentian Mountains, and the most notable government preserve of Canada is that of Henri Menier, which consists of the entire Anticosti Island, in the Gulf of Saint Lawrence. The Vanderbilt game preserve at Biltmore, N. C., is the largest private reservation of this kind in the United States. That country has many public reservations, such as the Yellowstone National Park, where animals and natural scenery are protected for the benefit of the people.

**GAMES**, a class of amusements or sports, played either as a pastime or to test physical or mental skill. Among many ancient peoples, especially the Greeks and Romans, it was customary to play games at regular intervals. These games were in the form of public exhibitions of skill and strength. They were maintained under the patronage of the government and usually accompanied with religious ceremonies. The Grecian games included the Isth-

mian, Nemean, Olympian, and Pythian. The gladiatorial games of Rome made famous the circus and the amphitheater. Among the most popular modern games may be mentioned baseball, cards, croquet, tennis, billiards, football, etc. See **Athletics; Circus; Olympic Games**.

**GANGES** (gān'jēz), one of the most important rivers of Asia, rises in Garhwal, at the western slope of the Himalaya Mountains. It is formed by the junction of the Bhagirathi and the Alaknanda rivers, at Deoprag, about ten miles east of Srinagar. The Bhagirathi is regarded a sacred stream by the natives, has its head 13,800 feet above sea level, and is considered the source of the Ganges, though a larger volume of water is brought from a great distance by the Alaknanda. Among the principal tributaries of the Ganges are the Jumna, Gandak, Son, and Kusi, though there are numerous other tributaries, while the Brahmaputra receives the main channel of the delta, called the Padna, or Padda, and the other streams of the delta flow into the Bay of Bengal. The lower basin constitutes the great valley of Hindustan. It contains much fertility and is one of the most important regions of Asia. Branches begin to flow out from the main stream about 225 miles from its mouth, forming a vast delta in the nature of level and waste swamps, through which many channels course and intersect each other at various points. The entire length is 1,550 miles and the basin drained embraces 395,000 square miles. The largest branches of the delta are the Hugli and the Meghna, the former being on the west side and the latter on the east, and these begin about 200 miles or more from the sea.

Among the principal cities situated on the banks of the Ganges are Cawnpore, Faruckabad, Bahar, Benares, Calcutta, Patna, Allahabad, and Murshedabad. Navigation extends a distance of nearly 1,250 miles from the Bay of Bengal, which makes it an important avenue for commercial and passenger intercourse, though within late years several railroad lines have been constructed in various directions through and along the valley. In the hot season of the year the volume of water is decreased slightly, while in the rainy season great floods cover the lower country, when the water extends over a region about one hundred miles wide. The floods recede about the middle of August, leaving rich alluvial deposits to greatly fertilize the soil. The river is held sacred by the Hindus, who either bathe in it or partake of its waters. From this custom a considerable industry has arisen, and the water is bottled and carried as an article of commerce to

the remote interior districts. Bathing in the Ganges is considered necessary in order to exempt the dead from returning to the earth to recommence life anew. The Hindus think that those who partake of the water have assurance of eternal bliss. Throngs of pilgrims visit various points annually, especially at Allahabad, where a great fair is held periodically.

**GANGES CANAL**, an artificial canal of India, constructed to overcome the obstructions of the Ganges River above Allahabad. It was commenced in 1848 and cost about \$25,000,000. The total length is about 700 miles, 400 miles of which are navigable, while the remainder and a large number of branches are used to irrigate the country which lies between the Ganges and the Jumna.

**GANGLION** (gǎŋ'glī-ōn), in anatomy, an enlargement of the nerves, consisting of a small rounded or elongated nervous mass, usually of a reddish-gray color. Two kinds of nervous ganglia are recognized, those of the sympathetic system and those of the cranial system of nerves. They serve to strengthen nervous impulse, or act as centers for communication with distinct sets of nerves.

**GANGRENE** (gǎŋ'grēn), or **Mortification**, the loss of life in any of the soft parts of the body, without extinction of the vital powers in the rest of the organism. It is either partial or complete. In the former case it does not completely destroy the sensibility of the nerves, hence the local loss of action may be recovered, while in the latter it results in the death of a part. Gangrene is fatal in case it affects a vital part, such as the stomach, but amputation may be resorted to when it attacks a limb or an exterior wound. Modern methods of applying aseptic remedies have overcome the danger of gangrene in wounds, though formerly many deaths resulted from this cause.

**GANNET** (gǎn'nēt), a web-footed bird related to the pelican and classed with the sea fowls. The bill is longer than the head, the beak is strong, and beneath the throat is a small pouch. The plumage is white, except the top of the head, which is yellowish, and some species have gray and black markings. Gannets swim well and have a powerful flight. They capture fish by plunging several hundred feet through the air, striking headlong downward to the surface of the water. They are migratory, passing from the Gulf of Mexico in the spring to breed on the northern coasts of the United States and in Southern Canada. In Europe they breed as far north as the coast of Norway and in autumn move southward to the Madeira Islands.

**GAPES** (gāps), a disease common to fowls and other birds, due to parasitic worms. The gapeworm causes the bird to choke and induces inflammation. It may be removed, after treating the throat with spirits of turpentine, which is done by thrusting a moistened feather into the windpipe. Mammals are affected by similar organisms lodging in the air passages, but their presence is not easily detected, hence no effective treatment can be given.

**GAR**, or **Gar Pike**, a fish of the ganoid family, found in the fresh waters of North America. It has an elongated body, is somewhat cylindrical in form, and is covered with bony scales. The teeth are sharp and set in the jaws of a prolonged bill. The garfishes range from Canada to Texas and live by preying upon other fishes. They are sometimes called *billfishes*, or *bony pikes*, and are not considered good for food. The marine garfishes are larger, from three to five feet long, and are widely distributed. They often leap high out of the water in pursuit of the flying fishes, which they pursue for food. These fishes are numerous in the Gulf of Mexico and the West Indies.

**GARBAGE** (gār'bāj), the discarded remnants of materials which accumulate in cities. Within recent years the authorities of the great centers of population have turned their attention to utilizing garbage in fertilizing and increasing the productiveness of the soil. In New York, Boston, Montreal, and other American cities these wastes are removed by vehicles. Usually they are classified as waste and usable, after which portions are utilized and the remainder is disposed of in a manner best calculated not to impair public health. In many of the cities of Europe garbage is transported by convenient and well-protected means to outlying districts, and, as a result, large areas of waste and unproductive lands have been reclaimed and rendered valuable. This process of utilizing offal and sewage has largely improved the sanitary conditions, lessened the liability of breeding trichinae in hogs fed with refuse matter, and tended to maintain the purity of the city water supply. Many cities maintain garbage furnaces, which were first installed in Great Britain, and they are utilized to burn the class of waste matters that are considered dangerous to public health. It is not difficult to realize how sanitary conditions may be improved by lessening the amount of decaying litter which is often found in cellars and other places throughout many cities. The garbage disposal of New York City, not including the ashes and light wastes, is estimated at about 300,000 tons per year. In Chicago much of the

garbage materials has been used in filling and grading, both in the low lands and in making land along the lake front.

**GARDA** (gär'dà), a lake of Italy, the largest in that country. It is 35 miles long, about 8 miles broad, and covers 190 square miles. The lake is fed by the melting of the Alpine snows and by the inflow of the Sarca River, and its surplus is conveyed by the Mincio to the Po River. It is a beautiful sheet of water and is traversed by numerous steamers. On its shores are many villas and towns, including Salò and Gardone-Riviera.

**GARDEN CITY**, a village in Nassau County, New York, about eighteen miles east of New York City, on Long Island, on the Long Island Railroad. It was laid out by A. T. Stewart as a model villa town, intended for residential purposes, and is beautified by numerous boulevards and avenues of trees. Among the buildings are a fine Gothic cathedral, a memorial school for boys, a female seminary, and other extensive structures. The Protestant Episcopal bishop of Long Island has his residence in Garden City. It is a popular residence of many New York business men.

**GARDEN OF THE GODS**, the name of a region in Colorado, near Colorado Springs. The name applies to a tract of 500 acres, remarkable for the grotesque forms of huge red and white sandstone, many of which bear local names, such as Seal Rock and Cathedral Spires. Near the entrance is the gateway, formed of bright red rocks fully 325 feet above the surrounding surface.

**GARDINER** (gärd'nēr), a city of Kennebec County, Maine, at the junction of Cobbossee and Kennebec rivers, six miles south of Augusta, on the Maine Central Railroad. An abundance of water power facilitates the operation of numerous manufacturing establishments, including sawmills, machine shops, and flouring mills. It has a public library and a number of fine schools. Among the municipal improvements are electric lights, waterworks, pavements, and a system of sewerage. It was settled in 1760 and chartered as a city in 1849. Population, 1900, 5,501.

**GARDNER**, a town of Massachusetts, in Worcester County, on the Otter River and on the Boston and Maine Railroad. The surrounding country is fruit growing and agricultural. An almshouse, the Levi Heywood Library, a home for the aged, and Crystal Lake Park are noteworthy. Among the manufactures are furniture, ironware, implements, clothing, and machinery. It was incorporated as a town in 1785. Population, 1905, 12,012.

**GARFIELD** (gär'fēld), a borough of New Jersey, in Bergen County, on the Erie Railway. It is located on the Passaic River, opposite Passaic, and is important as a shipping and manufacturing center. Among its chief industries are chemical works, machine shops, and cotton and woolen mills. It has electric lights, waterworks, and a considerable trade in merchandise. Population, 1905, 5,092.

**GARLIC** (gär'lik), a perennial plant allied to the onion, composed of a compound bulb of ten or twelve smaller ones, called *cloves*. The plant has long pointed leaves, quite narrow and flat, and whitish or pinkish flowers, similar to those of the onion. It is indigenous to the southern part of Europe. In some countries it is cultivated extensively, especially in Portugal, where peasants eat slices of it with bread. Most species have a highly pungent taste and a disagreeable odor. In medicine it serves as a stimulant, expectorant, and diuretic, but its mildness renders it useful as a diet rather than as a medicine.

GARLIC.

A, Stalk; BB, Flowers; C, Bulb; D, Clove.

**GARNET** (gär'nēt), a class of minerals, including various species that are prized highly. They occur usually in mica slate or in gneiss, but sometimes in limestone and granite, or in serpentine and lava beds. The three species of garnet which bring the highest prices are known as *alumina garnet*, *iron garnet*, and *chrome garnet*. These vary in color, such as red, brown, green, black, and yellow, according to the amount of coloring oxides contained in them. Some iron garnet contains enough metal to be attracted by the magnet. Garnets are found in Brazil, Peru, Ceylon, Bohemia, Siberia, and in many mountainous districts, the finest being the Syrian. Garnets which are transparent scarlet and crimson are known as *carbuncles*. A black variety is known as *melanite* and a green kind is called *demantoid*. Common garnet is often

powdered and used for cutting and polishing other stone.

**GARNISHMENT** (gär'nish-mənt), a process of attachment whereby a creditor levies upon money or property of his debtor in the possession of a third person. By this process such property is held subject to the payment of a debt, and advantage may be taken of it at the time of beginning a cause or after a judgment has been rendered. The person who is notified to hold such property subject to the order of the court is called a *garnishee*. This process is commonly used in cases where the wages of a debtor are seized to secure payment of a debt.

**GARONNE** (gá-rôn'), a river in the southwestern part of France, rises in the Pyrenees at an altitude of 6,142 feet above sea level and flows toward the northwest, discharging into the Atlantic. It receives numerous tributaries, among them the Save, Lot, Baise, Ratz, and Dordogne, and, after forming a junction with the last-mentioned, is called the Gironde, a distance of about fifty miles, where it constitutes an important estuary. The basin of the Garonne includes 22,050 square miles, is fertile, and contains numerous thriving commercial centers. The Central Canal joins the Garonne at Toulouse and unites it with the Mediterranean Sea, thus forming an important connection between that and the Atlantic. Several other canals join it, one of which crosses the river at Agen by a viaduct.

**GARROTE** (gär-rôt'), a method of execution practiced by the Spaniards. It is a form of strangulation and was originally performed by placing a heavy cord around the neck of a criminal, who was seated on a stool fastened to a stake, and the cord was twisted by inserting a stick between the rope and the back of the neck, then twisting until strangulation took place. Another method was by means of a brass collar placed around the neck, and pressure was obtained by means of a screw. The garrote was used extensively during the Inquisition. The name is sometimes applied to a species of robbery in which the victim is surprised by the highwaymen, who produce temporary strangulation by drawing a cord or handkerchief about the neck, when the pockets are rifled.

**GARTER, Order of the**, one of the most celebrated and ancient orders of knighthood. It was probably originated by Edward III., about Jan. 18, 1334, and served to reward the distinguished military personages who assisted in the struggle against France, though its founding is sometimes assigned to Richard I. It is

related that Edward III. was dancing with the Countess of Salisbury when her garter dropped, and, after putting it around his own leg, restored it with the expression of "Dishonored be he who thinks evil of it," which was afterward changed slightly to form the motto of the organization. Numerous revisions of the statutes of the order were effected in the reigns of Henry V., Henry VIII., Edward VI., and in 1805 under George III.

Originally there were 26 knights, inclusive of the sovereign, who was the recognized head. The statute passed in 1786 recognized and maintained this number, but admitted as supernumerary members certain of the princes. The common title of the order was *Order of Saint George* prior to the reign of Edward VI., and the same term is still applied synonymously with that now used. A dark blue ribbon, edged with gold, is used to represent the garter as the emblem. On it the motto appears, *Honi soit qui mal y pense* (Shame to him who thinks evil), together with a buckle and pendant. It is worn below the knee of the left limb. However, there are other marks of distinction, such as a hood, mantle, gown, plume, star, ribbon, golden collar, and a figure of Saint George on horseback in contact with the dragon. The members use the initials K. G. to designate the order, which are written after their names. From some authorities we learn that ladies were members prior to the reign of Edward IV. The Prince of Wales is a member by virtue of his title.

**GARTER SNAKE**, the name applied to various small snakes of North America. The common garter snake is found widely distributed from Mexico to Canada, but in appearance the species vary somewhat. Most of them are brown or black, and those of the warmer section have spots or crossbars, while the species common to the colder regions are striped with greenish color. They retain their eggs until they hatch, bringing the young forth alive, frequently as many as fifty at a time. The mother defends the young by rushing at the enemy with extended mouth, though the bite is not poisonous. In the winter they find shelter in the ground, where they lie dormant until spring. They subsist on worms, frogs, and other small forms of animal life.

**GAS**, one of the three forms of matter, the other two being *solids* and *liquids*, and which constitutes a fluid that cannot be liquefied nor solidified at ordinary temperatures and pressure. Air was practically the only gas known to the ancients, but artificial gas was referred to as *spiritus* by writers as early as the 14th

century A. D. The term gas soon came to be applied to all elastic fluids that differ from common gas, and which were thought to be permanent. However, Faraday liquefied various gases by reducing the temperature and increasing the pressure, and since then the term has been applied generally to all substances in an elastic aëriiform state. Experiments in liquefying gases have established the fact that none is permanent, and that even air may be reduced to a liquefied state, this being first demonstrated in 1878. To reduce a gas to a liquid state it is necessary to make application of cold or pressure, or a combination of both. The point at which the distinction between a gas and a liquid is lost is called the *critical point of temperature*, and there is a particular temperature for any given pressure at which the critical point of temperature can be reached. It is only at or below this particular temperature that pressure converts a gas into a liquid.

Gases are generally distinguished from liquids by the term *elastic fluid*, while liquids are termed *nonelastic fluids*, this being due to the circumstance that liquids have comparatively little or no compressibility. Though all liquids have elasticity, they expand after compression is removed to their former state, while gases expand to an indeterminable extent and in every direction when left unconfined. As a general rule the density of a gas depends upon the pressure to which it is subjected, or, in other words, an increase of pressure reduces the volume of gases proportionally. This is in accord with the law announced by Edme Mariotte (1620-1684), a French physicist, which is substantially as follows: *The volume of a given mass of gas varies inversely with the pressure to which it is subjected.*

Two or more gases brought into contact mix in any proportion and diffuse themselves uniformly regardless of their gravities. This may be verified by filling a bottle with hydrogen and another with oxygen, whose specific gravity is sixteen times that of hydrogen, or with carbonic acid, whose density is twenty-two times as great, and connecting the two bottles with a glass tube about ten inches long. Diffusion of the gases will begin at once, and within a few days they will be found to have the same proportion to each other in both bottles, even if a porous substance, as a thin membrane, be placed in the tube. The kinetic theory of gases accounts for the power of motion inherent in all parts of aëriiform matter. According to it a gas consists of molecules sparsely distributed through space, but which move about with much velocity. An increase of temperature has the

effect to greatly increase the molecular energy, when the pressure within the vessel will be increased correspondingly, while lowering the temperature has an opposite effect.

Gas is a valuable agent in lighting, heating, and for various other purposes in the arts and industries. Large quantities are derived from natural sources, but the greater supply is obtained from coal, wood, resin, peat, water, coke, oils, and fats. In many localities gas issues from the surface of the earth, as in Pennsylvania, Texas, Ohio, New York, and various parts of Eurasia, especially at Baku, and is now used very extensively for illuminating and heating purposes. The Chinese have utilized gas for centuries in various industries and even transported it to different parts of their own country, which they did in ancient times by confining it in bamboo tubes. It may be said that the artificial manufacture of gas in Europe dates from 1739, when an inflammable gas was obtained in England by subjecting coal to heat in a closed vessel and conducting the fluid through a small tube into bladders. A simple experiment consists of placing particles of bituminous coal in the bowl of a tobacco pipe, then closing the top with moist clay and heating to a red heat. When reaching the point of distillation, a yellowish smoke issues from the stem of the pipe, which yields a bright flame when lighted.

In the manufacture of coal gas the coal is placed in an iron or clay retort, in which it is heated until it expands to twice its bulk and forms coke, while the gas generated is conducted by a pipe into a receiver. The tanks used in factories have a large capacity, some having storage room for 3,000,000 cubic feet of gas. In distilling the coal it gives off heat, steam, ammonia, tar and gas. The ammonia and tar are run off into cisterns, while the gas is passed over lime before running it into gas storage tanks for the purpose of freeing it from acids.

In an analysis made by Robert W. Bunsen (q. v.) it was found that the products of the destructive distillation of bituminous coal include the following: Coke, sixty-eight per cent.; tar, twelve; water, eight; marsh gas, seven; carbonic oxide, one; and carbonic acid, one. In addition to these are generated small quantities of olefiant gas, hydrogen, ammonia, and nitrogen. Coal gas is used largely for heating and lighting, and for that purpose is passed to houses and factories by pipe lines. Small pipes carry the gas to lamps and burners in different parts of the buildings. A gas meter, through which the gas passes, is usually in each building,

and the quantity consumed is measured quite accurately.

*Wood gas* contains more illuminating power than olefiant gas and its specific gravity is greater than coal gas, hence, it requires burners with larger orifices. *Resin gas* has a high illuminating power, but the supply is necessarily limited. *Peat gas* is distilled in retorts similar to those used in wood gas. *Water gas* is made by forcing steam and the vapor of crude petroleum into retorts, which are subjected to a high temperature. This product is cheaper and more satisfactory for illuminating than coal gas. *Oil gas* is obtained by dry distillation, or by running oil or petroleum through tubes which have been raised to a red heat. This gas, stored in cylinders and subjected to pressure, is used generally in lighting railway cars. Crude petroleum is used extensively in making gas for illuminating purposes. See **Natural Gas; Acetylene**.

**GASCONADE** (gäs-kō-nād'), a river in Missouri, rises in Wright County, and flows in a general course toward the northeast. It discharges into the Missouri River at Gasconda, about 35 miles below Jefferson City, after a course of 250 miles. The basin includes a large portion of the slopes of the Ozark Mountains and the course of the river is quite tortuous.

**GASCONY** (gäs'kō-nī), or **Gascogne**, a former duchy in the southwestern part of France. It was bounded by the Bay of Biscay, the Pyrenees, and the Garonne River, corresponding to the present departments of Gers, Landes, and Hautes-Pyrénées and portions of four other departments. The inhabitants were generally known as Gascons, who descended from the Goths and the Basques. They submitted to the Franks in 1602, but maintained a semi-independent government, and later were conquered by Pepin. The region was a possession of England from 1152 until 1453, when it was reconquered by France.

**GAS ENGINE**, an engine in which the motion of the piston is produced by the combustion or sudden production or expansion of gas. Machines of this kind now in extensive use receive their motion by an explosive mixture of gas and air being forced into the working cylinder and ignited there by a gas flame or an electric spark. The largest number are *gasoline engines*, in which gasoline gas produces the motion, but natural gas, illuminating gas, and gas from naphtha or other petroleum products are employed. These engines vary in construction and efficiency, ranging from very small machines to those having a capacity of 650 horse power. Besides having valves for the admis-

sion and escape of gas from the cylinder and igniting apparatus, they possess the essentials of the steam engine, having a piston within the cylinder, a connecting rod, a crank, and a fly wheel. Motion is induced by admitting gas into the cylinder, where it is exploded by an electric spark, causing the piston to be thrown forward, which acts to cause a partial vacuum within the cylinder, into which more gas is admitted, which, on being exploded, causes another forward movement of the piston. The burned gas escapes at the return of the piston, when the exhaust valve is thrown open. The movement would be irregular and ineffective without a fly wheel, which moves rapidly and maintains uniformity in the rate of speed. The inflow of gas, as the intake valve is thrown open, is regulated by a governor attached to the fly wheel. Gas engines are used extensively where power is required periodically, especially in such structures as motor bicycles, automobiles, hoisting machines, yachts, etc. See illustration on following page.

**GASTRIC JUICE** (gäs'trik), a colorless liquid secreted by the stomach, containing 98.5 per cent. of water. It has a salty, acid taste, the active principle being pepsin. The function of gastric juice is to dissolve the nitrogenous elements of food, such as albumen, fibrin, and casein. It affects portions of the vegetable food and all animal food, except fat, converting them into what is known as *peptones*. The acid in some cases seems to be largely of a hydrochloric nature. In others hydrochloric and lactic, or even butyric and acetic acids are present, but they are thought to be due to the change undergone by the food in the process of digestion. When the food has been thoroughly mixed with the liquid of the stomach, it is known as *chyme*, which passes into the intestines as a thick but sticky substance. About fourteen pounds of gastric juice are secreted daily in the human adult. Artificial gastric juice can be made by extracting pepsin from the coat of the stomach of animals by means of glycerin, and adding water to the filtered liquid, with a small per cent. of hydrochloric acid.

**GASTRITIS** (gäs-trī'tis), an inflammation of the stomach, especially of the mucous membrane of that organ. The early symptoms include a pain in the stomach and a severe headache, which are usually followed by fever and nausea. A common form is known as acute catarrhal gastritis, which is usually due to careless dieting. Toxic gastritis is caused by an excessive use of stimulants, especially alcohol. An acute and persistent form is known as chronic gastritis, which causes a general decline

of health. Wholesome exercise and careful dieting are recommended in all forms of this disease.

**GASTROPODA** (gäs-tröp'ä-dä), a class of mollusks that have distinct head, bearing eyes and tentacles, and movement is by means of

cerebral masses, including the stomach, circulatory organs, and the glands of reproduction. The shell is single or univalve, usually coiled in a spiral. The greater number of mollusks with univalve shells belong to this class, but it also contains some species with multivalve shells, such as the chitons. Among the species of gastropods are the limpets, snails, slugs, and cowries.

**GATH**, one of the five chief cities of Philistia, frequently mentioned in the Bible in connection with David and the Jews. Goliath, who was slain by David, lived in Gath. It was alternately independent or under the power of the Jewish Kings, except for a short period when it was under Syrian rule. The Philistines defended it against David and Solomon, and it still remained a center of influence until the time of Jerome. It is not known where Gath was, but it is thought to have been located between Ashdod and Ekron.

**GATINEAU** (gä-të-nō'), a river in the province of Quebec, Canada, the largest tributary of the Ottawa. It has its origin in a number of lakes, flows in a general southerly direction, and enters the Ottawa River about a mile below the city of Ottawa. It receives a number of tributaries and is about 400 miles long. Only a short distance is navigable, but it is utilized extensively in rafting timber and lumber.

**GAUCHOS** (gou'chōz), the name of a nomadic class of people in South America, confined largely to Argentina and the Pampas in the basin of the La Plata River. They descended from whites and Indians, are tall and handsome, and engage chiefly in stock raising. They are skilled in using the lariat. The Gauchos are good horsemen and are independent and warlike.

**GAUGE** (gāj), or **Gage**, the name of many instruments used in the mechanical arts. The distance between the inner sides of the rails of a track is known as the gauge of railways and to ascertain it an instrument known as a *gauge*

Sectional view of a Vertical Gas Engine, showing working parts.

a large creeping disk or foot. In most species the body is not symmetrical, but the head and foot are usually well formed. All the species have a more or less clearly defined hump upon the back, which is extended in some to a considerable size, and in it are contained the vis-

is used. It serves to set the rails to the proper space apart and to measure the distance when the rails require adjustment. An instrument known as a *steam gauge* is fixed to the boilers of engines, serving to register the force of the steam. It consists of a cylindrical box of metal furnished with a dial and the force is indicated by a needle, which is moved by a spring according to the pressure of the steam, which acts through a tube upon a movable piece of metal attached to the spring. The spring is compressed according to the pressure of the steam, and the needle indicates on the dial the pressure per square inch in pounds. A *water gauge* is one to indicate the level of the water in a boiler. It consists of a vertical glass tube, which communicates at both ends with the boiler, hence the water in the tube will rise to the same level as that in the boiler. Some boilers are provided with *gauge cocks* in addition to the vertical gauge.

**GAUL**, or **Gallia**, the name applied anciently to the country situated between the Rhine and the Pyrenees, which was the region occupied chiefly by the Gauls, the most numerous branch of the original Celts. The principal divisions of the region consisted of the district on the Roman side of the Alps and the one beyond the Alpine Mountains. In the course of time the former became known as *Gallia Cisalpina*, and the latter as *Gallia Transalpina*, though each was variously modified in extent by the fortunes of war and insurrectional disturbances. The Gallic people were first brought into history about 397 B. C., when they crossed the Alps and engaged in a series of wars with the Etruscans and Romans. In 390 B. C., they inflicted a defeat upon the Romans at Allia, burned a large part of Rome, and planted their authority far toward the East.

In 280 B. C., the Gauls conducted successful campaigns into Greece, penetrated across the Hellespont into Asia Minor, and made important settlements under the name of Galatians, with which the early Christian teachers came in contact. Their foothold along the Danube was lost as a result of the conquest of the Germanic peoples, who occupied the entire region tributary to the Rhine. The Cisalpina Gauls were prominent factors in contending against Roman power until the first Punic War, when an armed conflict of six years' duration compelled them to submit to the Roman authority, in 220 B. C.

The march of Hannibal across the Alps to reduce Rome gave them an opportunity to again rise with prospects of success, but, when the Carthaginians were defeated by the Romans, the Gauls were again reduced to submission. A Roman invasion in 128-122 B. C. reduced and made them tributary, the Romans establishing *Provincia*, a name since perpetuated as *Provence*. Later the successful incursions of Germanic and Cimbrian armies tended still further to reduce the Gallic tribes, and they were ultimately subdued by the Romans in a war lasting nine years, conducted under the proconsulship of Julius Caesar, from 58 to 50 B. C.

**GAUR** (gär), or **Gour**, a wild ox native to Southern Europe, found chiefly in India. It stands about five feet high at the shoulders, has strong and much curved horns, and is one of the largest species of the ox tribe. The color is brown or blackish, except the legs below the knee, which are white. The hide is very thick and is used in making shields.

**GAVIAL** (gā'vī-äl), or **Gharial**, a species of crocodile native to Southern Asia, found chiefly in the region of the upper Ganges and its tributaries. It is peculiar for its long and narrow jaws, which have numerous sharp and slender teeth. The food consists principally of fish and small reptiles. An adult gavial is

GANGES GAVIAL.

about twenty feet long. The male has a large hump upon the snout, formed of cartilage, and in this the nostrils open. Though closely allied to the crocodile and alligator, it has a much narrower and feebler jaw.

**GAZA** (gā'zà), a town of Syria, three miles from the Mediterranean, and fifty miles southwest of Jerusalem. It occupies an important position on the caravan road between the desert and the Mediterranean, hence has been important as a trade center from remote antiquity. The Egyptians were an important factor in extending its commercial influence, but it was conquered by the Philistines and became their most important city. Alexander the Great captured

it after a siege of two months, in 332 B. C., and its final destruction, which occurred in 96 B. C., is referred to in Acts viii., 26. The Romans rebuilt it, but it was more distinctly a Greek city, and for a long time rivaled Athens and Alexandria in culture. Omar captured and destroyed it in 634, but it was rebuilt by the Crusaders and defended by the Templars. The modern city is known as Ghazze. It has a considerable trade, but the buildings are poorly constructed. A large majority of the inhabitants are Mohammedans. Population, 1906, 38,530.

**GAZELLE** (gà-zěl'), the type of antelopes, including about twenty species, most of which frequent desert and mountain regions. They are found mostly in North Africa, Persia, and

GAZELLE.

Arabia. The various species are gentle in disposition, light fawn colored, and have lustrous eyes. Both sexes have horns. The gazelle is preyed on by the lion and hunted for its flesh and hide. Though gregarious in habits, they are shy and difficult to approach. The *admi*, or mountain gazelle, is a familiar species of the Sahara highlands. Other well-known species include the *dama* of the Sudan, the *Loder's* of Algeria, and the *common gazelle* of Arabia.

**GEARING** (gēr'ing), the name applied to a set or system of wheels in machinery, constructed so motion is communicated from one part of the machine to another. A gearing usually consists of a train of friction wheels, screws, or toothed wheels, and frequently of a

series or combination of them. A machine is said to be *out of gear* when all parts are not adjusted for communication and *in gear* when it is set ready for use. The velocity of a machine depends upon the construction of its gearing, which may be so adjusted as to increase or diminish the speed of the part which does the work. Gear wheels are of various forms, depending upon the velocity desired and the nature of communicating motion. A *beveled gear wheel* has teeth set radially in the face of a cone, while a *spur gear wheel* is one in which the teeth are parallel to the axis of the wheel. In a *worm wheel* the teeth are cut spirally, hence have the effect of a screw.

**GECKO** (gěk'ō), the common name of an extensive family of lizards. They are small animals, seldom exceeding eight inches in length, and the body is covered with numerous round warts. The head is flattened, the body is short and thick, and the eyes are large. The species vary greatly in color, which is usually quite dull. Formerly it was thought that their bite is poisonous, but such is not the case. On the other hand, they are entirely harmless, and are useful in feeding upon insects and worms. They are found quite frequently in cellars and under wet boards and logs. Species closely related are common to all the continents.

**GEHENNA** (gē-hēn'nà), in Hebrew, the valley of Hinnom, a gorge with precipitous and rocky sides, situated a short distance southwest of Jerusalem. The Jewish kings made it a favorite place for the celebration of religious ceremonies and idolatrous rites. When the pure religion of the fathers was restored in the reign of King Josiah, he defiled the valley in making it a charnel district by covering it with the sewage of the city. It was common to burn the offal and carcasses of animals in order to make the place one of disagreeable repute and thereby destroy it as a resort for idol worship.

**GELSENKIRCHEN** (gěl'zēn-kērk-ēn), a city of Germany, in the province of Westphalia, five miles north of Essen, with which it is connected by electric and steam railroads. It is surrounded by a productive coal-mining region and is noted chiefly as an industrial center. The noteworthy buildings include the townhall, the public library, and a number of fine schools and churches. Among the principal industries are machine shops, iron works, flour mills, and soap factories. The rapid growth of the city dates from 1855, when coal was discovered in the vicinity, and it was incorporated in 1875. Population, 1905, 147,005.

**GEM**, a precious stone, especially one intended for an ornament. Gems are sometimes

found with a natural polish and crystallized in regular shapes, but more commonly with a rough surface and of irregular form. The term is applied particularly to a stone cut and finished ready for setting and wearing as an ornament, as the ruby, sapphire, diamond, and emerald. Other stones are used for ornament to which the term does not properly apply, such as carnelian and agate. The manufacture of artificial gems has made notable progress in recent times. A kind of glass known as *paste* or *strass*, which contains about fifty per cent. of oxide of lead and is peculiar for its brilliancy and hardness, is a common base for artificial gems. Recently some progress has been made in producing gems artificially. These consist largely of rubies, sapphires, and others of the corundum class. Genuine diamonds have been made by a chemical process, but the expense and labor is too great to make the production profitable. Another product of value is obtained by fusing small chips or imperfect stones in an electric furnace. When the fused product is cut and polished, gems of good size and color are obtained.

**GEMINI** (jēm'ī-nī), the twins, a constellation of the zodiac, containing the two stars Castor and Pollux. The former star is a double one. The constellation may be seen in the Northern Hemisphere during the evenings of December and January. Gemini is a sign of the zodiac, which is entered by the sun about May 21, and the sun passes from it June 21.

**GEMSBOK** (gēmz'bōk), the name of a large antelope in South Africa, called *kookam* by the natives. It is a stout animal, about four feet high and five feet long, and has straight horns about two feet in length. It has a dark gray color above, white on the under part, and markings of white and black on the head. The gemsbok frequents the mountainous districts and usually congregates in small groups when upon the open plain. It is found in many barren desert tracts, where it appears to subsist a long time without water. Its inability to run with great speed is partly compensated for by its strength, which enables it to withstand the attacks of the lion. The flesh is esteemed highly.

**GENDARMES** (zhän-därm'), meaning men at arms, the name formerly applied in France to the corps of cavalry that formed a body-guard to the kings. At present the name refers to a military police composed largely of soldiers taken from the army. About 21,000 men make up the gendarmes at the present time. They include both cavalry and infantry, receive higher pay than other men in the army, and form a

national police in the departments and colonies of France. Similar forces are maintained in Russia and Germany, where they serve both as soldiers and national police officers.

**GENERALIZATION** (jĕn-ēr-äl-ĭ-zā'shŭn), in psychology, the act of bringing individuals or particulars under a class, or deducting a general principle from particulars. Some writers use the word *generalize* to mean the forming of logical concepts, while others employ it to signify scientific classification. It may be defined as the power of grasping the common qualities of objects and uniting them into a single notion comprehending them all. From this it will be seen that generalization is the power of combining the individual with the general, of uniting the manifold into one. See **Conception**.

**GENESEE** (jĕn-ĕ-sĕ'), a river of western New York, which has its source in Potter County, Pennsylvania, and, after coursing northward into New York, discharges into Lake Ontario, seven miles north of Rochester. The total length is 140 miles. It passes through a fertile valley, has falls at Portage and Rochester, and is navigable for small craft about fifty miles.

**GENESIS** (jĕn'ĕ-sĭs), meaning creation or origin, the name of the first book of the Bible. It is one of the most ancient of existing books, giving an account of the creation, of the original happy state and the fall of man, of the Deluge, and of the dispersion of mankind, ending with the calling of Abraham and the rise and progress of the Jewish nation. Moses is regarded the author of the book of Genesis, but it is supposed that he derived a large part of his materials from written documents coeval with the events recorded, being infallibly guided by inspiration in the entire work. Some writers think that a few additions were made to Genesis after the death of Moses, probably by Ezra. See **Pentateuch**.

**GENET** (jĕn'ĕt), a carnivorous mammal native to Europe and Africa. Only one species is found in the southern part of Europe, whence it extends into Western Asia. Five species are found exclusively in Africa, ranging from the Mediterranean to the Cape of Good Hope. The common genet has a dark gray color, thickly spotted with black, and is nearly allied to the civet. It has retractile claws and a faint smell of musk, and the pupil of the eye is narrow and vertical. The fur is valuable as an article of commerce. It is easily domesticated and is employed in many places to destroy rats and mice.

**GENEVA** (jĕ-nĕ'vā), a city of Ontario County, New York, on Seneca Lake, about fifty miles southeast of Rochester. It is on the

Seneca and Cayuga Canal and on the Lehigh Valley, the New York Central, and other railroads. Among its municipal facilities are pavements, street railways, electric lights, waterworks, and a library. Besides having a good system of public schools, it contains Hobart College, the State agricultural experiment station, the Delancey Divinity School, and the Delancey School for Girls. Among the manufactures are steam heating apparatus, clothing, scientific instruments, machinery, engines, and boilers. The surrounding country is agricultural and contains many thousand acres cultivated in nurseries. Geneva was incorporated as a city in 1898. Population, 1905, 12,250; in 1910, 12,446.

**GENEVA**, a city of Switzerland, capital of the canton of the same name. It is situated on the western shore of Lake Geneva, at the point where the Rhone issues, and is connected with European cities by extensive railroad systems.

The city is located on both sides of the lake, though the larger portion is on the south bank of the Rhone, over which several bridges are maintained and facilitate free public intercourse. The two portions of the city are known as the upper and lower, the former containing excellent edifices and beautiful hotels. On the other hand, the lower city is the seat of the commercial institutions and manufactories and the residences of the poorer classes. Among the manufactures are gold, silver, and other metal wares, silk, cotton and woolen goods, leather, calico, hats, musical instruments, clocks and watches, machinery, and chemicals. Of these jewelry, musical instruments, and watches are the most important.

Communication is facilitated by steam navigation on Lake Geneva, the Rhone, and numerous canals, besides by many electric railway lines that center in the city. As a seat of science and literature Geneva takes high rank, its institutions of learning, libraries, museums, and galleries of art ranking with the most famous of Europe. Among the eminent men who resided at Geneva and influenced its learning are Calvin, Knox, Necker, Rousseau, Beza, Sismondi, and Huber. Its cathedrals, public parks, electric lighting system, and statuary take high rank. The university was founded in the 12th century. It carries advanced courses of study and is attended by 1,150 students.

Though originally a Gallic city, it was afterward included in the Roman Provincia, and later passed to the Burgundians and Franks. In the 12th century it witnessed the controversies between the bishops, who were feudatory to the German Empire, and the counts of Savoy, each striving for supremacy. During these con-

tentions the citizens secured numerous advantages, among them religious and political liberties and commercial independence. An alliance was concluded with Freiburg in 1518 and subsequently with Berne, thus making Geneva an important member of the Swiss Confederation. In the Reformation it was a seat and stronghold of Protestantism, becoming so largely under the preaching of William Farel and Calvin. Besides impressing the people with rigid morality, these teachers awakened a taste for the exact sciences. The aristocratic party continued to oppress the people for centuries, although in the 18th century the popular party gained much strength, but the contests that followed might have ended even more dangerously to the people if France and the adjacent cantons had not interfered. France annexed the canton of Geneva in 1798 as the department Du Lemane, but, with the overthrow of Napoleon in 1815, it became independent and formed the twenty-second canton of the Swiss Confederation. Population, 1907, 116,387.

**GENEVA ARBITRATION.** See *Alabama Claims*.

**GENEVA CONVENTION.** See *Red Cross Society*.

**GENEVA LAKE**, or **Lake Lemane**, a beautiful fresh-water lake between France and Switzerland, though the larger part of it belongs to the latter country. It is formed as a crescent, has a length of 48 miles from east to west, and is 1,215 feet above sea level. The area is 225 square miles; the greatest breadth, nine miles; and the maximum depth, 980 feet. It is rich in fish, especially trout, pike, salmon, and German carp. The lake is valuable in navigation, being never entirely frozen over in winter. It is entered from the upper end by the Rhone, which pours its turbid and silt-laden water into it, but passes from it clear and transparent. Near the lake are the mountains of Savoy, while Mont Blanc is visible, though sixty miles distant. The city of Geneva is situated at the point where the Rhone River flows from the lake. Many adjacent localities are celebrated in literature, among them the places treated by Rousseau and Schiller. Byron in "Childe Harold" and "The Prisoner of Chillon" has added interest to the lake.

**GENNESARET** (jĕn-nĕs'ă-rĕt). See *Galilee*, *Sea of*.

**GENOA** (jĕn'ō-ă), a seaport city of Italy, capital of the province of Genoa, on the northern shore of the Gulf of Genoa, an inlet from the Mediterranean. It occupies a fine site at the foot and on the slope of the Ligurian Alps. Extensive fortifications surround the city and

crown the heights near it. The older portions have narrow streets with lofty buildings, while those of the newer part are spacious and regularly platted and beautified by tall edifices and fine palaces. Orchards and groves of pomegranate and orange trees cover the hills adjacent to the city, and above them rise lofty ranges of towering mountain peaks. The harbor is protected by piers and moles, and is studded with innumerable vessels that carry on an important navigation trade in fruits, cereals, minerals, and manufactured articles produced in the city and surrounding region. Among the manufactures are Italian marble, macaroni, paper, ironware, machinery, cheese, flour, jewelry, gloves, textile fabrics, and scientific instruments.

Many of the buildings are famed in history, among them the Cathedral of San Lorenzo, built in the 10th century; the churches of Santo Stefano and Santa Maria di Carignano; the university, with 1,425 students; and the ducal palace (Palazzo Ducale), built in the 13th century. Other noted buildings include the Theater Carlo Felice, the palaces of Balbi, Doria, Serra, and several others, the town hall, the Plazzo Reale, and the central railway station. The city has a well-organized public school system, schools of fine arts, a military school, the Royal Marine School, a theological seminary, and numerous parochial schools and hospitals. In the public parks are numerous statues, among them several fine marble memorials of Columbus. The Saint George bank building is used as a customhouse and was anciently one of the most stable banks of deposit and circulation in Europe. Its celebrated cemetery, known as Campo Santo, is remarkable for its beauty and the large number of eminent men whose graves it contains. The city is beautified by modern lighting, has electric street railway service, important railroad connections, and is noted for its large commercial and passenger traffic.

Genoa was famous as a seaport under the Romans. It was organized as an independent republic and presided over by doges subsequent to the division made by Charlemagne. Saracen incursions in 935 led the Genoese to form an alliance with Pisa, though in 1119 the two cities engaged in wars and continued hostile until 1294, when Pisa was given a crushing defeat. In the meantime Venice had risen as a successful rival, which led to periodic wars from the 12th to the 14th centuries, and, after discordant strife internally, it became subject to Milan and later to France. Napoleon secured permanent possession of Genoa after the Battle of Marengo, in 1800, and formally annexed it in 1805. In 1815

it became a part of the kingdom of Sardinia, and with it was annexed to Italy. Historically, the Genoese are noted for their spirit of liberality and enterprise. They fostered learning, encouraged industrial arts, established civil reforms, and built internal improvements. The annexation to Italy within recent times has given the city its present prosperity. Population, 1906, 241,617.

**GENTIAN** (jěn'shan), a genus of plants native to all the continents, but found chiefly in the temperate regions. The *common gentian*, or

ALPINE GENTIAN.

*yellow gentian*, is native to the mountains of Southern Europe and is found in the meadows of the Alps and Pyrenees. It has opposite leaves, a stem from three to four feet high, and whorls of yellow flowers. The root is employed for medicine to increase the appetite and promote digestion. It is used as a stomachic tonic and is given in the form of a solid, a tincture, an infusion, and as fluid extract. The dried root is a spongy texture with a faint odor, and is intensely bitter to the taste. A species known as the *blue fringed gentian* is found in the southern part of Canada and the northern part of the United States, and other species are more or less widely distributed in North America. The root of the *Alpine gentian* of Europe, which has cup-shaped, blue flowers, is considered the best in medicine, but similar medical properties are contained in other species.

**GENTILE** (jěn'til), the name applied by the Jews to all who were not of their own nationality. The Jews and Gentiles had an aversion

for each other, and the latter were generally regarded in the same spirit as the Christians regard the heathens, though the Jews did not extend to the Gentiles the privileges accorded to pagans by the Christian people. The court of the Gentiles about the temple was the outer space, marked off by a wall or balustrade about four feet high, within which strangers were forbidden to enter, though they might come as far as the barrier to present their offerings. Paul refers to this when he says that "the middle wall of partition" between Jews and Gentiles was broken down by the Gospel.

**GENUS** (jē'nūs), in scientific research, a classification of plants or animals which embraces one or more species, closely agreeing in certain characteristics by which they are distinguished from all others. The term applies to forms subordinate to order, tribe, and family. A genus may be constituted of a single species, as the giraffe, which possesses certain characteristics belonging to no other species. In others there are several or many species. To illustrate, the *Mus* constitutes a genus containing such animals as the mouse and the rat, which differ in size and are clearly distinct species, but still have a similarity of structure obvious to all. Among plants the *Rosa* includes the various species of the rose.

**GEOGRAPHICAL DISTRIBUTION** (jē-ō-grăf'ī-kal dīs-trī-bū'shūn), the term applied to the diffusion of animals and plants in the different regions by natural and artificial means. For centuries the view was held that all species of both the vegetable and animal kingdoms were created within the geographical regions to which the different forms originally were common, but, when the idea came to be held that species are allied and that they originated from a common source, the implication gained widespread foothold that the ancestral stock had a definite birthplace, and from this the various kinds were distributed widely to different provinces and regions. In studying the distribution of plant and animal life it is essential to investigate the means for diffusion and the natural barriers that offer effective obstacles against migration. Animals possessing much power of locomotion, such as fishes, birds, and many land animals, may become easily dispersed to the most remote regions of the continents, and in many cases to adjacent grand divisions.

It is of interest to note that with one exception the mammals of North America are allied to those of the West Indies. From this we may infer that the ancestors of the West Indian animals inhabited the American continent, and that, by some means, they secured passage to

those islands. It is likewise interesting to note that the marsupials are confined wholly to America and Australia, that the tapirs are found only in South America and the Malay Islands, that there is a greater difference in the flora of the Pacific coast of North America and Japan than between that of the latter country and the Atlantic coast plain, and that the birds of North America are more closely allied to those of Europe than to the species which are common to South America. Similar notable instances of distribution may be alluded to in relation to various regions of the continents and oceans, each showing a remarkable dispersment in latitude and longitude of the different forms of life, all, of course, being attributable to some natural cause either clearly known or inferred.

The means to facilitate distribution are quite various and their effectiveness depends more or less upon divers circumstances. In the scope of this article it is possible to call attention only to the more important, since the subject is one which may be treated more properly in works especially designed to throw light upon the various phases, such as Wallace's "Geographical Distribution of Animals," Engler's "Distribution of Plants Since the Tertiary Period," and Darwin's "The Origin of Species."

Besides the normal facilities to disperse which are found in the different species, various other means must be taken into account. Seeds of many classes of plants become widely diffused by winds carrying them to regions remote from their native locality, especially those provided with feathery appendages, while animals, insects, and the movements of water by waves, currents, and streams largely transport and disperse them. Oceanic currents likewise carry animals to remote regions, especially in the polar vicinities by ice floes and icebergs. The branches and trunks of trees frequently carry animals and seeds long distances down streams, across straits, and even over extensive bodies of water. Fur-bearing animals often disperse seeds that cling to the fur, and birds of plumage likewise carry them to distant regions. Aquatic birds transport the spawn of amphibian animals and the seeds of plants to remote districts and fresh-water bodies of inland waters. In like manner they distribute shellfishes, seeds of marine plants, and various forms of marine life. It is certain that wide distribution has been effected by seeds clinging to the hoofs of animals and to insects driven by strong winds, and often unintentionally by man.

Among the barriers against rapid and wide diffusion are climatic conditions, elevated mountain ranges, and vast expanses of water surface.

It is quite certain that a large per cent. of the general distribution, as occurring in recent times, was effected by the sinking of islands and continents, thus detaching a portion of the land masses and with it its proportional share of animal and plant life, such as was likely effected by the detachment caused by the sinking of large areas of the Pacific, thereby forming the great archipelago southeast of Asia and other island groups equally noteworthy. The more recent diffusions, however, were effected by migration, which doubtless occurred in the usual manner by marine life passing over isthmuses, and land forms, including both plants and animals, being carried across straits and narrow channels of water. The most important and widespread distribution of the higher animal and plant life is due to the commercial designs of man. As a source of profit the various domestic animals and highly cultivated cereals, vegetables and other plants have been carried to climates and latitudes agreeable to their production and use.

**GEOGRAPHICAL SOCIETIES**, the organizations formed to obtain and disseminate geographical knowledge. In 1821 the first important association to promote and extend geographical knowledge was organized in Paris, known as the Society of Geography, which founded the *Bulletin of the Society of Geography* in 1822. The celebrated German society, the Berlin Association of Geography, was founded in 1828, and its proceedings are published annually in *Reports of the Berlin Association of Geography*. The Royal Geographical Society, founded in 1830, is the leading organization of this kind in Great Britain. Among the societies devoted to the study of geography is the American Geographical Society, founded in New York in 1852; the National Geographical Society, organized at Washington, D. C., in 1888; and the Geographical Society of Philadelphia, established in 1891.

**GEOGRAPHY** (jě-ōg'ra-fÿ), the science that treats of the earth. As a study it is pursued under four departments or branches—mathematical, political, physical, and commercial. *Mathematical geography* is that branch of general science which treats of the earth in its relation to the solar system, and forms the true basis for accurate geographical knowledge, since by means of it we are enabled to form clear conceptions of the laws governing terrestrial phenomena. Through its agency we learn of the location of the earth in space; its form, size, and movements; its divisions by lines and circles imagined to be drawn; and the method of representing portions of it on maps.

*Political geography* embraces the description

of the earth in relation to government and societies of mankind. It treats of the manner of life of the people, and of their civilization and government. *Physical geography* is a treatise of the physical condition of the earth, its relation to nature and the natural laws by which it is governed. It treats especially of the atmosphere, the natural divisions of land and water, the aërial currents and movements of oceanic waters, and the distribution of animate and inanimate objects found upon the surface of the earth. These are described not only in a given locality, but the causes of their existence and the natural results are discussed with a view of learning their causes and effects. *Commercial geography* includes an investigation of the products of merchantable commodities, the migrations of plants and animals, the routes of travel and transportation, and the natural laws that govern or facilitate commerce and commercial relations. In the scope of geographical institutions the student is brought in contact with various other branches, such as geology, history, astronomy, and zoölogy, though these are all separate sciences, the relationship serving principally to facilitate general advancement and to broaden culture in basic principles.

In ancient times geographical knowledge was necessarily limited, owing to the insufficient means to navigate the vast expanse of ocean and proceed with any degree of rapidity across the continents. Besides, the absence of powerful offensive weapons of war prevented exploring parties from making material progress against the hostile peoples occupying distant and unexplored regions. The expanse of geographical knowledge is coördinate with that of explorations and discoveries effected by expeditions and vast cruising enterprises. Among the ancient geographers was Eratosthenes, who flourished about 240 B. C. Greater, however, were Strabo, who lived in the reign of Augustus and Tiberius, and Ptolemy, who flourished at Alexandria about 139 A. D. As a people the Phoenicians made the greatest geographical progress in early history. They not only explored the Mediterranean, but passed through the Strait of Gibraltar, cruised along the Atlantic coast of Africa and Europe, and made voyages as far south as the Tropic of Capricorn and north to the British Isles.

Various views were held by early geographical writers in regard to the universe. They regarded the earth a disk with their own country forming the center. The poems of Homer lead to the conclusion that the Greeks in the 9th century B. C. thought the earth to be a circular plane bounded by water and from which the

various streams had their source. In the time of Alexander the Great geographical knowledge was extended by his famous expedition to the interior of Asia, and subsequently by cruises on the Indian and Mediterranean waters. Eratosthenes considered the earth a sphere and was the first to use lines to indicate latitude and longitude, and to employ mathematical principles in the construction of maps. Strabo, also mentioned above, wrote extensively regarding geography as understood in his time, and furnished valuable descriptions and drawings of the countries adjacent to the Mediterranean. Ptolemy prepared a geography of a large portion of Eurasia and Africa, including the British Isles, Germany, large parts of Russia, and all the region between the last mentioned country and the Mediterranean. His geography embraced Northern Africa and large regions of Western Asia.

The ancient geographers remained standard authority during the Middle Ages, and new material of note was not added until the extensive voyages of Marco Polo in the 13th century, who published the first accounts of Japan and the East Indies. However, the discovery of America in 1492 by Columbus, the doubling of the Cape of Good Hope in 1497 by Vasco da Gama, and the discovery of Tierra del Fuego in 1520 by Magellan, with contemporary discoveries and explorations, gave geography an enlargement and interest not previously known. Other achievements worthy of note in this connection are the extensive explorations of Vasco da Gama in Eastern Africa and Southern Asia, the expeditions of Frobisher in 1576, of Davis in 1585, of Hudson in 1607, and of Baffin in 1616, all of which led to the enlargement of accurate knowledge. The Dutch navigators Tasman and Van Diemen made fruitful explorations in the Pacific about the middle of the 17th century and added Australia to the explored portion of the earth. Subsequently Captain Cook explored innumerable islands in the Pacific.

The explorations of the 19th century were devoted more largely to discoveries in the polar regions and the interior of Africa. Exploring expeditions were sent to the Antarctic regions from America, England, and France in 1840, when Victoria Land and the Antarctic continent were discovered. Another important discovery was that of the northwest passage around North America by way of Bering Strait and Baffin Bay. It was made in 1850 by an expedition under McClure. Among the most celebrated explorers to add knowledge of the interior of North America are Lewis and Clark, Humboldt, Spix, and Frémont, while the interior

of Asia and Australia likewise became known largely in the latter part of the last century. The explorations and discoveries of interior Africa by such eminent men as Livingstone, Schweinfurth, Stanley, Bruce, Barth, and Rohlfs have led European nations to occupy practically the entire continent. They not only claimed the regions as colonial possessions, but constructed canals, founded cities, and built vast railroad enterprises. Interior Asia is now in a fair way to become similarly controlled by European peoples. Not satisfied with their successes, the more ambitious are still making venturesome exploits to the polar seas, and are promoting extensive excavations to determine complicated questions in physical geography. School textbooks are assuming scientific completeness and institutional instruction is becoming of greater pedagogic worth. The schools of Germany have long led in both these important lines.

**GEOLOGICAL SURVEY** (jē-ō-lōg'ī-kā-l sūr'vā), the name of a bureau maintained by most governments, which has charge of investigations of the mineral resources and geological structure of the country. Bureaus of this kind are under the supervision of a director, who is controlled directly by a cabinet or ministerial officer. In Canada the Geological Survey Department is under the Minister of the Interior and the work is divided into two divisions, known as (a) Geological Survey and (b) Mines Branch. The direct supervision is under an officer known as assistant director, chemist, and mineralogist, while each of the two divisions is supervised by a director.

The United States Geological Survey was organized as a bureau in 1879, when a plan for unifying the four independent surveys that have been maintained was adopted by Congress. It is under the control of a director, who submits an annual report of plans and operations of the department to the Secretary of the Interior. Among the duties of this department are the making of surveys in regard to the geological formations, the classifications of public lands, the surveys for the irrigation of arid regions, the examination of mineral deposits, the survey and mapping of the areal geology, and detailing information of the rock formations. Maps prepared by the department indicate the character of the surface, the distribution of ores, and the character of the soil. Many pamphlets are published to distribute information in regard to physical and chemical research, mining and mineral resources, and various other subjects of interest coming under consideration of the department.

**GEOLOGY** (jē-ōl'ō-jy), the department of

natural science that treats of the present constitution and structure of the earth and the operations of its physical forces. It investigates the history of geological formations in past ages, together with the causes and modes of physical changes, and the formation of inorganic and organic structures. The study of geology received attention many centuries ago, but it has taken high rank among the studies only since the beginning of the last century. Herodotus gave the subject much careful thought. He devoted studious consideration to the formation and fertility of the soil in Egypt, and traced their cause to the silt-laden waters of the Nile that overflow the delta and Lower Egypt periodically. Strabo flourished in the 1st century A. D. and ranked as the greatest of early geologists. He took up the discussion of the origin of fossils (q. v.), which long formed the subject of much controversy, and maintained that they were organic when entombed.

Dr. Abraham G. Werner (1750-1817), professor in the school of mines at Freiburg, Germany, in 1775, gave modern geology its widespread interest. He held that a series of universal deposits had been formed by the action of a chaotic fluid, which evaporated and fell on the earth's crust in periodical succession and otherwise operated to erode and deposit silts. He thought this action aided in cooling and thickening the crust, and that it had a marked influence upon the distribution of materials which exuded or were thrown from volcanic craters. In 1788 James Hutton published his "Theory of the Earth," in which he directed attention to the causes that now exist in producing formations. He held a contrary view to Dr. Werner in that he thought granite and basalt are of igneous origin.

At present there are three recognized schools of geology, those known as catastrophism, uniformitarianism, and evolutionism. Those holding to *catastrophism* maintain that there have been a series of creations and catastrophes, life forms springing into existence and after a great lapse of time meeting with universal destruction, as in the deluge of Noah. Of this school Sir Roderick Murchison is a representative. Those holding to the theory of *uniformitarianism* think that causes now in operation alone constitute the reasons of all geologic phenomena. To this theory Sir Charles Lyell holds, and he exemplifies it in his "Principles of Geology." He cites in support of his opinion the action of rivers, tides, currents, and ice as the causes of stratified rock and other formations, directs attention to the action of volcanoes and earthquakes as agencies in producing igne-

ous and metamorphic results, and states his belief that collectively they are sufficiently potent to cause nearly every phenomenon witnessed in studying the earth's crust. Those holding to *evolution* (q. v.) accept all the theories of the uniformitarians, except those referring to the development of life forms. Of this school Darwin and Huxley are representatives, the latter assigning from 1,000,000 to 300,000,000 years as the time required for the production of the present conditions in geological phenomena.

It is probable that both the surface and interior of the earth were once highly heated, a condition probably still existing within the earth, and after cooling gradually formed a thin layer or crust at the surface. The lowest rocks, being of igneous or heat formation, are called igneous rocks, of which granite is an example. Owing to the presence of intense heat while forming, life could not exist, hence fossils do not abound. At that time the waters which now cover a large portion of the earth hung over the surface as dense vapor, but, as soon as a thin crust had formed, the cooling atmosphere tended to bring the vapor to the dew point and it fell to the surface in the form of rain. By continued cooling the crust became thicker, while contractions wrinkled the surface and caused portions to form dry land by emerging from the ocean. By the action of the water and that of heat and cold vast quantities of materials were broken up and ground into sand, clay, gravel, and other forms, which were carried to particular locations and stratified into strata of slate, sandstone, shale rock, and other common forms. These rock formations are known as aqueous or sedimentary, and contain more or less fossil remains. The heated interior long remained the seat of volcanic disturbances, which formed channels through the crust, and still give evidence of internal action and general contraction by occasional, though diminished, eruptions. The rocks modified by the action of heat are known as metamorphic.

Geologists make subdivisions of time based on the main rock systems, in each of which peculiar characteristics and organic remains, if present, have been studied and classified. These are shown in an ascending order in the following table:

LIFE PERIODS.	ROCK SYSTEMS.
Post-Tertiary or Quaternary . . . . .	{ Recent—Alluvial. Peat, etc. Pleistocene.
Tertiary or Cenozoic . . . . .	{ Pliocene. Miocene. Oligocene. Eocene.

LIFE PERIODS.	ROCK SYSTEMS.
Secondary or Mesozoic.....	{ Cretaceous. { Jurassic } Oölitic. { Liassic. { Triassic. { Permian or Dyas. { Carboniferous. Primary or Palaeozoic..... } Devonian and Old Red Sandstone. Silurian. Cambrian. Archaean, Laurentian, or Eozoic } Fundamental Gneiss.

The five principal periods or times are divided into ages in which the forms of life are classified in an ascending scale as follows:

Quaternary.....	{ The Age of Man.
Cenozoic.....	{ The Age of Mammals.
Mesozoic.....	{ The Age of Reptiles.
	{ The Age of Coal Plants.
Palaeozoic.....	{ The Age of Fishes.
	{ The Age of Invertebrates.
Archaeon.....	{ The Lifeless Age and Dawn of Life.

The Archaeon time witnessed the dawn of life. It included an extensive era, and the temperature was so extremely high that life could not have existed. However, the simpler forms began to be created toward its close. The rocks of this period resulted from cooling of the molten mass of the earth and became the covering of the entire surface, including the regions below the ocean. On the older archaeon rocks sedimentary rocks less ancient were deposited. At this period North America was largely submerged. Only portions in the vicinity of Lake Superior, the Iron Mountains of Missouri, the Blue Ridge range, the Wind River Mountains, the ranges farthest east in Colorado, and the New Jersey Highlands projected above the highly heated water. These portions constitute the oldest part of North America. It was within this time that iron was formed, the rocks of this period containing a large per cent. of iron ore. The Laurentian and Huronian are among the North American rocks that then existed, the former in the vicinity of the Saint Lawrence and the latter near Lake Huron, from which they were named.

In the Palaeozoic time the animals and plants but slightly resembled those now living. Fossil remains are mostly those of mollusks, protozoa, radiates, and articulates. The rocks were made under water and consist of vast deposits of limestone, sandstone, and shales, which are either largely or entirely formed of the remains of shellfish, clams, oysters, and other similar forms of life. This is known as the Silurian or Age of Invertebrates. The Devonian Age followed, in which the first vertebrates appeared in the form of fishes. Plants became abundant and vast swarms of insects appeared. In the Carboniferous Age the surface was covered with

many fernlike and other plants which were of gigantic size and ultimately formed beds of coal (q. v.) by the remains decaying under water. The period was characterized by alternated elevations and subsidences, thus forming in some regions two or more coal veins by being tilted, as in many regions of the Allegheny Mountains. In this period all the animals of the subkingdoms lived and reptiles began to appear.

In the Mesozoic time, known also as the Age of Reptiles, the plants and animals began to resemble existing species. The reptiles were greatly in preponderance and included many species of snakes, turtles, and crocodiles. The ichthyosaurus, an animal that swam in the sea or paddled in the mud, and the plesiosaurus, a large reptile with a snakelike neck, were common in this period. Great birds, such as the archaeopteryx (q. v.), lived at this time and left their foot imprints as fossil remains by walking over the forming rocks.

In the Cenozoic time North America was largely above the sea, though numerous large lakes with fresh water were abundant, the largest of which extended from Texas northeasterly to Nebraska. This period bears evidence that vegetation was still abundant in the Arctic zone, where fine forests of redwood, magnolia, and other species native to warm climates extended over vast regions. Large animals, including elephants, were abundant in the Rocky Mountains, of which fossil remains are not uncommon. The glacial period swept over the northeastern portion of the continent of North America at that time with its destructive effects upon life forms, causing vast drifts and carrying great boulders, reaching south to about the 40th parallel. The glacial period was followed by the Champlain period, in which alternating floods and varying climates followed in succession. Subsequently the climate was again tropical, when many animals inhabited the forests, while slowly through long periods of time the temperature gradually fell. In the Quaternary Age the present animals and plants appeared and man was created. Geologists differ as to the length of the creation period measured in years, and many do not undertake to assign any given number of years. They commonly call all time before life appeared Azoic and the appearance of life Eozoic, and classify all subsequent time as exemplified above.

**GEOMETRY** (jê-ôm'ê-trÿ), the science that relates to the measurement of definite portions of space, such as lines, angles, surfaces, and volumes. The various divisions of geometry include plane and solid geometry, analytical geom-

etry, descriptive geometry, and higher geometry. *Plane geometry* and *solid geometry* treat of right lines and plane surfaces, and of circles and spheres. In *higher geometry* are treated the conic sections, curved lines, and bodies generated from them. In *analytical geometry* are involved the various calculi in algebraical forms, while *descriptive geometry* embraces an extension of the principle of projections.

The origin of geometry is traced to the Hindus, but the Egyptians appear to have possessed a knowledge of it at the times the pyramids were built. Thales, who flourished in 639-548 B. C., is among the first of the Grecian geometers, and to him is attributed the discovery of the properties of triangles. Pythagoras was a disciple of Thales. He greatly extended the knowledge of the geometry of polygons by discovering the theorem of the square of the hypotenuse. He demonstrated that the area of a circle is greater than that of any plane figure having an equal perimeter, and that the sphere has the greatest volume of the bodies which are bounded by an equal surface. Many other Greeks followed in adding to the science, among them Anaxagoras, Hippocrates, Plato, and Euclid. The last mentioned founded a school of mathematics in Alexandria, Egypt, some time in the reign of Ptolemy I., in 323-284 B. C. He published a treatise on "Porisms," a book on "Data," and his "Elements of Geometry." Most of his works are lost, but his "Elements" are still in use in many schools and colleges. Among the celebrated geometers of recent times are Kepler, Descartes, Pascal, Newton, and Carnot.

**GEORGE, Fort**, a small fortress of Canada, near Queenstown, Ontario, on the Niagara River. General Brock took up his headquarters at Fort George in 1812, where he was attacked on May 27, 1813, by a force of Americans, who landed their troops under cover of the guns of the fleet. The Americans were under General Dearborn and the British were defeated, after which the fort was abandoned. Forts Erie and Chippewa were abandoned soon after, and the whole Niagara frontier passed into the hands of the Americans.

**GEORGE, Lake**, a beautiful lake in northeastern New York, extending from southwest to northeast. The length is thirty-five miles, breadth, from one to three miles; and greatest depth, 400 feet. The surface has an elevation of 310 feet above sea level. On its northern shore are the ruins of Fort Ticonderoga. The shores are beautified by lofty hills, on which picturesque forests abound. The outlet is into Lake Champlain, which is a short distance to-

ward the north. Lake George is a popular resort for many artists and tourists.

**GEORGE JUNIOR REPUBLIC**, the name of a community maintained for boys and girls near Freeville, N. Y., about eight miles west of Ithaca. It was established by William R. George in 1895. The purpose is to afford employment and training for unfortunate children, most of whom are obtained from the cities. This community has a constitution modeled after that of the United States, which provides for the election of legislative, judicial, and executive departments. Mr. George was the first president, but this and all other offices have been filled by boys since 1896, though the power to veto is retained by Mr. George. It is incumbent upon the members of the community to work at some occupation, such as carpentry, printing, blacksmithing, farming, or domestic science. The buildings include a store, a library, a bank, and a school, and several hotels, restaurants, and workshops. Primary and grammar schools are provided for all children under sixteen years of age and the courses fit the students for academic or college work. The trustees of the enterprise control about 400 acres. At present the average attendance is about 225 children.

**GEORGETOWN** (jôrj'town), the capital of British Guiana, situated near the mouth of the Demerara River, in Demerara County. It is the most important city of the Guianas. The streets are regularly platted, with fine shade trees and buildings, and the city is connected with adjoining trade centers by railways. Among the public buildings are the town hall, the Parliament building, the Episcopal cathedral, Queen's College, a mariners' hospital, a public library, and a museum. Besides its public school system, there are a number of flourishing historical and scientific societies, and divers religious and economic associations. The streets articulate with several canals which furnish convenient connection with the harbor. Most of the buildings are placed on piers to elevate them above the low site. The principal exports include coffee, sugar, fruits, and rum. Among the imports are machinery, fabrics, and manufactured articles. The city is the center of the export and import trade of the colony, has a good harbor, and is well fortified. Three-fourths of the inhabitants are Negroes and people of native birth. Population, 1906, 54,692.

**GEORGETOWN**, a city of South Carolina, county seat of Georgetown County, 55 miles northeast of Charleston, on the Georgetown and Western Railroad. It is located at the head of Winyah Bay and is important as a seaport. The trade consists chiefly in rice, fish, turpentine,

cotton, and machinery. It has electric lights, waterworks, and a number of fine school and county buildings. The first settlement was made on its site about 1700 and its incorporation dates from 1805. Population, 1900, 4,138.

**GEORGETOWN UNIVERSITY**, an educational institution in Georgetown, D. C., which is now included within the limits of Washington. The university was founded in 1799 and later, in 1815, it was empowered by Congress to grant academic degrees. It is under the auspices of the Society of Jesus, an order of the Roman Catholic church, and carries courses in dentistry, medicine, law, philosophy, and theology. Degrees are conferred in arts, dentistry, law, medicine, and philosophy. About 750 students attend the different departments. The library contains 90,000 volumes.

**GEORGE WASHINGTON UNIVERSITY**, an institution of higher learning located at Washington, D. C., the origin of which dates back about ninety years. It was originally the Columbian College of the District of Columbia and was chartered by a special act of Congress on Feb. 9, 1821, with all the powers commonly granted to American colleges. By a special act of March 3, 1873, Congress changed the name to the Columbian University. By another special act of Congress on Jan. 23, 1904, the Columbian University was authorized, on compliance with certain formalities, to take a new name, the name chosen to be approved by the Secretary of the Interior and the Commissioner of Education. These formalities were complied with, and on Sept. 1, 1904, the present name was adopted. On March 3, 1905, Congress recognized the George Washington University by this name and conferred upon it additional powers of the most comprehensive nature for carrying on higher education. It may, under its charter, apply in whole or in part the English system of carrying on undergraduate work through colleges which are educationally under its jurisdiction. Such colleges are organized by permission of the university under a special incorporating act contained in the university charter. Each college has its own trustees, faculty, and financial foundation, separate and distinct from the university. All are, however, so under the jurisdiction of the university that they must conform to the standards set by it and can only present to it their candidate for degrees, all degrees being conferred by the university. It carries on graduate work directly through its special university lectures. All the existing university systems may thus be applied by it in carrying on its work; and by this composite plan of organization, combining the ad-

vantages of a federal and a unitary system, the work of the university is standardized and coördinated, the time of the student is economized, and the institution is kept at the highest point of efficiency.

In addition to its power to permit the incorporation of colleges in the District of Columbia which are educationally under its jurisdiction, the university is authorized to affiliate with itself institutions of learning outside the District, which may desire to have the benefit of university affiliation at Washington. This feature enables colleges to enter into arrangements whereby their students may do some of their work in the national capital and receive credit for it towards the degree given by the college, while these students may, at the same time, be pursuing graduate or professional studies and taking their graduate or professional degree at the university.

A provision of the charter reads as follows: "Persons of every religious denomination shall be capable of being elected trustees; nor shall any person, either as president, professor, tutor, or pupil, be refused admittance into the university or be denied any of the privileges, immunities, or advantages thereof, for or on account of his sentiments in matters of religion." The board of trustees is organized so that no religious denomination has a control. The charter provides for a board of visitors, which may be representative of the interests of the country at large, and which will assure the observance of every provision of the charter.

The university has, in its various faculties, over two hundred professors and teachers. It has fourteen hundred students, every State in the Union being represented, as well as foreign countries. It gives full day instruction in all its colleges and departments. Undergraduate work in arts and sciences is done by Columbian College, which is a corporation recently organized under the provisions of the charter, a College of Engineering, and a College of Pharmacy. The possibility of giving undergraduate instruction through colleges under the jurisdiction of the university, on the broadest as well as on the most specific and practical lines, is thus illustrated. The graduate work of the university is done through a graduate department of the arts and sciences. It has a department of medicine, a department of law, a college of the political sciences, and a teachers' college.

The college of the political sciences carries on undergraduate, graduate, and professional instruction in American history, politics, economics, finance, international law, and diplomacy. It has distinguished teachers and lecturers and

has graduated many young men who now hold important positions in the civil and foreign service of the United States.

**GEORGIA** (jôr'jĭ-à), a State of the United States, one of the original thirteen, popularly called the Empire State of the South. It is bounded on the north by Tennessee and North Carolina, east by South Carolina and the Atlantic, south by Florida, and west by Alabama. Its length from north to south is 330 miles; width, 253 miles; and area, 59,475 square miles, including 495 square miles of water surface.

**DESCRIPTION.** The State lies partly in the coastal plain and partly in the Appalachian highlands. In the eastern part are the Blue Ridge Mountains, which cross into the State from North Carolina and terminate in the northern

1, Atlanta; 2, Augusta; 3, Columbus; 4, Macon; 5, Savannah; 6, Brunswick. Chief railways are shown by dotted lines.

part of Georgia. These mountains have a general elevation of from 3,000 to 5,000 feet, culminating in Sitting Bull Mountain, which has an elevation of 5,046 feet above sea level. In the western part is the Cohutta group, which is a continuation of the Unaka Mountains of Tennessee, and the Lookout and Sand Mountain ranges are in the northwestern corner. A broad plain characterizes the coastal region, where the surface is slightly elevated above the sea, but it rises quite uniformly toward the interior. Between the coastal plain and the mountains is a broad area known as the Piedmont plateau, which extends over about one-third of the State. Numerous swamps prevail in the low region of the coast, but the largest marshy tract

is the Okefinokee Swamp, which is 30 miles wide and 45 miles long, and a small part of it extends into Florida. Off the coast are numerous islands, including Ossahaw, Saint Catherine's, Sapelo, Saint Simon's, and Cumberland.

The rivers form a valuable network of drainage and furnish considerable transportation facilities. Much of the northeastern boundary is formed by the Savannah River, which is navigable to Augusta. A large part of central Georgia is drained by the Altamaha, which receives the inflow from the Oconee and Ocmulgee, and is navigable to Macon. Other rivers that flow into the Atlantic include the Ogeechee, the Satilla, and the Saint Mary's, the last mentioned forming a part of the northern boundary of Florida. The Coosa and several of its tributaries, which belong to the Alabama River basin, drain the northwestern part of the State. A number of rivers flow southward into the Gulf of Mexico, including the Appalachianicola, which is formed at the southwestern corner of the State by the junction of the Flint and the Chattahoochee, the latter forming a large part of the western boundary. No lakes of importance are located within the State, but a number of lagoons and sounds characterize the coast.

The State has a wide range of climate. On the coast in the southern part the annual average temperature is 70°, while in the valleys of the mountain regions it falls somewhat below 40°. In the northern part the climate is quite equable, no season of the year being severe or marked with extremes. Snow and frosts are very rare in the southern part, where the summers are long and the climate is similar to that of Florida. Brunswick has a mean temperature of 69°; Athens, 63°; and Atlanta, 61°. The State has an average rainfall of 48 inches, being greatest in the northern and smallest in the southern part. Fevers and malaria are not infrequent in the marshy region, but all other parts are healthful the entire year. Far toward the interior extend beautiful forests of palmetto, oak, beech, magnolia, elm, and other useful species of timber. The wild animals include alligators, wildcats, bear, opossum, and many species of birds and waterfowl.

**MINING.** Many minerals are found in the mountainous region of the northwestern part. Both coal and iron are obtained in considerable quantities, hence supply a considerable share of the material used in manufacturing. Gold has been produced in paying quantities for about a century, and the State yields nearly one-half of the manganese produced in the United States. Georgia marble is a peculiarly valuable product,

both for monuments and the construction of bridges and buildings. It is especially valuable for finishing stone. Other materials include silver, bauxite, limestone, granite, amethyst, and beryl.

**MANUFACTURING.** Within recent years the manufacturing interests have been greatly enlarged and diversified, and the State takes a high rank in this respect among the southern states. The forests yield vast quantities of turpentine and tar, and a large part of the lumber products is utilized in making furniture and machinery. However, in the value of the output, the first place is held by textiles. In the manufacture of cotton products Georgia is surpassed by only three of the New England states. These products include textiles, hosiery and knit goods, cottolene, and cotton-seed oil and cake. The manufacture of fertilizers has made rapid progress, which is true likewise of railway cars, machinery, flour, clothing, and rosin.

**AGRICULTURE.** About seven-tenths of the surface is in farms, hence agriculture is the leading industry. A larger acreage of land is improved at present than at any former period, and the farms average a smaller size. This is accounted for by the fact that many of the large plantations have been subdivided and are worked by Negro farmers, though fully 65 per cent. of the land is worked by the whites. Cotton and corn are the chief crops, and the value of the product of these is about equal, though formerly cotton held a much larger place than corn. Sea-island cotton of a fine quality is grown extensively along the coast and on the islands, and the upland species thrive in all parts of the State. In 1900 the State had 3,343,083 acres in cotton and 3,477,684 acres in corn. Oats and wheat, which are grown on about an equal area, have an acreage of less than one-tenth of either corn or cotton. Other farm products include rice, hay, potatoes, peanuts, and sugar cane. Cattle are grown both for meat and dairy purposes, each of which receives marked attention. Other domestic animals are mules, swine, horses, sheep, and poultry. Fruits of all kinds can be grown profitably. The State has very large interests in the culture of oranges, lemons, pineapples, peaches, pears, apples, and garden vegetables.

**TRANSPORTATION.** The State has a coast line of 128 miles and a large mileage of navigable streams. In 1900 the railroad lines aggregated 6,125 miles, exclusive of the many interurban lines of electric railways. All of the counties have railway or river transportation facilities, hence every section can be reached conveniently.

Atlanta, Savannah, Albany, Macon, Columbus, Rome, Athens, and Waycross are among the principal railway centers. Savannah is the chief export city, being located near the mouth of the Savannah and on a number of railways. Brunswick and Saint Mary's have a considerable foreign commerce. The chief exports include cereals, cotton, turpentine, granite and marble, machinery, manganese, and textiles. The fisheries, especially shad and oysters, furnish considerable material for exportation.

**EDUCATION.** Educationally, Georgia has attained to an enviable position among the states of the South. Common schools are maintained throughout the State and are instrumental in causing illiteracy to decrease rapidly. Funds are supplied liberally to maintain high schools in the larger centers of population, while normal schools and other institutions of higher learning are rapidly multiplying and increasing in effective value. The number of higher institutions maintained for white pupils include several universities, and about forty colleges and private institutes, while the needs of the Negro youth are met by six higher institutions. The State University of Georgia, which is at the head of the system of education, is situated at Athens. Other institutions which are maintained under State support include the North Georgia Agricultural College at Dahlonega, a normal and industrial school for girls at Milledgeville, a technological school at Atlanta, and an industrial college for Negroes near Savannah. Besides these are numerous denominational and nonsectarian institutions of higher learning, among them Mercer University at Macon, Emory College at Oxford, the Wesleyan Female College at Macon, and the Lucy Cobb Institute at Athens.

**GOVERNMENT.** Georgia is governed by a constitution which was ratified by the people in 1877. It confers the right of suffrage to all male citizens 21 years of age, with the requirement that they shall have been citizens of the State one year and of the county six months, and that they have registered and paid assessed taxes. The Governor is elected for a term of two years and is ineligible for four years after having served two terms. He has the power to veto bills passed by the Legislature, but his veto may be overcome by a two-thirds vote of each house. Representation in the Legislature depends upon a population basis, and bills appropriating money must originate in the house of representatives. The legislative branch consists of two houses, the senate and house of representatives, and the members of each are elected for a term of two years. A chief justice and five

associate judges make up the supreme court, in which the terms of service are six years. Each judicial district has a superior court judge, who is appointed for four years by the General Assembly. The justices of the peace, who are elected for four years, have local jurisdiction in the militia districts.

**INHABITANTS.** The State has eleventh rank in the number of inhabitants and next to Texas is the most populous southern State. In some counties the Negroes greatly outnumber the whites, especially in the southern part of the State, and the whites are most numerous in the mountainous regions. Atlanta, the capital, is the largest city. Savannah, on the Atlantic coast, is the chief seaport. Other cities of importance include Augusta, Macon, Athens, Rome, Brunswick, Thomasville, and Columbus. In 1900 the State had a population of 2,216,331. This number included 1,035,122 colored persons, or 46.7 per cent. The total Negro population was 1,034,199; in 1910, 2,609,121.

**HISTORY.** The history of Georgia begins in 1540, when De Soto visited that region with 600 Spaniards in search of gold. However, not until 1733 were permanent settlements made. At that time James Oglethorpe founded a colony for the refuge of poor debtors and the persecuted Protestants of Germany, and named the colony in honor of George II. The settlement founded developed into the city of Savannah, but in 1752 the charter granted Oglethorpe was surrendered to the British and Georgia became an English province. During the Revolution the people of Georgia entered into the struggle for liberty with much enthusiasm, but many were compelled to leave their homes by the invading armies of England. The first constitution was framed in 1777, and on Jan. 2, 1788, the Constitution of the United States was ratified. In 1838 the Creek and Cherokee Indians were removed to Indian Territory, now Oklahoma, after prolonged troubles and local wars.

In the Civil War Georgia sided with the South, seceding in 1861, and furnishing an effective force for the Southern army. Its own capital, Atlanta, was for a brief time the capital of the Southern Confederacy. Sherman marched through the heart of the State when on his famous expedition to the sea. The recent history is one of large agricultural, manufacturing and mining development. Several industrial exhibitions have attracted attention to the superior resources of the State, such as the National Exposition held at Atlanta in 1881. The State enacted a law in 1907 which forbade the sale of liquor after Jan. 1, 1908.

**GEORGIA**, formerly a kingdom of Europe,

but now a part of the Russian Empire. It comprises the territory lying south of the Caucasian Mountains, between the Caspian and the Black seas, and is bounded on the south by Persia and Asiatic Turkey. The region is divided into the Russian governments of Kutais, Baku, and Tiflis. Anciently it comprised the kingdoms of Albania, Colchis, and Iberia. The Georgians trace their history back to Japhet, but little is known of them until the time of Alexander the Great, who conquered their country, and after his death they established a government of their own. In the 4th century they became Christianized, but many of them are now Mohammedans. Georgia prospered until the 13th century, when it was conquered by the Mongols, and Timur laid it waste in the 14th century, but it was liberated in the 15th century by George VII. He was succeeded by Alexander I., who divided the territory among his three sons. It was invaded a number of times by the Persians and Russians until 1802, when Paul, Emperor of Russia, proclaimed it a part of his royal dominion. The Georgians speak a language that is regarded a link between the tongues of Eastern Asia and those of the Indo-European peoples.

**GEORGIA, Strait of**, a large inlet from the Pacific Ocean, in the northwestern part of North America, which separates Vancouver Island from the mainland. It is about 250 miles long, in a direction from southeast to northwest, and has an average width of 25 miles. The Fraser River discharges into it. It is connected with the Pacific Ocean at its northern end by Queen Charlotte Sound and at its southern end by the Strait of Juan de Fuca.

**GEORGIA, University of**, a State institution of higher learning at Athens, Ga., chartered in 1785. It was formally opened in 1801 and is the oldest State institution of the United States. In 1872 it received the proceeds arising from the sale of lands granted to Georgia under an act of Congress passed in 1862, and since that time it has greatly increased its facilities. The institution comprises the State College of Agriculture; Franklin College; North Georgia Agricultural College, situated at Dahlonega; the law school; the medical college, situated at Augusta; the Normal and Industrial School for Girls, situated at Milledgeville; the School of Technology, situated at Atlanta; the State normal school, and the industrial college for colored persons. It has a library of 35,000 volumes, a faculty of 165 members, and an attendance of 2,250 students.

**GEORGIAN BAY**, an inlet from Lake Huron into Canada, extending into the south

part of the Province of Ontario. It is about 120 miles long and 50 miles wide. The deepest water, which is in the southwestern part, is about 300 feet. Manitoulin Island and the peninsula of Cabot's Head partly separate it from Lake Huron, with which it is connected by North Channel and a short channel south of Manitoulin Island.

**GERA** (gǎ'rá), a city of Germany, capital of the principality of Reuss, on the White Elster, 44 miles southeast of Weimar. It is regularly platted and well built. The chief buildings include the post office, the palace of the prince, the theater, and a number of schools. It has manufactures of woollens, carpets, jewelry, cigars, brick, leather, and machinery. The streets are well paved with stone and macadam. It has extensive systems of waterworks, sewerage, and electric urban and interurban railways. Gera dates from the 12th century and became a possession of the house of Reuss in the 14th century. Population, 1905, 46,909.

**GERANIUM** (jê-rā'nî-ŭm), the name of a flowering plant, popularly called *crane's bill*, which constitutes the typical genus of the order

GERANIUM.

*Geraniaceae*. A number of species are cultivated for their flowers, of which the *spotted crane's bill* is the largest. It has a stem about two feet high and bears light purple flowers. Most species have a bitter rootstock, which is used in medicine, when it is known as *alum root*. They thrive best in rocky places, on sandy

shores, and on the slopes of mountains. By cultivation a large number of plants with beautiful flowering qualities have been originated. The geraniums commonly cultivated are grown as flowering plants and are known in botany as *Pelargoniums*. They are native to the southern part of Africa, especially to Cape Colony. These have been widely acclimated and are popular for window culture and greenhouse decoration. They are easily propagated by cuttings, and bloom almost continuously under proper care.

**GERMAN EAST AFRICA**, the largest colony of Germany, on the east coast of Africa, with a coast line of 620 miles. It is bounded on the north by British East Africa, east by the Indian Ocean, south by Portuguese East Africa and British Central Africa, southwest by Rhodesia, and west by the Congo Free State. The northern boundary crosses Lake Victoria Nyanza, the western boundary passes through the middle of Lake Tanganyika, and the northeastern part borders on Lake Nyassa. It includes the Island of Mafia, in the Indian Ocean. The area is 384,176 square miles.

A narrow coastal plane extends along the Indian Ocean, whence the surface rises gradually toward the interior, where the country assumes the aspect of a wide plateau with an altitude of from 3,000 to 4,000 feet. A range of highlands extends through the central part, trending north and south, where some of the mountains have a height of 6,000 feet. The highest elevations are in the northern part, where the volcanic peak of Mount Kilimanjaro rises to a height of 19,720 feet, forming the highest point in Africa. Many streams water the country, most of which is drained into lakes Victoria Nyanza and Tanganyika, which have their outlet through the Nile and the Congo. Few of the rivers, such as the Rufiji and the Panzani, are navigable by small boats, but many streams are available for irrigation. The climate is tropical and plant life is numerous and luxuriant. Malaria prevails in the lowlands, but the more elevated regions are healthful. The annual temperature is 78° along the coast, although it is somewhat higher in the lowlands of the interior. Rainfall is excessive in some parts.

The colony has extensive deposits of coal, salt, iron, and petroleum. Gold and silver are found in the southwestern part, but mining has not been developed to a large extent. Agriculture is the chief occupation. The products include coffee, rice, wheat, tobacco, maize, cotton, and tropical fruits. Sugar beets are grown successfully in many parts of the colony. The domestic animals include cattle, horses, sheep, and goats. Timber, India rubber, tobacco, and

live stock are the leading exports. Textiles, hardware, and machinery are imported. The principal ports are at Dar-es-Salaam, Lindi, Tanga, Kilwa, and Pangani. Several lines of railroads have been built, including one from Dar-es-Salaam inland, and the Cape-to-Cairo Railway is projected through the east central part.

The administration is under a governor, who is appointed by the crown and assisted by a legislative council. Dar-es-Salaam is the capital and leading seaport. Schools are maintained under the government in the leading towns, with higher instruction at Tanga, Bagamoyo, and Dar-es-Salaam. The first German settlement was made on the eastern coast of Africa in 1884, but the territory was turned over to the German East Africa Company the following year, under which trade and colonization were promoted. The Sultan of Zanzibar renounced his claims to the coast in 1891, when the colony came under the control of Germany. About 1,500 of the inhabitants are Europeans. The natives belong chiefly to the Bantu race. Population, 1905, 7,365,500.

**GERMAN OCEANICA** (ô-shê-ăn'ê-kâ), the portion of the Pacific Ocean which lies between the Coral Sea and the Marianne Islands and extends from the northern part of eastern New Guinea to the Gilbert Islands. It includes the northeastern part of New Guinea, or Kaiser Wilhelm's Land, Dampier Island, Long Island, the Bismarck Archipelago, part of the Samoan or Navigator Archipelago, two chains of the Lagoon Islands, the Eastern Carolines, part of the Solomon Islands, the Pelew Islands, the Western Carolines, part of the Marianne Islands, part of the Gilbert Islands, the Admiralty Islands, and a number of others. These islands have a considerable trade, but their administration requires imperial aid. In recent years the revenues have been improving and they will likely soon yield returns to the government.

**GERMAN SILVER**, an alloy of nickel, copper, and zinc in varied proportions. This alloy was first made at Hildburghausen, Germany, of 2.6 parts iron, 25.4 parts zinc, 31.6 parts nickel, and 40.4 parts copper. The proportions commonly used at present are one part zinc, one part nickel, and two parts copper. It is whiter and harder than silver and takes a high polish. Strong acids attack it and some organic acids, such as vinegar, affect it materially. It is used largely in the manufacture of forks and spoons, knife and fork handles, candlesticks, and watch cases.

**GERMAN SOUTHWEST AFRICA**, a

colonial possession of Germany, bounded by Portuguese West Africa on the north, British South Africa on the east, and by Cape Colony and the Atlantic Ocean on the south and west. The area is 322,450 square miles. Among the chief rivers either wholly or partly in the region are the Orange, Cubango, Cunene, and Zambezi. Walfisch Bay receives the water of the rivers draining the interior. It contains the most important harbor, besides which are Swakopmund, Lüderitz Bay, and Sandwich Harbor. About 480 miles of railroads are in operation. The mission schools are attended by 5,650 students.

The coast region is sterile, but the interior is susceptible to cultivation and yields agricultural products, cattle, horses, hides, and ostrich feathers. Deposits of copper and other minerals are found in paying quantities. Since the war between the Boers and British a considerable number of Boer agriculturists settled in the fertile regions of the interior and are aiding in rapidly developing its productive resources. German merchants established trading posts on the coast in 1883. Several insurrections have been raised by the native Hereros, but they were finally subdued in 1906. Other native tribes include Hottentots, Bushmen, and Bechuanas. Windhock, on Wolfisch River, is the seat of local government and is connected by a railway with the harbor at Swakopmund. Population, 1908, 246,800.

**GERMANTOWN**, a town which was annexed to Philadelphia, Pa., in 1845. It was the scene of an important battle between the American army under Washington and the British under Howe, on Oct. 4, 1777. Howe occupied Philadelphia and sent a detachment to seize forts Mercer and Mifflin, which caused Washington to make an attack at Germantown, where he hoped to crush the British. Early in the morning two columns of the American army advanced upon the village under Sullivan and Greene, but the Americans were thrown into a state of confusion on account of a heavy fog which occasioned a mistake and led Greene to charge upon the left center of the American army, causing a panic and the loss of the battle. Washington conducted a retreat in good order before the advance of Cornwallis, who had hurried from Philadelphia with two battalions. The American loss was 673 men and the British lost 575. Germantown was settled by Palatinate Germans in 1683. They established the first paper mill in America at this place in 1690 and published the first American edition of the Bible in 1743. At present it is a pleasant part of Philadelphia, about six miles

north of the center of the city, and has fine gardens and superior buildings.

**GERMAN UNIVERSITIES**, the term applied to the more important institutions of learning founded in the German-speaking countries, but located principally in Germany, Austria, and Switzerland. These institutions are the most efficient and constitute the greatest organizations of institutional learning in the world. Twenty-one of these institutions are in Germany, of which thirteen are Protestant, four are Roman Catholic, and four have mixed faculties. This system includes 4,820 instructors and professors and about 48,500 students, and numbers among the alumni some of the leading thinkers and writers, both living and dead. The institutions maintained in Berlin, Munich, Leipzig, Bonn, Freiburg, Halle, Breslau, and Göttingen are the largest. However, the University of Heidelberg is the oldest, having been founded in 1386. Those classed as Roman Catholic are at Freiburg, Munich, Münster, and Würzburg and those having both Protestant and Roman Catholic faculties are at Bonn, Breslau, Strassburg, and Tübingen. All the courses of study articulate with those of preparatory schools, though foreigners are admitted to membership without examination on certificates from foreign institutions of recognized merit.

The discipline is rigid and expulsion from one university constitutes a bar to admission to the others. In the higher courses are included medicine, philosophy, theology, and law, though the natural sciences, civics, higher pedagogy, music, political economy, civil and electrical engineering, architecture, and other departments are maintained. The studies are largely elective, which gives students the privilege of pursuing such advanced work as seems best adapted to their needs, while they may enroll contemporaneously in different institutions for the purpose of taking additional and supplementary work. These universities are under the control of appointees of the government, who constitute, with the minister of public instruction, the managing, directing, and guiding officers for particular institutions.

The expense of maintaining these universities is borne largely by the state, only about ten per cent. being paid by students in the form of fees. Among the university museums, libraries, and publications those of Germany take high rank. In all the great centers of learning are adequate requirements to facilitate references and home reading, while the scientific societies, especially those which foster original research, are represented by a wide

range of organizations. Instruction is mostly by lectures, the preparatory work being done largely in laboratories and during private hours. Students may secure lodging and board in private families, but ample facilities are provided at the dormitories and may be utilized at small expense. Most of the courses cover four years of work, though in medicine it is often five. The class of degrees issued depends largely upon previous preparation. A large proportion of the students are from foreign countries, including many from America, for whose accommodation advanced and special post-graduate courses are maintained in some of the institutions.

The leading German universities of Austria-Hungary are at Vienna, Graz, Innsbruck, Czernowitz, and Prague, but the last mentioned maintains a faculty in Bohemian. Basel, Bern, Geneva, Lausanne, and Zurich have the chief German universities of Switzerland. The alphabetical list of the universities of Germany is as follows:

Berlin,	Kiel,
Bonn,	Königsberg,
Breslau,	Leipzig,
Erlangen,	Marburg,
Freiburg,	München,
Giessen,	Münster,
Göttingen,	Rostock,
Greifswald,	Strassburg,
Halle,	Tübingen,
Heidelberg,	Würzburg.
Jena,	

**GERMANY** (jěr'mà-nĭ), or **German Empire**, one of the great powers, situated in the north central part of Europe. From east to west it extends through 17° of longitude, about 750 miles, and its breadth is 600 miles. Its northern boundary is formed by Denmark and the North and Baltic seas; eastern and southern by Russia, Austria-Hungary, and Switzerland; and western by France, Belgium, and Holland. The coast on the North and Baltic seas has a length of 1,200 miles, which is equal to about one-third of the entire frontier. The position occupied by it brings it in closer touch with the leading nations of Europe than any other country and the leading highways of the continent pass through it. It has a total area, exclusive of the colonial possessions, of 212,028 square miles, about one-sixteenth of that of all Europe.

**SURFACE.** The northern one-third is a low plain and the remainder of the empire may be classed as highland. In the southwestern part, on the boundary of Switzerland, are the high

WILLIAM II.

William II., King of Prussia and Emperor of Germany, eldest son of Frederick III., was born January 27, 1859. He studied in the Gymnasium of Cassel and the University of Bonn. In 1881 he married Augusta Victoria of Schleswig-Holstein. He succeeded his father as Emperor in 1888. His eldest son, Frederick William, the crown prince, was born in 1882.

elevations of the Alps. Toward the north of these, extending far into central Germany, are the Mittelgebirge, or Secondary Mountains, and north of these are the low plains. No great elevations exist, the highest being the Bavarian Alps, of which Zugspitze, in Bavaria, is the culminating peak. It has an altitude of 9,675 feet. Other elevations include the Vosges, 4,710 feet, and Feldberg, in the Black Forest, 4,910 feet. The Harz Mountains are near the central part, forming the northern elevations of the highland. Toward the south of these are the Black Forest, the Bavarian Forest, and the Swabian and Franconian Jura. Connected with them by lower ranges are the ridges of the Erzgebirge, the Böhmerwald, the Riesengebirge, and the Fichtelgebirge. All of these elevations have rounded summits and in and through them extend broad valleys of great fertility. Numerous streams water the highland and fine grasses and forests are abundant. Many inlets characterize the shore, but the good class of harbors are confined to the mouths of rivers, where the streams have worn channels through the rather shallow sea. The lowlands form a somewhat sandy plain, which is diversified by elevations attaining heights of about 750 feet. In the northeastern part are many lakes, including a number of inlets known as Haffs, of which Kurisches Haff and Frisches Haff are the most important. In the southern part are Chiem See, Ammer See, and Lake Constance, the last mentioned forming a part of the boundary with Switzerland.

**DRAINAGE.** Three drainage basins characterize the surface: those of the Danube, of the North Sea, and of the Baltic Sea. They are penetrated more or less by tributaries of navigable streams and the valleys are formed of loam mixed with sand. The greater portion is drained toward the north into the North and Baltic seas by the Vistula, Oder, Elbe, Weser, Ems, and Rhine, each of which receives the inflow from numerous tributaries. Its southern part, especially Bavaria, is drained by the upper Danube and its numerous affluents into the Black Sea. The Memel and the Pregel drain the extreme northeastern part, and the Vistula, which rises in Russia, flows through the eastern section into the Gulf of Dantsic. The Rhine, in the western part, has its lower course in Holland and is the most important highway of commerce. The rivers are largely connected by canals and furnish a vast network of means to navigate the interior, while many jetties have been constructed to deepen and improve the rivers.

**CLIMATE.** Germany has a temperate climate and the high elevations of the southern part render it quite equable. The colder section is in the northeastern part, bordering on the Baltic, and the warmer region is in the basin of the Rhine. Ice obstructs navigation a part of the year at the ports of the Baltic, but those of the North Sea are open practically the entire year, where the climate is influenced noticeably by the warm winds from the Atlantic. The mean temperature for the year is about 70°, ranging somewhat above that in the southern part and a little below it in the northern part. All sections of the empire have an abundance of rain for the germination and growth of all classes of plants common to the Temperate Zone, though it varies considerably according to locality and season. The heaviest precipitation is in the vicinity of some of the mountain ranges, where it reaches 40 inches, while the northern section has from 25 to 30 inches. Heavy storms and winds do not prevail, but the northern part has a heavy snowfall.

**FLORA AND FAUNA.** Nearly one-fifth of the empire is covered with forest, consisting chiefly of deciduous trees, and these receive as much care as the cultivated fields. Among the chief species are oak, elm, beech, fir, and pine. Coniferous trees are most abundant in the eastern part, and the beech may be said to be the most prominent tree in the eastern section. More than seventy per cent. of the entire area is under cultivation, either for agricultural or horticultural purposes.

Small game is abundant in the forests and wolves and wild boars are found in reservations and some of the mountains. The wild goat, marten, fox, otter, deer, chamois, and badger frequent the Alpine region, and the elk and fallow deer are protected in the preserves. The region of plains in the north is frequented by aquatic birds, such as the duck, snipe, and goose, which migrate there from the northern seas. Storks are abundant and are frequently found in the high buildings of cities, where they are protected by government regulations. The coast and stream fisheries are very valuable and produce merchantable quantities of the clam, eel, trout, salmon, carp, tunny, and oysters.

**MINING.** The geological formations are diversified, the principal characteristics being the recent sand loam deposits of the northern portion, Jurassic rocks in the central part, and Palaeozoic rocks in the southern section. Mining is an important enterprise, especially in coal and iron, in which Germany takes third rank, being exceeded only by Great Britain

and the United States. These minerals are widely distributed over the country, especially in the southwestern part, and the output comes largely from Bavaria, Baden, and Alsace-Lorraine. A large number of the mines are owned and operated by the government. Formerly bituminous and anthracite were mined exclusively, but the larger demand for fuel in the manufactories has caused a large output of lignite coal. Prussia is a heavy producer of copper, lead, zinc, nickel, and cobalt, though these minerals are distributed more or less over the empire. The silver mines take rank as the richest in Europe. Rock and other salts and potash salts are abundant. Other minerals include limestone, granite, sandstone, petroleum, and ocher. The quarries yield a large output for building purposes and monumental work.

**AGRICULTURE.** About two-thirds of the surface is in a high state of cultivation and is used either for pasturage or the growing of crops. Though one-third of the people engage in agriculture, the products are not sufficient to supply the demand. Great care is exercised in cultivating the soil, and many of the hillsides and mountain slopes are terraced to make husbandry possible. A large majority of the farms are small, ranging in extent from five to twenty acres, and the number that exceed 300 acres is comparatively insignificant. Modern methods are employed in all departments of farming, and a large number of steam plows, seeders, self-binding harvesters, and steam threshers are in use. This is accounted for largely by the increase of manufacturing enterprises, which have been the means of producing and introducing newer methods.

Rye is grown most extensively of the cereals, and is cultivated on about three times more land than either wheat or barley, though these can be raised profitably in all sections of the empire. Oats take second rank among the cereals. Corn is grown chiefly in the southern part. The acreage of hay is about equal to that of rye, being an important crop on account of the extensive interests in dairying. Germany has first place in the production of sugar beets and in this product has made greater progress than any other country, the enterprise being encouraged by bonuses paid by the government. The vine is a staple product along the Rhine, Main, Moselle, and in Swabia and Brandenburg, and the Rhine wines are famous in the markets of the world. Garden vegetables of all kinds, flax, tobacco, hops, barley, spelt and rape are cultivated extensively. All classes of domestic animals thrive, but the largest share of attention is given to raising

cattle for their meat and dairy products. Next in the order of importance are horses, sheep, swine, and goats. The Prussian studs and the Holstein cattle have a wide reputation.

**MANUFACTURING.** Germany ranks as the third manufacturing country of the world, being exceeded in the output only by Great Britain and the United States. About forty per cent. of the entire population are engaged in manufacturing enterprises, which include about 275 distinct industries. In the production of beet sugar it takes first rank, and it is classed among the leading nations in the output of steel and iron manufactures. However, the largest per cent. of persons engaged in any of the manufacturing industries are employed in making clothing, and those next in order are the building trades and the manufacture of foods. The textile industry furnishes a very large share of the commodities exported, especially the preparation of flax and the weaving of linen fabrics, although the output of cotton and woolen goods takes high rank. Other enterprises of this class include those of the velvet, silk, carpet, lace, and damask industries. Large interests are vested in the manufacture of toys, scientific instruments, armor plate, hardware, sailing vessels, spirituous liquors, earthenware, leather, paper, and heavy artillery pieces and projectiles. Large shipyards are located at Hamburg, Stettin, Bremen, Kiel, and Dantzic. Germany has extensive interests in the manufacture of rubber and gutta-percha goods, carved wooden specialties, clocks and musical instruments, and glassware.

**TRANSPORTATION.** Germany had an extensive system of transportation even before steam and electricity came into use, which consisted of well-improved highways, canals, and navigable streams. The Rhine, Elbe, Weser, Oder, and Vistula are navigable, and these and others have been materially improved by the construction of jetties and canals. Among the principal canals are the Finow, 40 miles long, in Brandenburg; the Ludwig's, 110 miles, in Bavaria, which unites the Black Sea and the North Sea by connecting the Danube and the Main; and the Kiel and Ider Canal, 21 miles, which unites the North and Baltic seas. The Great Canal extends from Kiel to the Elbe, facilitating the movement of the largest vessels, and is now used extensively for commerce between the North and Baltic seas. The Kaiser Wilhelm Canal affords a short outlet from the Baltic to the Atlantic.

Germany has 36,943 miles of railway lines and is exceeded in railroad mileage only by Russia and the United States. These lines are

owned principally by the national government, or by that of the states, and they are operated as public enterprises. Berlin is the most extensive railroad center in the empire, but lines penetrate every section of the country. In addition there are a large number of electric railways, both in the cities and throughout many parts of the country. The government maintains an efficient mail service and systems of telephone and telegraph lines. Stone and macadamized highways are numerous and in good condition.

**COMMERCE.** The foreign commerce of Germany is of vast importance and is exceeded only by that of Great Britain. At present the annual imports aggregate \$1,750,000,000 and the exports, \$1,500,000,000, being larger than the combined exports and imports of the United States, which aggregate \$2,750,000,000. Textiles, chemicals, coal, machinery, scientific instruments, leather goods, and clothing are the chief exports, while the imports consist principally of breadstuffs and raw materials. The greater share of trade is with Russia, Great Britain, the United States, Austria-Hungary, France, Argentina, India, Belgium, the Netherlands, Italy, and Switzerland.

**COLONIES.** The development of colonial possessions and commercial interest is a national policy. Its colonies include Kamerun, German East Africa, Togoland, German Southwest Africa, Kaiser Wilhelm's Land, the Ladrões, the Carolina Islands, the Marshall Islands, Kiauchua in China, the Bismarck Archipelago, the Pelew Islands, the Marianne Islands, the Solomon Islands, and part of the Samoan Islands. These possessions have an area of 1,027,950 square miles and a population of 12,500,000, and are governed through a centralized bureaucracy. Trade with the colonies has increased steadily the past decade, the imports amounting to \$12,500,000 and the exports from the colonies being \$7,500,000, of which the mother country received about fifty per cent. The expenditures on account of the colonies have been somewhat larger than the receipts, though the burden has been lessened materially by the development of a growing trade.

**EDUCATION.** The educational affairs of Germany are in a prosperous and effective condition, its schools, colleges, and universities taking the highest rank among the nations of Europe. For many years it was the land of pedagogy, in which teachers flourished who gave impulse and enthusiasm to its educational arts, promulgated basic principles vital in the education of man, and paved the way for progress in other lands. Elementary schools,

or *Volkschulen*, are supported in all communities, while institutions disseminating knowledge of industry, arts, sciences, and higher education are established and maintained under state and national supervision. The elementary schools include 61,500, in which 125,500 teachers give instruction and 8,980,000 pupils attend. Higher education is centered in 21 universities, at the head of which is the University of Berlin (q. v.), and the Lyceum Hosianum at Braunsberg, which has faculties in theology and philosophy. The institutions of secondary learning are numerous, including scientific schools, academies, and gymnasiums. The universities carry courses in medicine, law, theology, and philosophy. Many of these institutions are equipped to teach political and domestic economy, civil and electrical engineering, the natural sciences, and the trades, and all have museums, libraries, and collections of art. The scholars of Germany are renowned for faithful research, patience, and thoroughness, and have given the world many authorities on the important sciences and for professional reference. Newspapers, magazines, and periodicals have a wide circulation and are made up of superior educational, scientific, and intellectual material. Attendance at school is compulsory from six to fourteen. The number of normal schools for the training of teachers is reported at 185.

**GOVERNMENT.** Germany may be considered the successor of the Holy Roman Empire, which came to an end in 1806. However, Austria does not belong to the present confederation. The states included at present are the four *kingdoms* of Bavaria, Prussia, Saxony, and Württemberg; the seven *grand duchies* of Baden, Brunswick, Hesse, Mecklenburg-Schwerin, Mecklenburg-Strelitz, Oldenburg, and Saxe-Weimar; the four *duchies* of Anhalt, Saxe-Altenburg, Saxe-Coburg, and Saxe-Meiningen; the seven *principalities* of Lippe, Reuss-Greiz, Reuss-Schleiz, Schaumburg-Lippe, Schwarzburg-Rudolstadt, Schwarzburg-Sondershausen, and Waldeck; the three *free cities* of Bremen, Hamburg, and Lübeck, and the *crown land* of Alsace-Lorraine.

The government is a constitutional monarchy, based upon the constitution adopted in 1871, which recognizes the *Kaiser*, or emperor, as the highest executive officer. It provides that all the states of Germany are to "form an eternal union for the protection of the realm and the care of the welfare of the German people." The office of emperor is hereditary and in it is vested the power to represent the empire in concluding treaties and

alliances, declaring war, and concluding peace, and the emperor has chief command of the army and navy. Internal trade is free, while a high protective tariff is in force in relation to other countries, which, with the revenues from railroads, telegraphs, the postal system, and excises, constitutes the chief source of government receipts. The legislative power is vested in the upper and lower houses, which are known as the Bundesrath and the Reichstag. In the former are 58 members, appointed by the several states, and the latter has 397 members, elected by a universal ballot. The term of office in each branch is five years. The chancellor is appointed by the emperor and is the president of the Bundesrath. He has a seat in the lower house by virtue of his office, where he represents and defends the government in public measures and policies. In his general duties he is assisted by eleven secretaries, who are at the head of the several departments of the government. The proceedings of the legislative branch are public. A bill, to become a law, must have a majority vote in both branches, be assented to by the emperor, and receive the signature of the chancellor.

The political parties are organized similarly to those of Canada and the United States and include the liberal, conservative, and clerical. The liberal party advocates a united Germany on constitutional lines, the conservatives constitute the imperial party proper, and the clerical, known also as the ultramontane, is the Roman Catholic Party. These, besides the social democratic and several other parties, comprise the leading factors and are maintained by aggressive organization-work. The 25 states and the crown land of Alsace-Lorraine are pledged to a perpetual union, none of which has the power to secede or withdraw from the confederation. The laws of the empire are fundamental and all others must harmonize and conform to them.

Every male citizen of sound health and constitution is required to serve three years in the imperial army, in the reserve four years, and in the militia or landwehr five years. No one may be represented by a substitute, but the three years' compulsory service may be reduced one year by the completion of a course in the gymnasium. The navy has been enlarged within recent years, especially since the war with China in 1900, and now comprises one of the most powerful in the world. It includes 30 first-class battleships, 45 cruisers, 125 torpedo boats, 18 dispatch vessels, and numerous others. The peace footing is 510,350 men and 23,500 officers;

the war footing, 3,450,000 men. As a whole the army and navy are well organized and thoroughly disciplined and constitute an effective and mobile force.

**INHABITANTS.** The people of Germany are classed as Low German and High German. This classification includes, respectively, the people of North and South Germany, the term being applied on account of the difference of elevation in the different sections. Emigration from Germany has exceeded that of any other country, except Ireland. The number of Germans in the United States is about 8,000,000, exclusive of the American descendants who have lost the identity of language. The total number of German people residing in other countries is about 50,000,000, of which the greater number reside in the United States, Austria, Switzerland, Belgium, Russia, and Australia, and they are otherwise distributed to various sections of the world and in colonies. About 65 per cent. of the population of the empire are Protestants and 35 per cent. Roman Catholics, the latter being resident most largely in Alsace-Lorraine, Bavaria, and Baden.

In 1905 the population was officially reported as 60,641,278, and in 1909 it was estimated at 65,003,500. It ranks next to Russia in population of the European countries, but its density is greater, being about 310 to the square mile.

Nineteen cities have a population of over 200,000. These include Chemnitz, Charlottenburg, Stettin, Düsseldorf, Essen, Magdeburg, Bremen, Hanover, Nuremberg, Frankfurt-on-Main, Cologne, Dresden, Breslau, Leipzig, Königsberg, Munich, Hamburg, Stuttgart, and Berlin. In 1905, Berlin, the capital, had a population of 2,040,148, and Greater Berlin, which includes a number of suburbs, had a population of 2,870,000. The remarkable growth of German cities within recent years is accounted for by the vast increase in the manufacturing enterprises.

**LANGUAGE.** The German language is a branch of the Indo-European group of languages. It is commonly divided into three parts, known as Old High German, Middle High German, and New High German. In this classification the word "high" has a mere geographical distinction, and is used to distinguish from the German spoken in the low countries, which is known as *Plattdeutsch*. As to time the periods are classified to include the years 600-1100, from the rise of the Franks to the Crusades; 1100-1500, from the Crusades to the Reformation; and from 1500 to the present. While the different provinces still have a somewhat variant dialect, the official language and that taught in the schools

is universal, and there is a constant tendency to unify the spoken tongue in all parts of the region where the German language is officially recognized. The language is especially rich in synonyms, making it prolific in words to express emotion and adapting it to the purposes of the orator and poet. There is little difference between the German alphabet and that of the English, but the orthography and pronunciation differ considerably. While the grammar is more complicated by the fuller inflection and conjugation of words, it is notable that the orthography is much more in line with natural sounds, and as a result spelling and pronunciation are less difficult.

**LITERATURE.** The year 600 A. D. is fixed as the time when Gothic influence began to decline and the Franks took the lead in German history. After gaining control of Middle and South Germany, they embraced Christianity. Collections of folklore and legends were made as early as the time of Charlemagne. That distinguished sovereign not only encouraged literary art, but also made a collection of popular German poetry, mostly songs. The age of the Minnesingers, or singers of love, began about 1200, when companies of poets visited the castles and courts of nobles, where they sang the story of King Arthur and the history of Troy. To this period belong the "Nibelungenlied" and "Gudrun," in which the story of the heroic combats of Siegfried is related, and in them is a detailed account of how Griemhild, the beautiful daughter of King Gunther, was won by the gallant Siegfried. They relate the story of sinking the Nibelungen treasure in the Rhine, detail the death of Attila the Hun, and give a glowing account of the death of Hagen at the hands of Griemhild.

Another epoch is marked by the introduction of the mysteries and passion plays. These plays attained to the height of popularity in the 15th century, and not only gave rise to the German drama, but still continue in such interesting exhibits as are periodically witnessed at Oberammergau. Though all these and Walther von der Vogelweide, the greatest of the Minnesingers, had an extended influence upon the language and literature, it remained for Martin Luther to institute the era known as that of the New High German. This he did by translating the Bible into the German, thereby giving the language a fixed literary value, and he also wrote many songs which still engage the attention of singers in many tongues. Hans Sachs (born in 1494) was a contemporary of Luther, and his permanent place in literature is due to the 6,048 poems from his pen.

Johannes Fischart (1545-1591) is the author of numerous works, including "Christian Education," "The Luckship," and "The Marriage Book," the last named depicting the joy and peace of home life. To this epoch belong the popular stories written by the same author known as "The Wandering Jew" and "Eulenspiegel." The 17th century witnessed a period of great revival in learning and culture. At this time were translated many of the classics, while biography, romance, history, and philosophical works received marked attention. Martin Opitz (1597-1639) is the author of "German Poetry," a work celebrated on account of its purity in language and diction. Other writers of this period include Paul Gerhardt (1607-1676), one of the greatest hymn writers.

German literature in the 18th century, became quite free from foreign influence, and exercised a marked impression in Switzerland and the low countries. Johann Gottsched (1700-1766), is the most eminent literary man of the early part of the 18th century, and may be regarded the most eminent philologist prior to Grimm. His chief writings include the drama, "Dying Cato," while Johann Jakob Bodmer (1698-1783) translated "Paradise Lost" and published the "Nibelungenlied." Frederick Gottlieb Klopstock (1724-1803) is one of the noted poets of this period and the author of a religious epic entitled "Messias," while Christoph Wieland (1733-1813) takes high rank with the cultured poets. His best known productions include "Oedron," a tale of fairy lore, and he made numerous translations from Shakespeare. However, the most eminent poet of this period is Gotthold Lessing, who not only published comedies and tragedies of much value, but greatly benefited literature by elevating style through efficient criticism. His writings include "Nathan the Wise," "Hamburg Dramaturgy," and "The Young Scholar." J. G. Herder (1744-1803), a contemporary of Lessing, is noted chiefly for his searching criticisms. Among the eminent writers of the latter part of the 18th century are J. W. von Goethe and J. C. F. Schiller, two of the most distinguished characters in German literature. The names of these two writers are inseparably linked to each other, and their productions rank with the most eminent in the world's literature. See **Articles.**

The system of public schools and universities of Germany placed the literature on a high plane, a result to be expected from the fact that its scholars are recognized the foremost in the world. Among the philosophical writers are such eminent men as Schelling, Haeckel, Kant, Fichte, Hegel, Lotze, Schopenhauer, and von

Hartmann, whose productions have been widely translated. The historians include Niebuhr, Ranke, and Mommsen; the biblical writers, Strauss, Schleiermacher, Paulus, Neander, De Wette, and Baur, while Humboldt, Agassiz, and Max Müller, who wrote both in German and in English, hold eminent places as naturalists and scientific inquirers. Heinrich Heine, Ludwig Uhland, August von Schlegel, Ferdinand Freiligrath, and H. Fallersleben are classed with the later poets, Karl Gutzkow (1811-1878) and Gustav Freytag (1816-1895) are among the novelists, and George Ebers takes rank as an Egyptologist and general writer, producing among others "Cleopatra," "In the Blue Pike," and "Barbara Blomberg." The satirists include Jean Paul Richter; the humorists, Fritz Reuter; the dramatists, C. F. Heibel, and the miscellaneous writers, Gottfried Keller, Paul Heyse, and Wilhelm Jordan. The Grimm brothers are noted for their eminent services to philology.

German literature includes the best known authoritative works on music, and the master musicians have so fully touched the hearts of the people that their names are known in all civilized lands. These include such eminent composers as Mozart, Bach, Beethoven, Haydn, and Handel, in the 18th century, and Meyerbeer, Mendelssohn, Weber, Wagner, Schumann, Schubert, Liszt, and Franz Abt (1819-1885), in the 19th century. Among the eminent educational writers are Froebel, author of "Education of Man;" Henry Pestalozzi, writer of "How Gertrude Educates Her Children;" and Kant and J. F. Herbart, two well-known philosophers and writers of works on psychology. Among the eminent writers of the 20th century are Hermann Sudermann (born in 1857), who takes high rank as a novelist and dramatist, among his productions being "Dame Care," "Sodom's End," "Love in a Grove," and "Honor." Gerhart Hauptmann (born in 1862) is famous as a dramatist, his works including "Weavers" and "Sunken Bell." Other writers of this period include the historians, Ludwig Hartmann, Hans Prutz, Paul Hassel, and Johann Penzler; the literary critics, P. Schwanke, Karl Federn, B. D. Diederich, and M. Neckar; and the writers of fiction, Max Dreyer, Wilhelm Polenz, Hermann Stehr, William Armenius, and Paul Lindau.

**HISTORY.** The German people are descendants of the Indo-Germanic or Aryan race. In history they are first mentioned in the year 113 B. C., when they came in contact with the Romans. At that time they occupied a region east of the Rhine and north of the Danube, and were divided into numerous separate and

independent tribes, being bound together by language and racial ties. In the time of Alexander the Great the Germanic tribes of the Baltic coast were met with, but the first authentic history of them appeared in the "Commentaries" of Julius Caesar in 58 B. C. The Celtic name given to these tribes was *Germani* and was the name used by the Romans, but the term by which they designated themselves was the present name *Deutsch*, meaning people. There were about fifty tribes, most of which were united in the 1st century and succeeded in overthrowing Roman control, driving the legions of Varus from their possessions. In the year 200 A. D. the Germanic peoples invaded the territory of the Romans and threatened their capital. Later the different tribes formed numerous groups, the most powerful being known as the Frisians, Burgundians, Saxons, Goths, and Franks. Soon after the Huns, who were pressing them southward, caused them to cross into the Roman Empire, and for many years they controlled more or less of the former Roman possessions.

The Franks under Clovis defeated the Roman governor in 486 and established their seat of government near the present site of Paris. After subduing the Alemanni, Visigoths, and other minor tribes, Clovis became the ruler of Gaul, and, after his death, in 511, these possessions were divided among his four sons. The dynasty of Clovis was known as the Merovingian and controlled the destiny of the German tribes until the rise of Charlemagne, who became emperor in 800, founded the Carolingian dynasty, and gave rise to a long line of kings and emperors who for more than 1,100 years occupied the throne of Germany. The empire of Charlemagne, known as the Holy Roman Empire, was reared on the ruins of Rome. It brought about marked changes in the civilization and intellectual status of the Germans, and impressed them with a nationalism sufficient to endure, though it was suppressed at intervals. The vast empire was divided among the successors of Charlemagne and subdivided successively until many small principalities with potentates having absolute power came into existence. In 887 the French and Germans became finally separated, at which time there existed five powerful divisions among the Germans. These constituted the Bavarians, Saxons, Lorrainers, Swabians, and Franks, of whom the last were the most powerful, and in 911 succeeded the descendants of Charlemagne in the government of Germany. Duke Henry of Saxony is counted the founder of the German Empire, since he was the first

to establish a government distinctly German, and largely strengthened the five dukedoms by greatly reforming the military system, building fortresses, and providing for internal improvements. The Saxons reigned about one hundred years, during which time the Wends rose in rebellion in 928 and the Magyars in 933, and other local differences occurred. However, the Saxons maintained their sovereignty and were followed by the house of Franconia, which ruled until 1125.

Conrad II. was the first Franconian king. He ruled energetically in 1024-39 and succeeded in subduing the nobles and establishing an alliance with Canute, the celebrated Danish king. In 1138 the Hohenstaufen dynasty began its reign with Conrad III. (1093-1152), who ranks as one of the most celebrated kings of mediaeval history. The reign of this dynasty is noted because of prolonged conflicts between the imperial powers and that of the Pope and for the organization of the early Crusades, Frederick, surnamed Barbarossa, being the most celebrated in this line. The first Crusade was undertaken in 1095. In the second, organized in 1147, Conrad III. took a conspicuous part. He amalgamated the strength of his nation into a vast army, but both he and his soldiers perished in an attempt to reclaim the Holy City, his death occurring in the third Crusade, after a reign of fourteen years. The Hohenstaufens governed until 1273, when the Carolingian line became extinct, and the next king was chosen by the nobles, who, after long contests, decided upon Rudolph I., founder of the Hapsburg dynasty, which is still the ruling line in Austria. Within the period of his reign the royal authority was largely extended, important conquests were made in southeastern Germany, and the influence of the princes was curtailed largely.

In the reign of Albert of Austria, in 1298-1308, began the prolonged revolutionary movements for the independence of the Swiss cantons. Within the succeeding century occurred sanguinary contentions among rival claimants of the throne, and in 1415, in the reign of Sigismund, terminated the persecutions of the followers of John Huss, who was burned at the stake on a charge of heresy, but this event was only a forerunner of the Reformation. Luther began to preach the Protestant faith under Maximilian I., and the reign of Charles V., from 1519 to 1556, fully grounded that faith in Germany. The seeds of civil discord germinated during the great religious movements resulted in the Thirty Years' War, which began its depressing ravages in 1618.

The weakened condition of commerce, the stagnation of interior trade, and the heavy burdens of taxation occasioned by the prolonged war brought a desire for the cessation of hostilities, which was first secured by the Peace of Augsburg. However, the terms of the treaty gave offense to various adherents of Luther, Calvin, and the Catholics, and war soon broke out anew. In the meantime Wallenstein led the army against Bohemia for the extermination of the Protestants, and these movements continued until the Swedes, under Gustavus Adolphus, came to the rescue of the Protestants, when the latter obtained his memorable victory at Lützen in 1634. The ascension of Ferdinand III. to the throne, in 1637, made possible the Treaty of Westphalia in 1648, which adjusted religious matters, though Germany was divided into 203 independent states, and each gave only nominal support to the emperor. Besides, Switzerland and the Netherlands were separated from the empire, while Alsace was ceded to France. After the Treaty of Westphalia, Prussia gained strength and became the controlling power in Germany and the stronghold of Protestantism. This led to the rise of the house of Hohenzollern, as the house of Hapsburg was Catholic, giving Prussia marked advantage over Austria. In 1702-13 the war of the Spanish Succession brought marked glory to the rising power of Germany, but it did not operate to solidify and strengthen the internal affairs of the empire. Soon after, in 1756-63, occurred the Seven Years' War, which gave Prussia additional advantages over Austria. Frederick the Great of Prussia strengthened the power of the army, replenished the treasury, and made that country the center of German unity.

The power of Germany was almost destroyed by the wars immediately following the French Revolution. In 1806 Francis II. resigned the title of Emperor of Germany, having assumed that of Emperor of Austria, with which the Holy Roman Empire ended. In 1813 the allied forces of Prussia, Russia, Sweden, and England frustrated the plans of Napoleon to add most of the German states to France, at the Battle of Leipzig, and the vigorous assault of Blücher with 30,000 Prussians destroyed his last hope at Waterloo in 1815. The congress of Vienna now endeavored to restore order and organized a German Confederation, of which the Emperor of Austria was chosen president, Frederick William III. as ruler of Prussia, receiving one-third of Saxony. In 1848 the national assembly, which met in Berlin for the purpose of framing a national con-

stitution, was prevented from rendering material aid by the rivalry of Austria and Prussia, and was followed by a Revolution, but Frederick William IV. restored order by promising a constitution. The growing popularity of Bismarck and his firm rule led to a final union of many of the states.

In 1866 occurred the war between Austria and Prussia, known as the Seven Weeks' War, which was the last great struggle for German unity, and, under the leadership of von Moltke, the Austrians were utterly routed at Sadowa, in Bohemia, on July 3. The Prussians occupied Vienna on August 23, and the war terminated after seven weeks. In the peace treaty which followed Austria was shut out from the federation formed north of the Main River. France, jealous of the rising power of the house of Hohenzollern, found occasion to declare war when Leopold, a member of the family, was offered the crown of Spain. War was declared on July 19, 1870, and the South German states were enthusiastic from the first in supporting Prussia, while the northern states showed an equal degree of interest in the cause of unity. Two powerful armies invaded France and by a spirit of marked enthusiasm won battle after battle, captured Napoleon III. with an army of 90,000 men, and sent him to Germany as a prisoner. A siege of Paris caused that city to surrender on Jan. 29, 1871. The treaty which followed required France to pay \$1,000,000,000 as a war indemnity and cede Alsace and the German portion of Lorraine to Germany. The most important result of the war with France was the solidification of the German states, the development of a spirit of nationalism, and the restoration of the old empire. King William was proclaimed emperor with the title of William I. on Jan. 18, 1871, before leaving the capital of France, and was received on his return by his own people with signal demonstrations.

Among the subsequent events of the empire are its constant growth of influence, colonial expansion, the building of great railroads and canals, and vast improvements in economic and social life. The triple alliance formed by Germany, Austria, and Italy on March 9, 1888, strengthened the peace aspect of Europe and was renewed by Caprivi, the chancellor who succeeded Bismarck. William I. was succeeded by Frederick, his son, on March 9, 1888, but the new emperor suffered from a cancerous affection in the throat and died June 15, and was succeeded by his son William II. The latter at once adopted the policy

of William I. and Bismarck in extending the colonial empire, enlarged the army and navy, and vigorously supervised the internal conditions of his dominion. He visited many of the leading courts of Europe in 1889, two years later he appointed Chancellor Caprivi to succeed Bismarck, and in 1894 selected Prince von Hohenlohe for that position.

William II. visited Palestine in 1898, where he took a prominent part in consecrating an Evangelical church, the Church of the Redeemer, at Jerusalem. The empire became involved in a controversy with China in 1900, owing to the murder of the German minister at Peking, Clemens A. von Ketteler (1853-1900), and sent an army and warships for the purpose of securing to the empire an adjustment of important issues between the two nations. Other complications followed and led to an alliance of European powers and the United States, the allied army being commanded by Count Waldersee. The contentions resulted in an extension of foreign interests in China, Germany securing its share of the benefits, in addition to a payment for individual damages sustained. A disagreement between the emperor and Hohenlohe in regard to the policy relating to China caused the latter to resign, when Count von Bülow became chancellor.

**GERMINATION** (jĕr-mĭ-nā'shŭn), in botany, the sprouting of a plant from a seed. It depends upon the seed coming in contact with moisture and warmth at the proper time. Few kinds of seeds will grow after keeping them for five or six years, while some must be brought in contact with the ground as soon as they ripen, and others may be kept safely for fifty or sixty years. It is impossible to tell whether the germ of a seed will grow, and this can be determined only by placing it in a condition under which it will germinate. The seed of the soft maple ripens in the spring and germinates in early summer, while corn and wheat can be kept several years, and the seed of the sensitive plants have been preserved over fifty years.

A seed consists of two parts, the *embryo* and the *cotyledons*. The former is a miniature plant and the latter is the food stored to promote its growth. Seeds differ in the number of cotyledons; corn and rye have but one, the bean and pea have two, while the pine and a number of others have more than two. When the seed is brought in contact with moisture and warmth, it swells a little and the tiny stem of the embryo begins to lengthen and soon bursts through the coats of the seed. Later the two leaves straighten and grow larger and the seed coats are thrown

off, leaving the plantlet stand in the soil. It must be observed that the little stem which first comes out of the seed turns downward and points into the earth, giving rise to the roots and rootlets, while the other end of the stem turns upward and lengthens into the stalk and leaves. It is not known why the roots grow downward and the stem turns upward, though some botanists assert that these phenomena are due at least in part to the rotation of the earth upon its axis.

The seedling plant is complete in all parts at the time of germination and it develops into a matured organism through growth. It has all the organisms of vegetation found in any plant before blossoming, and its life and development depend upon nutriment derived from the soil and the air. As the root begins to branch out into *rootlets*, a little bud called the *plumule* appears on the top of the stem, just between the stalks of the two seed leaves, and it enlarges and develops into a leaf. This leaf is soon raised upon a new piece of stem, which carries it upward a short distance, and another leaf soon appears on the summit of this joint of stem, and is likewise raised upon its joint of stem. At an early stage of growth the plant obtains food wholly from the cotyledon, later

Germination of a Maple Seed, showing successive stages from the seed to the plant with leaves and rootlets.

it is nourished partly by the cotyledon and partly by the soil and air, and in due time the nourishment is derived entirely from the soil and air and the cotyledon, which has now become useless, falls off, though in some plants it is consumed entirely by the young growth.

The nourishment in the cotyledon consists in its starch and albumen, but neither is available for use by the plant until it has been acted upon and made soluble. This takes place when it becomes moist, causing fermentation, through

which the starch is changed to dextrin and sugar. Chemical changes of this kind cause a rise of temperature, but fermentation does not set in unless the moistened seed is subjected to sufficient warmth. About 85° Fahr. is the best temperature, though it may vary according to the nature of the seed. Germination takes place in wheat in temperatures ranging from 41° to 108° and in corn from 48° to 115°, while the most favorable temperature for the former is 85° and for the latter 98°. Corn having one cotyledon, the cotyledon remains under ground and is absorbed by the plant. This is true also of the pea, both of which have a true leaf at the beginning. In the bean, which, like the pea, has two cotyledons, the cotyledons appear above the ground and there undergo certain changes, furnishing nutriment until they cease to be necessary, when they fall to the ground.

**GERMS.** See **Bacteriology; Germ Theory of Disease.**

**GERM THEORY OF DISEASE,** a view according to which a specific germ exists for each definite disease infectious to the various organs. The theory implies that these germs of living organisms are communicated from an infected person, principally by food, drink, or air, and grow and multiply in the body they come in contact with, producing the disease of which they are characteristic. The particles of contagious matter retain their vitality during definite periods; this, like their growth and promulgation, varies in the different forms. It has been demonstrated that they succumb when subjected to a temperature of 200° to 300° Fahr., and to a low temperature of from 30° to 75° below zero, though in each case the infectious matter must be exposed for a definite time. In the 17th century Hauptmann, a German physician, expressed the view that invisible germs existing in the air may cause epidemic diseases, and all the more important discoveries in relation to contagion have been made since that time.

The living germs are grouped as micro-organisms and vary greatly in size and form. They multiply largely by fission, especially the bacterium and micrococcus. The former is rod-shaped and about one ten-thousandth of an inch in length, and the latter is round in form and about one thirty-thousandth of an inch in length. Other forms are the vibrio, spirillum, and bacillus, the last mentioned being formed like rods, slightly larger than the bacterium, and multiply by spores and divisions. Animals having died from splenic fever contain blood

laden with swarms of bacilli, which multiply and throw off spores that can be cultivated, and the production may be continued through different classes of fluids. A rabbit or guinea pig can be inoculated with artificially developed contagion, and death ensues from the same disease as that of the animal from which the contagion germ was taken. For many centuries tubercles were known to be hereditary and were regarded noninfectious, but the tubercular bacilli have been discovered.

Dr. Koch, of Berlin, cultivated the bacillus organism and communicated it to animals, in whose bodies it was found after death. In 1876 he published an important treatise on the life history of this form of germ life, and in 1882 announced his discovery of a microorganism in tubercles which he regarded the principal, if not the only, cause of consumption of the lungs. Later he demonstrated that the expectorations of consumptive patients contain microbes which multiply by spores and infect other persons with the disease, even after having dried, in which form they are scattered in the air and breathed in the regular course of respiration. In 1883 Dr. Koch discovered peculiar bacilli in cholera patients. These organisms are formed like a comma and are found in large numbers in the intestines of persons who succumb to the cholera epidemic.

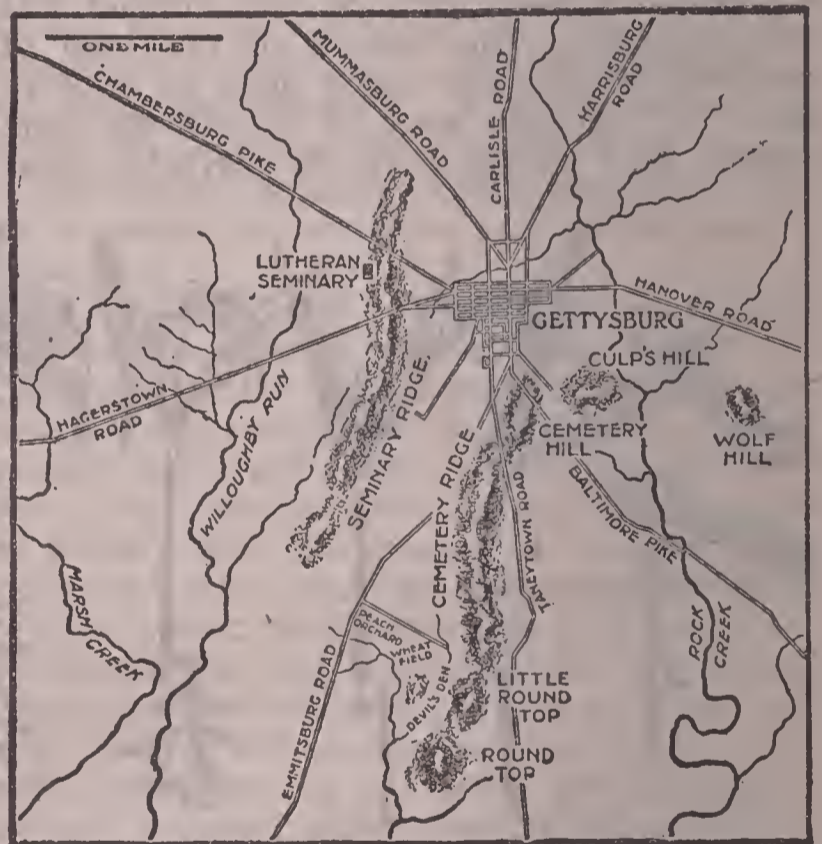

The germ theory of disease was investigated by Pasteur, who also supported it, and contributed much valuable information regarding several forms of bacilli. Germs enter the body and give rise to disease through various channels, particularly through the mouth, nose, eye, ear, and broken surfaces of the skin. The mucous membranes are especially susceptible to certain species of germs, as the mucous membrane of the intestine to the bacillus of typhoid fever and that of the respiratory tract to the bacilli of pneumonia and diphtheria. At first the effect is feeble, but the germs multiply rapidly and soon cause direct local and injurious results. A general knowledge of the conditions of life of the various kinds of organisms has greatly decreased the spread and harmful effect of contagion, while pending investigations promise valuable and specific discoveries of more particular and complicated forms.

**GETHSEMANE** (gĕth-sĕm'ă-nĕ), a place about three-quarters of a mile southwest of Jerusalem, at the foot of Mount Olivet, and contiguous to the garden noted as a favorite resort of Christ and his disciples. In this garden Christ retired the night before the crucifixion and suffered the agony mentioned in the New Testament. Its exact location is not

known definitely at present, but is pointed out to tourists in a locality where a number of olive trees stand in an enclosure.

**GETTYSBURG** (gĕt'tiz-bûrg), **Battle of**, a celebrated battle that occurred July 1-3, 1863, at Gettysburg, Pa., about 36 miles southwest of Harrisburg. It is considered the turning point in the Civil War. The Union army was under the command of General Meade and the Confederates were commanded by General Lee, each numbering about 80,000 men. The latter had invaded the Shenandoah Valley, crossed the Potomac at Williamsburg in the latter part of June, and was pressing forward to Harrisburg. General Meade had just superseded General Hooker in command of the Union forces, and his plan was to engage the enemy at Pipe Creek, but this was frustrated by the Confederates' attack on Reynolds' division at Gettysburg on July 1, when General Meade hastened forward to his assistance.

The battle raged for three days with fearful carnage. On July 3 the Confederates made

VICINITY OF GETTYSBURG.

their last charge on the Union army, but met with fearful slaughter and were repulsed. As a result, Lee was obliged to retreat with his shattered columns across the Potomac into Maryland. The Union army lost 23,190 and the Confederate nearly 30,000, the losses on both sides including many generals and officers. The successes for the Federals at Gettysburg and Vicksburg occurred at the same time. Both being decisive, they greatly added to the enthusiasm of the North. The national cemetery at

the town of Gettysburg was dedicated by President Lincoln, Nov. 19, 1863, and the government erected a fine monument in its center at a cost of \$50,000. In this cemetery are the graves of 3,580 Union soldiers.

**GEYSER** (gī'sēr), a word derived from the Icelandic name *Geysir*, meaning to burst or gush forth, and applied to intermittent hot springs in various portions of the earth. The most notable specimens include those in the Yellowstone region of the Rocky Mountains, New Zealand, Tibet, the Azores, and those of the southwestern division of Iceland, thirty miles northwest from Mount Hecla. About 100 separate geysers are active within a small area of Iceland, situated within a radius of two miles. They throw out jets of hot water through steaming apertures at intervals lasting five or six minutes, though some throw jets continuously for a half hour. However, the Great Geyser and the New Geyser are the largest. The former has an opening about eight feet in diameter, and throws up columns of hot water to the height of 75 to 100 feet. In the upper portion the opening is about 50 feet in diameter, which is gradually widening. Its action is preceded by subterranean noises resembling the firing of cannon, a slight movement of the earth's crust, and, after throwing up immense volumes of water, steam begins to take its place. After a time the fountain ceases to act, but the process is renewed after a short intervening period. The New Geyser, or *Strokkur*, as it is called by Icelanders, is supposed to be connected with Mount Hecla, which is, perhaps, true of all those in that region. The phenomenon is explained by Tyndall in that he thinks the water is brought to the boiling point under pressure, after which it explodes into steam, and this, occurring periodically, gives rise to the intermittent ejections.

The geysers in the Yellowstone region of the Rocky Mountains are the most picturesque and powerful yet discovered. About 50 distinct geysers are located within an area of 30 square miles in the vicinity of the Fire Hole River, and throw up water jets from 50 to 200 feet, though some jets rise to about 250 feet. Of these geysers Old Faithful is the most celebrated. It has an opening six feet in diameter, and at intervals of 50 minutes throws water to a height of from 75 to 150 feet. Another wonderful geyser is the Beehive, which acts once every 24 hours, and throws up a jet 175 feet. The geysers of New Zealand are situated in the hot land district of Auckland and present wonderful phenomena. In this vicinity are numerous natural terraces that form reservoirs for cisterns, and near them are thermal springs and

boiling geysers. Several are characterized by emitting continually dense volumes of steam. Geysers occur only in volcanic regions. They are connected more or less closely with earthquakes and volcanic disturbances. Geologists generally hold the view that their action tends to relieve the interior. It furnishes an outlet for matters under the action of heat or pressure, and in this manner counteracts and greatly modifies the more extensive volcanic disturbances.

**GHATS** (gāts), or **Ghauts**, the name of two chains of mountains in Hindustan, located in the eastern and western sections of that country. The chain of Ghats in the eastern part have an altitude of 1,500 feet and disappear at Cape Comorin. The Ghats in the western part are higher, ranging from 4,000 to 7,000 feet, and extend across India to the Bay of Bengal. They are important in that they form a great watershed and have gold deposits of considerable value.

**GHEBERS** (gē'bērz), or **Guebres**. See **Parsees**.

**GHENT** (gēnt), a city of Belgium, capital of the province of East Flanders, 31 miles northwest of Brussels. It is situated in a fertile plain at the junction of the Scheldt and Lys rivers, which are crossed by many bridges, and has communication by numerous canals and railroads. Several of the canals divide it into a number of islands, which are connected by 275 bridges. The city has well-organized public schools and is the seat of a university. Among the public buildings are the Cathedral of Saint Bavon, a Gothic structure built in the 10th century; the Church of Saint Nicholas, begun in the 10th and completed in the 13th century; and the Church of Saint Michael, which contains valuable paintings by Van Dyke. Other buildings include the town hall, the Hôtel-de-Ville, the Palace of Justice, and the Institute of Sciences. It has beautiful parks, gardens, and promenades. The university carries extensive courses of study. It has a library of 115,000 volumes and 750 manuscripts. The manufactures include sugar, hosiery, tobacco, paper, ribbons, vehicles, machinery, and cotton, linen, silk, and woolen goods. It has many flouring mills, machine shops, and railroad car works. The harbor is spacious and furnishes ample moorage for 450 vessels. It has had remarkable prosperity within recent years, owing to its conveniences in navigation and steam and electric railway transportation.

Ghent is first mentioned in history in the 7th century. Baldwin, the first Count of Flanders, erected a fortress on its site in the year 868 to defend it against the Normans. It was made

the capital of Flanders in the 12th century and in the 14th supported an army of 75,000 men. By reason of wealth and unity the people of Ghent were able to maintain their liberty and defend themselves successfully against the feudal lords, who came from Burgundy and Spain to encroach upon them. Jacob Van Artevelde led two revolts respectively in 1338 and 1369 against Burgundy, and in 1504 it was deprived of its privileges by Charles V. of Germany. This conquest caused its prosperity to decline, particularly during the reign of Philip II. of Spain. France conquered it in 1792 and made it the capital of the department of Scheldt. In 1814 it was added to the kingdom of the Netherlands, with which it was included until the separation of Holland and Belgium in 1830, when it became a part of the latter. The peace treaty between the United States and England, known as the Treaty of Ghent, was concluded and signed here in 1814. Population, 1906, 163,079.

**GHENT, Treaty of**, a treaty between Great Britain and the United States, concluded at Ghent, Belgium, on Dec. 24, 1814. It terminated the War of 1812 and was ratified on Feb. 17, 1815. The British commissioners for negotiating it were Henry Gouldburn, William Adams, and Lord Gambier, and those representing the United States were James A. Bayard, Henry Clay, John Quincy Adams, Jonathan Russell, and Albert Gallatin. The treaty, as signed, provided for the restoration of all conquered territory and for the appointment of commissioners to examine and report to their respective governments on certain boundary questions. Singularly it failed to settle the chief causes of the war, which were the impressment of American seamen, the rights of neutrals, and the participation of citizens of the United States in the Newfoundland fisheries.

**GHOST**, the name applied to an apparition, or the departed human spirit as seen or imagined by the living. The belief in ghosts is very ancient and has existed to some extent in all countries and in every age. Various religious theories are based upon the belief in ghosts, especially ancestor worship, witchcraft, and totemism. The conception of a ghost seems to originate with dreams, a state or condition in which the body is inert and unconscious while the mind is at least partially active. It is not hard to understand that a savage may be suddenly awakened from a sleep, and that his mind has a vivid impression of a dream in which some departed person was thought of, hence the conclusion that the person actually came in contact with the living. Besides, many have re-

garded death and sleep quite closely related, and instead of believing that the body has departed at the time of death, they look upon it as still existing somewhere in its living form, ready to pass unseen great distances, or to do superhuman acts when brought under the proper influence.

The ancient Egyptians taught that the soul has separate phases and that the *ka*, a phase of the soul, remains near the corpse. This belief was made plausible to them in connection with their art of embalming, since the bodies of the dead were to be preserved indefinitely under the watchful influence of the *ka*. To some a ghost acts with magic, while others look upon such a being as having the spirit manifested at the time the person died. Hence, when the deceased died in peace and contentment, the ghost was thought to have a peaceful disposition, but one who came to death by violence or under great mental agony was thought to have a spirit of the same kind. This caused fear to be felt by those closely associated with the deceased, a view still evident by those who believe certain houses or places to be haunted.

**GIANTS** (jī'ants), the persons having extraordinary large stature, size, and bulk. History mentions giants and races of giants, but the occurrence of nations of giants is assigned chiefly to the early stages of civilization. Among the races of giants mentioned in historical legendry are the Laestrygones and Cyclopes, while in the English folklore are mentioned the Cornish and Welsh giants. The Bible makes mention of giants in Genesis, vi., 4, in which the sons of Anak, who resided in the vicinity of Hebron, are described by spies as of such gigantic size and proportion that they themselves were relatively as small as grasshoppers. The Bible frequently mentions the Rephaim race of giants and the giants of Emim and Zuzim. In Greek mythology giants are regarded largely as personifications of natural force, and the term became applied to anything possessing unusual or superior power. The natives of Patagonia, South America, have an average height of six feet and are among the tallest of the living races.

While individual giants have lived at various times, there are at present persons who have a height, no doubt, fully as large as any that ever lived. Among the persons attaining to high stature may be named Maximinus, a Roman emperor, who was nearly nine feet tall. Queen Elizabeth had a Flemish porter who was seven feet six inches tall; Cajanus, a giant of Sweden, was nine feet; Patrick Cotter (O'Brien), who flourished in Ireland in 1783, was eight feet

eight inches; and the Swedish guard employed by Emperor Frederick William I., of Prussia, measured eight feet six inches. It has been found by careful investigation that giants die comparatively early and have a more feeble mind and body than persons of average stature. Their parts are usually out of ordinary proportion. Among the more prominent differences are broad shoulders and haunches, a small forehead and brain, a large lower jaw and a weak muscular system. The disproportion between the trunk and limbs is greatest. Though the cause for unusual growth in the different parts is not understood, it is known that some portions grow more quickly than others, and often continue to gain in size after other parts have ceased to grow.

**GIANTS' CAUSEWAY**, a promontory which extends into the North Channel from the coast of Antrim, Ireland. It is a portion of the basaltic formations found in Antrim County and near Londonderry. Large quantities of basalt appear to have been forced outward during the Tertiary period, since which time the intruding rocks have been dissected by erosion, leaving a line of perpendicular cliffs exposed. Some of the cliffs are 500 feet high. The Giants' Causeway is exposed for 300 yards, consisting of many thousands of vertical columns of largely six-sided formations, though many of them have five, seven, eight, or nine regularly formed sides. While the columnar structures vary in size, they range from 20 to 30 inches in diameter.

**GIBBON** (gib'bŏn), the name of an anthropoid ape native to the East Indies. It belongs to the same division as the oranges, gorillas, and chimpanzees, but is smaller and has a more slender form. The arms are sufficiently long to reach nearly to the ground when the animal stands erect. Several species have been studied. The active gibbon is remarkable for its power to swing itself from one tree to another. Other species include the lar, the hoolock, and the white-handed gibbon. These animals, while active in moving about among the boughs of trees, are not able to move rapidly on the ground.

**GIBEON** (gib'e-on), an ancient city of Palestine, about five miles northwest of Jerusalem. It was inhabited by Hivites at the time Joshua conquered Canaan, but they obtained safety and protection from Israel by professing to have come from a far country. When the deception was discovered, the Gibeonites were degraded to the condition of hereditary "hewers of wood and drawers of water unto all the congregation." The five kings of the Amorites besieged Gibeon because it had concluded an alliance with

Israel, but Joshua marched against them and it is said that "the sun stood still, and the moon stayed, until the people had avenged themselves upon their enemies." Saul persecuted and nearly exterminated the Gibeonites and their land was possessed by the tribe of Benjamin, but later it became a possession of the Levites. The sanctuary was at Gibeon in a part of the reigns of David and Solomon. The village of El-Jib, located on a summit of a hill characterized by massive ruins, is supposed to be the site of Gibeon.

**GIBRALTAR** (jĭ-bral'tēr), a town in the southwestern part of Spain, situated on the west side of a strongly fortified rocky peninsula of the same name, both belonging to Great Britain. The town occupies a site north of the place where the peninsula terminates in Europa Point, on Gibraltar Bay, and has a convenient and spacious harbor. It is a free port, has important commercial business, and is utilized by the British as a distributing station for their manu-

VICINITY OF GIBRALTAR.

factures. The principal street is about one mile long, with which others intersect at right angles. It has many large buildings, including barracks, two theaters, a naval hospital, the governor's building, several churches, and the admiralty. The chief export commodity from the town is wine, though there is a considerable trade in fruits, textiles, and machinery. Several remains of cathedrals of Moorish construction are in evidence, and near the town are the celebrated Alameda Gardens. The lighthouse, built in 1841, is situated on Europa Point, casting a light 150 feet above the sea, which can be seen fully twenty miles. The population of the town, in-

cluding the garrison of about 6,000 men, is 26,382.

The rocky peninsula of Gibraltar rises to an elevation of 1,410 feet. It is three miles long and three-fourths of a mile wide, and is connected with the mainland by a sandy isthmus known as the neutral ground. On the west is the Bay of Gibraltar, and its eastern and southern shore is washed by the open sea. Powerful artillery is planted on the entire rocky precipice. The south side is almost inaccessible, while the precipitous and rugged extremity on the west is made impregnable by powerful batteries. Caverns and galleries sufficient for the passage of carriages have been cut through the solid rock in various angular and parallel lines, and at intervals of twelve yards portholes have been drilled, which serve for firing heavy ordnance. Besides these are numerous caverns, of which the Hall of Michael is the largest, having a height of 70 feet, a width of 90 feet, and a length of 225 feet, with stalactite pillars supporting the roof. The entrance to this cavern is 1,106 feet above the sea.

This precipitous peninsula was known to the Greeks as Calpe. The Saracens, under their leader Tarik Ibn-Zeyad, first fortified it in 711-12, after whom it was called Gebel-al-tarik, from which its present name was originated. Later it fell into the hands of the Moors and was conquered by the Spaniards in 1462, who so strengthened the works that engineers considered it impregnable. After a vigorous bombardment by the Dutch and English forces in 1704, it was reduced and captured. The Peace of Utrecht conveyed it to the English in 1713, in whose hands it has since remained, though desperate efforts to dislodge them were made by the French and Spanish in 1779, but they were completely repulsed after battling in vain for six days. It is no longer the key to the Mediterranean, since modern warships are able to pass it without sustaining effective damages by the guns of the fortress, and, besides, it is not at all likely that the fortress would hold out against modern implements of war. The rocky eminence of Gibraltar and Abjla, now called Ceuta, a precipitous cliff across the Strait of Gibraltar, were anciently called the pillars of Hercules.

The Strait of Gibraltar is a narrow channel connecting the Mediterranean with the Atlantic. It is 36 miles long and has an average depth of 900 feet. At its narrowest point, west of Gibraltar, it is about ten miles wide. A strong and continual current flows in the center of the strait into the sea from the Atlantic, an opposite current passing at the bottom along the

coasts, into the ocean. The strait separates the Iberian Peninsula from Africa.

**GIBRALTAR, Strait of.** See Gibraltar.

**GILA** (hē'là), a river of the United States, rises in the northwestern part of New Mexico, flows westward through Arizona, and joins the Colorado at Yuma, about fifty miles from the mouth of the latter river. The length is 500 miles. Among its tributaries are the Rio San Pedro, Rio Santa Cruz, and Rio Verde. The Rio Santa Cruz discharges into the Gila only part of the year, being lost in the sand much of the time. Ruins of a prehistoric people are found in the Gila basin, and in its proximity are mines that yield gold and silver.

**GILA MONSTER**, a poisonous lizard, one of the largest in North America, found in the region of the Gila River and the sandy deserts of Mexico. It is inactive and stupid. The average length of the body is about one foot. At the base of the teeth, which are grooved like those of snakes, are large salivary glands. The bite is fatal to small animals and is considered somewhat dangerous to man. The gila monster is classed with the *heloderma*, a genus of North American lizards, which embraces only two species.

**GILBERT ISLANDS**, an archipelago in the Pacific Ocean, located on the Equator, almost south of the Marshall Islands. The group includes sixteen small islands, chiefly of coral formation, and the area is 166 square miles. Cocoanut, taro, and various tropical fruits are the chief products. The climate is favorable and the inhabitants are mostly semicivilized, but a number have been converted to Christianity. A part of the islands formerly belonged to Germany, but since 1892 they have been British territory. Population, 1906, 35,036.

**GILDING** (gild'ing), the process of applying a thin layer of gold to a surface, such as the surfaces of wood, paper, metal, leather, plaster of Paris, etc. While the processes of gilding differ with the nature of the substance to be gilded and the kind of effect required to be produced, they may all be classified under three heads: *mechanical gilding*, *chemical gilding*, and *encaustic gilding*. In a common method of mechanical gilding or oil gilding, from four to ten coats of whiting mixed with white glue are applied, each in turn being smoothed down with sandpaper and a pumice stone. This surface receives the gold leaf, which is put on by means of a brush. A false gilding, although an old invention, is now used extensively to make a cheap and quite durable gilding. The molding is first covered with silver leaf or tin foil and then is coated with a yellow paint.

Metals are usually gilded by a process of electrotyping (q. v.), but, besides this, various methods of chemical gilding are employed. Water or wash gilding consists in applying to metal a wash of an amalgam of gold and mercury and afterward evaporating the mercury by heat, leaving the gold firmly adhering to the surface of the metal. It is worth noticing that this process of gilding is the best form, being more durable than electro-gilding, and is now used in the more costly kinds of decorative work. Fully 30,000 buttons an inch in diameter may be gilded with one ounce of gold. Other methods of chemical gilding are cold gilding, Grecian gilding, and gilding by immersion. *Encaustic gilding* is applied usually to glass and porcelain. An amalgam of gold protosulphide with iron and turpentine, or other substances, is painted on the ware, and the whole is subjected to heat, which fixes the gold, the luster being brought out by burnishing.

**GILEAD** (gīl'ē-ūd), a mountainous region in Palestine, lying east of the Jordan. It became famous because of being allotted to the tribes of Gad, Manasseh, and Reuben, being of much pastoral value for their large herds. The Scriptures mention its fertility in producing grasses and forests, and names Jabesh, Ramoth, and Jazer as its important cities. Among its rivers were the Arnon and the Jabok. It was rich in aromatic plants.

Gilead was conquered from Sihon and Og and was held against the Midianites, Ammonites, and Syrians. However, it was finally captured by the Assyrians, who carried the people away in captivity. David found an asylum in Gilead during the rebellion of Absalom. Here Ishbosheth, the son of Saul, was proclaimed King by Abner. Jesus visited the region several times.

**GILLS**, the respiratory organs of aquatic animals, as fishes, amphibians, mollusks, and crustaceans, serving to breathe the air dissolved in water. In fishes they consist of vascular processes of mucous membrane on either side of the neck. Water is taken into the mouth and forced out through the gill slides, which act upon the blood as it circulates through the vascular fibrils. The gills in invertebrates are variously situated.

**GILOLO** (jē-lō'lō), or **Jilolo**, an island of the East Indies, the largest of the Moluccas or Spice Islands, and sometimes called Halmahera. It has an area of 6,350 square miles. The surface is mountainous, the coasts are irregular, and the climate is tropical. Much of the soil is fertile. Among the chief products are spices, sago, fruits, timber, and edible

birds' nests. Cattle, horses, and sheep are grown successfully. Galela and Potani are the chief towns. The island belongs to the Netherlands. Population, 1906, 120,108.

**GIN** (jīn), an alcoholic liquor distilled from grain and flavored with common salt, juniper berries, oil of turpentine, and various allied substances. In making gin, as in other beverages, each rectifier has his own recipe for regulating the quantities of flavor used. The most renowned article comes from Schiedam, Holland. Alcohol constitutes about fifty per cent. of high grade gin.

**GIN**, a machine used for raising weights. A common form of the gin consists of three long poles fastened together at one end, having a pulley attached, and the poles are set upright with the lower ends equal distances apart. A rope is passed through the pulley and fastened to a windlass, by the revolution of which the weight is raised. The gin for raising coal and other substances from mines is made by erecting a shaft with a large drum, to which is attached a transverse beam, having a horse hitched at one end. The horse is driven in a circle to raise the weight. The horse power is disappearing rapidly before the steam engine, but the drum is still in common use.

**GINGER** (jīn'jēr), a genus of plants indigenous to the East Indies, but now cultivated in the West Indies, South America and West Africa. The ginger of commerce is obtained from the rootstalk, which is about the thickness of a man's finger. A very noted grade of ginger comes from Jamaica. It is used as a medicine, especially in a powdered form, and in preparing mild drinks, such as ginger ale. In medicine it is used chiefly as a stomachic. Essence of ginger, which is properly a tincture prepared of alcohol and ginger, is of value for flavoring.

**GINGHAM** (gīng'am), a class of cotton dress goods woven of plain dyed yarn, usually in checks or plaids. Real gingham differs from calico in that the colors are woven with the cloth instead of being stamped on after weaving. Although gingham was first made in the East, especially in India, it is now an important article of manufacture in Europe and America.

**GINSENG** (jīn'sēng), the root of the *Panax ginseng*, which is native to Asia and North America. It is so named from a Chinese word which signifies *likeness of a man*, owing to the fact that specimens are sometimes found which resemble the human form. These are particularly valuable and often sell for their weight in gold. The ordinary prices range from \$2 to \$4 per pound. The Chinese employ ginseng for

aromatic purposes, but principally as a panacea in cases of bodily weakness, though its virtues are limited. Ginseng is collected in many parts of the United States for exportation. It is cultivated in some places, but not very profitably, since it requires about five years for the root to mature.

**GIRAFFE** (jĭ-răf'), or Camelopard, the tallest of quadrupeds, constituting a distinct family of ruminants and the only species of its genus. It is a native of Africa, ranging from Nubia to the Cape of Good Hope.

GIRAFFE.

Upper view shows prehensile tongue.

Giraffes are gregarious in habit, living in small herds, and feed on the leaves and small branches of trees. They stand eighteen feet or more in height, which is due to the long fore legs and neck. When browsing on grass, the fore legs are stretched apart as far as possible so as to permit the head to reach the ground. The body slopes back, the legs are slender, and the hoofs are cloven. On the head are two protuberances called horns, which are covered with skin, hair, and bristles. The tongue is very long and prehensile, being employed to grasp food, for which purpose it may

be protracted and retracted at will. The hair is short and smooth, of a reddish-white color, and is marked with rusty-brown spots. Their peculiar gait in running resembles a pace. Giraffes are inoffensive, seeking safety in flight, and in captivity become docile and playful. Their flesh is eaten, being quite nutritious, but is not esteemed as food by Europeans. They supply only a limited quantity of milk.

**GIRARD COLLEGE**, an institution of learning at Philadelphia, Pa., established in 1832 under a will made by Stephen Girard. It was founded for the purpose of providing facilities to educate and maintain poor white male orphans. Admission is open to students between six and ten years, and they may attend the institution until the age of eighteen years is reached, when they are to be bound out in the arts and trades. The founder provided that applicants for admission are to be given preference in the following order: those coming from Philadelphia; next, Pennsylvania; next, New York; next, New Orleans. Since then the courses of study and the regulations have been modified to provide for the newer conditions which resulted from industrial progress. The institution has 75 professors and instructors, 1,800 students, and a library of 18,000 volumes. The value of the property aggregates \$18,500,000 and the net income is \$1,150,000. Some of the ablest and most eminent men of America are included in the alumni.

**GIRONDISTS** (jĭ-rŏn'dĭsts), a political party of France during the Revolution. They were so named from the department of Gironde, whose deputies were the acknowledged leaders of this organization. Among the chief representatives were Guadet, Brissot, Pétion, Vergniaud, Dumouriez, and Roland. The Girondists were a party of moderate republicans, but their opponents, the Jacobins, charged them emphatically with plotting against the unity of the nation. In 1793 twenty-two of the leaders were arrested, including Madame Roland, who was an active supporter of the party. Most of them were taken prisoners and beheaded, or died by their own hands.

**GIZZARD**, a part of the alimentary canal of birds and some invertebrates, whose function is to grind up the food. In this respect it answers the purpose of the teeth in many animals. In birds the gizzard is the second, or true, stomach, in which the food is crushed after it is softened in the glandular stomach,

CREVASSE IN MUIR GLACIER, ALASKA, THE DEPTH BEING OVER 200 FEET.

or *crop*, which is situated in the lower part of the esophagus. The interior is lined by a horny epithelium, or shelly plates. The gizzard is assisted in grinding the food by small pieces of gravel and other hard substances, which are swallowed for that purpose by most birds.

**GLACE BAY** (glás), a city of Cape Breton Island, on the northeastern coast, fifteen miles northeast of Sydney. It is on the International Railway and has a good harbor. The surrounding country contains productive coal mines. It has a large trade in merchandise, machinery, coal, and produce. Among the principal buildings are several fine schools, a public library, and many substantial business blocks. Population, 1906, 7,845.

**GLACIAL PERIOD** (glá'shál). See **Glaciers**.

**GLACIERS** (glá'shērz), the immense masses of ice and snow which move almost imperceptibly from higher to lower levels, found chiefly in the more elevated valleys and slopes of mountains. In the upper parts they consist of soft snow, which is later pressed into compact masses, and at the lower portion the accumulations are constituted of clear, hard ice. The great quantities of snow which form above the snow line press in masses slowly down the slopes. By the pressure, due to the weight of the layers, the air confined in the snow is pressed out, and the lower part of the glacier is thus changed into a compact mass of pure ice. In some cases ice is formed from the snow by successive thawing and freezing, though this phenomenon more or less affects all glaciers below the snow line.

Glaciers resemble rivers, since the solid material which passes into them moves as drainage within their channel. However, the current is much slower, often imperceptible. The larger glaciers, like rivers, have numerous affluents, and peculiarities of flow and velocity. Where tributaries unite and flow on with the main mass, they do not intermingle as the waters of rivers, but the mass coming from each affluent may be distinctly traced throughout the remainder of the course. Owing to the diminished friction at the top and middle portions, these parts move more rapidly than those at the bottom or sides, and in this respect are similar to rivers. On the surface they are usually quite smooth, but at regular intervals in the direction of a valley and in the slope of the bed they are broken into deep fissures called *crevasses*. These occur most frequently at the bend of a valley, where one side is compressed and the other extended, and at such places the crevasses extend obliquely up the stream, and at abrupt descents in the bed directly across.

The crevasses vary from less than an inch to great chasms over one hundred feet in width, and in the larger openings the depth is generally greatest. On the surface the appearance is a dirty white, while down the walls of the crevasses the ice has an appearance of deep azure blue. Where glaciers flow from elevated mountains in the temperate climates, they usually melt in the warm months of the year as they proceed downward, and are thus transformed into streams of water. In this way they frequently give rise to rivers. Among the rivers that have their origin in glacier streams are the Rhine and Rhone of Europe and the Ganges of Asia. The velocity of the ice and the rapidity with which it melts govern the extent of the glacier below the snow line. They retreat up the mountain during an unusually warm summer, following a light snowfall in winter, and, on the contrary, advance further down the valley when heavy snows in the winter are followed by a cool summer.

Glaciers possess much transporting power, and carry to a lower level large volumes of stone and dirt which accumulate on the surface of the moving mass, after rolling down from adjacent elevations. The accumulations are called *moraines*. Generally the moraines are most abundant at the side of glaciers, where they are called *lateral moraines*. At the point where two glaciers unite the meeting edges are marked by a crevasse which is called the *medial moraine*, and at the end of the glacier a *terminal moraine* extends across the valley in a wide curve. Medial moraines one hundred feet in height are not uncommon, while terminal moraines attain to several hundred feet. The erosive power of glaciers is very effective and tends to greatly deepen the valleys through which they move. Evidences of extinct glaciers are found in many localities, and their former existence is attested by deep grooves cut in the bottom and sides of the valleys, and by deposits formed of rock, mud, and boulders carried by their moraines. When glaciers extend into the sea, like those of Greenland, the base is undermined by the warmer waters of the ocean and the waves break off great fragments, which form floating mountains of ice called *icebergs*. These are carried into warmer latitudes by ocean currents, where they drop their load of moraine by melting. Icebergs appear most numerous in the north Atlantic, into which they descend from the extensive Arctic glacier region.

The total number of glaciers in the world is not less than 1,100, of which one hundred are of large size. In the tropical and temperate

climates they abound only in the more elevated portions of mountains, while whole continents and islands are apparently covered by them at the poles. Those of the Antarctic regions are probably sheets of ice fully 10,000 feet thick. The Muir glacier, in Alaska, is about 150 miles long and 500 feet deep, and is probably the largest in the world. In the north polar region they abound extensively, but those of Greenland and the islands north of North America are the only ones known to any extent in that region. Others are more or less widely distributed in the continents. Those of the central Alps of Europe have been studied with the best results. The most widely known of these is the Mer de Glace, which rises on the slopes of Mont Blanc and has three large branches, descending into the vale of Chamouni. The longest glacier of the Alps is Aletsch, which has a course of fifteen miles, while the Aar glacier has an estimated depth of 1,515 feet, being regarded the deepest.

The Glacial period, or Age of Ice, is so named from the climatic conditions which prevailed in the Northern Hemisphere at a time when intense cold and sheets of ice prevailed in what are now temperate latitudes. It began in the Newer Pliocene period and terminated before the close of the Post Pliocene, though Arctic conditions prevailed only at intermittent times. The occurrence of great glacial action is evidenced by numerous traces in North America and Eurasia. In the Alpine regions evidences of early glacial action are common, and it is certain that the plants now found on the summits of these mountains were brought down from the Arctic regions at that time. Man existed during the latter part of the two distinct glacial periods traceable in the Alps. The cause of these phenomena in past ages is explained by Sir Charles Lyell by assigning to the north polar regions vast elevations, from which the streams of ice moved southward. Sir John Herschel attributes astronomical reasons, which seem the more probable. The chief cause assigned is the varying eccentricity of the earth's orbit. In 1800 A. D. it was .0168, but 210,000 years prior to that time it was .0567, making the difference of 10,250,000 of miles and the winter days 27.8 in excess. However, the possibility of astronomical causes is militated against by the absence of glacial periods prior to the Newer Pliocene time.

**GLADIATOR** (glăd'ī-ā-tēr), in Roman antiquity, a man who fought with deadly weapons against another gladiator or wild beast, especially in the amphitheater, for the amusement of the people. The first gladiatorial fight occurred at

the funeral of Brutus in 264 B. C. between his sons, Marcus and Decius. Originally, a gladiator was a prisoner, a slave, or criminal; later the performance became a mere spectacle, and knights, senators, and even women and emperors entered the arena. The gladiatorial exhibits were announced by private circulars or proclamations. Gladiators marched to the arena on the day of the performance, where they were matched in pairs and their weapons were formally examined. In many cases the combats were fought between a man without arms, but provided with a net in which to ensnare his op-

ROMAN AMPHITHEATER.

ponent and a three-pronged fork with which to spear him when caught, and an opponent in full armor, who sought safety in evading his enemy while seeking to pursue and kill him. The audience witnessing the combat became frantic with excitement, and yelled and applauded while rising in their seats, shouting their approval when ghastly blows were dealt, followed by blood spouting forth. In most places the arena was protected from the rays of the sun by a gorgeous awning, while strains of music floated in the air, drowning the cries of death. It was not uncommon to distribute Syrian perfumes to

overcome by their odor the scent of blood, and the spectators were delighted by the most brilliant scenic decorations.

The gladiatorial battle opened at the sound of a bugle and a shout of command. A gladiator dropped his weapons when severely wounded, and as a plea for life held up his forefingers. This was sometimes in the gift of the people, but more often was vested in the vestal virgins. During the empire the power to spare life was lodged in the sovereign. Mercy was signaled by waving handkerchief or by a turned down thumb, while all hope was forbidden by a clenched and upright fist. Only the brave were accorded mercy. In the time of Julius Caesar it was common to give exhibits by couples fighting. He gave a show in which 320 were engaged. Titus provided an exhibition that continued one hundred days. In it the gladiators fought with wild beasts. The great gladiatorial exhibition of Trajan engaged 10,000 men, who fought with each other and wild beasts, continuing 123 days.

The wild beast fights were the most revolting, and by them many Christian martyrs lost their lives. Among the animals engaged were elephants, rhinoceroses, camelopards, hippopotami, tigers, lions, and many others of a ferocious nature. During naval fights the arena was flooded with water. A naval fight given by Augustus engaged 30 vessels, and during the combat 36 crocodiles were pursued and killed. The combatants were classified according to the arms they carried. Thus, one carrying a shield, helmet, sword, and breast armor was called *sammite*; those carrying a lasso or noose, the *laquearii*; those armed with Thracian buckles and a short sword were known as *secutores*. Gladiatorial games were forbidden in the reign of Emperor Honorius, about 404 A. D.

**GLADIOLUS** (glă-dī'ō-lūs), a genus of ornamental plants of the Iris order. They have bulbous roots, a tubular two-lipped corolla, a trifid stigma, and ensiformed sheathing leaves. Many species are native to South Africa and Eurasia. The flowers are beautiful and richly colored, and many species have been improved by intercrossing. In color they are greatly variegated and include pure white, violet, crimson, scarlet, and yellow. Each of these is variously modified and shaded. As house plants they are popular, the majority of those cultivated in America coming originally from Cape Colony.

**GLANDERS** (glăn'dērz), a contagious disease which affects certain domestic animals and which may be communicated from them to man. It is especially harmful to the ani-

mals that have an undivided hoof, such as horses and mules, but swine, cattle, and sheep are subject to it. The disease is due to a specific microbe discovered in 1882. At present no treatment is known under which a cure can be effected, though in rare instances the affected animal may recover. It makes its appearance in swellings of the submaxillary glands, accompanied by a dry cough and discharges from the nose. These discharges cause the disease to spread, especially when left in contact with the harness, stables, vehicles, or the watering places. As the disease advances small bunches or nodules form under the skin, which afterward break open and form ulcers. It is recommended that animals affected with the glanders be killed and that the places frequented be carefully disinfected.

**GLANDS**, in anatomy, the organs of the body that secrete or separate some particular fluid from the blood. Anatomists divide them into two great classes, known as true secreting glands and ductless glands. *Secreting glands* are special organs, such as the liver, kidneys, and pancreas, and the mammary, lachrymal, and salivary glands. The *ductless glands* include the spleen, the thyroid, the thymus, and the parotids. An ordinary secreting gland consists of a number of follicles, all of which open into a common duct by which the glandular product is discharged. The follicles are contained in the interior cells, which are the active agents in the secreting process, while their exterior is surrounded by a network of capillaries, from whose contents the materials of secretion are extracted.

In the lower class of animals the glands are quite simple as compared to the same or similar glands in the higher forms of animal life. The *mammary gland*, which is quite complex in the higher mammal, presents a very simple arrangement in the lower types of this class, being merely a cluster of follicles, each of which discharges its contents by its own orifice. The *thymus gland* is located partly behind the sternum and partly in the lower part of the neck, and is largest in infants, disappearing at or about maturity. Its function is to form colorless corpuscles in the blood, and it likely supplies a need in the infant that is cared for by other organs at maturity. Hibernating animals have this gland, which is enlarged by the presence of fat during activity, and appears to supply nourishment and maintain temperature during the period of hibernation. The *sudoriferous* are the sweat glands; the *parotid glands* are the seat of the disease known as mumps; and the *submaxillary, parot-*

*id*, *buccal*, and *sublingual* secrete the saliva. Inflammation and solid swelling are among the diseases that affect the lymphatic glands.

**GLASGOW** (gläs'kô), the largest and most important city of Scotland, situated on the Clyde River, in Lanark County. The southern part of the site is level, while the northern portion is situated largely on convenient elevations of varying heights. Many of the streets are platted at right angles, being both wide and straight, and the buildings are mostly of freestone. For architectural beauty Glasgow ranks among the best cities of Great Britain. A Gothic cathedral in the northeastern part of the city is the most historical structure. It was commenced in 1240 and completed within 200 years. The length is 320 feet; breadth, 63 feet; and height, 90 feet, with a spire from the center 225 feet high. Among the buildings of modern construction are the Bank of Scotland, the general post office, the Merchants' House, the Royal Exchange, the Stock Exchange, and the Central Station and the Saint Enoch Station hotels. The institutions of learning include the University of Glasgow (q. v.), Free Church College, Glasgow and West Scotland Technical College, Saint Mungo's College, Saint Margaret's College for Women, and Anderson's College of Medicine. The Mitchell Library, which receives a grant from the city and serves the purposes of a public library, has 125,000 volumes.

George Square, the finest public place in the city, contains many monuments of great beauty, including those of Queen Victoria, Sir Robert Peel, Sir Walter Scott, and the Prince Consort. It has many fine public parks, numerous boulevards, electric lights and street railways, telephone and telegraph connections, and is the junction of numerous railroads. Among the manufactures are woolen, cotton, silk, and linen goods, calico prints, dyed and bleached textiles, iron and steel, machinery, chemicals, pottery, tobacco, sugar, glass, beverages, jute, and leather. In 1895 a central underground railroad was opened for traffic, which affords rapid transit to many parts of the city. Since 1894 it has owned and operated the system of street railways. Practically all of the public utilities, such as the waterworks, meat markets, harbor ferries, and systems of gas and electric lighting, are owned by the municipality.

The importance of Glasgow is due largely to its location near the mouth of the Clyde, which permits navigation by the largest vessels. The interior highlands and adjacent districts are reached by means of canals, railways,

and electric lines. Its harbor and docks are very extensive and near them are vast marine-engineering and shipbuilding yards, which are noted for their large output of vessels. In the vicinity of the city are deposits of coal and iron, through which the manufacturing enterprises have been largely facilitated. Glasgow was founded in 560 A. D., when the Celts that populated the region were induced by Saint Kentigren to embrace Christianity and a small church was erected on the site of the great cathedral. However, its prosperity began in 1707, when its commerce became widened and shipbuilding took on large proportions. At present it has seven representatives in Parliament. Population, 1907, 847,584.

**GLASGOW, University of**, an institution of higher learning of Great Britain, located at Glasgow, Scotland. It was founded by Bishop Turnbull in 1451, but was reorganized by acts of Parliament in 1858 and in 1889. The university is governed by a special court, which consists of the principal, the rector, the lord provost of Glasgow, and a number of representatives of the city and university. The chancellor is elected by the general council and holds his position for life, while the rector is appointed for three years by the students. The departments include those of science, art, law, medicine and surgery, and theology. It has a fine botanical garden, an observatory, and a library of 215,000 volumes. The attendance averages about 2,350 students. Many noted scholars and scientists are included in the alumni.

**GLASS** (gläs), the compound product of silica, having at least two metallic oxides, the most common being those of calcium or lead and potassium or sodium. It is brittle and sonorous at ordinary temperatures, generally transparent or translucent, and is made soft and ductile by heating. The point of melting and fusion varies with its composition. Hydrofluoric acid acts upon it, though ordinary solvents do not. It breaks with a vitreous fracture. Its discovery is not known, though as a commodity of utility and commercial importance it is as old as any known production of man. The Egyptians made use of glass before the Hebrew exodus. Their monuments and ruins bear evidence that they used it for vases, beads, and various ornaments as early as 3250 B. C. The Assyrians, Babylonians, Phoenicians, Greeks, and Romans were all more or less acquainted with and skilled in its manufacture. The vases made by the Romans were among the most beautiful productions of their arts, being finely finished by engraved figures

and relief forms, variously colored on shaded background, and sometimes more or less transparent. Among the surviving specimens still preserved is the famous Portland or Barberini vase, though relics of inferior productions of great antiquity are abundant.

The use of glass for windows is much newer than its manufacture for other purposes. It was not utilized in buildings until 250 years after the beginning of the Christian era. Europeans began to use glass extensively to admit light into dwellings and public buildings in the latter part of the 3d century, though for the purpose of lighting churches it was used fully four centuries earlier. The early Puritan settlers of Jamestown, Va., began its manufacture in 1608, and from their rude beginning it has sprung into a vast industry in America. The production in the United States represents a total annual value of about \$68,500,000. Practically all classes of glass are manufactured in Canada and the United States and several varieties, such as pressed glass, are American inventions. The principal manufactures of Europe are located in Germany, Belgium, and France, though the enterprise is carried on with more or less success wherever civilization extends. In window glass the American product exceeds all others in quality, while in the finer plate glass and the grade used for optical instruments the manufactures of Europe still exceed those of America. Among the states producing glass extensively are Pennsylvania, New Jersey, New York, Massachusetts, Indiana, Ohio, and Missouri.

In manufacturing the various kinds of glass different materials are used, such as fine sand or powdered flint, together with salt, alkali, alkaline earth, or metallic oxide. Crown, sheet, and plate window glass are made of silica, lime, and soda. *Flint glass* used for dishes, lamp chimneys, goblets, and bottles is more brilliant and tough than window glass and is made of silica, lead, and potash, though some forms of bottle glass are made of a variety of mixtures containing alumina. Any kind of glass may be *colored* by metallic oxides, though other substances are employed. In applying the coloring matter it may be mixed with the other ingredients while in a melted state, or a partially colored effect may be secured by taking the melted material from two vessels—the one colored and the other transparent—and in manufacturing the product so construct the desired article that a coat of colored glass will cover the other. Alumina and silver produce a yellow color; copper, gold, and oxide of iron, the reddish; cobalt, bluish; oxide of cop-

per and oxide of iron, the greenish; chloride of silver with peroxide of iron, the orange color. To destroy the transparency of glass it may be roughened on the surface, when it is called *frosted glass*, and has the appearance of hoar frost. It is used in buildings where light is admitted, but the view is obstructed. Among the most important properties of glass is its transparency, and, next to it, its effective resistance to acids. When heated, it can be formed into any shape, or may be spun into fine threads and used for ornaments and wearing apparel. It is a very efficient nonconductor of heat. When cold, it is most effectively cut by the diamond.

In glass manufactories the furnace is constructed of fire brick. Two openings are arranged in the furnace; one contains large melting pots and the other is employed to facilitate placing the half-blown product into the heat for softening it. Gas and crude oil are used for fuel, as most other fuels emit too much smoke. The melting pots are of the best fire clay and cement, usually three feet high, about four feet in diameter, and are open at the top. They are made with much care in order to bear the immense heat required in melting the sand and other materials of which the glass is made. Under ordinary care pots serve about two months and the furnace about two years, though neither should be allowed to cool. The melted material contained in the pots is dipped by workmen with an iron tube, called a *blow-pipe*, this being turned over and over until a sufficient quantity gathers and assumes an oval form. After placing the melted glass in a proper mold, it is blown and formed into the desired shape, such as a bottle, vase, tumbler, or some other vessel, this depending on the mold used.

The *engraving* on glass is effected by means of a sand blast, while *glass cutting* is done by a process of grinding on a cast-iron wheel, with which water and sand is brought in contact. Cut glass is prized for its brilliancy and is used in making fine grades of table glass. The ornamentation is not put on until after the glass has been annealed, a process under which it is gradually cooled, and requires about 36 hours. *Sheet glass* is made by taking the melted material from the pot, when it is blown and whirled until it assumes a cylindrical form. The ends are then cut off, the cylinder is cut open longitudinally, and the sheet is heated, pressed and rubbed until it is flattened out. *Plate glass* is made by pouring the melted material upon a table, which has a marginal edge equal in height to that desired for the thick-

ness of the glass. It is then flattened out by a roller passed over the table, resting on the edges, and thus secures equal thickness throughout. In making *stained glass*, the paint, which is usually compounded of the oxides of metals and oil of turpentine, is applied when cold and the colors are afterward stained into the glass by heating the latter. *Mosaic glass painting* is a department of art painting and is not to be associated with glass manufacture. The most common mosaic glass painting is executed with an enamel or a stain, though stained glass is often used for the background.

**GLASTONBURY** (glás'tūn-bēr-ī), a town of Somersetshire, England, on the Brue River, about twenty miles southwest of Bath. It has some export trade and various manufacturing establishments. In the vicinity are mineral springs. Glastonbury is noted chiefly for its ancient tradition and history. It is famous on account of the legend that Joseph of Arimathea came there with the Holy Grail and founded the first church in Britain. In 1539 the supposed grave of King Arthur was discovered while excavating for the abbey and a church. The abbey is one of the oldest in England. Population, 1906, 4,185.

**GLAUBER'S SALT** (glou'bērz), the popular name of a salt found native in sea water and the water of many mineral springs and saline lakes. It was so named from J. R. Glauber (1604-1668), a German chemist, who first prepared it by decomposing sodium chloride with sulphuric acid. Glauber's salt has a bitter saline taste, is soluble in water, and becomes liquid when heated. It loses most of its water by crystallization and becomes a white powder when exposed to the air. The chief use of this product is as a purgative medicine, especially in veterinary practice. It is used in fixing lead mordants in dyeing and printing and in the production of certain kinds of glass.

**GLAZING** (glāz'ing), the art of imparting a smooth, shining surface to anything, such as pottery, gunpowder, and paintings, to prevent them from being penetrated by fluids. The most common mixture for earthen vessels is constituted of ground flint with oxide of lead, which is generally used, but in various proportions and with different tints.

**GLEIWITZ** (glī'vīts), a city of Germany, in the province of Silesia, 98 miles southeast of Breslau. It is on the Klodnitz River and the Klodnitz Canal, has steam and electric railways, and is regularly platted and well paved. The manufactures include paper, glass, hardware, cigars, clothing, and machinery. Gleiwitz is first mentioned in the 12th century, but

its larger development dates since the last two decades. Population, 1905, 61,336.

**GLENCOE** (glēn'kō), a celebrated valley of Scotland, in the County of Argyll, near Loch Etive. The sides are almost perpendicular, rising abruptly to heights of 3,000 feet above the valley and giving the locality a wild and sublime aspect. In 1692 it was the scene of the Massacre of Glencoe, when Mac Ian, chief of the Macdonalds of Glencoe, was destroyed by his enemies under the leadership of Sir John Dalrymple. It had been arranged that he and his followers should have pardon if they submitted to William III. and Mary before Dec. 31, 1691, but the delay in the surrender caused his enemies to take advantage of the technicalities and treacherously destroy about sixty men, women, and children. Though the morning was stormy, about 300 men and women escaped, but a number of them perished from cold and hunger.

**GLENS FALLS**, a village of Warren County, New York, on the Hudson River, 55 miles north of Troy. It is on the Delaware and Hudson Railroad. The noteworthy buildings include the Crandall Free Library, Glens Falls and Saint Mary's academies, the Parks Hospital, and an old ladies' home. Among the manufactures are machine shops, iron foundries, brick works, paper mills, and cigar, shirt, and furniture factories. It has electric street railways and lights, waterworks, and a sewerage system. The surrounding country contains valuable deposits of limestone and black marble. It was incorporated in 1837. Population, 1900, 12,613; in 1910, 15,243.

**GLENVILLE** (glēn'vil), a village of Ohio, in Cuyahoga County, five miles from Cleveland, of which it is a suburban residential center. It is situated east of Gordon Park, on the Lake Shore and Michigan Southern Railroad, and is a well-improved place. The manufactures consist chiefly of furniture and machinery. It was settled in 1804 and incorporated in 1872. Population, 1900, 5,588.

**GLOBE**, a sphere used in geography and astronomy for the study of terrestrial and celestial phenomena. A *terrestrial globe* is a common schoolroom apparatus and is a useful supply in the study of geography. A globe of this kind may be made of plaster, metal, or pasteboard, upon the surface of which is a map or a representation of the surface of the earth. The extremities of an axis passing through the center represent the poles of the earth, and it is usually so constructed that it may be turned upon the axis to indicate the rotation of the earth. Meridians and parallels

of latitude are indicated by lines drawn upon the surface. The meridians are usually drawn through every 15° of the Equator, hence each two indicates points that differ by one hour in time. The globe is suspended in a brass ring somewhat larger than the diameter, within which it turns upon the axis, and is usually mounted on a wooden stand. In size globes vary from those six inches to four feet in diameter, though much larger ones have been constructed. A *celestial globe* has represented upon its surface the stars, which are placed in positions to indicate their actual situation in the skies.

**GLOMMEN** (glôm'men), the most important river of Norway, rises in Lake Aursundsjö, and flows into the Skager Rack. Its source is in the province of South Trondhjem, near the town of Röros, and its course of 350 miles is in a general southwesterly direction. In its course it passes the fortress of Kongsvinger and at its mouth is the city of Fredrikstad. The Vormen is its chief tributary. It is navigable for about thirty miles, but numerous falls and rapids interfere with its navigation farther up the course.

**GLOUCESTER** (glös'tēr), a river port and city of England, on the Severn River, about ninety miles northwest of London. Numerous railroads and canals facilitate important commercial enterprises, for which it is noted. Among the noteworthy buildings is the cathedral, one of the largest in England, being 140 feet wide and 420 feet long. The tower is 225 feet high. It contains the Great Peter's Bell, weighing more than three tons. Other buildings include the public library, a theological college, King's School, and an asylum for the insane. Among the manufactures are flour, cordage, cutlery, ships, ironware, and machinery. Gloucester was a Roman station under Aulus Plautius. At the time of the Saxons it was an important center of trade. Population, 1907, 52,435.

**GLOUCESTER**, a port of entry in Essex County, Massachusetts, thirty miles northeast of Boston. It is on the Boston and Maine Railroad, near Cape Ann, and includes Riverdale and several other villages. The municipal improvements include waterworks, electric and gas lights, stone and asphalt pavements, and electric street railways. It is distinctly a commercial city and its domestic fisheries are the most important in America. Those employed in mackerel and cod fishing include about 5,000 persons. It is the seat of a United States piscicultural station, is the center of a large foreign trade, and has a convenient harbor. The manufactures include clothing, machinery, muci-

lage, tents, seines, sails, canned fish, and granite products. In 1765 it had a population of 3,763, since which time it has grown steadily. Population, 1905, 26,006.

**GLOUCESTER CITY**, a railroad center of Camden County, New Jersey, on the Delaware River. It is on the West Jersey and Seashore and the Atlantic City railroads, one mile south of Camden, and is connected with Philadelphia by steam ferry. The chief industries are fishing and manufacturing. Among the manufactures are canned fish, calicoes, ginghams, and machinery. It was settled in 1677 and incorporated in 1868. Population, 1905, 8,055.

**GLOVE** (glöv), a covering worn on the hand, having a separate sheath for each finger. Gloves are made of various materials, such as silk, wool, linen, cotton, fur, and different classes of leather. Several kinds of the finer gloves are manufactured of the real-skins of goats, but most kid gloves are made of lambs' skins. The so-called dogskin, buckskin, and doeskin gloves are manufactured chiefly from sheepskin. In manufacturing this class of gloves the leather is dressed as light as possible and each glove is cut by means of a die. Much of the sewing is done by machinery. The glove is stretched over a metal hand, which is first heated on the inside, and the material is smoothed or dyed as desired. Gloves are cleaned with oil of turpentine, camphor, or benzine, the last mentioned being the cheapest and most serviceable substance now in use. Machine sewing is used largely in the cheaper grades, the best being hand-stitched. Gloversville, N. Y., contains large glove works, though factories are located in the larger cities throughout Canada and the United States. The finest and most expensive gloves produced in the world are made in France.

**GLOVERSVILLE** (glöv'ēr-z-vil), a city of Fulton County, New York, on the Cayadutta River, fifty miles northwest of Albany. It is on the Fonda, Johnstown and Gloversville Railroad. The streets are mostly broad and well paved. It has sewerage, stone and macadam pavements, electric lights, and street railways. Among the noteworthy buildings are the high school, the Nathan Littauer Hospital, and a public library with 10,000 volumes. The manufactures include machinery, vehicles, cigars, gloves, and buckskin and other mittens. In the manufacture of gloves it takes very high rank among the cities of America. It was known as Stump City until 1832, when it received its present name, and was incorporated as a city in 1890. Population, 1905, 18,672; 1910, 20,642.

**GLOWWORM**, a name applied to several

species of serricorn beetles. They somewhat resemble a caterpillar and are remarkable for the luminosity of some of the segments of the abdomen. The male has wings and emits a very faint light when flying about at night, and is attracted to the female by her soft, but strong, light. The luminous matter is capable of mixing with warm water, which increases its brilliancy. Though both sexes are luminous, the light in the female is much stronger than that of the male. The latter is wingless. See **Firefly**.

**GLOXINIA** (glōks-īn'ī-ā), a genus of herbaceous plants native to the tropical parts of America. It was so named from B. P. Gloxin, a German botanist, who developed a number of the species into fine flowering varieties. The

GLOXINIA.

common gloxinia has soft, velvety leaves and a nearly bell-shaped corolla. It flowers profusely. It is a favorite plant in flower gardens, both for the richly colored leaves and the graceful flowers.

**GLUCOSE** (glū'kōs), a sugar found in the vegetable kingdom and in honey. It occurs in small quantities in various animal substances, as in the blood and liver. Another name for it is grape sugar or starch sugar. It is less sweet than cane sugar and is manufactured in considerable quantities both in solid and liquid forms. A report made in 1840 by a committee of the National Academy of Science to the com-

missioner of internal revenue placed the sweetening power of ordinary glucose at about two-thirds that of cane sugar. The manufacture in the United States is principally from corn and in Europe it is made chiefly from potatoes. Its use is mostly for table syrups and confectionery, though it is employed in making artificial honey, in brewing beer and ale, and as a food for bees. In the production of artificial honey, the comb is made of paraffin and the cells are filled by machinery with a pure grade of glucose. Though less sweet than real honey, it is inviting, has a fine appearance, and can be sold at about one-half the price of genuine honey. As bleached grape sugar it is often mixed with table sugar and is used largely in the manufacture of condensed milk. A bushel of corn yields from 30 to 45 pounds of glucose. Manufacturers recognize four substances in corn, all of which are useful, but they need to be separated in order to secure the product desired. They comprise starch, oil, gluten, and bran.

The first process in manufacturing glucose is to soak the corn in water, in large wooden tanks, which hold from 500 to 1,000 bushels of corn. A temperature of 80° Fahr. is necessary, and fumes of burning sulphur are injected for the purpose of dissolving the gummy properties that bind together the gluten and starch. After soaking from one to three days, the corn is washed with fresh water and ground between corrugated rollers and crushed. Next the crushed material is placed in tubs and stirred mechanically with the view of separating the germs from the other portions. This is done for the purpose of afterward extracting the oil in the germs, which is about 50 per cent., and is valuable as a salad oil, for mixing paints, and in making toilet soaps. The oil is extracted from the germs by means of powerful hydraulic pressure of about 4,000 pounds, which causes it to run in a stream into tanks below, and the residue is utilized as a food for cattle. Next the gluten is removed from the starchy matter by means of a filter press, and is then dried and sold at about \$18 per ton for cattle food.

After practically all the ingredients unnecessary in the manufacture of glucose have been removed from the starchy material, the residue is mixed with water, and, by a process of filtering several times under the influence of sulphuric and muriatic acid, it is converted into a syrup. The converting is done most effectually under a pressure of from 25 to 40 pounds, the starch being heated by means of steam, about an hour being necessary to complete the process of converting starch to glucose or grape sugar. The product at this stage contains about 35 per

cent. of solid matter and is of a yellowish-brown color. To clarify it the liquid is passed through animal charcoal, by which all foreign substances and the coloring matter are removed, though for the higher grades a second filtration is necessary. After this process, the liquid is evaporated in a vacuum until it has reached the desired consistency for syrup or takes on the form of sugar.

The manufacture of glucose from beets differs somewhat from the process employed in using corn, though the steps employed in the later stages are similar. The amount of corn consumed annually in the manufacture of glucose in the United States is about 48,000,000 bushels, though the quantity varies somewhat with the price of corn and sugar, many factories limiting the output when corn is high in price and sugar is cheap, and increasing the capacity when the reverse is true. Within recent years glucose manufactured from beets has been encouraged under government supervision and has attained to the rank of an important industry. See **Sugar**.

**GLUE**, a viscid cement or adhesive preparation, usually a form of impure gelatin derived from boiling certain animal substances. Glue is used for uniting pieces of wood and other materials. It is made largely of the offal and heads of fish in seacoast towns, and from remnants of slaughterhouses, such as the feet, heads, cartilage, and sinews of hogs, cattle, and sheep. In some places it is made in large quantities from the fleshings, ears, horn piths, and intestines. These portions are freed from dirt and hair by boiling before they are actually utilized in the manufacture. The product is sold in the market either as thin, hard, or brittle cakes, which are afterward dissolved for use, or in a liquid form ready to be applied. *Gelatin* is made much the same as glue, but the parts used are selected with a view of making that product and are cleaned with greater care. *Fish glue* is made of isinglass dissolved in water. Commercial *isinglass glue* is manufactured of isinglass soaked in cold water, which, when swelled, is put in spirit of wine and later powdered chalk is added. *Marine glue* is made of equal parts of caoutchouc and shellac dissolved separately in naphtha and then mixed. *Waterproof glue* is derived from isinglass, for which purpose it is boiled in skim milk until the required consistency is obtained. *Fish glue* is used largely in making fine confectionery and as a gum for sealing letters.

**GLUTEN** (glū'tĕn), or **Vegetable Fibrine**, an elastic albuminous substance of a grayish-yellow color, obtained from the flour of wheat

and other cereals. The flour of good wheat contains about twenty per cent. of gluten. When gluten is heated, it crackles and swells, and when dried it loses more than one-half of its weight. It gives tenacity to the paste of flour and is important for its nutritive quality. Careful analyses have proven that the bran of wheat contains a larger per cent. of gluten than is found in the flour and, consequently, is more nutritious than the finely bolted flour. Since gluten gives tenacity to the dough, it is possible to judge of the quality of flour by test. The juices of certain plants, as well as oats, rye, barley, and other grains, contain gluten.

**GLUTTON** (glūt't'n), a carnivorous mammal of the badger family, ranging intermediately between the weasel and bear. It is found in the northern part of Eurasia and North America, extending as far south in the United States as Great Salt Lake. The common name applied generally is *wolverine*. Its fur is a valuable article of commerce, being used for muffs and sleigh robes.

**GLYCERIN** (glīs'ĕr-ĭn), an oily, transparent liquid compound, nearly colorless, with a sweetish taste. The different varieties are obtained by the decomposition of animal fats and some vegetable substances under treatment with alkalies, or superheated steam. It was first discovered by Scheele in 1779 while saponifying lard with the oxide of lead. Glycerin serves many useful purposes in the arts. It is of value as a preparation to keep more or less moist substances useful in the arts, such as paper for printing, tobacco, modeling clay, and materials used in rope making, spinning, weaving, and tanning. Glycerin is employed to lower the freezing point of water and as a preservative of meat and natural history specimens, and is the basic substance for many chemical products, among which nitroglycerin is one of importance. It is insoluble in ether, absorbs moisture from the air, and may be dissolved by a mixture composed of alcohol and water. In the manufacture of soap it serves a useful purpose in that it has the tendency to soften the skin, and as a medicine it is employed largely as a soothing and healing substance. Manufacturers of confectionery employ it. In some instances it is used as an adulterant of beer, wine, and milk, and is itself adulterated with cane sugar and glucose.

**GLYPTODON** (glĭp'tō-dŏn), a large extinct mammal, a member of the armadillo family, formerly common to the southern part of North America and the northern part of South America. Fossil remains are found in many parts of Florida, Texas, Mexico, and as far

south as Argentina. Four species have been described. The back and sides of the animal were covered with bony plates and the tail was encased in a sheath of horny scales. It resembled the Galapagos tortoise rather than the armadillo, but its size was much larger, since the fully developed specimens measured from six to eight feet in length.

**GNAT** (nät), a genus of insects found in marshy places, having wings laid flat on the back when at rest. The mouth of the female is furnished with a long, projecting proboscis adapted for piercing the skins of animals and sucking the blood, while the male has a proboscis with featherlike projections more suitable for sucking honey from plants. The eggs of the gnat are laid on the surface of stagnant water, hatching in about three days, and the young live in the water until they are fully grown. Several generations of gnats hatch in a single summer. The common mosquito belongs to this genus of insects.

**GNEISS** (nīs), a term introduced from the German to designate a variety of metamorphic rocks composed of mica, feldspar, and quartz. Gneiss differs from granite in that the constituents are arranged in layers instead of forming a confused aggregate mass. Originally it was sand or mud, having been acted on by heat in the course of time, and was converted into a hard, tough crystalline rock. It contains no fossil remains, since they were destroyed by the action of heat, but it is rich in copper, iron, cobalt, gold, silver, and other metallic ores. Large deposits are found in Northern Europe, especially in Norway, and in the Alpine region of that continent. New Brunswick, New England, and New York have large deposits of gneiss.

**GNOSTICISM** (nōs'tī-sīz'm), a system of philosophy devised to solve the origin of evil, and which flourished extensively from the 1st to the 6th centuries. It occupied a middle ground between Christianity and paganism, holding that knowledge rather than faith is the key to salvation. It promulgated the doctrine that there is an eternal God of infinite power, wisdom, and goodness. While there were many systems of gnosticism, all Gnostics agreed that God is incomprehensible, that all the natural and spiritual existences are derived from emanations from the supreme Deity, and that Christ was a superior emanation.

The two main branches of the Gnostics were generally distinguished as the Jewish and the Greek. Many sects of Jewish origin sprang up, including mainly the Sethians, the Cainites, and the Ophites, the last named being serpent wor-

shippers. Meander and Cerinthus were the leading Jewish Gnostics. The Greek Gnostics belonged chiefly to the schools of gnosticism founded by Basilides, Valentinus, Heracleon, and Ptolemy. Basilides and Valentinus were the founders of the Alexandrian Gnostics, which constituted the most important branch of the Gentile Gnostics. The literature of the Gnostics is extensive, but the sects did not endure beyond the 5th century.

**GNU** (nū), a kind of antelope found in small herds in South Africa, belonging to the ruminating animals. The hair is black, or yellowish, and bristly, the mane is white and stiff, and the

GNU.

tail resembles that of a horse. The average length of the body is nine feet. In all species the female is somewhat smaller than the male, but both have horns and cloven feet, and move with a gallop like a horse. When caught young, they can be domesticated. The flesh is considered a nutritious article of food.

**GOAT**, a hollow-horned ruminant quadruped which is allied to the sheep. It differs from the latter in having erect or keeled horns, an arched forehead, a short tail, and a bearded chin. The male is characterized by an unpleasant odor. Goats are common to mountain regions. They are skilled in passing over precipitous and rocky ledges, springing with much precision from rock to rock, and subsist on coarse and scanty food. It is thought that the domestic goat descended from the wild species of Western Asia, since they resemble those largely in size, form, and habits. Many species are known in both the wild and the domestic states, but they are commonly subdivided into goats proper and ibexes. Some are valuable for their production of wool or hair, flesh and milk. Many species are reared extensively in Eurasia for their flesh, which resembles mutton, and for general dairying purposes. The skin yields

leather known as morocco, which is valuable in the manufacture of gloves and shoes. The intelligence of goats is proverbial, many species being known for their playfulness, ingenious habits, skill in seeking protection, and contriving cuteness in obtaining food. Innumerable species have been domesticated in all inhabitable portions of the world. The food consists principally of grass and herbs, though they partake of many forms of vegetation and are fond of

HIMALAYAN GOAT.

ROCKY MOUNTAIN GOAT.

the younger shoots and bark of many shrubs and trees. The *Angora goat* (q. v.) has silky hair eight or nine inches long which hangs in curly locks from its sides. It is of a silver white color and useful in the arts and manufactures. The *Cashmere goat* (q. v.), a native of Cashmere, is rather undersized and has fine silky hair. Other species, including the *Maltese* and *Nubian* goats, are known for their superior milk, skin, and flesh. The *Rocky Mountain goat* is a native of the western portion of Canada and the United States, where it is generally known as the goat antelope.

**GOAT ISLAND**, an island in the Niagara River, at Niagara Falls. It divides the current where it plunges over the precipice, being situated between the American Falls and the Canadian Falls. The island is reached from the city of Niagara Falls, N. Y., by a fine stone bridge. It is covered with beautiful evergreen and deciduous trees and is improved by walks and drives. A fine view of the falls is obtained from the west end of the island.

**GOATSUCKER** (gōt'sūk-ēr), the common name of the European nightjar, which is allied to the night hawk, whip-poor-will, and other birds of North America. The goatsucker is so named from the popular belief that it sucks the milk of goats and cows and in so doing infects these animals with a deadly disease. The name nightjar comes from a jarring or purring sound

which it utters. Birds of this class have large mouths and at dusk frequent the ground in search of insects, from both of which facts the erroneous belief that they suck animals likely arose.

**GOBI** (gō'bē), **Desert of**, a vast stretch of desert in Central Asia, called Shamo, or Sand-Sea, by the Chinese. It is included in China, Turkestan, and Mongolia. The length is about 1,750 miles; breadth, 375 miles; and area, 290,850 square miles. Spurs of the Altai, Tian Shan, and Yablonoi mountains traverse the northeastern part. The general elevation above sea level is 4,000 feet. The boundary is designated by a gradual rise in a series of marked terraces and several interior rivers. The central point is at Ozon Khoshu, which is the lowest region in Central Asia, and is elevated about 1,940 feet above the sea. The interior is thought to have formed a vast sea in former times, but now is occupied by different Mongolian tribes, who utilize the region in rearing sheep, horses, cattle, and camels.

**GOD**, or **Supreme Being**, the infinite, eternal, immutable Creator and Preserver of all things, and the object of human sacrifice and worship. In Christian theology there is a general agreement that God is a perfectly good, true, and righteous personal spirit, that he is eternal, and that he possesses omnipotence, omnipresence, and omniscience. Christians generally agree as to the trinity of God; that is, he is held to be one individual, but constituted of three persons—God the Father, God the Son, and God the Holy Ghost. The three are held to have existed from eternity, not as three distinct beings, but as one God, the glory equal and the majesty coeternal. In the doctrine of the trinity, which is most elaborately defined in the Athanasian Creed, the persons of the Godhead are not to be confounded nor is the substance to be divided. God the Son is worshiped as Jesus (q. v.), who came to the earth, born of God and the Virgin Mary, to redeem fallen man under a plan of salvation instituted by the merciful God for his creatures. The Holy Ghost, the third person of the trinity, the Father being the first and the Son the second, is held to proceed from the Father and the Son, though is equal to them in substance and majesty. His function as a spirit of holiness is to apply to the hearts of men the benefits of Christ's death, and to sanctify them by inducing a belief in the truth as it is in Jesus. The Jewish people generally hold to the belief in Jehovah (q. v.), but reject Christ as the redeemer, and believe that the Saviour is yet to come.

Practically all peoples, even the most savage,

manifest belief in a being higher than man. There seems to be an innate feeling, a potent something, in man that renders him a worshipping being and leads him to stand in awe when contemplating the greatness and wisdom of the Creator and Preserver of the universe as a whole, and of the immutable laws under which organic and inorganic substances either multiply their kind or endure without material change. Within man dwells either a living faith in the superiority of his power to nature, which induces a feeling, an experience, that grounds his belief in God, or he denies his superiority to nature and is without faith in God, in which aspect he experiences nothing in existence but necessity and fate. Hence, the argument for the existence of God is based upon certain fundamental principles involved in our mental and moral being, such as causation and design. The existence of God is likewise argued from the manifestations he has made to man, either by miracles, visions, or personal contact, but even Christian theists admit that they cannot be accepted as real unless faith in the divine existence was previously held by those receiving them.

Various terms are employed to designate belief or disbelief in God. *Theism* is a system of belief in God as the Creator and Preserver; *atheism* implies, not a denial of the existence of a Deity, but an absence of any definite idea on the subject; *polytheism* is the doctrine that there are more gods than one; and *agnosticism* is the belief that God is unknown or unknowable. *Monism* is the doctrine which attempts to explain the cosmos by one principle of being or ultimate substance and may be materialistic, idealistic, or pantheistic. *Materialistic monism* holds that all spiritual phenomena are from matter; *idealistic monism*, that both spiritual and material phenomena are from spirit; and *pantheistic monism*, that both mind and matter are from one original substance, neither being substantial. *Materialism* is a denial of the doctrine that man possesses any immaterial part. *Fetichism* is a form of worship which implies the ability of man to force the Deity to comply with his wishes, and *totemism* is a kind of nature worship in which stones, trees, rivers, etc., are adored.

**GODAVARI** (gō-dä'vār-è), a river of central India, the largest stream of the Deccan. It has its source near the Indian Ocean and, after a course of 900 miles, enters the Bay of Bengal by a delta of seven mouths. The entire basin drained includes an area of 112,000 square miles, a large portion of which is fertile. Along its banks is much beautiful natural scenery. At

various places the water is led by canals from the narrow channel and utilized for irrigating purposes. The river is held sacred by the Hindus, and is the objective point of numerous pilgrimages. Among the chief tributaries are the Purna, the Maner, and the Manjera.

**GOD SAVE THE KING**, the national song of Great Britain. The words were probably written by Henry Carey (1696-1743) and the music was adapted from the national air of Germany, entitled "Heil Dir Mein Vaterland." The popular patriotic song of the United States, "My Country, 'Tis of Thee," is sung to the same tune. In Great Britain the song, "God Save the King," is played and sung on all solemn and festive occasions.

**GOKSCHA** (gök-chà'), or **Sevanga**, a lake of Russia, in the government of Erivan. It is situated almost due west of Baku, between the Black and Caspian seas, and is surrounded by high mountains. The surface is 6,350 feet above the sea and covers an area of 540 square miles. The Sanga carries the overflow to the Aras River, which discharges into the Caspian Sea. An Armenian monastery is located on Sevang, an island near the northwestern part of the lake.

**GOLCONDA** (göl-kön'dä), a ruined city and fortress of India, seven miles west of Hyderabad. Golconda was the capital of the principal kingdom of the Deccan, but was conquered by Aurungzebe in 1687. The fortress now serves as a military post and treasury of Nizam. It has extensive interests in cutting and polishing diamonds, which is the chief employment in the city, diamonds being mined some distance from it, at Partial, on the southeastern boundary of Nizam.

**GOLD**, a bright yellow precious metal, noted for its value, ductility, and malleability. The specific gravity is nineteen; the atomic weight, 196; and the melting point, about 2,282° Fahr. It has a ductility so great that a grain can be drawn into a wire 500 feet long and the same quantity is sufficient to gild two miles of silver wire. The malleability of gold makes it possible for one grain to be beaten out so as to cover 56 square inches, when it has a thickness of only  $\frac{1}{281,000}$  part of an inch. Water and oxygen do not act upon it at any temperature. Air does not tarnish it, and it may not be dissolved by hydrochloric, nitric, or sulphuric acid, but it is soluble in a mixture of nitric and hydrochloric acids. Gold crystallizes in cubes and other regular forms and yields two series of salts, aurous and auric. It is extracted from the quartz ore by pulverizing, and, after adding a quantity of mercury with some sodium, the amalgam is

heated to liberate the mercury. In this process, which is called *cupellation*, the sulphur and arsenic are set free by highly heating the auriferous pyrites before treating them with the amalgam.

Pure gold is 24 carats fine, but it is used in the arts to form an alloy for the reason that pure gold is too soft to serve useful purposes. One-fourth of copper and three-fourths of gold form the usual alloy used by jewelers. In gold coinage two parts of copper and 22 parts of gold form the standard, making it 22 carats fine. The highest degree of fineness commonly used by jewelers is eighteen parts of gold to six of alloy; thus the degree of fineness is eighteen carats. Both gold and silver occur as an alloy in nature, this form of the metal being of a paler yellow than pure gold, while the copper alloy has a more reddish-yellow color. Gold serves a useful purpose in medicine, especially in scrofulous diseases, while dentists use gold leaf in filling teeth.

Gold has been sought from early historic times. The Bible makes mention of this metal in the second chapter of Genesis. It is found in alluvial deposits, occurring in small particles or nuggets, and is separated by washing in troughs and pans, by which the foreign matter is separated from the gold dust, grains, or nuggets. However, it occurs most numerous in sandstone, slate, quartzite, granite, and serpentine. The most celebrated gold fields are in Australia. Those of California, discovered in 1848, in El Dorado County, brought on the so-called gold fever of 1849. Gold found in Alaska occurs largely as placer deposits, while in many of the extensive mountain regions, as in Colorado, portions of the Pacific coast, and in South Africa, it is found in fissures or in quartz veins. The mining is done by vast machinery in the larger mines and the rock is crushed, after which the gold is separated from the rock and other ore bodies by excessive heat; natural gas, coal, and electricity are employed as agents in smelting.

Gold deposits have been found in more or less paying quantities in many of the states and in all the countries of the world, though in some regions the deposits are not sufficiently rich to warrant the application of time and labor. It is estimated that the value of the world's production of gold from 1493 to 1905 equaled \$11,298,890,300. The present annual production of the world is estimated at \$407,775,020, which was the total output for 1906. Of this amount North America produced \$126,065,682; South America, \$10,043,714; Europe, \$28,088,571; Asia, \$24,575,711; Africa, \$134,914,114; and Austral-

asia, \$84,087,228. The largest pure gold nugget ever found was taken from the diggings at Ballarat, Australia, shortly after the discovery of the Australian gold fields in 1857. It weighed 130 pounds. Colorado, California, and South Dakota produced the largest output of gold in 1907, in the order named: Other very important gold fields are found in Alaska, Montana, British Columbia, Yukon, Saskatchewan, Utah, Arizona, Nevada, and Idaho. In 1907 Canada produced gold valued at \$12,023,932 and the output of the United States was \$96,101,400.

**GOLD COAST**, a British colony of West Africa, lying along the Gulf of Guinea. It has a coast line of 345 miles and extends inland 300 miles. The area is 16,500 square miles, but a protectorate of 46,600 square miles belongs to the colony. Among the principal towns are Accra, Elmina, and Cape Coast Castle. The first British colony within the region was founded in 1821. In the meantime several settlements were made by the Dutch, but they ceded their holdings to the British for trading privileges in 1872, since which time the English have had supreme control. Among the chief productions are live stock, gold, coffee, palm oil, copal, rubber, timber, monkey skins, and cocoa. Several railway lines connect the coast towns with the interior, while numerous canals and highways facilitate trade. The climate is quite unhealthy for Europeans. In 1908 the population was placed at 1,487,634, including about 500 Europeans.

**GOLDEN AGE**, the term applied in mythical history to the early period of many nations. It refers to a time when all animals were supposed to be at peace with each other, the earth produced the fullness of all necessary fruits for comfort, and innocence and happiness were general among mankind. The Egyptians believed that the gods sent successive conflagrations and deluges to purify the earth of guilt, and after these man was pure for a time, but when he was again degenerated a catastrophe once more came for his destruction. Roman literature was in its golden age from 150 B. C. to 14 A. D., when flourished the great Cicero, Caesar, Sallust, Ovid, Virgil, and Horace. In English literature the golden age includes the reign of Queen Anne, which period was made famous by the writings of such men as Pope, Addison, and Dryden.

**GOLDEN BULL**. See Bull.

**GOLDEN FLEECE**, in mythical history, a fleece taken by Phryxus from the ram Chrysomallus and nailed by Aetes in the Grove of Ares, where it was guarded at the entrance of the grove by an immense dragon which never

slept. To secure the fleece Jason made his Argonautic expedition to Colchis, and, while Medea put the dragon to sleep, he carried the treasure away. The name was applied to an order of knighthood, founded in Austria and Spain by Philip III. in 1429, which still survives and continues to be the highest order bestowed in those countries.

**GOLDEN GATE**, a passage from the Pacific to the Bay of San Francisco, about one mile wide. It separates two peninsulas and is defended by two forts, one on the inner and one on the outer side. The channel was named the Golden Gate by Sir Francis Drake in 1578.

**GOLDEN HOUSE**, a structure erected in Rome by Nero, located between Palatine and Esquiline hills. It covers an area of a square mile, including the baths, vineyards, and colonnades. In the court was a bronze statue of Nero, 120 feet high, and the portico was 3,000 feet long. The Golden House was taken down about 75 A. D., and the remains were used for the baths of Titus and Trajan. Though substantially constructed, only a few remains of the palace are now extant.

**GOLDEN-ROD**, a genus of plants allied to the aster, including more than one hundred species, most of which are native to America. The stems are rodlike, the leaves are alternate, and the flowers are closely bunched and yellow in color. In some communities the leaves are used for tea. The general distribution of the golden-rod has caused some states to adopt it as a state flower. It was selected as the national flower of the United States in 1899 by a vote taken among interested people.

**GOLDFINCH** (göld'fīnch), the name of several birds which are noted for their beautifully variegated colors, mostly yellow, red, black, and white. The bill is sharp and the song is exceptionally pleasing. A number of species are widely distributed, some being favorites as cage birds. They lay four or five purple and brown spotted eggs in nests built of twigs and moss, inlaid with wool, and most frequently breed in hedges and orchards. The goldfinch is found largely in America, Eurasia, and other grand divisions. A familiar species, the American goldfinch, or yellowbird, is found in most parts of North America.

**GOLDFISH**, a beautiful species of carp largely distributed in the fresh waters of China and Japan, whence it was introduced into Europe in the 17th century. In the native state it is greenish-brown in color, but by artificial breeding and selection a golden-yellow hue has been acquired. At present the goldfish is cultivated extensively, being kept largely in aquariums for

ornament. When propagated in large bodies of water, the artificially bred revert to the color of the original stock. The silver fish is a species of the same class of fishes.

**GOLD LACE**, a kind of fabric made by weaving gilded silk threads, but so constructed that the product is quite flexible. The manufacture of this product requires an unusual degree of skill, since it involves the work of making sheets of gold much thinner than can be obtained by beating. The usual method is to burnish leaves of gold upon a rod of silver, which is then drawn into a very fine wire, after which it is further extended by flattening between polished steel rollers, and the finishing is done by passing it through perforated diamonds or other gems. By this process it is possible to make a film much thinner than beaten gold leaf, which may be seen from the fact that an ounce of gold is sufficient to cover a wire fully 100 miles long. This flattened wire, being delicate and covered with the gold, is wound over the silk thread. In making silver lace the same method is used, except that the wire is not coated with gold.

**GOLDSBORO**, a city and the county seat of Wayne County, North Carolina, on the Neuse River, 47 miles southeast of Raleigh. It is on the Atlantic Coast Line, the Southern, and other railroads. The noteworthy buildings include an Odd Fellows' Orphan Home, a State normal school for Negroes, the high school, and the Eastern Insane Asylum. Among the manufactures are tobacco, cotton-seed oil, furniture, machinery, pottery, and cotton goods. It has waterworks, electric lighting, and several county buildings. The surrounding country is a fertile agricultural region. It was settled in 1838 and incorporated in 1841. Population, 1900, 5,877.

**GOLF**, an outdoor game of Scottish origin, played with balls and clubs. It may be played on any greensward. The players number one or more on each side, and each is provided with a separate ball. The player who can land his ball in a given series of holes with the fewest strokes of his club is the most skillful. To place the ball in a proper position for striking off is called *teeing*, and the plot on which the game is played is termed the *putting ground*. The balls generally used are made of hard gutta-percha, about five inches in circumference, and the golf clubs are of various sizes and shapes. The latter include those known as driver, cleek, iron, lofting iron, mashie, niblick, and putter. A large amount of literature has been published on the subject, and the rules governing the game differ somewhat according

to the country in which it is played. Many clubs are maintained in Canada and the United States, and frequent contests for national and international championships take place. The Royal Montreal Golf Club, organized in 1873, is one of the most noted in Canada. Those of the United States are very numerous, including the United States Golf Association, the Chicago Golf Club, the Newport Golf Club, the Florida Golf Association, etc. Most of the associations are governed by the rules of the Saint Andrew's Club of Scotland.

**GONDOLA** (gōn'dō-là), a class of barges used at Venice to navigate the canals. A gondola of medium size is rowed by one man, has seats amidships, and is about thirty feet long and four wide. The ends terminate with pointed projections about six feet high. Usually the larger sizes are rowed by two men, one at either end, each using a single oar.

**GONG** (gōng), a musical instrument shaped like a tambourine, made of copper alloy, and struck by a padded drumstick. It gives out a combination of harmonies, serving to produce signals and to add intensity to martial music.

**GONIOMETER** (gō-nī-ōm'ē-tēr), an instrument for measuring the angles formed by the faces of crystals. It consists of a graduated semicircular arc with a fixed and a movable radius, between which the crystal is placed, each radius being made to coincide with the plane of one of its faces. The angle of their opening may then be read off on the arc. This instrument is called *Hauy's goniometer*, and it cannot be depended upon for obtaining absolutely accurate results. A more complicated instrument has crystals with clear faces, which distinctly reflect the image of a dark line across a clear light, and its graduated arc is furnished with a vernier, by which the degrees are divided into minutes.

**GOOD FRIDAY**, the fast kept in memory of the crucifixion of Christ, on the Friday before Easter. Nearly all the Protestant and Catholic churches observe the feast with much solemnity. It is named *good* because of the beneficent effect that comes from keeping the day, and during its observance special prayers are included for all classes of people.

**GOOD TEMPLARS, Independent Order of**, a total abstinence society organized in New York City in 1851. In 1859 it adopted a plat-

form of absolute prohibition, no license, and total abstinence. It organized branch lodges in Europe in 1868, and in 1870 established a grand lodge in England. Both sexes are admitted and adults and juvenile members are recognized, though in different branches. About fifty official periodicals are issued in different languages. At present branch organizations are maintained in all parts of the civilized world. The membership in the main organization is 416,125, while the juvenile branch has 181,840 members.

**GOOD WILL**, the advantage of an established reputation to the interest of a particular business. It is sometimes described as a favorable disposition of persons to extend their patronage to a particular line of trade, or a certain locality, which is considered a benefit in addition to the capital invested. The good will of a business is often sold with it, hence the purchaser receives a promise, either oral or written, that the person or company selling will not engage in the same business in the vicinity for a definite time. In cases where the good will is purchased along with the business, it is an advantage to have an expressed agreement that the former owner will not engage in the same or a similar business, and it should state some particular sum to be forfeited as liquidated damages in case the agreement is violated.

**GOODWIN SANDS**, a stretch of shifting sand banks off the coast of Kent, England. The region is dangerous to navigation and has been the scene of many noted shipwrecks. A ridge divides the sands into two portions, which, during low water, are partly uncovered.

1. Snow goose; 2. Pomeranian goose; 3. Toulouse goose.

**GOOSE** (gōōs), a web-footed bird of the duck family. In all species the body is large and heavy, the bill is conical, and the upper mandible is slightly hooked. The head is small, the neck is long, the wings are powerful, and

the toes are short. Geese are migratory and move from the polar regions toward the warmer zones on the approach of winter. They swim less than ducks and do not dive, but commonly search for food by submerging the head under water. The domestic goose is thought to have originated from the *Anser ferus*, the typical genus of the subfamily *Anserinae*. Many species of geese are grown, all of which are valuable for their flesh, eggs, and feathers. Most of the wild species are gray in color and the domestic breeds are largely white. An average-sized goose is two feet ten inches long, the extended wings measuring five feet in expanse. Among the geese of North America are the snow goose, white-front goose, bean goose, Canada goose, China goose, Toulouse goose, Pomeranian goose, and cravat goose. The Canada goose is the most widely distributed wild species in North America. Several of the species are noted for their longevity. There are instances on record showing that they live to an age of eighty years. The male is commonly called *gander*.

**GOOSEBERRY** (gōōz'běr-rŷ), a class of shrubs allied to currants, but differing from

GOOSEBERRY.

them in having thorny stems. They grow wild in North America and Eurasia, but have been greatly improved by cultivation. The leaves are three-lobed and the flowers are small and yellow in most species. The fruit is succulent and variously colored when ripe, as green, yellow, whitish, and red. Plants four years old bear the best quality of fruit. The berries are eaten as a dessert and form a favorite material for jelly, pie, vinegar, and preserves. New plants may be propagated from the seeds or from slips.

**GOOSEFOOT.** See **Pigweed.**

**GOPHER** (gō'fēr), a class of burrowing animals native to North America. The name was first applied by the French to the species which honeycomb the ground by burrowing. Among the common species are the gray burrowing squirrel, the striped squirrel, and the pocket gopher. All these are mammals. The pocket or pouched gopher has peculiar pouches on the sides of the head, which facilitate piling up mounds in fields and meadows. Gophers are destructive to corn in the early stages of growth.

**GORAMY** (gō'rā-mŷ), or **Gourami**, a fish in the fresh and brackish waters of China and the East Indies. The body is flat and short. It is covered with large scales and the dorsal and anal fins have numerous spines. The ventral fins are prolonged backward and have long filaments. In size these fish are from two to five feet long. They are remarkable for building nests at the breeding season, using stems and leaves of grasses for that purpose. The nest is watched by both the male and female to prevent intrusion by other fish until the spawn is hatched. It is considered a fine fish for the table and has been acclimated in Australia and other continents.

**GORDIAN KNOT** (gōr'dī-an nōt), a knot bound by Gordius, a peasant of Phrygia, in tying the yoke of his chariot. This was done so intricately that the oracle of Delphi promised the empire of Asia to him who would untie it. When Alexander the Great arrived at Gordium, he wished to inspire his soldiers with courage and spread the belief among his enemies that he was destined to conquer. Accordingly, he cut the knot with his sword and claimed that he had fulfilled the oracle. To "cut the gordian knot" has since implied the removal of a difficulty by bold means.

**GORILLA** (gō-rī'là), the name applied as early as the 5th century B. C. to the largest animal of the ape family, which is native to the western part of Africa. An adult gorilla is from five to six feet tall when standing erect. It has black hair on the back and reddish-brown to black on its belly. The shoulders are broad and massive, above which is a heavy neck and a somewhat conical head. It subsists chiefly on vegetables and fruits. The gorilla is allied to the chimpanzee, but is larger. In the number of teeth, height of the body while standing, bones in the hand, ribs, and brain structure it corresponds to man, though the brain measures only from 23 to 35 cubic inches, while in man it measures from 62 to 114 cubic inches. In physical strength the gorilla is powerful, being the strongest of the anthropoid apes. The

voice resembles a bark, though it is like a roar when the animal becomes enraged. Gorillas live in families and build hammocks in trees as places to sleep and rest.

GORILLA.

Male, female, and infant.

**GÖRLITZ** (gēr'līts), a city of Germany, in the province of Silesia, 62 miles east of Dresden. It occupies a fine site on the Neisse River and has railway communication. The chief buildings include the Church of Saint Peter and Saint Paul (Protestant), the Gothic Frauenkirche, the city hall, and the public library. It has many gymnasiums and benevolent institutions and is the seat of the Upper Lusatian Scientific Society, which has a library of 75,000 volumes. The manufactures consist chiefly of clothing, toys, machinery, cigars, earthenware, and jewelry. It has an extensive jobbing trade. Görlitz was founded about 1200. It was the capital of the Duchy of Görlitz from 1377 until 1396. In the 17th century it was annexed to Saxony and became a part of Prussia in 1815. Population, 1905, 83,766.

**GOSHAWK** (gōs'hāk), the name of several species of hawks widely diffused in Europe and Asia. They include five or six species and are distinguished from the true falcons by a festoon on the edge of the upper mandible, while the latter have a sharp tooth. Their wings are shorter, reaching to the middle of the tail. In flying at game and other birds, they do not rise in the air to descend upon them, but pursue a straight line in making the attack. The goshawk native to America is larger than the European species. It is abundant in Canada and Alaska during the summer and moves southward to the southern part of the United States

during the fall. Locally it is known as the chicken hawk or hen hawk.

**GOSHEN** (gō'shən), an ancient district of Egypt, the territory assigned to Jacob and his family after they left their native land. It included the region around Heroopolis, near the eastern border of the Nile delta, but its exact boundaries are not known. Goshen was spoken of as fertile land and suited for grazing. The Hebrews resided here until they were enslaved by the Egyptians, after which they were delivered by Moses, who led them through the wilderness and within sight of Canaan.\*

**GOSHEN**, a city in Indiana, county seat of Elkhart County, on the Elkhorn River, midway between Chicago and Toledo. It is on the Cleveland, Cincinnati, Chicago and Saint Louis and the Lake Shore and Michigan Southern railroads. The public library, the high school, and the county courthouse are its chief buildings. An abundance of water power is secured from the Elkhart River, which has facilitated building up many manufacturing establishments. Among the manufactures are wagons, plows, flour, oil, woolen goods, machinery, and cigars. The lumber, grain, and fruit trade is extensive. It has regularly platted streets, gas and electric lighting, brick and macadam pavements, and a municipal system of waterworks. Population, 1900, 7,810.

**GOSPEL** (gōs'pəl), meaning a joyful message, any one of the four histories of the life and teachings of Christ written by Matthew, Mark, Luke, and John. The first three give a summary or synopsis of the ministry of Christ and were probably written between 60 and 70 A. D. It is certain that they were completed before the destruction of Jerusalem, to which they refer as a future event. The Gospel of John was probably written near the close of the first century, at Ephesus, since writers generally assign its completion to the year 90. They are not complete biographies of Jesus, but contain an account of the events that appeared most important to each evangelist as a means of leading the people to believe that Christ is the Savior of mankind. The Gospels were received and used in the churches before the end of the 2d century, which is confirmed by Origen and other ante-Nicene fathers of the Church.

**GOSSAMER** (gōs'sā-mēr), a term applied by German and French writers to the flakelike webs seen floating in the air on calm autumn days. They are composed of silk emitted by many species of immature spiders. Being lighter than the atmosphere, they float in the gentle breezes. The threads are spun to connect different blades and plants, and, by reason

of the loosening effect resulting from autumnal breezes and the shrinking of plants, the gossamer becomes detached and is carried to various heights and frequently long distances. The name *gossamer* applies to a light waterproof cloak worn by ladies.

**GOTHA** (gō'tà), a city of Germany, capital of the duchy of Gotha, fifteen miles southwest of Erfurt, with which it is connected by railway. It is located near the northern border of the Thuringian Forest, is well platted, and has a large number of fine and substantial buildings. The palace of Friedenstein, a massive structure of the 17th century, contains a library of 200,000 volumes. Other buildings of note include the museum, an art gallery, a theater, the post office, and the town hall. The manufactures consist chiefly of porcelain, stoves, cotton and woolen goods, boots and shoes, machinery, and tobacco products. It has extensive machine shops and railway repair shops. Gotha passed to the electors of Saxony in 1440 and has been the capital of the duchy of Gotha nearly 400 years. Population, 1905, 36,947.

**GOTHARD**, or **Gotthard, Saint**, a mountain group in Switzerland, belonging to the Helvetic Alps, and famous for the Saint Gothard pass over the Alps. The highest peak of this mountain group is about 12,000 feet, and the point at which the Saint Gothard Hospice stands is 10,810 feet. A carriage pass across the Alps was completed in 1832. One of the most important railroad tunnels in the world, known as Saint Gothard's, passes through the mountains between Airolo on the south and Göschenen on the north, and by it the railroad systems of Italy, Switzerland, and Germany are connected. The tunnel was commenced in 1872 and opened for traffic in 1882. It is nine and one-half miles long and cost about \$12,000,000.

**GOTHENBURG**. See **Gottenburg**.

**GOTHIC ARCHITECTURE** (gōth'īk), the style of architecture which is characterized by the pointed arch and makes use of the cross-vault or groin-vault. In a wider sense it includes the forms introduced by the barbaric tribes that overthrew Rome. It prevailed largely in Europe from the 6th to the 16th century, though in a newer classification it dates only from the 11th century, when it took on an improved form. The term is generally used in history to distinguish the Gothic from the classic architecture as well as from the transition styles introduced by the Norman-Franks. Besides the pointed arches, it is marked by a prolongation of vertical lines, an absence of square edges, a want of columns and rectangular surfaces and the general substitution of various

surfaces and grouped shafts. It stands in contrast to other styles because of its multiplication of different ornamental forms. Excessive decoration of the perpendicular lines and ornamentation of the horizontal by starring caused the Gothic to lose favor, but it is now reviving somewhat. Many of the most noted historic buildings of Germany, Spain, France, England, Norway, Sweden, and other countries of Western Europe are in the Gothic style. The two principal forms of the Gothic architecture are known as the *perpendicular* and the *decorated*. The former originated in Germany and the latter in England.

**GOTHLAND** (gōt'länd), an island in the Baltic Sea, about 52 miles east of Sweden, to which country it belongs. It has a rocky coast, but much of the soil is fertile. The surface is about 250 feet above sea level and the area is 1,210 square miles. It has several good harbors. The larger cities are connected by railway and carry on an important trade in cereals and fish. Wisby is the chief city, having a population of 7,645. The island became a part of Sweden in the 9th century, was captured several times by the Danes, and has belonged permanently to Sweden since 1645. Population, 1906, 53,290.

**GOTHS** (gōths), an ancient race of German people who occupied a large portion of Europe and Asiatic Russia. In the early part of the 3d century they inhabited the country north of the Black Sea, and by numerous conquests came into possession of much territory and powerful military forces. They were divided into three great tribes, known as Ostrogoths (eastern Goths), Visigoths (western Goths), and Moesogoths (the Goths of Bulgaria). Before their division into the eastern and western branches, their king, Filmer, led an army and occupied Euxine, from which region the different historical branches sprang. War was waged by their king, Ostrogotha, against the Romans in 248, and extensive contests were conducted in the eastern provinces of Rome for eighteen years, but subsequently Claudius defeated them. Emperor Aurelian was compelled, in 272, to cede the province of Dacia to them, where the Visigoths formed their chief settlement, while the Ostrogoths remained in the region of the Black Sea. Ermanric attained much power and included the region from the Gulf of Bothnia to the Black Sea, extending far toward the east. Internal disputes caused a division in the year 369, after which the Visigoths formed a separate kingdom west of the Danube and the Ostrogoths became confined to the section east of that river. Alaric, King of the Visigoths, in-

vaded Greece in 396, conquered the Peloponnese, and obtained the government of Illyria. He invaded Italy in 409-10, captured Rome, and carried away much of the riches of that city. Shortly after the death of Alaric, in 410, the Visigoths invaded Spain and Gaul. In the 5th century they established the seat of their government at Toulouse, their principal provinces being Languedoc, Provence, and Catalonia. The Visigoths were finally vanquished by the Moors, who crossed into Spain from Africa, and for many years constituted the principal factor in the Iberian Peninsula. Roderick, who died in 711, was the last king of the Visigoths.

The kingdom of the Ostrogoths was overthrown by the Huns in 375, after which they largely followed a nomadic life. At the time Attila, the Hun, invaded Gaul he was supported by a vast horde of Ostrogothic warriors, and, when the empire of the Huns came to an end, they settled near Vienna, and later in Moesia, now called Bulgaria, from which they became known as Moesogoths. The Ostrogoths attained vast military power under Theodoric. This ruler was educated at Constantinople as a Roman nobleman and in 474 was made king by the Ostrogoths. Odoacer the Usurper conquered the western empire in 476. In 489 Theodoric invaded Italy with a vast army, and four years later was recognized king. He reigned successfully until his death in 526, and in 554 the kingdom came to an end. During its greatest prosperity the Ostrogothic kingdom included Italy and large portions of Switzerland, Hungary, Austria, and Rumania. Subsequently the Gothic people lost their identity as a nation and became assimilated by other peoples.

The German, English, and Scandinavian languages may be traced to the Gothic tongue, the first two to the Visigothic and the last to the Ostrogothic. A translation of the Bible into Gothic was made by Bishop Wulfila, a man of profound learning, about 375. Several portions of this work are extant, with which are included a number of explanations of the gospels. The language attained its highest literary culture during the occupation of Italy, though it did not long survive the Gothic peoples. A number of literary works and the translations from the Bible are of great value in studying the growth and history of the early Germanic languages.

**GOTTENBURG** (göt'en-bürg), or **Göthenburg**, a city and seaport of Sweden, called Göteborg in Swedish. It is situated on the Cattegat, about 25 miles southwest of Stockholm, and has an excellent harbor and extensive canal

and railroad connections. Among the noteworthy buildings are the market place, the cathedral, the governor's palace, the public library, and the arsenal. It has a fine museum and a scientific society founded in 1778. Systems of gas and electric lighting, stone and macadam pavements, and electric street railways are maintained. The city ranks among the best built cities of Sweden, having extensive shipbuilding yards, excellent institutions of learning, and important factories. Among the products are cotton and woolen goods, sail cloth, spirituous beverages, machinery, sugar, tobacco, paper, glass, and furniture. It is important for its exports of fish, iron, copper, tar, pitch, and lumber. The imports include cereals, food products, and salt. Since 1865 a successful system of municipal regulation has been in force, under which companies are licensed for the management of public houses, and, after retaining six per cent. as profit on the capital invested, they turn the balance over to the city. Gottenburg was founded in 1619 by Dutch settlers, who platted the town and built several canals. In 1806, during the continental blockade, it rose to commercial importance. Population, 1906, 156,927.

**GÖTTINGEN** (gēt'ting-en), a city of Germany, in the province of Hanover, on the Leine River, about 58 miles south of Hanover. It has connections by several railroads, a fine school system, and a hospital. However, it is famous chiefly as the seat of the celebrated University of Göttingen, which was founded in 1734 by George II., King of England and Elector of Hanover, and formally opened in 1737. The university contains an observatory, a museum, botanical gardens, anatomical collections, and a library with 515,000 volumes and 6,000 manuscripts. It has 135 professors, 1,550 students, and an alumni that includes many of the eminent German masters, among them Blumenbach, Gieseler, Gauss, Herbart, Müller, the Grimm brothers, and Weber. Among the illustrious Americans who studied there are Longfellow and Bancroft. The city is supplied with all municipal facilities, such as telephones and electric conveniences. It has manufactures of woolen and cotton goods, scientific instruments, chemicals, and musical instruments. Göttingen was founded in the 10th century and was prominent as a member of the Hanseatic League. Population, 1905, 34,081.

**GOURD** (görd), a plant related to the cucumber, having large yellow flowers, ovate or oblong fruit, trailing stems, and hairy leaves. Many varieties have been produced by propagation, some of which are edible, and others yield

a tough outer shell useful for bottles, dippers, and other household vessels. Several species are native to Astrakhan and the East and West Indies, but many have been naturalized and are cultivated in America and Europe. The gourd family includes the watermelon, muskmelon,

GOURDS.

squash, cucumber, pumpkin, and musk gourd. Many members of this family of plants have been highly improved by cultivation. They furnish valuable food for man and cattle and form important articles of commerce.

**GOUT**, a constitutional disorder arising from an excess of uric acid in the blood, caused by an impaired condition of the kidneys. It arises from excessive indulgence in wines, fermented beverages, and inactivity, and is not uncommon among those who partake of undue quantities of nitrogenous foods. However, it is inherited by some individuals, but seldom appears before the age of thirty. Gout is more common among males than among females. It is characterized by pains in the joints, but more commonly affects the great toe, the heel, and the calf of the leg. Gout affecting the internal organs is most dangerous. The best preventives are regular habits, proper diet, and abstinence from alcoholic drink.

**GOVAN** (gŭv'an), a city of Lanark County, Scotland, on the Clyde River, immediately west of Glasgow, of which it is a suburb. It contains extensive manufactures and has important shipbuilding yards. Electric and steam railways connect it with Glasgow and other cities. It was one of the largest towns of Scotland in the 16th century, when it was known as Meikle Govane. Population, 1907, 84,513.

**GOVERNMENT** (gŭv'ĕrn-mĕnt), that power or influence which is exercised by one person or thing over others. The mainspring of a watch, gravitation, the parental head of a family, and civil officers are agencies that govern in their respective spheres of influence. The term is applied most commonly to the power exercised by recognized officers of a state or

nation. Government is an essential element in civilization, indeed, without it citizens would be unprotected in their personal safety and security of property against the attacks of lawless vandals and marauders. Thus, the term government implies the organized means of a state or nation maintained to vouchsafe protection to the industrial, political, social, and moral rights of the people, and for perpetuating its own existence.

Governments vary in their form, the most ignorant and barbarous people being governed by tyrants and despots, while the more intelligent and law-abiding are governed under a system in which each individual has certain recognized rights to be protected, and certain powers which he may exercise in promoting and enforcing the laws. The principal forms of government known in history are patriarchal, theocratical, monarchical, aristocratic, democratic, and republican. In general the *patriarchal* is the family government and existed as the first and oldest. The father is the recognized head of the family, and exercises an influence in shaping the welfare of the household. Though patriarchal governments do not exist at present, yet the family government is the true basis of national security and intelligence. In a *theocratic* form of government the people are governed as were the Israelites, by the immediate direction and administration of God.

In a *monarchical* government a monarch is the supreme ruler, who bears the title of king, emperor, czar, sultan, pasha, or some other term implying sovereignty. Monarchies are *limited* when the power of the sovereign is restricted by a constitution and established laws, but *absolute* when unlimited power is vested in the chief ruler, and he is responsible to no earthly tribunal. China, Morocco, and Persia are absolute monarchies, while Germany, England, Italy, Austria, and Spain are limited. A *hereditary* monarchy is one in which the sovereign inherits the title to the throne, and in an *elective* monarchy the sovereign owes his position to an election by the people. In an *aristocratic* government the supreme power is vested in a few men of wealth, usually comprising the clergy and a titled nobility, though both these classes are not uncommon in monarchical governments. A *democratic* government is one in which the people exercise absolute power, and not only have a voice in making the laws, but in seeing that they are enforced. A *republican* government is representative. In it the people authorize officers to serve them in making and enforcing the laws. The government of the United States is sometimes called a *democratic-*

*republican* government for the reason that the people may direct their lawmakers to some extent and are represented by them in making laws, while by public approval or disapproval they may induce the officers chosen to administer the laws wisely and justly. On the other hand, Canada is governed as a *limited monarchy*, in which the people have large powers in managing local and provincial affairs, while the general government of the country is vested by heredity in the crown of Great Britain.

Three distinct branches are recognized in every well-established government—the executive, legislative, and judicial. *Executive* power in the United States government is vested in the President, who is advised in his duties by nine cabinet officers. The cabinet officers are appointed by the President with the consent of the Senate. *Legislative* power is vested in a Congress, which contains two branches—the Senate and House of Representatives. The Senate is composed of two members from each State, who hold office for six years. Members of the House of Representatives, who are elected by a popular vote in the states, or in various congressional districts of each State, hold office for two years. The *judicial* department, consisting of a system of Federal courts, culminates in a Supreme Court, which is composed of a Chief Justice and eight associate justices. These are appointed by the President with the consent of the Senate and hold office during good behavior. Each State has a local government modeled after the essential features of the general government, and which the Constitution of the United States guarantees to maintain. The executive officer of the State is the Governor, the legislative power is vested in the General Assembly, and the judicial authority is in a Supreme Court having jurisdiction within the particular State. In Canada the government is very similar, but the Governor General, who represents the Crown, takes the place of the President. This official is the chief executive officer within the Dominion and is appointed by the home government. Each Province, instead of a governor, has a Lieutenant Governor, who is appointed by the Governor General. The legislative functions for the country and the provinces are exercised respectively by the Dominion and the provincial parliaments.

Among the principal resources of the general government of most countries are customs duties, internal revenue taxes, proceeds of the sale of public lands, and its ability to borrow money. The required amount of revenue is devoted to the general expenses of the government, and all surplus revenue is expended for

the gradual reduction of the public debt or for constructing internal and general improvements.

**GOVERNOR** (gŭv'ĕrn-ĕr), a mechanical device serving to regulate the admission of steam to an engine according to the rate of velocity. It is formed of a vertical shaft, on which two balls are suspended, and, when the shaft revolves, the balls swing outward. The centrifugal force increases with the rate of velocity at which the shaft rotates, hence the balls are caused to swing farther from the axis of rotation. The object is to secure the uniform velocity of the engine, which is done by this arrangement, since the admission of steam is restricted by a valve as the balls swing outward, but is admitted more freely when they swing nearer to the axis of rotation. A similar contrivance is utilized in mills to equalize the motion of machinery. In high-class motors the ball governor is being displaced rapidly by the *inertia governor*. This invention overcomes the objection that a ball governor does not act on the valve until the speed is increased. The inertia governor consists of weights and springs, is set in the flywheel of the engine or motor, and acts by its inertia. When there is a tendency of the speed to increase, the inertia of the weights acts in opposition to this tendency, affects the eccentrics, and through them the valves. By means of this device it is possible to check a tendency to increase speed in less than one revolution of the fly wheel. Other governors include those which regulate the inflow of gas and water, each class being used for various purposes.

**GOVERNOR'S ISLAND**, an island in New York Bay. It has an area of 65 acres. Since the War of 1812 it has been occupied by the War Department. Besides containing a number of forts, it is headquarters for the Department of the East. It is the seat of a military museum in which are a number of interesting relics, among them the horse ridden by Sheridan from Winchester, which has been substantially mounted.

**GOVERNOR'S ISLAND**, an island of Massachusetts, in Boston Harbor, about two miles east of Boston. For government purposes it belongs to Suffolk County. Fort Winthrop, at its northern end, is the principal fortification. The island is occupied by the national government.

**GRACE**, Days of, a short period, usually three days, allowed for the payment of a bill of exchange or a promissory note, after the day indicated for payment on the face. In most countries, as in Great Britain and the United States, there are three days of grace,

but in some instances the time is longer, varying from three to thirty days. Such an allowance is now almost universal; hence a bill does not become due, either in law or in fact, on the day stipulated, but on the last day of grace. If the last day of grace is a holiday, so the banks are closed, the obligation is due the date preceding the last day of grace.

**GRAFTING** (gráft'ing), the process of inserting a scion or bud, taken from a vigorous tree or shrub, into a closely allied species so as to cause them to unite organically and enable the graft to receive greater nutritive power than it could otherwise obtain. Among the advantages

GRAFTING.

A, Cleft grafting; B, splice grafting; C, tongue grafting; D, saddle grafting; E, side grafting; F, scion receiving moisture partly from a vessel; G, part of stock.

of grafting are the rapid multiplication of species, the propagation of particular types which cannot be obtained from seed, and the cultivation of tendencies to bear fruit several years earlier than is otherwise possible. The fruit borne by the graft does not partake of the identical kind common to the stock, but preserves its own peculiarities. Thus, it is possible to propagate several species of fruit or flowers on one stock. This is shown in the illustration,

since the scion F receives support in part temporarily from water contained in the vessel, while the twig G is a part of the stock.

The principal methods of grafting are by approach, scions, and buds. In *approach grafting* several parts of two or more plants growing from different stocks are united by bringing the roots, branches, or stems together. To effect this it is necessary to remove equal parts of the bark and unite the wounds by air-tight inclosures of grafting wax, ligature, or clay. *Scion grafting* includes various methods, some of which are known as cleft, side, splice, tongue, saddle, crown, and whip grafting. In all of these forms it is necessary to bring the growing parts into apposition; that is, the edges of the bark must be arranged so the alburnum of both parts will be in close contact. The scion method may be performed both in woody and herbaceous plants, but union takes place only in case the processes of life are freely exercised. *Bud grafting* is practiced largely in fruit trees and roses. It consists of transferring the buds of one plant, along with a small section of the bark, to another plant in which a wound has been made. In all forms of grafting it is necessary to exclude air from the wound. Among the common materials used for this purpose are India rubber, clay, and a mixture of beeswax and tallow. See **Budding**.

**GRAFTON** (gráft'ün), a town of Massachusetts, in Worcester County, seven miles southeast of Worcester. It is on the Boston and Albany and the New York, New Haven and Hartford railroads, and has a large trade in produce and manufactures. The chief industries include cotton mills, boot and shoe factories, and machine shops. It has electric lights, waterworks, and several fine schools and churches. The first settlement was established by John Eliot in 1660 and the town was incorporated in 1735. Population, 1905, 5,002.

**GRAFTON**, a city of North Dakota, county seat of Walsh County, forty miles northwest of Grand Forks, on the Northern Pacific and the Great Northern railroads. It is nicely located on the Park River, in a fertile farming district. Among the enterprises are flour mills, stock yards, machine shops, grain elevators, and a creamery. It is the seat of a State institution for the feeble-minded. Population, 1905, 3,523.

**GRAFTON**, a city in West Virginia, county seat of Taylor County, on the Tygart Valley River. It is on the Baltimore and Ohio Railroad. The surrounding country is lumber and coal producing. Among the noteworthy buildings are the State reform school, which is at Pruntytown, the courthouse, and the high

school. Near the city is a national cemetery with 1,265 graves. It has manufactures of railroad cars, machinery, flour, and ironware. Grafton was platted in 1854 and incorporated two years later. The growth of the city is due largely to the machine shops of the Baltimore and Ohio Railroad. Population, 1910, 7,563.

**GRAHAMLAND**, a region discovered in 1832 in the Antarctic Ocean and claimed for Great Britain by Captain Biscoe. It is situated south of 68° south latitude, has an apparently large area, but is snow and ice bound and of little value.

**GRAIL**, or **Graal**, **Greal**, **Grasal**, and **Sangrael**, according to legends, the cup used by Christ at the Last Supper, preserved by Joseph of Arimathea, and by him used to receive some blood of Christ at the crucifixion. An account of this vessel is given in the gospel of Nicodemus, a work not accepted as canonical. Many of the Moorish and Christian remains of early times indicate traces of the tradition and the use of various forms of worship into which a symbolic vessel entered. According to a legend, the Holy Grail, as it became known, was brought to England by Joseph of Arimathea in 63 A. D. Later the vessel was lost because the possessor to whom it had passed committed sin, and a search undertaken for the lost treasure by King Arthur and the Knights of the Round Table became known as the Quest of the Holy Grail. At the capture of Caesarea by the Crusaders, in 1101, a dish made of a single large emerald was found which was regarded as the Holy Grail, and is still preserved at the Cathedral of San Lorenzo in Genoa. The Holy Grail was reputed invisible to persons not pure and holy, and when anyone approached who was unholy the cup vanished. Wagner accords the story of the Holy Grail a prominent place in the opera of "Parsifal" and Tennyson gives it a place in his "Idylls of the King." Lowell's "Vision of Sir Launfal" makes mention of it. The numerous romances and poems found in literature referring to the Holy Grail are of much interest, particularly those of Arthur and the Knights of the Round Table.

**GRAIN**, a term applied to the common cereals, as growing plants, in gathered condition, or as seeds in bulk. Many of the grains are used in making meal or flour. They include corn, wheat, rye, oats, barley, rice, buckwheat, flax, and cotton. The principal constituents of grain seeds are starch, gluten, sweet mucilage, and an aromatic substance. Among the largest grain fields of the world are those of the Mississippi Valley in North America, the Paraná valley in South America, the Nile valley in

Africa, and the valleys of the Po, Volga, and Ganges of Eurasia.

**GRAIN ELEVATOR**, a building used for elevating, storing, and loading grain for transportation into cars or vessels. Buildings for these purposes are maintained in all the grain-producing districts and in the large cities where the grain market centers. The capacity of grain elevators situated in the trade centers and shipping ports is very large. Some of the larger elevators of Chicago have a capacity of 50,000,000 bushels; New York, 29,000,000 bushels; Minneapolis and Winnepeg, 26,000,000 bushels; Buffalo and Toronto, 15,000,000 bushels; Saint Louis, 15,000,000 bushels; and Toledo, 7,000,000 bushels. The largest elevators in Chicago are 150 feet wide and 550 feet long and have a height of 160 feet. In construction the bins and the buildings were formerly largely of wood, and the outside was encased by a brick or fireproof metallic covering. At present the construction is principally of steel, modeled after the methods of constructing blocks of steel in cities, and thus furnish ample protection against fire. This form of construction provides greater convenience and durability. The newer elevators are built largely of brick and concrete, though the frame and bins are of steel and iron. See **Elevator**.

**GRAKLE** (grāk'1), or **Grackle**, the name of several birds found in both hemispheres. The name was first given to various birds of the starling family, such as the paradise grackle, which is native to India. These birds are represented in America by the crow blackbird and the rusty grackle. The former is widely distributed, some species of which are known locally as the jackdaw. Most species have a long tail and the male is uniformly glossy black, while the female is gray or brownish. The rusty grackle extends from the eastern part of the United States to the northwestern part of Canada.

**GRALLATOIRES** (gräl-lä-tō'rēz), or **Waders**, an order of birds which frequent shores, banks, and marshy places. They have long legs, necks, and beaks, and wade in the shallow water in search of worms and insects. Some of the species dive to obtain food at the bottom of the water. Among the representative birds of this order are the plovers, coots, snipes, curlews, and herons.

**GRAM**, or **Gramme**, the unit of weight in the metric system. It is intended to be exactly equivalent to the weight in a vacuum of one cubic centimeter of pure water at its maximum density. In comparison with the English system it is equal to 15.432 grains. A gram degree, in

physics, is a unit of heat, being the amount of heat necessary to raise the temperature of one gram of pure water one degree centigrade.

**GRAMMAR** (grăm'mēr), the science which treats of the principles and usage of language. English grammar is divided into four parts, orthography, etymology, syntax, and prosody. *Orthography* treats of elementary sounds, letters, syllables, and spelling; *etymology*, of the classification, derivation, and properties of words; *syntax*, of the construction of sentences; and *prosody*, of the quality of syllables, of accent, and of the laws of versification. Every language has a grammar peculiar to itself. *Comparative grammar* is based on the study of words, analyzes them, and accounts for the changes they have undergone. It properly embraces a study of the growth of languages. However, comparative grammar is of recent origin. It dates from the development of knowledge of the Sanskrit as associated with the Indo-European group of languages. Among the eminent students of comparative grammar are Grimm, Max Müller, Pott, and Schleicher.

**GRAMOPHONE** (grăm'ō-fōn), an apparatus to reproduce sound, invented by Emile Berliner. It differs from the phonograph and graphophone in that the record is on a disk instead of a cylinder. The disk contains the record on a rubber surface and the stylus or needle is connected with a diaphragm, which travels along a spiral groove as the disc revolves horizontally under the impulse of a spring clockwork. The gramophone is now used quite extensively as a phonograph (q. v.).

**GRAMPIANS** (grăm'pī-āns), a group of highlands in Scotland, stretching a distance of 150 miles from the northeast to the southwest. The average height is about 2,500 feet, but Ben Macdhui and Ben Nevis, the highest summits of Scotland, have elevations of 4,048 and 4,406 respectively. Beautiful valleys intersect the Grampians. A mountain system in the western part of the province of Victoria, Australia, is known by the same name.

**GRAMPUS** (grăm'pūs), the popular name of a genus of large dolphins. The common grampus differs from the porpoise in having a thicker body. It has no teeth in the upper jaw, only a few teeth in the front part of the lower jaw, and the color is gray with streaks of white. The larger species are about twenty feet long. The common grampus feeds on small fish, squid, and mollusks. The name is applied to nearly all the cetaceans that are too small to be classed with the whales and too large to be grouped with the porpoises.

**GRANADA** (grā-nā'dā), a former Moorish

kingdom of Spain. It had an area of 11,060 square miles, but is now included with the three Mediterranean provinces of Almeria, Granada, and Malaga. Grenada became a separate kingdom in 1225 and was made a part of Spain in 1492. The products of the region are cereals, domestic animals, sugar cane, fruits, and minerals, especially lead and iron. Granada, one of the chief cities, is the capital of the province of Grenada.

**GRANADA**, a city of southern Spain, capital of the province of Granada and formerly of the Moorish kingdom of Granada. It is situated on the Jenil River, at the foothills of the Sierra Nevada, and occupies a site about 2,000 feet above sea level. Its streets are tortuous, but the houses are well built in the Moorish style. The city is connected by several railroads and within recent years has had a healthful commercial growth. It has manufactures of saltpeter, woolen textiles, gunpowder, silks, and machinery. Among its public institutions are a splendid cathedral, a university, several public parks, and a number of schools and academies. The university was founded in 1531, carries advanced courses of study, and is attended by several hundred students. Granada was founded by the Moors in the 8th century. It became the capital of the Moorish kingdom in 1235, and, when conquered by Ferdinand and Isabella, in 1492, it had a population of nearly 500,000. In 1610 the Moors were expelled from Spain, which caused the city to decline. At present it is surrounded by a strong wall. It still contains the Moorish palace of Alhambra and an unfinished palace commenced by Charles V. Population, 1906, 76,090.

**GRAND ARMY OF THE REPUBLIC**, a patriotic society of the United States, founded at Decatur, Ill., on April 6, 1868. The principal object is to promote a feeling of fraternal friendship among the sailors and soldiers who took part in the naval and military forces of the Federal government during the Civil War, to perpetuate the memory and history of the dead, and to extend aid and comfort to the orphans and widows. All the sailors and soldiers who were called into active service between April 12, 1861, and April 9, 1865, and received an honorable discharge, are eligible to membership. The list of eligibles also includes those who were members of State regiments, hence were subject to the Federal officers. Annual encampments are held in the leading cities and meetings of state and territorial departments usually meet each year. The official badge consists of a ribbon showing the national flag, to which is attached the brass star of the mem-

bership badge. The membership in 1890 was 409,489, but there has been a constant decrease owing to the annual deaths, which have averaged about 9,000. In 1908 the membership was 216,832. Though the society is not organized as a political body, its members have in many cases influenced the election of members of the Legislature and of Congress. All the presidents from Grant to McKinley saw service in the Civil War, and they polled nearly the entire vote of the society. Much has been done by the organization to promote legislation, relieve suffering, and maintain a fraternal feeling among its members.

**GRAND FORKS**, a city in North Dakota, county seat of Grand Forks County, on the Red River of the North, about 75 miles north of Fargo. It is on the Northern Pacific and the Great Northern railroads, and is surrounded by a fertile agricultural country. The noteworthy buildings include the high school, the county courthouse, the Northwestern Normal College, the Federal building, and a number of banks and hotels. Besides being the seat of Saint Bernard's Ursuline Academy, it contains a Lutheran college and the University of North Dakota. Among the manufactures are farming implements, flour, woolen goods, cigars and machinery. It has electric lights, waterworks, pavements, and other municipal improvements. Grand Forks was settled in 1871 and incorporated in 1881. Population, 1905, 10,127.

**GRAND HAVEN**, a port city on Lake Michigan, county seat of Ottawa County, Michigan, near the Grand River, about 31 miles west of Grand Rapids. It is on the Père Marquette and the Grand Trunk railroads, and is surrounded by a fertile agricultural and fruit-growing country. The city has a good harbor, two lighthouses, and a large trade in grain and lumber. Among the manufactures are furniture, machinery, sailing vessels, ironware, and cigars. The fisheries are an important factor in its prosperity. Several steamboat lines furnish regular communication. It is improved by electric lights, waterworks, etc. The chief buildings include the high school, the public library, and the Ackley College for girls. It was first settled in 1835. Population, 1910, 5,856.

**GRAND ISLAND**, a city in Nebraska, county seat of Hall County, on the Platte River, 148 miles west of Omaha. It is on the Chicago, Burlington and Quincy, the Union Pacific, and other railroads, and has extensive railway machine shops. The noteworthy buildings include a fine courthouse, the Grand Island College (Baptist), the public library, the Saint Francis Hospital, and the Nebraska Soldiers' and Sail-

ors' Home. It is an important grain and stock shipping center, and manufactures flour, beet sugar, wire fences, brooms, machinery, farming implements, and cigars. It has systems of sewerage, parking, electric lights, waterworks, and telephones. It was settled in 1869 and incorporated in 1872. Population, 1900, 7,554.

**GRAND JURY.** See Jury.

**GRAND MANAN** (mà-năn'), an island of Canada, in Charlotte County, New Brunswick, at the entrance to the Bay of Fundy. It is about twenty miles long and five miles broad and is well timbered with hardwood and evergreen trees. The shores are high and the surface is fertile, though the island is not greatly elevated. Good drives and roads have been constructed and the island is popular as a summer resort. At Indian Beach, on the northern shore, is a small settlement of Quoddy Indians. Grand Harbor is the principal settlement. The island has a population of 2,750.

**GRAND PRÉ** (grän prâ), a village of Nova Scotia, in Kings County, on the Windsor and Annapolis Railway. It is about fifteen miles from Windsor and is famous in literature as the central theme in Longfellow's "Evangeline." The French settled it in 1604 and it became a British possession in 1713. However, the expulsion of the Acadians did not occur until 1755. Population, 1900, 874.

**GRAND RAPIDS**, a city and the county seat of Kent County, Michigan, at the head of navigation on the Grand River. It is on the Grand Trunk, the Michigan Central, the Père Marquette, the Lake Shore and Michigan Southern, and other railroads, and has communication by a network of electric railways. An abundance of water power is obtained from the rapids in the Grand River. The streets are well paved with brick and asphalt and lighted with gas and electricity. The architecture is generally substantial, including many tall and fireproof buildings. Among the noteworthy structures are the Federal buildings, the county courthouse, the public library, the Masonic Temple, the Pythian Temple, and many public schools and churches. It is the seat of the Michigan Soldiers' Home, Saint John's Orphan Asylum, State Masonic Home, city home for the treatment of contagious diseases, and numerous hospitals.

Grand Rapids is important as a manufacturing and jobbing center. It has a large trade in lumber, fruit, grain, quarry products, and merchandise. Among the manufactures are furniture, flour, clothing, machinery, utensils, and hardware. Near the city are gypsum quarries that product an immense quantity of stucco. It

has extensive productions of brick and tile. The furniture manufactories rank as the largest in the world. Grand Rapids was settled in 1833 and received its charter as a city in 1850. Population, 1904, 95,718; in 1910, 112,571.

**GRAND RAPIDS**, a city of Wisconsin, county seat of Wood County, 95 miles west of Green Bay. It is on the Wisconsin River and on the Chicago and Northwestern, the Chicago, Milwaukee and Saint Paul, and other railroads. It has a public library, electric lighting, waterworks, and a growing trade in merchandise and agricultural products. The manufactures include paper and wood pulp, furniture, flour, machinery, and clothing. It has a number of fine county and school buildings. A bridge connects the city with Centralia, which was annexed to Grand Rapids in 1900. Population, 1905, 6,157.

**GRAND REMONSTRANCE** (rě-mön'-strans), a document presented by the House of Commons to Charles I. of England in 1641. It was adopted by a majority of 11 votes at a time when the king was absent in Scotland, and consisted of 204 sections in which real or alleged irregularities of the government were enumerated. Among the principal grievances stated were that the government had levied forced loans, practiced excesses in the courts of the Star Chamber, injured the people by building up commercial monopolies, and illegally enlarged the royal forests. The king at first ignored the manifesto and later issued an evasive reply, but afterward tried to impeach the leaders who promoted it in the House of Commons. This unsatisfactory policy on the part of the king was one of the causes that brought on the Civil War and the establishment of the Commonwealth.

**GRAND RIVER**, a tributary of the Colorado, rises in Grand Lake, and after a course of 350 miles joins the Green River in Utah to form the Colorado. It flows through a mountainous country in the greater part of its course, and in several localities passes through deep canyons. The Dolores and Gunnison are its chief tributaries.

**GRAND RIVER**, a river of the United States, rises in Iowa, and after a course of 300 miles flows into the Missouri. Its direction is mainly toward the southeast, entering the Missouri River at Brunswick, Mo. The country through which it flows is highly fertile and in its lower course are valuable forests.

**GRANGE** (grānj), or **Patrons of Husbandry**. See **Farmers' Organizations**.

**GRANITE** (grăn'it), an unstratified rock, generally consisting of the three minerals,

quartz, mica, and feldspar. The crystal grains of which it is formed vary in size, thus giving rise to the fine-grained and coarse-grained varieties. The latter is commonly called *pegmatite*. The grain crystals range from the size of a pin head to a two-foot cube. Such minerals as beryl, garnet, and tourmaline are found in granite formations, often in small particles scattered through the body. Granite is classed as an igneous or fire-formed rock, and originated under great heat and pressure beneath the surface of the earth, the pressure being produced in most cases by earth, but also by water and steam. It was forced from the pre-Cambrian to the Tertiary ages, the granite of the Alpine region of Europe being of the more recent formation. It is widely distributed and constitutes the most durable material for buildings and monuments. Among the productive granite districts of the United States are those of New England, New York, California, Michigan, and other states. It is quarried extensively in Canada, Italy, Sweden, Switzerland, Russia, and in Africa. The *red granite* of Scotland and the *Barre granite*, a gray species, of New Hampshire, are used extensively in monuments.

Granite varies greatly in hardness and color, according to the proportion of its constituents. The varieties in which feldspar predominates are inclined to crack, hence they do not possess much value for building. The harder species are used for building monuments, bridges, public buildings, and fortresses. Its hardness makes the expense for quarrying and cutting considerable, though this is at least in part overcome by its durability and beauty. Most species take on a fine polish. Those containing considerable feldspar are reddish, the flesh shade of some being due to mica, while others are grayish-blue, gray, yellowish, pinkish, or drab. Among the ancient Egyptians granite was highly prized as building material and for tombs and monuments. Their statues were made largely of Oriental basalt found in the deserts of Egypt, while Oriental red granite served for monuments, such as Cleopatra's Needles and Pompey's Pillar. The ancient method of polishing brought out good results, and usually the finished product was decorated with finely cut hieroglyphics. Egyptian ruins bear evidence that they preferred to use the species which are darkened by the presence of hornblende, the grayish, and those containing a flesh color due to the presence of feldspar.

**GRAPE**, the wine plant or its fruit. It belongs to the genus *Vitis*, is a climbing vine, and has lobed and somewhat hairy leaves. The stock is woody and is supported by strong ten-

drils. Nearly all the plants have very long and branching stems, from which the outer bark is easily removed. It is thought that the best fruit-bearing plants are native of the region surrounding the Caspian Sea, extending as far west as the Crimea. Several species of wild grape of inferior quality are native to many countries and grow extensively in the forests of America. The cultivated species thrive in the warm and temperate zones. They produce berries in clusters, some of which are seedless, but others have from one to four stony seeds.

The Phoenicians introduced the grape into Europe from Asia, where it has been grown from remote antiquity, and it was brought to America as soon as permanent settlements were made in the new world. Since then many of the native plants have been improved by cultivation and new species originated by mixture with those of Eurasia. The grape plant may

GRAPE VINE.

be propagated by inoculation, cuttings, grafting, and seeds. Grades of sweet wine are made from grapes which are allowed to be left on the vines until overripe, when they contain a larger per cent. of saccharine matter. The wine products of France, Spain, and Germany are noted, while for productiveness and large species few countries exceed South Australia. In many of the warmer climates the wine plant bears twice a year. The application of artificial heat has materially increased the production, though this was not practiced extensively until within the last century. California is the greatest wine-producing State of the United States, and its products now rival those of Germany and France.

Not less than 500 species of grapes are indigenous to North America, but the number cultivated is comparatively small. The plants are usually obtained by cuttings and are set in rows about ten feet apart. In most cases the ground is cultivated in other crops one or two years, after which it is subjected to clean culture and the vines are supported on trellises. Careful trimming is necessary to secure a large yield of good quality. Among the popular species of grapes grown for the market are the Concord,

Catawba, Niagara, Clinton, White Frontignan, Madeira, and Black Prince.

**GRAPESHOT**, a class of spherical shot put up in stands, generally consisting of three tiers with three shots in each tier. The use of case shot has superseded largely that of grapeshot.

**GRAPHITE** (gräf'it), a mineral carbon, also called *black lead* and *plumbago*. It is found in the oldest rock formations, occurring in many portions of the Altai Mountains, Germany, and the United States, especially in New York, Pennsylvania, Michigan, Alabama, and California. Extensive deposits are found in Canada, notably in the Laurentian rocks at Brougham, Bohemia, and Ceylon. It occurs in masses or beds, having a chemical composition similar to anthracite coal, and may be made artificially from coal. The marketable grades have a highly metallic luster, a granular texture, and an iron-gray color. They are soft to the touch and quite unchangeable in the air. Graphite may be heated in a closed vessel without effecting a change. Its use is largely for crucibles, portable furnaces, and pencils. It is employed in electrotyping, for protecting iron from rust, and various other purposes in the arts and industries. The manufacturing establishment founded at Stein, Germany, by A. W. Faber is one of the oldest and largest in the world engaged in the manufacture of pencils. In making pencils the larger blocks of pure graphite are utilized in their natural state by cutting them into pieces and forms of proper size, while the cheaper grades of pencils contain graphite secured by grinding the smaller particles of powder and purifying them by washing, and afterward drying and pressing into proper forms. The harder varieties of graphite pencils are made by adding a small quantity of clay.

**GRAPHOPHONE** (gräf'ô-fôn). See **Phonograph**.

**GRASS** (gräs), an important and extensive order of endogenous plants, including about 450 genera and 4,500 species. They are distinguished from sedges by their generally cylindrical, pointed, and hollow stems, while sedges are largely triangular in shape, pointed, but solid. There are two classes of grasses, *artificial* and *natural*. The former include such cultivated plants as trefoils, sainfoin, and clover grown for fodder, and the latter embrace the grasses proper. Both of these are of incalculable value on account of the nutritious herbage furnished for stock and the various textiles employed in manufacturing. The soil is enriched by the decaying substances of grasses, and washing away of the surface soil by rains is hindered largely by their roots. Many of the

grasses are annuals, but those growing in forests and many having woody structure are not. Different species are commonly found on hills, slopes, valleys, and marshes, and the quality of the soil is often indicated by the kind of grass it bears. The growth in a single season varies from minute forms to heights of fully one hundred feet. Bamboo grasses are woody, while grains rank with the herbs. The different cereals and their products, such as beer, paper, sugar, rum, medicine, bread, and starch, are treated in separate articles.

**GRASS CLOTH**, the name of certain beautiful fabrics manufactured from ramie, or China grass. The name is somewhat misleading, since the fibers from which the product is made do not belong to the grasses, and the kinds of cloth made from the fiber of true grasses are very coarse. Some varieties of cloth made from ramie resemble silk in fineness and luster and are extremely durable.

**GRASSHOPPER** (grás'höp-pēr), an order of insects characterized by large, strong hind legs fitted for leaping. They are allied to the

GRASSHOPPERS.

A, A, A, Adults depositing eggs; B, eggs; C, group of eggs.

ADULT GRASSHOPPER.

locusts, crickets, and cockroaches. Distinguishing and characteristic sounds are produced, as in the locust, by rubbing the wings and wing covers together during flight, and others by rubbing the serrated hind legs against the wing covers, while the peculiar sounds of the katydid and cricket are caused by rubbing one wing cover on the other. The common grasshoppers

have long, threadlike antennae and the wings are folded together like the sides of a roof. In some species they are rudimentary and usually are grayish or green in color. They are numerous in all parts of the world, often occurring in such numbers as to be destructive to vegetation. In some of the arid regions, as in western Kansas and Nebraska, they have been known to obscure the sun for hours in their flight, and, when alighting, to be so numerous as to greatly damage the growing crops. Some species are said to live on insects, but the greater number feed on grass and herbage.

**GRASS TREE**, the common name of tree-like plants native to Tasmania and Australia, so called from the grasslike foliage. Six species have been described, all of which have upright stems with tufts of long narrow foliage at the upper part, and clusters of flowers are borne amid the tufts of leaves. The bases of the inner leaves are edible and are prepared for the table by roasting. A balsamic gum useful in medicine is obtained from the stem by incisions. The stem rarely reaches a height of more than six feet, though usually it is about four feet high, and the diameter is sometimes a foot.

**GRASS VALLEY**, a city of California, in Nevada County, 68 miles northeast of Sacramento, on the Nevada County Railroad. It is surrounded by a rich gold-mining region. The industries include quartz mills, machine shops, and marble works. It is the seat of Saint Mary's Academy, has electric lights and a public library, and is the center of a growing trade in merchandise and manufactures. The first settlement on its site was made in 1849. Population, 1900, 4,719.

**GRATZ** (gräts), or **Graz**, a city in Austria, capital of Styria, on the Mur River, about ninety miles southwest of Vienna. The site of the city is a beautiful eminence about 400 feet above the river, the streets are well improved, and important railroad connections facilitate commercial enterprise. Besides a well-organized school system, it has a university founded in 1586 which is attended by 1,725 students and has a library of 90,000 volumes. Other noteworthy buildings are the Gothic cathedral, founded in 1456 by Frederick III., a Gothic church, numerous monasteries, several government buildings, and many splendid residences. The manufactures include silk, woolen, and cotton goods, machinery, ironware, vehicles, soap, sugar, railroad cars, wine, and candles. It has electric lights and street railways, waterworks, pavements, several public parks, and many fine monuments. Gratz was founded in

the 12th century. The Hungarians made an attack upon it in 1481, but they were repulsed. It was captured by the French in 1797 and in 1809. The building of railways and the development of manufactures since 1860 has caused it to grow rapidly. Population, 1906, 158,212.

**GRAVEL** (grāv'ěl), the general name of small stones or pebbles mixed with sand, loam, or clay. It is formed by the action of water disintegrating rocks, the particles appearing first as boulders, but later are worn down to pebbles, sand, and even silt. Gravel forms useful material in building highways and ballasting railroad grades.

**GRAVELOTTE** (grāv-löt'), a village in Lorraine, about eight miles west of Metz, Germany. It is noted as the scene of a severe battle on August 18, 1870, between the Germans and the French. The German army consisted of 211,000 men under the personal direction of King William of Prussia, and the French army of 140,000 was under Marshal Bazaine. The German losses were 20,000 and the French 13,000, but the army of the latter was compelled to retreat to Metz, where the whole force surrendered to Prince Frederick Charles.

**GRAVITATION** (grāv-ī-tā'shūn), the force with which all heavenly bodies attract each other, often called the attraction of gravitation. That heavenly bodies attract each other was believed by Democritus and Epicurus and later by Bacon, Galileo, and Kepler, but it was left for Newton to discover the universality of gravitation and the law of its action between all bodies. The law he announced is that every particle of matter in the universe attracts every other particle of matter with a force directly proportional to its quantity of matter, decreasing as the square of the distance increases. In all heavenly bodies two opposing forces are constantly at work; one an attractive and the other a projectile force. If the attraction of gravitation alone operated, all planets would fall into the sun; or, if the projectile force alone existed, all planets would go off into space and move in a straight line forever, unless ultimately brought to rest by some external agency.

The two forces of gravitation are so nicely balanced that all heavenly bodies move around the central luminary with an exact precision, and when a planet is nearest the sun its projectile force is increased to exactly balance the increased force of attraction. Not only are the planets attracted by the sun, but they attract the sun. Their revolution is not properly around the sun, but all heavenly bodies, including the sun, revolve around the center of gravi-

tation, which is a point at or near the center of the sun. The same law operates in the case of all the satellites and primary bodies; they all attract each other directly as their respective masses, and inversely as the square of their distance. The laws of gravitation are well known, but why interposed substances will not interrupt gravitational tendencies, and how it can act at a distance without contact or connection, are problems not yet fathomed.

**GRAVITY** (grāv'ī-tŷ), the natural force exerted on all terrestrial matter, by which all bodies have a tendency to fall toward the center of the earth. This attraction holds all objects, as rock, water, animals, air, buildings, metals, and wood, and from it they receive the property called *weight*. The term *specific gravity* has reference to the relative weight or density of substances. If gravity did not exist, all objects loose on the earth's surface would be inclined to pass off into space by themselves. It is greatest at the surface of the earth, and diminishes as one goes upward, being a thousandth part less on a mountain 10,000 feet high. It is exerted alike on all bodies of equal density, and remains constant at a given place. At the poles its influence is greatest and it gradually decreases toward the Equator. Tests with spring balances have demonstrated that bodies appear to become heavier as we proceed toward the poles. This is due to the centrifugal force caused by the revolution of the earth upon its axis, which is greatest at the Equator and has a tendency to throw bodies off the earth. The difference in weight is  $\frac{1}{174}$ , or a body weighing 194 pounds at the Equator weighs 195 pounds at the poles. From this is learned that if the earth turned seventeen times faster upon its axis than it does, gravity would be overcome, and bodies would lose the property of weight. Gravity is measured by the acceleration of a falling body and by an oscillating pendulum. Increase in the weight of a falling body on the line between Canada and the United States is about 50.2 feet per second, and the variation of acceleration in different places determines the gravity. A pendulum oscillating once a second at sea level in the latitude of New York, moves slower or faster at places having greater or less gravity, hence it must be shorter or longer respectively to oscillate the same number of times. All heavenly bodies have gravity, the intensity of which is modified by their volume, density, velocity, and the attraction of gravitation.

**GRAYLING** (grā'ling), the name of a genus of edible fish, resembling in habits and external appearance the small salmon. The body is slender, the head is somewhat elongated, and the

mouth is small. It is active and considered a good game fish. The flesh is highly prized for table use. Two species are widely distributed in North America. These include the *arctic grayling* of Canada and Alaska, which is about eighteen inches long and weighs from one to two pounds. The other species, generally known as the *Michigan grayling*, is found in various parts of the United States, but especially in Michigan and the head streams of the Missouri River. The European species are abundant in the northern part of that continent and extend as far south as northern Italy.

**GREAT BARRINGTON**, a town of Massachusetts, in Berkshire County, forty miles west of Holyoke, on the New York, New Haven and Hartford Railroad. It is surrounded by picturesque scenery, hence is popular as a summer resort. The manufactures include cotton goods, machinery, cigars, and electrical apparatus. It has electric lights, a public library, and waterworks, and is the seat of Sedgwick Institute. In 1786, during Shay's Rebellion, it was the scene of an insurrection. William Cullen Bryant was the town clerk of Great Barrington for several years. It was settled in 1725, but formed a part of Sheffield until 1761, when it was incorporated. Population, 1905, 6,152.

**GREAT BASIN**, a vast triangular plateau between the Wasatch and Sierra Nevada mountains. It includes nearly all of Nevada and part of Idaho, Oregon, and California. Its length from north to south is 800 miles, and its breadth in a line crossing Great Salt Lake equals about 500 miles. The surface is diversified by valleys and mountains, among which numerous streams and salt lakes abound, but none has an outlet to the sea. In early geologic times the basin formed a vast lake.

**GREAT BEAR LAKE**, a large fresh-water lake in the western part of North America, situated in the district of Mackenzie, Canada. Its coast line is irregular and, being crossed by the Arctic Circle, its waters are frozen half of the year. Keith and McVicar bays are the principal coast indentations. The surface area is 14,000 square miles and the elevation above the sea is about 225 feet. It discharges into the Mackenzie by the Great Bear River.

**GREAT BRITAIN**, the English Empire, including the British Isles and extensive colonial possessions, and known officially as the United Kingdom of Great Britain and Ireland. The British Isles embrace two principal islands, the most important of Europe, the largest of which contains the three political divisions of England, Scotland, and Wales, and the smaller, Ireland. Five groups of islands are included, of which

the Scilly and Channel islands belong properly to England, and the Orkney, Hebrides, and Shetland islands, to Scotland. Other islands adjacent and belonging to Great Britain include Wight, Man, and Anglesey. The eastern boundary of the British Isles is formed by the North Sea; the southern, by the Strait of Dover and the English Channel; and the western and northern, by the Atlantic Ocean. Ireland is separated from the larger island by the North Channel, Irish Sea, and Saint George's Channel. The area of the British Isles is 130,979 square miles. It has a coast line, including indentations, of about 4,000 miles.

**SURFACE.** The surface is greatly diversified, being mountainous and rugged in the northern portion, especially in Scotland, while the southern part consists of undulating plains. Immense bogs characterize the interior of Ireland, but its coastal regions are fertile and of moderate elevation. The most elevated peaks of Scotland are the Grampians, which attain to heights of about 4,410 feet. In Wales the highest elevation is Snowdon, 3,375 feet, and the most elevated in Ireland is Carrantal, 3,414 feet. The mountain regions extend from Scotland and Wales into England and culminate in Scafell, 3,210 feet. On the border between England and Scotland are the Cheviot Hills, separated from the Pennine Chain by a low strip of country, but a larger part lies in Scotland. These highlands enabled Scotland to maintain a separate political existence for many years, and transportation lines are still mainly around the ends, where they are lowest.

**RIVERS.** Numerous rivers and lakes furnish ample interior water surface for navigation, fisheries, and facilities to propel machinery and supply cities with water. However, the rivers are not of great length and volume, owing to numerous mountains and the comparatively small extent of the surface. The Clyde and the Severn are the two longest rivers, the former in Scotland and the latter in England. The Clyde has been greatly improved by widening and deepening and is an important avenue of commerce. Next to the Severn, which is nearly 250 miles long, is the Thames, about 200 miles, among the river systems of England. Both have sluggish currents and are benefited for navigation by the tides. The Thames is one of the most important avenues of commerce in the world, estimated on the basis of the volume transported. Other streams of importance include the Don, Tay, Dee, Spey, Forth, Trent, and Tweed. In the northwestern part of England is the Lake District of the Cumbrian Mountains, and a famous lake region is in the

GEORGE V.

George V., King of Great Britain and Ireland and Emperor of India, born June 3, 1865, is the son of Edward VII. and Alexandra, eldest daughter of Christian IX., of Denmark. He was trained to become a sailor, after which he spent five years in cruising, and in 1892 entered the House of Lords as Duke of York. He succeeded his father in 1910. He married Victoria May, daughter of the Duke of Teck, in 1893. Edward Albert, the heir apparent, was born June 23, 1894.

Highlands of Scotland. Among the lakes of the latter are included Loch Katrine, Loch Lomond and Loch Rannoch.

**CLIMATE.** The climate as a whole is healthful. The summers are cool and the winters are moderately cold, while the rainfall is quite large. These characteristics are due to the proximity of the sea, since the location in latitude is about that of the Gulf of Saint Lawrence in North America. The harbors do not become ice bound at any time of the year and snowfalls are rare, except in the higher altitudes, but none of the mountains are covered with snow in the summer. In winter the average temperature is about 25° and in summer it is about 60°, while the annual average may be placed at 48°. Clouds are very frequent and the land is covered with fogs quite often. The inland and the western part have the heaviest rainfall, but the annual average for the country is about 40 inches. It is much greater in Wales, where it reaches 60 inches. As a whole the climate of the British Isles is favorably modified by the Gulf Stream, which sweeps across the Atlantic Ocean from North America, and by the prevailing southwest winds. These causes combine to render it equable and highly salubrious.

**INDUSTRIES.** The wealth of Great Britain originated from extensive agricultural and mining interests, and upon these were built vast manufacturing enterprises. By aid of an extensive marine it was possible to open the channels of commerce for the exchange of products and the increase in the output of manufactories. All the available land fit for cultivation is utilized with much care and the fertility is maintained by a high state of cultivation and by the use of fertilizers. All the domestic animals common to North America are grown successfully, especially milch cows, dairying being an important enterprise. The agricultural products were nearly sufficient for the food supply of the people until the middle of the 19th century, but with the advent of steam power and improvement in machinery the demand for raw materials rapidly increased and the cost of foreign foodstuffs was cheapened. For these reasons it became impossible to compete longer with grain grown in foreign countries, and thousands of agricultural laborers left the farms and sought employment in the manufactories. Great Britain at present exceeds all countries in the importation of food products and the supply grown at home is far short of the requirement.

Commercially Great Britain holds an important position among the nations. On the one hand it is the largest importer of food products, and on the other hand exports a vast quantity

of manufactured articles. The total imports received annually are valued at \$3,150,000,000, of which about one-half is paid for articles of food and drink, and the bulk of the balance is expended for raw material for shipyards and factories. At present the domestic exports aggregate about three-fifths of that of imports and nearly all of this represents manufactured or partly manufactured articles. The manufacture of cotton, woolen, linen, and silk textiles have been renowned for many centuries. Its productions of tinware, ironware, machinery, glass, furniture, porcelain, and other useful commodities take high rank among the products of the world. It not only holds a high place among the most important manufacturing nations, but in the production of merchant-marine vessels and general shipbuilding it occupies first place. The annual output of vessels is about 750, with a tonnage of 1,850,000.

Great Britain possessed good transportation facilities long before the advent of the era of railroad building. None of the manufacturing or commercial centers is far from the sea, not more than 75 miles, and all of the cities that have a large trade are near rivers or canals. The Thames River was improved by the government as early as 1423, and the vast network of main and auxiliary canals now in use aggregate a length of about 3,250 miles. The Manchester Ship Canal, 35 miles in length, is one of the most important waterways for large ocean vessels. Many of the rivers, such as the Severn, Thames, and Clyde, have been canalized. The railroads are exceptionally well built and equipped and include a total of 23,500 miles, exclusive of the lines operated in Ireland. With the exception of the United States and Germany, no country of the world has risen to the high development in commerce enjoyed by Great Britain. The import trade, based on values, in the order of importance, is with the United States, France, Germany, Holland, Russia, Belgium, Spain, and Denmark. The exports are largely to the colonies, though it has a large export trade with France, Germany, and Brazil.

**EDUCATION AND RELIGION.** Educationally the British Isles take a high rank, though the per cent. of illiteracy is much greater than in Germany and the Scandinavian countries. Until 1870 education was voluntary, but in that year measures to promote elementary education were passed, and soon after attendance was made compulsory for all children between the ages of five and fourteen. A school attendance law for Scotland was enacted in 1872, by whose terms attendance was made compulsory from five to fourteen years. The Board of Education cre-

ated in 1899 has charge of educational affairs in England and Wales, but in the latter division the instruction includes a department in the Welsh language. Schools are maintained generally by taxation and public grants. Support is given by the government to many industrial institutes which teach agriculture, dairying, commerce, mining, and the fine arts. In Ireland the educational status is not as well advanced as in the other portions, but a spirit in favor of progressive teaching and for greater educational advancement is becoming more marked.

Among the higher institutions of Great Britain are the universities at Cambridge and Oxford, which rank among the most celebrated of Europe. Other universities in England include those at Liverpool, Manchester, Sheffield, Birmingham, London, and Leeds. The University of Dublin is the most noted in Ireland, and the four celebrated institutions of Scotland are at Glasgow, Aberdeen, Edinburgh, and Saint Andrews. Besides these, there are about ninety colleges in the British Isles, which are supported partly by public grants, but mostly by private and religious societies. All forms of religious worship are tolerated. However, in England and Wales the Protestant Episcopal and in Scotland the Presbyterian churches are favored by state endowments. In this portion of the British Isles the people are largely Protestants, while in Ireland about two-thirds belong to the Roman Catholic Church. Among the numerically strongest Protestant sects in Ireland are the Presbyterian, Methodist, Independents, Baptist, and Friends.

**GOVERNMENT.** The government is a constitutional monarchy. It was gradually developed from the feudal period to a popular form. The two leading features, which are an administrative ministry and representation of the people in the legislature of two houses, have been adopted by many of the republics of the world. However, the constitution is unwritten and consists of important manifestoes and treaties, royal decrees relating to administration, and numerous precedents and judicial decisions. The *Magna Charta* of 1215, the Declaration of Rights in 1689, the Act of Settlement in 1771, the Act of Union with Scotland in 1777, and the Act of Union with Ireland in 1800 are the most important of the constitutional instruments. Nominally the executive power is vested in the king or queen and the two houses of Parliament, but it is actually exercised by a committee of ministers known as the *Cabinet*. The Parliament has supreme legislative power, and the laws made by that body are administered through the Cabinet. Since the cabinet officers are dependent

largely upon Parliament and the latter body may name the sovereign when the question of succession arises, it is apparent that the principal governmental powers in the kingdom ultimately are vested in the Parliament.

Succession to the crown is vested in the eldest child of the preceding ruler and male heirs are preferred over female heirs. At the age of eighteen the heir apparent comes into possession of his title, being Duke of Cornwall by heredity and Prince of Wales by grant. The Protestant Episcopal church being official, it is required that the heir and crown affiliate with it. The sovereign is the nominal head of the Church, presides over the highest ecclesiastical bodies, may grant pardons and issue passports, has power to declare war and make treaties, is the commander of the navy and army, and may appoint and remove certain administrative officers. It is within his range of power to summon, open, prorogue, and dissolve Parliament, but the last-mentioned function is not exercised without the advice of the ministry. Though he has the veto power in legislation of Parliament, this right has not been exercised since 1707.

When a new Cabinet is to be chosen, the sovereign selects the leader of the majority party in the House of Commons as Premier, who, after holding consultations with the members of his party, selects a ministry. The ministers chosen by the Premier are appointed by the sovereign, and they may be members of either house of Parliament. They not only retain their seats in Parliament, but as ministers propose many subjects for legislation and are leaders in the debate. Twenty ministers make up the Cabinet, but all of them are not directly engaged in the work of council. When a majority of Parliament become dissatisfied with the action of the Cabinet, they declare that the ministry no longer has their confidence, and they must either change their course in deference to the wishes of the majority or resign.

The legislative functions of the government are exercised by the two houses of Parliament, the House of Lords and the House of Commons. The *Great Council*, as the Parliament was originally called, was first a gathering of nobles and bishops, but in 1265 the commoners were given representation. Edward I., in 1295, issued writs ordering the election of two citizens from each city or borough and two knights from each county. In the 14th century the Parliament was divided into the two houses, and this arrangement has continued up to the present. The lords hold their seats by hereditary right; by virtue of office, as bishops of the Established Church; by creation of the sovereign;

by election for the duration of Parliament, as in the case of Scottish peers; or by election for life, as in the case of Irish peers. In 1900 the number of names on the roll of lords was 593. Power to revise all bills that come from the House of Commons, except those relating to public revenue and expenditure, is vested in the House of Lords. The expenditures of the nation are controlled by the lower house. All the members of the House of Commons are chosen by qualified electors. The right to vote is restricted to male citizens who are twenty-one years of age or over and who possess a property qualification. The total membership of the commons is 670 members, being one representative for each 54,000 inhabitants, and a few of the towns and the great universities have representation. Women are permitted to vote under certain conditions for city and county councils and school boards, and are eligible to serve as members of the latter, but they are not permitted to vote for members of Parliament.

Great Britain being one of the largest political powers in the world, necessarily has vast interests in different lines of government, both local and colonial. Local government is administered in six distinct lines, including those of parishes, rural districts, urban districts, school districts, boroughs, and counties. In these administrative districts the government is vested very largely in the people themselves, subject only to the law and constitution of the nation. Wales has been governed as a part of England since 1536, and the privileges of its inhabitants are coextensive with that of other English subjects. Scotland is represented in Parliament by 16 peers and 72 commoners, and the administration is through the Chief Secretary for Scotland. Local government is similar to that of England, but there is a separate system of civil and criminal courts, though the House of Lords is the highest judicial tribunal to which appeals may be taken. Ireland is governed through a personal representative of the crown, who is known as the Lord Lieutenant. He is aided by the Chief Secretary for Ireland, who, like the Chief Secretary for Scotland, is usually a member of the Cabinet. Ireland has 28 peers and 103 commoners in the British Parliament, but has no Parliament of its own. Here the local government conforms quite generally to that of England, and its system of courts culminates in the supreme court of judicature, from which appeals may be taken to the British House of Lords.

The colonies are divided into four classes, depending upon the system under which government is administered. Those of the first class include the possessions that are practically inde-

pendent of the mother country, such as Canada and Australia; those of the second class are semi-independent, where the legislature is partly elected by the people and partly appointed by representatives of the crown, such as Ceylon and Malta; those of the third class are known as crown colonies and are governed by a council and governor appointed by the crown, such as British Honduras and the empire of India; and those of the fourth class embrace the protectorates, in which native agencies conduct the government. To these may be added a fifth class in which the government is administered by charters through trading companies. Egypt is in a class by itself, where the influence of Great Britain is paramount, but the government is nominally administered through Turkey.

Great Britain has the largest navy in the world. It includes, besides others, 60 battleships, 20 armored cruisers, 100 protected cruisers, 80 torpedo boat destroyers, and 100 torpedo vessels. The total displacement of vessels is estimated at 1,150,000 tons. The revenues of the government for all purposes are derived from various sources, but the most important of the direct taxes is the income tax, which is levied on the income of individuals in graduated rates. In addition to this are the excise duties, inheritance tax, customs duties, house duties, stamp duties, and land tax. In 1908 the national debt amounted to \$3,875,000,000. Many of the public utilities are owned by the government, such as the postal service, which includes a parcel post, and the telegraph lines.

**INHABITANTS.** The population of Great Britain, including Ireland, has been increasing steadily. However, Ireland has shown a constant decrease for many decades. London, the capital of the British Empire, located on the Thames, is the largest city in the world. In 1907 fourteen cities of England, two of Ireland, and two of Scotland had a population of more than 200,000. Owing to the great uplift in manufacturing enterprises, there has been a constant increase in urban population. Fifteen per cent. of the people of Wales speak Welsh only, 45 per cent. of Ireland speak Irish only, and 63 per cent. of Scotland speak Gaelic only. The inhabitants of the United Kingdom in 1907 were 44,100,231. Of this number 4,378,568 were in Ireland, 4,776,063 were in Scotland, and 34,945,600 were in England and Wales.

**COLONIES.** The colonial possessions of Great Britain are more extensive than those of any other nation. The entire possessions embrace about one-seventh of the land area and nearly one-fourth of the inhabitants of the earth. All the more important islands and continental prov-

inces are treated in separate articles. The table published in connection with this article does not include some of the minor possessions and some of the unsurveyed territories of Africa may contain a greater or smaller area and population than stated. However, based upon the most recent reports, the table may be considered sufficiently accurate.

GREAT BRITAIN AND COLONIAL POSSESSIONS.	AREA IN SQUARE MILES.	POPULATION.
<b>In Africa:</b>		
Ascension Island.....	35	260

**HISTORY.** As a distinct name Great Britain was first used to distinguish the English government from that of Britainy in France, though it was employed only in a poetic sense until 1603, when James I. began to style himself King of Great Britain. In that year the crowns of England and Scotland were united by the accession of James VI. of Scotland to the throne of England as James I., but an independent legislative body was retained by each. The name Great Britain became legalized in 1707, when the two countries became organized as one inseparable union. Queen Anne, the last of the Stuarts, ascended the throne in 1702 and died in 1714. She was succeeded by George I. of the present house of Hanover. Twelve new peers had been created in 1711 and this gave the Tories a majority in the lords, but the rise of the house of Hanover caused the Stuarts to be exiled, and the insurrections that followed were soon suppressed. King George was supported by the Whig party, which remained in undisputed power nearly fifty years. During his reign Walpole rose to power and was a potent factor in overcoming the panic that followed the failure of the South Sea Company. He was the first of the premiers, though he did not assume the title, and remained influential after the succession of George II., in 1727.

In 1739 Great Britain became involved in a war with Spain, though Walpole tried to avert it, and three years later he resigned rather than assume the responsibility of the Austrian Succession. He was succeeded by the ministry of Carteret, who participated in the War of the Austrian Succession, which proved unprofitable to England, but was rather fortunate for the house of Hanover. Charles Edward Stuart, the Young Pretender, invaded England while the war was in progress, but was finally defeated at Culloden in 1746. Ten years later, in 1756, William Pitt entered the Cabinet. He supported Frederick the Great in the Seven Years' War and advocated the war against France, which resulted in the loss of Louisiana, Canada, and India to the French. George II. was succeeded by George III. in 1760, and the new king immediately began to plan for a restoration of many of the royal powers that had been lost by his two predecessors. Pitt resigned from the Cabinet in 1761 and was succeeded by Lord Bute, but the latter soon gave way to Lord North, during whose ministry the Revolution in America began. The Treaty of Paris conferred independence on the American colonies in 1783, and as a result of the dissatisfaction that followed the younger Pitt became Prime Minister, retaining this position until his death in 1806.

The general attitude of republicanism in France after the Revolution along with other causes brought on a war with France in 1793. It resulted fortunately to England, since Nelson's victory at Trafalgar made Great Britain the supreme naval power, while the successes of Wellington in Spain and Portugal forced the Congress of Vienna to grant favorable terms to the British. However, Ireland undertook to obtain independence by force of arms and England soon after became involved in the War of 1812 with the United States. The reign of sixty years by George III. was ended in 1820, when George IV. ascended the throne. He had already served as regent for his insane father, during whose term of service the country had contracted an enormous debt, which greatly retarded economic and political reforms. In 1822 England opposed the alliance between Austria, Prussia, and Russia for the suppression of democracy, and five years later assisted the Greek patriots against Turkey. George Canning became Premier in 1827, but was soon succeeded by Wellington, who promoted a policy of reform. Catholic emancipation was granted in 1829. William IV. ascended the throne in 1830 and the following year Lord Russell introduced the first of the famous reform bills, which was indorsed after an appeal to the country by a large majority. Slavery was abolished in the colonies in 1833, new poor laws were enacted in 1834, and Upper and Lower Canada were united into one Dominion in 1837.

Queen Victoria began her long reign of 64 years in 1867. She exercised a very limited political influence, since the government was largely in the hands of the ministry. Among the principal events of her reign are the extension of territory and political power in India, the repeal of the Corn Laws, the invasion of Afghanistan in 1839, the Crimean War in 1854, the Opium War in China in 1840, the Sepoy Mutiny in 1857, the disestablishment and disendowment of the Irish Church in 1871, the proclamation of Victoria as Empress of India in 1877, the Anglo-Boer War in 1899, and the agitation for home rule in Ireland. Edward VII. succeeded his mother, Queen Victoria, in 1901, while the Anglo-Boer War was still in progress. At the conclusion of peace, in 1902, the territory of the Orange River Republic and of the Transvaal Republic was annexed to the British possessions. The past fifty years of history are important in the newer progress of the great empire, especially in its educational, commercial, and military development. Within this period lived many of the eminent statesmen who formulated its newer policies, including Gladstone,

Ewart, Disraeli, Salisbury, and Campbell-Bannerman. See England.

**GREAT EASTERN**, the first of the large steamships built in Europe. It was constructed in 1854-58 at Millbank, England, for the Eastern Navigation Company, after designs made by Scott Russell, and intended for service to Australia by way of the Cape of Good Hope. The length was 680 feet; breadth, 83 feet; and height to the bulwarks, 70 feet. It had one mast of wood and five of iron and a capacity of 11,000 horse power, and could spread 7,000 yards of sail. The capacity was ample for 5,000 persons when all compartments were fitted out, though the design was to carry only about 1,000 passengers and devote the remaining space to the cargo. The cargo capacity was 20,000 tons. It cost \$300,000 to launch the vessel, which was done on the Thames, Sept. 8, 1859. The expense of manning and keeping up repairs made the enterprise disastrous. After laying the Atlantic Cable and making a number of trips across the Atlantic, the vessel was used to transport troops and later as a coal hulk at Gibraltar in 1884. Subsequently it served as a curiosity. In 1888 it was sold at auction in Liverpool and broken up for repair and building material. Although the *Great Eastern* was considered too large to be practical at the time it was in use, it has been greatly surpassed in size and power by the modern vessels. For instance, the *Kaiser Wilhelm II.* is 683 feet long and the *Lusitania* is 760 feet long.

**GREAT FALLS**, a city in Montana, county seat of Cascade County, on the Missouri River, near its falls at the mouth of the Sun River, 98 miles northeast of Helena. It is on the Great Northern and other railroads, within a region which produces large quantities of gold, silver, iron, coal, copper, and sandstone. Among the chief buildings are the county courthouse, the public library, the high school, and the Federal building. It has seven parks with a total area of 560 acres. Immense water power is derived from Rainbow and Great falls. Among the manufactures are earthenware, clothing, cigars, machinery, and brick. It has large smelting and refining works. Great Falls was settled in 1884 and incorporated in 1888. Population, 1900, 14,930; in 1910, 13,948.

**GREAT FISH**, or **Back River**, a stream of Northern Canada, rises near Lake Aylmer, and flows into the Arctic by a wide estuary. Its source is in Mackenzie, whence it has a course of about 500 miles toward the northeast. It was discovered and explored by Sir George Back in 1834.

**GREAT KANAWHA** (kà-nà'wà), an important river flowing into the Ohio, rises in the

Blue Ridge Mountains of North Carolina. Its entire length is 410 miles, about 100 of its lower course being navigable. The upper portion is called New River, which has a general direction toward the northeast through Virginia, but makes a bold turn into West Virginia, and thence the Kanawha has a northwesterly course. Among the towns on its banks are Charleston, W. Va., and Pearisburgh, Va. The region through which it passes is rich in coal and iron deposits.

**GREAT LAKES.** See **Lakes, The Great.**

**GREAT PEDEE RIVER** (pě-dě'), a stream formed in North Carolina by the confluence of the Yadkin and Rocky rivers. It passes into South Carolina, where it receives the Little Pedee, and flows into Winyaw Bay at Georgetown. It has a total length of 415 miles and is navigable to Cheraw, a distance of 150 miles.

**GREAT SALT LAKE**, a body of salt water situated in the northern part of Utah. It is about 85 miles long, from 20 to 48 miles wide, and is 4,150 feet above sea level. Its only outlet is by evaporation, hence the water is one of the most concentrated salt brines known in the world, containing about 20 per cent. of sodium chloride and slight quantities of other salts. No fish subsist in the lake, but its shores are frequented by gulls and wild fowl. The discharge from Lake Utah, a fresh-water lake, is carried into it by the Jordan from the south. Other rivers flowing into it include the Ogden, Bear, and Weber.

The first account of this lake was made in 1689 by Baron La Hontan (1667-1715), who based his report on information given by the Indians. In 1776 Escalante, a Franciscan friar, mentioned the lake and Frémont explored it in 1843. The adjacent geological formations give evidence that in early times the lake was an immense body and at least 1,000 feet deeper than at present. The present average depth is about 18 feet and at its deepest point it is about 35 feet. The valleys lying adjacent have been improved greatly by irrigation, and now constitute the richest part of the State. Numerous railroad lines traverse the adjacent country, and near it are the thriving cities of Salt Lake City, Ogden, and Logan. A line of the Southern Pacific Railroad crosses the lake, passing almost due west from Ogden.

**GREAT SLAVE LAKE**, a large, irregular fresh-water lake in Mackenzie, Canada, about 325 miles long and 80 miles wide. The area is 7,100 square miles. It has irregular shores and numerous islands, and is frozen over half the year. The discharge from Athabasca Lake flows

into it, and its surplus waters are carried to the Arctic by the Mackenzie River.

**GREAT WALL OF CHINA.** See **Chinese Wall.**

**GREBE** (grēb), the name of a water bird common to Europe and America, peculiar in that the feet are not webbed. Each toe has a separate membrane, which is united with the membrane opposite. It has no visible tail. The bill and head are of nearly equal length, the wings are short, and the legs are thin and not well fitted for walking. In water they are skillful and swim rapidly, and when frightened they dive quickly and pass under water for considerable distances. The common grebe is about ten inches long and is hunted for the silky plumage of the under part, which is used in the manufacture of muffs and trimmings. Nine species are common to North America, ranging from Mexico to the southern part of Canada. They are quite numerous along the eastern coast and are known locally as *dippers* and *hell-divers*. The *crested grebe* is one of the larger species and has the finest plumage.

**GREECE**, a kingdom in Southeastern Europe, occupying the most easterly of the three peninsulas that project from Europe into the Mediterranean. The northern boundary is formed by Turkey, eastern by the Aegean Sea, southern by the Mediterranean, and western by the Ionian Sea. It extends from latitude 40° north southward to latitude 36° 23'. The length from north to south is about 250 miles and the greatest breadth is 180 miles. Many islands are located in the Aegean and Ionian seas, most of which appear to be the summits of sunken volcanic formations. The boundaries of the interior provinces are formed largely by mountain ranges, all of which have associated with them historic incidents of much interest. Together with the Ionian Islands, the Euboea and the Cyclades, it has an area of 25,040 square miles.

**DESCRIPTION.** A continuation of the Balkan Mountains, known by the general name of Pindus, extends across the boundary line from Turkey and divides and subdivides into numerous chains. The coast line is extraordinarily irregular, being indented by many gulfs and bays valuable in commercial enterprises. The numerous islands that belong to Greece are separated from the mainland and from each other by navigable channels, and like the mainland contain numerous mountain elevations. Olympus, 9,750 feet high, supposed to have been the dwelling place of the gods in ancient times, is located on the northern boundary. It belongs to the eastern extremity of the Cambunian Mountains. Other

mountain peaks include Parnassus, 8,075 feet, and Cithaeron, 4,615 feet, in central Greece; and Taygetus, 7,900 feet, situated in the Peloponnesus. A number of plains are located in different sections of the country, but all of them are surrounded by chains of mountains. The great plains of Thessaly, in the northern part of Greece, are the most extensive. They are level and woodless, but have a very fertile soil and may be regarded the granary of the kingdom. Other plains are located in Argolis, Boeotia, and Messenia.

The rivers of Greece are numerous, but all are quite small and unimportant, except as they are associated with legends and history. None of the streams is important for navigation or water power. The greater number dry up during the summer, others disappear in sinks in limestone, and only the largest flow the entire year. The Achelous, which flows into the Ionian Sea north of the Gulf of Patras, is the most important river. The Iri (Eurotas) and the Alpheus are the chief rivers of the Peloponnesus. Aside from the Messongi; on the Island of Corfu, there are no streams in the islands. The mountainous regions have a number of lakes, many of which have no visible outlet to the sea, the surplus being drained through porous limestone. Lake Copais in Boeotia is the largest inland body of water. The Gulf of Lepanto or Corinth, located northwest of Athens, is almost surrounded by land, and is connected with the Gulf of Patras, an inlet from the Ionian Sea, by a narrow channel.

**CLIMATE.** As a whole, the climate is temperate and salubrious. The atmosphere is remarkable for its clearness and beauty, rivaling the Italian sky, and the country is generally healthful, though it is not thought to be as agreeable as it was in ancient times. The sirocco winds from Africa make some of the summer days very hot, almost unendurable, and the cold of winter is somewhat intensified by the winds blowing from the snowy mountain summits of the north. Frosts and snowfalls rarely occur in the lowlands, but the summits of mountains are visited by heavy snows in the winter. The eastern part is subject to droughts, hence irrigation is necessary for many farm crops, but the western region has an abundance of rainfall. A larger part of the precipitation takes place in autumn and winter and the summers are generally very dry. On the plains and some of the coasts the soil is quite fertile, hence the yield of produce gives greater returns than any time since Greece had its ancient prosperity.

**MINING.** Lead is the most important of the minerals, the yield being about 30,000 tons per

year. Lignite coal is found in Euboea, but the supply is quite limited. Important deposits of iron and copper are known to exist, but the scarcity of fuel has prevented them from being worked to any extent. Gypsum, salt, and sulphur deposits of considerable value are found in various localities. Fine marble is obtained in Paros and Pentelicus and emery occurs in Naxos and other islands. Building stone, especially limestone, is very abundant.

**AGRICULTURE.** Greece is principally an agricultural country. The ownership of the land is vested largely in the peasant farmers, who must depend to a considerable extent upon irrigation. Nearly half of the tilled land is used in the cultivation of cereals, but the supply of wheat and other grains is not sufficient for the home demand. In the region of Elis, where the lands are low and well watered, a superior quality of rice is grown. Fruits are cultivated very extensively, especially currants, grapes, figs, lemons, oranges, apples, and pomegranates. The mulberry tree is propagated extensively as an adjunct of the silk industry and vegetable gardening is an enterprise of much value. Sheep are the most important of the domestic animals, while goats are reared for their milk, from which butter and cheese are made. Other domestic animals include horses, cattle, and swine. Bee culture has been practiced from ancient times. The forest area is very small, this being due to the fact that the large number of goats tend to kill the young trees, but some attention is given to forestry.

**MANUFACTURING.** Greece is especially adapted to the production of wines that are rich in color and alcohol, hence their manufacture receives marked attention. Most of the manufacturing enterprises are conducted in small shops, many of which are located near the towns and in the country. Peasant women weave carpets in their houses and engage locally in spinning and sewing. Flour is ground in many of the towns and cities. Piraeus is the center of cotton, wool, and silk factories. The fisheries yield many commercial products, especially the sponge fisheries of the Aegean Sea. Other manufactures include machinery, clothing, utensils, toys, leather, soap, and sailing vessels.

**TRANSPORTATION AND COMMERCE.** Greece had 950 miles of railways in 1908. Electric lines and tramways are operated in the cities and in some sections of the rural districts. About 2,200 miles of good highways are maintained and 6,500 miles of telegraph lines are in operation. Much of the transportation is by the sea. The Corinth Canal, completed in 1893, crosses the Isthmus of Corinth and connects the Aegean with the

Ionian Sea. It is the seat of an important commerce, since it furnishes a short and safe route between points in Italy and Constantinople. A railway line parallel to the Gulf of Corinth has been in operation a number of years, furnishing transportation facilities between Athens and Patras, and important lines are being constructed to connect the chief centers of Greece with those of the central part of Europe. The imports exceed the exports, the former being about \$26,500,000 and the latter \$17,500,000. Foreign trade is chiefly with Great Britain, Russia, Austria, Turkey, Germany, France, and Italy.

**EDUCATION.** The state of education has been greatly neglected, in consequence of which many of the people are unable to read and write, the proportion of illiteracy being about 25 per cent. This is due not so much to the inclination of the Grecians, but more particularly to the fact that the country has been subject to distracting internal and foreign wars. These causes have brought about a low state in the national finances. Within recent years the school system has been modeled after that of Germany, in which the *Realschulen* are important factors in fitting for the industries. By national law all children between six and twelve years of age are required to attend school, but the law has not been enforced strictly in the more impoverished districts. Besides the public elementary schools, there are private institutions and a system to promote higher education, including numerous colleges, academies, and the national university at Athens. A number of European and American colleges have been established to promote the investigation and study of antiquities with the view of adding to general knowledge of Grecian art and history. Religious worship is free and unrestricted, though a very large majority of the people belong to the Greek Catholic Church, which is the official religion. The Christian sects aside from the Greek number about 25,000, while the Mohammedans have about the same strength and 6,000 are Jews.

**GOVERNMENT.** The government is a constitutional monarchy, of which the king is the chief executive. Legislative power is vested in a chamber of deputies known as the *Boulé*, which meets in Athens annually, and its members are elected by popular vote. The six heads of departments compose the ministry, and they are responsible to the chamber of deputies. Service in the army is compulsory from the ages by nineteen to forty years, if necessary, though two years' service with the *colors* enables admission to the *reserve*, and the remainder to the *Landwehr*, these three divisions constituting the army. On a peace footing the military force

numbers 25,180 men and the reserve is 98,000. The entire navy as now organized is composed of forty vessels of all classes. The drachma, equivalent to the franc, is the monetary unit. Greece adopted the metric system of weights and measures in 1898 and maintains an efficient postal service.

**INHABITANTS.** The modern Greeks resemble the Iberians of Spain and the Ligurians of Italy. In stature they are medium, averaging about five feet six inches, and the hair, skin, and eyes are dark. About one-tenth of the people are Albanians and the remainder of the inhabitants are Greeks. Not more than one-third of the Greek people live in Greece, the remainder being distributed largely in European Turkey, Crete, Asia Minor, Cyprus, and the United States. Athens, the capital, is the largest city and chief center of trade. Other cities include Corfu, Piraeus, Patras, Larissa, Volo, and Zakyntos (Zante). The total population in 1907 was 2,631,952.

**LANGUAGE.** The Greek language is a branch of the great family of Indo-European languages, and was spoken as early as the 15th century B. C. From Asia Minor and southeastern Europe it was carried by colonies of Greeks to Sicily, lower Italy, and other regions on the Mediterranean. Ultimately it became the spoken language of Macedonia, Syria, Egypt, and the Byzantine Empire. Ancient writers, especially those associated with Greece and Rome, trace the language to a race of people called by them Pelasgi, who were regarded by some more recent writers as of Gothic origin, and who were undoubtedly the people from whom both the Greeks and Romans had their origin. Little was known of the Greek language to the people of Western Europe during the Middle Ages, but with the revival of learning came a renewed interest in the language and literature of the Greeks, who came to be known as a people of much culture and refinement. The Dutch scholar, Erasmus (q. v.), not only induced a widespread interest, but carried Greek as a branch of study to Cambridge University in 1510.

Three distinct dialects, known as the Ionic, Doric, and Aeolic, were spoken in the historic period of ancient Greece. Of these the first two were the most important, since they entered more largely into the literary treasures of the Greek masters. The Ionic was the dialect used by Homer, Hesiod, and Herodotus, and thus is embodied in the master productions known to modern students. In northern Greece and the colonies the Doric prevailed largely, and it is represented in the writings of Pindar and Theo-

critus. As a whole, the language was remarkable for its beauty and elasticity, on account of which many of its elements are retained in the modern European languages. The spoken tongue was greatly influenced by the Roman conquest, after which many Latin words were incorporated with the vocabulary. However, the classical forms are well preserved in the modern language, making it possible for a student of ancient Greek to read the modern tongue quite readily. The Germanic languages, especially the English and German, have incorporated many words from the Greek, but the words of Greek origin are comparatively few as compared with the number derived from a Latin source.

LITERATURE. Much of Greek literature, as known to modern writers, is as old as the history of the Greek language. The first works known to us as Greek writings are the "Iliad" and the "Odyssey," two productions generally attributed to Homer. They are unlike the first writings that have come down to us from other nations in that their language is highly cultured, instead of being a recital of simple fable or folklore. From this it is evident that learning had flourished long before the time of Homer, and that the poetic art had a firm hold upon the Greeks many centuries before the Christian era. Both these productions are epic poems, the "Iliad" treating of the war against Troy, and the "Odyssey" reciting the adventures of Odysseus, a celebrated Greek hero of the Trojan War, while on his return voyage to Greece. It is generally assumed that these epics were passed from generation to generation in a spoken form, and that they were not committed to writing until after many years. This circumstance has given rise to doubts as to their authorship, it being quite probable that Homer only collected and compiled them into convenient form.

Hesiod, the eminent poet of nature, flourished about a hundred years after the time of Homer and is the author of "Works and Days," an epic treating of farm life and work. It contains many general reflections on domestic virtues, industry, and poetic art. The same writer gives a genealogy of Greek gods and heroes in his "Theogony." Lyric poetry had its rise in the latter part of the first period, and its finest examples are embodied in the writings of the poetess Sappho, and Alcaeus, Alcman, and Pindar. The latter was, perhaps, the greatest of all lyric poets, his productions treating of the heroes associated with the Olympian and other festal games. It was the custom in Greece to recite the epics in the family before retiring at night, while the lyrics were sung at the festi-

vals given on state occasions and in the homes of the wealthy classes.

Greek literature is particularly rich in drama and history and attained its height of importance in the oratory of Attica. In the Golden Age of Greece the literature reflected the political glory and educational importance of the Hellenes. The drama rose as a means to educate the common people in religious duties, as well as to instruct them in government and the industries. The dramatical works reached their highest perfection in the Age of Pericles, when vast theaters were built to accommodate large audiences, the largest at Athens. Sophocles, Aeschylus, and Euripides are among the best known writers of tragedy, and Aristophanes has the highest place among the writers of comedy. Herodotus stands preëminent as the greatest historian of Greece. We are indebted to him for much of our knowledge of early peoples, including the Chaldaeans and Babylonians, and many events in the Persian wars. Other historians of note were Thucydides and Xenophon. The former is best known for his "History of the Peloponnesian War," and the latter by his "Recollections of Socrates" and "Cycropaedia," a history of Cyrus the Great.

Socrates stands preëminent among the philosophers and is closely associated with Plato and Aristotle, these three being the greatest philosophical teachers of antiquity. We are indebted to Plato for a knowledge of the teaching of Socrates, the latter leaving no written works. Plato is the author of "Dialogues," a work that has exercised marked influence on modern thought. Aristotle wrote on metaphysics, logic, economics, physics, and rhetoric. No less important than Grecian philosophy is the oratory of the Hellenes. To be an orator was not only regarded a high accomplishment, but oratory was taught as a special branch of study, and expert teachers found lucrative employment in writing speeches. Antiphon was the first of the ten great orators, but Demosthenes ranked as the most eminent, and his efforts are taken as the highest perfection in the art. The most noted oration of the former is "On the Murder of Herodes," while the oration of Demosthenes entitled "Oration on the Crown," which was directed against Aeschines, and his "Philippics" against Philip of Macedon, were the most effective in arousing the Athenians against the Macedonians. Other great orators include Pericles, Lysias, and Isocrates. The three philosophical schools of Greece were the Stoics, Epicureans, and Skeptics, with which are associated respectively the names of Zeno, Epicurus, and Pyrrho.

The Alexandrian Age of Greek literature is the last period in the literary development of ancient Greece, being so called from the rise of Alexandria in Egypt. It embraces the epoch from the division of the empire founded by Alexander the Great to the conquest of Greece by the Romans, from 300 to 146 B. C. In this period Greek scholars influenced learning in Egypt and aided in producing the Septuagint version of the Old Testament, the name applied to the translation from the Hebrew into the Greek made by seventy scholars at Alexandria. Among the writers of this period are Theocritus, author of "Idylls," Euclid, Archimedes, and Aristarchus, the last mentioned being a forerunner of Copernicus. The scientist, Strabo (50 B. C.); the astronomer, Claudius Ptolemy (150 A. D.); and the historian Plutarch, are among the later writers to enrich the literature. Plutarch, a Greek-Italian writer of the 14th century, had a modifying influence on Greek literature as the author of "Parallel Lives," in which he contrasts many Greek soldiers and statesmen with the leaders of Rome.

Modern Greek literature has its beginning with the fall of Constantinople, in 1453, but the early productions of this period are characterized by the defenses of orthodox traditions as against the Latin heresy. In this respect they are a continuation of the spirit of Byzantine literature. However, comparatively little of permanent value was produced until the 18th century, when the works in fiction and poetry began to multiply. In the 18th century many dramatical works were translated from Lessing, Shakespeare, Schiller, Goethe, and other English and German writers by Alexander Rangabé and Demetrios Bernardakis. A revival of the spirit of nationality in the 19th century has stimulated many current works. The improved condition of schools and institutions of higher learning is having a wholesome and elevating effect in literary lines.

**HISTORY.** Historically, Greece occupies an important position, though mostly because of its glory in the remote past. Hellen is its fabled ancestor, who was regarded the son of Deucalion and Pyrrha, two survivors of the deluge. From him descended the four celebrated divisions—the Dorians, Ionians, Aeolians, and Achaeans. Collectively, these were called *Hellenes* and the country became known as *Hellas*, the names by which the Grecians still call themselves and their country. The Italians originated the word *Greek* from their northern tribes *Gracci* which, through the Romans, passed into common usage among the Europeans. The Achaeans were renowned in war, but the Ionians and Dorians

were the most important divisions, and respectively founded the two great cities of Athens and Sparta. A people called the Pelasgians occupied the country before the Grecians secured possession, but they probably were earlier Aryan immigrants from Asia, since they were readily assimilated by the intellectually superior Grecians. Phrygia in Asia Minor is regarded the nativity of the Grecians before coming to Greece, and it is thought that they came by way of the Hellespont to the islands of the Aegean Sea. Civilization and religious rites were brought over from Egypt and Phoenicia.

The Heroic Age of Greece has reference to the historic events of Hercules, Theseus, Minos, Jason, and the celebrated Trojan War, all of which are treated in special articles. It is thought that the Trojan War occurred about 1194-84 B. C. Authentic history begins about 1000 B. C., at which time the celebrated Dorian invasions of two centuries were ended. These were followed by the establishment of the Dorian states in the Peloponnesus, the successive invasions of Asia Minor, and the conquests of Crete, Rhodes, Cos, and other islands of the Ionian and Mediterranean seas. The best picture of early Greek life is given in the famous works of Homer, the "Iliad" and "Odyssey." While mixed with poetic fancy, they make us acquainted with the Grecian deities, customs, industries, games, commerce, and arts of war.

The Dorians and Ionians were long powerful rivals for supremacy among the Hellenes. While the former established their stronghold at Sparta, the latter made Athens their seat of influence. Lycurgus prepared a code of laws for the Spartans, under which the people secured greater rights and developed material prosperity. The culture of Sparta was military, a condition brought about largely by the need of means of defense and the promotion of commerce. At Athens, Solon prepared a code of laws, repealing many that inflicted severe forms of punishment. His laws made ample provision for the intellectual, physical and moral culture. Under the legislation introduced by Solon splendid temples and public improvements were built, libraries were founded, and learning was patronized. Though hostile to each other, the several states of Greece united when King Darius of Persia landed at Marathon in 490 B. C. for the purpose of conquering the Athenians. In the battle that ensued, Miltiades led an army of 10,000 Athenians and succeeded in defeating the Persians, the battle being classed as one of the decisive engagements of the world.

In 432 B. C. the Spartans began a general war to conquer Athens and after 27 years established

Spartan supremacy. The oppressions that followed caused an alliance between a number of the states and the Persian king, and in 371 led to the defeat of the Spartans at Leuctra. Greece attained its height of prosperity and military power during the Macedonian supremacy, particularly under Alexander the Great, son of Philip of Macedon, who reigned in 336-323 B. C. This great leader defeated Darius, overthrew the Persian Empire, annexed large parts of Asia and Africa, and among other cities founded Alexandria. The brief reign of Alexander was followed by internal dissensions and an invasion by the Gauls in 279 B. C., and the nation was threatened by the states that rose in the West. Had Greece remained united by strong internal ties, it might have predominated over the Romans, but, owing to local differences, all of Greece became a Roman province after the capture of Corinth in 146 B. C. Under Roman rule a period of peace and prosperity prevailed.

The Goths invaded Greece in 395 A. D. and captured many of its cities. However, Rome was divided in the same year into the Eastern and the Western empires, by which the country became incorporated with the former. It remained an integral part of the Byzantine Empire (q. v.), with its capital at Byzantium, until that city, whose name had been changed to Constantinople, was captured by the Turks in 1453. While belonging to the Byzantine Empire it retained renown for its learning and was turned from paganism to Christianity.

In 1453 Greece was conquered by Mohammed II., and in 1669 it came under absolute control of the Turks. A war of independence began in 1821 under the leadership of Alexander Ypsilanti. With the help of Russia, France, and England it finally threw off Turkish rule in 1828. The Greek statesman, Count Capo d' Istria, became president, but in October, 1831, he was assassinated. The powers in 1832 elected Otho, second son of the King of Bavaria, as King of Greece, who reigned thirty years and abdicated.

George I., the present sovereign, ascended the throne in 1863. He is the second son of the late Christian IX. of Denmark, and owes his election to the national assembly. He granted a liberal constitution, which went into effect in 1864, and the widespread brigandage that formerly prevailed was finally suppressed in 1870. Owing to the cruel treatment of Greek Christians in Crete by the Turks, hostilities continued more or less for several centuries, and war broke out anew between Greece and Turkey in 1897, which proved disastrous to the Grecian army in every battle. The treaty of Constanti-

nople required Greece to pay a war indemnity of \$18,000,000 and rectified the frontier between the two countries. In 1898 the powers required Turkey to withdraw from Crete, which was made nominally independent of Turkey under the protection of Greece. The war with Turkey aroused anew the spirit of nationalism, which is exemplified in its present efforts for greater prosperity.

**GREEK CHURCH**, one of the Christian sects, whose official title is Holy Orthodox Catholic and Apostolic Church. Its membership is confined largely to the countries formerly under the Byzantine Empire and to Russia. Three distinct branches of this faith are recognized, which are known as the Orthodox Church in the Turkish Empire, the Orthodox Church of Russia, and the National Church of Greece. Each of these has a definite head, but in points of doctrine and practices they are closely allied. The Orthodox Church in the Turkish Empire is presided over by the patriarch of Constantinople, who is under the protection of the Sultan, and with it are affiliated the patriarchates at Alexandria, Antioch, and Jerusalem. The Holy Synod of Saint Petersburg is the primary influence of the Orthodox Church of Russia, but the Czar is the temporal head of it and of the whole Greek Church. The Holy Synod of Greece, established in 1833, is at the head of the National Church of Greece. Prior to 1054 the adherents of the Greek Church were a part of the Roman Catholic denomination, but in that year the two branches became separated, largely on account of contentions regarding papal supremacy and vital doctrinal points.

The Greek Catholics teach seven sacraments, those of baptism, confirmation, eucharist, penance, extreme unction, holy orders, and marriage. They reject the word *purgatory* and the papal supremacy, but admit there is purgation after death and pray for the dead. They practice triple immersion, teach transubstantiation, and use leavened bread in giving the Lord's Supper. The pictures of the saints and the Blessed Virgin are very common in churches, but the crucifixes are not used. No seats are provided for the worshipers, who stand during the entire service, and instrumental music is not permitted in the churches. Many formal ceremonies are used and periods and days for fasting are numerous. Clergymen are usually required to marry before they are ordained, but bishops do not marry. Formerly the archbishop of North America was resident in Alaska, but his seat is now in New York City. The Greek Church of the world at present has a total membership of about 100,000,000, of which 90,300,000

are in Russia. The Greek Orthodox Church has 101,500 communicants in the United States and the Russian Orthodox has 40 churches and 68,000 members.

**GREEK FIRE**, the name applied to several inflammable and destructive compounds used in military operations during the Middle Ages. A preparation of this kind was employed extensively by the Greeks of Constantinople, who used it both in naval and military warfare. The simplest weapon was the hand tube, which was filled with combustibles of various kinds and flung by the hand against the buildings and upon the vessels of the enemy, serving to inflict damage and set fire by the explosion that followed. The use of explosive compounds of various kinds gave the Greeks superiority for centuries, and the art of manufacturing them was concealed for a long time at Constantinople. They were made principally of sulphur, naphtha, and niter. A compound of sulphur, saltpeter, and lampblack has been used for a similar purpose in modern warfare. Bunsen made an agent of this kind and called it the *kakodyl*, which somewhat resembles the Chinese stinkpot, both having a deadly efficiency through the use of arsenic.

**GREENBACK PARTY**, a political organization of the United States, formed in 1876, called by its members the Independent National party. The name *Greenback* was attached to it because it favored the larger use of "greenback" currency, a class of legal tender notes issued by the government during the Civil War. It had for its main tenets the repeal of the specie resumption law enacted in 1875, suppression of national bank paper, and the circulation of United States notes. It advocated the freer use of silver money. Peter Cooper, its candidate, received 81,740 votes for President in 1876; J. B. Weaver, 308,578, in 1880; and B. F. Butler, 175,375, in 1884. Ultimately it became merged in the People's party.

**GREEN BAY**, a city in Wisconsin, county seat of Brown County, on Fox River, 112 miles north of Milwaukee. It is on the Chicago and Northwestern, the Chicago, Milwaukee and Saint Paul, and other railroads, and has communication by steamboats and electric railways. The harbor is ample for the accommodation of the largest lake steamers. The noteworthy buildings are the public library, the county courthouse, the high school, the post office, and the State reformatory. Hagemester Park is a fine public resort. The streets are well paved and improved by modern facilities. Among the manufactures are flour, clothing, furniture, soap, fermented beverages, cigars, and machinery. The surrounding country is agricultural. Nu-

merous calcic magnesian springs are within a short distance of the city, which have made Green Bay a favorite health resort. It has a large trade in lumber, cereals, live stock, and dairy products. Green Bay was settled in 1745 and chartered as a city in 1854. Fort Howard was united with it in 1896. Population, 1905, 22,854; in 1910, 25,236.

**GREEN BRIER** (*brí'ér*). See **Smilax**.

**GREENBUSH**. See **Rensselaer**.

**GREENFIELD**, county seat of Franklin County, Massachusetts, in the valley of the Green and Connecticut rivers, eighty miles northwest of Boston. It is on the Boston and Maine Railroad and several electric lines. The surrounding country is farming and stock raising, which makes the town a central shipping point. Among the chief buildings are the public library, the Franklin County Hospital, the townhall, and several fine schools. It has a monument erected to the soldiers. The manufactures include boots and shoes, machinery, bicycles, and cutlery. It was settled in 1686 and was incorporated as a town in 1753. Population, 1905, 9,156.

**GREEN GAGE**, the name of a luscious kind of plum, cultivated quite extensively in America and Europe. The tree is small and spreading, but bears abundantly and quite regularly, and the fruit ripens in August. Chancellor Livingston brought it from France to America, and it has been cultivated for many years in the eastern part of the United States and the southeastern section of Canada. The fruit is juicy and of a green or yellowish color.

**GREENHEART**, or **Bebeeru**, the name of a valuable tree of South America, found chiefly in Guiana and the northern part of Brazil. It yields the *bebeeru* bark, which is used in medicine. The seeds are rich in starch and the natives use them as food. However, the greenheart tree is most valuable for its wood, which is hard and durable and takes a high polish. It is used extensively in turnery and shipbuilding. The tree has a tapering trunk about fifty feet high and four feet in diameter, hence yields a large quantity of lumber.

**GREENHOUSE**, a structure designed to furnish protection for plants. Formerly greenhouses were built principally to protect exotic and other tender plants that were grown for ornamental or scientific purposes, but more recently structures of this kind came into wide use as forcing houses for the growth of plants out of their season. Greenhouses are kept for the latter purpose either to grow plants for resetting or to raise them for the early market, and are sometimes called hothouses, conservatories, or warm houses. The construction is usually sim-

Danish expeditions sent for the inspection of the colonies from 1585 to 1670 were unsuccessful in finding them. The only evidence of their former existence consists of inscriptions and numerous relics. In 1721 the Danes founded a colony, the expedition being led by Hans Egede, and it became known as Good Hope Settlement. Nansen crossed the interior from east to west in 1888, which was the first extensive interior expedition. Subsequently explorations were made by Peary and Nordenskjöld. Only 228 of the inhabitants are whites, the others being Eskimos. Population, 1906, 12,093.

**GREEN MOUNTAIN BOYS**, the name of a band of Vermont mountaineers who took part in the American Revolution. They were led by Ethan Allen and Benedict Arnold on May 10, 1776, when they captured Fort Ticonderoga with 50 British prisoners and 200 cannon. Other notable victories include those of Crown Point and the Battle of Bennington. They rendered efficient service throughout the Revolution.

**GREEN MOUNTAINS**, a range of the Appalachian system, dividing Vermont into two nearly equal portions. Mansfield is the highest peak, 4,280 feet high, and five others range over 4,000. The mountain sides are covered with fine forests of spruce and other evergreen and deciduous trees. They contain valuable deposits of gneiss, granite, slate, iron, and marble. Numerous streams have their sources in the Green Mountains, flowing through fertile valleys. The region was first settled by the patroons and others and became famous in Colonial and Revolutionary history.

**GREENOCK** (grēn'ūk) a city and seaport of Scotland, in Renfrewshire, on the Firth of Clyde, eighteen miles northwest of Glasgow. It has an excellent harbor, is beautifully located along the coast, and back of it are picturesque cliffs. Among the public buildings are several educational institutions, the townhall, and several fine churches. Sugar refining and shipbuilding are the principal industries. Other manufactures include anchors, cordage, steam engines, clothing, textiles, and sails. The prosperity of the city dates from 1707, when its commerce with the West Indies and America became important. Visitors are shown the grave of Burns's "Highland Mary" and places frequented by Watt, who was born here. Greenock was a small fishing village in 1635. Population, 1907, 71,269.

**GREEN RIVER**, a river of the United States, rises in the Wind Range Mountains of Wyoming, and joins the Grand River to form the Colorado. From the western part of Wyoming it flows in a general direction toward the south, passing through a small part of north-

western Colorado and joining the Grand River in southeastern Utah. Green River, Wyoming, is the principal town on its banks. It has a length of about 500 miles, the greater part of its course being through deep and rugged canyons.

**GREEN RIVER**, a river of the United States, rises in Lincoln County, near the central part of Kentucky, and flows into the Ohio about six miles above Evansville, Ind. The Echo River of the Mammoth Cave is a subterranean affluent of the Green River. The lower valley of the Green River has vast coal deposits and its upper course is through a region of limestone. It is about 300 miles long and the construction of dams and locks have made it navigable nearly 200 miles.

**GREENSBORO** (grēnz'būr-ō), a city in North Carolina, county seat of Guilford County, about eighty miles northwest of Raleigh. It is on the Southern and the Cape Fear and Yadkin Valley railroads, and has manufactures of clothing, textiles, earthenware, cigars, hosiery, and machinery. Among the chief buildings are the public library, a State college of agriculture, Bennett College, and Greensboro College. The surrounding country produces large quantities of cereals, live stock, and fruits. It has deposits of iron and copper. Greensboro was settled in 1808 and became a city in 1870. Population, 1900, 10,035.

**GREENSBURG**, a city in Indiana, county seat of Decatur County, 45 miles southeast of Indianapolis. It is on the Cleveland, Cincinnati, Chicago and Saint Louis and other railroads. The noteworthy buildings include the county courthouse, the high school, and the State Odd Fellows' Home. It is surrounded by a fertile country and has a large trade in produce. The manufactures include clothing, furniture, flour, carriages, and machinery. The city has good municipal improvements. Population, 1900, 5,034.

**GREENSBURG**, a borough of Pennsylvania, county seat of Westmoreland County, thirty miles southeast of Pittsburg, on the Pennsylvania Railroad. The surrounding country has rich deposits of gas and coal. Among the manufactures are glass, brick, flour, engines, and hardware. It has a number of fine schools, several county buildings, and institutions for secondary education. The village of Hanna's Town, located in the vicinity, was destroyed by the Indians in 1782. Population, 1900, 6,508.

**GREENVILLE**, a city in Mississippi, county seat of Washington County, on the Mississippi River, 98 miles northwest of Jackson. It is on the Southern and the Yazoo and Mississippi

Valley railroads. The industries include oil mills, cotton compresses, and lumber mills. It has a public park, a fine courthouse, and several large schools. Electric lights, waterworks, and telephones are among the improvements. Its annual shipment of cotton is very extensive. Population, 1900, 7,642.

**GREENVILLE**, county seat of Darke County, Ohio, on Greenville Creek, 35 miles northwest of Dayton. It is on the Cleveland, Cincinnati, Chicago and Saint Louis and other railroads and is surrounded by a fertile farming country. It has a Carnegie public library, a children's home, and a fine county courthouse. The manufactures include vehicles, furniture, and machinery. It is a grain-shipping center. A public park, waterworks, and electric lights are among the facilities. Greenville occupies the former site of an Indian village in which Tecumseh made his home. General Wayne made it his headquarters in 1794. It was incorporated in 1832. Population, 1900, 5,501.

**GREENVILLE**, a city in South Carolina, county seat of Greenville County, on the Reedy River, 160 miles northeast of Atlanta, Ga. The manufactures include carriages, cotton goods, tobacco, clothing, and machinery. It is the seat of Furman University, the Greenville Female College, and Chicora College. Other noteworthy buildings include the public library and the county courthouse. It has systems of electric street railways, electric lights, waterworks, and pavements. The surrounding country is fertile, producing large quantities of cotton, cereals, fruits, and live stock. It was settled in 1784 and incorporated in 1831. Population, 1900, 11,860.

**GREENVILLE**, a city in Texas, county seat of Hunt County, 56 miles northeast of Fort Worth, on the Missouri, Kansas and Texas and other railroads. The noteworthy buildings include the high school, the county courthouse, and the Holiness and Burleson colleges. It is surrounded by a fertile region and has a large trade in farm produce and merchandise. The chief manufactures are utensils, cigars, clothing, and machinery. It has systems of waterworks, sewerage, and electric lighting. Greenville was settled in 1844 and incorporated in 1875. Population, 1900, 6,860; in 1910, 8,850.

**GREENWICH** (grīn'ij), a borough of London, in Kent, England, situated on the south side of the Thames, about five miles southeast of London. The most important building is the Greenwich Hospital, founded in 1694 by William and Mary for the care and maintenance of British soldiers, but it was not completed until eleven years later. Its original cost was \$250,-

000, but subsequently additions were made by which the hospital was enlarged and rendered much more serviceable. Other noteworthy buildings include the Royal Naval College, a naval museum, and the Royal Observatory. It is connected with London and other centers of population by railroads, electric car lines, and telephones. Among the enterprises are extensive rope works, shipyards, machine shops, and engineering establishments. It is the birthplace of Henry VIII. and Queen Elizabeth. Longitude is reckoned from Greenwich by English geographers, and it is made the basis of calculations by American writers in connection with the American basis, which is at Washington. Population, 1907, 192,519.

**GREENWICH OBSERVATORY**, an institution situated in Greenwich, England, where it was erected in a park containing 190 acres and designed for the advancement of nautical astronomy and navigation. It was founded by William III. and completed in 1705. The courses of study pursued at present fit the students either for the navy or the merchant service. This institution is one of the oldest and most celebrated observatories in the world and is equipped with all modern apparatus. From it the exact time is telegraphed to various English cities.

**GREGORIAN CALENDAR** (grê-gō'rī-ən). See **Calendar**.

**GREIFSWALD** (grīfs'wält), a city of Germany, in the province of Pomerania, three miles from the Baltic Sea. It is located on the Rick River, has railroad facilities, and is the seat of the University of Greifswald. This institution was founded in 1456. It has a library of 140,000 volumes. Other buildings include the gymnasium, a geographical and scientific museum, and a number of fine churches. Among the manufactures are machinery, sailing vessels, tobacco, chicory, and canned fish. It has a large foreign trade in fruit preserves, fish, machinery, and grain. Greifswald was an important member of the Hanseatic League, became a possession of Sweden in 1631, and has belonged to Prussia since 1815. Population, 1905, 23,767.

**GRENADA** (grên-ā'dà), an island of the West Indies, in the Windward group. It has an area of 133 square miles. The surface is mountainous, especially in the interior, where the peaks rise to a height of about 3,000 feet above the sea. The valleys and coastal regions are fertile, yielding cocoa, sugar cane, spices, and cereals. Columbus discovered Grenada in 1498 and the French colonized it in the 17th century. In 1763 it was captured by the British,

but was retaken by the French in 1779. It was restored to the British in 1793 and has since been a British colonial possession. Saint George, the capital, is strongly fortified and has a fine harbor. In 1906 the island had a population of 69,784, of which the greater part was colored.

**GRENADIER** (grĕn-à-dĕr'), the name of a class of troops distinguished by their height and fine appearance. The name was originally applied to the soldiers who threw the hand grenade, a small explosive shell filled with gunpowder and furnished with a fuse. It originated in 1594 and was employed chiefly to be thrown from parapets upon the besiegers below, and later came into use in naval service in close action. Grenadier troops continued to use the grenade until the modern musket was invented, and now the name is applied to a company of picked men attached to most European regiments.

**GRENOBLE** (grĕ-nō'b'l), a city of France, capital of the department of Isère, sixty miles southeast of Lyons. It is well located on the Isère River, has transportation facilities by railways, and is surrounded by high mountains. The chief buildings include the University of Grenoble, a military school, and a public library of 170,000 volumes. The streets are finely paved and lighted, and a system of electric railways provides transportation facilities with urban and interurban points. Among the manufactures are leather, cement, liquors, gloves, and cotton and woolen goods. Anciently it was called Cularo and was fortified by the Romans, who changed its name to Gratianopolis in honor of Gratian. Population, 1906, 73,022.

**GRETNA GREEN**, a village in Dumfriesshire, Scotland, near the head of Solway Firth. It is famous as the place for contracting many irregular marriages. The Scotch law relating to marriage, being more liberal than that of England, caused young couples from the latter country to resort to Gretna Green to take the marriage vows. In the most widespread prevalence of this practice, about 1771, the marriages there often reached 200 per year. The marriage laws were revised in 1856, whereby those contracted at Gretna Green were invalid unless one of the contracting parties had been a resident of Scotland at least 21 days previous to the ceremony.

**GREYHOUND.** See **Dog.**

**GRIFFIN** (grĭf'fin), or **Gryphon**, a fabulous monster of ancient India, supposed to have watched over the treasury. It is represented as half bird and half beast, and is said to have guarded the gold of the Hyperborean regions from the one-eyed Arimaspians. In fable

and poetry the ancients describe it as having the head and wings of an eagle, the ears of a horse, and the body of a lion. It was common to have the figure of the griffin in heraldry.

**GRIFFIN**, a city in Georgia, county seat of Spalding County, forty miles south of Atlanta, on the Southern and the Central of Georgia railroads. The State Experimental Farm is near the city. It has manufactures of furniture, cigars, machinery, canned fruits, and utensils. The surrounding country produces large quantities of cotton, fruits, cereals, and live stock, thus giving it considerable trade advantages. Among the municipal improvements are waterworks, sewerage, and pavements. Population, 1900, 6,857.

**GRINDING**, the operation of breaking and reducing any hard substance to fine particles by friction or attrition. The process is used in various mechanical arts, such as grinding corn and wheat, and fitting for use various metals and stones. In grinding glass into facets it is generally customary to use stone lapwheels, while in grinding needles and steel pins a process called *dry grinding*, which is effected by dry grindstones, is employed. Diamond dust is used in grinding diamonds and other precious stones. Grinding is employed variously, depending upon the material to be affected by friction. The mechanical implements used are variously constructed and are propelled either by hand, steam, or electric power.

**GRINDSTONE** (grĭnd'stōn), a sandstone disc, more or less circular, used for abrading hard substances. A horizontal axle rests upon a support on either side of the stone. The stone, in its simplest form, is rotated by means of a handle or a foot treadle, while in machine shops or factories grindstones are turned by belts or some other appliances. Grindstones are used extensively for sharpening many kinds of edged articles and in smoothing and polishing rough surfaces.

**GRIPPE** (grĭp). See **Influenza.**

**GRIQUALAND** (grĕ'kwā-lānd), a region of South Africa, in Cape Colony, so named after the Griquas, a class of people that originated from native and Dutch ancestry. Griqualand East is an eastern district of Cape Colony. It has an area of 7,594 square miles and a population of 225,500, including about 5,000 whites. It has been a dependency of Cape Colony since 1875. Kokstad is the capital. Griqualand West is a northern district of Cape Colony and has an area of 15,187 square miles. In 1871 it was annexed to Cape Colony. Kimberley, the capital, is surrounded by a productive diamond-mining region. Population, 1906, 84,278.

**GRISTLE** (grīs'1). See **Cartilage**.

**GRODNO** (grôd'nö), a city of Russia, capital of the government of Grodno, 160 miles northeast of Warsaw. It is located on the Niemen River, has extensive railroad facilities, and is surrounded by a fertile region. The city is not well built, but it has a large trade in merchandise and grain. Among the manufactures are soap, tobacco, paper, pottery, and machinery. In 1793 it was the seat of a conference that agreed upon the partition of Poland, and it became a part of Russia two years later. The French occupied in 1812. Population, 1908, 51,092.

**GRONINGEN** (grō'nīn-ġen), a city and port of the Netherlands, capital of a province of the same name, on the Hunse River, 92 miles northeast of Amsterdam. It is connected by several railroads and has canal facilities through the Hunse and the Aa rivers, by means of which large vessels reach the city. Among the important buildings are a beautiful Gothic church with a tower 345 feet high, a university founded in 1640, and several government buildings. It has an observatory, a museum of natural history, an academy of architecture and navigation, and a library of 95,000 volumes. Many electric railway lines furnish communication to suburban and interurban localities. Among the manufactures are ships, soap, white lead, paper, clothing, furniture, and machinery. Extensive dikes protect it against the encroachments of the sea, while substantial fortifications make it an important strategic point. Groningen dates from the 11th century, when it was known as Villa Cruoninga. Population, 1906, 73,278.

**GROSBEAK** (grôs'bēk), the general name of a number of birds, especially those that have a large bill of sufficient strength to break the stones of olives, cherries, and other fruit. The common grosbeak of North America winters in the southern part of the United States and breeds as far north as Maine and Manitoba. It is a favorite bird of song, has a rose-red breast, and is commonly called the *rose-breasted grosbeak*. The pine grosbeak breeds far north in Canada and winters in the latitude of Washington, D. C., and southward. Other species include those known as the *blue grosbeak*, the *evening grosbeak*, and the *black-headed grosbeak*. Birds of this class belong to the finch family and the hawkfinches. The *hawkfinch* of England is usually classed as a grosbeak.

**GROSSWARDEIN** (grôs'vār-dīn), or **Nagyvarad**, a city of Hungary, capital of the county of Bihar, 36 miles southeast of Debreczin. It is situated in a beautiful plain, has railroad facilities, and is notable as a military cen-

ter. The buildings include a number of fine cathedrals, the Church of Saint Ladislas, and several educational institutions. Among the manufactures are pottery, wine, starch, liquors, machinery, and earthenware. Electric lights and street railways, stone and asphalt paving, and waterworks are among the public utilities. The sulphur springs of Hajó are six miles south of the city. Population, 1906, 49,508.

**GROUND HOG.** See **Woodchuck**.

**GROUND SQUIRREL**, the name of a class of rodent mammals intermediate in character between the marmots and the true squirrel. The common ground squirrel has short legs and a slender body and lives chiefly on or in the ground. It is an active and restless animal, has longitudinal stripes on the back and sides, and emits a peculiar chirping sound when calling its mate. The *chipmunk* belongs to the ground squirrels. Other species are the *flickertail* of North Dakota and Saskatchewan and the *striped gopher* of the northwest. The *pocket gopher* has peculiar pouches on the sides of the head and is troublesome in piling up mounds in the meadows. Allied species are found in Asia and other continents.

**GROUSE**, the common name of various game birds abundant in the northern sections of both hemispheres, belonging to the group of gallinaceous birds, distinguished by a naked band in place of an eyebrow. They are characterized by their plump bodies and the feet, legs, and nostrils are covered more or less with feathers. In many species a loose, bare sac is suspended on each side of the neck. They are the most delicate game birds that come to the table. Among the different species are found the ptarmigan, red grouse, ruffed grouse, pinnated grouse, and sage hen. To the same family belong the quail and various domestic fowls, including the cock and hen, turkey, guinea fowl, and peacock.

The *ptarmigan* is a species native to the Arctic regions, whose plumage in winter is snow-white. It somewhat resembles the red grouse, sometimes called the *European ptarmigan*, which is found in Scotland and does not turn white in winter. The *ruffed grouse* is common to America. It is known in the eastern states as pheasant, farther west as partridge, and in the western states by its proper name—*grouse*. This species prefers to frequent timber and brushy lands, is shy and quick in movement, and the color is closely adapted to the gray of the underbrush. A distinguishing habit of the male is a drumming sound, made while standing upright, by strokes of the wings upon the earth or some hard substance with

such rapidity and strength as to be heard at a considerable distance.

Several species closely allied to the ruffed grouse are found in Eurasia, but do not drum.

GROUSE.

Male.

Female.

The pinnated grouse, or *prairie chicken*, inhabits the central and western plains and is protected by the laws of the states, except for a short period in the fall of the year. The *oom-oom-boo* produced by the male in the breeding season is well known to hunters, and is made by means of the large, orangelike sacs on its neck. These sacs are covered with long, winglike tufts of feathers, which, when booming, stand up like ears, giving it a peculiar appearance. In size the prairie chicken is equal to the common hen and has a speckled-grayish color. The *sage hen* is the largest American grouse and is found principally on the western plains of Canada and the United States, especially in the arid regions of the Rocky Mountains. It lives on wild sage, which renders it inferior for food to other members of the grouse family.

**GRÜNBERG** (grün'bērg), a city of Germany, in the province of Silesia, thirty miles northwest of Glogau. It is located on a tributary of the Oder and has convenient railway facilities. The surrounding country is noted for its extensive production of grapes and other fruits. Among the manufactures are wine, flour, yarn, clothing, and machinery. Population, 1905, 21,630.

**GUADALAJARA** (gwä-thä-lä-hä'ra), a city in Mexico, capital of the state of Jalisco, the second city of the republic. It is situated in the fertile valley of the Rio de Santiago, about 280 miles from the city of Mexico, and ranks as an important manufacturing and commercial cen-

ter. The streets are regularly platted and well paved with stone and asphalt. The most important buildings include a government mint, the cathedral, several convents, and the university. Among the manufactures are pottery, paper, jewelry, cotton and woolen goods, leather, and machinery. It has good railroad and electric railway facilities. The city was founded in 1530. Population, 1909, 106,802.

**GUADALQUIVIR** (gä-däl-kwiv'ēr), the largest and most important river of Spain, rises near the frontiers of Murcia. It has a general course toward the southwest, flowing into the Atlantic north of Cadiz. Its length is 375 miles, of which 85 miles, or from the sea to the city of Seville, are navigable by large vessels. It has been improved by canals and jetties and is noted for its production of fish.

**GUADALUPE HIDALGO** (gwä-thä-lōō'pā è-thäl'gō), **Treaty of**, a treaty concluded between Mexico and the United States at the conclusion of the Mexican War. It was negotiated at Guadalupe

Hidalgo, a small town near the city of Mexico, on Feb. 2, 1848. The Senate ratified the treaty on March 16th and the ratifications were exchanged the following May. By the terms of the treaty Texas, New Mexico, and Upper California were ceded by Mexico to the United States and the Rio Grande was fixed as the boundary between Texas and Mexico. The United States assured protection to the Mexicans and their property within the ceded territory, assumed the payment of claims of American citizens against Mexico in the amount of \$3,250,000, and agreed to pay Mexico \$15,000,000.

**GUADELOUPE** (gä-dä-lōōp'), a colonial possession of France in the Lesser Antilles, consisting of two islands, Grande Terre and Basse Terre, which are separated by a narrow channel called Rivière Salée, meaning Salt River. The colony, together with five small dependent islands, has an area of 688 square miles. Basse Terre is the larger of the two main islands, having a length of 27 miles and a breadth of 15 miles; while Grande Terre is 29 miles long and about 10 miles wide. The islands are of volcanic formation, but in several regions of the group are large tracts constructed by corals. The climate is marked by humid atmosphere, generally hot and unhealthful, and the soil is fertile. Among the principal exports are tobacco, sugar, coffee, pepper, dye and cabinet woods, cacao, and a large variety of tropical fruits. The imports consist of machinery, fab-

rics, and various implements. Most of the trade is with France. In 1897 the islands were disturbed by destructive earthquakes and in 1899 by a disastrous hurricane. Basse Terre is the capital and Pointe-à-Pitre is the chief commercial center. A senator and two deputies represent the colony in the chambers at Paris. Columbus discovered these islands in 1493 and they were colonized by the French in 1635. They belonged to England and France at different times, but have been French territory since 1814. Population, 1906, 183,108.

**GUADIANA** (ḡwā-thē-ā'nā), a river of the Iberian peninsula. It rises in New Castile, Spain, has a general course toward the west until it enters Portugal at Monsaras, and thence flows south into the Atlantic. Its entire course is 520 miles, but the navigable portion is only about 40 miles. The Ardilla and Giguela are its chief tributaries.

**GUAM** (gwām), an island in the Pacific Ocean, the largest of the Ladrone Islands, situ-

ated about 1,500 miles east of Manila. It has an area of 190 square miles. Guam is thirty miles long and from two to twelve miles wide. It has a mountainous surface, but the soil is fertile, producing rice, indigo, sugar cane, and fruits. Agaña, situated on Agaña Bay, is the capital and contains more than half of the population of the island. This possession is of little importance except as a port of transit and as a naval station, for which purpose the harbor

of Apra has been improved, but the principal station is at the capital.

The inhabitants consist chiefly of Chamorros intermixed with Malays and Tagalos, and they engage largely in fishing and agriculture. Domestic animals were imported by the Spaniards, who introduced the cultivation of rice, fruits, and vegetables. Sugar and indigo are produced to some extent, and the climate is generally favorable and healthful. Since 1898 Guam has belonged to the United States, having been captured by the cruiser *Charleston* in the Spanish-American War and ceded by the Treaty of Paris. It is governed by a naval officer acting under the direction of the Secretary of the Navy. Important reforms were instituted by Captain Leary, the first governor, and the present policy is to encourage agriculture, restrict the sale of intoxicating liquors, and extend education among the natives. Population, 1906, 10,798.

**GUAN** (gwän), a bird of Central and South America, where it is found both wild and domesticated. It belongs to the same family as the curassow and in many respects is similar to the grouse and partridge. The color is dark brown or black, marked with green and white, and the throat is wattled and nearly bare. Some of the species have the head crested. The tail and wings are quite long in all the species. These birds are seen in flocks most of the year, but during the breeding season separate into pairs, and incline to live a considerable part of the time in the high forest trees. The guan, or *chachalaca*, of North America, is found in the valley of the lower Rio Grande, both in Texas and Mexico. It is about two feet long, has a glossy grooved tail, and the general color is dark brown with lighter shades below. It builds its nests on the ground, in bushes, or in the limbs of trees.

**GUANABACOA** (ḡwā-nā-vā-kō'ā), an important suburban town of Cuba, situated about four miles east of Havana, with which it has railroad and telephone connections. It is noted for its beautiful gardens, parks, and hot and cold baths for invalids. The streets are regularly platted and many of its buildings are of good material and on modern plans. Population, 1907, 21,805.

**GUANACO** (gwā-nä'kō), a kind of llama found in various parts of South America, especially on the plains of Patagonia and the highlands of Peru and Ecuador. It is somewhat smaller than the alpaca and llama, which are the domesticated species. The height at the shoulders is about four feet. It has slender legs. The flesh and skin are valuable. It can be eas-

ily domesticated, in which state it furnishes milk and flesh for food, and wool and skin for clothing. It is greatly improved by domestication and artificial breeding.

**GUANAJUATO** (g̃wä-nä-hwä'tō), a city of southern Mexico, capital of the state of Guanajuato, situated among mountain ranges which are 6,780 feet above sea level. The streets are irregular, but many of the buildings are substantial and modern. It is connected with other cities by railroads, surrounded by one of the richest mineral countries in the world, and has manufactures of implements, clothing, machinery, jewelry, and fabrics. The institutions include several public schools, convents, and churches. Guanajuato was founded by the Spaniards in 1554 and became a city in 1741. Population, 1906, 56,042.

**GUANO** (gwä'nō), the decomposed excrement of fish-eating sea birds, intermixed with the remains of seals and sea fowls. It has accumulated to the depth of eighty to a hundred feet on the Chincha Islands and the coasts of Peru and Chile. For centuries innumerable flocks of sea birds have bred and roosted on these shores, thus causing the deposits. Its value for fertilizing has been known in Peru for centuries, but it was not transported to other countries as a commercial fertilizer until 1846. Eight million tons were taken from the Chincha Islands in 1853-72. Guano contains nearly all the inorganic matter required by plants and, therefore, is one of the best fertilizing agents for the different crops. It has been found in greater or less quantities in various places, but Peru still remains the chief source of supply. However, the available quantity there and elsewhere is becoming considerably limited. The Chilean government has control of the business, which for a number of years has proved a lucrative enterprise. The principal supply of guano used in the United States and Canada is now produced at slaughterhouses from refuse flesh and blood, called *flesh guano* and *blood guano*, and at the fisheries from refuse of edible fish or from undesirable species. The menhaden are utilized largely for this purpose, though the oil is extracted before the fish are converted into fertilizer. Another class of this product, known as *bat-guano*, is obtained in caves from the manure and remains of bats.

**GUAPORÉ** (g̃wä-pō'rā), or **Itenez**, a navigable river of South America, which at its confluence with the Mamoré forms the Madeira. It rises in the province of Matto Grosso, Brazil, forms a portion of the boundary between Brazil and Bolivia, and has a total length of 950 miles.

**GUARANTEE** (gär-än-tē'), or **Guaranty**, a promise or contract to be responsible for the payment of a debt or the performance of an obligation of another. In most countries a verbal promise to assume the debt of another is not binding in law, although it implies a moral obligation, and a valid agreement to answer for the default of another is made legally binding only by a written agreement. Such a contract should state definitely the obligation or extent of liability assumed, since a guarantor can be held only to the extent expressed in the written instrument. The business of guaranteeing risks of others is an important commercial enterprise. It differs materially from the risks taken by insurance companies, since it is based upon the ability of a contracting party to perform certain definitely stated obligations. However, experience has demonstrated that it is less hazardous than the business of insurance companies.

**GUARDAFUI** (gwär-dä-fwē'), **Cape**, a point of land in Africa, next to Ras Hafun the most eastern point of that continent. The southeastern shore is washed by the Indian Ocean and the northwestern by the Gulf of Aden. It forms the headland of an immense promontory.

**GUARDIAN** (gärd'ī-ən), in law, one who has the care and management of the person or property of another. Guardians are appointed by the judge of a court or some other qualified officer prescribed by law, and are intrusted with the care and management of those incapable of directing their own affairs, such as a minor child, a person of unsound mind, a drunkard, or a spendthrift. A person appointed to such a duty must account for all the profits as well as the estate of his ward, whose money can be invested only by the order of the court. It is incumbent upon him to provide for the maintenance and education of a minor ward, but all the estate and profits must be used judiciously, for which the guardian is required to give a good and sufficient bond. When a ward attains majority, the guardianship ceases. Guardians appointed to look after the interests of drunkards, spendthrifts, or persons of unsound mind continue to act under the direction of the court as long as their services are required.

**GUATEMALA** (g̃ä-tē-mä'lä), the most northwesterly republic of Central America, bounded on the west and north by Mexico; east by British Honduras, the Gulf of Honduras, Honduras, and Salvador; and south largely by the Pacific Ocean. It has an area of 48,225 square miles. The surface is largely mountainous and elevated, the principal mountain chains being a continuation of the Andes. They trend from northwest to southeast, sending off a num-

ber of irregular branches. Among the mountains are numerous volcanoes, of which several are active, the most noted being Fuego, 12,075 feet high, and Agua, 14,875 feet. The drainage is in various directions, though mostly toward the east and north. Among the important rivers are the Belize, Dulce, and Motagua, which flow into the Gulf of Honduras, and several tributaries of the Usumacinta, a river system whose waters flow into the Gulf of Campeche.

**PRODUCTIONS.** Agriculture and stock raising are the principal occupations. The fertile and productive districts are largely in the valleys and along the coast, where diversified farming is carried on successfully. Cattle, sheep, mules, horses, and swine are reared profitably. Among the products are tobacco, cacao, maize, wheat, coffee, and many species of tropical fruits. The forests are abundant, yielding quantities of valuable building material, rubber, and fiber products. The minerals are numerous and occur in rich deposits, though mining has not yet developed exceedingly. Among the principal products are sulphur, tin, lead, salt, copper, silver, and gold. Manufacturing has received encouragement from the government, especially the rubber industry. Among the general manufactures are cotton and woolen goods, ironware, earthenware, sugar, cordage, furniture, beverages, and utensils. Much of the traffic formerly carried on by pack mules is being brought to seacoast points by railroads. The principal railroad line connects Santo Tomás, on the Bay of Honduras, with San José, on the Pacific, passing through the capital city and being connected by branch lines in various directions. In 1909 the country had 450 miles of railroads in operation, but the lines were owned by German and American companies. The highways are generally good, while several canals have been cut for the improvement of river navigation.

**GOVERNMENT AND INHABITANTS.** The government of Guatemala is republican in form, of which the president is the chief executive, holding office for six years. He is assisted by a cabinet of advisers, who include the heads of the six departments of foreign affairs, justice, war, public credit, interior, and public instruction. The national assembly of a single chamber is the chief legislative body, the members of which hold office four years and are elected by popular vote. A supreme court and a well-organized system of inferior courts constitute the judicial branch. The army consists of 56,000 men, but the standing army disciplined for immediate service includes only 7,000. Roman Catholic is the dominant religion, but all forms of religious worship are unrestricted and no

state church is recognized. Education is free and school attendance is compulsory. The school system includes elementary and high schools, normal schools, industrial schools, and several universities. About one-third of the inhabitants are Europeans and various classes of mixed descent, while the Indian races include Aztecs, Mayas, and Toltecs. Spanish is the official language, though some of the natives retain their own distinct tongues, which are fast giving way to the general language under a system of public education.

Guatemala ranks as one of the most progressive countries of Central America, due largely to its growth in wealth and the development of its cities. Guatemala, situated about eighty miles from the Pacific, is the capital. Other cities include Cobán, Mazatenango, San Pedro, Santo Tomás, Zacapa, and Quezaltenango. Population, 1904, 1,842,134.

**HISTORY.** The history of Guatemala dates from 1524, when it was conquered by Cortez. After three centuries of Spanish dominion, the country declared its independence and a confederation was formed in 1821, which administered the government successfully for eighteen years. Rafael Carrera, a native Indian, conquered the country in 1839 and ruled until 1865. After his death the country was organized under a constitution modeled after that of the United States, and from that time dates its greatest progress and prosperity. Insurrections have occurred at various times, but they have been successfully suppressed and the republic has maintained its integrity.

**GUATEMALA,** a city of Central America, capital of the republic of Guatemala, about eighty miles east of the Pacific, on an elevation 4,975 feet above sea level. The streets are platted regularly and are paved and drained. It contains several excellent government buildings, a fine cathedral, a university, an archbishop's palace, and numerous modern municipal facilities. Among its manufactures are pottery, woolen and cotton textiles, machinery, utensils, cigars, spirituous beverages, embroidery, furniture, and jewelry. In 1774 it became the capital, at which time Old Guatemala, situated some distance to the southeast, was destroyed by an earthquake. It has railroad connections with the coast, both east and west, and with many interior towns. The public school system is well organized and numerous periodicals and scientific societies are maintained. It has an extensive system of electric railways. The city was first founded in 1524, but it was twice destroyed by earthquakes, hence the present city dates from 1773. Population, 1904, 96,568.

**GUAVA** (gwá'vá), the common name of many small tropical trees found in Asia and America. The larger number of these trees are native to the tropics of America, but the more useful species have been widely acclimated in the warm climates. They yield important dessert fruits, which are fleshy and have the shape of apples or pears. The lemon guava attains a height of twenty feet, has white fragrant flowers, and yields fruit about the size of a hen's egg. The fruit is exported or used in making jelly. Another species, the red guava, is cultivated extensively in the West Indies. The strawberry guava produces small fruit of excellent flavor.

**GUAVIARE** (gwä-vê-ä'rá), a river of South America, rises in the Andes near Bogotá, Colombia, and flows eastward into the Orinoco. The basin of the Guaviare is largely a level country, but it is very sparsely settled. The river has a length of 700 miles and the greater part of it is navigable.

**GUAYAQUIL** (gwī-ä-kēl'), a seaport city of Ecuador, capital of the province of Guayas, on the Guayaquil River, about forty miles from the Gulf of Guayaquil. The site is on low and moist ground, on account of which fevers are common. The noteworthy buildings include a national university, several hospitals, the government buildings, and a number of churches. It has a fine harbor on the river, which is two miles wide at this point, and has extensive railroad connections with interior mining and trading centers. As a port city it is one of the best on the west coast of South America, the principal exports being coffee, cacao, fruits, timber, nuts, India rubber, and mineral products. It has a considerable trade in ivory, live stock, tobacco, and drug materials. A waterworks system and a tramway are among the municipal improvements. It was founded in 1535 and owes its prosperity to its extensive shipping facilities. In 1896 damage to the amount of \$30,000,000 was done by fire. Severe disturbances by earthquake shocks have also destroyed portions of the city at various times. Population, 1908, 74,642.

**GUDGEON** (gǔj'ün), a fish found in the fresh-water lakes and streams of central and temperate Europe. It has a lengthened and rounded body, short dorsal and anal fins, and a labial barbel at each corner of the mouth. The head is flattened, the snout is obtuse, and the lower jaw is somewhat the shorter. It has no teeth in either jaw, but triangular bones near the entrance of the throat serve to grind the food. The gudgeon is a small fish, measuring from five to six inches in length, but it is prized

for its fine flavor. A species of gudgeon about five inches long is found in the Niagara River, while five species occur in Europe.

**GUELPH** (gwělf), a city in Ontario, county seat of Wellington County, on the Speed River. It is on the Canadian Pacific and the Grand Trunk railways and is important as an inland port of entry. The noteworthy buildings include the Ontario Agricultural College, the public library, the high school, and the county buildings. Extensive water power is obtained from a fall of thirty feet in the river. Among the manufactures are flour, woolen goods, sewing machines, farming implements, furniture, musical instruments, soap, and shoes. Building stone of a fine quality is quarried in the vicinity. John Galt, the Scotch author, founded the city. Population, 1901, 11,496.

**GUELPHS AND Ghibellines** (gǐb'ěl-lĭns), the names of two important political parties that contended for supremacy in Germany and Italy from the 11th to the 14th centuries. The party names originated from two families known as the Waiblingen and Welf, who were rival parties in the German Empire, the latter being still represented in the ruling house of England. These names sprang into existence from the Battle of Weinsberg, which occurred between Emperor Conrad of Hohenstaufen and Welf in 1140. The Welfs became known as Guelphs, receiving their chief support in the Italian cities of Bologna, Florence, Vienna, Modena, and Milan, while the Waiblingens took on the name of Ghibellines and were supported principally by the cities of Lucca, Pisa, and Arezzo. During the conflicts many of the cities and communities changed in accord with the interests peculiar to different localities. In the main the Ghibellines supported the imperial authority of Germany in Italy, while the Guelphs were in opposition. Toward the latter part of the 13th century the bitter feuds partook more of the nature of a personal warfare. After the 14th century both parties disappeared from history.

**GUERNSEY** (gěrn'zĭ), the most westerly and the second largest of the Channel Islands. It is located 45 miles southwest of Cherbourg, France, and 69 miles southeast of Start Point, England. The length is nine miles, the breadth is about five miles, and the circumference is thirty miles. The surface is elevated in the southern part, where the coast is picturesque, and the northern part is level. It is the nativity of the Guernsey breed of cattle, which are noted for their rich milk. Other products include flowers, fruits, and granite. Saint Peter Port is the seat of government. The inhabitants speak

a Norman-French dialect. Population, 1907, 41,037.

**GUIANA** (gē-ä'nä), an extensive region lying between the Amazon and Orinoco rivers, South America. It is properly divided into five divisions: Portuguese Guiana, now united with Brazil; Spanish Guiana, now connected with Venezuela; and the three European colonies of Dutch, British, and French Guiana. The entire territory has a length of 1,200 miles from east to west and a breadth of 800 miles, including an area of 690,000 square miles. However, the portions united with Venezuela and Brazil have largely lost their identity, and in modern geographies the name is applied only to the European colonies. These colonies are enclosed by Brazil, Venezuela, and the Atlantic Ocean.

Europeans first explored Guiana in 1499, but settlements were not made until 1613, when the Dutch established themselves at Essequibo. The English founded a colony at Surinam in 1650, and in 1664 the French settled at Oyapok. Following these settlements numerous conflicting claims arose, which were marked by various contests until 1803, when the history of British Guiana begins and the various possessions assumed their present geographical forms. The coast regions and valleys are exceedingly fertile, and the chief wealth consists of an exhaustless soil and many tropical products. As a whole the climate is moist and hot. The rainfall ranges from 70 to 98 inches, and the temperature varies from 75° to 90° Fahr. Within the territory are many navigable rivers, splendid tracts of forest, and rich deposits of gold, silver, iron, and other minerals, especially in the southern region of the country.

**BRITISH GUIANA, or DEMERARA**, is bounded on the north by the Atlantic Ocean, east by Dutch Guiana, south by Brazil, and west by Brazil and Venezuela. The area, including a portion claimed by Venezuela, is 90,277 square miles. Ranges of mountains belonging to the Parima system trend on the eastern boundary and the Awariwa highlands characterize the southern part. The principal rivers include the Essequibo, Guyuwini, Berbice, and Corentyn, the last mentioned forming part of the eastern boundary. The principal products include live stock, tobacco, coffee, maize, indigo, rice, butter, sugar, fruits, and cereals. Gold and silver are mined in the mountain districts on the south and east. The forests are luxuriant and yield large quantities of valuable timber. Among the leading exports are fish, rice, timber, vegetables, and fruits. Several railroads and numerous telephone lines have been built, connecting the sea-coast towns with the interior. The government

is administered by a resident governor, who is appointed by the crown, and he is assisted by an executive council and by a court of policy. Several colleges and many public schools are maintained jointly by taxation and government grants. Georgetown is the capital and principal seaport. Other thriving cities are Hope Town and Amsterdam. The inhabitants consist of natives, Africans, mixed races, and 16,900 Europeans. Population, 1906, 306,959.

**DUTCH GUIANA, or SURINAM**, a colonial possession of Holland, situated between French and British Guiana. It has a seacoast of 240 miles and an area of 46,060 square miles. The government is administered through a resident governor, council, and the colonial legislature. All the coast region and many extensive valleys are highly fertile. Ranges of the Tumuc Humac Mountains extend into the southern part from Brazil. They contain valuable deposits of gold, silver, coal, petroleum, and other minerals. The principal products are sugar, cacao, lumber, live stock, cereals, tobacco, rice, and tropical fruits. Numerous connections have been made by means of telephone, telegraph, and railroads, and schools and institutions of higher learning are maintained by government grants and taxation. The principal rivers include the Corentyn on the western boundary, the Maroni on the eastern boundary, and the Carapion, Surinam, and Coppename flowing through the interior. Its exports and imports are about equal, and the productive resources are developing rapidly. The government is administered by a governor general, who is appointed by the crown, and assisted by a council. Legislative authority is exercised by an assembly, which is constituted of four members appointed by the governor and by one member chosen for each 200 voters. The population includes many Europeans, but it is made up chiefly of Negroes and Indians. Religious liberty is granted to all classes. Paramaribo, on the Surinam River, is the capital and chief city. In 1905 the country had a population of 75,465.

**FRENCH GUIANA, or CAYENNE**, a colonial possession of France, located between the Atlantic Ocean and Dutch Guiana. The surface is largely level, though there are several ranges of mountains in the southern part. Besides the Maroni River on the western boundary, there are a number of smaller streams, among them the Sinamari and Arouague. The total area is 46,697 square miles. Cayenne, a city of 12,000 inhabitants, is the capital. The climate is exceedingly moist and unhealthful. Pepper, cloves, nutmegs, cinnamon, fruits, timber, cereals, gold, live stock, and asphalt are the princi-

pal products. The colony has not been materially prosperous, owing to its unhealthy climate. From 1853 to 1864 it formed a penal colony of France, but since the latter date no convicts have been transported there. However, Captain Dreyfus was imprisoned on Devil's Island, which lies off the coast. The government is vested largely in a governor, who is appointed from Paris and is assisted by a privy council of seven members. The city of Cayenne contains about one-third of the population of the entire possession. It has been improved by public works and is the seat of a good public school system. Besides containing several government buildings, it is the seat of the Royal Astronomical Society's station. Population, 1906, 33,256.

**GUILD** (gıld), the name of various associations that flourished in the Middle Ages, being designed to further commerce, handicrafts, and various business enterprises. These associations were advantageous in obtaining municipal and civil liberty as against the oppression of the nobles and for mutual development and protection in the industrial arts. The German guilds of craftsmen attained the height of their influence in the 13th century, when they were empowered to defend their interests by force of arms, but a decree issued in 1240 by Emperor Frederick II. restricted them in various respects with the intention of destroying further growth in political power. This decree and others issued subsequently were inoperative, and the guilds remained influential in Germany until the beginning of the 19th century, when the practice of all trades became unrestricted in all German states. Austria established freedom of the trades in 1860. The guilds secured a foothold in England early in the 7th century, remaining powerful factors in the trades and arts until Henry VIII. issued a decree confiscating their property. However, they were maintained in a general way until 1835, when every form of restriction on the trades and arts was abolished and since then various corporations have succeeded them. France and other European countries as early as 1739 took like steps for the purpose of giving all parties freedom of choice in the pursuits of trades and business enterprises. At present trades unions take the place of guilds in the matter of protecting the interest of workmen, but they do not restrict the young in the selection of a business or occupation.

**GUILFORD COURTHOUSE** (gĩl'fěrd), **Battle of**, an engagement of the Revolution in America, fought on March 15, 1781. Greene with an American army pursued Cornwallis after the Battle of Cowpens and joined Morgan in the Catawba Valley, and the two American

forces were finally united at Guilford Courthouse, N. C. Cornwallis had an army of 2,215 veterans, while the Americans numbered 4,440. The British made a well-directed charge and at first were successful, but a regiment of Maryland troops was followed by a cavalry charge, causing the British to fall back. Cornwallis retreated toward Wilmington and abandoned the Carolinas. The Americans lost 400 and the British lost 600. This battle is considered a strategic victory for the former.

**GUILLEMOT** (gĩl'lě-mõt), the popular name of several birds of the auks family. The common guillemot is from twelve to fifteen inches long, has almost completely black plumage, and is native to the northern parts of Europe, Asia, and America. A rare species known as the *sooty guillemot* has a white ring about the eye. The bill in all species is straight, the legs are short, and the wings are pointed. Great numbers of these birds breed in the rocky shores of the northern coasts, where their eggs are hunted for the market. The feathers are used for making clothing by the natives, who eat their flesh and eggs.

**GUILLOTINE** (gĩl'lō-těn), an apparatus named from its supposed inventor, Joseph Ignace Guillotin (1738-1814), and used by the French government for executing criminals. A similar invention for beheading was used in the Middle Ages, but the form adopted by the convention at the time of the French revolution contained a number of improvements. A highwayman was executed on April 25, 1792, at the Place de Grede, Paris, being the first to be guillotined. The common guillotine consists of two posts placed upright on a platform about twelve feet square, between which an ax is suspended. In the ordinary guillotine the ax is formed much like a hay knife, running in grooves between the posts, where it is suspended by a loop in the halyards, and held in place by a button at the top. The person to be executed is bound to the platform and the knife is dropped upon his neck by its own weight, which is sufficient to cause the head to be severed from the body. The Persians and Italians used a similar instrument for beheading criminals, and one called the *maiden* was employed in Scotland in the 16th and 17th centuries. It is commonly supposed that the inventor perished by the machine of his own invention, but this is erroneous, since he founded the academy of medicine after the guillotine was abolished and lived until 1814. The name guillotine is commonly applied to a machine for cutting straw, paper, and other substances.

**GUINEA** (gĩn'ě), the name of a region in

West Africa, bordering on the Gulf of Guinea. As a geographical term it came into use in the 14th century, when the Portuguese explored and traded along the coast, and later the region became the center of a large slave trade. At present it is not used extensively, being displaced by names given to particular localities by European nations, but in a restricted sense it is applied to Angola and Portuguese Guinea. Formerly the region from Sierra Leone to French Congo was known as Upper Guinea and the region south was called Lower Guinea. Anobón, Fernando Po, Principe, and Sao Thomé were known as the Guinea Islands.

**GUINEA**, a coin formerly used in Great Britain, so named because it was first made from the gold brought from the coast of Guinea. It came into use in the reign of Charles II., in 1664, and was superseded by the sovereign in 1817. The value of the guinea was 21 shillings, or about \$5.06. This coin is rare at present, but it is still customary to use the name for various purposes, especially in estimating professional fees and the price of pictures.

**GUINEA, Gulf of**, the name applied to a large portion of the Atlantic Ocean, on the west coast of Africa, washing the shore between Cape Lopez and Cape Palmas. The bights of Biafra and Benin are within the gulf. It receives the waters of the Niger and contains the islands of Saint Thomas, Fernando Po, Principe, and Sao Thomé.

**GUINEA FOWL**, or *Pintado*, a genus of birds of the turkey family, belonging to the genus *Numida*, native to Western Africa. About a

GUINEA FOWLS.

dozen species are included in the group, the best known being the common guinea fowl, which has been domesticated and is reared extensively. It is about the size of a common fowl, has a quarrelsome disposition, a peculiar harsh cry, and seeks to tyrannize other poultry. The species which are grown most extensively are shy.

They have slate-colored plumage with speckled feathers alternating and a naked head, and lay small eggs with a strong shell. The eggs are esteemed for food. Usually the guinea fowl is kept partly as a barnyard ornament and because of its inclination to defend other fowls against their enemies. In the West Indies they are met with in flocks in a wild state, and are seen frequently in numbers ranging from 25 to 50. Some species of Africa and Asia have a pure white plumage. In the time of Roman prosperity the guinea fowl was a favorite bird of the chase and its flesh was highly esteemed.

**GUINEA PIG**, a class of rodent mammals native to South America. They are a species of cavy and are domesticated and grown extensively as pets. Most of these animals are white, reddish, or white and black spotted. They are very small, about twelve inches long, and resemble the pig only in their grunting voice. Among the common characteristics are short and rounded ears, timid habits, the absence of a tail, and a low degree of intelligence. In South America they occur in large numbers on the banks of the La Plata, in Brazil, Bolivia, and other countries. They most commonly frequent the forests during the daytime in a secluded manner and come out in the evening for food. Their stupidity makes them an easy prey to various serpents and flesh-eating animals, though their loss by destruction in this manner is at least partly overcome by their rapidity in multiplying. They begin to bear young, when only two months old, produce from one to five at a birth, and commonly bring forth from three to six litters each year. See illustration on following page.

**GUITAR** (gī-tār'), a stringed musical instrument which has a hollow body somewhat resembling the violin. It is played by plucking or twitching the string with the right hand, while the left is used to form notes by pressing the strings against the frets on the finger board. It is used principally to accompany the voice in singing. The Moors introduced it into Spain, where it has remained a popular instrument ever since. Those of modern manufacture have six strings. The three lowest strings are made of silk, covered with a fine wire, and the three highest are of gut. At present it is used extensively in all civilized countries.

**GULF STREAM**, one of the most extensive and best known of the oceanic currents, receiving its name from the Gulf of Mexico. All the currents of the ocean are so nearly continuous that they in fact resemble one vast movement. Any given current in the ocean is influenced more or less by the movement of all other

oceanic streams. The winds and differences in the density of oceanic waters cause large volumes to pass from near the Equator into the Caribbean Sea, thence through the Yucatan Channel into the Gulf of Mexico, whence it is known as the Gulf Stream, a name applied until

GUINEA PIGS.

it finally disappears as a distinct current, after passing across the Atlantic.

In the Gulf of Mexico it has a temperature of about 50° Fahr., flows as a definite warm current through the Strait of Florida, courses in a northeasterly direction a short distance from the coast of the United States, and has a width varying from 50 to 300 miles. In the Straits of Florida its velocity is about six miles per hour, whence it gradually diminishes, being about four miles per day at its greatest width in the Atlantic. The coast of Europe divides it into two parts, one passing southward along the coast of Spain and to the northeastern part of Africa, and the other flowing to the Arctic Ocean by way of the north coast of Norway. The waters become denser as heat is radiated. On account of this circumstance the stream appears as a middle or lower current farther on in its course.

The effect of the Gulf Stream upon the temperature of the Bermudas is marked, giving these islands a semitropical climate. On the other hand, its union with currents moving toward the northeast along the shores of Europe has a modifying effect upon the climate of Great Britain and the Scandinavian peninsula. However, when considered by itself, it cannot be said to have a material influence upon the climate of Europe, since it is not sufficiently wide or deep to be highly effective. In commerce it is

quite important from the fact that sail-vessels moving in the current are enabled to derive some advantage in navigating portions of the ocean, but in this respect it is of no utility in steamship navigation.

**GULF WEED**, a genus of seaweeds floating in the Atlantic Ocean within an area of about 250,000 square miles, and so called because they are found chiefly in the Gulf Stream. The best known of the large areas covered by seaweeds is the so-called Sargasso Sea, situated north of the Tropic of Cancer, in the north Atlantic, and west of the Azores. They propagate themselves by breakage. See *Algae*.

**GULL**, a widely distributed genus of web-footed sea birds. They are distinguished by large wings, small hind toes, slender legs, and a straight bill. Fully sixteen species of gulls have been studied, of which the color is variegated, though the prevailing hues are blackish-slate, pearl-gray, and whitish. Some species have black and white markings on the head that vary at different seasons of the year. The young are brownish and have a dark bill, but at maturity both sexes are very similar in color. They frequent the shores of lakes and the sea, while some species are seen far out from the land and appear to be tireless in their flight. They feed on fish, insects, and various forms of putrid food with much voracity. Their nests are along the shore or in rushes, where they breed once a year and

GULL.

rear from two to four young. The most common species include the *black-headed gull*, *glaucous gull*, *common American gull*, *common herring gull*, and *sea mew*. Sea mews have a cry quite similar to that of a cat, hence the name.

The flesh of sea gulls is coarse, though their eggs are prized for table use, and the plumes serve as trimming for ladies' hats.

**GUM**, a vegetable secretion that exudes from intercellular spaces of certain trees, among them the peach, plum, and cherry. Gums are viscid. The purest varieties are transparent or translucent and pale yellow in color, but sometimes are several shades darker. Among the more valuable gum products are those known as gum arabic, gum Senegal, East India gum, cherry-tree gum, and Barbary gum. The gum taken from the spruce tree is prepared for chewing gum and sold in the market, and there are various other classes of this product prepared and sold in the form of confections. Gum resins are the inspissate juices of certain plants which contain both gum and resins. They are obtained from various plants either by spontaneous exudations or from incisions. They include asafoetida, myrrh, aloes, and many others.

**GUM ARABIC** (är'á-bīk), a gum obtained from the *acacia arabica*, a plant abundant in Arabia and India. For the purpose of securing a large yield it is necessary to make incisions in the bark, from which the gum exudes spontaneously. The product is transparent, often colored yellow or brown by impurities. It is inodorous and brittle and has a bland taste. Gum arabic is useful in calico printing, for cement, for ink, in pharmacy, and in finishing fabrics.

**GUM RESINS**, the dried products obtained from various plants, consisting of a mixture of gum and one or more resins. Alcohol dissolves the resin, leaving an insoluble residue of gum, while the latter is dissolved by rubbing with water. If gum resins are brought in contact with water, the gum dissolves and the insoluble resin forms an emulsion, hence a gum resin requires both water and alcohol to be completely dissolved. The principal products of this class include ammoniac, asafoetida, gamboge, myrrh, and ivy gum resin. These products are solid and opaque, have a strong taste and smell, and are employed chiefly in medicine. Substitute gums are made from the starch of wheat and potatoes by roasting or baking and are used to some extent as substitutes for the more expensive real gums.

**GUMTI** (gōom'tê), or **Goomti**, an important river of India, rises in a small lake in the Northwest Provinces, and flows into the Ganges near Benares. The course is generally toward the southeast and is remarkable for its many turns and windings. It is about 485 miles long and it is navigable for small craft to Lucknow, about 300 miles.

**GUN**, a term applied to any weapon which

has a barrel designed to receive and discharge a missile, in the projection of which powder, gun cotton, or air may be employed. The various implements ranging from the hand gun or pistol to the largest cannon are described by the name, but in common use it is customary to limit the term to the sporting gun. When gunpowder first came into use different terms were applied, such as *bombards* in Italy and *crackeys* in England. The early cannons were about the size of large muskets and by means of them it was as common to throw stone and iron as leaden balls. They were not only comparatively small, but were hard to manipulate, and firing was slow and ineffective as compared with the newer implements of modern times. The most rapid firing in 1638 by the musketeers was from seven to ten shots per hour. At that time it was quite common to use a *match-firing* gun, but soon after the *flintlock* came into general use, this being an invention of highwaymen, who found that firearms in which matches were employed were liable to lead to their discovery.

The flintlock guns were in common use in Europe until 1840, when more effective and rapid-firing weapons took their place. As early as 1540 it was common to use pistols in warfare and for personal protection, the weapons being confined to a place of concealment and used as a surprise to the enemy. The pistols used in the 18th century contained a cylinder with four barrels, which revolved much like the cylinders of newer implements of a like character. At an early date the art of aiming and firing by holding the implement in one hand developed into a very skillful practice, equaled only by pioneers and herdsmen who usually are adepts in the use of the pistol. The modern magazine gun has a shorter barrel and a smaller bore than the old musket, yet the carrying power is greater and its accuracy is of a much higher character. This is due largely to the rifling or grooving of the barrel, an art developed in the last century. The larger implements of war are classed as cannon, which include mortars, howitzers, and siege guns. In the larger cannon the barrels are about sixty feet long. These implements weigh 125 tons, carry projectiles or shells weighing 1,800 pounds, and consume 900 pounds of powder in a single charge. The cannon commonly used in the army and navy weigh about sixty tons, are forty feet in length and five feet in diameter at the larger end, and have a rifle bore. Beside these, mention may be made of the rapid-firing and machine guns, by means of which it is possible to fire as high as 800 shots per minute.

All the different varieties of guns are made of steel. They are thoroughly tested before being

used in the public service. The Gatling gun, invented in America and adopted in 1866 for the United States service, was capable of firing 1,200 shots per minute in special tests. The Krag-Jørgensen gun is in extensive use in the infantry of many countries, having been widely adopted in 1896 and since. The largest establishment for manufacturing guns is the celebrated Krupp works at Essen, Germany. The guns manufactured there have gone widely into use and are among the best in the world. The most remarkable single gun manufactured at that establishment was completed in 1886, by means of which it was possible to throw a ball weighing 2,300 pounds a distance of nine miles with sufficient force to penetrate iron plates four feet thick. All the modern guns are breech-loading, the projectile being first inserted, after which the propelling force is placed back of the projectile, and the breech is plugged by means of a substantial screw plate.

**GUNBOAT**, a vessel of small size, usually supplied with a single gun. Vessels of this class are employed in war for attacking armored vessels, or for defenses on the coast and in rivers. Those of modern construction are armed largely with one heavy gun, which is mounted on the deck. It is commonly set on a pivot in such a manner that it may be turned in any direction. In other gunboats a single gun is so constructed that it may be raised or lowered by means of an engine, and in maneuvering it is necessary to turn the vessel. Iron-plated steam gunboats are a powerful aid in a fleet and are employed extensively as auxiliaries.

**GUN CARRIAGE**, the vehicle or support upon which a cannon is mounted for service. It may or may not be adapted for transporting the gun. Those used for siege and field purposes have a carriage designed for traveling, which consists of a fore part with two wheels, called a *limber*, and with the carriage proper forms a four-wheeled vehicle. The limber serves for the attachment of horses, but for action it is unlimbered, when it rests on a strong support called the *trail* and its own wheels. Land gun carriages include *casemate*, *barbette*, *siege*, and *field carriages*. The first two are intended to be kept in position at a particular fortification, while the last are adapted for transportation as well as for stationary service. The iron carriages of modern construction contain elaborate mechanical parts, combining convenience in transportation and firing, and are sufficiently substantial to endure elaborate use.

**GUN COTTON**, or **Pyroxylin** (pī-rōks'ī-līn), a powerful explosive substance prepared by the action of nitric acid on cotton wool. It

was discovered by Christian F. Schönbein (1799-1868), a German chemist, in 1845. His experiments in mixing nitric and sulphuric acids with cotton wool demonstrated that the product possesses a highly combustible property and that its burning results in an explosion. It is prepared at present by drying cotton wool at 100°, then submerging it in a mixture consisting of one volume of nitric acid and three volumes of sulphuric acid, and leaving it immersed for 24 hours. Next it is washed with water or a preparation of alcohol to remove the lower nitrates. It explodes at about 165°, if finally divided, though when compressed it burns like tinder, but may be exploded by a mercuric fulminate. If washed in soda, it retains its explosive properties to the best advantage. The principle advantage of gun cotton over gunpowder is that it can be conveyed safely in a moist state without injury and is almost smokeless. In mining and for torpedoes it serves a highly useful purpose. It has been introduced as an effective agent in warfare. In photography an imperfect chemical form of gunpowder, known as *collodion*, is used. This is soluble in a compound of alcohol and ether.

**GUNNERY** (gūn'nēr-ĭ), the branch of science which treats of the construction and mode of firing guns. The term is commonly used in contradistinction to *musketry*, which refers especially to like purposes in small arms. Much has been written on the subject of gunnery, the first standard work being that of Niccolò Tartaglia (1500-1559), an Italian mathematician, who published a treatise called "The New Science" in 1537. Other publications of note are the "Dialogues on Motion" published by Galileo, in 1638, and the "New Principles of Gunnery" by Benjamin Robbins in 1742. The latter writer, besides treating of the resistance of air, bore of guns, methods of taking aim, and force of gunpowder, produced an invention for measuring the velocity of cannon balls, a mechanism not superseded until 1862. By a study of the theory of gunnery it has become possible to solve many problems relative to the best systems of constructing firearms for the purpose of securing the most serviceable motion of projectiles through the air, and for manufacturing implements of the proper length, rifle bore, thickness, weight, and strength. It has aided in solving the problems involved in actual firing, such as calculating the necessary velocity, range, angle of elevation, rotation of projectiles while passing through the air, and other problems involved both in individual firing and in handling a large number of guns in the time of war.

The guns that are manufactured according to

the better methods take into account the necessary velocity of the projectile and the effect upon it by the recoil, as well as the construction most effective in the different kinds of fire, as direct fire, vertical fire, and enfilade fire. By *direct fire* is meant the discharge of projectiles horizontally against the front of a column. In *vertical fire* the gunner aims at a high angle of elevation with the object that the projectile will be caused to fall at a vulnerable point of the enemy. In *enfilade fire* the projectiles sweep against the earthworks or lines of men. Many circumstances must be taken into account in endeavoring to make firing effective. They include the direction and velocity of the wind, the drift due to the rotation of the projectile, the state of the atmosphere as regards heat and moisture, and the movement of the ship and of the enemy. No perfectly satisfactory range finder has yet been discovered, but high classes of guns combined with careful experiments and practice have developed a high degree of proficiency in firing.

**GUNPOWDER**, an effective explosive mixture of charcoal, saltpeter, and sulphur. The composition varies according to the uses for which it is employed. The ingredients are pulverized separately into fine particles and mixed carefully in the proportion of about 75 per cent. of saltpeter, the remaining 25 per cent. being divided equally between sulphur and charcoal. In manufacturing the mixed materials are subjected to great pressure for the purpose of forming a solid cake, which is then ground into fragments and the grains are separated by sieves. The necessary apparatus includes a series of sieves or screens, by means of which the different sizes are separated from each other. The dust particles remaining are again pressed into cakes, the proper sizes being utilized in forming the different grades of gunpowder, and the coarser residue, if any, is broken into finer particles.

The pressure is applied while the material is in a moist state and determines the character of the explosive, high pressure giving violent action, while the milder pressure causes the product to be less violent as an explosive. When the grains are first separated, they contain sharply marked points, but these are worn off by placing the granulated powder in barrels and revolving them for a period of four to twenty hours. This process is accomplished while the powder is still moist and is necessary to give the grains a perfectly smooth surface. After this process, the granulated powder is glazed with graphite and subjected to a process of drying in a large room under a temperature of 135°.

The most common grades of powder are known as mammoth, cannon, mortar, and musket powder. The last mentioned is the finest grained and is used largely in the smaller fire-arms. However, coarser-grained powder is more serviceable in the larger guns, since the strain produced by it tends rather to move the projectile forward than to effect an influence by which its force is lost before the projectile is started, as is the case with small-grained powder. In recent years much progress has been made in the use and effectiveness of smokeless powder. This class is used almost exclusively in small and rapid-fire guns by the principal nations, and many of them employ it for field and heavy cannon. The reason that smokeless powder possesses superior value is that the dense volumes of smoke arising from rapid firing tend to obstruct the view and impede the successful operation in time of battle.

The powders usually classed as smokeless are more properly designated as semi-smokeless, since they produce a small amount of smoke. Powders containing ammonium nitrate as a principal ingredient yield products that are largely gaseous and almost invisible. There are three classes of true smokeless powder, of which the ingredients consist mainly of nitrocellulose, a mixture of nitrocellulose and nitroglycerin, and those containing nitro-derivatives of the aromatic hydrocarbons. Among the objects sought in manufacturing an effective and serviceable powder may be named the property of being smokeless. To this must be added high and uniform velocities with safe and regular pressure, the property of not excessively fouling in the gun, the virtue of not being unusually liable to ignite from the effect of friction or a shock, and that it be not excessively difficult to ignite when placed in the gun ready for use. Besides these essentials, high grade powders must not be impaired by temperature, age, and moisture, and be free from obnoxious and irrespirable gases when used in firing. Manufacturers take into account the chemical and physical effects of powder upon the gun, and seek to produce grades that will not rapidly erode or corrode the barrel.

The history of gunpowder properly dates from the 7th century, when it was employed by the Byzantine emperors to defend Constantinople against the Saracens. However, it is of great antiquity among the Chinese, who employed it for blasting rocks and in manufacturing fireworks long before the Christian era. It is quite certain that the discovery was made by the Chinese while accidentally mixing saltpeter with sulphur and charcoal, and that the products used

by them were greatly inferior to the varieties in use at present, or even during the Middle Ages in Europe. A German monk named Berthold Schwartz made valuable discoveries in 1336, which greatly facilitated the manufacture and increased its propulsive power. Guns were used by the British as early as 1327, during the invasion of Scotland by Edward III. In 1342 powder was employed at the siege of Algeciras by the Moors and shortly after attracted the attention of various European nations. The manufactories of gunpowder established in Germany and Italy were among the first in Europe and the first in England were founded about 1590. The American colonists brought gunpowder to America, but even before their time it was used extensively by navigators and explorers who cruised on the American shores. At present the United States ranks as one of the principal powder manufacturing countries in the world, its product being both large in quantity and efficient as an explosive projectile agency.

**GUNPOWDER PLOT**, a celebrated conspiracy formed in England in 1604 by Robert Catesby and several Roman Catholics of rank for the purpose of blowing up Parliament and the king as a matter of revenge on account of the passage of the penal laws directed against their faith. The time fixed for the execution of the plot was Nov. 5, 1605, and it was designed to destroy the commons, lords, and king by one blow. The plan was to excavate a channel so as to form an underground passage, but later a cellar under the chamber of Parliament was rented, and in this the powder was stored. An anonymous letter was sent to Lord Mounteagle, a Catholic peer, advising him not to be present at the meeting of Parliament, which that gentleman delivered to Cecil, then Secretary of State, and from this the plot became known. An investigation led to a discovery of 36 barrels of powder and several large quantities of other explosives, together with billets and faggots. Guy Fawkes was arrested while starting to ignite the explosives, while several others were apprehended, tried at Westminster, and executed on Jan. 30 and 31, 1606. A later investigation demonstrated that the Catholics, with few exceptions, were not implicated and knew nothing of the plot.

**GURNARD** (gûr'nêrd), a family of spiny-rayed fishes, including those called grunTERS, cuckoos, and sea robins. The common gurnard has an angular head covered with bony plates and the elongated body is tapering and nearly round. It has many sharp spines and peculiar appendages. The flying gurnard has enormous spreading wings and is able to lift itself out of the water with ease. Most species of these fishes utter a peculiar note when above the water, hence the names piper and cuckoo have been applied to them. They frequent the eastern coast of Canada, and the United States and are found off the coasts of Europe and Asia. None of the species is more than eighteen inches long and some are regarded good food fishes, though their uncouth appearance has caused them to be eaten only to a very limited extent.

**GUTHRIE** (gûth'ri), the capital of Oklahoma, county seat of Logan County, on Cottonwood Creek, 32 miles north of Oklahoma City. It is on the Atchison, Topeka and Santa Fé, the Chicago, Rock Island and Pacific, and other rail-

FLYING GURNARDS.

roads. The surrounding country has large interests in agriculture and dairying. Among the noteworthy buildings are the State capital, the Carnegie public library, the city hall, the high school, and the Federal building. Other buildings include the Scottish Rite Temple, a Federal prison, and Saint Joseph's Academy. Among the manufactures are flour, furniture, vehicles, machinery, cigars, and cotton products. It has gas and electric lighting, systems of waterworks and sewerage, and electric street railways. Guthrie was founded in 1889, became the capital of Oklahoma Territory the next year and was made the

PHYSICAL EXERCISES IN SCHOOLS.

capital of the State in 1907. Population, 1907, 11,652.

**GUTTA-PERCHA** (güt'tä-pēr'chà), the inspissated juice of the gutta-percha tree, which somewhat resembles caoutchouc, but differs from it in being more soluble and stronger, but less elastic. The gutta-percha tree has a trunk of two or three feet in diameter, grows to a height of sixty or seventy feet, and abounds in south-eastern Asiatic islands, principally in Borneo, Singapore, and Sumatra. The juice is extracted by tapping. It is brownish-red in color when pure, becomes hard and tough below a temperature of 90°, and can be molded into various designs at a temperature of 145° Fahr. Its principal use is for coating submarine telegraph wires as a protection against salt water. In a modified form it is used for the soles of boots, ear trumpets, door handles, bottles, and hose tubes.

**GWALIOR** (ḡwā'lê-ôr), a fortified city of India, capital of the state of Gwalior, about sixty miles south of Agra. Its fortifications are situated on an elevated rocky eminence and are accessible only by steps, the whole constituting the most formidable strategic point in India. The older portion of the city is situated at the base of the rocky heights. It contains a preponderance of stone buildings and is noted for its ancient temples of interesting Hindu architecture. The old town has narrow and illy improved streets, but the newer part, known also as Sashkar, is situated toward the southwest and is well graded and drained. It has systems of pavements and electric street railways. Gwalior has had a long and eventful history and took a leading part in the mutiny of 1857. Population, 1906, 120,208.

**GYMNASIUM** (jīm-nā'zī-ŭm), a name applied by the Greeks to the public places and buildings where the Grecian youths exercised themselves by running, leaping, wrestling, boxing, and throwing the spear. The most noted of these were located at Athens. That city contained seven resorts classed as gymnasiums, which were frequented not only for gymnastic exercises, but likewise for instruction by rhetoricians, philosophers, and the eminent teachers who delivered their lectures as a means to cultivate the intellectual faculties of youth. The term *gymnasium* is used to designate a system of schools in Germany, which occupy a place immediately between the elementary schools and universities, serving as feeders of the latter. Collectively they are known as *Gymnasia* or *Realgymnasia*. In these institutions the youth of Germany are trained especially for admission to the universities, and before completing the

course are required to take a critical examination in at least one modern language, history, Greek, and Latin.

**GYMNASTICS** (jīm-nās'tiks), a word derived from gymnasium and used to designate any system designed to discipline the physical and muscular powers of the body by exercising in feats of bodily skill. Games for the purpose of encouraging outdoor exercises by children are as old as human history, though the various games have been characterized by marked differences in the various ages. Among the most common games to develop physical strength and skill which are popular at present are those of baseball, football, tennis, croquet, rowing, and others designed especially for children younger than those adapted to playing the recognized standard games. However, the term *gymnastics* is applied more strictly to indoor exercises, usually those that involve muscular activity under system, and are performed in special rooms or departments set aside for the different sexes in many of the schools, colleges, and universities. It has been found that these exercises are helpful in invigorating especially the students of sedentary habits, giving greater strength to muscles and frame, and imparting such a degree of general vigor to the system that intellectual development becomes more marked and rational.

Perhaps the ordinary infantile and childhood pastimes are sufficient to engage the attention of most children until twelve years old, but from that time to the age of thirty-five it is highly beneficial to take rational and suitable exercise at regular intervals, though much care is necessary lest the system be overtaxed and the vital organs fatigued. For this reason it has been found highly profitable to place the gymnasium under special supervision of competent directors and guide the gymnastic training of each pupil in accordance with individual needs. This is true especially in beginners for the reason that some experience is necessary in order to estimate the proper amount of invigorating exercise wholesome to the system.

**GYPSIES** (jīp'sŷz), a peculiar race of people found widely distributed in most parts of the world. They are known among themselves as Romani. The name Romani was derived from *Rom*, the Egyptian word meaning man, and *Romni*, meaning woman. Formerly the French called them Bohemians for the reason that they regarded them banished Hussites from Bohemia, while to the Germans they are known as *Zigeuner*, a term thought to have been derived from the Italian *Zingari*. The name Romani seems to imply their descent from the early Egyptians, but the language, which is the same among the wan-

dering companies in all countries, indicates descent from the people of India, probably from the Hindus. Like the Jews, they have been able to preserve their identity and language in a remarkable degree.

The color of the typical Gypsies is yellowish-brown, the hair and eyes are jet black, the limbs are symmetrical, the teeth are extremely white, and the size is medium. They are rarely content to make permanent settlements, but prefer to wander in emigrant wagons or live in tents. The older women turn a few pennies by telling fortunes, the younger women engage extensively in selling wares and fruits, while the men vend notions, trade horses, perform sleight of hand tricks for exhibition purposes, or engage as general traders. Their musical skill is remarkable and many of their melodies have become incorporated with the most noted operas and cantatas.

The vocabulary of the Gypsy language is limited to about 5,000 words, which are taught by vocal sounds, and no idea of a general education is possessed. They marry and divorce without much ceremony, have no particular religion, exhibit much delight at turning a good bargain, and are given to amusements and games. As a rule the children are reared in indolence and ignorance, while traits of superstition and boastfulness are common. Historical writers generally agree that they appeared as a wandering people in Germany, Italy, Switzerland, and France about 1417, thence moved into Spain about 1445, into Russia about 1500, and into Sweden and England about 1514. The kings and princes of many countries have been friendly to them on account of their harmless disposition, though in some localities they were charged with being spies and kidnaping children for the purpose of securing ransom. Straggling parties emigrated to America shortly after permanent settlements were made, and at present the Gypsy population in the United States is considerable. The total number of Gypsies in the world is estimated at 650,000, though this does not include those that have become assimilated by other peoples, which, however, does not occur with much frequency.

**GYPSUM** (jĭp'sŭm), a mineral occurring in monoclinic strata as alabaster in a compact state and as selenite in a crystallized form. It is found extensively in the form of a soft, chalky stone, this being transformed into plaster of Paris by kiln-drying. The common characteristics of gypsum are its color, which includes white, gray, yellow, blue, reddish-brown, and black. It is often transparent, though usually opaque. The grade designated as soft and

chalkish stone occurs largely in Michigan, Kansas, Texas, New York, Iowa, Ohio, Canada, Austria, Germany, France, Arabia, and elsewhere. At Paris, France, it is found in extensive masses, hence its name, *plaster of Paris*, when manufactured. The rock masses containing gypsum may be found in any geological age, but occur most frequently in the alluvial formations of the more recent periods. Gypsum is still being formed by the action of water, which holds in solution different ingredients, such as calcareous rock particles carried by mineral waters in volcanic regions, from the combination of sulphuric acid, from iron pyrites, or as a deposit from water in which it is held in a soluble state. It occurs most abundantly in combination with water and is the substance to which the hardness of water is due. Among the uses of gypsum are its employment for fertilizing, cornice moldings, interior decorations for buildings, models in statuary, and in preparing articles for ornamentation, though for most of these purposes it must be subjected to varied forms of treatment. France is the leading producer of gypsum and its products, but it is followed closely by both Canada and the United States.

**GYPSY MOTH**, an insect native to Europe, where it is highly destructive to the fruit and shade trees. In 1869 specimens were brought to America by Leopold Trouvelot of Massachusetts, who experimented to find some hybrid that would be free from certain diseases of silkworms. Several specimens escaped and the authorities were notified, but efforts to exterminate the insect proved futile, although several million dollars were expended for the purpose. These insects lay their eggs on fences, trees, and other objects in August. The eggs hatch the following spring, when the caterpillars attack the leaves of trees and many plants. In July they become full grown caterpillars, when they form loose cocoons and after two weeks more the moths emerge. The female is white and does not fly, while the male is brown and flies quite rapidly.

**GYROSCOPE** (jĭ'rō-skōp), an instrument used to demonstrate various properties of rotation. It consists of a circular disk so balanced in gimbals that its axis is free to take any direction with the least possible resistance. A reasonably clear idea may be obtained from the *toy gyroscope*, which differs from a top in that both ends of its axis are supported by being mounted in a circular frame. When the disk is put in motion, the entire apparatus not only retains its position as long as the disk revolves rapidly, but it takes up a slow horizontal mo-

tion (gyration) in the reverse direction to that in which the upper periphery of the disk is moving. In the illustration, one end of the outer frame, or gimbal, rests on the support D, the arrows indicating the direction of the two movements, which, as long as they continue, prevent the instrument from falling from the position E to the ground at F. This action is due to the principle that a mass set in rotation about its principal axis of inertia continues to revolve

TOY GYROSCOPE.

about it, the direction of the axis remaining unchanged unless extraneous force is applied.

The gyroscope was invented by Johann Bohnenberger (1765-1831), a German astronomer and mathematician. He first described it in 1817, after employing it in astronomical experiments to show that the apparent rotation of the stars about the earth is due to a real rotation of the earth itself in the opposite direction. In 1862 Jean Foucault, the French physicist, made a similar application. He set a large gyroscope in rotation and, by using a telescope, observed the apparent change in the plane of its rotation

due to the movement of the earth. Sir William Thompson devised the *gyrostat*, a modification of the gyroscope, and used it to illustrate the dynamics of rotating rigid bodies. It consists essentially of a fly wheel, the axis of which is fixed within a massive rim, and the rotation is upon fine steel pivots inside a rigid case.

Although the gyroscope was long considered merely a toy, it has recently been adapted to very practical uses. Otto Schlick of the German navy, in 1904, suggested it as an instrument with which to give ships a steady motion even in very rough water. He devised a gyroscopic apparatus which weighed 1,100 pounds and rotated at a velocity of 1,600 revolutions per minute. The first experiment was with the torpedo boat *Seebär*, which is 115 feet long and has a displacement of 56 tons. The results obtained were entirely satisfactory. Subsequently many passenger vessels have been equipped with the apparatus, the object being to secure greater stability and correspondingly reduce the cases of seasickness. - Another notable instance of applying the gyroscope is that of Louis Brennan (b. 1852), an Australian inventor of Irish descent, who is the first to suggest the *monorail railway*. In 1907 he exhibited at London a locomotive which moved rapidly and safely on a single rail, being held in position by two gyroscopes located in an air-tight case. A partial vacuum was maintained in the case and the revolutions were at the rate of 7,500 per minute. Subsequently locomotives and trains of cars have been constructed for experimental purposes, the gyroscopic apparatus being driven by electric power and weighing about five per cent. of the weight of each engine or individual car. In such a train, when it moves rapidly around curves, the gyroscopes lean inward in the manner of a cyclist when rounding a curve.

## H

**H**, the eighth letter and sixth consonant of the English alphabet. It is usually classed as an aspirate rather than a consonant for the reason that its sound is a mere breathing or aspiration of vocalized breath. Its distinctive sound occurs when it is written as the first letter of a word and when it follows *w*, as in *help*, *heavy*, *hope*, *where*, and *whither*. In combination with other letters it is used to represent sounds in digraphs, such as *child*, *this*, *than*, and *shift*, and in others in which the digraph is silent, as in *plough* and *bough*. In some cases it is combined with consonants to represent the sound of *f*, as in *tough* and *enough*. In words taken from the Greek, *ch* generally has the sound of *k*, as in *chyle* and *chemistry*. *H* is used in chemistry as the symbol of *hydrogen*.

**HAARLEM** (här'lem), a city in the Netherlands, capital of the province of North Holland, ten miles west of Amsterdam, on the Spaarne River. It is connected by important railroad lines and traversed by a system of canals, and its buildings are largely of the typical style found in the Netherlands. The cathedral of Saint Bavon, one of its finest buildings, is an ancient and famous structure. It was erected in the 15th century, is 425 feet long, and is crowned by a tower 253 feet high. Other buildings include the public library, the townhall, and the meat market. It has numerous scientific schools, associations of general learning, and fine parks and statuary. The manufactures include machinery, beverages, woolen goods, clothing, silk, laces, and embroidery. It ranks high as a center of trade in flowers and merchandise, and is noted as the seat of the most extensive type foundry and printing establishment in Holland. Among the celebrated men born in Haarlem is Lourens Coster, an accredited inventor of movable types for printing. Haarlem dates from the 13th century and obtained municipal rights in

## HABIT

1245. In 1572 it was besieged by Don Frederico, a son of the Duke of Alva, but was finally freed from Spain by the Prince of Orange. Population, 1906, 69,701.

**HABEAS CORPUS** (hā'bē-ās kôr'pūs), a legal writ of relief directed to the person detaining another, and demanding him to produce the body of the prisoner at a specified time and place. The term is of Latin origin, meaning you may have the body. A writ of *habeas corpus* may be issued in all cases where a person in custody claims to be illegally detained or wrongfully refused bail, or who desires to be removed to a different court than the one in which the case is pending. In England, where this writ is called the *writ of right*, it is based upon the Magna Charta, which declares that "no freeman is to be deprived of his life, liberty, and property except by the judgment of his peers and the law of the land." The writ of *habeas corpus* is assured to all persons by the Constitution of the United States and by those of most of the states. It can be withheld only in cases of rebellion or invasion, or when the public safety may require its suspension.

**HABIT** (hăb'it), the tendency of the body or mind to repeat the same action more or less involuntarily. Habits are acquired through the inclination of the nervous system to repeat its own acts in the same way from time to time. They have a wide range in all our mental and bodily acts, and are likewise concerned in the improvement or debasement of our moral and spiritual nature. It has never been satisfactorily explained why singular facility is acquired by repeated action in accomplishing what at first was either difficult or impossible, but it is generally thought to be due to a condition of nerve force as influenced by the movement of its currents. That is, when a current traverses a nerve tract, it produces a tendency in the nerve

center to induce a similar current again under like conditions, and as the currents are reproduced from time to time the nerves become habituated to their passage. Some psychologists find a reason for this power of habit in the sympathetic nerves and others trace it to the association of ideas. However, it is universally recognized that both mental and bodily habits depend upon the repetition of the same act. This gave rise to the useful educational maxim, "Practice makes perfection."

Children and youth need special care to influence the formation of right habits. At that time of life the nervous system is in a plastic condition and may be influenced to act with facility, hence the training should aim to inculcate a tendency toward the formation of wholesome habits with the view of inducing the highest possible physical, intellectual, and moral development. It is important to detect and eradicate bad habits, if such have been acquired, and to replace them with those which tend toward right thought and action. This is important for the reason that right habits economize both time and strength and at the same time tend toward proper and right action. The man for whom education has done all that it can do, who has received the extent of its benefits, finds habit not his master but his most useful servant. Rosenkranz says in this connection: "Education must procure for the pupil the power of being able to free himself from one habit and to adopt another. Through this freedom, he must be able not only to renounce any habit formed, but to form a new one; and he must so govern his system of habits that it shall exhibit a constant progress of development into greater freedom. We must discipline ourselves, as a means toward the ever-changing realization of the good in us, constantly to form and to break habits."

**HACK**, or **Hackney Coach**, a coach or carriage which is let out for hire. It is usually a vehicle with two seats inside facing each other. The term is commonly applied to a cab.

**HACKBERRY** (hăk'bër-rÿ), a tree of the nettle family, sometimes called sugar berry, nettle tree, and hoop ash. The common hackberry of North America ranges from Canada to Tennessee, extending westward to the Pacific. It is about three feet in diameter and from 80 to 120 feet high, and has rough bark and nearly horizontal branches. The wood is coarse-grained and heavy and in value may be classed with that of the elm. Other species are found in different parts of Canada and the United States, including the species usually known as *sugar berry*. The lotus tree of Europe and Asia is a species of the hackberry. It attains a height of about

70 feet, and the wood is used in carving and for making furniture.

**HACKENSACK** (hăk'ən-săk), the county seat of Bergen County, New Jersey, on the Hackensack River, eight miles southeast of Paterson. It is on the New Jersey and New York and other railroads and has communication by several electric lines. Among the conveniences are city lighting, pavements, a public library, and several fine school and church buildings. It has manufactures of brick, silk, jewelry, and utensils. Many business men of New York City have their residences at Hackensack. The place was settled about 1640 by the Dutch. Washington, while retreating through New Jersey, stopped here in 1776, but it was afterward occupied by the British. Population, 1905, 11,098.

**HADDOCK** (hăd'dŭk), a fish belonging to the same family as the whiting, coalfish, and cod. In size it is smaller than the cod, but it resembles that fish. It has three dorsal fins and a pale-brown back, but the under part is silvery-white. The forehead is flattened between the eyes. This species of fish is valued for food, weighs from two to eight pounds, and breeds in the northern seas in February and March. The haddock is a common fish on the Atlantic coast of North America and Europe. An allied species called the *Norway haddock* is smaller and is abundant off the coast of Newfoundland. The salted and smoked flesh of the haddock, known as *finnan haddie*, was first prepared by the Scotch, whence the name.

**HADES** (hă'dēz). See **Hell**.

**HADJ**. See **Hajj**.

**HADRIAN** (hă'drĭ-ən), **Arch of**, a triumphal arch at Athens, southeast of the Acropolis, erected by Hadrian or his successors. It is in a good state of preservation. The structure is 44 feet wide and 59 high. It was erected to divide Hadrianopolis from the ancient city of Theseus. Another structure erected by Hadrian is his tomb in Rome, which is now known as the Castel Sant' Angelo. It was completed under the direction of the emperor about 135 A. D. and was surrounded by beautiful gardens which extended to the Tiber. Though in a good state of preservation, the *Tomb of Hadrian* is partly concealed by works of fortifications that were erected in comparatively recent times. The *Villa of Hadrian* was located near Tivoli, about fifteen miles from Rome, and had an area of several square miles. It contained fine baths, theaters, terraces, libraries, and gardens, and the decorations were largely those obtained from Greece or made specially in imitation of Greek masters. The most important treasures now extant are in the museums of

Rome, but many ruins are still found where the villa was located.

**HAGEN** (hä'gĕn), a city of Germany, in the Prussian province of Westphalia, 42 miles from Cologne. It is located on the Volme River and several railroads and is surrounded by a productive agricultural country. The manufactures include cotton goods, tobacco, iron and copper products, and machinery. It has electric lights and railways, stone and asphalt pavements, and a large trade in produce and merchandise. It is the seat of several technical schools. Population, 1905, 77,567.

**HAGERSTOWN** (hä'gĕrz-toun), a city in Maryland, county seat of Washington County, in the Cumberland valley, 86 miles northwest of Baltimore. It is on the Baltimore and Ohio, the Norfolk and Western, and other railroads. The chief buildings include the county courthouse, the Kee Mar College, the Washington County Library, and several schools and churches. The city is noted for its social refinement, beautiful streets, and electric and steam railway facilities. Among the manufactures are vehicles, farming implements, cigars, fertilizing, flour, pottery, brooms, and machinery. The surrounding country is agricultural and fruit growing. Hagerstown was settled about 1740 and is governed under a charter issued in 1885. Population, 1900, 13,591.

**HAGFISH** (häg'fish), or **Hag**, the name of a class of fishes structurally related to the lamprey. They live as parasites upon other fishes. The shape of the body resembles that of an eel, but they have no visible eyes and the mouth is round and formed for suction. Eight tentacles or barbels surround the mouth, which has a single tooth in the upper part, and two rows of strong teeth are attached to the tongue. The body is slimy and has no scales or bones, but is membranous and cartilaginous. They attach themselves to fishes and bore their way to the inside by means of the mouth, and in the course of time consume the body, leaving only the skeleton and entrails. The common hagfish is about fifteen inches long. It is very abundant off the west coast of North America and on the east coast from Cape Cod north, where it is known as the *slime eel*.

**HAGUE** (häg), **The**, a city in the province of South Holland, capital of the Netherlands, fifteen miles northwest of Rotterdam. It is pleasantly situated three miles from the North Sea, 23 miles southwest of Amsterdam, and is connected in all directions by canals and railroads. It has communication by steamship lines with the leading ports of Europe. Among the noteworthy buildings are the palaces of the

general government, several historic churches, a system of public schools, a number of colleges, and a university. The royal library contains 525,000 volumes, besides which are other public institutions, such as a public museum of antiquities and modern art, several parks and zoölogical gardens, an electric street railway system, and stone and asphalt pavements. The Hague is the most fashionable and modern city in Holland, and about three miles from it is the celebrated Scheveningen, a favorite bathing and pleasure resort on the coast. The royal villa of Huis ten Bosch, located in a forest near the city, has costly decorations and valuable collections of art.

The Hague does not rank high in commerce, but it is the seat of many industries. Among the manufactures are firearms, jewelry, furniture, musical instruments, clothing, hats, machinery, and textile fabrics. Owing to its excellent facilities for entertaining visitors, it has been a favorite place for holding international congresses. Among the most recent held here is the peace conference suggested by the Czar of Russia in 1899. This conference was called for the purpose of considering the gradual disarmament of civilized nations, whereby, if consummated, the burdens of vast standing armies would be lessened greatly.

The Hague was made a princely residence under William II. in 1250. In the 16th century it became the seat of the stadtholder of Holland and from the 17th to the 18th centuries it was the diplomatic capital of Europe. The Treaty of Ryswich, concluded in 1697, was signed at the castle of Ryswich. About three-fourths of the inhabitants are Protestants. Population, 1906, 248,995.

**HAIL**, the small masses of frozen rain or congealed vapor falling from the clouds in showers or storms, constituting pellets or hailstones of variable size and shapes. Hail results when considerable differences of temperature exist between the lower and higher strata of air, and the presence of intense cold causes the moisture to condense suddenly. Usually there are several layers of dark, grayish clouds which move in different directions and have a varying temperature. Two kinds of hail are generally recognized, one consisting of small grains, which usually precedes the fall of snow, and the other being composed of hailstones. The latter class occurs most commonly in the spring and summer, but reaches its greatest severity and frequency in tropical climates. It is probable that the small hail pellets are formed by raindrops freezing as they fall through strata of colder air than those in which they were formed as rain-

drops. The larger class of hailstones are thought to be due to the coming together of clouds of vastly different temperatures.

On examining a large hailstone it is found to be constituted of concentric layers, similar to

THEORY OF HAIL BY ROTARY MOVEMENT.

those of an onion, arranged around a central nucleus formed generally of snow, but sometimes of ice. The stones are more or less spheroidal in shape and weigh from a few grains to several ounces, though hailstones weighing several pounds sometimes occur. The theory that accounts for the layers is that there are currents of wind which rotate like cyclones, but instead of having vertical axes, the movements are horizontal. In such cases several horizontal and almost parallel strata of clouds form some distance apart, the upper layer of snow and the lower of rain. The nuclei of the hailstones are formed in the upper layer in the form of snowflakes, are caught in the rotating currents of wind and carried alternately through the two layers of clouds, and in this way receive successive coatings of snow and ice until they finally fall to the ground.

Some naturalists attribute the influence of electrical attraction and repulsion as formative agencies of hail, since thunder and lightning invariably attend hailstorms. Other writers hold the view that there are many alternate layers of different clouds during the formation of large hailstones, and, in falling from the upper stratum through the different lower strata, they take on the peculiar characteristics by whirling through the successive cloud formations. Hailstones measuring about one-fourth of an inch in diameter are most frequent, but stones having a diameter of from two to five inches sometimes occur. In hot climates they are frequently of the larger size and effect much damage to growing crops. Noteworthy hailstorms are those which occurred in New Hampshire in 1851, at the Cape of Good Hope in 1860, and in Moravia in 1889. At the time of these historic hail-

storms stones weighing from eighteen ounces to four pounds fell to the ground, destroying much vegetation and some human life. In many localities hailstorms occur in which the bark of trees is punctured, the heaviest plate-glass windows are broken, and the shingles of houses are destroyed.

**HAINAN** (hī-nān'), an island in the China Sea, east of the Gulf of Tonquin, belonging to the province of Kwangtung, China. It is separated from the mainland by the Strait of Hainan. The area is 13,600 square miles. It is well wooded and has fine groves of palm and coconut trees. Cotton, tobacco, rice, sugar cane, and fruits are grown profitably. A large majority of the inhabitants are Chinese. Kiang-chow, an important seaport on the northern coast, is the capital. Population, 1908, 2,450,850.

**HAIR**, one of the threadlike structures that grow from the skin or outer covering of mammals, serving as a protection similarly to the feathers and down of birds and the scales of fishes and reptiles. All species of mammals in an adult state have hairs, which vary greatly in structure, as is noticed by comparing the finer kind of wool with the *bristles* of the hog and the *quills* of the porcupine. The hairs of the human head furnish a protection in heat and cold and serve as a shield against blows. All parts of the body, except the palms of the hands and the soles of the feet, contain more or less hair growths, and the parts usually described as destitute of hairs are covered with a small colorless growth. In some males the breast, arms, shoulders and other portions have hairs much like those common to the head.

Each hair is hard and compact on the outside, and contains layers of colorless scales overlying one another like the shingles of a roof. The interior is porous and is thought to contain the liquids by which it is nourished. It is a modified form of the epidermis, growing from a tiny bulb called the *papilla*, which is an elevation of the cutis at the bottom of a little hollow in the skin. The hair is produced from the surface of the bulb, like the cuticle, by the constant formation of new cells at the bottom, the old cells being pushed forward to constitute a portion of the hair shaft. Minute pigment granules, which are contained in the cells of the hair, determine its color.

Race characteristics greatly influence the color of the hairs, but it is likewise modified by age, sex, climatic conditions, and various other circumstances. In infancy the color is light and with age it becomes darker and less fine. A growth of hairs commences in the armpits and on the breast at the age of puberty in both sexes

and in males a beard begins to appear. If the hair bulb is destroyed, the hair never grows again, but, if uninjured when a hair is pulled out, a new one is produced. Baldness is due usually to an affection of the papillae, which results generally from an impairment of the blood circulation in the scalp, and grayness is attributed to the same cause, or to a deficiency in the amount of pigment granules in the hair cells. The hairs themselves are destitute of feeling, but nerves are located in the hollow in which each hair is rooted, thus accounting for the pain experienced when a hair is pulled. Small glands are connected with the hairs, which serve as lubricators to them and the skin by secreting an oily substance.

The tendency of hairs to stand erect under the influence of cold or electricity is due to muscles interlacing among the fibers of the skin. In some animals these muscles are so well developed that the hairs may be moved to drive away flies, as is the case in horses, cattle, and

Italy, Germany, France, and other European countries peasant girls sell their hair to dealers for the purpose of manufacture, these products being best when taken from living subjects. Other purposes to which hairs are put include the manufacture of brushes and hair pencils for painters, dusting brushes, and numerous fancy articles.

**HAIR DRESSING**, the art of taking care of the hair. It has been a subject of much study from remote antiquity, especially by the fashion mongers and the people engaged in hair dressing. In the costume of some classes it forms an important agent to convey an idea of personal dignity or rank in the community, but more frequently it is entirely decorative to the person. The ancient Egyptians were extremely careful in taking care of the hair, as may be seen from their paintings and bas-reliefs, which show that the hair was carefully curled or plaited. False hair and beards were worn in many parts of Western Asia, where the

sheep. Next to the bones and teeth, the hairs are the most indestructible portions of the body and the color is preserved for many years after death. The hair structure in plants is an outgrowth of the epidermis and may be either a single cell, a cell row, a cell surface, or a cell mass. These hairs usually consist of minute transparent tissues more or less elongated, arranged in a single row, and are of various types, such as scabrous, stellate, and uncinated hairs.

Hairs constitute an important material for manufacturing, but those taken from horses, cattle, goats, sheep, hogs, camels, and alpacas are the most valuable. The purposes to which hairs are best adapted include the manufacture of upholstered furniture, haircloth, brushes, and fishing lines. They are employed in plastering, spinning, and weaving various kinds of textile fabrics. Human hairs are used extensively in the manufacture of beards, wigs, watch chains, and other articles of dress and ornament. In

Hebrews and others considered a bald head very unbecoming. The custom was taken to Greece and Rome, where the hair was worn short by artisans and warriors, but many of rank prided themselves on having a fine growth of long hair.

The practice of elaborate hair dressing reached its height in the 15th and 16th centuries. At that time the men had their beards tightly curled and gummed, while the women took pride in wearing the hair on cushions or supports, giving the appearance that the growth of hair was very prolific. In the 18th century, during the reign of Louis XVI. of France, the women wore the hair in a fantastic style. It was combed upward and stiffened with wire, hence gave the appearance of being about twice as large as the head, and at the upper part were decorations of beads, ribbons, and feathers. The practice of wearing wigs continued during this period and is still fashionable, but the forms are much smaller than those of former times.

The *chignon*, or waterfall, worn formerly is

not fashionable at present, but the so-called *rat*, a form of dressing the hair above the forehead to give it the appearance of fullness, is used extensively in costumes by women. Men almost universally wear their hair cut short and the majority shave the face smooth or wear a small mustache. As a whole there has been a tendency toward simplicity in hair dressing, with the design that it serves for ornamentation to suit the individual. *Hair dyes* are used to a considerable extent to conceal approaching age or retain the natural color of youth. Substances used for this purpose include preparations made of sulphur, bismuth, and various vegetable juices, such as the juice of oak bark and of green walnut shells.

**HAIRLESS DOG**, a kind of dog whose skin is almost entirely naked, or whose body has a few hairs scattered in different parts. The hairless dog of Mexico is the best known American species and is frequently seen at the exhibits of pet dogs. It somewhat resembles the black-and-tan terrier, but is less active and lacks the keen eye, and the skin in most specimens is wrinkled. The African hairless dog resembles the greyhound in form and is entirely naked, except that it has a few tufts of hair on the legs, around the mouth, and near the tail. A naked dog of China, known as the Oriental hairless, is formed like the small greyhound terrier and is cooked and eaten by the Chinese as a delicacy. The hairless dog of the Philippine Islands is another well-known species. It is popular as a pet among the natives, especially the Tagals.

**HAITI**. See *Hayti*.

**HAJJ** (häj), or *Hadj*, the pilgrimage to the Kaaba at Mecca, performed by the Mohammedans. One who makes the pilgrimage becomes known as a *hadji*, which Orientals regard a respectable salutation or a title of honor. The pilgrimage dates from the time of Mohammed, who grew more fond of the Kaaba as his years increased, and he visited it for the last time the year before his death. The institution of the pilgrimage as one of the five cardinal duties of every Mohammedan dates from that time. While the visit may be made any time, the full rites of the Hajj, which includes a visit to Mount Arafat, is carried out only in the twelfth month of the Mohammedan calendar, called *Dhul Hajjeh*. Some of the pilgrims begin the journey one or two months before the appointed time of the meeting, depending upon the distance to be traveled. The number of pilgrims varies greatly, but a concourse of 100,000 is not uncommon. Many travelers have made the pilgrimage in disguise, including T.

F. Keane, in 1878, who published an account of the journey.

**HAKODADI** (hä-kō-dä'dê), or *Hakodate*, a seaport city of Japan, near the southern extremity of the Island of Yezo. It is located on a bay extending inland from Tsugaru Strait, has an extensive harbor, and is strongly fortified. The architecture is singularly Japanese, including a naval school and a commodious townhall. Transportation is facilitated by tramways. It has electric lighting, waterworks, and well-paved streets. The city is a treaty port, hence has a large foreign trade. It is the seat of several mission schools and consulates. The port was opened for commerce in 1859. Population, 1903, 85,313.

**HALBARD** (höl'bērd), or *Halberd*, a weapon employed in warfare during the Middle Ages. It consists of an ax blade balanced by a pick, having an elongated pike head at the end of a staff from five to six feet in length. The earliest halberds were used in the 14th century. The English *halbardiers* were troops who performed special duties, such as defending the colors, and reached their height of efficiency in the 16th century.

**HALBERSTADT** (häl-bēr-stät'), a city of Germany, in Saxony, 28 miles southwest of Magdeburg. It is located on the Holzemme River and several railways, and has considerable trade in merchandise and manufactures. The chief buildings include the Cathedral of Saint Stephen, the Church of Our Lady, the market, and a number of schools. Among the manufactures are leather, sugar, cigars, soap, gloves, and machinery. The city became a part of Brandenburg in 1648. Population, 1905, 45,529.

**HALCYON** (häl'si-ön), the poetical name applied to the kingfisher from early historic times. According to Greek mythology, Halcyone and her husband, King Ceyx, were transformed into kingfishers, hence the name halcyon. The idea of the ancients was that these birds lay their eggs in nests floating on the surface of the sea in calm weather, before and after the shortest day of the year, when the gods were supposed to keep the water smooth and tranquil for their benefit. Hence, the term *halcyon days* signifies a period of rest and untroubled felicity. This Grecian legend is mentioned by Shakespeare, Socrates, Aristotle, and other writers.

**HALF TONE**, a kind of plates made from photographs and engravings, used extensively in the illustration of books and periodicals. The best half tones are made from photographs, but they can be obtained by the reproduction of engravings and drawings. The process consists

mainly in making a negative of the picture to be reproduced, which is done by a camera having a screen of two glass plates that are ruled diagonally with very fine parallel lines. When the plates are placed together, the lines form diamond-shaped checks. They are held together with some resinous substance, such as Canada balsam, and in the camera are placed near the plate that is to contain the negative. The purpose of the screen is to produce the shadow effect in the half tone.

The negative is developed and placed face downward upon a sensitized copper plate, which is prepared by carefully polishing the surface and covering it with a thin film of sensitized material. The action of light causes this material to harden. When the negative and the plate are exposed for a short time to a strong electric light, certain chemical changes take place and the picture is reproduced upon the copper. It will be seen that some portions of the sensitive film were not acted upon and that different parts were affected differently, hence by washing, the portions not acted upon are reduced, while those acted upon remain to protect the surface of the copper. After placing the plate thus prepared in an acid bath and etching it, the surface is cleaned and the plate is mounted on a block for printing. Screens having about 200 lines to the square inch make good half tones, but coarser screens are generally better when the surface of the paper used in printing is not of a fine quality.

**HALIBUT** (hōl'i-būt), a genus of fish allied to the turbot, so called because it was formerly eaten extensively on holidays. It is among the

HALIBUT.

largest of flat fishes, specimens often weighing 600 pounds or more. Though esteemed for its food qualities, it is considered inferior to the turbot. The genus is characterized by having both eyes on the same side of the head. The lips are large and fleshy. Nearly all species are dark brown on the upper surface, have small smooth scales, and the lower surface is white. The oil is valued and is extracted largely from the bones. Halibut fisheries are especially pro-

ductive off the northeastern coast of North America, Iceland, the Scandinavian peninsula, and Western Europe, though various species are distributed widely in the Pacific.

**HALIFAX** (hāl'i-fāks), a town in the County of York, England, situated on the Hebble River, 38 miles southwest of York. It contains numerous substantial buildings, has municipal facilities of importance, and is connected by important railroad lines. The noteworthy buildings include All Souls' Church, the townhall, the Blue Coat School, the Heath Grammar School, and an observatory. It has a public library, a market house, public baths, and electric railways. Among the manufactures are woolen goods, carpets, chemicals, ironware, and machinery. The large output of carpets and worsted goods has given the town an extended reputation. Halifax was governed under the manor rule until 1848, when it received its charter. Population, 1907, 110,138.

**HALIFAX**, a seaport city and the capital of Nova Scotia, on a small peninsula in Halifax harbor, on the Atlantic coast. It is on the Cana-

VICINITY OF HALIFAX, N. S.

dian Pacific, the Inter-Colonial, and the Nova Scotia railways. The harbor offers easy access and anchorage for the largest sea-going vessels. It is the principal harbor and naval station of the British possessions in America, is strongly fortified, and has an extensive export and import trade. The noteworthy buildings include the Dominion Building, the Provincial Parliament, the Saint Paul's church, the Roman Catholic cathedral, and the Dalhousie University. It has several scientific associations and

institutions for the blind, deaf, and dumb. The manufactures include tobacco, machinery, paper, leather, soap, and canned fish. Halifax was founded in 1749 and supplanted Annapolis as the seat of government in 1750. Population, 1906, 42,807.

**HALLE** (hăl'lē), a city of Germany, in Prussian Saxony, on the Saale River, twenty miles northwest of Leipzig. It is an important railroad center, has well-improved and wide streets, and is the converging center of many electric lines. As an educational center it has long taken high rank. The celebrated university located here has been famous since the 17th century. Other noteworthy buildings include the Church of Saint Maurice, the Market Church, the townhall, the normal school for teachers, and the central railroad station. It has fine statues of Handel, Roland, and other prominent personages. The city has fine public school buildings and several equestrian monuments. Among the manufactures are chemicals, machinery, dies, oil, and malt. Within the vicinity are extensive mineral springs that yield great quantities of salt. Halle contained a castle as early as the 8th century. It was important as a member of the Hanseatic League and was a stronghold of Lutheranism in the Reformation. The French captured it in 1806, but it was annexed to Prussia in 1813. Population, 1905, 169,916.

**HALLE, University of**, an institution of higher learning at Halle, in the province of Saxony, Germany. It was founded as a Lutheran center of education in 1694, when it had over 700 students. It has taken high rank as a theological school since the beginning. During the Napoleonic wars it was twice suspended, but was shortly after reopened, and the University of Wittenberg was united with it in 1817. The library has over 215,000 volumes. In 1909 it had 2,150 students, including a large number from foreign countries. The names of Francke, Gene-sius, and Schleiermacher are closely associated with this institution.

**HALLELUJAH** (hăl-lē-lū'yä), or **Halleluiah**, an ascription of adoration to God, occurring at the commencement of many psalms, meaning praise ye Jehovah. It is a doxology in the Jewish synagogues and was probably retained in Christian translations on account of its signification and poetic sound. The name has been adopted for many musical productions, as the *Hallelujah Chorus* in Handel's "Messiah," which is considered a masterpiece of choral music.

**HALL OF FAME**, a building at University Heights in New York City, on the grounds of

the New York University. It is one of the buildings inclosing the campus, consists of a colonnade about 500 feet in length, and is built about the library. It contains 150 panels, in which will be set bronze tablets for the names of that number of great Americans. The selection of the subjects to be honored is intrusted to a committee of 100, made up of college presidents, educators, chief justices, and others, the selections finally to be approved by the senate of the New York University. Originally only persons born in the United States and deceased at least ten years were eligible, but in 1904 an apartment was set aside for women and foreign-born Americans. Twenty-nine names were chosen in 1900, eleven others were selected in 1905, and five will be added every fifth year, until in the year 2000 the roll of 150 shall be complete. Helen Gould made a liberal gift toward constructing the Hall of Fame, which will cost \$250,000 when fully completed.

The names selected in 1900 and 1905 are: George Washington, John Adams, John Quincy Adams, Benjamin Franklin, Thomas Jefferson, Alexander Hamilton, James Madison, Henry Clay, Daniel Webster, Abraham Lincoln, John Marshall, James Kent, Joseph Story, John Paul Jones, Ulysses S. Grant, William T. Sherman, Asa Gray, David G. Farragut, Robert E. Lee, Robert Fulton, Eli Whitney, Samuel F. B. Morse, John Audubon, Louis Agassiz, Jonathan Edwards, Horace Mann, William E. Channing, Henry Ward Beecher, Washington Irving, Nathaniel Hawthorne, Ralph Waldo Emerson, Henry W. Longfellow, James R. Lowell, John G. Whittier, Gilbert Stuart, Peter Cooper, George Peabody, Mary Lyon, Emma Willard, and Marie Mitchell.

**HALLOWEEN** (hăl-lō-ēn'), an abbreviation of *Alle halowene tyd*, meaning all hallows tide, and applied to the evening of October 31 on account of that day being the eve or vigil of All Saints, which occurs on November 1. It is known in America principally on account of the practical jokes and youthful pranks that are played upon unsuspecting neighbors. In many countries it forms a time for evening fireside meetings and was made the subject of Burns's poem, "Hallowe'en."

**HALLUCINATION** (hăl-lū-sī-nā'shūn), a mental sensation which has no corresponding external cause, or the perception of objects which have no reality. This phenomenon is due to a disorder of the nervous system, as in a case of delusion or delirium tremens. In general, delusions differ from hallucinations, especially in that the former may arise from an error in interpreting a real sensation, while a hallucination

arises from a derangement of some mental faculty. While all the senses may be affected, hallucinations are most closely associated with the sense of hearing. Rest and regularity in habits are recommended as essentials in the treatment.

**HALO** (hā'lō), a circle of light seen frequently around the sun and moon, caused by the presence in the air of small particles of ice and snow, by which the rays of light are reflected, refracted, dispersed, and diffracted. Smaller and less distinct halos are caused by raindrops and vapors constituting clouds. There are at least three distinct forms of these phenomena; *halos* proper, caused by the snow and ice particles; *coronas*, circles of light caused by condensed vapor; and *paraselenae*, mock moons that appear on a lunar halo and resemble suns or moons. A fourth halo, observed by aëronauts on the upper surface of clouds, is called *aureola*.

**HAM**, the thigh of an animal, such as that of the hog, sheep, or ox, but especially the thigh of the hog when cured by salting and smoking. The curing of hams is an important part of slaughtering and meat packing, since this class of meat is considered among the best obtained from domestic animals. Hams are first pickled in brine and then smoked by burning wood, hickory being preferred, and in some cases powdered mahogany is added to the burning. See **Bacon**.

**HAMATH** (hā'math), or **Hamah**, an ancient city of Syria, on both sides of the Orontes River, frequently mentioned in the Old Testament. It is situated in a fertile valley, about 110 miles north of Damascus. The manufactures include flour, clothing, carpets, woolens, and jewelry. Though once a city of vast importance politically and commercially, it is now less fortunate. About 10,000 of the inhabitants are Greeks and fellahs. Population, 1909, 48,503.

**HAMBURG** (hām'bûrg), a free city of Germany, on the north branch of the Elbe, about eighty miles from the North Sea. The site of the city proper has an area of 30 square miles, but the region included in the state of Hamburg embraces 159 square miles. With it are included a number of contiguous districts and the island of Neuwerk, in the estuary of the Elbe. Many orchards, gardens, and dairy farms surround the city.

Hamburg is the most important commercial city of continental Europe, having a fine harbor, wharves, and steamboat connections. It contains excellent public institutions, numerous centers of higher learning, several libraries, observatories, and botanical gardens. Among the chief buildings are the Exchange, the govern-

ment house, the townhall; the churches of Saint Michael and Saint Nicholas, and the public library of 115,000 volumes. It has monuments of Lessing, Schaper, Schilling, and the soldiers who fell in the Franco-German War. Besides electric railways, it has waterworks, electric lighting, boulevards, sewerage, and many parks. The importance of its harbor is increased by convenient railroad and canal facilities. As a money exchange it is, next to London, the most important of Europe. Among the manufactures are sugar, spirituous beverages, scientific instruments, cured meats, engines, machinery, cotton, woolen, and silk goods, cordage, and tobacco. Its shipbuilding yards are extensive and of vast importance.

Educationally Hamburg is in a flourishing condition. In religion the people are largely Protestant. It dates from 809, when it was founded by Charlemagne. However, its commercial importance began in 1189, at which time it was made a free city. In 1241 it led in the formation of the Hanseatic League of towns and soon after increased its territory. It was occupied by the French in 1806, annexed to France four years later, and, when French dominion ceased in 1814, it had lost much of its commercial importance. In 1815 it became one of the four free cities of the German Confederation, and since then has enjoyed phenomenal prosperity, though vast damage was done by a fire in 1842. It includes the suburban towns of Cuxhaven, Ritzebuttel, and several others. These and Hamburg proper constitute the most important passenger and emigrant center of Northern Europe. Population, 1905, Hamburg City, 802,793; Hamburg State, 874,878.

**HAMILTON** (hām'il-tūn), a town of Australia, capital of Dundas and Normanby counties, in the western district of Victoria. It is located on Grange Burn Creek, fifty miles northeast of Portland, and is surrounded by a fertile farming and stock-raising country. It has electric lights, waterworks, and railroad connection with the principal cities of Australia. The chief buildings include several churches and schools and a number of structures erected for city and county governmental purposes. Population, 1901, 4,026.

**HAMILTON**, a town on Hamilton Island, capital of the Bermudas. It has a safe and commodious harbor and is the seat of a considerable trade in fruit, sugar, and merchandise. The place was founded in 1790. Population, 1901, 2,246.

**HAMILTON**, a city in Ohio, county seat of Butler County, on the Great Miami River, 25 miles north of Cincinnati. It is on the Miami

and Erie Canal and on the Pittsburg, Cincinnati, Chicago and Saint Louis, the Cincinnati, Hamilton and Dayton, and other railroads. Many of the streets are finely paved, lighted by gas and electricity, and improved by sewerage, waterworks, and avenues of trees. The noteworthy buildings include the county courthouse, the public library, the high school, and several charitable institutions. The chief manufactures are stoves, steam engines, candy, laundry machinery, hosiery, earthenware, vehicles, furniture, cordage, spirituous beverages, and textile fabrics. It has a large trade in farm produce and merchandise. The place was settled in 1791, when Gen. Arthur Saint Clair built Fort Hamilton, and it was incorporated in 1810. Population, 1900, 23,914; in 1910, 35,279.

**HAMILTON**, the capital of Wentworth County, Ontario, Canada, at the west end of Lake Ontario, seventy miles northwest of Buffalo, N. Y. It is on the Grand Trunk, the Canadian Pacific, and other railways. The site is a

VICINITY OF HAMILTON, ONT.

fine tract on Burlington Bay, an inlet from Lake Ontario, and the port is connected with deep water by a canal through a sand bar, which serves as a breakwater for the inner harbor. It has regularly platted and well-graded streets, many of which are paved with stone and macadam. The chief buildings include the county courthouse, the Dominion post office, the town-hall, and many fine schools and churches. It has a public library, gas and electric lighting, systems of waterworks and sewerage, and intercommunication by electric railways. The race course is one of the finest in America. As a manufacturing center it takes high rank among Canadian cities, the products including canned goods, flour, ironware, machinery, glassware, cotton and woolen goods, shoes, and musical in-

struments. Hamilton was platted in 1813, but its larger growth has been realized within the past two decades. Population, 1901, 52,634.

**HAMITES** (häm'its), or **Hamitic**, the name of a race of people in the northern part of Africa, so named because they are supposed to have descended from Ham. They belong to the white or Caucasian branch of the human family and were the earliest to develop a high civilization. In language they are related to the Semites, but there are three principal dialects, those known as the Berber, Egyptian, and Ethiopian. Though Egypt is supposed to have been their original seat, they extended their settlements to the Canary Islands and southward on the continent to the southern limits of German East Africa. At present they are divided into numerous branches, many of which are strongly negroid. They include principally the Copts, Gallas, Berbers, Kabyles, Tuaregs, Tubus, Falashas, Somalis, Danakils, and Guanches.

**HAMM**, a city of Germany, in Westphalia, on the Lippe River, 23 miles northwest of Arnsberg. It is important as a railway junction and manufacturing center. The streets are regularly platted and well paved. It has a church which dates from 1510. The manufactures include gloves, leather, machinery, clothing, and brick and tile. It was for many years an important member of the Hanseatic League. Population, 1905, 38,429.

**HAMMER**, an instrument for driving nails or beating metals, consisting of the head and the handle. The small hammers in use among blacksmiths have an iron or a steel head fixed to a wooden handle. One end of the head is usually larger than the other, one being fitted for drawing nails or for hammering larger pieces of metal than the other. The larger use of steam and electricity has caused power hammers to come into general use for manufacturing purposes, some of which are large machines, especially those used in forging iron and steel. See **Steam Hammer**.

**HAMMOND** (häm'münd), a city of Lake County, Indiana, on the Grand Calumet River, three miles from Lake Michigan and twenty miles southeast of Chicago. It is on the Erie, the Baltimore and Ohio, the Wabash, the Monon, the Michigan Central, and other railroads, and has direct connection with Chicago by electric railways. The noteworthy buildings include the Carnegie library, the Federal building, the courthouse, the public high school, and a number of fine churches. Among the industries are starch works, machine shops, iron foundries, flouring mills, meat-packing establishments, and publishing houses. Many of the highways adja-

cent to the city have been finely macadamized. Among the public utilities are sewerage, waterworks, and street pavements. Hammond was settled in 1869 and incorporated in 1883. Population, 1900, 12,376.

**HAMPTON** (hämp'tün), a town of Virginia, county seat of Elizabeth City County, on the Chesapeake and Ohio Railroad. It is located on the north side of Hampton Roads, about two miles northwest of Fortress Monroe, and has considerable trade in oysters, fish, vegetables, and agricultural produce. The public institutions include the Hampton Normal and Agricultural Institute. It has the Church of Saint John built in 1660, a national soldiers' home, and a national cemetery where 3,325 bodies are buried. The first settlement on its site was made about 1610. Population, 1900, 3,521.

**HAMPTON COURT CONFERENCE**, a conference held at Hampton Court, an English royal palace on the north bank of the Thames. It met in 1604, shortly after the accession of James I., for the purpose of discussing religious differences with the Puritans. The latter had presented a petition for a more liberal use of the Prayer Book and other reforms within the church, but the king, angered by the use of the word presbyter, refused to grant the points petitioned for by the Puritan party. The last of the three sessions of the conference, held on Jan. 18th, was the beginning of Puritan opposition to the house of Stuart.

**HAMPTON NORMAL AND AGRICULTURAL COLLEGE**, an institution of general learning and industrial arts at Hampton, Va., to which only Negroes and Indians are admitted. It was opened in 1868 under the auspices of the American Missionary Association, under the direction of Gen. S. C. Armstrong, and received a state charter in 1870. The grounds contain 185 acres on the Hampton River, on which about 60 buildings are maintained, and five miles distant is a farm of 600 acres that is worked by students. Besides teaching the fundamental courses in educational work, instruction is given in carpentry, painting, blacksmithing, horticulture, agriculture, stock raising, and other industrial arts. The industrial department continues throughout the year, but the schools of general education have a vacation during the summer. About 60 per cent. of the graduates engage in teaching, but a large number become successful farmers, carpenters, blacksmiths, and workers in other lines. Booker T. Washington, president of the Tuskegee Institute and Normal School, is one of the graduates. The institution has about 600 stu-

dents, an annual income of \$170,000, and a library of 15,000 volumes.

**HAMPTON ROADS**, an inlet from Chesapeake Bay, in Virginia, forming the mouth of the James River. The channel is wide and deep, amply sufficient to accommodate the largest vessels, and on its shores are many good harbors, including those of Norfolk and Newport News. On the northern shore is Fortress Monroe, which on March 8, 1862, was the scene of an important naval battle between the Confederate ironclad *Virginia*, previously called the *Merrimac*, and the Union vessels *Congress* and *Cumberland*, which resulted in the destruction of the latter two. On the following day the *Monitor*, a Union ironclad of a new type, appeared on the scene of battle, and after a fight of four hours compelled the *Virginia* to withdraw.

**HAMPTON ROADS CONFERENCE**, an informal conference of the United States, held on board of the *River Queen* near Fortress Monroe on Feb. 3, 1865. The purpose was to discuss the differences arising from the Civil War between the two sections of the country. President Lincoln consented to this meeting as a means of perpetuating the Union, in which he was aided by Secretary Seward, while the Confederacy was represented by Alexander H. Stephens, Vice President, Robert M. T. Hunter, and John A. Campbell. The meeting had been promoted by Francis P. Blair as a means of uniting the two sections with the view of abolishing slavery and expelling the French from Mexico. While Lincoln declared himself in favor of admitting the Southern States after their surrender, he expressed himself opposed to modifying the Emancipation Proclamation and to any treaty with the Confederate States as an independent government. No agreement was reached during the four hours that the conference was in session.

**HAMSTER** (häm'stēr), a genus of rodent animals closely allied to the rat, but belonging to the family of mice. The tail is short and the body is from eight to twelve inches long. They have large cheek pouches in which they carry grain and other food into their burrows. The food consists chiefly of cereals, vegetables and other forms of plant growth. Several of the species are noted for carrying corn and other seeds into their subterranean abodes for use as food in the winter. The common hamster ranges throughout the dry region of Europe and Asia.

**HANCOCK** (hän'kōk), a town of Michigan, in Houghton County, on Lake Portage, opposite Houghton. It is located on the Duluth, South Shore and Atlantic Railroad and has

transportation facilities by water through a ship canal to Lake Superior. The surrounding country is noted for its rich deposits of copper and near it are the famous Calumet and Hecla mines. It has foundries, smelting works, machine shops, and a large trade in merchandise. It is the seat of a Finnish college, has electric lighting and waterworks, and contains Montezuma Park. The place was settled in 1859 and incorporated in 1863. Population, 1910, 8,981.

**HAND**, the part of the fore limb which is attached to the lower extremity of the forearm and is adapted for grasping. It is possessed by man, apes, monkeys, and lemurs, but in its highest perfection belongs only to man. The hand of apes and kindred animals serves partly for prehension and grasping, and to some extent it is necessary for support and locomo-

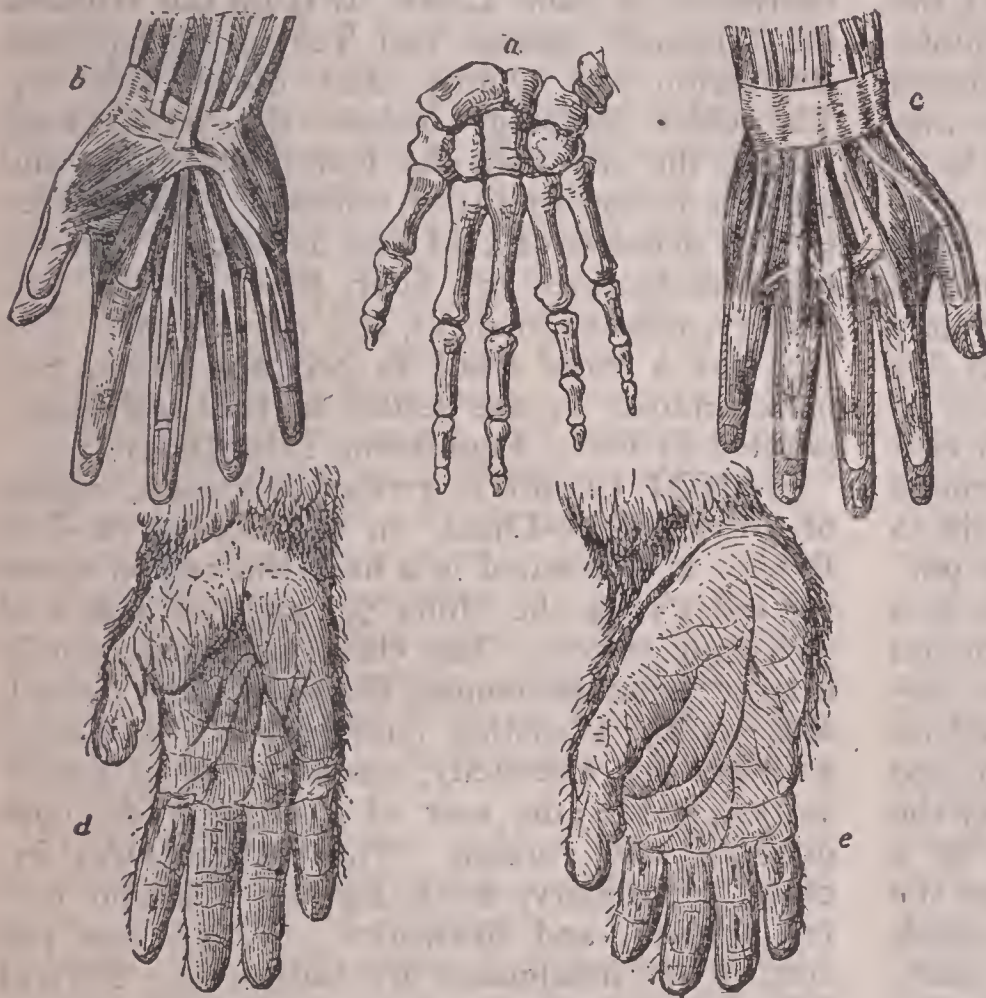

contact with the fingers. The outer phalanges form hinge joints, but the first bone of each finger is attached to the corresponding metacarpal bone so as to be movable in several directions. Fingers are named in order—the little, ring, middle, and index finger, and the thumb. When closed they fit the hollow of the hand, and are thus capable of more easily grasping objects of varying size. When clasping a ball, the tips of the fingers are in a straight line.

All parts of the hand are supplied with strong ligaments and muscles, thereby giving much freedom of motion, elasticity, and power of activity in numerous directions and for a great diversity of purposes. Artists have studied the elegance of outline, beauty of color, and delicacy of mold in the human hand, while its extraordinary mobility and adaptation to various

uses have led many philosophers to attribute superiority to man fully as much on account of the hand as for his higher intellectual powers. The numerous nerves of the hand and fingers give the latter a more acute sense of touch than is found in any other part of the body. In linear measure the hand is assumed to be four inches and is frequently used in measuring the height of horses. Palmistry relates to the lines of the inner hand. Those who make it a study claim to be able to predict regarding the future.

**HANG-CHOW** (häng'chou), a port and city in China, capital of the province of Che-kiang, on the Tsién-tang River, at the place where it flows into Hang-chow Bay. It is the southern terminus of the Grand Canal, which furnishes transportation facilities to Tientsin. Walls about twenty feet thick and from thirty to forty feet high surround the older parts, but the finest buildings are outside the walls, in the suburbs. The city has some of the most beautiful monuments, temples, and edifices of China. It ranks as one of the leading

literary, religious, and commercial centers and is noted for its public improvements and well-paved streets. Among the manufactures are silks, tapestry, furs, lacquered ware, carpets, porcelain, jewelry, fans, and machinery. The foreign trade is transacted chiefly at Chapu, its seaport, about twenty miles nearer the sea. At the time of its greatest prosperity it had a population of over 2,000,000. The Taipang rebellion of 1861 caused temporary decline, but it is rapidly gaining in population and industrial rank. Marco Polo visited the city in the 13th

HAND.

a, Bones; b, c, Muscles; d, e, hand of the Chimpanzee.

tion. Twenty-seven bones comprise the framework of the human hand. In the wrist are eight separate bones, called the *carpal*, consisting of two rows, each containing four bones. The five bones of the inner hand and lower part of the thumb are called *metacarpal*, while in the fingers and thumb are fourteen bones, three in each finger and two in the thumb, these being known as the *phalanges*. The thumb, standing apart from the rest, possesses a well-known freedom of motion, and is thereby especially useful in seizing and grasping when brought in

century and described it as a center of much grandeur and wealth. In 1896 it was opened to foreign commerce. Population, 1906, 768,550.

**HANGING**, a mode of inflicting capital punishment. This method is of great antiquity and was first practiced by hanging a murderer upon a gibbet near the place where the crime was committed. It was first used in England in 1241, when the son of a nobleman was hanged for piracy. At present it is the ordinary mode of executing in the United States and Great Britain, but in a few of the states in the former country electrocution has been adopted. Hanging causes the windpipe to become compressed by the rope or cord, which prevents the flow of blood to a considerable extent and in some instances causes a fracture or dislocation of the vertebrae. Although attended by violent struggles in some cases, it is considered one of the most humane methods and is usually administered without unnecessary publicity. The courts that pronounce the sentence usually direct that the convict "be hanged by the neck until he is dead."

**HANGING GARDENS**, a structure built at Babylon and classed among the seven wonders of the world. The construction of these gardens is attributed to Nebuchadnezzar about five centuries B. C., although others ascribe them as the work of Queen Semiramis, fully seven centuries earlier. Several historians who attribute them to Nebuchadnezzar think they were built to gratify his Median queen, Amytis, for the purpose of making the plains of Babylonia less dreary to her when contrasted with the mountain scenery of her native land. The gardens covered an area of four acres, were supported on arches of masonry of terrace construction, and rose to a height of 75 feet. A reservoir at the top supplied water, which was pumped by a force of men from the Euphrates, to irrigate the flowers, shrubs, and trees by artificial channels and fountains. Banqueting rooms were maintained in various parts of the gardens, and beautiful scenic walks and resting places were located at convenient localities.

**HANKOW** (hän-kou'), a river port and city in China, at the junction of the Yang-tse-kiang and the Han River, in the province of Hupeh. The site is mainly in the angle formed by the two rivers, hence is quite level and not well drained. It is on the line of the trunk railway which is eventually to connect Canton on the south with Peking on the north. Regular steamship communication is maintained with the leading ports of China. It is important as a commercial center and is the chief industrial city in the green tea district. The manufac-

tures include porcelain, clothing, jewelry, earthenware, and silks. It was opened to foreign commerce in 1862. The trade is chiefly with Great Britain, Japan, and Germany. Population, 1906, 585,500.

**HANLEY** (hän'li), a manufacturing city of Staffordshire, England, near Stoke-upon-Trent, about 148 miles northwest of London. It is on a branch of the Trent and Mersey Canal and has extensive steam and electric railway connections. The municipality maintains a market, public baths, a cemetery, and a public library. Among the manufactures are chinaware, clothing, pottery; and machinery. Hanley was granted a municipal constitution in 1857. Population, 1907, 67,174.

**HANNIBAL**, a city of Missouri, in Marion County, on the Mississippi River, 112 miles northwest of Saint Louis. It is on the Wabash, the Missouri, Kansas and Texas, the Chicago, Burlington and Quincy, and other railroads. The chief buildings include the public high school, the city hall, the Federal building, and a public library of 15,000 volumes. In the vicinity are deposits of coal and limestone. Among the manufactures are flour, lime, pottery, machinery, tobacco, utensils, and railway cars. The city has a large trade in produce, grain, and merchandise. It was settled in 1819 and incorporated in 1839. Population, 1910, 18,341.

**HANOI** (hä-noi'), a city of Annam, capital of French Indo-China, on the Sonkoi or Red River. It is situated in a beautiful region about 110 miles from the China Sea and has wide and well-built streets. The chief buildings include a large Buddhist temple, the palace, the citadel, and several Christian churches. It is lighted with gas and electricity, has a system of waterworks, and is the seat of a large trade, both domestic and foreign. The manufactures include embroidery, mats, leather, silk and cotton textiles, and fireworks. About one per cent. of the inhabitants are Europeans. Several French newspapers are published within the city and it is the seat of many European public and missionary schools. It has been a possession of France since 1882. Population, 1906, 110,508.

**HANOVER** (hän'ö-vēr), or **Hannover**, a province of Prussia, in the northwestern part of the German Empire. It has an area of 14,869 square miles. The surface is an undulating plain, with alluvial flats and moors in the northern portion. It is well watered by the Weser, Elbe, and Ems rivers and their numerous tributaries. Nearly one-half of the province is arable and about one-seventh is covered with timber. Farming and stock raising are extensive industries, but it likewise has considerable

interests in fruit culture and fishing. It is penetrated by many steam and electric railways and is noted for its production of beet sugar. The mines yield vast quantities of copper, iron, lead, asphaltum, coal, zinc, and silver. Among the chief manufactures are clothing, canned fish, paper, glass, linen, woolen, and cotton goods, sugar, machinery, and musical instruments.

Hanover is divided into the six administrative districts of Lüneburg, Hanover, Stade, Hildesheim, Aurich, and Osnabrück. These districts are divided for local government into 78 circles. It holds high rank in education, its system of schools culminating in the famous University of Göttingen. Hanover was formerly an independent kingdom, but, siding with Austria in 1866, it was annexed to Prussia in the same year. Hanover is the capital. The inhabitants are chiefly Protestants. Population, 1905, 2,759,544.

**HANOVER**, a city in Germany, capital of the province of Hanover, at the confluence of the Leine and Ihme rivers, 65 miles southeast of Bremen. It is noted for its beautiful streets, extensive railroad connections, and commercial importance. The chief buildings include the royal palace, the Church of Christ, the railway station, the townhall, and the Royal Theater of Hanover. Among the manufactures are machinery, chemicals, cotton and woolen goods, tobacco and cigars, musical instruments, porcelain, and toys. Gas and electric lights, stone pavements, electric street railways, and systems of waterworks and sewerage are among the improvements. It is first mentioned in history in 1163, joined the Hanseatic League in 1481, and became the capital of Hanover in 1486. Since 1866 it has belonged to Prussia. Population, 1905, 250,024.

**HANOVER**, a town of New Hampshire, in Grafton County, on the Connecticut River, 55 miles northwest of Concord. It is opposite Norwich, Vt., with which it is connected by a bridge. Hanover is noted as the seat of Dartmouth College (q. v.), which was established here in 1769, and is one of the important educational institutions of America. The town is a beautiful place, having an advantageous site, scenic gardens, and many fine churches and residence buildings. Population, 1900, 1,884.

**HANOVER**, a borough of Pennsylvania, in York County, forty miles northwest of Baltimore, Md., on the Pennsylvania and the Western Maryland railroads. It is surrounded by a productive agricultural region. Deposits of iron ore and clay are worked in the vicinity. The manufactures include shoes, cigars, carriages, clothing, and machinery. It has a large trade in merchandise and farm products. The first

settlement on its site was made in 1730. Population, 1900, 5,302.

**HANSEATIC LEAGUE** (hän-sē-ät'ik lēg'), or **Hansa**, an association of certain German and adjacent cities formed in the 13th century for the purpose of mutual protection and the development of commercial interests. The first steps in the direction were taken by Hamburg, Hadeln, and Ditmarsh in 1219 to protect themselves against pirates that infested the North Sea. In 1241 the city of Lübeck was added with the view of joining Hamburg in protecting travel on the highway across Holstein between the Baltic and the North Sea. Brunswick joined in 1247, when the general name applied to the league originated. During its most prosperous period the association included 85 cities, embracing both inland and maritime towns from Amsterdam to Reval, and from Cologne to Breslau and Cracow. Lübeck was recognized as the principal member and was the meeting place of the deputies who governed the league. The association attained much political influence by supplying money and extending trade to various countries.

The Hanseatic League, as a safeguard and for mutual protection, maintained armies and navies. It constructed canals, developed the principles of mercantile law, adopted a system of weights and measures, and made treaties with various countries to further commercial interests. In 1370 its army gained victories over the kings of Norway, Sweden, and Denmark, and for a time the association claimed the power to choose the sovereign of the last mentioned country. Since the seaport cities possessed advantages over inland towns, the league began to lose power in the 16th century, and most of the countries with which it had treaties revoked them before the beginning of the 17th century. After 1628 the only cities to maintain an organization were Hamburg, Lübeck, and Bremen, but these were joined by Frankfort-on-Main in 1813. In 1866 Frankfort was incorporated with Prussia and the other three became a part of the German Empire in 1870. Since 1889 these cities have belonged to the German customs union.

**HAPSBURG**, **House of**, the reigning dynasty of Austria. The name was derived from the castle of Hapsburg in the Swiss canton of Aargau, on the Aar River. Bishop Werner of Strassburg built the castle in 1027, and his successor, Werner II., was the first to assume the title of Count of Hapsburg, about 1090. From him descended Albert, who is mentioned as Count of Hapsburg in 1152, and Emperor Frederick I. appointed him landgrave of upper Al-

sace. The family attained to much power in Swabia under his son, Rudolph I., and in 1273 Rudolph, son of Albert IV., secured the election as Emperor of Germany. He became hereditary monarch of Austria in 1282. From him descended all the Hapsburg monarchs of Austria to Charles VI. With the marriage of Marie Theresa to Francis Stephen of Lorraine, it became known as the house of Hapsburg-Lorraine, and Francis II. assumed the title of Emperor of Austria. The house of Hapsburg has furnished numerous sovereigns of Austria, Germany, and Spain, Francis Joseph I. being one of its most distinguished members.

**HARA-KIRI** (hä'rä-kē'rī), or **Seppuku**, a method of committing suicide, formerly permitted by the government of Japan. It was practiced by those of the Samurai and nobles who preferred self-disembowelment to some disgrace. At first it took the form of a custom, but in 1500 it was adopted as a mode of punishment, and noblemen and gentlemen were permitted to demand the hara-kiri instead of being executed like common criminals. Afterward this mode of punishment developed into execution by the best friend of the accused, who usually beheaded the criminal in the presence of friends and several official witnesses. Hara-kiri has been abolished as a mode of punishment, but suicide is sometimes committed by this method.

**HARBOR** (hä'r'bēr), a port for ships, natural or artificial, on the coast of a sea, lake, or some other body of water. The importance of a harbor depends upon the depth of its water, freedom from breakers, and natural protection against storms. Inlets and indentations on the shore of lakes and the ocean ordinarily furnish the best roadsteads for ships. Many governments have made liberal expenditures to dredge and otherwise improve the harbors located on rivers, lakes, and the ocean. Indeed, the designing and construction of harbors constitute one of the most difficult departments of civil engineering. Among the essential parts of harbors are docks, quays, piers, jetties, wharves, and breakwaters. A harbor which is designed primarily for shelter, usually called a *harbor of refuge*, must have an artificial or a natural breakwater. Commodious docks are maintained in many harbors, whereby loading and unloading is facilitated by keeping the water surface practically at a common level.

**HARBOR GRACE**, a port of Newfoundland, on the west coast of Conception Bay, 27 miles northwest of Saint John's. It is connected with the interior by the Newfoundland Railway. The chief buildings include the cathedral, the public library, and the courthouse. The harbor

is well protected by the beach. It has many mercantile establishments, fishery supply houses, and manufactures of clothing, earthenware, and machinery. The place is noted for its fine scenery, well graded streets, and extensive facilities for bathing and boating. It has an important commercial trade, both inland and foreign. Population, 1908, 8,264.

**HARBURG** (hä'r'böörg), a city of Germany, in the province of Hanôver, on the Elbe River. It has extensive railroad and electric railway facilities and a large trade in farm produce and merchandise. An old castle on the Elbe, a real gymnasium, and several schools and churches are among the noteworthy buildings. The manufactures include chemicals, jute, linseed oil, cement, boilers, glass, machinery, and gutta-percha wares. An electric railway connects it with Hamburg, which is seven miles north. It has been a part of Prussia since 1866. Population, 1905, 55,676.

**HARDNESS** (härd'nēs), the property of matter which causes bodies to resist being scratched or worn by other bodies. Since there is no such thing as an absolutely hard or soft body, it follows that hardness is a relative property. Heating and cooling change the degree of hardness of some metals. If iron and steel are heated and then cooled slowly, they become softer, but they are hardened by being cooled quickly after raising the temperature to a red heat. On the other hand, copper is softened by cooling quickly and hardened by cooling slowly. The diamond is the hardest of all natural substances and diamond dust is used to cut other stones. Glass, which is harder than wax, is softer than the diamond. Both glass and steel are hard, but the former is brittle while the latter is tough.

**HARE**, a class of rodent quadrupeds which belong to the genus *Lepus*. They are characterized by a short tail, long ears, a cleft upper lip, and long hind legs. Hares are similar to rabbits in all general respects, but differ from them in that the latter are inclined to burrow more extensively and show more sociability in living in families, while hares are solitary and prefer to find an abode in grasses and underbrush. About forty species have been described, fully half of which are indigenous to America. The *polar hares* of North America are noted for their pure white color in winter and large size, while the *prairie hares*, a class embracing the *jack rabbits*, are distinguished for their large body and long limbs. The timidity of these animals is proverbial, though their lack of courage and cunning is overcome largely by marked acuteness of hearing and sight and by their remarka-

ble swiftmess in leaping and running. Most species lie secluded during the day and come out at twilight in search of food, which consists mainly of green vegetation, roots, and the bark of trees, but in populated districts they feed also on cereals. The voice somewhat resembles that of a child, but it is never heard except when they are wounded or seized. The flesh is prized as an article of food, but it is much more valuable

HARE.

during the fall and winter than in the summer season. It is rare sport to pursue the hare, especially after a light fall of snow, when it may be tracked to its place of hiding. The fur of hares enters into the manufacture of hats, and is used to a limited extent for linings and garments.

**HAREBELL** (hâr'bĕl), or **Bluebell**, the name of a plant native to Europe and America, so named from its bell-shaped flower. The stem is slender and about five inches high and the flowers are variously colored. Most of the species have blue flowers, hence they are called *bluebells* in some localities. The harebell thrives in cold regions and the flowers are often seen among the snow and ice on the rocky slopes of mountains. It is believed they generate sufficient heat to permit their growth and endurance under such conditions.

**HAREM** (hâr'rĕm), the set of apartments reserved for the female members of a Mohammedan family, at which all males are forbidden entrance, except the husband and near relatives. Harems are maintained only by the richer Moslems and in them the wives, concubines, and children have their abode, being attended by female slaves and eunuchs. The inmates spend their lives largely in dressing, bathing, pleasurable occupations, and in the society of other

Turkish women. It is commonly reported that the Sultan of Turkey maintains the greatest harem in the world, most of his women being Circassians and Georgians. The apartments occupied by them are of magnificent architecture and contain elaborate decorations and furniture. At the time of the Spanish-American War much interest centered in the Sultan of the Sulu Islands, one of the Philippines, who maintained a harem of considerable size.

**HARLEM RIVER** (hâr'lĕm), the name given to the tide channel that separates Manhattan Island, on which New York City is mainly situated, from the mainland. It connects the Hudson River with the channel called East River, which separates Manhattan from Long Island. Harlem River begins at Kingsbridge, where Tibbet's Brook flows into Spuyten Duyvil Creek, and extends for a distance of seven miles toward the southeast to Randall's Island, near Hell Gate. At low water the depth is nine feet and at high water fifteen feet. The Speedway, a beautiful roadway, extends along the western shore of the Harlem and the buildings of New York University are on the lofty eminence on the opposite shore.

**HARMONICA** (hâr-mŏn'ĭ-kâ), an instrument for producing musical sounds by means of glasses of different sizes. The glasses are fixed to a spindle, which is set in motion by a treadle worked with the foot, and they are touched by the moistened finger of the player as they revolve. This instrument was improved by Benjamin Franklin, who invented the revolving spindle, and in this form the instrument became fashionable in America and England. Miss Davis, a relative of Franklin, became celebrated as a player on the harmonica. However, the instrument was known at the time Goldsmith mentioned the musical glasses in his novel. The name harmonica is applied to a flat instrument with delicate brass reeds, which is played by the inhalation or exhalation of the breath, and is sometimes called *mouth organ*.

**HARMONICS** (hâr-mŏn'iks), in music, the attendant or secondary tones produced by the vibration in aliquot parts of the same body or string that gives, by its complete simultaneous vibration, the primary or fundamental tones. They are sometimes called *overtones*. The vibration of a piano is so regulated that higher harmonics than the seven are not present. Harmonics serve to modify tones and give them their distinctive quality or timbre, and may be detected without difficulty by the practiced ear.

**HARMONY OF THE SPHERES**, a kind of music supposed by the ancients to be produced by the motion of the heavenly bodies.

Pythagoras and a number of early philosophers taught that the harmony of the spheres is audible at all times, but that it cannot be contrasted with absolute silence, since the latter is a condition entirely unknown. It was the general impression that this music was produced under fixed laws, which could be expressed in numbers like those used in designating the harmony of sounds.

**HARNESS**, the equipment of a horse for drawing a coach, wagon, or a vehicle or load of any kind. It consists essentially of leather straps, either simple or padded, fastened or united by sewing, buckles, or rings. Formerly harnesses were either sewed or riveted by hand, but at present they are made almost entirely by sewing machines. The principal parts of a harness consist of the saddle, collar, tugs, bridle, checkrein, hames, and lines. Harnesses intended for heavy work are usually plain and strong, while those for light driving are mounted or ornamented with silver or gold plate.

**HARP**, a stringed instrument of triangular form. It is of great antiquity. The sculptures and ruins of the Egyptians and Syrians give evidence that it was a favorite instrument among

ANCIENT EGYPTIAN HARPS.

them. It is mentioned at numerous places in the Scriptures, and long remained in popular favor among the Greeks, Romans, and various peoples of

Western Europe. The instruments of this class used in ancient times were about seven feet high, and, like those of more modern manufacture, were furnished with gut strings. The harp mentioned in the Bible was somewhat smaller and could be carried easily from place to place by strolling musicians. In Western Europe the harps were similar to those of Eastern peoples, and formed a popular musical accessory for many centuries. The *Italian harp*, a kind popular in Italy several centuries ago, is rarely used at present, and the triangular harp of mediaeval construction has likewise gone out of general use. The so-called *pedal harp*, in which pedals are utilized to raise the pitch of all the strings chromatically, is the one now generally preferred. A harp on this plan was patented in 1810. It is provided with seven pedals, contains 43 strings tuned according to the diatonic scale, and may be readily adjusted to produce beautiful and diversified tones.

**HARPER'S FERRY**, a town of Jefferson County, West Virginia, at the confluence of the Potomac and Shenandoah rivers, 55 miles northwest of Washington. It is on the Baltimore and Ohio Railroad. The surrounding country is fertile, producing cereals, tobacco, and vegetables. It is the seat of Storer College, a normal school for Negroes. Harper's Ferry is celebrated on account of the historic raid made by John Brown in 1859 for the purpose of forcibly liberating the slaves. When Virginia seceded, in 1861, it was abandoned by the Union garrison, consisting of only 45 men. The following year it was again occupied by the Federals, but General Jackson captured it on Sept. 15, 1862, and procured about 12,500 prisoners. Population, 1900, 896.

**HARPOON** (här-pōon'), an implement of iron used in killing large fish and whales. It consists of a shank terminating at one end in a socket, to which a long rope is attached, and at the other end is a broad flat head, sharpened so as to penetrate with facility. It is furnished with barbs or withers. The rope, called the *whale line*, is coiled in the boat and is quite long, so the whale may dive after the harpoon, which is about three feet long, has been fastened into its body. Whalers may throw the harpoon by hand, or it may be shot from a harpoon gun. More recently the bomb lance has come into use. It is shot from a gun and explodes when the body of the whale is entered, causing almost instant death.

**HARPSICORD** (härp'si-körd), a stringed instrument with a keyboard somewhat resembling a modern pianoforte, and now largely superseded by it. A superior kind of harpsichord had two keyboards, one for producing the soft notes and the other the louder tones. They contained stops for modifying the tones, being thereby rendered suitable for different classes of music. The sounds were produced by the keys raising oblong slips of wood, called *jacks*, which were supplied with appendages that struck the wires in a manner quite similar to the hammers used in the modern pianoforte.

**HARPY** (här'pÿ), a large eagle of South America, considered one of the most powerful birds of prey. The bill is strong and curved at the tip, the toes have powerful claws, and the spread of wings is from five to six feet. The feathers of the breast are long and loose and the general color is black above and white below. The Indians use its feathers in making arrows and for decorative purposes. It lives in the dark forests, especially near the border of great rivers, and subsists on large birds, sloths, monkeys, young deer, and other quadrupeds. Nat-

uralists agree that it is one of the most powerful and bold birds of prey, but the current idea that it attacks man is not well founded. The harpy is most numerous in South America, but is met with in various parts of Central America and Mexico.

**HARRISBURG** (hă'rîs-bûrg), the capital of Pennsylvania, county seat of Dauphin County, on the Susquehanna River, 104 miles west of Philadelphia. It is on the Pennsylvania, the Philadelphia and Reading, the Cumberland Valley, and other railroads, and has communication by suburban and interurban electric railways. The site is a beautiful tract along the river, which is spanned by many bridges. It has broad and regularly platted streets and many fine public buildings, among them the State capitol, an arsenal, an insane asylum, a Roman Catholic cathedral, a State library of 105,000 volumes, and numerous beautiful churches. The State capitol, erected at a cost of \$5,000,000, has a frontage of 520 feet and a dome 241 feet high. It was dedicated to public use in 1906, when President Roosevelt delivered the dedicatory address before a large concourse of people. Other noteworthy buildings include the high school, the county courthouse, the Federal building, the Grand Opera House, the Y. M. C. A. building, and many tall bank and office buildings.

The importance of Harrisburg as a manufacturing center is to be attributed to large deposits of coal in the vicinity, and to its excellent transportation facilities by river navigation and railways. Among the manufactures are railroad engines and cars, hats, ironware, machinery, cotton and woolen goods, flour, shoes, pottery, silk textiles, musical instruments, and brooms. The extensive iron and steel interests are worthy of special mention. It has a large trade in grain, lumber, coal, building stone, and merchandise. The streets are well graded and paved with stone and asphalt. Harrisburg was first settled in 1726 by John Harris, an English trader. It was platted in 1785, became the capital in 1812, and was chartered as a city in 1860. Population, 1900, 50,167; in 1910, 64,186.

**HARRISON** (hă'rî-sûn), a city of Hudson County, New Jersey, on the Passaic River, opposite the city of Newark. It is on the Erie, the Pennsylvania, and the Lackawanna railroads. The surrounding country is agricultural and fruit growing. Among the manufactures are cutlery, linoleum, thread, electric fixtures, wire, machinery, and clothing. It is the seat of the State Soldiers' Home, has communication by electric railways and maintains a system of waterworks. Harrison was settled in 1668 and incorporated in 1873. Population, 1910, 14,498.

**HARROW**, an implement for pulverizing and smoothing plowed land, either before or after sowing the seed. It consists of an iron or a wooden frame, either square or rhomboidal, to which iron teeth are fastened by bolts or otherwise. Originally the harrow was made entirely of wood, but later iron teeth were driven through the woodwork, projecting downward about eight inches, and now many harrows are entirely of metal. Revolving disks of steel, fastened to heavy iron bars, have to some extent displaced the common harrow. The work with these implements is done by dragging them across the land with horses or mules.

**HARTFORD** (hărt'fêrd), a city and the capital of Connecticut, county seat of Hartford County, on the Connecticut River, 110 miles northeast of New York City. It is on the New York, New Haven and Hartford and the Connecticut Valley railroads. The large vessels reach it from Long Island Sound, which is 50 miles distant, and it has communication by many electric lines. It has a fine site, which commands a view of the Connecticut valley. The streets are regularly platted and improved with grading and stone and asphalt pavements. Charter Oak Park contains the race tracks and fair grounds. The State capitol is located in Bushnell Park, which embraces 46 acres.

Hartford is generally well built and has many large and modern structures. The State capitol, which is built of white marble, is a large and imposing building. The city hall, which was formerly the State house, is famous as the seat of the Hartford Convention. Other noteworthy buildings include the post office, the Hartford Theological Seminary, the Cheney building, the Saint Joseph Cathedral, the Wadsworth Athenaeum, and the buildings of the Aetna Life, the Phoenix Mutual Life, and the Connecticut Mutual Life insurance companies. It is the seat of asylums for orphans, for the insane, and for the deaf and dumb. Trinity College, an Episcopal institution, is located near the city. The library of Trinity College has 50,000 volumes, and, besides it, there are several other libraries. Hartford has been a port of entry since 1887 and has an extensive commercial and insurance business. The manufactures include sewing machines, silk and woolen goods, firearms, vehicles, machinery, hardware, flour, bicycles, stoves, and furniture. In 1633 the Dutch built a fort on its site and in 1635 a colony settled here from Massachusetts. It was incorporated as a city in 1734 and until 1873 was the joint capital of the State with New Haven, but in that year became sole capital. Among the sights of interest shown visitors for

a number of years was the celebrated Charter Oak, the tree in which the charter of Connecticut was hidden when Governor Andros demanded its surrender. Population, 1910, 98,915.

**HARTFORD CITY**, a city and the county seat of Blackford County, Indiana, 72 miles northeast of Indianapolis. It is on the Pittsburg, Cincinnati, Chicago and Saint Louis and the Lake Erie and Western railroads. The chief buildings include the courthouse, the high school, and several fine churches. It has manufactures of flour, paper, glass, vehicles, and machinery. Electric lights, telephones, waterworks, and a library are among the facilities. Population, 1900, 5,912.

**HARTFORD CONVENTION**, an association of delegates proposed by the Legislature of Massachusetts. It convened at Hartford, Conn., Dec. 15, 1814, and adjourned Jan. 5, 1815. The Federalists of the New England states opposed the war with Great Britain, which was then in progress. The war was especially injurious to the interests of New England because it operated to destroy the commercial importance and the fisheries of that region. The object of the convention was to devise means for security that would prevent total destruction, but it met behind closed doors, and was carefully watched by a government military officer. From time to time the conclusions of the convention were published in the form of measures looking to the protection of the citizens against compulsory military service, but there was a widespread suspicion that the members of the convention designed to disseminate a sentiment favorable to the establishment of a kingdom in New England. Since the delegates consisted of leading Federalists who had favored an eastern confederacy in 1804 and the work of the convention was designed against the Democratic administration, a public sentiment was formed against the Federalists and entirely ruined them as a party in the election of 1816. Subsequently it was shown conclusively that the reports of treason were not well founded and that the delegates had in mind only the interests of their section of the Union.

**HARTSHORN** (härts'hörn), a volatile preparation of ammonia, now obtained from carbonate of ammonia and other sources, but formerly prepared from the horn of the common stag. The product was derived by distillation and sold as oil of hartshorn or spirits of hartshorn. It is employed for many purposes in medicine, especially in cases of fainting and nervous weakness. The scent is very strong, serving as a relief in headache.

**HARVARD UNIVERSITY**, an important

institution of higher learning, situated in Cambridge, Mass. It was founded under an appropriation of \$2,000 voted by the general court of the Massachusetts Bay Colony and established on Oct. 28, 1636, being the oldest university in the United States. No material advancement was made until 1638, when John Harvard bequeathed half his estate valued at \$4,000 and his library of 300 volumes to the proposed institution. In the same year it was organized as Harvard College. The first class of nine graduates completed the course in 1642. Henry Dunster, the first president, succeeded in obtaining a charter on May 31, 1650, when it was legalized as the President and Fellows of Harvard College. This document was signed by Gov. Thomas Dudley and is now in the custody of the trustees. It provides for the management under a board of overseers, but the character of this board has been changed by several acts of the State Legislature. At present the candidates for members of the board are nominated by postal ballot, both residents and non-residents of the State being eligible, and the election is held annually on commencement day.

The name Harvard College is still used to designate the central portion, which grants the degree of A. B., while the entire complex institution is known as Harvard University. As a whole it includes seventeen departments, each of which is finely equipped with such aids in teaching as are demanded in its particular line. At present there are about 25 college buildings, an endowment fund of \$23,500,000, and departmental libraries with 790,800 volumes and 485,500 pamphlets. In 1908 it had 558 instructors and 6,472 students, of whom 143 were from foreign countries. The courses include those of law, divinity, medicine, zoölogy, veterinary, dental science, and liberal arts. In connection with it is a college of liberal arts for women. The laboratories and observatory are thoroughly equipped. Its museum of comparative zoölogy is known as the Agassiz Museum, from the circumstance that it was endowed by Professor Agassiz. In 1907 the university celebrated the 300th anniversary of the birth of its founder.

**HARVEST BUG**, the name of a mite of a bright red color, so called from the fact that it attacks the workmen at harvest. It makes its appearance in July, when it is found on blades of grass, whence it comes in contact with the legs and thighs of persons in the field. It is annoying both to man and various animals, such as dogs and sheep. The mite is very small and causes an intolerable itching of the skin.

**HARVESTING MACHINERY**, the implements used in harvesting the crops of agricul-

turalists. The first machines of this character known in history were used by the Gauls before the Christian Era. It consisted of a box fixed on wheels and had a cutting apparatus in front that gathered the heads of standing grain as an ox pushed the machine from the rear. At present three principal classes of machines are used for harvesting small grain. These are known as headers, reapers, and harvesters. *Headers* are utilized for cutting the heads of standing cereals, as wheat and oats, and some of the more modern structures thresh and bag the grain while the machine is propelled forward, though in most cases the heads are gathered and threshed afterward. In *reapers* the grain is cut, bound by hand, and, after being stacked, or stored in barns, is threshed by machines. *Harvesters* consist either of self-binders, which bind the grain with sisal or manilla cord and carry the bundles into rows upon the field, or machines on which two men bind the grain by hand, though the latter form has gone practically out of use. Besides the implements employed in harvesting small grains, there are numerous machines for cutting grass, clover, and corn.

Among the earliest of the modern machines were those of Patrick Bell, who patented a harvester in Scotland in 1826, and the machine invented by Cyrus H. McCormick in the United States in 1834. Since then various excellent implements have been invented for harvesting many grains and grasses with the result that all classes of farming have become more profitable. They give the advantage that harvesting may be carried on with much less physical exertion than formerly. As a consequence agricultural enterprises have been extended over vast areas formerly not cultivated. In the manufacture of harvesting machines the United States has long occupied the foremost position. Its products have gone into all the markets of the world. The machines of newer manufacture are almost exclusively of steel, which has been made serviceable because of improved methods of tempering metals. The improvements due to the general use of ball bearings has greatly lightened the draft of machines on the one hand and increased their durability on the other. See **Corn Harvester**.

**HARVEST MOON**, the name given to the moon at the time she is in that part of her orbit where she makes the least possible angle with the ecliptic. This occurs about the autumnal equinox, in September, in high northern latitude and during March in southern latitude. Ordinarily the moon rises about fifty minutes later each succeeding evening, owing to her changing position in the sky, this difference being called

*retardation*. At the time of full moon, during the autumnal equinox, when the retardation is at a minimum, the farmers have the advantage of moonlight nearly the entire night on several successive nights. Before harvesting machinery came into general use, they worked nearly all night to take care of the grain, hence the harvest moon was looked upon as of much benefit.

**HARVEY**, a city of Illinois, in Cook County, twenty miles south of the courthouse in Chicago, on the Illinois Central, the Cleveland, Cincinnati, Chicago and Saint Louis, the Grand Trunk, and other railroads. It is a residential and manufacturing suburb of Chicago. Among the chief industries are machine shops, stove works, and machine and automobile factories. The city was incorporated in 1892. Population, 1900, 5,395; in 1910, 7,227.

**HARZ** (härts), or **Hartz**, the most northerly mountain chain of Germany, extending between the Weser and Elbe and trending from the northwest to the southeast. The range is about twenty miles wide and sixty long, rising quite abruptly from the plains in irregular ridges. It is covered in many places with native forests. The average elevation is about 1,500 feet. Brocken, the predominating peak, is elevated 3,741 feet above sea level. The range is divided into two portions, the southeasterly being known as the Lower Harz and the remainder as the Upper Harz, the latter being the higher and including Brocken. Many historic incidents are connected with these mountains, chiefly because they form a natural boundary between the High and Low German peoples. They have entered largely into German literature, lending a realistic vividness to poetic imagination. The mineral deposits are exceedingly rich, including zinc, copper, silver, iron, arsenic, lead, marble, granite, slate, alabaster, and porphyry. The region has valuable forests, fertile valleys, and fine pasture lands.

**HASHISH** (häsh'ēsh), or **Hasheesh**, a term applied to the tops and tender sprouts of a variety of hemp native to India and to an intoxicating preparation made of this plant. Hashish, in various forms, is smoked, drunk, and taken in confections. The habit of using hashish prevails extensively in the East, where it enters to some extent into the practice of medicine. The juice of the plant contains narcotic properties and exudes from it in the form of resinous matter. Whether taken as a beverage, with confections, or smoked, it has a marked stimulating influence. When taken in excessive quantities, it has an intense intoxicating effect, which is accompanied by results quite similar to those affecting persons using alcoholic beverages ex-

cessively. The effects partake largely of the nature of hallucinations and merriment, but are frequently accompanied by boisterous, quarrelsome tendencies.

**HASTINGS** (hāst'ingz), a seaport of England, on the Strait of Dover, in Sussex County, 54 miles southeast of London. It forms, together with Saint Leonards, an important railroad and trade center. The principal industries are fishing and boat building. During the greater part of the year it is frequented by large numbers of invalids, who bathe in its waters or take treatment for pulmonary complaints. The town is of great antiquity, possessing importance in the early times of the Anglo-Saxons. King Harold garrisoned it as a means of defense against William the Conqueror, but it surrendered to the latter without much resistance. He made it his permanent base of operations and on Oct. 14, 1066, the celebrated Battle of Hastings occurred between the two leaders at Senlac Hill, in which Harold was defeated and his army was destroyed. This battle is classed among the fifteen decisive engagements of the world. Population, 1907, 67,477.

**HASTINGS**, a city in Nebraska, county seat of Adams County, situated in a fertile agricultural country, 95 miles west of Lincoln. It is on the Missouri Pacific, the Chicago and Northwestern, the Chicago, Burlington and Quincy, and other railroads. Among the public buildings are the city hall, the Masonic temple, the county courthouse, the State asylum for the insane, a Roman Catholic academy, Hastings College, and the high school. It has a large trade in live stock, cereals, and fruits. The city has waterworks, electric lights, street railways, and a public library. The manufactures include flour, canned and packed goods, pottery and brick, machinery, utensils, and cigars. Hastings has an extensive jobbing trade. It was incorporated in 1874. Population, 1910, 9,338.

**HAT**, a covering for the head, generally with a crown and brim and of various materials, shapes, and styles. The manufacture of hats originated with the ancients, who employed different fibers for making outdoor covering for the head. Hats began to resemble those now worn at the time of Alexander the Great, when the Greeks made hats of round felt called *petasos*. Extensive manufactures of headwear began in Western Europe in the latter part of the 15th century. In 1760 silk hats were made and came into style at Florence, but the manufacture did not assume its present aspect until 1828. The exhaustion of certain fur products and many changes of style in hats for both men and women has led to the use of various classes of

material. At present they are made largely of cloth, felt, silk, splints, grass, and straw. They serve as a protection for the head or as an ornament, or for both purposes.

**HAVANA** (hà-văn'á), in Spanish, *La Habana*, the capital of Cuba and the largest city of the West Indies; situated on the northwestern coast of the island and on an extensive natural harbor. The entrance to the harbor is about 350 yards wide. It is defended by Punta Castle on the west and La Cabaña and Morro Castle on the east, all of which occupy convenient heights above the place where vessels pass. The old portion of the city has narrow streets, but the newer part contains many excellent buildings and is adorned by beautiful avenues of palm trees. All the principal streets

AVENUE IN HAVANA.

are improved by pavements, street railway lines, waterworks, and sewerage. Railroad and telephone connections are extensive and the streets are lighted by electricity. The public buildings include a cathedral built in 1724, an orphan asylum, the governor's palace, the public library, the Tacón Theater, and the government buildings. It has many parochial and public schools, at the head of which is the University of Havana. Colón Park is the largest of the many public grounds:

Havana ranks as the most important sugar market in the world. It has extensive manufactures of cigars and smoking tobacco. Other products include molasses, hats, woolen fabrics, clothing, wax, earthenware, machinery, and im-

plements. The shipyards of Havana for many years produced the principal portion of the vessels for the Spanish fleet. At present the export and import trade is important, especially with the United States. Since the Spanish-American War the city has made rapid improvements. Many of the streets have been repaved and a new system of sewers has been installed. Havana was founded by the Spanish in 1515, under the direction of Diego Velasquez, but its growth dates from 1519, when it was replatted and improved by public buildings. Buccaneers burned it in 1528. It was taken by the English in 1762, at which time it was the center of trade in the West Indies, but it remained under Spanish dominion until 1898, when it was occupied by the United States and the revolutionists. On Feb. 15, 1898, the United States battleship *Maine* was destroyed in the harbor of Havana while on a friendly visit and 262 officers and men were lost. About one-fifth of the inhabitants are of foreign birth. Population, 1902, 262,395.

**HAVERFORD COLLEGE** (häv'ēr-fērd), an institution of learning established by the Society of Friends at Philadelphia, Pa., in 1830. It was opened for instruction in 1833. The purpose is to supply the need of religious training as well as literary culture. It has a faculty of 25 instructors and about 200 students. At present the endowments amount to \$1,050,000. The library contains 40,000 volumes.

**HAVERHILL** (häv'ēr-īl), a city of Massachusetts, in Essex County, on the Merrimac River, 32 miles north of Boston. It is on the Boston and Maine Railroad and has an extensive system of electric railway lines. The site overlooks the river, which is crossed by a number of iron bridges, connecting it with Groveland and West Newbury. Among the noteworthy buildings are the public library, the city hall, the Masonic Temple, the Hale Hospital, and a number of fine churches and schools. Haverhill is the birthplace of John G. Whittier. It contains a monument to commemorate the historic liberation of Hannah Dunston from her Indian captors in 1697. The city takes high rank in the manufacture of boots and shoes. Other products include fine hats, leather, brick, clothing, woolens, and machinery. It has a large trade in merchandise. The place was settled about 1640. It was chartered as a town in 1645 and incorporated as a city in 1870. Population, 1905, 37,818; in 1910, 44,115.

**HAVERSTRAW** (häv'ēr-strā), a village of Rockland County, New York, on the Hudson River, 35 miles north of New York City. It is on the West Shore and the New Jersey and

New York railways. At this place the river expands to form Haverstraw Bay. The town has manufactures of brick, paper, and copper products. It was settled by the Dutch and became a precinct in 1719. The home of Thomas H. Smith, known as the "Treason House," was the meeting place of Arnold and André. Population, 1905, 6,182; in 1910, 5,669.

**HAVRE** (hä'vēr), a city and seaport in the department of Seine-Inférieure, France, on the estuary of the Seine, about 108 miles northwest of Paris. Besides numerous steamboat lines, it has connections by a network of railroads. The noteworthy buildings include the palace of justice, the customhouse, the museum, the Church of Notre Dame, and the commercial exchange. It dates from 1516, when it was a small fishing village, but its harbor was improved and fortified by Francis I., after which it grew to importance. At present it ranks next to Marseilles as the most extensive commercial center of France. It has manufactures of paper, cotton and woolen goods, clothing, earthenware, chemicals, cordage, oil, glass, beet sugar, and machinery. Its export trade with the United States is extensive. It is noted for its large emigration traffic, the most important of France. The city has beautifully improved streets, including electric lights and street railways, waterworks, public parks, and stone pavements. Population, 1906, 132,430.

**HAWAII** (hä-wī'ē), or **Hawaiian Islands**, an archipelago of twelve islands in the Pacific ocean, formerly called Sandwich Islands, and now known politically as the Territory of Hawaii. They are located about 2,200 miles southwest of San Francisco and 4,890 miles from Hong Kong. Geographically they form the extreme northeastern group of Polynesia and extend in a chain from southeast to northwest for about 400 miles. Eight of the islands are inhabited. The entire group has an area of 6,450 square miles. The following is a list of the eight inhabited islands, in which are shown the area and population as reported in 1910:

	AREA, SQ. MI.	POPULA- TION
Hawaii...	4,015	55,382
Kahoolawe.....	69	85
Kauai.....	544	13,400
Mauai.....	728	25,856
Lanai.....	135	1,460
Molokai.....	262	3,146
Niihau.....	97	10,552
Oahu.....	600	82,028
Total.....	6,450	191,909

**DESCRIPTION.** The islands are volcanic in origin, having been raised by eruptions from the sea, but considerable surface has been added

through the growth of coral reefs. Groups and chains of mountains occur in the larger islands, the most elevated peaks being in Hawaii, the largest island, where Mauna Kea rises to a height of 13,805 feet and Mauna Loa, 13,675 feet. Kilauea, one of the most noted volcanoes in the world, is situated on the eastern slope of Mauna Loa. The most recent eruptions of this crater occurred in 1880 and 1887, when lava flowed for a period of eight months, spreading in a stream from two to forty miles in width. Some of the coasts are low and sandy, but nearly all the islands have bold cliffs that rise quite abruptly from the sea. Kauai and several other islands are eroded with deep ravines and gorges and the coast is more or less indented with deep bays. Fertile plains and valleys extend between the mountains and the coasts. Few lakes and rivers characterize the surface and the streams are chiefly short mountain torrents. Most of the rivers are located on the northern slopes.

The climate is mild and temperate and the thermometer seldom falls below 50° Fahr. and rarely rises above 90°. In the lowlands the average temperature is 70° in January and 78°

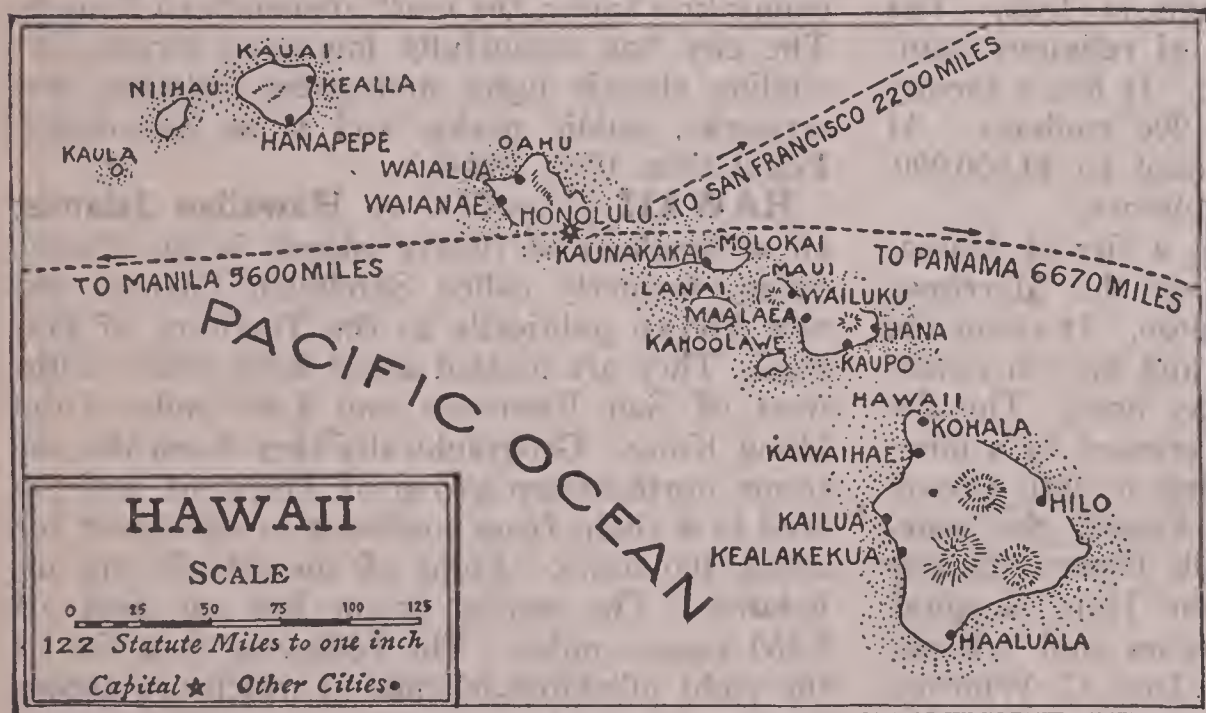

and thunderstorms are rare and frosts occur only on the mountains, where snow sometimes remains the entire year, though only on the highest peaks.

**FLORA AND FAUNA.** The plants resemble those of Australasia, but include some species common to America. Many flowering plants have been described, of which fully 600 are peculiar to the islands. Formerly the forests were very abundant, especially those of the screw pine, and large areas of the uplands still have considerable timber. Tree ferns are especially numerous and all of the vegetation is luxuriant. Birds of song and plumage are abundant, but the mammals are not well represented. Aside from a species of lizards there are no reptiles. The mammals include wild swine, rats, dogs, and a species of bat that flies by day.

**TRANSPORTATION.** The harbor of Honolulu is protected by a coral reef and is counted one of the best in the Pacific. Pearl Harbor, a short distance north of Honolulu, may ultimately be made the chief center of commerce, as it has unlimited port facilities. In general the islands have good landing places, since the water near

many of the shores is deep. Steamers land regularly on routes out of San Francisco, Hong Kong, Vancouver, Yokohama, and ports in Australia and New Zealand. Railways have been built on several of the islands, the largest mileage being on Oahu, where a line extends from Honolulu along the coast to Kahu-ku. Several short lines are in operation, including a number that transport commodities from and to the sugar plantations.

**INDUSTRIES.** Agriculture is the chief industry. The climate and soil are favorable to the cultivation of a large variety of plants, but considerable of the surface is mountainous and much of the area is covered with lava. Sugar cane is cultivated extensively and the sugar industry is the most important industrial enterprise. It is confined largely to the low plains, where the soil is exceptionally fertile, and the higher lands are utilized for raising fruit, coffee, and vegetables. The level lands near the sea are well adapted to the cultivation of rice, which takes rank next to sugar cane in the acreage, but nearly the entire crop is con-

in July. Summer and winter make up the two seasons. The rainfall is greatest in winter, when the northeast trade winds cause considerable precipitation. Vegetation is most abundant on the northeastern side of the highlands, owing to this fact, and in Hawaii Island an almost arid tract is located on the southwestern sides of the mountains. The rainfall at Honolulu is 32 inches per year, but in some localities it ranges from 80 to even 240 inches. Europeans find the climate agreeable and healthful, though it is not favorable to those who are afflicted with pulmonary diseases. Hurricanes

sumed at home. Bananas and pineapples are grown most extensively of the fruits and large quantities are exported. Potatoes thrive and corn can be raised profitably in many localities.

The islands do not contain coal deposits, hence the supply of fuel is quite limited. This has had a marked influence upon manufacturing enterprises, which are confined chiefly to the products obtained through the sugar plantations. Sugar is the principal manufactured product, and next are fertilizers, machinery, and clothing. Among the chief minerals are basalt, sandstone, and coral rock, but no metals abound. The export and import trade is chiefly with the United States and has been augmented by the fact that home manufactures are limited. Coal is the most important import and is followed by machinery, clothing, and utensils. The chief exports include sugar and fruits. Cattle, hogs, horses, mules, and sheep are reared, but they do not furnish a large volume of materials for export.

**EDUCATION.** Education is free, universal, and compulsory. A department of public instruction, consisting of a superintendent of public instruction and six commissioners appointed by the Governor, have control of education throughout the Territory. It has 155 public schools with 18,206 pupils and employing 466 teachers. There are 51 private schools with 4,881 pupils and employing 154 teachers. A college of agriculture and mechanic arts, established by the Territory at Honolulu in 1908, is maintained jointly by the Territory and the Federal government. A normal school, a high school, and a girls' industrial school, at Honolulu; a boys' industrial school at Waialua; Lahainaluna School, an industrial and manual training school for boys, at Lahaina; and a high school at Hilo, are maintained by the department of public instruction. Of schools on private foundation are Oahu College, Kamehameha Schools, Saint Louis College, Iolani College, Mills Institute, Kawaiahao Seminary, Convent of Sisters of the Sacred Heart, and Saint Andrew's Priory, at Honolulu; Maunaolu Seminary for Girls, at Makawao; Hilo Boarding School, at Hilo; and Kohala Seminary, at Kohala. The English language is the basis of instruction in all schools.

**GOVERNMENT.** The government has been that of a territory since 1900. It has a territorial representative in Congress and the chief executive is a Governor, who is appointed by the President of the United States. Legislative power is vested in a senate of fifteen, elected for four years, and a house of representatives of thirty members, elected for two years. The chief charitable institution is the leper settle-

ment on the island of Molokai, at which about 900 are provided for by public grants. This settlement is on a peninsula which is isolated from the mainland by mountains and those confined here are permitted a large measure of local self-government. A large majority of the people of Hawaii are Protestants, but the Catholics and various Oriental faiths are represented.

**INHABITANTS.** The inhabitants are greatly diversified, consisting of Japanese, Chinese, Caucasians, Hawaiians, and South Sea Islanders. Immigration from the United States has been considerable since the islands were annexed. At present there are about 4,250 inhabitants who were born in the United States and the total foreign born population is placed at 12,500. In 1778, when Captain Cook visited the islands, the native population was estimated at 400,000, but the census of 1900 shows that the purely native inhabitants number only 29,834. In the same year the total population was 153,727, which included 25,767 Chinese, 28,533 Caucasians, and 61,111 Japanese. Honolulu, on the island of Oahu, is the capital and principal city. Hilo, on the island of Hawaii, has a population of about 2,500. The inhabitants have increased within recent years. In 1910 the population was 191,909.

**HISTORY.** The island group was discovered in 1542 by Gaetano, a Spanish explorer. It was visited by Captain Cook in 1797, who was killed by the natives the following year. The government previous to the last century was vested in separate kings resident on the different islands, but in the early part of the century Kamehameha I. consolidated them into one monarchy, in which form they were governed by him and his successors until about 1886, when the people secured numerous concessions. Kamehameha II., who was friendly to Europeans and encouraged missionary work, visited England and in 1824 died at London. A constitution was granted to the people in 1840 by Kamehameha III., and the former despotic government was succeeded by a limited monarchy, in which the affairs were in the hands of the king and an assembly of nobles. During his reign Europeans governments came to look upon the islands as important on account of their position, and France and England united in guaranteeing their independence in 1843. Kamehameha IV. ascended the throne in 1854 and was succeeded by Kamehameha V. in 1863, but the latter died ten years later and the Kamehameha dynasty became extinct.

In 1874 Kalakaua was elected as king. He reigned successfully until 1891, when he was

succeeded by his sister, Queen Liliuokalani. The government of this queen did not meet with the approval of the large foreign element and the progressive party, since she adopted a policy to set aside the constitution. She was deposed in January, 1893, when a republic was organized. Sanford B. Dole was chosen provisional president and was confirmed chief executive of the islands on July 4, 1894, when the new government was officially proclaimed.

Annexation to the United States was advocated immediately after the republic was proclaimed. President Dole visited Washington to promote an interest in making the islands territory of the United States. Congress soon after passed a joint resolution, which was approved by President McKinley, and the islands were officially annexed on July 7, 1898. To carry out the provisions of annexation, a commission was sent to the islands with instructions to formulate a plan of government. On August 12, 1898, Annexation Day was celebrated at Honolulu with imposing ceremonies, and the islands were formally declared a possession of the United States in the presence of a great crowd. In 1900 the islands were organized as a territory and in that year Sanford B. Dole became the Governor. He was succeeded by W. F. Frear in 1905.

**HAWK**, the name of several species of birds. It is frequently applied to all birds of prey, except the vultures, owls, and eagles. The fal-

GOSHAWK.

SPARROW HAWK.

cons are included with the hawks proper, though the latter differ from them in that their beaks are smaller and the wings are shorter. The goshawk and sparrow hawk are widely distributed in the continents and islands. They are noted for their rapacious and fierce habits and the swiftness with which they pursue animals and birds for the purpose of catching them.

The American hawk preys upon insects, small quadrupeds, and domestic chickens. It is a common bird in many parts of the United States and Canada. The color of most species of hawks is grayish-brown. See **Falcon**.

**HAWKSBILL**, or **Caret**, the name of a large sea turtle. It is found in the tropical sea and different species inhabit the Indian and Pacific oceans. The beak is horny and formed somewhat like that of a bird of prey and the tail is used as a weapon of defense. This turtle furnishes the tortoise shell of commerce.

**HAWTHORN** (hă'thörn), a shrub or small tree found in Europe and Asia, but naturalized in many parts of North America. The plant reaches a height of 25 feet, has deciduous leaves, and bears crimson flowers. It produces a red fruit with yellow pulp which remains on the tree after the leaves fall off in autumn. The hawthorn is cultivated to some extent as a hedge, since it bears pruning, and the fruit is used in making a fermented liquor. An American plant, the *thorn apple*, belongs to the same genus of plants.

**HAY**, the stems of grasses and other plants cut and dried for fodder. The United States is the principal hay-producing country of North America. It has an area of 42,500,000 acres cultivated in hay, which yields an annual product of 65,500,000 tons, the crop being valued at \$450,500,000. Among the states producing the largest crops of hay are Iowa, New York, Kansas, Pennsylvania, Missouri, Illinois, and Nebraska, but the annual output varies largely on account of the difference in the amount of rainfall, it being quite necessary that the early part of the growing season be favored with an abundance of moisture. Canada holds a high rank in the output of hay, the largest yield being in Ontario and Manitoba.

The best quality of hay from the different plants is secured when the saccharine matter is most abundant, which occurs when they are in full bloom. The grasses are harvested by mowing machines, which cut swaths four to six feet wide. On large farms the hay is allowed to cure a short time and is then tedded mechanically and loaded on wagons by means of machinery, to be stored in stacks or haymows. In many of the larger western hayfields it is customary to push the hay by means of hay sweeps to the stacks, where it is lifted by horse power under roofing. To obtain a nutritive quality of hay it is necessary that the weather be dry, since grasses are more or less damaged by moisture in the process of curing, and thereby lose much of their flavor and nutritive qualities. Timothy, clover, alfalfa, red top, and native

grasses are the chief plants utilized to make hay. Other plants that yield hay include oats, barley, cowpea, vetch, and orchard grass. Some plants, such as clover and alfalfa, yield *rowen*, which is made by cutting the second growth or aftermath.

**HAY FEVER**, an affection that is similar to a severe cold, sometimes called hay asthma or autumnal catarrh. It is so called for the reason that it affects some people in July, at the time of the haying season, but is more prevalent in August. It usually disappears in October, or on the approach of autumn. The disease is characterized by sneezing and discharges from the nose and the patient usually has weeping eyes, headache, irritability, slight fever, and a loss of appetite. Those affected are likely to have it with more or less regularity every summer. It is caused by the pollen of some plants or the dust arising from molding vegetation, and in some persons is due to nasal deformity. The disease seems to be more violent in America than in Europe, and the best method of obtaining relief is to change climate. Hay fever patients usually find it advisable to go to higher altitudes or a region that has a colder climate than the place of their residence.

**HAY-PAUNCEFOTE TREATY**, the name of a treaty negotiated in 1901 between the United States and Great Britain. It was so named because John Hay acted for the former and Lord Pauncefote for the latter country. Its purpose is to control the policy of the United States in the construction and maintenance of a canal between the Atlantic and Pacific oceans. Attention was called to the necessity of constructing an isthmian canal by President McKinley in his message to Congress in 1898, which led to the opening of negotiations by which the Clayton-Bulwer Treaty would be modified so that the American government could proceed with the construction of the canal without affecting the general policy of neutrality. This treaty gives to the United States control of the canal, vesting the sole power of guarantee of its neutrality in this country. Under this treaty the work was taken up and promoted without interruption.

The Hay-Pauncefote Treaty was agreed upon by the two representatives on Nov. 18, 1901, and was transmitted by President Roosevelt to the Senate on December 5th, in which body it met some resistance but was duly ratified on December 16th. The following provisions are contained in this treaty:

I.—The Clayton-Bulwer Treaty is abrogated, but the neutralization of the canal is maintained on the same basis as the Suez Canal.

II.—Neither Great Britain nor any other power is to guarantee neutrality of the canal, but it is to be constructed and managed by the United States.

III.—The canal is to be free and open to all nations for commercial purposes, but the United States is allowed certain undefined rights of control in time of war. While the canal must be kept open and free from blockade, the United States is permitted to erect fortifications with the view of commanding the canal, or its adjacent waters, and it may maintain a military force to protect it against lawlessness.

**HAY RIVER**, a river of Canada, rises in the northeastern part of British Columbia, and after a course of 350 miles flows into Great Slave Lake. It has a general course toward the northeast, and in the northwestern part of Alberta passes through Hay Lake. Alexandria Falls, about 250 feet high, occur in its course. It is navigable for small boats about 135 miles.

**HAYTI** (há'ti), or Haiti, a republic which occupies the western part of the island of Hayti, the eastern portion being the republic of San Domingo. The island of Hayti is, next to Cuba, the largest of the West Indies. It is separated from Cuba by the Windward Passage and from Porto Rico by Mona Passage. Its length from east to west is 400 miles; width, 155 miles; and area, 28,250 square miles. The coast lines are irregular and afford good landings for vessels. Much of the surface is mountainous, but there are extensive valleys, savannas, and coast plains. The highest mountain chain trends through the central part, Loma Tina, with an elevation of 10,165 feet, being the culminating peak. The climate, like that of other West Indian islands, is variable, the seasons being designated as wet in May and June and dry during the time of lower temperature, but it ranks as the most healthful of the entire group. Numerous small streams drain the interior, but most of them are swift and only a few are fitted for navigation by small boats. Several large lakes, including Lake Enriquillo, are in the western part. Extensive and valuable forests abound.

Hayti was discovered by Columbus in 1492, when about 2,000,000 natives inhabited the island, but under Spanish rule they were reduced to slavery and many perished. The French settled in the western part in 1630 and secured a cession of that portion from Spain in 1697. Under the leadership of Toussaint l'Ouverture, who was recognized as the generalissimo by the natives, the Negroes led a revolt against France in 1791. An independent republic was established, but this was suppressed by Napoleon in 1801, when Toussaint was captured

and deported to France. Another revolt was led by Dessalines in 1803, when he was made emperor, but was assassinated three years later, and Spain again gained possession of the entire island. After many years of war and bloodshed the two portions became separated and now maintain their integrity as independent republics.

The republic of Hayti has an area of 10,204 square miles. In 1909 the country had 25 miles of railways, the principal line being between Cape Haytien and Grande Rivière. The official language is French and the prevailing religion is Roman Catholic. Public schools of an elementary nature are maintained in most of the districts, but are in a backward condition. The government is vested in an assembly of two chambers, the senate and the commune, and a president, whose term is seven years. Among the industries are agriculture, lumbering, commerce, mining, and manufacturing. The soil being productive, agriculture is the principal in-

ISLAND OF HAYTI.

dustry. Among the chief products are rum; coffee, tobacco, cotton, sugar cane, cacao, and many species of tropical fruits. Gold, silver, tin, iron, clay, and granite are the principal minerals. The forests yield logwood, pine, satinwood, mahogany, and dyewoods. Among the domestic animals are cattle, swine, mules and horses. The export and import trade is largely with the United States, Germany, France, and Great Britain. Hayti has extensive pearl and other fisheries, but they have not been developed to their full capacity. The manufactures include soap, matches, candles, cigars, utensils, fabrics, toys, and machinery.

The inhabitants are Negroes and mulattoes, about ninety per cent. being of the former class. Port au Prince is the capital and largest city. Other cities include Cape Haytien, Aux Cayes, Gonaves, and Port de Paix. Population, 1906, 1,503,048. See **San Domingo**.

**HAZE**, a slight obscuration in the atmosphere, causing objects to appear dim and obscure. When the haze is very dense, it obscures the light of the sun to a considerable extent, and a light haze deadens the blueness of the sky so objects in the distance appear dim or dull. It is due to the presence of small particles of solid matter, which are raised by ascending currents of hot air or by wind. This kind is ordinarily called *heat haze*. The presence of small particles of water or ice give the sky a light gray color, when the haze is said to be *aqueous*. Other forms are those caused by smoke from peat bogs or forest fires, or by the particles of matter thrown into the air during volcanic eruptions. Many parts of India and China are frequented by dust clouds and dust haze is seen frequently in autumn in most countries, especially if the season is somewhat dry.

**HAZEL**, a class of shrubs or small trees which belong to the genus *Corylus*, widely distributed in North America, Eurasia, and Africa. Twelve recognized species have been described. They bear nuts much favored as food and for the production of hazelnut oil. The larger nuts borne by the hazel tree are called *filberts* and the smaller are known as *hazelnuts*. They have staminate and pistillate flowers and are among the first plants to bloom in the spring. The wood of many species is used for making baskets, hoops, crates, and charcoal, and the roots are serviceable in veneering.

The charcoal of the hazel tree is valuable for painting and in the manufacture of gunpowder. A species common to Italy yields woods useful in refining turbid wine. See illustration on following page.

**HAZLETON** (hā'z'l-tŏn), a city of Pennsylvania, in Luzerne County, 98 miles northwest of Philadelphia, on the Lehigh Valley and other railroads. The surrounding region is noted for its immense production of anthracite coal. It has a State hospital for miners, the Hazleton Seminary, a fine high school, and the Saint Gabriel's Academy. Among the manufactures are ironware, machinery, coffins, brushes, and earthenware. Street railways, telephones, waterworks, and pavements are among the improvements. Hazleton was settled in 1820 and incorporated as a city in 1890. Population, 1900, 14,230; in 1910, 25,452.

**HEAD**, that part of the body of an animal which contains the brain and the organs of the special senses. The head of man has 22 bones, which form a cavity for the protection of the brain and the organs of smell, hearing, sight, and taste. These bones are immovable, except the lower jaw, which is hinged at the back so as to allow the mouth to be opened and closed. The skull bones are composed of two compact plates, with a spongy layer between. These bones are joined at the outer portions by sutures in a way termed dovetailing by carpenters. Within the skull is the delicate brain, peculiarly protected by the oval shape of the bones. The smaller and stronger structure of the skull is toward the front, where danger is greatest, while the spongy packing between the layers serves to deaden a blow that might fall upon the head. Nerves pass through openings in the skull and communicate with the brain. The skull proper consists of eight bones—two temporal, two parietal, and a frontal, occipital, ethmoid, and sphenoid. Fourteen bones constitute the framework of the face, including the vomer and the inferior maxilla, and two each of superior maxillae, nasal, malar, lachrymal, turbinated, and

HEAD.

1, frontal bone; 2, parietal; 3, temporal; 4, sphenoid; 5, ethmoid; 6, superior maxillary; 7, malar; 8, lachrymal; 9, nasal; 10, inferior maxillary.

palate. Many animals of the lower forms of life are destitute of heads.

**HEADACHE**, or **Cephalalgia**, the name applied to any pain in the upper or back part of the head. In itself it is not a disease, but is a symptom of many widely differing conditions, though the seat of the disease causing the head-

ache may be seated at a place remote from the pain. An unhealthy liver may cause a general headache, while typhoid and many other fevers

HAZEL.

1, Flower. 2, Leaves and Fruit.

have a severe headache as a symptom. Those suffering with Bright's disease are frequently sufferers of frontal headache. Gastric dyspepsia, malaria, gout, indulgence in alcoholic beverages, and eye-strain are other prolific causes. Careful diet and regularity in habits should be adopted by persons suffering from an attack, but a skillful physician is needed in chronic headache. Meningitis or brain diseases cause very severe headache and need the most careful treatment. Drugs usually given, such as morphia, aconite, belladonna, quinine, and antipyrine, are frequently very dangerous and tend to produce drug habits. Drugs of this kind should be taken only upon the advice of a physician.

**HEALTH, Board of**, an organization established and maintained by the government to protect the health of the citizens. Organizations of this kind are maintained in the various political divisions of most countries and are formed on such a basis that the people in all the communities have some form of protection. Local boards of health, such as town and city boards, are more or less subject to the regulations of the state or general boards of health, and the latter work in harmony with various departments of the national government. The function of a State board in most cases is advisory, and its requirements are carried out by the boards of townships and municipalities. A county or parish physician is usually the advisory officer of a township board, while municipal

boards are aided by a health officer, who is required to be a physician, and is appointed or elected for that purpose. In most countries, as in the United States, though no national board of health is maintained, the duties devolving upon such an organization is performed under the direction of the Department of the Interior.

The duty of the board of health is not to provide for the treatment of diseases, but rather to prevent the spread of influences that are harmful to health in a general way. It consists mainly in enforcing vaccination and quarantine regulations to prevent the spread of contagious diseases, to prevent fraud in preparing medicine and food, to control drainage and plumbing, to look after the ventilation and fire escapes of buildings, to regulate the slaughtering of animals, to provide for the removal of dirt and filth, and to consider and direct in regard to any matter that may injuriously affect the health of the community. In many cases the local board of health has exclusive charge of disinfecting the buildings in which patients were treated for contagious diseases, and in some instances provide for medical treatment of those unable to secure a physician. See **Hygiene.**

**HEART**, the organ that propels the blood and causes it to circulate through the arteries,

HEART.

A, right ventricle; B, left ventricle; C, right auricle; D, left auricle; E, tricuspid valve; F, bicuspid valve; G, semilunar valves; H, valve of the aorta; I, inferior vena cava; K, superior vena cava; L, pulmonary veins.

veins, and capillaries. It is muscular, pear-shaped, and about the size of the fist. The heart has four chambers, the two upper being called *auricles* and the two lower, *ventricles*.

The auricles are receiving chambers and the ventricles are expelling chambers, but the auricles and ventricles on each side communicate with each other, while the right and left halves of the heart are distinct and perform different offices. The red blood is propelled by the left side and the dark blood by the right. In man the heart hangs point downward in the left central part of the chest and is inclosed by a loose sack of serous membrane, called the *pericardium*. It is held in place by the attachment of the pericardium to the diaphragm and by the large blood vessels that communicate with it. The heart has an alternative contraction and expansion movement; the former is called the *systole* and the latter the *diastole*. Blood flows into the heart during the diastole movement and is expelled by the systole. The beating of the heart is due to these movements and may be distinctly heard between the fifth and sixth ribs.

The impure blood coming from the system enters the *right auricle* through the *inferior* and *superior vena cava*, thence passes into the *right ventricle* through the *tricuspid valve*, and is then driven past the *semilunar valves* through the *pulmonary artery* to the lungs to be purified. It next returns as bright-red blood through the four *pulmonary veins* to the *left auricle*, is forced past the *bicuspid valve* to the *left ventricle*, and is driven through the *semilunar valves* into the *great aorta*, whence it passes into the general circulation.

**HEAT**, a form of energy which is generated by the transformation of some other form of energy, as by chemical action, combustion, or the stoppage of mass motion by friction. All bodies possess some heat, since *cold* is merely a relative term, but the degree of heat which is known as *temperature*, differs greatly in various forms of matter. Heat possesses the power of vaporizing, expanding, melting, and decomposing bodies. It has the effect of raising the temperature of objects and of passing through space with the velocity of light. It may be manifested as light, as temperature, and as chemism, or in all of these ways at the same time.

The theory of heat now generally accepted is that of Macedonio Melloni (1798-1854), an Italian physicist. This theory is called the *theory of undulation*, and supposes that heat is caused by a vibratory or oscillatory motion of the particles of the body and is a condition of matter, not a substance. The hottest bodies are those in which the vibrations move quickest through the widest space. The theory implies that the molecules of solid bodies are in constant vibration. When this oscillation is increased,

the body becomes heated; when it is decreased, the body is cooled. Ether fills the vacant spaces between the molecules. The ether puts the molecules in motion, or it is thrown into vibration by them, in the same manner as the air moving through the leaves of a tree sets its boughs in motion, and in turn may be kept in motion by the waving of branches. The sources of heat are chemical and mechanical energy, the stars, and the sun.

That friction and percussion produce motion may be illustrated in bringing a moving mass in contact with one at rest, by which the motion of the mass is changed into motion among molecules. Chemical action is seen in fire, in which the oxygen of the air has an affinity for the carbon and hydrogen of the fuel, and, by combining the chemical energy, there is a transformation into that of sensible heat. The cause of heat coming from the sun and stars is the rapid vibration of the molecules. By them waves of ether are set in motion, which are propagated across the intervening space, and give up their motion when they meet the earth. The effect of heat upon all solid, liquid, or gaseous bodies is to expand them, while a material reduction of the temperature causes them to contract. This gives rise to the popular term, "Heat expands; cold contracts." The only partial exception to the rule is water (q. v.). At a certain temperature heat vaporizes liquids, but in solids it produces fusion. By conduction and radiation it may be transmitted to other bodies. The term *radiated heat* implies the heat produced by radiation, which gives rise to the terms thermal ray, ray of heat, and calorific ray, these being used in correspondence to the terms luminous ray and ray of light.

In propagating radiate heat from a hotter to a colder body the intervening medium is not heated. Both heat and light are transmitted by the same medium. They are similar in that they are the vibrations of an elastic medium, obey the same laws of reflection, interference, refraction, and polarization, and are subject to the general laws of wave motion. Two bodies placed in contact with each other give off heat to each other. If they are equally hot, the exchange of heat is mutual, and it appears as if no heat passes between them, and they are then said to be of the same temperature. However, if one of them is more highly heated than the other, it gives more heat than it receives, and is therefore at a different temperature. Instruments used to measure temperature are called *thermometers*. Different scales or units of measurement may be adopted for measuring heat and various chemicals, such as mercury and

spirits, serve in the preparation of thermometers. The branch of science that treats of the measurement of quantities of heat is called *calorimetry*.

**HEATH** (hēth), the common name of any plant of the heath family, which includes about 500 species. They are widely distributed in Europe and South Africa, but only a few species are native to North America. The common heath of England, a low evergreen shrub with small leaves and clusters of rosy flowers, is found chiefly on the waste lands. It grows in beds on the sides of mountains, and the stems are from three to four feet in length. The flesh-colored heath is found on the mountains of Europe. In this plant the leaves come out early in the spring, causing it to be looked upon as a harbinger of the growing season. Several species native to South Africa are cultivated extensively as greenhouse plants and are favorites for the beauty and variety of their flowers. Small tracts of land in which small evergreen shrubs comprise the dominant plant types are commonly called *heaths*. Small regions of this kind are found in Canada and the northern part of the United States, in which the junipers and bearberry are the prevailing plants. The huckleberry, cranberry, and trailing arbutus are familiar species allied to the heath.

**HEAVEN** (hēv'n), in science, the expanse which surrounds the earth and seems like a great dome or arch containing the sun, moon, and stars. It appears to rest on the horizon, and is in reality merely the aspect that a spectator sees when looking into the immeasurable space of the universe. In theology, heaven signifies the abode of God, where the Most High and the angels dwell and are especially manifest. Among the Jews heaven is regarded as the special abode of God and it is held to be high above the earth. Christians believe that Christ came from heaven, and, after fulfilling His mission on earth, returned there to prepare a place for the saved. Those who reach heaven shall not experience hunger or thirst, nor feel undue heat nor any sorrow. This condition is to be reached after the resurrection, when mortality shall become immortal and incorruptible.

**HEAVES.** See *Broken Wind*.

**HEBREWS** (hē'bruz). See *Jews*.

**HEBREWS**, *Epistle to the*, one of the canonical books of the New Testament. It was addressed to the converted Jews for the purpose of fortifying them in the Christian faith. The chief purport of it is to demonstrate the preëminence of Christ over Moses and the angels and of the Gospel over the law, and to show that the latter was typical of the former and was abol-

ished by it. Luther suggested Apollon as the author, and this view was held by a number of prominent Christian writers. However, the Greek fathers ascribed the authorship to Paul, though no Latin writer attributed it to him until about the 4th century.

**HEBRIDES** (hĕb'ri-dĕz), or **Western Islands**, a chain of islands off the western coast of Scotland. The total number includes about 500 islands and islets, of which only 90 are inhabited. They are classed in two groups, known as the Outer and the Inner Islands. Barra, North Uist, South Uist, Benecula, and Saint Kilda belong to the Outer Islands, while Skye, Mull, Jura, Coll, and Tiree belong to the Inner Islands. They belong to the counties of Inverness, Ross, and Argyle. The climate is humid and the soil is largely poor. Agriculture, cattle rearing, and fishing are the principal industries. The Hebrides were colonized by the Norwegians in the 9th century and remained subject to Norway until 1266, when they were annexed to Scotland. They were governed by chiefs for a number of decades, who assumed the title of *Lord of the Isles*, and were made a crown possession of Scotland in 1540. Population, 1908, 98,045.

**HEBRON** (hĕ'brūn), an ancient city of Palestine, located in the valley of Eschol, twenty miles south of Jerusalem. It is situated in the region which anciently belonged to the tribe of Judah. The streets are narrow and crooked. It has tombs which are alleged to be those of Abraham, Isaac, Jacob, and others of the patriarchs. The surrounding country is noted for its fruits, especially grapes and olives. Abraham and David resided in Hebron a number of years. It was captured by Saladin in 1187. Population, 1906, 19,020.

**HECLA** (hĕk'là), or **Hekla**, an Icelandic volcano, situated 20 miles from the southwestern coast, elevated 5,100 feet above sea level. It is covered with snow perpetually, contains several craters, and is composed largely of lava and basalt. The most extensive eruption on record occurred in 1783, when a stream of lava was thrown out which extended a distance of 45 miles and was 15 miles wide. Other notable eruptions were those of 1845 and 1878. The discharges consist largely of ashes, lava, and masses of pumice stone.

**HEDGEHOG** (hĕj'hōg), a mammal native to Eurasia and Africa, belonging to the insectivorous animals, and remarkable for its covering of spines instead of hair. It has small black eyes and short legs. The body is about ten

inches long. It defends itself against its enemies by contracting special muscles whereby it is rolled into a ball, causing the spines to stand quite rigid. The hedgehog inhabits small thickets and feeds on insects, worms, snails, and sometimes on vegetable matter, which it seeks at night. During the winter it hibernates. From three to eight young are born in a litter. The spines develop soon after birth. Fourteen species have been described, most of which have only a rudimentary tail and none is native to America or Australia. A closely related spine-bearing mammal, called the Canada porcupine, is native to the northern part of North America.

**HEGIRA** (hĕ-jī'rà), **Hejra**, or **Hijra**, an Arabian word, meaning *going away*, and used to describe the flight of Mohammed from Mecca on Sept. 13, 622 A. D. This is the beginning of the Moslem era. A calendar made by Caliph Omar in 639 begins with the first day of the month in which the flight occurred. The Mos-

HEDGEHOG AND YOUNG.

lem year consists of 354 days and 9 hours, hence is about 11 days shorter than the Gregorian year. This makes it difficult to reduce the Christian to the Mussulman year, but it may be roughly done by subtracting 40 from the former and adding 622 to the remainder. Since 1328 of the Hegira corresponds to the year 1910, it will be seen that  $1328 - 40 + 622 = 1910$ .

**HEIDELBERG** (hī'del-bĕrg), a city of Germany, in the grand duchy of Baden, on the Neckar River, ten miles southeast of Mannheim. It occupies a beautiful site in a valley between the river and the slope of the Königstuhl, an elevation 1,860 feet high, and has several beautiful streets. The noteworthy buildings include a castle of much beauty begun in the 13th century, the Church of the Holy Ghost, the Church of Saint Peter, the city hall, the public library, and the University of Heidelberg. Among the

manufactures are musical and scientific instruments, fabrics, clothing, and machinery. The celebrated Heidelberg tun is kept under the castle. It has a diameter of 26 feet, a length of 36 feet, and a capacity of 50,000 gallons of wine. Heidelberg has many beautiful parks, electric lights and street railways, pavements, and extensive railroad connections. The city dates from the latter part of the Middle Ages and suffered much during the Reformation. In 1803 it was annexed to Baden. Population, 1905, 49,527.

**HEIDELBERG**, University of, a famous institution of higher learning at Heidelberg, Germany, founded by Elector Rupert I. in 1386. Although a Roman Catholic center of learning at the beginning, it became a powerful influence of the Protestants in the 16th century. Here Melancthon preached the reformed faith. The 500th anniversary of the university was celebrated with imposing ceremonies in 1886. It has a library of 500,000 volumes, a faculty of 160 instructors, and an attendance of about 1,600 students.

**HEILBRONN** (hīl-brōn'), a city of Germany in Württemberg, 32 miles north of Stuttgart. It is located on the Neckar River, which is navigable at this place, and is at the junction of several railways. Among the chief buildings is the Church of Saint Kilian, a Gothic structure of the 11th century. It is the seat of a gymnasium, a school of agriculture, a large public library, and a meteorological observatory. The chief manufactures include sugar, jewelry, salt, cigars, chemicals, and machinery. It has a large trade in groceries, coal, merchandise, and farm produce. Near it are several mineral springs, which were visited by Schiller and a number of prominent sovereigns, including Gustavus Adolphus and Charles V. Heilbronn became a free city in 1360. It suffered greatly during the Thirty Years' War. Since 1802 it has belonged to Württemberg. Population, 1905, 40,004.

**HEIR**, in law, one who succeeds to his estate, not by the will of a decedent, but by the death of another. Such inheritance comes to the heir by operation of the law. This may be said to be a restrictive use of the word, since the term is used in some countries to describe the descent of property both by will and by the natural law of descent. An heir is said to be *direct* when the line of descent is direct, as from parents to children or grandchildren. All others, as brothers, sisters, cousins, uncles, etc., are termed *collateral heirs*. One who is certain to inherit property, provided he outlives another, is called an *heir apparent*.

**HELDER** (hēl'dēr), a city of the Nether-

lands, in the province of North Holland, at the entrance to the Zuyder Zee. It is strongly fortified and is protected from the sea by a dike built of Norwegian granite. This dike is five miles long and thirty feet wide at the top. It serves as a roadway from Helder to Nieuwediep, the harbor at the entrance to the North Holland Canal, by which Helder is connected with Amsterdam. The city has a large local and foreign trade. It is the seat of a naval hospital, shipyards, barracks, and magazines, and a military school. In 1673 it was the scene of a famous battle between the allied fleets of France and England, on one side, and the naval forces of Holland under Tromp and De Ruyter, in which the latter were successful. Population, 1906, 26,982.

**HELENA** (hēl'ē-nā), county seat of Philips County, Arkansas, on the Mississippi River, about eighty miles below Memphis, Tenn. It is on the Saint Louis, Iron Mountain and Southern, the Arkansas Midland, and other railroads. The chief buildings include the county courthouse, the high school, and the Southland College. It is surrounded by a fertile country and has a large trade in cotton and lumber. Among its manufactures are shingles, cotton-seed oil, machinery, lumber, and utensils. In 1863 it was the scene of a battle between the Confederates under General Holmes and the Federals under General Prentiss, in which the latter were defeated. Population, 1900, 5,550; in 1910, 8,772.

**HELENA**, the capital of Montana, county seat of Lewis and Clarke County, in the Prickly Pear valley, about fourteen miles west of the Missouri River. It is on the Northern Pacific and the Great Northern railroads and has intercommunication by electric lines. The site is a fine tract of land, sufficiently rolling to be well drained, and is surrounded on all sides by elevated ridges of the Rocky Mountains. The noteworthy buildings include the State capitol, the public library, the county courthouse, the Federal building, the high school, Saint John's Hospital, and several fine churches. It is the seat of the Montana Wesleyan University, a Methodist Episcopal institution. The surrounding country is agricultural, and contains valuable deposits of gold, silver, ruby, and sapphire. Among the manufactures are harness, vehicles, flour, machinery, implements, lumber, and quartz products. It has extensive machine shops and foundries. Helena was a mining camp in 1864, but was platted the same year and incorporated in 1881. Population, 1900, 10,770; 1910, 12,515.

**HELGOLAND** (hēl'gō-lānt), or **Heligoland**, an island in the North Sea belonging to Germany, situated 38 miles from the mouth of

the Elbe. It is a half a mile wide and two miles long. The area was formerly much larger, but it has been worn away by encroachments of the sea. The coast lines rise perpendicularly from the sea, but the soil is very fertile. It is cultivated largely in orchards and gardens. The fisheries are important, especially those yielding haddock and lobsters, and as a summer resort it is a favorite gathering place. Helgoland is important mainly as a strategic point and has been strongly fortified by the German government. In 1807 England forced Denmark to evacuate the island, when it was ceded to the British, and in 1890 it was formally ceded to Germany. Population, 1905, 2,385.

**HELICON** (hĕl'ī-kŏn), or **Sagara**, a mountain range in the southwestern part of Boeotia, Greece, and the fabled resort of the ancient Grecian muses. In these mountains were temples dedicated to the Muses and Apollo. They contained the fountains of Aganippe and Hippocrene, which gave inspiration to the poet Hesiod. Paleo-Vuno, the loftiest peak, is 5,730 feet high.

**HELIOPOLIS** (hĕ-lī-ŏp'ŏ-līs), meaning city of the sun, the city called On, Bethshemesh, or Rameses in ancient Egyptian writings, but now known as Matarich. It is situated on the Pelusiac branch of the Nile, near the canal which connects that river with the Red Sea, eight miles northeast of the present city of Cairo. Under the Pharaohs it was the most populous city of Egypt, being beautified by lakes and canals that connected it with the Nile, and in it were many temples and schools. These schools were visited by Eudoxus and Plato. Mention is made of the place by Herodotus and Strabo, but in the time of the latter it was little more than a deserted village. It is thought to have been the place where Joseph and Mary found refuge in their exile with the infant Christ. The pillar of On still stands near the present village. The obelisk now in Central Park, New York, was first brought to Alexandria from Heliopolis and thence to America.

**HELIOTROPE** (hĕ'lī-ŏ-trŏp), a genus of plants, including both annual and perennial species. They occur mostly in the warmer climates as herbs or undershrubs, but many are now cultivated extensively in all countries as ornamental plants and for the manufacture of perfumes. The leaves are oblong and small, the flowers are white or pale red and of beautiful fragrance, and the fruit is in the form of four drupes covered by a fleshy inclosure. A species known as Indian heliotrope is an Asiatic plant, but now grows wild in the Mississippi valley. It has hairy leaves. The **heliotrope** thrives best

in a light, rich soil and may be propagated by cuttings.

**HELIOTROPE**, or **Bloodstone**, a form of quartz allied to chalcedony or jasper. The color is usually deep green with red spots. It is highly prized for seals, signet rings, and various other purposes. Deposits occur in practically all countries, but the finest specimens come from Asia, particularly from Persia, Tartary, and Siberia.

**HELIUM** (hĕ'lī-ŭm). See **Chemistry**.

**HELL**, the place of punishment for the wicked after death. The term is used with

HELIOTROPE.

more or less distinctness in nearly all forms of religion, though the precise nature of the punishment varies widely. The three most common views are that it is a place where a future life is to be spent in eternal misery, with no idea of moral retribution, that the offenders punished there for deeds done in this life may escape after a period of torment, and that it enters as an important factor in the moral government of the universe, serving as a place or condition in which the wicked are punished rigorously. The terms used in the Hebrew from which translators have drawn in compiling different works are *sheol*, meaning a grave or pit, and *gehenna*, a term referring to the valley of Hinnom. The Greek *hades*, the unseen, is now used with its original meaning, and those said to enter there are thought to pass into an unseen or invisible state. In the New Testament *gehenna* is translated into the word hell, which is described as a place where the fire is not quenched. It is especially stated that hell was instituted as a place of punishment for the devil and his angels.

**HELLEBORE** (hĕ'lĕ-bŏr), the common name of several species of plants. The common

hellebore of Europe is a perennial herb with short root-stalks. It has leathery leaves and variously colored terminal flowers. The black hellebore has evergreen leaves, white flowers tinged with red, and is commonly called Christ-

HELLEBORE.

mas rose, since it has a rose-like flower and blooms early in the season. In this species both the leaves and flower stalks originate from the root-stalks. A species known as green hellebore has been naturalized in the eastern part of Canada and the United States, where it is cultivated and grows wild to a considerable extent. The white hellebore does not properly belong to this class of plants, but is a member of the lily family. Hellebore is a drug used in medicine for its cathartic properties. Formerly it was thought to be useful in cases of insanity and was used by the ancients for treating that malady.

**HELLESPONT.** See **Dardanelles.**

**HELL GATE,** the name of a formerly dangerous pass in the East River, between New York and Long Island. This pass is a portion of the strait which connects Long Island Sound with New York Bay. In 1885 the obstruction was removed by extensive submarine mining and the use of powerful explosives. As these obstructions no longer interfere with the passage of vessels, much value has been added to the East River for navigation purposes.

**HELMET,** a covering or protection for the head, formerly worn as a piece of armor. The helmet was made of iron or steel throughout the Middle Ages, when it had appendages to be drawn over the neck and face during an engagement. It was intended particularly to furnish protection from behind and from above, since the warrior was expected to defend the face chiefly by an adroit use of the sword or some other weapon. The helmet is of very ancient

origin, being mentioned by Homer in connection with the Trojan War.

**HELOTS** (hē'lōts), the name applied to the slaves in ancient Sparta, which had authority to assign them to citizens and alone had power to dispose of their life and freedom. They were employed largely by citizens in agricultural and mechanical pursuits, but during the time of war they were required to bear arms. They gave evidences of especial bravery during the Peloponnesian War, for which about 2,000 were granted liberty in 431 B. C. Since they were the most numerous element in Sparta, they were kept under close observation by the Ephors, who exercised a wide administrative authority in the government. See **Sparta.**

**HELSINGBORG** (hěl-sing-bör'y'), or **Hälsingborg**, a city of Sweden, located on the Sound, opposite Elsinore, Denmark. It is the converging center of several railroads and has a safe and commodious harbor. The manufactures include sugar, cured meats, canned fish, machinery, and sailing vessels. It has a large export trade in earthenware, iron ore, and fish. The imports consist chiefly of fertilizers and coal. The city is strongly fortified and has been the scene of several battles. Population, 1906, 31,404.

**HELSINGFORS** (hěl-sing-förs'), a city and seaport of Russia, capital of Finland, on the northern shore of the Gulf of Finland. As a naval station it is next in importance to Cronstadt. The prominent buildings include the governor's palace, the parliament house, the Lutheran Church of Saint Nicholas, the Russian church, and the commercial exchange. It is the seat of the University of Helsingfors, which has a library of more than 200,000 volumes. The city has many fine parks and charitable institutions. It is a flourishing trade and railroad center, has an excellent harbor, and engages largely in the manufacture of woolen and linen goods, sail cloth, machinery, and tobacco. The trade in fish, lumber, and corn is important. It was founded in the 16th century by Gustavus I. of Sweden. Since 1809 it has been a part of Russia. Population, 1905, 117,317.

**HELVETII** (hěl-vē'tī-i), the ancient people who inhabited the regions now occupied by Switzerland. They were of Gallic or Celtic origin. In 58 B. C. Julius Caesar, then governor of Gaul, came in contact with them. At that time they attempted to emigrate in large numbers from their possessions and occupy southern Gaul, but were defeated by Caesar at Bibracte, in Burgundy, and made subject to Roman authority. In the "Commentaries" written by Caesar an account is given of these people. Later they re-

fused to recognize Roman supremacy, which caused Vitellius to send General Caecina to subdue them. After that the Helvetii disappear from history and their territory was occupied by the Alemanni.

**HEMATITE** (hēm'ā-tīt), or **Specular Iron**, a common ore of iron, divided on account of the color into red and brown hematite. Both kinds occur in stratified and igneous rocks. The crystals are in the hexagonal system, and some of the varieties have a characteristic metallic luster. The red hematite is an important mineral, containing about seventy per cent. of iron, and is widely distributed. The most extensive deposits of North America are in the Lake Superior region, where the ranges of Gogebic, Vermilion, Menominee, Mesabi, and Marquette are located. Iron Mountain and Pilot Knob, Missouri, are the most noted regions producing this mineral in the Mississippi valley.

**HEMIPTERA** (hē-mīp'tē-rā), the name of an order of insects, so called because many of the species have wings formed partly of horny and partly of membraneous matter. All have the mouth formed like a beak or proboscis for piercing the plants or animals on which they feed. Metamorphosis is incomplete, though the young do not have a close resemblance to the adults. Some of the species are wingless. Among the insects belonging to this order are the cicada, louse, bedbug, water scorpion, chinch bug, and squash bug. See **Insects**.

**HEMISPHERE** (hēm'ī-sfēr), one of two equal parts into which a globe or sphere is divided by a plane passing through its center. Geographers use the term in describing the surface of the earth, which they divide into the land and the water hemispheres. Another division is to classify the surface as the Eastern Hemisphere and the Western Hemisphere, the former comprising Africa, Asia, Australia, and Europe, and the latter containing North America and South America. See **Earth**.

**HEMLOCK** (hēm'lök), a genus of poisonous plants of the parsley family. They have a tall, hollow stem and white flowers in compound umbels surrounded by an involucre of three or more leaflets. The best known species is the poisonous hemlock, or spotted hemlock, found extensively in waste places in Europe, but it is now naturalized in America. This plant grows from two to six feet tall, has a spotted stem, and closely resembles parsnip in its root growth. The poison contained in the different species is an alkali, which causes weakness and later death by paralysis. Extracts of the leaves and fruit have valuable medicinal properties and are used as powerful sedatives. The Grecians

administered capital punishment by giving a decoction of hemlock to criminals, and this is the form of death which Socrates died. In medical practice it is now used as a substitute for opium. It is valuable in treating chronic rheumatism, whooping cough, and cancerous and other sores. The *hemlock spruce*, a species of spruce, is a widely distributed and valuable evergreen tree of North America. It yields large quantities of lumber. See illustration below.

**HEMLOCK SPRUCE.** See **Spruce**.

**HEMP**, a class of plants with unisexual flowers, native to Asia, but now naturalized in all portions of the world. Hemp is cultivated extensively in the Philippines, the United States, Italy, Russia, and many other countries. It is an annual plant and varies in height from two to twenty feet, according to climatic conditions. The quantity of seed sown per acre is from one to two bushels. It is drilled in rows for the reason that the male plants mature earlier than the female, the latter

POISONOUS HEMLOCK.

growing larger and requiring a month longer to ripen the seed. A pithy matter fills the stem, the latter being constituted of woody fibers and covered with a fibrous bark. In India it is cultivated for the narcotic drug commonly called *hashish* (q. v.) and in other countries largely for the fibers, which are useful in the manufacture of sail cloth, ropes, cordage, and other coarse fabrics. The finer species are used extensively in manufacturing shirting, sheeting, and other fabrics suitable for wearing apparel and household purposes. These products are coarser than those made from flax fibers, but they may be bleached with equal success and are much more durable. The seeds produced by the female plant yield an oil highly valuable for mixing paints and varnish, and in the manufacture of soap and illuminating products. Cage birds are fed chiefly with hemp seed. Kentucky

is the principal hemp-producing State. Manila and sisal hemp are not classed with the true hemps.

**HENDERSON** (hĕn'dĕr-sŭn), a city in Kentucky, county seat of Henderson County, on the Ohio River, 148 miles west of Frankfort. It is on the Illinois Central, the Louisville and Nashville, and other railroads. The river is crossed here by a large bridge. The chief buildings include the courthouse, the high school, the public sanatorium, and several churches. Atkinson Park includes a tract of 100 acres. Electric lights and street railways, pavements, and waterworks are among the improvements. The chief manufactures are cotton and woolen goods, vehicles, ironware, machinery, and spirituous beverages. Henderson was one of the first settlements on the Ohio River. It was incorporated in 1797. Population, 1900, 10,272; 1910, 11,452.

**HEN HAWK.** See **Goshawk**; **Hawk**.

**HENLEY REGATTA** (rĕ-găt'ta), a famous rowing contest held annually at Henley-on-Thames, England. The regatta was organized in 1839, as a result of rowing contests held previously between the students of Oxford and Cambridge. Only two boats at a time are permitted in the races, since the river is narrow at this place, and both English and foreign amateurs are eligible. The course is about one and a third miles in length. The contests are held in the month of July and continue for three days. They are attended by vast assemblages of people from the United Kingdom and foreign countries.

**HEPATICA** (hĕ-păt'ĭ-kā), a plant common to the temperate parts of Europe and North America, where it blooms in the early part of spring. It belongs to the genus *Anemone*. The stalk is hairy, the leaves are three-lobed, and the flowers are somewhat similar to the buttercup. Owing to the bloom coming early, the hepatica is used in the study of nature in elementary schools. Some of the species are cultivated for their beautiful flowers, which are pink, white, or blue.

**HEPTARCHY** (hĕp'tark-ĭ), a frequent appellation of the seven principal kingdoms established in England by the Saxons. These established governments did not all exist simultaneously, nor were they entirely independent of each other. They included Essex, Sussex, Mercia, Wessex, Kent, North Umbria, and East Anglia. In 827 they were united by King Egbert of Wessex, who assumed the title of King of England.

**HERALD** (hĕr'ald), an officer employed in ancient and mediaeval times to carry messages of courtesy or defiance between sovereigns or

persons of knightly rank, to challenge to battle, and to proclaim war or peace. In more recent times the official duties of a herald included the granting of arms, marshaling processions and public ceremonies, treating and drawing up genealogies, recording the creation and succession of peers and others, and to determine and regulate all matters in connection with the use of armorial bearings. It is probable that the office originated as early as the origin of coats of arms. In England heralds are appointed by the earl marshal. Most European countries still continue the office of a herald, but the duties are modified from those pursued in former times.

**HERALDRY** (hĕr'ald-rĭ), the science that treats of blazoning or describing armorial bear-

HEPATICA.

ings or coats of arms, and of determining genealogies, precedent, and other matters in connection with titular rank. Historians trace the origin of heraldry to remote antiquity and find it practiced by the early Egyptians and the twelve tribes of Israel. It is exemplified by the Roman eagles. It is probable that signs and emblems were first used for clans and families to distinguish each other, each bearing different coats of arms. During the Crusades it was necessary to use heraldic arms extensively for the purpose of distinguishing the commanders of the different military organizations from each other, which led to an extensive adoption of heraldic practice in Western Europe. The coats of arms borne consisted of an escutcheon or shield, on which were displayed the emblems to distinguish the different commanders or bands of warriors. Besides indicating the rank

of the bearer, many designated the name and residence, and others the country or province in which the ruler held sway. The Herald's College was incorporated in England in 1484, and in it was vested the power to inquire concerning rights and titles in heraldry, to regulate the use of heraldic devices, and to inquire into claims and violations growing out of the system. The rules now recognized by the college are modified largely from those first enforced, but in many respects they are similar to those of other European courts.

**HERAT** (hĕr-ăt'), a city of the northwestern part of Afghanistan, on the Hari-Rud River, about 370 miles west of Cabul. It is surrounded by a rich agricultural and fruit-growing country, has an important market, and is famous as a strategic military and political stronghold. Its trade is controlled chiefly by the Hindus and consists largely of rice, wool, dyes, indigo, asafetida, and leather. The imports from Europe include principally ironware, machinery, textile fabrics, and sugar. Though not extensive, the local manufactories are noted for their production of cloaks, harness, carpets, shoes, sword blades, and sheepskin caps. It was the capital of Afghanistan for many years, but at present is the capital of the western division. Timour captured the city in 1381. It passed into the hands of the Persians in 1510, but has been a part of Afghanistan since 1863. Population, 45,500.

**HERB**, any plant whose stem does not become woody, but dies down to the ground after the growing season. Many herbaceous plants, such as annuals, die entirely and are propagated from the seed, while others die only to the ground and may be grown either from the seed or the root. To the former belong the pea, bean, tomato, melon, and sunflower, while the latter include the caraway, parsley, sage, and horseradish. Herbs are useful in medicines and for food. Many species of aromatic plants are employed in the preparation of viands, such as dill with cucumber pickles and sage in dressings with delicate meats.

**HERCULANEUM** (hĕr'cū-lā'nĕ-ŭm), an ancient city of Italy, situated about five miles southeast of Naples, near Mount Vesuvius. A vast eruption greatly damaged it in 63 A. D., and in the reign of Titus, in the year 79, it was totally buried by the lava flowing from the volcano. It was entirely forgotten until 1709, when its site was discovered by a well being dug at Pesina. The city lies under from 35 to 100 feet of ashes, but in 1713 some relics were found. In 1738 the first extensive excavations were commenced. Since then much work

has been done and many works of ancient art have been secured from the entombed city. Many of the remains, including numerous writings on papyrus, may be seen at Naples.

**HERCULES, Pillars of.** See **Gibraltar.**

**HERCULES BEETLE**, a giant beetle of Brazil, remarkable both for its great size and the peculiar head of the male. It is about six inches long. The male has two large horns, the larger of which is upon the head and the smaller upon the thorax. These projections have the appearance of a pair of pincers and are powerful weapons for offensive and defensive warfare.

**HEREDITY** (hĕ-rĕd'ĭ-tĭ), the tendency possessed by animals and plants to resemble the ancestral stock in many essential characteristics. There is in each animal or plant a tendency or peculiarity which causes it to resemble in certain respects the individuals from which it sprang. In animals the resemblance may be either in mental or physical characteristics, or in both, and the similarity may be noticeable in early infancy or may appear as the individual develops by growth and age. Among the more noticeable points of similarity may be mentioned the form and size of the body, the degree of intelligence, the color of the eyes and hair, and the tendency toward industry and activity. In some instances the marked hereditary tendencies may be traced to only one and in others to both parents, or they may originate from one or more generations which precede the immediate parent. Sometimes the hereditary tendencies alternate in the children. However, in all instances some minute differences are certain to arise. These dissimilarities in some cases tend to be reproduced in successive generations, but generally the movement is in a contrary direction, reproducing a reversion to ancestral types. Darwin, Herbert Spencer, Haeckel, and Wallace have written extensively on this subject and have introduced heredity as a doctrine into zoölogical study. See **Embryology, Evolution.**

**HEREFORD** (hĕr'ĕ-fōrd), a town of England, in a county of the same name, 51 miles south of Shrewsbury. It is on the Wye River and is surrounded by a productive farming and stock country. The chief building is a fine cathedral dating from 1079, having a frontage of 325 feet. It has manufactures of leather, gloves, and hardware. The celebrated Hereford cattle, noted for their meat and production of milk, are native to the vicinity of Hereford. The city has pavements, several fine schools, and railway connections. It was first chartered as a city by King John. Population, 1907, 22,070.

**HERESY** (hĕr'ĕ-sÿ), a word employed in the New Testament to denote a sect or a school of opinion among the Jews. Mention is made of the heresy of the Sadducees and the Pharisees. Saint Paul, when speaking to Agrippa, said: "After the strictest heresy of our religion I lived a Pharisee." Christianity was spoken of by certain Jews in the beginning of its history as the heresy of Nazarene. Later the term came to be applied to the belief of any person who differed from the standards of the church, though he professed Christianity. The Gnostics were among the first to be called heretics among the early Christians, and Gnosticism (q. v.) continued as a potent influence up to the 6th century. The church maintained a systematic policy of repressing heresy, as the beliefs differing from the dominant church came to be called, up to the time of the Protestant reformation, when the era of religious liberty had its beginning.

It was a common practice for the Roman Catholics to be enjoined in communicating in sacred matters with heretics, and many papal bulls were publicly read in Rome as a warning to the faithful against prevalent error. Pius IX., as late as 1864, issued his celebrated "Syllabus of Errors," in which he condemned as erroneous eighty current opinions. Huss, Wycliffe, and Luther are among the many reformers who were designated as heretics and their teachings in the main were stigmatized as heresies. A long line of persecution was practiced in France, Italy, and Spain from the latter part of the 12th to the 16th century, but greater moderation was shown to those who differed from the dominant church in the states of Germany. Many people were burned or tortured in England on the charge that they were heretics. At present the ecclesiastical authorities may pass upon points of doctrine and declare certain beliefs to be heresy, but no punishment aside from excommunication can be inflicted.

**HERKIMER** (hĕr'kĭ-mĕr), a village of New York, county seat of Herkimer County, eighty miles northwest of Albany. It is located on the Mohawk River and the Erie Canal and has transportation facilities by the New York Central Railway. The public library contains about 10,000 volumes. It is the seat of the Folts Mission Institute, has a free public library, and maintains a municipal system of waterworks. The manufactures include mattresses, clothing, and machinery. It is surrounded by a fertile farming and dairying region and has considerable trade in merchandise and farm produce. Population, 1910, 7,520.

**HERMIT** (hĕr'mĭt), a person who retires

from society to live in solitary contemplation and devotion. The word was probably derived from Paul the Thebaid, who lived for many years as a recluse in the deserts of Egypt, dying there at the age of 113 years. Saint Anthony and other historic characters were imitators of the first hermit and from them the name has gone into general use. The term gave rise to the word hermitage, which is generally applied to the home of some prominent person who lives in retirement and to many places of retreat, as the home of Andrew Jackson near Nashville, Tenn., and Rousseau's retreat in the valley of Montmorency, France.

**HERMIT CRAB**, the name applied to several species of crustaceans, found most commonly in the tropical seas. Each individual of the family consists of a fleshy mass, and for protection occupies the cast-off univalve shell of suitable size, which it carries until its size is too large, when it takes up its abode in one larger. See **Crab**.

**HERMON** (hĕr'mŭn), **Mount**, the most elevated mountain of Syria, rising 9,150 feet above the Mediterranean. It belongs to the Anti-Lebanon group. The modern name is Jebelsh-Sheikh. It is mentioned in the writings of Moses by the names Sion and Hermon.

**HERMOSILLO** (hâr-mŏ-sĕl'yŏ), a city of Mexico, capital of the state of Sonora, about ninety miles north of Guaymas. It is located in a fertile valley which produces large quantities of cereals and vegetables. The buildings are chiefly of stone and adobe. Among the improvements are a public library, a government mint, and several schools and churches. It is connected with Guaymas, its port on the Gulf of California, with a railway. Population, 1908, 18,250.

**HERNIA** (hĕr'nĭ-ä), the protrusion of some vital part from the cavity in which it normally belongs. It is due to an unnatural or accidental opening of the walls of the cavity that contains the organ affected. *Rupture* is the common term applied to abdominal hernia, in which the abdominal viscera may become partially or totally displaced. Other organs affected include the heart, the brain, and the lungs, and the protrusions give rise to hernial tumors. Formerly abdominal hernia was entirely neglected by the medical profession, but it is now the subject of careful attention of the most eminent physicians in all countries. The less severe cases can be cured by careful treatment, and temporary or permanent relief may be obtained by wearing a truss or support to retain the organ in its natural position.

**HERON** (hĕr'ŭn), a wading bird allied to

the flamingoes, storks, and spoonbills, belonging to the family *Ardeidae* and the genus *Ardea*. The species are numerous and widely distributed. The *green heron* and the *great heron*, sometimes called the *great blue heron*, are native to North America. In all species the bill is sharp, straight, and longer than the head. The common heron has a grayish color, black quill feathers, and a glossy plume, and measures about three feet from the bill to the end of the tail. It builds its nests in trees, but some nest on low bushes, laying three to four eggs. The different species inhabit the vicinity of ponds, marshes, fresh-water streams, and lakes, and abound on the seashore. They feed on insects, frogs, fish, rats, mice, the young of other birds and mollusks. Some species are

COMMON GRAY HERON.

esteemed for table use, but they are not generally eaten, except by natives.

**HERRING** (hĕr'ring), the name of a large family of soft-rayed fishes, of which the common herring of the North Atlantic is the most valuable. The head is one-fifth its total length. It has small teeth in both jaws. The upper side is blue-green in color and the length is from eight to twelve inches. The herrings are remarkable for rapid propagation. As many as 70,000 eggs have been found in a single female. They travel in schools, live on the small animals of the sea, and are widely distributed.

The herring fisheries of the North Sea and the North Atlantic are the most important. There

HERRING.

they accumulate in large groups to spawn in the summer months, when they are caught in countless numbers by fishers, and are preyed upon by sharks, seals, whales, and predatory birds. The small eggs are heavy, cling together, and settle on rocks, shells, and other solid surfaces at the bottom of the water. It is thought that the herring used for food subsist mainly on minute crustacea and small fishes. The artificial propagation of herring has attained to much success and is pursued extensively. As a food fish the herring is of much value and is utilized largely for curing as well as for fresh consumption. In Norway the annual catch aggregates 1,000,000 barrels. Other extensive herring fisheries are found off Nova Scotia, Holland, France, New England, and in the North Sea.

**HERZEGOVINA** (hĕr-tsā-gō-vĕ'nā), a province of Austria-Hungary. It is bounded on the north by Bosnia, east by Montenegro, and southwest by Dalmatia. The area is 3,530 square miles. It is mountainous, the highest peak ranging about 7,850 feet above the sea, and much of the surface is barren and rocky. The valley of the Narenta River, the largest stream, is fertile. Other tracts are fruitful, but the fertile lands are confined chiefly to the valleys. Fruits, grains, tobacco, and live stock are the principal products.

Herzegovina was formerly a part of Dalmatia, but became a dukedom in 1440. The Turks made it tributary in 1463, after which it was a battlefield for many years between the Christians and Mohammedans. It was transferred to Austria-Hungary by the Treaty of Berlin in 1878, in which condition it remained until 1908, when it was annexed as a crown land to the dual empire. Mostar is the capital and chief city. The inhabitants consist mostly of Slavs and Germans. Population, 1908, 203,080.

**HESSE** (hĕs), or **Hesse-Darmstadt**, a

grand duchy of Germany. It is eighth in size among the German states. The area is 2,965 square miles. Hesse-Nassau divides it into two separate portions, the most northern of which is entirely inclosed by that state. The Rhine, Main, and Neckar are the chief rivers. The soil is productive and yields large quantities of cereals, grasses, and fruits, particularly of the vine. Among the minerals are manganese, iron, and peat. The manufacturing industries produce furniture, shoes, chemicals, cotton and woolen goods, machinery, cigars, and leather. Hesse is a hereditary constitutional monarchy and the chief executive authority is vested in the grand duke, who is assisted by three ministers. About 850 miles of railways are in operation, most of which are owned and operated by the government. Darmstadt is the seat of government and Mentz is the largest city. Other cities include Bingen, Worms, and Giessen. In 1567 the landgraviate of Hesse was divided, from which the grand duchy of Hesse originated. It was formed into Hesse-Cassel and Hesse-Darmstadt in 1604. Napoleon enlarged the latter in 1806. In 1866 it was ceded to Prussia as one of the results of the Austro-Prussian War. About two-thirds of the inhabitants are Protestants. Population, 1905, 1,209,175.

**HESSE-CASSEL** (hēs'-kās'sel), a district of Cassel, in the province of Hesse-Nassau, now a part of Germany. The history begins with 1567, when it was organized as a landgraviate by William IV. Napoleon made it a part of the kingdom of Westphalia in 1806, but it was restored to an electorate in 1813. In the Seven Weeks' War it sided with Austria, which caused it to be occupied by a Prussian army, and in 1866 it was incorporated with Prussia.

**HESSE-NASSAU** (hēs-nās'sa), a part of the German Empire, being a province of Prussia, situated between the Rhine and the Weser. It is composed of portions of Hesse-Cassel, Nassau, and Hesse-Homburg. The area is 6,055 square miles. It is generally elevated, but has rich soil and is well fitted for agriculture and forestry. Iron, coal, zinc, lead, and copper are mined extensively. Cassel is the capital. Fulda, Frankfort, and Wiesbaden are flourishing cities and manufacturing centers. Population, 1905, 2,070,052.

**HESSIAN FLY** (hēsh'an), a small dipterous insect, the larvae of which are exceedingly destructive to rye, barley and wheat. It is about an eighth of an inch in length, the color is brown, the wings are dusky-gray and fringed at the outer sides, and the males are somewhat smaller than the females. The eggs are laid in

May and September on young plants, where they hatch after from ten to fourteen days, and the larvae develop into flies in about ten days. The damage to growing crops occurs during the larval state, when the young suck the juices of the joints and roots. In many sections of the country the erroneous view is held that the Hessian fly was brought to America by the Hessians employed by the British in the Revolution, hence the name. The first extensive ravages in America occurred in 1786 and 1789, but since then they have been quite destructive to small grain, except oats, at various times both in America and Europe.

**HIBBING** (hib'bing), a town of Minnesota, in Saint Louis County, eighty miles northwest of Duluth. It is on the Great Northern and the Duluth, Missabe and Northern railways. The surrounding country is rich in timber and deposits of iron ore. It has electric lights, a fine high school, and a number of well-built churches. Recently it has grown rapidly and it has a large trade in merchandise and manufactures. Population, 1905, 6,566; in 1910, 8,832.

**HIBERNATION** (hī-bēr-nā'shūn), the state of torpor in which many animals that inhabit cold or temperate climates pass the winter. On the other hand, in dry and hot countries various animals pass into a similar condition in the hottest season of the year, this state being known as *aestivation*. Many species of insects hibernate, some in the egg, others in the caterpillar, and still others in the chrysalis state. Hibernation is a physiological condition which is favored, but not produced, by cold. In severe winters many hibernating animals perish, since the temperature of their bodies is reduced to nearly the same degree as that of the surrounding atmosphere. Among the hibernating mammals are the porcupine, hedgehog, dormouse, badger, bear, and squirrel. Bats pass almost the entire winter in a state of sleep. Reptiles hibernate in both cold and temperate climates, which is likewise true of many amphibious animals. Among the hibernating reptiles are the tortoises, lizards, crocodiles, and serpents. During hibernation the digestion and respiration are either almost or entirely suspended.

**HIBERNIA** (hī-bēr'nī-à), or **I v e r n a**, the name given to Ireland by Julius Caesar and the classical writers. Though the island was never conquered by the Romans, it was well known to them. It is mentioned by Aristotle as one of the two islands situated in the ocean beyond the Pillars of Hercules. Ptolemy described a number of the rivers and harbors and speaks of the island as Juverna or Iverna.

**HIBISCUS** (hī-bis'kūs), the name of a large

genus of plants, including herbs, shrubs, and trees. They belong to the mallow family and are widely distributed in both hemispheres. Many of the species have very beautiful flowers, including several obtained from Syria, which are cultivated extensively as ornamental shrubs in Great Britain and the United States. Another species is a tree native to Florida and the West Indies. It yields material for matting and cordage and the wood is light and useful in manufacturing. The Deccan hemp of India belongs to this class of plants and is useful for its valuable fiber. Other species, mostly tropical, are cultivated for their fruit or seed, or are favorite garden plants because of the beauty of their flowers.

**HICCOUGH** (hĭk'kŭp), a spasm of the diaphragm and the glottis. The sharp sound which accompanies a hiccough is caused by the rush of air into the larynx. It is usually due to an unusual distension of the stomach, caused by eating rapidly or eating and drinking excessively. Hiccough is a symptom of some diseases, such as gangrene and peritonitis. A mild attack may be overcome by taking long inspirations of air or by drinking water.

**HICKORY** (hĭk'ŏ-rŷ), the name of several species of forest trees, formerly classed with the natural order *Walnut*. They grow to a great height, frequently 95 feet, and are stately and beautiful. Unless barked, the wood is rapidly damaged by worms, but when cared for is of much value in the manufacture of whip handles, axles, shafts, cogged wheels, and other purposes where a strong and durable wood is serviceable. Among the valuable hickory nuts are those borne by the shagbark, or shellbark, and the pecan, but the wood product of these species is also very valuable. They thrive in many parts of the Mississippi valley and regions farther east. The nutmeg hickory is a species common to South Carolina and elsewhere, but its fruit is of little value. Though an American tree, the hickory has been naturalized and is cultivated in Europe.

**HIDES**, the skins of animals, especially when considered material for leather or when made into leather. The trade in hides of cattle, horses, and other domestic animals has long been an important industry. At slaughterhouses the hides are removed from cattle, protected by a layer of salt, and transported to the tannery, where they are prepared for manufacture into boots, shoes, harness, belts, and many other articles for which leather is utilized. Formerly the chase supplied large quantities of hides, especially those taken from the buffaloes of North America and the wild horses of South

America, but at present the leather used in manufactures is derived almost exclusively from domestic animals.

**HIERARCHY** (hĭ'ēr-ärk-ŷ), a form of government administered in the church by bishops, archbishops, and patriarchs, and in a lesser degree by priests. Theological writers apply the name to the whole government and ministry body of the church, but in this sense it can be applied only to the Christian denominations that are ruled by bishops, such as the Anglican church and the Roman Catholic church. The term was applied especially to the papal hierarchy in the Middle Ages, when the Pope exercised both spiritual and civil authority, although he was limited more or less in the latter by councils and princes. In the latter part of the 14th century a powerful movement began against the exercise of hierarchical powers, and the Protestant revolution made possible the separation of the government of the state and the church.

**HIEROGLYPHICS** (hĭ'ēr-ŏ-glĭf'ĭks), a term originated by Greek and Latin scholars to describe the writings sculptured on buildings and monuments in Egypt and Babylonia. Subsequently it came to be applied to the writings of other peoples, including the picture writings of the Mexicans, Peruvians, and North American Indians. The name originated because it was thought the Egyptian writings related exclusively to sacred subjects and that they were legible only to priests. All attempts made by Western peoples to read the Egyptian hieroglyphics were abandoned in the 17th century and these writings were wholly unknown until 1777, when the French discovered a stone among the ruins of Fort Saint Julien, near the Rosetta branch of the Nile, which has since been called the Rosetta Stone, and is now in the British Museum. This stone contains an inscription of the coronation of Ptolemy V. and was probably sculptured in 95 B. C. It afforded a key by which the language and writings of the Egyptians became known to European scholars.

Four modes of more or less closely associated ancient writings of the Egyptians are generally recognized. They are known as the hieroglyphic, the hieratic, the demotic, and the Coptic. The *hieroglyphic* is the earliest and is formed by figures of objects with various symbols, most of which are arbitrary or mathematical. Later it assumed the form of a lapidary script and was traced in ink or painted on public monuments. *Hieratic* writing is known as the priestly and contains two symbols. The *demotic* form came into use in the

9th century B. C., and was used in commercial and social relations. *Coptic* writing is a form employed in the more recent period of ancient Egypt. On the Rosetta Stone the inscription is written in both the hieroglyphic and hieratic characters, hence it furnished a key to hieroglyphic writing which enabled scholars to translate extensively from Egyptian monuments.

The hieroglyphics found in Mexico and Peru are thought to have originated from the Aztec kings. Their earlier forms consisted of picture designs, but later they became modified into alphabetical characters. It was thought by Baron Houghton (1809-1885) and Stephan Ladislaus Endlicher (1804-1849) that the Assyrian and Chinese writings rose from the earlier hieroglyphics, and that the cursive forms which now constitute their alphabet were derived from the sculptured forms of objects formerly employed on monuments and in temples. See **Egypt**.

**HIGH PRIEST**, the principal religious dignitary in the hierarchy of the Jews. Aaron was the first high priest and from him the office succeeded to Eleazer, his eldest son, and thence to his successor. The Mosaic law provided that the office be held for life. It vested in the high priest the duties of overseeing the sanctuary. The high priest had charge of the service and the treasure and entered the Holy of Holies on the Day of Atonement. About the beginning of the Christian era conflicts began to arise between the civil and ecclesiastical authorities, hence the office ceased to be hereditary and the high priests were appointed or removed by the civil rulers. The pontificate in the time of the Maccabean princess reached its highest brilliancy, since they joined regal to priestly authority in the exercise of the office.

**HIGH SCHOOL**. See **Education**.

**HIGHWAY**, the road or way over which the public generally has a right to pass. In popular usage the term is restricted to ways or roads upon land, such as are used by pedestrians and vehicles, but in law it is applied to all ways that are open to public convenience, including paths, roads, streets, bridges, canals, ferries, public squares, and navigable streams. In English law it is usually called the king's highway, since by the theory of that law it was considered as having been originally given by him. Vehicles meeting in a highway in England are supposed to turn to the left, while in the United States the teams are expected to turn to the right. The law has recognized this rule to a certain extent, and proof of a violation in case of accident is quite essential where action is brought for damages.

A highway may be created by an act of government, as in the case where a new country is laid out for settlement, when the highway is located on the section line and is usually 66 feet wide. New highways may be established in a section of country already settled either by condemnation or by dedication. In the former case it is located by the civil authorities and the owner of the land is compensated according to its value, and in the latter instance the land is given free by the owner of the property, though it does not become a public highway until it is legally accepted by the proper officers. In case property is used as a highway for a considerable length of time to the knowledge of the owner, it becomes a highway through such use and cannot afterward be closed. Formerly extensive interstate or national roads were maintained, but the practice has been abolished very largely since the building of railways, and the authority over highways at present is vested in the smaller political divisions, such as the parish, town, or county. Though the public is permitted to use the whole or any part of a highway, the property right is usually vested in the owner of the abutting land and in case the highway is vacated it reverts to him. Those obstructing a highway are liable to a fine and imprisonment, or both, and in most instances legal restrictions limit the use to some extent, such as prohibiting stock to remain on the same without an attendant. It is unlawful to drive faster than a walk, or more than a certain number of head of stock at one time across the larger bridges.

**HILLSBORO** (hīlz'būr-ō), a city in Texas, county seat of Hill County, in the central part of the State. It is on the Saint Louis Southwestern and the Missouri, Kansas and Texas railroads. The chief buildings include the county courthouse, the high school, and an academy. Among the manufactures are flour, hosiery, candy, clothing, machinery, and cottonseed oil. It has electric lights, waterworks, and a considerable trade in live stock, cereals, and merchandise. Population, 1900, 5,346; 1910, 6,115.

**HILO** (hē'lō), a seaport and the largest city of the island of Hawaii, situated on Hilo Bay. It is the second city of the Hawaiian Islands, being exceeded in size only by Honolulu. The noteworthy buildings include the customhouse, the public library, the courthouse, and several fine schools. It has delightful drives and is ornamented by tropical plants and parkings. The city has a large trade in fruit, rice, fish, sugar, and coffee. Many of the inhabitants are Americans, but the natives and Chinese predominate. Population, 1910, 6,745.

**HIMALAYA** (hī-mā'lā-yā), meaning snow

abode, the most elevated mountain system in the world, situated in the southern part of Asia. As a whole the system contains several parallel ranges, which have a length of about 1,500 miles and an average width of 180 miles. The Himalayas form a natural boundary between Tibet and India, contain numerous fertile valleys, and are the source of many important rivers, among them the Brahmaputra, Ganges, Indus, and Ghara, which belong to the watersheds tributary to the Bay of Bengal and the Arabian Sea. The general height of the Himalayas is approached only by the Andean system of South America. They contain the most magnificent snow-capped peaks in the world. The highest elevations are Mount Everest, 29,002 feet, the highest mountain in the world; Mount Godwin-Austen, 28,250 feet; Kunchinginga, 28,160 feet; Dhwalagiri, 26,825 feet; and Nanda-Devi, 25,675 feet. Other peaks are thought to be as high or even higher than Mount Everest, but their exact altitude has not been ascertained. The geological structure consists largely of granite, with important deposits of mica slates and gneiss. Metamorphic rocks and more recent alluvial deposits occur at the lower slopes, while the entire region is rich in zinc, coal, copper, iron, petroleum, gold, silver, and other mineral deposits. Vast forests of spruce, pine, deodar cedar, silver fir, and deciduous trees abound in the regions which have altitudes suitable to their growth. The Hindus regard the mountains sacred. Many pilgrims visit annually the sources of the Ganges and other localities especially interesting to them in religious rites and legends.

**HINDU-KUSH** (hīn'dōō-kōōsh), a system of mountains in Central Asia, lying west of the Himalayas, of which the Hindu-Kush form a continuation. The Indus River passes between them, and the Himalayas. Their breadth is about 200 miles and the length is 370 miles, separating Afghanistan from British India. Hindu-koh, north of Cabul, is covered perpetually with snow and is regarded the culminating peak. Its height is 20,225 feet. Several tributaries of the Oxus River rise in the northern slopes of the Hindu-Kush, and from the southern slope flow the Helmond and the Cabul.

**HINDUSTAN** (hīn-du-stān'), a name applied to the Punjab and Ganges valley. It is frequently, but less correctly, used to describe the whole of British India. See **India**.

**HIPPOCAMPUS** (hīp-pō-kām'pūs), or **Sea Horse**, a genus of fish allied to the pipefishes, of the suborder *Syngnathi*, found in the Mediterranean and the Atlantic. The head bears a curious resemblance to the head of a horse, and, when swimming, is held in a nearly vertical

position. Several species have been described, most of which have a length of from seven to twelve inches. The young are hatched and reared for a time in a marsupial sack under the

SYNGNATHI.

Hippocampus.

Pipefishes.

tail of the male. Several species are described in fables as monsters consisting of half horse and half fish.

**HIPPODROME** (hīp'pō-drōm), a word applied by the Greeks to the place where horse and chariot races were given for public exhibition. The hippodrome at Constantinople in the Byzantine period was especially noted and corresponded generally to the Roman circus. Olympia had a hippodrome which was 350 feet wide and nearly a mile long. In modern times the name is associated with the circus, but differs from it in that the exhibition consists mainly of horse and chariot racing and gorgeous displays by large vehicles.

**HIPPOPOTAMUS** (hīp-pō-pōt'ā-mūs), the river horse of Africa, a genus of a family of ungulates, which contains only two living species. One of these is large and occurs in the swamps, rivers, and lakes of Africa, while the smaller species is found principally in the vicinity of Lake Tchad and the rivers flowing into the Atlantic Ocean. The larger species is char-

acterized by a large head, small eyes and ears, a thick skin, few hairs, and a reddish fluid exuding from the skin. It delights to swim and dive in the waters of lakes and rivers and feeds on the plants growing in or near the water. In ancient times it was found in Lower Egypt, but its tendency to interfere with tilled fields has caused it to be driven from the cultivated por-

mentioned by Job to be the hippopotamus now found in Africa.

**HIROSHIMA** (hē-rō-shē'mā), a commercial city of Japan, in the province of Aki, at the southwestern extremity of the island of Honshū. It is about three miles from an inlet of the Seto Uchi, has railroad and electric railway facilities, and is the seat of several fine temples and schools. The manufactures include clothing, carpets, furniture, metal wares, and lacquered products. It has a large domestic and foreign trade. Population, 1903, 121,196.

**HISTOLOGY** (hīs-tōl'ō-jŷ), the branch of science which classifies and describes the microscopical structure of living organisms. It is subdivided into *vegetable histology*, which treats of the tissues of plants; *comparative histology*, which treats of the tissues of the lower animals; and *human histology*, which treats of the tissues of man. The history of this science dates back to an early period in the Christian era, but very little progress was made until the early part of the 19th century, when the compound microscope and the camera enabled scientists to make important investigations. These instruments were the means of discovering the nature of cell structure as well as that of the tissues, and the camera proved especially useful in preserving the result of

HIPPOPOTAMUS.

tions. The size of the body is large, being next to that of the elephant, but its legs are very short; hence, it appears much smaller. While the length is often seventeen feet, it stands only from four to six feet high. The feet are small, the hoofs are short, and each foot has four toes. The flesh is esteemed as food and is sought by the natives, who capture the animal by arranging pits from which escape is impossible. The feet and tongue enter into the manufacture of jelly, while the teeth furnish ivory, and the hide is serviceable for leather of a heavy kind. When not pursued, it is peaceable and apparently indifferent, but when attacked it becomes dangerous. Fossils of this animal do not occur in America, but there are remains of several extinct species both in Europe and Asia. Commentators on the Bible regard the behemoth

the investigations made by scientists. Since most of the diseases are due to some disorganization of the cells, it has been possible to determine the effect of many ailments by bringing the tissues and glands under the microscope at different stages, then preserving the records by means of the camera.

**HISTORY** (hīs'tō-rŷ), a systematic record or narration of events and circumstances relating to man, especially those having reference to his social and political conditions. In giving a record of the past it treats of facts concerning both nations and individuals, tracing to some extent the causes of the present condition of different peoples. As to accuracy, the facts related depend remotely upon contemporary witnesses and various circumstantial evidences. Although history as now understood is pre-

served in written form and is being added to constantly, it need not necessarily be committed to writing, as historic facts may be passed from generation to generation in the nature of story, when it is called *tradition*. This is substantially the form common among barbaric peoples, a circumstance due to their primitive mode of life and the absence of both desire and ability to preserve a written record of events. However, authentic history dates only from the invention of writing, whether uncial or cursive.

The ancients used hieroglyphic characters to inscribe important events on monuments, tombs, and temples. By them we have come into possession of valuable information touching their political and social life. However, ancient history as known to us is limited to a few nations and to a comparatively small area of the surface of the earth. The regions included comprise Northern Africa, Southern and Western Asia, and Southern Europe; the history connected with the other portions of these grand divisions is either mediaeval or modern. There are evidences that America and Australia, as well as all the continents, were inhabited in the remote past, but our knowledge of the peoples occupying these regions is limited to the information obtained from fossil remains and ruins of temples and dwellings. This is true particularly of portions of America and Europe. It is evidenced in many remains met with in Peru, Mexico, and the Mississippi valley in America, and in various cliffs and lakes of Europe. Modern history is not only more extensive than that coming to us from the preceding periods, but it is vastly more accurate. This is due at least partly to the circumstance that early peoples studied to make their records artistic rather than instructive.

Writers have divided history into various classes, these serving to detail information according to style in writing or as related to time. *Chronological history* is a record of successive times, *narrative history* is a story of events or a series of events, and *philosophical history* considers the causes of events and traces their results. History is sometimes classed as *sacred* and *profane*, the former being the history recorded in the Bible and the latter that of secular events. As to time, history is either ancient, mediaeval, or modern. *Ancient history* ends with the fall of the Western Roman Empire, in 476 A. D., including Jewish, Oriental, Greek, and Roman history. *Mediaeval history* closes with the revival of learning and the Protestant Reformation, in 1517. *Modern history* includes the period from 1517 to the present. *Biographical history* treats of the lives of individuals.

**HISTORY, Methods of Teaching**, the orderly process or procedure by which to give instruction in the facts and events of history. The purposes are to stimulate patriotism and to give information concerning the development and the underlying principles upon which nations are established. Other objects are to strengthen the character, train the judgment, and direct the reading of the students.

**INTEREST.** The first essential step in teaching history is to arouse interest. Students are interested in that of which they know something. One of the fundamental principles of pedagogy is to "proceed from the known to the unknown." It is a mistake to employ an overwhelming list of books to begin with. One book at a time and that the *right* one is a wholesome motto. In many instances it is well to vary from the chronological order, although the general method is to begin with the ancient history and drift down to modern times. While the usual plan is to teach modern history by reading backward from effect to cause, it may be said that to proceed from cause to effect appears to be fully as pedagogical. In general, the instructor should seize upon that which is already known as the starting point and thus proceed to the unknown, irrespective of whether the reasoning is onward from cause to effect or backward from effect to cause. However, with children it is more philosophical to begin with modern history, especially with that of our own country, rather than with that of Europe, mediaeval or ancient.

**PRIMARY WORK.** In the primary grades the teaching should be oral and the instructor should exercise skill and tact in presenting stories from history. When the learner enters school at about the age of six years, he may receive a bias from history which will avail much in his future life. He may be taught to tell the teacher in what town, in what county, and in what country he lives. Later may follow instruction as to who the chief executive officers are, where the capital is located, and what certain lines and illustrations on maps mean. These simple points, repeated until they are fixed in the memory, may seem of little consequence, but they invariably stimulate thought. They suggest local, state or provincial, and national government. Later may be added pleasing anecdotes from the lives of distinguished men, such as the exploits of Captain John Smith, the voyages of Columbus, and the adventures of La Salle and Daniel Boone. In this connection it is more essential to dwell upon the explorations, developments, and inventions than upon the achievements and contentions of war. Action

is the keynote of history and implies actors who do things. Brief sketches from the lives of Washington, Lincoln, and other distinguished Americans lend interest in studying the events which have an important influence in training for citizenship.

The work in the primary grades should lead up to the grammar school course. This implies that a line of supplementary reading may be placed in the hands of the students, making it possible to articulate the instruction in the lower grades. Suitable books for this purpose include Johonnot's "Stories of Our Country," Mowry's "American Inventions" and "American Pioneers," Coffin's "Boys of '76" and "Boys of '61," and Hale's "The Man Without a Country." Regular text books well suited for this work should be afterward introduced, including Mowry's "First Steps in the History of Our Country," Eggleston's "A First Book of American History," or Channing's "First Lessons in United States History."

**GRAMMAR GRADES.** The larger part of teaching history is done in the higher grades of the grammar school. Very properly, it consists almost everywhere in the study of the history of our own country. This requires both a good text book and a skillful teacher. In order to arouse real enthusiasm, it is well to have a half dozen or more different books, besides the use of supplementary work drawn from the reference department of the school library. Happily, the recent texts abridge the stories of wars and devote a larger amount of space to the triumphs of peace. However, care should be taken to discriminate between important paragraphs and those of less value. Facts are to be learned in their relations and care is to be taken that the words of the text are not memorized. Regular sequence of facts in chronological order is not enough. Relations of one fact to others and a strong grasping of cause and effect should be clearly pointed out. Maps and pictures are of much importance, especially as they fix localities and the early customs in the mind, but the intelligent use of reference books is relatively essential. As a whole the work in the grammar schools should lay a broad and liberal foundation for general work in history in the higher institutions of learning.

**ACADEMIC AND HIGHER WORK.** A general outline of ancient and mediaeval history should be pursued in the high schools and academies, especially in connection with the study of the ancient languages. While the higher institutions have agreed upon the general plan of studying history, many colleges and universities, as well as many individual professors, have specialized

methods for particular branches or divisions of the course. The purpose is not merely to become acquainted with the achievements of men in past times, or to study cause and effect, although these are important matters, but in addition to observe the various degrees of civilization and enlightenment through which the human race has passed in reaching the present stage. Here the study of the uplift of humanity becomes of vital importance. Indeed, whatever in history shows the progress of mankind, the steady advancement of the human race, is worth studying, and ordinarily only that.

**DATES AND OUTLINES.** The important dates should be memorized by the student, but too large a number sometimes confuses the learner. Such important dates as the discovery of America by Columbus, the English settlement at Jamestown, the landing of the *Mayflower* at Plymouth Rock, the expedition of Braddock, the capture of Quebec by the English, and the surrender of Burgoyne at Saratoga are among those that can profitably be memorized. In order to teach both dates and the general facts of history, the instructor should place outlines of the subjects upon the blackboard as the study proceeds from day to day. These outlines are to be constructed so as to embrace the important facts of the lesson in chronological order, giving the important names, dates, causes, effects, etc. Each lesson should include a brief review of one or more previous lessons and suggest facts for study in the lesson to be assigned for the succeeding day.

**MIGRATIONS.** In the study of general history it is well to emphasize the fact that migrations promote civilization. The four distinct movements in very ancient times of large bodies of people toward the west, from the banks of the Indus, in Asia, to Europe are notable examples. From these sprang the Celtic, Teutonic, Pelasgic, and Slavic peoples who produced the civilization of modern Europe. Then we may notice the great migration of from two to three centuries ago from Europe to North America, especially to the French and English colonies, which later gave rise to the United States and to the Dominion of Canada. Although the immigrants came from different countries and spoke a number of languages, they were brought together and eventually formed two of the largest and most enlightened countries in the world. At first these migrations peopled the Atlantic slope and the valley of the Saint Lawrence, but they moved westward across the plains and over the Rocky Mountains to the Pacific Coast. They were a hardy set, owing to the life of exposure which they had lived

in the eastern section of the country. To the early pioneers and their descendants were added many thousands who came directly from Great Britain, Ireland, Germany, France, Sweden, Norway, Denmark, and Austria. Later a large stream of immigrants came from countries of Southern Europe, including Italy and Portugal, and many immigrated from Russia, Japan, and other countries. Although at first heterogeneous in language and customs, these peoples are becoming welded together under the American system of education into a homogeneous whole.

**PEACE RATHER THAN WAR.** Although the essential campaigns and battles should be understood, it is of vitally more importance to study the causes leading to the wars and the results of these conflicts upon the nation. One campaign, as that of Burgoyne in the Revolutionary War, may be taken as a type and the others studied less exhaustively. Hitherto text books of history magnified the periods of war and neglected the triumphs of peace. The newer books have been improved by shortening the descriptions of campaigns and dwelling more upon the progress made in times of peace. They have added chapters or divisions on railroad and steamboat lines, canals and jetties, under land and water tunnels, wireless telegraphy, subways and elevated railroads, passenger and freight elevators, sewing machines, commerce and mining, and many other inventions and industries. It may be shown that we have attained a higher position in creative art and many of the sciences than any country of the world in the same period of time. This fact of history in our nation may well be emphasized in teaching youth in our schools. In connection with this it may be observed that the civilized world has made material progress in developing the spirit of universal, international peace, and that the different nations now regard each other as members of one vast family, rather than conflicting and antagonistic countries. All this has been stimulated by the modern development of commerce and the more liberal education of the masses.

**HITTITES** (hīt'tits), the name of a powerful tribe of Syria, which occupied the region between the Orontes and the Euphrates. The first mention of the Hittites in the Scriptures is in connection with Abraham at Hebron, who bought of them the field and cave of Machpelah. From them Esau obtained his first two wives. They occupied a part of Canaan at the time of the Jewish invasion under Joshua. Uriah, one of the chief officers under David, was a Hittite, and they appear to have remained with the Jews even up to the time of Ezra and Nehemiah.

They are referred to in the cuneiform inscriptions of Egypt, in which they are called Khita or Kheta. It is probable that they were a far greater people than the biblical mention of them indicates, since their outposts seemed to have extended as far west as the Aegean Sea about 1200 B. C.

**HIVES**, or **Nettle-Rash**, the common name of eruptions of the skin. They appear as white rounded elevations, but later turn red, causing an intense itching. Hives result from certain drugs, such as balsams and often from eating certain kinds of food, as crabs or lobsters.

**HOANG-HO** (hwäng'hō), or **Yellow River**, one of the important rivers of China, rises north of Tibet, flows toward the Khingán Mountains, thence south to the Pe-ling Mountains, and thence northeast into the Gulf of Pe-chi-li. Its banks are protected by levees, but it often overflows, the most noted of its inundations occurring in 1887. The entire length is 2,600 miles and the area of its basin is about 390,000 square miles, which constitutes one of the most productive and populous regions of China. The principal tributaries include the Tao-ho, the Wei-ho, and the Ta-tung-ho. It is designated Yellow River on account of the quantities of yellow earth held in solution by its waters and carried as silt into the Yellow Sea.

**HOBART** (hō'bērt), the capital of Tasmania, on the Derwent River, near its entrance into Storm Bay. It is located on the south coast of the island, has a railroad and electric railway facilities, and is the seat of considerable trade. The chief buildings include a college, an art gallery, a public library, a museum, and the Parliament buildings. The streets are regularly platted and well improved. Near the city is Mount Wellington, which is visited by many tourists. It has manufactures of clothing, soap, flour, earthenware, and machinery. Regular steamship communication is maintained with London and the important ports of New Zealand and Australia. The city was founded in 1804. Its prosperity is due largely to an extensive import and export trade. Population, 1906, 33,318.

**HOBOKEN** (hō'bō-ken), a city and port of entry in Hudson County, New Jersey, on the Hudson River, immediately above Jersey City and opposite New York City. It is on the Erie, the West Shore, the Delaware, Lackawanna and Western, and other railroads. A number of European steamship lines have their termini here. The city is at the base of the Palisades and the principal streets run north and south, parallel to the river. Among the noteworthy buildings are the Stevens Institute of Technology,

the Saint Mary's Hospital, the public library, and a number of fine schools. It has a firemen's monument, situated in Church Square Park, and maintains Hudson Park.

Hoboken is an important coal and produce depot and has a large trade in fruits, cereals and live stock. The manufactures include lead pencils, machinery, leather goods, coffins, paper, silk goods and tobacco products. Extensive electric street railway lines, sewerage, gas and electric lighting, and stone and macadam pavements are among the facilities. The site was a part of the patroonship granted to Michael Pauw in 1630 and was first called Hobocan Hacking. It was settled in 1640, but the city was really founded by John Stevens in 1804. It was incorporated as a town in 1849 and became a city in 1855. The city was visited by a destructive fire in 1900, but the damaged parts were rebuilt on an improved plan shortly after. Population, 1910, 70,324.

**HOBSON'S CHOICE**, a phrase originating from Tobias Hobson, the first keeper of a livery stable in England. The *Spectator*, a periodical published in London, related that Hobson had forty horses in his barn, and that he always kept near the door the one he wished to have used. Travelers coming to the barn were induced to allow him to choose the horse, when he always took the one nearest the door, hence "Hobson's Choice" came to signify an apparent rather than a real choice.

**HOCHKIRCH** (hōh'kīrch), a town in Saxony, Germany, famous on account of a battle fought there in the Seven Years' War, on Oct. 14, 1758. The Prussians under Frederick the Great were defeated by the Austrians under General Daun, but after retreating to the Heights of Drehsa the Austrians were routed completely.

**HOG.** See **Swine**.

**HOHENLINDEN** (hō-en-līn'den), a village in Bavaria, Germany, twenty miles east of Munich. It is celebrated for the victory of the French over the Austrians, in which the latter lost 8,000 killed and wounded, while the French lost 5,000 men. Marshal Moreau commanded the French and Archduke John had command of the Austrians. The battle occurred on Dec. 3, 1800, and shortly after the Peace of Lunéville was concluded.

**HOHENZOLLERN** (hō'en-tsōl-lērn), a province of southern Germany, forming an administrative district of Prussia. The area is 480 square miles. It is entirely surrounded by Württemberg. In 1905 it had a population of 66,780. The house of Hohenzollern, a princely family of Germany, derived its name from this region. It descended from Count Thassilo, a

Swabian noble of the time of Charles the Great, who founded a castle on the Zollern Heights in the 9th century. This dynasty has continued in an unbroken line until the present. Emperor William II. of Germany is a representative, though the most distinguished name associated with it is that of Frederick II. the Great.

**HOLIDAY** (hōl'ī-dā), a day set apart for the commemoration of some important event, as a religious or national festival. Besides the Sunday or Sabbath, the more important are New Year's Day, Washington's Birthday, Good Friday, Decoration Day, Fourth of July, Labor Day, Thanksgiving Day, and Christmas. This list of holidays is observed in nearly all parts of the United States, but in most states others are quite generally observed, particularly Lincoln's Birthday, Lee's Birthday, Arbor Day, and Election Day.

The statutory holidays of Canada are Sundays, New Year's Day, the Epiphany, Good Friday, the Ascension, Ash Wednesday, Conception Day, Easter Monday, All Saints' Day, Christmas Day, the birthday of the ruling sovereign, Victoria Day, Dominion Day, Labor Day (the first Monday in September), and any day appointed by proclamation for thanksgiving or a general fast. This list applies to the Dominion and in addition certain days are observed by some of the provinces, as Arbor Day and any day appointed by the Governor General.

**HOLLAND** (hōl'land), a city of Michigan, in Ottawa County, on the Black River, about three miles from Lake Michigan. It is on the Père Marquette Railroad and regular steamboat lines of the Great Lakes. It has a large trade in grain and lumber. The manufactures include leather, flour, ironware, machinery, and utensils. It has many churches, a fine public school system, and good municipal improvements, including electric lights, waterworks, and pavements. It is the seat of Hope College, an important educational institution of the Reformed Church, with an attendance of 300 students and a library of 18,000 volumes. Holland was founded in 1847 and incorporated in 1867. The city has a large number of citizens of Dutch extraction. Population, 1910, 10,490.

**HOLLAND.** See **Netherlands**.

**HOLLY** (hōl'ly), a genus of plants which includes many species of evergreen shrubs and trees, found mostly in temperate climates. The leaves are glossy, the flowers are whitish or white with yellow shading, and the fruit is mostly scarlet. The tree is from ten to forty feet high and of conical shape. Its ability to bear clipping makes it an excellent plant for

hedges and fences that are kept dwarfed. The wood is white and hard and is useful for knife handles, musical instruments, and turnery work.

AMERICAN HOLLY.

EUROPEAN HOLLY.

The leaves and twigs are used extensively for decorating houses and public buildings, especially at Christmas. From the bark a mucilaginous substance is secured, which serves in preparing birdlime. The holly tree is widely distributed in North America, Europe, and Africa. Several species are cultivated as ornamental plants. The *maté*, or *Paraguay tea*, of South America, is the leaf of a species of holly.

**HOLLYHOCK** (hōl'li-hōk), a plant native to China, but now cultivated for its ornamental flowers in gardens and parks. Though perennial in warm countries, it is classed with the biennials in temperate climates. It has a tall, branchless stem. The flowers are either single or double on the upper part and are greatly variegated in color. As cultivated in gardens, it reaches a height of from five to twelve feet, and is popular on account of its blooming until late in autumn. The leaves are rough and heart-shaped, the sessile flowers are large, and the corolla has five petals. In some countries the flowers are used in medicine. Some of the double flowering species are grown extensively.

**HOLSTON** (hōl'stūn), a river of Tennessee, rises on the eastern slope of the Clinch Mountains, and at Kingston joins the Clinch River to form the Tennessee. Its length is about 200 miles, most of which is navigable for light-draft river boats.

**HOLY ALLIANCE**, a league formed by Alexander I. of Russia, Frederick William III. of Prussia, and Francis of Austria on Sept. 26, 1815. It was concluded at Paris and signed by the sovereigns in their own hand. The purport of the league was to make the precepts of Jesus Christ the basis of administration, but the real purpose consisted of maintaining the power

of the existing dynasties. The Holy Alliance came to an end by the events of 1848.

**HOLY FAMILY**, in art, the name applied to representations of the Virgin, the infant Savior, and their attendants. Many paintings known by this title are extant, the first of which date from the 6th century. Among these is the famous production in which the Virgin is represented sitting on a seat, now in the Catacomb of Saint Calixtus in Rome, and later painters substituted a throne for the seat. Subsequently the Prophet Isaiah and angels were introduced as prominent attendants. Other figures frequently seen in these paintings include the mother of the Virgin, the infant John the Baptist, Saint Catherine, Saint Anna, and Saint Joseph. The Madonna and Child later became prominent subjects of paintings, although they were comparatively unknown in art before the 13th century. Among the leading painters who produced works in which the Holy Family is a prominent figure include Raphael, Leonardo, Perugino, Giovanni Bellini, and Andrea del Sarto.

**HOLY GHOST**, or **Holy Spirit**. See **God**.

**HOLYOKE** (hōl'yōk), a city of Massachusetts, in Hampden County, on the Connecticut

DWARF DOUBLE HOLLYHOCK.

River, eighty miles west of Boston. It is on the Boston and Maine and the New York, New Haven and Hartford railroads. Extensive water power is obtained from the river, which has a

fall of sixty feet at this place. The municipal facilities include electric lights, waterworks, a public library, and an extensive street railway system, by which it is connected with Springfield and other cities. The public schools rank among the best in the State, and the public buildings include many valuable and massive structures. They include the Federal building, the city hall, the public library, and many schools and churches. Among the manufactures are machinery, cutlery, cotton and woolen goods, screws, rubber, sealskin, blank books, and wire. Holyoke was long called Ireland Parish as it was originally settled by the Irish. From 1786 until 1850 it was a part of West Springfield. It was chartered as a city in 1873. Population, 1905, 49,124; in 1910, 57,730.

**HOLYOKE, Mount**, a ridge situated in Hampshire County, Massachusetts. It is about seven miles long. The highest point is 1,122 feet above sea level. It separates Hadley and Amherst townships from Granby and South Hadley. Mount Holyoke College is situated in Hadley township, on the northern side of the ridge, and is the oldest college for women in the United States. It was established in 1837, has 85 instructors, 700 students, and contains a library of 25,000 volumes. The college property has a value of \$1,580,000.

**HOLY ROMAN EMPIRE**, a vast dominion established in the western part of Europe. It dates from the year 800, when Charlemagne was crowned at Rome as successor of the Roman emperors, but the name *Roman Empire* was not used until 962, when Otho the Great was crowned by Pope John XII. and inaugurated the Roman Empire of the German nation. The empire included all of the territory in which the people recognized the German monarch and Italy, and at different times it included Denmark, Hungary, Poland, Cyprus, and Jerusalem. Frederick Barbarossa, in 1152, prefixed the word *Holy*, after which the dominion became known as the Holy Roman Empire. The Hohenstaufen (q. v.) dynasty represented the stronger monarchs of this imperial realm, and after their time the title was rather honorary than imperial. Switzerland became independent from the empire in the 15th century, the Netherlands obtained their independence by the Peace of Westphalia in 1648, and other territory was gradually lost or became semi-dependent. All but two of the emperors after 1438 belonged to the house of Hapsburg. In 1806 the title Holy Roman Emperor became extinct, as Francis II., two years previous to that, had been crowned as Emperor of Austria.

**HOLY SEPULCHER** (sĕp'ŭl-kĕr), the

tomb in which Jesus lay. It was located near the place of crucifixion, having been hewn out of a rock near the walls of Jerusalem. The place called *Golgotha*, meaning a skull, which has been anglicized as *Calvary*, is the place of the crucifixion. Not far from it, near a road and within a garden, was the tomb, which is said to have belonged to a rich man by the name of Joseph. Within the modern city of Jerusalem, about 450 yards west of the northern part of the Haram esh-Sherif, or temple area, is the Church of the Holy Sepulcher, which covers the traditional site of both Golgotha and the tomb of Jesus. See **Jerusalem**.

**HOLY WATER**, a consecrated mixture of salt and water used in the ritual of the Roman Catholic Church. The use in churches is very ancient and many believe it to have been derived from a similar custom practiced by the ancient Hebrews. The water, after being blessed by a priest, is sprinkled on the worshipers and some of the objects in the church, such as the images, vestments, and bells. It is used at various domestic occasions, especially at marriages and funerals.

**HOLY WEEK**, the last seven days of Lent, the week before Easter, and frequently spoken of as Passion Week. It is kept as a penitential season to commemorate the passion and death of Christ. The special days included are Palm Sunday, Spy Wednesday, Holy Thursday, Good Friday, and Holy Saturday. The Roman Catholic church commands abstinence from wine and flesh for all the days, but absolute fast is enjoined for the Friday and Saturday.

**HOMEOPATHY** (hō-mĕ-ōp'ā-thÿ), or **Homoeopathy**, the name of a system of medical practice introduced by Samuel Hahnemann. The distinguishing characteristic of the system is based upon the principle that "like cures like." He set forth the essence of the system in the following words: "Every powerful medicinal substance produces in the human body a peculiar kind of disease; the more powerful the medicine, the more peculiar, marked, and violent the disease. \* \* \* We should imitate nature, which sometimes cures a chronic disease by superadding another, and employ, in the disease we wish to cure, that medicine which is able to produce another very similar artificial disease, and the former will be cured." See **Allopathy**.

**HOME RULE**, a term applied in British politics to the movement made by the Irish home rule party with the view of establishing a Parliament in Ireland for the purpose of legislating in relation to local affairs, but subject to the imperial Parliament of the empire.

It designed to make the local government similar to that now common to Canada and Australia. The movement originated at Dublin in 1870, and four years later 60 members of Parliament were elected who favored the home rule policy. In 1885 there were 86 members under the leadership of Parnell. The project received a new impetus by the support of Gladstone. A large party of Irishmen favor absolute independence, but the adoption of local self-government is held by many to be both feasible and of mutual interest to all concerned. John Redmond and Justin McCarthy are among the influential leaders within the last decade.

**HOMESTEAD** (hōm'stēd), a borough of Pennsylvania, on the Monongahela River, eight miles above Pittsburg. It is on the Pennsylvania and the Pittsburg and Lake Erie railroads. The surrounding country produces large quantities of coal, which caused large steel, iron, and glass industries to be built up at Homestead. It is the seat of the steel works established by Andrew Carnegie, in which extensive labor disturbances occurred in 1892. The place has good municipal facilities, electric street railways, and a number of fine schools and churches. It is noted especially for its extensive production of steel plate. Population, 1900, 12,554; in 1910, 18,713.

**HOMESTEAD ACT**, a law enacted in 1862 by the Congress of the United States, under which it became possible for the head of a family, or any person at least 21 years of age, to acquire by settlement and improvement title to 160 acres of public land. The only condition provided is the payment of a registration fee, improvement as a residence, and occupation for five years. This law carries with it the commutation privilege, by which title can be acquired to not more than 160 acres after fourteen months' occupation and the payment of \$1.25 per acre, but \$2.50 if situated within United States railroad grants. So-called homestead exemptions are recognized in all the states. These provide that a specified amount is exempt from execution for debt to the head of a family, but the amount in different states varies greatly.

In Canada a homestead entry may be made on 160 acres by any male over eighteen years of age, but it must be applied for personally at the district land office. The entry fee is \$10. Residence upon the land is required at least six months in each of three years. The homesteader must cultivate a portion of the land each year and not less than fifteen acres must be under cultivation at the end of that time. A patent is issued at the end of three years upon

proof of residence and improvement as required by law.

**HOMICIDE** (hōm'ī-sīd), the act of killing a human being. It may be either criminal or justifiable, depending upon the circumstances under which the act is committed. Justifiable homicide includes the taking of a human life in self-defense, by accident, or under an order issued by a court to an officer. It is especially declared in the law of most countries that whoever kills a human being with malice aforethought, either expressed or implied, is guilty of murder. This constitutes criminal homicide, which is usually divided into three classes, those of murder in the first degree, murder in the second degree, and manslaughter.

**HONDURAS** (hōn-dōō'rās), a republic of Central America, bounded on the north and east by the Gulf of Honduras and the Caribbean Sea, south by Nicaragua and San Salvador, and east by Guatemala. It has an area of 43,300 square miles. The climate is similar to that of Guatemala, being hot in the low regions and quite equable and pleasant where the country is elevated considerably. Among the minerals are coal, gold, silver, cobalt, iron, zinc, and lead, but iron is the most important. Much of the soil is fertile. In the southwestern portion trend lofty mountain ranges, but the northern and eastern parts consist of valuable coast and valley lands. The streams flow almost exclusively into the Gulf of Honduras and the Caribbean Sea, and include the Guangues, Cutchabutan, Roman, Tinto, Barba, Catago, and Cape rivers.

Agriculture is the principal industry. The various products include sugar, coffee, tobacco, wheat, indigo, maize, rice, and a large variety of tropical fruits. The forests yield valuable dyewoods, tamarinds, cabinet woods, rubber, and vegetable ivory. Cattle raising and dairying are important industries. The country has considerable trade with the United States, Germany, and Great Britain, in the order named. Several short lines of railway have been constructed, by which the Gulf of Honduras is connected with Puerto Cortez and other interior points, and several lines penetrate the coast and valley regions. In 1909 the railroads included a total of 112 miles. A large part of the interior is reached only by mules and ox-carts. Tegucigalpa is the capital. Other important cities are Juticalpa, Nacaome, La Esperanza, Santa Rosa, and Choluteca.

At present the country comprises fifteen departments. A national constitution proclaimed in 1894 vests the chief executive authority in a president, who is elected by popular vote for a

term of four years. The president is assisted by ministers of the interior, finance, war, public instruction and justice, and public works. Legislative authority is vested in a national congress, which is constituted of deputies elected by popular suffrage. It has a standing army of 500 men and a national militia of about 20,000. The inhabitants are largely of Spanish descent and the dominant faith is Roman Catholic, but religious liberty is extended to all. Education is gratuitous and nominally compulsory. Spanish is the spoken and official language. Besides the system of common schools, there are twelve colleges or institutes.

Columbus discovered the coast of Honduras in 1502. Settlements were made by the Spaniards in 1524, when the town of Triunfo de la Cruz was founded. The region was made a royal province of Spain two years later and afterward it became a captain generalcy of Guatemala. It revolted from Spain in 1821 and was annexed to Mexico. In 1823 it joined the states of Central America, but since 1838 it has been an independent republic. At several times it has been disturbed by revolutions and wars with neighboring countries. Population, 1905, 500,136.

**HONDURAS**, Bay of, an important inlet of Central America, extending from the Caribbean Sea. It is bounded largely by Honduras, Guatemala, British Honduras, and Yucatan. The bay contains several important islands, including Turneffe and the Bay Islands, and on its shore are several growing seaport cities.

**HONE**, or **Whetstone**, a kind of stone used to sharpen edged tools, such as knives, scythes, and razors. Hones are of finer grain than either ordinary whetstones or grindstones. The finest kinds are very hard and compact and are commonly called oilstones. They are made of several species of slate and are used in sharpening the finer class of instruments. The best hones for scythes obtained in America are made of sandstone found in Arkansas. The finer classes of slate or oilstones come from Bohemia and Siberia.

**HONEY** (hŭn'y), a vegetable food product deposited by bees in the cells of their honeycomb. It is a sweet, thick liquid, quite clear and transparent, and when kept for some time solidifies into a granular white mass. The neuter bees collect the sweet juices of flowers by means of their proboscides, thence it is transferred to the honey-bag, and by certain chemical changes honey is produced, which is deposited in store for food during winter. When elaborated by young bees, it is whiter than in other cases and is called *virgin honey*. The

product of older bees is more or less of a yellowish hue. The flavor of honey is dependent largely upon the plants from which it is collected. In many countries the culture of bees is an important industry, the milder climates being best adapted to the enterprise. Besides being a valuable food, it is used in medicine as a promoter of expectoration, with vinegar as a gargle, in pastry and cooking, and for the manufacture of mead. Both extracted and comb honey are sold in the market, while an artificial product is made of glucose placed in cells of wax. Where apiaries are kept, it is customary to prepare bee food by cultivating clover and other plants. Clover is a favorite food plant because honey made from its flowers is almost white and of excellent flavor.

**HONEY LOCUST**, a leguminous forest tree widely distributed in North America, but found most extensively in the southern part of the Mississippi valley and the Atlantic coast plain. The flowers are greenish, usually in spikes, and generally unisexual. They are followed by pods, which are more or less twisted and from a few inches to two feet long. Within the pods are the seeds, enveloped in a pulp, and they become quite sweet when ripe. The leaves are pinnate and the foliage is elegant in appearance. Long thorns develop on the limbs, which make the plant a favorite for ornamental hedges and for fencing. The wood is of an inferior quality and decays rapidly. Several species of locusts grow to a height of 80 to 100 feet, having fine spreading branches.

**HONEYSUCKLE**, a genus of shrubs and twining plants found in the Northern Hemisphere. About 100 species have been described, of which the common honeysuckle is the best known. It is found largely in Europe and North America, where it blooms from June to September. The flowers are tubular in form and red without and yellow within. The fruit consists of scarlet berries. This species is cultivated extensively for its flowers. In North America there are nine different species of honeysuckle. The Australian honeysuckle is so called because of the sweet liquid found in the flowers. The trumpet honeysuckle is cultivated largely in the United States as a twining plant in gardens and at porches.

**HONG-KONG** (hŏng'kŏng'), or **Hiang-Kiang**, meaning sweet water, an island near the mouth of the Canton River, off the southeastern coast of China, forming a possession of Great Britain. It is separated from the mainland by a narrow channel called Ly-e-Mun. The area is 32 square miles. Much of the surface is rocky and barren and the shores are steep.

The general elevation above the sea is from 1,000 to 2,000 feet. Population, 1906, 328,638.

Hong-Kong, in a larger sense, is a crown colony of Great Britain. It consists of the island of Hong-Kong and the leased district of Kowloon. The latter is in the southeastern part of China and was leased to Great Britain in 1898 for 99 years. This portion of the colony has an area of 376 square miles and a population of 89,012. Victoria is the capital. It extends several miles along the bay. Its harbor is one of the finest in the world, being strongly fortified, and it is the center of a vast trade. The local products consist of various manufactures, such as clothing, cigars, textiles, utensils, and machinery. Among its buildings are a government house, the courthouse, a cathedral, the university, and a number of other public buildings. The island was ceded by China to the British in 1842 after the close of the opium war. Since then it has developed an enormous trade, the value of its annual imports amounting to about \$20,000,000 and the exports to \$12,000,000. The trade is chiefly with Great Britain, Japan, the United States, Germany, and France.

**HONOLULU** (hō-nō-loō'loō), the largest city and the capital of the Hawaiian Islands, on the southern coast of the Island of Oahu. The site is beautiful and is surrounded by groves of fruit and ornamental trees. It has a pleasant and healthful climate. Among the noteworthy buildings are the public treasury, the post office, the customhouse, the capitol, the public library, a museum, and a cathedral and several churches. It has many hospitals and fine schools. The harbor is well protected, giving the city considerable advantage in foreign trade. It has manufactures of clothing, earthenware, canned fruits and fish, and utensils. The general facilities include sewerage, electric lights, waterworks, pavements, public parks, rapid transit, and railroad connections. It has had a rapid growth in wealth and population. In 1815 it was little more than a fishing village. It became the capital of the archipelago in 1820. Population, 1910, 52,183.

**HOOD, Mount**, an elevated mountain of Oregon, in the Cascade Range. It is located in the western part of Wasco County, about fifty miles southeast of Portland. It has an altitude of 11,935 feet. The summit affords a fine and extensive view of the surrounding country.

**HOODED SEAL.** See Seal.

**HOOKE, Mount**, a lofty peak of Canada, one of the highest summits of the Rocky Mountains. It is situated on the border between Alberta and British Columbia and has an altitude of about 15,710 feet.

**HOOPOE** (hōōp'ō), a genus of birds native to the warmer parts of the Old World. These birds are classed according to some with the honey eaters and by others with the horn-billed birds. The bill is long and slightly curved, the tail is broad, and the eyes are large. Two nearly parallel rows of long feathers form a crest on the head. In most species the color is buff, but variegated with black and white. The male is about twelve inches long, somewhat larger

HOOPOE.

than the female, and is more vivid in color. The nest is built in the holes of trees, in which five or six eggs of lavender-gray are laid. They feed largely on insects, worms, and filthy accumulations. The double whoop uttered has originated its name.

**HOOSAC TUNNEL** (hōō'sak), an important railroad tunnel on the line from Boston to Troy, in the western part of Massachusetts. It is built through the Hoosac Mountain, a range extending into Massachusetts from the Green Mountains of Vermont. It was completed in 1875 at a cost of about \$18,000,000, is nearly five miles long, and contains a double railway track.

**HOOSICK FALLS** (hōō'sik), a village of Rensselaer County, New York, on the Hoosick River, 27 miles northeast of Troy. It is on the Boston and Maine Railroad. The chief buildings include the high school, a parochial school, and several churches. The manufactures consist principally of clothing, farming machinery, utensils, knitted goods, and ironware. It was settled in 1688 and was first incorporated in 1827. Population, 1905, 5,251; in 1910, 5,532.

**HOOSICK RIVER**, a stream in eastern New York, flows toward the west, and joins the Hudson about fourteen miles above Troy. It is noted for its vast water power, which is utilized extensively for manufacturing purposes in towns along its banks. The valley is highly fertile.

**HOP**, a perennial plant of the nettle family. A single species is found native in North America and Europe, but under cultivation it has

HOP-VINE AND FLOWER.

been greatly variegated. The perennial root annually sends forth long, weak, rough, twining stems. The flowers are male and female. The latter, occurring in cones, are greenish in color and constitute the hops sold in the market.

These cones are gathered when ripe, and, after being carefully dried, are used to communicate an aromatic bitter flavor to beer. Hop culture is an important industry and is pursued extensively in all civilized countries. About 80,000,000 pounds of hops are grown annually in the United States, the supply coming chiefly from New York, Oregon, Washington, and California. Large quantities are grown in Ontario and British Columbia. The County of Kent, in England, is noted for its production of hops. Besides being used in the manufacture of beer, hops enter into the preparation of medicine on account of their tonic and narcotic properties. They are placed in pillows to induce sleep. In some countries the young shoots are bleached and eaten like asparagus, while the fibers of older stems enter into the manufacture of cordage. Hops are an important ingredient in the manufacture of yeast for baking and general leavening purposes.

**HOPKINSVILLE** (hōp'kīns-vīl), a city in Kentucky, county seat of Christian County, seventy miles northwest of Nashville, Tenn. It is on the Illinois Central, the Louisville and Nashville, and other railroads. The surrounding country produces large quantities of wheat and tobacco and has extensive deposits of coal and iron. Among the manufactures are carriages, farming machinery, earthenware, flour, and tobacco products. The chief buildings include the county courthouse, the high school, and several churches. It is the seat of the South Kentucky College, a State insane asylum, and

two seminaries. It was settled in 1797 and incorporated the following year. Population, 1900, 7,280; in 1910, 9,419.

**HOREB** (hō'rēb), Mount. See Sinai.

**HOREHOUND** (hōr'hound), a labiate plant found in Europe and Asia. Most of the species are herbaceous. The common horehound of Europe has downy leaves and stems, dense whorls of flowers, a bitter flavor, and an aromatic smell. It yields a volatile oil and a bitter fluid, which are used in the preparation of a tonic given as lozenges for coughs and colds. Many species have been naturalized in the United States.

**HORN**, the name applied to a modification of the epidermis in animals, as the hoofs and horns of ruminants, the spines of porcupines, and the claws of birds. These parts are constituted of substances similar to those forming the anatomical structure of animals, but differ from them in the proportion of their parts. There are three classes of horns borne for defense on the heads of animals—those composed of bone, as the antlers of the deer; those consisting of epidermis or skin formations, as the horns of the rhinoceros and the buffalo; and those partly bone and partly epidermis, as in the case of the cow. Horns are either solid or hollow, and differ from each other in that some are single, while others contain a number of branches or prongs. Generally the single horn is hollow, and those containing prongs are of solid or bone formation throughout.

In commerce the term horn is often applied to the hoofs, claws, nails, bills, and quills of animals, and to the shell of the tortoise, but in a narrower sense it refers only to the appendages on the heads of animals. Horn formations contain both animal and mineral matter. They are tough, may be softened by heat, and are usually semitransparent. The horn growth differs widely in various animals, as, for instance, in the stag only the males have horns. Both sexes of most cattle have horns, but some species are hornless. In deer the horns are shed annually, while a horn once destroyed in cattle, goats, and sheep does not grow again.

The various kinds of horns are employed to manufacture many articles of commerce. They are used in making handles for knives and forks, canes, umbrellas, and walking sticks. Some enter into the manufacture of buttons, combs, snuffboxes, pipe tips, and ornaments. Besides, they serve a useful purpose in preparing a convenient vessel for powder and in making hat racks and decorative articles. Horn can be softened by heat and pressed into molds or split into sheets. When cooled, it resumes

its former toughness and flexibility. Many dyes and other coloring matters can be employed to give it a lasting tint in color.

**HORN**, the name applied to a large number of different kinds of wind instruments. They were made formerly of the horns of animals, but these have fallen more or less into disuse. The musical instrument now designated particularly by that name is manufactured largely in France. It consists of a metal wind instrument furnished with a *mouthpiece* and a *bell*. The Saxe horn and other military horns, as well as those used in bands, are usually some form of the *French horn*. Instruments which belong to the class known as *horns* are seldom played singly in the orchestra. A pair and more frequently two pairs are employed.

**HORNBEAM** (hörn'bēm), the name of a small tree, so called because the wood has been

HORNBEAM.

A, Flowers; B, C, Fruit.

used extensively for making yokes for cattle. The common hornbeam, or yoke elm, is native to Western Asia and the temperate parts of Europe. The trunk is frequently flattened and twisted and covered with a smooth and light gray bark. The roots descend deep into the

ground. In moist and shady places this species frequently attains a height of sixty to ninety feet. The wood is white and quite hard and is used by carpenters and wheelwrights. The hornbeam of North America is a smaller tree, usually from twenty to forty feet in height, and is found from Quebec to the Gulf of Mexico. Locally it is called ironwood, blue beech, or water beech. A similar tree known as hop hornbeam, locally known as leverwood, is of slow growth and has very hard and heavy wood.

**HORNBILL**, the name of a family of large birds native to Africa and the East Indies. They are related to the kingfishers and toucans, and, like the latter, have very large bills. The bill is broad at the base and compressed toward the tip, and in most species a large bony protuberance surmounts the upper part. The rhinoceros hornbill is the largest species. It has an expanse of wings of about three feet, is four feet long, and the upper mandible has a peculiarly large protuberance. It is stupid and cowardly, showing little boldness except when in search of food, and the flight is rather slow. The female, after laying four or five eggs, sits on the nest until the young are fully fledged, usually eight or ten weeks. In the meantime the male plasters the opening of the nest over with clay, leaving only a slit three or four inches long and sufficiently wide to permit the entrance of its head, and through this the female and young are fed. During this time the male becomes lean, but the female gets very fat and is considered a dainty by the natives.

**HORNBLENDE** (hörn'blënd), a subvariety of aluminous amphibole. It is one of the five most abundant simple minerals of which rock is composed. The others are mica, quartz, feldspar, and carbonate of lime. It occurs in various forms, differing in the composition of its crystalline particles. In color it is greatly diversified. It is found as a constituent of trap rock and with such igneous forms as granite and gneiss. Some species of hornblende are transparent and others are opaque. The colors predominating are white, brown, and black.

**HORNED TOAD**, or Horned Frog, a genus of horny lizards of North America, which somewhat resemble a toad or frog. They are found chiefly in the western part of North America, especially in the arid plains and mountains, extending from Alberta to the central part of Mexico. They lie close to the ground, usually among weeds and cacti, and the color somewhat resembles that of the surrounding objects. Several species have been described, but all have a more or less circular or oval body, which is flattened and covered with scales surmounted

by horny spines. They are sluggish in their movements and pass the winter in holes dug by various rodents. The food consists of ants, flies, and other insects.

**HORNELLSVILLE** (hörn-ělz'vīl), a city of New York, in Steuben County, on the Canisteo River, 57 miles south of Rochester. It is on the Erie and other railroads. The chief buildings include the high school, an academy, and a public library of 15,000 volumes. It has a growing trade in merchandise. Among its industries are railroad shops, tanneries, glove factories, iron foundries, potteries, and brick-yards. The public utilities include sewerage, pavements, waterworks, and electric street rail-ways. It was settled in 1790 and was called Upper Canisteo until 1820, when it was incorporated under its present name. Population, 1905, 13,259; in 1910, 13,617.

**HORNET** (hôr'nět), a stinging insect of the family *Vespidæ* and the genus *Vespa*. It is larger than the common wasp, being about an inch long, and has a more venomous sting. The hornets are widely distributed in North America and other grand divisions. They are usually black or dark brown and are ornamented with white and yellow. Several species of

painful, that of some species causing fevers in men and cattle.

**HORSE**, a genus of quadrupeds classed with the zebra and the ass. It is distinguished by an undivided hoof, a mane on the neck, a simple stomach, and lips and teeth adapted for cropping short herbage. Careful breeding has developed many kinds of horses, all of which are distributed more or less widely. They serve more important purposes than any other animal as beasts of burden and draft. It is thought that Central Asia is the nativity of the horse, but some contend that it was first domesticated in Egypt. Writers generally agree in expressing the view that the horse was brought to Western Europe at an early date, a fact evidenced by remains found in caves in Switzerland and figures of horses cut on rocks.

The Scriptures mention the horse in connection with warfare and with the arts of peace among the ancient Egyptians. Prior to the discovery of America, horses were unknown in the Western Hemisphere. Those met with in a wild state in South America descended from animals introduced by Spanish settlers. Fossil remains found in America indicate that an animal similar to the horse existed in remote ages, but it was much inferior to the species common to the Old World, even to those known in Egypt during the time of the Pharaohs. Forty or more species have been discovered in the Tertiary deposits of North America, but all were comparatively small and none was represented by living forms at the time of the discovery by Columbus. It is assumed that the horse developed from a small and inferior class of animals, about three feet tall, and that this early class is now extinct, the wild horses of Tartary and other regions being descendants of animals that escaped from domestication and gradually developed into the present wild and inferior form.

The horses of Arabia are classed as the most beautiful breed and excel in swiftness, endurance, and perseverance. The European breeds came largely from importation of the Arabian, and have been more or less intermingled with the different classes which were previously common to the West. In America horse breeding has attained a high state of development and constitutes one of the important industries. Among the classes used for draft and agriculture are the Clydesdale, Percheron, and Belgian; those used for speed embrace the Hambletonian, Morgan, and French coach; and the ponies include the Shetland, Galloway, and Indian. These races of horses are interbred more or less with each other and with other grades, and represent classes possessing qualities of su-

HORNET AND NEST.

Asiatic hornets attain to a length of fully two inches and are peculiar for their bright colorings. Their nests are built in the large trunks of trees and in old walls, and some species construct a kind of paper work, which is hung in the branches of trees. They live in communities, which consist of about 200 insects. Hornets feed on the sap of trees and on fruit and honey. Some prey on other insects. The sting is very

periority for various purposes, including several species which may be considered strictly American, such as the Kentuckian.

The horse is characterized by its acuteness of the senses, ability to observe danger, and strength of memory. By suitable food and careful treatment it can be made to serve man in all the arts of war and peace. The period of gestation is a trifle over eleven months and the age of puberty is reached at two years. At the

1, PERCHERON; 2, BELGIAN.

age of from three to four years the horse begins to come into its higher state of usefulness, but lives to an age of from twenty to thirty years, serving with more or less profit during the entire time after being broken for work. In docility it surpasses all the domestic animals, except the dog and possibly the elephant.

Corn, hay, oats, barley, and beans constitute the principal food for horses, but they thrive well when given a variety of these and small quantities of linseed, bran, carrots, and straw.

For driving and running purposes it is best to feed oats largely, while for heavy work corn is the staple food. Until about nine years old the age can be estimated by the marks on its teeth, but after that it is difficult to determine. Horse flesh is used for food in some countries. The hide is an important material for the manufacture of leather and in making robes and rugs, and the tail and mane are utilized for hair cloth and upholsterers' products. The introduction of electric street cars, bicycles, and automobiles has lessened the use of horses to some extent, but, on the other hand, the development of natural resources in new countries has widened it correspondingly. The running record of American race horses is among the best in the world. "Black Beauty," written by Anna Sewell, is one of the most beautiful works on the horse. Literature abounds with valuable and interesting productions relating to the horse and its uses.

**HORSE CHESTNUT**, a genus of trees widely distributed in North America and other continents. The leaves are opposite and quite large, and the seeds are unpleasantly bitter. The seeds contain considerable starch, which is prepared for the market by freeing it from bitterness through repeated washing with an alkaline solution. The species native to North America do not have wood of material value and the seed is quite small, but the true chestnut has nuts that are quite valuable as food for swine, sheep, oxen, and horses. The latter is native to Tibet and has been naturalized in many parts of Europe, where it is cultivated for its wood and for the nuts. The chestnut of North America ranges from Canada to Mexico and is especially abundant in various parts of the Mississippi Valley.

**HORSE POWER**, the unit of force employed in measuring the power of engines, water-wheels, and other prime movers. The term was obtained by Boulton and Watt from observing the dray horses employed in London. They found that a horse is able to go at a rate of two and one-half miles per hour, and at the same time raise a weight of 150 pounds by means of a rope placed over a pulley, hence they estimated the horse power, the horse working eight hours per day, at 33,000 foot pounds per minute. From this circumstances it is estimated that a horse power is equal to a force which will raise a weight of 33,000 pounds one foot in one minute. An engine of ten horse power has the power to raise the same weight ten times that distance in one minute. In practice it is necessary to deduct one-tenth for friction, hence the estimate given is theoretical.

**HORSE-RADISH**, a perennial plant with long stalks, cylindrical roots, and whitish flowers. It is cultivated in many portions of America, but grows vigorously in all kinds of soil after once getting a foothold. The roots possess medicinal qualities. They are used extensively as a condiment for table purposes. Their medicinal qualities are diuretic, stomachic, and diaphoretic. Several preparations are employed as external applications.

**HORSESHOE**, a plate of iron bent into the form of the hoof of a horse, and fastened to the bottom of the same by nails driven through the outer layer and clinched upon the outside. Shoes intended for use upon icy roads are provided with steel points called *corks*, one at the toe and one at each heel of the shoe. Those used for horses employed for draft purposes on soft roads have corks of iron, and those for shoeing driving horses are quite smooth or have blunt corks. Iron shoes are used to some extent for oxen, but they are of two parts on account of the clefts in the foot, and are made to fit the bottom of the hoof. The practice of providing a protection to the feet of horses and mules is quite ancient, and originated from the utility of furnishing security against these animals becoming foot-sore in the time of war. Xenophon and other writers mention certain methods of rendering the hoofs harder as a protection against rough and stony roads. Leather coverings are used to some extent to protect the feet of camels on long journeys. The lower part of these is made from oxhide much like heavy soles in the shoes of modern times. Horseshoes made of iron were introduced into Europe about the 9th century and the custom was taken to England by the Normans. At present this class of horseshoes is used in practically all countries, especially for draft and driving horses, but those used in farming are generally unshod.

**HORSESHOE CRAB**. See **King Crab**.

**HORSETAIL RUSH**, or **Scouring Rush**, the common name of the *Equisetum*, a genus of small plants belonging to the fernwort family. About 25 species are represented in the living flora, and they are classed with an extensive race of plants that predominated in the Mesozoic and Carboniferous times. Formerly they were of great size, in fact enormous trees, but the living species are quite small. They are characterized by having spore-bearing leaves. The plants are unisexual; that is, different plants produce the male and female organs.

**HORTICULTURE** (hôr'ti-kŭl-tŭr), the art or science relating to the cultivation of garden plants for decorative and useful purposes. The main divisions of horticulture are *pomology*, or

fruit growing; *floriculture*, or flower growing; and *olericulture*, or vegetable growing. It is properly a branch of agriculture and like the latter has made rapid progress in America. Many species of shrubs, flowers, and fruit-bearing trees have been naturalized in the different soils and climates, thereby rendering the garden and orchard more productive and profitable. In planting gardens and orchards it is essential to take into account the character of the soil, the drainage, and the slope of the surface. Fruit trees usually thrive best in a rich, dark loam, while early crops and vegetables yield the best returns in a sandy loam. Systematic drainage is essential for the reason that cultivation is most effective in well-drained surfaces, and freezing is thereby rendered less injurious to the growing trees. A slope facing the sun is preferable for orchards in some climates, but in northern latitudes, where frosts appear late in the spring, it is much better to select a slope toward the north for the reason that the early sap flow occasioned by the warm sun in the early part of the year will, when followed by frost, cause a rupture of the cells and consequently result in damage to the tree.

Next of importance to selecting choice species of plants and a suitable location is the careful fertilization and cultivation of the soil. Thorough tilling permits the essential elements of the air to penetrate to the roots, while the destruction of weeds and insects is essential in preserving both the tree and the vigor of its fruit. To succeed in the culture of flowers and ornamental plants it is quite necessary to construct plant houses, pits, greenhouses, and other structures with the view of securing early development. The art of grafting and propagating plants has led to wholesome results and greater profit. Suitable instruments, tools, and various forms of machinery patented within recent years have facilitated the culture to a great extent. Besides, the operation of railroad lines in various directions has opened a wider market in city and country districts for fruit and ornamental products, making it possible for the inhabitants of the colder regions to enjoy largely the more delicate products grown in the warmer climates.

The United States is the leading fruit-growing country of North America. Apples, which can be grown in all the states, comprise the leading crop and yield about 30,000,000 barrels per year. California has first place in the yield of citrus fruits and ships about 32,500 car loads annually. Florida holds second rank in the production of citrus fruits. Peaches, pears, tomatoes, grapes, bananas, strawberries, and many other fruits are grown more or less extensively. Canada

and the southwestern part of the United States have made remarkable progress in the number of species and the quantity of fruits produced. Both countries make large shipments to foreign ports.

**HOSPITAL** (hōs'pīt-al), an institution for the reception, care, and medical treatment of the sick and wounded. The term was applied formerly to a place of hospitality for those in need of shelter and maintenance. This application is still made to institutions built for the care of children, and in some cases to retreats or almshouses for the poor. Hospitals of a general character established in modern times are designed for those who are more or less dependent upon the public, or who are afflicted so as to make it a matter of public policy to extend aid. However, many institutions of this kind are built with the view of supplying the demand of those who prefer to be treated when sick in a hospital rather than in the home. Frequently private families and societies have special departments in readiness for use when needed in such institutions. In many instances the hospitals are maintained by appropriations or donations made by private individuals, but more largely by the city, county, or state under a system of general taxation. In these institutions departments or wards are provided, each being in charge of a separate force of attendants, and the whole is supervised by a matron, house surgeon, and apothecary. Patients afflicted with contagious diseases are kept and treated separately. Special departments are provided for those having ailments likely to prove fatal.

During the time of military operations field and naval hospitals are maintained for the care of sick and wounded soldiers and seamen. The hospitals are either temporary or permanent, the former serving immediate wants, while in the latter prolonged cases are treated. Sick or wounded seamen are usually taken on board of hospital ships, where they are given treatment for a brief period. Later they are transferred to the nearest permanent hospitals, or conveyed to their homes. The care and treatment of sick and wounded military men have made material progress within recent years. They have attracted the attention of philanthropists and of various societies, such as the famous Red Cross.

General hospitals were first established in the 4th century of the Christian era, and since then have spread to all the civilized nations. The United States, Canada, and the countries of Europe have excellent facilities for the care of unfortunates in hospitals. Some of the finest institutions provided by the government are main-

tained for that purpose. The hospitals of New York, Philadelphia, Chicago, Saint Louis, San Francisco, Montreal, and Toronto are especially noteworthy. The most important of Europe are in London, Berlin, Vienna, Paris, and Saint Petersburg. In Europe the institutions of this character date largely from the early part of the 16th century.

**HOTEL** (hō-těl'), a large inn or house for the reception and entertainment of strangers or travelers. The larger hotel buildings of the larger cities are among the finest and best equipped institutions of modern times. They are usually built fireproof throughout, or have fireproof construction in one or more of the lower floors, and are equipped with electric lighting, steam heating, hot and cold water service, baths, telephones, and elevators. The basement usually contains the heating and electric lighting plants, the laundry, the sample rooms, and a general lavatory. The first floor of a modern hotel has the office, the lobby, the news and cigar stands, one or more reception rooms, and rooms for the café, a drug store, a barber shop, a gents' furnishing store, and several small offices. In most instances the parlor and one or more writing rooms are on the second floor, which likewise has the best rooms for guests. All of the floors are reached by elevators and are furnished with fire escapes.

Two general plans of service are in vogue, known as the European and the American. The *European* plan is to place a price upon each particular kind of food enumerated on a bill of fare and extend to the guest the privilege of ordering what he pleases. In fact, the matter of board is entirely separate from lodging, since the guest registers only to take a room at a specified rate per day, and he may secure his meals wherever he chooses. This practice has been adopted with more or less favor in many of the American cities. The *American* plan is to serve a general meal without special orders. Under this plan the guest pays for his lodging and board at a specified price per day or per week.

**HOT SPRINGS**, a city in Arkansas, county seat of Garland County, fifty miles southwest of Little Rock, on the Chicago, Rock Island and Pacific and the Saint Louis, Iron Mountain and Southern railroads. The noteworthy buildings include the Federal Army and Navy Hospital, the high school, the public library, and the Park, Eastman, Arlington, and Majestic hotels. Building stone is quarried in the vicinity. It has a large trade in cotton, fruit, and merchandise. Hot Springs is celebrated for its thermal springs, about 75 in number, some of which have a temperature of 130° Fahr. Electric lights, water-

works, rapid transit, and sewerage are among the improvements. The place was settled in 1804 and was incorporated as a city in 1879. Population, 1900, 9,973; in 1910, 14,434.

**HOTTENTOT** (höt't'n-töt), the descendants of the aborigines of the southern part of Africa. When South Africa was first visited by Europeans, this peculiar race occupied a territory including about 100,000 square miles, from the Cape of Good Hope to the Orange River, but subsequently the number has been reduced greatly. A late census of Cape Colony places the Hottentot population at 90,000, but these are mixed more or less with other races, the total number of purely Hottentot inhabitants being about 20,000. The name was first applied to them by the Dutch; they call themselves Quaqu. The complexion is light brown, the hair is wooly, the nose is flat, the nostrils are wide, the beard is scant, and the cheek bones are high. Though symmetrical in form, their faces are quite ugly, and the general appearance is not pleasant. Formerly the dialect consisted of three classes, but at present they have a language mixed largely with the Dutch and English. They wear European dress.

**HOUGHTON** (hō'tŭn), a village of Michigan, county seat of Houghton County, 95 miles northwest of Marquette, on the Copper Range and the Duluth, South Shore and Atlantic railroads. It is located on Portage Lake, near Lake Superior, and has transportation facilities by a canal. The surrounding country is a rich mineral district, chiefly of copper. The principal buildings include the high school, the county courthouse, and a number of fine ward schools and churches. It is the seat of the Michigan College of Mines. Electric lights, waterworks, and a library are among the public utilities. Population, 1904, 4,345; in 1910, 5,113.

**HOUND**, a class of dogs useful in hunting, noted for their ability to locate game by the scent. The best known species include the bloodhound, staghound, foxhound, beagle, harrier, and greyhound. In the last named the scent is less acute. Hounds are noted for their docility and attachment to man and, when properly trained, are of much service. See **Dog**.

**HOURLASS**, an invention made at Alexandria, Egypt, in the 3d century, and used for measuring time. It consists of two hollow glass bulbs connected by a narrow neck, through which dry sand or some other substance passes. The instrument is not absolutely accurate, as the sand is impeded or affected by the fluctuations of temperature and the humidity contained in the air. Hourglasses are divided into hourglasses proper, and those having a shorter period, as

half-hour and three-minute glasses. In the 16th and 17th centuries hourglasses were used as regular pulpit furniture to indicate the length of the sermon, being placed where the congregation could see the grains of sand falling from the upper to the lower bulb.

**HOUSATONIC** (hōo-sə-tōn'ik), a river of western Massachusetts and Connecticut. It rises in the former State, flows through Connecticut, and after a course of 150 miles discharges into Long Island Sound. It passes through a rich country, affords an abundance of water power for manufacturing, and is affected by tide water for fourteen miles.

**HOUSE BOAT**, a raft with a flat bottom, designed as the support of a house with several rooms. The first structures of this kind were made by fishermen, who designed them as habitations during the fishing season, and later they came into use for the homes of people who were unable to own land. More recently structures of this kind have been built for the use of families or parties who wish to spend the summer season in fishing, or as a season of recreation. House boats are very common on the Thames River during the summer. They have come into use on the Saint Lawrence River and other streams of North America, especially on the lakes. The smaller house boats are propelled by means of poles or oars and the larger ones by gasoline engines. Some of these structures have houses with three or four well-furnished rooms, and offer good accommodations to those who wish to spend a short season in rest or recreation.

**HOUSEFLY**. See **Fly**.

**HOUSELEEK**, or **Live-Forever**, a genus of plants with thick, succulent stems and leaves. They are cultivated for their ornamental flowers. Several species are native to the region extending from Siberia to Italy, but the cultivated plants have been improved and are popular in gardens and parks. The common houseleek has flowering stems from six to twelve inches in height, and is the cyphel that grows on the rocky soil of the Alps in Europe. The flower stems and the blossoms have a beautiful roseate hue. It is hardy under cultivation and the flowers vary in color, though they are usually red or yellow. The juices of the leaves are considered cooling when applied to ulcers, burns, and inflammations.

**HOUSTON** (hūs'tŭn), a city in Texas, county seat of Harris County, fifty miles northwest of Galveston. It is on the Missouri, Kansas and Texas, the International and Great Northern, the Southern Pacific, the Gulf, Colorado and Santa Fé, and other railroads. The chief buildings include the Carnegie Public Li-

brary, the high school, the Federal building, the county courthouse, the Masonic Temple, the Rice Polytechnic Institute, and the cotton exchange. It has a fine union railroad depot. Among the manufactures are furniture, spirituous beverages, oil, cotton and woolen goods, railroad cars, farming machinery, and packed beef. The cottonseed oil factories are among the largest in the United States. The surrounding country is agricultural and fruit producing and contains deposits of cement-producing minerals. Among the facilities are electric street railways, street lighting, sewerage, pavements, and an extensive sewer system. The place was settled in 1836 and was named in honor of Samuel Houston. Population, 1900, 44,633; in 1910, 78,800.

**HOWITZER** (hou'its-ēr). See **Gun**.

**HOWLER** (houl'ēr), or **Stentor**, a kind of monkey native to South America, so named from the hideous howls it utters. The hyoid bone is expanded into a hollow drum, which communicates with the larynx and acts as a resonator. In the males it is much larger than in the females. The hair is long, the tail is prehensile, and the thumbs are large. In size this monkey is the largest of America. Ten or twelve species of howling monkeys have been listed. The *ursine howler* is black or dark brown with yellow markings, and the *golden howler* has a chestnut-red color diversified with yellow on the back. The latter furnishes the principal food for the natives in many parts of the Andes. Some of the species are peculiar in that they hang from the limbs of trees, suspended by their tails, and utter sounds that can be heard more than a mile at night.

**HOWRAH** (hou'rā), a city of India, on the Hugli River, opposite Calcutta, with which it is connected by a floating bridge. The chief buildings include many churches, temples, schools, hospitals, and government structures. It has good railroad and electric railway connections. The manufactures include fabrics, furniture, machinery, utensils, and toys. Howrah is a modern city and has many municipal utilities. In 1785 it was little more than a small village of huts. It is now a suburban section of Calcutta. Population, 1907, 161,535.

**HUCKLEBERRY** (hük'k'l-bēr-rÿ), or **Whortleberry**, a small shrub native to the temperate part of the Northern Hemisphere. It belongs to the genus *Vaccium*. Many species are included in the genus, some of which are common throughout North America. They have bell-shaped flowers and berries with many seeds. They thrive best in the dry soil of woods and mountain sides and yield dark purple berries, which are used in preserves. Species called *bil-*

*berry* grow in moist and marshy places, but their fruit is less serviceable, owing to greater tartness. Most species attain a height of from one to two feet.

**HUDDERSFIELD** (hüd'dērz-fēld), a city in the West Riding of Yorkshire, England, on the Colne River, sixteen miles southwest of Leeds. The chief buildings include the townhall, the public library, the Market hall, and the technical school. The place is noted for its manufactures of steam engines and machinery. It produces cotton, woolen and silk goods, and utensils. The city has extensive railroad connections and several lines of electric railways. The public utilities include sewerage, pavements, several parks, and a system of waterworks. It is the seat of Huddersfield College, which is affiliated with the University of London. Population, 1907, 94,814.

**HUDSON** (hüd's'n), a town of Massachusetts, in Middlesex County, 27 miles west of Boston, on the Boston and Maine Railroad. It is situated on the Assabet River and is surrounded by a productive farming country. The manufactures include clothing, boots and shoes, leather, machinery, and cigars. It has a public library, electric lights, waterworks, and well-improved streets. Several school buildings and churches, a townhall, and a number of substantial business blocks are among the chief buildings. Population, 1905, 6,217; in 1910, 6,743.

**HUDSON**, county seat of Columbia County, New York, on the Hudson River, 28 miles below Albany. It is on the Boston and Albany, the New York Central, and other railroads. The site is on the slope of Prospect Hill. Among the chief buildings are the county courthouse, the State Armory, the State House of Refuge for Women, the city hospital, and the Hudson Orphanage Asylum. The Public Square and the Franklin Square Park are points of interest. The manufactures include steam engines, car wheels, pianos, carriages, cotton and woolen goods, and farming implements. It has electric street railways, electric lights, pavements, waterworks, and a sewer system. The place was settled by New Englanders in 1783, when it was known as Claverack Landing, but the present name was adopted in 1784 and it was chartered the following year. Population, 1910, 11,417.

**HUDSON BAY**, a large bay, or inland sea, situated in the northeastern part of North America. Its length is about 1,000 miles; breadth, 600 miles; and area, 400,000 square miles. It is inclosed wholly by British territory, communicates with the sea through Fox Channel and Hudson Strait, and receives the drainage of a large portion of Canada. Numerous reefs and islands abound along the western shore. In

the southern portion is James Bay. The streams flowing into it include the Great Whale, Churchill, East Main, Albany, Nelson, Fish, Seal, and Severn rivers. It is open to navigation about five months in the summer, and the remainder of the year its surface is covered with ice or largely obstructed by drift ice. Several harbors are situated in the southern part, where the adjoining regions are adapted to stock raising and farming. The fur trade and white whale fisheries are especially profitable, but considerable quantities of fish are also secured in the summer season.

**HUDSON RIVER**, an important river of New York, rises by two small streams in the Adirondack Mountains, at a height of 4,325 feet above sea level. Its course is almost due south and about 340 miles long. It flows into the Bay of New York. The Hudson is navigable a distance of 145 miles, to Albany, for the largest vessels. Beautiful falls of 50 feet are at Glens Falls, 56 miles north of Troy, where great water power has been developed by means of a dam. Its course is through regions both historical and beautiful. It was named from its discoverer, Henry Hudson. Upon it sailed the first steamboat made by Fulton. A tunnel under it connects Jersey City and New York, and it is spanned by many valuable bridges. Near its mouth are the Palisades, which rise from 300 to 500 feet above the surface of the water. Tappan Sea, about three miles wide, and Haverstraw Bay are features between the Palisades and the Highlands. About 50 miles north of New York is the West Point Military Academy, near which the historic treason of Arnold took place. The upper Hudson is noted for its precipitous banks and picturesque scenery. Albany, Yonkers, Troy, Peekskill, and Poughkeepsie are among the cities on its banks.

**HUDSON'S BAY COMPANY**, a corporation chartered by Charles II. of England in 1670, in which Prince Rupert and other noblemen were interested. The company secured sole control of the large region known as Rupert's Land, consisting of all that portion of Canada which drains into Hudson Bay. The object was to control the fur and skin trade. Later the company secured control for a like purpose of possessions extending to the Pacific, but in 1869 its rights were transferred largely to the crown in consideration of \$1,500,000. However, the company reserved rights to certain ports, about 50,000 acres of land, and exclusive control of the chase in certain regions. It has still a large trade in furs and in the sale of its lands to speculators and settlers.

**HUÉ** (hōō-ā'), a city on the Hué River, in

Anam, ten miles from the China Sea. It is the capital of Anam and is noted for its importance as a military and trade center. The French fortified it in 1801, to whom it is subject. It contains a garrison of troops and several public buildings, but the houses of the natives are inferior. The inhabitants are mostly Annamites, but include 850 Chinese and 380 Europeans. Population, 1906, 53,041.

**HUE AND CRY**, a phrase that originated with the Anglo-Saxons from the manner in which criminals were apprehended. If the offender could not be found, the hue and cry was raised, and all the people joined in the search until the offender was seized. For many years all persons informed of a criminal offense were by law required to raise the hue and cry, but it was abolished many years ago.

**HUGLI** (hōō'glē), or **Hoogly**, an important river of British India, the principal channel of the delta of the Ganges. It is formed by the confluence of three branches of the Ganges, known as the Churni, Bhagirathi, and Jalangi, and has a length of 160 miles. At the mouth it is about fifteen miles wide and at the time of the southwest monsoon it is traversed by a bore seven feet high. Shoals obstruct the entrance of the river in many places, but ships drawing 25 feet of water may ascend as far as Calcutta. The city of Hugli, population 30,500, is located about 27 miles north of Calcutta, on the west bank of this river.

**HUGUENOTS** (hū'gê-nōts), a term which probably originated from Hugues, an obscure religious advocate, and applied to the Protestants of France during the Reformation and in the religious struggles of the 16th and 17th centuries. Among the early Protestants of France were Farel and Margaret of Valois, sister of Francis I. and Queen of Navarre. The movement was opposed by Francis I., but, when Henry II. of Germany joined the Protestant party and gave it encouragement in 1547-59, the Reformation made powerful advances in both France and Germany. In the reign of Francis II. it was headed by the Bourbon family and supported with vigor by the Queen of Navarre and the Prince of Condé. The Guises led the Catholic party. Under their leadership a fanatical persecution of the Protestants was pursued, when many were executed or banished and their property was confiscated. The events rapidly formed under which the Protestants took up arms. They named Louis I., the Prince of Bourbon-Condé, as their leader, and at a meeting in Nantes, on Feb. 1, 1560, resolved to petition the king for the removal of the Guises and the freedom of religion. It was also agreed that, if the peti-

tion be ignored, the king should be seized and Condé proclaimed regent of the realm. Shortly after the king was informed of the intention and fled to Amboise, and 1,200 Protestants were made prisoners and executed.

After the death of Francis, in 1560, it became necessary for Charles IX. and his mother, Catherine de' Medici, to curb the power of the Guises by encouraging the Protestants. Accordingly, the Guises were removed, an edict freeing the Huguenots from penalty of death was issued, and in 1562 they received the freedom of religious worship on their own estates. An attack made by adherents of the Duke of Guise on a Protestant meeting, in 1562, brought about a prolonged series of religious wars, by which France suffered great losses in life and property for many years. The Protestants were defeated at Dreux by the Duke of Guise, but he was assassinated on Feb. 18, 1563, while marching upon Condé at Orleans. The Peace of Amboise, concluded by Catherine, granted freedom of religion in many portions of France, but an alliance with Spain caused a renewal of hostilities and the execution of about 3,000 Huguenots. Condé was killed in battle at Jarnac on March 3, 1569, and shortly after Catherine began to plan the suppression of the Protestants by a general massacre. This scheme was inaugurated in 1572 by the Massacre of Saint Bartholomew, and within a few months about 30,000 Protestants were slain in France. The Protestants fled for protection to their fortified towns and carried on a defensive war with varying success until 1580, when peace was concluded.

In 1584 Henry of Navarre became heir to the throne on account of the death of the Duke of Anjou, but the Duke of Guise laid claim to the throne of France. He revived the Holy League, formed an alliance with the Pope and Spain to exterminate heresy, and inaugurated the so-called "War of the Three Henries." The Protestants secured troops from Germany and some from England, and under the leadership of Henry of Navarre presented a formidable opposition. In this conflict the Duke of Guise, Cardinal Lorraine, and the King of France were assassinated, and Henry of Navarre ascended the throne. On April 13, 1598, the famous Edict of Nantes was issued, by which the Protestants were given freedom of worship. Previous to this, in 1593, Henry of Navarre went over to the Catholic party for the purpose of maintaining himself on the throne.

In the meantime the Protestant influence continued to develop, and successive hostilities occurred in 1615, 1622, and from 1624 to 1629, when a war was waged against the Protestants

by Richelieu, which ended in the latter year by the capture of the Huguenot stronghold, La Rochelle. However, the Protestants still continued to enjoy freedom of conscience under the ministry of Richelieu and Mazarin, but they were required to surrender their strongholds. Later Louis XIV. and Madame de Maintenon inaugurated a new series of persecutions, which caused many thousands to seek refuge in Germany, Switzerland, Holland, and England. Those remaining were guarded by dragoons or compelled to abjure their faith. Louis revoked the Edict of Nantes on Oct. 23, 1685, which was followed by horrible persecutions and the industry of thousands of Huguenots was carried to foreign countries. These persecutions included the annulling of marriages, the ruthless murder of women and children, the execution of preachers, and the closing of convents. Louis XV. issued an edict of suppression, though this was revoked because of general opposition. The Protestants attained equality only with the Revolution of 1789, when they secured a recognition of their political and civil rights.

The first Huguenots came to the American colonies in 1630, when they were induced to settle in the Carolinas under the charter granted to Sir Robert Heath. About the same time large numbers settled in Virginia. When the Edict of Nantes was revoked, their immigration reached its height, and large parties came to Virginia and other American colonies in 1700. They founded a settlement at Charleston, S. C., and made settlements in the middle states, particularly in New York. The industry of the Huguenots added greatly to the early development of the colonies, since they possessed superior skill, thrift, and energy. Besides engaging in agriculture, they introduced dyeing, the manufacture of woolen goods, and glass making.

**HULL**, a city of Quebec, capital of Ottawa County, on the Ottawa River, opposite the city of Ottawa. It is on the Canadian Pacific and the Pontiac Pacific railways and a number of electric railway lines. The Ottawa River is crossed by two extensive bridges, the Chaudière bridge over the Chaudière Falls and the Interprovincial, or Alexandria bridge, a short distance farther down stream at Nepean Point. Among the noteworthy buildings are the Church of the Holy Redeemer, the Notre Dame de Grâce, the Church of Saint James, the courthouse and jail, the city hall, the Notre Dame College, the Notre Dame Hall, the Scott block, the Graham block, and many public schools. It has manufactures of cement, matches, clothing, cured and packed meat, lumber products, hardware, and machinery. The municipal-

ity maintains a modern fire department, waterworks, an electric lighting plant, sewerage, and street pavements. Hull was first settled in 1800 and was incorporated in 1870. It suffered greatly by a fire in 1900, but has been rebuilt on a more substantial plan. The prosperity of the city is due to its extensive trade. Population, 1908, 14,765.

**HULL**, or **Kingston-upon-Hull**, a river port of England, in the East Riding of York, on the north bank of the estuary of the Humber, where it is joined by the Hull. The Trinity Church, the townhall, the corn exchange, and several hospitals are among the noted buildings. It is noted for its spacious docks and an extensive trade. The city has many modern improvements, such as gas and electric lights, street railways, stone and asphalt pavements, and systems of sewerage and waterworks. The manufactures include ships, steamboats, flax and cotton goods, oil, cordage, machinery, and utensils. It is noted as a commercial and educational center, has a fine public school system, and is the seat of several large churches, a public library, and Hull College. The city was chartered by Edward I. in 1299. In the Civil War it was held by the Parliamentary forces, and successfully repulsed the Royalists at two different sieges. Population, 1907, 266,792.

**HULL HOUSE**, a social settlement in Chicago, situated at 335 South Halsted street. It was founded by Jane Addams and Ellen Starr in 1889, and was so named from Charles J. Hull, who occupied the site as a tenement residence and junk shop. The portion of the city surrounding the site is occupied largely by foreigners, including chiefly Jews, Italians, and French. Under wise management, the institution has been made highly beneficial, and its property includes a gymnasium, a library, a coffeehouse, and numerous buildings used in educational and industrial work. The Hull House takes rank as a leader in the social settlement movement of North America, and many of its former residents have held responsible positions in city and state offices and as inspectors and superintendents of industrial enterprises.

**HUMBOLDT** (hŭm'bōlt), an inland river of Nevada, rises by two forks in Elko County, and after a course of 390 miles flows into Humboldt Lake, an inland body of water in the western part of that State, about 4,000 feet above sea level. The Humboldt River is remarkable because its water contains a large per cent. of soda. It flows through an arid valley which has large tracts of sagebrush. The dry air causes the water to evaporate and become less in volume toward the mouth. The river is followed

from its source to its mouth by the Central Pacific Railroad.

**HUMIDITY** (hŭ-mīd'ī-tŷ). See **Rain**.

**HUMMING BIRD**, the name applied to a family of small birds, so named from the sound made by their wings in flight. They are native only to America and the West Indies, and are more abundant in the tropical than in the temperate regions. Most species are very small, some not larger than a bumblebee, but all are noted for their beauty of color and plumage, their quickness in darting through the air, and the peculiar manner in which they gather the food from flowers and foliage. In taking food they never alight, but feed while hovering on the wing before a flower, supporting themselves by vibratory movement of the wings, thus producing a peculiar humming sound. Most species have a long, slender beak, either curved or straight, and a tongue which they are capable of

HUMMING BIRDS.

protruding some distance in securing food. Their food consists partly of the nectar found in flowers, but they also feed on insects, and carry away flies caught in the webs of spiders. The female lays two eggs in a nest built of vegetable fibers or cotton. Both sexes display much boldness in defending their young, and with much vigor strike their enemies, usually aiming to inflict a wound in the eyes. No less than 400 species of humming birds have been described, some of which are migratory and are seen far in the north of the Temperate Zone. The *tufted-necked* humming bird of northern Brazil is the most remarkable species of these birds, and is noted for its variety of color and beautiful plumage. The only sound given out by humming birds is a chirp, with a vigor equal to that of a cricket. Their flight is so rapid as to elude the eye. The larger species are about the size of a wren.

**HUNDRED** (hūn'drēd), an ancient territorial division of England, which occupied an intermediate place between the parish or township and the shire or county. The name probably originated from a convenient grouping of one hundred families for local government. It is thought to have been a Danish institution, adopted by King Alfred about 897. The name *wapentake*, which has reference to the military side of the organization, is generally connected with the Danish occupation. The hundreds were represented in the shire mote, which, under the presidency of its bishop, sheriff, or earl, regulated the affairs of the county. In the time of Edgar the hundred became responsible for the administration of justice, and a fine or some other punishment was imposed upon it if criminals were not brought to the law.

**HUNDRED DAYS**, a term applied to the second reign of Napoleon I. as Emperor of France. It began on March 20, 1815, when he entered Paris after the return from Elba, and ended on June 28 of the same year, when Louis XVIII. was restored to power. Napoleon, on hearing that the restoration of the Bourbon monarchy was unpopular in France, left Elba and landed near Cannes with 900 men. Immediately the soldiers rallied to the support of their old leader, but 800,000 men were sent against him by the allies, who had pledged themselves to forever prevent Napoleon from disturbing the peace of Europe. He swore to support a liberal constitution and succeeded in raising an army of 287,000 men, but was defeated at Waterloo. He abdicated in favor of his son and gave himself up, after attempting to flee to America.

**HUNDRED YEARS' WAR**, the name of a long struggle between England and France, in which the English kings sought to obtain the territory and crown of the French kings. It began in 1337 and continued with several intermissions until 1453. Edward III. of England, who was a son of a sister of Charles IV. of France, claimed the crown of that country. War was declared in 1337, but the early contests were those of diplomacy rather than of arms, and in 1346 the English gained a substantial victory at Crecy, after which Calais became an English possession. The French were again defeated at Poitiers in 1356, where the leadership of the Black Prince was a potent factor in obtaining victory for the English. In 1360 a short intermission was secured by the Peace of Bretigny, but when Charles V. ascended the throne of France he had the help of Du Guesclin in regaining the lands lost by his predecessor. He was succeeded by Charles VI. in 1380, when few possessions were left to the English

in France, and a truce for 28 years was signed in 1396. War broke out again in 1415, owing largely to the Civil War in France, hence the English under Henry V. found comparatively little resistance. The latter compelled Charles VI., in the Treaty of Troyes, to recognize him as his heir and the regent of France. At that time the English were in possession of nearly the whole of France, but in 1429, through the achievements of Joan of Arc, the French were victorious on every hand. When the war closed, in 1453, the English held no territory except the city of Calais and a small district adjoining, and this was regained by the French in 1558.

**HUNGARY** (hūn'gà-rī), a political division of Europe, forming the eastern part of the monarchy of Austria-Hungary. It has an area of 125,430 square miles, and comprises, besides Hungary proper, Croatia, Slavonia, and Transylvania. In 1900 it had a population of 19,254,559. The surface is well adapted to agriculture, which is the principal industry. It may be regarded a natural basin around which extend mountain chains, except on the south, where the valley of the Danube stretches into Servia. The Theiss, Danube, and Drave, with their tributaries, form the drainage, practically all of which is by the Danube into the Black Sea. Two lakes, the Balaton Lake and the Neusiedler Sea, are situated between the Drave and Danube, and form the principal lake basins. They have a depth of about forty feet and include extensive marshes, but the water evaporates from the latter in dry seasons.

The productions, climate, and general industries of Hungary are practically the same as those of Austria. Hungary is exceedingly rich in minerals, forests, soil products, and internal improvements. The canals and navigable rivers have a length of 3,150 miles, while railroad lines penetrate all portions of the country, the different lines including about 12,500 miles. Among the minerals are iron, lead, copper, cobalt, salt, gold, silver, coal, petroleum, zinc, antimony, and peat. The soil products consist of wheat, cotton, tobacco, hay, barley, rye, a large variety of fruits, and many valuable forest products. Stock raising, dairying, and manufacturing are of growing importance. About 35 per cent. of the adult inhabitants are illiterate, but schools and colleges are maintained under government grants, and school attendance is compulsory. The religious affiliations are diversified greatly, as also are the races represented in the various portions. Among the numerically strongest sects are the Roman Catholics, Lutherans, Calvinists, Greek Catholics, Arminians, Unitarians, and Israelites. All forms of worship are free and

marked liberalism is shown in the treatment of all classes. The races most numerous are Hungarians, Germans, Servians, Croatians, Bohemians, Moravians, Slovaks, and Jews. However, the Hungarians constitute about one-half of the inhabitants.

**HISTORY.** The Hungarians, or Magyars, are an Asiatic people of the Turanian race and are allied to the Finns and Turks. Formerly they occupied a large district in southern Russia adjacent to the Caspian Sea, but under their leader, Arpad, they crossed the Carpathians in 889 and established a foothold in the plain of the Danube. Subsequently they conquered the regions now occupied by Transylvania and Hungary and made incursions into Germany and France. Otho I. of Germany defeated them with great slaughter, after which they became less warlike and developed agriculture and civilized arts. They established a kingdom in the latter part of the 10th century. In 997 Steven I. became their king, ruling until 1030. During his time the Hungarians embraced Christianity, established churches, founded cities, developed the arts of peace and laid the foundation for their present power. Steven was made a saint by Pope Sylvester II. and was given the title of Apostolic King. During the reign of succeeding kings the boundary line was extended. Croatia and Slavonia were added in 1089 by King Ladislaus and Dalmatia was annexed in 1102 by King Coloman.

In 1222 the nobles secured from Andrew II. the Golden Bull, the so-called Magna Charta of Hungary, by which the civil rights were defined. Andrew III. was the last of the house of Arpad, died in 1301, and was succeeded by Charles Robert of Anjou in 1309. During his reign Hungary became one of the greatest military powers of Central Europe. In 1342 Louis I. became king. In his reign of forty years he annexed Red Russia, Moldavia, Poland, and a part of Servia. Sigismund, who ascended the throne in 1387, was elected Emperor of Germany. His reign became famous for the wars with the Turks and the Hussites. He established an academy at Buda and secured various reforms. Matthias Corvinus became king in 1458, founded a university at Pressburg, defended the country against the Turks, and added territory to his dominion. The next sovereign of note was Ladislaus II., who reigned from 1490 to 1516, and was succeeded by Louis II., reigning until 1526. While the last two sovereigns occupied the throne the country was disturbed by domestic troubles and incursions of the Turks. At Mohács the Hungarian army was defeated by Soliman the Great and 30,000

people were carried into slavery. A large portion of the Hungarian provinces remained under Turkish dominion for 160 years. Ferdinand of Austria, a brother-in-law of Louis II., subsequent to the death of the latter entered upon a conquest of Hungary. After a dispute between him and John Zápolya, of Transylvania, the Protestants sided with Ferdinand and the house of Hapsburg obtained control of Hungary. In 1687 Leopold I. forced the Hungarians to declare the crown of Hungary forever hereditary in the house of Hapsburg.

Francis Rákóczy induced the Hungarians to rebel against Austria in 1703, but the effort proved futile. Charles VI. succeeded in gaining the approval of the Hungarians by granting reforms and adopting the Pragmatic Sanction, under which Maria Theresa eventually became ruler. Both Germany and France disputed her claim, but the invaders were repelled by the Hungarians. The queen showed her gratitude by granting religious freedom, building schools, and encouraging agriculture. Joseph II., son of Maria Theresa, governed Hungary without regard for its constitution, but, when Francis I. succeeded him, the Hungarians gave the latter valuable support in money and troops to defend the Hungarian constitution against the claims of Napoleon. Later he imposed exorbitant taxes, but in 1825 a diet was summoned to devise reforms, which discontinued the Latin language in public debates and adopted the Magyar. The diets of 1830 and 1832 again raised questions regarding absolute religious views, popular suffrage, and the rights of the common people, in which such men as Francis Deak and Louis Kossuth were prominent factors. These patriots were first imprisoned, but, when the French Revolution of 1848 gained strength, it gave an impulse to the demands for greater rights and equality to the people of Hungary, and soon after many concessions were granted by the court of Vienna.

Kossuth published the first Hungarian daily newspaper and spread the doctrine of human rights broadcast in the land, advocating equal taxes for all, freedom of speech and the press, and equality in citizenship. The government began to operate secretly against these demands, but the Austrians, who were also clamoring for reforms, encouraged a revolt of the Croats and Wallachians, inducing them to invade Hungary. An Austrian army sought to suppress the revolution, but after a number of battles the successes were on the side of the Hungarians, and Austria was obliged to enlist aid from the Russians. After struggling for some time, the Hungarians were obliged to surrender, and

many of the rebellious statesmen and soldiers were executed. The Battle of Sadowa, in 1866, brought about a separation between Austria and Germany, and the demands of Hungary were now heeded by the granting of a constitution. In 1867 Francis Joseph was crowned King of Hungary with a splendid public ceremony. Since then the government has been a constitutional monarchy. Hungary has its own parliament for local government and sends its share of delegates to the national assembly, a form of home rule long contended for by Ireland. Budapest is the capital. It is a beautiful city of thrift and enterprise. Other important cities include Szegedin, Maria Theresiopel, Pressburg, Debreczin, and Temesvár. See **Austria-Hungary**.

**HUNS**, a Turanian race of nomadic and warlike people, who, prior to the Christian era, were confined to Asia. They had a yellow complexion, a low and strong structure, a flat nose, and eyes deeply sunken in the head. To prevent the growth of the beard they scarred their faces with lashes and consequently possessed a peculiar ugliness. In habits they were roving, built no houses or cities, clad themselves in skins, and were noted for excellent horsemanship. Their families and all their possessions were carried in huge wagons, and their means of subsistence was secured largely from the chase and rude agriculture.

The Huns organized a powerful state in Mongolia. In the year 200 B. C. they overran the Chinese Empire, and after consecutive defeats compelled the Chinese Emperor, Kao-ti, to make a treaty. In the reign of Vou-ti, about the year 80 B. C., they were defeated by the Chinese, and subsequently large waves of emigrants began to move westward in search of possessions in the vicinity of the Caspian Sea. They settled between the Ural and Volga rivers. About 372 A. D. many Huns crossed the Volga, conquered the Alani and the Ostrogoths, and caused the Visigoths to emigrate and settle west and south of the Danube. Successive waves of immigrants followed each other until the former possessions of the Goths became a stronghold of the Huns, and their powerful chief, Rugias, in 432, secured from Theodosius II., Emperor of Byzantium, valuable tributes and territorial possessions.

Their greatest warrior was Attila, who called himself the scourge of God. He gathered a half million savages, with whom he moved westward from his wooden palace in Hungary, and vowed that he would not stop until he reached the sea. The army of Theodosius was beaten in three battles and Macedonia, Thrace,

and Greece were completely overrun by the Huns. Subsequently Attila conducted a campaign against the Germans on the Rhine and proceeded into France. On the field of Chalons, in 451, the Huns were defeated by Aëtius, the Roman general in Gaul, and Theodoric, King of the Goths, and Europe was saved to Christianity and Aryan civilization. Attila next crossed the Alps and descended into Italy, where city after city was taken. While marching upon the city of Rome, he was met by Pope Leo I., and by his majestic mien and exemplary character inspired Attila to spare the city. The death of Attila and the defeat at Chalons were heavy blows against the Huns. Later they were defeated in successive battles by the Goths and other Germanic tribes. This not only scattered their forces, but required them to remain principally on the east side of the Danube.

**HUNTING.** See **Game**.

**HUNTINGDON** (hūn'ting-dŭn), a borough and the county seat of Huntingdon County, Pennsylvania, on the Juniata River, 98 miles west of Harrisburg. It is on the Pennsylvania Railroad. Among the chief buildings are the county courthouse, the high school, and several fine churches. It is the seat of Juniata College and of the State Industrial Reformatory. The surrounding country has extensive deposits of iron, lead, coal, and building stone. Among the manufactures are railroad cars, flour, ironware, cigars, and machinery. It was settled in 1760 and incorporated in 1796. Population, 1900, 6,053; in 1910, 6,861.

**HUNTINGTON**, a city in Indiana, county seat of Huntington County, on the Little River, 24 miles southwest of Fort Wayne. It is on the Erie and the Wabash railroads. The noteworthy buildings include the high school, the public library of 12,500 volumes, and a United Brethren College. The surrounding country is agricultural and produces the famous Huntington white lime. The general facilities include waterworks, electric railways and lights, and good public schools. Among the manufactures are woolen goods, cigars, flour, shoes, bicycles, stoves, and ironware. It is the seat of important railroad shops. The place was settled in 1834 and incorporated in 1848. Population, 1900, 9,491; in 1910, 10,272.

**HUNTINGTON**, a town of New York, in Suffolk County, thirty miles northeast of New York City. It is located on Long Island Sound and on the Long Island Sound Railroad, has electric railroad facilities, and is surrounded by a fertile farming district. The manufactures include pottery, machinery, brick, clothing, and cigars. It is popular as a residential center

and as a summer resort. The public library has about 5,000 volumes. In the town is a monument to commemorate the spot where Nathan Hale was captured by the British. Population, 1905, 10,236; in 1910, 12,004.

**HUNTINGTON**, a city of West Virginia, county seat of Cabell County, on the Ohio River, 52 miles west of Charleston. It is on the Chesapeake and Ohio, the Baltimore and Ohio, and other railroads. The surrounding country is fertile and produces large quantities of iron, coal, salt, fruits, and lumber products. Among the chief buildings are the county courthouse, the high school, the Carnegie Library, Marshall College, and the West Virginia Asylum for the Insane. The enterprises include woolen and flouring mills, car and broom factories, iron works, tobacco factories, and railroad machine shops. Electric street railways, pavements, public lighting, and waterworks are among the municipal facilities. Huntington was settled and incorporated in 1871. Population, 1900, 11,923; in 1910, 31,161.

**HUNTSVILLE**, a city in Alabama, county seat of Madison County, called "Queen City of the Mountains." It is on the Nashville, Chattanooga and Saint Louis and the Southern railroads, and is beautifully situated on a spur of the Cumberland Mountains. The surrounding country is agricultural, dairying, and fruit raising. It is the seat of the Central Alabama Academy, the Huntsville Female College, a State normal and industrial school, and the Huntsville Female Seminary. Other noteworthy buildings are the high school and the county courthouse. The manufactures include railroad machinery, farming implements, ironware, cotton, cotton-seed oil, ice, and lumber products. Gas and electric lights, waterworks, and a public library are among the facilities. It was settled in 1775 and incorporated in 1800. Population, 1900, 8,068; in 1910, 7,611.

**HURON** (hūr'ŕn), **Lake**, one of the five Great Lakes of North America, located between the State of Michigan on the west and the Province of Ontario on the east and south. It joins lakes Superior and Michigan on the north and Lake Erie on the south. The length is 256 miles; the width, 190 miles; and the area, 22,322 square miles. It is from 200 to 700 feet deep and its surface is 582 feet above the sea. Within the lake are about 3,000 islands, of which Grand Manitoulin is the largest. The bays are Saginaw and Thunder on the west and Georgian on the east, though there are numerous others of less importance. The water is pure and clear. Many valuable species of fish abound. Good harbors are plentiful, including those at

Bay City, Port Huron, and Cheboygan, Mich.; and Collingwood, Kincardine and Goderich, Ontario. The most important streams flowing into it include the Saginaw and Au Sable rivers. Lake Huron receives the discharge from Lake Superior through the Saint Mary's River, and is connected with Lake Michigan by the Strait of Mackinaw. It discharges into Lake Erie through the Saint Clair River, Lake Saint Clair, and the Detroit River.

**HURON INDIANS**, a tribe of North American Indians, which formerly occupied the lake region of Ontario. They were classed with the Huron-Iroquois family. Among the Indians they were generally spoken of as the Wyandottes and they have been known by that name since 1751, but they were designated as 'Hurons throughout the early colonial times. They were frequently at war with the more powerful Iroquois, for which purpose they became allied with the Algonquins at different periods, but by the middle of the 17th century were driven westward to the vicinity of Lake Superior. In 1632 the Jesuits started missions among them, and by 1670 they had caused most of the tribe to settle in the vicinity of Mackinaw. The operation of these missionaries induced many to embrace the Catholic religion and to learn the French language. Subsequently some of them drifted into territory which is now occupied by the United States. In 1812 they aided the British and in 1832 a reservation was formed on the present site of Kansas City, Kan., which was known as the Wyandotte. Subsequently the larger part of the tribe was settled on the Quapaw reservation, where it numbers about 300. The Hurons remaining in Ontario, Canada, occupy a region near Quebec, where they have been intermixed largely with the French. Many have adopted civilized arts and are advanced in education.

**HURRICANE** (hūr'ŕi-kān). See **Storms**.

**HUSBAND AND WIFE**, the two parties to a marriage contract, after the same has been suitably ratified through solemnization by a minister or a civil officer empowered to perform that act. The laws which govern the marital relation are among the most important of those which prevail in any community. Though they have been looked upon in this respect from remote antiquity, many marked changes have taken place within the last two centuries in the legal relations existing between husband and wife. The common law of England formerly regarded the person of the wife as merged in that of the husband, and all of her property rights were transferred to him at the time of marriage. This law did not give to woman

that place and those rights which place her on an equality with the husband, and since then many changes have taken place in the equity of England as well as in the statute law of America. At present the marriage relations between husband and wife may be said to be those of practical equity, and they are governed by the laws enacted in the State or Province. Since equity and statute law differ somewhat in the various states and as there is no national law governing marriage relations, it is impossible to give more than a general outline of the more important common law rules in the scope of this article.

Since the residence of the husband is that of the wife, it being her duty to reside with him, the husband has the right to determine the residence of the family. He is required to support the wife according to his ability and income, and she is obligated to furnish reasonable and necessary domestic service. In some states the husband is liable for debts contracted by the wife before marriage, but generally neither husband nor wife is liable for the debts or liabilities of the other incurred before marriage. At common law, when a man married a woman, he became liable for all the debts she owed when married, but she was not competent in law to contract a debt in her own name after marriage. At present she may purchase necessaries for the home, such as clothing, articles of food, and essentials in furthering the reasonable educational advancement of the family, but in general the wife does not possess the power to make contracts, this right being vested in the husband.

Previous to a marriage the parties may make agreements between themselves about their separate properties, and, if these are not unreasonable or against the policy of the law, they will be enforced after marriage. In the absence of such a contract, neither the husband nor wife can dispose of real property without the consent of the other, since the right of dower is attained at the time of marriage in the absence of a contract. Under the common law neither the husband nor wife could sue the other, except for separation or divorce, but now the law of most countries permits either party to sue for the recovery of property or in equity for other rights. However, neither is a competent witness against the other, except in actions at law where one of the parties sues for protection against the other. The presumption of the husband's influence over the wife still exists to the extent that, if she commits a crime in his presence, she is punishable for it if it is shown that she did it of her own free will. While married women have been emancipated from

many of the disabilities imposed upon them by the common law, the statutes and courts still recognize the husband as the head of the family.

**HUSSITES** (hūs'its), a powerful organization that honored John Huss and Jerome of Prague as martyrs, and after the death of the former took up arms in defense of their religious principles. Under the leadership of Johann Ziska they captured Prague and successfully opposed Emperor Sigismund, whom they charged with breaking his pledge in furnishing safe conduct to Huss. There were two parties among the Hussites, known as the Calixtines and Taborites. The former comprised the so-called moderate Hussites, who, later, by the compact of Prague, in 1433, united with the Catholics. During the union of both branches the priests and monks were punished excessively, but when they became separated a weakness appeared and the Taborites were defeated in a battle at Bömischbrod on May 31, 1434. Subsequently their political influence declined and for religious purposes they became united with the Bohemian Brethren.

**HUTCHINSON** (hūch'in-sūn), a city in Kansas, county seat of Reno County, on the Arkansas River, 225 miles southwest of Kansas City, on the Missouri Pacific, the Chicago, Rock Island and Pacific and the Atchison, Topeka and Santa Fé railroads. In its vicinity are vast beds of pure rock salt, which are worked extensively. The chief buildings include the county courthouse, the high school, and the public library. It is the seat of the State reformatory, has many beautiful residences, and is a center of trade in merchandise. The municipal facilities embrace electric lights, waterworks, a sewerage system, and a street railway. It has manufactures of matches, creamery butter, ironware, flour, salt, cigars, and machinery. It was settled in 1872 and incorporated in 1874. Population, 1910, 16,364.

**HYACINTH** (hī'ā-sīnth), a genus of flowering plants which belong to the order of *Liliaceae*. It includes many species, several of which are highly popular as garden flowers, especially the bluebell hyacinth. Dutch traders first brought the hyacinth to Europe from its nativity in the Levant in the early part of the 16th century. Since then it has been greatly improved by cultivation and bears many kinds of beautiful flowers of various colors. The bulb is stout and onionlike, the leaves are fleshy and linear, the stamens are six in number, the style is single, and the seeds are numerous. At Haarlem, Holland, are the most extensive bulb gardens in the world, where the finest double-flowering species have been originated. In early times it

was cultivated in Asia Minor and as far east as Persia, where it is still a favorite flower. Many beautiful romances and literary productions

BLUEBELL HYACINTH.

mention the Oriental hyacinth, but it has entered modern literature of all countries with even greater latitude.

**HYBRID** (hī'brīd), an animal or plant which is produced by the union of two distinct but closely allied species or genera. Extensive experiments

have been made in relation to the crossing of species, and, while material knowledge and productive results have been obtained, there is yet a wide field for experimental investigation. It is quite certain that successful crossing extends largely to different genera, but reproduction will not take place from the union of different orders. Plant hybrids are produced artificially by applying the pollen of one species to the stigma of a plant closely allied. The theory that hybrids are uniformly sterile and that this sterility is provided in nature to prevent the confusion of species was long held by scientists. Darwin pointed out in his "Origin of Species" that this view is generally erroneous, and that two fundamentally different facts have been confounded by many writers, namely, the sterility of species when first crossed, and the impotence of the hybrids produced from them. His views imply that the sterility of various hybrids has arisen from divers causes and not from natural selection. He asserts that crosses between the progeny resulting from two breeds, called *mongrels*, are not uniformly sterile. From this fact he elaborates the view that there is nothing in the phenomena of hybridization from which to conclude that species had not existed at first as varieties.

Hybrids are secured between the toad and the frog and between the swan and the goose. In fishes they result from artificial impregnation, as between different species of the carp. Among mammals they are produced from the copulation between the tiger and the lion, the fox and the wolf, the ibex and the goat, the horse and the ass, the he goat and the female sheep, and the horse and the zebra. In many cases the hybrids are sterile, even though the crossing

may be brought about without difficulty, while in other cases the act of conjunction may be more difficult but the hybrids produced are fertile. Generally it is impossible to secure offspring from crossing different species, but where it is possible it takes place between animals or plants having a fair degree of likeness. Some hybrids are sterile among themselves, but fertile with their parents. Usually the degree of fertility depends upon various physical peculiarities differing in degree among various species.

**HYDE PARK**, a popular pleasure resort at London, England, occupying an inclosure of 400 acres. Formerly it was a park of the manor of Hyde, belonging to Westminster Abbey, but in the reign of Henry VIII. the grounds came into possession of the crown.

**HYDE PARK**, a town of Norfolk County, Mass., on the Neponset River, about eight miles south of Boston. It is on the New York, New Haven and Hartford Railroad, has electric railways and is a favorite residence place for Boston business men. The chief buildings include the public library and a number of schools and churches. It has systems of waterworks, pavements, and drainage. The manufactures include machinery, cotton and woolen goods, and curled hair. Population, 1905, 14,492; in 1910, 15,507.

**HYDERABAD** (hī-dēr-ä-bäd'), or **Haidarabad**, capital of the state of Hyderabad, situated on the Musi River, in the southeastern part of India. It is elevated 1,800 feet above the sea and is important as a trade and railway center. The principal buildings include the Nizam's palace, the British government buildings, and a number of important Mohammedan institutions, among them a college founded in 1590. The Jama Musjid, a celebrated mosque, is built on the pattern of the great mosque at Mecca. It has many fine schools, churches, hospitals, and municipal improvements. The city has beautiful streets, several parks, and extensive gardens. It is noted for its manufacture of silks, turbans, woolen and cotton goods, and machinery. In recent years it has grown rapidly and is the fourth city of India. Population, 1906, 452,646.

**HYDRA** (hī'drā), in Greek mythology, a monster serpent with nine heads. It was the offspring of Typhon and Echidna and infested the vicinity of Lake Lerna, where it committed great depredations among the herds. To slay this monster was one of the twelve labors of Hercules. Accordingly he proceeded in the task, being assisted by his servant Iolaus, but as the heads were stricken off by his club two new ones grew forth. Hercules next burned away the heads of the hydra, but the center

head, being immortal, he buried under an immense rock. Into the poisonous blood of the monster he dipped his arrows, which ever afterward rendered wounds inflicted by them incurable.

**HYDRA**, an island of Greece, off the east coast of Morea, near the Bay of Hydra. It is about eleven miles long and three miles wide, and has an area of 22 square miles. The surface is broken and barren and the shores are steep and rocky. The inhabitants are classed among the best sailors of Greece and during the war of independence performed important services. Hydra, the capital of the island, is located on a barren height near the northwestern shore. It has manufactures of soap, leather, and silk and cotton textiles, and carries on considerable trade with foreign countries. In 1825 the population was about six times larger than at present, but the decline of its trade has caused a decrease, being due to the improvement of other harbors. At present the inhabitants are centered almost entirely in the town of Hydra. Population, 1906, 7,086.

**HYDRA**, or **Hydroid**, a fresh-water polyp found in ponds, so named because its buds resemble the Hydra of mythology. It is usually found attached by a basal sucker to sticks, stones, and other objects in the water. The body is extensible and the terminal mouth is surrounded by a varying number of tentacles. It is one of the simplest forms of many-celled animals, the body being a simple tube. Young hydras bud out from the side of the older ones, and after a short time become detached and take on the form of their parents. If the body be divided into pieces, each piece will grow into a complete hydra. The food consists of small insects which are paralyzed by the barbed cells of the tentacles, and by them are carried to the mouth of the hydra, through which it enters into an internal digestive cavity, where the nutritive parts are absorbed, after which the indigestible portions are expelled through the mouth.

**HYDRANGEA** (hî-drăn'jê-à), a genus of plants which belong to the saxifrage family, including about fifty species. They are favorite plants on account of the size and beauty of their flowers. The stalk is shrubby, the leaves are oval, and the flowers are showy and greatly variegated in color. They are employed in Japan to make a kind of tea and elsewhere in the preparation of medicine. The cultivated species include the snowy-leaved and oak-leaved hydrangeas.

**HYDRAULIC ENGINE** (hî-dră'lik), a machine which is propelled by the pressure of

a column of water. It differs from the steam engine in that the piston of the cylinder is driven by water power instead of by steam. In construction machines of this kind are similar to steam engines, but, as the pressure under which they work is greater, they are usually smaller than the engines employing steam. The

SNOWY-LEAVED HYDRANGEA.

plungers in the cylinders are forced outward by the water being admitted through valves, and, when the outward stroke is completed, the water escapes from the cylinder, the plungers slide inward, and are again forced outward by a new supply of water. Some hydraulic engines are known as single-acting, while others of a different construction are double-acting. Generally the entire water pressure is cut off at the end of the outstroke, and the water exhausts by a valve after serving its purpose. The speed is usually slow, as power is increased by a corresponding decrease of speed, but the pressure is magnified so intensely that engines of this class are exceedingly powerful.

**HYDRAULIC RAM**, a machine for raising flowing water to a greater height than that of its source. It is utilized only where there is an abundant supply of water, for the reason that a portion of the water is wasted in the operation. In the hydraulic ram the momentum imparted to water in falling is utilized, this being sufficient to carry it to a height greater than that of the source, where it is held in place by the uplifting valve *E*. Valve *D* is located in a supply pipe *AB* beyond the uplifting valve *E*, which is closed periodically by the velocity of

water running down the supply pipe. Successive reaction causes alternate jets of water to pass the uplifting valve *E*, into the chamber *G* above, in which the air becomes compressed. The valve *D* at the end of the supply pipe opens as soon as the pressure into the air chamber ceases, when the uplifting valve *E* closes, and the water passes through the supply pipe *AB*. The end valve *D* is closed again as soon as sufficient velocity is gathered, and water is forced into the air chamber *G*. A continued series of operations forces the water to the proper height to be utilized for the purpose intended, flowing out of pipe *H* in successive jets. The first self-acting hydraulic ram was invented in 1796 by Joseph M. Montgolfier (1740-1810), who secured a gold medal at the exposition of 1802 held in France.

**HYDRAULICS**, the branch of science which treats of liquids in motion. It describes the flow and elevation of liquids, and the machines for moving liquids or intended to be moved by them. Water is taken as the type, and in theory its principles are those of falling bodies, but they cannot be relied upon in practice except when verified by experiment. The discrepancy arises from various conditions, such as the shape of the orifice; the changes of temperature, which vary the fluidity of the liquid;

HYDRAULIC RAM.

and friction. *Hydraulic engineering* treats of the control and management of water by the practical application of the mechanics of fluids, particularly such as are concerned in water power, artesian wells, canals, hydraulic machines, waterworks, pumps, dams, and water motors. The energy or capacity for work found in pressure transmitted by water is termed *hydraulic power*, and is exemplified in engineering by the water pressure in pipes, cylinders, and channels.

When a fluid is confined in a vessel and a certain amount of pressure is exerted on a given area, an equal amount is transmitted in all directions to every equal area on the walls

of the vessel. If the area of the external pressure surface is decreased, the whole pressure may be increased proportionately. It is on this principle that such mechanical structures as jacks, hydrostatic presses, rail benders, elevators, punches, and lifts are operated successfully. Hydraulic engineering likewise is concerned with the velocity of rivers, water motors, undershot wheels, overshot wheels, turbines, and breast wheels. In the construction of machinery to employ hydraulic power the principle is utilized that pressure is equal in all directions, area for area, as well as in all parts, which makes it possible to obtain increased pressure by giving a larger surface to the working area against which the pressure is exerted. In this way a magnified pressure is obtained at one end from only a small pressure at the other.

The first *hydrostatic press* for utilizing this principle dates from 1796, but at that time only the simplest form of the apparatus was known. Since then vast strides of progress have been made in the application of hydraulic power. It may be said that improvements in this line have kept pace with the use of compressed-air apparatus and electric motors. Where great power is required for short intervals, hydraulic power is preferable, since it is not expensive when idle. It is utilized extensively in sheet-punching machines and in riveting. The hydrostatic press is to some extent taking the place of the steel hammer for forming wrought iron and steel. Some of these have a capacity of 4,000 tons. Notable examples of vast machinery of this class may be found in some of the larger manufactories of Pennsylvania, in which from six to twenty tons of pressure is secured to the square inch. Another use to which this power is now applied extensively is in tunneling operations. The machinery thus employed is adequate to penetrate through various formations with success, and serves to push aside small boulders with little difficulty. Wherever the nature of the ground permits it, tunneling is carried on most extensively by hydraulic shields. Notable incidents of successful operations of this character within recent years are those at the Saint Clair River and the tunneling under the Thames, in London, in 1897.

**HYDROCARBON** (hī-drō-cār'bōn), a compound containing only hydrogen and carbon, such as benzine and methane. This compound occurs in many plants as wax or essential oil, in natural gas, gutta-percha, petroleum, caoutchouc, etc. The hydrocarbons are of considerable commercial importance. They are insoluble or slightly soluble in water. The natural decomposition of organic substances is the chief source

of hydrocarbon, but they may be produced by artificial means, such as making gas by the destructive distillation of coal.

**HYDROCHLORIC ACID** (hī-drō-klō'rik), or **Muriatic Acid**, a corrosive gas consisting of equal volumes of hydrogen and chlorine. It is colorless, has a suffocating odor, and has a marked affinity for water. Great quantities are obtained in making soda, by the acting of sulphuric acid on common salt. During volcanic eruption this gaseous compound is set free, hence is found in the water of lakes and rivers that have their source in volcanic formations. In medicine it is used in a greatly diluted form as a tonic and an astringent. Its chief commercial use is in manufacturing bleaching powder and in preparing phosphorous, glue, artificial waters, and carbonic acid.

**HYDROFLUORIC ACID** (hī-drō-flū-ōr'ik), a volatile liquid obtained by the action of sulphuric acid on fluorite. It is colorless and very corrosive and has a pungent, suffocating odor. Since it attacks all silicates, such as glass or porcelain, it is employed chiefly for etching upon glass and to decompose and dissolve silicates in mineral analysis. To preserve it for use, it is necessary to have it in a vessel made of lead, caoutchouc, platinum, or gutta-percha.

**HYDROGEN** (hī'drō-jěn), an element which is very abundant in nature, occurring as a constituent of water and of all organic compounds. It may be obtained by pouring hydrochloric acid over granulated zinc. If this mixture be confined in a tall jar, an effervescence arises and gas forms at the mouth of the jar, which may be lighted by applying a match, when a large stream of very pale flame shoots into the air. Water may be decomposed into its elements, hydrogen and oxygen, by the action of an electric current. It may be obtained by bringing the vapor of water in contact with red-hot iron filings. Hydrogen is the lightest substance known, being  $14\frac{1}{2}$  times lighter than air and 11,160 times lighter than water; hence, it is taken as a standard in comparing atomic weights and volumes. If it be breathed in a pure state, death results, not by poisoning, but from the absence of oxygen. Six volumes of air with two of hydrogen form an explosive. In blast furnaces requiring unusual heat it is burned in oxygen gas, these two elements being necessary to produce the most intense heat.

Pure hydrogen is a gaseous element, is odorless, tasteless, colorless, and slightly luminous when lighted, but intensely hot. It is a powerful refractor of light and is the only gas that conducts heat. It combines with many of the other elements, but under ordinary circumstances

its affinities are not very pronounced. Heat is required to bring about the union of hydrogen and oxygen, and chloride combines with it under the influence of light. Compounds of much utility and importance are formed with or of it, such as ammonia, when combined with nitrogen; hydrochloric acid, when united with chlorine; and hydrofluoric acid, when combined with fluorine. It does not occur extensively in a free state, but escapes as a gas in many of the petroleum regions, such as are met with in Pennsylvania and Ohio. Hydrogen forms, in combination with oxygen, one-ninth part by weight of water.

**HYDROGRAPHY** (hī-drōg'ra-fy), the art of surveying bodies of water, such as lakes, rivers, and the ocean. It relates to the determination of the contour, depth, character of the bottom, and other phenomena of bodies of water. As a branch of geography, it relates to the water surfaces of the earth, including the general characteristics of currents, icebergs, winds, and other phenomena that affect the sea. It treats of the systems of rivers, of lakes, and other bodies of water that are associated with the land. Hydrographic departments are maintained by all the leading governments. The purpose of these is to make coast surveys, direct soundings, and conduct other work of research which tends to promote navigation and other industrial enterprises.

**HYDROGEN DIOXIDE** (dī-ōks'id), a colorless liquid obtained by the action of acid on barium peroxide. *Oxygenated water* and *peroxide of hydrogen* are other names for this compound. It resembles water, but has a bitter, sour taste. It is found in nature in small quantities, especially in some plants and in rainwater. Large quantities are manufactured for an oxidizing and bleaching agent, such as are used for bleaching hair and textiles. In medicine it is used as a tonic to overcome indigestion and in the treatment of diphtheria.

**HYDROMETER** (hī-drōm'ē-tēr), an instrument used to determine the specific gravity of a liquid. It consists of a small glass tube to which two larger bulbs are sealed, one above the other. In order to keep the stems of the instrument vertical, a weight, either mercury or small shot, is put into the lower bulb. The upper end of the stem is graduated decimally, and the instrument sinks to the point marked zero when immersed in water. A liquid that is heavier than water will not permit it to sink to the zero point, while one lighter than water will permit it to sink below the point marked zero. Special forms of hydrometers are used for particular liquids. A *lactometer* is used for testing the purity of

milk, and an *alcoholmeter* for determining the per cent. of absolute alcohol in spirits.

**HYDROPHOBIA** (hī-drō-fō'bi-à), or **Rabies**, a disease which is communicated by the bite of a rabid animal, due to a specific virus in the saliva. Dogs are the most liable to be afflicted with madness, but there are other animals subject to the disease, particularly cats, wolves, raccoons, and foxes. In hydrophobia the patient experiences great nervous disturbance, difficulty of swallowing, convulsive dread of water, and spasmodic muscular contractions. The symptoms of the disease appear from six weeks to eighteen months after the bite is inflicted and death results about three days after the specific symptoms begin. To prevent affection it is advisable to impede the circulation from the wound by bandages, stopping the flow of blood, and cauterizing with an iron at a white heat, or with nitrate of silver, but any burning or cauterizing agency may be used. In 1884 M. Louis Pasteur announced that protection against hydrophobia can be secured by inoculation with a prepared virus. Inoculations are effected by marrow taken from a rabid animal and are made consecutively, first with weak virus and then with stronger, and they are increased gradually in strength until the strongest obtainable is injected into the system. In this way the parasitic cause of the disease may be destroyed. Institutes have been established in New York, Paris, and other cities where this method has been thoroughly tested and the patients treated are cured almost universally. Out of 21,631 cases treated at the Pasteur Institute in Paris, France, in a period of fourteen years, all the patients except 99 were cured.

**HYDROSTATICS** (hī-drō-stāt'iks), the branch of science which treats of the pressure and equilibrium of liquids. Its principles apply to all liquids, but water, on account of its abundance, is taken as the type. A liquid placed in several vessels communicating freely with each other comes to rest in all at the same level, or height. Two or more liquids placed in the same kind of vessels arrange themselves according to their relative densities, after which the equilibrium continues firm and distinct. The law relating to hydrostatics as announced by Pascal is considered fundamental. From it we learn that pressure exerted anywhere upon a mass of liquid is transmitted in an undiminished degree in all directions, and acts with the same force in all directions, and in a direction at right angles to the surfaces upon which it is exerted. It may seem impossible at first thought that a pressure of one pound is sufficient to produce a pressure of 100 pounds, but this is only an ex-

emplification of the general law of mechanics that applies to both liquids and solids. If a force of one pound on one square inch causes motion by pressing through the medium of 100 square inches, the velocity of the body moved is only one-hundredth of that of the body applying the pressure.

In the hydrostatic press this principle is taken advantage of by filling two connected cylinders

HYDROSTATIC PRESS.

with water, as shown in the illustration. If the smaller cylinder, *A*, has an area of one square inch, and the larger cylinder, *B*, 100 square inches, then a downward pressure of one pound on each square inch, by means of the lever, *P*, acting on a piston in the small cylinder, lifts a weight of 100 pounds. *C* is a platform and *D* a strong frame, between which the compression takes place. If the pressure downward be 100 pounds, it balances 10,000 pounds, and in like proportion the pressure of the hydrostatic press may be increased to 200 or 300 tons. This class of machinery is utilized extensively in raising heavy weights, for testing anchors, and for other purposes where immense pressure is necessary. Other matters investigated in the study of hydrostatics are the equilibrium of floating bodies, the buoyancy of liquids, the specific gravity of liquids, and the four laws of equilibrium. These laws embrace: 1. At any point within a liquid at rest the pressure is the same in all directions. 2. The pressure increases with the depth. 3. The pressure does not depend on the shape or size of the vessel, but on the area and depth. 4. Water seeks its level.

**HYDROTHERAPY** (hī-drō-thēr'á-pÿ), or **Water Cure**, a method of treating diseases by the frequent and copious use of water, both internally and externally. It has long been recognized that water is an efficient agent in the

cure of numerous forms of diseases. Hippocrates employed it to a considerable extent, and it has continued to be advocated as a remedial agent, especially in the treatment of acute and some forms of chronic disorders. Many institutions of Canada and the United States use the hydropathic treatment, either as supplementary or exclusive, though it is generally recognized by physicians that this method is not efficient in all maladies. However, it is looked upon as a potent stimulating remedy, and is efficient in that it cleanses the body and tends to produce greater uniformity and vigor in the various organs. Fevers are reduced by bathing, sore throat and tonsillitis are relieved by hot and cold water compresses, the circulation is stimulated by local bathing, and various other forms of treatment are universally recognized as efficient.

**HYENA** (hī-ē'nā), a genus of flesh-eating quadrupeds found in Asia and Africa. They are characterized by strong teeth well adapted to breaking the bones of their prey, extended claws,

SPOTTED HYENA.

a rough tongue, prominent eyes, long and acute ears, and fore legs longer than the hind limbs. Their gait is shambling, but they are able to move with considerable speed. Long, coarse hairs cover the body and form a mane and enlargement on the back. They feed on carrion, but also on fresh flesh, and devour carcasses in an advanced state of decay. Their claws are well adapted for digging, on account of which they are reputed to dig into newly made graves. At night they come out of their places of seclusion and gather in packs like coyotes, often attacking domestic animals and even children. At least four species are recognized, of which the

*striped hyena* of Western Asia and Northern Africa has been known the longest. The ancients knew of these animals and attributed many peculiar habits to them. A closely related species called the *spotted hyena* is found in South Africa. It has a yellowish color with numerous spots, and is more ferocious and somewhat smaller than the striped hyena. The *strand wolf* is a species allied to the spotted hyena, has a grizzled-brown color, and is found in the vicinity of the Orange River. The *brown hyena* is native to Natal and the southeastern part of Africa. Remains of extinct species occur in Germany, France, and England. They are known as the cave hyena, from their remains occurring in caves formed during the glacial epoch.

**HYGIENE** (hī'jī-ēn), the branch of medical science which relates to the preservation and improvement of health, both in individuals and communities. This branch of study has been receiving increased attention within recent years, and by means of modern agencies it has been possible to both improve the general health and prolong materially human life. The period in which delicacy was considered an element of beauty has passed away, and it is now sought to so develop the body in its powers and usefulness that it may be a fit dwelling for the mind and soul. Strength and vigor physically are looked upon as personal and national blessings, while weakness and timidity are deplored. Not only is it sought to provide the most highly sanitary conditions for the preservation of health in individuals, but a public policy is pursued by the authorities, and institutions are maintained under which the most favorable conditions of healthy living may be vouchsafed to all classes of people in rural and urban districts. The establishment of sewer systems in the cities, the provision of a water supply, the removal of waste materials, and the regulation of lighting and ventilation of public buildings are the outgrowth of economic study. They exhibit the public concern that civilized nations have for the best interest of each individual community.

Though public hygiene has been made a subject of investigation by the leading nations for many centuries, definite aims regarding the promotion of public health and the prolongation of human life did not take form until the beginning of the 18th century. Besides, it cannot concern itself specially with the diet of persons, since each individual may choose for himself in relation to the diet of his household and the use of medicines so long as they do not interfere

with the rights and welfare of others. However, conditions have been provided generally, whereby individuals may take advantage of public conveniences, that both the comforts and sanitary conditions may be rendered of the highest character for all.

Legislation has been directed with the view of supervising the sale of drugs, liquors, and articles of food. The aim is principally to protect purchasers against adulterations and to counteract the tendency of unscrupulous manufacturers to take advantage of the public by placing on sale articles of great inferiority, with the view of inducing their purchase by consumers under the apprehension that they are pure and genuine. Instances of this are seen in the laws regulating the sale of oleomargarine, those preventing the sale of diseased meats, and those forbidding the exposure of persons affected with contagious diseases. Pure air is an important essential in promoting public hygiene, since we consume it infinitely beyond our consumption of food. This has been recognized by the government and city authorities, which is evidenced in the regulations requiring cleanliness in cities, providing for the grading of sites, and stimulating numerous other sanitary measures. Material advancement in our knowledge of the sciences and the regulation by law of the practice of medicine, especially such as requires rigid examinations for admission to practice the profession, have likewise been material agencies in public hygiene. Such discoveries as those of Jenner in relation to vaccination against smallpox, those of Koch in the treatment of consumption, the discoveries of antitoxin as a remedy in diphtheria, and many others equally important have had a marked influence in preserving human life as well as preventing a weakening of the general system by diseases long affecting the individual. A proper knowledge and observance of hygienic laws are thus lessening greatly the number of persons afflicted with such diseases as consumption, rheumatism, dyspepsia, gout, cholera, hydrophobia, smallpox, and others.

It is found that one-half the children in some parts of England die before they reach the age of five years, and it is estimated that 100,000 persons die annually in that country from causes easily preventable. What is true of England is true of other countries to a varying extent. The movement now in progress looking toward better observance of individual and public rules of health will lessen fatalities at immature ages very materially. Besides, the advancement of education and public intelligence is having a wholesome effect. One of the most prolific reforms ever instituted is that in the case of

scurvy, a disease formerly prevalent among sailors, but now entirely avoided by the use of vegetables or lime juice. Much progress has been made in the construction of jails and prisons, which formerly contained few provisions calculated to maintain the health of those confined, while now the most wholesome sanitary rules are enforced with much care.

Another prolific movement in stimulating the public health is found in the construction of school buildings. We have learned from past experience that the early years of life need especial consideration, since during the formative period it is very important that the different organs of the body be provided with conditions favorable to growth and that overstrain of immature organs be avoided. To effect this the clothing, food, and cleanliness of children need careful attention, while schoolhouses must be well ventilated, lighted, warmed, and provided with adequate sanitary drainage. Child study has become a branch of intense interest. Teachers everywhere are concerning themselves with the study of the individual capacity of each child, its powers, inclinations, and weaknesses, thereby becoming better fitted to provide especially for the nature and need of each child life. It is not now a question whether children should begin study at four or eight years, but rather when each individual child possesses maturity and strength sufficient to begin the work of the schoolroom. Thus, the prevention of disease by culture, disinfection, sanitary regulations, pure food and water, and other measures for individual and public health have been and are among the immediate duties. To cure a disease is wholesome, but to prevent it is far better, such prevention being the object of intelligent application of effort in medicine, instruction, and all lines of progressive institutional development.

**HYGROMETER** (hĭ-grŏm'ĕ-tĕr), an instrument for measuring the degree of moisture contained in the atmosphere. Various forms of this instrument are in use. It is an essential supply in the weather bureau of the government. The Daniell hygrometer consists of a bent glass tube terminating in two bulbs, one of which is covered with muslin, and the other is of black glass or is coated with metal. The latter contains some ether and a thermometer. When ether is poured on the muslin, the black ball, cooled by the evaporation of the ether within, is soon covered with dew. At this time the inclosed thermometer indicates the dew-point, and this, compared with the reading of a thermometer in the air, determines the humidity.

**HYMNOLOGY** (hĭm-nŏl'ŏ-jĭ), the science

of sacred miracle poetry, or the hymns used at a particular time or place. Formerly the term was restricted to hymns which were written to praise God in the form of songs, but it is now defined as a lyric expression of religious feeling. The Greeks dedicated many hymns to their gods and heroes and these were usually sung at festivals. The older Greek hymns, as those written by Homer, are chiefly descriptive and are classed with the epics, while those of Pindar and the later poets are largely lyric. Many hymns are contained in the sacred books of the Orient, especially the Vedas, and these have been translated extensively into the languages of Europe. However, the Jewish psalms are the most familiar of all the sacred poems of antiquity and they have become familiar to all the Christian churches. Ambrose and a number of other Latin hymn writers have enriched literature with many lyric poems that have become well known in the civilized nations. These include "Stabat Mater" (The Mother Stood), "Dies Irae" (q. v.), and "Veni, Sancte Spiritus" (Come, Holy Spirit).

The Reformation gave birth to much interest in sacred songs, which were made an instrument by the Protestants in spreading the new faith among the nations. It is especially noteworthy that Luther was a potent factor in forming and directing the writing of hymns, chiefly because he wrote in the common language of the people. His "Ein' feste Burg ist unser Gott" (A Mighty Fortress is Our God) is still in wide use. To the same period belongs Martin Rinkart, the composer of "Nun danket alle Gott" (Now Thank We all Our God). Paul Gerhardt (q. v.) wrote a large number of sacred hymns and many of these were translated into English by John Wesley, including "O Sacred Head Once Wounded." Isaac Watts (1674-1748) is one of the most prolific English writers of hymns and is frequently referred to as the "father of English hymnody." His collection published under the title "Divine and Moral Songs for Children" was long a standard and popular work. Charles Wesley (1707-1788) is the author of about six thousand hymns, several hundred of which are still in popular use, and at least twenty may be classed among the favorite sacred songs in the English language. Other English writers of hymns include John Keble, William Cowper, Frances Ridley Havergal, and John Henry Newman, the last mentioned being the author of "Lead, Kindly Light."

The evangelistic movement of the 19th century was the means of producing and making popular a favorite class of church hymns. Some of these were not of a high order, but many were

exceptionally appropriate and are at present in great favor among the Christian churches. These include "Nearer, My God, To Thee," by Sarah Flower Adams; "Just as I am Without One Plea," by Charlotte Elliot; "My Faith Looks Up to Thee," by Ray Palmer; "Battle Hymn of the Republic," by Julia Ward Howe; "One Sweetly Solemn Thought," by Phoebe Cary; "Pass Me Not, O Gentle Saviour," by Frances Jane Crosby; "My Country, 'tis of Thee," by Samuel Francis Smith; and "Onward, Christian Soldier," by Arthur S. Sullivan.

The music in use for hymns among the early Christians was heavy and somber, and many melodies were in the form of chants. These were rarely sung in the common language, but were more generally chanted in the Latin. Luther translated many of the popular tunes into German, thereby seizing the opportunity for reforming the church music as well as making it an instrument of education and public worship. Johann Sebastian Bach (q. v.) developed the structural side of music and emphasized the rhythmic element. The movement of reform in music spread to France and England in the 18th century. The popular epoch was reached in the latter country through the hymns of Isaac Watts and Charles Wesley. In the earlier period of this movement the music was rather somber and solemn, but later it became livelier in character. To the latter class belong the hymns used extensively by Moody and Sankey in America.

**HYMNS** (hĭmz), **National**. See **National Hymns**.

**HYPNOTISM** (hĭp'nō-tĭz'm), a method of artificially inducing sleep, formerly called animal magnetism and mesmerism, but the results differ from sleep by several striking peculiarities. See **Mesmerism**.

**HYPOTHERMIC INJECTION** (hĭp-ō-dĕr'mĭk), a method of treating disease by introducing medicine beneath the skin, where it is taken up directly by the blood. It was first used by Alexander Wood of Edinburgh, Scotland, who injected remedies by means of a fine hollow needle connected with a small syringe. Medicine injected in this way is absorbed speedily. The pain is felt less acutely if the point of the needle is lubricated with carbolic oil or some similar preparation. This method is particularly valuable in cases where the stomach or other organs make it inadvisable to administer by the mouth, and it requires less bulk and is more rapid in its effects. Morphine and other vegetable alkaloids are often administered in this way, but all the drugs and instruments used should be carefully sterilized.

**HYPOTHESIS** (hĭ-pŏth'ĕ-sĭs), a supposition made without evidence, or with insufficient evidence of its own, in order to deduce conclusions in agreement with real facts. In this sense it may be said to be a defective kind of proof, there being some missing link, and the question is raised upon the proposition that this be made good in other ways. In the geological investigation concerning the transportation of boulders, we have various suppositions regarding icebergs, glaciers, and water currents, and by verifying observations and making deductions we are able to arrive at a strictly scientific theory, which accounts for the existence of boulders at certain localities. Newton's supposition was that celestial attraction is the same force as terrestrial gravity. He thus proceeded upon a known cause, the hypothetical element being the extension of gravity to the sun and planets. The great amount of coincidence in this case has justified the assumption that the two attractions are the same, hence the hypothesis has been proven by its consequences. As no rival supposition has ever stood the same test, the theory of Newton is considered as beyond the reach of challenge.

**HYRAX** (hĭ'răks), a genus of small mammals native to Asia and Africa, somewhat similar in size and appearance to the rabbit. The body is covered with fur, the tail is short, and the snout or muffle is split like that in the rodents. A species called *klipdas* is native to South Africa, where it is also known as the Cape hyrax. These animals have the pads of the feet so arranged as to give a slight suction, hence they are able to climb about smooth rock

and the lower limbs of trees with much agility. A species native to Syria is called *cony* in the Bible and is known locally as the *daman*. The flesh is eaten by the Arabs and others, but it is not considered very palatable by Europeans. The skin is used in making cloaks and other wearing apparel.

**HYSSOP** (hĭs'sŭp), a genus of labiate plants native to Southern Europe and Asia, but now cultivated extensively in gardens. They are perennial, shrubby plants, grow to a height of two feet, flower from June to September, and have an agreeable aromatic odor. They yield a kind of camphor, but are cultivated more largely for their beautiful blue flowers. Many species are grown in flower gardens, some of which are mentioned in both the Old and New Testaments. They are spoken of as the symbol of spiritual purification from sin.

**HYSTERIA** (hĭs-tĕ'rĭ-ă), an affection of the nervous system, in which the excitability is exaggerated and the will power is reduced correspondingly. While it affects both sexes, it occurs almost exclusively in women. The chief symptoms are a choking sensation, uncontrollable laughing and crying, and convulsive and irregular movements of the head and limbs. Hysteria is often due to worry, overwork, irregular habits, and great mental excitement. Though formerly regarded as of little consequence, it often takes the form of a dangerous disease. It is generally curable by mental treatment alone, but requires a removal of the causes that produce the disease, and the patient should have wholesome nourishment and healthful exercise.

## I

**I**, the third vowel and ninth letter of the English alphabet. In the early Phoenician and Greek alphabets, from which it was derived, it was formed somewhat like the letter z. Up to a comparatively late date *I* and *J* were regarded as one character, and in dictionaries the words beginning with these letters were classed together. It has two principal sounds, the long and short. The *long sound* is represented in such words as *find*, *bind*, *wind* and the *short sound*, in *bill*, *pin*, *fill*. In addition to these, it has three minor sounds, as in *dirk*, *intrigue*, and the consonantal sound of *y*, when followed by a vowel, as in *billion* and *Christian*. *I* is the pronoun by which a speaker or writer denotes himself, being the nominative case of the first personal pronoun of the singular number.

**IBADAN** (ĕ-bă'dân), an important town of Western Africa, in the Yoruba country, 75 miles north of the Bight of Benin. The town is surrounded by walls and is connected with Lagos by a railway. It contains 25 mosques, a system of Mohammedan schools, and numerous temples. The trade is important, especially in cotton, live stock, clothing, and fruits. Population, 1908, 198,408.

**IBAGUÉ** (ĕ-và-gă'), a city of Colombia, capital of the department of Tolima, sixty miles west of Bogotá. It is situated on a fertile plain and has a healthful climate. The surrounding country is rich in silver and sulphur mines. Ibaqué was founded in 1550. Population, 1906, 16,475.

**IBÁJAY** (ĕ-vă'hī), a town of the Philippines, on the island of Panay, about sixty miles northwest of Cápiz. It has considerable trade in amber, rice, tobacco, and fruit. Population, 1906, 11,375.

**IBARRA** (ĕ-băr'rá), a city of Ecuador, capital of the department of Inbabura, sixty miles northeast of Quito. The surrounding region is volcanic and the city has suffered from earth-

## IBICUI

quakes at different times, hence it has declined somewhat in importance. The chief industries are cotton and woolen mills, machine shops, and brickyards. Population, 1905, 13,506.

**IBERIA** (ĭ-bĕ'rĭ-ă), the name by which Spain was known to the Greeks and other ancient peoples. It was probably derived from the Iberus or Ebro River, and the inhabitants were called Iberians. These people are represented in the modern Basques (q. v.), who speak a language derived from that of the ancient Iberians. They were of low stature and are sometimes identified with the Picts and other groups. English writers generally apply the term Iberian to the Mediterranean race. In this larger sense the Iberians form the basis of the inhabitants in Spain, Portugal, France, and Italy.

**IBEX** (ĭ'bĕks), the general name of several species of wild goats, of which the common ibex is the best known. This species, called *bouquintin* by the French and *steinbock* by the Germans, is about five feet long from the nose to the tip of the tail, and is two feet eight inches high at the shoulders. The horns are large, about thirty inches long, have flattened sides, and contain numerous ridges and knots. The hairs are short and thick, reddish-brown in summer and grayish-brown in winter, and the beard is short and dark. The females have shorter horns than the males and are of an ashy color. This species of ibexes inhabits the Alps of Europe and the Spanish side of the Pyrenees. Three other species are found in Asia and in the Abyssinian Mountains, of which the *Himalayan ibex* is the most important. The ibexes have similar habits to those of other wild goats, preferring the highest mountains. They are skilled in passing over precipitous places.

**IBICUI** (ĕ-bĕ-kwĕ'), or **Ibicuy Guassu**, a river in the province of Rio Grande do Sul, Brazil, which is formed by the Rio de Santa Maria and several other sources, and after a

course of 400 miles joins the Uruguay near Yapeyu. Its upper branch is called Ituzaingo.

**IBIS** (ī'bīs), a genus of wading birds allied to the storks, herons, and spoonbills. The species, of which there are ten or twelve, are widely distributed in America, Eurasia, Africa, and the islands of the sea. The *red* or *scarlet ibis* is an American bird and is found most abundantly in the Amazon region of South America. It is about three feet long, the ex-

is rapid. They lay three or four eggs, which are considered excellent as food, but the flesh is not eaten, except by natives. Being aquatic birds, they prefer to feed on fish, mollusks, frogs, and other forms of animal life common to rivers and the sea.

**IÇA** (ê-sä'), or **Putumayo**, a river of South America, rises in the Andes of Colombia, and joins the Amazon near San Antonio, in Brazil. The general course is toward the southeast. It

is about 1,000 miles long and the greater part of this distance is navigable. The valley of the Iça is covered with fine forests and the region is sparsely settled.

**ICE**, the name of water when it is congealed or frozen into a solid mass. This occurs in case the temperature is reduced to 32° Fahr., when a condition is reached which is designated as zero on the Réaumer and Centigrade scales. At 39.2° Fahr. water begins to expand as the cooling process goes on, and continues until 32° is reached. Thus a given quantity of ice is lighter than an equal quantity of water, on account of which ice floats on the surface of water. It is due to this fact that the lakes and oceans do not freeze solid, since the protective covering formed by ice on the surface prevents the escape of heat stored in the water. If it were not for this phenomenon, the solid masses of ice formed in large bodies of water would not be melted by the heat of a tropical sun in the warmer seasons of the year, and at least three-fourths of the earth would be incapable of sustaining its present life.

SACRED IBIS.

WOOD IBIS.

tended wings measure over three feet, and the bill is about seven inches long. The *white ibis* abounds in Florida, the *strawneck ibis* is native to Australia, and the *glossy ibis*, a bird of fine silky plumage of dark green color, is found in Eurasia and Egypt. The *wood ibis* found in the southern part of the United States is not an ibis, but belongs to the stork family. However, the most remarkable species of this genus of birds is the *sacred ibis*, which is found throughout Africa. It was worshiped by the ancient Egyptians. They reared and cared for this bird in their temples and embalmed the body after death. It is about the size of a common fowl, has white plumage with black tips on the wings, and the head and neck are bare. It formerly inhabited the Lower Nile, but is found farther south at present, in the regions of the lakes and Central Africa. The flight of ibises

The freezing point of water is affected by various circumstances, such as pressure and ingredients held in solution by liquids. With an increase of pressure on a liquid the freezing point is lowered, and it is raised by a removal of pressure. Bodies of water holding salts in solution, as is the case in the ocean and many lakes, freeze at a lower temperature than pure water. The freezing point of sea water is about 28° Fahr., varying somewhat with its saline ingredients and the atmospheric pressure. Water at perfect rest and not containing dust particles requires a lower temperature to be congealed into ice, since in that state it more effectually retains its latent heat, but it is influenced to some extent by the depth. In freezing, the saline matters are separated from the salty water, hence fresh and pure water may be procured by melting the ice.

The formation of ice has a marked effect in

disintegrating rocks and stones. This is due to the circumstance that water fills the cavities and pores, and the expansion which results in freezing causes particles or even large pieces to break off the main body. The largest masses of ice occur in nature in the form of glaciers and icebergs, and in their clefts the deep blue of pure ice is most beautiful.

Ice formed in nature and by artificial processes is an important article of commerce, and is transported in large quantities for general consumption. Ice-cutting tools for harvesting the ice of rivers and ponds are numerous. The ice is cut into large blocks by an ice plane, which is usually moved by one or two horses. These blocks are cut about two feet wide and four feet long, though this depends somewhat upon the thickness, about eighteen inches being preferred. After the blocks are cut they are severed from each other and loaded in wagons to be transferred to an ice house, in which the ice is preserved for consumption. The ice houses usually have two or three walls, between which are spaces of dead air, and the ice is packed in sawdust or spent tan bark.

**MANUFACTURE OF ICE.** The manufacture of ice is an important industry in countries where it does not form in nature. It is made in vast quantities even in moderately cold climates, but especially in the large manufacturing establishments where perishable articles are produced, such as packing houses and canning factories. This enterprise began to develop about 1850, but the industry assumed extensive proportions only within recent years. The process involves lowering the temperature below the freezing point by permitting pure ammonia liquid to expand within iron pipes that are coiled in tanks filled with salt brine, from which the heat is drawn by the ammonia in evaporating. The machines consist generally of a congealer, in which the evaporation of the ammonia takes place; a pump for aspirating the gas as it forms in the vaporator; and a condenser. In the condenser the gas is compressed by a pump, the liquefaction being aided by a condensing stream of cold water, and by this means the ammonia is restored to its original state, being used successively for the same purpose. Cans filled with pure water are set into the brine tanks and there are frozen. The cans contain from 100 to 300 pounds of ice. Another plan is to produce the ice in plates or sheets, in which form it is generally known as plate ice. It is obtained in this form from pure water in sheets about eight by twenty feet in size, and with a thickness of ten to fifty inches. When frozen and reduced to a comparatively low temperature, the plates are

cut into blocks suitable for transportation. It requires from five to ten days to form plate ice of these dimensions, the time depending somewhat upon the outside temperature. In some factories sulphurous oxide is utilized instead of ammonia, and the brine is made of magnesium chloride instead of salt. Scientists have perfected machinery for the production of liquid air (q. v.), which may take the place of ice in refrigerators and for other purposes, but at present its production is too expensive for commercial use. See **Refrigeration**.

**ICEBERG** (is'bërg), a large mass of ice, usually floating in the ocean, but sometimes located on the shores or on breakers. These phenomena arise from glaciers that move through channels, from which, when they reach the shore of the sea, large masses glide into the ocean, thus forming icebergs. They are seen both in the northern and southern seas in latitudes between 68° and 70°, but increase as we proceed toward the poles, finally merging into the frozen seas which inclose the polar region. Icebergs rarely drift nearer the Equator than 40° N. and 39° S., owing to their melting in the warmer regions. In size they differ widely, sometimes attaining a circumference of several miles and rising to a height of 250 to 300 feet above sea level. However, only about one-ninth of their volume is seen above the surface. The bluish-green tint of the solid ice masses is very beautiful, and in their cavities fresh water often occurs from the melting ice. In some regions they are carried by winds and oceanic currents into warmer seas, where they give rise to fogs, but melt rapidly. Large masses of rocks and earth are carried by them, and they likewise transport seeds of plants and sometimes animals. Ice which covers a large portion of the sea is called an *ice field*, a small field is designated a *floe*, and a field which is broken up forms an *ice pack*. Field ice covers a vast portion of the sea in winter, but it is broken up on the approach of summer.

**ICELAND** (is'land), an island of volcanic origin, situated in the North Atlantic Ocean, about 230 miles southeast of Greenland and 600 miles west of Norway. The area is 39,756 square miles. It is 300 miles long from east to west, with a central breadth of 200 miles. Its coast lines are indented by great bays or fiords, and adjacent to it are many small islands. The surface is diversified by several mountain chains, a number of which contain active volcanoes. Numerous lakes abound and many streams penetrate through the valleys, of which the Thjorsa, Skja Danda, Jökulsa, and Axarfirdi rivers are the most important. Geysers are distributed in

many portions, but are found most numerous in the southwestern part, near Reykjavik. Sulphur is the most abundant mineral, but it has workable deposits of rock crystal, chalcedony, refracting spar, and brown coal.

The climate of Iceland is extremely cold, but mild considering the latitude, while the summers are short and damp. Vegetation abounds only in narrow confines, mostly along the coast, and the timber is limited to several stunted species, the principal tree being the birch. Other plants include the willow, bilberry, heath, and lichens. Nutritious grasses of different kinds mingle with the shrubs and afford good grazing for sheep. The manufactures are largely of a domestic nature, such as earthenware, clothing, utensils, leather, and canned fish. The principal imports include breadstuffs, timber, hardware, clothing, sugar, and tobacco. Among the chief productions are cattle, sheep, potatoes, radishes, vegetables, horses, and ponies. The exports include seal skins, sulphur, wool, cattle, fish, eider down, and the edible Iceland moss.

The inhabitants are of Scandinavian origin and speak the oldest form of the Scandinavian group of languages. Their literature is extensive. It has been enriched by translations from many master productions of German and English writers. The *Sagas* are histories and works of a romantic character, and have been translated into various languages, forming at present an interesting portion of reading matter for schools in many countries.

The government is administered under a constitution adopted in 1874. It is vested in the governor general, who is appointed by the King of Denmark, and in the althing or parliament. The latter is the local legislative body. It consists of thirty-six members, six members being nominated by the King of Denmark and forming the upper division, and the remainder, or lower division, being elected by popular suffrage. Practically all the people belong to the Lutheran Church. The educational institutions include elementary schools, several colleges, and a university at Reykjavik. This city, located in the western part, is the most important seaport and the capital of the island.

The history of Iceland begins with the end of the 8th century, when scattered settlements were made by Irish emigrants. Shortly after people immigrated from the Scandinavian countries, and in 870 Harold Haarfager by his arbitrary rule caused many Norwegians to emigrate to Iceland. By 925 the coast regions were largely populated and an aristocratic republic was formed, which maintained itself through several centuries. In 981 Christianity was introduced,

schools were established, and considerable advancement was made in agriculture, commerce, and other civilized arts. At that time Iceland attained to its highest degree of prosperity. Within that period Greenland was discovered, in 983, and North America was visited under Lief Ericsson about 1001. Magnus VI. of Norway annexed Iceland to his dominion in 1264. In 1380 it was made a territory of Denmark, and since then has remained a Danish possession. Population, 1906, 78,685.

**ICELAND MOSS**, the name of several species of lichens found in cold climates, so named from its wide distribution in Iceland. It is widely distributed in Northern Europe, especially in Norway, and is found on the upper parts of many elevated mountains. Iceland moss is gathered as a food by the inhabitants of Iceland and Lapland, and is either boiled with milk or the plant is dried and used in making bread. To render it palatable and remove a bitter taste, it is necessary to steep it in water. It is important in the manufacture of sizing paper, in dressing warp in weaving, and as a diet for those suffering of pulmonary diseases.

**ICELAND SPAR**, a transparent variety of calcite, so named from the fact that the best specimens are obtained from Iceland. Being transparent and having a double refraction property, it is employed in optical instruments.

**ICE PLANT**, the name of an annual herb native to Africa and Europe, so named because the leaves are covered with vesicles that appear

ICE PLANT.

like crystals of ice. Several hundred species have been described and all of them are native to moderately warm climates. A few of the plants have been introduced in California, where they are cultivated for their flowers. The natives of the Madeira Islands use the seeds as food, and the ashes of the plant yields carbonate of soda, useful in making glass and soap.

**ICHNEUMON** (ik-nū'mōn), a genus of carnivorous animals which belong to the civet fam-

ily. They are noted for their destruction of rats, mice, reptiles, and insects. They are especially fond of the eggs of crocodiles, on account of which they were held sacred among the Egyptians. The best known ichneumon is found in Egypt and a smaller kind is native to India. Several of the species are kept as useful domestic animals in many homes of Egypt and Asia, serving to destroy pests. The Egyptian ichneumon is somewhat larger than a cat. It is yellowish-brown in color and has a long tail. This species is popularly known as *Pharaoh's rat*, while the Indian ichneumon is now commonly called *mongoose*.

**ICHNEUMON FLY**, an insect of a large group of *Hymenoptera*, including about 5,000 known species. They deposit their eggs either on the bodies or within the eggs of other insects and spiders. The larvae devour the eggs, insects, or animals, either mature or immature, in which they are developed. When the insect reaches maturity, the worm on which it fed expires from exhaustion, and the fly begins to feed on the juices of plants. In this way they are of vast benefit to man, since they destroy grubs, caterpillars, the Hessian fly, and other pests, while they themselves are harmless in a state of maturity. The adult ichneumon does not attack

ICHNEUMON FLY.

insects, except to make a deposit of eggs, which it does by making a minute puncture.

**ICHOLOGY** (ik-nōl'ō-jŷ), the branch of science which treats of fossil imprints. The rocks bearing fossil footprints or other impressions are found largely in deposits which were in the form of mud at the time imprints were made, but many occur in sandstone. The Jura-Trias sandstones of North America contain many trails, tracks, and other impressions, especially of birds, fishes, and ornithopod dinosaurs, all of which have been studied systematically. See *Fossils*.

**ICHTHYOLOGY** (ik-thī-ōl'ō-jŷ), the branch of zoölogy that treats of fishes. Aristotle is the most eminent ancient authority on this science, and is practically the only writer of antiquity to furnish data of value regarding fishes, their habits, and their culture. Modern treatises on ichthyology date from the middle of the 16th century. Among the most eminent writers are Max-Müller, Agassiz, Cuvier, Owen, and Pierre Belon (1518-1564). See *Fish Culture*.

**ICHTHYOSAURUS** (ik'thī-ō-sā'rūs), a remarkable fossil reptile which inhabited the sea in the period when the secondary strata were

FOSSILS OF THE ICHTHYOSAURUS.

deposited. The form was somewhat like that of the porpoise. It had four paddlelike limbs, an enormous head, a long tail, and broad vertebrae, the last mentioned resembling those of fishes. Fossil remains of this animal occur from the lower Lias to the Chalk periods, but they are most numerous in the Lias Oölite. More than thirty species have been discovered, some resembling the gavial of the Ganges and others the common crocodile. They are represented in the deposits of Australia, Europe, Asia, and South America. Only one species, the *Baptanodon*, is found in North America.

**ICONOCLAST** (i-kōn'ō-klāst), the name given in the 8th century to one who supported a movement against the religious use of images. Those who worshiped images were called *iconolaters* and they became particularly numerous in the Eastern church. At first images of bishops and martyrs were used to commemorate their lives, but later they were worshiped and incense was offered to them on altars. Leo III., Emperor of Byzantium, promulgated an order against the worship of images, and directed that pictures and other movable objects should be placed sufficiently high so as to prevent people from kissing them and showing other marks of devotion. In 842 a council at Constantinople sanctioned the worship of images in the Greek church, and this order was subsequently affirmed by other councils. Similar decisions were made by the popes, hence image worship became established and has since been practiced in the

Western church. Iconoclasm became quite general in some sections of Europe during the Reformation, when many sacred statues and images were destroyed. During the time of Cromwell it reached its height in England.

**IDA**, a mountain range of Asia Minor, forming the southern boundary of the Troad. It extends from Phrygia into Troad and overlooks the valley of Troy. Mount Gargarus, height 5,745 feet, is the culminating peak. This range of mountains is celebrated in ancient mythology as the place from which the gods witnessed the battles of the Trojan War. The highest peak of the mountain chain that trends the island of Crete from east to west is known by the same name. It is covered by beautiful forests of maple, cedar, and pine, and is noted for its alleged connection with the education of Zeus, the chief Grecian god. Its height above sea level is 8,050 feet.

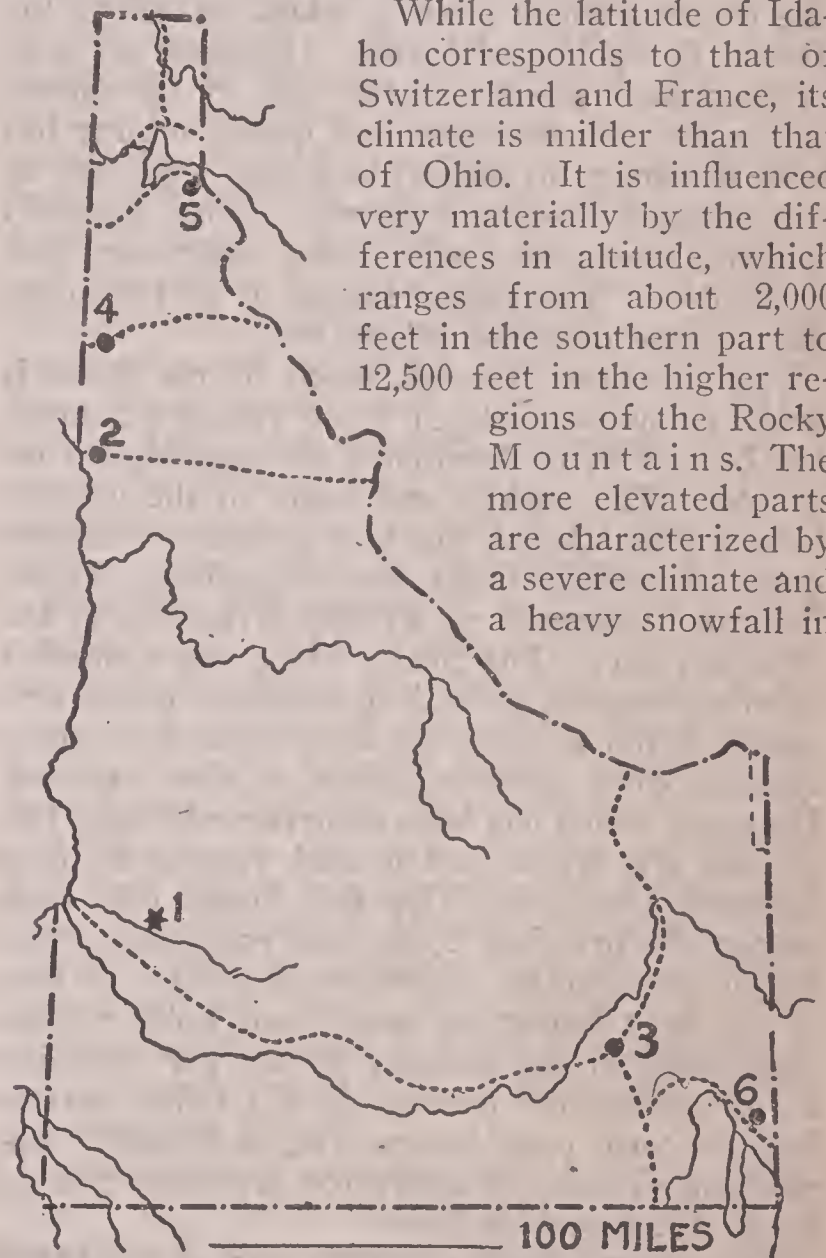

**IDAHO** (i'da-hō), a northwestern state of the United States, so called from the Indian language, the name meaning Gem of the Mountains. It is bounded on the north by British Columbia, east by Montana and Wyoming, south by Nevada and Utah, and west by Oregon and Washington. The length from north to south is 490 miles and the width varies considerably, being 45 miles at the northern boundary and about 300 at the southern. It has an area of 84,800 square miles, including 510 square miles of water surface.

**DESCRIPTION.** The State consists chiefly of an elevated and mountainous region. It lies mainly between the Cascades on the west and the Rocky Mountains on the east, and a large part of the southern portion is in Great Basin, which has an elevation of from 2,000 to 5,000 feet above sea level. Many mountain summits in the northern and eastern parts are elevated above the snow line. The Bitter Root and Salmon River ranges are highest near the eastern border, but spurs extend from them in a westerly direction almost across the State. In the northern part are the Cabinet and Coeur d'Alene ranges, which extend to the border of Canada, and the Black-foot and Snake River ranges are in the southeastern part. Many of the valleys lying between the ranges have a soil of great fertility, though much of the surface is made up of regions of canyons and sandy and rocky formations.

Though the State has many streams of considerable size, the drainage is almost exclusively into the Columbia, which receives the inflow from the Snake, Clark Fork, Spokane, and Kootenay rivers. The Snake, which is the largest of these rivers, flows through the south central part, forms a part of the western boundary, and

near Lewiston enters the State of Washington. It drains a basin of about 60,000 square miles and receives the inflow from the Salmon, Boise, Wiser, and Clearwater rivers. In its course are the three falls known as the Salmon, the Shoshone, and the American, the first mentioned having a descent of nearly 200 feet. A small portion in the southeastern part of the State is drained into Bear Lake and Great Salt Lake, the former of which is situated partly in Idaho. Several lakes are located in the northern part, including Coeur d'Alene, Kaniksu, and Pend Oreille. The two last mentioned discharge by the Clark Fork into the Columbia near Waneta, Canada.

While the latitude of Idaho corresponds to that of Switzerland and France, its climate is milder than that of Ohio. It is influenced very materially by the differences in altitude, which ranges from about 2,000 feet in the southern part to 12,500 feet in the higher regions of the Rocky Mountains. The more elevated parts are characterized by a severe climate and a heavy snowfall in

IDAHO.

1, Boise; 2, Lewiston; 3, Pocatello; 4, Moscow; 5, Wallace; 6, Montpelier. Chief railroads are indicated by dotted lines.

winter, but the plains and valleys are exceptionally free from extreme. The mean temperature at Boise City is 51°, and in the moderately elevated parts in the north it is 54°. In summer the thermometer may rise as high as 100° in the southern part of the State, but the refreshing mountain breezes have an invigorating effect. The rainfall is very light in the south, but an abundance of moisture is common to the

northern part of the State, where the western winds give up their humidity when coming in contact with the elevated ranges. Fine grazing is afforded on the uplands. In many places are valuable forests of evergreen and deciduous trees, especially along the streams and in the mountains.

**MINING.** The mineral resources are of great importance. Gold was first discovered about 1861, and this mineral is distributed in nearly all parts of the State. Placer mining has been conducted to a considerable extent, but quartz mining has been developed to a high degree of prominence. Silver and lead are obtained in the Coeur d'Alene district, which is one of the richest in the United States. Dredging for gold is conducted chiefly in the bed of the Snake River and its tributaries, and quartz mining has been developed in several localities, especially in the Thunder Mountain district. Other minerals include coal, iron, salt, soda, magnesia, and quicksilver. The annual output of all the mines has a value of about \$25,500,000.

**AGRICULTURE.** Though much of the State is arid and not capable of being reclaimed, much has been done in developing the agricultural resources. The valleys and many of the uplands have a rich alluvial soil that produces excellent crops of cereals, fruits, and vegetables. Farming can be carried on without irrigation in the northern part. The Snake River and a number of other streams have deep channels, hence irrigation is not possible the entire length of these streams, or is quite expensive in some sections. However, much has been done in reclaiming fertile but arid tracts, and in such regions farming is highly profitable. Hay and forage take rank among the principal crops, and particular attention is given to the cultivation of alfalfa. Wheat is the most important cereal and holds a high place both in the quantity grown per acre and in its quality for making flour. Other cereals include corn, oats, barley, rye, and spelt. Apples and prunes are cultivated profitably and all kinds of vegetables thrive.

The pasture lands cover an area of 25,750,000 acres, and the grasses are peculiarly nutritious. Live stock is kept on the elevated table lands during the summer, and in winter it is withdrawn to the valleys along the streams, where the climate is less severe and both cattle and horses can subsist without much feeding. Sheep raising is an important enterprise of the State, and the annual production of wool has a value of about \$2,750,000. Swine are not grown extensively, owing to the fact that corn is not raised on a large acreage, but large interests are vested in the rearing of mules, horses, and cat-

tle. The Bitter Root Timber Reserve, which comprises an area of fine pine and fir forests, is located chiefly in Idaho.

**MANUFACTURES.** Rapid progress has been made in manufacturing the last two decades. Since the State has about 20,000,000 acres of valuable timber, much material for manufacturing is available. To this may be added the product of the mines, which furnish large quantities of products for smelting and other industrial enterprises. Many flouring mills are operated profitably, although they are devoted chiefly to the grinding of wheat. Other manufactures include machinery, cigars, clothing, utensils, and lumber products.

**TRANSPORTATION.** Several transcontinental railway lines pass through the State, all of which have numerous branches in different directions. The Oregon Short Line crosses the State from east to west, affording convenient transportation from Granger, in Wyoming, through the Snake River Valley. Four lines cross the northern part of the State, including those of the Oregon Railroad & Navigation Company, the Northern Pacific, the Great Northern, and the Chicago, Milwaukee and Saint Paul railroads. The total railroad lines aggregate 1,500 miles, but this is insufficient to supply the demand, since a large portion of the central part of the State is without railroad communication. Many wagon roads have been constructed and numerous telephone and telegraph lines are in operation. The export trade is chiefly with ports on the Pacific, especially through San Francisco, Tacoma, and Seattle. Gold, silver, lead, wool, lumber, hides, and live stock are the chief products exported. The imports consist mainly of manufactured articles.

**GOVERNMENT.** The present constitution was adopted in 1889. It vests the executive authority in the Governor and other State officials, who are elected for terms of two years by popular vote. The legislative branch consists of the senate and house of representatives, the former having 24 and the latter 60 members. Meetings of the Legislature begin in January of even years, but extraordinary sessions may be convened by the Governor. Members of both branches are elected for terms of two years by popular vote at the time and place of voting for State officers. Local judicial power is vested in justices of the peace. Each county has a prosecuting attorney, who is elected for two years. The higher courts consist of those organized in the judicial district, and the supreme court has final jurisdiction. The latter consists of three judges, who are elected for a term of six years by the people of the State.

**EDUCATION.** The common school system is very similar to that of all other states of the Union. The school district is the territorial unit and is composed of an indefinite and varying number of families residing within its limits. A board of three trustees, elected by the qualified voters of the district, has general charge of the school property, employs teachers, and supervises locally the buildings and the school. The county superintendent, elected for two years, has general supervision of all the schools within the county, issues certificates to teachers, and stimulates professional interest by correspondence and personal contact. The State Superintendent has supervision over all the schools and the work of county superintendents. This officer prepares the courses of study for use in the schools and the questions to be used in the examinations for county and state certificates and life diplomas, the two last mentioned being issued by the State Board of Education.

The schools and public instruction are supported by a system of local taxation, which is supplemented by an income from the State fund. The latter is obtained from the lease and sale of school lands, consisting of sections 16 and 36 of the congressional townships. Only 4.6 per cent. of the population ten years of age and over were unable to read and write in 1900, a record of illiteracy smaller than that of the whole country. The University of Idaho is located at Moscow and is the chief institution of higher learning. An agricultural and mechanical college is located at Idaho Falls, two normal schools are maintained at Albion and Lewiston, and a State academy is at Pocatello. The private and denominational institutions include Saint Aloysius Academy, Lewiston; College of Idaho, Caldwell; Episcopal College, Lewiston; Saint Teresa's Academy, Boise; and an industrial school for Indian girls, Desmet. Ample provisions have been made for the care of unfortunates, and for benevolent, reformatory, and correctional purposes. An asylum for the insane is located at Blackfoot, a soldiers' home near Boise, an industrial and reform school at Saint Anthony, and a penitentiary at Boise.

**INHABITANTS.** The population of the State formerly consisted largely of miners and ranchers, but the development of agriculture, lumbering, and manufacturing has caused all industrial and professional classes to be well represented. About one-sixth of the people are foreign born and the male sex is considerably in excess. Boise, in the western part of the State, is the capital. Other cities include Idaho Falls, Moscow, Pocatello, Wallace, Lewiston, and Montpelier. The State has grown constantly in popu-

lation since it was admitted into the Union, the growth in the last decade being 92 per cent. In 1900 its population was 161,772. This included a total colored population of 7,277, of which 293 were Negroes, 1,291 Japanese, 1,467 Chinese, and 4,226 Indians. In 1910 the population was 325,594.

**HISTORY.** Idaho was acquired by the Louisiana Purchase. The first explorations were made by Lewis and Clark in 1805 and 1806. A mission was established at Coeur d'Alene in 1842, but those who visited the region were largely hunters and prospectors. Gold was discovered in 1858 on the Oro Fino Creek, after which settlements began to develop rapidly, and on March 3, 1863, Idaho was created a Territory by act of Congress. In 1890 it was admitted to the Union as the forty-fourth State and the thirty-first under the Federal Constitution. Considerable hostility was shown against the Mormons, who formed large settlements in the southern part and for some time practiced polygamy, but in 1893 the leaders of that denomination renounced polygamy as an institution. Several strikes took place at the Coeur d'Alene mines, those of 1892 and of 1899 being the most noteworthy. As a whole the State is on a sound educational and industrial basis, and its public institutions are making rapid strides of development.

**IDAHO, University of,** a State institution established in 1892 at Moscow, Idaho. Free instruction is offered to students of both sexes who reside within the State and others are required to pay a nominal tuition. Five regents have general control. The courses comprise instruction in the sciences, classics, agriculture, civil and mining engineering, and military tactics. The library has about 20,000 volumes, including books and pamphlets, and the institution is endowed by a large grant of land. About 400 students attend, about one-half of whom are in the collegiate department. The annual income approximates \$70,000.

**IDEA** (ī-dē'ā), any product of mental apprehension or activity considered as an object of thought. Plato regarded ideas as the eternal and immaterial forms of all material things, while Kant treated them as the primitive elements of intelligence, not as products, and modified and developed the Platonic theory of innate ideas into the modern doctrine of intuitions. See **Intuitions.**

**IDEALISM** (ī-dē'al-iz'm), in philosophy, the doctrine held in contradistinction to realism. According to realism three positively distinct things are implied and involved in any act of vision. For instance, in seeing a book there are the book, the image or apprehension of the book,

and an apprehending mind, ego, or self. These three facts are dealt with in idealism as subjective, objective, and absolute. Subjective idealism embraces the view that the book and the image are one thing and that a modification of the mind is the only fact which is perceived. According to objective idealism the book and the mind are existences equally real or ideal, but they are regarded manifestations of an objective fact of some kind. Absolute idealism teaches that the only thing really perceived is the idea or relation, of which the mind and the book are but two terms, and to which idea or relation they owe all the reality they have. Idealism has been influenced more or less by the teachings of Plato. The modern advocates of it include Fichte, Kant, Schelling, Berkeley, Hegel, and Descartes.

**IDES** (īdz), a term applied by the Romans to the 15th day of March, May, July, and October, and to the 13th of the other months. Caesar's assassination occurred on the ides of March, on account of which it was an *ater dies*, or black day, when the senate did not convene.

**IDIOT** (īd'ī-ōt), a person who is in a large degree destitute of intelligence, or who suffers from a condition of mental imbecility. Although the term is of Greek origin, it expresses a condition different from the idea contained in the root from which it was derived. In ancient Greece an idiot was primarily the private individual, in distinction from an educated man or one who took part in public affairs. The Spartans used the term to describe an ignorant or unlettered man, and it finally came to be applied to those who did not possess the capacity to learn. Idiocy is now regarded as an arrest of mental development, either from congenital defect or some disease occurring subsequent to birth. In idiocy the will has but partial control over the muscular system and external impressions are not readily communicated to the mind. The brain of idiots is sometimes quite regular in conformation, but in most cases it is abnormal. In many instances the forehead is depressed and flattened, sometimes receding backward from a point near the eyebrows, and in others the back part of the head is greatly enlarged. Idiots rarely live beyond the age of forty years, due probably to their inactivity or certain sensual emotions. The education of idiots received attention as early as the 17th century. At present they are classed largely with the feeble-minded, but separate institutions for the training of this class are maintained in many countries.

**IDOL** (ī'dōl), an image intended to represent a divinity and as such to be worshiped. One

worshiping an image is called an *idolator* and the worship is known as idolatry. However, it must be distinguished from *iconolatry*, in which the mind is directed to the Deity or saints represented, while in idolatry the things themselves are worshiped. Various forms of idolatry have been practiced from remote antiquity, the worshipers making greatly diversified things the objects of their worship, such as the sun, moon, stars, the elements, heroes, animals, and various forms of manufactures. The Phoenicians are thought to have originated the worship of heavenly bodies and objects of nature, while to the Egyptians is attributed the origin of animal worship, such as that of the sacred ibis, oxen, and ichneumon. Hero worship was general in Greece and Rome. The mythology of these peoples deals chiefly with such gods as Zeus, Jupiter, Apollo, Mars, Neptune, and many others. Idol worship has been practiced by many of the Chinese from remote antiquity, and the construction of earthen and other images of human form still prevails among them and other classes. Many of the savages prepare peculiar figures representing animals and human beings, which they adore with feelings of intense devotion. Some writers regard idolatry among the so-called heathens as a degradation of the true God, while others think it is the result of an innate longing common to the human breast and through which a knowledge of the true God is sought. Man is a worshiping being, and activity in this line is common among all peoples, whether it prevails in the worship of one God, in that of idols, the imaginary deities, or the lower forms of fetichism.

**IDYL** (ī'dīl), or *Idyll*, the term usually applied to a poem that represents scenes of pastoral life, or which is highly descriptive in treating one or more subjects. Theocritus, who published 31 idyls, is a famous ancient writer of this class of poems. Tennyson's "Idylls of the King" embraces twelve poems based on the romances of Arthur. They include "The Coming of Arthur," "Gareth and Lynette," "The Marriage of Geraint," "Geraint and Enid," "Balin and Balan," "Merlin and Vivien," "Lancelot and Elaine," "The Holy Grail," "Pelleas and Ettarre," "The Last Tournament," "Guinevere," and "The Passing of Arthur."

**IGNEOUS** (īg'nē-ūs), the term applied in geology to rock which is formed by the action of heat intense enough to produce fusion, including such as basalt, lava, and granite. Rocks of this class occur with formations of different geological ages, on account of being forced up from below the surface. They prevail in an unstratified condition.

**IGNIS FATUUS** (ig'nīs fāt'ū-ūs), a Latin term applied to a luminous appearance in the atmosphere a few feet above the ground in marshes, burial grounds, and other places where there is vegetable or animal matter in a state of decay. It appears to recede when approached. The cause is thought to be the escape of gaseous substances liberated from decaying bodies, which ignite spontaneously by a union of different forms of gases. Common names applied to this phenomenon are *Jack-o'-lantern* and *Will-o'-the-wisp*. The best examples of it are found in the marshes of Ireland and the low regions of Germany near the North Sea.

**IGORROTE** (ē-gōr-rō'tā), a race of people native to the Philippine Islands. The Igorrotes are a mixture of Malay and Mongol races and may be classed as warlike. They are found chiefly in the island of Luzón, but the term is applied generally to any uncivilized Filipinos of Malay blood, such as the Ygolots.

**IGUANA** (i-gwā'nà), a genus of lizards native to tropical America, including about a hundred species. The common iguana is from two

to five feet long and is mostly of a greenish color. Natives consider the flesh edible, but it is not particularly wholesome. The female lays from four to six eggs in the sand, where they are incubated by the sun. The eggs are hunted by the natives and form a wholesome food. In the adults the claws are sharp, enabling them to crawl on trees. They paddle through the water with a rapid, serpentine movement, being aided by the long, flat tail. They feed largely on vegetable substances, such as fruits, fungi, and tender plants. The *spiny agama*, an allied animal about seven inches long, is native to South Africa.

**IGUANODON** (i-gwā'nō-dōn), an extinct lizard of immense size, so called from the similarity of its teeth to those of the iguana. Fossil remains indicate that the fore feet were comparatively small and the hind ones were large. While walking the animal moved largely on its

hind legs. Fossil remains have been found in the British Isles and other European countries, and from them it is held that the animal was between twenty and forty feet long. These animals are represented in North America by the *Laosaurus* and the *Camptosaurus*, of which remains are found in the Mesozoic deposits.

**ILION** (il'i-ūn), a village of New York, in Herkimer County, twelve miles southeast of Utica, on the West Shore and the New York Central railroads. It is located on the Mohawk River and the Erie Canal. The surrounding country is fertile. It has manufactures of bicycles, firearms, clothing, and machinery. Electric lights, waterworks, and a public library are among the general utilities. It has considerable trade in farm produce and manufactures. Ilion was settled about 1816 and its incorporation dates from 1852. Population, 1910, 6,588.

**ILLIMANI** (ēl-yē-mā'nē), Mount, a lofty peak of the Andes, situated in Bolivia, about 25 miles southeast of La Pas. The summit is 21,040 feet above sea level. Vegetation ceases at about 11,400 feet and the snow line is 14,900 feet above the sea. In its vicinity are rich deposits of minerals and fine forests.

**ILLINOIS** (il-li-noi'), a state of the United States, one of the north central section, popularly called the *Prairie State*. It is bounded

on the north by Wisconsin; east by Lake Michigan, Indiana, and Kentucky; south by Kentucky; and west by Missouri and Iowa. It is separated from Iowa and Missouri by the Mississippi, from Kentucky by the Ohio, and partly from Indiana by the Wabash River. The length from north to south is 376 miles, and the greatest breadth is 212 miles. The area is 56,650 square miles, including a water surface of 650 miles.

1. Springfield; 2, Chicago; 3, East Saint Louis; 4, Peoria; 5, Quincy; 6, Rock Island; 7, Rockford; 8, Joliet; 9, Cairo. Chief railroads are shown by dotted lines.

The area is 56,650 square miles, including a water surface of 650 miles.

**DESCRIPTION.** The surface is largely a gently undulating plain, containing practically no waste lands, and constituting an extensive fertile area. Next to Delaware and Louisiana, it is the most level State, though the surface is made up of broad valleys and low, smooth hills. In the southern part the altitude is 300 feet above sea level, whence it rises gradually toward the north, where the general elevation is 800 feet. The highest land is in the south central part, where a spur of the Ozark Mountains extend into it from Missouri, having an altitude of 1,150 to 1,400 feet. In this section the hills are more or less abrupt, especially on their northern slopes, and the descent southward to the Ohio is quite gradual. The general slope of the State is toward the south and southwest, which is the direction of nearly all of the larger streams.

Since the State borders on Lake Michigan and the boundary is formed in part by the Wabash, Ohio, and Mississippi rivers, it is supplied with important waterways for transportation. The three rivers mentioned receive the discharge from nearly all streams within the State. The Illinois River, which is formed by the junction of the Des Plaines and the Kankakee, drains the central part of the State, and discharges into the Mississippi. It receives the inflow from the Sangamon, Mackinaw, Vermilion, Spoon, Fox, Kankakee, and Des Plaines, and through the last mentioned has connection with the Chicago Drainage Canal. The Rock River is in the northern part, and the Embarras, Little Wabash, Kaskaskia, and Big Muddy drain a large portion of the southern section. Lake Peoria, formed by an expansion of the Illinois River, is in the central part of the State. Grass and Fox lakes are in the northeastern part, and a number of other lakes are located in the vicinity of Chicago.

**CLIMATE.** The climatic conditions are temperate, the mean temperature ranging from 46° to 54°. The summers are pleasant and marked by cooling breezes, while the winters are moderate, though the thermometer occasionally falls below zero. In the southern part the climate is considerably warmer than in the northern section, but in general the State is subject to marked changes in temperature. Vegetation begins to grow in the early part of April, which is the principal month for seeding, and the first frosts occur late in September. All parts of the State have an abundance of rainfall, which averages 38 inches, but is somewhat heavier in the south than in the north. As a whole the climate is healthful and favorable to agriculture.

**MINING.** Though mining has been developed to a considerable extent, it is surpassed in im-

portance by agriculture and manufacturing. In the output of bituminous coal Illinois takes high rank, and the total mined is equal to ten per cent. of the amount produced in the entire country. The coal area is estimated at 42,500 square miles, most of which is workable, and the deposits are south of a line drawn through Rock Island and Joliet. Several veins of marketable coal are located from 80 to 1,200 feet below the surface, ranging in thickness from three to nine feet, but most of the mines now operated do not exceed a depth of 400 feet. The annual output of coal in Illinois is about 52,500,000 tons, making the State second in the production of coal, being exceeded only by Pennsylvania. Zinc is obtained in the northern part and sandstone, limestone, and commercial clays are abundant in nearly all sections. Petroleum is obtained in the southeastern part and galena, a lead ore, is worked in the northwestern section. Gypsum and limestone are abundant, hence cement and lime are manufactured extensively.

**MANUFACTURING.** Illinois ranks third as a manufacturing State, being exceeded only by New York and Pennsylvania. This favorable condition is accounted for largely by its extensive coal fields and convenient location for collecting and distributing. Fully seventy per cent. of the manufactured products of Illinois are credited to Chicago, which is the most important meat-packing center of America. All parts of the slaughtered animal are utilized, hence a number of industries have developed aside from the enterprise of producing fresh, cured, and canned meats. These include principally the manufacture of leather, soap, candles, brushes, and lard and tallow products. South Chicago and Joliet are centers for the manufacture of iron and steel products, the ore being obtained from the mines of Minnesota and Michigan. Elgin and Aurora are noted for the manufacture of watches and clocks; Moline, Dixon, and Rock Island have extensive factories of agricultural implements; and Peoria has the largest distilleries in America. Other manufactures include clothing, musical instruments, electrical apparatus, flour, lumber products, bicycles and automobiles, railway cars, and earthenware. Among the manufactures depending for raw materials upon agriculture are cheese, butter, and condensed milk. About twenty per cent. of the corn crop of the State is consumed in manufacturing enterprises, including chiefly spirituous liquors and glucose.

**AGRICULTURE.** The farm acreage embraces 92 per cent. of the land area and agriculture is the leading industry. In the volume of farm products the State long held first rank and at

present it is exceeded only by Iowa. The soil is exceptionally rich and free from stones. Much of the surface has been improved by tile drainage and the cultivation of crops which invigorate the land, such as clover. Aside from stable manure, only a small quantity of fertilizers is employed, and the methods of farming are modern and progressive. Corn is the principal cereal, the annual production ranging from 350,000,000 to 410,000,000 bushels. Oats is the second crop of importance, hay the third, and wheat the fourth. Considerable quantities of potatoes, rye, barley, and spelt are produced. Fruit, though grown in all sections of the State, is especially abundant in the southern part, where both the soil and climate are favorable to the endurance of orchards for a long term of years. The chief varieties grown generally are grapes, apples, plums, strawberries, and cherries, and pears, quinces, and peaches thrive best in the central and southern parts. Formerly heavy belts of timber extended along the streams and through the valleys of the southern section, but a large part of the area formerly in forests are utilized for farming and pasturage, though considerable valuable timber still abounds along the streams and in artificial groves.

Although Illinois is located near the great markets of Chicago, Peoria, and Saint Louis, stock raising has continued to be an important industry. This is accounted for largely by the fact that agriculturalists appreciate the value of feeding their hay and grain upon the farms as a means to maintain the fertility of the soil. In the number of milch cows Illinois is exceeded only by Iowa and New York. Though all departments of dairy farming are well developed, fully 65 per cent. of the income is obtained from the sale of milk. Large quantities of swine and cattle are fattened for the market each year. The State ranks next to Iowa in the number of horses, and particular attention is given to the rearing of well-blooded animals. In the number of domestic fowls it ranks next to Missouri. Mules and sheep are grown profitably, though there has been a noticeable decrease in the latter for several decades.

**TRANSPORTATION.** Illinois has the largest railroad mileage of the states, the lines aggregating 11,750 miles. It likewise holds high rank in the mileage of electric railways, both urban and interurban. Chicago, located at the terminus of many lines articulating in all directions, is the greatest center of railways in the world. The lines that cross the State include the Chicago and Alton, the Chicago, Burlington and Quincy, the Chicago and Northwestern, the Chicago, Milwaukee and Saint Paul, the Chicago

Great Western, the Chicago, Rock Island and Pacific, the Illinois Central, the Wabash, and the Atchison, Topeka and Santa Fé, all of which furnish extensive communication toward the southwest, west, and northwest. The Erie, the Nickel Plate, the Wabash, the Pennsylvania, the Baltimore and Ohio, the Monon, the New York Central Lines, and the Grand Trunk furnish the principal connections toward the southeast, east, and northeast. Rock Island, Alton, East Saint Louis and Cairo are the principal cities of the Mississippi. Peoria, Springfield, and Bloomington are thriving inland cities. Chicago, on Lake Michigan, is the largest inland port city of the world. Lake Michigan is connected by the Illinois and Michigan canal with the Illinois River at LaSalle. It is probable that the Chicago Drainage Canal will eventually become a ship canal.

**EDUCATION.** The educational institutions take a high rank and include some of the finest schools of America. Free schools have been maintained since 1855. The rate of illiteracy is 4.2 per cent. of the population over ten years of age, as compared with 10.7 for the entire country. The system of schools is under the supervision of a State superintendent, who is assisted by superintendents in the cities and counties. All the rural communities have district schools, the terms ranging from seven to nine months per year, and township high schools may be organized where the people vote to establish them. The University of Illinois, located at Urbana, is at the head of the school system. Five normal schools are maintained for the instruction of teachers at Carbondale, Charleston, De Kalb, Macomb, and Normal. A noted training school, the Cook County Normal School, is situated in Chicago. About 35 institutions that are classed as colleges and universities are within the State, all of which carry representative courses of study and are liberally patronized. Among these may be mentioned the Northwestern University, Evanston; the Illinois Wesleyan University, Bloomington; the University of Chicago, Chicago; the Augustana College, Rock Island; the Lincoln University, Lincoln; the Knox College, Galesburg; the Illinois College, Jacksonville; the Armour Institute of Technology, Chicago; the Rush Medical College, Chicago; the Lake Forest University, Lake Forest; and the Monticello Seminary, Godfrey.

Illinois maintains a high class of correctional and charitable institutions. It likewise has several hospitals and homes for the care of soldiers' orphans and for the soldiers and sailors of the wars. The correctional institutions include a penitentiary at Joliet, a reformatory at Pontiac,

a home for juvenile female offenders at Geneva, and a prison at Chester. Among the charitable institutions are the Soldiers' Orphans' Home at Normal, the Soldiers' and Sailors' Home at Quincy, the Soldiers' Widows' Home at Wilmington, hospitals for the insane at Elgin, Jacksonville, Anna, and Kankakee, and institutions for the blind and the deaf and dumb at Jacksonville and Chicago. Many scientific and educational societies are in a flourishing condition, most of which are centered in Chicago, and reference and reading libraries are maintained in all the towns and cities.

**GOVERNMENT.** The present constitution was ratified by a vote of the people in 1870. By it the chief executive authority is vested in the Governor, who is elected for a term of four years by popular vote. The other State officers include the lieutenant governor, auditor, secretary, treasurer, attorney general, and superintendent of instruction, who are elected for four years, except the treasurer, who is elected for two years and cannot be reelected to succeed himself. Legislative authority is vested in the General Assembly, which consists of a senate of 51 members elected for four years and of a house of representatives of 153 members elected for two years. In voting for representatives each elector is allowed three ballots, which he may cast for one candidate, or he may cast one and a half ballots for each of two candidates, or he may cast one ballot for each of three candidates. This provision works to the advantage of the minority party. Local judicial jurisdiction is exercised by police magistrates and justices of the peace. Counties having a population of more than 50,000 inhabitants may have probate courts, but each county has a judge, a clerk of courts, and an attorney, all being elected for four years. In addition there are circuit and inferior appellate courts. The highest judicial authority is vested in the supreme court, constituted of judges from seven districts, who are elected for terms of nine years.

**INHABITANTS.** About one-fourth of the inhabitants are of foreign birth, this portion in 1900 numbering 966,747. Germans of foreign birth constitute over one-third of the foreign born population and next in order are the Scandinavians, Irish, and Slavs. More than half of the people reside in cities and towns. The density of population is 86 per square mile. All of the leading Christian denominations are well represented, including principally the Methodist Episcopal, Lutheran, Baptist, Roman Catholic, Christian, Presbyterian, and Episcopalian churches. The United Brethren and Congregational sects likewise have a large membership. Springfield

is the capital of the State. Other important cities are Chicago, Peoria, Quincy, Rockford, Bloomington, Aurora, Elgin, Galesburg, Belleville, Decatur, Rock Island, East Saint Louis, Jacksonville, Danville, Moline, Alton, Cairo, Streator, and Freeport. In 1900 Illinois held the third rank in population among the states, being exceeded only by New York and Pennsylvania. In that year the population was 4,821,550. This number included 86,677 colored inhabitants, of whom 85,078 were Negroes. Population, 1910, 5,638,591.

**HISTORY.** Illinois was first visited by white men in 1673, when Louis Joliet and Father Marquette ascended the Illinois River, and by way of the Des Plaines and Chicago rivers reached Lake Michigan. In 1680 La Salle and several companions erected Fort Crevecoeur on the Illinois River, and Catholic missions were established about the same time. The region came under English dominion by the conquest of Canada in 1763, when many French settlers removed to the towns in the Mississippi Valley, especially to Saint Louis and Natchez. Kaskaskia, the oldest town in the State, was settled in 1680, but it declined after the English occupation. In 1787 it was included with the Northwest Territory.

Illinois was erected into a territory in 1809, comprising at that time the region now included in the present states of Illinois, Wisconsin, Minnesota, and part of Michigan. Fort Dearborn (Chicago) was destroyed and the garrison was massacred in 1812. The first constitution was adopted and it was admitted into the Union in 1818. The Black Hawk War of 1832 terminated in the removal of all the Indians to regions farther west. Congress made appropriations for the improvement of the Chicago River in 1834. In 1840 the Mormon excitement occurred. About that time a large number of Mormons removed from Missouri to Nauvoo, Ill., and four years later Joseph and Hiram Smith were confined in the jail at Carthage and there murdered. Subsequently about 20,000 emigrated under the leadership of Brigham Young and settled in Utah. The State furnished six regiments of troops for the Mexican War. The Illinois and Michigan Canal, from Lake Michigan to LaSalle, was opened for traffic in 1848. A great fire destroyed a large part of Chicago in 1871, but it was rapidly rebuilt, and in 1893 was the seat of the World's Columbian Exposition. The capital was located successively at Kaskaskia, Vandalia, and Springfield. At the time of the Civil War Illinois furnished 260,000 men to support the Union. It has since made rapid strides of advancement in wealth, commerce, education, and influence in the national government.

**ILLINOIS, University of**, an educational institution situated between Champaign and Urbana, Ill. It was established in 1867 as the Illinois Industrial University and assumed the present name in 1885. At first the institution was open for men only, but women were admitted as students in 1870. It consists of the six colleges of law, agriculture, literature and arts, science, engineering and medicine. Courses are maintained in military science, art and design, music, pedagogy, and preparatory work. It has 25 buildings, 310 instructors, and about 4,125 students, of whom about one-fourth are of the undergraduate college. The library contains 100,000 volumes. The buildings and grounds are valued at \$1,250,000.

**ILLINOIS AND MICHIGAN CANAL**, a waterway that connects Lake Michigan with the navigable waters of the Illinois River, hence furnishes transportation facilities from the Gulf of Mexico to the Great Lakes. It extends from the south branch of the Chicago River to the Des Plaines, thence follows that stream to the mouth of the Kankakee, and thence follows the valley of the Illinois River to its terminus at LaSalle. The canal is 96 miles long, has seventeen locks, and is six feet deep and sixty feet wide at the bottom. Work upon it was commenced in 1836, and it was opened for traffic in 1848, costing a total of \$8,750,000. Formerly it was important as a waterway, but the construction of railways has caused it to be used very little at present.

**ILLINOIS INDIANS**, a family allied to the Dakotas, who formerly inhabited Illinois and tracts west of the Mississippi. They were classed with the Algonquins, constituted a brave race, and were identified with the French in their wars against various Indians, especially the Sacs and Foxes. They now occupy a small reservation in Oklahoma and have taken kindly to the arts of peace and education.

**ILLINOIS RIVER**, the most important river of Illinois. It is formed in Grundy County by the Kankakee and Des Plaines rivers, receives the Fox and Sangamon, and after a course of about 500 miles joins the Mississippi fifteen miles above Alton. Formerly it was navigable only to Peru, a distance of 250 miles, but it is now serviceable for vessels to points farther up by reason of its receiving the water of the Chicago Drainage Canal, which enters the Illinois River through the Des Plaines.

**ILLITERACY** (il-lit'ēr-ā-sŷ), the term used generally to denote inability to read and write. Although it is not important as to how many persons in any community are unable to read and write, this fact is of interest in that it

marks the dividing line between those who are hopelessly ignorant of books, and are therefore deprived of all the advantages to be derived from perusal or study, and those who have at least the rudiments of an education. This standard, though marking a primitive degree in the development of culture and intelligence, is at present a dividing line to which a large majority of the people have not attained. However, the statistics exclude all who have not reached school age, which differs somewhat in the various countries, and in some cases an age limit is fixed in the census reports. For instance, the law of Italy fixes the age under which children are omitted at six years while in the United States those under ten years are not counted. Since Germany has enforced the compulsory school attendance laws a long term of years, it occupies the foremost position in the world when measured on an educational standard, although Sweden and Norway hold a very high rank in elementary instruction. Illiteracy in the United States is somewhat higher than could be expected, this being due to a large colored population. Below is a table showing the per cent. of illiteracy for the different countries.

	PER CENT.		PER CENT.
Germany.....	0.11	Ireland.....	17.00
Sweden.....	0.11	Austria.....	23.80
Switzerland.....	0.30	Hungary.....	28.10
Scotland.....	3.57	Greece.....	30.00
Holland.....	4.00	Italy.....	38.30
France.....	4.90	Russia.....	61.70
England.....	5.80	Spain.....	68.10
Canada.....	10.20	Portugal.....	79.00
United States.....	10.70	Servia.....	86.00
Belgium.....	12.80	Rumania.....	89.00

**ILLUSION** (il-lū'zhŭn). See **Eye**.

**ILLYRICUM** (il-lir'ī-kŭm), or **Illyria**, the name of an ancient country in Europe, which extended from the northeastern coast of Italy into Macedonia. Philip of Macedon conquered the country as far west as the Drino River and annexed it to Macedonia. The western portion comprised the territory corresponding to Bosnia, Croatia, Dalmatia, and Herzegovina, and this region remained independent until the middle of the 18th century before the Christian era, when it was made a Roman province. Illyricum was generally divided into two parts, known as *Illyris Graeca* and *Illyris Romana*, and both of these divisions were afterward incorporated with the Eastern Empire. Napoleon organized the Illyrian provinces in 1809, but they were formed into a kingdom and annexed to Austria in 1816. Later the kingdom was dissolved and the territory was subdivided into provinces, all of which are now Austrian possessions, except Albania, which is a part of Turkey.

**ILOILO** (ē-lō-ē'lō), a city of the Philippines, capital of the province of Iloilo, located on the southeastern shore of the island of Panay. It has an excellent harbor on Iloilo Strait, which separates Panay from the island of Guimaras. The chief buildings include a cathedral, several schools, a seminary, and the buildings used by the government. It ranks next to Manila as a commercial center in the Philippines, and has a large trade in coffee, sugar, rice, tobacco, and dyewoods. A foundry, a machine shop, and a pottery are among the industrial enterprises. The United States bombarded and occupied the city in 1899, at the time of an insurrection. Population, 1906, 19,150.

**IMAGINATION** (im-āj-i-nā'shūn), that faculty of the mind by which it receives concepts of absent objects, not as they are or were, but as they might be. The original material with which it builds is derived through memory by sense perception, thus imagination is created in a limited sense. The material secured in this way is used with modification, or it may be modified and then used, and thus new images or mental pictures are created that differ from any product that memory gives. In the combining of images, or the formation of new ones, the laws of the association of ideas govern the operation, but imagination is governed at least partially by the will, for by it the thoughts are controlled to some extent and the limits are determined within which the laws of association are to act. The products of imagination are termed according to the results, as phantasmal, fanciful, artistic, and inventive. Imagination makes possible the culture of fine arts, gives vividness and force to language, lightens life's burdens, and leads to the attainment of success in the practical affairs of life. Its culture is important, since it may serve a good or evil purpose, this depending upon its early and right training.

**IMAM** (i-mām'), or *Iman*, a priest among the Mohammedans, one who is looked upon as a leader among the learned men. He has the ordinary care of a mosque, calls the people to prayer, and reads the prayers before the congregation. The imam is elected by the people and is ecclesiastically independent from the mufti or chief priest. Imam is the name which is applied to the founders of the four principal Mohammedan sects, but among the Shiites it refers especially to the twelve legitimate successors of Ali. The Sultan, being supreme in ecclesiastical affairs, has the title of imam.

**IMMIGRATION** (im-mī-grā'shūn), the act of coming into a country for the purpose of

residing there permanently. It is closely associated with colonization, since progress in the development of a new country increases labor. Immigration is not only encouraged by the authorities of a new country, but a gain in population is considered an advantage. In the past century the over-populated states of Europe have had a constant movement of emigration to the newer portions of the world, especially to the United States, Canada, Australia, Africa, and South America. The annual immigration to Argentina is 112,000 persons and to Uruguay it is about 10,000. These countries continue to attract settlers owing to their extensive natural resources being undeveloped. In 1908 Canada received 218,500 immigrants, of which number about one-third came from the United States. Formerly the immigrants into Canada came largely from Europe, but since 1905 a constant stream of settlers moved from the United States into the new country of the Canadian west, especially to Manitoba, Saskatchewan, Alberta, and British Columbia. The newer element in general includes Galicians, Germans, Hungarians, Mennonites, Chinese, and Negroes. Australia has been receiving about 60,000 immigrants annually, who are attracted chiefly by its gold mines and fertile lands.

Immigration to the United States has varied greatly from year to year since 1850, and was smallest in 1862, owing to the progress of the Civil War. Below is a table showing the annual immigration since 1850:

PERIOD.	IMMIGRANTS.	PERIOD.	IMMIGRANTS.
1851.....	379,466	1880.....	457,257
1852.....	371,603	1881.....	669,431
1853.....	368,645	1882.....	788,992
1854.....	427,833	1883.....	603,332
1855.....	200,877	1884.....	518,592
1856.....	195,857	1885.....	395,346
1857.....	112,123	1886.....	334,203
1858.....	191,942	1887.....	490,109

Following is a table showing the immigration into the United States for each decade since 1821, and giving the population at the beginning of each period of ten years:

DECADE.	IMMIGRANTS.	POPULATION AT BEGINNING.
1821-1830.....	143,439	9,633,822
1831-1840.....	599,125	12,866,020
1841-1850.....	1,713,251	17,069,453
1851-1860.....	2,598,214	23,191,876
1861-1870.....	2,314,824	31,443,321
1871-1880.....	2,812,191	38,558,371
1881-1890.....	5,246,616	50,155,783
1891-1900.....	3,844,420	62,622,250

In this connection is given the following table, showing the population and foreign-born inhabitants for each year stated:

YEAR.	FOREIGN BORN.	POPULATION.
1850.....	2,244,602	23,191,876
1860.....	4,138,697	31,443,321
1870.....	5,567,229	38,558,371
1880.....	6,679,943	50,155,783
1890.....	9,308,104	63,069,756
1900.....	10,460,085	76,303,387

Immediately following the close of the Civil War a large number of immigrants came from Germany, Sweden, and other countries of Europe to take advantage of the cheap lands and excellent opportunities afforded by the new country in the Northwest. However, at present the largest number of foreign born are attracted to the cities. Below is given a list of eighteen cities, showing the foreign-born and native population in 1900:

CITIES.	FOREIGN BORN.	POPULATION.
New Bedford.....	25,529	62,442
Holyoke.....	18,921	45,712
Manchester.....	24,257	56,987
Lowell.....	40,974	94,969
Woonsocket.....	12,518	28,204
Lawrence.....	28,577	62,559
Passaic.....	12,900	27,777
Fall River.....	50,042	104,863
Milwaukee.....	88,991	285,315
Detroit.....	96,503	285,704
Buffalo.....	104,452	352,387
Saint Louis.....	111,356	575,238
San Francisco.....	116,885	342,782
Cleveland.....	124,631	381,786
Boston.....	197,129	560,892
Philadelphia.....	295,340	1,293,697
Chicago.....	587,112	1,698,575
New York.....	1,270,080	3,437,202

In 1900 the foreign born constituted 13.7 per cent. of the total population of the United States, of which number only about half a million were in the Southern States. The North Atlantic states had 4,762,796 of foreign birth, and the North Central states had 4,158,474. In the Western states there were 846,321. Immigration to America comes largely from Western Europe. The number of inhabitants of the United States in 1900 who came from Italy were 484,207; from Austro-Hungary, 579,042; from Russia, 807,606; from Sweden, Norway, and Denmark, 1,064,309; from England, Scotland,

and Wales, 1,169,737; from Ireland, 1,618,567; and from Germany 2,666,990.

**IMMORTALITY** (im-mör-täl'i-tý), the term employed to designate the endless life of the soul. In theology it is applied to the eternal, personal, and conscious existence and union with God. Belief in the immortality of the soul is very ancient. It implies a continuation of our personality, or consciousness, and of the will. The most rude people hold views regarding a future state, one in which the arts of this life will be pursued with even greater satisfaction than the present existence affords, a state in which nature and the chase will yield enlarged gratifications. Among the ancient Egyptians the idea of immortality led to a belief in a dwelling place of the dead and of a future judgment. Their beneficent god Osiris judged the departed, and, "having weighed their hearts in the scales of justice, he sends the wicked to the regions of darkness, while the just are sent to the god of light."

Among the early Grecians the belief was prevalent that the departed passed into the realms of light or hades, the place for the dead. Thus we read of Achilles, the ideal hero, that he declared he would rather till the soil than live in pale Elysium. Socrates discourses on the doctrine of immortality in the "Apology" and the "Phaedo," and concludes that the soul is the immaterial and superior part, and is not dispersed into nothingness when separated from the body. He thought that to study how to die calmly is true philosophy, and that the soul spends the rest of its existence with the gods, freed from the evils of humanity. The Christian religion teaches the immortality of the soul, as do also other religions, and some Christians and others hold to the belief in a state where purification of the soul takes place after death. Man is taught by reason and religion to strive for continued perfection, and that the truthful and rightful will not pass unrewarded.

**IMMORTELLES** (im-mör-télz'), or **Everlasting Flowers**, a term applied to a class of flowers which do not lose their color or beauty in drying. They are native to Northern Africa and Western Asia, and are cultivated extensively in gardens and greenhouses. The name immortelles was compounded in France, where they are grown extensively and used in making wreaths. In many countries wreaths made of immortelles are placed on graves to symbolize immortality.

**IMPEACHMENT** (im-pēch'ment), the calling into question of the motives of an individual or of the validity of the law. It is applied particularly to the accusation and prosecution of

an officer for maladministration, by a legislative body. The proceeding is sanctioned in England, where the House of Commons is the prosecutor and the House of Lords is the trial court. Lord Latimer was the first to be prosecuted by this method. However, the proceeding is now practically obsolete.

In the United States the Constitution vests the right of impeachment exclusively in the House of Representatives, but the right of trial is vested in the Senate. The officers liable to impeachment are the President, Vice President, and all civil officers of the United States. Among the causes for which an officer may be impeached are treason, bribery, and other high crimes and misdemeanors. In the trial by the Senate the regular officer presides, but when the President is impeached the Chief Justice of the Supreme Court is the presiding officer. A two-thirds vote of the senators present is necessary for conviction. Punishment extends only to removal and disqualification to hold any office under the Constitution of the United States, but the offender is still liable to an ordinary trial by law. Impeachments of State officers are provided for by the constitutions of the various states. In the United States seven Federal officers have been impeached, two of whom were convicted. The number embrace Senator William Blunt of Tennessee, in 1797; District Judge John Pickering of New Hampshire, in 1803; Supreme Judge Samuel Chase of Maryland, 1804; District Judge James H. Peck of Missouri, 1830; District Judge West H. Humphreys of Tennessee, 1862; President Andrew Johnson, 1868; and Secretary of War William R. Belknap, 1876. The only convictions secured were in the trials of John Pickering and West H. Humphreys.

**IMPERATOR** (im-pĕ-rā'tōr), the term applied to a military commander in ancient Rome. During the time of the republic the term *imperator* followed the name, but when the empire was organized it was changed to *emperor* and as a title preceded the name of the supreme ruler. The title became extinct with the fall of the Byzantine realm in 1453. Charlemagne, the founder of the German Empire, assumed the title of emperor. The term *imperator* was applied to triumphant generals throughout the Roman Empire.

**IMPERIALISM** (im-pĕ'rī-al-izm), the policy of territorial extension by conquest, the spirit of empire, or the system of government under an emperor or empress. The term is used in France to designate the revival of the Napoleonic empire, and in England it refers to a policy of territorial extension. In the presi-

dential campaign of 1900, in the United States, the term was employed largely for the purpose of designating the policy of the national administration in dealing with the Philippine Islands.

**IMPRESSIONIST** (im-prĕsh'ūn-ist), the name applied to a painter of the school of painting whose aim is to produce works of art in exact accord with nature. The painters of this group are usually called *impressionists*, since they seek to reduce to the canvas an exact impression of their subjects, so they will impress the mind in a way similar to the object or scene painted. From this circumstance they are sometimes called *naturalists*, owing to the fact that they seek to reproduce according to nature. Formerly these terms applied more particularly to painters, but now they are used likewise in reference to sculpture and literature. The impressionist school of painting is concerned chiefly in rendering the effects of light and shade. The painters of this school oppose the practice of painting in the studio, because they think it gives untrue tones, but instead do their painting in full light.

**IMPRESSMENT** (im-prĕs'mĕnt), the act of impressing into the public service, or of seizing property for public use. Formerly the power of impressment was claimed by many governments, but since the War of 1812 it has been abandoned by most countries. The British government claimed the right of searching American vessels prior to the War of 1812, and of impressing into service British seamen who were employed under the American flag. At that time England was at war with France and claimed the service of all her maritime citizens, refusing to recognize allegiance to the United States even by naturalization. The willful impressment of many American sailors was instrumental in bringing about the embargo system and the War of 1812.

**IMUS** (ē'mōos), a town of the Philippines, on the island of Luzón, in the province of Cavite. It is located a short distance from Manila Bay, about eighteen miles south of Cavite, and is surrounded by a fertile farming and fruit-growing region. The manufactures include clothing, pottery, and machinery. It has a cathedral and a number of schools. Population, 1906, 15,808.

**INAGUA** (ĕ-nā'gwà), **Great and Little**, the names of two islands in the West Indies, belonging to the Bahama group. Great Inagua, the larger of the two, is located sixty miles northeast of Cuba and has an area of 660 square miles. Little Inagua, located ten miles northeast of Great Inagua, has area of 35 square

miles. The population of the two islands is 1,640.

**INCA** (in'kà), the name of the governing class of the Peruvian Indians, and later the title of the chief or imperial head of the Empire of Peru. The Incas took rank with the Aztecs and the Mayas in the scale of intellectual and industrial advancement. Their territory extended from the Equator southward a distance of about 38°, and embraced the Andean region south of the Equator and much of the slope toward the east, extending far into the valleys of the Amazon and the Orinoco. Their capital was at Cuzco until a short time before the Spanish conquest, when it was removed to Quito by Atahualpa. At that time the Incas were highly developed in agriculture and fruit raising. They maintained a considerable commerce, manufactured clothing and implements, promoted mining, and built substantial forms of architecture. They were finally conquered by the Spaniards in 1532, when their empire had a population of about 10,000,000. Prescott, the historian, in speaking of the Peruvians, says that "they originated civil and social institutions of much perfection, possessing an indefinite power of expansion, and suited to the most flourishing condition of the empire, as well as to its infant fortune." Many relics of Incan architecture are found in Peru and other countries of South America. They constructed of adobe bricks and of stone, built aqueducts and waterways, and attained to much proficiency in embalming and entombing the dead. Many of the respected and educated people of the Andean countries of South America trace their ancestry to the Incas.

**INCARNATION**, the manifestation of the Deity in a human form, as in the union of God and man in the person of Christ. The doctrine is clearly stated in the first chapter of the Gospel according to John, in which Christ is spoken of as the *Word*. Here it is made clear that the Word is God, existing from the beginning, but yet in some sense He is different from God. The doctrine of incarnation is a vital part of the religion of the Hindus, who believe in many incarnations, as the nine incarnations of Vishnu.

**INCENSE** (in'sens), an aromatic substance which emits a sweet odor when burned. Perfumes of this kind were used from remote times in religious rites. The substance employed consisted anciently of a mixture of gums, spices, and balsams, which form a large portion of the ingredients still used. Among the Jews incense was burned on a special altar, called the *altar of incense*. They employed it only as an act of worship, and not as a sacred offering. The

worshiping of gods in ancient Assyria, Babylonia, Egypt, India, Greece, and Rome included incense burning daily, a practice usually performed in the morning and evening. It is still employed by the adherents of divers religions of Asia, especially by the Buddhists. The Greek and Roman churches both employ incense in worship, especially in the most sacred services, such as high mass, in funerals, and the consecration of churches.

**INCLINED PLANE** (in-klind' plān), any plane surface that makes an angle with a horizontal surface, used for raising heavy weights. If a ball is placed upon a horizontal plane, it retains its position and presses upon the plane with its entire weight. However, as soon as one end of the plane is raised, the entire weight of the ball will not rest upon the plane and it will begin to roll toward the lower end. It is one of the machines designed to use force advantageously, as in loading a barrel of salt upon a wagon, when one end of a plank may rest upon the ground and the other upon the wagon, and the barrel may be rolled over the plank to much better advantage than in lifting it direct. Steep grades in constructing highways are avoided by building them in a winding position around a hill.

**INCOME TAX** (in'kūm), a tax levied upon the annual income of individuals, investments, and corporations. This form of taxation has been levied more or less extensively since mediæval times. In 1646 the first income tax levied in America went into effect under the direction of the Massachusetts Bay Colony. Massachusetts has maintained a tax of this character during most of its history. It and a few other states still impose this class of taxes. In Great Britain the first income tax of modern times was levied in 1799, a form of taxation still existing in that country. The first income tax imposed by the United States went into effect in 1861, when a tax of three per cent. was levied on incomes of \$800 per annum and over, and the following year Congress imposed an income tax of three per cent. upon the excess of incomes above \$600 to \$10,000, and five per cent. on the excess above \$10,000. The graduated scale was somewhat revised in 1864 and in 1867, and in 1872 the law was repealed. From the available statistics it is learned that the taxes collected under these laws were as follows:

1863.....	\$ 2,741,858	1868.....	\$41,455,598
1864.....	20,294,732	1869.....	34,791,856
1865.....	32,050,017	1870.....	37,775,871
1866.....	72,982,159	1871.....	19,162,654
1867.....	66,014,429	1872.....	14,436,862

The total amount derived from the income tax, including some arrears, was \$346,911,760.48.

In 1894 Congress imposed an income tax of two per cent. upon the excess of all incomes above \$4,000 per annum, and included all corporations, companies, and associations other than partnerships. On May 20, 1895, the law was declared unconstitutional by the Supreme Court of the United States. This decision was based upon the theory that, although a direct tax, it was not apportioned among the states according to population. Since the tariff reduction effected by the same law that included the income tax, known as the Wilson Law, did not provide sufficient revenue aside from that of the income tax, a deficit in the funds of the nation was created. Much criticism has been made of the court on account of rendering this decision.

**INCUBATION** (in-kû-bā'shŭn). See **Egg**.

**INCUBATOR** (in'kû-bā-tēr), a machine used for hatching eggs by artificial heat. Various forms have been manufactured and are in common use by those who raise poultry. However, the enterprise of hatching eggs by artificial incubation is very old. It is certain that this method was practiced anciently in China and Egypt. The earliest forms of incubators were formed like a barrel and the heat was obtained by fermenting manure. Modern incubators are divided into a number of chambers suitable to receive the eggs and the heat is furnished by a lamp, which either warms the air direct or conducts it to a reservoir filled with water, whence the warm water is conducted by pipes so as to maintain the temperature uniformly. The proper temperature ranges between 90° and 100°, a somewhat higher degree being necessary during the first week, after which it should be lowered gradually. The eggs should be turned frequently during the first few days of incubation, and a thermometer should be adjusted so as to permit observing the temperature at any time. The incubators in use range in size from a capacity of a few dozen eggs to several hundred. About eighty per cent. is the average hatch of fertile eggs, but to obtain the best results much experience and careful attention to details are required.

**INCUBUS** (in'kû-bŭs), a male sprite or demon connected with the superstition of the Middle Ages. It was commonly believed that these demons were the cause of *nightmare*. The corresponding female demon was known as *succuba*.

**INDEPENDENCE** (in-dĕ-pĕnd'ĕns), a city in Iowa, county seat of Buchanan County, on the Wapsipinecon River. It is on the Illinois Central and the Chicago, Rock Island and Pacific railroads. The surrounding country is farming and dairying. It has an excellent high school and

is the seat of the State hospital for the insane. Among the facilities are a public library, electric street railways, waterworks, and street lighting. Population, 1905, 3,838.

**INDEPENDENCE**, a city of Kansas, county seat of Montgomery County, 85 miles southwest of Fort Scott, on the Missouri Pacific and the Atchison, Topeka and Santa Fé railroads. It is located on the Verdigris River, in an agricultural section, and is surrounded by a productive petroleum and natural gas region. The chief buildings include the public library, the county courthouse, the city hall, and several schools and churches. It has a growing market for agricultural produce and merchandise. The manufactures include glass, sugar, crackers, flour, pottery, and machinery. The rapid and healthful growth of the city in recent years is due to the development of its manufacturing and commercial enterprises. Population, 1905, 11,206; in 1910, 10,480.

**INDEPENDENCE**, a city in Missouri, county seat of Jackson County, five miles east of Kansas City. It is on the Missouri Pacific, the Chicago and Alton, and other railroads. The noteworthy buildings include the Kansas City Ladies' College, Woodland College, the county courthouse, the high school, and the public library. It has many fine residences and is the home of many Kansas City business men. The surrounding country is agricultural and fruit growing. It has manufactures of flour, woolen goods, ironware, and machinery. Pavements, street lighting, waterworks, and other improvements are among the municipal facilities. It was settled in 1827 and received an influx of many Mormon settlers in 1831, before their removal to Utah. The place was chartered as a city in 1889. Population, 1910, 9,859.

**INDEPENDENCE DAY**, the national holiday of the United States, celebrated on the 4th of July in commemoration of the signing of the Declaration of Independence (q. v.).

**INDEPENDENCE HALL**, a building erected between 1729 and 1734 as a meeting hall, on Chestnut Street, Philadelphia, Pa. In 1775 it was the meeting place of the Continental Congress, when Washington was made commander in chief of the American army. On July 4, 1776, that body adopted the Declaration of Independence, which was read to a vast public assemblage in the street. The structure is of brick, though much of the woodwork and finishing has been replaced or restored. It is now used as a museum of historical relics and is open to the public.

**INDEPENDENTS**, the name of a Protestant sect that originated in England in the 16th

century. Robert Brown, an English clergyman, organized the sect in 1586, and for some time they were known as Brownists or Separatists. They included those Protestants who believed that each individual church should administer its own affairs, instead of being under the authority of a civil or ecclesiastical official or potentate. Later the members were merged largely with the Congregationalists, who represent a strong following both in England and America at the present time.

**INDEX LIBRORUM PROHIBITORUM**, the name of a catalogue of books proscribed by the Roman Catholic church, which its members are not permitted to read. Such a catalogue was first prepared by the Council of Carthage in the year 400, but a much larger edition was compiled by the inquisition at Rome under the direction of Pope Paul IV. in 1557. This work forbade the reading of the works of Luther, Calvin, and other reformers, and later other authors of the Protestant faith were placed on the list. With these publications were included a number of books relating to magic, mesmerism, and some of the sciences, but it was provided that bishops could permit educated people to read some of the works of the prohibited list. The *Index Expurgatorius* is a similar catalogue. The latest edition of the latter was issued in 1895, under the direction of Leo XIII.

**INDIA** (in'di-à), a region of Asia, the most populous member of the British Empire. Formerly the name Hindustan was frequently used instead of India, but it has reference to the land of the Hindus, which is located in the north central part of India. The Empire of India, as the subject of this article is known officially, is in the form of a great triangle. It extends from north to south a distance of 2,000 miles, which is about the extent east and west when Baluchistan is included. The northern boundary is formed by Afghanistan and the Chinese Empire; the eastern, by the Chinese Empire, Siam, and the Bay of Bengal; the southern, by the Indian Ocean; and the western, by the Arabian Sea, Persia, and Afghanistan. The area, including Burma, Baluchistan, and the native states, is 1,766,650 square miles. Popularly the native states and the dependencies are spoken of as Hither and Farther India. With the empire are officially included Aden, on the Arabian Coast, and Socotra, a dependency of Aden.

**DESCRIPTION.** India is separated from the interior of Asia by the great ranges of the Himalayas, Hindu Kush, and Sulaiman mountains. The surface is naturally separated into three vast regions. In the southern portion is the table-land of Deccan, with a general elevation

of from 1,800 to 3,000 feet; north of it is the Great Plain, which is the most fertile and populous region; and the elevated highlands of the Himalayas, which comprise the northern part. These mountains are the most lofty in the world, many of the peaks rising to heights of from 20,000 to nearly 30,000 feet above sea level. They include vast regions that are perpetually covered with snow. Mount Everest, the loftiest of the Himalayas, is the highest mountain in the world. The Hindu Kush extend in ranges westward from the Himalayas, and chains of the Sulaiman and Hala stretch southward along the western border. These mountains can be crossed only by lofty passes, some of them fully 18,000 feet above the sea, hence they have served as a great barrier against invasions from the north. They constitute the height of land between the slopes of India and the Chinese Empire, and the drainage is generally toward the south, being toward the southwest in the western part and toward the southeast in the eastern section.

The Brahmaputra, Ganges, Indus, and Irrawaddy are the four largest rivers of India, the last mentioned being in Burma. The Brahmaputra and the Ganges drain the northeastern section. They have their sources on the southern slopes of the mountains, where the rainfall is heaviest, hence they carry an immense volume of water in proportion to their length and the basins drained. Both discharge by many mouths into the Bay of Bengal, where they have deposited an immense quantity of silt. In the northwestern part is the Indus, which receives the inflow from the Chenab and the Sutlej rivers. It drains an immense basin into the Arabian Sea, which it enters by an extensive delta. Among the rivers of the Peninsula are the Nerbudda and Tapti, flowing into the Arabian Sea; and the Godavari, the Kistna, and the Kavery, discharging into the Bay of Bengal. The Jumna, a tributary of the Ganges, drains a large portion of the central plain. As a whole the coast line is quite regular and not deeply indented, the largest inlet being on the western shore and including the Gulf of Cutch and the Gulf of Cambay. The only lakes are Kolar and Chilka, both of which are located near the eastern coast.

**CLIMATE.** In most parts of India the climate is tropical, with two distinctive periods, the rainy season and the dry season. The rainy distribution of humidity is more or less irregular season continues from November until March and the dry from May until November, but the on account of which droughts are not infrequent. In the summer or dry season the heat is very great, especially in the southern portion, but the elevated interior and the mountains in the north

have a moderate climate. A marked influence is exercised by the monsoons that blow across the country from the Indian Ocean, which carry considerable humidity against the mountain slopes, where the rainfall is excessive. In the northwest, in the region of the Indian Desert, the mean temperature for July is about 96°, which is the hottest part of the country. As a whole the climate is healthful for Europeans, except in the jungle and marsh land along the coast and in the lower courses of the larger streams. In the north central part is an arid region, where famines are quite frequent on account of excessive droughts. The precipitation at Madras is 52; at Bombay, 74; and at Calcutta, 65 inches. The heaviest rainfall occurs in Assam and Lower Burma, where the precipitation ranges from 500 to 600 inches per year.

**FLORA AND FAUNA.** The growth of vegetation is diversified according to elevation and the distribution of rainfall. Desert conditions prevail in the region lying east of the Indus, in the vicinity of the Gulf of Cutch, where plant life is very scant. Dense jungles are located along the Gulf of Bengal and in the lower course of the Ganges, where the plants are numerous and of large size. In the Deccan, east of the Western Ghats, the rainfall is scant and the plants are correspondingly limited, and in the mountain region the flora is arctic in form. The alluvial lands of the Indus and the Ganges are very fertile, and these regions are the seat of a vast population and the nativity of many useful plants. Among the forest trees are the sandalwood, blackwood, cedar, teak, and many species of palms. Numerous fruit trees abound, especially the mango, banana, and cocoanut. The large species of wild animals are becoming scarce, though the elephant, wild cattle, deer, antelope, and wild goats are still met with. The lion, tiger, and numerous birds and reptiles are plentiful. Many species of the ape, bear, rhinoceros, jackal, leopard, and jungle fowl occur in different sections.

**MINING.** Though India has vast mineral wealth, the mining industry has not been developed to a considerable extent when compared to its possibilities. The construction of railways and the building of manufacturing enterprises have stimulated a greater interest in the coal resources of the country, and the output of this product shows a steady increase the past two decades. Most of the coal mining is confined to the province of Bengal, but profitable mines are worked in Assam and a number of places in the peninsula. Gold is found in the river gravels of the Himalayas and elsewhere and quartz deposits are worked in Mysore and other regions,

Petroleum is obtained in large quantities from Upper Burma, being used in the manufacturing enterprises and for fuel. A monopoly is exercised by the government in the production of salt, which is obtained principally by the process of evaporation along the coast and in some of the small lakes of the interior. Other minerals obtained in paying quantities include lead, copper, and manganese. Though India was long famous for its diamonds, the output of this mineral is now insignificant. Building stone and commercial clays are abundant.

**AGRICULTURE.** The people of India have looked upon agriculture as an important enterprise for many centuries and it still takes precedence as the chief industry. Improved means of tillage and harvesting are utilized, including much steel machinery, and a vast area has been reclaimed by irrigation. Little farming can be done in Sindh and Lower Punjab without an artificial supply of water, and this is true likewise of many other sections, especially in the Deccan and some districts of the upper region of the Ganges. The irrigated lands aggregate 38,500,000 acres, though the need of supplying water artificially varies somewhat with the prevailing winds at certain seasons of the year. Rice is the most important crop and the acreage cultivated in that product is nearly five times as great as that devoted to the cultivation of wheat. Hay is grown on about half the area cultivated in rice. Other important crops include pulse, cotton, flax, sugar cane, opium, tea, indigo, tobacco, and coffee. Rice is cultivated extensively in the region of the deltas and along the coast, while wheat is the leading cereal in the northwest provinces, and sugar cane is grown largely in Bengal. The latter likewise has large interests in the cultivation of indigo.

Stock raising does not take rank with that enterprise as developed in Canada and the United States. This is due to various reasons, especially to the fact that people in tropical climates subsist largely on a vegetable diet, and because the caste or religious prejudices bar a large number of Hindus from eating pork and beef. To these must be added the circumstance that excessive droughts during the dry season deprive a large scope of country almost entirely of vegetable growth, owing to which stock is frequently reduced almost to starvation. The cattle grown in India belong to the humped variety, a breed that is scarcely known in America. Buffaloes are the chief animals of draft and burden. Interest is developing in the rearing of horses and mules and considerable enterprise is shown in growing sheep and goats.

**MANUFACTURING.** The people of India have been celebrated from ancient times for their skill in manufacturing textile fabrics and beautiful metal work. They do not engage extensively in building large enterprises, but work of this kind is done chiefly in small shops or in the houses of the natives. Very simple implements are used and the labor is done almost entirely by hand. Rugs, carpets, and laces obtained from India are in a class by themselves, and are remarkable for their beautiful designs and exquisite workmanship. Within recent years modern machinery has been introduced, especially in the manufacture of cotton and woolen textiles, flour, sugar, spirituous liquors, and paper. Many of the larger manufacturing enterprises are fostered by English capital and superintended by expert laborers, but the work is done chiefly by natives who have been carefully trained by Europeans. Large smelters and machine shops have been constructed and several extensive shipyards are operated. European methods have been introduced in the manufacture of copper, brass, and steel products, but work in ivory and wood carving is still done by native artisans by ancient methods. The sawmills and manufactories, especially those producing furniture and other lumber products, employ European methods and machinery. Formerly large quantities of various commodities that are now manufactured within the country were imported. The list of home manufactures is constantly increasing.

**TRANSPORTATION.** India has a larger mileage of railways than all the other countries of Asia combined. Important lines cross it in all directions, hence the chief centers of industry and population have extensive connections for transportation purposes. This fact is a potent factor in promoting the welfare of the country, both in the development of its resources and in conducting the affairs of the government. Lord Dalhousie originated a policy in 1850 to extend the construction of railways, under which private corporations were guaranteed a reasonable income on the capital invested for a term of years. In 1870 the government began to build and operate new lines and at present the publicly owned lines represent about one-half of the total mileage. In 1908 there were 28,500 miles in operation. A number of canals communicate with some of the principal railway lines, while others connect or supplement the rivers, hence all the sections have adequate transportation facilities, except the mountainous regions in the northern part. Navigation is possible for long distances on many of the rivers, particularly on the Indus, Ganges, and

Brahmaputra. The country has 85,000 miles of telegraph lines, mostly under government control, and the postal system includes 30,750 post offices. Many highways have been improved with macadam, affording communication to points considerable distances from the cities and railroads.

**COMMERCE.** India has held high rank in the trade of the world from an early period of the history of Asia. This is due to the fact that a large number of commodities of value in commerce are produced, as well as to its convenient location on important routes of oceanic transportation. The East India Company established trading posts in India as early as 1600, and through its commercial relations the influence of England was greatly augmented in the trade of Asia. At present the total annual imports have a value of \$352,500,000 and the exports are placed at \$387,280,000. Great Britain continues to have the largest share of the trade. Other countries that participate to a great extent in its foreign commerce include Germany, France, the United States, Belgium, Egypt, and Japan. Calcutta on the east and Bombay on the west are the two principal ports of foreign trade, and both have commodious and safe harbors. Extensive harbors have been completed recently at Rangoon and Madras. The exports consist chiefly of rice, cotton, coffee, opium, indigo, jute, tea, leather, wool, wheat, drugs, silks, and gunny bags. Formerly considerable raw material was imported, but at present the imports consist chiefly of manufactured products. Manufactured cotton has been imported for many years and still continues to be an important item. Other imports embrace woolens, sugar, iron and steel manufactures, farming utensils, machinery, and railway supplies. A very large majority of the articles represented in the foreign trade are carried by vessels under the flags of Great Britain, Germany, and Austria-Hungary.

**GOVERNMENT.** In 1858 the Parliament of England declared the king of that country to be the sovereign of India, and in 1876 the queen was proclaimed its empress. The government is administered by the Secretary of State for India, who is a member of the British Cabinet. He has the assistance of an undersecretary and a council of fifteen members. The executive functions are vested in a Viceroy, or Governor General, who is appointed by the crown for a term of six years, and his residence is at Calcutta. He is under the control of the Secretary of State for India, is assisted by a council of five members, and has general jurisdiction of foreign affairs. This council, of which he is a

member, is increased by sixteen additional members chosen by the Viceroy, some of whom are natives. In this body is vested the power to make all laws of British India, but certain restrictions are placed upon it. For local government India is separated into a number of presidencies and states, each under the control of a single executive officer, such as a governor or commissioner. The provinces are divided into districts for purposes of local administration, and each district is under the direct charge of a deputy commissioner. The British government at Calcutta has direct political control of three-fifths of the area in India, this portion being included in fourteen local governments and administrations, and the remaining two-fifths comprise feudatory states under native rulers. It is the policy of the British government to permit the native inhabitants, as far as possible, to have the responsibility of local government. This is true in a large measure of the local courts, but the courts of appeal are in the hands of Europeans. The courts of appeal are located at Calcutta, Madras, Bombay, and Allahábád, the judges being appointed by the home government, but supreme judicial power is exercised by the privy council in England, which is the court of last resort. The army of India proper consists of 210,000 men, including that of the feudatory states, about 350,000, and the officers are almost exclusively Europeans.

**EDUCATION.** About three-fourths of the inhabitants descended from the tribe known as Arya, from whom the term Aryan is obtained, and these people are generally known as Hindus. The language of this class is spoken by a large majority, but the dialects differ materially. This fact, and the circumstance that caste exercises a wide influence, has made it difficult to promote a system of education modeled after that of Europe and America. Instruction is given in the native languages, though English is included in the advanced courses. The school-attendance is about 6,500,000, though the males in attendance greatly exceed the females. Many schools and institutes are maintained by foreign missionary societies, all of which have an influence for the betterment of social, religious, and educational conditions. Numerous colleges and high schools are maintained throughout India and there are five universities of note, including those in Bombay, Calcutta, Madras, Allahábád, and the Punjab. The present system places special stress upon higher education, but much is done by the government to further instruction in the trades and in agriculture. As a rule the state schools reach the middle classes, while those conducted

by the missionaries are attended principally by those belonging to the lower castes.

Many forms of religious worship are conducted and the creeds professed are very numerous. However, Brahmanism is the faith of a great majority of the people, being professed by over 200,000,000 of the inhabitants. Mohammedanism has been extending since its introduction in the 11th century, the number of adherents throughout India being placed at 62,625,000. The inhabitants of Burma are largely Buddhists, who include about 9,500,000 adherents in India. Those who worship nature are placed at 8,500,000, while the Sikh religion is professed by 2,000,000, and the adherents to Jainism number 1,050,000. The Christians embrace 3,125,000 souls. The denominations represented by the largest numbers include the Roman Catholics, Anglicans, Baptists, Syrians, Lutherans, Methodists, Presbyterians, and Congregationalists.

**INHABITANTS.** India is densely populated and contains nearly one-fifth of the population of the world. It has about 190 inhabitants to the square mile, as against about 26 in the United States and 283 in China. The valley of the Ganges contains about two-fifths of the entire population, and the greatest density is in the province of Bengal. A small number of inhabitants speak European languages, such as English, German, and French, but these are confined to the cities and to those who hold official positions. The native dialects include principally the Bengali, spoken by about 45,000,000, and the Hindi, which is the vernacular of about 87,500,000 people. The languages or dialects are numerous, but they belong chiefly to the Indo-Germanic group of tongues, which in different forms are common to about 215,000,000 people. English is spoken by about 240,000 of the inhabitants.

Calcutta, in the province of Bengal, is the capital and largest city. Twenty-two cities, in 1906, had a population of more than 130,000. These included, in the order of size, Calcutta, Bombay, Madras, Hyderábád, Lucknow, Rangoon, Benares, Delhi, Lahore, Cawnpore, Agra, Ahmedábád, Mandalay, Allahábád, Amritsar, Jaipur, Bangalore, Howrah, Poona, Patna, Bareilly, and Nágpur. The population of India has increased steadily the past several decades. In 1891 it was 287,314,691; in 1901, 294,360,356; in 1906, 301,054,108.

**HISTORY.** The history of India begins with legends and sketches from Sanskrit literature. The first authentic facts come to us from about the year 2000 B. C., when the original inhabitants were subdued by the Aryans, a people of

much advancement in civilization and industrial arts, who inhabited the regions in the northwestern part of India. In 518 B. C. a Persian army under Darius invaded India, and in 327 Alexander the Great led an expedition to the Indus. Buddhism was established in the 3d century B. C., but it yielded almost entirely to Brahmanism in the several succeeding centuries. The Moham-medans invaded India in 711 A. D., and in 1001 the entire country was occupied by them, under Mahmud of Ghazni. Powerful invasions occurred under Genghis Khan in the 13th century, and under Timour, or Tamerlane, in the 15th century. In 1525 the Mogul Empire was established by Sultan Baber. From 1556 to 1607 Akbar, a grandson of Baber, reigned successfully and extended the boundaries so as to include almost the entire peninsula in his dominion, his government being the most important and powerful under the Indian sovereigns. After his death the empire became divided and Europeans began to manifest an interest in the riches of India. Travelers, traders, and missionaries of various European nations frequented the country in the beginning of the 16th century. The first of these to secure a foothold were the Portuguese, who established fortresses and trading posts on the Malabar coast, and soon after obtained control of the ports of Persia, India, and the adjacent islands.

The Dutch established a foothold in India in 1595 and carried on important trade relations with interior river points. In 1613 the British East India Company formed a settlement at Surat and later obtained territory at Madras and Calcutta. The French founded settlements about the same time, giving rise to conflicting claims, and in 1746 a war occurred in which the French won Madras, but later restored it by the Treaty of Aix-la-Chapelle. The Deccan and Carnatic were under the influence of the French governor, Dupleix, at Pondicherry in 1751, and soon a second war resulted, after which Carnatic fell into the hands of the British, and in 1757 Clive won Bengal by a victory over the Moguls at the Battle of Plassey. Charters were granted to a company soon after, which were renewed successively, and at each renewal more control became vested in the home government. In 1838 an effort to establish a British protectorate over Afghanistan failed. The Sepoy mutiny occurred in 1857, in which British residents at Cawnpore and other localities were massacred. However, Queen Victoria had already assumed the government of the principal territories of India in 1855, giving the British decided advantage in the occupation of many strategic points. The mutiny was finally sup-

pressed in 1858, after which vast internal improvements in canal and railroad building were carried forward. In 1877 Victoria assumed the title of Empress of India. Wars with Afghanistan and Upper Burma occurred in 1878 and in 1884, and the latter was annexed in 1886.

The boundary between India and Afghanistan was surveyed under the supervision of the home government, which was practically determined upon by the Durand Treaty of 1893. In the same year the Earl of Elgin became Viceroy, in whose administration much was done to improve the condition of the natives. A region lying in the basin of the Chitral River, known as Bashgal, was taken from the sphere of British influence and annexed to Afghanistan in 1895. Two years later a serious outbreak occurred on the Afghan frontier, in which the British were victorious after several decisive engagements. Several million people were affected by the severe famine of 1899, which was attended by local revolts against the government. In the same year Lord Curzon of Kedleston became Viceroy, gold was established as the monetary standard, and several regiments were sent to assist the British in the war in South Africa.

Complications arose in 1903 between England and Russia on account of the affairs in Tibet, which both countries determined to protect as neutral territory. The British government sent an expedition under Colonel Younghusband into the country as a means of protecting certain commercial rights, which had been denied by the grand lama, but that official fled when the expedition took Lhasa after some severe fighting. Though Russia objected to the proceedings, the English government announced that its policy was to maintain the commercial rights of India and not to annex Tibet. Gilbert John Elliot, who held the position of Governor General of Canada from 1898 to 1904, was made Viceroy of India in 1905.

**INDIA INK**, the name of a kind of black ink originally made in China and Japan, but so named because it became known to Europeans from its manufacture in India. It is a true black ink, having no tinge of some other hue, and is indelible. Soot or lampblack is used in its manufacture by the Chinese, who mix with it glue or size and a little camphor. Another variety is made from the dried pigment of certain cuttlefishes, which is browned by the action of an alkali and is known as *sepia*. The Chinese use India ink for writing and painting. In America and Europe it is employed in pen and ink drawing. The depth of the shade can be reg-

ulated by the amount of water used in mixing the ink.

**INDIANA** (in-dī-ān'ā), an east central State of the United States, popularly called the *Hoo-sier State*. It is bounded on the north by Michigan and Lake Michigan, east by Ohio,

INDIANA.

1, Indianapolis; 2, Fort Wayne; 3, Evansville; 4, South Bend; 5, Terre Haute; 6, New Albany; 7, Michigan City. Dotted lines indicate chief railroads. Heavy line shows Wabash and Erie Canal.

**DESCRIPTION.** The surface is an undulating plain, sloping toward the southwest. Along the Ohio River is the lowest land, being 300 feet above the level of the sea in the southwest corner. The northwestern part has an elevation of 500 to 650 feet, and in the northeastern section the elevation attains a height of 1,200 feet. Sandy hills extend along the shore of Lake Michigan, which are interspersed more or less with swamps, and the counties bordering on the Ohio have a broken and hilly surface. Several large marshes abound in the sandy region of the north, some of which assume the form of shallow lakes, and these are characterized by a growth of rushes, slough grasses, and evergreen trees. Much of the surface is a fertile, rolling prairie. Several large caverns occur in the south central part, especially in Crawford County, where is located the celebrated Wyndotte Cave.

Among the principal rivers are the Wabash, White, and Kankakee, all of which belong to the Mississippi system. In the northern part is the Saint Joseph River, which flows into Lake

Michigan, and the northeastern section is drained by the Maumee into Lake Erie. However, the larger part of the State is drained by the Wabash, which receives the inflow from the Eel, Salamonina, Tippecanoe, Wild Cat, and Mississinewa rivers before reaching the western border, and about fifty miles from its confluence with the Ohio it receives the White River. English Lake, Turkey Lake, and Tippecanoe Lake, all in the northern part of the State, are the largest bodies of water. It has a length of 275 miles from north to south and the greatest breadth is 145 miles. The area is 36,350 square miles, which includes 440 square miles of water surface.

Michigan, and the northeastern section is drained by the Maumee into Lake Erie. However, the larger part of the State is drained by the Wabash, which receives the inflow from the Eel, Salamonina, Tippecanoe, Wild Cat, and Mississinewa rivers before reaching the western border, and about fifty miles from its confluence with the Ohio it receives the White River. English Lake, Turkey Lake, and Tippecanoe Lake, all in the northern part of the State, are the largest bodies of water.

**CLIMATE.** The climate is very similar to that of Ohio and Illinois. In the southern part the mean temperature is considerably warmer than that of the northern section. The mean annual temperature of the State is about 62°, with extremes ranging from 22° below zero in winter to 95° above in summer. Cold winds blow across the lake and noticeably affect the climate in the winter. Vegetation appears in April and early frosts occur in September. All parts of the State have an abundance of rainfall, which is somewhat heavier in the south than in the north, and the average is about 42 inches. Heavy snows fall in the winter, usually affording from one to three months of sleighing.

**MINING.** The coal fields are estimated at 6,500 square miles, located chiefly in the western and southwestern part. In quality the product takes rank as a good grade of bituminous coal, being similar to that of Illinois, and it is used and shipped largely for heating purposes. In 1908 the output was about 12,500,000 tons. Petroleum is a valuable product and is found extensively in the Lima district, which includes the counties of Adams, Blackford, Grant, Jay, and Wells. The State has a natural gas field of about 2,550 square miles, located chiefly in the central part, and a large quantity is transported by pipe line to Whiting and other manufacturing points near Chicago. Limestone and sandstone quarries are worked extensively and a grade of rock known as Bedford limestone, which is exported in large quantities, is classed among the best known building material in America. Marls used in manufacturing cement and brick and fire clays are abundant.

**AGRICULTURE.** The soil generally is fertile and well adapted to the production of agricultural products. Most of the rivers and smaller streams are skirted by valuable belts of timber, and forests of greater or less extent are found in different regions of the State, but a large area formerly well timbered is utilized in farming. About 95 per cent. of the tillable land is cultivated. The farming is conducted on progressive methods, involving careful cultivation and fertilization. Much of the surface formerly

wet and marshy has been redeemed by drainage. Corn is the chief cereal and the acreage planted is nearly equal to that cultivated in both wheat and hay. It holds a high rank among the leading corn and wheat growing states, both in the quality of the product and in the yield per acre. Other products include oats, potatoes, rye, and vegetables. Fruit is grown in all parts of the State, but the best quality of quinces, pears, and peaches thrive in the southern section. Vast interests are vested in the live-stock industry. Horses, cattle, and swine receive an equal share of interest, and mules and poultry are grown profitably. There has been a decrease in the number of sheep, but the interests in dairying have grown steadily with every decade.

**TRANSPORTATION.** Michigan City is the only port on Lake Michigan, and through it communication is maintained by steamship navigation with the leading cities of the Great Lakes. The Ohio River is navigable the entire distance along the southern border, and the Wabash furnishes communication for small boats. Transportation facilities are provided by the Wabash and Erie Canal and the Whitewater Canal. The National Road, though not important at present, formerly constituted a highway of much value. Few states are as well provided with steam and electric railways as Indiana. It has a total steam railway mileage of 6,750 miles. The railroads crossing the State include lines of the great systems that connect Chicago with the commercial centers of the east and south, hence they furnish direct connection with New York, Philadelphia, and Saint Louis. Indianapolis, located in the center of the State, is the focus of many railways and is noted as a jobbing and manufacturing center.

**MANUFACTURING.** Since the State has a large supply of coal and natural gas, in addition to being located conveniently to the coal fields of Illinois and Ohio, it is highly favored in facilities to manufacture. In addition must be considered its favorable situation for transportation, giving it points of vantage rarely excelled. Steel and iron take high rank among the manufactured products. The quality and quantity of its glass products have opened a market in many countries of Europe. Terre Haute is a center of distilling interests. Many of the cities are noted for their output of flour and meal. Gary, East Chicago, Hammond, and Whiting are among the manufacturing centers located near Chicago, and their growth in various enterprises, such as the manufacture of machinery, books, packed meats, and steel and iron products, give evidence of constant and health-

ful growth. Other manufactures include paper, railway cars, furniture, clothing, textiles, carriages and wagons, and butter and cheese.

**GOVERNMENT.** The government is organized under a constitution which was ratified by the people in 1851. It vests the chief executive power in the Governor and the Lieutenant Governor, who are elected for a term of four years. Other State officers include the treasurer, secretary, auditor, attorney-general, and superintendent of public instruction, each elected for two years. The General Assembly consists of a senate and a house of representatives. In the former are 50 members elected by districts for four years, while the latter has 100 members elected for two years. Annual meetings are held by the Legislature and all revenue bills must originate in the house, but amendments may be proposed by the senate. Circuit courts, an appellate court and the supreme court comprise the judicial system. Superior courts may be established in the large cities. Justices of the peace are elected in the townships. Local government is vested in the towns, cities, and counties.

**EDUCATION.** Indiana has an efficient system of public instruction, which is maintained under the supervision of a state superintendent, who is assisted by county and city superintendents. The township is the smallest unit in the educational system and is under the direct management of a trustee, who is elected by the voters of the townships, while the county superintendent is chosen by the school trustees of the entire county. Adequate and well articulated courses of study are maintained, hence the instruction is in a systematic order from the lower schools to the higher institutions. Indiana University, situated at Bloomington, is the highest institution in the system of the State. A large proportion of the teachers have received training in normal schools and colleges. The state normal school, with an attendance of about 2,000 students, is located at Terre Haute. Other institutions of higher learning include the Northern Indiana Normal School, Valparaiso; the Tri-State Normal, Angola; the Eastern Indiana Normal University, Muncie; the Rochester Normal University, Rochester; the Concordia College, Fort Wayne; the De Pauw University, Greencastle; the Earlham College, Richmond; the Butler College, Irvington; the University of Notre Dame, Notre Dame; and the Indianapolis University, Indianapolis.

An efficiently managed system of correctional and charitable institutions is maintained by the State, some of the institutions being supported partly by the county, and other benevolent insti-

tutions are maintained by private interests. Knightstown has a soldiers' orphans' home, Lafayette has a soldiers' home, Jeffersonville has a reformatory, Michigan City has a penitentiary, and Indianapolis has a school for the deaf, dumb, and blind. Hospitals for the insane are located at Evansville, Indianapolis, Logansport, and Richmond. The public institutions maintained for charitable and reformatory purposes are generally under the control of non-partisan boards. Indianapolis is noted for its efficiently managed system of public schools.

**INHABITANTS.** The population is made up largely of native-born inhabitants and a large number who settled in the State from Virginia, Kentucky, and South Carolina. About half of the foreign born are Germans. Indianapolis is the capital and largest city. Other cities include Evansville, Fort Wayne, Terre Haute, South Bend, New Albany, Lafayette, Logansport, Richmond, Michigan City, Elkhart, and Jeffersonville. In 1900 the total population was 2,516,462. This included 57,960 colored inhabitants, of whom 223 were Indians and 57,505 were Negroes. Population, 1910, 2,700,876.

**HISTORY.** The territory comprised within the present limits of Indiana was first visited by white men in 1679. La Salle crossed the State the following year, when he visited the Illinois Indians. The first settlement was made at Vincennes, on the Wabash River, in 1702 by the French under La Salle. It was a part of New France until 1763, when it became a possession of England. The United States acquired it in 1783, having been conquered under George Rogers Clark and a number of frontiersmen during the Revolution. In 1800 the Territory of Indiana was separated from Ohio; Michigan Territory was cut off in 1805; Illinois Territory, in 1809; and what remained was admitted as a State in 1816. Indian wars occurred at various times, but the success of General Harrison at Tippecanoe in 1811 terminated the more important contests. The center of population of the United States was calculated by the census of 1890 at a point southwest of Greensburg, the county seat of Decatur County, twenty miles east of Columbus. Ten years later, in 1900, the center of population in the United States was in southern Indiana, about six miles southeast of Columbus, the county seat of Bartholomew County. Its growth in wealth and population has been uninterrupted from its admission into the union.

**INDIANAPOLIS** (in-dī-an-ăp'ô-lis), the capital and largest city of Indiana, county seat of Marion County, 182 miles southeast of Chicago, Ill. It is located on the White River, in

the center of the State, on the Pennsylvania, the Monon, the Big Four, the Lake Erie and Western, and other railroads. The surrounding country is rich in agricultural resources and in its vicinity are productive coal fields. Though an inland city, it is the seat of a large commerce. A belt railway encircles the city, by which it is possible to handle a large volume of freight with facility. The street railway system includes 140 miles of tracks, and with it are connected numerous interurban electric lines that furnish transportation facilities with other centers of commerce. Near the principal business section is a handsome union depot, into which the railway passenger trains enter.

Indianapolis is noted for its beautiful streets, which are regularly platted and substantially paved. From a circular plaza in the center of the city, called Monument Place, radiate the four principal avenues. Georgia, Market, Maryland, and Washington are the most important business streets. Many of the thoroughfares are beautiful on account of fine lawns and imposing residences, and all are amply lighted by gas and electricity. Delaware, Meridian, and Pennsylvania are especially noted as residential streets. The parks include 1,250 acres. Riverside Park, extending along the White River, Woodruff Place, and Military, Garfield, University, and Saint Clair parks are among the most noted public grounds. Many fine monuments and statues ornament the public places. The Soldiers' and Sailors' Monument, designed by Bruno Schmitz of Berlin, was erected in Monument Place to commemorate the Union veterans of the Civil War. In the capitol grounds is a monument of Thomas A. Hendricks and University Park has a statue of Schuyler Colfax. Among the statues are those of William Henry Harrison, Oliver Perry Morton, and George Rogers, and a fine memorial has been erected to the memory of Benjamin Harrison. The cemeteries include Greenlawn, Crown Hill, and those maintained by the Lutheran, Roman Catholic, Jewish, and other denominations.

Indianapolis is noted as a center of learning. The public school system has a national reputation for its carefully articulated courses of study, which range from the kindergarten through the grades to the high school, and are designed to prepare for college and university work. It is the seat of the University of Indianapolis, which has an academic department known as Butler College, and maintains departments of dentistry, medicine, and law. Other institutions of learning include the State institutions for the education of the blind and of the deaf and dumb, a

Roman Catholic seminary, United Brethren College, and several schools of law and medicine. It is the seat of numerous charitable and reformatory institutions. The principal buildings include the city hall, the county courthouse, the public library, the Commercial Club, the Columbia Club, the post office, the Claypool Hotel, and numerous office buildings. All of the leading Christian denominations have fine churches. The State capitol, erected at a cost of \$2,125,000, occupies two large blocks and is a fine specimen of modern architecture.

The city has large interests in various manufactures and other enterprises. It has many grain elevators and extensive stock yards. The chief manufactures include cotton and woolen goods, pianos, sewing machines, furniture, railroad cars, flour, drugs, terra cotta, and milling machinery. It is an extensive market for grain, fruit, and merchandise, and has a large jobbing and wholesale trade that extends far beyond the borders of the State. The first settlement on its site was made in 1819. Two years later it became known as the village of Indianapolis. It was made the capital of the State in 1825, when the seat of government was removed from Corydon. Its growth as a commercial center dates from 1847, in which year it was connected by a railway with the Ohio River at Madison. Natural gas was piped to the city in 1889 and introduced in manufacturing enterprises. In population it takes rank as the twenty-first city of the United States. Population, 1910, 233,650.

**INDIAN ARCHIPELAGO.** See **Malay Archipelago.**

**INDIANA UNIVERSITY,** a coeducational institution of learning at Bloomington, Ind., founded in 1820 as Indiana Seminary. It was chartered as a State institution in 1838, since which time it has been a part of the public school system. The departments include those of law, philosophy, medicine, engineering, and collegiate work. A biological station is maintained at Winona Lake. Degrees of bachelor of law, bachelor of arts, master of arts, and doctor of philosophy are conferred. It has a library of 60,000 volumes, a faculty of about 100 and endowments amounting to \$650,000. The attendance is about 1,700 students.

**INDIAN CORN.** See **Corn.**

**INDIAN MALLOW,** or **Stamp Weed,** a plant of the mallow family, found native in many parts of Asia. It has been naturalized in Canada and the United States, and is troublesome as a weed in the cultivated lands of the Mississippi Valley and elsewhere. The leaves are heart-shaped, the flowers are orange-yellow colored, and the stem grows to a height of three

to four feet. It is difficult to destroy by cultivating with machines, hence it becomes obnoxious in corn fields during the principal part of the growing season.

**INDIAN OCEAN,** the third in size of the five great oceans. It lies south of Asia, west of the Sunda isles and Australia, north of the Antarctic Ocean, and east of Africa. A line drawn from the southern extremity of Tasmania to the Cape of Good Hope is its southern boundary, from which it gradually narrows toward the north. India divides it into the Bay of Bengal and the Arabian Sea, and from the latter the Persian Gulf and the Red Sea branch toward the northwest. Its length from north to south is about 6,500 miles, and the breadth is from 4,000 to 6,000 miles. The Equator passes through it, along which the equatorial current flows from east to west. Its navigation is influenced by periodic monsoons and trade winds. The principal rivers flowing into it include the Limpopo and Zambezi from Africa; the Ganges, Indus, Tigris, Euphrates, and Irrawaddy from Asia; and the Ashburton, Gascoire, and Murchison from Australia. Ceylon and Madagascar are the only large islands, though there are many small islands and several important groups of islets. Its depth is greatest near the coast of Asia, southeast of Java, where soundings to a depth of 20,340 feet have been made. The greatest depth in the Arabian Sea is 15,000 feet and in the Bay of Bengal it is about 13,500 feet. Its depth near the southeastern coast of Africa ranges from 7,500 to 12,000 feet.

**INDIANOLA** (in-dī-an-ō'la), a city of Iowa, county seat of Warren County, eighteen miles south of Des Moines, on the Chicago, Burlington and Quincy and the Chicago, Rock Island and Pacific railroads. It is surrounded by a fertile agricultural and coal-mining region. The principal buildings include a courthouse, a public library, and several fine schools and churches. It is the seat of Simpson College, a Methodist Episcopal institution founded in 1867. Population, 1905, 3,396.

**INDIAN RESERVATIONS,** the tracts of land set apart for the Indians by treaty or by executive orders. It was long the policy of the government of the United States to reserve certain tracts of land for the Indians, from which white trespassers were excluded, and the Indians themselves could not pass beyond the limits except for necessary purposes or by special permission. This system of reserving lands had its origin in the difficulty of keeping peace in the frontier territory. After being defeated in war, the Indians usually agreed to a treaty of peace that bound them to retire to a

certain reservation, where they could live by themselves and under the peaceful protection of the government. In some cases the tribes agreed to accept the value of a part of their possessions in money, hence released it and confined their residence to a smaller area. Reservations of the latter class were usually made by an act of Congress, while the former were set apart by an executive order under the approval of the Senate. The largest reservation at present is that of the Navajo Indians in Arizona, which embraces 9,500,000 acres. Several reservations in South Dakota cover an area nearly as large. The total number of reservations in the United States at present is about 140. An agent or superintendent has charge of the affairs of a reservation and is responsible to the commissioner of Indian affairs who is under the direction of the Secretary of the Interior. Citizenship is not extended to Indians on reservations, but they may settle on other lands and thus become entitled to the privileges of a citizen. Many Indians have lost their racial characteristics and are now regarded as white citizens, but purely Indian citizens in the United States who are entitled to vote exceed 20,000.

**INDIAN RIVER**, a tidal inlet of Florida, located in Brevard and Volusia counties, extending along the east coast of the State. It is about ninety miles long and communicates with the Atlantic Ocean at Indian Inlet. The width varies from several hundred feet to three miles, but it is shallow and can be navigated only by boats drawing not more than five feet. Several resorts for invalids and sportsmen are located on its banks.

**INDIANS**, American, the collective name applied to the people found in America when it was discovered by Columbus. The name origi-

INDIAN CHIEF.

inated from the incorrect idea that the continent is a part of India, and that these people were only a portion of the great population of Southern Asia. However, they generally called themselves *Onkwé Honwé*, meaning men. More recently they came to be called the *American* or *Red* race.

**INDIAN POPULATION.** The most trustworthy early writers place the number of Indians east of the Mississippi River at the time America was discovered at 200,000. Aside from this we

have no reliable data, but it is generally assumed that the Indian population of both North and South America was fully 12,000,000. California alone, at the time of the gold discovery, had an estimated Indian population of 200,000. At present Alaska has 29,536; British America, 100,000; and the United States, 266,760, or a total of less than 400,000.

**DISTRIBUTION.** The distribution of the Indians at an early period depended upon the existence of forests and game. They lived in tribes and clans. All were members of one great family, but they ranged from the rudest savages to the cultivated Aztecs of Mexico and the Peruvians of South America. In the extreme north were the Eskimos, who still occupy the northern part of the British possessions. Those formerly dwelling in the vast regions south of the Eskimos have been widely diversified by intermarriage and scattered from the regions they formerly occupied. The tribes occupying the northeastern portion of the United States were classed either with the Algonquin or Iroquois races. Those in the northwest, extending far into Canada, were classed as Siouan Indians, while in the southern regions were the Mobilians and the Natchez. The Aztecs occupied large portions of Mexico and Central America, but in these regions were also the Otomis, Maya, and Quiches Indians. The Peruvians of South America were advanced in civilized arts quite as much as the Aztecs, and included the Inca and the Aymaras races. In Chile were the Araucanians; on the Atlantic slope, the Guaranis; and on the northern coast, the Caribs, who also occupied most of the West Indian islands. In the extreme south lived the tall Patagonians.

**INDIAN WARS.** The Algonquins and Iroquois included many branches, but these two great families were continually at war with each other for supremacy, and later offered formidable resistance to the onward march of the Europeans. At intervals they made incursions toward the West, where they were met by the warriors of the many affiliated tribes of the Sioux Indians, who were often at war with each other when not in conflict with their more powerful rivals of the East. The English first engaged in hostilities with the Indians in Virginia in 1622, and these were followed by engagements in New England in 1637. The Indian wars waged between 1790 and 1795 against the Miami Confederation in Ohio were the most destructive of human life, but General Wayne dealt a crushing defeat to them in 1793. The success of General Harrison at Tippecanoe, in 1811, checked them materially, but in the following year the Indians became allied with the British, and were again

CHIEF STANDING BEAR.

defeated by Harrison in 1813 at the Thames, when Tecumseh was killed. General Jackson in the same year conducted operations against the Creeks in the south and defeated them at Talladega and the Horse Shoe Bend of the Tallapoosa River. He likewise defeated the Seminoles in Georgia and Alabama in 1817, and on the same expedition executed two Englishmen, Arbuthnot and Ambrister, after conviction by court-martial on a charge of inciting the Indians to cause disturbances. The last battle with the Indians taking rank as a severe contest occurred on the Little Big Horn River, near the Black Hills, in 1876, when General Custer was slain.

**GOVERNMENT AND INDUSTRIES.** Government among the Indians was loosely administered, and, though confederations were formed among the tribes, they were not of long duration. Their occupations were principally hunting and fishing. They dwelt largely in tents and other perishable buildings, but some, as the Pueblos, built of stone or adobe, or constructed *kivas*, or public rooms, underground. Some tribes developed skill in the culture of corn, beans, and tobacco, and the more highly civilized of Mexico and Peru were considerably advanced in civilized arts. They built dwellings and cities; constructed aqueducts, canals, and highways; had a recognized system of government and a fixed form of worship; and left to future generations massive pyramids and innumerable mummies. The manufactures of the Indians in the region now occupied by the United States and Southern Canada included bows, arrowheads, pottery, snowshoes, stone pipes, canoes, baskets, and other articles useful to them in domestic life and in the arts of war. Their dress was largely of the skin of animals, and their food consisted of vegetables and a few cereals, but principally of the wild game which was then very abundant. They had few domestic animals aside from the dog, but became very fond of horses, which they first obtained from the Spaniards.

**RELIGION AND CHARACTERISTICS.** In religion the Indians held that there is a future life and that the spirit after the death of the body enjoys the happy hunting grounds. It was commonly believed that a spirit animates every living plant and animal. While many of the tribes believed that virtue and bravery constitute essentials to welfare in this life, they did not make a distinction as to the influence that the conduct in the present life might have in attaining to happiness beyond. The name *Red* race originated from the reddish tint observable in their complexion, which varies from almost white to dark brown. In nearly all Indians the hair is

long and straight, usually black, but sometimes brownish. The eyebrows are heavy, the beard is scant, the eyes are sleepy and dull, the lips are compressed, and the face is broad. Some ethnologists think they descended from the Mongolian race, while others regard them a mixture of the Polynesian and Caucasian with the Mongolian. From the tradition of their tribes it is learned that they themselves thought that they emigrated from some region, but know not from whence. The sun worship of the Incas and Aztecs has been taken to indicate some connection with early Asiatic peoples, while the Eskimos of North America are quite identical with those of Siberia.

**POLICY OF THE GOVERNMENT.** The policy of the government in Canada and the United States

for many years has been to make citizens of the Indians by giving them every possible encouragement in educational facilities, landed possessions, and financial support. It has been the aim from an early date to make them self-supporting. Indian Territory was set apart for this purpose by the United States with

INDIAN IMPLEMENTS.

A, Tomahawk; B, Head dress; C, Stone implements; D, Quiver and bow case.

the view of inducing them to found homes and give them greater opportunities in educational and industrial advancement. When that region was annexed to Oklahoma, in 1906, this policy was continued. However, the larger number of Indians are on reservations, both in Canada and the United States, and each country maintains a Department of Indian Affairs. The Indians in territory of the United States are located principally as follows: Oklahoma, 64,455; Alaska, 29,536; Arizona, 26,480; Michigan, 6,354; South Dakota, 20,225; Minnesota, 9,182; California, 15,377; Montana, 11,343; Mississippi, 2,203; Oklahoma, 11,945; North Dakota, 6,968; New Mexico, 13,144; New York, 5,257; Nevada, 5,216; Oregon, 4,951; Kansas, 2,130; Nebraska, 3,322; Idaho, 4,226; Utah, 2,623; North Caro-

lina, 5,707; Wisconsin, 8,372; Washington, 10,039; and Wyoming, 1,686.

Many of the tribes do not look with favor upon an intermingling with the whites, but others take readily to education and intermarry extensively. Some of the Indians have attained to much educational advancement and have become famous as scholars and educators. Large numbers attend the higher institutions of learning, where they make an honorable record. Besides taking up farming and other industries, they engage in the practice of medicine and law, the publication of newspapers, and the various arts and trades. Under certain conditions the Indians are admitted to full citizenship, when they may hold office under the government, exercise the right of suffrage, and have all privileges and benefits accorded to other citizens. The condition under which these privileges are extended is that they stipulate with the government to waive all claims to public support.

**INDIAN SUMMER**, the name of a season of warm and pleasant weather that occurs late in the fall, usually in October or November, and is confined chiefly to the northern part of the United States and the southern part of Canada. Usually it occurs but once in a season, though sometimes it may be noticeable two or three times. It is distinguished by a dry and somewhat hazy atmosphere. A similar season in England is known as All Hallow Summer or Saint Martin's Summer, and in Germany it is called Saint Luke's Summer and Old Woman's Summer. The name Indian Summer is supposed to have been derived from predictions of fair weather made by the native Indians while in conversation with the early settlers in America.

**INDIAN TERRITORY**, a former territory of the United States, located south of Kansas and west of Missouri and Arkansas. It was set apart in 1834 for Indian reservations, but was united with Oklahoma in 1906, which was admitted as a State the following year. The Creeks, Choctaws, Cherokees, and Chickasaws settled in this region in 1834. Later the Seminoles and other tribes received reservations. The name *Five Civilized Nations* was applied to those mentioned, and the others were distributed on seven reservations within the region. See **Oklahoma**.

**INDIA RUBBER**, or **Caoutchouc**, a soft, flexible, and very elastic substance derived from the milky sap of various tropical plants. It is a composition formed chiefly of carbon and hydrogen. Many species of shrubs and trees produce gummy products that have commercial value. The principal tree yielding juices from which India rubber is manufactured is tall and pos-

sesses an abundance of the fluid. The juice is secured by making incisions in the trunks of the trees, under which receptacles are placed. From ten to twenty-five gallons of the juice are obtained from a single tree in a season, and about two pounds of good rubber is secured from a gallon. The rubber is obtained in a crude form by evaporating the juice in the sun, or in tanks placed over a fire. It may also be coagulated by mixing with it sap from the bejuco vine. The raw material is purified by boiling and subsequently by pressing through powerful machines, after which it is rolled into plates and dried.

The India rubber of commerce is produced largely in Mexico, Central America, South America, Java, Singapore, Assam, Penang, and the Congo basin of Africa. In 1823 Mackintosh patented a water-proofing process by which India rubber came largely into use. At present its applications are innumerable. It is now rarely employed in a pure state, but is vulcanized by heating the pure rubber with sulphur. In this way it is hardened and serves many useful purposes, such as for belting, shoes, hose, tires, cloth, combs, bracelets, furniture, paper knives, water packing, life preservers, paving, gas bags, and gloves. The harder products, such as buttons, inkstands, rulers, canes, and artificial teeth, are secured from rubber which is vulcanized under an application of sulphur exposed to a high temperature. In making covering for telegraph wires it is vulcanized with asphalt, sulphur, and oils.

**INDIGIRKA** (ĕn-dyĕ-gĕr'kà), a large river of Eastern Siberia, rises in the Stanovoi Mountains, and after a course of 900 miles flows into the Arctic Ocean. It enters the sea through a large delta about 450 miles east of the mouth of the Lena. The region traversed by it consists largely of frozen marshes, and the inhabitants support themselves chiefly by the chase.

**INDIGO** (in'dĭ-gŏ), a vegetable dyestuff that yields a beautiful and very durable blue dye. It is employed extensively in forming a basis for black dye in woolen goods, for dyeing, and for calico printing. The product is obtained from numerous plants of a shrubby and herbaceous character which thrive in equatorial regions. These plants belong to the order of *Leguminosae*, of which the *Indigofera tinctoria* is a genus. The plants are from two to six feet tall, have rounded leaves, and bear blue, purple, or white pea-shaped flowers. Ordinarily they are classed with the bean family. They are cut at the time of blooming, which occurs when the plants are about three months old. The seeds are sown early in the spring and the cutting

takes place in midsummer. After several months a second crop shoots up, and in some localities a third. The indigo market of Southern Asia centers largely at Bengal, whence large quantities are exported to the ports of Europe and America. The plants which yield indigo are now grown extensively in warmer parts of Europe, Africa, and America, especially in Central America. Only from fifty to sixty per cent. of the indigo of commerce is pure indigo blue, and the other portion consists of indigo yellow,

INDIGO PLANT.

A, Fruit.

indigo gluten, indigo red, or some allied substances. From history it is learned that indigo has been produced in India from remote times. It was imported from that country by the Phoenicians, Grecians, and Romans.

**INDIGO BIRD**, a North American finch, native to the southern part of the United States, Mexico, and Central America. In the summer time it comes north as far as Missouri, where it is captured and domesticated as a cage bird. It is about six inches long. The general color is greenish-blue, but the wing feathers are brown, and it is black beneath the bill. It nests in the tallest trees and is noted for its beautiful song. The female is somewhat smaller than the male and has a yellowish-brown body with the wings several shades darker. From three to four eggs of a pale bluish-white, without spots, are laid early in the spring.

**INDIUM** (in'dī-ŭm), a metal found in various zinc minerals, in some galenas from Italy, and in the flue dust of the furnaces in which zinc ores are treated. Reich and Richter discovered this metallic element in 1863 with the aid of the spectroscope, while analyzing specimens

of zinc blende obtained from Freiburg. In a pure state the metal has a bluish-silvery luster, and in softness and ductility it resembles lead. It is slightly volatile, has a very low fusion point, and tarnishes slowly in air. See **Chemistry**.

**INDO CHINA** (in'dō chī'nà), a name frequently applied to the larger part of the southeastern peninsula of Asia, which is situated between the Bay of Bengal on the west and the gulfs of Siam and Tonquin and the China Sea on the east. The area is estimated at 363,422 square miles. It includes Anam, Laos, Cambodia, French or Lower Cochin China, and Tonquin. The name is sometimes applied to the entire peninsula, in which sense it includes Burmah. This region contains natural resources of much commercial value and has been developed under a colonial policy fostered largely by France. Railroad construction, canals for navigation and irrigation, telegraph and telephone lines, and municipal facilities have received aid from the French government. The exports and imports are alike extensive. Among the chief imports are machinery, woolen goods, cotton products, and various manufactured articles. The exports embrace principally rice, rawhides, pepper, volatile oil, copra, cocoa, and many species of fruits. Mining has developed in copper, coal, tin, iron, and zinc. It has productive fields of gas and mineral oils. The region is well watered by the Menam and Mekong rivers and their tributaries, which furnish extensive navigation facilities and supply water for the irrigation canals. Stock raising and lumbering are important industries. The governor general of the French possessions is resident at Hanoi, which is the chief seat of political influence, and in the separate divisions are local and subordinate governors.

**INDO-EUROPEAN** (in-dō-ŭ-rō-pē'an), **Indo-Germanic**, or **Aryan**, the names applied to the most important of the groups of languages into which human speech has been classified. It is subdivided into numerous branches, of which the Germanic or Teutonic is the most important, which includes the German, English, Dutch, Scandinavian, and extinct Gothic. Other branches are the Slavonic, including the Russian, Polish, and Bohemian; the Latin or Italic; the Celtic, which embraces the Breton, Irish, Welsh, and Gaelic; the Lithuanian; the Greek; the Persian; the Armenian; and the Sanskrit. The oldest literature is included in the Sanskrit and is found among the Hindus. All these branches of the Indo-European language descended from a parent or ancestral tongue which prevailed at a remote period in Central Asia, and spread

through succeeding centuries into India and westward through Asia to the western extremities of Europe. Searching study has demonstrated that there is a similarity in construction and meaning sufficient to warrant a classification through succeeding ages, tracing the tongues to a common source.

**INDRA** (in'drā), a diety of the Hindus, worshiped as the supreme god throughout the Vedic period. He lost his supremacy by the rise of Brahma, Siva, and Vishnu, and is now assigned a subordinate place in the Pantheon. In paintings and sculpture he is represented with numerous eyes and four arms and is seated on an elephant. His powers include the control of rain and shade, the hurling of thunderbolts, and the restoring of the sun to the sky. He has also been assigned a supervisory influence of Swarga, a paradise in which pious men and inferior deities dwell in eternal felicity. Indra is interesting to the student of history for the important connections given him in the literature and legends of the Hindu peoples.

**INDUCTION** (in-dük'shün), a term in logic which implies the process of reasoning by which we proceed from the particular to the general. It is used in contradistinction to deduction, a process of reasoning from the general to the particular. In following the inductive method we not only arrive at conclusions of generals, but rise into higher generalities. It involves the process of proceeding from the known to the unknown, and obtaining a conclusion broader and deeper than the premises. In other words, induction is the process by which we conclude that what is true of certain individuals of a class is true of the whole class, and what is true in certain times will be true at all times. The impossibility of observing all particulars makes it necessary to reason inductively with much care, lest the conclusion be erroneous. The basis of induction is the established fact that nature is uniform, and by observing in detail every material fact the conclusion arrived at must be true.

**INDUCTION**, in electrical science, a term used to describe the action by which an uncharged body will exhibit electrical forces when it is brought near an electrified one. An insulated conductor charged either positively or negatively so acts on bodies in a natural state placed near it as to decompose the neutral fluid, attracting the opposite kind of electricity and repelling the same kind. Heinrich D. Ruhmkorff (1803-1877), a German inventor, produced an instrument called the *induction coil* (q. v.), by which induced currents of great electro-motive force are secured in a long secondary coil by means of rapidly making and breaking the cur-

rent of electricity in a primary short coil of wire. The principle of induction is illustrated in the Leyden jar, in which mutual induction takes place between the two coatings, one being charged positively and the other negatively.

**INDUCTION COIL**, or **Ruhmkorff Coil**, an instrument used for the purpose of getting induced electric currents of high potential difference. Michael Faraday was the first to state the fundamental fact of electro-magnetic induction, which he did in a paper read before the Royal Society of London in 1831. The form in use at present is that of Ruhmkorff, who devised a superior method of winding the coil. The essential parts are a soft iron core, a primary coil of insulated wire connected with a battery, a secondary coil of fine insulated wire, a brake arrangement to work automatically between the battery and the primary coil, a condenser connected with the primary circuit on each side of the break-point, and a switch to make and break the current. When the induction coil is attached to the battery and the switch is turned on, the current passes through the primary and the iron core is acted upon as a magnet. The soft iron armature, which it attached to a vertical spring, is attracted and breaks the current at C, but when this is done the core ceases to be a magnet, hence the armature is thrown back by the spring, and the movement of coming in contact and being released is repeated from time to time in rapid succession. A strong potentiality is secured in the induced current through the length of the secondary coil and the fineness of the wire. When the binding posts of A and B, which are at the opposite ends of the coil, are brought near each other, a spark passes between them. Peculiar physiological effects are obtained by taking hold of the terminals in a small secondary coil, but the effect of a large coil is quite painful. Induction coils are used in telephones, in telegraphy, and in medical laboratories.

**INDUCTIVE METHOD.** See **Deductive Method.**

**INDULGENCE** (in-dül'jens), a partial or total remission of the temporal punishment which still remains due to sin after its guilt is forgiven, or has been remitted by penance. It is a point of doctrine in the Roman Catholic church that without indulgence the offender must undergo temporal punishment here or in purgatory. An indulgence cannot be granted for an unforgiven sin, or as a permit to sin in the future, but it can be gained only after the sin has been remitted by repentance. A partial indulgence is granted for a specified length of time, while a total indulgence is a remission of the en-

tire temporal punishment. These indulgences are never absolutely gratuitous, but can be obtained only by those who are in full communion with the church and have resorted to the sacrament of penance, which, after due contrition and confession, is alone sufficient for the remission of the penalty of sin. In the Middle Ages indulgences were granted to those who made pilgrimages, gave alms, or engaged in holy war, and later they were extended for fighting against heretics. The thesis of Luther published in 1517 were directed against the selling of indulgences. In 1563 the Council of Trent reaffirmed the belief that the church has power to grant them, but laid down the principle that indulgences are to be granted gratis.

**INDUS** (in'dūs), an important river in the northwestern part of India. It rises in Tibet, on the north side of the Himalaya Mountains, flows northwest, thence makes a bold curve and assumes a course toward the southwest. The length is 1,800 miles. It has a basin of 375,000 square miles, and the delta extends about 130 miles along the coast of the Arabian Sea. Its source is 18,000 feet above the sea, on account of which the flow is rapid in many portions of its course. The Indus is valuable as a highway of commerce and vessels enter safely by a number of the mouths of the delta. Among the tributaries are the Gartok, which enters it before it passes the Himalayas, the Shayok, the Sutley, the Chenab, and the Kabul. It is navigable to its confluence with the Kabul, about 900 miles from the sea. Many edible fish, waterfowl, and crocodiles are abundant. The valley of the Indus is famed for its fertility.

**INDUSTRIAL SCHOOL** (in-dūs'trī-əl), an institution devoted to the dissemination of knowledge in the industrial arts, such as agriculture, mining, dairying, horticulture, etc. Many institutions of this character are supported either jointly by the national and state governments, or by either of them separately. Another class of these schools is maintained as private institutions, in which these arts are combined in courses with other branches of learning. In many the instruction is coextensive to both sexes. The term is likewise extended to many reformatory institutions established under state supervision in which youthful offenders of law and vagrant children are confined for correctional purposes. They aim to teach the arts of industry along with the elements of an education. Many governments support industrial schools of this character for both sexes in different localities. The schools in which industrial and mechanical arts are taught as regular branches of study are abundant in European countries, those of Aus-

tria, Germany, Denmark, France, and Russia taking the highest rank.

**INERTIA** (in-ēr'shī-à), the incapability of matter to change its state, whether that be one of motion or of rest. From this follows the two laws: That a body at rest continues at rest forever unless acted upon by some force; and that a body in motion continues in motion forever unless some counteractive force, like that of gravity, acts upon it. The resistance which, especially at first, a body at rest gives to a force operating to move it, is called the *power of inertia*. Newton established the idea that inertia can be measured and that it is a fundamental property of matter.

**INFANT**, in law, a person who is too young to bind himself by what he says, or in a contract. In the law of England and America the term is applied to all persons who have not attained their majority, which is reached at the age of 21 years. Females reach their majority in some states and countries at the age of 18 years. In general the term minor is applied to a male who is under 21 and to a female under 18 years of age. Contracts made by infants are not binding, except for necessities essential to their life and health, and for the purpose of providing for their wants they are subject to their parents or guardians. Though infants may be punished for criminal offenses, the penalty inflicted varies somewhat in degree and kind from that imposed upon adults. The father is the natural guardian of his children until they are 21 years of age, and in case of his death or inability, in some states, this power becomes vested in the mother. An infant cannot contract marriage, except with the consent of the parents or guardians.

**INFANTRY** (in'fan-trÿ), the portion of a military system which is armed and equipped for marching and fighting on foot. It constitutes the largest organization of the military forces of all countries and comprises the most powerful branch of an army, but modern warfare has somewhat changed the importance and effective fighting force of the infantry. Formerly the infantry moved upon the enemy in the form of a solid phalanx, sometimes from ten to twelve files deep, but the rapid-fire guns of modern times throw bullets with sufficient force to penetrate several ranks, hence rapid movement and great perfection in discipline is required. The infantryman of Greece was equipped with helmet, shield, and breastplate, and the fighting was done at close range with swords, battle-axes, or javelins. At present firing usually begins at about 600 yards, but this depends upon position and the character of the arms used.

From fifteen to twenty miles per day is the average distance marched by infantry. The loss of life in the infantry is ordinarily about three times as great as that either in the cavalry or the artillery. In the Franco-German War, which may be taken as a reasonable basis, the percentage of loss in the German infantry was, 17.6; in the artillery, 6.5; and in the cavalry, 6.3.

**INFINITE** (in'fī-nīt), an unlimited or boundless quantity in space or time. The term is used in mathematics to designate a sum greater than any assignable quantity of the same kind. It is employed in music to designate certain forms, sometimes called *perpetual fugues*, which are so constructed that the performance may be incessantly repeated, their ends leading to their beginnings. The term *infinite* is used as opposed to *finite*, the former being boundless and immeasurably great, while the latter is limited in degree, capacity, or quantity. An *infinitesimal* quantity, although immeasurably small, is greater than zero.

**INFLECTION** (in-flĕk'shŭn), the term used in grammar to designate the variation of the terminations of nouns and pronouns in declension, verbs in conjugation, and adjectives and adverbs in comparison. The agglutinative languages, as the Turkish and the Hungarian, combine many of the root words, while in the highly inflectional tongues, as the German and Old English, the endings of many words are inflected. In modern English the analytic form has encroached upon the inflectional. However, many philologists have raised the question whether this marks an advance in the expression of ideas.

**INFLORESCENCE** (in-flō-rĕs'sĕns), the arrangement of flowers upon a branch or stem. When the axis in a flower cluster terminates with a flower, the inflorescence is said to be definite; otherwise it is designated as indefinite, indeterminate, centripetal, acropetal, or botryose.

**INFLUENZA** (in-flŭ-ĕn'zà), or **Grippe**, a contagious and often epidemic catarrhal inflammation of the mucous membrane of the air passages. The early symptoms are similar to those in a cold. It is accompanied by frontal headache, sleepless nights, loss of appetite, discharge from the nose, and feverishness. The affection is not usually fatal, but unless care is exercised it sometimes becomes complicated with bronchitis or pneumonia. Under good care the patient recovers in from four to eight days. In certain seasons and localities it is especially prolific in its spread, and often assumes larger proportions than any other disorder. Epidemic influenza is usually designated *la grippe*.

**INFUSORIA** (in-fŭ-sō'rĭ-à), the name of certain microscopic animals, regarded the highest or most specialized class of protozoans. Formerly the name was applied to many kinds of microscopic organisms common to organic infusions, but some of these later became known as forms of vegetable matter. They occur in both fresh and salt water. Several species are parasites on other animals, in which they are sometimes the cause of disease. They are reproduced by division, by budding, and by spore formation.

**INGERSOLL** (in'gĕr-sŭl), a town of Ontario, in Oxford County, nineteen miles northeast of London. It is located on the Thames River and the Grand Trunk Railway, and is surrounded by a productive farming country. The manufactures include cheese, machinery, woolen goods, and farming implements. It has a well-organized public school system, electric lighting, and a number of fine church buildings. Population, 1901, 4,572.

**INHERITANCE TAX** (in-hĕr'it-āns), an assessment on the property passing from a deceased person to his heirs or legatees. The Romans imposed a tax of this kind before the advent of the Christian era, and it has been the source of considerable revenue in the countries of Europe for many centuries. Since the time of Gladstone such taxes are known as *death duties* in England, and this term is applied in many of the British colonies where such assessments are made, especially in Australia and New Zealand. The United States government imposed an inheritance tax during the Civil War, but subsequently it was repealed. However, inheritance taxes are imposed by a number of the states, though in some instances they apply only where the property inherited does not pass to direct heirs. In most cases the rate is progressive, graduated on a percentage basis according to the amount inherited and the degree of relationship. Some of the states exempt the smaller estates entirely, extending the free limit in most cases from \$500 to \$5,000.

**INIA** (in'ī-à), the name of a mammal classed with the dolphin family, of which only one species is known. The body is seven to nine feet in length, and the color is usually pink mixed somewhat with black. It is found in the lakes of Peru and the Amazon and its tributaries. This animal is remarkable in that it resembles a mammal found in the Ganges, and because it is common to waters located a long distance from the sea.

**INITIATIVE** (in-īsh'ī-à-tĭv). See **Referendum**.

**INJUNCTION**, in law, an order issued by

a court to restrain one or more persons or corporations from doing some act which they threaten to commit, or to continue the prosecution of some act which is already in progress. An injunction is likewise issued to restore certain rights to a plaintiff. The Romans originated the injunction, but their process, which was somewhat different, was known as an *interdict*. Now these writs are designated as *preventive*, when they are issued to restrain, and *mandatory*, when they operate to restore rights. A *temporary* or *preliminary* injunction is issued to restrain only until the defendant may answer, after which, if good cause is shown, it may be made *perpetual*. Those who disobey an injunction are guilty of contempt of court and may be fined or imprisoned. The term *government by injunction* originated from the employment of the injunctions in restraining interested parties from interfering in strikes and other labor troubles.

**INK**, a liquid used for writing or printing, the different classes being known as writing, printing, marking, and copying inks. *Writing ink* consists either of finely divided colored precipitates held in suspension in a liquid by means of gum, or of colored liquids. The inks used by the peoples of ancient times were made with especial care to insure blackness and durability, two qualities in which they surpassed most inks of modern manufacture. Black inks contain as ingredients sulphate of iron, gum arabic, and gallotannic taken from gallnuts. Gallnuts also contain pectose, by which gallotannic acid is converted into gallic acid when it is exposed to the air. Durability and blackness in inks are secured by utilizing iron salt with an infusion of gum and gallnuts, and exposing the compound to the air for some time. The addition of carbolic acid, essential oils, crushed cloves, or corrosive sublimate prevents ink from becoming moldy.

*Copying ink* differs from the ordinary writing ink in being thicker and in drying less quickly. It is prepared by the addition of a little sugar or glycerin to ordinary black ink. *Marking ink* is made of a solution of silver nitrate colored by lampblack and thickened by gum, but some kinds are colored with sap green. *Printing ink* is much thicker than writing ink. It is made by boiling linseed oil and mixing with it lampblack or other pigments, and sometimes soap and rosin are added to give it the proper consistency. Colored inks contain various solutions of coloring matter, such as cochineal and Brazil wood for red and Prussian blue for blue. In printing ink lead chromate is used for yellow, vermilion for red, and ultramarine for blue. The ink used in lithographing is variously composed of lamp-

black, Paris black with shellac, virgin wax, dry white soap, and tallow or lard. Various kinds of *sympathetic ink* are used in secret correspondence. They leave no trace of color upon the paper, but exposure to heat causes chemical action by which the characters become legible. Substances used for that purpose include lemon juice, solutions of cobalt, and dilute sulphuric acid.

**INKERMAN** (ĩnk-ēr-mán'), a town in the government of Taurida, Russia, situated at the eastern extremity of Sebastopol harbor. It is celebrated on account of a battle that occurred on Nov. 5, 1854, between the Russian army and the allied French and English forces. The Russians led an attack early in the morning under cover of darkness, but were defeated by the allies. On the battlefield is a monument to commemorate the event.

**INNOCENTS' DAY**, a day set apart to commemorate the massacre of the children at Bethlehem, who are called the Holy Innocents and considered as the earliest martyrs in the Christian cause. It is sometimes called Childermas and Feast of Holy Innocents, and is celebrated on Dec. 28th by the Roman Catholic and Anglican churches. The Greek church observes this day on Dec. 29th.

**INNSBRUCK** (ĩns'pröök), a city in Austria, capital of Tyrol, situated on the Inn River. Its site has an elevation of 1,875 feet above sea level and near it are ranges of mountains from 7,500 to 8,600 feet high. It is well connected by several trunk railroads and electric railway lines. The manufactures include silks, machinery, woolen and cotton goods, ribbons, and gloves. It has considerable trade in merchandise, live stock, and fruits. Its important buildings include a celebrated university founded in 1677, the Franciscan Church, containing an elaborate monument to Maximilian I., a number of monasteries, and an imperial palace. The university has 98 instructors, 1,150 students, and a library of 100,000 volumes. A famous monument of Walther von der Vogelweide stands in a public place. The streets are handsomely improved, being well paved and drained, and are ornamented by many statues and beautiful parks. Population, 1906, 28,065.

**INNS OF CHANCERY**, the name of certain buildings in London, England. They were erected as places of residence and study for law students, and formerly were subordinate to the Inns of Courts. Several are still maintained as societies, but now have no public function, and are occupied mainly by solicitors. The principal buildings of this class at present are Clifford's Inn and Furnivall's.

**INNS OF COURTS**, the four sets of buildings in London, England, that belong to the legal societies in which is vested the exclusive right of admitting persons to practice at the bar. These four buildings are known as Lincoln's Inn, the Inner Temple, Gray's Inn, and the Middle Temple, and they belong to the four legal societies of the same name. They had their origin about the end of the 13th century, and as early as the Middle Ages became famous as schools of law. The members consist of students, barristers, and benchers. Each inn is self-governing under a committee or board of the benchers, who are usually senior council or king's council. This governing board is self-perpetuated. It has the right to admit to the bar, disbar from practice, and reject a candidate without stating its reasons for refusal. One of the benchers is elected annually as treasurer, and this election qualifies him to be the presiding or chief officer. The term *barrister* is applied to all those members who are at least 21 years of age, and who have been called to the bar by the benchers of the inn of which they were students.

**INOCULATION** (in-ök-ŭ-lā'shŭn), the art of communicating the virus of a particular disease to the system through the skin, or otherwise. Its purpose is to produce a mild form of some contagion and thereby protect the human body against contracting a highly dangerous form of the disease. Emanuel Timoni, a Greek physician, wrote a letter from Constantinople in 1713 favorable to inoculation, but it was not firmly established as a safeguard against smallpox until 1798, when it was introduced by Dr. Jenner. Inoculation is efficient only in diseases which attack the body but once, such as smallpox and measles. A mild form of the disease is experienced by the person artificially inoculated and this protects him against the contagion, but the disease in a dangerous form may be communicated to others.

**INQUISITION** (in-kwĭ-zĭsh'ŭn), a court or tribunal established by the sanction of the Roman Catholic Church in various countries for the purpose of examining and punishing heretics. This tribunal was suggested by Saint Dominic, but was not founded until in the pontificate of Gregory IX., when a synod at Toulouse, in 1229, resolved upon it, and it became formally established in 1233. The plan instituted carried with it the appointment of a priest and several laymen in every parish for the purpose of bringing heretics before the bishops. Soon after the power of trial was delegated to the Dominicans, and the tribunal became known as the Holy Office or the Holy Inquisition. The practice continued for several centuries, torture being applied in

some cases to extract evidence, but in 1560 the power of tribunal courts was transferred to the bishop. The Inquisition was introduced into Italy, France, and other countries, but attained the most widespread influence in Spain. In that country were large numbers of Mohammedans and Jews, who professed Christianity for the sake of shelter from persecution, but continued the practice of their religious rites and even sought converts to their respective faiths.

In 1481 the Inquisition was established at Seville under formal sanction of Ferdinand and Isabella. Two Dominicans were made the first judges. Later it extended to other towns, where it was popular among the clergy and lower orders, but was opposed by the middle classes and the nobles. Fully 2,000 persons were held by the Inquisition the first two years and burned alive. In 1571 it was introduced into Mexico and Peru. Napoleon I. suppressed it in 1808, and it was likewise abolished by the Spanish Cortes in 1813, but was reestablished in 1814 and again abolished in 1820. The decree of Napoleon in 1808 against the Inquisition abolished it in Italy, but Pius VII. restored it to Rome in 1814.

The Inquisition never became established in England. When Conrad of Marburg made an attempt, in the 13th century, to establish the Inquisition in Germany, he was assassinated, and it never gained a firm foothold there. Juan Antonio Llorante (1756-1823), a Spanish historian, estimates that the victims of the Spanish Inquisition, in the period of 481 to 1808, numbered 341,021 persons, of whom 32,000 were burned alive and 17,659 were burned in effigy. In 1848, when the dungeons of the Inquisition were opened in Rome, a powerful sentiment was created throughout Europe against the institution and the Papacy, causing the practice to decline. However, Archbishop Spalding and other creditable authorities assert that it is difficult to prove an instance of death for heresy at Rome. The Inquisition is now known as the Congregation of the Holy Office, under which the press censorship has been supervised for some time. The purpose is to suppress so-called heretical literature.

**INSANE ASYLUM** (in-sān' ä-sĭ'lŭm), an institution established for the care and treatment of the insane. The monasteries were the retreats of those who suffered with unsoundness of the mind in an early period of the Christian era, and out of these grew the bedlams, or bethlehems, formerly common to England. In many countries the insane were greatly neglected. They were imprisoned, tormented, and even executed as criminals. A more humane view was

taken as civilization advanced, and they came to be looked upon as specially unfortunate or stricken for some mortal sin by the Divine. However, asylums for the insane are strictly modern institutions, and they may be said to date from the early part of the 19th century. They are maintained chiefly as institutions belonging to the state or province, and are open to all who are adjudged insane after due examination by a competent committee or commission. In some instances the afflicted are kept at the state asylum until they are cured or until it becomes established that they are incurable, and in the latter case they may be turned over to the authorities in the county from which they were sent, when they are placed as incurable inmates in a county hospital. The treatment of the insane is conducted on a humane basis, at the expense of the state, and a large number of cures are reported every year.

**INSANITY** (in-săn'ĩ-tŷ), a general term applied to disorders of the intellect, or unsoundness of the mind. The nervous textures are primarily involved in this disease. Since the mind manifests itself by the brain, a restoration of the perverted functions of the brain by appropriate treatment of its structures is necessary to effect a cure. Many terms are employed by medical writers to designate the different phases of insanity, but the most common are idiocy, mania, dementia, melancholia, cretinism, and aberration. *Idiocy* is a congenital or an acquired defect of the mental faculties, and prevails as a total want or partial defect of the understanding. Malformation of the cranium or brain is a common origin of congenital idiocy, while a disease of the brain, mechanical injury to the brain, or excessive sensual indulgences may result in acquired idiocy. *Mania* is a form of furious insanity resulting from disorder of one or more of the faculties, and is generally accompanied by frenzy and blind impulses.

*Dementia* differs from idiocy in being curable. It is a gradual weakening of the mental powers, such as loss of memory, confusion of thoughts, weak-mindedness, and loss of volition. *Melancholia* is characterized by a depression of the spirits, brooding over mournful ideas, and grieving about a real or apparent loss. This form is brought on by failure in matters of business, love, religion, and personal ambitions, and not infrequently results in suicide. *Cretinism* is a form of idiocy and is associated with a bodily malformation. *Aberration* is a form of mental eccentricity. It is manifested in rambling thoughts and by error in perception, and is due largely to an abnormal state of the perceptive faculties.

Institutions for the care and treatment of the insane are maintained by provincial or general governments in all civilized nations. Marked strides of advancement have been made in these institutions, though insanity is apparently on the increase. It is of interest to note that the excessive use of tobacco at an immature age and the intemperate use of alcoholic drinks, opium, and morphine are prolific causes, and that during the time of financial panics the per cent. of insane cases, like suicide, are most numerous. Insanity is an excuse in law for the commission of acts which, in others would be crimes, for the reason that an insane person has no intention. It likewise deprives a person from entering into any valid contract.

**INSECTICIDE** (in-sĕk'tĩ-sĩd), a preparation used for destroying insects. The insecticides are in many cases similar to the *fungicides*, which are used for destroying fungi. Agencies to destroy insects are especially valuable in horticulture, since otherwise the plants are defoliated and the fruit is injured. Various devices and methods are employed for this purpose, but the application of poisonous substances through the spray pump or some similar device is in most common use. However, they must be applied with much care, else the person engaged in the work may become poisoned, or the application may be made at a time when the fruit itself will be injured or rendered unwholesome. The best time to spray the plants is when the insects or fungi make their first appearance. All parts of the plant should be carefully sprayed, which usually requires a ladder, especially where the application is to be made to bushes and trees. Plants should not be sprayed while they are in blossom, especially those from which the fruit is to be used.

The successful application of insecticides depends upon the insect coming in contact with the poison, or in absorbing a part of it while feeding upon the sap or leaves of the plant. A good solution for spraying consists of adding one pound of slaked lime to twenty gallons of water, to which two ounces of Paris green is added before mixing. An arsenite of lime obtained in the manufacture of aniline dyes, known as London purple, is used in the same way as Paris green, but it is somewhat more caustic on the foliage. Sucking insects can be destroyed by an emulsion of kerosene. It may be prepared by dissolving a pound of hard soap in a gallon of hot water, to which a gallon of kerosene is added and thoroughly mixed. This may be diluted by twenty gallons of water, if a strong solution is wanted, and about twice that amount may be added for a weak solution. Scale insects and

bark lice common to fruit trees may be destroyed by using a lye wash. The principal fungicides are made of sulphur, copper carbonate, and copper sulphate.

**INSECTIVORA** (in-sĕk-tiv'ō-rā), an order of placental mammals, including about 250 species, none of which is large in size. They are so named because they subsist largely on insects, although many are not exclusively insectivorous. Nearly all of the animals belonging to this order are timid and nocturnal in their habits, and they serve the useful purpose in nature of counteracting an undue increase of worms and insects. The molar teeth are fitted to break the coverings of insects, the legs are short, and most species step squarely on the soles of their feet. This order of mammals includes the mole, hedgehog, and shrew.

**INSECTS**, a group of arthropods known as the class *Insecta* or *Hexapoda*. They comprise the most numerous class of animals, of which

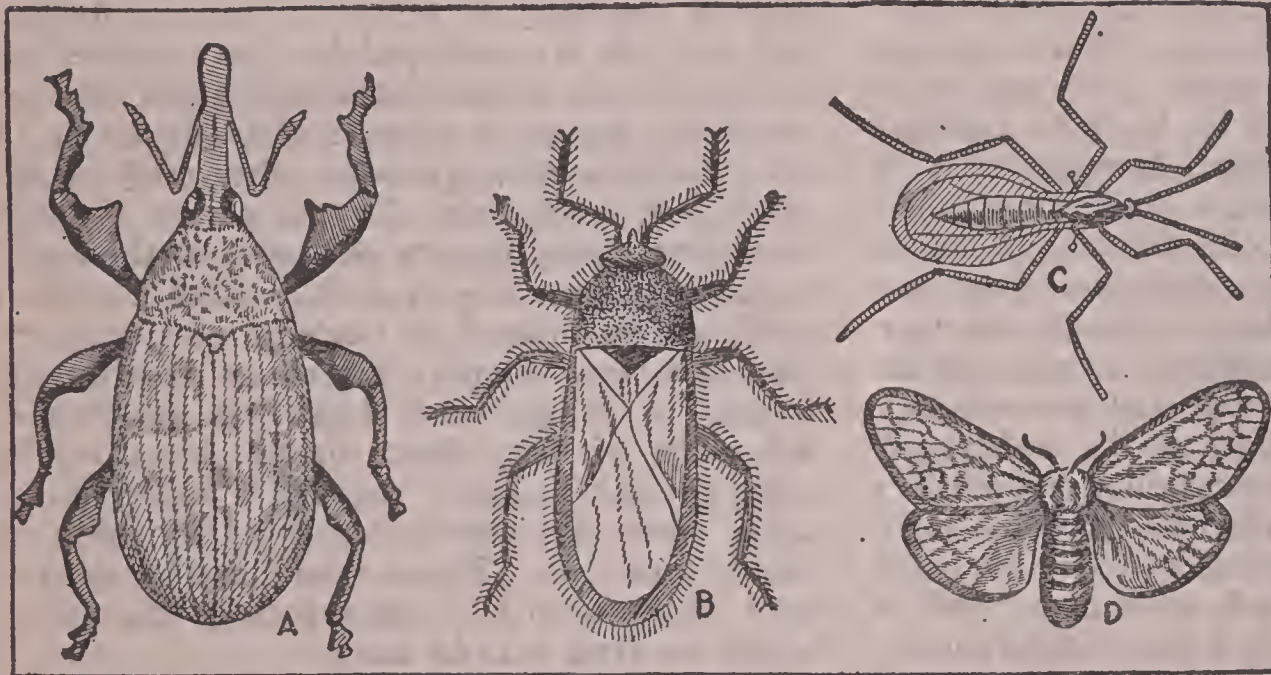

the thorax, have from six to nine joints, and are designed to move with facility, enabling the insect to walk, run, swim, and in a few cases to facilitate flight. Two pairs of wings are present in most species, though in some one or the other of the pairs may be wanting. Two antennae or feelers facilitate movement, or rather aid in guarding against danger, while the eyes are in pairs, but usually compound. The respiration is by air tubes or trachea, which extend through every part of the body.

The typical insect has thirteen segments, one of which constitutes the head, three the thorax, and nine the abdomen. The mouth is of two forms, masticatory and suctorial; the former is typified in the beetles and the latter in butterflies and mosquitoes. The organ of circulation is called the dorsal vessel and consists of a contractile organism with circulatory functions. The alimentary canal is constituted of a gullet, crop, gizzard, stomach, and intestine, and terminates in

a cloaca. A series of ganglia make up the nervous system. Most insects are oviparous, the sexes are in different individuals, and the reproduction is sexual, but in some species nonsexual reproduction occurs.

Most species of insects have a more or less horny skin, and all pass through three stages of development. These phases of life include that of caterpillar, larva, or grub; that of the chrysalis or pupa;

and that of the perfect winged insect or imago. The life of an insect depends somewhat upon climate and season, though the larval state is of longest duration, and that of the perfect insect is the shortest. Some species die immediately after laying their eggs, others live the remainder of the season, and some endure a number of years, as in the case of the queen bee, whose life sometimes extends to a period of five years. Most insects have ample means of protection, though this exists principally in their ability to fly rapidly, and some protect themselves by defensive organs, as in the case of hornets and bees. It is thought that there are fully a half million species of insects, but about 200,000 are known, and these are more or less confined to particular regions. Thus,

A, Cotton Boll Weevil; B, Chinch Bug; C, Hessian Fly; D, Cotton Boll Moth.

the typical species have their bodies divided into three parts—the head, the thorax, and the abdomen. Formerly centipedes and spiders, and some other animal forms, were enumerated with the insects, but now only animals having three pairs of legs are classed as insects. However, a perfect classification has not been established. Linnaeus classified the insects into the seven groups known as the *Coleoptera*, or the beetles; the *Diptera*, or the two-winged insects; the *Hymenoptera*, or gauze-winged insects; the *Lepidoptera*, or the moths and butterflies; the *Hemiptera*, or stinging and sucking insects; the *Orthoptera*, such as the grasshoppers and cockroaches; and the *Neuroptera*, or those having membranous wings and mouth organs fitted for chewing. The legs of insects are all affixed to

the insects of China differ from those of Europe, and those of North America are noticeably different from the species which are common to other grand divisions. However, some of the species are widely diffused, of which the painted lady butterfly is a noted example.

Many species of insects are cumbersome pests to man. Some display great hostility and almost constitute a barrier to his success in some portions of the earth, yet they are a very necessary and useful part of nature. Among the helpful purposes they serve are that they fertilize plants, furnish food for birds, beasts, and reptiles, and consume much of the decaying matters that would otherwise render the climate of some regions extremely unhealthful. They pervade nature everywhere. Some burrow in the ground, bore in trees, live under and above water, or thrive on and in plants. Many species subsist in other insects or larger forms of life as parasitic animal forms.

Among the most useful insects is the bee, which furnishes honey and in some countries produces beebread for the support of human life. Silkworms yield material for clothing, and their culture is a vast industry in many countries. The common wood ant is used extensively in Europe for the manufacture of vinegar, and in France as a valuable material in producing flavoring. In some countries the locusts, though destructive to vegetation, constitute a valuable food for man and animals. The cochineal insects supply a valuable coloring matter, while even the grub is a useful article of food in the West Indies. The bee furnishes wax, the blister beetle supplies useful irritant juices, and others serve like economic purposes.

Among the insects which are most injurious to man may be named the Hessian fly, potato bug, chinch bug, army worm, cotton boll weevil, cotton boll moth, and grasshopper, all of which attack growing crops. The moths, lice, fleas, bedbugs, mosquitoes, flies, ants, and others invade the home, if proper precaution is not taken. Though generally pestiferous, the mosquito is a source of much good in that it is utilized in Central Africa for the manufacture of a form of cakes and serves a wise purpose in devouring decaying substances. While insects inhabit practically all parts of the world, they are much more abundant in tropical climates, where they live longer and attain to larger forms than in the colder zones. Among the noted persons who have written extensively on insects and made valuable discoveries are Aristotle, Humboldt, Linnaeus, Cuvier, Marcello Malpighi (1628-1694), Haeckel, and Pasteur. In America, as

in Europe, many experimental stations are maintained in connection with colleges of agriculture for the purpose of investigating the uses of insects and the agencies that operate to destroy them. Besides, it is aimed to discover new species which are still unknown in their ravages, such as the minute forms in France which for years destroyed the grape industry. However, these and many others have been successfully counteracted by the application of destructive agencies. Among the substances used against insect pests are Paris green, London purple, sulphur, hellebore, kerosene, soaps, tobacco, lime, naphthalene, and arsenate of lead.

**INSESSORES** (in-sēs-sō'rēz), a name applied by many writers to a large order of birds, which includes the perchers. The order embraces all those that live habitually among trees, excluding only the climbing birds and the birds of prey. Their feet are adapted to walking and perching. They possess much contriving ingenuity in building their nests. The order of insectivores embraces all the more noted and beautiful birds of song.

**INSOMNIA** (in-sōm'nī-à), or **Sleeplessness**, a condition due to some emotional disorder, such as exhaustion, worry, or excitement. It is treated by removing the cause, if it can be ascertained, and by applying hygienic measures. Although in practice it is customary to resort to drugs, ventilation, careful dieting, massage, and hot baths are the best curative agents.

**INSPIRATION** (in-spī-rā'shūn), in theology, the influence exercised upon the human mind by the Holy Spirit, through the influence of which the understanding is widened and all the mental faculties are quickened. It is in this sense that the term inspiration is used in regard to the Scriptures, which are held to be the writings of men who were inspired by the divine mind to reveal and communicate to man what is essential for his salvation. However, the degree and extent as well as the mode of inspiration are subjects of dispute.

**INSTINCT** (in'stīnkt), a natural impulse by which animals are directed without reasoning toward the actions that are essential to their existence, preservation, and development. The theories advanced regarding animal instinct include at least three. These are that each species is endowed by the Creator with various faculties and impulses; that the instincts have resulted from consecutive repetition, and these have been transmitted by inheritance to subsequent generations; and that they arise from unknown causes, though the more complex are modified through natural selection and the simpler actions

of an instinctive nature. In some animal forms the instincts are developed to a high state of perfection, as is the case in bees, by which they are enabled to construct cells with a perfection that would tax quite highly the reasoning powers of man, and he would be able to secure equal results only by the application of the higher mathematics. Darwin thought that animals in the past as now have varied in mental qualities, and that those variations are inherited. He likewise thought that by natural selection the instincts of many animals have been developed to a higher degree.

**INSTITUTE** (in'stī-tūt), a scientific body or society established under certain rules for the promotion of some particular object, as a literary or philosophical association. The term is applied in France to the principal society of its kind in the world, which was formed in 1795 by the union of the four principal royal academies—the Académie des Belles-Lettres et Inscription, Académie Française, Académie Royale des Sciences, and Académie Royale d'Architecture. Since 1848 it has been known officially as the Institut National de France, but English writers usually term it the Institute of France. At present this great institution embraces five distinct divisions, each of which represents a particular field of knowledge. The divisions are Académie Française, Académie des Beaux-Arts, Académie des Sciences, Académie des Inscriptions et Belles-Lettres, and Académie des Sciences Morales et Politiques. In each division is a distinct organization, but all are closely affiliated, and the control of the finances of each academy is under a distinct board. Membership is for life, with a salary of 1,500 francs. To become a member of this celebrated organization is a worthy ambition of every Frenchman of educational advancement.

**INSTITUTIONAL CHURCH** (in-stī-tū'-shūn-əl), the name given to a form of organization in a church or society to distinguish it from the so-called ritualistic church. In the former it is made an objective point to secure the general development of the individual, a line of training that involves mental, physical, and moral elevation through personal activity, while in the ritualistic church the belief, sacraments, and forms of worship are emphasized. The movement to demand activity and apparent results in the improvement of both the outward and inward life of the members has gained much ground in England and America since 1840. Though the new function originated about 1840, it may be said that a recognized movement did not begin until fifty years later, and an impetus was added by the extension of university

settlements, evangelistic efforts, and the Salvation Army, and through these agencies many were reached that could scarcely be brought into contact with Christian influences by the use of other recognized lines of church work. Besides calling upon the members for personal work along religious lines, the institutional church required activity in social, educational, and physical effort. To promote these lines extensively, it is made an objective point to establish libraries, gymnasiums, employment bureaus, hospitals, night and day classes, and lecture courses, in all of which the Christian work is made an important feature. In 1894 the Open and Institutional Church League was organized in New York City. It is supported by a number of prominent so-called institutional churches, including the Berkeley Temple, Boston; People's Palace, Jersey City; Pilgrim Church, Cleveland; People's Church, Saint Paul; Plymouth Church, Indianapolis; Judson Memorial, New York; the Tabernacle, Denver; All Souls' Church, Chicago; and People's College, Detroit.

**INSTRUMENTAL MUSIC** (in-strū-iněn'-təl), the music which is produced by instruments, as distinguished from singing or vocal music. Purely instrumental music was known in ancient Greece, and it is said that the flute was played publicly at the Pythian games. However, the art of arranging the part of a composition for the orchestra, which is known as *instrumentation*, is of comparatively recent origin. Johann Sebastian Bach is properly regarded the originator of modern instrumentation, and his masterpieces are unrivaled even at the present time. Proficiency in instrumentation, which is also called *orchestration*, requires a thorough knowledge of music and of musical instruments, since some instruments sound chords in a manner to produce exquisite harmony, which, when sounded by others, result in discordant strains. Beethoven, Haydn, Mozart, Schubert, Wagner, and Weber are among the celebrated masters of orchestration.

**INSULATOR** (in'stū-lā-tēr), a body or substance which offers great resistance to the passage of electricity. A body that carries the charge readily is called a *conductor*, while one which carries it with difficulty is termed an *insulator*. Wire is a good example of the former, though it is not an absolute conductor, since there are no substances that act as perfect conductors or insulators. Among the more notable insulating materials are glass, paper, silk, shellac, gutta-percha, and dry wood. Both temperature and moisture have a decided effect upon the conductivity of bodies. Dry air is an insulator, while moist air is a conductor. Porcelain and

glass cones are used as insulators at points where telegraph and telephone wires are supported on posts or brackets. Wires carrying currents for electric lights usually pass through porcelain cones adjusted in the woodwork of buildings, thus furnishing insulation as protection against electric sparks that may result through a short circuit, or otherwise, in case the covering of the wire becomes impaired.

**INSURANCE** (in-shur'ans), a system by which a company, in consideration of a sum of money paid, becomes bound to indemnify the insured or his representatives against losses by accident, fire, or storm, or, in case of life insurance, to pay a certain amount in the event of death. The different classes of insurance now recognized include principally fire and lightning insurance, life insurance, accident insurance, marine insurance, and insurance against cyclones and tornadoes. Among the earliest instances of insurance is the one connected with the Second Punic War against the Romans. The first systematic insurance mentioned in modern times is that of Barcelona, where the magistrates issued ordinances, in 1435, relating to this class of business, though special instances of insurance by potentates in cases of marine commerce and losses in agriculture by storms are mentioned much earlier. In the reign of Elizabeth, in 1601, the English statutes first recognized insurance, but in continental Europe it was systematized and legalized some earlier. *Marine insurance* is the oldest form, and was instituted for the encouragement of commercial relations with other countries among many of the governments of the Middle Ages.

At present insurance has assumed vast proportions and represents a large volume of accumulated capital. It has become greatly diversified, each class of insurance being subdivided into many departments and covering greatly diversified classes of risks on life and property. Some of the most beautiful and costly buildings in the world are owned by insurance companies as an investment, and they likewise hold large interests in government and railroad bonds, canal securities, stocks, farm and city loans, and mining stocks and bonds. In the insurance business two distinct classes are recognized, mutual and stock companies. The mutual insurance companies are the newer and represent organizations in which the individual insured participates in all the profits of the company and contributes directly in case of losses, while in stock companies individuals are insured for a definite amount and receive definite payments in case of loss. Besides these classes are fraternal insurance companies, in which the fra-

ternal and insurance features are combined in a society or in an association. In this class and several others the assured is assessed each month to cover the losses by deaths. Mutual companies are maintained to a considerable extent among farmers and other classes, in which they insure each other against property losses by fire, lightning, or storms.

Life insurance is based upon the experience of different companies, on which they assume risks and calculate their sources of profit and loss. Below is a synopsis of an insurance table, in which is shown the experience of thirty life insurance companies:

AGE, YEARS.	DEATHS PER 1,000	LIFE EXPECTATION IN YEARS.	AGE AT PROBABLE DEATH IN YEARS.
20.....	7.29	41.49	61.49
30.....	8.43	34.43	64.34
40.....	10.36	27.28	67.28
50.....	15.94	20.18	70.18
60.....	30.34	13.77	73.77
70.....	64.93	8.54	78.54
80.....	140.41	4.78	84.78
90.....	323.73	2.11	92.11
99.....	1,000.00	.50	99.50

A number of terms are used in the insurance business, these being recognized both in law and contracts as more or less clearly implying certain parties or facts. Among them are the terms *underwriter* or *insurer*, meaning the party taking the risk. The *assured* or *insured* is the party who is promised compensation in case of loss. The *premium* is the amount paid for insurance, the *policy* is the written contract, the *risks* or *perils* constitute the events insured against, and the *insurable interest* is the interest, subject, or right to be protected. The laws of all the civilized countries have been constructed with a view of bearing upon the insurance interests and protecting the assured against fraud or loss by unsound companies. In all companies the premium paid is governed by the nature of the risk taken. Property which is exposed to unusual danger requires the payment of a higher premium, while the age and class of individuals influence largely the premium in life insurance companies. Although the adjustment of these matters is left largely to individual companies, they are under legal supervision, and adequate security to the insured is explicitly demanded under all circumstances.

The enormous business done by life insurance companies of the United States has had more or less attention the past decade. Twenty-five leading companies wrote \$1,250,000,000 of new insurance in 1908, and the new policies of these companies for the last three years were \$3,500,-

000,000, which is a billion more than all insurance in force in the country twenty years ago. To obtain the business in 1908 premiums amounting to about \$50,000,000 were paid. Fully \$32,000,000 of the premiums went for commissions to solicitors and \$11,000,000 was paid for establishing agencies and for advertising. Nearly half of all the insurance in the country is carried by three companies in New York City—the Equitable, the Mutual Life, and the New York Life. In 1908 a total of 6,050,000 life insurance policies were in force, and the total amount insured was \$12,235,000,000, or a little more than \$2,000 to the policy. These figures do not include industrial life insurance, which is about twice as large as ordinary life.

**INTELLECT** (in'tel-lĕkt), the power or faculty of the human soul by which it knows. It is sometimes defined as the soul acting. Ideas are communicated to us by the senses or by other means. Through the intellect the soul becomes able to perceive objects in their relations, upon which depends its power of judging, reasoning, and comprehending. It is distinguished from the other two powers of the soul; namely, the power to feel and the power to will.

**INTEREST** (in'tēr-ĕst), an allowance or premium for the use or detention of money. The profit paid on borrowed money is called *interest*, the money on which interest is paid is termed the *principal*, and the interest and principal taken together constitute the *sum* or *amount*. Interest is either simple or compound. *Simple interest* is computed at a certain rate for the whole time on the loan. *Compound interest* arises when the simple interest is not paid when due. To illustrate: \$100 at six per cent. for one year amounts to \$106. For the second year the principal is \$106, the interest is \$6.36, and the amount is \$112.36. The rate of interest depends upon various conditions, among them the amount of money in circulation in a given country or state, the demand for money, the amount offered for investment, and the nature of the security offered, or the personal liability of the borrower. The *legal rate* of interest is a rate allowed by law, and any excess charged is termed *usury*. In some states a rate higher than the legal rate may be provided by contract, as in Iowa, where the legal rate is six per cent., but by contract eight per cent. may be stipulated. Contracts providing more than the rate of interest allowed by law are void and not collectible.

**INTEREST**, in mental science, the excitement of feeling, either pleasant or painful, which accompanies special attention to some object. It

involves a more or less conscious recognition of some relation to self, and is essential to the best success of any mental effort. To awaken interest in worthy things, as in the subjects of instruction, is an indispensable condition to the true success of the teacher. Primarily the young pupil feels no interest in the school studies, since the immature mind is unable to appreciate their importance and has no desire to acquire a knowledge of the subjects of which they treat. But the skillful teacher is able to stimulate curiosity and impress upon the mind of the pupil the idea that he is acquiring knowledge, and thus to awaken an interest in the process of instruction. It is easy to sustain the interest when these processes are appropriate and natural, and a lack of interest is usually due either to previous defective teaching or to the endeavor to teach subjects for which the mind of the pupil is not prepared. Psychologically the mind has as much appetite for knowledge of the right kind as the body has physically for proper food. Hence, the teacher needs to study to determine the character of mental food proper for every age, so as to supply the kind that will stimulate and satisfy the mental appetite.

**INTERIOR** (in-tĕ'rĭ-ĕr), Department of the. See **United States, Departments of the.**

**INTERLAKEN** (in-tĕr-lă'kĕn), meaning between the lakes, a village of Switzerland, situated in the valley of the Aar, between lakes Brienz and Thun. It was founded by Augustine monks in 1130, and is noted as a favorite health and pleasure resort. About 35,000 tourists visit the place annually. It has an old monastery which was founded in 1130, in which both Protestant and Catholic services are held during the season. The railroad connections are convenient, making it possible for tourists to visit many points of historical interest and witness the most celebrated glaciers and other noted natural sceneries within its vicinity. Population, 1908, 3,041.

**INTERMEZZO** (ĕn-tĕr-mĕd'zō), an interlude inserted between two main parts of instrumental works, such as a drama or an opera. The name is sometimes applied to the entire production, intended to be played independently or between two more extensive pieces. Originally the intermezzos were short musical interludes designed to be performed between the acts of a tragedy. In the 17th century they treated largely of mythological subjects or were comic, and these were performed between two serious acts.

**INTERNATIONAL DATE LINE** (in-tĕr-năsh'ün-əl), a line drawn arbitrarily near the 180° meridian of longitude, in the Pacific Ocean,

This line is located quite closely to the 180° meridian of longitude from the South Pacific to the Bering Sea, whence it passes through Bering Strait. It designates the place where a navigator on a trans-Pacific voyage changes his date of reckoning time. The use of the word international in connection with this date line is sanctioned only by practice, as the principal nations have not created a joint commission to locate such a line definitely, but the term has come into general use and the meridian designated is quite generally accepted by navigators. That the 180° meridian has been chosen is based upon the fact that it is located exactly twelve hours from Greenwich, though this is not essential or material, as any point could have been chosen by agreement or established by practice. However, the fact that it is located near the middle of the Pacific Ocean, a great distance from civilization and populous countries, is a practical reason for choosing this locality, and no doubt this fact offers the best argument in its favor.

The explanation for having a date line is founded on the fact that a person traveling west or east lengthens or shortens his day one hour for every 15° traveled, since he moves with the sun in traveling west and in the opposite direction from the sun in traveling east. In moving eastward, a traveler shortens each day four minutes for every terrestrial degree he travels, and when having gone entirely around the earth he will have gained one day. To him the first of the month is the second, and according to his reckoning Sunday is Monday. On the other hand, a traveler who moves westward lengthens each day four minutes for every terrestrial degree traveled, and if he passes entirely around the earth he will have lost one day when he returns to the point from which he started. To him the second of the month is the first, and Monday to him is Sunday. If two persons were to start from the same place and travel around the earth in opposite directions, they would differ from each other two days in their reckoning, when they met in the place from which they started. The reason for having a date line is clear from this explanation, else it would be impossible to reckon days correctly, and travelers would differ in their time from that kept by people located at considerable distances east or west from the starting point.

**INTERNATIONAL LAW**, the term applied to what was formerly called the law of nations. It comprises the rules and established doctrines that govern states and nations in their conduct toward one another, and defines the relations of citizens of different countries in

their social and commercial affairs. The system was created by modern nations and is recognized by the civilized peoples of the world. New rules are introduced by war and by treaties of peace. Among the more important matters provided for by international law is the equal and common right to sail upon the high seas, where all nations have equal authority to enforce their own laws and the established laws of nations. The domains of other nations cannot be interfered with, and, if a fugitive from justice escapes into a foreign state, the nation from which he escaped has no right to enter the foreign country for his arrest, but may request that he be surrendered.

The commercial relations of different countries may be regulated by treaty without the interference of other nations, for which purpose all nations may send and receive public ministers or delegations, and their persons and property must be protected properly. Any visiting foreigner is required to obey the laws of the country in which he sojourns, and is entitled to the same treatment as the natives. In making treaties ministers usually treat with each other or with duly qualified representatives, but the compacts formed are not deemed binding and formal until they have been ratified by the respective governments. Liberties are granted to all nations alike for the purpose of extending their navigation, improving commercial and agricultural industries, developing national resources, making exploring expeditions, and establishing trade relations. In the time of war the property of the different nations involved, as well as of the persons engaged in unfriendly acts, are subject to capture anywhere, and neutral nations are bound to maintain impartiality as between the contending countries. Besides, neutral nations are understood to prevent every interference on the part of their subjects in the matter of aiding the hostile country or in any manner giving aid or support to the enemy.

**INTERNATIONAL PEACE CONFERENCE**, a conference held in The Hague, in the Netherlands, from May 18 to July 29, 1899. It was convened at the suggestion of the Czar of Russia, who advanced an invitation to the principal nations of the world to participate in a conference with the view of securing a gradual reduction of the naval and military armaments. Twenty-six countries of the world participated, and the total delegates in attendance numbered 101. The principal work of the conference consisted of adopting a perfected code of the rules of war, recommending the larger use of balloons in warfare, and recom-

mending that the question of the rights of neutrals and private property be considered by future conventions.

**INTERSTATE COMMERCE**, the name applied to the trade among the several states of the United States. Though considerable commerce was carried among the states at an early period in history, its rapid development properly began with the construction of railroads. In 1887 Congress passed an act known as the Interstate Commerce Act, intended to regulate trade between the states. Previous to the enactment of this law all common carriers, either by rail or water, were permitted to discriminate against individuals or localities in granting rates and providing facilities to carry freights. It was charged that the railroad showed favoritism to certain shippers, and that they granted favorable rates under certain conditions, and, on the other hand, frequently made them exorbitant and oppressive. By the Interstate Commerce Act all this was prohibited, and the transportation companies were barred from concealing the rates charged, from changing rates without due notice, and from pooling the traffic and dividing the profits. This act created a commission of five members, known as the Interstate Commerce Commission, with power to investigate alleged violations of the act and to require reports from carriers in regard to their operations. An important amendment was enacted in 1906, by which the commission became empowered to fix the rates to be charged and to set aside those found to be unreasonable. The operation of the law has been to protect the small shippers against the destructive competition of the larger ones. It has tended toward benefiting smaller communities or cities, in that it operated to cause the rates to be less advantageous to the larger distributing points.

**INTESTINES** (in-tēs'tīnz), the portion of the digestive organ situated below the stomach. It is commonly divided into the small and large intestines. The former has an average length of about 23 feet and includes the duodenum, jejunum, and ileum, while the latter, which extends nearly around the small intestine, includes the caecum, colon, and rectum. The *small intestine* extends from the pylorus of the stomach to a valvelike opening at the entrance of the large intestine, near the right groin. It is from one to one and a half inches in diameter. The first ten inches, known as the duodenum, receives the inflow from the ducts of the pancreas and liver. The upper two-fifths of the remainder constitutes the jejunum, and the lower three-fifths forms the ileum. On the interior

are many transverse projections and an immense number of minute threadlike processes called *villi*. These villi stand up and resemble the pile of velvet when immersed in water. Each villus contains a lacteal, a vein, and an artery. Food in the stomach moves forward through *peristaltic action*, which consists of slow and successive contractions of the muscular fibers within the tube.

The *large intestine* is from five to six feet long, from one to two and a half inches wide, and is greatly wrinkled and sacculated. Only a few glands occur in the depression of its mucous membrane, which is smooth and contains no villi. Between the small intestine and the colon is a valve of two segments, which prevents the contents of the colon from returning to the small intestines. Projecting from the lower end of the first part of the colon is a narrow, tapering tube known as the *vermiform appendix*. In this round objects sometimes stop, such as cherry stones, causing pain or inflammation.

**INTOXICATION** (in-tōks-ĭ-kā'shŭn), the state produced in the system by the excessive use of a stimulant, such as opium, chloral, belladonna, and alcoholic liquids. The intoxication is acute when a considerable quantity of poisonous substances are taken at once, especially by a person not accustomed to its use. In the first stage of slight intoxication the blood circulates quite rapidly and the nervous and mental processes are stimulated. This state of excitement is soon followed by the second stage, in which the baser traits are manifested and the sense of propriety is lost. In the third stage an intoxicated person suffers from dizziness, stupor, double vision, and greatly weakened consciousness, and in some cases by fits of delirium. Delirium tremens often results from habitual intoxication and sometimes it causes alcoholic insanity. The excessive use of liquor frequently induces vomiting, especially in those not accustomed to it. A cathartic, an emetic, or a Turkish bath may relieve a person when becoming drowsy from intoxication, and in extreme cases a stomach pump may be employed.

**INTUITION** (in-tŭ-ĭsh'ŭn), the power of the mind by which we obtain ideas and truths not derived through the special senses, nor by an elaboration of the understanding. The products of intuition are termed *primary ideas*, and include those of space, time, cause, identity, being, right, and personal identity. Primary ideas, or primary truths, as they are sometimes called, are all self-evident, as the axioms of logic and mathematics. The ideas derived through the intuitive power spring up immediately in the mind

upon the presentation of the proper occasion. They are not the product of sensation or perception, but arise spontaneously. Some writers associate intuition with the instinct. Kant speaks of the intuitive power as the reason, a term quite appropriate, since it appears to be the element of the mind that gives to it a condition of rationality.

**INVERNESS** (in-vēr-nēs'), a town in Scotland, capital of Inverness-shire, on the Ness River, 105 miles northwest of Aberdeen. It is located near the Moray Firth, on the Caledonian Canal, and has railway transportation facilities. The chief buildings include the county hall, the cathedral, an insane asylum, and the Royal Academy. Among the manufactures are leather, cordage, spirituous liquors, woolen goods, ironware, and sailing vessels. It has considerable trade, gas and electric lighting, and substantially paved streets. Inverness was the capital of the Picts. It was destroyed by Charles Stuart in 1746. Population, 1906, 22,103.

**INVERTEBRATA** (in-vēr-tē-brā'tā), a subdivision of the animal kingdom. It includes the animals which have no vertebral column or backbone, and are distinguished from the higher group that possess a vertebral column, the latter being known as *vertebrata*. In the invertebrate animals nothing resembling a cartilaginous spinal column is found, and the more solid portions of the body are on the outside, thus constituting a protective shell, as in the case of the oyster, lobster, and clam. Naturalists now recognize five different divisions of the invertebrate animals: the mollusca, protozoa, annulosa, coelenterata, and echinozoa or annuloida.

**INVOLUTION AND EVOLUTION** (in-vō-lū'shūn, ěv-ō-lū'shūn), in mathematics, two operations which are converse to each other. The object of *involution* is to raise a number to any power, which is done by multiplying the number by itself, as  $2 \times 2 \times 2 = 8$ . Thus, the third power of two is eight. On the other hand, *evolution* is the extraction of a root of any number; that is, by means of it we may find what number, when raised to a certain power, gives the known number. For instance, 64 is the power of some number, and by evolution we find that eight is the square root; thus eight multiplied by eight equals 64.

**IODINE** (i'ō-dīn), a bluish-black non-metallic elementary crystalline substance. When heated it yields fumes of a rich violet hue. Iodine belongs to the halogen group of elements, similar to bromine and chlorine. It is obtained principally from the ash of seaweeds called *kelp*, but occurs likewise in oceanic waters and mineral springs. Iodine is found more or less

abundantly in marine molluscos animals, in cod-liver oil, and in certain plants common to the land. The lead, silver, and zinc ores of Mexico and Chile contain this product. It is employed in medicine and photography. In medicine it is used either in the pure state or as iodide potassium, and is useful in the treatment of scrofula, rheumatism, spleen and liver diseases, and many maladies as an agency to kill parasites. It is used in photography to prepare aniline colors and for other purposes. In the treatment of glandular affections, chlorosis, scrofula, and other diseases iodide of iron is a valuable remedy.

**IODIFORM** (i-ōd'ō-fōrm), a compound of iodine, carbon, and hydrogen. It is similar to chloroform, but differs from the latter in that the chlorine is replaced with iodine. Iodoform is a yellow crystalline substance with a penetrating odor and a sweetish taste. In water it is nearly insoluble, but it may be dissolved readily in ether or alcohol. It is valuable as a medicine, both as an antiseptic and an anaesthetic. Being a solid, it is not employed as a general anaesthetic by inhalation, but is used as a local application to relieve pain, as in sores and ulcers. It is employed for cold in the head in the form of a snuff, but its disagreeable odor makes it difficult to use in this way.

**IOLA** (i-ō'lā), a city in Kansas, county seat of Allen County, on the Neosho River, 37 miles west of Fort Scott. It is on the Missouri Pacific, the Missouri, Kansas and Texas, and the Atchison, Topeka and Santa Fé railroads, and is surrounded by a farming and natural gas producing country. The noteworthy buildings include the county courthouse, the high school, and a number of churches. It has manufactures of ironware, brick, cement, clothing, cigars, and machinery. Electric and gas lighting, waterworks, and pavements are among the public utilities. Iola was settled in 1857 and was chartered as a city in 1898. Its prosperity is due largely to the abundance of natural gas in the vicinity and to its extensive smelters and rolling mills. Population, 1910, 9,032.

**IONA** (ē-ō'nā), the modern name applied to the most celebrated island of the Hebrides, an island group lying northwest of Scotland. The length is three and a half miles; breadth, one and a half miles; and area, 2,265 acres. It has a history beginning in 563, when Saint Columba landed with twelve disciples and built a monastery. The soil is exceedingly fertile and from early times yielded extensively. Potatoes, barley, and oats are the chief products. The monastery established by Saint Columba was the first church of the Picts. It has furnished many

interesting pages in the development of the Catholic faith in the British Isles.

**IONIA** (î-ō'nî-à), the name applied anciently to the most flourishing country of the Ionian Greeks in Asia Minor. According to tradition it was so named from Ion, one of the five Greek tragic poets, reputed a son of Apollo. The Ionian Greeks settled in Asia Minor about 1050 B. C., when they were driven from the Peloponnesus by the Achaians. They built twelve towns of much importance, including Ephesus, Miletus, Smyrna, and Colophon, which formed the basis the Ionian League. All the cities of Ionia were captured by Croesus, King of Lydia. In 557 B. C. the region became a possession of Cyrus, King of Persia, but it was acquired in 331 B. C. by the Greeks under Alexander the Great. In the year 64 B. C. the entire region was added to the Roman Empire by Pompey, and subsequently the Turks devastated and destroyed most of the evidences of early civilization, as the temples and amphitheatres. The Ionic dialect was commonly spoken by the people of Ionia, and was noted for its smoothness on account of containing a large number of vowel sounds.

**IONIA**, county seat of Ionia County, Michigan, on the Grand River, 33 miles east of Grand Rapids. It is on the Grand Trunk and the Pèrè Marquette railroads. The surrounding country is agricultural. Among the chief buildings are the high school, the county courthouse, the State Asylum for Insane, and the State House of Correction. It has manufactures of clothing, farm machinery, earthenware, and lumber products. Ionia was settled in about 1832 and was incorporated in 1873. Population, 1910, 5,030.

**IONIAN ISLANDS**, a chain of about forty islands stretching along the southwestern coast of Greece, of which Cephalonia, Corfu, Zante, Ithaca, Paxos, and Santa Maura are the most important. The total area is 1,117 square miles. Much of the surface is mountainous, but the valleys and many of the slopes are fertile. Disturbances by earthquakes have been numerous, but they have not been very destructive. Most of the inhabitants are of Greek descent. They engage in agriculture, fruit growing, and manufacturing. Among the exports are fruits, oil, salt, wine, soap, textile fabrics, and ornamental articles. The Venetians ceded the islands to France in 1797, but they were seized by Russia and Turkey two years later, and by the Treaty of Tilsit were restored to France in 1807. Later they became the scene of various political disturbances, but in 1863 were made a part of Greece, to which country they have belonged since. Population, 1908, 267,095.

**IONIAN SEA**, the name applied since an-

cient times to the portion of the Mediterranean which lies between Greece and Italy. It is connected by the Strait of Otranto with the Adriatic. The Gulf of Taranto, on the coast of Italy, is an extension toward the west. It contains the Ionian Islands, which lie near the shore of Greece. An extensive navigation and coastwise trade is carried on in this part of the Mediterranean.

**IONIC ORDER** (î-ōn'îk), a style of Grecian architecture that originated in Ionia, and which is distinguished particularly by the capital of the columns. It derived several features from Assyria and entered largely into many celebrated temples erected in Greece and Asia Minor. The best examples still existing include the Acropolis at Athens, the Temple of Minerva Polais, and the Temple of Fortuna at Rome. A modified form of this order is known as the Roman-Ionic, of which the last named temple is a representative. See **Column**.

**IOWA** (î'ō-wà), a west central state of the United States, popularly called the *Hawkeye State*, situated between the Mississippi and Missouri rivers. It is bounded on the north by Minnesota, east by Wisconsin and Illinois, south by Missouri, and west by Nebraska and South Dakota. Its length from east to west is about 300 miles, its breadth from north to south is 200 miles, and the area is 56,025 square miles. The eastern boundary is formed by the Mississippi River and the western by the Big Sioux and the Missouri rivers.

**DESCRIPTION.** The surface is an undulating plain, watered by numerous streams. It has an average elevation of about 900 feet and has no mountains. The lowest point of the State is at the junction of the Des Moines and Mississippi rivers, which is 445 feet above the sea, while the most elevated point is in Dickinson County, near Spirit Lake, where the elevation is 1,690 feet. Along the Mississippi and Missouri rivers are bluffs ranging from 200 to 400 feet above the valleys, which are from one to twelve miles in width. The northern half of the State is more nearly level than the southern half, and along some of the interior rivers, especially the Des Moines, are rugged hills and rocky canyons.

The drainage of the greater part of the State is into the Mississippi, but the western and southern portions are drained into the Missouri. The divide between the two systems runs from southeast to northwest, about two-thirds being drained toward the southeast into the Mississippi. A greater part of the central portion of the State is drained by the Des Moines, which rises in Minnesota, flows in a general direction

toward the southeast, and discharges into the Mississippi at Keokuk. The Boone and Racoon are its principal tributaries. Other rivers flowing into the Mississippi include the Turkey, Red Cedar, Iowa, Skunk, and Wapsipinicon. The Big Sioux, Little Sioux, Soldier, and Nishnabotna flow into the Missouri. A number of streams which discharge into the Missouri cross the boundary on the south, including the Nodaway and Grand rivers. Several lakes are located in the north central part, near the line of Minnesota. These include Clear Lake, Spirit Lake, Okoboji Lake, Storm Lake, and Swan Lake.

**CLIMATE.** The climate is similar in all parts of the State and varies mainly on account of latitude, the altitude not being sufficiently diversified to affect it materially. In type it is continental, having a wide range of temperature

1, Des Moines; 2, Cedar Rapids; 3, Davenport; 4, Dubuque; 5, Sioux City; 6, Council Bluffs; 7, Boone. Chief railroads are indicated by dotted lines.

between winter and summer. The average annual temperature is about 48°, but in the southern part it is notably higher than in the northern section. The extremes of summer range from 90° to 100° in July and August to from 10° to 20° below zero in winter. All parts of the State have an abundance of rainfall, which averages 31 inches, and the greatest amount of precipitation occurs in the spring and summer months. Considerable snow falls in the winter, but there is rarely sufficient in the southern part to make sleighing possible, except for short periods at rare intervals.

**MINING.** Iowa has an extensive area of bituminous coal beds, which include about the southeastern quarter of the State. In the output of this product it exceeds all the states west of the Mississippi River except Colorado. The veins are from two to seven feet thick, and in some places there are two workable veins of marketable coal. Mahaska, Wapello, Appanoose,

Monroe, Polk, and Boone counties are among those that have extensive interests in coal mining. In 1908 the output was 7,500,000 tons. Valuable deposits of lead ore occur in the northeastern part of the State, in the vicinity of Dubuque. Gypsum is mined extensively near Fort Dodge, in Webster County, which is noted as a center for the manufacture of cement. Limestone, sandstone, and fire and potter's clay are widely distributed. The supply of building stone of the finest quality is inexhaustible.

**MANUFACTURING.** The State has shown a steady advancement in manufacturing enterprises the past two decades. This is accounted for by the abundant coal supply and the presence of other raw materials, which includes large quantities derived from agricultural sources. It takes third rank in the manufacture of dairy products, including cheese, butter, and condensed milk. The slaughtering and meat-packing industry produces about one-fifth in value of the manufactured products of the State. Flour and grist mill products are considerable, including principally wheat flour, corn meal, and oatmeal. The manufacture of pearl buttons is an important enterprise at Muscatine and other cities on the Mississippi, in which is obtained a freshwater mussel valuable for its shell. Other manufactures include machinery, cement, brick and tile, earthenware, pottery, canned goods, vehicles, clothing, cigars, and farming implements.

**AGRICULTURE.** Iowa is one of the leading agricultural states, and at present exceeds all others in the value of farm products. It contains practically no waste land unfit for farming, the only exception being the rugged margin of its larger streams, but these are valuable for pasturage. There has been a noticeable decrease in the size of farms, which average about 150 acres. Over 86 per cent. of the area included in farms is improved, and the soil is sufficiently fertile to produce abundantly without artificial fertilizers. Though formerly almost exclusively prairie land, the State is now well dotted with fine groves planted artificially, and belts of hard timber extend along the streams. A fine growth of native grasses furnishes a supply of hay or serve for pasturage, but the larger part of the hay grown is now obtained by cultivating clover, timothy, and alfalfa. Cherries, grapes, apples, and small fruits thrive in all parts of the State. Peaches are grown successfully in the southern section.

Corn is the chief crop and in value is about equal to all the other crops. The State usually holds first place in the production of both corn and oats, but in the yield of corn it is some-

times exceeded by Illinois. Wheat is grown most extensively in the northern part. In the production of barley the State takes second rank. Other important crops are rye, buckwheat, flax, potatoes, vegetables, and sorghum. The abundance of land suitable for pasturage and the growing of hay places Iowa among the leading stock-growing states. It usually takes first rank in rearing swine and second rank in the number of cattle, being exceeded in the latter only by Texas. Cattle are grown for meat and for dairying purposes. In the number of milch cows it exceeds the State of New York, which long held first place. Other farm animals include horses, mules, sheep, Angora goats, and poultry. The grade of stock raised has been highly improved by careful breeding, this being true especially of milch cows and draft horses. Large quantities of fatted swine and beef cattle are exported to the markets of Chicago, Kansas City, and Omaha.

**TRANSPORTATION.** The navigation is confined to the two border streams, the Mississippi and the Missouri, both of which are navigable the entire distance. However, the construction of railroads and electric railways has made the navigation of these streams less important than formerly. Texas is the only State west of the Mississippi River that exceeds Iowa in railroad mileage, the lines of the latter comprising 9,500 miles. Trunk railway lines extend across the State from north to south and from east to west, and the latter include a number of the important links in the transcontinental avenues of transportation, such as the Chicago, Milwaukee and Saint Paul, the Chicago and Northwestern, the Chicago, Rock Island, and Pacific, the Illinois Central, and the Chicago, Burlington and Quincy. Every county has one or more railway lines. Interurban electric railways are operated in many sections of the State. The commerce has shown a steady growth during every decade since the Civil War. Among the chief articles of trade are manufactures, live stock, hay, grain, dairy products, meat, buttons, coal, and food-stuffs.

**GOVERNMENT.** The present constitution dates from 1857. It vests the chief executive power in the governor, lieutenant governor, auditor, secretary of state, treasurer, attorney-general, railroad commission, board of control, and superintendent of public instruction, the election to these positions being by popular vote for two years. The legislative branch consists of fifty senators elected for four years and 107 representatives selected for two years. The senators are divided numerically into two classes, hence the senate is a continuous body, the term of one-

half of its members expiring every two years. A supreme court of six judges, elected for six years, constitutes the highest judicial tribunal. Subordinate to it are the district courts, which have jurisdiction in districts that are composed of several contiguous counties and are presided over by two to four judges, who are elected for four years. Superior courts may be established in the cities by a vote of the people. The county and township officers are elected by popular vote and administer local government.

**EDUCATION.** Iowa has long occupied a foremost position in educational affairs, its per cent. of illiteracy being among the lowest. Only 2.3 per cent. of the population over ten years of age are unable to read and write, as compared with 10.7 for the whole country. This condition has been brought about in part by compulsory school attendance laws, which require attendance from seven to fourteen years of age. The schools are supervised by a State and by county and city superintendents. Adequate and articulated courses of study are pursued in all the schools, making it possible to assign studies in consecutive order as pupils are promoted from the lower to the higher departments and institutions. The State University of Iowa, at Iowa City, is at the head of the educational system and is supported partly by contingent fees and partly by state appropriations. Iowa has a larger school fund, obtained chiefly from the sale of school lands, and the income together with local taxation furnish adequate support. Candidates to become teachers are examined either by the county superintendent or the state board of examiners, but all the licenses, or certificates, to teach are issued under the direction of the state department. A large and well equipped State normal school is maintained at Cedar Falls and the Iowa College of Agriculture and Mechanical Arts is at Ames. Among the many private institutions of higher learning are the Drake University, Des Moines; the Iowa College, Grinnell; the Cornell College, Mount Vernon; the Central University, Pella; the University of the Northwest, Sioux City; the Luther College, Decorah; the Highland Park College, Des Moines; the Des Moines College, Des Moines; the Simpson College, Indianola; the German-English College, Charles City; the Wartburg College, Clinton; and the Tabor College, Tabor.

Ample provisions have been made for the unfortunate and to provide punishment for the incorrigible. Asylums for the insane are located at Cherokee, Clarinda, Independence, and Mount Pleasant. Two state prisons are maintained, at Anamosa and Fort Madison. Eldora

has an industrial school for boys and Mitchellville has a similar institution for girls. The school for the deaf is at Council Bluffs, the home for feeble-minded children is at Glenwood, the college for the blind is at Vinton, and the inebriate hospital is at Knoxville. Marshalltown is the seat of the State Soldiers' Home.

**INHABITANTS.** Iowa takes tenth rank in the number of inhabitants. In 1900 it had 305,920 persons of foreign birth, two-thirds of whom were Germans and Scandinavians. In the same year the colored population was 13,186, of which number 382 were Indians and 12,693 were Negroes. All of the Protestant denominations are well represented, but the Roman Catholics are more numerous than any other body of Christians. The Protestant denominations which have the largest number of communicants include the Methodists, Lutherans, Presbyterians, Baptists, Christians, and Congregationalists. Des Moines, located in the central part of the State, is the capital and largest city. Other cities include Dubuque, Davenport, Sioux City, Council Bluffs, Cedar Rapids, Burlington, Clinton, Ottumwa, Keokuk, Muscatine, Fort Dodge, Marshalltown, Fort Madison, and Boone. In 1905 the State had a population of 2,210,050; in 1910, 2,224,771.

**HISTORY.** Iowa was named from an Indian word which means "the beautiful land." It was included in the region inhabited by the Iowa, Illinois, and Sac and Fox Indians. Marquette and Joliet visited the region in 1673, but no attempt to found a settlement was made until about a century later. Julien Dubuque, a French Canadian, in 1788 obtained a grant of land near the present city of Dubuque, where he operated lead mines and carried on trade with the Indians. The first permanent settlements were made in 1833 near Burlington. It was organized as a part of Michigan Territory in 1834, became a part of Wisconsin Territory in 1836, and was organized as the Territory of Iowa in 1838. Flourishing settlements had in the meantime grown up in the eastern part of the State and along the Des Moines River. Iowa City was made the capital in 1839 and a constitution was formed in 1844, but the State was not admitted into the Union until Dec. 28, 1846. Ten years later the capital was removed to Des Moines. The Sioux Indians perpetrated a massacre upon the whites at Spirit Lake in 1857, but this did not check the rapid immigration from states farther east and from Europe. Railroad building was promoted rapidly, and as early as 1885 there was not a locality within the State farther than fifteen miles from a railway. A consti-

titutional amendment to prohibit the manufacture and sale of spirituous liquors was adopted in 1882, but it was declared unconstitutional by the courts. For more than fifty years the State has enjoyed an unbroken era of growth in population, industrial enterprise, and intellectual development.

**IOWA, State University of,** an institution of higher learning for both sexes, located at Iowa City, Iowa. It was founded in 1855 with an endowment by Congress of two townships of land, and it was reorganized in 1860. It comprises the colleges of medicine, law, engineering, homeopathic medicine, dentistry and pharmacy, natural sciences, and liberal arts, and the Iowa School of Political and Social Science. A summer school for library training and a summer session for teachers are maintained by the college of liberal arts. The system of accredited high schools in the State brings the university in close touch with various educational institutions, and it maintains university extension and lecture courses. It has a library of 100,000 volumes, one of the finest in the State. The university includes eighteen buildings, valued at about \$1,550,000, and has an annual income of \$450,000. The faculty of instructors numbers 170 members and the enrollment of students is about 2,150.

**IOWA CITY,** a city in Iowa, county seat of Johnson County, on the Iowa River, 54 miles west of Davenport. It is on the Chicago, Rock Island and Pacific Railroad and on several electric lines. The surrounding country is fertile and has large interests in dairying and farming. The noteworthy buildings include the county courthouse, the State University of Iowa, the Mercy Hospital, the opera house, and the Iowa City Academy. Among the manufactures are paper, flour, gloves, vehicles, packed pork, ironware, and machinery. It has electric lighting, street railways, waterworks, pavements, and other improvements. Iowa City was founded in 1839, was the capital from 1839 until 1856, and was incorporated in 1853. Population, 1910, 10,091.

**IOWA COLLEGE,** a coeducational institution of higher learning at Grinnell, Iowa, the oldest college in the State. It was founded at Davenport in 1847 by Congregationalists, but was removed to Grinnell in 1860. It includes three departments, the academy, the college, and the school of music. The buildings and grounds are valued at \$250,000. It has a library of 35,000 volumes, an income of \$50,000, and an endowment of \$500,000. The faculty consists of 45 instructors. In 1908 it had an attendance of 653 students.

**IOWA INDIANS,** an Indian tribe of the

Dakota family that formerly lived in the vicinity of the Mankato River, Minnesota. In 1700 the tribe numbered about 1,500, but at present there is a remnant of only about 125, who are colonized on reservations in Oklahoma and Kansas. This tribe led several destructive wars against the Osage Indians. The Iowas have taken kindly to the industries.

**IOWA RIVER**, an important river of Iowa, rises near the Minnesota boundary, and after a course of 300 miles discharges into the Mississippi. It flows through a fertile agricultural country, is skirted by a belt of valuable timber, and contains many varieties of fish. Among the cities on its banks are Eldora, Marshalltown, and Iowa City.

**IOWA STATE COLLEGE OF AGRICULTURE AND MECHANIC ARTS**, an educational institution for both sexes, situated at Ames, Iowa. It was established by an act of the State Legislature in 1858, and four years later came into possession of certain lands granted by Congress to promote agricultural and mechanic education. In 1869 it was formally opened. The departments include those of engineering, agriculture, veterinary medicine, science, and domestic economy. In connection with it is the Iowa Experiment Station, which affords facilities for investigating agricultural problems. A campus of 120 acres has been set apart from the college domain, which embraces about 800 acres. Free tuition is granted to all residents of the State, while others pay a very nominal fee. Students are admitted from accredited schools or upon examination. It has been proven by experiments that this institution has been of much value in developing the industrial and intellectual forces of Iowa and other states. The endowment is \$750,000, the value of all college property is \$1,550,000, and the annual income is about \$200,000. It has an excellent supply of apparatus and a library of nearly 20,000 volumes. About 2,350 students comprise the average enrollment.

**IPECACUANHA** (ip-ĕ-kāk-ŭ-ăn'ă), the name of a plant of South America, found chiefly in the damp and shady woods. It is a shrub, has a few leaves near the ends of the branches, and bears small white flowers. The fruit is a dark purple berry. It is valuable for the root, from which a medical substance known as *ipecacuanha* is obtained. This product has a bitter taste, is mildly irritant, and is commonly known as *ipe-cac*. As a medicine it is used as a stomachic tonic, as an expectorant, and in disorders of the skin.

**IPSWICH** (ips'wich), a town and river port of Suffolk County, England, on the Orwell

River, about 68 miles northeast of London and twelve miles from the North Sea. The streets are tortuous and narrow. Within recent years it has made material development on account of its navigation and railroad commerce. It has several fine schools, hospitals, and churches. The manufactures include flour, soap, beverages, machinery, agricultural implements, and fabrics. Shipbuilding is an extensive enterprise. It has electric lights and street railways. Ipswich has remains which date from the Roman occupation of England, but no mention is made of it until 991. It received a charter from King John in 1199. Population, 1907, 72,825.

**IPSWICH**, a town of Massachusetts, in Essex County, on the Ipswich River, 26 miles northeast of Boston. It is on the Boston and Maine Railroad and has communication by electric railways. The noteworthy buildings include the public library, the town hall, and the Manning High School. It has manufactures of soap, hosiery, isinglass, and machinery. The municipality maintains systems of waterworks and sanitary sewerage. Ipswich was settled by John Winthrop in 1633, when it was known as Agawam, but the name was changed to Ipswich the following year. It was the home of Anne Bradstreet and other pioneers of colonial times. Population, 1905, 5,205; in 1910, 5,777.

**IQUIQUE** (ĕ-kĕ'kă), a city and seaport of Chile, capital of the province of Tarapacá, on the Pacific coast. It is connected by railways with other trade centers. In its vicinity are extensive mining interests, including those of silver, iron, borax, iodine, saltpeter, and nitrate of soda. It has a large trade in live stock, fruit, lumber, and minerals. The climate is quite hot, but healthful, and earthquakes are not infrequent. Prior to 1881 it belonged to Peru, but in that year it became a possession of Chile. Population, 1906, 43,502.

**IRAN** (ĕ-răn'), the name used by the natives of Persia to designate their country. It is of ancient origin and has been applied to a region much larger than is included in that country at the present time, usually to the portion of Asia lying between the Tigris and the Indus. In history it is frequently applied to the region bounded by the Caucasus, the Caspian Sea, and Russian Turkistan on the north; by the Tigris, the Persian Gulf, and the Arabian Sea on the west and south; and by the Indus on the east. Within it was embraced the territory now included in Afghanistan. See **Persia**.

**IRANIANS** (ĭ-ră'nĭ-anz), or **Persians**, a people belonging to the Aryan or Indo-European family. They are so named from Iran, the ancient name of Persia. The Medes, who are men-

tioned as early as 2400 B. C., are the first of these people of whom we have historic record. Both the Medes and the Persians were highly advanced in civilization at an early date. The Iranian language may be divided into three general groups, which include the Old Persian cuneiform inscriptions; the Zend or Old Bactrian, the language in which the sacred writings of the Parsees is committed; and the Middle Iranian or Pehlevi languages, in which the Zend-Avesta commentaries are preserved. The modern Persian is Iranian, but it contains many Arabic words. In this language many celebrated masterpieces of literature were produced. The modern Iranians inhabit regions west of the Indus River. Among them are the Kurds, the Ossetians, the Baluchis, the Afghans, the Tajkis, and the Persians.

**IRAWADI** (ir-ä-wä'di). See **Irrawaddy**.

**IRELAND** (ir'land), popularly called the Emerald Isle, an island located 60 miles west of England, from which it is separated by Saint George's Channel and the Irish Sea. It is the smaller of the two principal islands included in the United Kingdom of Great Britain and Ireland. It is bounded on the south, west, and north by the Atlantic Ocean, and on the northeast by North Channel, which separates it from Scotland. The greatest length, measured from Fair Head in the northeast to Mizen Head in the southwest, is 304 miles. Its breadth varies considerably, being about 110 miles through the central part, between the bays of Galway and Dublin, and 210 miles from Benwee Head in the northwest to Carnsore Point in the southeast. The area is 32,583 square miles, including a water surface of 52 square miles.

**DESCRIPTION.** The surface is diversified, including large tracts of undulating districts and elevated ranges with hills and mountains, the greatest height being about 3,500 feet. Mount Carrantual, a peak of the Macgillicuddy's Reeks, in the southwestern part, has an elevation of 3,414 feet. In the southeastern part are the mountains of Wicklow, rising about 2,750 feet above the sea. The coast varies from gradual elevations to precipitous heights, but the general surface may be described as basin-shaped, the interior being a vast plain with extensive tracts of bogs and lakes. A number of islands abound along the west shore, of which Clare and Achill are the most important. Many excellent harbors are furnished by numerous coast indentations, and the entire coast line, including the inlets, has a length of 3,000 miles. The principal inlets are the bays of Donegal, Galway, Dingle, Bantry, and Dundalk. Lough Foyle is an important inlet on the north coast.

An irregular line drawn from Lough Foyle in the north to Mizen Head in the southwest marks the dividing line from which the rivers radiate, but the divide is not distinguished by striking surface features. Many of the streams widen into long lakes or loughs, owing to the fact that rainfall is abundant and the slopes are gradual. The Shannon, in the west, about 250 miles long, is the largest river in the United Kingdom. About half of it above the estuary is made up of the three lakes Derg, Ree, and Allen. In the north is the Erne River, which drains a part of the central plain and flows into Donegal Bay. The Boyne, rising in the central plain, is not made up of lakes. In the south is Waterford Harbor, into which flow the Suir and Barrow rivers. Other streams having a southward course include the Lee, the Bandon, and the Blackwater. The inland lakes include Lough Derg, Lough Ree, Lough Mass, Lough Neagh, and Lough Erne.

The climate of Ireland is greatly modified by the westerly winds blowing from the Atlantic Ocean, where they are tempered by passing over its comparatively warm surface. From this circumstance the climate is milder and more equable than that of England, and the mean winter temperature is 25° higher than that of the same latitude as the Atlantic region of America. While it has the advantage of a moderate temperature and ample rainfall, the disadvantages of damp winds and heavy fogs are felt in nearly all parts of the island, but particularly along the west and south coasts. In the interior the atmosphere is somewhat drier, the rainfall being about 35 inches, while the wetter districts have a rainfall of 42 inches. Owing to favorable climatic conditions, Ireland is clothed with the verdure of numerous plants, many of which are native to the island and winter in the open air.

**MINING.** Though Ireland has valuable deposits of iron ore, this mineral is not worked extensively, owing to the absence of large deposits of coal. Most of this product is obtained in Antrim County. A limited supply of anthracite coal exists, but the coal measures consist chiefly of an inferior grade of bituminous coal. About 125,000 tons are produced annually. Copper mining, though formerly extensive, is not important at present. Sandstone, limestone, and granite suitable for building purposes are abundant. Other minerals found in various quantities include alum, slate, salt, and lead ore.

**AGRICULTURE.** Though the arable surface is rich in having a productive soil, large districts are made up of moorland. The land titles are vested in large owners, who lease the estates to

peasants, and much of the land is sublet in small tracts. This condition arose from the English occupation of the island, when much of the land was confiscated and granted to English citizens. In the latter part of the 19th century the government adopted a policy to enable the peasants to purchase land, under which money was advanced for that purpose, and the peasants were permitted to repay by remitting annual installments. This resulted in dividing many of the larger estates, though much of the land is still held under conditions that require the payment of excessive rents. However, the methods of farming are improving, and much of the land has been redeemed by drainage and enriched by fertilizers.

A large per cent. of the land is in meadows and pastures. This condition has been augmented through the live-stock industry and as a means of improving the soil. The area cultivated in clover and other grasses for hay comprises nearly one-half of the cultivated lands. The acreage of oats is about one-half that devoted to the production of hay. Other crops grown extensively include potatoes, turnips, barley, beet roots, and wheat. Flax is grown chiefly in the northern part. Vegetables and small fruits are abundant in all sections of the island. Cattle raising is the principal live-stock industry, and the interests in dairying and for meat production are about equal. Sheep are grown chiefly in the highlands, where the grasses and climatic conditions are peculiarly favorable. Poultry raising is carried on almost universally among the peasants. Other domestic animals include horses, mules, swine, and goats. Forests of commercial value are abundant on the larger estates.

**MANUFACTURES.** The manufacturing industries are not important, when compared to the resources. A large proportion of the live-stock marketing is shipped to Great Britain, and many commodities that could be manufactured profitably are imported. Linen, silk, and woolen textiles are the principal manufactures. Belfast has been noted as a center of the linen textile enterprise for several centuries. Ulster is a center of manufacture of woolen and worsted goods. Large shipyards are located at Belfast, where the *Celtic* and the *Oceanic* of the White Star Line were constructed, and shipbuilding is well established at Dublin and Londonderry. Other manufactures include machinery, clothing, embroidery, lace, leather, and spirituous liquors. Considerable material for the manufacturing industry is supplied by the fisheries, which yield large catches of cod, herring, pilchard, and salmon.

**TRANSPORTATION.** Railways are operated in all parts of Ireland, thus connecting the coast with the productive interior points. The total lines aggregate 3,500 miles. Many of the streams are navigable in their lower courses for small boats, but the Shannon supplies the most important river transportation, and ocean steamers ascend it as far as Limerick. A number of the rivers have been canalized and connected by systems of canals. The highways are in a well-improved condition, affording means for transportation by wagon from the railway and canal centers. England has most of the Irish trade, which consists in large parts of the exportation of raw products and the importation of manufactured articles. The chief exports are live stock, grain, fish, whisky, and dairy products, while the imports include wheat, corn, flax, tea, tobacco, and machinery. The trade with foreign countries is principally with the United States, Germany, Belgium, and Russia.

**GOVERNMENT.** Ireland has been an integral part of the United Kingdom since 1801. Chief executive authority is vested in the Lord Lieutenant, who is assisted by a privy council, and is the representative of the crown of Great Britain. The government is conducted by the Chief Secretary for Ireland, who is president of the local government board and a member of the Cabinet. While Ireland has no Parliament of its own, it is represented in the British House of Lords by 28 peers and in the House of Commons by 103 commoners. The judicial system is modeled upon that of England and culminates in the supreme court of judicature. For the purpose of local government, Ireland is divided into four provinces and 32 counties, the provinces being Leinster, Munster, Ulster, and Connaught.

**RELIGION AND EDUCATION.** The prevailing religion is Roman Catholic, the clergy of which is supported by voluntary contributions. Nearly one-third of the people are Protestants, the sects being Anglicans, Presbyterians, Methodists, Independents, Baptists, and Quakers, in the order named. The Anglican, or Episcopal Church, was the established church until 1869 and has 620,500 adherents, while the Presbyterian Church has 454,500 communicants. Elementary schools are under the management of the commissioners of national education and are maintained in all the districts. Besides the common and high schools, several colleges, seminaries, and universities are supported. Of the higher institutions the most important are the University of Dublin; Queen's colleges of Belfast, Cork, and Galway; University College, Dublin; Saint Patrick's College, Maynooth; and the Royal College of Science.

**INHABITANTS.** The majority of the inhabitants belong to the Celtic race, and the earlier immigrants from England have completely amalgamated themselves with the native people. Settlements of English and Scotch are numerous in the northeastern part. This element is Protestant and furnishes a large part of the Orange population. The native inhabitants are descendants of the ancient Celts, by whom the island was inhabited during the Roman occupation of England, but they are now called *Irish*. Large numbers of the Irish people have come to Canada and the United States, where they comprise a large and influential element, and have taken a prominent part in the social and industrial development. They are noted for their wit and industry.

Dublin, on Dublin Bay, an inlet of the Irish Sea, is the largest city and seat of government. Other cities include Cork, Belfast, Limerick, Queenstown, Waterford, Rathmines, Galway, Kingstown, Newry, and Wexford. The population of Ireland has decreased materially the past fifty years. At present it is 140 per square mile, or less than one-fourth that of England. This decrease is due chiefly to emigration, especially from the rural districts. In 1841 the island had a population of 8,196,000. In 1901, fifty years later, it was only 4,458,775. Population, 1907, 4,378,568.

**LANGUAGE.** The Irish language is a branch of the Celtic and belongs to the Gaelic, being allied to the Manx and Scotch Gaelic, and to the British dialects known as the Cornish, Welsh, and Armoric. About 65,000 people of Ireland speak only Irish, while 890,000 speak both the English and the Irish. A widespread movement is now in progress by which it is designed to preserve the language and extend its use, a plan projected both in Ireland and the United States. At the head of this movement is the Society for the Preservation of the Irish Language, which has maintained headquarters at Dublin since 1877. The literature of the Irish is extensive, including legendry, history, poetry, and many works of value in theology and romance, some of the earlier dating from the 5th century. Many of the most eminent men classed with the English scholars and authors are more properly Irish. These writers include Thomas Moore, Justin McCarthy, Geoffrey Keating, and Douglas Hyde (b. 1860). The Irish scholars have given to the English language some of the most beautiful poems, searching historical writings, and eloquent orations.

**HISTORY.** The early history of Ireland is wrapped in fable. It is thought that the Iberians, or a branch of the Mediterranean race, were

the earliest inhabitants. Later the Celts settled in Ireland, coming there at different times, and still later came large numbers of Scots. The controlling influence seems to have been vested in various tribes until the Scoti, which was the most powerful, subdued the others. Subsequently they made incursions into Gaul and Britain, which was then a Roman colony. In the middle of the 5th century Christianity was introduced by Saint Patrick, a man of Scottish birth, who was taken a slave to Ireland while still young. Later he escaped to Rome and returned to Ireland with the avowed intention of introducing Christianity. His work was attended by much success and Ireland became a seat of learning, while its monasteries supplied many noted missionaries to operate in continental Europe. However, the various political elements continued to be hostile toward each other, which had a depressing influence upon the national feeling, and the prosperity was more or less affected by the incursions of the Danes and other invaders from the north.

In 1167, while Henry II. was King of England, the Norman invasion occurred. At that time the island was districted into counties, the lands were divided among Norman barons, and English courts were established at Dublin. Then likewise originated the feudal titles to lands, which are still a hindrance to the prosperity and success of the common people. A heroic defense was made against the invaders, and at the beginning of the 16th century the English were still unable to conquer the larger part of Ireland. An act of the Irish Parliament granted Henry VIII. the title of King of Ireland, instead of lord, as was the case in the reign of Henry VII. This sovereign confiscated the lands of the church and attempted to force the people away from the Catholic religion, a measure bitterly opposed by the Irish. Elizabeth instituted a Protestant clergy, but the movement occasioned numerous uprisings under the Earl of Tyrone.

At the time of the Civil War in England, in the reign of Charles I., the Irish rose in rebellion and attempted to become free from the English dominion, but they were subdued by Cromwell in 1649. Many atrocities were perpetrated on both sides during this contest for supremacy in Ireland, and after the Irish and Loyalists were defeated they were generally banished to Connaught, while the English and Scotch settlers occupied the other portions. The struggle for independence continued during the reigns of Charles II. and James II., but, when the Irish preferred James to William III., the latter invaded Ireland in 1690, and in the Battle of the Boyne defeated the forces of James. In 1691 the

Irish were defeated at Galway and Limerick, but a treaty was concluded by which the Catholic Irish were given religious liberty. This treaty was violated by Parliament granting about one million acres of land to the Protestants, and severe penal laws were passed against the Catholics, by which it was aimed to exterminate that faith. The enactment of these laws excited bitter opposition.

When the war for American independence began, it gave the Irish an apparent opportunity to become free. Some of the penal laws were modified to appease the people, privileges to erect schools were extended, and some of the restrictions previously placed on the Catholics were withdrawn. However, a declaration of independence was made by the Irish Parliament in 1782 under the leadership of Grattan and Flood. The uprising was supported by both Protestants and Catholics in Ireland, who were alike anxious to secure more wholesome legislation for the common people, as well as to obtain complete liberty of conscience. When the French Revolution began, in 1798, the Society of United Irishmen was instrumental in making another desperate effort for independence, but the movement was crushed after much loss of life. The government at London now resolved to unite the Irish and English parliaments into one body. This was done by the Act of Union, which was adopted by the Irish Parliament in 1800. On Jan. 1, 1801, Ireland was united by proclamation with England in the same manner that Scotland had been assimilated, except that it was not permitted to have as large a measure of local government, and the English Parliament became the supreme legislative authority. This measure was universally unpopular in Ireland from the beginning, causing several rebellions, and continues to be the source of much contention.

In 1829 the Catholic emancipation act went into effect, a measure making Catholics eligible to most public offices and to membership in Parliament. Since then many strenuous efforts have been made to secure the independence of Ireland, particularly in 1848 and 1865. The movement of the latter year is known as that of the Fenians, being promoted by the Fenian Society, and it received financial support from many Irishmen who were citizens of the United States and other countries. Several attacks were made on the Canadian frontier in 1866, but the American government interceded to maintain neutrality. This was followed by the disestablishment of the Irish Episcopal church in 1869 and slight modification of the land tenure laws. Subsequently agitation for Home Rule became the leading question, a movement designed

to give Ireland a local Parliament and local self-government under English sovereignty, similar to that of Canada and Australia. Among the distinguished leaders in favor of this movement may be named Parnell and Isaac Butt (1813-1879), while the cause was ably defended by such Englishmen as Gladstone and Bryce. The National Land League was organized in 1883, which succeeded the Land League. This organization had for its object the acquisition of title to land by Irish tenants and was generally supported by the people of Ireland irrespective of political affiliations. In 1903, after an extended discussion, Parliament finally passed the Land Purchase Bill, under which the tenants or subtenants may purchase tracts of land from the landlords and pay for it in annual installments.

The principal issue which now engages the public men of Ireland is that of Home Rule. Augustine Birrell (b. 1850), who was for some time chief secretary to the Lord Lieutenant of Ireland, introduced a measure of this kind in the Parliament in 1907. The discussion turned largely on the point of establishing an administrative council in Ireland, but up to the present no definite action has been taken. In the meantime the people of Ireland continue to advocate industrial emancipation along with some measure of political independence.

**IRIDIUM** (i-rid'i-ŭm), a metal discovered in 1803, so named from the colors exhibited by its solutions. It occurs native with platinum, osmium, and rhodium, in alloys of various proportions of these metals. Iridium is insoluble in mineral acid, and may be readily alloyed with copper, lead, gold, and other metals. It is used in the manufacture of standard weights, the fine edges of balances, and many articles that are to be preserved for a long time from the influence of the atmosphere. It is found in the Ural Mountains and the Pacific coast of North America. See **Chemistry**.

**IRIS**, the name of a genus of beautiful plants, sometimes called *flag* and *fleur-de-lis*, and native to the temperate climates. It includes many species, some of which are noted for their medicinal properties and others on account of their beautiful flowers. Most species grow in wet and marshy places and bear a variety of flowers, of which the most common tint is blue. The best known species of North America include the *blue flag* and the *common iris*, the former growing in marshy places and the latter being distinguished on account of its grassy leaves. The common iris has ornamental flowers of a violet-blue color, but they are variegated with veins of white-green or yellow. Its stems are about three feet high. Among the naturalized

species grown in gardens are the beautiful *Spanish*, *Chalcedonian*, *Persian*, and *snake's-head*. Many are cultivated as border plants.

COMMON IRIS.

**IRIS**, the colored portion of the eye that surrounds the black central pupil, which is an aperture in the iris. It consists of a muscular curtain of three layers, the anterior, posterior, and middle fibrous. The surface is variously pigmented, giving the eye its color. *Iritis* is an inflammation of the iris, due to a prolonged use of the eye, to injury or accident, or to rheumatism or some other constitutional disease.

**IRISH LANGUAGE.** See *Ireland*.

**IRISH MOSS**, or *Carrageen*, the name of several species of seaweed common to the coast of Ireland and other countries of Europe. They are not mosses, but are algae, and thrive on rocky and stony coasts. The common *carrageen* yields the greater part of the Irish moss of commerce. It is used as medicine and as an article of food. The plant is branched, grows to a length of from two to twelve inches, and is reddish brown in color. It is prepared in the form of jelly and blancmange by boiling in water or milk, then adding some sugar and spices. Iceland moss, although used in a similar way, is a different plant, being a lichen.

**IRISH SEA**, a body of water located between Ireland and Great Britain, connected with the Atlantic Ocean on the north by North Channel and on the south by Saint George's Channel. Its length is about 135 miles and the width varies from 60 to 120 miles. Several islands are located within it, including Anglesey and the Isle of Man.

**IRITIS** (ī-rī'tis). See *Iris*.

**IRKUTSK** (īr-kōōtsk'), a city of Siberia, capital of a government of the same name, and the residence of the governor general of Eastern Siberia. It is located near Lake Baikal, on the Trans-Siberian Railway, 3,385 miles from Moscow. It is well built, has broad and substantially paved streets, and maintains public waterworks and electric street railways. Among the noteworthy buildings are the museum, the public library, and several public schools. It has a number of fine hospitals, churches, and seminaries. The manufactures include linen goods, leather, machinery, furniture, and woolens. The trade in tea, furs, and cereals is very extensive. Irkutsk was founded in 1652, but its prosperity dates from the railroad development and the growth of Russian influence on the Chinese boundary. Population, 1906, 60,382.

**IRON** (ī'ūrñ), the most important of all metals. It is found in nearly all forms of clay, earth, and rock, though rarely in a pure state. When pure, it is silvery-white, very tenacious, malleable, and ductile. The commercial product is derived from ores, which are abundant and widely distributed, and are known as magnetite, hematite, siderite, and limonite. Ores classed as *magnetite*, when pure, contain 72 per cent. of iron and are so named because the iron in them occurs as magnetic oxide. *Hematite* may be red, blue, or specular. *Limonite* consists of hydrated oxides and includes the bog and other ores. *Siderite* contains carbon dioxide. Iron is found in varying proportions in both sea water and mineral water, and forms an essential constituent of plants and animals. The sun and stars contain iron, and it constitutes a large portion of meteorites that fall from space to the earth.

Pure iron burns before reaching the melting point. For this reason it must be combined with other substances to make it of the greatest utility, such as sulphur, copper, silicon, carbon, arsenic, phosphorus, and other metals with which it forms important alloys. Absolutely pure iron is seldom seen, except in laboratories, where it is used for experimental purposes. *Cast iron* is a commercial iron produced in a blast furnace and contains a large proportion of carbon, is neither ductile nor malleable, and may be easily cast in molds. *Pig iron* is the form in which cast iron is made at the furnace, being run into molds, called *pigs*. *Wrought iron* is usually fibrous, ductile, and malleable, is produced in a puddling furnace or a forge, and contains very little carbon or other impurities. *Weld iron*, *bar iron*, and *steel* are different compounds of iron. They contain less carbon than cast iron and more than wrought iron, and can be forged, tempered, cast,

and materially hardened by heating to redness and cooling suddenly. The several varieties of iron manufactured differ in the degree of their properties as well as in the proportions of their constituents, and by different applications serve man in an unlimited field of useful purposes. Salts of iron are used largely in medicine as tonics.

The iron deposits of North America are very extensive. In the production of pig iron the United States exceeds every other country in the world. Nearly all states of the Union and most of the provinces of the Dominion have iron deposits, though there are some districts in which they are especially abundant. The most productive iron fields operated at present are those of the Lake Superior region, from which about two-thirds of the iron ore is obtained. Other vast deposits are in Pennsylvania, Ohio, Alabama, Tennessee, Virginia, and Missouri. Pennsylvania leads in the manufacture of iron products, but Minnesota ranks first in the output of iron. The highly productive deposits of that State are chiefly in the Vermilion and Mesabi ranges, where mines were first opened in 1884. This district extends northward into Ontario and eastward by the Gogebic and Menominee ranges of Wisconsin and Michigan. In 1688 the first blast furnace of Pennsylvania was operated under the direction of William Penn, and in 1817 the first rolling mill was established at Plumstock, Pa. The iron industry of the Southern States is making rapid progress, owing to the vast iron ore and coal deposits in that region, while marked attention is also directed toward the industry in the states of the West, especially Colorado.

The world's production of pig iron, as reported in 1908, is 62,524,500 tons. Of this quantity 25,850,000 tons were produced in the United States, 12,850,500 tons in Germany, 10,340,250 tons in Great Britain, and 3,425,000 tons in France. In the same year Canada produced 562,450 tons. Other countries producing iron extensively are Austria, France, Russia, Belgium, Sweden, and Norway. The finest grade of iron produced in Europe is taken from the mines at Dannemora, Sweden, and is used extensively for horseshoe nails. These mines have been operated continuously since the 15th century and are inexhaustible. The manufacture of all forms of machinery and utensils and the construction of large buildings have increased remarkably the demand for iron and steel. There are few machines now produced that do not consist largely of these metals. The impetus of railroad building in Africa, Asia, South America, and Australia has greatly increased the foreign demand

for the American product. However, the growing markets abroad are tending to develop on a large scale the output of native products in many sections of the Old World.

**HISTORY.** Iron is one of the metals earliest known in history, being mentioned in the Bible as early as Genesis iv., 22, where Tubal-Cain is spoken of as "instructor of every artificer of brass and iron." Egyptian sepulchers represent butchers sharpening their knives on a round bar of metal. It is reasonably certain the discovery of iron at Mount Ida dates from 1406 B. C. The vast deposits of iron ore in India were known from remote times, and the Romans utilized products of iron at an early period. Iron mines were operated in Britain as early as 54 B. C., and much earlier in continental Europe, especially in Germany, Spain, and Italy. When the Egyptian obelisk was removed from Alexandria to New York, in 1880, a piece of pure iron was discovered under its base, which was estimated to have been situated there over 1,900 years. Tools made of iron and steel by the ancients more than 3,000 years ago are preserved in the museums at Rome, Berlin, London, Paris, and other cities of Europe.

After the decline of Rome, Spain became noted for the production of iron and steel, the most extensive furnaces being located in the province of Catalonia, in the north of Spain, whence the *Catalan furnace* was named. The Catalan furnaces are still used for low blast, and serve a useful purpose where iron ore is reasonably pure. With the discovery that all ores cannot be melted in Catalan furnaces, it became necessary to construct higher furnaces, with an opening at the top into which the ore is thrown. This is the form of structure utilized in modern blast furnaces, and their invention dates from the early part of the 14th century, when a native of Germany introduced this form and utilized it extensively for the production of iron from ore secured in the Rhine provinces. These furnaces were introduced into France in the middle of the 15th century and into England about the same time.

Coal did not come into general use in blast furnaces until 1713, charcoal being used previously, but the latter was displaced because it does not furnish sufficient heat. The imperfectly worked iron ore left in Britain by the Romans supplied materials for some of the high grade furnaces for nearly 300 years, being rendered of value because of the increased heat obtained from coal and coke. In 1585 iron deposits were discovered in North Carolina by an expedition sailing under Sir Walter Raleigh. The iron first used in America was smelted in Europe,

but the American products began to be used in manufacturing in Virginia as early as 1619. However, material progress was not made until 1643, when blast furnaces were built near Massachusetts Bay, at the present site of Lynn, where deposits of bog ore are found. Among the valuable improvements in the manufacture of iron may be mentioned those of Cort, who, in 1783, secured a patent on machinery used in rolling and the next year was granted a patent on devices employed in puddling. Dalton discovered the hot blast in 1827 and Bessemer, in 1856, discovered the method of converting crude iron into steel by the Bessemer process. See **Blast Furnace; Rolling Mill; Steel.**

**IRON AGE**, a term used to indicate the degree of civilization and culture of a people considered from the material of which their tools and weapons are made. The three prehistoric stages are known as the ages of stone, bronze, and iron. This succession in the use of tools and weapons was not followed universally in every part of the world. In some portions, as in America, Africa, and the islands of the South Pacific, the natives passed directly from the use of stone to iron. The age of iron began in Greece in the time of Homer, the Homeric poems alluding to the transition from bronze to iron. From the southern portion of Europe the age of iron moved northward. It reached Scandinavia about the period of the Christian era, and became fully established about the year 800 A. D., when the Scandinavians were converted to Christianity. In the stone age implements and weapons were cut from native rock, in the bronze age they were cast, and in the iron age they were hammered into shape and ornamented by curved lines. The iron age was characterized in most countries by the introduction of alphabetic characters, by which a basis was laid for history and literature. The present time is often spoken of as the *age of steel*, and sometimes as the *age of electricity*.

**IRONCLAD VESSELS**, the naval vessels that are protected from the fire of the heavy guns by iron or steel plates. Ironclad vessels are of comparatively modern invention, and were first tried on some of the French floating batteries at Kinburn in 1855. The experiments were not satisfactory until 1858, when the French vessel *La Gloire* was constructed, and the following year Great Britain began to introduce armor-clad vessels into the navy. Since then marked improvements have been made, and war vessels have taken on a powerful and secure form. The first test of a protected vessel in actual military contact occurred in the Civil War, when the Confederates covered the *Merri-*

*mac* with railroad rails and other heavy irons, naming it *Virginia*, and in this way succeeded in damaging the Union navy. This was followed by the invention of the *Monitor*, a protected turret ship, by Ericsson, and from it resulted an entire revolution in naval warfare.

The first ironclads were constructed of wood, with steel or iron plates protecting the entire exposed surface, but at present iron and steel enter extensively into the general construction, while the firing from them is done through port-holes, or from central turrets or citadels. The plate formerly used was from three to five inches thick, the thinner being near the bow and stern, but those of more recent manufacture have armor from six to fifteen inches in thickness on the sides, and a deck plate from two to four inches thick. The most important manufactories of armor plate are located at Essen, Germany, known as the Krupp works. All the powerful nations, such as the United States, Great Britain, Germany, France, Russia, and Italy, have ironclad vessels for offensive and defensive operations. The navy of Great Britain has more ironclad vessels than that of any other country. Such battleships as the *Oregon* and the *Minnesota*, of the United States navy, are representative types of first-class armored vessels. Italy long had two of the largest ironclads in the world, the *Lepanto* and *Italia*, each having a displacement of 13,840 tons. However, they are exceeded in size by the *Minnesota*, the *Connecticut*, and the *Louisiana*, each of which has a displacement of 16,000 tons.

**IRON CROSS**, a military decoration given for distinguished service by the German government. It was first given by Frederick William III. of Prussia in recognition of distinguished services in war. During the war with France, in 1870-71, it was revived. The decoration consists of a Maltese cross of iron bordered with silver, and is suspended from the neck by means of a cord. A similar decoration, known as the grand cross, is awarded to officers of high rank.

**IRON CROWN**, a crown used at the coronation of the kings of Lombardy and afterward by the German emperors, when the latter were sovereigns of that country. It is made of six pieces and is adorned with jewels, enamels, and golden roses. The cross was so named from an iron circle, which, according to tradition, was forged from a nail used in the crucifixion of Christ. Charlemagne, when he united Italy with Germany to form the Holy Roman Empire, wore this crown. Subsequently it was worn by Charles V., by Napoleon I., and by two emperors of Austria. In 1866 it was placed in the

Church of Saint John the Baptist at Monza, Italy.

**IRON GATE**, a narrow place in the Danube River, near Gladova, a short distance below the point where the river crosses the boundary of Hungary. It is formed by the Transylvanian Alps. Formerly it obstructed navigation. In 1890 vast excavations were begun to widen and deepen the river bed, which were completed in about ten years.

**IRON MOUNTAIN**, a city in Michigan, county seat of Dickinson County, near the Menominee River, fifty miles west of Escanaba. It is on the Chicago and Northwestern and the Chicago, Milwaukee and Saint Paul railroads. In the vicinity are productive iron mines. The chief buildings include the county courthouse, the high school, and a number of churches. It has manufactures of mining and agricultural machinery, clothing, and utensils. Sewerage, pavements, electric lighting, and waterworks are among the utilities. It was settled in 1873 and was incorporated in 1888. Population, 1904, 8,585; in 1910, 9,216.

**IRON MOUNTAIN**, or **Iron Mount**, a famous hill in Saint Francois County, Missouri, 81 miles south of Saint Louis. It has an area of 500 acres and rises to an altitude of 200 feet above the surrounding country. The deposits consist of specular or hematite iron ore and appear to be inexhaustible, constituting one of the richest and purest iron ores in the United States. Near it is Iron Mountain, a village having important railroad connections and containing blast furnaces and factories.

**IRONTON** (i'urn-tun), a city in Ohio, county seat of Lawrence County, on the Ohio River, about thirty miles above Portsmouth. It is on the Norfolk and Western, the Cincinnati, Hamilton and Dayton, and other railroads. On the opposite side of the river is the Baltimore and Ohio Railroad, which reaches the city by a free ferry. The surrounding country has deposits of bituminous coal, iron ore, and brick and fire clays. Among the chief buildings are the high school, the Masonic Temple, the county courthouse, the Odd Fellows Hall, and the Briggs Public Library. It has stove works, machine shops, brickyards, foundries, cement works, and rolling mills. Gas and electric lighting, street railways, pavements, and waterworks are among the public utilities. Ironton was settled in 1832 and incorporated in 1849. Population, 1900, 11,868; in 1910, 13,147.

**IRONWOOD**, the name of several species of hornbeam, a tree native to North America. This tree is rather small, rarely exceeding six inches in diameter, and the wood is hard and

tough. A similar forest tree is native to South America. The ironwood of commerce is obtained from a myrtle of the eastern part of Asia. This wood is extremely hard, dark colored, and so heavy and dense that it sinks in water. The natives of China and the East Indies use it for anchoring. From its hardness and density, ebony is sometimes called ironwood.

**IRONWOOD**, a city of Michigan, in Gogebic County, on Montreal River, 150 miles west of Marquette. It is on the Wisconsin Central and the Chicago and Northwestern railroads. The iron industry is the most important enterprise, its mines yielding large quantities of rich ore. Among the chief buildings are the city hall, the Carnegie Library, the high school, and a number of churches. It has manufactures of cigars, ironware, machinery, furniture, and utensils. The surrounding country is included in the rich Gogebic iron range of Michigan and Wisconsin. It has systems of public drainage, lighting, and waterworks. The place was settled in 1884 and incorporated three years later. Population, 1904, 10,019; in 1910, 12,821.

**IROQUOIAN INDIAN** (ir-ō-kwoi'an), one of the largest groups of American Indians, comprising the most important linguistic stock. Originally they appear to have occupied the region in the lower part of the Saint Lawrence, whence they spread up the river and to the section bordering on the Great Lakes. They comprise the Iroquois, the Eries, the Hurons, the Tuscaroras, and many others. Cartier first came in contact with them in 1535, when they were well established in the region now included in Quebec, Ontario, New York, and Pennsylvania. These Indians are closely related in language to the Cherokees, but the latter appear to have separated from the parent stock at a very early date. See **Iroquois**.

**IROQUOIS** (ir-ō-kwoi'), or **Six Nations**, a celebrated confederation of North American Indian tribes. They were first known as the Five Nations, which included the Mohawks, Onondagas, Senecas, Oneidas, and Cayugas. In 1712 they were joined by the Florida Tuscaroras, when the union became known as the Six Nations. They carried on extensive hostilities against the French in the 17th century, when they numbered about 15,000, but suffered severe losses. Subsequently they became allied to the Dutch, later to the English, and afterward joined Pontiac. A peace concluded was broken in 1774, but another treaty was made in 1784 with the United States, and the greater portion moved across the lakes into Ontario. In the War of 1812 the American and Canadian branches were pitted against each other, but at the close of that

can never be redeemed. In many portions of Arizona, Idaho, Colorado, California, Oregon, Utah, Washington, Montana, New Mexico, Nevada, Wyoming, and Alberta much value has been added to lands by irrigation. In some regions the water supply is drawn from rivers, while in others vast reservoirs are maintained to catch the water coming from melting snows, and this is distributed by means of canals at the proper season. In the western portion of North and South Dakota, Nebraska, Kansas, Oklahoma, and portions of Texas and Saskatchewan, the rainfall is sufficient at certain periods, and irrigation is provided when there is less than the usual amount of rainfall. In some states, particularly in South Dakota and California, irrigation is effected to a considerable extent from artesian wells. In portions of South Carolina, Georgia, Texas, Louisiana, and other states irrigation takes on the form of inundation, which is an essential in the cultivation of rice.

The United States has an arid region estimated at 175,000,000 acres, of which about 10,000,000 have been reclaimed by irrigation. California reports the largest area of reclaimed land, about 2,100,000 acres, while Colorado has 1,500,000 acres, Montana 700,000 acres, Idaho 500,000 acres, and Utah 400,000 acres under successful cultivation. The largest irrigated area is in India, where 25,000,000 acres have been reclaimed. Egypt has 6,500,000 acres of reclaimed land, and this region will be greatly increased as the benefits of the Assouan dam are utilized more fully under projected extensions of the canal district. Italy has the largest irrigated area of Europe, about 3,000,100 acres, while Spain has 500,000 acres, and France has 410,000 acres.

Congress passed the Reclamation Act on June 17, 1902, which is greatly facilitating progress in reclaiming arid regions. Under this law 50,000 acres of land in Nevada were supplied with water in 1905 by the great Truckee-Carson system. It is so named from the Truckee and Carson rivers, which rise on the eastern slopes of the forest-clad Sierra Nevada Mountains in California, and flow in a general northeasterly direction into Nevada. The drainage basin of the former contains a number of beautiful lakes, including Lake Tahoe, all of which are to be utilized for flood storage. In Nevada these rivers flow for some distance parallel to each other, and at one point not more than twenty miles apart. The Truckee River then flows northward from Wadsworth, passing into Pyramid and Winnemucca lakes, and the Carson River, dividing into three channels, ultimately disap-

pears into Carson Sink. The illustration shows the Diversion Works on the Truckee River, where its water is turned into a large canal 31 miles in length and carried into the Dam Site on the Carson River, where the combined flow is directed into two large canals, one on each side of the river, which are the feeders for a distributing system of ditches hundreds of miles in length. It is estimated that 350,000 acres will be reclaimed eventually at an expenditure of \$9,000,000. Similar projects have been carried out or are under way in Colorado and other states.

**IRTISH** (ir'tish), or **Irtysch**, a river of Asia, the most important tributary of the Obi. It rises in the Altai Mountains, in China, and after a northwesterly course of 1,625 miles joins the Obi near Samarova. The valleys of the upper Irtish and its tributaries are among the best cultivated and well populated districts of Siberia, and through the region passes the Trans-Siberian Railroad. Tara, Omsk, and Tobolsk are among the ports on the Irtish.

**IRVINGTON**, a town of New Jersey, in Essex County, adjoining the city of Newark. It is noted as a residential center and has well-platted and improved thoroughfares. It has a public library and several fine schools and churches. The manufactures include clothing, wall paper, brushes, and machinery. Electric lights, street railways, and a system of sewerage are among the public utilities. The first settlement on its site was made in 1666. It was incorporated in 1898. Population, 1910, 11,877.

**ISCHIA** (ês'kê-ä), an island in the Mediterranean, situated about six miles west of Italy, near the Bay of Naples. The area is eighteen square miles. It is of volcanic origin, contains many thermal springs, and is noted for its healthful climate and production of excellent wine and fruits. Monte Epomeo, the highest point, is 2,617 feet above the sea. Among the chief industries are fruit culture, fisheries, and the entertainment of many tourists who visit it annually. Ischia is the capital and most important city, having a population of 7,008, and other towns are Forio and Casamicciola. Earthquakes are not infrequent, the most important of recent date occurring in 1883, when about 5,000 persons were killed. In the city of Ischia is a picturesque castle built by Alfonso I. of Aragon, in the 12th century. Population, 1908, 27,034.

**ISHPEMING** (ish'pê-ming), a city of Michigan, in Marquette County, fifteen miles west of Marquette. It is on the Duluth, South Shore and Atlantic and the Chicago and Northwestern railroads. The city is noted because large quan-

ties of red hematite iron ore are mined in the surrounding country. Among the manufactures are ironware, clothing, carriages, cigars, machinery, steam boilers, and utensils. The public school system carries a fine course of study. Among the municipal facilities are electric lights, pavements, a public library, and an extensive system of street railways. It was settled about 1857 and was incorporated in 1873. Population, 1904, 11,623; in 1910, 12,448.

**ISINGLASS** (ī'zīŋ-glās), the popular name of mica, a mineral of a metallic luster found in large deposits, remarkable for its tendency to split easily into thin, transparent, elastic plates. It is used as a substitute for glass in windows in Mexico, Siberia, and some countries in South America, and for lanterns, having the property of bearing sudden and marked changes in temperature without breaking. In the manufacture of stoves it is used for ornamental portions. It constitutes a valuable substitute for glass on war vessels, since it is not easily broken by the jar from the discharge of guns.

**ISINGLASS**, a gelatinous substance made from the air bladder of various kinds of fish. The best quality is secured from the bladder of the sturgeon, but the American product is made from the cod, hake, and other fishes. The purposes for which it is used include the manufacture of glue, court-plaster, a cement for glass and porcelain, and for refining sherries and white wine. It likewise serves for stiffening silks, linens, gauzes, and other textiles.

**ISLAM** (iz'lām), a word used by the Mohammedans to signify full submission to God, hence to designate their religion. It is applied to the whole body of believers who accept the formula of faith: "There is no God but Allah, and Mohammed is his prophet." In this profession of faith is included the acknowledgment of the divine unity and of the submission of Mohammed, the observance of prayer, alms giving, keeping the fast of Ramadan, and the pilgrimage to Mecca. To this the Shiites, who are dominant in Persia, add: "Ali is the vicar of God." However, the orthodox Mohammedans, who comprise the majority of the Church of Islam, reject the position thus assigned to Ali.

**ISLAND** (ī'lānd), a small body of land surrounded by water. The islands differ from the continent in that they are smaller in size, and range from very small islets to large tracts of land, such as Cuba and Great Britain. They were formed by corals, by volcanic action, or by being separated from the mainland through the action of waves and currents. To the last mentioned class belongs Great Britain, which

was probably separated by the action of currents from the continent of Europe. *Oceanic* or *pelagic islands* are located in the ocean, while *continental islands* lie near the continents and resemble them in geological structure. Oceanic islands are either coral or volcanic, with few exceptions. An *archipelago* consists of a group of islands, such as the Hebrides and the West Indies. The action of waves causes many changes on the coasts of islands, as in the case of Helgoland, which has been greatly reduced in the historic period.

**ISLAND NUMBER TEN**, an island formerly in the Mississippi River, near the boundary between Kentucky and Tennessee, about forty miles below Columbus, Ky. It was so named from its position below Cairo, Ill., being the tenth of a series of islands. The Confederates under General Pope had fortified it, and after the fall of forts Henry and Donelson it was commanded by General Mackall with a part of Beauregard's army. Commodore Foote, commanding seven Federal gunboats, bombarded it three weeks. At the same time an army under Pope operated against it, and the Confederates were compelled to surrender on April 7, 1862. About 7,000 prisoners and an immense quantity of ammunition and supplies were captured by the Federals. The river gradually washed the island away, the last portion of it disappearing in 1866.

**ISLANDS OF THE BLESSED**, in Greek mythology, the name of certain islands of the western ocean, regarded the abode of departed spirits and of certain favored mortals who were rescued from death by the gods. The locality is referred to by Homer as the Elysian Plain. The inhabitants were thought to enjoy an abundance of everything and live eternally in ease and comfort.

**ISLAY** (ī'lā), one of the Hebrides Islands, included in Argyllshire, Scotland. It is a short distance southwest of the island of Jura, from which it is separated by the Sound of Islay. The area is 220 square miles. It is the richest and most productive of the Inner Hebrides, hence is often called "Queen of the Hebrides." Population, 1907, 6,982.

**ISLE OF PINES**. See *Pines, Isle of*.

**ISLE ROYALE**, an island in the northwestern part of Lake Superior, located a short distance south of Port Arthur, Canada, and forming a part of Houghton County, Michigan. The surface is rocky, but it is rich in copper mines and fisheries. Low spruce and fir trees cover a considerable part of the island. It is about ten miles broad and forty miles long, and near it are a number of small islets. Siskawit Bay

is on the southeastern shore, and is the principal inlet.

**ISLES OF SHOALS**, a group of eight small islands off the coast of New Hampshire, about ten miles southeast of Portsmouth. They are inhabited by fishermen and are noted as a favorite resort for bathing, fishing, and general recreation. On Star and Appledore islands, containing 150 and 400 acres respectively, are a number of hotels for summer visitors, and on White Island is a revolving light 87 feet above the sea. Steamers run regularly from Portsmouth to the principal landings on the islands. Champlain discovered these islands in 1605 and they were visited by Captain Smith in 1614. The permanent inhabitants consist mostly of fishermen.

**ISOBARS**, or **Isobarometric Lines**, the lines which join places that have an equal atmospheric pressure. They are employed in making weather maps and charts. Formerly they were used to show only the pressure at sea level, but now such maps indicate the variations of gravity at different places. Charts constructed in this way usually indicate the places that have the same monthly and annual atmospheric pressure, hence are of importance in forecasting the weather. The so called *gradient of pressure* is the rate of change of pressure in a unit of horizontal distance. It is greatly influenced by the movement of air, especially strong winds, the latter tending to lessen the difference of atmospheric pressure. The gradient of pressure is greatest around a storm center and is least in the strongest currents of wind.

**ISOTHERMAL LINES** (i-sō-thēr'mal), the lines on a globe or map passing through places in which the mean temperature is the same. The first observations and collection of facts bearing on isothermal lines were made by Humboldt. *Isocheimnal* lines are drawn over places in which the winter temperature is the same, and *isothermal* lines are used to designate places having the same mean summer temperature.

**ISPAHAN** (is-pā-hän'), an ancient city of Persia, capital of the province of Irak-Ajemi, on the Zendarud River, about 210 miles south of Teheran. For centuries it was the capital of Persia and is still an important commercial center of the interior. It is situated in a fertile valley. A wall about 23 miles long incloses the city. The noteworthy buildings include the palace, a royal mosque, and many bazaars. It is ornamented with a large number of parks and public gardens of shrubs and flowers. The trade, though large, is carried on principally by caravans. It has manufactures of cotton,

woolen, satin, and velvet goods, glass, firearms, earthenware, brassware, sword blades, pottery, and trinkets. The surrounding country produces large quantities of tobacco, opium, and cereals. Ispahan attained to much power during the reign of the caliphs of Bagdad. It was captured by Timour in 1387. In the 17th century it contained a population of about 900,000. The capital was removed to Teheran in 1722, after Ispahan had been ravaged by the Afghans. It is now the seat of the high priest and the religious center of Persia, containing many institutions of educational importance. Population, 88,581.

**ISRAELITES** (iz'rā-ēl-īts). See **Jews**.

**ISTHMIAN GAMES** (is'mi-ān), one of the four great national festivals of Greece, celebrated on the Isthmus of Corinth, the other games being the Nemean, Olympian, and Pythian. They were celebrated in April or May of every alternate year, and consisted of boxing, wrestling, foot and chariot racing, gymnastics, throwing the discus, and contests in music and poetry. These games were of very ancient origin and were established in honor of Neptune (Poseidon). With the spread of Christianity they began to decline, but they were still celebrated in the time of Constantine and Julian. Those who took a prize were originally awarded with a garland of pine leaves, and later cash awards were given to the victors.

**ISTHMUS** (is'müs), a narrow passage of land connecting two larger bodies, or uniting a peninsula with the mainland. The ancient Greeks applied the name Isthmus without any addition to designate the Isthmus of Corinth, which connects the Morea with northern Greece. The Isthmus of Suez, connecting Africa and Asia, and the Isthmus of Panama, connecting North and South America, are the most prominent isthmuses.

**ISTRIA** (is'tri-ā), a peninsula in the northeastern part of the Adriatic Sea, forming the crown land of Istria, a part of Austria. With it are included the islands of Cherso and Veglia, the whole possession including an area of 1,910 square miles. The surface is diversified, being mountainous in the north and quite level in the south. Monte Maggiore, the highest peak, is 4,600 feet above the sea. Valuable forests abound. The minerals include salt, alum, and lignite coal, and the cultivated lands yield fruit and cereals. Large quantities of wine, olive oil, and lumber products are manufactured. Parenzo is the capital. It became a possession of Austria in 1797. Population, 1906, 345,506.

**ITALY** (it'a-lī), a kingdom of Europe, com-

prising chiefly the middle peninsula of the three that project from the southern coast of the continent into the Mediterranean Sea. Besides this, it includes the islands of Sardinia, Sicily, Elba, and about 65 others of more or less importance. Its length from Sicily to the Alps is about 690 miles, and in width it varies from 90 to 350 miles. The boundary line is formed on the north by the Alps, which trend from east to west in irregular ranges, and the Mediterranean and Adriatic seas form the principal portion of the remainder of the boundary. It is separated from the Balkan Peninsula by the Strait of Otranto, 47 miles wide. On the east it is bounded partly by Austria, on the north by Austria and Switzerland, and on the west by France. The western shore is washed by the Ligurian and the Tyrrhenian seas and the southern by the Ionian Sea, all being portions of the Mediterranean. Sicily, which extends almost across the Mediterranean, is separated from the mainland by the Strait of Messina. The mainland has an area of 91,000 square miles and the islands equal 19,684, making a total of 110,684.

**DESCRIPTION.** The Apennine Mountains traverse centrally the entire peninsula and attain to heights of from 10,000 to nearly 14,000 feet above sea level. In the vicinity of Naples the Apennines are little less than 10,000 feet, and in the northern portion the greatest height is 13,650 feet. Many of the summits are volcanic, though Vesuvius, on the Bay of Naples, is the only active volcano in the continent of Europe. Mount Aetna, in Sicily, is the highest volcanic elevation of Europe. Others of historic interest include Mount Stromboli in the Lipari Isles. In the northern part of Italy is the valley of the Po, popularly called the Plain of Lombardy, which embraces an area of 37,000 square miles. Much of the Italian mountain scenery is picturesque, the vegetation is abundant, and the valleys are remarkable for beauty and fertility.

Though the drainage is carried by numerous streams, the only rivers of large size are the Po and the Adige, both of which flow into the Adriatic Sea. The former is navigable to Turin, and with its tributaries affords navigation a distance of 600 miles. It is fed by the snows of the Alps and the rains of the Apennines, and enters the sea by a large delta. Among the rivers of the peninsula are the Arno, the Brenta, and the Tiber, but these and others of their class flow swiftly and are subject to great changes between the dry season in summer and the seasons of heavy rains. Many beautiful lakes are located in the central

and northern parts, among them Como and Bolsena, while Garda and Maggiore extend partly beyond the northern border. A system of canals is maintained in the basin of the Po and several of the rivers have been canalized, both for transportation and for irrigation of rice lands.

The climate varies greatly on account of the extent in latitude and vast differences in elevation. In the northern part the climate is continental, similar to that of Central Europe, but in the southern part it resembles that of Africa, being affected by the dry atmosphere and the sirocco winds that blow across the Mediterranean. The mean annual temperature on the peninsula is about 57°, while in the extreme south and on the islands it varies from 60° to 64°. The largest rainfall occurs in autumn and winter, hence irrigation must be utilized during the growing season in many parts of the kingdom. The valley of the Po is particularly fertile and is one of the best agricultural regions in the world. Extensive swamps are located in different sections, such as the Pontine marshes, the Maremma in Tuscany, the Campagna of Rome, and the swampy lands of the lower Po. These marshy regions are subject to pestilence and fevers, but all other parts are singularly healthful. The clearness and beauty of the Italian sky is famous.

**MINING.** The mineral wealth of Italy is not extensive. Coal, though found in limited quantities, is not produced to the extent that the output supplies the demand, hence the manufacturing enterprises are necessarily abridged. Lignite coal is obtained in Tuscany and in Sardinia, and small quantities of anthracite are mined in Piedmont. Sulphur is the most important mineral, constituting about one-half of the mineral output. The most productive sulphur mines are worked in Sicily, and small quantities are obtained in the mainland. The Italian sulphur mines are the most important in the world. A good grade of iron ore is found in the island of Elba. The zinc mines are confined chiefly to Sardinia and Lombardy. Copper is obtained in Tuscany and Piedmont, rock salt in Calabria and Sicily, and quicksilver in Tuscany. The marble quarries of Carrara are famous, but marble is obtained in other localities, especially in Massa and Serarezza. Other minerals include small quantities of gold, silver, and antimony. The mineral waters in various localities of the Apennines and the volcanic regions are especially suited for bathing and medicinal purposes.

**AGRICULTURE.** About 72 per cent. of the land is productive; hence agriculture maintains its

position as the leading industry. The land is held under three classes: peasant proprietorship, a system of rent, and a form of coöperative partnership. An extensive arid region and large stretches of swamp land have interfered with farming to a considerable extent, but the government is promoting a system of irrigation and drainage, through which several millions of acres will be added to the agricultural area. Wheat is the most important product and it is grown in all parts of the kingdom, but the crop is not sufficient to supply the demand. Corn is likewise grown in all parts of the country, but most largely in the provinces of Milan and Caserta, though some importation of this cereal is necessary to supply home consumption. The production of rice holds third rank, and the quantity grown is sufficient to supply the demand and to furnish considerable for exportation. Other important crops include oats, rye, barley, potatoes, hay, turnips, and vegetables. Small quantities of flax, cotton, and hemp are produced.

The breeding of live stock has not been developed to the extent of that industry in England and Germany, neither in the quantity and in the rearing of improved grades. Horses, cattle, swine, and sheep are exported, and cattle and goats are grown largely for meat and dairying to supply the home demand. The sheep industry is confined largely to the elevated and poorer regions of the peninsula, while the most extensive interests in cattle are in the northern part. Poultry and eggs are exported in large quantities. In Italy, having a favorable climate, much of the land area is devoted to the cultivation of fruits and silk cocoons. Fine groves of lemons and oranges are met with in the southern part, especially in Sicily and Sardinia. Italy produces a larger quantity of olives than any country in the world, and has large interests in such fruits as figs, dates, apples, quinces, and melons. The mulberry tree is grown in connection with silk culture, and is cultivated most extensively in the central and northern sections. Tobacco is cultivated profitably. A large forest area is maintained, much of which belongs to the government, and practically all of the timber land is under government supervision. The trees include the olive, myrtle, mulberry, lemon, chestnut, and numerous others.

**MANUFACTURES.** The absence of extensive fuel resources has made it impossible for Italy to develop rapidly as a manufacturing country, much of its coal supply being imported. Raw silk is the most important manufactured product, and is produced extensively in Lombardy, Piedmont, and Venetia. Cotton and wool are

spun and woven to a considerable extent, but the output is not sufficient to supply the demand. Macaroni is produced in large quantities, both for home consumption and for exportation. Considerable progress has been made the last two decades in the iron and steel industry, but the enterprise is greatly abridged by the absence of a sufficient supply of fuel. Butter and cheese of a fine grade are produced. Other manufactures include pottery, glassware, alabaster, chemicals, leather, and straw-plaited goods. The government has a monopoly of the manufacture of tobacco and salt, and government supervision is exercised over the manufacture of powder, sugar, chicory, alcohol, and beer. Having a favorable soil and a genial climate, large quantities of grapes are grown, and the manufacture of wine is correspondingly important.

**TRANSPORTATION.** The railways include a total of 11,200 miles. This is a smaller mileage than is now operated in any of the leading countries of Europe, but it is compensated for to some extent by the large transportation facilities along the coast of the Mediterranean, from which Italy secures great trade advantages with the cities of Southern Europe and on the Atlantic. Most of the railroads were built by the government or with government support, but they are now operated by private companies with the condition that they will revert to the state after they have been operated sixty years, or either party may terminate the contract at the expiration of each period of twenty years. A fine system of highways is maintained, partly by the nation and partly by the provinces and communes. These means of transportation, connected with the facilities afforded by rivers, canals, and steam and electric railways, afford communication with all the principal cities and districts of the country. The postal and telegraph systems are conducted by the government, and lines of telephones under public and private ownership afford excellent facilities. Submarine cables extend from the principal ports to the leading commercial centers in the world.

The trade of Italy is not as extensive as that of the principal European countries. At present the exports are somewhat exceeded by the imports. The largest foreign trade is with Germany, Austria, Switzerland, France, Great Britain, and the United States. Silk, wine, sulphur, raw flax, eggs, fruit, and olive oil are the chief exports. Among the leading imports are coal, wheat, raw cotton, machinery, fish, and raw wool. A large and active merchant marine is maintained.

**EDUCATION.** The system of schools is main-

tained and regulated by the government, either entirely or in conjunction with the communes or provinces. Attendance is compulsory in most parts of the kingdom, but the law is not efficiently enforced and the per cent. of illiteracy is considerably larger than in the countries of Northern Europe. Within recent years education has made rapid progress among the people, but in the southern part of the kingdom illiteracy is practically general. However, the higher institutions are efficient. The country has 21 universities, some of which have been celebrated many centuries for efficient work, especially those at Pisa, Padua, Genoa, Naples, Rome, and Palermo. The kindergarten system is modeled after that of Germany and the common schools are known as *lower grade* and *higher grade* elementary schools. Religious instruction is given to those whose parents request it. In addition are maintained night schools, Sunday schools, normal schools, gymnasia, colleges, and an extensive system of private educational institutions. Roman Catholic is the dominant religion, the Pope residing at Rome. Protestants and Jews constitute only a small portion of the people, but the exercise of religion is free to all.

**GOVERNMENT.** The government is a constitutional monarchy, dating from 1848, and for government purposes the kingdom is divided into 69 provinces. Chief executive authority is vested in the king, who holds his office by heredity. At present the royal family is that of Savoy. The king has power to negotiate treaties and declare war, and is commander of the army and navy. Though clothed with large prerogatives, the sovereign is dependent upon a minister to have his official acts made valid, which minister assumes personal responsibility when countersigning imperial orders. The departments of government include those of the treasury, interior, foreign affairs, war, marine, finance, justice and religion, public works, commerce, industry and agriculture, public instruction, and posts and telegraphs. Legislative power is vested in the parliament, which consists of a senate and a chamber of deputies. The former is composed of princes of the royal blood and members of the latter are elected by citizens over 21 years of age who can read and write. The senate contains 320 members and the chamber of deputies is comprised of 508 members. Military service is obligatory from 21 to 39 years of age, the period of active service ranging from two to five years. At present the army consists of 250,000 men and officers, which is increased on a war footing to 3,200,000. It is divided into the three divi-

sions known as the territorial militia, the mobile militia, and the permanent army. Its navy, though not equal to the most powerful, is in a state of healthful growth and includes a number of modern vessels.

Italy has not been particularly successful in its scheme of colonial expansion, its policy of keeping abreast with the great powers being at least a partial failure. At present the colonies are limited to Africa, where it has Italian Somaliland and Eritera. The former has an area of 100,000 square miles and the latter, 95,000 square miles. These possessions are populated mostly by nomadic peoples and have a population of about 730,000. The metric system is used in all weights and measurements and the monetary system is the same as that of France, except that the method of issuing paper money is somewhat different.

**INHABITANTS.** The inhabitants of Italy are of small stature and quite dark in complexion. Only a small number of foreigners reside in the country. The foreign inhabitants include principally French, Albanians, Greeks, Slavs, Germans, and Spaniards. A heavy emigration has been going on the last quarter of a century, due chiefly to the unsatisfactory condition of public affairs. Those who leave the country seek homes principally in the United States, Brazil, Argentina, and other countries of North and South America, and a considerable number find new homes in France, Germany, Austria, and Switzerland. In 1906 the total emigrants numbered 787,977, of whom 10,032 came to Canada and 358,569 to the United States.

Rome, on the Tiber, is the capital and largest city. Other cities of importance include Naples, Milan, Turin, Palermo, Genoa, Florence, Bologna, Messina, Venice, and Ravenna. The population has increased about fourteen per cent. in the last twenty years, and the density at present is 285 people to the square mile. In density of population it ranks third among the countries of Europe, being exceeded only by Belgium and the Netherlands. Population, 1907, 33,640,710.

**LANGUAGE AND LITERATURE.** The language of Italy is the Italian, which descended from the Latin. From the same source sprang the Spanish and French, but they are allied with other local elements, which make them more distinct from the Latin than the language of Italy. The German emperor, Frederick II., who ruled in Italy from 1212 to 1250, established the University of Naples and made the Italian his court language in Sicily. This circumstance may be taken as the first step to place the Italian language among those to survive the general up-

heaval after the Middle Ages, and soon after writers and teachers began to multiply, especially in Tuscany. By the end of the 13th century Italian, owing to its accuracy and poetic beauty, began to take precedence as the language of literature. It was greatly extended in popularity by the writings of Dante (1265-1321), who gave it the form in which it has prevailed in an almost unchanged condition until the present. The "Divine Comedy" is Dante's masterpiece, and still continues a work of much popularity. Petrarch and Boccaccio, in the 14th century, wrote works in prose that greatly improved the language in grammatical accuracy. The best known work of Petrarch is his "Parallel Lives," while to Boccaccio we are indebted for his "Decameron," a work in prose from which Chaucer, Schiller, and other subsequent writers drew much inspiration.

Florence became the great center of classic learning after the Middle Ages, but other noted centers of education aided in extending a taste for literary work. Alberti (1406-1472), an eminent poet and prose writer, is best known by his "On the Family." The great political reformer, Savonarola, added valuable orations to the literature. Ariosto (1474-1533), an eminent poet, is the author of "Orlando Furioso," an epic of chivalry which is still popular. Among the historians of this period is Machiavelli (1469-1527), who is the writer of "Prince," a work translated into many languages. Benevenuto Cellini (1500-1571) gave tone and tendency to literature by fine, artistic work, while Torquato Tasso wrote many dramas and poems, the latter including "Jerusalem Delivered," and to the same period belong the painters Titian and Raphael. Galileo, in the 17th century, produced numerous scientific writings which for clearness and purity of prose, linked with his discoveries in astronomy, gave immortality to his name. At the end of the 18th century we note the tragic writings of Alfieri, including "Agamemnon," "Philip II.," "Antigone," and "Marie Stuart." Vincenzo Monti (1754-1828) made an excellent translation of the "Iliad" and "Odyssey," while Carlo Goldoni (1707-1793) ranks as a famous comedian, and Silvio Pellico (1788-1854) produced numerous patriotic and historical writings. Among the writers of the 19th century are Gabriele Rossetti (1783-1854), a poet of considerable renown, and the novelists Manzoni and Rosini. The historians of this period include Capponi and Balbo, the political writers, Joseph Mazzini, and the satirists, Giusto.

Italian literature, though quite extensive in scope and character, has hardly touched the people with as marked an impression as that of

France, Germany, and England, largely because education has not been so widely disseminated within the regions where the Italian language prevails. However, with the larger encouragement of schools and higher institutions of learning there came a notable increase in interest, and the 20th century opened with prospects that before its close additions of wide scope will be made and general interest will become greatly extended. Among the recent writers of Italy may be named the historians Giovanni Monticcolo and Vittorio Fiorini; the poets, Arturo Graf, Giosuè Carducci, and Gabriele d'Annunzio; the novelists, Matilde Serao; the dramatist, Roberto Bracco; and the general writers, Eugenio Rossi and Nicola Zingarelli.

**HISTORY.** The history of Rome (q. v.) includes the early history of Italy. Prior to Roman supremacy Italy was peopled by various Italian tribes, including the Etruscans, Oscans, Latins, Umbrians, and Sabines. Of these the Latins attained to the greatest power and gave their language and name to the people. At present there are few traces of the first inhabitants. In the northern part the Germanic element is mingled with the native peoples, especially in Lombardy, while in the southern section are many descendants of former Greek colonists. At present the people of Italy partake of the characteristics of the early Romans, Gauls, and Germanic peoples.

The history of Italy proper begins with 476, when Rome fell under the invading Heruli, who comprised the barbarian tribes that proclaimed Odoacer King of Italy. Theodoric the Great, King of the Ostrogoths, obtained possession in 493, and by wise administration gave Italy a more wholesome government than had been experienced since the first decline of Roman prosperity. However, the Eastern emperor, Justinian, vanquished the Ostrogoths in 552, and Italy was governed from Constantinople, where the Eastern Empire had held sway since 395. The Germanic Lombards secured dominion in 568, and in 800 Charlemagne became the recognized ruler of Italy.

The Carlovingian dynasty gave eight kings to Italy, and in 951 Otto, King of Germany, reduced Berengarius II. to vassalage and ten years later was crowned King of Italy and Emperor of Rome. For more than two centuries German kings governed Italy. However, numerous wars for supremacy took place periodically between the popes, emperors, and the independent cities, and at that time rose the famous contest between the Guelphs and Ghibellines. Frederick Barbarossa, the emperor, stipulated a six years' peace at Venice in 1177,

VICTOR EMMANUEL III.

The King of Italy, Victor Emmanuel III., was born November 11, 1869. He studied at Rome and received a command in the national division of troops stationed at Naples. In 1896 he married Princess Helene of Montenegro. He succeeded his father, Humbert I., in 1900.

and concluded a treaty with the Lombard towns in 1183. The municipalities of Genoa, Venice, Milan, and Pisa flourished during this period, and Venice became the supreme power in the Levant, after the capture of Constantinople. The popes became temporal sovereigns of Rome in 1278, and an effort made by Henry VII. to restore German supremacy was defeated in 1312 by the Guelphs. Three years prior to this, in 1309, the papal seat was established at Avignon, and from there the papal power was exercised for seventy years. The history of Italy as an integral political body ceases in the 14th century, when five powers controlled the country and continued to hold supremacy until about the end of the 15th century. These five powers include the former republics of Venice and Florence, the duchy of Milan, the kingdom of Naples, and the Papacy.

In Florence arose the Medici family, which by its wealth and sagacity had almost absolute sway, but the Battle of Pavia, in 1525, gave the German emperors appointive power over several of the states. With the rising power of Florence was exemplified the influence of Savonarola, under whose activities political opinion was influenced largely. Within the 16th century the rival armies of different claimants struggled for supremacy, particularly those of Charles V. of Germany and Francis I. of France, by which the papal influence gained in strength. Francis I. was expelled from Italy shortly after the Battle of Pavia, after which Rome was captured and Pope Clement VII. became the prisoner of Charles V., in 1527. Two years later Charles V. attained supremacy by the Peace of Cambrai, and his son Philip was recognized undisputed sovereign by the Treaty of Cateau-Cambresis, giving the Hapsburgs undisputed control. The establishment of the order of the Jesuits and the Inquisition strengthened the Papacy, and in 1684 Venice conquered the Peloponnesus. However, the Peace of Utrecht, in 1713, gave Austria supremacy in Milan, Naples, and Sardinia. After prolonged wars the condition of Italy was one of apathy, its spirit of nationalism remaining crushed until the rise of the French Revolution, when it began to take on new life.

In 1796 Napoleon invaded Italy, was successful against the Austrians in the Battle of Marengo, in 1800, and five years later was crowned king. Soon after several districts were annexed to France and the following year, in 1806, Joseph Bonaparte became King of Naples, who, two years later, was succeeded by Murat. Napoleon held undisturbed sway in Italy until 1814, when Murat and Austria coöperated

against Napoleon, but Murat was dethroned and by court-martial was sentenced to death. In 1815 the Congress of Vienna restored Italy to its former state. At the same time the house of Savoy received Sardinia, the Hapsburg-Este family secured several principalities, and the wife of Napoleon, Maria Louise, received Parma. Lucca was given to the Duke of Parma, the Austro-Lorraine dynasty received Tuscany, the Pope was restored in the papal states, the Bourbons received Naples, and Monaco and San Marino secured independence.

These conditions existed more or less undisturbed until the Revolution of 1848, which broke out in Milan and Sicily, and the Italian people again became involved in a war for national union against foreigners. The movement received the support of the Pope in the beginning, but later it was withdrawn, whereby the national cause was weakened materially. In 1849 the Pope fled from Rome, a republic was proclaimed, and Mazzini became president. A French army of occupation restored the Pope in 1850 and other sovereigns were restored also, making the revolution fruitless. Victor Emmanuel II., King of Piedmont, gave aid to the national cause and was supported by Cavour of Sardinia and by Garibaldi. The Austrian army was defeated on June 14, 1859, at the Battle of Magenta and on June 24 at Solferino, after which the Peace of Villafranca was concluded. Victor Emmanuel was declared King of Italy in February, 1861, by the Italian parliament in session at Turin.

In the War of 1866 between Prussia and Austria, Italy was allied with the former, and, after the victory at Sadowa, Venetia was annexed by treaty to Italy and about the same time the capital was removed from Turin to Florence. In 1867 the national party under Garibaldi made an attack upon Rome, but was opposed by the papal army. However, on Sept. 20, 1870, Victor Emmanuel entered Rome, this being made possible by Napoleon III. withdrawing his troops to participate in the Franco-German War, and the emancipation of Italy was assured. The Pope was given a yearly donation of \$622,500. He retained possession of the Lateran Palace, the Vatican, the Church of Saint Maria Maggiore, and the villa of Castel Gandolfo. Reunited Italy entered with enthusiasm upon an era of nationalism, developed internal improvements, and regained its place as one of the great powers of Europe. In 1872 destructive eruptions of Vesuvius occurred, when much property and many lives were destroyed. Victor Emmanuel died in 1878. He was succeeded by his son, Humbert I., who

ruled with success until 1900, when he was assassinated, being succeeded by his son, Victor Eminent III. Italy became a member of the Triple Alliance with Germany and Austria in 1883. Though financially embarrassed at various times on account of protracted wars, the finances are assuming greater stability under continued national development. An earthquake destroyed the cities of Messina and Reggio in 1908 and changed the contour of the Strait of Messina. See **Earthquake**.

**ITCH**, a contagious disease of the skin, characterized by the appearance of small pustules, irritation, and uneasiness, by which the patient is inclined to rub the affected parts. It is caused by the itch mite, a microscopic insect that burrows within the epidermis. The eggs are laid in the skin by the female, hatch in about ten days, and give rise to the disease. An application of lard and sulphur to the affected parts is a common remedy.

**ITHACA** (ith'â-kâ), a city in New York, county seat of Tompkins County, at the southern end of Cayuga Lake, .36 miles south of Auburn. It is on the Lehigh Valley, the Delaware, Lackawanna and Western, and other railroads. The surrounding country is agricultural and dairying. The noteworthy buildings include the county courthouse, the Ithaca Conservatory of Music, the high school, and many fine churches. Cornell University occupies a fine site near the lake. It has electric lights, a public library, waterworks, pavements, and street railways. Among the manufactures are vehicles, paper, farming machinery, flour, clocks, musical instruments, typewriters, leather, glass, and firearms. The vicinity was settled in 1789. Ithaca was incorporated as a village in 1821 and became a city in 1888. Population, 1910, 14,802.

**ITHACA**, now called *Ithaki*, an island of the Ionian group, situated west of Greece. It is sixteen miles long and four wide. The area is 38 square miles. It has a mountainous surface, some of the elevations rising to a height of 2,600 feet. The inhabitants engage largely in agriculture, fruit growing, and marine life. Ithaca is mentioned by Homer in the "Odyssey" and contains many interesting relics. Vathi is the present capital, has a population of 6,010, and engages in commercial enterprises. The island has a population of 11,508.

**IVORY** (iv'ô-rÿ), the hard substance that constitutes the greater part of the tusks of certain animals, as the elephant, narwhal, hippopotamus, mammoth, and walrus. The value of ivory is in its elasticity, hardness, whiteness of color, fine grain, and capability of taking a high polish. Elephant ivory obtained in equa-

torial Africa is considered the most valuable on account of its exquisite fineness, close arrangement, and frequent curvature of the tubules. The tusks of elephants commonly weigh about 60 pounds each, but some reach 180 and even 200 pounds. Ivory is useful in making ornaments, handles for knives and forks, billiard balls, pianoforte keys, and many other useful articles. Ivory taken from the hippopotamus is much harder and of a clearer white than elephant ivory, and is preferred by dentists. Mammoth ivory is secured from Siberia, where it is found as a fossil of that extinct animal. Ivory black is a black powder used in painting, and is made from sawdust and shavings of ivory by burning. Different colors, such as green, red, and black, can be given to ivory by staining or dyeing. In ancient times ivory was quite as valuable as at the present, ranging in price from \$200 to \$350 per hundredweight, the value depending upon its purity. Solomon brought ivory from Tarshish and used it in making a throne of ivory and gold. Ivory is mentioned by Homer. In the year 400 B. C. Phidias made statues from it, plating them with gold. Specimens of ivory used in manufacture in the times of Moses are still preserved as Egyptian relics, while in many European museums are carvings in ivory made in Nineveh and other ancient Asiatic cities. The annual ivory trade of Africa is considerable, on account of which the elephant is gradually decreasing in numbers.

**IVORY, Vegetable.** See **Ivory Palm**.

**IVORY COAST**, a colony of France in West Africa. It is bounded on the north by Senegal and the French Military Territories, east by the British Gold Coast, south by the Gulf of Guinea, and west by Liberia. The possession has a coast line of 400 miles, along which the surface is flat, and in the southwestern part is Cape Palmas. The area is 125,250 square miles. As a whole the climate is hot and unhealthful to Europeans. Large tracts of forest characterize the interior, interspersed with extensive savannas. The western boundary is formed by the Cavalry River. Other streams include the Songan, Bandama, and Tanno. Toward the north the country gradually rises, but all of the vegetation is luxuriant. The forests yield large quantities of mahogany, palm oil, rubber, and resinous plants.

All parts of the gold coast have an abundance of rainfall, but the greatest precipitation occurs between February and July. In the months of August and September is a short dry season, but copious rains begin to fall in October. Considerable trade is carried in vari-

ous products, especially in coffee, bananas, maize, pineapples, rubber, and cocoanuts. The larger portion of the trade is with France. Grand Bassam and Grand Lahou are the chief seats of trade, and gold deposits occur near the former. Bingerville is the seat of administration. Ivory Coast has been a French possession since 1842, when several forts were established, and the extensive explorations of the interior date from 1885, under Captain Binger. The period of development began in 1887. Subsequently a railway line and telephone and telegraph communication were established. The colony is profitable territory, since it has great wealth in natural resources, especially in its extensive forests. It is administered by a lieutenant governor, who is subject to the governor general of French West Africa. Population, 1908, 2,054,000.

**IVORY PALM**, a plant native to South America, found in the Peruvian Andes and on the Magdalena River, valuable in commerce on account of yielding the vegetable ivory. It is palmlike, rather low growing, and occurs principally in damp localities. Its leaves are very large, different plants bear male and female flowers, and the fruit forms in clusters or drupes, often the size of a man's head. The drupes are massed together, having from five to nine nuts about as large as hens' eggs, and contain a close-grained and very hard albumen, resembling in color and texture the finest ivory. Ivory-palm albumen is used extensively in the manufacture of ornaments, buttons, umbrella handles, knobs for doors, and small trinkets, and is known as *vegetable ivory*. The seeds, called *corozo nuts*, are exported in large quantities from the northern part of South America to foreign markets.

**IVY**, a climbing plant of the ginseng or ivy family. It is native to Europe and Asia and is cultivated extensively as a climbing shrub for the walls of churches and dwellings, the stems becoming attached by means of radiating fibers. In the wild state the lower branches spread on the ground, and the main stems climb upon trees and other supports by means of aerial rootlets. The leaves are evergreen, have a smooth and shining surface, and are from three to five lobed. Many species of these plants are widely distributed, most of which bear greenish flowers and deep green or blackish berries. They include the *common ivy*, the *Japanese ivy*, and the *Virginia creeper*. Some of these plants attain a great age, growing to the top of high buildings, and developing stems several inches in diameter. Both the roots and leaves have medicinal properties, but

they are not important. In some countries the plant serves in the manufacture of baskets and other useful articles. The *American ivy* found commonly in the woods is a species of woodbine.

**IXGAQUIXTLA** (ēks-kä-kēks'tlä), a town of Mexico, in the state of Puebla, southeast of the City of Mexico. It was the scene of an important battle between the Mexican revolutionists under General Mier of Teran and

IVY.

1. Ivy with aerial rootlets; 2, Five-lobed leaves.

the Spanish forces under La Madrid. The town is occupied at present by native Mexicans and Indians. In its vicinity are numerous remains of antiquity. Population, 1906, 5,105.

**IXTAPALAPA** (ē-stā-pā-lā'pā), a town of Mexico, ten miles southeast of the capital, celebrated in early history for its splendid gardens of the Aztec emperors. It contains remains of ancient temples and altars of Aztec priests, but few traces of the ancient city now remain. At the time of the conquest by Cortes it was an important place. Population, 1906, 5,046.

**IZALCO** (ē-säl'kō), **Mount**, a volcano of Central America, in Salvador, 35 miles northwest of the city of San Salvador. It belongs to a group of extinct volcanoes, but itself is almost constantly in action, giving to the earth a trembling and rocking motion. This volcano was formed in 1770 and since then has been destructive at various times. The height is about 2,000 feet, but it is becoming higher gradually. It is one of the few incidents known to recent geographers where a mountain was formed in an open plain, thereby changing several streams and drainage basins.

**IZTACCIHUATL** (ēs-tāk-sē'whät'l), an extinct volcano of Mexico, situated near Popoca-

tapetl, forty miles southeast of the City of Mexico. It is covered with snow perpetually, whence the name, which means *White Lady*. The height is 16,705 feet above sea level.

**IZÚCAR** (ē-sōō'kär), a city of Mexico, in the state of Puebla, situated in a sugar district near the volcano Popocatapetl. The name Mat-

amoras Izúcar is sometimes applied to it in honor of the Mexican patriot of that name. It has good railroad connections and is noted for its sugar market. The chief buildings include the cathedral and several parochial schools. It has considerable trade and divers manufactures. Population, 1906, 12,985.

J

JACKAL

**J**, the seventh consonant and tenth letter of the English alphabet. It is classed as a palatal, its sound being that of *g* in *gem*, or of *dg* in *ridge*. Formerly it was interchangeable with *i*, the same character being used for both, and the separation of the two letters in English lexicons is comparatively recent. The sound does not occur in the Anglo-Saxon and was introduced from the French. It is used as a symbol in medical prescriptions at the end of a series of numbers, as *vij*=seven, *viiij*=eight.

**JABIRU** (jäb'î-rōō), the name of several birds of the stork family, native to Africa, Australia, and the tropical parts of South America. An American species is sometimes seen as far north as Florida. The body is about four feet long, with a wing extension of seven feet, and the plumage is white. The head and neck are black with reddish markings and are destitute of feathers. It is the only true American stork.

**JACANA** (jäk'ä-nä), the name of several species of small wading birds native to the warmer parts of the continents. They are related to the plovers, but quite closely resemble the rails. The toes and claws are remarkably long and slender, enabling them to walk on the floating leaves of water lilies and other aquatic plants while in search of food. The common jacana of South America is about ten inches long, has a black color marked with bright chestnut, and is abundant in Brazil and Guiana. The purple jacana is met with in Mexico and Texas and is peculiar in having a strong spur at the bend of each wing, which it uses in fighting its enemies. Several species are native to Australia and Africa, including the so-called lotus bird, named from its habit of frequenting places where the lotus grows.

**JACK**, a mechanical or hydraulic apparatus for lifting heavy weights. The simplest form

is the screw jack, which serves to apply much lifting power, while with a hydraulic jack a single man is able to raise ten tons one foot in a minute and a half. Jack is a nickname for John. It is the name of a flag used in the navy of the United States and Great Britain, which is displayed nearest the staff or on the end of the bowsprit. Jack is likewise the name of a species of the breadfruit tree found in the South Sea islands, which bears a large fruit, often weighing thirty pounds. The fruit is eaten extensively by the natives.

**JACKAL** (jäk'al), an animal which is similar to the dog, native to many parts of Asia and Africa. It somewhat resembles the fox and

JACKAL.

wolf, but is smaller than any of the wolves. The pupil of the eye is circular, as in the dog and wolf, but the tail is more nearly like that of the fox. Jackals live in holes in the ground, have a dirty color, and eat any kind of flesh. They come out of their places of hiding to search for food during the night, often in large packs, running down the animals on which they feed. In some countries they skulk around

the camps of armies where they devour the refuse matter or dig up the hastily buried dead. The jackal is easily domesticated and interbreeds with the dog.

**JACKDAW** (jăk'dă), a common bird of the crow family, belonging to the genus *Corvus*. It is smaller than the rook, has white eyes, a short bill, a gray neck, and glossy black back and wings. The jackdaw is native to all the continents, but is more common in the Old World. It frequents towns and cities, often building its nest in chimneys, spires, towers, or other elevated places. The female lays five or six greenish eggs, covered with dark brown spots. Its food consists of larvae, insects, and worms. Jackdaws, like the crows, are very social birds, being easily domesticated, and learn to imitate the human voice.

**JACK-IN-THE-PULPIT**, or **Indian Turnip**, a flowering plant common in moist and shady woods. It is a perennial herb, has a turnip-shaped root, and usually bears two leaves made up of three leaflets. The root is acrid, or biting, and is used to some extent in medicine. It has small flowers grouped together and surrounded by a greenish leaf, which falls away and the red berries become exposed. About the middle of the summer all parts wither, except the stem and the berries. This plant thrives in gardens when planted in a cool and moist place.

**JACK RABBIT**, the name of a very large rabbit which is found on the plains of North America, but is seldom seen east of the Mississippi River. It has large ears and is noted for its long leaps and great speed. Though gray in summer, it becomes white in winter. The jack rabbit is sometimes confounded with the Norwegian hare, which has been introduced into the United States, but has a much heavier body.

**JACKSON** (jăk'sŭn), a city of Michigan, county seat of Jackson County, on the Grand River, 35 miles south of Lansing. It is on the Grand Trunk, the Lake Shore and Michigan Southern, the Michigan Central, and other railroads. Large quantities of fruit and agricultural products are grown in the vicinity. The noteworthy buildings include the county courthouse, the public library, the Federal building, the State prison, and the high school. It has extensive car and machine shops of the Michigan Central Railway. The manufactured products include machinery, vehicles, pumps, cigars, agricultural implements, beverages, and woodenware. Near the city are extensive coal mines, which supply a large portion of the fuel required in manufacturing. It has an extensive jobbing

trade. The vicinity was settled in 1829 and the city was incorporated in 1857. Population, 1904, 25,300; in 1910, 31,433.

**JACKSON**, a city of Mississippi, the capital of the State and the county seat of Hinds County, on the Pearl River, 180 miles north of New Orleans, La. It is on the Illinois Central, the Queen and Crescent, and other railroads. Among the noteworthy buildings are the State capitol, the institutions for the blind, deaf, and dumb, the Federal building, the public library, and the Governor's mansion. It is the seat of the State penitentiary, Millsaps College, Bellhaven College, and Mary Holmes Industrial Seminary for colored girls. The municipal facilities include paved streets, waterworks, electric lighting, and a system of sewerage. Among the manufactures are cotton goods, farming implements, and tobacco products. It has a large trade in merchandise, cotton, and farm products. The region was settled about 1828 and the place was incorporated in 1840. General Grant occupied it with a Union force in 1863 and the next year it was partly destroyed by General Sherman. Population, 1910, 21,262.

**JACKSON**, a city of Ohio, county seat of Jackson County, 45 miles northeast of Portsmouth, on the Baltimore and Ohio Southwestern, the Detroit Southern, and other railroads. It has a county courthouse and several fine schools. Extensive coal and iron mines are worked in the vicinity. The manufactures include leather, woolen goods, ironware, flour, and machinery. Electric lights, waterworks, and sewerage are among the public utilities. It was settled in 1795 and incorporated in 1847. Population, 1900, 4,672; in 1910, 5,468.

**JACKSON**, a city in Tennessee, county seat of Madison County, on the south fork of the Forked Deer River, 85 miles northeast of Memphis. It is on the Mobile and Ohio, the Illinois Central, and other railroads. Among the noteworthy buildings are the county courthouse, the public library, the Memphis Conference Female Institute, the Southwestern Baptist University, a colored female seminary, and numerous fine business blocks and private residences. Highland Park is a fine public resort. The manufactures include flour, woolen goods, ironware, ice, cigars, furniture, pottery, cotton-seed oil, and farming implements. The surrounding country is agricultural and produces large quantities of cotton, cereals, and live stock. It is the seat of a large and important jobbing trade. The city has street railways, electric lights, pavements, waterworks, and other conveniences. It was settled in 1810 and incorporated in 1854. Population, 1900, 14,511; in 1910, 15,779.

**JACKSONVILLE**, a city of Florida, county seat of Duval County, on the Saint John's River, 150 miles southwest of Savannah, Ga. It is on the Southern, the Seaboard Air Line, the Florida East Coast, and other railroads. Steamship lines connect it with the leading ports of Cuba and the Atlantic coast. The noteworthy buildings include the county courthouse, the Union Depot, the Federal building, the Windsor Hotel, the Confederate Soldiers' Home, the Masonic Temple, the Duval high school, the Church of the Good Shepherd, and many charitable institutions. It has a fine beach and many hotels for the accommodation of invalids and visitors. Among the manufactures are cigars, clothing, packed fruit, spices, ice, and machinery. Large quantities of cotton, fruits, and lumber are exported.

Jacksonville is the largest city of Florida. It has long been a popular resort. Many of the streets are well paved with macadam and vitrified brick. The waterworks and electric light plant are owned by the city. It was founded in 1822 and named in honor of Andrew Jackson. A fire destroyed many blocks of the city in 1901. Population, 1900, 28,429; in 1910, 57,699.

**JACKSONVILLE**, a city of Illinois, county seat of Morgan County, 34 miles west of Springfield. It is on the Wabash, the Chicago and Alton, the Chicago, Burlington, and Quincy, and other railroads. The city is noted for its numerous educational institutions, among them the Illinois Woman's College, the Jacksonville College for Young Women, and the Illinois College, which includes Whipple Academy. It is the seat of the State institutions for the blind and the deaf and dumb. Other noteworthy features are the Carnegie public library, the county courthouse, the high school, and the Morgan County fair grounds. The leading industries include flouring mills, machine shops, and a woolen mill. It has manufactures of ice, vehicles, draining tile, railroad cars, candy, boilers, paper, and soap. The city is beautified by paved streets, public parks, waterworks, and an extensive street car system. It was platted in 1825 and incorporated in 1867. Population, 1900, 15,078; in 1910, 15,326.

**JACKSTONES**, a game played with small marbles or with pieces of iron. It is a popular amusement among children and is played in a variety of ways. Anciently it is said to have been played with the knuckle bones of sheep. Usually it is played with five stones, which are thrown in the air and caught on the back of the hand. Another way is to hold the five stones in the hand, then toss one of them into the air, the test being to lay the remaining four

stones on the ground and catch the one that has been tossed up before it can land.

**JACOBINS** (jäk'ô-binz), the most celebrated political club maintained during the French Revolution. It was organized at Versailles in 1789, when it was called the Club Breton. When the national assembly was removed to Paris, it increased rapidly in numbers and importance. Gradually it grew to greater controlling power than the national assembly, and by the year 1791 had 1,200 subordinate societies. Its height of power was reached in 1792, when it was foremost in the insurrectionary movements. The Commune of Paris was originated by the Jacobins, and through Robespierre they ruled supreme until his overthrow in 1794. After the execution of Robespierre, the club was prohibited by law and its halls were closed. Extreme revolutionists and those holding radical views in politics are often designated Jacobins.

**JACOBITES** (jäk'ô-bitz), the name of a Christian sect of Western Asia, confined chiefly to Syria and Mesopotamia. They were so named from Jacobus Barbadæus, Bishop of Edessa, who united them into a distinct religious sect. They are Monophysites in belief; that is, they maintain that the divine and human natures in Christ were so united as to form only one nature. The patriarch of Antioch is the head of the present Jacobites, and his appointment is subject to confirmation by the Sultan of Turkey. Three bishops and eight metropolitans are under the patriarch, who has his seat at the monastery of Zaphran, near Mardin. The Copts of Egypt originated from the Jacobites and like them hold to the doctrine of the single nature of Christ. They use the Syriac language in their church service, practice circumcision before baptism, and in most other respects they resemble the orthodox Greek Church.

**JACOBITES**, a party in Great Britain, who adhered to the male line of the house of Stuart after the revolution of 1688. They were numerous and powerful in Scotland, and for more than half a century continued to advocate the restoration of the dethroned James II. and his descendants. They rose in revolt in 1715 and in 1745, but the party became extinct after the death of the Pretender, Charles Edward, in 1788. In Ireland the Jacobites were supported by the Celts against the Saxons and by the Roman Catholics against the Protestants.

**JACOB TOME INSTITUTE**, an educational institution at Port Deposit, Md., established in 1894 by Jacob Tome. It was founded to promote secondary education, hence serves as a preparatory school for entrance into col-

lege or technical and professional schools. The departments include the kindergarten, a junior school for boys and girls, a high school for girls, a boarding school, and a high school for boys. The annual tuition is \$100, except for residents of Maryland, who are admitted free. The endowment is \$2,125,000, the library has 10,000 volumes, and the value of the property is \$850,000. About 600 students are in attendance.

**JACQUERIE** (zhák-rě'), **Insurrection of the**, the name of a war conducted by the peasants against the nobles of France. It began in 1358, at the time John II. of France was a prisoner in England. The insurrection was caused by the tyranny of the nobles and had its beginning near Paris, whence it extended rapidly to the valley of the Marne and elsewhere. At first the peasants were successful and committed many atrocities, but they were defeated near Meaux by Charles the Bad of Navarre. The nobles retaliated by killing many peasants and burning their villages. The name *Jacquerie* signifies clowns, or *Jaques*, and is derived from *Jacques Bonhomme*, a name frequently applied to French peasants.

**JADE**, the name of a species of hornblende. It is composed chiefly of silica, calcium, magnesium, and alumina, and is valued for its hardness and toughness. The primitive peoples used it for making ornaments and utensils, and it is still employed as material for carved objects by the Chinese. Jadeite implements are found among the prehistoric ruins of Mexico, Peru, France, Spain, and Central America. Axes and adzes made of jade are seen frequently in museums, such as the famous adze found at Oaxaca, Mexico, which is now in the American Museum of Natural History in New York City.

**JAFFA.** See *Joppa*.

**JAGANNATH** (jüg-ü-nät'), or **Juggernaut**, meaning "Lord of the World," the name applied to the Indian god Krishna. The term likewise has reference to the eighth incarnation of Vishnu and to numerous images of this deity, the most celebrated being at Puri, a city near the Bay of Bengal. The first mention of this god occurred in 318 B. C., and numerous temples and statues were erected to him at various times since. The image is wooden and has a black face, red body, and gilt arms. The mouth is usually extended and the eyes are formed of brilliant stones. It is worshiped on festal occasions by assemblages of pilgrims who give offerings in money. Formerly they dedicated

themselves in sacrifice by throwing themselves on the ground for the purpose of having the car on which the idol is mounted pass over their bodies. The deluded and confiding worshipers thought that this form of death was instrumental in conveying them into heaven. Since European occupation the practice has gone gradually into disuse, deaths occurring at the festivals now being rather accidental than designed.

**JAGUAR** (jä-gwär'), the American tiger, the largest representative of the cat family in America. It abounds chiefly in South America, though it is found in the region south of a line drawn due west from the boundary between North and South Carolina. It has a soft, rich fur, usually yellow, with large black spots, and within them are rings with smaller black spots.

JAGUAR.

In strength it is little inferior to the tiger, being nearly three feet high. The limbs are large, the body is thick, and the tail is long and of nearly equal thickness throughout. The jaguar is the largest carnivorous animal native to America. Its favorite abode is in the timber, where it lives chiefly on birds, monkeys, peccaries, and other animals. It can readily climb trees and often springs upon its prey. The hide of the jaguar is valuable for footwear and gloves.

**JAIPUR** (jī'pōor), or **Jeypore**, a city of India, capital of a native state of the same name, situated 850 miles northwest of Calcutta. It is important as a railway center, is inclosed by fortified walls, and has a large trade in produce and merchandise. The chief buildings include the palace of the Maharaja, the Mayo Hospital, the Sanskrit College, a school of art, and a meteorological observatory. It is lighted

by gas and electricity, has wide and substantially paved streets, and supports a well-constructed system of waterworks. The public park has a fine zoölogical section. Among the manufactures are muslins, jewelry, clothing, and carpets. The city was founded in 1728. Population, 1906, 168,109.

**JALANDHAR** (jä'lün-dür), or **Jullundur**, a city of India, capital of a district of the same name, 75 miles east of Lahore. It is located in the Punjab, in a fertile agricultural region, and is important as a railway and commercial center. The streets are regularly platted and well paved. It dates from an early period in the history of Asia. In the 4th century B. C. it was the capital of the kingdom of Rajput Katoch. Population, 1906, 69,235.

**JALAP** (jä'lap), a well-known purgative medicine obtained from the tuberous root of several plants found near Jalapa, Mexico, hence

JALAP.

its name. It grows on a tableland 6,000 feet above sea level, and is a twining plant with large white flowers and a turniplike root. Jalap is a valuable cathartic, but, being disagreeable and nau-

seous, is seldom given alone. It is very useful in some forms of dropsy, diseases of the brain, and febrile affections of children associated with constipation.

**JALAPA** (hä-lä'pä), or **Xalapa**, a city of Mexico, capital of the state of Vera Cruz, 54 miles northwest of the city of Vera Cruz. It is situated on an elevated slope and is surrounded by a fine farming and fruit-growing region. The healthful and genial climate causes it to be favored as a health resort. Among the principal buildings are those erected by the government, a large cathedral, a Franciscan convent, and a commodious railway depot. The snow-capped summit of Orizaba may be seen from Jalapa. The city was founded at an early date in the Spanish occupation of Mexico. In 1847 it was occupied by the United States troops. Population, 1905, 20,275.

**JAMAICA** (jä-mä'ká), the largest island of the British West Indies, one of the Greater Antilles, situated 90 miles south of Cuba and 100 miles west of Hayti. The greatest length from east to west is 145 miles; greatest width, fifty miles; total area, 4,225 square miles. A number of islands which are politically attached to

Jamaica have an area of 224 square miles. The western part is made up chiefly of lowlands, whence the surface rises toward the east, culminating in peaks with an altitude of 7,000 feet. The Blue Mountains, which occupy the eastern part, comprise the most important and highest chain. Most of the highlands are covered with forests of logwood, mahogany, braziletto, lignum-vitae, and other species of trees. Many indentations characterize the coast and furnish good harbors, such as Old Harbor and Port Royal, the harbor at Kingston. The rivers are short and unimportant, except for irrigation, and include the Salt, the Black, and the Garden rivers. The coast has a hot climate, but in the higher regions it is delightful. Rainfall is abundant in most sections. The year is divided into four seasons—two wet and two dry periods.

The government is administered by a Governor, who is appointed by the crown and assisted by a privy council. The legislative council consists of thirty members, half of which are appointed by the Governor and half are elected by popular suffrage. Kingston is the capital and seat of government. Other cities of importance are Spanish Town, Montego Bay, Savannah-la-Mar, and Falmouth. Schools are maintained by government grants and local taxation. Several normal schools, academies, and industrial schools are similarly supported. The interior commerce is facilitated by a number of railways, the total including about 245 miles. The principal exports include coffee, rum, sugar, vegetables, tobacco, and a large variety of tropical fruits. Among the imports are principally fish, rice, cotton goods, and flour.

Columbus discovered Jamaica in 1494, while on his second expedition to America. Several

settlements were made by the Spaniards in 1509. The island was taken by Cromwell in 1655, and by the Treaty of Madrid was ceded to England in 1670. The abolition of slavery, while proving beneficial to the moral aspect, caused a decline in its prosperity, owing to the fact that a large portion of the mongrel races are destitute of thrift. Signs of discontent on account of

British occupation manifested themselves at various times, a serious revolt occurring in 1865 and another in 1899, due largely to the prevailing system of taxation. For the purpose of relieving the laboring classes at least to some extent, the British government imposed an income tax, increased the land revenue, enlarged the stamp duties, and placed the colony under control of the colonial office. The islands politically dependent on Jamaica include the Turks, the Cayman, and the Caicos islands. The inhabitants consist chiefly of halfbreeds, Indians, and Chinese, only about 15,000 being whites. Population, 1906, 803,906.

**JAMAICA**, a town of New York, county seat of Queens County, twelve miles east of Brooklyn. It is located on Long Island and has direct connection with Brooklyn by railway and electric railroad lines. In 1898 it was included in the Borough of Queens of Greater New York.

**JAMES**, a river formed in Alleghany County, Virginia, by the union of the Cowpasture and Jackson rivers. The length is 450 miles, the course is largely toward the southeast, and it is navigable for large steamers to its confluence with the Appomattox, at City Point. Its largest northern tributary is the Chickahominy. The sixty miles nearest its mouth is an important estuary which articulates with Chesapeake Bay, while the James River and Kanawha Canal extends from Richmond to White Sulphur Springs. At Richmond it is obstructed for navigation by rapids which fall 100 feet in six miles. Lynchburg and Richmond are the most important cities on its banks, while Jamestown, the site of the first English settlement in America, is 32 miles from its mouth.

**JAMES**, or **Dakota**, a river of the northwestern states, rises in the east central part of North Dakota, flows south through South Dakota, and joins the Missouri about eight miles below Yankton. The James flows through a fertile prairie country and is about 400 miles long. It is popularly called the Jim River.

**JAMES BAY**, the southern part of Hudson Bay. It is 300 miles long from north to south and about 160 miles wide. Near the central part is Agomska Island, which is about 70 miles long. Moose Factory, an important station of the Hudson's Bay Company, is located near its southwestern extremity. Thomas James wintered near the bay in 1631-32, while in search of the northwest passage, hence the name.

**JAMESTOWN**, a city of Chautauqua County, New York, on the navigable outlet of Chautauqua Lake, about 68 miles southwest of Buffalo. It is on the Erie and the Jamestown and Chautauqua Lake railroads. The noteworthy

buildings include the high school, the Erie depot, and the James Prendergast Free Library of about 20,000 volumes. The popular resort of Celoron, on Lake Chautauqua, is similar to Coney Island (q. v.). It has well-paved streets, a system of public waterworks, and gas and electric lighting. The manufactures include flour, pianos, cotton goods, ironware, furniture, bicycles, boots and shoes, and worsted goods. The surrounding country is dairying and agricultural. Jamestown was platted in 1815 and incorporated in 1827. Population, 1910, 31,297.

**JAMESTOWN**, a city of North Dakota, county seat of Stutsman County, eighty miles west of Fargo. It is located on the James River and on several branches of the Northern Pacific Railroad, and is surrounded by a fertile farming country. In the vicinity are numerous artesian wells. Among the chief buildings are the county courthouse, the high school, the State hospital for the insane, and several large business blocks. The industries include grain elevators, machine shops, flouring mills, stockyards, and railway shops. Electric lights, telephones, and waterworks are among the public utilities. Population, 1905, 5,093.

**JAMESTOWN**, the locality in James City County, Virginia, where, in 1607, the first English settlement was made in America. It is about 32 miles from the mouth of the James River, on an island, which was formerly a peninsula, having been partly destroyed by the fluctuations of the river. The town was almost totally destroyed by Nathaniel Bacon in 1676 and was never rebuilt. It contains the ruins of a church and the fort.

**JAMESTOWN TER-CENTENNIAL EXPOSITION**, an international exhibition on the south shore of Hampton Roads, five miles from Norfolk, Va., to commemorate the 300th anniversary of the first permanent English settlement in America. The exposition was open from April 26 to November 30, 1907. The total appropriations, including those of the several states and the Federal government, aggregated \$5,444,500. About 2,500 classified exhibits were on the grounds and in the buildings, including those of the arts and sciences, agriculture and horticulture, machinery and transportation, forestry and game, manufactures and liberal arts, education and social economy, mines and metallurgy, etc. Considering the splendid location, few American exhibits have been more interesting to tourists. The total admission was 2,800,000, of which about 1,500,000 were paid.

**JANESVILLE**, a city in Wisconsin, county seat of Rock County, on the Rock River, seventy miles southwest of Milwaukee. It is on

the Chicago and Northwestern and the Chicago, Milwaukee and Saint Paul railroads. The chief buildings include the county courthouse, the high school, the public library, the Y. M. C. A. building, and the State school for the blind. Among the public utilities are electric lights, paved streets, waterworks, and electric street railways. The manufacturing enterprises include iron foundries, machine shops, a cotton mill, woolen factories, and flouring mills. It has manufactures of vehicles, boots and shoes, and farming implements. The surrounding country is agricultural and noted for the breeding of high-grade horses and cattle. Janesville was settled in 1837 and incorporated in 1853. Population, 1905, 13,770; in 1910, 13,894.

**JANIZARIES** (jăn'î-zâ-rÿz), a corps of Turkish infantry organized by Sultan Orkhan in 1330. It was the first regular standing army organized by the Turks, was comprised largely of children captured from Christian parents and brought up as Mussulmans, and used principally for garrison duty. According to an edict, they were provided with no habitation but their quarters, were forbidden to marry, enjoyed numerous special privileges, and took the field only when the Sultan was in command. The army of Janizaries numbered 10,000 in 1362, but later developed a strength of 100,000 men, while the irregular militia included 350,000. Their remarkable bravery and daring won Ottoman victories for more than two centuries, but later they degenerated into lawless and insubordinate bands, and planned several successful plots to assassinate Turkish nobles and sultans. In the War of 1826 with Russia they revolted, which led Mahmud II. to determine upon their destruction. Large numbers were banished by proclamation and others were executed, but those remaining made a desperate resistance. They lost 16,000 in killed and 7,000 were burned in barracks. In the organized military forces of Turkey they were succeeded by the *nizam*, the regular Turkish army, organized and disciplined on the general plan adopted by European powers.

**JANUARY** (jăn'û-â-rÿ), the first month of the year in the Gregorian calendar. It is named from Janus. According to Roman tradition it was first added to the calendar, together with February, by Numa. Originally it had 29 days, to which Julius Caesar added two more. The Roman year originally consisted of only ten months and began with March. It was known by the Scandinavians as the month of Thor. The Parliament of England, in 1751, made January the first month of the year.

**JAPAN** (jâ-păn'), an island empire of East-

ern Asia, situated in the Pacific Ocean, east of Corea. It consists of a chain of islands located north of the Philippines, from which it is separated by the Bashi Channel, and its western shore is washed by the Sea of Japan. The entire Archipelago consists of an immense number of islands, about 4,000, all of which appear to be the more elevated portions of a partially submerged mountain system. These islands, which embrace Japan proper, include 500 that are inhabited. In addition the empire includes 20 islands of the Bonin group and 55 islands of the Loo-choo group, and the colonial possessions of Yezo, Pescadores, Formosa, Corea, the Kurile Islands, and the southern half of Sakhalin. From north to south it has a length of nearly 2,400 miles, but the greatest width does not exceed 250 miles. The total area, including Corea, is about 244,000 square miles. The following table contains a list of the principal islands and possessions, together with the area:

NAMES.	Sq. MI.
Iki .....	51
Oki .....	131
Awaji .....	219
Tsushima .....	266
Sado .....	336
Shikoku .....	7,031
Sakhalin .....	12,250
Formosa .....	13,418
Kiushiu .....	15,588
Yezo .....	36,299
Corea .....	82,000
Hondo .....	87,771

**DESCRIPTION.** It may be said that the main group of islands is crescent-shaped, with the convexity toward the Pacific Ocean, the several portions being separated by narrow channels in which numerous islets abound. The coasts are indented by many gulfs and bays, but possess few good harbors. In most of the islands the coasts rise abruptly from the sea in rocky precipices, which continue in the form of mountain chains and diversify the surface with marked elevations, alternated with beautiful and fertile valleys. The dormant volcanic mountain Fusiyama, situated on Yezo, 60 miles southwest of Tokyo, rises 12,365 feet above sea level and is the culminating point of the Japanese group of islands. However, Mount Morrison, in Formosa, is somewhat higher, rising to an elevation of 14,360 feet. Lofty ridges extend in a general direction from north to south through the central part of Hondo and Kiushiu. Numerous active volcanoes occur in different localities, while earthquake action is frequent, the most damaging disturbances on record occurring in 1707, 1783, and 1792. In the earthquake of 1792 fully 53,000 people were killed by the eruptions of Wauzendake, on Kiushiu. Along the streams and near the coast are level tracts of

land. Tall grasses and forests occur in the mountains and where the land is not cultivated. The geological formations are largely igneous.

The islands being narrow and mountainous, Japan has no long rivers, though all parts of the country are well watered. Streams or streamlets furnish drainage in all of the valleys, which are beautified by many cataracts and waterfalls. The Ishikari, in Yezo, is the longest stream. It drains most of the central part, has a course of 407 miles, and discharges into the Sea of Japan. The Shinanogawa, in Hondo, flows northwest into the Sea of Japan, after a course of 320 miles. Few of the other streams exceed a length of 100 miles, and most of them are rapid and furnish navigation for only short distances. Numerous lakes are located in the larger islands, but only few are of any great extent. Lake Omi, in the south central part of Hondo, is 37 miles long and 10 miles wide. It is famed for its beauty, and is much visited by tourists in the summer season.

**CLIMATE.** Owing to the vast extent in latitude, the physical features are variously marked by climatic influences. The Kurile Islands have an extremely cold climate, where the sea freezes over in winter and the snow and ice never entirely disappear. On the other hand, snow and ice are never seen in the Loo-choo group, where the heat is great and the conditions are subtropical. In Hondo and the central part of the country, the climate is equable and moderately temperate, this being due in part to the warm currents in the Pacific Ocean. Although snow falls in Kiushiu and the southern part of Hondo, it remains only a short time, but in Yezo and the northern part of Hondo the winters are quite severe. While the country has an abundance of rainfall, precipitation depends largely upon the winds, hence some parts of the year are quite dry. The heaviest rains occur in June and September, and in some parts of the year it is necessary to resort to irrigation. At Hakodate the annual fall is 57 inches; at Yokohama, 70; and at Tokyo, 65. In general the climate is healthful, though the temperature frequently rises to 96° in the summer.

**FLORA AND FAUNA.** Japan is rich in the variety and luxuriant growth of its plants. Many of the species known to us as garden plants grow wild in different sections. These include the bluebell, violet, gladiolus, iris, and lily of the valley. The ferns are well represented and about 150 species of evergreen trees abound. Among the forest trees are the holly, cypress, yew, box, myrtle, camphor tree, mulberry, maple, birch, banyan, wax tree, lacquer tree, and many species of bamboo. Flowering plants are

very numerous, both wild and cultivated, and the Japanese are noted for their festivals in which flowers play a leading part. Many shell and fin fishes abound in the streams and coastal waters, including numerous species that are important in the industries. Among the mammals are the fox, wolf, black bear, weasel, flying squirrel, hare, and deer. The birds of song and plumage are abundant, including about 360 species. Flies, cicadas, crickets, and other insects are numerous. Many species of monkeys are met with in the southern part of the country. The reptiles are represented by 300 species, including numerous snakes, frogs, and lizards.

**MINING.** Though not especially rich in minerals, Japan has mining interests of considerable extent. Coal is mined extensively in Kiushiu and Yezo and is found in various other parts of the country, especially in Formosa. Iron ore occurs in nearly all the islands and copper is likewise well distributed. Silver mines are worked in Hondo and gold is obtained chiefly from the alluvial sands and gravels, though auriferous quartz exists in Sado and various parts of Hondo. Petroleum has been obtained in small quantities since the year 668 A. D. Other mineral products include lead, manganese, antimony, sulphur, graphite, tin, salt, and mercury. Granite and other building stones occur in many sections of the country, but they are not used extensively at present in general building, aside from the construction of bridges and aqueducts.

**FISHERIES.** The Japanese depend in a large measure upon the fisheries for their supply of food, since rice and fish are quite indispensable. Many species abound in the fresh and salt waters, and the abundance and variety seen in the markets are not surpassed in any country of the world. Fishes of the mackerel family are most numerous, and the golden bream is the most prized as a food fish. Many salmon-curing establishments are maintained, but they are most abundant in Yezo. Several large plants for the hatching and rearing of fish are operated under the supervision of the government as a means to replenish and maintain the supply. Sperm whales infest the waters of the northern section, yielding an abundance of ambergris. Other classes of fish include the shad, trout, flounder, halibut, sturgeon, haddock, sole, perch, and turbot.

**AGRICULTURE.** Farming ranks as the chief industry, nearly half of the inhabitants being engaged in agricultural pursuits. Rice is the staple food and the principal crop, fully 215 species being cultivated, and rice land is worth about three times as much as any other arable land.

The annual production of rice is about 215,000,000 bushels. Much of the product is used in the manufacture of saki, the beverage consumed most extensively. An area of 120,500 acres is utilized in the cultivation of the tea plant, and the production averages about 63,500,000 pounds of tea per annum. Other products include corn, pulse, millet, buckwheat, tobacco, rye, wheat, barley, and vegetables. Large interests are vested in the production of cotton, sugar, indigo, hemp, and silk cocoons. It must be noted that the variety of crops is very great, owing to the extent of the country in latitude, but the productions of any one section are not so greatly varied as would seem from the list of crops assigned to the entire country. To the list of productions enumerated above must be added a large number of fruits, such as the orange, persimmon, plum, banana, apple, cocoanut, grape, and strawberry. Sugar cane is an important product in the southern section.

Formerly little attention was paid to the rearing of herds and flocks, owing to the fact that the religious teaching of the Buddhists forbids the taking of life. However, the government more recently began to give much attention to the live-stock enterprise, and experimental farms are maintained to breed cattle, horses, and sheep. Butter, cheese, and milk were formerly unknown, but dairying has been introduced, and much attention is given to the rearing of cattle for milk and meat. Horses have likewise come into extensive use. Sheep rearing is promoted profitably in the elevated regions where farming is otherwise unprofitable. As a whole it may be said that the tillage of the soil is conducted with much care. The animals reared, especially poultry and sheep, are of a superior grade and receive marked attention.

**MANUFACTURES.** The manufactures of all kinds have grown extensively within recent years. Japan, like China, continues to hold a high place in the production of fine ceramics, wood, stone, and bone carving, lacquer work, and inlaid articles. Pottery and porcelain products are made at 4,750 establishments. Paper, silk, and cotton textiles, machinery, and clothing are manufactured on a large scale. Shipbuilding is an important enterprise at Nagasaki, a port of Kiushiu. Saki and soy brewing, salt making, and the manufacture of sugar and tobacco are important industries. Other manufactures include gunpowder, earthenware, matches, fireworks, chemicals, and cotton and silk textiles.

As a general rule the factories are comparatively small and employ an average of from forty to fifty men, though the aggregate capital

invested is extensive. Until recently the large machinery used in manufacturing and in agriculture was imported from America and Europe, but the rapid strides made in education and the industrial arts have led to a utilization of the native resources, the government encouraging the same by grants and efficient supervision. The Mikado has not only recommended appropriations for this purpose, but skilled laborers have been invited to Japan to teach and direct in utilizing its wealth of natural resources in the modern arts of manufacture. Perhaps no people in history have made more marked changes than the Japanese in the last half century, particularly in the use of machinery, modes of living, and educational arts. Since they have in large quantities all the essential substances for manufactures, such as timber, coal, iron, and stone, and possess the necessary intellectual and physical capacity, it is but natural that their cities should rise, factories develop, canals and railways extend, and all the institutions of civilization thrive.

**TRANSPORTATION.** Railways were not built in Japan until in 1872, when a line was constructed from Tokyo to Yokohama. At present the empire, exclusive of Formosa and Corea, has in operation 5,250 miles, of which about two-fifths belong to the government. Canals have been constructed to connect a number of the streams and to provide means for reaching several of the interior lakes. Extensive transportation facilities are provided by its long coast line, which accounts for the maintenance of a large merchant marine, including about 1,375 steamships and 4,150 sailing vessels. Ocean steamers ply regularly between the leading ports of Japan and those of the principal countries of the world, including Canada, the United States, Australia, Germany, England, India, and Italy. A system of highways is maintained jointly under government and local supervision, and much attention is given to carriage by the jinrikisha, of which 225,500 are in use. The telephone and telegraph are used extensively, and submarine cables supply communication with the leading nations of the world. The American postal system was adopted almost as an entirety in 1871, and much of the mail is delivered by free carriage.

Japan has an extensive commerce, both domestic and foreign. The former has been greatly augmented by the construction of steam railroads and electric railways, as well as by the establishment of larger manufacturing enterprises than were maintained formerly. The imports somewhat exceed the exports, and the total foreign trade aggregates annually about \$425,-

000,000. Among the chief exports are matches, textiles, copper, rice, tea, coal, cotton yarn, and raw and manufactured silk, and the imports include petroleum, tobacco, sugar, iron and steel, machinery, and cotton and woolen goods. The leading nations to participate in the foreign trade are Great Britain, the United States, Germany, China, France, Italy, and Belgium.

**GOVERNMENT.** The government is a limited monarchy, modeled after the constitution of the German Empire. In 1889 the present constitution was adopted, a representative government having been promised by Metusu Hito, who ascended the throne in 1868. The chief executive is known as Emperor, or Mikado, and is assisted by the imperial cabinet, the privy council, and the nine ministers of finance, foreign affairs, navy, war, justice, home affairs, communications, education, and agriculture and commerce. Legislative authority is vested in the diet or parliament, which meets annually and is constituted of an upper and a lower house. The upper house is composed of princes and titled classes who are members for life, while the lower house is constituted of representatives elected by direct vote of the people. The right to vote is based upon residence, one year in the voting district, the payment of direct taxes amounting to at least \$7.50, and male citizens who have attained the age of 25 years. At present the lower house has 300 members, chosen in 258 electoral districts. Each parliament continues for a term of four years, unless previously dissolved. Government is administered locally in districts, each having an assembly elected by the people and a governor. The system of courts extends from the local and district courts to the supreme judiciary, which is the tribunal of final appeal.

The financial system is based upon the gold standard, which was adopted in 1897, though silver and subsidiary coins are circulated extensively. For the purpose of providing an adequate volume of money, paper currency redeemable in coin is in general circulation. The unit of value in the monetary system is the *yen*, which is worth in United States currency about fifty-two cents, while silver coins in circulation have a value of fifty, twenty, and ten cents. The coins which have a value of five are of nickel, and two, one, and one-half cents are of copper. The resources of the government consist of the collection of revenues accruing from imposts, excises, registrations, customs, income taxes, state services, and the telegraph and telephone systems. The standing army numbers 167,650, which, on a war footing, is increased to 675,000 men and officers. Japan has a modern navy

made up of serviceable and powerful ships, and as a naval influence takes rank as the fifth among the nations of the world.

**EDUCATION.** The public school system is under the superintendence of the general government. Attendance is free and compulsory at specified ages. Equal care is exercised in the education of both sexes. All grades of work with suitable courses of study from the kindergarten to the university are maintained. Elementary schools are located in all the communities and culminate in a high school. The higher institutions include normal training schools for teachers, industrial schools to disseminate knowledge in the industries, and colleges and universities. The Imperial University at Tokio is the culminating institution of higher learning. Its courses of study articulate with those of other higher institutions maintained in college centers. This noted central institution was reorganized in 1886 and maintains departments of science, literature, law, economics, medicine, engineering, and civics. Its faculty of instructors includes ten German professors, nine English, two American, and two French. About 3,125 students receive instruction at this center of learning, at which they have access to a large library and utilize the most modern apparatus. Another noted university is maintained at Kyoto. Newspapers, magazines, and books are being produced extensively and read widely, while liberal translations have been made from the productions of other countries. In 1908 the country had 115 public libraries with a total of 1,448,950 books. The public library belonging to the government contains more than 200,000 volumes and numerous manuscripts. A strict newspaper censorship is maintained, while imprisonment for publishing matter derogatory to the government is not infrequent.

**RELIGION.** The religion of Japan is largely Shintoism, a form of worship according to whose tenets the Mikado is held to have descended from the sun goddess. It was introduced before the historical period as the ancient nonidolatrour religion. Later Buddhism and Confucianism were brought over, from China. Religious worship is free to all and state support is not given to any sect. The country has about 96,500 Shinto temples, many of them beautiful structures and quite similar in design. Those in the large cities are magnificent and costly buildings, the most celebrated being the Temple of Asava at Yeddo. Worship is observed at the temples, where a profound spirit of reverence and piety is displayed, while ancestral worship also prevails. Respect for the gods and the living parents is held to be the

source of all virtues. Mission stations and churches are maintained by all the leading Christian denominations and Christianity is making rapid progress.

**CHARACTERISTICS.** The Japanese speak various dialects of the same tongue, the only exception being the Ainos of Yezo, who number about 15,000. It is thought that the race is a mixture of the Malays of the islands situated toward the south and the Tartars who emigrated from Corea, and that their marrying and intermarrying finally resulted in the present marked Japanese type. The Aino race probably constituted the early population, which, after many centuries of wars, has become isolated to the island of Yezo. Among the characteristics of the Japanese type are an oval head and face, a well-shaped and curved nose, slightly oblique eyes, and somewhat rounded frontal bones. The expression inclines to the sordid, the complexion is rather pallid and yellowish, and the male face is almost hairless, but quite often is marked by a short and narrow mustache. They are several shades darker than the Chinese. The limbs are short in proportion to the trunk, though the stature is undersize, and the hair is dark brown, or black, and straight. The dress of both men and women has undergone marked changes within recent decades. The footwear consists of a small sock, called a *tobi*, which has a separate compartment for the great toe, is ankle high, and is covered by a sandal of straw or a wooden clog, but this covering is removed when treading on matted floors. Though the footwear of men and women is the same, there are marked differences in the headgear and dress. In 1886 a national law was enacted requiring the government officials to wear European dress when on duty, and women of the higher classes began to appear in public with European garments. Since then dress reform has been advancing rapidly even in the lower classes, and the former garments, somewhat allied to the Chinese, have either become modified or are fast disappearing.

As a people the Japanese are cleanly, courteous, frugal, kind, and pathetic. The children are admonished to parental obedience and are carefully disciplined, and all classes are required by law to secure at least an elementary education. Tobacco smoking is a common evil among both men and women, the theater is a place of popular amusement, and flowers and foliage are favorite decorations for all public places and the home. The architecture, though ornamental, lacks solidity and proof against fire. While their builders are skilled as turners, joiners, and carvers of wood, they lack a knowledge

of the more substantial and serviceable in architecture. Most of the furniture is plain and simple and is kept unpainted. The interior furnishings of edifices are rather grotesque than beautiful. The employment of European and American engineers and architects in the construction of railroads and electric car lines has brought about revolutionary movements in the construction of public buildings, harbors, and aqueducts, and in shipbuilding. Modern forms of masonry and the use of steel are rapidly displacing the looser and less endurable Eastern style. The *jinrikisha*, a two-wheeled carriage with two shafts drawn by a man, is still the common vehicle for conveyance, this having displaced the larger *palanquin*, though street railways, carriages, bicycles, and automobiles are coming into use in the larger cities and gradually gaining favor among the higher classes. Buffaloes and zebus are used as beasts of burden, while the horse and ox serve mostly for agriculture and draft purposes.

**INHABITANTS.** Comparatively little is known of the population of Japan prior to 1872, when the first reliable census was taken. At that time the inhabitants numbered 33,110,825. Since then the country has not only become more populous by the extension of territory, but there has been an increase through the excess of births over deaths. Within the last quarter of a century the urban population has increased noticeably, owing chiefly to the larger developments of the factory system. Tokyo, in Hondo, is the capital and largest city. Other cities of importance include Yokohama, Nagasaki, Osaka, Hiroshima, Kobé, Sendai, Hakodate, and Kyoto. About eighty cities have a population of over 20,000. Japan, in 1908, exclusive of Corea, had a population of 49,674,460.

**HISTORY.** The history of Japan dates from 660 B. C., but the accounts published for the period of fully 1,000 years following this date are legendary. Authentic history begins in 500 A. D. Jimmu Tenno is the reputed founder of the present dynasty and, according to Japanese historians, ascended the throne in 660 B. C. Empress Jingo invaded Corea in 201 A. D., from which time the Corean civilization is said to date. The *Rongo* and *Senjimon*, two sacred Chinese books, were introduced into Japan in 285 by the Coreans. Buddhism gained a foothold in 552 and became the established religion in 595, and in 624 the government established a Buddhist hierarchy. Chinese civilization was assimilated largely through commercial relations, and after 646 great strides of advancement were made in government, science, and educational arts.

The Fujiwara family established a superior form of civil service several centuries before 792, but by that time the military classes rose, and Yoritomo became shogun or generalissimo. This ruler is known generally to Europeans as Tycoon, the name applied by the Chinese. While he was not recognized as the person in whom the reigning power was vested, he really governed, but paid homage to the Mikado, who was regarded as the spiritual emperor. At that time the spirit of militarism spread to all parts of the dominion. In many cases the Buddhist monasteries even became military centers, which continued until 1603, when Tokugawa Iyeyasu instituted an era of peace by reason of his superior statesmanship. He made Yeddo the capital and center of power, from which his lineal descendants governed until 1868. This dynasty, known as the Tokugawa, repelled the Portuguese invasion in 1638, prevented the spread of Christianity, built great cities, and maintained a commerce and interior development distinctly Japanese, excluding entirely all classes of foreigners.

In 1853 Commodore Perry entered the harbor of Uraga with a United States squadron. He secured a treaty with the shogun, on March 31, 1854, which caused Japan to be opened to the commercial nations after its seclusion for 216 years. Since then modern civilization and arts have overwhelmed the Japanese like a contagion. The feudal system that rose under military fiefs was overcome largely. In 1867-68 the shogun was overthrown and replaced by a powerful empire under the Mikado. Yeddo was renamed Tokyo, or Tokio, a constitution was granted, and modern arts were introduced in every branch of the government and the industries.

The effective strength of the Japanese military force was ably demonstrated in the Chinese-Japanese War in 1894-95. This war resulted from internal dissensions in Corea, in 1894, which were incited largely by the factions of Japanese and Chinese in that country. Each of these respectively appealed to Japan and China for aid to quell insurrections, and, as each complied, a formal war was declared in August. A Japanese army promptly invaded China, while its navy destroyed that of the Chinese within a period of three months. The loss of immense stores and 25,750 men prompted China to ask for peace early in February, 1895. The conditions of the treaty ratified a month later provided for a cash war indemnity of \$150,000,000, the independence of Corea, and the cession of Formosa to Japan. Among the important events occurring since are those in relation to commer-

cial treaties with other nations, the extension of vast internal improvements, and the prominent part taken in the Chinese War of 1900-01.

In 1904 Japan became involved in an extended war with Russia, because the latter country had occupied Manchuria. Important battles were fought early in May on the Yalu River, where General Kuroki with a large army defeated the Russians under General Sassulitch. Port Arthur fell in 1905. Japan won the great Battle of Mukden, and Admiral Togo destroyed the Baltic fleet, which events were followed by the peace treaty at Portsmouth, N. H. Subsequently Japan suppressed a rebellion in Formosa, absorbed Corea, and strengthened its position as a factor in Manchuria. In 1905 it concluded a treaty with Great Britain. An imbroglio was threatened with the United States in 1907, owing to an unfriendly attitude of a large faction in America against Japanese immigration, but the issues were adjusted by wise diplomacy in both countries. See Russo-Japanese War.

**JAPAN CURRENT.** See Kuro Sivo.

**JAPANESE-BRITISH ALLIANCE**, an agreement concluded between Great Britain and Japan. It was signed at London Aug. 12, 1905, by Lord Lansdowne, Foreign Secretary, on behalf of the former, and Baron Hayashi, envoy extraordinary of Japan, on behalf of the latter. The agreement has for its avowed object the maintenance of general peace in the region of Eastern Asia and India and the independence and integrity of the Chinese Empire. The treaty is as follows:

The governments of Great Britain and Japan, being desirous of replacing the agreement concluded between them on Jan. 30, 1902, have agreed upon the following articles:

ARTICLE I.

It is agreed that whenever, in the opinion of either Great Britain or Japan, any of the rights and interests referred to in the preamble of this agreement are in jeopardy, the two governments will communicate with one another fully and frankly, and will consider in common the measures which should be taken to safeguard those menaced rights or interests.

ARTICLE II.

If by reason of unprovoked attack or aggressive action, wherever arising, on the part of any other power or powers, either contracting party should be involved in war in defense of its territorial rights or special interests mentioned in the preamble of this agreement, the other contracting party will at once come to the assistance of its ally, and will conduct the war in common, and make peace in mutual agreement with it.

## ARTICLE III.

Japan possessing paramount political, military, and economic interests in Corea, Great Britain recognizes the right of Japan to take such measures of guidance, control, and protection in Corea as she may deem proper and necessary to safeguard and advance those interests, provided always that such measures are not contrary to the principle of equal opportunities for the commerce and industry of all nations.

## ARTICLE IV.

Great Britain having a special interest in all that concerns the security of the Indian frontier, Japan recognizes her right to take such measures in the proximity of that frontier as she may find necessary for safeguarding her Indian possessions.

## ARTICLE V.

The high contracting parties agree that neither of them will, without consulting the other, enter into separate arrangements with another power to the prejudice of the objects described in the preamble of this agreement.

## ARTICLE VI.

As regards the present war between Japan and Russia, Great Britain will continue to maintain strict neutrality unless some other power or powers should join in hostilities against Japan, in which case Great Britain will come to the assistance of Japan, and will conduct the war in common, and make peace in mutual agreement with Japan.

## ARTICLE VII.

The conditions under which armed assistance shall be afforded by either power to the other in the circumstances mentioned in the present agreement, and the means by which such assistance is to be made available, will be arranged by the naval and military authorities of the contracting parties, who will from time to time consult one another fully and freely upon all questions of mutual interest.

## ARTICLE VIII.

The present agreement shall, subject to the provisions of Article VI., come into effect immediately after the date of its signature, and remain in force for ten years from that date.

In case neither of the high contracting parties should have notified twelve months before the expiration of the said ten years the intention of terminating it, it shall remain binding until the expiration of one year from the day on which either of the high contracting parties shall have denounced it. But if, when the date fixed for its expiration arrives, either ally is actually engaged in war, the alliance shall, *ipso facto*, continue until peace is concluded.

**JAPANNING** (jā-pān'ning), the art of coat-

ing articles of wood, leather, metal, and papier-maché with a variety of varnishes, which are caused to adhere by means of a high temperature applied in hot chambers during the drying process. The first step is to dry the article to be japanned, after which several coats of varnish are applied to constitute the *priming*, and subsequently the ground tint is mixed with the varnish. Several designs are secured by painting with colors, after which additional coats of varnish are applied to insure permanence. The grades of varnish used are largely mastic and shellac, though copal, dissolved in alcohol, is used to add fineness and durability. As a general process japanning is immediately between painting and enameling, and is done largely in imitation of Japanese and Chinese lacquered work.

**JAPURÁ** (zhä-pōō-rä'), or **Yapurá**, a river of South America, rises in the Andes, where it is sometimes called the Caqueta River. It flows through the department of Cauca, in Colombia, and is the first great tributary of the Amazon above the Negro. In part of its course it forms the boundary between Ecuador and Colombia. It is navigable a distance of 620 miles, to the Cupaty Falls, and above the falls it is navigable for small vessels several hundred miles. The valley of the Japurá contains a luxuriant growth of forests, which yield rubber and sarsaparilla. The entire length is 1,350 miles.

**JARNAC** (zhär-näk'), **Battle of**, a military engagement at the town of Jarnac, department of Charente, France, between 15,000 Huguenots under Louis, Prince of Condé, and 26,000 Catholics under the Duke of Anjou. Owing to the superior numbers of the latter, they gained a decisive victory.

**JASMINE** (jäs'min), a group of flowering shrubs of the genus *Jasminum*, including about 100 species. They are native to Asia, but some species are found in Southern Europe and Central Africa. In temperate climates they are cultivated in gardens for their evergreen foliage and very fragrant white flowers. Oil of jasmine is prepared from the flowers. Many of the species are twining plants. The leaves are simple or compound, the corolla is tubular, the ovary is two-lobed, and the fruit is berrylike. A species known as *Carolina Jasmine* is common to South Carolina and other sections of the South.

JASMINE.

**JASPER** (jäs'pēr), an opaque mineral belonging to the quartz family. It is very abundant and is prized for ornamental purposes, being susceptible to a high polish. Many shades of color, according to the impurities present, are found in jasper, including dark green, reddish brown, and brownish black. The different varieties of jasper include the Egyptian jasper, with distinct stripes; agate jasper, found in layers with chalcedony; and porcelain jasper, a kind of natural porcelain formed by the action of fire. Heliotrope, or bloodstone, is a variety of quartz having blood-red particles of jasper embodied in its mass.

**JASSY** (yäs'sê), or **Yassy**, a city of Rumania, formerly the capital of the principality of Moldavia. It is situated near the Kopoberg Mountains, in a beautiful valley of the Bachlui, a tributary of the Pruth, about 200 miles north of Bucharest. The city contains numerous edifices that date from the 14th century. Many of its streets are tortuous. It is connected by railroads and rapid communication lines, and is important as a commercial and manufacturing center. The business of the city is conducted mainly by Jews. Among its public facilities are several libraries, electric street railways, an art gallery, and numerous parks. Population, 91,500.

**JÁSZBERÉNY** (yäs'bě-rân-ÿ), a town of Hungary, on the Jazyva River, forty miles east of Budapest. The surrounding country is agricultural. It has a brisk trade in wine, corn, and live stock. It is a railway center, has electric lights, and contains a monument that marks the burial place of Attila. The inhabitants are chiefly Magyars. Population, 1906, 26,506.

**JATS** (jats), the name of a native race of India, confined chiefly to the Punjab and in the Northwest Provinces. About 5,000,000 of the inhabitants of India are classed as Jats. It is probable that they descended from ancestors who immigrated from Afghanistan. The Jat language belongs to the Sanskrit. These people are chiefly Brahmans, but a considerable number adhere to the Sikh and the Mohammedan faiths. They are dark in complexion, wear long beards, and engage chiefly in agriculture and stock raising.

**JAUNDICE** (jän'dis), or **Icterus**, a morbid condition due to the presence in the blood of an abnormal quantity of the bile. It is an indication rather than a form of disease, though a malignant attack is often followed by fatal results. Jaundice is marked by a yellowish color of the skin and eyes, peculiar languidness and weakness, and constipation. It results frequently from a diseased condition of the liv-

er, or an obstruction of the bile duct that connects with the intestines.

**JAVA** (jä'vá), the principal island of the Dutch East Indies and the most important colonial possession of the Netherlands. It is separated from Sumatra by the Strait of Sunda, which bounds it on the west. The boundary on the north is formed by the Java Sea, on the east by the Strait of Bali, and on the south by the Indian Ocean. Its length from east to west is 600 miles; breadth, from 30 to 125 miles; and area, 50,554 square miles. The surface is rolling, being generally characterized by torrent-like streams and precipitous ravines. Several large marshy tracts occur in the northern part. The southern coast line rises abruptly in unbroken cliffs, several of which extend as ridges over the island. They attain their culminating peaks in Slamet, height 11,325 feet, and Semeru, height 12,240 feet above sea level. The Solo River, 175 miles long, is the largest stream. Coal, salt, sulphur, manganese, and marble are the principal minerals. The climate is genial, being moderated by sea breezes, and is favorable to the production of cereals, fruits, forage crops, and domestic animals. Birds of fine plumage and song abound. The tiger cat, snakes, wild hog, rhinoceros, panther, tiger, deer, several species of monkeys, and large bats are indigenous.

The soil is generally fertile and the valleys and slopes of the mountains are generally covered with fine forests. Among the native trees are the teak, sandalwood, mahogany, camphor, and many other tropical species. Bamboo, rattan, flowering shrubs, and vines are very numerous. The principal exports are tea, coffee, sugar, cinchona, tobacco, pepper, indigo, horses, buffaloes, and cattle. Manufactories have been established, producing textiles, toys, and earthenware. Machinery, metals, petroleum, spirits, and clothing are imported to a large extent. Cable lines connect Java with Australia and Europe, and several railroads, electric car lines, and canals are operated. At present the railroad lines aggregate 1,650 miles. The trade is chiefly with the Netherlands, Germany, Japan and the United States.

The ancient history of Java is clothed in legendry, the first authentic date being 412 A. D., when several records were made of Hindu colonies. Under the Hindu dynasties the natives were converted to Brahmanism, but this form of religion was succeeded by Mohammedanism in 1478. The island came under control of the Portuguese in 1511. In 1610 the Dutch made settlements, but they were suppressed by the English from 1811 to 1817, since which time the

Dutch have governed the island as a colony without interruption. The natives belong largely to the Malay race and in religious affiliations to the Moslems, though there is a small per cent. of Christians, Brahmans, and Parsees. Several thousands of the natives are Christians. Dutch occupation has brought signal prosperity, developed the material resources, built an important commerce, and disseminated education and industrial arts through schools and several institutions of higher learning. Batavia is the capital. Soerabaya is the largest city. Besides these are numerous important seaports, among them Samarang, a thriving city. The standing army numbers 41,500 men and officers, of whom about half are Europeans. Population, 1905, 30,098,008.

**JAY**, a genus of birds of the crow family, smaller than the magpie and common crow. They are distinguished from the crow by having

BLUE JAY.

EUROPEAN JAY.

a shorter bill and wings and a blue or brownish-red color instead of black. About twenty species are well known, nearly all of which have a tuft of feathers on the top of the head and a long rounded tail. The wings are considerably shorter than the tail, which in some species is about as long as the body. They are found in both hemispheres, and live on insects, seeds, fruits, eggs, and young birds. The *blue jay* is one of the best known and handsomest species. It, like all others, has a peculiarly harsh, grating note, but when tamed partially imitates the human voice. The *English jay* is somewhat

larger than the American blue jay and the general color is a light brown, inclining to red. Another familiar species, the *Canada jay*, is widely distributed in the northern part of North America.

**JAYHAWKER**, a name which originated in Kansas at the time of the contest over slavery. The name was derived from jayhawk, a vicious bird of prey, to which the irregular and free-booting soldiers who were first called jayhawkers were likened. Later the term was used generally in the states of the West and South throughout the Civil War.

**JAY TREATY**, the name of a treaty concluded between the United States and Great Britain in 1794. The former country was represented by John Jay and the latter by Lord Grenville. It provided for peace and friendship between the two countries, free commercial intercourse on the American continent, the evacuation of the British posts in the United States by June, 1796, a commission to determine the northeast boundary between Canada and the United States, unrestricted navigation of the Mississippi, and indemnity to citizens of the United States who suffered losses through the capture of American merchantmen after the close of the Revolution. The treaty was generally unpopular in the United States, since it made no reference to the impressment of seamen and restricted the trade of that country in the West Indies. After a hard struggle the treaty was ratified on June 24, 1795, by a vote of twenty to ten in the Senate. It was declared that both Jay and Washington had been corrupted by money, and the former was burned in effigy in many places. In 1796 the House of Representatives voted by a narrow margin that the treaty ought to be carried into effect.

**JEANNETTE** (jĕn-nĕt'), a borough of Pennsylvania, in Westmoreland County, 26 miles southeast of Pittsburg, on the Pennsylvania Railroad. It has well-graded streets, waterworks, and lighting by natural gas. The surrounding country is agricultural and contains rich deposits of coal. Among the manufactures are window glass, rubber goods, hardware, and machinery. It has several fine schools and municipal buildings. The borough was incorporated in 1889. Population, 1910, 8,077.

**JEFFERSON CITY**, the capital of Missouri and the county seat of Cole County, on the Missouri River, about 123 miles west of Saint Louis. It is on the Chicago and Alton, the Missouri Pacific, and the Missouri, Kansas and Texas railroads. The location is on a lofty site, about 600 feet, and is nearly in the geographical center of the State. Among the note-

worthy buildings are the State capitol, the Lincoln Institute, the county courthouse, the State prison, a female seminary, and numerous churches and public schools. It is the seat of Jefferson City College and a normal school for Negroes. The manufactures include brick, beverages, farming machinery, vehicles, and pottery. The surrounding country is agricultural and contains valuable deposits of limestone and bituminous coal. Among the general facilities are pavements, electric and gas lights, city waterworks, and street railways. The place was settled in 1826 and incorporated in 1839. Population, 1900, 9,664; in 1910, 11,850.

**JEFFERSONVILLE**, a city in Indiana, county seat of Clark County, on the Ohio River, opposite Louisville, Ky. It is on the Cleveland, Cincinnati, Chicago and Saint Louis and the Baltimore and Ohio railroads. The chief buildings include the high school, the county courthouse, the Indiana reformatory, the United States quartermaster's supply depot, and numerous churches. It has electric and gas lights, city waterworks, pavements, and a system of sewerage. Among the manufactories are machine shops, foundries, shipyards, railroad car works, shot factories, oil refineries, and flour and lumber mills. It has a considerable trade in manufactures, coal, and produce. Population, 1900, 10,774; in 1910, 10,412.

**JEHOVAH** (jê-hô'vâ), the most sacred of the name applied to the Supreme Being in the Old Testament, in which it is used especially to designate the God of the Jewish people. Its meaning is explained in Exodus to be, "I am that I am," thus predicating self-existence in a sense that it cannot be applied to any other being. To the Jews the meaning implied is the personality of the Creator and Ruler of the universe, their Theocratic Guide, the First and the Last, and the Being above all gods. The name is of Phoenician origin and was used in a limited sense among the Israelites up to the time of Samuel, when its use spread rapidly. As a name it was deemed so holy by the Jews that they were guarded in allowing it to escape their lips, and therefore took means intentionally to mispronounce it or apply less sacred names, such as *Adonai*, which signifies lord, and *Elohim*. The latter is a less sacred name employed in some portions of the Pentateuch. Some writers think the name arose from Iao, the Phoenician sun god in the several seasons, especially in autumn, while others think it originated from Iao, the Chaldaean intelligent light.

**JELLY**, the juices of fruits or meats boiled with sugar so as to form an elastic consistence. This product is made most commonly from the

juices of currants, grapes, raspberries, and plums, from which the liquid is pressed and afterward boiled with sugar to form the proper consistence when cold.

**JELLYFISH**, a bell-shaped fish, belonging to the radiated animals, so called because, when lying on the sea-sand, it looks like a mass of jelly. It is familiarly known as sea-blubber and sea-nettle, two names originating from its long, stinging tentacles. In the water it appears exceedingly beautiful, moving with much rapidity by alternately contracting and expanding its crystallinelike body. Many of the jellyfishes show a phosphorescent light at night. They live on crustaceans and small fish, which they seize with their tentacles. Several orders and many species have been described. They are devoured in immense numbers by the right whales and other animals of the sea.

**JEMAPPES** (zhê-mâp'), a town of Belgium, in the province of Hainault, noted chiefly as the scene of the Battle of Jemappes. This battle was fought on Nov. 6, 1792, between the French under Dumouriez and the Austrians under the Duke of Saxe-Teschen. The French army of 46,000 men consisted largely of inexperienced volunteers and was sent in three columns against the Austrians, who had an army of 26,000 veterans. At first the French were beaten back with great losses, but they were rallied by Louis Philippe, who subsequently became king, and the engagement resulted in a defeat of the Austrians. At present the town has railroad communication and manufactures of various kinds. Population, 1906, 12,983.

**JENA** (yâ'nâ), a city in the grand duchy of Saxe-Weimar-Eisenach, Germany, about twelve miles southeast of Weimar. It is famous on account of the celebrated University of Jena, which was founded by John Frederick of Saxony in 1547, and was opened for instruction in 1558. The founder intended to build a great seat of learning at Wittenberg as a means to disseminate the evangelical doctrines. It soon rose to eminence and now attracts, as it has for several centuries, students from all parts of the world. The work in biology, philosophy, and theology is especially noteworthy. It has an average attendance of 800 students. Among the eminent men who were associated with the institution are Fichte, Hegel, Schelling; Schlegel, and Schiller. The university is supported by public taxes from all the Saxon states, has a splendid museum, zoölogical gardens, fine works of art, and a library containing 250,000 volumes. The city is beautified by numerous statues and parks. Population, 1905, 26,360.

**JENA, Battles of**, two important engage-

ments between the Prussians and French, which occurred on Oct. 14, 1806, one near Auerstadt, Germany, and the other near Jena. In the former battle General Davout commanded 30,000 French and the Duke of Brunswick led 48,000 Prussians, while in the latter Napoleon I. commanded 90,000 French, and Prince Hohenlohe had the superior command of 65,000 Germans. The French were victorious in both battles, thereby securing advantage over the whole of Prussia.

**JERBOA** (jēr-bō'ā), or **Gerboa**, a genus of small rodents which are closely related to the rats and mice, remarkable for their long hind legs. These animals use their fore legs more like hands than as feet, and the prolonged hind legs cause their movements when running to appear as though they were flying. They burrow in the ground with the fore limbs, these being armed with powerful claws, and the long

EUROPEAN JERBOA.

tail aids in holding the body in position while standing upon the hind legs, forming a kind of triangular support. In the winter they hibernate, especially in the colder countries, instead of storing up a supply of food as is the habit of mice. A number of species are native to Africa and Asia, and a similar ratlike rodent is found in the northern part of Europe. The jumping mouse common to North America belongs to the same class of animals. It is known locally as deer mouse.

**JEREZ DE LA FRONTERA** (hā-rāth' dā lā frōn-tā'rā), or **Xerez**, a city of Spain, in the province of Cadiz, sixteen miles northeast of the city of Cadiz. It is situated on the Guadalete River, has railroad facilities, and is surrounded by a fertile country, which produces large quantities of fruits, especially grapes. The chief buildings include a Moorish castle, the public library, the high school, the Convent of La Cartuja, and several theaters. It is famous as a market for wine and as a place for

bullfights. The place is mentioned as a Roman colony. In 711 it was the scene of a great battle between the Saracens and the Visigoths, in which the latter were overwhelmed. Population, 1905, 64,743.

**JERICHO** (jēr'ī-kō), a famous city of ancient Palestine, on a plain eighteen miles northeast of Jerusalem and six miles west of the Jordan River, near where that stream discharges into the Dead Sea. In the time of Solomon it was a flourishing city, exporting spices and balsam. Joshua made it his headquarters after his first entry into Canaan. It was destroyed by the Israelites and rebuilt by Hiel, the Bethelite, in 918 B. C. Later it was the seat of a school of prophets and the home of Herod the Great. Mark Antony assigned a portion of it to Cleopatra, Queen of Egypt. Subsequently it was destroyed in Vespasian's reign and rebuilt under Hadrian. It was repeatedly captured by the Crusaders and finally completely destroyed. The village of Er-Riha, with less than 300 inhabitants, now occupies the site.

**JERICHO, Rose of**, the name of a small plant of the mustard family, native to Arabia. It is a climbing shrub, with a singularly shaped blossom of a greenish-yellow color. When dried, the leaves and blossoms fold together upward, but open again when placed in water, and this process can be repeated several times. The plant was brought from Palestine to Europe by the Crusaders.

**JERSEY** (jēr'zī), the largest of the Channel Islands, located in the English Channel, 16 miles west of the coast of France. It is about 12 miles long from east to west, has a width of six miles, and the area is 45 square miles. The surface is high and rocky, but many of the valleys are unusually fertile. It has a rainfall of 30 inches, a mean annual temperature of 50°, and an equable and healthful climate. Large quantities of apples, pears, grapes, peaches, and other fruits are exported. Shipbuilding and oyster fishing are productive industries. The Alderney and Jersey breeds of cattle are grown extensively for dairying and export purposes. Saint Helier is the principal town. Population, 1906, 52,986.

**JERSEY CITY**, a city in New Jersey, county seat of Hudson County, on the Erie, the Central of New Jersey, the Pennsylvania, the West Shore, and other railroads. It is situated on the Hudson River, opposite New York, with which it is connected by ferries and by the tunnel of the Pennsylvania Railway. Several transatlantic and other steamship lines sail regularly from this port. Communication is likewise furnished by the Morris Canal and many electric urban and

interurban railways. In population it ranks as the second city of New Jersey, being exceeded only by Newark.

Jersey City is well built, much of the architecture being of vitrified brick and stone. The chief buildings include the county courthouse, the Hasbrouck Institute, the city hall, the Fourth Regiment Armory, the Saint Peter's College, and the public library with more than 100,000 volumes. It has thirty substantial public school buildings. In the northern part of the city are the southern ridges of the Palisades, where many modern and costly residences have been built. Other features include the soldiers' and sailors' monument, the West Side Park, and the Hudson County Boulevard, which extends entirely through Hudson County and beyond.

The streets are platted at right angles, well paved, lighted by gas and electricity, and connected with Hoboken and suburban districts by electric street railway lines. Among the numerous manufacturing establishments are potteries, planing mills, and engine and car works. It has manufactures of jewelry, rubber goods, fire-works, copperware, castor and linseed oil, hydrants, oakum, tobacco, lead pencils, etc. The trade in crucibles, live stock, grain, and fruit is especially extensive. It has a growing jobbing trade in all classes of merchandise. The site on which Jersey City stands was formerly called Paulus Hook, but was named City of Jersey in 1820 and was chartered as Jersey City in 1838. In size it takes rank as the seventeenth city of the United States. Population, 1910, 267,779.

**JERUSALEM** (jê-ry'sâ-lêm), an ancient and interesting city of Palestine, in the Turkish province of Syria, noted as the holy city of the Jews. It is situated 15 miles west of the Dead Sea and 32 miles east of the Mediterranean, about 2,500 feet above sea level, on the slopes of two hills. Near it are two ravines, the valley of Hinnom being toward the south and the valley of Jehoshaphat toward the east. A third depression, the Tyropean Valley, extends through the city from north to south. Mount Zion, a celebrated eminence on the southwest, rises 300 feet above the surrounding surface. Other eminences include Mount Akra on the northwest, Mount Bezetha on the northeast, Mount Moriah on the east, and Mount of Olives east of the city.

Jerusalem is mentioned as early as 1500 B. C., when the Jebusites were in possession. Joshua conquered a portion of the city, but they maintained control of at least the upper part until the time of David, who made it his capital and strengthened the portion known as Zion. In the time of Solomon it attained its greatest prosperity, but began to decline shortly after his

death. Nebuchadnezzar took it from Zedekiah in 586 B. C. after a protracted siege, carried many of the Jews to Babylon in captivity, and left it in a desolate condition. Cyrus permitted the Jews to return from captivity. In 515 they rebuilt the temple, but the walls were not replaced until 455, in the time of Ezra and Nehemiah. Shortly after it was possessed by the Persians and passed consecutively to the Macedonians, Syrians, Egyptians, and Romans. It was sacked at various times, its temples were burned, and the city was razed.

Hadrian ordered Jerusalem rebuilt in 131 A. D., though it remained in a poor condition until Rome became Christianized, when it prospered for a time under the protection of Constantine the Great and his successors. With the Mohammedan conquest, in 636, it became a possession of Caliph Omar, an Arabian, and continued under Moslem rule until 1099, when the Crusaders planted the cross upon its domes and converted it into the seat of a Christian monarchy. A desperate war between European Christians and Moslems prevailed for 87 years, in which much life was spent and many institutions were ruined, but finally the city was taken by Saladin in 1187 and was never retaken by the armies of the Crusaders. Since 1244 it has been constantly under Moslem rule, being under the Turks since 1517, and still remains a part of the Ottoman Empire. The last seven centuries have been largely times of peace, Europeans being permitted to explore, settle, and build institutions within its confines.

The various parts of Jerusalem are of intense interest to the Jewish and Christian travelers as they explore the old portions of the city, visiting the various historic places, such as the site of Solomon's temple, the palace of Jewish kings, the localities frequented by Jesus Christ, and the place of the Holy Sepulcher. Many excavations have been made to study localities of interest, while the ruins and structures remaining intact have been scrutinized with a devoted reverence. Formerly three walls provided amply against invasions, though these are now largely among the ruins. It is remarkable that far more of the old city remains than is left of either Carthage, Corinth, Tyre, or even Rome, yet many of the buildings are illy constructed, almost windowless, and marked by low and dingy ceilings. A majority of the buildings are one-story and present a unique appearance as they skirt the numerous tortuous streets. The manufactures are not important, including chiefly jewelry, clothing, fabrics, crucifixes, and utensils. In 1893 a railroad was opened to Joppa. The railroad commerce, telegraphic

connections, and other modern facilities have since been enlarged and brought into extensive use.

Besides the beautiful Church of the Holy Sepulcher, there are numerous Christian edifices, convents, and institutions of learning. Several mosques are maintained in conspicuous places, the most important being the Mosque of Omar, which occupies the site of Solomon's temple. Fifty years ago the inhabitants all lived within the city walls. At present nearly one-third reside in the suburbs. The Jews are immigrating rapidly and have fully 70 synagogues. They occupy the southwestern part of the city; whereas, the Christians reside chiefly in the western, and the Mohammedans in the eastern, including the Haram, or temple area. Christians and Jews are vying with each other to secure the best sites. The different classes of people are Turks, Greeks, Armenians, Copts, Abyssinians, Syrians, Georgians, Jews, and others, the whole presenting a great mass of conglomerated humanity. The city has several fine hospitals, seminaries, and elementary schools. An extensive society known as Zionists, well organized in Europe and America, constituted of wealthy and representative Jews, is vigorously promulgating a plan whereby the city is to be reoccupied and invigorated by the Jewish people. At present the population is 61,348, two-thirds of whom are Jews, about 9,000 are Christians, and 5,500 are Mohammedans. See **Zionists**.

**JESTER** (jĕst'ĕr). See **Court Fool**.

**JESUITS** (jĕz'û-its), or **Society of Jesus**, a celebrated religious order of the Roman Catholic Church, founded in the 16th century under the leadership of Ignatius Loyola. It was sanctioned by a papal bull in 1540, when the first generalship was vested in the founder. He was supported with much zeal by Saint Francis Xavier, the so-called "Apostle of the Indies," who did much effective missionary work in India and Japan. The original design of the originator and his five associates was to make a pilgrimage to Palestine and convert infidels, but, as this was averted by a Turkish war, the organization turned its efforts to meet the new conditions that had arisen after the Reformation. The vows include those of chastity, poverty, implicit obedience to superior authority, and compliance with the mandates of the Pope in going to any country or under any conditions to convert heretics and infidels. Popes Paul III. and Julius III. recognized the influence that the Jesuits might wield and granted them extraordinary privileges, among them the power to absolve from all sins and ecclesiastical penalties, to exercise all priestly functions, and to

dispense themselves from the prohibitions of meat and observance of fasts, to which were added extraordinary privileges in the use of the breviary. Their efforts were directed with particular zeal against the rise of Protestantism. In their practices they carefully avoided the appearance of pride, seclusion, and superiority, rather mingling promiscuously with the common people and adapting themselves to various local circumstances.

Besides opposing Protestantism, the Jesuits labored against the claims of monarchs to counteract the establishment of papal power. Their influence spread rapidly, more or less affecting all European countries, even the new settlements of America, though the work was less effective in the United States than in Canada, Mexico, or the countries of South America. Their remarkable rise of power at European courts and among the people led many institutions of learning, professors, and the non-Jesuit clergy to fear them. It was largely for this reason that the parliament of France resisted the Jesuits in their attempts to obtain a foothold, though by the assistance of the Guises they succeeded in getting legal recognition in 1652, but were required to renounce some principles and assume the name of Father of the College of Clermont. Their power in Germany gave them marked prestige after 1549, when they secured chairs in a number of universities and exercised political influence, but they lost some power by the Jansenist controversy. Soon after the famous "Provincial Letters" from the pen of Pascal weakened their influence by pointing out doctrines and practices which he considered dangerous and vacillating, and called attention to their consecration to the policy that "the end justifies the means."

In 1773 Pope Clement XIV. suppressed the whole Jesuit order by a papal bull, but in 1814 it was restored by Pope Pius VII. During the suspension of the society the excellent institutions founded by the Jesuits in Canada were either confiscated by the government or destroyed, but since then they have been replaced and greatly enlarged. Among the more noted institutions in Canada are the Saint Mary's Academy in Montreal, which is unrivaled by any other Canadian institution of the kind, the church in Montreal, and the Saint Boniface in Manitoba. In the United States they possess a large number of educational institutions, the most noteworthy being in New York City; Washington and Georgetown, D. C.; Baltimore, M. D.; Buffalo, N. Y.; Saint Louis, Mo.; New Orleans, La.; Denver, Col.; Cincinnati and Cleveland, Ohio; Omaha, Nebr.; and San Fran-

cisco, Cal. The Jesuits have not had legal existence in Italy since 1861. They were expelled from Germany in 1872. These two countries are unfriendly to the order on account of the opposition of the Jesuits to the present governmental organizations, which they opposed during the formative period. France expelled them from their conventional establishments in 1880, which caused many Jesuits to settle in Great Britain. Within recent times they have taken unusual interest in ecumenical councils, labored earnestly among the American Indians, and exercised influence in shaping the higher policy of the Pope and the church.

**JET**, a black and compact variety of lignite. It is light, hard, and capable of being turned easily, or cut into articles for charms and ornaments. It takes a fine polish. Jet is found in many parts of Europe and Asia, particularly in Asia Minor, France, and at Whitby, in England. The jewelry and various articles of ornament used for mourning are made largely of jet, though excellent imitations are produced from tempered India rubber and glass. The products made of the former are more properly known as ebonite or vulcanite.

**JETTY** (jět'tý), a construction of masonry or wood which projects into the sea, or some other body of water, as a wharf or pier for landing and shipping, or as a mole to protect a harbor. Jetties of another kind are constructed in rivers for the purpose of increasing the current and depth by narrowing the channel. Among the most noteworthy in the United States are those at the mouth of the Mississippi, which have caused the depth of the river to be increased from seven to thirty feet. These were planned and constructed by Capt. James B. Eads (q. v.), in 1875, under an order of Congress to improve the South Pass of the Mississippi. He built two parallel jetties with a channel of 350 feet, the west jetty being 7,800 feet and the east jetty being 11,800 feet long. The longest jetty in the world, that at the mouth of the Columbia River, is nearly five miles long. Other American jetties are at Charleston, S. C., in the Saint John's River, Florida; and at the mouth of Sabine Pass, Texas. Among the many jetties of Europe those in the Danube are of greatest utility, since they have increased the depth of the main channel of its principal mouth twenty feet and made navigation by the largest steamships possible. In numerous places jetties are serviceable in retarding the advance of sand and gravel bars.

**JEW**, The Wandering. See Wandering Jew.

**JEWELRY** (jü'ěl-rý), the precious stones,

gems, and ornaments prepared by jewelers, also the art of mounting precious stones. Jewelry made of metals, amber, alloys, coral, and other materials were used as personal adornments from the earliest periods of history, and were commonly worn by peoples in all stages of savagery and civilization. Relics found in the tombs of ancient Egypt, Peru, and Mexico indicate that jewelry was highly prized. Many antiquities obtained in Egypt indicate that gold work of the highest quality was used extensively for ornaments about 3,000 years ago. In many of the European museums are splendid specimens of ancient Roman and Greek jewelry produced by Etruscan artists, these being secured from the tombs of Etruria. Most jewelers of Oriental countries still pursue the primitive methods of manufacture common many centuries ago, and by their dexterity and refined taste secure products that display rare taste, but their products are surpassed in finish by those made by workmen who employ modern methods. The jewelry trade of modern times is an important branch of industry. In America its greatest center is in New York, while Paris, Berlin, Vienna, and London are important European centers of the manufacture and trade in jewelry.

**JEWFISH**, the name of several large fishes found along the coast of California and in the Gulf of Mexico. The common jewfish, or *black grouper*, has a large head and mouth and at maturity weighs about 300 pounds. It is found off the coast of Florida and in the West Indies. The jewfish of California is much larger, frequently weighing 500 pounds. It frequents rocky islands, has a brownish color, and is commonly called *black sea bass*. This fish is prized for food and commands a high price in the market.

**JEWS**, a race of Semitic people which descended from Abraham, frequently called Hebrews and Israelites, but the last two names apply more properly to them prior to the Babylonian captivity. In their early period they were linked closely with Palestine.

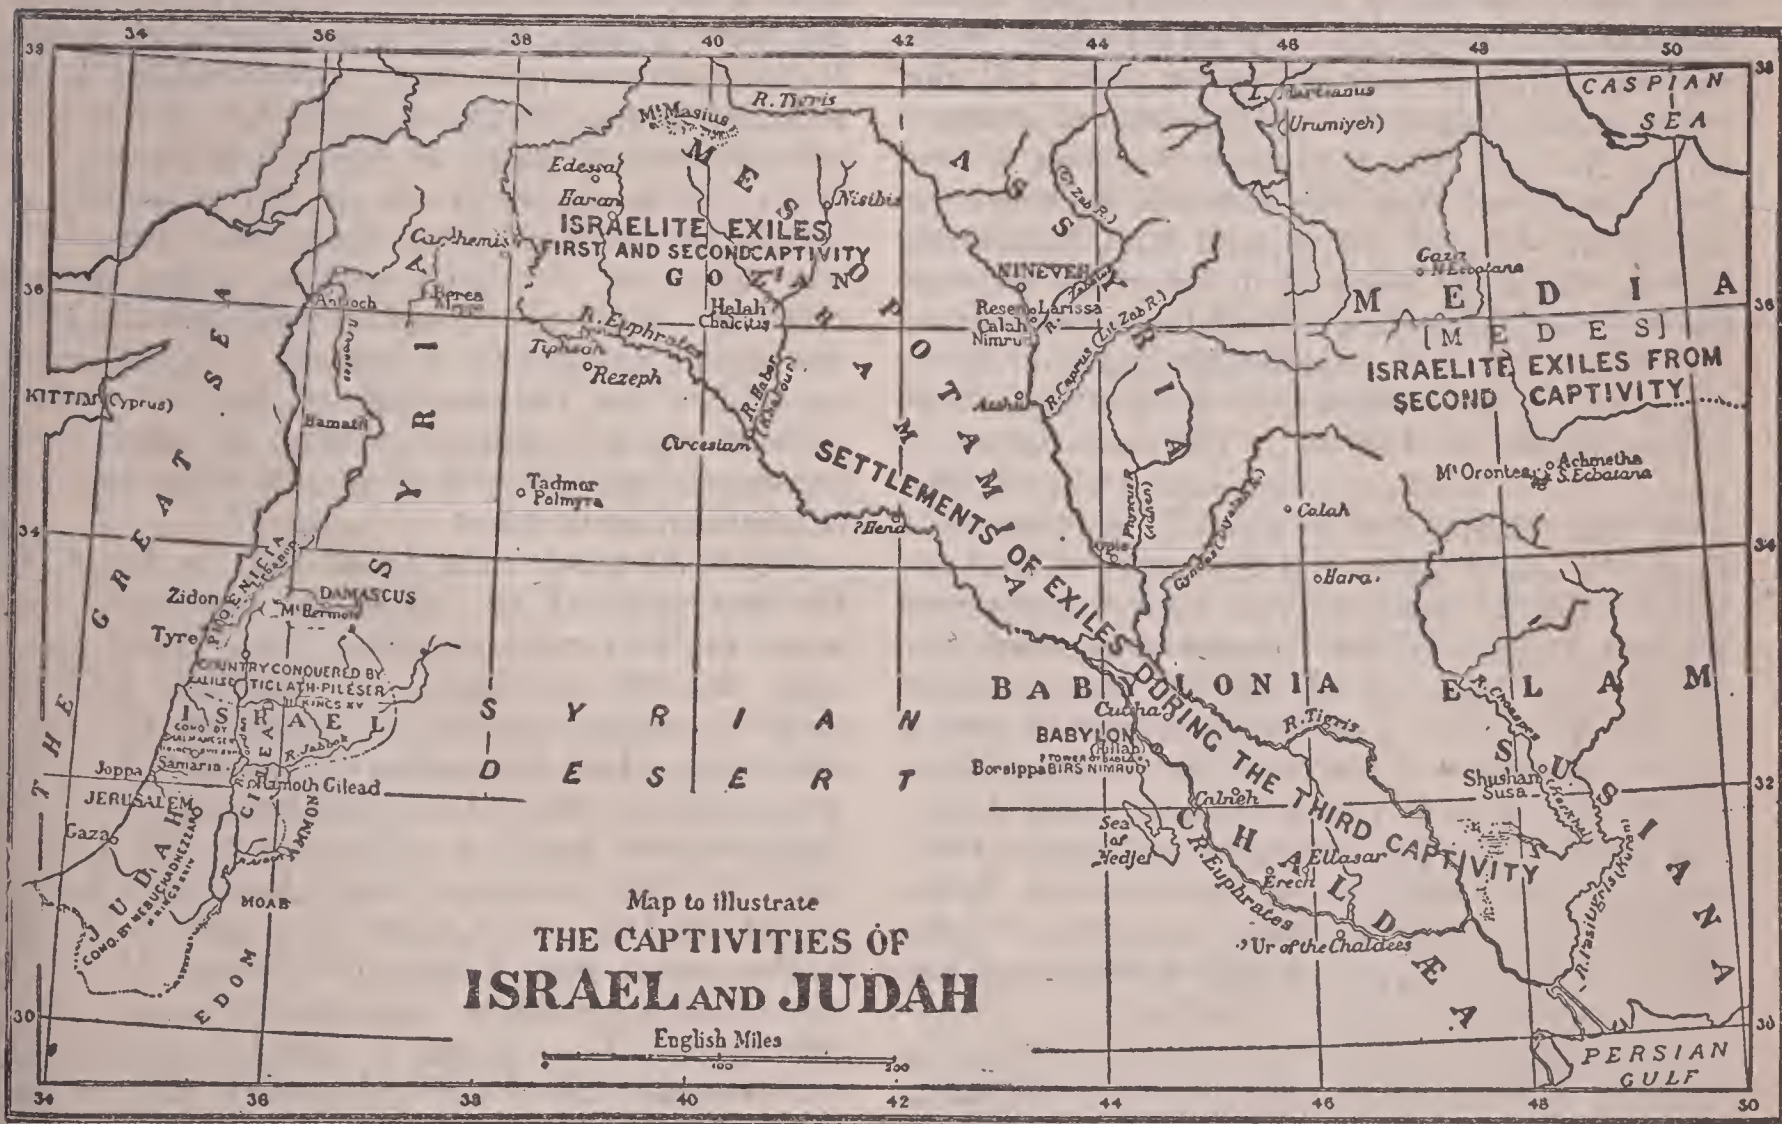

**ANCIENT HISTORY.** The Jewish history dates from the time when the patriarch Abraham left Ur of the Chaldees and settled in Canaan or Palestine. He and his descendants, the houses of Isaac and Jacob, flourished in the southeastern part of Palestine until Joseph, a son of Jacob, became a high official of Egypt. At the time of a widespread famine Jacob and his other eleven sons were induced to emigrate to Goshen, Egypt, where their descendants flourished with marked prosperity for 430 years, though during the latter part of the period they

were treated as bondsmen and held in abject slavery.

It is thought Rameses II. was the Pharaoh who first oppressed the Israelites, and that their deliverance was effected in the reign of his son. In 1320 B. C., or according to others in 1491, Moses became their deliverer and led them out of bondage, directing their famous exodus and wandering in the wilderness in the vicinity of Kadesh, near the boundary of Palestine. During this period they numbered several million. They were divided into twelve tribes according to their descent from the twelve sons of Jacob, receiving in the wilderness through Moses, direct from God, the ten commandments

the Jordan from the Canaanites in 1274 B. C. However, the native peoples were not entirely subjugated at that time, though the lands were divided among the twelve tribes, each receiving a district more or less separated from those of the others, and the whole was governed as a union of states under local chiefs. The grazing lands lying east of the Jordan were allotted to the tribes of Gad, Reuben, and the semitribe of Manasseh, and the others—Benjamin, Simeon, Dan, Judah, Ephraim, Zebulon, Asher, Naphtali, and the second semitribe of Manasseh—received lands west of the Jordan. The priestly tribe of Levi secured 48 cities, was allotted the tenth part of all agricultural products, and received

on Mount Sinai and a complete polity of government. All the laws imposed upon them in the Pentateuch were given as eternally binding. Their government was theocratic. The hereditary priesthood was vested in the tribe of Levi, originally under the direction of Aaron, the elder brother of Moses, and constituted the central idea of national unity.

At the close of the extended wanderings in the wilderness they marched northward to found settlements in Palestine, but Moses died before setting foot upon the land of promise and was succeeded by Joshua, who led the hosts of Israel and successfully conquered the regions west of

authority to frequent any portion of the territory.

Joshua died about 1220 B. C., after which period the bonds of unity between the tribes were less rigid, of which fact the Philistines, a people inhabiting the coast plains along the Mediterranean, took advantage and brought a portion of the Israelites under subjection. These wars were followed by the heroic age of the Jewish people, during which time they were governed by a succession of fifteen judges, of whom the most noted were Deborah, Gideon, Jephthah, Samson, and Samuel. Samuel was the most successful ruler since Moses, the last

of the judges, and, after popular entreaty by the people, inspired Saul, a Benjamite, to become king, he anointing him as ruler of all the Jews. Though a successful warrior, Saul lacked statesmanship, but succeeded in numerous battles against the Philistines until his final defeat and death at Mount Gilboa. He was succeeded by David, his son-in-law, who ruled from 1055 until 1015. The successful reign of David caused him to become known as the greatest king of the Jewish throne. The period including the reigns of David and Solomon is designated the golden age of Jewish history.

David rose from the tribe of Judah. He was a native of Bethlehem, came in conflict with Saul until the death of the latter, and established a separate principality with Hebron as its capital. After a war of seven years, all the tribes acknowledged David king, who now transferred the seat of government to Jebus, a fortress conquered from the Canaanites, which he named the City of David, and later Jerusalem. During the long reign of forty years he conquered the Edomites, Moabites, Ammonites, and Philistines, and extended his dominion from Damascus to the northeast of the Red Sea. Solomon reigned in 1015-977. He built the great temple in Jerusalem, negotiated treaties with Tyre and Egypt, and extended the commerce from Africa to Java and Sumatra. This sovereign effected many internal improvements and showed a wisdom that became proverbial, but in the later years of his life he was weakened greatly in influence by various causes which led to interior dissensions and insurrections. In 975 the Jewish people became divided into two nations, the kingdom of Israel under Jeroboam and the kingdom of Judah under Rehoboam. The latter kingdom consisted of the tribes of Benjamin and Judah, while Israel was constituted of the other ten tribes.

The capital of Israel was first established at Sichern, but later was transferred to Samaria. Rehoboam made a number of unsuccessful attempts to reconquer Israel, but was prevented by an Egyptian invasion under Shishak, and some time after Judah averted annihilation by Israel through an alliance with the Syrians. After varied successes in wars covering many generations, Shalmaneser, King of Assyria, subdued Israel in about 720 B. C., and carried many of the leading citizens away into captivity. The succeeding Assyrian king, Sargon, completely destroyed the government of Israel and settled the principal inhabitants in Media and Assyria, while Assyrian colonists occupied the different regions, intermarried, and largely formed the historic Samaritans. Among the most noted

kings that governed Israel during its prosperity are Jeroboam I., Jeroboam II., Ahab, Joram, and Pekah.

Judah was less powerful and prosperous than Israel. The kings of the house of David numbered twenty, the most successful being Jehoshaphat, Uzziah, Hezekiah, and Josiah. These kings were the most devoted to the laws of Moses and the worship of Jehovah. This kingdom was invaded by armies from Egypt and Assyria and later became tributary to Babylon. In 588 Nebuchadnezzar captured Jerusalem and carried away its riches, making the leading citizens captives. When Cyrus captured the throne of Babylon, in 538, he set the Jewish people free, after a captivity of about seventy years, restoring them to their former possessions, but made Judah a Persian province. About 42,000 Jews returned to the vicinity of Jerusalem in 538 and built the second temple in 516. In 458 Ezra, the priest, led a second return of exiles to Palestine in the reign of Artaxerxes, and Nehemiah was appointed Persian governor, under whose reign the walls of Jerusalem were rebuilt. In the period between the return of Nehemiah and the fall of the Persian Empire, the Jews were Persian subjects, but this formed an epoch during which they enjoyed their own religious and educational institutions.

When Alexander the Great led the hosts of Grecian warriors into Asia, he penetrated toward the east and conquered the Persian Empire. In 332 B. C. the Jews submitted to him under promise that they be permitted to exercise freely their religious rites. After the empire founded by Alexander became divided, Palestine was made a possession of the Ptolemies of Egypt. About 100,000 Jews were taken to Alexandria and Cyrene and settled chiefly in the region from Libya to Ethiopia. Under a system of equal rights with the Egyptians they prospered. They aided in building the great schools and libraries of Alexandria and translated the Old Testament, this translation being known as the Septuagint, or Greek version.

About 198 B. C. a Syrian and an Egyptian party rose among the Jews of Palestine. This resulted in civil strife and finally brought on an invasion by Antiochus IV., in 170, which led to great slaughter and an effort to compel the Jews to change their religion. About this time the Maccabees attained power, and, after struggling fourteen years, succeeded in driving the Syrians out and establishing the sanhedrim, a national council. The Jewish reign of this epoch is marked by the establishment of the Pharisees and Sadducees, two rival sects. A controversy between Hyrcanus II. and Aris-

tobulus over the title to the throne caused local disturbances and led the Pharisees, in 63 B. C., to ask aid of Pompey, who made Palestine a Roman province. The Roman senate recognized Herod the Great as King of Judea, who exercised sovereign prerogative in setting aside Jewish manners. Within his reign, in 4 B. C., Christ was born at Bethlehem, and in 6 A. D. Samaria and Judea became a united Roman province, being governed by a procurator from Caesarea. In 26 A. D. Pontius Pilate was made procurator, in whose reign Christ pursued his ministry and suffered death. Herod Agrippa was king in 41-44, persecuted the Christians, and caused the apostle James to suffer martyrdom. An insurrection occurred in 65, which resulted in the capture and destruction of Jerusalem five years later by Titus. Hadrian razed it to the ground about 135 A. D., and erected a gentile city in its place, called Aelia Capitolina. He forbade the Jews under penalty of death to enter it, and not until the time of Constantine was the name of Jerusalem revived.

After the destruction of Jerusalem by Titus, the Jewish people became scattered extensively to all countries. Since that time they have lived either as aliens or as citizens by adoption. In the time of Emperor Julian they made an unsuccessful attempt to build a new temple at Jerusalem. This movement resulted in a revival of the sanhedrim at Tiberias and the establishment of two presidencies of the sanhedrim, one at Tiberias and the other at Bagdad. From them the Jewish people attained a foothold among the learned and professional institutions suitable for the culture and higher education of the rabbis. Among the celebrated products of their scholars is the Talmud, completed in the year 500, which contains expositions of the Old Testament with additions and annotations. By reason of their superior business sagacity and continued application, the Jews became ruling spirits in the commerce of the world, established great banking centers, and rose to stations of business and political importance. They flourished alike in the countries of Christians and Moslems, though during the supremacy of the Moors in Spain their learning and prosperity were greatest. In the 11th century they were largely colonized on particular streets in the cities of Germany, Italy, and France, as a class of inferior or dishonored people, and often suffered by political and social oppression. In the 15th century Spain and Portugal required them to be baptized, to which they either consented, were put to death, or were banished from the peninsula.

MODERN HISTORY. At the beginning of the

19th century the different nations began to treat the Jews as other citizens. Shortly after the French Revolution they were placed on an equality in France. Russia followed the lead of France in 1811, and Denmark did likewise in 1814. Great Britain admitted them to Parliament in 1858 and Norway sanctioned their immigration in 1860. Other countries modified their laws more or less in harmony with France and Germany, though disturbances have prevailed periodically, the most noted of recent times occurring in Russia in 1892 and in France in connection with the Dreyfus affair in 1899. In the United States they have always had equal rights with other peoples. The tenacity with which the Jews of modern times retain their racial characteristics, and cleave to the religion of their fathers among alien nations and peoples, is remarkable. Some of the greatest names in modern history are those of Jews, among them Rothschild, Disraeli, Mendelssohn, Spinoza, Heine, Meyerbeer, etc. The greatest number of Jewish people are in Russia, where they aggregate 5,850,000; Austria-Hungary, 1,950,000; the United States, 1,145,000; Germany, 615,000; and Rumania, 450,000. The total Jewish population of the world is estimated at 11,800,000.

LANGUAGE. The Jewish language is a branch of the Semitic family of languages. Perhaps originally it was the language spoken by the Phoenicians, and was adopted from those people by Abraham and his family at the time that patriarch settled in Palestine. The religious and moral notions of all Hebrews caused many distinct characters to be impressed upon it, as also did the long residence in Egypt and the sojourn in the wilderness, thus making it a dialect distinct in many essentials. While the oldest sacred writings known to us are in the Hebrew, there are secular works and inscriptions coming to us from older sources. It is quite common to distinguish the language by two distinct periods, including the time up to the Babylonian exile, and from the exile up to the present. In the former period comparatively few foreign words were mixed with the language, while in the latter time many Arabian and Aramaic elements became incorporated. No material progress was made in securing a grammatical treatment of the language until about the 6th century A. D., when several technical texts were published. In the written language are many accents and marks of punctuation, but it has no capital letters. It has twenty-two consonants, five letters have a separate final form, and the vowels are designated by marks above or below the letters.

**LITERATURE.** The literature is of vast importance because of its wide influence on the Christian and Mohammedan nations. It surpasses the literature of all other ancient peoples on account of the vigorous style of its poetry and its religious characteristics, and at the same time is the most reliable source of the early history of the human race. The Bible (q. v.) is the greatest product of Jewish literature. No work of ancient or modern times has been read and studied with an equal interest and devotion, and its precepts have influenced human action more than any other works, either singly or collectively. The first period of Jewish literature extends to 143 B. C., and one of its greatest products is the "Midrash," a work making inquiry into the meaning of sacred writings. In the second period, extending from 143 B. C. to 135 A. D., the "Midrash" was divided into the "Halacha" and "Hagada," the former relating to common law, and the latter embracing the religious teachings. Josephus in this period wrote his "History of the Jewish Wars," Philo compiled various philosophical works, and divers writers produced the different books of the New Testament and the *Apocrypha*. The latter is now seldom published in the edition of the Bible which is commonly used by Protestants.

The third period is included between 135 and 475 A. D., in which time the schools of Palestine and Rome gave instruction from the "Halacha" and "Hagada." In this time the scholars versed in the "Mishna," the oral law, exercised a wide influence, and the "Talmud," a work containing the "Mishna," was written. From this time on the Jewish people became widely scattered in many countries, thus causing them to acquire the language of the lands of their adoption. Many writers of modern nations are of Jewish extraction, the products being in various languages, and including works in philosophy, law, science, poetry, music, medicine, mathematics, philology, and higher criticism.

**JEW'S-HARP** (jüz'härp), a metallic musical instrument. The sound is produced by inhaling and ejecting air from the lungs, while the instrument is held between the teeth, the metallic tongue, or spring, being struck by the finger. Instruments of this kind are made wholly of steel. The sizes vary from small toys to those used to produce musical tones of considerable volume and in rhythmic order.

**JEYPORE.** See Jaipur.

**JHELAM** (jē'lām), or **Jhelum**, a large river of India, in the Punjab, one of the affluents of the Chenab. It rises in Kashmir, passes through the Himalayas in the defile of Baram-

bula, and thence has a southward course. It discharges into the Chenab River after a course of 490 miles. The Jhelam is navigable for a distance of 300 miles, and is noted for its fisheries.

**JIGGER** (jīg'gēr), or **Chigoe**, a kind of small flea, native to the West Indies and South America. It resembles the common flea, but is somewhat smaller. Its bite is at first indicated by a slight itching, but later it becomes quite painful. Several species have been described, some of which attack the eyelids of poultry. The name is applied in the United States to a small scarlet insect that is troublesome to the skin of man. It is common to the grasses in the Southern States, where it subsists most of its life. When it attacks the skin, it burrows and deposits its eggs, causing quite an annoyance by producing an itching and tingling sensation. Salt-water bathing has a relieving effect.

**JINGOISM** (jīn'gō-iz'm), a term applied to an individual or party who advocates a warlike policy. The expression, by *jingo*, originated from a corruption of the Basque word *Jinkoa*, and from it the term jingoism was coined in 1877, when the political parties in England disagreed as to the policy of intervening in the war between Russia and Turkey. Gladstone and the Liberals advocated a neutral policy, while Beaconsfield and the Conservatives favored intervention to aid Turkey against Russia. Since then the term has been in popular use in Great Britain and the United States, and is usually applied to the advocates of an imperial policy. The doggerel sung at a musical hall in London at the time has been widely published:

"We don't want to fight;  
But by Jingo, if we do,  
We've got the ships,  
We've got the men,  
We've got the money, too!"

**JINRIKISHA** (jīn-rīk'ī-shà), a light carriage drawn by a man, who goes between the shafts. This vehicle has two wheels and is constructed to carry either one or two persons. Some are provided with a hood, which is attached to the upper part of the seat, and two springs make the vehicle quite easy. The man employed to pull this vehicle is called the *hiki*. Where long distances are to be made or a heavy load is to be drawn, he is assisted by one or more outrunners, who pull by cords attached to the crossbar. The jinrikisha was invented in 1868 and was shortly after introduced in China, Japan, and India, where a large number are in use. The rate charged is from one to five cents a mile, depending upon the speed and the character of the road to be covered.

**JITOMIR** (zhê-tô'mêr), or **Zhitomir**, a city in Russia, capital of the government of Vollandia, on the Teterev River, about eighty miles west of Kiev. It is a commercial center and contains numerous manufactories. The place has railway facilities, several schools, and a number of government buildings. Population, 1908, 82,084.

**JOB'S TEARS**, the name of a grass native to India, grown as a cereal in a manner similar to corn. It is so named from the seeds, which are tearlike, hard, shining globules. The seed is used in India for food. The plant has been naturalized in Canada and the United States as an ornamental grass.

**JOHANNESBURG** (yô-hän'nês-bürg), the largest city of South Africa, in the Transvaal Colony and in the center of the Witwatersrand gold fields, 35 miles south of Pretoria. It is regularly platted with wide streets, which intersect each other at right angles, and they are generally well improved by grading and pavements. The chief buildings include the stock exchange, the post office, the public library, the city hall, and many business blocks. Much of the architecture is of stone and vitrified brick laid in cement. It has a system of public waterworks, gas and electric lighting, and electric street railways. Among the manufactures are clothing, brick, pottery, tobacco, machinery, leather, soap, packed meat, and jewelry. It has a large trade in produce, merchandise, grain, and live stock.

Johannesburg was founded by the Boers in 1886. Three railways were opened to it in 1892, giving it communication facilities with Pretoria, Cape Town, Dunbar, Port Elizabeth, and Delagoa Bay. In 1895 the famous Jameson raid was made upon the city, which resulted in the capture of the insurgents, and four of the principal leaders were sentenced to death, but the sentence was afterward commuted to a cash payment of \$125,000 each. The fortifications constructed by the Boers long prevented British occupation, but it was captured by Lord Roberts in 1900. About half of the inhabitants are whites. Population, 1906, 174,284.

**JOHN**, the name of 23 popes, who reigned within the period from 523 to 1417, of whom John VIII. and John XXIII. are the most noteworthy. The former was Pope from 872 to 882. He succeeded Adrian II. and attained remarkable success in overcoming Saracen influences. John XXIII. reigned from 1410 to 1415. He was of noble descent, and became noted because of prolonged controversies regarding papal succession with Gregory XII. and Benedict XIII. See **Pope**.

**JOHN DORY**, the English name of a fish native to the warm seas of the Eastern Hemisphere. A species common to the Mediterranean is prized as a food fish. It is about twenty inches long and has bony jaws fitted for the passage of large objects taken in as food. It is rather sluggish and inactive, except when in pursuit of other fish, upon which it feeds. The body is covered with spinous scales and has an olive-brown tail, marked by a large circular brownish spot on each side. According to legends, this fish was caught by Saint Peter in the Lake of Gennesaret, the marks being the impression of his thumb and finger. Several other species occur in the tropical seas, all of which have a compressed body, with a protruding under jaw.

**JOHNS HOPKINS UNIVERSITY**, an institution of higher learning at Baltimore, Md., founded by Johns Hopkins, who bequeathed the sum of \$3,500,000 for this purpose. The university was incorporated in 1867, six years before the death of the founder, and the first president, Daniel C. Gilman, was inaugurated in 1876. Graduate and collegiate courses were first offered and in 1893 a medical department, to which only college graduates were admitted, was opened. President Gilman retired from office in 1901, when Ira Remsen, the professor of chemistry, was elected president.

The buildings of the department of philosophy and the arts are situated not far from the center of the city and include a central building; laboratories for zoölogy and botany, chemistry, geology and mineralogy, and physics; a gymnasium; and a Christian Association building. A beautiful site of 125 acres was given to the university in 1902, when the permanent endowment was increased by the sum of one million dollars contributed by friends and the alumni. The buildings of the medical department adjoin the Johns Hopkins Hospital, with which it is closely affiliated and upon which it is dependent for its clinical advantages. The funds of the university amount to about \$4,500,000, the grounds and buildings are valued at \$1,750,000, and the library and scientific apparatus have a value of \$390,000. About 135,000 bound volumes and many pamphlets are contained in the library.

Instruction is given in mathematics, physics and astronomy, chemistry, geology and mineralogy, zoölogy and botany, Greek, Latin, Sanskrit and comparative philology, Semitic language, English language and literature, German and Germanic philology, Romance languages, history, political economy, political sciences, philosophy and psychology. Instruction is given in all the branches of medicine and surgery. The

three degrees offered are Bachelor of Arts, Doctor of Philosophy, and Doctor of Medicine. Twenty-two fellowships and 91 scholarships are offered to students of ability and promise. About a dozen journals are issued regularly from the Johns Hopkins Press. The faculty consists of 196 instructors and the enrollment is about 700 students.

**JOHNSTOWN**, a city of New York, county seat of Fulton County, forty miles northwest of Albany. It is on Cayadutta Creek and the Fonda, Johnstown and Gloversville Railroad. The chief buildings include the Carnegie public library, the county courthouse, the public prison, and the high school. Among the manufactures are gloves, shoe leather, cigars, machinery, and knit goods. Gas and electric lighting, pavements, street railways, and waterworks are among the municipal facilities. It has a large and growing trade. The region was settled in 1760 under the direction of Sir William Johnson, after whom the place was named. It was chartered as a city in 1895. Population, 1905, 9,845; in 1910, 10,447.

**JOHNSTOWN**, a city of Cambria County, Pennsylvania, at the confluence of Stony Creek and the Conemaugh River, forty miles southwest of Altoona. It is on the Pennsylvania and the Baltimore and Ohio railroads, and is surrounded by a country rich in coal, fire clay, and iron deposits. Among the noteworthy buildings are the public library, the high school, the city hall, and the Conemaugh Valley Memorial Hospital. Grand View Cemetery is a fine burial ground. The manufactures include iron plate, brick, cement, furniture, pottery, and hardware. It has street railways, waterworks, pavements, gas and electric lights, and other improvements. Johnstown was settled about 1790. The city was almost totally destroyed May 31, 1889, by the bursting of a dam in the Conemaugh River, which formed Conemaugh Lake above. The total loss of life was 2,500 persons and 99 entire families were lost. Contributions sent for the relief of the sufferers amounted to \$4,116,801.58. However, the city soon recovered from this calamity and developed rapidly in trade and wealth. Population, 1900, 35,936; in 1910, 55,482.

**JOHORE** (jō-hōr'), an independent state in the southern part of the Malay Peninsula. It comprises an area of 8,980 square miles. The larger part is covered with a dense growth of primitive forests. Timber, gambier, rattans, fruits, and black pepper are the chief products. The soil is fertile and well adapted to the cultivation of cereals, sugar cane, tobacco, and the coffee tree, but comparatively little advancement has been made in agricultural arts. Johore Barhru, the capital, is a small town located a

short distance northeast of Singapore. In 1885 the British concluded a treaty to control the foreign affairs. The country is populated chiefly by Malays and Chinese. Population, 1906, 195,506.

**JOINT**, in anatomy, a connection between the bones and cartilagenous formations of the skeleton. The joints permit the movements of the animal frame, contribute to the strength of the skeleton, especially of the back and the lower limbs, and give form and shape to the body. They are either *movable* or *immovable*. The former embrace such as the joints of the hip, shoulder, and ankle, and the latter include the frontal and parietal bones. The end of one bone in a joint is usually convex, that of its companion bone is concave, and both ends are covered by a thin layer of elastic cartilage. This cartilage has a highly polished surface and serves to facilitate motion and to deaden shock. The moveable joints are usually divided into planiform, hinge, and ball and socket joints.

In the *planiform joints* the surfaces are more or less plane, permitting a gliding movement, as in the tarsal and metatarsal articulations of the foot. They permit only a limited motion, but impart elasticity and slight flexibility. The *hinge joints*, which permit motion in two directions, are provided with very strong ligaments on the sides, as in the elbow, ankle, and finger. In the joints of the ankle and the fingers the tendons of certain muscles replace the ligament. In the *ball and socket joint* there is a cuplike cavity in one of the bones, into which a headlike extremity of the other bone is fitted, the latter being held in place by a membranous capsule. This class of joints permits great freedom of motion in all directions, as in the joints of the hip and the shoulder. The socket in the latter is not as deep as that of the hip, hence there is greater freedom of motion, but the joint is more easily dislocated. A secretion called *synovia* is supplied by a thin membrane that surrounds the joints, serving to moisten and salubricate them.

**JOINT-FIRS**, the common name of several species of small trees and shrubs closely related to the coniferous plants. A number of these are native to the southwestern part of North America, and others are found in the warmer parts of Asia and Europe. They are so named from their jointed stems. The juices are not resinous, but are watery or somewhat gummy.

**JOINTS**, in geology, the fissures of a peculiar kind that divide rock masses. They usually occur in parallel lines of a system of clefts. Joints are due either to the passage of earthquake waves or faults resulting from strains by the forces that elevate the surface. They differ

from dividing surfaces of strata in that the texture is the same on both sides of the dividing line, and from cleavage by the fact that the blocks are thicker and that they have little or no tendency to split in the same direction. Joints are designated as *strike*, *dip*, and *diagonal joints*, depending upon whether they run parallel to the strike or to the dip, or extend diagonally across either of these.

**JOINT-STOCK COMPANY**, the name usually employed to designate a partnership in which the capital is distributed among a number of partners. They assume in certain respects a corporate form, but possess legally none of the peculiar attributes or powers of corporations. Joint-stock companies are either limited or unlimited, and they may become incorporated under the law by complying with its requirements. A *limited* company is one of two forms, in one of which each member is limited to the amount unpaid on the shares that he stipulated to purchase, and in the other the liability of each member is limited to the amount he agrees to contribute to the assets should the business of the company be discontinued. In an *unlimited* company the liability of the members has no legal limit. The word *limited* must be added to the name of the company, in case the liability is to be restricted, which serves to give notice to the public of the character of the organization. In addition there must be a record kept by the company to show the place of business, the amount of capital, the limit or the amount of guarantee, and the object for which the association of individuals is established.

**JOLIET** (jō'li-ět), a city in Illinois, county seat of Will County, on the Des Plaines River, forty miles southwest of Chicago. It is on the Atchison, Topeka and Santa Fé, the Chicago and Alton, the Michigan Central, the Chicago, Burlington and Quincy, and other railroads, and on the Illinois and Michigan Canal. The surrounding country is a fertile agricultural and dairying district, which also produces an excellent quality of Silurian limestone and bituminous coal. Among the noteworthy buildings are the post office, the county courthouse, the public library, the township high school, the State penitentiary, the workingmen's clubhouse, and Saint Francis and Saint Mary academies. It has manufactures of flour, lime, lumber products, pottery, farming utensils, tombstones, cigars, bridges, furniture, and Bessemer steel. Among the general facilities are electric street railways, sewerage, waterworks, and pavements. The place was settled in 1831 and incorporated in 1852. Population, 1900, 29,353; in 1910, 34,670.

**JOLIETTE** (zhō-lyět'), a city of Quebec,

capital of Joliette County, 42 miles east of Montreal. It is connected with the Saint Lawrence River by a railway of twelve miles and is on the Canadian Pacific Railroad. The manufactures include leather, lumber products, and machinery. It has a hospital, a college, waterworks, and electric lighting. Limestone quarries are worked near the L'Assomption River, on which the town is located. Population, 1901, 4,220.

**JOPLIN** (jöp'lin), a city and one of the county seats of Jasper County, Missouri, fifteen miles southwest of Carthage, on the Missouri, Kansas and Texas, the Missouri Pacific, the Saint Louis and San Francisco, and the Kansas City Southern. In the vicinity are extensive deposits of zinc and lead. The average annual output of the mines within the adjacent district is valued at \$9,500,000. Large quantities of fruits are produced in the vicinity. The noteworthy buildings include the Carnegie library, the high school, the Federal building, the opera house, and the Y. M. C. A. building. Among the manufactured products are machinery, ironware, cigars, steam boilers, soap, and flour. The smelting works and foundries give employment to a large number of laborers. It has a large trade in produce and merchandise. It was settled in 1870 and incorporated in 1873. Population, 1900, 26,023; in 1910, 32,073.

**JOPPA**, or **Jaffa**, a city in Palestine, 33 miles northwest of Jerusalem, on the seacoast of Syria. It is a very ancient city and in the time of Solomon was the port of entry to Jerusalem, being the place to which the cedars of Lebanon were floated from Tyre for the building of the temple. The Jewish prejudice concerning the Gentiles and the Christian religion was corrected after a vision seen by Peter at Joppa. In the time of the Crusades the city reached its highest prosperity, being the principal place of landing. The French under Bonaparte captured it in 1799. In 1832 Mehemet Ali reduced the city, but the Turks, with the assistance of the Austrians and British, took possession of it in 1840. At present Joppa is an export city for live stock, cereals, fruits, and various manufactures. In September, 1892, it was made the terminus of a railroad to Jerusalem. Population, 1906, 45,048.

**JORDAN** (jôr'dan), a celebrated river of Palestine, lying in a valley that stretches from north to south in the eastern part of Syria. It has several sources, rising in the southern declivities of the Libanus and Anti-Libanus, is 150 miles long, and its mouth is 1,312 feet below the surface of the Mediterranean. In its course from Mount Hermon and Mount Lebanon to the Dead Sea it passes through the lakes Huleh

(the waters of Merom) and Bahr Tubariyeh (Sea of Galilee or Tiberias). Its bed varies greatly in breadth, many places having rocky and precipitous banks, while others are flat and sandy. The average width of the Jordan is from thirty to fifty yards. It is spanned by very few bridges, the one most famous being Jacob's bridge, situated north of the Sea of Galilee. The total fall of the Jordan is 2,300 feet. Many Christians regard it a special privilege to be baptized in the Jordan, from the circumstance that Christ was baptized in the stream by John.

**JORULLO** (hō-rōōl'yō), a volcanic mountain about 150 miles west of the city of Mexico, thrown up by volcanic force on Sept. 29, 1759. It consists of numerous cones, some of which give out vapor. The highest elevation is 4,250 feet above sea level. Owing to the gradual loss of temperature, foliage and forest trees have slowly moved upward and now cover most of the region.

**JOTUNS** (yō'tunz), the name of immense giants and magicians, especially those spoken of in Scandinavian mythology. They are credited with living in dark caves in their kingdom known as Jotunheim. The Jotuns were thought to be destructive forces and the possessors of much cunning, but had an inferior intellect. They are represented as being skilled in the arts of witchcraft.

**JOURNALISM** (jūr'nāl-iz'm), the business of managing, editing, or writing for newspapers or other periodical publications. It has come to be one of the important occupations in the promulgation of knowledge and the diffusion of intelligence. Within recent years periodicals have been founded in practically all parts of the world inhabited by civilized and semi-civilized peoples. They have come to be regarded important avenues for the spread of news, and for instruction in politics, morals, arts, industries, theology, sport, and sociology. At the time of the operations of the Roman imperial armies accounts were published regarding their movements. These were under the direction of the generals, served as communications of intelligence to the officers of the different divisions, and are regarded the first systematic means of bearing tidings. Modern journalism dates from the 15th century and had its beginning in Germany, the first newspaper sheets being issued regularly in Saint Augsburg, Nuremberg, Ratisbon, and Vienna. However, the first publication resembling newspapers published at the present time was the *Notizie Scritte*, established at Venice in 1566. The name applied to this publication caused the word *gazette* to be coined, and shortly after gazettes were

issued regularly in many of the large European cities.

Nathaniel Butter founded the first newspaper in England, which appeared as the *Weekly News* in 1662, and in the same year the London *Weekly Courant* was established. The latter was published as a daily in 1702, but consisted only of a small sheet printed on one side. Advertisements did not appear in periodicals until the latter part of the 17th century, and came to be inserted on account of notices given of new books as they were published. These notices attracted the attention of the public and led to the conclusion that advertisements of merchandise and other matters kept for sale would prove remunerative. At present newspaper advertisements are among the most profitable departments of the business, and are thought to be fully as remunerative to the advertisers as to the publishers.

It was estimated in 1909 that the number of newspapers in the world was 93,500. The number credited to the United States is 23,806; Germany, 12,480; France, 5,600; Great Britain and Ireland, 5,500; Austria-Hungary, 4,950; Italy, 2,800; and Canada, 1,478. In the other countries of Europe and in the other grand divisions the periodicals are limited to a smaller number, though more or less appear in all countries. They are published in practically all the languages.

The first newspaper founded in America was *Publick Occurrences* in 1690. This was followed by the *Boston News Letter* in 1719, and immediately after many others were established in various parts of the colonies. They rapidly gained circulation among the people in towns and later among those residing in districts remote from common centers. Benjamin Franklin was one of the early publishers to gain influence. He established the *Pennsylvania Gazette* in 1729, which was merged into the *North American* in 1745. Other noted journalists of America include James Gordon Bennett, founder of the *Herald*, and Horace Greeley, founder of the *Tribune*. Since then many great newspapers and other journalistic enterprises have developed in all the large cities of Canada and the United States.

Many of the leading publishers have been induced by the rapid growth and phenomenal success in newspaper enterprises to invest their surplus capital in substantial fireproof buildings, which are used for publishing and general office purposes. These buildings are fine specimens of modern architecture, and add convenience to the management as well as serve to beautify the cities where located. Among the most

prominent are those of the *New York World*, *New York Times*, *Washington Post*, *Omaha Bee*, *Chicago Tribune*, *Seattle Post-Intelligencer*, *San Francisco Chronicle*, *Portland Oregonian*, and *Saint Louis Globe-Democrat*.

Each newspaper has a business manager, whose business it is to make contracts with advertisers, keep the office records, purchase the necessary supplies, and attend to the payment of employees. The business manager works to the same end as the editor, both striving to make the publication successful and to keep its tendency in accord with the views of the owner. The editor has charge of the editorial work and supervises the reading matter that goes into the newspaper. Much of the general news is gathered and furnished by organizations known as *press associations*. The first association established to gather news was in New York City, though a number of newspapers prior to that furnished each other news under a local agreement, and this is quite commonly the case with newspapers at present. Intelligence syndicates have successful news gatherers in all sections of the world, and usually make arrangements with authors and special contributors at certain times for signed articles. These contributions are generally sold to one newspaper in a city, and are published by the different newspapers simultaneously.

The leading newspapers have branch offices in many large cities for the purpose of both gathering news and distributing their daily papers to the public. These offices are managed by American companies, not only in the United States, but in Paris, London, Berlin, and other foreign cities, though more particularly for the purpose of gathering the news. The larger organizations send special correspondents to legislatures, congresses, and the seat of war for the purpose of having the news gathered and promptly telegraphed to the central office. Readers residing out of the city of publication receive their papers through the mails or news vendors, or buy them on the trains, while within the city of publication they are delivered largely by special carriers. The press is free in Canada and the United States to publish all matters of news, but may be held liable for damages or be subject to an action in libel. In most European states a strict censorship is maintained over newspapers, while during the time of war the military authorities of all countries guard carefully the transmission of intelligence regarding military movements.

The American people are the most extensive readers of newspapers, largely because of the high state of literacy, rapid means of transpor-

tation, and remarkable business activity. It is estimated that the total number of separate newspapers published in the United States in 1896 was 4,681,113,530, but in 1908 the number reached the marvelous total of 10,500,000,000. The great daily newspapers are wonderfully productive in the amount of published matter of various kinds, covering all branches of knowledge and relating to all the countries of the world. This is true especially in the Sunday edition, which usually includes sufficient subject-matter to constitute a book of fair size.

**JOURNALISM, School of**, an institution founded by Joseph Pulitzer (q. v.) in 1903, forming a college of Columbia University, in New York City. He endowed it with a grant of \$2,000,000. The purpose is to train men in the art of journalism with the view of maintaining a high standard in the newspaper profession, and to increase the power and prestige of the press as an agency in promoting the cause of government and good citizenship. Students have access not only to a course of study in the law and ethics of journalism, but pursue advanced courses in literature, rhetoric and composition, commercial law, sociology, economics, political science, and United States and contemporary European history. Though the course of study covers a wide range, the instruction is designed particularly to supply the requirements for practical newspaper work.

**JUAN FERNANDEZ** (hōō-än' fēr-nän'-dēth), an island about 400 miles off the coast of Chile, to which country it belongs. The island was discovered in 1574 by a Spaniard whose name it bears. It is about thirteen miles long and four broad, rocky, mostly high, but with some parts fertile. The chief products include cereals, cherries, peaches, figs, apples, grapes, melons, etc. It is famous on account of the story of Robinson Crusoe written by Daniel Defoe (q. v.), which is thought to be founded upon the solitary confinement and residence of Alexander Selkirk (1676-1723), a Scotch pirate, on the island of Juan Fernandez. He quarreled with the captain and at his own request was put off on the island, where he lived on fruit and wild goats for four years. The island is at present occupied by a number of Chilean settlements.

**JUBILEE** (jū'bī-lē), a festival celebrated by the Jews every fiftieth year, the year succeeding every seventh sabbatical year. During this year all slaves were set at liberty, all lands lay fallow, and all estates that had been sold reverted to the heirs of the original owner, to whom the land had been parceled out in the time of Joshua. The design of this institution was

to check the rise of any great inequality of social conditions, and to prevent the rich from oppressing and enslaving the poor. It strengthened the bonds of families and bound the people to their country, by leading them to cherish an affection for estates derived from their ancestors and to be transmitted to their posterity. It was observed both prior and subsequent to the Babylonian captivity, but ultimately fell into disuse.

**JUDE**, *Epistle of*, the last of the 21 epistles of the New Testament. It was probably written in Palestine about the year 62, and is directed against heretics and false teachers. In early times of the Christian church its authority was contested on the ground that it contains citations of apocryphal writings, though belief in its divine inspiration was general in the church. Most commentators maintain that it was written by Judas Thaddeus (q. v.).

**JUDEA** (jū-dē'á), or *Judaea*, the name used in ancient geography to designate the kingdom of Judea to distinguish it from the kingdom of Israel. After the Babylonian captivity and up to the time of the Roman occupation it denoted the whole of Palestine. The Romans used the name in a general sense to signify the land of the Jews. In a restricted sense it applied to the southern part of Palestine, which was bounded on the north by Samaria, east by the Jordan and the Dead Sea, south by Idumaea, and west by the Mediterranean. See *Palestine*.

**JUDGE**, an officer who has authority to hear and determine causes at law. The term is sometimes used interchangeably with *justice*, or *lord justice*, and extends to the presiding officer in courts of both equity and civil and criminal law. Although a justice of the peace is in a certain sense a judge, he is not usually spoken of in this respect, since the term applies more properly to the judges of district, circuit, and supreme courts. These officers are sometimes spoken of as a *district judge*, *circuit judge*, or *supreme judge*. It is necessary that a judge be an entirely disinterested party, hence one who has a private or pecuniary interest is disqualified from hearing a case. Although a judge may be prosecuted for a violation of the law, he cannot be held for damages in consequence of his decisions.

**JUDGES**, *Book of*, one of the historical books of the Old Testament. It is so named because it narrates the deeds of the thirteen judges of Israel from Othniel ben-Kenaz to Samson, the first and the last of the judges. Though fragmentary and somewhat disconnected, it gives a reasonably full account of Beborah and Barak, Gideon, Jephthah, and Samson. This book shows at its beginning that the calamities suf-

fered by the Hebrews after the death of Joshua were due to their apostasy from Jehovah.

**JUDGMENT**, in psychology, the operation of the mind that involves comparison and discrimination, by which a knowledge of the values and relations of things is obtained. In forming a logical judgment or thought the mind has before itself two concepts, or a single percept and a single concept, and through a process of comparing decides wherein they agree or disagree, hence, every judgment involves two concepts and the decision respecting them. The concepts may be simple or very complex, and in either case knowledge is made more valuable through the forming of a logical judgment.

**JUGGERNAUT** (jüg-gēr-naŭt'). See *Jagannatha*.

**JUGGLER**, one who produces tricks by sleight of hand, or performs feats in legerdemain. The magicians of Egypt were skilled in apparent sleight of hand performances, and delighted to repeat the wonders performed by Moses and others mentioned in ancient history. Tricks of different kinds have been devised by jugglers as matters of amusement or wonderment. Performers of this kind were common among the Romans and other ancient peoples. The art is still practiced largely in all countries, but particularly at exhibitions and various entertainments.

**JUGULAR** (jū'gū-lēr), the name of a large vein in the neck, through which the greater part of the blood that circulates in the neck, face, and head is returned to the heart. There are two of these veins, located on either side of the neck, one of which is near the skin and the other is somewhat deeper, the external jugular returns blood from the face and neck, and the internal jugular from the brain and interior of the skull.

**JUJUBE** (jū'jūb), the name of a small tree native to Africa and the warmer parts of Asia and Europe. The common jujube is a small spiny tree and produces a reddish-yellow fruit about the size of an olive, which, when dried, is sold on the market as a sweetmeat. It was formerly used to make jujube paste, a well-known confection, but this product is now obtained by compounding sugar, gum arabic, and the whites of eggs. Several species of these plants have been naturalized in Mexico and the southern part of the United States. According to tradition, the spines of the jujube were used in preparing the crown of thorns placed upon the head of Christ.

**JULEP**, in medicine, a refreshing drink flavored with aromatic herbs. It is a sweet demulcent liquid and is used chiefly as a vehicle. The

name is likewise applied to a beverage composed principally of whisky or some other spirituous liquor. A drink made with brandy or whisky and mixed with sugar and sprigs of mint is called a *mint julep*.

**JULIUS** (jūl'yūs), the name of three popes of Rome, who reigned between 337 and 1555. The most notable of these is Julius II. He was born at Albisold Marina in 1443; died Feb. 21, 1513. Julius II. occupied the papal throne from 1503 until his death. It is said of him; "he made his tiara a helmet and his cross a sword." See **Pope**.

**JULY**, the seventh month in the Gregorian calendar, but formerly the fifth month of the year, when it was called Quintilis. It has 31 days and is so named in honor of Julius Caesar, who was born on the twelfth day of July.

**JULY**, Column of, the name of a memorial erected in Paris, France, to commemorate those who fought for the liberty of that country on July 27, 28, and 29, in the year 1830. It is located in the Place de la Bastille, and on four bands that encircle the column are the names of the 615 who fell in the Revolution. Beneath the column are the vaults that contain their remains, together with those of the victims connected with the Revolution of 1848.

**JULY REVOLUTION**, the revolution that overthrew the Bourbon dynasty and restored the house of Orleans to the throne of France. It occurred in July, 1830, in Paris, and was the means of giving the crown to Louis Philippe. The Bourbon dynasty had become unpopular through the reactionary policy of Louis XVIII. and Charles X., and matters came to a climax when the latter undertook to interfere with the liberty of the press and to greatly abridge the right of franchise. By the July Revolution the influence of the clergy in the administration was removed. Contemporary revolts occurred in Poland and Belgium, with the result that the latter country gained its independence.

**JUMPING MOUSE**. See **Jerboa**.

**JUNCO** (jūn'kō), the name of several birds common to North America, from Mexico to Canada, sometimes called black snowbirds. The plumage is ashy above and nearly white below. The nests are built of grasses and rootlets on or near the ground, and are frequently lined with hair and feathers. Birds of this class move southward as far as the Gulf of Mexico in autumn, and in the spring migrate to the northern part of the United States and Southern Canada.

**JUNCTION CITY**, a city of Kansas, county seat of Geary County, 135 miles west of Kansas City, at the confluence of the Smoky Hill and

Republican rivers. It is on the Union Pacific and the Missouri, Kansas and Texas railroads. The surrounding country is fertile and productive and near the city are extensive limestone quarries. Large quantities of grain, flour, and live stock are shipped. The chief buildings include those maintained by the county and several schools and churches. Electric lights and waterworks are among the utilities. A military post is located at Fort Riley, which is two miles east of the city. The first settlement was made in the vicinity in 1858 and it was incorporated the following year. Population, 1910, 5,598.

**JUNE**, the sixth month in our calendar, so named from the Roman surname Junius. Formerly it was the fourth month and consisted of 26 days, to which four were added by Romulus. Numa took one day from it, but Julius Caesar again lengthened the month to 30 days.

**JUNEAU** (jū-nō'), a city and the capital of Alaska on the Gastineau Channel, opposite Douglas island. It is located 110 miles south of Skagway, and is surrounded by a productive gold and silver mining district. Steamships ply regularly between it and Seattle, Vancouver, San Francisco, and other cities of the Pacific coast. The enterprises include cigar factories, iron works, sawmills, bottling works, breweries, and supply houses. It has a large market in furs, lumber, and merchandise. Among the improvements are electric lights waterworks, a courthouse, and several schools and churches. It was made the capital of Alaska by an act of Congress. Population, 1900, 1,864.

**JUNEBERRY**, the name of several trees and shrubs found in Canada and the United States. Many species are included in this class of plants, some of which are cultivated for their flowers and others are grown for their fruit. The fruit is known as the juneberry, which is of a purple color and about the size of a cranberry. The fruit is known locally as the service berry and the mountain whortleberry.

**JUNE BUG**, or **May Beetle**, a large beetle common to North America. It is attracted by lamplight and often enters houses in the evening during early summer. When on the ground it is quite clumsy, but it flies swiftly through the air with a buzzing sound, and frequently strikes objects and falls from the stun received. The larvae are white grubs that injure the roots of grasses when numerous, and the adult beetles are harmful to the foliage of fruit and shade trees.

**JUNGFRAU** (yōng'frou), meaning the maiden, a celebrated mountain of Switzerland, situated in the Bernese Alps. It has an elevation of 13,670 feet above sea level. The peak is beautified by the presence of great snow de-

posits. It was first ascended in 1811. A railway line passes to the summit from Lauterbrunnen.

**JUNGLE FOWL**, the name of a bird native to the East Indies, regarded the source of the barnyard poultry. It resembles our domestic fowls. The cocks crow and the hens cackle and cluck like the domestic species of chickens. Several allied species are native to India. They are so named from the jungles of that country, in which they are found in large numbers. They live in small parties and frequently come out of the forests to feed in the cultivated fields.

**JUNIPER** (jū'nī-pēr), a genus of hardy exogenous shrubs and trees, belonging to the cypress subfamily of the cone-bearing group. Twenty species are known, all of which are evergreen, and abound chiefly in the temperate and cold regions of both hemispheres. The common wild juniper is generally a shrub from two to seven feet high, but in rare cases attains

JUNIPER SHRUB.

JUNIPER TREE.

the height of twenty to thirty feet. In this genus the leaves are awl-shaped and the flowers are whitish. The fruit is bluish-black, about the size of a currant, and requires two years to come to maturity. Within the fruit is a stone that yields oil of juniper, which constitutes a powerful diuretic, and the product of some species serves as a local irritant. The juniper tree found in Virginia is the red cedar of North America. It bears bright blue berries. Juniper trees often attain a height of from 25 to 50 feet. The wood is valuable for manufacturing lead pencils, cigar boxes, and cabinet products, and the berries of many species are used in flavoring gin.

**JUNIUS** (jūn'yūs), a signature affixed to seventy letters which were published between January, 1769, and January, 1772, in the *Public Advertiser*, in London, England. These letters became celebrated on account of the boldness with which various institutions, tendencies, and officials were attacked. Though the author never

became known, public suspicion was fixed strongly on Burke and Viscount Sackville. It is now generally believed that the letters were written by Sir Philip Francis, but the evidence is wholly circumstantial. The most characteristic statement made by Junius to George III. was: "Remember that while the crown was acquired by one revolution, it may be lost by another." Henry S. Woodfall, the editor of the *Public Advertiser*, collected and published them in one volume. He was afterward prosecuted, but on some legal technicality escaped punishment.

**JUNK** (jūnk), a Chinese vessel used in navigating their seas, but which has served for voyages extended to America and Europe. It is the largest of the Chinese vessels and has no prominent stem or keel. The bow on deck is square, the stern is full, and the rudder extends beneath the bottom of the vessel. The sails are usually of matting and stretched on large center masts.

**JUNTA.** See page 1163.

**JUPITER**, the largest planet of the solar system, fifth in order of distance from the sun, being situated in space an average of 478,500,000 miles from that luminary. The mean diameter is about 86,000 miles and the polar diameter is about 82,200. It has a density of about one-fourth that of the earth, but the bulk is nearly 1,250 times greater. It is estimated that the weight is 300 times as great as that of our planet. The orbit of Jupiter is inclined to the ecliptic at the angle of 1° 18' 40", and its period of revolution round the sun is eleven years and ten and one-third months. It is believed that the interior mass is intensely heated, which gives rise to light and dark belts. They are usually parallel to each other, but often merge into one another, and somewhat resemble the spots seen on the sun. When viewed with the naked eye, it is the brightest planet, next to Venus. In 1610 Galileo discovered four of the satellites, or moons, of Jupiter. The principal characteristics of each are as follows:

SATELLITES OF JUPITER.

NAME.	Mean Distance From Jupiter.	Diameter, Miles.	Density Water As 1.	Sidereal Period.		
				D.	H.	M.
I. Io.....	267,380	2,352	114	1	18	28
II. Europa.....	425,156	2,099	171	3	13	4
III. Ganymede.....	678,393	3,436	396	7	3	43
IV. Callisto.....	1,192,823	2,929	222	19	16	32

To the above list must be added at least three others, one discovered by E. E. Barnard in 1892, another by C. D. Perrine in 1904, and still another by the same astronomer in 1905. How-

ever, these are small and comparatively insignificant. The satellites of Jupiter, like that of our planet, revolve once upon their axis while making one complete revolution round the planet. They are eclipsed in the shadow of Jupiter and also by their own shadows, and appear to move in lines nearly parallel from one side of the planet, thus evidently having orbits similar to the orbit of Jupiter, but within the plane of the ecliptic of that planet. In 1706 the Danish astronomer, Olaus Römer (1644-1710), carefully observed the eclipses of Jupiter's satellites and discovered the progressive movement of light. Prior to his time light was considered instantaneous, but he became convinced that it requires sixteen and one-half minutes to travel the orbit of the earth, which has since been verified by the phenomena of the aberration of light, and the velocity has been fixed at 186,000 miles per second.

**JUNTA** (jūn'tà), the Spanish name given to legislative assemblies and administrative councils. The assemblies of the representatives of the nation called by the monarch in the Middle Ages were termed general juntas, and Charles II. established a great junta to regulate the competency of the Inquisition. Subsequently the name was extended to assemblies of a strictly legal character.

**JURA** (jū'rà), a range of mountains in Europe, chiefly in France, Germany, and Switzerland. These highlands trend from northeast to southwest and form the principal boundary between France and Switzerland. In Germany the range is called the German or Franconian Jura. The name is derived from the Jurassic limestone which constitutes the principal geological formation, though this is alternated with sands belonging to the lower Cretaceous series. Several gorges cross the mountain range, and it is otherwise characterized by stalactite caves in which the bones of extinct animals are numerous. The Ain and Doubs rivers rise in the western slopes and form tributaries of the Rhone. Among the highest peaks are Crêt de la Neige, elevation 5,650 feet; Reculet, 5,648 feet, and Mont Tendrè, 5,520 feet.

**JURASSIC** (jū-rās'sik), a system of rocks, so named from the Jura Mountains in Switzerland, found above the Triassic and below the Cretaceous systems. Rocks of this system occur in all the continents, but they do not correspond in all cases with the system of Europe. In general they are assigned to the Mesozoic Era, and in most instances are associated with the formations designated as the Lias and the Oölite. They cover large areas of France and Germany, where they contain several thousand species of

fossils, and are traceable in Colorado, California, British Columbia, and other sections of North America. The reptiles are very prominent among the fossils, especially the lizards and the Pterosauria, a class of flying reptiles.

**JURUÁ** (zhōō-rōō-ä'), a river of Brazil, rises in the Andes of western Peru, flows toward the northeast, and joins the Amazon some distance above Fonteboa. Its entire length is 1,100 miles, of which about 560 miles are navigable. The valley of the Juruá is timbered heavily and yields large quantities of rubber.

**JURY** (jū'rý), a body of men selected under legal provisions, impaneled, and sworn to investigate questions of fact, and to return a true verdict or decision according to evidence legally placed before them. Two kinds of juries are maintained in connection with courts of justice, grand juries and petit, or common, juries. *Grand juries* generally consist of less than twenty-four men and more than eleven, who are summoned by the county, or parish, sheriff and duly impaneled for service, though in some states the jurors to serve are limited to five or seven, these being selected by lot from the whole number summoned, and those remaining are excused. After administering the necessary oath, the presiding judge instructs them in their duty, when they repair to a closed room and select a *foreman* from their number. Their duties include the consideration of various accusations brought before them by the county attorney, or others, and if they agree by unanimous vote that certain charges against individuals are based upon fact and are of indictable character, they return a *true bill* or *indictment*, which forms the basis of subsequent prosecution in the court of record, otherwise the accusations are dismissed for want of sufficient foundation. Grand juries hear only one side of criminal procedures. They are relics of the Star Chamber abolished by the Magna Charta, a document which was exacted by the people of England from King John in 1215. They have been abolished in a number of the states.

*Petit juries* in most instances consist of twelve men, unless a smaller number is agreed upon by the parties to a cause. A petit jury is summoned to serve both in civil and in criminal cases. The decision of a trial jury, known as the *verdict*, is reached by a unanimous agreement. In the lower courts and in some special cases, juries consist of a smaller number of men, usually six. The panel for juries in courts of record includes generally twenty-four men, of which twelve are selected by parol, though a number of those chosen in this way may be excused peremptorily, or all may be challenged for

cause. After the trial jurors have been finally chosen, they are sworn by the clerk or the judge. They hear the evidence in the cause, listen to the plea of the attorneys, are instructed by the judge in relation to points of law, and retire for the purpose of agreeing upon a verdict.

After an agreement has been reached, the jury reports by a written and sealed verdict to the judge at the session of court immediately following an agreement, and before being discharged from service. However, if they cannot reach an agreement, they are discharged from service and a new jury may be impaneled to try the same cause at the same or a subsequent session of the court, though causes of a criminal nature cannot be taken up for trial a second time in case the accused is found *not guilty*. In cases of death by accident or violence, a *coroner's jury* is summoned for the purpose of determining the cause from which death resulted. It is under the direction of the county coroner, or an officer corresponding to a justice of the peace. The investigation may be made at the place where death occurred and in the presence of the body, and, in some cases, a corpse may be exhumed for that purpose. The person or persons who are designated by a coroner's jury as being guilty of a crime are subject to indictment by the grand jury, and triable by the petit jury. However, in many instances, as in a case of death by accident or from an unknown cause, it is impossible to determine who is responsible when no one is accused.

**JUSTICE**, Department of. See **United States, Departments of**.

**JUSTICE OF THE PEACE**, a subordinate official in Great Britain and the United States, elected or appointed to exercise certain subordinate administrative functions within the limit of a town, borough, or county. Such an officer in the United States is elected by the people and has jurisdiction in minor civil and criminal cases. He may act as coroner and solemnize marriages in some of the states. In most instances he has the power to hold a preliminary examination of those who are charged with grave offenses, and he may either dismiss or bind them over to appear for trial in the upper courts. The duties of the justice are practically uniform in most divisions of Great Britain, but in England this officer is appointed by the Lord Chancellor, and the judicial functions are supplemented by certain executive duties.

**JUSTIFICATION** (jūs-tī-fī-kā'shūn), a doctrine of Christian theology. It is based upon the writings of Saint Paul, particularly on his epistles to the Galatians and the Romans. The doctrine teaches that justification is an act by

which the individual is accounted just or righteous in the sight of God. It is not a mere remission of sin, but embraces the sanctification and renewal of the inward man through the voluntary reception of the grace of God. The doctrine had its beginning at the time of the Reformation, when Luther came to his spiritual liberty and taught the doctrine of justification by faith.

**JUTE** (jūt), the fiber of two plants of India, belonging to the natural order *Tiliaceae*. They are cultivated extensively in the warmer coun-

JUTE (*Corchorus capsularis*).

tries of Asia and elsewhere. The plants are annuals, have yellow flowers, and attain a height of from five to fifteen feet. The fiber forms the inner bark and is separated from the outer by steeping in water for several days. It is of fine texture, possesses a shining surface, and the injury that accrues when exposed to water renders it illy adapted for canvas and cordage. However, it is used profitably for carpets, gunny bags, and in a mixture with hemp for cordage and mats. Paper is made from the smaller fragments and cuttings. Though cultivated and used in manufactures in India for many centuries, jute did not come largely into use in America until 1830. Within recent years the plant has been naturalized and is now grown successfully in the southern part of the United States. Gunny-bags are employed largely in transporting cotton, rice, pepper, coffee, and other articles of commerce from Asiatic ports, while the raw ma-

terial is transported to the manufactories of America and Europe. Dundee, Scotland, is noted as a center of the jute manufacturing industry. The annual importation of jute to the United States is valued at \$3,500,000. In 1908 the total consumption of the world was 7,500 tons.

**JUTES**, the name of a people who resided in the lowlands of Germany at the beginning of the Christian era. They were closely associated with the Angles and Saxons in the conquest of England in the 5th century. Bede (q. v.), the Saxon writer of England, classifies the Teutons who conquered England into Angles, Jutes, and Saxons, but some writers treat the Jutes as Frisians.

**JUTLAND** (jüt'land), in Danish *Jylland*, an important peninsula of Europe, located north of Germany. On the east, north, and west it is bounded by the Cattegat, Skager Rack, and the North Sea. It comprises the principal portion of Denmark. The area is 9,746 square miles. Nearly all the surface is low, but a ridge of hills runs through the center from north to south, the highest point being 564 feet above the sea. The inhabitants have preserved the customs and language of the ancient Jutes, who were a powerful people of Northern Europe in the 5th century, and with the Angles and Saxons conquered and settled portions of Britain. Aalborg and Aarhus are the principal seaports. Population, 1906, 1,124,694.

## K

**K**, the eleventh letter and eighth consonant of the English alphabet. It has a guttural articulation before all consonants and vowels, except before *n*, where it is silent, as in *knell*, *knife*, and *knit*. From the 16th to the 18th centuries it was written after *c* at the end of a word for the purpose of strengthening the hard *c*, as in *publick*, *musick*, and *almanack*. In the French the letter *k* is used only in a few Greek derivatives, and in the Italian, Spanish, and Portuguese it has gone out of use. In German some words are written either with *c* or *k*, as *Carl* or *Karl*, *Cöln* or *Köln*. As a symbol, in chemistry, *K* stands for potassium (*kalium*). *K* signifies *knight*; *K. B.*, Knight of the Bath; *K. G.*, Knight of the Garter.

**K A A B A** (kā-ā'ba), or **Caaba**, an oblong stone structure in the great mosque of Mecca. It constitutes the sacred shrine to which Moslems make their pilgrimages for religious worship. According to legendry, it is located on the spot where Adam offered his first worship after being expelled from the Garden of Eden. Some writers assert that a tent was sent from heaven in which the worship took place, but others hold that Adam built a structure of stone and clay, which was destroyed by the deluge, but was afterward rebuilt by Abraham and Ishmael. The structure is 45 feet wide, 55 feet long, and about 40 high. It occupies a place in the sacred area of the mosque, which is surrounded by a wall and colonnades. The black-stone, or *Keblah*, is at the southeast corner of the Kaaba, where it is held by masonry, and toward it every pious Moslem directs his face when praying. To kiss the Kaaba is the supreme object of every pilgrim.

**KABUL** (kā'bul), or **Cabul**, the capital of Afghanistan since 1774, when it was made such by Timour. It is situated in a province of the same name, at the junction of the Loghar and Kabul rivers, on a productive plain southwest of

## KADIAK

the Hindu-Kush Mountains, at an altitude of 6,375 feet above the sea. The walls of former times are largely in ruins. Besides a number of government buildings, it contains a Jewish synagogue, several mosques, and the tomb of Sultan Baber. The manufactures consist chiefly of marble products, guns and ammunition, textiles, and machinery. It has systems of electric lighting and waterworks, but the streets are not well paved. Many of the buildings are of wood and adobe brick. It has an important trade in merchandise, fruits, jewelry, and live stock. Many of the bazaars are large and are noted for their trade in fine carpets and rugs. Kabul was captured by the British in 1842 and 1879. Within recent years it has been influenced more or less by the advances of Russia. The inhabitants include Afghans, Hindus, and Jews. Population, 1908, 68,502.

**KADESH BARNEA** (kā'dësh bär'ne-à), a city mentioned in the Scriptures as the place of encampment of the Israelites as they journeyed on their exodus from Egypt. It was the death place of Miriam, sister of Moses, and became celebrated on account of Moses and Aaron offending the Lord by presuming that water would flow from the rock when struck before the people with a rod in their own name, rather than by the help of God. For this sin Moses and Aaron were punished by being forbidden entrance into the promised land. The district of Kadesh is prominent in the accounts written of Abraham, Hagar, and Ishmael.

**KADIAK** (käd-yäk'), an island immediately south of Alaska. It is about 100 miles long and 60 miles wide. The area is 4,680 square miles. Much of the surface is rugged. Numerous inlets characterize the coast, which is rocky and more or less precipitous. The climate is made disagreeable by dense fogs and frequent rains. The principal industries are fishing, canning, and furring. The salmon canning industry employs

1,250 hands and derives its supply of fish mainly from the Karluk River. Saint Paul, the principal town, is a shipping point of fur and fish. The population, consisting chiefly of Eskimos, is about 2,500.

**KAFIR CORN**, a species of sorghum which is native to South Africa. It has been naturalized in the arid region of the United States, where it is grown extensively for fodder and for its seed. Large fields of this product are grown in the region extending from western Nebraska to the Gulf of Mexico. It is drilled in rows similar to sorghum and cultivated in the early growing season like corn. The crop is harvested with a corn harvester, by which the stalks are bound in bundles

KAFIR CORN.

or sheaves, after which it is either thrashed to separate the seed, or both the stalks and the seed are fed to stock.

**KAFIRISTAN** (kä-fê-rês-tän'), meaning *the country of infidels*, the name applied to a region of Asia, located southeast of Afghanistan. The area is about 5,000 square miles. It is situated between the Hindu-Kush Mountains and India. The country is mountainous and is inhabited by the Siaposh, or Kafirs, a native race consisting of tribes that vary greatly in stature and complexion. They engage chiefly in agriculture, fruit growing, and cattle raising. They have become distinguished for their love of independence and their strenuous resistance to the Mohammedan faith. Their dress is mostly of goatskins and fabrics woven from the hair of goats. Some writers consider the Kafirs of Asia an admixture of Greeks and Hindus. The total number of these people is about 200,450.

**KAFIRS** (käf'êrz), or **Kaffirs**, an Arabic word meaning *unbelievers*, the common name of the most important native race of Southeastern Africa, a branch of the Bantu family. The region occupied by these people extends with more or less variation from Delagoa Bay to Cape Colony. The head of the Kafir is shaped more like that of Europeans than the head of Negroes. The nose is high, the hair is frizzled, and the

complexion is brown, with lighter variations in those found in the southern districts. In their habits they are frugal and simple. The race generally is tall and muscular and the occupations pursued chiefly are hunting and cattle raising. The women engage to some extent in the cultivation of cereals, vegetables, and fruits. Several distinct branches of Kafirs have been described, including the Swazi, Pondos, Fingoes, and Zulus. The last named tribe is especially numerous in the British colonies of Natal and Cape Colony, and has shown marked improvement under the influence of missionaries and teachers. As a rule the Kafirs are deficient in sentiments of religion. They are exceptionally superstitious and generally believe in witchcraft.

The first accounts of the Kafirs were published in 1617, when they came in contact with the Dutch colonists, who began to make settlements near the Cape of Good Hope. After 1688 they are mentioned frequently in the colonial records kept by the Dutch. After settling in Cape Colony, the British began to press them and claim their lands, which resulted in several wars, notably those in 1811-12, and at numerous times since. The War of 1846 led to the reservation of a district known as Kaffraria, which in 1853 was made a crown colony. Originally they occupied territory which comprised 1,000,000 square miles, but with the general occupation of Africa by European powers they have been largely localized and their habits of living have been greatly modified. The total number at present is about 3,000,000. See **Zulus**.

**KAGÓSHIMA** (kä-gō-shē'mä), a city of Japan, situated on the Kagóshima River, at the southern end of the island of Kiushiu. It is an important seaport, contains a college, and has a large trade. The manufactures include earthenware, clothing, silks, and machinery. It has electric lights, waterworks, and well-paved streets. The export trade is chiefly in tea, rice, and camphor. Population, 1903, 59,001.

**KAILAS** (kī-lās'), an elevated mountain peak of the Himalayas, situated near the Sutlej and Indus rivers. The summit is 20,230 feet above sea level. It is celebrated as a sacred mountain of the Hindus. The slopes are covered with fine forests of deciduous and evergreen trees.

**KAISER** (kī-zēr), a word derived from the Latin term Caesar and applied as the official title of the Emperor of Germany. The title was originated from certain provinces near the Danube formed by Diocletian and, though anciently assigned to a Caesar, they became a part of the German Empire in 1438. When William III. of Prussia was proclaimed Emperor of Ger-

many at the conclusion of the Franco-German War, in 1871, the ancient title of the German Emperor was revived.

**KAISER WILHELM CANAL**, an artificial waterway of Germany, extending from Holtenau on the Baltic to Brunsbüttel on the Elbe. It connects the navigation of the North Sea with that of the Baltic Sea. The width at the bottom is 85 feet and at the surface it is 190 feet. It is 29 feet deep and 61.3 miles long. This canal shortens the distance from the Baltic to the North Sea about 200 miles. It was constructed by the government of Germany for naval and military purposes, but is utilized in the freight and passenger traffic. The canal was completed in 1885 at a cost of \$39,500,000.

**KAISER WILHELM'S LAND**. See *New Guinea*.

**KAISERSLAUTERN** (kī-zērs-lou'tērn), a city of Germany, in the Bavarian Palatinate, forty miles west of Mannheim. It has convenient railway facilities, an industrial museum, fine public schools, and a large Protestant church. The manufactures include furniture, cotton and woolen goods, boots and shoes, machinery, and ironware. It contains the ruins of a palace built by Frederick Barbarossa in the 12th century. In 1801 it was made a part of France, but in 1816 became a possession of Bavaria. Within recent years it has grown rapidly, owing to the establishment of large manufacturing enterprises, and it is supplied with electric lights, waterworks, and street railways. Population, 1905, 52,306.

**KALAHARI** (kā-lā-hā'rē), a vast desert in South Africa, located north of the Orange River and east of German Southwest Africa. The extent from east to west is 400 miles and from north to south, 600 miles. Much of the surface is level, having an elevation of 3,500 feet, and vegetation thrives in various parts of the interior. Rains fall copiously from August to April, but the rivers and most of the lagoons dry up during the season of drought. Bushmen and Bakalahari are the principal inhabitants. The giraffe, lion, leopard, antelope, and other wild animals are met with. Melons, grasses, shrubs, and thorny trees comprise the principal plants.

**KALAMAZOO** (kāl-ā-mā-zōō'), a city in Michigan, county seat of Kalamazoo County, on the Kalamazoo River, forty miles from Lake Michigan. It is on the Lake Shore and Michigan Southern, the Michigan Central, the Grand Rapids and Indiana, and other railroads. Large quantities of celery, fruits, and grain are grown in the vicinity. The noteworthy buildings include the post office, the city hall, the public

library, and the Y. M. C. A. building. It is the seat of the Michigan Female Seminary, the Kalamazoo College, the Michigan Asylum for the Insane, and an academy of music. Among the industries are flouring mills, iron foundries, and factories for the production of windmills, plows, vehicles, machinery, sleds, cigars, and furniture. The place was settled in 1829, incorporated as a village in 1843, and chartered as a city in 1884. Population, 1910, 39,437.

**KALAMAZOO**, a river in the United States, rising near the southern boundary of Michigan, in Hinsdale County. It has a general course of 200 miles toward the northwest, flowing into Lake Michigan 28 miles south of Grand Haven. The mouth is deep and is entered by large vessels. Along its banks are fine forests and it furnishes excellent water power. Kalamazoo and Battle Creek are on its banks.

**KALEIDOSCOPE** (kā-lī'dō-skōp), an optical instrument which produces an endless variety of symmetrical and beautifully colored designs, invented in 1817 by David Brewster. It is made of a tube with two plane mirrors, usually formed of slips of glass from six to twelve inches in length, darkened at the back. It tapers in width from about three inches at one end to one inch at the other. Some varieties are made rectangular, but the trapezoidal form is the most common. The mirrors are adjusted so their reflecting surfaces face each other and form any angle of which 360 is a multiple, the usual angle being 60°. The conical tube is made of paper, tin, or brass. It is a trifle larger than the mirrors, and of sufficient diameter at its wider end to inclose their points. A metal plate containing a small hole at the center closes one end of the tube, to which the eye is applied. The opposite end contains two plates, the one next the eye being of clear glass and the other being ground, between which a number of beads or small pieces of colored glass are placed so they may move freely. When applied to the aperture, the eye sees beautiful symmetrical figures produced by the mirrors, and these are greatly diversified whenever the tube is shaken or turned. It has been a favorite toy from its invention, but also serves a useful purpose for illustrating the optical problem of the multiplication of images produced by reflection. It is used by designers to secure patterns for calico, carpets, and wall papers.

**KALI** (kā'lē), the name of a Hindu goddess, formerly worshiped with sacrifices of human beings. She is one of the forms of the wife of Siva, and is the goddess of cholera and other epidemics. In statuary she is represented standing on the body of her husband, wearing a

necklace of skulls and a belt of serpents. A famous shrine built to her memory is maintained at Calcutta, where goats and other animals are offered as a blood sacrifice on her altars.

**KALISPEL**, or **Pend d'Oreille**, a tribe of Indians in the United States, found chiefly in Idaho and Washington. Formerly they occupied territory along Pend d'Oreille Lake, whence they came annually to the plains to hunt the buffalo. They made a treaty with the government in 1855 and the larger portion was removed to Montana, where they are federated with the Flatheads and Kootenai Indians on the Flat-head reservation.

**KALK** (kälk), a town of Germany, in Prussia, on the Rhine. It is located opposite Cologne, with which it is connected by railway and electric lines. It has well-paved streets, electric lights, and many modern business and residential buildings. The manufactures include porcelain, machinery, chemicals, and electric apparatus. Formerly it was a part of Deutz, but became a separate city in 1867. Population, 1905, 25,478.

**KALMIA** (käl'mī-ā), a genus of shrubs native to North America, consisting mostly of evergreen species. The common kalmia attains a height of three feet and bears corymbs of beautiful flowers. To this class of plants belongs the *mountain laurel*, which is native to the Allegheny Mountains, where it grows to the height of thirty feet. It has been naturalized in Europe as a favorite garden shrub. The leaves are poisonous to many animals.

**KALMUCKS** (käl'müks), or **Calmucks**, a people of the Mongolian race. In character they are warlike and nomadic and engage largely in agriculture and stock raising. The Kalmucks are native to the Chinese Empire and certain districts of Siberia and European Russia, extending westward as far as the Volga. They are colonized in large settlements on the Volga, Ural, and Don rivers. In stature they are of middle height, possess considerable strength, and are marked by prominent cheek bones, a short chin, a thin beard, and very shaggy hair. Their religion is Lamaism. The language is allied closely to the Mongolian proper, and is written with a similar alphabet and grammatical construction. The total number includes about 700,000, of which one-half reside in China, about 125,000 in Russia, and the remainder in Central Asia. They have conducted numerous wars against the Tartars, Chinese, and Russians. Those in Europe have been converted largely to the Greek Church by Russian missionaries.

**KAMA** (kă'mä), a river of Russia, the largest branch of the Volga. Its source is in the

province of Vyatka. It makes a bold turn through Perm and flows into the Volga in the province of Kazan, about forty miles below the city of Kazan. The Kama forms a part of the principal highway of commerce for boats between Saint Petersburg and Siberia, is free from ice about eight months of the year, and has been improved by several canals. The total length is 1,300 miles. It is navigable about 850 miles. A canal connects it with the Dwina, thus uniting the White and Caspian seas.

**KĀMA**, or **Kâmâdēva**, the god of love among the Hindus, corresponding to Cupid of the Romans and Eros of the Greeks. He was the son of Brahma and lost his life while trying to tempt Siva, but was born again as the son of Kirshma. After his second birth he was called Pradyumna, another name for Cupid. In statuary he is represented with a bow made of sugar cane, which is strung with a line formed of bees, and he bears five arrows ornamented with the blossoms of flowers. With these arrows he is able to overcome the five senses.

**KAMCHATKA** (kâm-chät'kâ), or **Kam t-chatka**, a peninsula which extends from northeast to southwest in the northeastern part of Asia. It is bounded on the east by Bering Sea, south by the Pacific, and west by the Sea of Okhotsk. The area is 104,000 square miles. It varies in width from 70 to 250 miles, being the widest in the central part, and is about 700 miles long. The climate is cold, though vegetation during the warmer parts of the year is remarkably luxuriant. The Kamchatka is the most important river, having a length of 110 miles, and flows northward through the most fertile and populous portion of the peninsula. Among the minerals are iron, copper, mica, lignite, and sulphur, which are mined largely under Russian supervision, but the principal products include furs and fish. Many fur-bearing animals are native to the region, including the beaver, bear, sable, and Arctic fox. The inhabitants consist chiefly of Kamtschadales, Koryaks, and Russians. Since 1706 it has been a possession of Russia. It is governed from the local capital, Petropavlovsk, a town of 1,200 population. The total population of the peninsula is 7,250.

**KAMERUN** (kâ-mâ-rōon'), or **Cameroon**, a German colony on the west coast of Africa, extending from the Cross River to the mouth of the Rio del Rey. It is bounded on the north by Lake Tchad, east by French Congo, south by Spanish Rio Muni, and west by Nigeria. The area is 191,130 square miles. A part of the colony is mountainous, being crossed by the Ka-

merun Mountains, which have peaks of 13,760 feet. The Kamerun River, from which it derived its name, flows into the Bight of Biafra by an estuary over twenty miles wide. Much of the colony is fertile and produces grasses and other plants in profusion. The rainfall is abundant and the climatic conditions are favorable to agriculture and stock raising. Among the products are tobacco, vanilla, palm oil, cloves, and cereals. The mines yield cobalt, iron, silver, and gold. Rubber, ivory, fruits, palm oil, grains, and live stock are exported. The chief town is Kamerun, on the Atlantic coast, and the most important trading stations are Campo, Bibund, and Victoria.

The colony is governed under an imperial governor, who is assisted by a chancellor and a legislative council. Buëa is the capital and largest town. Schools are maintained at Garna, Victoria, Duala, and other points. Kamerun became a colony of Germany in 1884. The boundary between it and the Niger Coast Protectorate was formerly settled in 1893. Most of the inhabitants are Bantus. In 1908 the colony contained 1,225 whites. Population, 1906, 3,850,640.

**KANAKA** (kā-nā'kā), the name applied by white traders and sailors to a native of the Hawaiian Islands. Later the term came into use to designate the natives of New Caledonia, the New Hebrides, and other oceanic islands. The term kanakas is now used in the sense of the name *coolies*, when speaking of the native laborers of Hawaii.

**KANAZAWA** (kā'nā-zā'wā), a city of Japan, situated near the northeastern coast of the island of Hondo. It contains numerous public institutions, several famous temples, and ruins of old fortifications. The manufactures include porcelain, silk, toys, and paper. It has railroad connections, waterworks, several parks, and a large trade. Population, 1903, 99,657.

**KANDAHAR** (kān-dā-hār'), or **Candahar**, one of the principal cities of Afghanistan, situated 250 miles southwest of Kabul, at an elevation of 3,400 feet. Its location on a general route to India makes it an important commercial and strategical center, which fact has induced the government to fortify it with strong works. A wall with a thickness of from ten to sixteen feet, a height of twenty-five feet, and a length of four miles has been built around it. A strong fortress is located two miles north on a precipitous rock, which has proven of much utility against the attacks of invaders. Few modern conveniences have been introduced. Excellent bazaars are maintained by numerous Persian and Hindu merchants. It contains the tomb of

Ahmed Shah. The manufactures include earthenware, clothing, jewelry, shawls, and utensils. It is thought that Alexander the Great founded the city, though it appears to be entirely of Persian origin. Population, 1906, 61,385.

**KANDY** (kān'dē), a town in the island of Ceylon, located on an elevated plain, about eighty miles from Colombo. It has railway facilities, electric lights, and several large buildings occupied by the government. Near it are the famous botanical gardens of Peradenia. It contains the palace of its former kings and has several ancient monuments and Buddhist temples. Population, 1906, 26,625.

**KANE**, a borough of Pennsylvania, in McKean County, 95 miles southeast of Erie, on the Pennsylvania, the Baltimore and Ohio, and other railroads. The surrounding country produces oil and natural gas. Among the manufactures are glass, brushes, machinery, cigars, and lumber products. It has a healthful climate and is a favorite summer resort. Population, 1900, 5,296; in 1910, 6,626.

**KANGAROO** (kāṅ-gā-rōō'), a species of herbivorous quadrupeds native to Australia, Tasmania, and New Guinea. The kangaroos were first made known to the Europeans by Captain Cook in 1770. They are distinguished by long hind legs, small fore legs, a huge tail, a small, deerlike head, and large ears. When standing erect, they are about the height of a man. They spring from ten to fifteen feet by means of the hind legs and tail, and are able to resist an attack with much skill and fury, though they have a timid disposition and are easily domesticated. The principal food is grass and other vegetable forms. Owing to the consumption of large areas of grass by herds of kangaroos, they have been hunted for destruction, but also for their skins, which are valuable in the manufacture of gloves and shoes. A peculiar pouch or marsupium is attached to the lower part of the body of the female, in which the nipple of the mammary glands open, and serve for the protection of the immaturely born young for a period of about eight months. The flesh of these animals is prized for food, resembling venison, while the tail is a favorite article for soup. Many species of kangaroos have been described, of which the *great kangaroo* described in this is the best known. Other species include the *red kangaroo*, *brush kangaroo*, and *agile kangaroo*. The kangaroo rat and kangaroo bear are other marsupials found in Australia and New South Wales. See illustration on following page.

**KANGAROO ISLAND**, an island at the entrance of Saint Vincent Gulf, South Aus-

tralia, about 102 miles southwest of Adelaide. It is separated from the mainland by Investigator Strait. The surface is barren and the island is valuable mainly for its fisheries. The area is 1,675 square miles.

**KANKAKEE** (kăŋ-kă-kē'), a city in Illinois, county seat of Kankakee County, on the Kankakee River, which supplies an abundance of water power. It is on the Illinois Central, the Illinois and Iowa, the Cleveland, Cincinnati, Chicago and Saint Louis, and other railroads. The noteworthy buildings include the high school, the county courthouse, the public library, the Y. M. C. A. building, and Saint Viateur's College. It is the seat of the Eastern Illinois Hospital for the Insane. The surrounding country is agricultural and fruit growing and has valuable deposits of limestone. Among the manufactures are clothing, flour, ironware, nails, machinery, and cigars. It has street railways, electric lights, pavements, and a sewerage system. The place was settled in 1853 and incorporated the next year. Population, 1910, 13,986.

**KANKAKEE**, a river of the United States, rising near the northern boundary of Indiana. It has a general course toward the west until it reaches Waldron, Ill., where it is joined by the Iroquois, after which it flows toward the northwest until it joins the Des Plaines to form the Illinois River. The valley of the Kankakee is highly fertile. Kankakee, in Illinois, is the principal city on its banks.

**KANSAS** (kăŋ'zās), a central state of the United States, situated in the geographical center of the Union, popularly called the *Sunflower State*. It is bounded on the north by Nebraska, east by Missouri, south by Oklahoma, and west by Colorado. In shape it is rectangular, with a length of 410 miles from east to west and a breadth of 210 miles from north to south. Its geographical position is between 94° 37' and 102° west longitude. In latitude it extends from the 37th to the 40th parallels. The area is 82,080 square miles, being the tenth State in size.

**DESCRIPTION.** The State consists largely of an undulating plain that slopes toward the southeast, and lies within the Great Plains which extend from the Missouri River to the Rocky Mountains. The surface rises gradually

from the eastern border, where the altitude is 750 feet, to a height of 3,875 feet on the western border. Sherman County, in the northwestern part, is the highest point in the State, having an altitude of 4,425 feet. Fertile valleys with belts of timber extend along the streams. The rivers of the eastern part are characterized by bluffs that rise from 100 to 200 feet above the valleys. The average altitude is about 2,000 feet above sea level, which is the height of a line passing a little west of the center. Though the surface is quite elevated, none of the eminences rises more than 500 feet above the general level. A sandy region about 100 miles in length is located in the southwestern part, south of the Arkansas River.

None of the rivers is navigable, except the Missouri, which forms the northeastern boundary. All of the streams belong to the Mississippi system, and the drainage is principally by the Kansas River into the Missouri and the Arkansas into the Mississippi. The north-

AUSTRALIAN KANGAROO.

ern half of the State is drained by the Kansas and its tributaries. The Arkansas drains most of the remainder, flowing eastward to about the south central part, where it forms a bold curve and after a general course toward the southeast passes the border into Oklahoma. The Cimarron, a tributary of the Arkansas, drains the southwestern part. Other tributaries of the Arkansas include the Neosho and the Verdigris. The chief tributaries of the Kansas are the Republican, Smoky Hill, Solomon, Saline,

and Big Blue rivers. While timber is found along most of the streams and water courses, the forests are most extensive in the eastern portion.

The climate is agreeable and is marked by windy but usually mild winters. The summers are tempered by breezes and the nights are refreshing and cool, except in the hottest part of the year, when they sometimes become quite warm. Owing to limited rainfall in the extreme west, that portion is not so favorable to the cultivation of cereals as the other parts of the State, though the soil contains marked elements of fertility. Rains fall most largely from April to July, which is the principal growing season, and the mean rainfall for the State is 27 inches. In the eastern part it is about 35 inches, whence it decreases toward the western border, where it ranges from 12 to 20 inches. In the north

KANSAS.

1, Topeka; 2, Kansas City; 3, Wichita; 4, Leavenworth; 5, Pittsburg; 6, Junction City. Dotted lines show chief railroads.

the mean annual temperature is 52°, whence it rises gradually toward the south, where it is 58°. Though snow falls in the winter, it does not lie on the ground a great length of time. A large portion of Kansas was formerly covered with the so-called buffalo grass, but this prevails at present only in the western portion, while the valleys are covered with an excellent and abundant growth of blue-stem and other bladed grasses valuable for hay and pasture.

**MINING.** The mining industry is centered largely in the southeastern part. Lead and zinc are mined in the vicinity of Galena, and the output is smelted in works that utilize fuel products obtained within the State. In the output of coal Kansas ranks third among the states west of the Mississippi River, and the yield has increased steadily for several decades. Cherokee and Crawford counties are located in the center of a large coal field. Allen County is noted for its output of natural gas and mineral oil. The yield of petroleum is about 3,125,-

000 barrels per year, and the output of coal is about 6,750,000 tons. Large quantities of salt are obtained in the central portion. The most important gas deposits are in the vicinity of Iola and Independence, and much of the output is utilized in smelting and various manufacturing enterprises. Workable quantities of gypsum, red and yellow ocher, fire and brick clays, and stone suitable for construction and monuments are obtained in many localities.

**AGRICULTURE.** Farming was formerly confined chiefly to the eastern half of the State, but it now extends to the western border. This has been made possible in part through irrigation canals, but mainly by introducing plants suitable to an arid climate, and by the adoption of a system of farming calculated to aid in retaining moisture in the cultivated lands. About 80 per cent. of the surface is utilized in farming, and the average size of farms is about 240 acres. In the acreage cultivated it is exceeded only by Iowa. In the production of hay and corn it usually holds third rank. Corn is grown most extensively in the east, where the climate and rainfall are peculiarly favorable. Other crops grown include wheat, oats, potatoes, vegetables, flax, and fruits. It holds high rank in the production of apples, tobacco, sugar beets, broom corn, and castor beans. Alfalfa yields abundantly throughout the State, while timothy and clover are grown more successfully in the east. Among the leading crops of the western part are alfalfa, kafir corn, millet, wheat, rye, and vegetables.

Large interests are vested in stock raising. Cattle are reared both for meat and dairy purposes, and butter and cheese making are important industries. Horses, mules, and swine are raised most extensively in the east, while the grazing lands of the west have contributed to the development of ranches for rearing sheep, cattle, and horses. Kansas City is one of the largest slaughtering centers of the United States, and much of the stock produced in the State is transported to that market.

**MANUFACTURES.** The manufacturing enterprises have grown in importance with every decade, but are not developed to the extent of their possibilities. Kansas City, on the eastern border, has large slaughtering and meat-packing establishments, and is a center for the manufacture of soap, candles, and leather. The products next in importance are flour and meal, which are produced in nearly all parts of the State. Condensed milk, butter, and cheese are exported in large quantities. The presence of vast deposits of natural gas, petroleum, and bituminous coal has caused a large increase in

the smelting and refining industries. Other manufactures embrace cigars, brick and tile, glass, beet sugar, brooms, railway cars, earthenware, wagons and carriages, and farming machinery.

**TRANSPORTATION.** River transportation is confined wholly to the Missouri. Railroad building has been promoted extensively since 1875, and the State is favorably situated with reference to transcontinental traffic. It is crossed by a number of trunk lines, several of which furnish direct communication with ports on the Great Lakes and the Gulf of Mexico. The eastern part is particularly favored in having numerous branches and electric railways. The total lines of steam railroads aggregate 9,200 miles. All of the larger cities are important as railway centers, especially Topeka, Kansas City, Wichita, Coffeyville, Fort Scott, Hutchinson, and Pittsburg. The telephone, telegraph, and electric railways are utilized extensively. Large quantities of live stock, fruit, wheat, wool, packed meats, corn, and dairy products are exported. The imports consist chiefly of merchandise, clothing, and machinery.

**GOVERNMENT.** The present constitution came into effect in 1861. It vests the executive power in a governor, lieutenant governor, auditor, treasurer, superintendent of public instruction, secretary of State, attorney-general, secretary of horticulture, superintendent of insurance, and secretary of labor statistics, all of whom are elected for two years. In addition there are the board of railroad commissioners, the State agricultural society, the free employment agency, the board of control of charitable institutions, and the executive council, the last mentioned being constituted of the Governor and six other State officials. The Legislature is composed of the senate and the house of representatives, the former having 40 and the latter 125 members. The senators are elected for four and the representatives for two years, and the legislative sessions are held biennially. A supreme court of seven judges elected for three years is the highest judicial tribunal. Subordinate to it are the district judges, who preside over the courts in districts made up of several counties. The judges of the supreme court serve for six years, while the district judges are elected for four years. Each county has a clerk of the district court and a probate judge. Justices of the peace are elected in the townships.

**EDUCATION.** Kansas has a high rank in educational affairs among the states. It contains the highest proportion of native born citizens. In 1900 the illiterate population was only 2.3

per cent. of the inhabitants. This result was attained largely because of a compulsory attendance law and the excellent system of public schools maintained in the State. A large majority of the inhabitants reside in rural districts, hence the elementary schools are well distributed in all the more densely populated sections. All the towns and cities have high schools, which are graded under a course of study prepared by the state department, and the public system terminates in the University of Kansas, situated at Lawrence. The State normal school is at Emporia, at which a large proportion of the teachers receive training, and a number of private normal schools and departments of other institutions furnish special courses for those who desire to enter the profession of teaching. Licenses are granted to teachers on the basis of training and experience, ranging from those issued in the counties to the State certificates granted by the State board of examiners. The average length of the school year is a little less than eight months, but all of the cities and many rural districts have nine months per year.

The State has many private institutions of higher learning. These include Washburn University at Topeka; Baker University, Baldwin; Bethany College, Lindsborg; Friends' University, Wichita; Ottawa University, Ottawa; Fairmount College, Wichita; Lane University, LeCompton; Salina Wesleyan University, Salina; Southwest Kansas College, Winfield; and Saint Benedict's College, Atchison. Kansas City has an institution for the blind. Olathe has a school for the deaf and dumb, and Leavenworth has a national soldiers' home. The soldiers' orphans' home is at Atchison, the State penitentiary is at Lansing, and the industrial reformatory is at Hutchinson. Beloit has an industrial school for girls. Topeka has a reform school for boys, and Leavenworth has a Federal prison. Osawatamie is the seat of an insane asylum.

**INHABITANTS.** The inhabitants consist largely of American-born citizens, many of whom immigrated from states farther east. The per cent. of foreign-born is smaller than that in most states of the Mississippi Valley. The urban population is comparatively small, owing to the fact that the State has no large cities, none of them having more than 75,000 inhabitants. Topeka, on the Kansas River, is the capital. Other cities include Kansas City, Leavenworth, Wichita, Atchison, Pittsburg, Lawrence, Fort Scott, Parsons, Hutchinson, Emporia, Coffeyville, and Independence. In 1900 the State had a population of 1,470,495. Of this number 54,176 were colored inhabitants, including 2,130

Indians and 52,003 Negroes. In 1905 the population was 1,544,968; in 1910, 1,690,949.

**HISTORY.** The larger part of Kansas constituted a portion of the Louisiana Purchase acquired from France in 1803, but the region lying south of the Arkansas River and west of longitude 100° W. was ceded in 1850 by Texas to the United States. It was first visited in 1541 by Coronado, a Spaniard, and was partly explored in 1819-20 by Major Long of the United States army. The region was a part of Missouri Territory until 1821, and then remained unorganized until the Kansas-Nebraska bill, in 1854, formed the Territory of Kansas, which then included part of the present State of Colorado. After much controversy between opposing parties to make Kansas a free or a slave State, it was admitted to the Union on Jan. 29, 1861, under the Wyandotte Constitution, prohibiting slavery. Prior to its admission occurred the celebrated border war, resulting from an attempt of people from the Northern and Southern states to influence its final position as to slavery.

Kansas furnished a larger proportion of men for the Civil War than any other State. It was not a direct battle ground, but Quantrell's guerrillas invaded the State from Missouri and captured Lawrence, where a large number of citizens were killed. About 40,000 Negroes migrated from the South into Kansas in 1878 and 1880. Prohibition became incorporated in the general laws shortly after 1880, after a period of extended discussion. It continues to attract considerable attention from time to time.

**KANSAS, University of,** a coeducational State institution at Lawrence, Kansas, established in 1864. It comprises the schools of pharmacy, medicine, arts, law, engineering, and fine arts. With it are included a graduate school and the University Geological Survey. Admittance is free to all residents of Kansas, and students from other states are required to pay a small tuition. The institution has a library of 45,000 volumes, property valued at \$1,125,000, and an attendance of 2,050 students. It is governed by a board of seven regents, consisting of the chancellor of the university and six members appointed by the Governor for four years.

**KANSAS CITY,** the largest city in Kansas, county seat of Wyandotte County, separated from Kansas City, Mo., by the State boundary. It is on the Union Pacific, the Chicago, Rock Island and Pacific, the Missouri Pacific, the Atchison, Topeka and Santa Fé, and other railroads. The site extends to both sides of the Kansas River, at its confluence

with the Missouri, and includes an area of twelve square miles. A part of the city is on the low bottom of the rivers, but the large part extends along the slopes and over the bluffs. Several bridges across the Kansas River unite the two parts of the city. It is also closely connected with Kansas City, Mo., by well-graded streets and a system of electric railways. The streets are well paved with brick and asphalt.

Kansas City, Kan., is the seat of Kansas City University, a Methodist Episcopal institution. It has a fine Carnegie library valued at \$80,000. Other noteworthy buildings include the public high school, the county courthouse, the State institution for the blind, and many churches and schools. The live stock business ranks as the second largest in the world. It is one of the most important packing-house centers in the United States, and those located in the city have given a world-wide reputation to the two cities. It has many large grain elevators and numerous manufacturing enterprises. Among the general manufactures are soap, leather, flour, candles, hardware, and machinery. Kansas City was chartered in 1886, when it was formed of Armstrong, Wyandotte, Armourdale, and several other villages. Population, 1910, 82,331.

**KANSAS CITY,** the second city in Missouri, situated in Jackson County, on the south bank of the Missouri River, separated by the State boundary from Kansas City, Kan. It is one of the most important railroad centers in the Mississippi Valley, being on the line of numerous trunk railroads, some of which pass through while others have their terminus in the city. They include the Chicago and Alton, the Wabash, the Chicago Great Western, the Atchison, Topeka and Santa Fé, the Chicago, Rock Island and Pacific, the Kansas City Southern, the Chicago, Milwaukee and Saint Paul, the Chicago, Burlington and Quincy, the Missouri Pacific and other railroads. Most of the lines use in common a large union depot, and a terminal circular railway furnishes intercommunication among the different lines. Several great bridges have been constructed across the Missouri River, which at this place receives the inflow from the Kansas River. A fine system of electric street railways has lines to all parts of the city, and suburban and inter-urban transit is furnished by branches and lines extending to various points in Kansas and Missouri. Additional transportation facilities are furnished by steamboat lines on the river.

The streets are broad, regularly platted, and improved by asphalt, brick, and stone paving. The site of the city is on a rolling and rather

uneven tract of land, but it has been greatly improved and beautified by grading and leveling. Many of the buildings in the business section are from ten to eighteen stories high. The construction is modern and of substantial material, mostly of stone. Among the noteworthy buildings are the Federal courthouse, the city hall, the United States customhouse, the board of trade building, the Kansas City Club building, the art gallery and museum, the public library, and the Y. M. C. A. building. It has many tall structures and office buildings, such as the Scarritt, the Dwight, the Midland, the Commerce, and the New York Life buildings. The public institutions include the Kansas City College of Law, Scarritt Training School, the University Medical College, and a number of hospitals. Among the leading parks are Holmes Square, Scarritt Point, and Fairmont and Washington parks. All the leading Christian denominations have commodious church buildings. Many fine public and private schools are maintained.

Kansas City is a distributing point for a large region in the Southwest and has an extensive wholesale and jobbing trade. It is important as a market for grain and live stock, and contains extensive mills and elevators. The milling products, including flour, oatmeal, and cornmeal, take rank as the most important manufactures within the city. Other products include clothing, malt liquors, confectionery, machinery, leather, hardware, brick and tile, and foundry products. The first settlement on its site was made by French fur traders in 1821 and it was platted as a town in 1838. It was incorporated in 1853, when it was known as Westport Landing. The early growth of the city is due to the navigation facilities of the Missouri River, by which it was built up before the construction of railways. It received its first impetus as a commercial city in 1865, when it was reached by the Missouri Pacific Railroad. In 1903 it suffered much damage by an overflow of the Missouri River. Population, 1910, 248,381.

**KANSAS-NEBRASKA BILL**, the name of a bill introduced in the Congress of the United States by Stephen A. Douglas in 1854, which was passed in the same year. It is so named because it separated and organized the territories of Kansas and Nebraska, and its importance is in the fact that it practically repealed the Missouri Compromise. It embodies the *squatter sovereignty* idea of Douglas, in that the question of slavery in the two territories was to be settled by the people residing therein, and if the people decided to adopt slavery the fugitive slave law was to apply. Nebraska was easily settled as a free territory, but the passage of the

bill was the occasion of much trouble in Kansas. It was one of the causes that hastened the Civil War.

**KANSAS RIVER**, a river of Kansas, formed in Dickinson County by the union of the Solomon and Smoky Hill rivers. It is joined near Junction City by the Republican and near Manhattan by the Big Blue River. After an easterly course of about 200 miles, it joins the Missouri at Kansas City. The valley of the Kansas River is highly fertile, producing large quantities of fruits and cereals.

**KANSAS STATE NORMAL SCHOOL**, institution of learning at Emporia, Kas., established by an act of the Legislature in 1863. In 1901 the Western Branch State Normal School was organized at Hays and two years later the Manual Training Auxiliary was founded at Pittsburg. The management of these schools is by law vested in one board of regents and the president of the normal school at Emporia is president of the three schools. These institutions are conducted for the instruction of persons in the art of teaching all grades of work from the kindergarten to the high school. On completion of two, three, and four years of work, respectively, state certificates for one year, three years, and life are granted. An advanced course of collegiate grade at Emporia confers the degree of bachelor of arts and education. The special features at Emporia are kindergarten and primary methods, the school of music, the practice school, the commercial department, and the advanced college course. The library of 25,000 volumes with its new building and equipment offers good opportunity for the practical training of teachers in primary methods. Among the special organizations for students are the literary societies, debating clubs for young men and women, the Y. M. and Y. W. C. A., the music society, the orchestra, and classes in chorus work.

In addition to the main building, there are separate buildings for the library, the training school, the gymnasium, the hospital, the boiler house, and the science department. Special attention is given to athletics, football, baseball, golf, tennis, and other out-of-door sports. The teaching force for the three schools is composed of 85 instructors, with a student attendance of approximately 2,700 students.

**KAOLIN** (kā'ō-līn), a hydrated silicate of alumina, so named by the Chinese from a hill in China called Kaoling. It is a soft clay formed by the decomposition of rocks and contains mica, feldspar, and quartz. This product is now obtained in various parts of Germany, France, England, and the United States. De-

posits of considerable extent occur at Schneeberg, in Saxony; at Cornwall, in England; and in various parts of Georgia, Pennsylvania, and Vermont. The proportion of silica to alumina varies in different countries. It is used extensively in the manufacture of porcelain and white earthenware and in paper making. It somewhat resembles mortar in the natural state, but becomes pure white when burned.

**KARAKORUM MOUNTAINS** (kā-rā-kō'rūm), an elevated range in the central part of Asia, extending from the Himalayas into Kashmir and Eastern Turkestan. These mountains terminate at the Pamir, where they merge into the Hindu Kush. Mount Godwin-Austin, elevated 28,278 feet above the sea, is the culminating peak and one of the highest summits in the world. The Karakorum Pass is one of many lofty passes that connect the intervening valleys.

**KARIKAL** (kā-rē-kāl'), a French possession on the Coromandel Coast of India, in the British district of Kanjore, 150 miles south of Madras. It has an area of 63 square miles and is inhabited chiefly by natives. This possession was made French territory in 1759, but was captured by the English in the early part of the 19th century, and was restored to the French in 1814. It has considerable trade with France and the French colonies, chiefly in rice and fruit. Karikal, the chief town, in 1906, had a population of 17,511. Population, 1906, 71,554.

**KARLSBAD.** See **Carlsbad.**

**KARLSRUHE.** See **Carlsruhe.**

**KASCHAU** (kā'shou), or **Kassa**, a city of Hungary, capital of the county of Adauj-Torna, 168 miles northeast of Budapest. It is located on the Hernád River, has railroad conveniences, and its streets are regularly platted. The surrounding country produces large quantities of wine and cereals. It has a fine Gothic cathedral, a royal law school, a coeducational seminary for teachers, and several schools and Protestant churches. The manufactures include flour, paper, cigars, spirits, and clothing. In 1241 the region was settled by German colonists. It was the scene of a battle between the Austrians and the Hungarians in 1849, in which the latter were defeated. Population, 1906, 43,150.

**KASHAN** (kā-shān'), a city of Persia, in a province of the same name, 120 miles south of Teheran. It has public baths, a Mohammedan college, and numerous mosques and bazaars. The manufactures include faïence, jewelry, and silk and woolen textiles. Population, 30,500.

**KASHGAR** (kāsh-gār'), a city of Asia, in East Turkestan, on the Kashgar River. It is surrounded by mud walls and the new part of

the town is defended by a citadel. The manufactures consist chiefly of textiles, carpets, and jewelry. It has considerable trade and is the seat of several native schools and mosques. Population, 65,808.

**KASHMIR.** See **Cashmere.**

**KASKASKIA** (kāś-kās'kī-ā), a river in Illinois, rises in Champaign County, flows south-east and enters the Mississippi at Chester. It has a length of 200 miles and is navigable for about 50 miles. The first settlement in the State was founded by the French on the Kaskaskia River, about seven miles from its mouth, in 1680. Kaskaskia was the first capital of Illinois. It is now a small post village. Population, 1900, 177.

**KATAHDIN** (kā-tā'dīn), or **Ktaadn**, a celebrated mountain peak, the most elevated in Maine. It is situated in the central part of the State, about eighty miles west of Bangor, and has a height of 5,385 feet above sea level.

**KATRINE** (kā'trīn), **Loch**, a lake of Scotland, in Perthshire, five miles east of Loch Lomond. It is eight miles long and about two miles wide, and is visited annually by many tourists. Ellen's Isle, located in this lake, is the scene of Scott's "Lady of the Lake."

**KATTEGAT.** See **Cattegat.**

**KATYDID** (kā'ty-dīd), a pale green insect, about an inch and a half long, allied to the grasshopper. Several widely distributed species have been studied. The name is an imitation of their peculiar note heard at night, which is caused by the friction of membranes attached to the covers of the wings. It is made only by the males, being a call to the noiseless females.

**KAUKAUNA** (kā-kā'nā), a city of Wisconsin, in Outagamie County, on the Fox River, 22 miles above Green Bay. It is on the Chicago and Northwestern Railroad, which maintains extensive shops at this place. Other industries include brick and tile works, flouring mills, and paper mills. It has electric lighting, waterworks, and several fine schools. Water power for manufacturing is obtained from the Fox River. Population, 1905, 4,991.

**KAW** (kā), or **Kansa**, a tribe of Sioux Indians who formerly occupied the lower valley of the Kansas River, in Kansas. They speak a dialect of the Osage language. At the beginning of the 19th century they numbered about 1,300, but at present not more than 200 full-bloods remain. In 1846 they were removed to Oklahoma, where they occupy a reservation with the Osage Indians.

**KAZAN** (kā-zān'y'), the chief city and capital of the Russian government of Kazan, on the Kazanka River, near its junction with the

Volga. It is strongly fortified. The industries include tanneries, soap factories, machine shops, and establishments for wool combing, weaving, and dyeing. Near it is a government dockyard. Its convenient navigation and railroad facilities make it an important market for flour, hemp, timber, and cereals. As an educational center it ranks among the most important of Russia. The university was founded by Alexander I. in 1804. It has an extensive observatory, botanical gardens, and a library of 100,000 volumes, and is attended by 1,000 students. Near the city are the shipyards in which Peter the Great built the Russian fleet, which became famous on the Caspian Sea during his reign. Kazan was founded in the 13th century, but originally the town was thirty miles farther east than the present location. It was the capital of the khanate of Kazan under the Tartars. The Russians under Ivan the Terrible captured it in 1552 after a prolonged siege. Population, 139,250.

**KEARNEY** (kär'nī), a city in Nebraska, county seat of Buffalo County, on the Platte River, about 125 miles west of Lincoln. It is on the Union Pacific and the Chicago, Burlington and Quincy railroads, and is surrounded by a fertile stock and agricultural country. The noteworthy buildings include the county courthouse, the high school, the public library, the city hall, the opera house, and the Nebraska Industrial School for Boys. Lake Kearney, which covers about forty acres, is near the city. Among the manufactures are brick, machinery, canned articles of food, crackers, cigars, and flour. The municipal facilities include systems of sewerage and waterworks. Kearney was settled in 1871 and incorporated in 1872. Population, 1900, 5,634; in 1910, 6,202.

**KEARNY**, a town of Hudson County, New Jersey, on the Passaic River, opposite Newark. It is on the Erie and other railroads and is popular as a residential center. The chief buildings include the townhall, an Italian orphan asylum, a State soldiers' home, the public library, and the high school. It has electric street railway connections with Jersey City, is important as a manufacturing center, and has a growing trade in merchandise. Kearny was first settled by Germans, when it was known as New Barbadoes, and it was incorporated under its present name in 1871. Population, 1910, 18,659.

**KEARSARGE** (kēr'särj), a famous battleship of the United States, which was used for effective service in the Civil War. It was launched at Portsmouth, N. H., in 1861, and on June 19, 1864, engaged in battle the Confederate cruiser *Alabama* off the harbor of Cherbourg, France, disabling and sinking that privateer,

which had destroyed a large part of the American merchant marine. In 1894 the *Kearsarge* was wrecked in the Caribbean Sea, though the officers and crew were saved. The vessel was burned by natives before a wrecking party arrived.

**KECSKEMÉT** (kěch'kě-māt), a town of Hungary, capital of the district of Pesth-Solt, fifty miles southeast of Budapest. It is surrounded by an agricultural and stock-growing country, and is the seat of an important annual cattle fair. The chief buildings consist of grain elevators, several churches, and a number of secondary educational institutions. Most of the inhabitants are Magyars. Population, 1906, 60,045.

**KEEL**, the lower timber of a wooden ship or vessel, answering to the spine, and giving the main support to the ribs and the whole structure. In most wooden vessels an additional timber beneath is called a *false keel*, and a piece bolted to the keel on the inside is called the *keelson*. Iron vessels are arranged with entirely different parts. The keel is the first part of a ship to be built, hence the term *laying of the keel* has reference to the first work in constructing a ship.

**KEENE**, a city in New Hampshire, county seat of Cheshire County, on the Ashuelot River, about ninety miles northwest of Boston. It is on the Boston and Maine Railroad, within ten miles of Monadnock Mountain, and is surrounded by chains of hills. The noteworthy features include a fine public library, the county courthouse, and a handsome monument dedicated to the soldiers of the Civil War. Among the manufactures are machinery, furniture, vehicles, ironware, woolen fabrics, and shoes. It has electric lights and street railways, waterworks, pavements and a system of sewerage. Keene was settled in 1734, but was known as Upper Ashuelot until 1753, when it was incorporated under its present name. Population, 1900, 9,165; in 1910, 10,068.

**KEEWATIN** (kê-wä'tin), a large district of Canada, extending from Manitoba and Ontario to the Arctic Archipelago. It is bounded on the north by Franklin, east by Franklin and Hudson Bay, south by Ontario and Manitoba, and west by Manitoba, Saskatchewan, and Mackenzie. The extent from north to south is 1,300 miles and the area is 756,000 square miles. Much of the surface is rugged, but it is characterized by numerous lakes, swamps, and patches of good arable land. All of the rivers drain into Hudson Bay. They include the Nelson, Severn, Churchill, and Back rivers. The English River, flowing west, and the Albany

River, flowing east to James Bay, form the southern boundary. The southern half of the district is covered with a dense growth of forests, but the timber in the north is sparse and scrubby. Pine, spruce, and aspen poplar are the chief species. Gold and copper are the most important minerals, but furring is the principal commercial enterprise.

The agents of the Hudson Bay Company exercise a personal influence among the Indians and half-breed trappers, thus fulfilling to some extent the functions of a civil government. When necessary the authority of the Dominion is enforced through the efficiency of the Northwest Mounted Police, a force of constabulary upon which the maintenance of peace devolves to a large extent. As magisterial powers are exercised by the officers of the police in their several districts, the development of the region has been aided to a considerable extent by the presence of these royal officials. Small detachments are kept on patrol duty and they visit regularly every point where settlement has begun. However, the few inhabitants are found mainly in the small villages along the west coast of Hudson Bay, where they engage in fishing and hunting. Population, 1901, 8,546.

**KELP**, the common name of several species of brown seaweeds found along the seacoast. Some of these plants are of large size, ranging from five to ten feet in length on the Atlantic coast of North America to the giant kelp of the Pacific, which is several hundred feet in length. These plants form submarine forests of gigantic size in the Southern Hemisphere. Some of the species are used as food, but their value is principally as a manure for enriching the soil. Formerly kelp was employed to a considerable extent in making soda, for which purpose it was dried and burned at a low heat. The product is itself called *kelp*, and is now used chiefly in the production of iodine and chloride of potassium.

**KENESAW MOUNTAIN, Battle of**, an engagement of the Civil War, fought near Marietta, Ga., on June 27, 1864. General Sherman with a Federal force of 95,000 men undertook to march from Chattanooga to Atlanta. At Kenesaw Mountain he came in contact with 60,000 Confederates under General Johnston, who repelled the Federal assault after fighting vigorously for nearly three hours. About 3,000 Federals were missing in killed and wounded. The Confederates were compelled to retreat after a vigorous attack directed by General McPherson on July 1, and soon after took a position beyond the Chattahoochee River.

**KENILWORTH** (kĕn'ĭl-wŭrth), a market town of Warwickshire, England, situated on a

tributary of the Avon, about ninety miles northwest of London. It is noted for its castle, which, until the year 1563, was a crown possession, and at that time was given to Robert Dudley, Earl of Leicester (q. v.), by Queen Elizabeth. This earl entertained the queen there in the year 1565 for a period of eighteen days at a daily cost of \$5,000. Sir Walter Scott's novel, "Kenilworth," is based upon this gorgeous entertainment. Population, 1907, 4,602.

**KENNEBEC** (kĕn'nĕ-bĕk), a river of Maine, being next to the Penobscot the most important in the State. It rises in Moosehead Lake, has a general course toward the south, and flows into the Atlantic Ocean. The length is 150 miles, falling 1,000 feet in the course from the source to the mouth. It is navigable for ships to Bath and for steamers as far as Hollowell. Among the cities on its banks are Bath, Augusta, and Waterville.

**KENOSHA** (kĕ-nŏ'shà), a city in Wisconsin, county seat of Kenosha County, on Lake Michigan, 33 miles south of Milwaukee. It is on the Chicago and Northwestern Railroad and has a fine harbor. The notable buildings include the public library, the county courthouse, the high school, and many churches. Among the manufactures are machinery, furniture, wagons, wire mattresses, hosiery, malt, bicycles, and ironware. The municipal facilities include electric street railways, waterworks, sewerage, and pavements. It is surrounded by a fine farming country and has a growing trade in produce and merchandise. Kenosha was incorporated as a city in 1850. Population, 1910, 21,371.

**KENSINGTON GARDENS**, a park about two miles in circumference, situated in the city of London, England. It extends west of Hyde Park, from which it is separated by the Serpentine. Near the northwestern part is Kensington Palace, which was purchased in 1689 by William III. This palace served as a royal residence for more than a century.

**KENTON** (kĕn'tŭn), a city and the county seat of Harden County, Ohio, on the Scioto River, seventy miles northwest of Columbus. It is on the Erie, the Toledo and Ohio, and the Cleveland, Cincinnati, Chicago and Saint Louis railroads. The chief buildings include the county courthouse, the public library, the armory, and the high school. Among the manufactures are machinery, ironware, furniture, strawboard, and bee-keepers' supplies. It is the seat of the largest iron fence factory in America. Kenton was settled in 1833 and incorporated in 1885. Population, 1900, 6,852; in 1910, 7,185.

**KENTUCKY** (kĕn-tŭk'ĭ), a southern state of the United States, known popularly as the

*Bluegrass State.* It is bounded on the north by Illinois, Indiana, and Ohio, east by Virginia and West Virginia, south by Tennessee, and west by Missouri and Illinois. The greatest breadth from north to south is 190 miles and the extreme length from east to west is 460 miles. It is separated from Virginia by the Big Sandy River, from Missouri by the Mississippi River, and from Illinois, Indiana, and Ohio by the Ohio River. The area, including 400 square miles of water surface, is 40,400 square miles.

**DESCRIPTION.** The surface slopes from the southeast to the northwest, and is comprised largely within the Allegheny Plateau. In the southeastern portion are the Cumberland Mountains and the Kentucky Ridge, which form elevations from 1,800 to 3,550 feet above sea level. A range of hills, known as the *Knobs*, extends centrally across the State from the southern border to the Ohio. In the interior and northeastern parts the elevations are from 300 to about 1,000 feet above sea level, much of which region is included in the celebrated bluegrass country. Swamps abound in the southwestern part among the elevated ridges, where the country is characterized by extensive forests. In the same region, but somewhat toward the west, are vast limestone formations that extend to the central

KENTUCKY.

1, Frankfort; 2, Louisville; 3, Newport; 4, Lexington; 5, Paducah; 6, Bowling Green. Chief railroads are indicated by dotted lines.

part of the State. Within this section are numerous caves and caverns, including the celebrated Mammoth Cave (q. v.).

The drainage belongs exclusively to the Mississippi system and the Mississippi River receives the inflow almost entirely through the Ohio, Mayfield Creek and a few minor streams being the only tributaries that discharge directly into it. The Mississippi forms 80 miles of the western border and the Ohio forms the entire northern boundary, having a winding course of nearly 600 miles. In the western part are the Cumberland and Tennessee rivers, but the former, owing to its great length, also drains a large region

in the southeastern part. Other important streams include the Tradewater, Green, Kentucky, and Licking rivers. Many of the streams are navigable and supply splendid facilities for interior commercial intercourse. The State has no lakes aside from a few small sheets of water.

The climate is equable and healthful. In the winter the prevailing winds are largely from the northwest and in the summer they blow mostly from the southwest. The mean temperature is about 55°, ranging from 35° in winter to 78° in summer. During the summer season the thermometer rises as high as 100° and in winter it very rarely falls to zero. Snow seldom falls in winter in the southern part, but it is frequently quite heavy in the northeastern section. The annual rainfall averages about 40 inches, ranging from 36 to 45 inches as the years are wet or dry.

**MINING.** Kentucky has an abundance of many useful minerals. Extensive deposits of coal are worked in the central and eastern parts of the State. The coal area is about 13,500 square miles in extent, forming a continuation of the fields in Indiana and Illinois. In 1908 the output was 10,385,000 tons, which is about the average yield for the past several years. The larger output consists of bituminous coal, but small quantities of cannel coal are obtained. Iron ore is found in more or less paying quantities in the coal regions, but this mineral is not worked extensively. Petroleum occurs in the south central part of the State and natural gas is obtained in several counties. Other minerals include salt, lead, gypsum, fluor spar, and fire and brick clays. Building stones of a superior quality are widely distributed.

**AGRICULTURE.** Originally the State was covered almost entirely with dense forests, but at present about 86 per cent. of the area is included in farms. Fully two-thirds of the farms are operated by the owners and the remainder are worked largely in small tracts by tenants. Corn and tobacco are the principal crops. The area cultivated in corn is nearly twice as great as that utilized in raising all other cereals, which include wheat, oats, and rye. A large acreage of hay is grown to supply the extensive interests vested in stock raising. Other crops include hemp, potatoes, sorghum, vegetables, and fruits. Kentucky is the leading tobacco-growing State and produces more than one-third of the crop grown in the entire country. The breed of road horses reared in Kentucky is well known, and the class of driving horses peculiar to that State have a high reputation. Large interests are vested in the cattle industry, both for the production of meat and for dairying. Other do-

mestic animals include swine, sheep, mules, and poultry.

**MANUFACTURING.** Kentucky has taken high rank as a manufacturing state for more than half a century. In the output of tobacco and tobacco product it holds first rank, the annual value of these products being about \$25,500,000. Next in the list are the malt and distilled liquors, which have a combined value approximately as large as that of the manufactures of all classes of tobacco. The output of the flouring and grist mills is likewise large. Being favored with an abundance of hardwood forests, such as oak, walnut, and cypress, the State has large interests in the manufacture of timber products, especially lumber and furniture. Other manufactures taking high rank include meat and other slaughtering products, leather, iron and steel, railway cars, clothing, and cotton and woolen goods. Louisville, Covington, Newport, and Lexington are among the manufacturing centers.

**TRANSPORTATION.** Few states are as favorably situated for river transportation as Kentucky, having ample facilities on the Ohio, Mississippi, Cumberland, Tennessee, Green, and Licking rivers. The State has 3,300 miles of steam railways in operation, including lines of the Illinois Central, the Chesapeake and Ohio, the Louisville and Nashville, and the Mobile and Ohio. Electric lines have been built in all parts where the population is reasonably dense. Many highways have been graded and macadamized. Considering the fact that much of the surface is very rolling and rugged, it must be said that Kentucky has made rapid strides in constructing means of communication, although a number of counties in the eastern part of the State are not supplied with railway facilities.

**GOVERNMENT.** The executive authority is vested in the Governor and Lieutenant Governor, who are elected for a term of four years and are not eligible to reelection. Other State officers include the treasurer, register of land office, auditor of public accounts, secretary of State, superintendent of public instruction, attorney-general, and commissioner of agriculture, labor, and statistics. The legislative functions are exercised by a senate and a house of representatives. Members in the former are elected for four years and of the latter for two years, the upper house having 38 senators and the lower house 100 representatives. Sessions of the Legislature are held in even years, beginning the first Tuesday after the first Monday in January. The supreme court, known as the court of appeals, is the highest judicial tribunal. It is presided over by from five to seven judges, who are elected from districts for a term of eight years. Sub-

ordinate to it are the circuit courts, county courts, and justice courts. The county officers are elected for terms of four years.

**EDUCATION.** The census reports show a steady decrease in illiteracy. Those who were unable to read and write in 1900 constituted 16.5 per cent. of the inhabitants of ten years or over, as against 21.6 per cent. in 1890. A system of public instruction is maintained by interest on State bonds and by general taxation. The presence of a large proportion of Negro inhabitants in many parts of the State has given rise to separate schools. Supervision is under the direction of county and city superintendents, who look after the schools locally under the superintendence of the State department of public instruction. Systematic courses of study have been devised by a State board for the public schools, particularly the high schools of cities and towns, which are graded so as to articulate with the institutions of higher learning. Kentucky University, at Lexington, is the most important educational center in the State. However, higher instruction is given in about 35 colleges and 67 academies, besides in numerous institutions for special culture. Among the centers of learning are the Central University, Danville; Berea College, Berea; Williamsburg Institute, Williamsburg; Georgetown College, Georgetown; Ogden College, Bowling Green; Eminence College, Eminence; South Kentucky College, Hopkinsville; Kentucky Military Institute, Farmdale; and Liberty College, Glasgow.

Ample provisions have been made for the care of the unfortunate and incorrigible. Danville has a school for the deaf, Louisville has a school for the blind, and Frankfort has an institution for feeble-minded children. The penitentiaries are at Eddyville and Frankfort. Asylums for the insane are located at Anchorage, Hopkinsville, and Lexington. Many hospitals are maintained by private interests in the cities, all of which have one or more benevolent institutions.

**INHABITANTS.** The foreign-born population is small, being only 50,249. As compared with most of the southern states, Kentucky has a large urban population. Frankfort, in the north-central part of the State, on the Kentucky River, is the capital. Other cities include Louisville, Covington, Newport, Lexington, Paducah, Owensboro, Bowling Green, Maysville, Henderson, and Hopkinsville. In 1900 the State had a population of 2,147,174. In this number were included 284,706 Negroes, 57 Chinese, and 102 Indians. Population, 1910, 2,289,905.

**HISTORY.** Kentucky, like other states of the Mississippi valley, contains historic relics of the

mound builders. Its name, signifying "The dark and bloody ground," was derived from the different tribes of Indians who met in various warlike conflicts in the region, which did not form the possession of a single tribe. Thomas Walker, who visited the section in 1750, was probably the first white man to make an extended report on its resources. Daniel Boone made an exploring expedition from North Carolina in 1769, and the first settlement was formed at Harrodsburg by James Harrod in 1774. Originally the entire territory was included with the colony of Virginia. It was made a separate territory in 1790 and admitted into the Union as a State in 1792. Many of its citizens took an active interest in the Mexican War. The State did not secede during the Civil War, though Kentuckians served in both armies, and it was represented in the Confederate Congress. Lincoln proclaimed martial law in the State in 1864, and Johnson restored civil authority the following year. The battles fought within its borders include those of Richmond, Mill Spring, and Perryville.

In 1908 local differences among the growers of tobacco were the occasion of much agitation and litigation. The tobacco trust had dictated the price paid for tobacco, which caused many producers of tobacco to organize a movement for mutual protection. However, a class of independent tobacco growers refused to join in the movement, which caused parties of men, known as *Night Riders*, to destroy much property at Hopkinsville and other places. Many of the raiders were captured, convicted, and executed.

**KENTUCKY**, a river in Kentucky, formed in Lee County by the junction of three forks that rise in the Cumberland Mountains. After a tortuous course of about 260 miles it flows into the Ohio River at Carrollton. It courses through a rich mineral and agricultural country, has been improved in its lower portion, and is navigable beyond Frankfort. The basin of the Kentucky contains deposits of coal, iron ore, and marble.

**KENTUCKY RESOLUTIONS**, a series of resolutions adopted by the Legislature of Kentucky, closely associated in spirit and contents with the Virginia Resolutions. They resulted from a feeling that the Federal party was making illegitimate use of the powers granted by the constitution to the Federal government. The Kentucky Resolutions were framed by Thomas Jefferson and introduced in the Legislature of Kentucky by John Breckenridge in 1798. They set forth the unconstitutionality of the Alien and Sedition Laws, and declared that the Union is not based upon the principle of un-

limited submission to the general government. In 1799 the Legislature of Kentucky declared a nullification of a Federal law by a State to be the rightful remedy in cases of Federal usurpation. The Virginia Resolutions were similar in sentiment, but were milder in their expression. They were passed by the Legislature of Virginia in 1798, and were probably written by James Madison. Though copies of both sets of resolutions were sent to the governors of all the states, no favorable response was evoked.

**KENTUCKY UNIVERSITY**, an institution of higher learning founded at Georgetown, Ky., in 1837, and removed to Lexington in 1864. It comprises four colleges, the College of the Bible, the College of Liberal Arts, the Commercial College, and the College of Medicine. The last named is located at Louisville and the first three mentioned are at Lexington. It is under control of the Disciples of Christ, has property valued at \$600,000, and is attended by 1,250 students.

**KEOKUK** (kē'ō-kūk), a city of Iowa, one of the county seats of Lee County, at the confluence of the Des Moines and the Mississippi rivers, over the latter of which it is connected by a fine railroad bridge with Warsaw and Hamilton, Ill. It is on the Wabash, the Chicago, Burlington and Quincy, the Chicago, Rock Island and Pacific, the other railroads. A short distance above the city are the rapids of the Mississippi, which formerly obstructed navigation, but they have been overcome by a canal constructed by the Federal government. This canal is 300 feet wide and nine miles long and cost \$8,000,000. The noteworthy buildings include the high school, the union depot, the Federal building, the opera house, the public library and the Y. M. C. A. building. Rand Park, which contains the grave of the Indian Chief Keokuk, and the National Cemetery are other features of interest.

The site of the city is on limestone bluffs 150 feet high. The business blocks are substantial and largely of native material. Among the general facilities are electric street railways, graded and paved streets, waterworks, and a sewerage system. Among the manufactures are starch, flour, machinery, clothing, pottery, firearms, and gunpowder. It has a large trade in grain and merchandise. The place was incorporated in 1848. It is popularly called the Gate City. Population, 1905, 14,604; in 1910, 14,008.

**KEROSENE** (kēr'ō-sēn), an oil used to illuminate and for heating purposes. Formerly it was obtained from the distillation of shales and bituminous coal, hence is sometimes called *coal oil*, but it is now produced principally by

the distillation and purification of petroleum. It has a slightly yellowish color, a disagreeable odor, and the property of burning with a bright flame. Russia and the United States are the largest producers of kerosene. Gas and electric lights have displaced it very largely for illuminating purposes in cities.

**KESTREL** (kēs'trēl), or **Windhover**, a species of falcon native to Europe and Africa. It is about one foot in length and in color and habits closely resembles the sparrow hawk of America. The kestrel hovers in search of prey at a height of about forty feet and pounces suddenly upon small birds, mice, and reptiles, hence the name *windhover*. Young kestrels may be trained to pursue small birds, such as larks, quails, and snipes. The plumage is of a variety of colors, usually light grayish-blue in the male and somewhat reddish in the female.

**KETCHUP**, or **Catsup**, a sauce made extensively for table use, so named from the Japanese *kitjap*, which is a favorite article in the East for seasoning fish and meat. The table sauce used commonly is made from tomatoes, mushrooms, and walnuts. It is a healthful condiment.

**KEW** (kū), a village of England, in the County of Surrey, on the Thames, opposite Brentford and about one mile northeast of Richmond. It is noted as the seat of the royal botanical gardens. These gardens were commenced by the mother of George III., and visitors are still shown a cottage with furniture as it was left by Queen Charlotte. They have been open to the public since 1840, when they were presented to the nation by Queen Victoria. Besides containing a large collection of native and exotic plants, these gardens have an observatory, a gallery of paintings of tropical flowers, and several museums.

**KEWANEE** (kē-wā'nē), a city of Henry County, Illinois, about 130 miles southwest of Chicago. It is on the Chicago, Burlington and Quincy Railroad, in a coal-producing region, and is surrounded by a fertile agricultural, fruit-growing, and dairying country. The chief buildings include the public library, the high school, and a number of churches and business blocks. Many of the streets are well graded and paved. The manufactures include pumps, flour, iron-ware, windmills, bottled goods, and machinery. It has municipally owned waterworks. The government is under a charter granted in 1897. Population, 1900, 8,382; in 1910, 9,307.

**KEY WEST**, a city and the county seat of Monroe County, Florida, on the island of Key West, sixty miles southwest of Cape Sable. It is the most southerly city of Florida and of the

United States, has a fine harbor, and is connected with the mainland by a railroad. The harbor is defended by Fort Taylor, which is near the entrance on an artificial island. Two lighthouses are maintained at the harbor. Steamships furnish regular communication with Havana and the principal ports of the Atlantic coast.

Key West is a fine city and has well-lighted and substantially paved streets. The noteworthy buildings include the public library, the post office, a Methodist seminary, the county courthouse, the customhouse, a marine hospital, and the United States building. Intercommunication is by a system of electric railways. It has an important jobbing trade, especially in tobacco and fruits. Among the manufactures are cigars, smoking and chewing tobacco, clothing, and machinery. The climate is agreeable and as a health resort it is a favorite place for consumptives. The island of Key West is about seven miles long, from two to three miles wide, and has an elevation of about ten feet above sea level. Key West, the city, was founded about 1822 and was incorporated in 1832. Population, 1906, 21,174; in 1910, 19,945.

**KHAN** (kän), the title applied to Tartar and Mongol chiefs and sovereigns. Though formerly it expressed high rank, it is now applied especially to the chiefs of the nomadic tribes and to governors of cities.

**KHARKOV** (kär'köf), a government in the south central part of Russia, in Europe, with an area of 21,050 square miles. Kharkov, the capital, is one of the most important cities of southern Russia. It is situated at the junction of the Lopan and Kharkov rivers, and is a convenient railroad center. Besides numerous public schools and churches, it is the seat of the University of Kharkov. The surrounding country is fertile and produces large quantities of bituminous coal and petroleum. Among the manufactures are beet sugar, candles, leather, machinery, soap, and canned fruit. It was founded in the 16th century. Population, 1906, 201,308.

**KHARTUM** (kär-tōom'), or **Khartoum**, a city in Eastern Soudan, on the Blue Nile, near its junction with the White Nile, on the line of the Cape-to-Cairo Railway. The surrounding country is a sterile and treeless region. In 1830 it began to grow rapidly and soon after became the capital of the Egyptian Soudan, when it developed an important trade in gum, senna, ivory, ostrich feathers, and fruits. The older portions contain numerous houses constructed of sun-dried brick, but in the newer part the buildings are imposing and largely built of na-

tive wood and stone. In 1884-85 General Gordon was held captive in the city by superior forces under command of the native Mahdi, and was slain along with many others before the British relief army arrived. At that time it had a population of 72,498, but it was razed to the ground and the capital was removed to Omdurman, on the opposite side of the river. Lord Kitchener captured the place in 1898 and reinstated it as the capital. Population, 1908, 21,065.

**KHEDIVE** (kâ-dēv'), the title of the Egyptian rulers. It was first used in 1866, when it was applied to Ismail Pasha. The word signifies lord or lordship.

**KHIVA** (kē'vâ), a semi-independent khanate in Central Asia, forming a part of Turkestan. The general surface is sandy, but there are numerous fertile tracts. It is inhabited by various resident and nomadic tribes. The area is about 22,000 square miles. It is governed from Khiva, a city situated on two canals west of the Amur River, which contains a population of 6,085. In 1717 Peter the Great of Russia sent an expedition to conquer Khiva and a second attempt was made by Czar Nicholas in 1839. Since 1873 it has been a part of Asiatic Russia. A short distance south of it passes the Trans-Caspian Railroad, from the Caspian Sea to Samarkand. The construction of this railroad line has materially affected its importance, and has given an impetus to various manufactures. Khiva, the capital, is the seat of several Mohammedan colleges, has many bazaars, and is fortified by walls and earthworks. The Khanate has a population of 800,550.

**KHORSABAD** (kōr-sä-bäd'), a village in Asiatic Turkey, twelve miles northeast of Mosul, near the ancient city of Nineveh. Extensive excavations led to the discovery of the palace of Sargon, which was built about 700 B. C., and from it were obtained the first historical inscriptions found in ancient Assyria. The French government uncovered a large part of the palace in 1844. Most of the relics found there are now in the Louvre of France.

**KHYBER PASS** (ki'bēr), a military road between Afghanistan and the Punjab. This pass is an important strategic point. It has a length of 30 miles and a width of from 10 feet to 150 yards. The cliffs on either side rise perpendicularly to heights of from 800 to 3,000 feet. Alexander the Great, as well as the Russian and British, found the pass of vast importance in military operations. It constitutes the key to northern Afghanistan.

**KIAO-CHAU** (kyä'ō-chou), or **Kiao-chow**, a German protectorate in China, on the south coast of the peninsula of Shan-tung. The pos-

session has an area of 200 square miles. A good harbor is located at Tsing-tao, which was greatly improved and made the capital of the German zone. It has wide and regularly platted streets, waterworks, electric lighting, and a number of fine government buildings. A railway line extends inland to the coal fields of Lao-shan. Kiao-chau, the largest native city within the possession, was formerly the center of an important trade, which has been transferred to the new port of Tsing-tao. The possession has been German territory since 1898.

**KICKAPOO INDIANS** (kĭk-ä-pōō'), a tribe of Algonquin Indians. They were first found by the French and English pioneers of the Ohio valley, but their largest centers were on the Illinois River. In 1779 they assisted the French against the English, but, after being defeated by Wayne, they ceded a part of their lands, in 1802-4. They allied themselves with the English in the War of 1812, but sustained disastrous defeats, and in 1822 the majority removed from the Illinois to the Osage. The greater number emigrated to Kansas in 1854, and in 1863 a large party removed to Mexico, but ten years later returned and settled in Indian Territory, now Oklahoma. The present number of Kickapoos in the United States is 550, of whom about 230 reside in Kansas. Within recent years many have been favorably inclined to education and have taken up civil arts.

**KIDNAP**, to steal, secrete, or carry away any person against his will. The act of kidnapping is regarded by the law as an aggravated species of false imprisonment and embraces the legal elements of that offense. It includes an assault and the act of carrying away or transporting the party injured, either to some place in his own country or to some other country against his will. The offense may be committed both against children and adults. The statutory penalties for the crime are severe, varying from 10 to 25 years' imprisonment.

**KIDNEY**, one of two glands which are common to vertebrate animals, whose function is to secrete urea and other waste products from the system. They are situated at the back of the abdominal cavity, one on each side of the vertebral column. In man they are near the fifth rib, but, owing to the position of the liver, the right kidney is somewhat lower than the left. The accompanying illustration shows the internal cavity, which is bounded by the outer *cortical substance*. The conical masses of the *medullary substance*, from fifteen to twenty in number, form the *pyramids*. At the apexes of the pyramids are the *papillae*. Above or anterior to each kidney is the *suprarenal capsule*,

whose function is not understood. The inner cavity, or *pelvis*, terminates in the ureter. The shape of these organs is that of the kidney bean, the concave side being turned inward and toward the spine, and each is imbedded in a layer of fatty tissue.

The average weight of the kidney in man is from four to six ounces. It is about four inches long, the color is deep red, and the constitution

SECTION OF KIDNEY.

is dense and fragile. The outer part is covered by a thin but tough membrane. A canal, known as the *ureter*, conveys the urine from the kidney to the bladder, where it is retained until a normal quantity has accumulated, when it is expelled from the body. The health depends in a large measure upon the regularity with which the uric acid is taken up by the kidneys. Among the diseases of the kidneys is the well-known Bright's disease (q. v.). See **Gout**.

**KIEL** (kēl), a city of Germany, capital of

Schleswig-Holstein, situated on Kieler Hafen, an inlet of the Baltic Sea. It has extensive shipyards, dry docks, flouring mills, iron foundries, tobacco works, machine shops, sugar factories, oil mills, and engineering works. Besides its numerous public schools and historic churches, it is the seat of a noted university, which has an attendance of 1,250 students and a library of 250,000 volumes. The city is supplied with all modern municipal facilities. It has extensive railroad connections, electric street railways, and communication with the Elbe by a ship canal. As a member of the Hanseatic League it attained much commercial importance. In 1814 it was the seat of the congress that concluded the Treaty of Kiel by which Denmark ceded Norway to Sweden. Population, 1905, 163,772.

**KIESELGUHR** (kē'sēl-gōor). See **Dynamite**.

**KIESERITE** (kē'zēr-īt), a mineral obtained in the mines of Stassfurt, Germany. It is a hydrated magnesium sulphate and is used in the manufacture of fertilizers and Epsom salt.

**KIEV** (kē'yēf), or **Kieff**, a government in the southwestern part of European Russia. It has an area of 19,690 square miles. The capital, Kiev, is an important commercial and manufacturing city. It is situated on the Dnieper River, 270 miles north of Odessa, and has communication by several railroads. The University of Kiev has fine botanical and zoological gardens, extensive courses of study, and an enrollment of 2,675 students. The manufactures include beet sugar, clothing, machinery, woolen goods, porcelain, and tobacco. The surrounding country is farming and dairying and has a mild climate. It is an important commercial center. Kiev is an ancient city and is mentioned as early as the 5th century. It has been a part of Russia since 1668. Population, 1908, 342,027.

**KILAUEA** (kē-lou-ā'ā), one of the most noted volcanoes in the world, situated on the island of Hawaii, thirty miles southwest of Hilo. The crater is oval and has a circumference of about eight miles. Volcanic action is constant, the most extensive disturbances occurring in 1789, 1823, 1832, 1840, and 1866.

**KILDEER**. See **Plover**.

**KILIMANJARO** (kīl'ē-mān-jā'rō), a celebrated snow-clad mountain in German East Africa, 98 miles from the port of Mombasa and 150 miles from Lake Victoria Nyanza. It has two elevated peaks or craters called Kimawenzi and Kibo, the highest of which, Peak Kibo, is 19,680 feet above sea level. It forms the most elevated peak of the African continent. The summit is covered with snow perpetually, but

KINDERGARTEN EXERCISES.

on its lower slopes are fine forests. Hans Meyer ascended Kibo in 1889.

**KILLARNEY** (kīl-lār'nī), a town of Kerry County, Ireland, celebrated as a resort for tourists. Three beautiful lakes are located within the immediate vicinity. The smaller of the lakes has an area of 430 acres; largest, 5,000 acres; and the one known as the middle lake, 680 acres. These lakes are famous for their remarkable beauty and the shady dells surrounding them. They are fed by the Flesh River and several smaller streams. The Laune River is the outlet. Numerous picturesque islands dot their surface. The town has a population of 5,680.

**KILN**. (kīl), a structure or furnace of brick or stone. Kilns are used for calcining, baking, burning, drying, or annealing various substances, especially such as brick, iron ore, corn, cement, hops, pottery, and malt. They are constructed according to various patterns best fitted for the purpose for which they are intended, but in all of them it is designed to generate an abundance of constant heat with the least possible consumption of fuel. Those intended for drying and baking cereals, or their products, are often constructed of light material, while those designed for generating great heat are made of the best fire-clay brick. According to the course of the draught, they are classified as *up-draught* and *down-draught*.

**KILOGRAM** (kīl'ō-grām), a measure of weight in the metric system, being a thousand grams, equal to 2.2046 pounds avoirdupois. It is equal to the weight of a cubic decimeter of distilled water at the temperature of 39° Fahr., its maximum density.

**KILOGRAMMETER** (kīl'ō-grām-mē-tēr), a measure of energy, being the amount expended in raising one kilogram through the height of one meter, in the latitude of Paris, France.

**KIMBERLEY** (kīm'bēr-lī), a city and the capital of Griqualand West, in Cape Colony, South Africa, about 540 miles northeast of Cape Town. It has an exceedingly favorable climate, regularly platted streets, and numerous improvements, such as waterworks, electric street railways, a public library, and fine public buildings. Kimberley has a large jobbing trade. It was the seat of the De Beers Consolidated Company for some time prior to the war between England and the Transvaal Republic, and during that conflict was besieged by a formidable Boer army. The city is well connected by railroads and surrounded by a fertile agricultural and mining country. Within the immediate vicinity are some of the most celebrated diamond mines now operated. It was founded in 1871. Population, 1907, 38,482.

**KINDERGARTEN** (kīn'dēr-gär-těn), a name applied by Friedrich Froebel to a system of education devised by him for young children, the word signifying, in German, "garden for children." The system is based on the fundamental idea that the nature and faculties of children must necessarily be understood in order to secure their highest, right development. In this system the playful tendencies are employed by active realities in the form of objects. To secure this end it is necessary to make use of familiar objects in which the children are interested. The methods are necessarily conversational, the purpose being to cultivate freedom of expression on the part of the child. In this way the teacher, observing the characteristics of each learner, becomes enabled to develop perceptive power as well as moral and intellectual strength. Froebel held to the theory that all learning is pleasurable, and, when the playful activities are rightly employed, the children learn with ever-growing interest, thus developing mental and physical strength and a consciousness of right and wrong. The objects employed with greatest success in the kindergartens are such as toys, pictures, tools, flowers, beetles, and various other convenient and familiar forms that the child is allowed to handle, or use as objects for conversational lessons and for various simple drawings.

Froebel made use of five classes of objects, known as *gifts*. They were grouped as *solids*, *surfaces*, *lines*, *points*, and *construction material*. These were employed in active work, which consisted of the use of the gifts in a logical order. Sand and plastic clay for modeling, paper and crayons for folding and coloring, strips and slats for intertwining and interlacing, and beads and buttons for stringing were among the materials for employing the activities.

By bringing the children in contact with the useful and convenient at an early age, it is possible to give them an early bent toward acquiring right tendencies, as well as to instill in them traits of industry and strength of character. To make the work most highly efficient, it is necessary for the teacher to possess and cultivate a true motherly spirit, through which the children under her care may be encouraged by the most wholesome relations. In this way growth is stimulated under right and spontaneous activities. From the incentive given by Froebel kindergartens rapidly spread to all civilized countries, and at present are a part of the school systems of the more populous communities of Canada and the United States.

Special training schools to teach kindergarten methods are maintained in the larger cities, whose purpose is to properly prepare the teach-

ers for this class of work. The instruction given to young children is modeled with the view of preparing them for entrance into the regular primary and second primary departments of the school course. Associated with these kindergartens are manual training departments, whereby industrial teaching may be successfully carried through all the lower as well as the higher grades. A modified system of kindergartens has been introduced in the schools for blind and feeble-minded children. In recent years the study of kindergarten methods has been facilitated greatly by the publication of numerous periodicals and teachers' text-books. All the higher classes of normal schools have added departments for teaching kindergarten methods.

**KINETOSCOPE** (kî-nē'tō-skōp), or **Vitascope**, an instrument for producing a series of images with a very lifelike effect, commonly called *moving pictures*. The kinetoscope in general use consists of a magic lantern (q. v.) with a strong light, and the images are produced from a fine projecting lens in such rapid succession upon a screen that the figures appear to be in actual motion. The images are produced from pictures made on a long celluloid film about an inch in width, the length depending upon the series of pictures to be cast upon the screen. The pictures upon the film are a series of photographs and the exposure is about one-fiftieth of a second in duration, hence from fifty to sixty exposures pass before the eye in a second. Movement of the film through the instrument is obtained by a rotating mechanism, the film being unwound from one cylinder and wound upon another by a belt and pulley or an electric motor, and a revolving shutter is operated by the same mechanism that moves the film. This shutter alternately cuts off and admits the passage of the light between the film and the projecting lens, serving to permit the passage of light as the picture is in position for a brief time in front of the projecting lens and shutting it off as the picture is changed. This apparatus is used in scientific investigations, but chiefly to give entertainments.

**KING**, a title to designate the supreme ruler of a nation or country. The term was probably derived from khan and other eastern terms of similar meaning. The difference between a king and an emperor is not always one of power or extent, but is sometimes the result of historical developments. Though Louis Philippe was satisfied with the title of king, Napoleon III., who governed the same dominions, assumed that worn by Napoleon I. In very ancient times the king was considered the representative of God on earth and was absolute in ruling his domain.

This distinction was lost or modified with the growth of the spirit of liberty among the people, and at present the powers of the king in most European countries are abridged by a constitution. Though the view that a king can do no wrong still prevails in some countries of Europe, the responsibility of his office is vested largely in a ministry, in which are inherent many of the functions formerly exercised by the sovereign.

**KINGBIRD**, the name of an American bird, frequently called bee martin and flycatcher. It is about eight inches long, the extended wings measuring fourteen inches. The bill is short and stout, the tail is slightly rounded and longer than the wings, and the color is bluish-ash. On the head is a small patch of bright red feathers, usually concealed, but capable of being erected as a crest. The nest is built in trees, in which four to six eggs are laid, and the parents defend it with remarkable bravery. It is not uncommon to see the kingbird pursue hawks and other birds for some distance to drive them from the vicinity of its nest, from which habit it has been named.

KINGFISHER; 2, KINGBIRD.

The kingbird is useful in devouring noxious insects, but also eats fruits and seeds. It pursues flies and other insects while on the wing. The note is not musical or pleasing, but during the breeding season it seems to lose some of its petulance.

**KING CRAB**, or **Horseshoe Crab**, an animal of the genus *Limulus*, so named from its great size. Only five species are known, all of which appear to date from the Cambrian times.

They are found in the tropical and northern coasts of America, in the Antilles, Japan, and the archipelago southeast of Asia. The head is composed of six fused segments. They have two pairs of eyes upon the upper surface, the head resembles a broad horseshoe, the mouth opens on the lower surface, and the tail is spine-like. Each side has six legs, a total of six pairs, but one pair is usually rudimentary. The inner side of the legs is armed with sharp spines to aid in retaining a hold upon the food or prey. As a means of obtaining food, the animal burrows in the bottom of the water, using the tail as a sort of a brace to burrow in the sand or

KING CRAB.

Lower View.

Upper View.

mud. The average length of king crabs is about two feet. They do not possess power to swim, and, like turtles, appear to be in agony when placed upon their backs.

**KINGFISHERS**, a family of incessorial birds noted for their bright plumage, stout bill, strong feet, and short tail. Several well-marked species are native to America and Europe, of which the common kingfisher is the best known. This species has the head feathers spotted with blue, while the sides of the neck are greenish and the bill is black. The length of the body is about seven inches. It frequents the coasts of lakes and banks of streams, where it engages in catching fish for food. In endeavoring to catch its prey the kingfisher occupies a position where

it may watch the fish, and, when an opportune time occurs, it darts down quickly and secures its prey by diving. The smaller fish are swallowed whole, while the flesh of larger ones is picked from the bones, after being carried to the perch, and the bones are used in building its nest. The eggs are nearly white, six to eight in number, and the nest is guarded with considerable care against intrusion of other birds. A species of kingfisher native to the Himalayas is spotted and is known as the *fish tiger*. The *laughing jackass*, so called from its peculiar cry, is a large species native to Australia. It is singular that the kingfisher is the subject of many superstitions. This bird is celebrated in the ancient poetic lore and mythology. See **Halcyon**.

**KINGLET**, the name of several small birds of the thrush family. The common kinglet of North America has yellow feathers with greenish markings and is one of the smallest perching birds. It is known locally as the *golden-crowned kinglet*. Another species, the *ruby-crowned kinglet*, has a red crest partly hidden by grayish feathers. These birds breed as far south as the Carolinas and in the spring move northward into Canada. Several species are native to Europe, including the *gold-crest*, which is noted for its song.

**KINGS, Books of**, the name of two books of the Old Testament. Commencing with the close of the history of David, they relate the events of the Hebrew state under Solomon and Rehoboam, give an account of the divided state under the rival dynasties of Israel and Judah, and carry the events down to the destruction of Jerusalem by the Babylonians. Many acts of Elijah and Elisha, the prophets, are detailed. According to the Talmud the Books of Kings were written by Jeremiah, but this is not admitted by Christian commentators, who generally treat the author as unknown.

**KING'S MOUNTAIN**, the name of a mountain range in North Carolina, trending north and south through Gaston and adjoining counties. It was the scene of a battle on Oct. 7, 1780, between the British and Americans. The Americans were commanded by Benjamin Cleaveland and the British by Colonel Ferguson. The battle terminated in favor of the Americans, but they lost their brilliant leader, Col. James Williams. However, the British lost 716 men as prisoners and 390 were slain, including General Ferguson. The Americans lost only 28 killed and 60 wounded. This battle had a favorable influence upon the American cause.

**KINGSTON** (kingz'tūn), a city and the capital of Jamaica, in the southeastern part of the island. It is defended by several forts, has an

extensive commercial trade, and contains a number of fine buildings and modern facilities. The harbor is commodious and admits the largest vessels. It is strongly fortified. Several fine parks and gardens are maintained. Rum, sugar, tobacco, coffee, dyewood, and fruits are exported. Spanish Town became the capital in 1858, but the seat of government was moved to Kingston in 1872, since which time it has grown rapidly. Population, 1908, 48,036.

**KINGSTON**, a city in New York, county seat of Ulster County, on the Hudson River, 87 miles north of New York City. It is on the West Shore, the Walkill Valley and the Ulster and Delaware railroads. The chief buildings include the public library, the county courthouse, the armory, the city hall, and Kingston and Ulster academies. It has the Senate House, which was formerly the meeting place of the State Legislature and now contains a collection of relics. Large quantities of coal, timber, and building stone are obtained in the vicinity. It has a large trade in grain, lumber, and merchandise. The manufactures include glass, cement, farming machinery, cigars, railroad iron, flour, earthenware, and liquors. Kingston was first settled in 1652 by the Dutch, when it was called Esopus, and the name was changed to Wiltwyck in 1661. In 1664 it was taken by the English and the name was soon after changed to Kingston. Later it was the capital of the State, when, in 1777, the first State constitution was adopted here. It was incorporated as a city in 1872. Population, 1905, 25,557; in 1910, 25,908.

**KINGSTON**, a city of Ontario, capital of Frontenac County, on the northeastern shore of

Lake Ontario, and on the Canadian Pacific, the Grand Trunk, and other railroads. It is finely situated on the bay of Quinte, near the source of the Saint Lawrence, and is connected with Ot-

tawa by the Rideau Canal. Kingston is 165 miles from Toronto and 172 miles from Montreal. It has a large trade in manufactures and produce. The chief buildings include the Royal Military College, the University of Queen's College, the Anglican and Roman Catholic cathedrals, and numerous substantial business blocks. In the public park is a bronze statue of Sir J. A. Macdonald. It is strongly fortified. Being located near the Thousand Isles, it is frequented during the summer by many tourists.

Kingston has a fine harbor and extensive shipyards. The manufactures include locomotives, edge tools, hardware, railway cars, clothing, cotton and woolen textiles, and spirituous liquors. The streets are substantially paved and well lighted with gas and electricity. An extensive system of street railways supplies transportation facilities to all parts of the city and many inter-urban points. It was made the site of a French fort in 1673. The city was incorporated in 1838. Originally the name was Fort Frontenac, but this was changed to Kingston after the American Revolution. Population, 1901, 18,043.

**KINKAJOU** (kin'ká-jōō), or **Potto**, a small mammal found in the tropical parts of South America. It resembles the raccoon, is nocturnal in habits, and feeds upon insects and small animals. The fur is soft and gray and the tail is prehensile. This animal is tamed and treated as a pet in some parts of Central America.

**KIOTO**. See **Kyoto**.

**KIOWA** (kī'ō-wā), a tribe of North American Indians, formerly numerous in the upper region of the Missouri River. They were considered the most savage and warlike tribe of the prairies, where they were dreaded by the early settlers, and formerly carried their raids as far south as the Gulf of Mexico. In 1875 they were removed to Oklahoma, where they became more or less associated with the Comanches. At present they number about 1,125.

**KIRGHIZ** (kīr-gēz'), the name of a Tartar-Mongol nomadic people of Asia. They occupy a vast region which extends from the Caspian Sea to the Altai Mountains, and from the Syr Daria River and the Sea of Aral to the Tobol and the Irtish. This section is characterized by several mountain ranges. It includes many salt lakes and the great steppe region. In language these people belong to the Turkish stock and many have embraced the creed of Islam. The total number of this race is placed at 3,000,000.

**KIRKSVILLE** (kērks'vil), a city and the county seat of Adair county, Missouri, 65 miles southwest of Keokuk, Iowa. It is on the Wabash and the Quincy, Omaha and Kansas City railroads, and is surrounded by a fertile farming

and dairying country. Bituminous coal is mined in the vicinity. Among the noteworthy buildings are the county courthouse, the high school, and a State normal school. It is the seat of the American School of Osteopathy and was long the residence of its founder, A. T. Still. Kirksville was first settled in 1840 and was incorporated in 1893. The manufactures include woolen goods, furniture, wagons, farm machinery, and cheese. Population, 1900, 5,966; in 1910, 6,347.

**KISHINEV** (kê-shê-nyôf'), or **Kishineff**, a city of Russia, capital of the government of Bessarabia, 85 miles northwest of Odessa. It is located on the Byk, an affluent of the Dniester, and is at the junction of several railways. The chief buildings include a public library, two gymnasia, several large Greek churches, and many substantial business blocks. It is important as a market for cereals and live stock and has manufactures of tobacco, clothing, and machinery. The inhabitants consist of Russians, Jews, Bulgars, Tartars, and Moldavians. It has been a possession of Russia since 1812. In 1905 and 1906 it was the scene of severe persecutions of the Jews. Population, 1906, 128,872.

**KITCHEN CABINET**, the name applied in American politics to a group of men during the administration of Andrew Jackson. These men were supposed to influence the action of the President more than the members of the Cabinet, though they were not important as government officials. Those who were included with these unofficial advisers were William B. Lewis, Duff Green, Isaac Hill, Amos Kendall, and Francis P. Blair, Sr., editor of the *Globe*.

**KITE**, the common name of many birds of prey. They belong to the falcon family, but differ from the true falcons in having shorter legs and longer wings. The wings are pointed, the tail is deeply forked, and the flight is easy and graceful. The *swallow-tailed kite* is common to the southern parts of the United States. It has glossy black feathers on the back and wings and the lower part is white. The common kite of Europe has a reddish-brown color. It is skillful in catching fish, insects, and small snakes.

**KITE**, a contrivance formerly used only as a toy, but now employed for various economic and scientific purposes. It is constructed of a light framework, covered with paper or cloth, and is raised into the air by the wind acting upon it. The effect of the wind upon a kite is similar to that upon a sail, and depends upon the contrivance being held by a string in a way that the wind will be most effective in lifting it. Kites are constructed chiefly in the form of dragons, and soar upward to the extent of the string by

which they are held. Besides furnishing the means of healthful pastime for children, kites are used in advertising, photographing landscapes, meteorological observations, communicating between stranded ships, and determining the temperature in the clouds. Benjamin Franklin made electrical experiments by using the kite. The forms used for amusement usually have a tail, which gives steadiness to the kite in sudden flaws of wind.

**KLAMATH** (klä'mät), a river in California, rises in the southern part of Oregon and flows into the Pacific Ocean about twenty miles south of Crescent City. In a part of its course it flows through the Klamath lakes, but the greater part of its distance is through deep and narrow canyons. Fine forests of cedar and redwood abound in its valley. It is 275 miles long.

**KLAMATHS**, the name of several tribes of Indians found originally near the Klamath lakes of southern Oregon and northern California. They are naturally of a peaceable disposition, but become aggressive when they are assailed, and have made material advancement in industrial arts. The early settlements made in California by the whites led to troubles in 1851, but peace was soon restored by a treaty. They ceded a large tract of land to the United States in 1864, reserving a productive region of about 1,200 square miles, on which they conduct agriculture, lumbering, and trading.

**KLAUSENBURG** (klou'zēn-bōork), or **Kolozsvár**, a city of Hungary, capital of the county of Klausenburg, 125 miles northwest of Hermannstadt. It is the seat of the Francis Joseph University, which has a library of 75,000 volumes and is attended by 750 students. Other institutions include a museum, a botanical garden, a Froebel institute, and a Roman Catholic cathedral. The manufactures are flour, cloth, beet sugar, cigars, and machinery. German colonists founded the city in 1178. The larger part of the inhabitants are Magyars of the Protestant faith. Population, 1906, 51,184.

**KLEPTOMANIA** (klēp-tō-mā'nī-à), a species of insanity in which is displayed an irresistible desire or propensity to steal and hoard. In a case of this affection it is considered that the afflicted person, while not absolutely insane, is nevertheless unaccountable and his acts are not held criminal. The symptoms usually consist of peculiar motives in stealing and hoarding, peculiar judgment as to the character of the commodities taken, and a characteristic interest in many articles of little value.

**KLONDIKE** (klōn'dik), a small tributary of the Yukon River, which has a general course toward the west, and flows into the Yukon near

Dawson. Valuable deposits of gold were discovered in the region by George Carmack, a native of Illinois, in August, 1896, and subsequently the district became known as the Klondike region. This region is largely in Canada, but extends along the Yukon across the boundary into Alaska. In 1897 many prospectors and miners proceeded to the Klondike region, and in that year secured fully \$2,000,000 in gold. Since then the work has progressed continuously during the summer season, and large quantities of the valuable mineral have been procured.

The precious metal occurs largely in a free state in the form of nuggets and grains, and is separated from the gravel and dirt by washing. As a rule the washing is done in the summer season, but much of the pay dirt is excavated from the frozen bed of muck at all times of the year. Formerly it was extremely difficult to reach this section, but a railway is now operated from Skagway to Hazelton, on the White Horse River, a tributary of the Yukon. Another line has been projected and partly built by the Grand Trunk Railway Company, extending from the eastern part of Canada to Dawson, the chief town of the Klondike.

**KNIFE.** See **Cutlery.**

**KNIGHTHOOD, Orders of,** a term applied to organized and constituted orders or bodies of knights. Two classes of orders of knighthood are generally recognized, one constituting fraternal associations and the other honorary. The associations or fraternities possess property as independent bodies, to which class belongs the Hospitalers, Templars, and Teutonic Knights. Honorary associations were established by sovereigns within their own dominions and embrace most of the orders now maintained in European countries, such as the orders of Saint George, Golden Fleece, Saint Michael, and Holy Ghost. The orders of the Garter, Saint Patrick, the Thistle, Saint George, and several others are British. The Star of India is an order of India. Each order of knighthood in the different countries has an appropriate insignia, with which is included a badge, ribbon, collar, jewel, and star. The Normans first introduced knighthood into England as a feudal institution, but at present a knight holds a title of honor next below a baronet. Since the 16th century it has been considered a title of honor conferred as a reward for personal merit or for service rendered the crown or the country. The title carries with it the right to prefix *sir* to the Christian name and the wife is legally called *dame*, though *lady* is by courtesy her designation. Knights who belong to no special order of knighthood are properly knights bachelor. Those belonging to

an order take the name of such order, as knight of the Garter and knight of the Bath. The rank is not hereditary. See **Chivalry.**

**KNIGHTS OF LABOR,** a fraternal labor association organized at Philadelphia, Pa., in 1869. The object of the organization is to protect the laboring classes, ameliorate the condition of the workingman, and promote industrial interests. It constitutes one of the most intelligent associations of the wage workers in the United States. The membership has declined within recent years, since the American Federation of Labor has superseded it in many localities.

**KNIGHTS OF PYTHIAS** (pīth'ī-ās), a fraternal and benefit association organized in 1864, whose purpose is to exemplify true and noble friendship. Three degrees are conferred, those of page, esquire, and knight, and the general control is vested in the supreme lodge, which likewise has charge of the uniform rank and the insurance branch. It is based upon the friendship of Damon and Pythias, two celebrated Pythagoreans of ancient Syracuse. Dionysius the Elder, tyrant of Syracuse, had condemned Pythias to death, but permitted him to visit his wife and family once more on the condition that Damon take his place in suffering the penalty, in case Pythias should not return. The latter returned before the time set for the execution, which so impressed Dionysius that both were set free. In 1909 the Knights of Pythias had 708,535 members. The total death claims paid by the insurance department equal \$28,947,608.

**KNIGHTS OF THE GOLDEN CIRCLE,** a secret society of the United States, organized in 1855 to advance the slave-holding interests of the South. The original purpose was to found a government in the vicinity of the Gulf of Mexico, which was to be the seat of vast slave-holding plantations. As a means to further organization, numerous lodges, or *castles*, were maintained. The members of this organization were not only numerous in the South, but were represented very extensively in the North. They had not less than 40,000 members in Indiana and a corresponding number in many other states. In the presidential campaign of 1860 they were a factor in defeating the Democrat party since they supported the Southern wing instead of McClellan.

**KNITTING,** the art of weaving a single thread so as to form a kind of fabric. It is done by means of knitting needles, which are made of various sizes to suit the fineness of thread used, usually of ivory or steel. Formerly the work of knitting was done wholly by hand, but the larger part of knit goods is now made

with knitting machines. The first knitter was invented in 1589 by William Lee of England, but many improvements have been introduced to make these machines highly utilitarian. Those in general use are rotary or circular in form, fitted to produce a circular web. They have a circular series of vertical parallel needles that slide in grooves in a cylinder, and are raised and lowered successfully by an external rotating cylinder which has cams on the inner side that act upon the needles. A hook at the end of each needle serves to draw down the thread so as to form a loop as it is depressed. This loop is slipped off over the hook when the needles are again elevated, thus forming a part of the web as the next hook is joined to it. Within the circle is an opening for the web, which is held in position by a weight attached to the lower end of it. The invention of the modern knitting machine has revolutionized the manufacture of knitted fabrics, such as hosiery and underwear.

**KNOT**, a fastening or twisting together of the ends or parts of one or more threads or ropes, or the looping of such threads around some other object so as not to come apart easily. The art of tying knots is important on shipboard, and those in use among seamen require much skill in the adjustment. They include about 200 different kinds, but of this number only a comparatively few are in general use. These include the so-called reef knot, figure of eight knot, bow line knot, running bow line knot, rope-yarn knot, manrope knot; and Matthew Walker knot.

**KNOW-NOTHINGS**, a name given to the members of the American party, which was organized in the United States in 1855. This appellation was applied because the party was a secret organization and, when asked about its affairs, the members professed to know nothing about them. Among its tenets were that naturalization should be granted only after 21 years' residence, that America should be governed only by Americans, and that allegiance to any foreign power should constitute a bar to selection for office. The party was organized for an active campaign in 1855, when it carried the state elections of Kentucky, New York, California, and most of New England. Millard Fillmore was its candidate for President in 1856 and received 874,534 votes, but in the electoral college obtained only eight votes, those cast by the State of Maryland. After the election of 1856 the party became disorganized and most of its members went over to the newly organized Republican party.

**KNOXVILLE**, a city in Tennessee, county

seat of Knox County, on the Holston River, 110 miles northeast of Chattanooga. It is on the Southern, the Atlanta, Knoxville and Northern, the Knoxville and Augusta, and other railroads. The site is at the foothills of the Clinch Mountains, which have much fine natural scenery. Among the noteworthy buildings are the post office, the county courthouse, the public library, the State Agricultural College, the University of Tennessee, the Tennessee School for Deaf Mutes, the East Tennessee Asylum for the Insane, and the Austin school for colored pupils. The surrounding country produces vast quantities of coal, zinc, and marble. Among the manufactures are flour, machinery, cotton and woolen goods, stoves, furniture, leather, soap, car wheels, and ironware. It has well graded and paved streets, waterworks and sewerage systems, and a large trade in produce and merchandise. Knoxville was settled in 1787, was the capital of the State from 1786 until 1811, and became a city in 1815. It was occupied by a Union army of 12,000 men under General Burnside in November, 1863, and a siege was laid by Longstreet. Sherman's army was sent to relieve Burnside in the latter part of 1863, after which the Confederates were compelled to raise the siege. Population, 1910, 36,346.

**KOALA** (kō-ä'là), or **Kangaroo Bear**, a bear or sloth native to Australia. It is a marsupial mammal. The tail is rudimentary, the head is small, and the color is ash-gray. It feeds largely on the leaves and tender shoots of the blue-gum tree. The length of its body is about two feet and the claws are well fitted to climb trees, in which it spends the greater portion of the time. Koalas live in pairs, are very tenacious of life, and the young are carried on the back of the mother when they have outgrown the marsupium.

**KOBE** (kō'bâ), a seaport city of Japan, in the southern part of the island of Hondo, on the Bay of Osaka. It has a safe and commodious harbor, extensive shipyards, and large railway shops. Direct steamboat communications are maintained between it and the leading ports of the world. Paper, clothing, saki, pottery, and machinery are among the leading manufactures. The principal buildings include those of the government, several schools and theaters, and a number of clubhouses and Buddhist temples. The streets are paved substantially and are improved by electric lighting and street railways. It has an extensive commerce with Great Britain, Germany, France, and the United States. Population, 1908, 288,516.

**KOHINOOR** (kō-ï-nōor'), or **Kohinur**, a famous diamond now owned by the crown of

Great Britain. It was secured from India when the Punjab was annexed. Originally the weight was 793 carats, but it was reduced by cutting until now it weighs only  $102\frac{3}{4}$  carats. The present value is about \$600,000.

**KOKOMO** (kō'kō-mō), a city in Indiana, county seat of Howard County, 54 miles north of Indianapolis. It is on the Lake Erie and Western, the Pittsburg, Cincinnati, Chicago and Saint Louis, and the Toledo, Saint Louis and Kansas City railroads. The chief buildings include the high school, the county courthouse, and several churches. It has a fine park, electric street railways, and a large trade in produce. The manufactures include stoves, carriages, lumber products, flour, cigars, furniture, and machinery. The place was settled in 1844 and incorporated in 1865. Population, 1910, 17,010.

**KOLA** (kō'lā), or **Cola**, the name of a plant native to the tropical regions of Africa, but now cultivated for its fruit in Brazil and the West Indies. The fruit, known as *kola nut*, is about an inch long, has a reddish-gray color, and its odor resembles that of nutmeg. It contains about two per cent. of alkaloid caffeine. Kola is used to some extent in the preparation of a drink similar to coffee. It has digestive and stimulating properties.

**KONG MOUNTAINS**, a mountain chain of Western Africa, stretching along the northeastern boundary of Liberia, and attaining to heights of about one mile above sea level. In these mountains the Niger has its source, flowing from them toward the northeast. The district is populated by Mohammedans. It contains valuable timber and minerals. The slopes and valleys are highly fertile, producing grasses, cereals, and fruits.

**KONGO.** See **Congo.**

**KÖNIGGRÄTZ** (kē-nīg-gräts'), a fortified town of Bohemia, on the Elbe River, seventy miles east of Prague. It has connections by railways and a considerable local trade. It is noted in history on account of an important battle between the German army of Prussia and the forces of Austria, which occurred July 3, 1866, and resulted in the defeat of the Austrians. As a consequence of the battle Prussia became the supreme power in the German states. Venice was ceded to Italy, and Hungary became constitutionally independent. The battle is better known by the name of Sadowa, from an adjoining town. Königgrätz is an old town. It has a fine library, a Gothic cathedral, and a theological seminary. Population, 1906, 10,302.

**KÖNIGSBERG** (kē'nīgs-bērg), a city and seaport of Germany, capital of the province of East Prussia, on the Pregel River, about five miles from Frisches Haff, an inlet from the

Baltic Sea, and 330 miles northeast of Berlin. It occupies a fine site on both sides of the Pregel, which is crossed by many stone and steel bridges. The streets are clean and well paved with stone and asphalt. Ample transportation facilities are furnished by steamships, steam railroads, and electric railway lines. An island in the river, at the west end of the city, contains the fort of Friedrichsburg, and other fortifications include twelve forts in the main walls on both sides of the river. It has extensive manufactures of clothing, chemicals, machinery, textiles, cigars, earthenware, and musical instruments.

The city is famous for the University of Königsberg, which dates from 1544, when it was founded as a Lutheran institution. At present it has 148 teachers, about 1,000 students, and a library of 225,000 volumes. Kant taught at the university nearly fifty years and a beautiful monument was erected to him in 1864. Among other famous teachers are Herbart, Bessel, Herder, Neumann, and Von Baer. The city has several fine schools, seminaries, colleges, and churches. It contains many valuable buildings, public parks, and several statues and monuments. The cathedral is one of the finest in Europe. Frederick I. was crowned King of Prussia at Königsberg, and in 1861 similar ceremonies were celebrated when William I. ascended the throne. Population, 1905, 223,770.

**KÖNIGSHÜTTE** (kē-nīgs-hüt'te), a city of Germany, in the province of Silesia, seven miles from the frontier of Russia. It has communication by railroads and electric railways, paved streets, and systems of waterworks and sewerage. In its vicinity are vast coal, iron, and zinc mines. The manufactures include ironware, machinery, and clothing. It is comparatively a new city and owes its prosperity to the development of mining and manufacturing. Population, 1905, 66,042.

**KOODOO** (kōō'dōō), or **Kudu**, the name of a large antelope found in Africa. It is about four feet high. The color is grayish-brown, with several vertical stripes of white on the sides. The flesh is considered very nutritious, hence it is hunted almost to extermination. This animal is easily domesticated and is grown in some places for its milk and flesh. The male has horns nearly four feet long. They are twisted spirally.

**KOORDISTAN** (kōōr-dīs-tān'), or **Kurdistan**, a region of eastern Turkey in Asia, including an area of about 80,000 square miles. The northern boundary is formed by Armenia and the eastern by Persia, extending into the latter country as far as Lake Urumiah. The inhabitants are principally Kurds, who adhere to the

Mohammedan religion, but differ from the Turks in language. They are fanatical in their religious views and extremists in government. The larger portion follow a pastoral life. They have been a source of strength to the Turks against the Armenians, but have opposed the spread of Turkish customs and language. The entire population is estimated at 2,750,000.

**KOOTENAI**, or **Flatbows**, a North American Indian tribe, resident in Montana, Washington, and British Columbia. Their chief seat in British Columbia is in the vicinity of Lake Flatbow. They support themselves mostly by hunting and fishing. The Kootenais are peaceable and quite industrious.

**KOOTENAY** (kōō'tê-nā), or **Kootenai**, a river of North America, which rises in the Rocky Mountains of British Columbia. It passes from British Columbia through the states of Montana and Idaho, thence reënters Canada, where it passes through Kootenay Lake, and after a course of 400 miles joins the Columbia River. Navigation is insignificant, owing to numerous rapids and the tortuousness of its course. The valley of the Kootenay is rich in iron and other minerals.

**KORAN** (kō'ran), or **Al Koran**, the book containing the sacred scriptures of the Mohammedan religion. It is made the basis of all civil, military, and social transactions among the Moslems. The name is usually written Al Koran; that is, *The Koran*, meaning originally "The reading," or "That which is to be read." The Mohammedans teach that the book is coeval with God, having existed eternally. In the beginning of time the transcript was made in rays of light upon gigantic tablets that were situated in the highest heavens, near the throne of the Almighty. Gabriel, the angel, is said to have communicated the different portions to Mohammed within a period of 23 years, both at Mecca and Medina. Mohammed dictated the Koran in manuscripts to a scribe, who preserved them in written form for the followers of the faith.

At first the different portions appeared without definite arrangement, but, after the death of Mohammed, Abu Bekr directed Zaid Ibn Thabit of Medina to collect them into a volume. Later this edition was revised by Caliph Othman, and in the thirtieth year of the Hegira, the year 652 A. D., it was published. This revision contains 114 chapters, and at the head of each is a title which indicates the nature of its contents, these often being strange sounding, including such as *The Cow*, *The Star*, *The Towers*, *The Poets*, etc. The chapters begin with the introduction: "In the name of God the Merciful, the Compassionate."

Among the tenets taught in the Koran are that there is but one God, and he is all-wise, merciful, and everlasting; that there is a punishment for the wicked and a reward for the just; and that all peoples will go to their reward at the day of judgment. Christ is assigned a place in the highest or seventh heaven, where he lives in the presence of God. When mankind becomes wayward and forsakes the path of righteousness, prophets are sent to direct them toward the true God. Among the prophets sent to earth are Adam, Noah, Abraham, Moses, Jesus, and Mohammed, the last named being the greatest of all the prophets. It teaches the doctrine of good and bad angels, outlines severe condemnation for the idolatrous, and describes heaven as a place in which seven degrees of award for righteousness will be made, these being called first, second, third, etc., heaven, and ranging from entertainment by music to the supreme joy of meeting God face to face.

The decrees of God are held to be unchangeable, the doctrine of predestination is taught, and all are admonished to fast, give alms, repeat prayers, and go on pilgrimages to Mecca and Mount Ararat. In praying it is advised that five prayers be said a day, during which the face is to be turned toward Mecca. When ready for prayer, it is necessary to perform the act of purification, which consists of bathing the hands, for which purpose sand or dry dust may be used where water is not obtainable. The laws of Moses and the decrees of Jewish rabbis are adhered to in the treatment of divorce, polygamy, inheritance, and other practices. In language the Koran is elegant and pure, and is considered the ideal production of Arabic classics. The Moslems think that no human being is capable of producing its equal. In size the Koran is about the same as the New Testament, the work containing 77,639 words. Innumerable commentaries on the Koran have been published. It is claimed that the Tripoli library in Syria at one time contained fully 20,000 different treatises on this book.

**KORDOFAN** (kôr-dō-fän'), a region in the Egyptian Sudan, located between Darfur and the White Nile. It has an area of 95,125 square miles. Much of the surface is level, but it is characterized by isolated hills, and during the rainy season is covered with a rich vegetation. In the hot and dry season the climate is quite unpleasant to Europeans. Water is obtained chiefly from wells, except from June to October, when the rainfall is abundant. The inhabitants consist chiefly of Arabs and Berbers, who engage in stock raising and the cultivation of cotton, sesame, tobacco, and millet. El Obeid is

the capital and chief town. The population is estimated at 300,000.

**KOREA.** See **Corea.**

**KOSCIUSKO** (kōs-sī-ūs'kō), **Mount**, one of the most elevated mountain peaks of Australia, situated in the Australian Alps, in New South Wales. It has a height of 7,308 feet above sea level.

**KOUMISS** (kōō'mīs), or **Kumys**, a fermented beverage made originally by the Tartars from the milk of mares. It is now made from the milk of cows. Large quantities are manufactured in Europe and the United States. It is valuable for its nutritive and digestive properties, and is prescribed by physicians in cases where other food cannot be retained by the stomach. Mares' milk, which contains a high per cent. of sugar, is used largely for this purpose in Russia and Siberia, but the product made from it and from the milk of goats is characterized by a somewhat unpleasant odor. About forty hours are required for fermentation. The product contains a considerable per cent. of alcohol and carbonic acid.

**KOVNO** (kōv'nō), a city in Russia, capital of the government of Kovno, situated near the junction of the Vilia and Niemen rivers. It is important as a railroad and commercial city. The streets are well paved and cross each other at right angles. It is surrounded by an agricultural country and has a large trade in produce. The manufactures include beet sugar, clothing, earthenware, and machinery. Kovno was founded in the 10th century. For many years it was a point of contention between the Poles and the German knights. Population, 1906, 78,302.

**KRAKATOA** (krā-kā-tā'ō), an island in the Strait of Sunda between Java and Sumatra. It is of volcanic origin. The area is six square miles. This island is celebrated on account of numerous earthquakes and volcanic eruptions that are associated with it. It was the scene of vast disturbances in 1883, when the explosions were perceptible a distance of 150 miles. Though the island is uninhabited, about 35,000 people were killed on the islands in the vicinity by great sea waves that swept away several villages and a number of towns. Prior to the disturbances the island was about twice its present size.

**KREFELD** (krā'fēlt), or **Crefeld**, a city of Germany, in Rhenish Prussia, about thirty miles northwest of Cologne. It is located four miles west of the Rhine, at the junction of several railroads, and has extensive electric railway facilities. The streets are regularly platted and substantially paved and lighted by gas and electricity. It is celebrated as a center for the manufacture of silk and velvet, in which en-

terprise it has few rivals in Europe. Other manufactures include soap, hosiery, chemicals, sugar, leather, paper, and machinery. It is the seat of an academy, a gymnasium, a conservatory of music, and many fine schools and churches. Krefeld dates from the 12th century. It has been a part of Prussia since 1702. Population, 1905, 110,344.

**KREMENTCHUG** (krēm-ën-chōök'), a city in the government of Poltava, Russia, on the Dnieper River, 68 miles southwest of the city of Poltava. It has extensive railroad connections and a large trade in tallow, salt, and timber. The manufactures include machinery, beet sugar, furniture, and fabrics. A large tubular railway bridge crosses the Dnieper. The municipal facilities are modern, including electric railways, sewerage, and waterworks. Population, 1905, 64,073.

**KREMLIN** (krēm'līn), the name applied in Russia to a citadel. The most celebrated of these structures is the Kremlin at Moscow, which is situated on the north bank of the Moskva River. It is surrounded with walls from 12 to 16 feet thick and from 28 to 50 feet high. These walls are supplied with battlements, embrasures, five gates, and numerous towers, and they inclose a space about one and a half miles in circumference. Within the Kremlin are many churches, cathedrals, monasteries, and fine public buildings. As a whole it presents a peculiar and imposing aspect. Many of the inhabitants remove their hats when passing by the gate known as that of the Redeemer, and no one passes it without bowing and crossing himself. Among the curiosities of this remarkable place are an ancient monster cannon and the broken Tsar Kolokol, a bell weighing 200 tons, cast for the Empress Anna in 1733. Napoleon I. resided in the Kremlin for a short time in 1812.

**KRISHNA** (krīsh'nā), in Hindu mythology, the eighth incarnation of the Brahmanic god Vishnu, and the most popular deity in the Pantheon of the Hindus. He is the hero of the greatest Sanskrit poem. His life history is similar to that of Hercules and Apollo.

**KRONSTADT** (krōn'stāt), a free town of Austria-Hungary, in Transylvania, at the foot of the Transylvanian Alps. It is conveniently connected by railways and is noted for its manufacturing and commercial trade. The municipal facilities include electric street railways, waterworks, and public parks. Among the noteworthy buildings are the townhall and the Church of Saint Bartholomew. It is surrounded by a mountainous country, which is well wooded and rich in minerals. The inhabitants are mostly Germans. Population, 1906, 33,807.

**KRONSTADT**, a seaport of Russia, on the island of Koblan, twenty miles west of Saint Petersburg. It is strongly fortified and serves as a strategic military protection to the national capital. The city is thought to be almost impregnable, being defended by strong granite forts and armed with heavy guns. Peter the Great founded it in 1710, but it has since been improved greatly. It has regularly platted streets, many Greek Catholic churches, a thoroughly organized school system, and modern municipal facilities. The harbor is safe and large. It has manufactures of ships, cannon, clothing, machinery, and various implements of war. Population, 1906, 61,206.

**KRYPTON**, a gaseous element which resembles argon, discovered in the air by William Ramsay in 1898. Owing to the rarity of this element, it is not well known. Ramsay estimated that only one part in a million of the atmosphere consists of krypton. The atomic weight is 58.74.

**KUBAN** (kōō-bän'y'), a river of the Caucasus, in Russia. It rises in the Caucasus Mountains, near Mount Elbruz, and discharges partly into the Black Sea and partly into the Sea of Azov. It passes through a fertile region, but in its lower course are many marshes. The total length is 525 miles.

**KU-KLUX KLAN** (kū-klūx'), a society founded at Pulaski, Tenn., in 1866, in the reconstruction period that followed the Civil War. At first the purposes of the society were for amusement, but later it took on the object of opposing the reconstruction acts and preventing freedmen from voting. In some cases the Negroes were persecuted, prevented from voting, and acts of violence were perpetrated upon them. The organization in the period of its greatest strength numbered about 550,000 members, all of whom were people of the Southern States, but its largest membership was in Mississippi, South Carolina, Georgia, Tennessee, Alabama, and Kentucky. An act of Congress passed April 20, 1871, provided suppressive measures and the society disbanded.

**KUMAMOTO** (kōō'mā-mō-tō'), a commercial city of Japan, near the western shore of the island of Kiushiu, on the Shira River. It is the capital of the Kumamoto district, is strongly fortified, and has an extensive interior and foreign trade. The municipal facilities are modern, including waterworks, sewerage, and rapid transit. It is an educational center and is reached by steamers. Population, 1906, 60,346.

**KUMASSI** (kōō-mās'si), or **Coomassie**, a town of Western Africa, in the British Gold Coast, capital of the native kingdom of Ashanti. It is located about 150 miles north of the Gulf

of Guinea and has railroad connections with Sekondi, on the Gulf of Guinea. The streets are regularly platted and somewhat improved. An exchange and market place are in the central part. The town has considerable trade in cereals, live stock, and fruit. Population, 1906, 30,680.

**KURDISTAN**. See **Koordistan**.

**KURO SIVO**, **Kuro Siwo**, or **Japan Current**, a warm equatorial current formed in the region southeast of Asia. It flows past Formosa, Japan, and the Aleutian Islands, after which it passes southward to California. Though important in commerce and in the modification of climate, it is inferior to the Gulf Stream.

**KUSKOKWIM** (kūs'kō-kwīm), a river of Alaska, the second in size of that territory. It rises on the north side of the Alaskan mountains, has a general direction toward the southwest, and after a course of 500 miles flows into Kuskokwim Bay, an inlet from Bering Sea. The channel is irregular and passes between precipitous rocks in much of the course. About 300 miles are navigable.

**KYANITE** (kī'ā-nīt), a mineral which is similar to garnet and is used in making inkstands, paperweights, and table tops. It varies in color, but blue predominates. This mineral is found in Bohemia, Switzerland, and various parts of the United States, especially in Virginia and Massachusetts.

**KYOTO** (kyō'tō), or **Kioto**, the third city of Japan, on the island of Hondo, connected with the other trade centers by important railroad lines. The surrounding country is fertile. About six miles from the city is Lake Biwa. The Kamogawa River divides the city into two nearly equal parts. For many years it served as the official residence of the Mikado and was the ecclesiastical capital. At present it is a center of learning, contains many excellent educational and other buildings, and has divers modern facilities. The municipal facilities include electric street railways, electric lights, telephones, and public parks. As a commercial center it ranks among the first of Japan, both in exports and imports. Among the manufactures are silks, clothing, lacquered ware, ivory ornaments, machinery, bronze ornaments, and textiles. Population, 1908, 382,658.

**KYRIE ELEISON** (kīr'i-ē ē-lī-sōn), a form of prayer, meaning "Lord have mercy." It is used in both Greek and Latin liturgies, and occurs in the prayer books and songs of the Anglican and Lutheran churches. In the ordinary mass of the Roman Catholic church it immediately follows the introit and precedes the *Gloria in Excelsis*.

## L

**L**, a letter of the Indo-European alphabet, the ninth consonant. In the English *l* has only one sound but is sometimes silent, as in *calm* and *half*, and is usually classed as a semivowel or a liquid. It is made by raising the tip of the tongue and passing the sonant breath through openings on both sides with a thrill or rustle. The letter *r* is more closely allied to *l* than any other letter which is associated with the latter, and the two are often interchanged in various languages. It is considered that *l* is a later modification of *r* in the Indo-European alphabet, *r* often changing to *l*, while *d* also takes the place of *l* in some of the languages. As a symbol, in chemistry, it stands for *lithium*.

**LAALAND** (lā'lān), or **Lolland**, an island in the Baltic Sea, belonging to Denmark. It is 36 miles long, about 12 miles wide, and has an area of 465 square miles. The soil is fertile, producing corn, hops, hemp, and fruit. It has about 50 square miles of oak and beech forests. Maribo is the capital and Nakskov is the largest city. Population, 1906, 71,956.

**LABIATAE** (lā-bī-ā'tē), the botanical name of the plants which belong to the mint family. The order embraces 150 genera and 2,800 species, most of which are native to temperate climates. These plants are widely distributed in the continents, including many that are prized for their flowering and economic properties. Among the best known are the thyme, lavender, marjoram, basil, horehound, sage, rosemary, and peppermint. See **Mint**.

**LABOR**, the voluntary effort put forth by man to secure some desired object. As associated with land and capital, it constitutes an important factor in the production of wealth. Land, labor, and capital are the three agents of production, but, since labor is the basis of all wealth, it may be regarded the most important factor in economic science. Nature and man are the two great agencies that cooperate in production, nature furnishing the material upon

## LABOR

which labor is to be exerted, and man supplying the necessary labor to render the materials of nature available for useful purposes. Labor includes not only muscular exertion, but all the mental effort involved in securing objects of desire. It does not create, but moves and affects changes upon things. By bringing the natural forces to the service of man, and moving materials and objects into positions where forces can act upon them with the desired effect, labor effects its chief productiveness.

The direct changes effected by labor are *transmutation*, *transformation*, and *transportation*; or, a change of elements, a change of form, and a change of place. These are exemplified by the agriculturist in the production of cereals, fruits, and cheese; by the manufacturer in transforming leather into shoes, cloth into garments, and lumber into houses; and by the transporter, who transfers the production of one community to a locality where it is consumed. Labor is productive or unproductive, depending upon the results that accrue. *Productive labor* is that form which increases wealth or adds to human intelligence, happiness, or morality. *Unproductive labor* includes the misdirected activities, such as are exemplified by failures in speculative projects and by most wars.

In ancient times labor was largely compulsory, such as was applied in the building of the Egyptian pyramids and the wall of China. Through almost the entire history of the world the laboring man has been suppressed more or less in his activities by potentates or men of great wealth, but with the concentration of labor in manufacturing centers powerful efforts began to be exerted for the protection and amelioration of the laborer. The first organizations of this character were formed in the early part of the 18th century, and through all of the last century educational organization tended to render the laboring man more intelligent and efficient. He has come to be an important factor in the govern-

ment, influencing legislation by the election of such men as are friendly to the interests for which the labor unions stand.

The Knights of Labor and the American Federation of Labor are the strongest industrial organizations of North America, but there are many affiliated branches in the latter, such as the powerful unions supported by miners, railroad workers, and employees of manufactories. Others are associated with the transportation enterprises, such as the International Brotherhood of Teamsters and the International Union of Steam Engineers. Legislation favorable to the interests of labor has been promoted in all the civilized nations of the world. This organization on the part of laborers has been a source of much benefit to the material industries, aiding in production as well as benefiting the laborer intellectually and financially. The most important objects of the labor movement of recent times embrace the compulsory arbitration of differences between employers and employees, the establishment of the eight-hour system of labor, and the improvement of the sanitary conditions of the mines and factories.

**LABOR DAY**, a legal holiday in many civilized countries. In Canada and the United States it occurs on the first Monday in September, but in most countries of Europe it is observed on May 1. Labor Day was first celebrated in a few states in 1886, but since then it has grown in favor. In many localities it constitutes a holiday of much importance. The celebration usually includes parades on the streets by industrial unions, music, speeches relating to labor interests, various games, and often fireworks in the evening.

**LABOR UNIONS.** See **Labor; American Federation of Labor; Knights of Labor; Co-öperation.**

**LABRADOR** (läb-râ-dôr'), a British possession of North America, situated mainly east and north of Quebec, and forming a dependency of Newfoundland. It extends from the Strait of Belle Isle to Hudson Strait, is bounded on the west by Ungava and the east by the Atlantic, and has an area of about 120,000 square miles. The surface is greatly diversified, portions being desolate and rocky, while in some localities are extensive forests of birch and fir trees. Among the principal streams are the Grand and Northwest rivers, the latter draining Lake Aswanipi, or Hamilton, which is in Quebec. The coast is rocky and is indented by many bays and fjords. Many fish, such as the salmon, cod, and trout, are abundant, and the region is visited annually by over 30,000 fishermen from Canada. The interior contains many

valuable fur-bearing animals, among them the otter, marten, fox, bear, wolf, reindeer, and beaver. The winter season is of nine months' duration and very cold, but the summer is moderately warm and adapted to the culture of potatoes and other forms of vegetables. Barley and oats are grown extensively for fodder.

Labrador was visited by the Norsemen in the year 1001, by Cabot in 1498, and by a Portuguese expedition under Cortereal in 1500. In the 11th century it was described by some Norse settlers of Greenland as Helluland, meaning the land of rocks. In 1763 it became a dependency of Newfoundland. The name Labrador was given to the region by the Portuguese, meaning Laborers' Land, and is frequently applied to the entire peninsula between the Saint Lawrence and Hudson Bay. In the latter sense it comprises a large part of Quebec and Ungava. The portion belonging to Newfoundland, in 1906, had a population of 4,023.

**LABRADORITE** (läb'râ-dôr-ît), a mineral formerly called Labrador hornblende, found on the coast of Labrador. The colors are commonly blue and green. Labradorite is formed chiefly of calcium, aluminum, and sodium silicate. It forms an essential constituent of many rocks, being associated with augite, hornblende, and other mineral substances, and serves a useful purpose for inlaid work and jewelry.

**LABUAN** (lä-bö-än'), an island in the East Indies, situated west of the coast of British Borneo, comprising a crown colony of Great Britain. The area is thirty square miles and the surface is mountainous. Coal, timber, sago, honey, and fruits are the chief products. Victoria, the capital, has a population of 1,500. It is the seat of a brisk trade with Singapore and Borneo. The island has been a possession of Great Britain since 1844. It is under the government of the British North Borneo Company. Population, 1906, 8,530.

**LABURNUM** (lä-bûr'nûm), a small tree native to the Alps of Europe, now planted in gardens and villas as an ornamental shrub. In May and June it presents a beautiful appearance, every twig and small branch being hung with racemes of brilliant yellow flowers. The wood is so hard and heavy that it sinks in water. It takes a high polish, has a greenish color, and is used largely for ornamental work and handles to knives. The seeds are poisonous. Rabbits are so fond of the bark that they damage the tree in the winter. See illustration on following page.

**LABYRINTH** (läb'î-rînth), a building which contains many tortuous passageways, so constructed that they are difficult to traverse

without a guide. Many buildings of this character were maintained anciently, notably in Egypt and Crete. The labyrinth of Crete, according to legendry, contained passages from which no one could escape, hence the visitors became the prey of Minotaur. It was reputed to have been built by King Minos. The only safeguard was a linen thread, which, in being followed, made it possible to reach the exit. This celebrated labyrinth was situated in the district

LABURNUM.

now called Fayoum, near Lake Moeris, contained 3,000 chambers, and is classed as a wonder of the world. Other celebrated labyrinths were at Clusium, Italy, and in Samos and Lemnos. Mazes are imitations of labyrinths and are fashionable in gardens and at expositions. The maze at Hampton Court, in England, is a good example in gardening, while the mystic maze exhibited at the Columbian Exposition, in 1893, was a fine example of a labyrinth with mirrors.

**LAC** (lāk), a resinous substance obtained from an insect called *coccus lacca*, or lac insect, found in the East Indies, Siam, Burmah, China, and other Asiatic countries. It consists of a granular substance. Among these insects there are about 5,000 females to each of the males, the latter being winged and about twice the size of the females. After the eggs are laid, the mother dies, and when the young come out they secrete the lac. They feed upon the resinous juices of the same tree for several generations, causing the superfluous excretions to form a coat about

half an inch thick. This product yields a red fluid for making crimson and scarlet dyes, which are quite similar to the coloring matter of the cochineal. In some portions of India the lac insect is cultivated, both for its lac and dye properties. When in a natural state the product is called *stick-lac*; when crushed and washed, *seed-lac*; and when transformed into a thin crust by melting, *shell-lac*. Lac is used in the manufacture of lacquer, varnish, sealing wax, and materials to stiffen various articles of apparel, such as the calico frame of silk hats. Lac dye produces a beautiful scarlet and is an important article of commerce.

**LAC**, or **Lak**, a term used in the commerce of the East Indies. It is derived from the Sanskrit word *lakṣa*, meaning 100,000. One lac is equal to 100,000 rupees and 100 lacs make a *crore*.

**LACCADIVES** (lāk'kā-divz), a group of small islands in the Arabian Sea, about 200 miles west of the Malabar coast of British India. They consist of about 20 islands of coral formation and have an area of 745 square miles. The surface is low and flat and much of it is barren and unproductive. The chief products include cocoanuts, plantains, and betel nuts. The inhabitants are Mohammedans of Arabian descent, who engage largely in fishing and seamanship. Population, 1906, 14,500.

**LACE**, a delicate fabric or network of threads formed of linen, cotton, silk, gold or silver wire, or some other suitable material, forming a fabric of transparent texture. The origin of lace is unknown, but it was used by the ladies of ancient Greece and Rome. In Italy the manufacture of lace was an important industry during the Middle Ages, whence it was introduced into France. A law passed in England in 1483 prohibited its importation, but in the 16th century the manufacture became quite extensive in Western Europe. Brussels, Alençon, and Maltese are among the best known point laces. They have been produced extensively in Belgium and France for many centuries. In the 16th century lace manufactories were established at Honiton, England, and at North Hampton in the 17th century, and in 1768 a machine for manufacturing lace was installed at the latter place.

Many styles of laces are now made, depending upon the mode of manufacture and the purposes for which they are to be used. The finest grades are handmade, these excelling in strength, delicacy, and beauty, and likewise commanding the highest prices. No branch of the textile industry has received more attention than that of lace manufacture, and it is one of the industries in which machine work does not com-

pete in fineness and delicacy with the handmade products. Pillow lace is made largely by hand, but many kinds of fine fabrics of this class are produced wholly by machinery. In lace weaving the threads of the weft are twisted around those of the warp. The character of the net and its name are determined by the manner of twisting, as pattern net, spider net, bobbin net, Paris net, and whip net. Point lace was developed from embroidery, and is made largely by needle and a single thread. Guipure lace is made by the crochet needle. It has a network ground on which patterns are wrought in various stitches in silk. The manufacture of gold and silver lace is associated with the ribbon trade. It has for a basis thin ribbons or flat bands, around which yellow and white threads of cotton are wrapped closely. In the lace industry France takes a very high position, no less than 250,000 persons being engaged in its manufacture in that country. Machine-made imitations of the finer laces are commanding a large sale and taking the place of the more expensive forms.

**LACHINE** (lă-shēn'), a town of Quebec, in Jacques Cartier County, eight miles southwest of Montreal, on Lake Saint Louis. It is on the Grand Trunk Railway and is popular as a summer residence for citizens of Montreal, with which it is connected by the Lachine Canal. This canal is maintained to avoid the Lachine Rapids on the Saint Lawrence. Extensive electric power works are maintained to supply Montreal. The chief buildings include several fine schools and churches. Lachine was settled and so named about 1669. Population, 1901, 5,561.

**LACHLAN** (lök'lan), a river of New South Wales, Australia. It rises in the Blue Mountains and has a length of 700 miles. Near Oxley it joins the Murrumbidgee, belonging to the Murray River system. A large part of the course is through a treeless plain, where it becomes almost dry during the dry season.

**LACHRYMAL GLAND** (lăk'ri-mal), a small almond-shaped body located in a depression in the upper and outer angle of the eye, between the bone and the eyeball. Its ducts, which secrete the tears, number from six to twelve and open on the inner surface of the upper eyelid, near the outer angle. The liquid is spread over the eye by the upper lid and passes to the inner angle of each eye, where it enters a small opening called the *puncta lachrymalis*. This is the commencement of the tear-canal. The short canals of the upper and lower lids meet in the nasal sack, from which the nasal duct conducts the tears to the lower part of the nose. The diseases which affect the lachrymal organs in-

clude an excessive secretion of tears, obstruction to their escape in the nose, and growths that affect the lachrymal glands.

**LACKAWANNA** (lăk-ă-wŏn'nà), a river of Pennsylvania, rises in Susquehanna County, and after a course of forty miles joins the Susquehanna near Pittston. The valley and basin of the Lackawanna River are productive coal fields and produce about one-half the anthracite coal obtained in the United States. Scranton, the largest city on its banks, is noted for its large factories and blast furnaces.

**LA COLLE**, a town of Quebec, in Saint John County, on the Grand Trunk Railway. It was the scene of an engagement on March 30, 1814, between a British force under Colonel Handcock and an American army under General Wilkinson. The British had a small garrison of 350 men, but they were reinforced during the battle by about 800, and the Americans made the assault with about 5,000. After two hours the Americans withdrew, and the project of clearing the way to Montreal was abandoned. General Wilkinson was relieved from command and tried by court-martial, but was acquitted.

**LACONIA** (lă-kŏ'nĭ-ă), a city and the county seat of Belknap County, New Hampshire, about 25 miles north of Concord, on Lake Winnisquam. It is on the Winnepesaukee River and the Boston and Maine Railroad. The chief buildings include the public library, the hospital, the opera house, the courthouse, and several public schools. It has manufactures of hosiery, machinery, railroad cars, woolen goods, and hardware. Electric lights, waterworks, and street railways are among the improvements. Laconia was settled about 1780 and incorporated in 1852. Population, 1900, 8,042; in 1910, 10,183.

**LACQUER** (lăk'ēr), a varnish composed of shellac dissolved in alcohol and colored with various substances, such as saffron, gamboge, and annatto. It serves as a protection from rust and improves the color of metals, especially brass, tin plate, and iron. Lacquer also is applied to wood and papier-maché for the purpose of giving improvement in color. The lacquer ware manufactured by the Japanese and Chinese is varnished by a product made from the juice of a species of sumac, called the varnish tree, which is native to that region of Asia. Vermilion is used in mixing this varnish for the purpose of making a reddish color, and different hues are secured by various other substances. The lacquer made from the sumac not only gives a firm surface, but is able to withstand considerable heat without damage, and it is due to this property that the lacquered vessels from those countries may be used to contain hot drinks and

soups. Lacquering among the Japanese is an ancient art and many of their designs are of much value, especially the specimens that were made by them in former centuries. Their silver and gold lacquer ware is among the finest now produced.

**LA CROSSE** (là-krôs'), a city in Wisconsin, county seat of La Crosse County, at the junction of the La Crosse and Mississippi rivers. It is on the Chicago and Northwestern, the Chicago, Burlington and Quincy, the Chicago, Milwaukee and Saint Paul, and other railroads. The surrounding country is agricultural and has extensive forests of hard-wood timber. Among the noteworthy buildings are the public library, the Federal building, the courthouse, the city hall, and the high school. It has an asylum for the insane, a marine hospital, and two fine parks. The manufactures include woodenware, flour, farming machinery, cigars, spirituous beverages, clothing, ironware, and lumber. The trade in grain and lumber is extensive. It has systems of waterworks, sewerage, and street pavements. The first settlement was made in 1841 and it was incorporated in 1856. Population, 1910, 30,417.

**LACROSSE** (là-krôs'), a game at ball which was originated among the Indians of North America. It is played similarly to football, differing from the latter in that the players endeavor to carry or throw the ball to their opponents' goal on a peculiar bat called *crosse*. The bat consists of a long staff, covered at the end, and has a network which reaches about halfway, becoming narrower as it approaches the hand. In lacrosse, as played at present, the *crosse* is five or six feet long and the widest part does not exceed one foot. The field is 125 yards long, at each end of which are two goals, which are surrounded by lines called the *crease*, drawn six feet outside the posts. Each of the two sides has twelve players. In 1867 the National Lacrosse Association of Canada was organized and the game has been steadily gaining in popularity. It is now classed among the international games.

**LACTEALS** (lăk'tê-ălz), the fine lymphatic tubes that take up fat from the intestines, so named in 1622 from their discoverer, Gasparo Aselli (1580-1626). They commence in the intestines, enter the mesenteric glands, and later unite to form large tubes, which terminate in the thoracic duct. During digestion they can be seen as milky lines across the mesentery. After a full meal, they convey a fluid which is milky in appearance, called *chyle*, and during intervals of fasting convey a yellowish lymph.

**LACTIC ACID** (lăk'tik), a product of the decomposition of sugar in solution, induced by

the presence of certain albuminous ferments. It is formed in milk when it turns sour, hence is found in buttermilk. The change of sweet to sour milk is called the *lactic fermentation*, and lactic acid is a product of this change. Scheele originally discovered this acid in sour milk, whence he named it lactic, but it is also obtained from the juices of many vegetables and from the fluids of the stomach and flesh of animals. The salts formed by this acid with bases are called *lactates*. The only one of importance is the lactate of iron, which is employed extensively as a tonic and a stimulant.

**LACTOMETER** (lăk-tôm'ê-têr), or **Galactometer**, an instrument to ascertain the comparative specific gravity and value of different samples of milk. It is a special form of the hydrometer, but a variety of these instruments has been originated. The one in common use consists of a glass tube, about twelve inches long, and is graduated into one hundred parts. The instrument is filled with fresh milk, and, after the cream has been fully separated by churning, the value is determined according to the graduated scale, depending upon the space occupied by the cream.

**LADOGA** (là'dô-gà), an extensive lake of northern Russia, situated northeast of Saint Petersburg. It is the largest inland lake of Europe. The length is 128 miles; breadth, 78 miles; and area, 7,115 square miles. Into it flow the waters from Lakes Ilmen, Onega, and Saima. It contains a number of rocky islands, the most important being Konevetz and Valaam, the two having an area of about 215 square miles. The lake is important on account of its fisheries, navigation facilities, and connection by several canals. Its discharge is by the Neva River into the Gulf of Finland.

**LADRONES** (là-drōnz'), or **Mariana Islands**, a group of islands situated in the Pacific Ocean, east of the Philippines and north of the Carolines. The group includes sixteen separate islands, of which Rota, Tinian, Saipán, and Guam are the most important. The area of the entire group is 418 square miles. They were discovered by Magellan in 1521 and were in the possession of Spain up to 1898, when Guam was ceded to the United States and the remainder of the Ladrões, together with the Caroline and Pelew groups, were sold to Germany in 1899 for \$4,875,000. At the time of their discovery they had a population of 60,000. However, at present the entire population is only about 10,500, of which the principal portion is on the island of Guam. The inhabitants were originally Chamorros, but are now constituted largely of Tagalas. The latter are allied to the Tagals who

constitute the chief inhabitants of Luzón. Properly the Ladrone Islands are divided into two groups, the northern of which is actively volcanic, while the southern group contains a greater area of fertile soil, though both have timber and tillable land. Agriculture and commerce are the principal industries, but neither is important. The climate is cooler than that of the Philippines and is quite healthful.

**LADYBIRD**, a class of small insects or beetles found commonly on plants and trees. They are noted for their various colors, such as yellow, red, and black and white variegated. The body is spherical and flat at the lower surface, and the legs and head are small. All of the many species are of utility in destroying plant lice. The eggs are laid on the under side of leaves. While both the larvae and the adults feed on plant lice, they also deprive vegetation of some of its juices.

**LADYSMITH** (lā'dī-smīth), a town of South Africa, in Natal, eighty miles northwest of Pietermaritzburg. It is important as a railway junction, being on lines that enter the Transvaal and Orange River colonies, and has a growing trade in live stock, cereals, and merchandise. The British made it a depot for military stores and supplies prior to the Anglo-Boer War. General White was besieged here from

November, 1899, until Feb. 28, 1900, when he was relieved by Lord Dundonald. Population, 1908, 3,150.

**LADY'S SLIPPER**, a genus of beautiful orchids native to the northern latitudes. Ten species are found in

North America. The pink lady's slipper and the showy lady's slipper are well known, the latter being about two feet high. The roots of the yellow lady's slipper yield medicine of value in cases of nervous affection. Most species bear beautiful flowers, which have a lip about two inches long, this being beautifully veined with rose purple.

**LAFAYETTE** (lā-fā-ēt'), a city in Indiana, county seat of Tippecanoe County, on the Wa-

bash River, sixty miles northwest of Indianapolis. It is on the Wabash, the Cleveland, Cincinnati, Chicago and Saint Louis, and other railroads. The surrounding country is agricultural and dairying. Among the chief buildings are the county courthouse, the public library, the high school, the Saint Elizabeth Hospital, and Purdue University. It has well-paved streets, electric street railways, gas and electric lights, and systems of sewerage and waterworks. The manufactures embrace carpets, safes, knit goods, flour, carriages, machinery, bicycles, and cooper products. Lafayette has an important jobbing trade and is a grain and live-stock market. It is located on the site of an old fort which was built by the French in 1720 and surrendered to the British in 1760. The first permanent settlement was made in 1820, when it was named in honor of General Lafayette, and was incorporated in 1854. Population, 1910, 20,081.

**LAFAYETTE COLLEGE**, an educational institution at Easton, Pa. It was chartered in 1826 and formally opened in 1832. In 1850 it passed under the control of the Presbyterian church. The departments include those of science, chemistry, language, philosophy, art, and engineering. It has a library of 30,000 volumes and property valued at \$1,250,000. The attendance averages 450 students.

**LAGOON** (lā-gōon'); a shallow lake connected with the sea or a river. Lagoons are of frequent occurrence, especially in Italy, Holland, and South America. In the summer time they frequently dry up or become stagnant pools. The term is applied to small ponds in some sections of the country, though chiefly in the western part of the United States.

**LAGOS** (lā'gōs), a city of Mexico, in the state of Jalisco, connected with the capital by the Mexican Central Railroad. The surrounding country contains extensive deposits of iron ore and opal. It has a large jobbing trade and extensive interests in smelting. In 1817 it was the scene of a battle between the Mexicans and Spaniards. Population, 1906, 14,048.

**LAGOS**, a British possession on the western coast of Africa, about 150 miles east of the Gold Coast and near the Bay of Benin. The colony has an area of 3,460 square miles, but to it is attached a protectorate of 28,350 square miles. Lagos, the chief town, is situated on an island of the same name, which has an area of about four square miles. It has exports of cotton, gum, palm kernels, and copal, and imports of tobacco, hardware, cotton goods, and machinery. The district was acquired by Great Britain in 1861, when it was governed from the Gold Coast, but an independent government was established

LADY'S SLIPPER.

for it in 1886. In 1901 it was made a colony. Population, 1906, 2,500,000.

**LA GUAYRA** (lá gwí'rá), a city of Venezuela, the principal seaport of that country, five miles from Caracas. It is situated on a narrow strip of land along the coast and is important for its harbor and railway connections. Among the structures of interest are two hospitals, a cathedral, and a statue of Vargas, a physician and native of La Guayra. The trade consists chiefly in coffee, hides, cocoa, and live stock. It was founded in 1588 and was blockaded by an English and German fleet in 1903, pending the adjustment of some claims against the government of Venezuela. Population, 1907, 9,125.

**LAHORE** (lä-hör'), a city of India, capital of the Punjab, on the Ravi River. It is connected by important railroads with many other trade emporiums. The older part of the city includes 640 acres and is surrounded by brick walls sixteen feet high. The walls are pierced by thirteen gates. Outside of these walls are the newer parts of the city. The streets in the older part are tortuous, narrow, and poorly graded. It has few modern improvements. Among the principal buildings are the fort, which occupies a prominent position, and the Punjab University, one of the most noted educational institutions of India. Other institutions are the Law School, Oriental College, Mayo Hospital, Medical School, and Roberts Institute. The Mongol Empire had its seat of government at Lahore, beginning with 1524, and during that period the city attained its greatest prosperity. It became the capital of the Sikhs in 1799, and in 1849 was made the capital of the Punjab. The inhabitants consist largely of Mohammedans, who maintain many fine mosques and several seminaries. It has an extensive trade in live stock, cereals, and manufactures. Population, 1906, 205,694.

**LAKE**, a sheet or body of water wholly surrounded by land, differing from a pond or lagoon in being deeper and larger. Lakes are very numerous in large bodies of land where rainfall is considerable, as in the equatorial region of Africa, the northern part of the United States, and the central part of Canada. The greater number of lakes receive and discharge streams of water, hence the water retained within their depressions is fresh. In many warm and dry regions the lakes have no visible outlet, hence the water is saline or salty, such as the Caspian Sea and the Great Salt Lake. Some lakes are fed almost entirely by springs. This class receive no inflow from streams and the outflow, though constant in most cases, is not materially large. Some small lakes receive no inflow and have no

outlet, the rainfall within the basin being practically equal to the evaporation. Lakes are important in that they supply a water surface for evaporation, thus affecting the rainfall. Some are highly valuable in their fisheries and as avenues for transportation.

**LAKE CHARLES**, a city in Louisiana, capital of Calcasieu Parish, on the Calcasieu River. It is on the Kansas City Southern, the Southern Pacific, and other railroads, and is surrounded by a fertile cereal and fruit-growing region. The city has a fine site on Lake Charles and is popular as a winter residence for people from the North. Among the noteworthy buildings are the Carnegie library, the county courthouse, the high school, and Arcadia College. It has manufactures of sugar, cigars, railroad cars, lumber products, and machinery. The city has electric lights, waterworks, and finely paved streets. It was settled in 1850 and incorporated in 1860. Population, 1900, 6,680; in 1910, 11,449.

**LAKE CITY**, a town of Florida, county seat of Columbia County, sixty miles west of Jacksonville. It is on the Seaboard Air Line, the Atlantic Coast Line, and other railroads, and is surrounded by a cotton-growing district. The manufactures include turpentine, cigars, phosphates, and lumber products. It is the seat of the State Agricultural College, has electric lighting, and contains several fine school and church buildings. In 1901 it received a new charter as a city. Population, 1905, 6,509; in 1910, 5,032.

**LAKE DISTRICT**, a region of England, embracing a portion of Cumberland, Westmoreland, and Lancaster counties, in which sixteen small lakes are situated. The region is a favorite resort for tourists, and has suggested many poetical gems to different writers of eminence. Coleridge, Southey, and Wordsworth, besides many others, took up their residence in the Lake Region, and became known as the "Lake School Poets," a name suggested by the *Edinburgh Review*.

**LAKE DWELLINGS**, the habitations built by ancient peoples on small artificial islands in lakes, or on piles in the shallow margins of lakes. These dwellings were mentioned by Herodotus, who described a Thracian tribe living in the year 520 B. C., in a small mountain lake of what now is included in Rumelia. The custom of constructing buildings of this character prevailed in Europe through many centuries. Among the best evidences of such structures are those found in Switzerland in 1854, which form the theme of a historic work by Dr. Keller, of Zurich, entitled "Lake Dwellings of Switzerland and Other Parts of Europe." Remains of this kind have been found in many lakes of Switzer-

land, but particularly in Lake Zurich, when the waters of that body materially receded during a drought. Similar remains of lake dwellings were discovered in Ireland in 1839, and, like those of Switzerland, contained specimens of earthenware, weapons of bronze, hatchets, ornaments of bone and minerals, implements of war, and coins containing Roman and Gaulish impressions.

The lake dwellings belong most commonly to the iron age, many of the shields, bridle bits, and implements found being made of iron. The dwellings described by Herodotus were approached by a narrow bridge and in the floor of each dwelling was a trapdoor whereby fishing from the domicile was facilitated. It is asserted that the fish were lured by feeding. Many of the remains throw light on prehistoric man and give evidence that pile buildings were used extensively for many centuries. It is noteworthy that lake dwellings still exist among barbarous tribes, being found in portions of the Caroline Islands, the Malay Archipelago, and New Zealand. In Lake Maracaybo, Venezuela, and in various parts of Russia lake dwellings are occupied by semicivilized people. Others occur in Central Africa, where they are occupied for convenience in fishing and as a means of defense against wild animals and savages.

**LAKE MALAR** (mä'lär), or **Maelar**, the largest lake of Sweden, situated immediately west of Stockholm. It is seventy miles long and from two to twenty miles wide. The surface is nearly level with the Baltic Sea, into which it discharges by several channels. It is noted for its navigation facilities and fisheries. Many castles adorn its shores. It contains about 1,200 islands, most of which are wooded.

**LAKE OF THE THOUSAND ISLANDS**, the name applied to an expansion of the Saint Lawrence River, extending from Lake Ontario about forty miles down the river. It contains about 1,750 islands. Wolf Island is the largest, being about twenty miles long and seven miles wide.

**LAKE OF THE WOODS**, a lake of North America, bounded by Minnesota, Manitoba, and Ontario, 190 miles northwest of Lake Superior. It contains a number of wooded islands, is about 65 miles long, and receives the water of Rainy River. The outlet is through the Winnipeg River, by which it is connected with Lake Winnipeg.

**LAKES, The Great**, five great fresh-water bodies of North America. They include lakes Superior, Huron, Michigan, Erie, and Ontario, of which the first named is the largest fresh-water lake in the world. The five lakes are connected with each other, the overflow being dis-

charged naturally by the Saint Lawrence River into the Gulf of Saint Lawrence. However, a portion of the outflow is now carried to the Mississippi through the Chicago Drainage Canal. Lake Michigan is wholly within the United States, and the other four form a portion of the natural boundary between that country and Canada. These lakes are of vast importance in the commerce of the two countries and are valuable for their fisheries. Chicago, the largest inland city of the world, is at the head of Lake Michigan. Other large cities on their shores include Buffalo, Cleveland, Detroit, Duluth, Milwaukee, Toledo, and Toronto. Following is a comparative table relative to size and elevation:

NAME.	AREA, SQUARE MILES.	ELEVATION ABOVE SEA LEVEL
Ontario.....	7,240	247
Erie.....	9,600	573
Michigan.....	22,450	581
Huron.....	21,000	578
Superior.....	31,200	602

**LAMAISM** (lä'mä-iz'm), the prevailing religion of Tibet and Mongolia, constituting a branch of Buddhism. It is so named from the lamas or priests, and was introduced in Tibet about the 7th century A. D. Buddha, who is considered the founder and the highest among the saints, is the chief object of worship. Lamaism is partly political, especially in Tibet, where the religious system is united with the temporal sovereignty of the country. Though the political authority is confined to Tibet itself, the chief official of the church, known as the *Dalai Lama*, is the acknowledged head of Lamaism. Adherents to this faith are quite numerous in Japan, China, and various parts of India. See **Buddhism**.

**LAMBAYEQUE** (läm-bä-yä'kä), a town in Peru, capital of the department of Lambayeque, six miles from the Pacific Ocean. It is surrounded by an agricultural country and has a considerable trade in tobacco, sugar, and cereals. The manufactures include clothing, boots and shoes, and cotton and woolen textiles. Population, 1906, 8,140.

**LAMBERTVILLE**, a city of New Jersey, in Hunterdon County, on the Delaware River, fifteen miles northwest of Trenton. It is on the Delaware and Raritan Canal and the Pennsylvania Railroad, and is connected by a bridge with Newhope, Pa. The manufactures include paper, rubber goods, flour, hardware, and machinery. It has electric lighting, waterworks, and a public library. The place was first incorporated in 1849. Population, 1905, 5,016.

**LAMENTATIONS** (läm-än-tä'shünz), **Book of**, a book of the Old Testament, written

by the prophet Jeremiah. -It treats of the destruction of Jerusalem, which it laments with much feeling, especially because the catastrophe was brought on by the sins of the Hebrews. The style of writing is poetic and the first five chapters are arranged in verses to correspond to the letters in the Hebrew alphabet, which circumstance has led some critics to believe that the fifth and last chapter may have been written by some contemporary of Jeremiah, instead of by the prophet himself.

**LAMMERGEIER** (läm'mër-gī-ër), meaning, in German, lamb vulture, the largest bird of prey native to Europe. The nativity of this vul-

LAMMERGEIER.

ture is in the lofty mountains of the southern part of Europe and Asia and the northern part of Africa. It forms a connecting link between the true vultures and eagles, measures ten feet between extended wings, and is from four to five feet long from the beak to the tail. The lammergeier feeds on both carrion and living prey, including such animals as kids, lambs,

chamois, and hares, which it carries to great heights in the mountains. It utilizes the bones of animals as a food by dropping them upon rocks from vast elevations, thereby breaking them into pieces suitable to be swallowed.

**LAMP**, a device employed for producing artificial light. The term is applied to vessels containing an inflammable liquid and a wick through which the liquid ascends by capillary attraction to feed the flame at the top, and likewise to any other contrivance for producing artificial light. In early times lamps were vessels of rude pottery or even the shells or skulls of animals, but later they were made of metal, glass, or porcelain, and became articles of ornament as well as utility. The substances used to produce light included fish oils and animal fats, but later vegetable oils, such as rape, were introduced. The flat wick was invented in 1783 and the round wick in 1784, the latter being known as the Argand wick from its inventor, Aimé Argand (1755-1803), a Swiss chemist.

The discovery of mineral oils and their preparation in the form of gasoline, kerosene, paraffin, petroleum, and crystal oil made it necessary to introduce oxygen into the burner in order that the carbon contents might be consumed properly. A lamp supplying this requirement was first made by the inventor Stob Wasser in Berlin, Germany, and the chimney of mica, porcelain, or glass was constructed to increase the draught and protect the flame of the lamp. This arrangement causes a powerful draught to be created, by which the flame is kept uniform, and there is a constant consumption of the gas that generates from the oil being heated. At present there are many kinds of lamps, including those known as gas, oil, and safety lamps and lanterns. Many lamps have come into use for electric lighting, such as the arc, flaming arc, and incandescent lamps. The wicks used in oil lamps are either single flat wicks, round wicks, or double wicks. *Lanterns* are either portable or fixed. They are used chiefly for lighting outdoors.

**LAMPBLACK**, the soot or carbon deposit obtained by the imperfect combustion of petroleum, tar, resin, and other substances containing carbon. In burning the substances for lampblack it is necessary to shut out the free flow of oxygen, when the flame becomes smoky and the soot may be accumulated on suspended surfaces. Lampblack is useful in the manufacture of printing inks, shoe blacking, and paint. The effect of it is to produce the various shades of brown or black. In preparing lampblack for printing it is commonly mixed with linseed oil. It is prepared for use in painting by adding linseed oil and white lead.

**LAMPREY** (lăm'prÿ), a genus of animals which occupy a place between the eel and fish, differing from the true fish in that they do not possess scales, paired fins, or jaws. In appearance they are eel-like, attain a length of nearly three feet, and have a mouth in the form of a sucker. Most species have a greenish-brown color. They inhabit both fresh and salt water bodies, occurring in the North and South Temperate zones, and feed on larvae and worms. They frequently attach themselves by the mouth to other fish to suck the blood. The fresh-water lamprey is smaller than the marine, but both have been used as food for many centuries, and are caught by traps baited with flesh or worms.

**LANCASTER** (lăn'käs-tēr), a city of England, capital of Lancashire, 45 miles northeast of Liverpool. It has a fine location on the Lune River and is connected by railway with Glasson Dock, its port five miles southwest. The manufactures include pottery, ironware, leather, cotton and woolen textiles, and clothing. It has a large market, slaughterhouses, public baths, electric lighting, and several technical schools. King John granted the first charter to Lancaster in 1193. Population, 1907, 43,308.

**LANCASTER**, a city in Ohio, county seat of Fairfield County, on the Hocking River and the Hocking Canal, thirty miles southeast of Columbus. It is on the Hocking Valley and the Cincinnati Valley railroads. The surrounding country is agricultural and produces coal and natural gas. Among the chief buildings are the county courthouse, the high school, the city hall, and the State industrial school for boys. The manufactured products embrace flour, woolen goods, shoes, agricultural implements, and machinery. The place was settled in 1800 and incorporated in 1831. It is the birthplace of General Sherman and John Sherman. Population, 1900, 8,991; in 1910, 13,093.

**LANCASTER**, a city in Pennsylvania, county seat of Lancaster County, on the Conestoga River, 35 miles southeast of Harrisburg. It is on the Pennsylvania and the Philadelphia and Reading railroads and has a network of electric railway lines. Besides other educational institutions, it contains Franklin and Marshall College, an institution for the higher education of men controlled by the German Reformed Church. This institution has a fine faculty of instructors, 400 students, and a library of 34,000 volumes. The noteworthy buildings include the county courthouse, a State normal school (at Millersville), the public library, the Saint Joseph's Hospital, the Stevens's Home, and many schools and churches. It has manufactures of paper, machinery, spirituous liquors, cotton and

woolen goods, leather, ironware, and caramel products. It was settled in 1718, when it was known as Hickory Town, and was incorporated in 1742. The Continental Congress met at Lancaster in 1777, while the British were occupying Philadelphia, and it was the capital of the State from 1779 to 1812. Population, 1910, 47,227.

**LANCASTER, House of**, a dynasty founded in England in the reign of Edward III. Blanche, daughter of Edward III., married John of Gaunt, and a royal charter settled the duchy upon him and his heirs. Henry IV., son of John of Gaunt, born in 1367, was the first king of the house of Lancaster. His son, Henry V., succeeded him on April 10, 1413, and with the death of Henry VI., son of Henry V., ended the dynasty, which occurred May 22, 1471, though Henry VI. reigned only until 1461. See **England**.

**LANCASTER SOUND**, a channel of North America, located between North Devon and Cockburn Island. It connects Baffin Bay with Barrow Strait. This channel was discovered by Baffin in 1616. It is about 65 miles wide and 248 miles long.

**LANCE**, a weapon for thrusting, designed to be used in the hand. It was used extensively by the knights of the Middle Ages, who employed it only when mounted, some of these weapons being twenty feet long. The modern lance is shorter, usually from ten to twelve feet, but the blade of steel, which is fitted on a handle of hollow steel or tough wood, is not more than a foot in length. Napoleon maintained several regiments of lancers, but the Russian Cossacks have the highest reputation for using this weapon, although it is now replaced in part by the saber. The German Uhlans carry the lance in addition to the carbine and saber. The use of modern firearms has displaced the lance to a large extent.

**LANCELET** (lâns'lët), a peculiar fish found in the temperate and tropical seas. The body is lance-shaped, slender, compressed, and transparent. It has no true jaws or skull, has colorless blood, and moves with considerable activity. Breathing takes place by admitting water through the mouth. The common lancelet is about two inches long. Six distinct species have been studied, including the wolf fish and the handsaw fish of the Pacific.

**LAN-CHOW** (lăn-chou'), or **Lanchau**, a city of China, capital of the province of Kan-su, on the Hoang-ho River. The streets are well paved, but the buildings are chiefly of adobe brick and wood. Among the manufactures are gunpowder, fireworks, and camel's-hair goods. It has considerable trade in grain, tea, vegeta-

bles, and silk textiles. Its commercial advantages are due to transportation on the Hoangho River and its location at the converging routes of trade with Tibet and Turkestan. Population, 1908, 500,000.

**LAND CRAB**, the name of many species of crabs that live on the land after they reach a mature state. The species are very numerous, but all of them are native to the warm countries. They are gilled animals, but breathe air in the adult stage. In general respects they resemble the aquatic crabs. Their food consists largely of the tender parts of plants. In some localities they do injury to cultivated plants, especially sugar cane. The natives of the West Indies consider the mountain crab, which lives largely in the woods and hills, a good article of food. Land crabs are abundant in Ceylon, many parts of India, and the West Indies.

**LANDGRAVE** (*länd'grāv*), or **Landgraf**, the title assumed by certain officers of Germany in the 12th century. It was frequently used in the simple form of *graf*. Sometimes it was preceded by certain words to indicate rank, such as *markgraf*, *burggraf*, and *landgraf*, meaning, respectively, marquis, burgrave, and landgrave. The whole empire of Charles the Great was divided into *graf* districts or counties, each presided over by a *graf*. Some of the princes likewise assumed the title at an early date, such as the landgraves of Thuringia and Lower Alsace.

**LAND LEAGUE**, an organization formed by Michael Davitt under a plan formulated by Parnell in 1879 by which land in Ireland was to be purchased for the Irish tenants. Funds for this purpose were subscribed largely in America, but the movement was suppressed in 1881. Subsequently the National League, a political and agrarian organization, was formed for the purpose of bettering the condition of Irish tenants and advocating home rule for Ireland. The measures advocated by this organization were at least in part met by the Land Purchase Act of 1903, as amended in 1905 and 1907, under which many holdings were purchased by the actual occupants.

**LANDSCAPE**, a tract of country, so called with reference to its appearance to the eye from some point of vantage. The term likewise has reference to what may be seen of nature in general, including the country with its groves and streams, as viewed in connection with a portion of the sky. In painting the term is applied to a picture that represents natural scenery, which may or may not include men and animals, though if any animate objects are shown they must appear as subsidiary. Landscape painting is comparatively more recent than that of figure

subjects, though a celebrated school of this class became renowned in China as early as the 12th century A. D. The development of this kind of painting did not gain importance in Europe until the 17th century, when Ruysdael and other Dutch painters gave the system of painting landscapes a notable impetus. Lessing of Germany and Innes of the United States are representatives of distinct schools of landscape painting, the former of the so-called Düsseldorf School and the latter of the Hudson River School.

**LANDSCAPE GARDENING**, the art of laying out grounds so as to produce pleasing effects. It is concerned in arranging drives and walks, planting grass and flowers, constructing bridges and buildings, and setting shrubs and trees that the whole will form a harmonious combination and lend beauty to a lawn or park. This art has been practiced from times immemorable, and many references are made in history to the groves and villas provided by the ancients. However, landscape gardeners who make this work their exclusive business were not commonly employed until in the 19th century. At present many private lawns and parks, as well as public grounds in cities and those surrounding public buildings, are laid out with great care. Shrubs and trees are planted with the view of giving the most pleasing effects, viewed either at close range or from a distance, and various water courses, fountains, and artificial lakes are introduced.

**LAND'S END**, the most southwesterly cape of England, directly opposite Scilly Isles. About a mile west of Land's End are the Longships Rocks, on which a modern lighthouse is situated.

**LANDSLIDE**, or **Landslip**, the settling down of a considerable portion of earth from a higher to a lower level, which is frequently the cause of damage to life and property. Landslides are caused by the action of water undermining the banks, which fall by decay of supporting strata, and sometimes as a result of slight earthquake disturbances. In many instances traffic on railroads has been delayed and in other cases entire villages were buried. A landslip occurred on the Isle of Portland in 1760, in which a tract equal to an area of a mile and a quarter suddenly spread over the lower level. Other instances include a landslide at Rossberg, Switzerland, in 1806; at Glarus, Switzerland, in 1881; and at Zug, Switzerland, in 1887. Another noted landslide occurred in the Himalayas at Naini Tal in 1880, when about 230 persons were killed.

**LANDSTURM** (*länt'stöorm*), a term applied in Germany to the local militia, which is utilized

only in case of actual invasion, and is constituted of men who are too old for the landwehr. This system has been adopted in many countries, notably in Austria, Greece, and Japan.

**LANDWEHR** (länt'vār), the military force of Germany, Austria, and other nations of Europe. It is called out only for occasional training in time of peace, but in war it takes its place in the regular army of defense and offense. The landwehr differs from a militia in that all landwehr soldiers have previous military training. In Germany this system is thoroughly developed. There the landwehr constitutes a powerful organization, and supplements the regular forces without material expense.

**LANGUAGES**, the aggregate of those articulate sounds, called words, that are used to express perception and thought, and which are accepted by and current among the different communities. At present more than 1,000 different languages are spoken. They are more or less closely allied to each other, but differ to such an extent that people of different classes cannot successfully communicate with each other by means of speech. The tongues that are allied, but still differing from the principal languages, include many thousands. Some ancient writers think that language was originally revealed from heaven and that the form was Hebrew. These writers assume that all other languages originated from the Hebrew, but others think that Hebrew, Chaldee, and Arabic are only dialects of the original tongue.

Many scholars, among them Horace, Lucretius, and Cicero, expressed the view that language is of human invention, and that the sounds and words uttered by the primitive peoples under a process of evolution extended into the first languages. From the beginning accessions were made as education and discovery provided new requirements, such as still occur at the discovery of every new principle and the invention of new devices. This constant addition is exemplified in those that resulted after the invention of the telephone, telegraph, and improvement in electrical machinery, all of which added hundreds of words to the languages of civilized nations. Besides, it is evident that the more advanced the educational arts of a people, and the higher their civilization, the greater becomes the need for an extensive vocabulary and enlarged lexicons.

The three general groups of modern languages include the Chinese; those derived from the Aryan, or Indo-Germanic; and the Semitic. The *Chinese language* has many dialects. Its origin is unknown. That it existed for many centuries is apparent, being spoken as far back

as any traces of Chinese history extend, and to-day it is the most widely used of all the languages. The *Aryan*, or *Indo-Germanic*, group of languages, is the most important in that it embraces the language of the best literature and of the most cultured nations of the world. It is classed in seven great branches: The Hindu or Indian, Iranian or Persian, Greek, Italic, Celtic, Slavonic, and Germanic. Each of these has many subdivisions; thus, the Germanic branch includes the German, English, Scandinavian, and Icelandic branches. The German language is an outgrowth of the Old Germanic, when it included the Gothic, Lombardic, Saxon, and many other dialects. The English language is principally an outgrowth of the German, but many words have been added from the Latin, French, etc. Besides, many original terms have been incorporated with it. The *Semitic* family of languages is next in importance to the Aryan group. It embraces the Arabic, Syrian, Assyrian, Babylonian, and Canaanitish dialects, and includes the more important Hebrew and Phoenician.

It is difficult to give an accurate statement of the exact number of people speaking the different languages for the reason that in some countries the dialects are mixed greatly and are changing constantly with various effects. It is reasonably certain that the Chinese is spoken by 410,000,000 people, while the Japanese is spoken by 50,000,000. The principal classes of the Aryan or Indo-Germanic group of languages are spoken in practically the following order: Hindu, 200,000,000; English, 118,000,000; German, 115,000,000; Russian, 112,000,000; French, 50,000,000; Spanish, 50,000,000; and Italian, 35,000,000. See **Aryan**.

**LANSING** (läns'ing), a city and the capital of Michigan, county seat of Ingham County, on the Grand River, 88 miles northwest of Detroit. It is on the Michigan Central, the Grand Trunk, the Père Marquette, and the Lake Shore and Michigan Southern railroads. The noteworthy buildings include the State capitol, the county courthouse, the high school, the public library, the city hall, the Michigan School for the Blind, and the State College of Agriculture, the last named having 1,200 students and a library of 35,000 volumes. An abundance of water power for manufacturing is obtained from the Grand River, which has a fall of eighteen feet. The surrounding country produces coal and timber and is noted for its fertility. Among the manufactures are condensed milk, flour, stoves, wagons, pressed stone, steam engines, and machinery. It has extensive systems of waterworks, sewerage, pavements, and electric street railways. The place was settled in 1837, became the cap-

ital in 1847, and was incorporated in 1859. Population, 1904, 20,276; in 1910, 31,229.

**LANSINGBURG**, a former village of Rensselaer County, New York, on the Hudson River, annexed to Troy in 1901. A substantial bridge across the Hudson connects it with Cohoes and Waterford. It was founded by Abraham J. Lansing in 1771. Population, 1900, 12,595.

**LANTERN FLY**, an insect which is allied to the cicadas. The genus includes about twenty species, some of which are widely distributed in the tropical regions of both hemispheres. Many are large and highly colored. Some are remarkable because of the forehead being formed in the semblance of a bag. Most of the species are about three inches long and five inches across the wings. They move about most commonly during sunshine and feed on herbs and grasses.

**LAODICEA** (lâ-öd-i-sē'â), the name of several ancient cities of Asia Minor, the most important of which was situated near the Lycos River in Phrygia. It was founded by Antiochus Theos and named after his queen Laodice. As a center of philosophy, art, and science it took high rank and became the seat of two important ecclesiastical councils, one in 363 A. D. and the other in 476. Its importance in the primitive history of Christianity is accounted for by the large number of Jews that settled there at the beginning of the Christian era. It is now entirely in ruins and is known as Eski-Hissar.

**LAOS** (lä'ōs), or **Laotians**, a distinct class of Mongolians who occupy the northeastern portion of Siam, regarded the original Siamese race. Formerly they constituted a powerful kingdom, but in 1828 were conquered by the Siamese, and since then have been subject to them. The Laos are divided into two main divisions, the so-called White Paunch and the Black Paunch. The two branches occupy different regions, but they are related more or less closely and agree in the support of Buddhism and in their semicivilized government. They are peaceable, industrious, and fond of music. These people engage chiefly in fishing, rice and vegetable culture, and poultry and stock raising. They have schools, temples, and fixed homes. Their total number is about 1,500,000. The region occupied by the Laos, known as Laos, has an area of 116,000 square miles. Since 1893 it has been a French protectorate.

**LA PAZ** (lä páz'), a Mexican town and seaport, situated in Lower California, capital of the state of Baja. The harbor on La Paz Bay is commodious. It has a large trade in pearlfish and minerals. In its vicinity are extensive stock ranches and orchards. Population, 1906, 7,044.

**LA PAZ**, a city of Bolivia, capital of a de-

partment of the same name, on the Chuquiaqu River. It is thirty miles southeast of Lake Titicaca, in a fertile valley, and has an elevation of 11,950 feet above sea level. The city contains some excellent buildings, has a public school system, and is the seat of a seminary, college, medical school, cathedral, and university. It is the residence of a bishop and has a number of convents. It has an extensive trade in alpaca wool, tobacco, copper, lumber, gold, and silver. The manufactures include textiles, furniture, machinery, clothing, and vehicles. The inhabitants consist largely of mixed races and Aymara Indians. Population, 1906, 67,235.

**LAPIDARY** (läp'ĩ-dâ-rÿ), one skilled in the art of working in stones, especially precious stones. The lapidary art was developed by the ancients. Remains of stone implements found in cave dwellings and other habitations are among the earliest examples of the art. Assyrian workmen invented the drill for penetrating hard substances prior to the year 760 B. C. Beautiful specimens of seals and engraved rings made by the Greeks as early as 600 B. C. attest their advancement along this line. It is thought that the Hindus and Chinese were acquainted with the cutting, engraving, and polishing of small stones very early in history, but the art was not developed as it applies to diamond cutting in Europe until 1475, when Charles the Bold of Burgundy had the first expensive diamond prepared in Europe. Formerly this class of work was done by hand, when it was effected by the powder of a harder stone being rubbed against a softer one, but subsequently different tools were adapted to machine use. The machinery consists of very accurate appliances. In the process three stages are necessary: cutting or slicing, grinding, and polishing. The cutting is done to prepare the general outline of the product desired; the grinding, to bring it to its proper form and shape; and the polishing, to give it a beautiful surface finishing. Formerly polishing was done by a pewter with stone coating, but at present it is effected with a wheel covered with some substance suitable for polishing, such as walrus hide. The kind of tools used depends entirely upon the stone to be treated.

**LAPIS LAZULI** (lä'pĩs läz'û-lĩ), or **Armenian Stone**, a rich blue mixture of minerals, of which the principal component is lazurite. It was employed largely by the ancients for decorative purposes. It occurs principally in crystalline limestone in North and South America, Thibet, Russia, China, and many other countries. When powdered, it constitutes a durable blue paint called *ultramarine*, which was employed formerly to some extent, but it has been replaced

by an artificial preparation of similar composition that is equal in color and durability, and is now used extensively in the arts. Imitations of lapis lazuli are made of bone ashes colored with oxide of cobalt.

**LAPLAND** (läp'land), a large section of Northwestern Europe, the nativity of the Lapps, comprising an area of about 95,000 square miles. It is bounded on the west by the Atlantic, on the north and east by the Arctic, and on the south by the White Sea and by about the parallel of 66° north latitude. The region belongs partly to Russia, Sweden, and Norway. In the western portion it is quite mountainous, but in the eastern part is a plain with numerous rivers and lakes. The two seasons are designated as day and night, the night season being nine months and extremely cold, while the day season is three months of continuous day, of which about six weeks are quite warm and pleasant. Vegetation consists largely of mosses and small timber, including birch, fir, and pine. Few domestic animals are reared, aside from reindeers and dogs. Hunting and fishing are the principal occupations, though there are some developments in the culture of reindeer, vegetables, fodder, and rude manufacture. The lakes and coastal waters are rich in fish, particularly the White Sea and lakes Kuto, Kano, Enara, and Imandra.

The Lapps are classed as Turanians, belonging to the Finnic branch. They are small in stature, have a flat nose, high cheek bones, and a scanty beard. Most of these people are muscular and have red hair. The life of many is nomadic in the summer season, when they hunt and fish, laying by a portion of the necessary supply for winter. Nearly all the Scandinavian Lapps are Lutheran, while those of Russia affiliate with the Greek Church. So far as known they were subject to the Norsemen up to the 12th century, since which time they were conquered by and alternately subject to Norway, Russia, and Sweden. The nomadic tribes speak a variety of dialects. All have shown a marked obedience to their government. The total number of Lapps is 30,408, of which about half are in Russia.

**LA PLATA** (lä plä'tà), a city of Argentina, capital of the state of Buenos Ayres, 32 miles southeast of the city of Buenos Ayres. It is the converging center of several railroads and electric railways. The streets are regular and well paved with brick and stone. Among the noteworthy buildings are the public library, the capitol, the courthouse, the union railway station, splendid churches, an observatory, a college, and a museum. The manufactures embrace cotton

and woolen goods, machinery, clothing, furniture, ironware, soap, tobacco, leather goods, and utensils. A canal connects the city with its harbor, Ensenada, on the La Plata River. La Plata was founded in 1882 and owes its rapid growth to the large trade and various manufacturing enterprises. Population, 1906, 81,402.

**LA PLATA, Rio de.** See **Plata, Río de la.**

**LAPORTE** (lä-pört'), a city in Indiana, county seat of Laporte County, 12 miles from Lake Michigan and 58 miles from Chicago, Ill. It is on the Père Marquette, the Lake Erie and Western, and the Lake Shore and Michigan Southern railroads. The chief buildings include the county courthouse, the high school, the public library, and a number of fine churches. Among the manufactures are flour, carriages, engines, woolen goods, cigars, clothing, and machinery. It has well-graded streets, sewerage, and waterworks. The place was settled in 1830 and incorporated in 1832. Population, 1900, 7,113; in 1910, 10,525.

**LAPWING** (läp'wîng), a genus of birds of the plover family, native to the temperate parts of Asia and Europe. In autumn they move southward to spend the winter. They are about the size of a pigeon, frequent marshes and woodlands, and from their peculiar cry are frequently called *peewit*. Both the birds and their eggs are hunted for food, the eggs being laid largely in cultivated fields, marshes, and depressions on the plains. The length of the common lapwing is about twelve inches. The color is variegated, but usually brownish-red, and the male has a crest of feathers on the head, which is most prominent in the winter time. They were named lapwing from their habit of luring intruders away from their nest by appearing to be lame.

**LARAMIE** (lä'r'à-mě), a river of Wyoming, rises in the northern part of Colorado, and after a course of about 200 miles toward the northeast joins the North Platte River at Fort Laramie. The river passes through a country which is rich in minerals. It is not navigable, but is utilized for rafting lumber cut in the mountains.

**LARAMIE**, a city in Wyoming, county seat of Albany County, on the Laramie Plains, at an elevation of 7,122 feet above sea level. It is 56 miles northwest of Cheyenne, on the Union Pacific Railroad and on the Laramie River. The noteworthy buildings include the county courthouse, the State Agricultural College, the State University, the State penitentiary, and the State fish hatchery. It has electric street lighting, a public library, telephone connections, and waterworks. Besides extensive railroad and machine shops, it has manufactures of flour, soda, glass, soap, building stone, machinery leather,

and bottled goods. The place was first settled in 1868 and was incorporated as a city in 1884. Population, 1905, 7,601; in 1910, 8,237.

**LARAMIE MOUNTAINS**, a mountain range of North America, extending from the central part of Wyoming into Colorado. The formations are composed largely of carboniferous, triassic, jurassic, and cretaceous formations, with fossiliferous deposits in many localities. Coal is the principal mineral. Laramie Peak, 10,000 feet high, is the culminating point.

**LARCENY** (lär'sē-nŷ), the taking and removing of personal property belonging to another, with the intent of depriving the owner of what belongs to him. The crime of larceny is usually divided into two kinds, known as *petty* and *grand*, though the distinction is abolished in some of the states and nations. Where these terms are recognized, they are used to designate crimes punishable by different penalties. Petty larceny is the designation when the value of the property stolen is small and the criminal may be tried and punished in a lower court. A charge of grand larceny is subject to investigation by the grand jury and the punishment is imprisonment in the penitentiary at hard labor.

**LARCH** (lärch), a genus of deciduous trees, bearing leaves in clusters and having cones. The American species are commonly known by the name of *tamarack*, or *kackmatack*, and are native to the northern portion of North America, particularly in the Allegheny Mountains. Several species abound, most of which grow from 15 to 45 feet high and are valuable for the quality of their wood. The *common larch* native to Switzerland, Germany, and Italy is noted for the durability of its wood, while the *golden larch* of Japan is counted the most beautiful tree and attains a height of 125 feet. Many species, especially those of Asia, grow to a height of 60 feet and thrive fully 250 years. The wood is inclined to warp and does not easily decay, owing to the resinous properties. Some of the species yield bark for tanning and a gummy substance useful for cement and in medicine.

**LARD**, the product obtained from the fat of swine by heating to the boiling point and straining. Lard is composed chiefly of stearine and oleine, in proportion of 62 parts oleine to 38 parts of stearine and palmatine, and is used for various purposes in culinary arts. It enters largely into the manufacture of soap, pomades, and lubricating oil. The enormous production of pork in America led to the separation of the oleine and stearine, which is done by pressure at a low temperature. The former is used as lard oil for lubricating machinery and the latter serves in the manufacture

of candles. Much of the best quality of lard is secured from the fat that surrounds the kidneys, from which ointments are prepared.

**LAREDO** (lä-rä'dô), a city in Texas, county seat of Webb County, on the Rio Grande, 152 miles southwest of San Antonio. It is on the Mexican National, the International and Great Northern, and other railroads, and is connected by several bridges with Nuevo Laredo, Mexico. The chief buildings include the courthouse and jail, the Laredo Seminary, the Mercy Hospital, the Ursuline Academy, and the high school. It is the seat of extensive machine shops, is noted for its importance as a wool-shipping point; and within its vicinity are copper, lead, iron, zinc, and coal mines. The manufactures include machinery, earthenware, cigars, and utensils. It has modern municipal facilities, including electric railways and lights, city sewerage, and waterworks. Laredo was settled by the Spaniards in 1767 and became incorporated in 1848. Population, 1900, 13,429; in 1910, 14,855.

**LARES AND PENATES** (lä'rēz, pē-nā'tēz), in legends, the protecting spirits among the ancient Romans, associated with domestic protection. The Lares came to the Romans from the Etruscan religion and the Penates from their early ancestors. They were worshiped by the Roman people under the form of two youthful warriors, who were in later times identical with Castor and Pollux. In many of the homes small images of these deities were placed as decorations round the hearth, and in the mansions of the rich they occupied separate apartments. They were adorned with wreaths on joyful occasions.

**LARK**, a genus of birds of song, resembling the finches in many respects. This genus includes many species, various kinds being native

SKYLARK

SHORE LARK.

to all the grand divisions and many islands. Among the best known are the meadow lark, skylark, wood lark, and shore lark. These birds are migratory, passing early in the spring to the higher latitudes, where they nest in hollows and depressions in the ground. The common char-

acteristics include a forked tongue, a short bill, feathers covering the nostrils, and straight hind claws. The color is variegated, but is largely sandy-brown with marking of black and yellow. The song is shrill and quite rare, except in flight, the skylark being celebrated for its prolonged song of much beauty while on the wing. In many European countries larks do damage to cereal crops. At that season they are caught in nets and sold on the market for their delicate flesh. The food consists chiefly of insects, larvae, and seeds.

**LARKSPUR**, an annual plant found in the Temperate Zone, so-called because the petals are spurred. The flowers are prolific, generally blue, and many varieties of colors have been developed by propagation. Among the species are the branching larkspur, upright larkspur, and rocket larkspur. These species are grown extensively as garden flowers.

**LARVA** (lär'vå), a term applied to the first stage in the development of insects, in which the young, after issuing from the egg, undergo a change of form known as *metamorphosis*. At this stage they are very different from the adults. The larval stage is so called because the form of the young masks or conceals that of the adult. It differs from the early stage in animals whose young are similar in form to the parent, the term *foetal stage*, or *fetal state*, being applied in the latter case. The greater part of growth in insects is developed during the larval state, and the skin is shed from time to time as may be required by the enlargement of the growing body. The *tadpole* is the larva of the frog; the *maggot*, of the fly; the *zoëa*, of the crab; and the *caterpillar*, of the moth or butterfly. See **Beetle**.

**LARYNX** (lär'ĩnks), the special organ of voice, situated at the upper part of the windpipe, or trachea, and at the base of the tongue, immediately below the hyoid bone. The larynx forms a projection of cartilage, known as *Adam's apple*. It consists of a cartilaginous box, across which are stretched folds of mucous membranes. These membranes constitute the vocal cords, which, by their vibration, due to passing of air from the lungs, produce sound. The glottis is a cleft or opening between the vocal cords at the upper orifice of the larynx, while the epiglottis is a leaflike lid upon the back of the tongue, which closes the larynx when swallowing. See **Voice**.

**LASALLE** (lä-säl'), a city of Lasalle County, Illinois, on the Illinois River, 98 miles southwest of Chicago. It is on the Illinois and Michigan Canal and on the Illinois Central, the Chicago, Burlington and Quincy, and the Chicago, Rock Island and Pacific railroads. The sur-

rounding country is agricultural and dairying and contains deposits of bituminous coal and building stone. It has a public library, a fine high school, Saint Bede College, waterworks, and electric street railways. Among the manufactures are glass, hydraulic cement, bottled goods, ironware, and machinery. It has a large trade in produce and merchandise. Lasalle was settled in 1830, when it was named after La Salle, the explorer. Population, 1910, 11,537.

**LAS PALMAS** (läs pä'l'mäs), the largest city of the Canary Islands, on the northeastern shore of the island of Gran Canaria, in a fertile and productive valley. It has a fine harbor, which is fitted for the largest ships. The noteworthy buildings include the public library, the theater, the city hall, an academy of art, and several large churches. Among the manufactures are hats, wine, glass, clothing, and leather goods. It has a large trade in coal, fruits, and merchandise. The place was founded by Juan Rejon in 1478 and was the capital of the Canary Islands until 1833, when the seat of government was transferred to Santa Cruz de Tenerife. Population, 1906, 44,857.

**LASSO** (läs'sö), a long line with a running noose, used chiefly in Spanish America, Mexico, and the western part of the United States for catching horses and cattle. It is usually made of rawhide, but also of sisal rope and hair. One end of the lasso is attached to the saddle, while the other has a sliding noose formed by rings, which the horseman throws over the head or around the foot of the animal while in full gallop, and thus succeeds in catching the desired animal. In the United States it is frequently called a *lariat* and in Mexico a *la reata*.

**LAS VEGAS** (läs vä'gäs), a city and the county seat of San Miguel County, New Mexico, on the Pecos River, 42 miles east of Santa Fé. It is on the Atchison, Topeka and Santa Fé Railroad, has a large trade in wool and live stock, and is surrounded by a grazing and gold and silver mining country. The chief buildings include the public library, the Castaneda Hotel, the courthouse, and the New Mexico Normal University. It has extensive railroad shops, flour mills, machine shops, wool scouring works, and brick and cigar factories. In its vicinity are the Las Vegas Hot Springs, a popular resort, whose waters are noted for their curative effects. It was formerly called East Las Vegas, but was incorporated as Las Vegas in 1896. Population, 1908, 8,145.

**LATERAN** (lä't'er-an), a celebrated church in Rome, Italy, founded by Constantine the Great and by him dedicated to the Savior. It was rebuilt in the 12th century by Lucius II.

and dedicated to Saint John Lateran. The church was maintained in the original form up to 896, when it was destroyed by an earthquake, but was rebuilt shortly after and has been remodeled many times. The palace annexed to it served as the papal residence until the 14th century, but is now in possession of the Italian government. The Scala Santa, or Holy Staircase, which is reputed to have served in the house of Pilate at Jerusalem, and to have been trod by our Lord as he passed to judgment, is preserved in the piazza of Saint John Lateran.

**LATHE** (lāth), a machine for shaping materials by turning. The work is done through a rotary motion, which is obtained in most cases by steam or electric power. Many forms of the lathe are in general use, depending upon the work to be done, such as cutting and polishing flat, oval, or cylindrical objects of wood, metal, or ivory. Small lathes are run by foot power. Those used for cutting wood have a much higher speed than those used in turning metal. The turning tool is held by the workman or by a tool holder attached to a movable slide rest, and the material to be shaped is sustained by two heads or centers. The finest crucible carbon steel is used in making lathe tools. The largest lathes are used in finishing heavy ordnance and in turning marine engine shafts, and from these they grade down to the delicate forms employed in finishing the finer parts of watches and scientific instruments.

**LATIN LANGUAGE.** See Rome.

**LATINS**, or **Latini**, the inhabitants of ancient Latium, in Italy, and from whom the language of Rome was obtained. These people were of great antiquity and their distinguished leader, Ascanius, son of Aeneas, aided in building the town of Alba Longa, which was the most important of their cities. Since Rome was held as a colony of Alba Longa, the Latin language was adopted by the Romans.

**LATITUDE** (lăt'ī-tūd), in geography, the term applied to distance north and south from the Equator, reckoned in degrees, and measured along the meridians. Latitude at the Equator is the smallest or lowest and is marked 0°, and distance from it is designated *north* or *south* respectively as the locality is north or south from the Equator. Since there are only 360° in any circle, and the distance from the Equator to the poles is one-fourth of an entire circle, 90° is the greatest value of latitude a place can have, thus the poles are each marked 90°. There may be any number of parallel circles imagined drawn between the poles and the Equator, these being designated *parallels of latitude*, and, if their distance in degrees from the Equator is known, it is

not difficult to locate a place in latitude. When the longitude of a place is associated with its latitude, an exact locality on a sphere or map may be designated. See **Longitude**.

**LATTER-DAY SAINTS**, or **Reorganized Church of Jesus Christ of Latter-Day Saints**, a body of the Mormon Church, which stands in opposition to the Mormons that have their principal seat of activity at Salt Lake City. It dates from 1844, when a schism occurred in the church, immediately after the death of Joseph Smith, and its promoters claim succession from the original organization. Its chief institutions are at Lamoni, Iowa, where the principal officials reside and several fine educational institutions are maintained. The tenets of faith are founded upon the Bible and the Book of Mormons, both of which are held to be inspired, plurality in marriage is opposed, and strict discipline is enforced. There are 1,450 ministers, 650 churches, and a membership of 50,560. See **Mormons**.

**LAUDANUM** (lā'dā-nūm), the name applied to several tinctures of opium, containing about 33 grains of the soluble matter of opium, or 3.3 grains of morphine, to each fluid ounce of the tincture. Its strength is increased by exposure to evaporation, when it becomes quite thick. Laudanum is used to relieve pain, especially in cramps and diarrhoea, but, being poisonous, it should be taken only under the advice of a physician.

**LAUGHING GAS** (lāf'ing), the name of a chemical used as an anaesthetic agent, so called from the feeling of merriment which it sometimes produces when it is inhaled. The agents used for this purpose consist mainly of hyponitrous oxide, or protoxide of nitrogen, and are administered by dentists, either to deaden pain or produce unconsciousness.

**LAUGHING JACKASS.** See **Kingfisher**.

**LAUGHTER** (lāf'tēr), the expression of mirth, merriment, and satisfaction by laughing. It is a sound or succession of sounds produced by a deep inspiration, followed by vocalized expulsions of air in quick interrupted succession. Laughter is caused by things of an apparent or real ludicrous nature and by tickling. Sometimes it accompanies extreme grief and hysteria. Since there is an intimate connection between the muscles of the eyelids and some of the muscles of the upper lip, in laughing, as in weeping, the eyelids are more or less contracted.

**LAUREATE** (lā'rê-ăt), **Poet**, an honorary office maintained in England, in which the poet regarded official is invested with the title of *laureate* by the crown. The recognition of a poet laureate originated from various sovereigns who engaged singers. Among the early kings

employing singers were Henry I., Richard I., Edward I., and Edward II. The term laureate itself arose from the laurel wreath given at the universities for marks of excellence in study and to men of notable poetic ability. Such a mark of distinction was bestowed by both English universities upon John Skelton, who afterward called himself *Poeta Laureatus*. Originally the title implied service, as the writing of an ode for the king's birthday and on festival occasions, particularly those celebrated after noted national victories. However, special duties have not been connected with the office subsequent to the reign of George III. The following have been poets laureate since the definite establishment of the office: Edmund Spenser, 1591-99; Samuel Daniel, 1599-1619; Ben Jonson, 1619-37; William Davenant, 1660-68; John Dryden, 1670-89; Thomas Shadwell, 1689-92; Nahum Tate, 1692-1715; Nicholas Rowe, 1715-18; Lawrence Eusden, 1718-30; Colly Cibber, 1730-57; William Whitehead, 1757-85; Thomas Warton, 1785-90; Henry James Pye, 1790-1813; Robert Southey, 1813-43; William Wordsworth, 1843-50; Alfred Tennyson, 1850-92; Alfred Austin, 1896-. It will be noted that interims occurred in 1637, 1668, and 1892.

**LAUREL** (lə'rĕl), a genus of plants which range in size from a shrub to trees sixty feet in height. They are natives of Europe, Asia, and Africa, chiefly in the countries bordering on the Mediterranean, but have been acclimated extensively in different countries. Several species are cultivated as ornamental plants and for their fine aromatic fragrance. The leaves are lanceolate and evergreen, the flowers are yellowish-white, and the fruit is about an inch long and of a bluish-black color. The flavor of the leaves is utilized in culinary arts and as a stimulant and carminative in medicine. Several oily substances are extracted from the leaves and the fruit, such as oil of sweet bay and oil of laurel. Laurel water is obtained by distillation from the leaves. In America the name is given to several native plants, including those known as the cherry laurel and purge laurel, but of the true laurel there is properly but one species. The true laurel and the noble laurel are somewhat similar in their evergreen foliage, but differ botanically. Wreaths and crowns were made of laurel twigs in ancient times by the Greeks, as a decoration for the heads of poets and heroes.

**LAURENTIAN MOUNTAINS** (lə-rĕn'-shĭ-ən), the mountain range of British America that divides the Saint Lawrence basin from the watershed of Hudson Bay. These highlands separate the upper tributaries of the Mackenzie

from the streams flowing into the same bay. It extends in an irregular curve from Labrador to the Arctic, a distance of about 3,000 miles. The highest peaks are 4,000 feet, the average height is 1,500, and the principal rock formations belong to the archæan system.

**LAURIUM** (lə'rĭ-ŭm), a village of Upper Michigan, in Houghton County, fifteen miles northeast of Houghton. It is on the Mineral Range and the Copper Range railroads, and is surrounded by one of the richest copper-mining regions of North America. The industries consist chiefly of cigar factories, machine shops, and enterprises connected with the mining of copper. In the vicinity are several villages, including Red Jacket. The name formerly was Calumet, but it was changed to Laurium in 1895. Population, 1904, 7,653; in 1910, 8,537.

**LAUSANNE** (lō-zān'), a city in Switzerland, capital of the canton of Vaud, near the northern shore of Lake Geneva. It occupies a site about 500 feet above the level of the lake and is built mainly on the lower slopes of Mont Jorat. The chief buildings include a Gothic cathedral built in 1235, in which Farel and Calvin took part with others in famous disputations. It is the seat of a university, an academy for Protestant ministers, a school of agriculture, and several charitable institutions. The manufactures include tobacco, machinery, clothing, and jewelry. Lausanne is visited by many tourists during the summer, who find entertainment at numerous fine hotels. It is the seat of a bishopric, of the supreme court of the republic, and of the cantonal library with 125,000 volumes. The city was founded about the 6th century. Population, 1907, 54,460.

**LAVA** (lə'vā), a term generally applied to all molten matter thrown from volcanoes, whether flowing as a stream or being deposited after the movement has ceased. When moving in a molten state within the volcanic channel, it is properly called trap, and after being deposited it forms basalt, trachytic greenstone, or tufa, this depending upon the degree of rapidity with which it cools, the cooling action influencing the formation of hornblende, feldspar, augite, and various other substances. The stream cools and hardens more rapidly on the surface, which causes it to become honeycombed as a result of escaping gases from the interior, while the interior continues to flow in a liquid state for some time, but after the heat escapes it forms a compact mass. The lavas thrown out by Etna and in Labrador are largely feldspar, those of Vesuvius are principally green augite and basalt, and those of the Peak of Teneriffe consist chiefly of trachytic masses.

**LAVAL** (là-vál'), a city of France, capital of the department of Mayenne, 45 miles east of Rennes. It has railroad and electric railway facilities and contains a cathedral which was begun in the 12th century. The manufactures include linen goods, leather, clothing, and marble products. It has a brisk trade in merchandise and cereals. Population, 1906, 32,563.

**LAVAL UNIVERSITY**, an institution of higher learning at Quebec, Canada. It was created in 1852 by the Quebec Seminary and granted a royal charter in December of the same year. By virtue of its royal charter, the Visitor of the Laval University is the Catholic Archbishop of Quebec, who has the right of veto over all the rules and nominations. The superior of the Quebec Seminary is *de jure* the rector, or principal, of the University. The council of the university is composed of the directors of the Quebec Seminary and of the three senior titular ordinary professors of each faculty. It maintains the four faculties of theology, law, arts, and medicine. The professors of the faculty of theology are named by the Visitor and all the others are named by the council, but they can be disposed at will. The degrees which the students may obtain are those of bachelor, master or licentiate, and doctor. Good conduct is an essential condition for obtaining degrees.

Laval University, in order to be ranked as a Catholic institution, was bound to be acknowledged and canonically erected by the Holy See. This solemn and final erection was granted by Pope Pius IX. in a bull dated in April, 1876. By virtue of this bull, the university has for its protector at the Holy See his eminence the cardinal prefect of the propaganda. The supreme direction of faith and morals is vested in a superior council composed of the most reverend and right reverend archbishops and bishops of the Province of Quebec, under the presidency of his grace the archbishop of Quebec, who is also apostolic chancellor of the university.

A decision of the propaganda, dated in February, 1876, authorized the establishment in Montreal of a branch of the Laval University, and it is affiliated by a system of seminaries throughout the Province of Quebec. The university has a library of 145,000 volumes. Instruction is given by a faculty of 54 instructors. The institution is attended by about 400 students.

**LAVENDER** (láv'ën-dēr), a genus of plants native to Southern Europe and Western Africa, but now widely naturalized and cultivated. They grow as shrubs from two to four feet tall, have hoary leaves and grayish-blue flowers, and are

prized for their fragrant, volatile oil contained in the flowers and used in perfumery. The oil has a bitter principle, is of a pale yellow color, and is obtained by distilling the flowers with water. Besides its use in perfumery, oil of lavender is employed successfully as a stimulant in colic, hysteria, and other affections. Lavender water is a toilet preparation and is secured by dissolving oil of lavender with musk, cloves, attar of roses, bergamot, and other oils in spirits. The spirit of lavender is obtained by distilling fresh flowers in rectified spirits. A species of broad-leaved lavender yields an oil used in preparing varnishes and ornamenting porcelain products. The American perfume known as Florida water is prepared largely from lavender. Lavender is cultivated most largely in Europe, where it is used for the distillation of its essential oil and for marketing the flowers. Considerable quantities are grown in the United States, particularly in Pennsylvania, New Jersey, and the states of the Pacific coast.

**LAW**, the collective body of regulations adopted by the government to regulate human conduct. The system of law which is enforced in a particular state or nation is known as its *municipal law*, while the system of rules acknowledged to be obligatory upon the nations is termed *international law*. Municipal law is divided into civil and criminal law. *Civil law* embraces all the provisions that regulate or protect the members of a community, except those that relate to the definition and provide for the punishment of public offenses, which constitute the code of *criminal law*. The acts of Congress and of the general assemblies, as defined by the decision of the courts, comprise the *written law*, while maxims and customs in use from time immemorial are known as the *common law*. Those portions of the law which are expressed in statutes and constitutions are denominated, respectively, *statute law* and *constitutional law*. *Administrative law* includes the regulations which limit and define the duties of the officials of the government and provide penalties for violations of the same. *Canon law* has reference to matters of ecclesiastical jurisdiction. The constitution of a nation is the supreme law of the land. To it are subject the constitutions of the various states and provinces, which are likewise limited by a constitution of their own. A law that is not in harmony with the constitution of the nation, or of the state or province in which it is enacted, is said to be *unconstitutional*.

**LAWN MOWER**, a machine designed to cut grass in parks and on lawns. Many forms of this machine are sold on the market, designed to be pushed by hand or propelled by a

gasoline engine or by horses. The principal part consists of a set of spiral knives with cutting edges, which revolve rapidly as the machine is moved along, cutting the grass as it comes between the cutting edges and a stationary knife. This machine is designed to cut only where the grass is short, hence is not serviceable in tall grasses.

**LAWN TENNIS**, a game of ball played on a ground, called the *court*, by either two or four persons. The balls used are of India rubber, a little less than three inches in diameter, and covered with white cloth. The requirements for the game are the balls, a net and posts, rackets, and a level surface of grass. Usually sides are chosen by a toss or spin of a racket, and the winner chooses the service or the preferable side. The server begins the game by striking the ball with his racket so that it passes over the net, which is hung across the court from the posts. The ball served must drop in the space which is diagonally opposite to him on the other side of the net, this being bounded by the net, the side line, the half-court line, and the service line. His adversary, called the striker-out, must return the ball before it touches the ground a second time, and the server must similarly return it. The ball must be passed back and forth in this way consecutively. When one player fails to do this he loses a stroke, which the adversary is deemed to win, and it is added to the score of the latter. The court should be 78 feet long and 27 feet wide for two players, or 36 feet wide for four players. Much skill and activity are required, hence the game is one of the many that furnish vigorous and healthful exercise. Several national and international lawn tennis associations are maintained, and contests in these and in local associations are quite numerous.

**LAWRENCE** (lə'rɛns), a city in Kansas, county seat of Douglas County, on the Kansas River, 28 miles southwest of Leavenworth. It is on the Union Pacific and the Atchison, Topeka and Santa Fé railroads. The surrounding country is agricultural. It is noted as an educational center, having fine facilities for instruction. Among the noteworthy buildings are the county courthouse, the University of Kansas, the Haskel Institute, the high school, and the city hall. The manufactures embrace barbed wire, cigars, carriages, furniture, earthenware, flour, shirts, paper, and machinery. The general facilities include a public library, street railways, pavements, and waterworks. It was settled in 1854, after the Kansas-Nebraska Bill was passed, and was a center of influence of the Antislavery party. Population, 1910, 12,374.

**LAWRENCE**, a city of Massachusetts, in Essex County, on the Merrimac River, 26 miles northwest of Boston. It is on several branches of the Boston and Maine Railroad and on many electric railways. The city has a public library of 50,000 volumes and is the seat of the Essex County Truant School. Other buildings of note include the townhall, the Lawrence Hospital, and many schools and churches. It has a large trade in merchandise, fruits, and cereals. The manufactures include boilers, furniture, car wheels, cotton and woolen goods, steam engines, boots and shoes, clothing, paper, hats, and machinery. Immense water power is obtained from the Merrimac, which has caused its manufacturing establishments to rank among the largest in the world. The vicinity was first settled in the latter part of the 17th century. Lawrence was formed in 1845 by uniting parts of Andover and Methuen. It was incorporated in 1853. Population, 1905, 69,939; in 1910, 85,892.

**LAWRENCEBURG**, county seat of Dearborn County, Indiana, on the Ohio River, eighty miles southeast of Indianapolis. It is on the Cleveland, Cincinnati, Chicago and Saint Louis and the Baltimore and Ohio railroads. The surrounding country is agricultural. It has a high school, a courthouse, and many fine churches. The manufactures include musical instruments, spirituous liquors, machinery, flour, furniture, coffins, and pumps. It was settled in 1817 and incorporated in 1847. Population, 1900, 4,326.

**LAZZARONI** (lăz-zà-rō'nī), a name applied to the fishermen and boatmen of Naples, Italy, but formerly used to designate all persons destitute of visible means of support. The name became connected with those occupying the hospital of Saint Lazarus, an institution of refuge. Formerly they included a large class who were prominent factors in the revolutionary movements of Naples, and under their leader conducted a prominent revolt against the Duke d'Arcos on July 7, 1647.

**LEAD**, a highly useful metal. It is bluish-white in color and possesses a brilliant luster when newly cut, but after exposure to the air becomes dull on account of taking on a coating of carbonate of lead. Lead possesses both ductility and malleability, but the former is less than that of all other ductile metals, while the latter is considerable. It is flexible, soft, inelastic, melts at 615° Fahr., and has a specific gravity of 11.37. The lead of commerce is mostly obtained from the native lead sulphide, which occurs in veins. It is extracted from the native ore by roasting in a furnace with one-twentieth part of lime and allowing the free access of

air. Lead occurs as a constituent of many minerals and in a native state is associated with others.

In separating lead from other metallic substances, the ore passes through several stages in heating and the sulphurous constituents are finally yielded up. If the lead still contains silver, copper, and antimony after the process of reduction, it is run off and repeatedly crystallized, a treatment under which the silver is concentrated. Antimony is the principal impurity and is burned off by a process of roasting in a reverberatory furnace. The lead of commerce is often nearly pure, and it can be obtained in a perfectly pure state by the reduction of the pure nitrate. Lead is used for type metal, plumber's solder, pewter, water pipes, gutters, and for forming various alloys. Owing to its being the softest of metals, it is rarely used in the pure state, except for special purposes. In manufacturing type metal it is alloyed with antimony. Pewter is a hard alloy, consisting of four parts of tin and one of lead. Tin is alloyed with lead in preparing solder, as well as in making britannia metal and various others.

Lead is obtained in North America to a large extent from the argentiferous ores, that is, from the ores bearing silver, and is produced largely in Colorado, Utah, Idaho, Montana, British Columbia, and Mexico. Extensive lead mines are worked in the Mississippi valley, where it occurs with deposits of zinc. The production of the United States aggregates annually 382,450 tons, which was the output in 1908, of which about one-fourth is exported. Lead is one of the most widely distributed of the metals and occurs in all the grand divisions, but the products of Europe are the most important aside from those of North America. Most commonly lead is found in galena ore. Carbonate and other salts of lead are unmetallic in appearance and occur in primitive and secondary rocks.

Lead has many oxides, such as *red oxide* and *plumbic oxide*, which serve useful purposes in the arts. *Litharge* is a protoxide and is produced by burning lead in a current of air. *Dioxide* or *brown oxide* is obtained by subjecting red lead to diluted nitrate acid or chlorine water. *White lead* is derived from carbonate of lead and is a basis for pottery glazes, cement, and white oil paint. *Carbonate of lead* and *salts of lead* are poisonous and give rise to so-called lead poisoning. That lead is one of the earliest known metals is evidenced by the fact that it is mentioned in the Books of Moses. It is spoken of by Pliny. Many of the articles made by the ancient Romans, Greeks, and Phoenicians still preserved in museums, such as rings, portions

of pipes, and weights, contain lead or are made wholly of lead.

**LEAD** (lēd), a city of Lawrence County, South Dakota, situated in the Black Hills, about three miles south of Deadwood. It is on the Chicago and Northwestern and the Chicago, Burlington and Quincy railroads. Extensive deposits of gold are worked in the vicinity. The chief buildings include the Hearst Library, the high school, the Lead Coliseum, a business college, and many schools and churches. It has manufactures of cigars, utensils, machinery, and jewelry. The municipal improvements include electric lighting and systems of sewerage and waterworks. Lead was settled in 1876 and was incorporated the following year. Population, 1905, 8,052; in 1910, 8,392.

**LEAD POISONING**, a disease due to the presence of a considerable amount of lead in the system. The most common symptom of the disease is lead or painter's colic, which is attended by pain, constipation, and blue lines on the gums. All ailments due to lead poisoning are accompanied by a loss of color and a species of rheumatism. In the more severe cases the patient is affected by paralysis, delirium, and more or less severe convulsions. Opium is the chief medicine used, since it relieves the pain and overcomes the obstinate constipation of the disease. Sulphuric acid and cathartics are useful in the general treatment and iodide of potassium is given in chronic cases. Lead poisoning is caused by the use of lead pipes in conducting drinking water, by the application of cosmetics and hair dyes, and by frequent contact with white lead, as in the case of painters and employees of white lead factories.

**LEADVILLE** (lēd'vil), a city of Colorado, county seat of Lake County, near the source of the Arkansas River, 78 miles southwest of Denver. It is on the Denver and Rio Grande, the Colorado Midland, and the Colorado and Southern railroads. The surrounding country is rich in silver and gold deposits. Among the chief buildings are the county courthouse, the Carnegie Library, the Tabor Opera House, the high school, and a Federal fish hatchery. It has manufactures of ironware, machinery, cigars, and clothing. The site of the city is very beautiful and near it are many cañons and other natural formations of interest. Much has been done to improve the streets by grading and paving. Placer deposits of gold were discovered in California Gulch in 1860, but the rapid growth of the city began in 1877, when the rich silver mines were developed. It was incorporated in 1878. Population, 1900, 12,455; in 1910, 7,508.

**LEAF**, the organ of a plant that commonly

grows from the axis or stem, but sometimes from the root. Leaves are flat, thin, and green in color and constitute the foliage. They never develop into flowers, but exhibit an endless variety of forms in different plants, and constitute marks by which to distinguish easily the different species. A complete leaf consists of a blade or limb, a leaf stalk or petiole, and a pair of stipules at the base. Many leaves have no stipules, and some have no petiole. In the latter case the leaf is said to be *sessile*. Simple leaves consist of one piece, while compound leaves have more than one piece or blade. The leaves are composed of two kinds of material, woody fiber and cellular tissue, the former constituting the framework that gives strength to the blade, and the latter forming the green pulp of the leaf.

The framework of leaves spreads in various directions and constitutes the ribs, from which branch veins and veinlets, these serving to con-

ARRANGEMENT OF LEAVES.

Alternate.

Opposite.

vey the sap. One side of the leaf is turned upward to the sky and the other toward the ground, each being covered above and below with so-called surfaces or skins. The *stomates* or *pores* are on the lower surface and act as breathing organs to take in essential elements from the air, but the leaves also give out a purified air laden with oxygen, which serves a useful purpose in the maintenance of animal life. Plants of the same species have the same kind of leaves, and these are arranged in an exactly similar way on the stems, being an expansion of the bark and a node of the stem. The arrangement is either *opposite* or *alternate* on the stem, but it is greatly variegated in different species.

**LEAF INSECTS**, the name of numerous species of insects remarkable for their resemblance to the leaves of plants on which they feed. The similarity is not only in color, but

also in size and in the resemblance of their legs to the ribs and veins of the leaves. Insects of this character are most numerous in tropical countries, occurring in South America, Australia, and portions of Africa. Their main protection against enemies consists in their resemblance to the leaf forms about them, since they are almost incapable of flight. In most species the males have wings, while the females are wingless.

**LEAGUE** (lēg), a measure used for estimating length, both upon land and at sea. The nautical league is one-twentieth of a degree, or three equatorial miles, or 3.457875 statute miles. In England the land league is three statute miles. The French league has been used for different distances, as the legal post league, equal to 2.42 English miles, and the league of 25 to the degree, or 2.76 English miles.

**LEANDER** (lē-ān'dēr). See **Hero**.

**LEAP YEAR**, a year to which one day is added, being distinguished from others in that it contains 366 days. Every year exactly divisible by four is a leap year, except that only every fourth year ending a century is thus classed. This exception is made to correct the error arising from the addition of one day in four years to the year over the true length of the year. Thus 1800 and 1900 were not leap years, but 1200 and 1600 were and 2000 will be so classified. For a considerable time centuries divisible by 400 will be leap years.

**LEATHER** (lēth'ēr), the tanned, tawed, or otherwise dressed skin or hide of an animal. The process of tanning is applied to the skins of different animals for the purpose of making them tough and pliable and to prevent them from putrefying. Some sort of dressing was applied to the skins of animals very early in history, which was but the result of the practice of ancients in using skins for clothing and in the construction of tents, boats, and implements of war. The fact that the Egyptians developed much skill in the production of leather is evident from the remnants found among ruins, many of which appear to date about 1,000 years before the Christian era. That bark is serviceable for tanning was discovered, in all probability, by mere accident, but it has furnished the principal means and is still used quite extensively in many countries. Other processes are by tawing with bichromate of potash, alum, and various mineral salts, and by shamoying or treating the skins with oils.

Commercially *leather* is distinguished from *skin* and *pelt*, the former being the skin of an animal dressed with the hair or fur removed and the latter being untanned skin or hide. Leather

is made most commonly from the skins of cattle, though those of swine, horses, asses, sheep, camels, and goats are utilized. When shipped from a long distance, hides reach the tannery in a cured or salted condition, but some, especially in cold seasons, are transported without curing. The first process is to unhair the skins, which is done by means of lime, or by a process of sweating. In the latter case a partial putrefaction takes place and the hairs are removed without injuring the hide. In some tanneries the skins are unhaired by sulphide of sodium, sulphide of arsenic, and other alkaline sulphides. The loosened hairs are removed by scraping, but machines for unhairing have been adopted in the larger tanneries. The next process is to remove the loose flesh by scraping and brushing, after which the hides are separated according to the class of leather desired. After soaking in water and washing out all particles of hairs, lime, and other matters, the skins are placed in a tan pit, in which a weak tanning solution is confined. In this they are turned several times daily and afterward are removed to pits containing stronger solutions, until they are placed in the final pit, where they remain for about six weeks. After this process they are taken out and beaten to give them hardness, when they are oiled and prepared for the market.

The various grades of leather are prepared differently, being pared, rolled, and then given smoothness by treatment, the smoothing being effected under a process of oiling. This is true of *japanned leather*, which, in the process of manufacture, is stretched on wooden frames and successive coats of varnish are applied, each of which is allowed to dry and then is rubbed down with pumice stone. *Russia*, *morocco*, and *seal leather* are other grades of highly finished products, but none of these has any connection with the locality or name applied, except as a recognized grade. The skins of lambs, kids, sheep, and goats are tawed and are used for light shoes and gloves. However, the grade known as *kid* is properly made from goatskins. A waterproof leather known as *cordovan* is obtained from horsehide. Shamoying is applied to shamois skins, being done by oil, but the so-called *shamoy* of the market is largely split leather.

Electricity was first applied in tanning in Sweden. Under the electric process hides may be completely tanned in from forty to ninety hours. The plan is to suspend hides in tanning liquor between two copper plates and apply an electro-motive force of fifty volts and a strength of one hundred amperes. However, the time required for the process depends upon the strength

of the tan liquor, but it has been well established that sole leather cannot be prepared by rapid action for the reason that it requires a slow process to tan thick hides. Many more or less rapid tanning processes have been adopted, but the best results require considerable time.

**LEATHER, Artificial**, a manufactured material similar in appearance to leather, used extensively in the arts for purposes in which leather was formerly employed. This product has come into extensive use since 1849, when a product known as *leather cloth* began to be manufactured on a large scale in America. The introduction of this article is due to the scarcity of leather as compared to the demand. Many kinds of artificial leather are on the market at present and the uses for this product are very numerous, including the varieties used in the manufacture of furniture, books, and boots and shoes. One variety is made of the parings and shavings of leather, which are reduced to a pulp and afterward molded into various objects. *Keratol* is used extensively for binding books and in upholstering furniture and the seats in railway cars. Boots and shoes are made to some extent of what is known as *leather board*, which is made of hemp rope, manilla rope, jute, or linen canvas, to which are added leather straps, and it is treated with certain chemicals and a cement which makes it more impervious to water than leather. Vegetable leather is a product that consists largely of caoutchouc, the latter being reduced to a state of dissolution and spread over linen cloth.

**LEATHERBACK**, the name of a large turtle found in the ocean, so named because the back is incased by a leathery integument instead of a bony shell. Several species have been described, including both oceanic and fresh-water animals. Those found in the Atlantic Ocean range along the coast of the United States as far north as New York, and in Europe they extend southward from the English Channel. Some of the specimens have a length of from six to seven feet, the shell being a little more than four feet long. They weigh more than a ton at maturity. Their food consists chiefly of mollusks, fish, and crustaceans.

**LEAVENWORTH** (lěv'ēn-wŭrth), a city in Kansas, county seat of Leavenworth County, on the Missouri River, 25 miles northwest of Kansas City. It is on the Union Pacific, the Chicago Great Western, the Missouri Pacific, the Atchison, Topeka and Santa Fé, and other railroads. The surrounding country has deposits of bituminous coal and is a rich farming district. Among the noteworthy buildings are the county courthouse, the Federal building, the Cathedral

of the Immaculate Conception, the public library, and the public high school. It has the United States and State penitentiaries. The manufactures include glucose, furniture, wagons, engines, iron bridges, cigars, clothing, machinery, shoes, and earthenware. Near the city is the extensive military establishment of Fort Leavenworth, being immediately north of the city. The place was settled in 1854 and was incorporated the next year. Population, 1905, 31,857; in 1910, 19,363.

**LEBANON** (lĕb'á-nŭn), a city in Pennsylvania, county seat of Lebanon County, 26 miles east of Harrisburg. It is on the Cornwall and Lebanon and the Philadelphia and Reading railroads, in a valley between the Blue and South mountains, and is surrounded by a rich coal and iron producing region. Among the chief buildings are the county courthouse, the city hall, the high school, and the public library. It has electric lights and street railways, pavements, and systems of waterworks and sewerage. The manufactures include machinery, engines, railway cars, organs, cordage, furniture, and farming implements. It was settled by Germans in 1700 and incorporated in 1820. Population, 1900, 17,628; in 1910, 19,240.

**LEBANON MOUNTAINS**, the name of two mountain ranges in the northern part of Palestine. They trend in almost parallel lines from northeast to southwest and inclose between them the Nahr Litany valley, anciently known as the Coele-Syria valley. The western range is called Lebanon and the eastern Anti-Lebanon, but the former is known in modern geography as Jebel-Libnan and the latter as Jebel-esh-Shurky. However, the western range is the more elevated, its highest peak being El-Kazib, which attains a height of 10,020 feet above sea level. The Anti-Lebanon range is comparatively irregular, but has the most elevated peak of the two ranges, Jebel-esh-Sheikh being 10,985 feet above sea level. Snow and ice remain in the higher ravines throughout the year, though the slopes are fertile. The cedar forests are famed in history, but they have been almost entirely removed by careless forestry. A number of streams penetrate the valleys, among them the Jordan River, which has its source in the Lebanon Mountains. A class of Christians called Maronites occupy the northern district, and in the southern portion are the Druses. The principal occupations of these peoples are the culture of silk, the vine, and the mulberry tree, and the rearing of sheep and goats. Considerable quantities of wheat, rye, barley, millet, and tobacco are cultivated. Eastern manufacturing enterprises receive growing attention. The most

desirable land is possessed by the monks, who maintain Maronite monasteries, and are influencing the culture and manners of the region. Protestant missions are gaining a strong foothold.

**LECH** (lĕk), a river of Germany and Austria. It joins the Danube after a course of 175 miles, at Donauwörth. The Lech is a rapid stream, falling 4,600 feet in its course. It is historical because of the battles in which Tilly defended the passage of this stream against Gustavus Adolphus, in one of which the former was slain.

**LECOMPTON CONSTITUTION**, the name of a constitution adopted by the proslavery party of Kansas in a convention held at Lecompton on Sept. 5, 1857. It declared the legality of slavery in Kansas and prohibited the passage of emancipation laws by the Legislature. The entire constitution was not submitted to the people of the territory, but they were to vote only for the constitution with or without slavery. In the election the free-state settlers abstained from voting, hence the result was a large majority in favor of the proslavery party. Later the territorial Legislature ordered a vote on the constitution as a whole, when it was voted down by a large majority, and in 1859 an antislavery constitution was adopted.

**LEECH**, a class of suctorial worms found in bodies of water, marshes, and other moist places. Most of the many species inhabit sloughs and ponds of fresh water, but they are also found in marine waters. The group includes the common horse leeches, medicinal leeches, green leeches, and a number of other species. The body is composed of from 80 to 100 rings. Most species have a mouth furnished with toothed plates with which they make an incision for sucking blood from animals and many are parasitic on crustaceans and fishes. In Ceylon the land leeches live among damp foliage and are a common pest, attaching themselves to man and beast. In the colder climates the leeches hibernate during the winter by burying themselves in the mud at the bottom of pools and in marshy lands. The medicinal leeches formerly were used extensively for local extraction of blood in cases where the depletion of venous blood was thought advisable. These leeches are from two to four inches long, have a stomach with elongated pouches, and are capable of holding several times their weight in blood. When the stomach is filled, the leech has sufficient nutritious food for about a year, but may be made to disgorge the contents of the stomach by sprinkling salt on its body, when it is again ready for service. At present leeches are used only to a limited extent. They are employed principally

in the southern part of Europe and the western part of Asia.

**LEECH LAKE**, a lake of Minnesota, in Cass County. It is near the source of the Mississippi River, into which it discharges by a short outlet. The length is twenty miles and the breadth is fifteen miles. It is 1,296 feet above sea level.

**LEEDS**, a city of England, in Yorkshire, on the Aire River, twenty miles southwest of York. It is at the junction of several important railroads. Communication is furnished toward the west by the Leeds and Liverpool Canal, which was opened in 1816. The river is navigable to Leeds and adds materially to the transportation facilities. Among the noteworthy buildings are the Church of Saint Peter, Yorkshire College, the Leeds Infirmary, the public library, the royal exchange, and many schools and churches. About three miles distant are the remains of Kirkstall Abbey. It is noted for its manufactures of woolen goods, steel and iron products, boots and shoes, machinery, clothing, glass, cotton prints, earthenware, and tobacco. In the vicinity are rich deposits of iron ore. Many of the streets are finely paved and improved with grading and parkings. It has electric street railways and municipally owned waterworks and sewerage. The surrounding country produces large quantities of cereals, fruits, and vegetables. Leeds dates from the time of the Saxons, when it was an important place, and was incorporated in 1208. Population, 1907, 470,268.

**LEEK**, a biennial plant native to the southern part of Europe. It is related to the onion, but the bulb in the latter is replaced by a thickening at the base of the stem, which grows to a height of from ten inches to three feet. The leaves are about an inch wide, somewhat thick and fleshy, and grow in clusters near the surface. Gardeners bleach the lower part of the stem by earthing up, which has the effect of causing the edible part to enlarge. In flavor the leek is milder than the onion. Some species are grown as ornamental plants, and others furnish leaves that are used by the peasants for constructing the roofs of their cottages.

**LEEWARD ISLANDS** (lē'wērd), a group of the Lesser Antilles, situated north of the Windward Islands and southeast of Porto Rico. A part of the group is governed as the British colony known as the Leeward Islands. This portion has an area of 705 square miles. It includes the islands of Antigua, Saint Kitts, Nevis, Montserrat, Barbuda, Redonda, and Anguilla. Saint John, on Antigua, and Basseterre, on Saint Kitts, have good harbors and have a large

trade. About four-fifths of the inhabitants are Negroes, 5,150 are whites, and the remainder are mulattoes. The principal religions are Anglican, Wesleyan, Roman Catholic, and Moravian. Among the chief products are coffee, rum, sugar, tobacco, live stock, cocoa, and tropical fruits. Population, 1908, 133,046.

The islands of the Leeward group that do not belong to Great Britain include principally the following possessions: French—Marie Galante, Gaudeloupe, Désirade, and Saint Bartholomew; Dutch—Saint Eustatius and Saba; Dutch—Saint Croix. The Virgin Islands belong to Denmark and England and Saint Martin is a possession of the Dutch and French. Geographers now place the total area of the Leeward Islands at about 4,850 square miles. Guadeloupe is the largest and most important of these islands.

**LEG**, a limb or member of an animal, forming the lower extremity, used for support and locomotion. The larger animals have either two or four legs, and are called bipeds and quadrupeds respectively. Anatomists class the portion of the leg from the body to the knee as the thigh, which has one bone, and the part below the knee as the leg proper. The bone of the thigh is called *femur*. It is the largest and strongest bone of the body. At the hip it articulates with the hip bone by a ball and socket joint and at the knee with a hinge joint. The two bones below the knee are called the *tibia* and *fibula*, the former being the larger, but both are firmly attached by muscles. The calf of the leg is a muscular mass on the back of the human leg, below the knee, and furnishes ample means for standing and moving in an erect attitude.

**LEGACY** (lēg'ā-cy), a gift of personal property or money conveyed by will and differing from a devise, which is understood to be a gift of real property. In the United States a legacy may be unconditional, or may be subject to some uncertain event or condition. The laws of the different states are somewhat varied, but in most instances the testator may bequeath in general or specific terms. He may name an executor and make bequests in favor of relatives, friends, or charitable and public institutions. In most countries a limited amount of property may be willed orally in the presence of witnesses, but when the legacy exceeds in value the common limit a written instrument is required. Creditors have a prior claim to legatees.

**LEGAL TENDER**, the act of tendering payment at the time and place in full settlement of a claim, using such currency, or money, as the law authorizes a debtor to tender and requires a creditor to receive. The effect of a tender of

payment does not discharge the debtor, but it saves the tenderer from paying interest thereafter and from the costs of a suit for the debt, but the exact amount due must be offered. It is not sufficient to offer to pay, but the money must be actually produced and made acceptable to the creditor. The provisions that regulate a legal tender differ materially in different countries. Notes of the Bank of England are a legal tender in Great Britain for any sum above £5. Although gold coins are a legal tender, they are such only when not diminished in weight below the statutory standard, and silver coins are not a legal tender to exceed forty shillings. Gold coins, certain treasury notes, and the so-called greenbacks are a legal tender for debts of any amount in the United States. Fractional silver money is a legal tender not to exceed ten dollars, but silver dollars are a full legal tender, unless it is otherwise stipulated in the contract.

**LEGEND** (lěj'čnd), a term formerly applied to certain writings that were designed as lessons in the religious service of the primitive church. These writings contain biographies of saints and martyrs and stories of remarkable religious enterprises. They are intermingled with many valuable precepts, encouraging moral conduct and right living. The monastic institutions were prolific centers for the accumulation of these writings, at which it was not uncommon to read the histories of saints and martyrs on the particular days set apart for them. Most of these writings originated in the 12th century and spread alike among the Eastern and Western churches, serving the useful purpose of suppressing many of the writings of heathen origin. At present the term legend is understood to imply a narrative, usually entertaining, based on tradition with some intermixture of fact. Many of the popular readings are of legendary origin. They sprang up naturally among the different peoples and embody popular feeling in characteristic narrations.

**LEGERDEMAIN** (lěj-ěr-dě-mān'), a deceptive performance that depends upon manual skill or dexterity. The different feats of legerdemain are performed by sleight of hand, collusion with assistants, mechanical contrivances, or some combination of these. They appear simple and uninteresting when they are understood. In giving exhibits of a high character it is common to utilize optical illusions, chemical properties, or some elaborate scientific phenomenon.

**LEGHORN** (lěg'hôrn), a seaport on the Mediterranean, in the province of Tuscany, Italy, twelve miles southwest of Pisa. It has a safe and commodious harbor, important rail-

road connections, and modern municipal facilities. The streets are regular and most of the buildings are modern. It has manufactures of ships, machinery, clothing, hats, cheese, tobacco, salt, spirituous liquors, cotton and woolen goods, and oil. As a seaport it is one of the most important of Italy, both its import and export trade being extensive. Its general facilities include electric lights, waterworks, and electric street railways. The city has a number of beautiful parks, many statues of noted men, and various public buildings and churches. Among the noteworthy structures are the Church of the Madonna, the Royal Marine Academy, the public library, the gymnasium, and the Leghorn Hospital. In 1421 Leghorn was a small fishing village and became a possession of Florence. Its importance dates from the 16th century, at which time its harbor was improved and various manufactures were established. In 1835 a line of strong fortifications were constructed for its defense. Population, 1906, 99,805.

**LEGION** (lě'jŭn), a division of the army of ancient Rome, constituting at different times a body of men numbering from 2,000 to 6,000. When first organized, the legion comprised fifteen companies, each company containing sixty rank and file, two officers or centurions, and a standard bearer. Subsequently it was divided into ten cohorts, each cohort into three companies, and each company into two centuries. Romulus established the legion that contained 3,000 foot soldiers. At the time of the Second Punic War the legion numbered from 4,200 to 5,200, and from the year 100 B. C. to the downfall of the empire the number varied from 1,000 to 6,200. An eagle was the standard of the legion.

**LEGION OF HONOR**, a French order of merit established by Napoleon on May 19, 1802. It is maintained for the purpose of recognizing civil and military merit. Originally the decoration was a star bearing the portrait of Napoleon, surrounded by a wreath. On one side was the inscription "Napoleon Empereur des Francais," and on the opposite side it bore the French eagle, holding a thunderbolt and the inscription "Honneur et Patrie" in its talons. The constitution of the order has been remodeled at different times, but at present five ranks are recognized, those of grand crosses, grand officers, commanders, officers, and chevaliers or knights. By a constitutional provision the membership in each rank or class is limited to the following number: grand crosses to 70, grand officers to 200, commanders to 1,000, officers to 4,000, and chevaliers to 25,000. Membership is limited to those who have served in some military or civil capacity a term of 25 years, attained marked em-

inence in civil arts, or become noted for skill and bravery in war. The decoration now bears the inscription "Republique Francaise, 1870," while the opposite side has two flags and is inscribed "Honneur et Patrie" (Honor and Country). The president of France is the grand master of the order by virtue of his office.

**LEGISLATURE** (lěj'is-lā-tūr), the lawmaking body of a state or country. It has the power to enact, amend, and repeal laws and resolutions and is subject to the constitution. The chief executive, whether in a republic or a monarchy, has more or less influence upon the legislature, and under certain restrictions may veto its enactments, though in most cases laws and resolutions may be passed over the veto of the chief executive. Originally, as in ancient Greece and Rome, the lawmaking functions were vested in assemblies that were constituted of a large number of the citizens, but later, as the countries became more populous, these powers were delegated to a few representatives chosen by the people. Later the legislative and executive functions were combined in the king or emperor, as in the Middle Ages, but ultimately the commons were granted enlarged powers, and at present all of the leading civilized nations have legislative assemblies constituted wholly or in part of representatives chosen by the popular vote of those entitled to the right of franchise.

In England the body having national legislative functions is known as the Parliament. It is constituted of the House of Lords and the House of Commons. In this respect it corresponds to the highest legislative authority in the Dominion of Canada and the Commonwealth of Australia. Members in the upper house hold their position by heredity or appointment, while those in the lower house are elected by the people. In the United States the national legislature consists of the two houses of Congress, the Senate and the House of Representatives. Members of the former are elected by the legislatures of the states, and those in the latter are chosen by popular vote in the several states. All of the civilized countries have national legislatures corresponding to those in Great Britain and the United States, and in most cases they are composed of two branches. In some countries, as in England, the members of the upper house serve for life, and in others, as in the United States, the term is for six years, and the incumbents may be re-elected any number of times. All of the subdivisions of a nation, such as states and provinces, have legislatures or assemblies for the purpose of enacting laws of a more local character. These likewise consist in most cases of an up-

per and a lower branch. In cities the legislative authority is vested in the common council, and in counties it is exercised by the board of supervisors or the county commissioners.

**LEHIGH** (lě'hī), a river of Pennsylvania, rises in Wayne County, and after a course of 120 miles flows into the Delaware River at Easton. The country through which it passes is rich in anthracite coal deposits. In its course the Lehigh passes the cities of Allentown, Mauch Chunk, and White Haven. About seventy miles of its length have been rendered navigable by extensive improvements.

**LEHIGH UNIVERSITY.** See **Bethlehem.**

**LEICESTER** (lěs'tēr), a commercial and manufacturing city of England, in Leicestershire, on the Soar River, 98 miles northwest of London. It is the focus of several important railroads. The chief buildings include the free library, the Royal Theater, the public museum, the Trinity Hospital, and many schools and churches. It has manufactures of ironware, boots and shoes, woolen and cotton goods, thread, lace, utensils, and earthenware. The surrounding country is fertile and produces cereals, vegetables, dairy products, and wool. It is reputed that the city was founded by King Lear. Many relics of remote centuries have been found in its vicinity. It received the first charter from King John. The building of railroads and the growth of manufacturing establishments are the causes of its modern prosperity. Population, 1907, 236,124.

**LEIPSIC** (lip'sik), or **Leipzig**, a commercial city of Germany, in a fertile region of Saxony, on the Elster, 73 miles northwest of Dresden. Many railroad and electric railway lines converge here. It has well-paved streets, extensive parks, modern municipal facilities, and many historic buildings and churches. The old portion of the city has narrow streets, but those of the newer part are entirely modern. The town-hall, a large building in the Renaissance style, dates from 1556. Other noteworthy buildings include the stock exchange, the market house, the Imperial courthouse, the Church of Saint John, the public library, the Church of Saint Thomas, and the University or Pauline Church. It has a large museum, several theaters, a castle, and many memorials and statues. Among the monuments is a fine work of art dedicated to scenes in several wars, erected in 1888. The manufactures embrace machinery, cotton and woolen goods, musical instruments, spirituous liquors, ribbon, earthenware, leather, paper, clothing, and ships.

Educationally Leipzig is one of the most important cities of the world, containing a fine

public school system, several gymnasia, conservatories of music, business colleges, industrial schools, and the celebrated University of Leipsic. This great educational center was founded in 1408, represents property of much value, and is efficiently equipped with courses of study and apparatus. It has 300 professors, 4,000 students, and a library of 500,000 volumes. The city of Leipsic dates from the 11th century, when it was founded by the Wendish. It has been the seat of many historic conventions and battles. In the Reformation it suffered intensely, was besieged and taken five different times, and near it, at Breitenfeld, occurred the victory over Tilly by Gustavus Adolphus on Sept. 17, 1631. The so-called "Battle of Nations" occurred here on Oct. 16-19, 1813, between the allied forces of Prussia, Austria, Sweden, and Russia and Napoleon, in which the French were defeated and a step toward Napoleon's final overthrow was accomplished. In this battle Napoleon had an army of 180,000 men, while the allied forces numbered about 300,000. The annual jobbing trade of Leipsic is at present estimated at \$60,000,000. Population, 1905, 503,672.

**LEIPSIC, Battles of.** See **Leipsic.**

**LEITH** (lēth), a seaport of Scotland, on the Firth of Forth, a short distance north of Edinburgh. It has an important harbor, is connected by several railroads with other commercial centers, and engages extensively in the manufacture of sugar, engines, machinery, spirituous liquors, fabrics, cordage, and ships. In 1128 it was known as Inverleith. Robert I. granted the city, port, and mills of Leith to Edinburgh in 1329. As an export and import city Leith is of growing importance, its trade in coal being particularly extensive. Population, 1907, 78,804.

**LELAND STANFORD JUNIOR UNIVERSITY**, an educational institution at Palo Alto, Santa Clara County, California, 33 miles from San Francisco and 15 miles from San Jose, the county seat. It was founded in 1885 by Leland Stanford (1824-93) and Jane Lathrop Stanford (1825-1905), his wife, as a memorial to their only son Leland, who died in 1884 at Florence, Italy, in his fifteenth year. The corner-stone of the main building was laid in 1887 and the institution was opened for instruction in October, 1891, when it had 559 students and a faculty of 35 teachers. This attendance grew to 1,751 students in 1908, when the faculty included 150 instructors.

The university campus, containing 9,000 acres, the country estate of Senator Stanford, is beautifully situated at the foothills of the Santa Cruz Mountains, with the sweep of the Santa Clara valley and the Bay of San Francisco in

front of it and the Mount Hamilton range beyond. The plan of the buildings was adopted from the architecture of the old Spanish missions of California. An inner quadrangle of twelve one-storied buildings of buff sandstone with red tiled roofs and connected by an arcade of columns and arches opens on a paved court of four acres, diversified with beds of tropical plants. It is surrounded by a second quadrangle of fourteen buildings, most of them of two stories, flanked by another arcade of columns and arches. Some of the buildings were damaged by the earthquake of 1906, but they were restored at once. In addition to the Palo Alto estate, the university has a landed endowment of 75,000 acres of fruit and farming land. However, the principal endowment consists in interest-bearing securities which aggregate \$30,000,000. The university library has 100,000 volumes and is rapidly increasing.

A board of trustees of fifteen members, elected for terms of ten years, has general management. Academic matters are dealt with by the academic council, comprising the professors and associate and assistant professors. The departments include those of ancient and modern languages, law, economics and social science, engineering, history, botany, education, zoölogy, philosophy, geology and mining, applied mathematics, etc. The Hopkin's Laboratory of Natural History, at Pacific Grove, is affiliated with the university. Honorary degrees are not granted. The degrees include those of Engineer, Bachelor of Laws, Bachelor of Arts, and Doctor of Philosophy. The full course requires 120 hours of university work, 30 hours being an average year. David Starr Jordan, formerly president of the University of Indiana, was elected the first president, which position he is still holding.

**LEMAN, Lake**, a name frequently applied to Geneva Lake. See **Geneva, Lake of.**

**LE MANS** (lē-mōn'), a city of France, capital of the department of Sarthe, 132 miles southwest of Paris. It is well located on both sides of the Sarthe River, which is crossed by several bridges. Among the features are systems of sewerage and waterworks, paved streets, electric street railways, and numerous churches. The most noteworthy public building is the Saint Julian Cathedral. It has an important trade in farm produce and poultry. The manufactures include cotton and woolen goods, lace, candles, soap, and machinery. In 1871 it was the scene of a decisive battle, in which an army of 100,000 French was defeated by the Germans under Prince Frederick Charles. Population, 1906, 65,467.

**LEMARS** (lê-märz'), a city of Iowa, county seat of Plymouth County, on the Floyd River, 25 miles northeast of Sioux City. It is on the Illinois Central and the Chicago, Saint Paul, Minneapolis and Omaha railroads. The chief buildings include the public library, the county courthouse, and the Western Union College (Evangelical). It has manufactures of flour, cigars, clothing, brick, and machinery. The surrounding country is agricultural. Population, 1905, 5,041; in 1910, 4,157.

**LEMBERG** (lēm'bërg), a railroad and commercial city of Austria-Hungary, capital of Galicia, situated in a fertile region, 362 miles northeast of Vienna. It consists of the old and new parts, the latter having regularly platted streets and most of the prominent buildings. Many of the streets are paved with stone and asphalt. It has eight monasteries and many churches, and is the seat of Greek Catholic, Armenian, and Roman Catholic archbishoprics. Among the noteworthy buildings are the Polytechnic Institute, the city hall, the government house, the museum, and the archiepiscopal palace. The university was founded by Joseph II. In 1908 it had an attendance of 2,050 students. The university library has 175,000 volumes. Lemberg is a jobbing center and general market. It has manufactures of glass, clothing, furniture, jewelry, earthenware, and machinery. The inhabitants consist principally of Germans and Poles, for each of which separate gymnasia are maintained. Population, 1906, 163,108.

**LEMMING** (lēm'ming), a rodent quadruped found in the northern parts of America and Europe, particularly in Norway and Sweden.

LEMMING.

It is allied to the rat and mouse. Several species have been described, of which the *common lemming* of Europe is the best known. It is about six inches long and has a short tail. The general color is brownish, the limbs are short, and the head is large. It feeds on grass, reindeer moss, vegetables, and lichens. The favorite habitations are in burrows a short distance below the surface, in which the female brings forth several litters of young per year,

numbering from three to five at a birth. These animals are noted for migrating at certain periods, especially at the approach of winter, when they form an immense line and proceed in parallel columns. In their course they are preyed upon by flesh-eating animals, such as wolves, foxes, and bears, but they move across streams and mountains and even venture far into large bodies of water, where many lose their lives. The *banded lemming*, found in the vicinity of Hudson Bay, is the best known American species. It extends as far southward as the northern part of the United States.

**LEMNOS** (lēm'nös), an island in the Aegean Sea, the most northerly of the Grecian Archipelago, situated midway between Mount Athos and the Hellespont. The area is 160 square miles. It has several large bays, the extinct volcano Mosychlus, and a generally productive soil. The productions include cereals, wine, tobacco, and fruits. In 1657 the island passed from the Venetians to the Turks, since which time it has been a Turkish possession. Lemnian earth, a soft aluminum silicate, was first found in Lemnos, but occurs also in Russia, Bohemia, India, and other countries. It is caused by a decay of feldspathic rocks, has a fatty consistency, is reddish in color, and is used as a medicine in cases of dysentery and other diseases. Lemno, or Kastro, is the chief town. The inhabitants consist chiefly of Greeks. Population, 1907, 29,406.

**LEMON**, the fruit of the tropical or subtropical tree *Citrus Medica*, of the orange family, originally native to the tropical portions of Asia. It is quite certain that lemons were unknown to the ancient Greeks and Romans and that this fruit was introduced into Spain by the Arabs about the 12th century. The lemon tree has since been naturalized extensively. Many highly improved species have been produced by cultivation. The fruit is ellipsoidal, with a protruding point at each end, and from two to four inches in length. It has a bright yellow color, the skin is quite thick, and the internal pulp is very acid and juicy. From eight to twelve compartments are in the fruit, each containing several seeds. On account of their keeping property lemons are more profitable to grow than oranges. The tree is knotty-wooded, has oval leaves, and grows to a height of about eight feet. It bears very abundantly, many trees producing 3,000 lemons in a favorable season.

The fruit of the lemon tree is gathered while still green, wrapped in small papers, and shipped in boxes for consumption in the general market, the ripening taking place in transit or while kept in the store. Among the favorite species of

lemons are the sweet lemon, thin-skinned lemon, common lemon, and citron lemon. The principal uses are for the manufacture of oil of lemon, for flavoring in cookery, to make lemonade and other drinks, as a stimulant in medicine, and for perfumery. Oil of lemon is a volatile product and is secured from the rind by pressure. Lemon extract is made largely from the more im-

LEMON.

A, Flower; B, Section of Fruit.

perfect fruit by squeezing, and, after removing all foreign properties, it is prepared with deodorized spirits and filtered. The most extensive production of lemons in the United States is in California and Florida, where large fields are cultivated successfully, and immense quantities are transported to all parts of America. They are grown in large orchards in the warmer parts of Europe and America, especially in the islands and countries of the Mediterranean. However, the Greek island of Andros and Sicily are particularly important in the culture of the lemon tree. In 1790 the cultivation of the lemon was introduced into Australia, where it is proving profitable.

**LEMUR** (lē'mūr), a family of mammals allied to the monkey, found mainly in Madagascar, but related species are common in Africa, Southern Asia, and the Philippines. The body, tail, and snout are long. A few species, as the *slender loris*, are tailless, but nearly all have a bushy tail which is about as long as the body. Most of these animals have longer hind legs than fore legs and are peculiarly odd in appearance. All are harmless and some build nests like birds. They inhabit forest districts, move about principally by night, and may be domesticated, when they become docile and play-

ful. The food consists of insects, vegetables, reptiles, birds, and fruits. Most of the species resemble the monkey in many respects, while others have foxlike faces and are about the size of a cat.

**LENA** (lyě'nà), one of the largest rivers in the world, rises near Lake Baikal, in southern Siberia, has a northeasterly course to Yakutsk, and thence flows nearly north into the Arctic Ocean. The entire length is 2,775 miles, the basin contains 950,000 square miles, and the delta is 250 miles wide. From May to October it is navigated, forming the most important transportation route of eastern Siberia, but the remainder of the year it is frozen. The valley is highly fertile, especially the upper part, where stock raising and farming are extensive industries. It receives the inflow from the Kuta, the Vitim, and the Kirenga.

**LENS**, a piece of transparent substance, usually glass, so called from the resemblance in form to the seed of a lentil, which is like a double-convex lens. A lens is shaped so as to afford two regular opposite surfaces, both curved, or one plane and the other curved, and designed to change the direction of rays of light, and for increasing or diminishing the apparent size of objects viewed through it. A lens that hollows or rounds inward is said to be concave; one that rounds outward, convex. The curved surfaces are usually spherical. Six distinct kinds of the ordinary lenses of this description are in general use. They are employed in the manufacture of telescopes, opera glasses, stereoscopes, spectacles, microscopes, lanterns, and other instruments and devices. The best grade of crown or

A, Plano-concave.  
B, Double-concave.  
C, Plano-convex.  
D, Double-convex.  
E, Meniscus.  
F, Concavo-convex.

flint glass is used in making lenses for microscopes and telescopes, and, since great accuracy is necessary in grinding and polishing, the lenses for the larger instruments represent much value. The six varieties of curved lenses include the double-convex lens, plano-convex, double-concave, meniscus, plano-concave, and concavo-convex. The *meniscus* are lenses in which the convexity is greater than the concavity, and the *concavo-convex* have greater concavity than convexity. See **Light**.

**LENT**, a fast of forty days, observed annually from Ash Wednesday until Easter by the

Anglican, Roman Catholic, and other churches as a season of special penitence and self-denial. It was instituted by the early Christian Church in commemoration of the resurrection of Christ, and to commemorate his fast of forty days in the wilderness. Originally the fast was but 36 days, the four additional being added in the 5th century, which change was generally accepted. Much rejoicing accompanies the close of Lent in Roman Catholic countries, and its beginning is preceded by the carnival. In many churches the fasting is left to the individual conscience of each member, but all are admonished to be diligent in prayer.

**LENTIL** (lě'n'til), a plant cultivated extensively in Europe and elsewhere for fodder and for human food. It grows to a height of about twenty inches, has numerous branches and whitish flowers, and bears seeds about as large as a pea. Garden lentil and field lentil are the two species commonly cultivated in Germany, France, Syria, and Egypt. Lentil straw is a wholesome fodder for stock. The seeds are used in cookery for soup, or are baked and prepared much like beans and peas. Formerly lentil was unknown in Canada and the United States, but its cultivation has been introduced into these countries.

**LEO.** See **Zodiac.**

**LEOMINSTER** (lěm'in-stēr), a town of Worcester County, Massachusetts, on the Nashua River, five miles south of Fitchburg. It is on the Boston and Maine and the New York, New Haven and Hartford railroads. The surrounding country is agricultural and dairying. It has electric street railways, public lighting, city waterworks, and a library of 18,000 volumes. The manufactures embrace musical instruments, linen and woolen goods, buttons, clothing, toys, and utensils. It was settled in 1725, but formed a part of Lancaster until 1740, when it was incorporated as a separate town. Population, 1905, 14,297; in 1910, 17,580.

**LEÓN** (lă-ōn'), a city of Mexico, in the state of Guanajuato, 32 miles west of Guanajuato. The site is in a fertile plain, on railways and regular routes of travel. It has manufactures of machinery, cotton and woolen goods, and leather. Among the chief buildings are a library, the city hall, and a number of schools and churches. It has modern municipal facilities, including waterworks, sewerage, and a public park. The jobbing trade is extensive. Population, 1906, 64,632.

**LEÓN**, the principal city of Nicaragua, Central America, capital of the department of León, on the shore of Lake Managua, twelve miles from the Pacific. It is surrounded by fer-

tile plains, has good railroad connections, and is well improved with pavements and parks. León is the seat of an episcopal palace, several churches, and the College of Saint Ramon. It has a good public school system, modern municipal facilities, and contains a massive cathedral. The manufactures and commercial enterprises are important. It has a growing trade in live stock, cereals, fruits, and merchandise. Population, 1906, 48,402.

**LEÓN**, a city of Spain, capital of the province of León, 81 miles northwest of Valladolid. It is celebrated as the capital of an ancient kingdom of the same name. The city was founded by the Romans, who named it Legio. Population, 1906, 18,041. See **Spain.**

**LEOPARD** (lěp'ěrd), a ferocious, carnivorous mammal native to Asia and Africa. It is regarded by some writers as allied to the pan-

LEOPARD.

ther, by some as a species of it, and by still others as a distinct species. The color is largely a pale fawn spotted with dark brown or black in rosettes or broken rings. The lower part of the body is whitish, the tail is long, and the movements are graceful and rapid. It can leap over precipices with ease and readily ascend trees, from which it springs upon its prey with marked certainty. The leopard is bloodthirsty, often killing more than it can devour for the sake of the fresh blood, and steals from ambush upon its prey, such as poultry, deer, antelope, or any animals it can destroy. The favorite haunts are in the woods. Its size and strength are sufficient to overcome a man, but it rarely attacks human beings, except in defense or when in dire need of food.

**LEOPOLDVILLE**, a city of the Congo Free State, on the Congo River, at the outlet of Stanley Pool. It is connected by a number of important railroads, giving it decided trade advantages. The cataracts occupy a distance of 235 miles and are impassable by vessels, but

about 7,000 miles of the Congo River and its tributaries above Leopoldville are navigable, hence the importance of the city as a trade and commercial center. The streets are platted at right angles. It has electric lights, waterworks, and several fine schools and churches. The city was named from Leopold, King of Belgium. Population, 1906, 21,785.

**LEPANTO** (lě-păn'tō), or **Naupaktos**, a seaport of Greece, on the north coast of the Gulf of Corinth, or Lepanto. Anciently it was of vast commercial importance. It came into possession of the Athenians after the Persian wars. The Venetians fortified it in 1477 and improved its harbor. On Oct. 7, 1571, a memorable battle occurred near Lepanto between the fleet of the Turkish Sultan and the allied fleets of Philip II. of Spain, Pope Pius V., and the republic of Venice. Prince Don John of Austria commanded the allied fleets, while the Ottoman fleet was under the command of Ulutch Ali of Algeria, Ali Pasha, and Mohammed Sirocco of Egypt. The battle raged four hours and terminated in the destruction of the Ottoman fleet of 200 galleys and sixty other vessels. From the Battle of Lepanto dates the decline of Turkish power in Europe.

**LEPROSY** (lěp'rō-sŷ), a chronic skin disease characterized by ulcerous eruptions and successive scaling off of dead skin. Those affected show symptoms that include thickening of the skin, loss of hair and feeling, offensive perspiration, ulceration, and death of parts. Two forms are generally recognized, known as tuberculous and nontuberculous, or anaesthetic. In ancient times many skin diseases were regarded as leprosy, but it is now generally restricted to *elephantiasis*, the name applied by the Greeks, and designated *lepra* by the Arabs. Leprosy is hereditary. It is regarded contagious, being caused by a minute organism, a bacillus, which may be conveyed to those not affected, and after a time develops the worst forms known. In former times the disease was prevalent to a vast extent, but was found more frequently in men than in women, and prevailed principally among the people who were excessively exposed to filth, poverty, and cold damps. At present it prevails most extensively in Iceland, the Pacific islands, the Hawaiian Islands, the West Indies, Madagascar, the Greek archipelago, in the vicinity of the Mediterranean, and the East Indies.

Increased efforts have been made within recent years not only to limit the spread of leprosy, but to provide adequate care for those afflicted. In Louisiana is a plantation for lepers, on which several hundred receive treatment,

while similar provisions have been made in a number of the other states. One of the largest colonies of lepers now within the domain of the United States is on the island of Molokai, one of the Hawaiian group, where about 1,250 persons are confined, about one-third of whom are females. Visitors have access to the colony, but the lepers are separated from others by wire fencing. A semiofficial estimate published in 1908 placed the number of lepers in the Philippine Islands at 30,000, most of whom are in the Visayas. Japan has 200,000 registered lepers. An estimate places the number in India and China at 500,000 for each country.

**LESBOS**, or **Mytilene**, an island in the Aegean Sea, formerly a possession of Greece, but now a part of Turkey. It is situated near the coast of Asia Minor, has a triangular form, and includes a total of 675 square miles. The surface is generally mountainous, but there are large tracts of fertile coast and valley lands. Among the chief products are pine timber, live stock, cereals, and tropical fruits. Aeolian colonists settled the island at an early period and built cities upon it. The poets and literary men of Lesbos included Sappho, Theophrastus, Arion, Pittacus, and several others famous in the history of Greece. Since 1462 it has been a possession of Turkey. The inhabitants consist almost entirely of Greeks and Turks, but the former are in the majority. Population, 1906, 128,403.

**LESINA** (lěs'ě-nä), an island in the Adriatic Sea, near Dalmatia, belonging to Austria. It is thirteen miles long and has an undulating surface. The principal town is Lesina, which has a good harbor, and exports fruits and cereal products. Population, 1906, 15,236.

**LESSER ANTILLES.** See **Leeward Islands; Windward Islands.**

**LETHE** (lě'thě), a stream mentioned in Grecian mythology, which flowed gently and silently in a secluded vale of Elysium. The waters of the Lethe had the property of dispelling care and producing utter forgetfulness of former events. The Pythagorean doctrine of the transmigration of souls implied that after the mortals had inhabited Elysium a thousand years they were destined to animate other bodies on earth, and, before leaving Elysium, they drank of the waters of the River Lethe in order that they could enter upon their new career without any remembrance of the past.

**LETTER**, as commonly understood, the name applied to a written message or communication. Previous to the rapid transit of intelligence by railway, steamboat, telephone, and telegraph, letters served a quite different purpose

than they do at present in that they assumed the form of epistles. These writings now constitute a large part of the literature that has come down to us through the centuries. Many of the letters of Cicero, Pliny, and Seneca are included in ancient literature. The epistolary writings of the early Christians, including the epistles of the New Testament, belong to this class. Among the literary men of more recent times are many writers who delighted to contribute messages of friendship and intelligence to others, and for this purpose wrote letters, sometimes of a private, but frequently of a public, character. We find in the literature of all languages men who were especially noted for extraordinary ability in letter writing. Such, for instance, were Walpole, Cowper, and Gray among the English; Goethe, Humboldt, and Schiller of the Germans; and Voltaire and Madame de Sévigné among the French.

**LETTERS OF MARQUE AND REPRISAL**, a commission issued by a state or government authorizing the bearer to pass beyond the boundaries of his own country for the purpose of capturing prizes of the enemy, consisting of their persons or goods. The term *letters of marque* signifies a license from the government to pass beyond the limits or jurisdiction of one's own country. On the other hand, *reprisal* signifies taking in turn.

**LETTS** (lěts), a people inhabiting portions of Russia, largely in Livonia, Courland, Kovno, and Vitebsk. They are Slavonic, closely allied to the Lithuanians, and number about 1,000,000. In 1586 the Lutheran Catechism was translated into the Lettic language. Many literary products of the Letts have much value, but many of the race have been Germanized. Most of these people are Protestants. The total number is about 1,350,000.

**LETTUCE** (lět'tis), an annual plant of the order *Compositae*, cultivated in gardens as a salad. Many species are grown, most of which attain a height of two feet, bear yellowish flowers, and have variously formed leaves. The plant is in its best state when from four to six inches tall, when it is tender and best adapted as a food. Lettuce has been cultivated in gardens since very early times, but does not grow spontaneously in any country. It includes both greenish and purplish species. Some have heads resembling those found in several kinds of cabbage.

**LEUCADIA**, or **Santa Maura**, an island off the west coast of Greece, in the Ionian Sea. The area is 109 square miles. It is traversed by hills, but contains a fair proportion of fertile soil, and produces cereals, fruits, and wine. In

the southern part is a line of white cliffs, the highest of which is about 2,000 feet, known as the Leucadian Rock, or the Lover's Leap, so called from despairing lovers throwing themselves from it. Amaxichi is the chief town. The inhabitants are chiefly Greeks. Population, 1906, 34,982.

**LEUCTRA** (lūk'trà), a village of Greece, in Bocotia. It is famous as the place where the Thebans under Epaminondas defeated the Spartans under Cleombrotus, in 371 B. C. Sparta had exercised an influence over Greece for several centuries, since the close of the Peloponnesian War, in 404 B. C., but it was terminated by the Battle of Leuctra.

**LEUTHEN** (loi'ten), a small town of Germany, in Lower Silesia, celebrated on account of a battle fought there on Dec. 5, 1757, by which Prussia recovered most of Silesia. The

CABBAGE LETTUCE.

Prussian army consisted of 35,000 men under Frederick the Great, while 90,000 Austrians were under Prince Charles of Lorraine, but the former won a decisive victory.

**LEVANT** (lě-vănt'), an Italian term, meaning the East. It is applied in a restricted sense to the Asiatic coast of the Mediterranean, from Constantinople to Alexandria, Egypt, but in a more general sense to the regions from Italy to the Euphrates and the Nile.

**LEVEE** (lěv'ê), a French term applied to embankments constructed to prevent water from overflowing level tracts of land, but now used in a similar way in the English and other languages. The most important levees of America are those of the lower Mississippi, which border the river for a distance of 1,200 miles. These levees are now almost continuous from Cairo, Ill., to the Gulf of Mexico, a distance of 1,000 miles. They serve to confine the stream to its natural channel. Other levees of vast extent are those of the Ganges River in Asia, of the Po

River in Italy, and those of Holland, the latter being more commonly called dams.

**LEVEL**, an instrument for indicating a horizontal line, for determining the true level, or to ascertain the difference of elevation between two or more places. It is used in engineering, architecture, surveying, drainage, and in many other arts. The devices used for such purposes are numerous, including those in which the horizontal line is determined by a bubble of air floating in a fluid contained in a glass tube, as in a spirit level; those in which the horizontal line is determined by the surface of the fluid at rest, as in the water and mercurial levels; and those of the simpler forms used by carpenters and masons, in which the vertical line is determined by a plumb line and the horizontal by a line perpendicular to it. The action of gravity is the principle upon which all levels are based.

**LEVER** (lē'vēr), an inflexible bar or rod moving upon a fixed point called the *fulcrum* or *prop*, and having the *weight* to be moved and

THREE CLASSES OF LEVERS.

the *power* to move it applied at two other points. The lever is one of the mechanical powers. It includes three classes, being numbered according to the relative positions of the fulcrum, the points of application, and the force of the weights. In levers of the *first class* the fulcrum is between the force and the power, as in a pump handle, in which the hand is the power, the water lifted is the weight, and the pivot is the fulcrum. Levers of the *second class* have the weight between the fulcrum and the force, as an oar, in which the hand is the power, the boat is the weight, and the water is the fulcrum. In levers of the *third class* the power is applied between the fulcrum and the weight, as in the treadle of some grindstones, in which the front end resting on the ground is the fulcrum, the foot is the power, and the force is transmitted

by the rod to the weight, the wheel above. In the lever advantage is gained mainly at a loss of time, that is, a heavy weight may be lifted by a small power passing through a greater distance. The force being smaller, it passes through a greater distance than the weight, and for that reason is able to overcome material resistance. The power is increased by a system of compound levers, as in an ordinary farm scale, in which a heavy load may be balanced by a slight touch of the hand.

**LEVIS** (lā-vē'), or **Point Levi**, a city of Quebec, capital of Lévis County, on the Saint Lawrence River, opposite Quebec. It is on the Grand Trunk and the Intercolonial railways, has extensive docks, and is connected with Quebec by one of the largest cantilever bridges in the world. The chief buildings include the county courthouse, the high school, and many fine churches. Among the manufactures are woolen goods, boots and shoes, furniture, machinery, and soap. It has a large domestic and foreign trade. The place was settled in 1647 and incorporated in 1861. Population, 1901, 7,783.

**LEVITES** (lē'vīts), the descendants of Levi, who were selected as the guardians of the sanctuary of Israel and ministers of worship. When the lands of Palestine were divided, the three divisions of Levites, the descendants of the three sons of Levi, Gershon, Kohath, and Merari, received no territorial possession, but were given tithes of the agricultural products. There were properly two classes of Levites, the entire tribe considered collectively, and those who were designated the sons of Aaron. Forty-eight cities of Canaan were assigned to the tribe of Levi, of which the priests were to occupy thirteen. The duty of preserving and interpreting the law was assigned to the Levites in connection with their other duties, and at the feast of tabernacles they were to read the law before the people once every seventh year. They lost their importance after the revolt of the ten tribes, but their lineage has been kept up more distinctly than that of any other, and even to the present time there are those who claim to be pure descendants from Aaron.

**LEVITICUS** (lē-vī'ĩ-kūs), the third book of the Old Testament. It contains the laws and regulations concerning the Levites and the ceremonies of worship. The offering of sacrifices, the distinction of things clean and unclean, the consecration and authority of priests, the feast of atonement, the sabbatical and jubilee years, and the prohibition of theft, perjury, and idolatry are treated in the book. It is of Mosaic origin.

**LEWIS AND CLARK EXPOSITION**, an international exposition held at Portland, Ore., to celebrate the centennial of the exploration of the Oregon country by Lewis and Clark. The gates were opened June 1, 1905, and closed Oct. 15, 1905, a period of 137 days. In point of attendance it ranks fourth among American expositions, being exceeded only by those held at Chicago, Saint Louis, and Buffalo, and the large receipts made it a financial success. Official reports place the attendance at 2,545,509. The exposition represented an expenditure of \$7,500,000, of which Portland contributed \$400,000 and Oregon \$450,000. The cost and dimensions of the principal buildings were as follows:

	DIMEN- SIONS, FEET.	COST.
Forestry Building .....	206x100	\$30,165
Oriental Exhibits Building .....	308x160	55,425
Agricultural Building .....	460x210	69,130
European Exhibits Building .....	462x100	51,720
Machinery, Electricity, and Trans- portation Building .....	500x100	28,540
Festival Hall (Auditorium) .....	108x120	12,534
Mines and Metallurgy Building ..	200x100	14,320
Arts and Varied Industries Build- ing .....	240x375	38,216
Fine Arts .....	*25x175x150	10,000

\*L-shaped.

**LEWISTON** (lū'is-tūn), a city of Idaho, county seat of Nez Perces County, on the Snake and Clearwater rivers, 144 miles south by east of Spokane, Wash. It is on the Oregon Railroad and Navigation Company Line and the Northern Pacific Railroad, and is surrounded by a productive agricultural and mining country. The industries include flouring mills, grain elevators, and sawmills. It has a growing trade in live stock, fruit, and merchandise. Waterworks and electric lighting are among the public facilities. It is the seat of the State normal school and maintains fine public schools. On the opposite side of the Snake River is the town of Clarkston, Wash., with which it is connected by a steel bridge. Population, 1910, 6,043.

**LEWISTON**, a city of Maine, in Androscoggin County, on the Androscoggin River, opposite Auburn, 35 miles north of Portland. It is on the Maine Central and the Grand Trunk railroads and several electric interurban railways. The noteworthy buildings include the townhall, the public library, and Bates College. The last named institution was founded in 1863 and endowed by Benjamin E. Bates and others. It has a fine public park and an auditorium. The river has a fall of about fifty feet, by which immense water power is secured through a canal as a means to promote industrial enterprises. The manufactures include cotton and woolen goods,

clothing, machinery, leather products, belts, hats, brooms, and utensils. The surrounding country is agricultural, giving the city an important trade in cereals and live stock. It was settled in 1770, when it became known as the Plantation of Lewiston, and was incorporated in 1795. Population, 1900, 23,761; in 1910, 26,247.

**LEWISTON**, a village of New York, in Niagara County, on the Niagara River and the New York Central Railroad. It is the terminus of navigation on Lake Ontario and is visited regularly by steamers from Toronto. It has a public library, and is visited by tourists during the summer months. The French located a blockhouse on its site in 1720. In 1814 it was occupied by the Americans under General Riall, who was defeated by a force of British and Indians under Colonel Tucker, and the place was burned. Population, 1905, 708.

**LEXINGTON** (lēks'ing-tūn), a city in Kentucky, county seat of Fayette County, twenty miles southeast of Frankfort. It is on the Southern, the Queen and Crescent, the Baltimore and Ohio, the Louisville and Nashville, and other railroads. The city is situated in the celebrated blue grass region, has well-paved streets, modern municipal improvements, and is the center of a large commercial trade. Among the noteworthy buildings are the Hamilton Female College, the Kentucky University, the Sayre Female Institute, Saint Catherine's Academy, the State Agricultural and Mechanical College, the Kentucky Reform School, and the McClelland Female College. It has a fine public library, a commodious high school, and Woodland Park. The manufactures include cordage, spirits, copper products, saddlery, hemp and cotton goods, clothing, carriages, and machinery. It has a large trade in Bourbon whisky, tobacco, cereals, and fine stock. A fine monument to Henry Clay is among the interesting structures that adorn the city. It was first settled in 1779, was incorporated in 1782, and was the capital of Kentucky from 1792 until 1793. Population, 1900, 26,369; in 1910, 35,099.

**LEXINGTON**, a town of Middlesex County, Massachusetts, ten miles northwest of Boston, on the Boston and Maine Railroad. It is celebrated as the site of the first battle of the Revolution, which occurred here April 19, 1775. The British had secretly dispatched a force from Boston to seize the military stores collected at Concord, the news of which was spread by Paul Revere. Accordingly, the call to arms was sounded and the militia was armed. When Major Pitcairn reached the village with British troops he found minutemen drawn up on the green. Finding that they refused to disperse at

his command, he promptly ordered his men to charge, but the militia held its ground until the British were reënforced, when they fell back and Major Pitcairn moved on to Concord. On returning from Concord, the British were attacked at Lexington and pursued by a galling fire from all sides. Exhausted by their march of eighteen miles and their fast of fourteen hours, the British fell into a disorderly flight and would probably have been destroyed, if Lord Percy had not come forward with heavy reënforcements from Boston. The British lost 273 men, the Americans lost 93 men. This engagement so aroused the colonists that within a week 16,000 men were besieging General Gage in Boston. Lexington contains a monument erected in 1799 to commemorate the battle. Population, 1905, 4,530; in 1910, 4,918.

**LEXINGTON**, county seat of Lafayette County, Missouri, on the Missouri River, forty miles east of Kansas City. It is on the Missouri Pacific and the Atchison, Topeka and Santa Fé railroads. The principal buildings include the Baptist Female College, the Central Female College, and the Wentworth Military Institute. Large quantities of coal and farm products are obtained in the surrounding country. It has manufactures of earthenware, clothing, and machinery. The place was first settled in 1825 and incorporated in 1830. At the time of the Civil War, in 1861, it was the scene of several engagements between the Federals under Colonel Mulligan and the Confederates under General Price. Population, 1910, 5,242.

**LEXINGTON**, county seat of Rockbridge County, Virginia, on the North River, in a fertile agricultural and stock-raising country. It is on the Baltimore and Ohio and the Chesapeake and Ohio railroads and is the western terminus of the James River and Kanawha Canal. The manufactures include flour, machinery, and ironware. Besides a good public school system, it has the Washington and Lee University and the Virginia Military Institute. It is historic because of being the burial place of Thomas J. Jackson and Robert E. Lee, the two most distinguished generals of the Confederate army. Population, 1900, 3,203.

**LEYDEN** (lī'den), or **Leiden**, a city of Holland, on the Old Rhine River, 22 miles southwest of Amsterdam. It is the oldest city in Holland. In 1640 it had a population of 100,000, but gradually declined until the beginning of the last century. Since then the city has gained considerably in population and importance. It has manufactures of cotton and woolen goods, earthenware, machinery, clothing, and musical instruments. The noteworthy buildings include

the Church of Saint Peter, the townhall, the municipal museum, the union railway station, and the public library. It is the seat of the University of Leyden, founded in 1575, which has a fine library and 975 students. The municipal facilities are modern, including electric lights and street railways, stone and asphalt pavements, and systems of sewerage and waterworks. The colony at Plymouth, Mass., was founded by the Pilgrims, who sailed from Leyden. Population, 1906, 57,095.

**LEYDEN JAR**, an electric accumulator introduced in 1746 by Musschenbroek of Leyden, Holland. It is constructed by coating the inside and outside of a glass jar with tin foil, for about two-thirds of the height, as shown in the accompanying illustration at *b* and *c*. The inside coating is connected with a metallic rod, *a*, having a brass knob at the top. To charge the jar the knob is brought near the conductor of an electric machine, and a number of sparks are passed into the jar. The inside coating is charged positively and the outside negatively, and, if one hand be placed on the outer coating and the other on the knob, a discharge passes through the body and gives a more or less

LEYDEN JAR.

severe shock. Several jars connected with one another, having their inner and outer coatings respectively in contact, constitute a battery of Leyden. In such a battery it is possible to collect a quantity of electricity equal to the sum of the charges from each jar, which may be passed through a number of persons joined hand to hand, while by a very large battery it is possible to melt metallic wires, rupture bad conductors, and otherwise utilize its force.

**LHASSA** (hläs'sä), or **Lassa**, the capital and principal city of Tibet, on the Upper Brahmaputra River, surrounded by elevated mountain ranges. It has been held sacred by the Buddhists for many centuries, is a commercial center of considerable magnitude, and has a diversity of manufactures. It is the seat of several noted monastic establishments, to which people from Tibet and Mongolia are attracted in great numbers. Formerly it was walled and fortified, but the fortifications were destroyed

by the Chinese in 1742. The inhabitants include, beside the native Tibetans, many Chinese, Hindus, and Arabs. Population, 1908, 32,575.

**LIANA** (lî-ā'nà), or **Liane**, the name applied by French travelers to a large variety of twining and climbing plants of tropical forests, but now commonly used by travelers of all nations. Most lianas have woody, ropelike stems and climb to the tops of trees, but sometimes run very far along the ground. Some species, such as the clematis and honeysuckle, are found in colder climates. In many tropical countries, where rainfall is unusually large, the lianas grow to the tops of the highest trees, often entwining the trunks with such force as to suppress life, and in other instances bearing heavily upon the branches, even breaking down large trees by their heavy vines and foliage. In some localities a dense network is formed among the forest trees, making it almost impossible to penetrate them without cutting passages, while animals keep open narrow paths by continuous use, or pass from bough to bough along the heavier vines. Many species bear beautiful flowers, others possess medicinal properties, while some are used in the manufacture of baskets and small wooden ware. The Amazon valley of South America, the lake region of Africa, and tropical Asia present notable districts in which lianas thrive.

**LIAS** (lî'as), in geology, a formation situated at the base of the Jurassic or Oölitic deposits. It consists principally of thin beds of blue or gray limestone, becoming light brown when exposed. The Lias formations contain abundant marine fossils, among them those of fishes, reptiles, and mollusks. They are likewise rich in numerous remains of plants.

**LIBAU** (lê'bou), a fortified city of Russia, on the Baltic Sea, in the province of Courland. It has well-improved streets, a naval school, a public library, and several hospitals and gymnasia. The manufactures include furniture, flour, machinery, and clothing. It has a large domestic and export trade in petroleum, cereals, and live stock. The Knights of Livonia fortified it in 1301. It has been a possession of Russia since 1795. Population, 1906, 66,894.

**LIBBY PRISON**, a large building formerly located in Richmond, Va., used as a Confederate military prison during the Civil War. Prior to that time it served as a tobacco warehouse and was so named from the owner. The first prisoners were confined there after the first Battle of Bull Run and at times it contained 1,200 prisoners. In 1864 a tunnel about fifty feet long was excavated by the prisoners, when 109 of those confined made their escape, but

half of them were recaptured before they reached the Federal lines. The structure was taken apart and removed to Chicago in 1888 and was there opened as a museum. Later it was taken down for its material.

**LIBEL** (lî'běl), the act of making an attack in writing, printing, or by signs, upon the character or reputation of another. It differs from slander, in that the latter constitutes a similar injury by spoken words. While liberty of speech and the press is recognized in all the states, both are restricted to an extent whereby the good name and character of all are protected. If statements that are true as an entirety be published against an individual, the act of publication is justifiable. However, in some states it has been held necessary to show that the publication was made for justifiable reasons and with good motives. Several important cases for libel were brought in the United States against a number of prominent publishers of newspapers, including Joseph Pulitzer of the *New York World*, in 1909, owing to charges of irregularities on the part of President Roosevelt and others in connection with the Panama Canal.

**LIBERAL REPUBLICAN**, a party which left the regularly organized Republican party in the presidential campaign of 1872. It declared in favor of tariff reform, civil service reform, universal amnesty and suffrage, and absolute opposition to Kuklux Klan disorders. Carl Shurz and other Republicans of Missouri were the first leaders in the movement. The party united with the Democrats in supporting Horace Greeley for the Presidency. Subsequently they reunited quite generally with the Republicans.

**LIBERALS**, those who advocate progressive views in politics, and who, through agitation and legislation, seek to secure a more liberal application of the principles of democracy in government. Political parties who make liberalism the basis of action are well organized in the leading countries of Europe. The Liberal party in Great Britain is usually the minority party in England, but generally has a majority vote in Wales and Scotland. It is the lineal successor of the Whigs and had its greatest modern champion in W. E. Gladstone, who, in 1886, incorporated the purchase of land through government aid and the Irish Home Rule bill as party tenets. This led to the formation of the Liberal Union party. The Liberals were out of power until 1906, when, under the leadership of Campbell-Bannerman, they gained a great victory on the issue of free trade. The Liberals are opposed to the Conservatives. The Radicals, although a branch of the former, demand more radical and sweeping reforms.

**LIBERAL UNIONIST**, a party formed in England in 1886, under the leadership of the Marquis of Hartington, in opposition to the policy of Gladstone. It was designed by the latter that the lands in Ireland be purchased and ultimately owned by the tenants, which the Liberal Unionists opposed, and the movement likewise contended against Home Rule. The party was represented by leagues in all parts of Great Britain. It supported about 250 branch organizations, elected 94 members to Parliament, and subsequently merged into the Conservative party.

**LIBERIA** (lĭ-bĕ'rĭ-à), a republic of Africa, on the northern coast of the Gulf of Guinea, extending northeast from Cape Palmas. The southeastern boundary is formed by the Cavally River and the northwestern by the Manua River. It extends inland from the coast a distance of about 250 miles. The coast line is 400 miles long. It has an area of about 35,000 square miles. The republic was formed in 1821 by liberated slaves from America, who at present number about 60,000, including American descendants, and the independence of the country was recognized by the United States and other governments in 1847. The government is under a constitution modeled after that of the United States. Under it the executive authority is vested in a president, who is elected for two years. He has the assistance of a cabinet, including the departments of state, justice, interior, finance, war, marine, and ports.

The legislative power is vested in a congress of two branches, the senate and the house of representatives. The former consists of eight senators, who are elected for four years, and the house of representatives is constituted of fourteen members, these being elected for two years. No standing army is maintained, but all able-bodied male citizens are members of the militia and are liable to be called upon when necessary. The government maintains a number of small gunboats. Slavery is prohibited, religious worship is entirely free, internal improvements are encouraged, and a system of elementary schools are supported by taxation. Many of the natives have little advancement in educational arts, but in the main the republic has not been a disappointment. Its influence has been extending locally. In 1899 there was some discussion of a protectorate by the United States, Germany, and Great Britain, under which it was hoped to increase native obedience to law, and intercept the encroachment of the French upon its territory. However, the republic is still entirely free from European claimants.

The coast regions of Liberia form an undulating plain, but through the interior are mountain ranges, with considerable elevations in the northern part. It is drained by numerous streams, possesses fertility of soil, and has some valuable mineral deposits, though mining has not been developed extensively. The principal exports include sugar, coffee, palm kernels and oil, cocoa, ivory, rubber, and hides. Hardware, earthenware, cotton goods, machinery, and utensils are imported. The import trade is chiefly with Germany, but there are growing commercial relations with the United States, Great Britain, Holland, and France. Monrovia is the capital and principal seaport. Other cities are Buchanan, Edina, Harper, and Robertsport. Population, 1908, 1,840,500.

**LIBERTY, Statue of**, a celebrated bronze statue in the harbor of New York City, located on Bedloe's Island. It was executed by Felix Bartholdi, a French sculptor, and presented by the people of France to the United States to commemorate the 100th anniversary of its independence. It was placed in position in 1885 and was dedicated the following year. It is the highest statue in the world, being 306 feet above mean tide. The female figure, from the base to the top of the head, is 111 feet high, and to the top of the torch, 151.41 feet. The inside of the head, in which forty persons can stand, is reached by a stairway within the statue, and a branch staircase extends for some distance up the right arm. An electric light is in the torch. The statue is known as Liberty Enlightening the World.

**LIBERTY BELL**, a famous bell of the United States. It formerly hung in Independence Hall, Philadelphia, Pa., and rang as the news of the signing of the Declaration of Independence was made known on July 4, 1776. It was brought from England in 1752, but was twice recast in 1753 because of becoming cracked. In 1835, while being tolled in memory of Chief Justice Marshall, it was again cracked. It has been exhibited at several expositions, but is kept at Independence Hall, Philadelphia. The bell has the inscription, "Proclaim liberty throughout all the land, unto all the inhabitants thereof" (Lev. xxv., 10).

**LIBERTY PARTY**, a political organization of the United States, formed in 1839 to oppose slavery. Though it did not attain a large membership, it effected much in the way of forming public opinion. Among its members were such eminent men as Salmon P. Chase, Louis Tappan, and Samuel Lewis. James G. Birney was its candidate for President in 1840, receiving 7,059 votes. He was likewise its presidential candi-

date in 1844, when he received 62,300 votes. John P. Hale was nominated for President in 1848, but he withdrew when Martin Van Buren was nominated for the same office by the Free Soil party, which ultimately absorbed the Liberty party.

**LIBRA** (lĭ'brà). See **Zodiac**.

**LIBRARY** (lĭ'brâ-rÿ), a term used to designate a collection of books and pamphlets kept for reading and consultation, and to describe a building containing such a collection. The different classes of libraries include such collections of individuals, municipalities, public and parochial schools, higher institutions of learning, and those of states and nations. In treating this subject particular attention is directed by most writers to the larger public libraries, but it is certain that private libraries are by far the most numerous and as a whole constitute collections of books and manuscripts representing a comparatively large value. However, statistics relating to private collections are not generally available and many of such libraries, either in whole or in part, are merged from time to time with public collections.

**HISTORY.** The earliest public library of which we have any knowledge was founded by the Assyrians in the 8th century B. C., but it is known that libraries were maintained in Babylon, Egypt, and other ancient countries at a very early date. According to Strabo, the first private library was that of Aristotle, in the year 334 B. C., but public libraries existed from times much earlier. A public library was founded at Athens about 540 B. C. by Pisistratus. The celebrated Alexandrian library, established about 298 B. C. by Ptolemy I., was greatly damaged in the Egyptian campaign of Caesar, in 47 B. C., and was finally destroyed in 640 A. D. by Caliph Omar. The libraries established under the ancient civilizations, though voluminous, differed largely from those of the present in that printing had not been invented. At that time writings of the different classes were preserved by inscriptions on skins, papyrus, and stone. In Persia, at the time of its greatest prosperity, vast libraries were established. The Hebrews likewise exercised much care in the collection of books in secure archives.

The King of Pergamus, Eumenes II., established a library of 200,000 volumes, which passed to the care of Eumenes III., and later this collection came into the possession of Mark Antony, who transported it to Alexandria as a present to Cleopatra. Julius Caesar was particularly anxious to build up a vast public library containing all the more valuable works of Greek and Latin writers, but his early death left the

project to be carried out by Octavianus Caesar. The two libraries established by the latter were the Palatine and the Octavian, the former existing up to the time of Pope Gregory I., but these and other libraries suffered extensively by the invasion of the Huns, Goths, Vandals, and other semibarbaric tribes, much of their contents being mutilated or destroyed in the conflicts of war. Constantine collected a vast number of books devoted to Christianity that had been preserved notwithstanding the spirit of unrest during the period of persecution under Diocletian. This library, being enlarged at different times, included fully 120,000 volumes, but in the 8th century a large part of it was destroyed. However, many valuable books and other writings of the ancient libraries have been preserved. It is in this way that former civilizations contribute to the extension of knowledge and culture, since all succeeding generations draw upon the experiences and writings of scholars who labored in the past. The civilized countries of all the grand divisions have libraries of a greater or less number of volumes. Additions are made to these collections from time to time as the communities develop and new discoveries are made in the arts and sciences.

**FRENCH.** The Bibliothèque Nationale at Paris, France, is at present the largest library in the world. It was instituted in the reign of King John and since then has been enlarged from time to time. Although an exact count has not been made since 1791, the number of books is placed at 3,500,000 volumes. It likewise has many manuscripts and pamphlets. France is noted for its numerous libraries, both public and private. The public libraries belong largely to learned societies, educational institutions, and the state. Libraries of more or less value are attached to all the public schools, being maintained by public taxation. Paris has a number of other libraries, aside from the great national library, such as the Arsenal, the Mazarin, and the Library of Sainte Geneviève. Other noteworthy collections are located in Rouen, Lyons, and Bordeaux.

**GERMAN.** German-speaking countries, including Germany, Switzerland, the Netherlands, and large parts of Austria, Belgium, and Russia, are noted for their many large libraries, in which respect they stand first among European countries. The want of political unity of various cities and provinces has made this condition possible. In Germany proper are several thousand excellent libraries, all of which are open to the public for study and research. The most important of these include the national library at Berlin with 1,000,000 volumes; Breslau, 400,000;

Darmstadt, 400,000; Dresden, 400,000; Heidelberg, 350,000; Leipzig, 750,000; Munich, 1,200,000; Strassburg, 525,000; Stuttgart, 450,000; Tübingen, 250,000; and Würzburg, 300,000. Those of Austria are not so numerous, but likewise represent a vast value, the largest being in Vienna, where the national library has 500,000 volumes. The most noted library of Switzerland is the one at Basel, having 150,000 volumes; in Belgium, the Brussels library has 375,000 volumes; in Holland, the library of The Hague has 225,000 volumes.

**BRITISH.** The libraries of Great Britain include those of the United Kingdom and the colonies. Attention was first given to the collection of vast libraries in England in the 17th century, since which time they have steadily increased in size and value. The most extensive library of Great Britain is the one in connection with the British Museum, which contains 1,500,000 volumes of books, 50,000 manuscripts, and 45,000 charters. Other noted libraries include the one at Cambridge University with 225,000 volumes; Edinburgh, 275,000 volumes; Bodleian Library, Oxford, 500,000 volumes; Glasgow, 130,000 volumes; Trinity College, Dublin, 200,000 volumes; and Birmingham, 115,000 volumes. At present the most extensive libraries in British colonies are in Australia and Canada, but there are many fine collections in India. The largest of Australia is at Melbourne, containing 125,500 volumes, and of Canada is at Ottawa, having 220,500 volumes.

**OTHER COUNTRIES.** The libraries of Italy are especially valuable in that they contain many rare manuscripts of antiquity and products of Italian masters. Among the extensive collections are the Florence library with 425,000 volumes; the Vatican library at Rome, 250,000 volumes; Padua, 160,000 volumes; and Venice, 275,000 volumes. The largest library of Denmark is at Copenhagen, having 500,000 volumes; the largest of Sweden, at Stockholm, with 275,000 volumes; the largest of Spain, at Madrid, with 425,000 volumes; the largest of Russia, at Saint Petersburg, with 1,200,000 volumes; the largest of Greece, at Athens, with 155,000 volumes; the largest of China, at Shanghai, with 15,000 volumes; and the largest of Japan, at Tokio, with 75,000 volumes.

**UNITED STATES.** The library movement began in the United States at an early period by gifts of philanthropists and government aid, but its most potent impetus was not reached until the middle of the last century, since which time rapid strides have been made. Besides many private libraries of much value, there are fully 4,500 public libraries that contain 1,000 volumes

and upward, and these now aggregate 40,000,000 volumes. The congressional library building at Washington is the finest structure of the kind in the world. It contains ample accommodation for 4,500,000 volumes, but at present it has 900,000 books and about 250,000 pamphlets and manuscripts. Other great libraries include the large library of San Francisco, which has 215,000 volumes; Yale College, 200,000; Chicago public library, 310,000; University of Chicago, 400,000; Annapolis, 125,000; Peabody Institute, 120,000; Boston Athenaeum, 190,000; Harvard University, 590,000; public library, Boston, 750,000; Detroit public library, 115,000; Albany State library, 165,000; Brooklyn, 120,000; Astor library, 300,000; Columbia College, 260,000; New York Mercantile, 250,000; Cincinnati public library, 250,000; Philadelphia Library Company, 180,000; Philadelphia mercantile library, 175,000; University of Pennsylvania, 140,000; and Saint Louis library, 120,000. School libraries are supported by taxation in many of the states, a system under which library privileges have been carried not only to the smaller towns, but likewise to many rural districts. Solomon's adage, that "Of making many books there is no end," is emphasized with remarkable accuracy at the present time.

**LIBRARY OF CONGRESS,** the national library of the United States, an institution at Washington, D. C., established in 1800. It contains the largest collection of printed books and pamphlets in the Western Hemisphere, about 1,450,000 copies, besides 99,800 manuscripts, 64,980 maps, and 348,650 pieces of music. The building has a floor space of nearly 8 acres. The book racks have about 45 miles of shelving and the accommodations are sufficient to house about 4,500,000 volumes of books. It is located on a site of 10 acres, about 1,250 feet east of the capitol, and was completed in 1897 at a cost of \$6,347,000, exclusive of the land, which cost \$585,000.

The number of employees at the library is 450, of whom 68 are in the copyright department, 127 attend the disbursement and grounds, and 255 are engaged in the library proper. Admission to the building is free and the doors are open from 9 A. M. to 10 P. M. week days, except legal holidays, and from 2 P. M. to 10 P. M. on Sundays. The library is maintained by annual appropriations by Congress for various purposes, including the purchase of books.

**LICENSE** (lī'sens), in law, a document conferring a permission to do some act which would otherwise be unlawful. The object of issuing licenses is two-fold; that is, to raise revenue and to regulate the prosecution of certain trades.

and professions. The manufacture and sale of tobacco and intoxicating liquors are usually regulated by the issuance of a license, and this is true likewise of peddling and the management of theaters and other places of amusement. The Prohibition party, a political organization of the United States, is opposed to the issuance of licenses which authorize the sale of alcoholic beverages. Those who advocate a *low license* seek to raise revenue without the view of regulating the traffic, while those favoring a *high license* aim to obtain revenue as well as regulation of the liquor traffic. A license is required in many special cases, such as those necessary before marriages may be solemnized, but they are issued so as to maintain a record and prevent the marriage of persons who are not legally qualified to enter into such a contract, and the element of revenue is eliminated.

**LICHEN** (lĭ'kĕn), an order of flowerless or cryptogamous plants. All plants are classified as belonging to the *flowering* or the *flowerless* division, lichens being included with the latter. They are found native in all zones up to the

ICELAND MOSS.

REINDEER MOSS.

snow line. These plants are composed of loose cellular tissue, a slender white-celled portion now conceded to be a parasitic fungus, and a number of globular greenish or bluish cells upon which the fungus cells prey. They contain neither stems nor leaves, but form gray, brown, or yellowish crustlike patches on trees, fence rails, rocks, and the ground, but derive their nourishment entirely from the air. In the most northern portions of the Arctic regions to which any form of vegetation exists, they constitute important means for sustaining animal life, especially the reindeer. *Iceland moss*, a kind of lichen found in the Arctic region of both hemispheres, yields dyes and contains medical properties. Some species furnish a nutritious jelly and other forms of food.

**LICHTENBERG** (lĭk'tĕn-bĕrk), a city of Germany, in the province of Brandenburg, within the limits of Berlin, the national capital. It is practically a part of Berlin, being popular as a residential center, but has had a separate city government since 1907. The place has extensive communication by steam and electric railways. Many of the streets are paved with stone and asphalt, but the larger number are macadamized. The chief buildings include the city hall, the central railway station, an insane asylum, and many churches. It has a large trade and manufactures of clothing, chemicals, and machinery. A large majority of the inhabitants are Protestants. Population, 1905, 55,391.

**LICK OBSERVATORY**, an institution of the University of California, built with a fund given by James Lick. It is situated 25 miles east of San José, Cal., on one of the summits of Mount Hamilton, and contains an object glass of 36 inches in aperture. In making the gift it was provided that the instrument "should be superior to and more powerful than any telescope ever made." It is now surpassed in size only by the telescope at the Yerkes Observatory, near Chicago, in which the objective lens has an aperture of 40 inches. The remains of Lick were placed in the vault at the base of the 30-foot pier that supports the great telescope.

**LICORICE** (lĭk'ō-rĭs), or **Liquorice**, a class of leguminous plants found in Europe, Asia, and Africa. They are cultivated for the juices found in the roots, which serve in preparing a medicine of value in the treatment of throat and catarrhal diseases. The plants include several species, attain a height of about four feet, bear violet-colored flowers, and have roots growing about three feet into the ground. Their leaves are alternate and pinnate, and the plants have few branches. The juices are pressed from pulp prepared by crushing the roots of plants having at least three years' growth, the liquid portions are evaporated by heating, and the solid parts are made into sticks, such as are commonly purchased in the market. They are packed for shipment with bay leaves. The medicinal qualities arise from the property of the licorice in aiding expectoration and its healing influence upon the irritated portions of the mucous membrane. Licorice in a pure state has decided medical virtues, but there are many adulterations. The only species of licorice found in America is a plant known as *Glycyrrhiza lepidota*, which thrives in portions of the Mississippi valley, especially in Missouri.

**LICTOR** (lĭk'tŏr), in Rome, a public officer appointed to attend upon the chief magistrates. The ancient kings were always preceded by

twelve lictors, who bore the *fasces*, or a bundle of rods with an ax. The rank of the magistrates determined the number of lictors. A praetor had two; a propraetor, six; a consul, twelve; and a dictator, twenty-four. The lictors inflicted punishment on condemned Roman citizens.

**LIECHTENSTEIN** (lēk'ten-stīn), an independent principality in Europe, which formed a part of the German Confederation until 1866. It is bounded on the northeast and east by the Austrian possession of Vorarlberg, south by the Swiss canton of Grisons, and west by the Rhine River, by which it is separated from the canton of Saint Gall. The area is 65 square miles. Vaduz, or Liechtenstein, is the capital and chief town. The surface is quite mountainous, but generally fertile, and considerable interest is taken in agriculture, fruit growing, stock raising, and mining. The language is German. Several fine schools and institutions of higher learning are maintained. The Prince of Liechtenstein, who has his chief residence in Vienna, is at the head of the government. He is assisted by a diet of fifteen members, three of whom are appointed by the prince and the remainder are elected by the people. It has no standing army and is joined to the customs union of Austria. The Prince of Liechtenstein belongs to the Este family, an old family of Europe, which was raised to sovereign rank in the 17th century. A large majority of the inhabitants are Roman Catholics. Population, 1906, 10,875.

**LIEGE** (lē-āzh'), a city of Belgium, capital of the province of Liège, at the confluence of the Meuse and Ourthe rivers. It is surrounded by a rich agricultural and mining country. Many railroads and electric railways center here, giving the city a fine outlet for its large trade. Coal and zinc are mined in the vicinity. The manufactures include machinery, cotton and woolen goods, clothing, locomotives, steam machinery, steamboats, ironware, and furniture. Among the important buildings are the Church of Saint James, the Cathedral of Saint Paul, the municipal theater, the railway station, the Palais de Justice, and the University of Liège. The last named institution has 1,200 students and a library of 200,000 volumes. Other institutions include the museum, the zoölogical and botanical gardens, and many schools and hospitals. The city has modern municipal facilities, including waterworks, sewerage, and electric railways, but contains a number of narrow streets and illy ventilated sections. In 1691 it was conquered by the French. It had a varied existence during the succeeding centuries, and

in 1831 became a part of the kingdom of Belgium. Population, 1906, 172,039.

**LIEGNITZ** (lēg'nīts), a city of Germany, in the province of Silesia, 145 miles southeast of Berlin. It is noted as a commercial and railroad center. The noteworthy buildings include the townhall, the gymnasium, and the Church of Saint John. Among the manufactures are cotton, woolen, and linen goods, musical instruments, hardware, saddlery, and machinery. Liegnitz was the scene of a great battle in 1813, in which the French were defeated by Blücher. This engagement is sometimes called the Battle of the Katzbach. Population, 1905, 59,706.

**LIFEBOAT**, a boat constructed for special use at sea in times of shipwreck and storms. Lifeboats, to be of the highest utility, must possess extra buoyancy and have means for the self-discharge of water. They must be self-righting, possess speed, have storage room, and be strong of build. In 1785 the first lifeboat was patented by Lukin in Great Britain, but it did not prove of sufficient utility, on account of which a prize was offered for the best model of a new structure. In the contest that followed, in 1789, the premium was awarded to Henry Greathead. However, his invention did not possess the property of righting itself and discharging water, hence it proved unsatisfactory, especially in an accident on the Tyne, in 1849, when a number of persons lost their lives by endeavoring to use this lifeboat in saving persons from drowning. Accordingly, the Duke of Northumberland offered a prize to the person who would supply the best model of a lifeboat. In the competition that followed James Beeching was awarded the premium. However, similar boats were constructed in various countries, combining all the necessary elements of a first-class lifeboat, and the credit cannot be claimed by any one country or individual.

**LIFE BUOY.** See **Buoys**.

**LIFE INSURANCE.** See **Insurance**.

**LIFE-SAVING APPARATUS**, the devices designed for the purpose of saving lives in case of shipwreck. Many classes of life-preservers have been introduced at various times, all of which have served a more or less valuable purpose. Those of modern manufacture are of especial value in that they take advantage of many methods demonstrated by experience to be of practical value. Among the different kinds may be mentioned the devices made of India rubber and inflated with air. These are constructed in several compartments with a view of insuring safety if a rupture should occur in one or more of the parts. Lifeboats have been efficient life-preservers, especially since a form of ballasting

has been devised by which they right themselves, if they are upset in the water. Mattresses stuffed with cork, jackets of inflated rubber and cork, life buoys, trousers and suits with cork, looped life lines, and many other devices are among the preservers now in use. All ships are provided with a supply of these for the safety of passengers and the crew.

**LIFE-SAVING SERVICE**, a public system maintained for the purpose of giving succor and assistance to seafarers, when they are subject to danger or shipwreck upon the sea and inland waters. All civilized nations have made provisions whereby the danger of loss of life at sea may be greatly lessened or entirely overcome within certain distances from the land. The life-saving service of the United States is among the most efficient in the world, although it was not established in its present form until 1871. It is under the control of the Treasury Department and a general superintendent, who has several assistants. About 10,000 miles of seacoast have been divided into districts. Besides the life-saving service concerned with the sea, there is a service corps which has charge of the inland waters. In the first thirty years of the operations of this department 16,112 lives were saved by the coast and inland services.

The coast service of both Canada and the United States is divided into a number of districts, each of which has one or more stations. These stations are supplied with life-saving boats and various forms of life-preservers. Experienced surfmen are constantly employed, who patrol a certain beat every night and during foggy days for the purpose of watching for vessels in danger and distress. The house provided for surfmen has a station outlook at the top, from which constant observations are made, and at night lights are displayed. Flare lights are used to indicate that those in danger have been observed. Lifeboats are sent to the points of danger, when a shipwreck occurs, carrying various life-preservers, and in many instances life lines are thrown to the stranded vessel by rocket or mortar. In this way persons in danger may be safely towed to shore, or prevented from sinking until they can be rescued. At each station is an adequate supply of provision and restoratives, by which to minister to the wants of those in need, or restore to consciousness and activity in cases of apparent drowning. Lighthouses located at various shoals and breakers are maintained to guard against dangers and overcome losses at sea.

**LIGAMENT** (lĭg'ă-ment), in anatomy, the short bands of strong, white, glistening fibers by which the bones are connected at the joints.

They serve to strengthen the attachments and keep in place various organs. Capsular ligaments surround all the joints, but the structures holding the tendons of the ankle and wrist are called annular ligaments. Distinct names are applied to the many different ligaments in the human body, whereby it is made possible for anatomists to locate and describe them with facility.

**LIGHT**, the form of radiant energy that acts on the retina of the eye and renders visible the objects from which it comes. It has a heating and chemical action of prime importance to plant and animal life, and neither can exist without its influence. The importance of light upon vegetation is seen by the fact that plants growing in places from which light is partially excluded are abnormal and of little vigor. Animals likewise lose much of their vitality and energy when wanting its influence. It has been shown successfully that sunlight is an important factor in the sanitary regulation of cities. It materially affects the growth of children and the recovery of patients in hospitals, darkness causing failure and even death. The sun is the most important of the self-luminous bodies. Other objects giving out light include fixed stars, certain meteors, nebulae, and bodies in a state of phosphorescence or incandescence, though nearly all of the earth's light comes from the sun.

**THEORY.** The undulatory theory of light is now generally accepted. According to it, radiant energy is propagated in waves that vary in length, and only those that affect the eye are known as light, the others being regarded as chemical rays or dark heat. Light and energy are transferred from one place to another by means of these waves, and pass with rapidity through the luminiferous ether that fills all space. The velocity of light, according to Foucault, Cornu, and Bradley, is 186,427 miles a second, but the rapidity depends somewhat on the medium through which it passes. To affect the eye and produce the sensation of light, the waves must have a frequency between 392,000,000,000,000 and 757,000,000,000,000 per second, and, since the frequency of the ether waves is so great, their wave lengths must be correspondingly small. Ether waves produce three classes of effects on ordinary matter, called heating effects, luminous effects, and affinic effects. To produce these the waves must be correspondingly rapid, and the molecules of the body must move to and fro with a sufficient frequency, otherwise none of the effects will be manifest. Different bodies are variously affected by rays of light.

**PROPERTIES.** The three most important classes of bodies are called transparent, translucent, and opaque. A *transparent body* is one through which the light passes in such a manner that the outlines of other bodies can be seen through it, as clear glass and water. A *translucent body* permits light to pass through in such a manner that we cannot see through it the outlines of other bodies, such as oiled paper and ground glass. An *opaque body* does not allow any light to pass through it, as wood and iron. A single line of light taken in the direction in which it is moving is called a *ray*, a number of parallel rays constitute a *beam*, and a number of converging or diverging rays form a *pencil*. A pencil is said to be converging, when the rays all move toward the same point, and diverging, when all are moving from the same point. Bodies are not visible unless they throw off light in all directions; therefore, both luminous and illumined bodies are visible. A body that regularly reflects light cannot be seen, as a clear glass placed in a doorway, which may be mistaken for an open doorway. Light, like sound, moves in straight lines, and varies inversely proportional to the square of the distance from the point. This may be demonstrated by placing an object near a light, where it receives the effects more intensely than when removed several times the distance from the luminous object.

**REFLECTION.** Light is said to be reflected when a portion of the quantity falling on the surface of a body is thrown off from it. The two recognized laws of reflection are: the angle of reflection is equal to the angle of incidence; and the incident ray, the perpendicular at the point of incident, and the reflected ray, all lie in the same plane. Ordinarily the amount of light reflected depends upon the kind of material forming the surface, on the degree of polish of the surface, and on the angle at which the light strikes the surface. Glass and highly polished metals are excellent reflectors of light, though considerable light is lost even from the surface of the best reflectors. Transparent substances reflect the greater amount of light the more obliquely it falls upon their surfaces, as is the case with glass and water, and when the light falls on such surfaces at nearly right angles most of its quantity passes into or through the body. This is demonstrated clearly by the sun shining at noon on a water surface, when we may look at its image without being dazzled, but shortly before sunset the image becomes quite dazzling and too powerful to be looked at steadily. The reverse is true of opaque bodies, since they reflect the greatest

amount of light when it falls the most directly on the surface.

**REFRACTION.** When light falls on a water surface, a part of the light is reflected and part of it enters the water. It moves onward in

FIGURE 1.

straight lines, both in the air and in the water, as shown in Figure 1, but the direction of the light in the water is not the same as in the air, the light being bent or refracted as it enters the water. Refraction of light always occurs when it passes obliquely from one medium to another of different density, but when it falls perpendicularly on the surface it is not refracted. Refraction may be illustrated by the double-convex lens, as shown in Figure 2. The eye at F sees the candle PQ, not at its actual place

FIGURE 2.

or in its real size, but the image at P'Q' is larger and more distant, owing to the bending of the rays. The accepted rules of refraction are: first, the incident ray, perpendicular at the point of incidence, and the refracted ray all lie in the same plane; second, between the same two mediums the value of the index of refraction remains constant, whatever may be the angle of incidence; third, the light is bent or refracted toward the perpendicular at the incident surface, when the ray enters a denser medium, and from the perpendicular, when it

enters a rarer medium. *Optics* is the science that embraces the application of mathematics to the laws of reflection and refraction. It treats of the formation of images by mirrors and lenses, the eye, cameras, telescopes, microscopes, and other optical instruments.

**HISTORY.** It was well known to the ancients that light is propagated in straight lines. They discovered the laws of reflection, a fact attested by an ancient fable, according to which Archimedes set fire to the Roman ships of Syracuse by means of concave mirrors. Kepler discovered the law of the intensity of light. The telescope was invented by the Dutch about 1608, Jensen, Lippersheim, and Metius each claiming the honor, but it is reasonably certain that Galileo perfected it by making a number of improvements. The law of refraction was discovered by Snell in 1621, and by its aid Descartes explained the rainbow. A half century later Newton accidentally discovered the decomposition of light by a sunbeam coming through an opening in the window shutter and, instead of noticing a light spot, he saw the seven colors—violet, indigo, blue, green, yellow, orange, and red. This discovery led to the invention of the spectroscope, an instrument by which rays of light may be decomposed and analyzed, and the body from which the light is emitted may be classified as to its constituents. That the seven principal colors of the solar spectrum produce the white color of light was first demonstrated in the 19th century by painting them on a top and whirling it rapidly, when it was shown that they unite and make a white appearance.

That the different colors of objects depend on the kind of light they reflect is another comparatively recent discovery. Thus, a body reflecting only yellow rays when touched by a beam of light is said to be yellow; when it reflects the green rays, it is said to be green; and, when it reflects none of them, it is called black. Newton was the first to publish an extensive treatise on the decomposition of light. Étienne Louis Malus (1775-1812), in 1808, discovered the elementary phenomena of the polarization of light, by which it was found that a single ray of light may be divided into two rays, and, when so divided, they possess properties not common to ordinary rays of light. In 1896 Roentgen announced the discovery of the X-ray, by which it became possible to pass rays through substances opaque to ordinary light, and to make photographic views of objects in the interior, such as the bones within the living body.

**LIGHTHOUSE**, an elevated structure or tower placed near a seaport or some headland

for the purpose of protecting vessels at night by warning navigators of danger. In some instances such a structure is maintained as a general landmark. The first building of this character of which there is authentic record was erected at Alexandria, Egypt, about 300 B. C., and is reputed to have been elevated 550 feet above the sea. It was built by Ptolemy Philadelphus on a small island named Pharos, and this name was used subsequently to designate various structures of a like character. The most celebrated lighthouse of the present time is situated near the mouth of the Garonne, in France. It has a height of 198 feet and is noted for its excellent architecture. This structure was completed in 1610, but in 1727 many alterations and improvements were made. The

Arrangement of fixed and revolving lights.

Arrangement of an alternating light.

first lighthouses were lighted with fires, but those of modern construction are lighted with oil, gas, or electricity, the power of the light being increased by the employment of glass reflectors, lenses, and prisms.

All modern maritime nations have a system of lighthouses on their coasts, and many maintain a similar system to aid in the navigation of interior waters. In Canada this department of the government is under the direction of the Lighthouse Board. The Congress of the United States passed the first act for the establishment of such a system in 1789. In 1852 it authorized

a lighthouse board, with the Secretary of the Treasury as ex-officio president. Under this act the coasts of the Atlantic, the Pacific, the Gulf of Mexico, and the Great Lakes were divided into lighthouse districts, each of which was placed under the supervision of an officer of the army or navy as inspector, and the general superintendents became subject to presidential appointment. In 1874 a lighthouse district which includes the Ohio, Missouri, and Mississippi rivers was added, and since then provisions have been made for maintaining lighthouses or signals in the Hawaiian Islands, Guam, and other regions under the jurisdiction of the United States.

Elevated coast points served as convenient situations for early lighthouses, but, since a lighthouse some distance from the shore is more effective, engineers began to plan the construction of the larger lighthouses some distance off the coast. To make them proof against waves and tides, as well as the storms frequent at sea, they must necessarily be built on solid rock, of which the Eddystone Lighthouse (q. v.) is a notable example. Besides, the elevation above sea level is a material factor, since the mariner's eye is able to see the more elevated at greater distances, while the character of the light is likewise material. The principal classes of lights comprise the catoptric, dioptric, revolving, intermittent, and alternate. A *catoptric light* is one in which reflectors are formed into a parabolic curve. The *dioptric light* has a central lamp and the rays are transmitted by bending or diverging them through a combination of lenses. A *revolving light* alternately increases and decreases gradually at equal intervals. An *intermittent light* appears and disappears suddenly, but remains visible when at its brightest stage for some seconds. The *alternating light* throws out different colors, such as red and white, at equal intervals. In most countries, as in Canada and the United States, the lighthouse service includes electric and gas buoys, fog signals, whistling buoys, unlighted beacons, post lights, light-ships, etc. The lights used are classified according to the different candle power.

**LIGHTNING**, the dazzling light emitted by a discharge of electricity, when passing from one cloud to another, or from a cloud to the earth. Atmospheric electricity is essentially the same as that produced artificially. It is caused by friction due to dry air coming in contact with moist air, by evaporation, and various other causes. More or less electricity is always present in the air. It is largely positive electricity during a clear sky, but takes on the nega-

tive form in cloudy weather. The discharge of lightning occurs when the two—positive and negative—come in contact with each other, but when a cloud charged with electricity comes near the earth, where it is charged with the opposite kind, the electric discharge passes into the earth's crust. In the lower regions of the atmosphere electricity is white and in the upper strata it is somewhat violet, as is the spark of an electrical machine in a vacuum.

Five general kinds of lightning may be mentioned, those known as zigzag, heat, sheet, globular, and volcanic lightning. *Zigzag lightning* appears in irregular lines, often forked at the end. This form is thought to be due to the electric current darting among the particles suspended in the air, as those of dust and moisture, to places where the air is less dense. *Heat lightning* is not accompanied by thunder. It occurs during hot weather, near the horizon, and is thought to be due to the reflection of lightning below the storm. *Sheet lightning* is generally accompanied by thunder, appearing as an expanded flash, and by it the clouds are illumined. *Globular lightning* is of rare occurrence. It appears in the form of a globe of light, remaining stationary or moving slowly through the air, but its origin is not known definitely. *Thunder* is due to the circumstance that lightning vaporizes the raindrops and enormously expands the air, thereby producing a partial vacuum. When the surrounding air rushes violently into the vacuum, the familiar loud report is produced. Since light has a velocity of about 186,000 miles per second and sound travels through a medium with an ordinary temperature at about 1,120 feet per second, it is easy to understand why a flash of lightning is seen some time before the sound of thunder is perceived. It requires about five seconds for a thunder clap to be heard a distance of one mile. The danger is slight at a mile distant from the place of lightning, though a severe shock is sometimes perceived even at a greater distance.

**LIGHTNING ROD**, a medium designed to protect buildings against destruction or damage by lightning. The effect of a high-class lightning rod is to conduct electric movements from the ground to the sky, thereby neutralizing the contrary electricity of passing clouds, thus diminishing their liability to flash lightning. However, if the rod is not potent enough to do this and is itself struck by lightning, it conducts the electricity to the ground. Lightning rods have a top of gilded copper or platinum at a height of from six to ten feet above the roof, thence pass in the form of a wire or iron bar to the ground, terminating from twelve to

twenty feet below the surface. The lower end should extend into moist soil or be connected by an artificial conductor, else it is not effective in dispelling the danger. An area on the roof having a radius of twice the height of a lightning rod is protected. For this reason there should be a number of points on a building, all being connected with the main rod, and the latter should be protected by inclosures of glass, or some other nonconductor, to prevent a distribution of the current.

**LIGNITE** (lig'nīt), or **Brown Coal**, a compact, partially carbonized vegetable matter. It is an imperfect fuel immediately between peat and true coal. Lignite often retains its fibrous structure. It abounds in cretaceous and tertiary strata. The most extensive deposits of North America are found in the western part of the Great Plains, extending from the Gulf of Mexico to the central part of Canada. A good class of lignite consists of 33 parts of fixed carbon, 45 parts of volatile carbon, 12 parts of ash, and 10 parts of moisture.

**LIGURIA** (lē-gōō'rī-ä), an ancient country of Europe, now included in the northern part of Italy. It was bounded on the north by the Po, east by the Macra River, south by the Gulf of Genoa, and west by the Varus River and the Maritime Alps. Besides including the province of Genoa and the territory of Nice, it embraced a part of the region traversed by the Alps and the Apennines. The inhabitants, known as the Ligurians, were a warlike and enterprising people. In 125 B. C. they were subjugated by the Romans. Later Liguria formed the nucleus of the province of Gaul.

**LILAC** (lī'lak), a shrub of the olive family, cultivated extensively on account of its fragrant flowers and ornamental foliage. The species are numerous, most of which are native to the southern part of Europe and the western part of Asia, but they are now grown extensively in gardens, for hedges, and in parks. The flowers are variegated in color, being mostly different shades of lilac, but the white species are numerous. Among the favorite species grown for their flowers are the Persian, Charles X., and common lilacs. They have opposite leaves and flower early in spring. The common lilac, if carefully cultivated, grows to a height of twenty feet. It sends out numerous suckers.

**LILLE** (lēl), or **Lisle**, a city of France, in the department of Nord, on the Deule River, seven miles from the frontier of Belgium. It is connected with Paris, which is 155 miles from Lille, by railways. The place is strongly fortified. It has many beautiful streets and modern municipal facilities, including electric lights,

pavements, waterworks, sewerage, and electric street railways. Among the noteworthy buildings are the Church of Saint Catharine, the Church of the Notre Dame, the Bourse, the public library, two universities, the Pasteur Institute, the lyceum, the Palais des Beaux-Arts,

CHARLES X. LILAC.

and many schools and hospitals. The manufactures include woolen, cotton, and silk goods, thread, sugar, spirituous liquors, porcelain, oil, and machinery. It has a large trade in merchandise and produce. Julius Caesar built a castle on the site of Lille, but its history properly dates from 1007, when it was fortified by Baldwin, Count of Flanders. Within recent years the city has added materially to its wealth and commercial importance. Population, 1906, 205,602.

**LILY**, an ornamental plant of the genus *Lilium*, characterized by an erect stem from a scaly bulb, numerous narrow sessile leaves, and one or more large and erect or nodding flowers. About fifty species are native to the North Temperate Zone, of which five are common to the eastern part of North America. The white lily is native to the Levant, but has been cultivated extensively in Europe for more than three

centuries. It has been grown in America from its early settlement. Some of the native species of America are very beautiful, among them the golden-banded lily, wild orange-red lily, southern red lily, Turk's-cap lily, and Carolina lily. Those cultivated most extensively are the white lily, tiger lily, and golden lily. The Turk's-cap is found in marshes and attains a height of from five to eight feet, bearing orange-colored flowers with black spots. A white lily symbolizes purity and has been used in paint-

GOLDEN-BANDED LILY.

Plant and Bulb.

ing in connection with the Virgin Mary. It is mentioned frequently by poets and in oratory. Lilies are cultivated from the seed, by planting the bulblets, and by layers. The process of growing from the seed is slow.

**LILY OF THE VALLEY**, a genus of plants of the family *liliaceae*, native to the bushy places of America, Europe, and Asia. It has oblong leaves. The cup-shaped flowers are well known for their agreeable odor. Several species have medical properties of utility in cases of heart disease. The lily of the valley is a perennial and has slender rootstocks. The flowers are in a one-sided raceme. It blooms in May.

**LIMA** (lī'mà), a city in Ohio, county seat of

Allen County, on the Ottawa River, 71 miles southwest of Toledo. It is on the Pennsylvania, the Erie, the Cincinnati, Hamilton and Dayton, and other railroads, and is surrounded by a productive fruit-growing and farming country. Coal and petroleum are produced in the vicinity. It has a fine courthouse, a public library, Lima College, and many schools and churches. The manufactures embrace machinery, carriages, egg cases, oil products, clothing, furniture, locomotives, and utensils. Many of the streets are well paved with brick and asphalt. Other facilities include electric street railways, waterworks, sewerage, and several parks. It has a large local and jobbing trade. Population, 1910, 30,508.

**LIMA** (lē'mà), a city and the capital of Peru, on the Rimac River, connected with its port, Callao, and other centers by railways. The city is one of the most beautiful in South America, having a splendid cathedral, government buildings, public schools, and a university. Many modern municipal facilities have come into popular use, including electric lights, sewerage, waterworks, and rapid transit. The manufactures include cotton, silk, and woolen goods, clothing, soap, machinery, furniture, sugar, and earthenware. Its domestic and import trade is of growing importance. Pizarro founded the city in 1535. It was partially destroyed by an earthquake in 1746, and in 1881 capitulated to the Chileans. Population, 1908, 132,083.

**LIME**, a small tree of the orange family, native to the southeastern part of Asia, but naturalized in the tropical parts of America, the West Indies, and Europe. It attains to the height of about ten feet, bears a fruit resembling the lemon in appearance and character, but much smaller, and yields a bark of value in making mats and ropes. The wood is light and is used in the manufacture of baskets, boxes, and cradles. Large quantities of the fruit are grown to manufacture beverages and citric acid. The citric acid obtained from the lime is used largely as an antiscorbutic on long voyages at sea. It is produced in considerable quantities in Cuba and other West Indian islands.

**LIME**, a white earthlike calcium oxide widely diffused throughout the animal, vegetable, and mineral kingdoms. In nature it occurs in numerous forms, but is not found in a pure state. It may be produced artificially by calcining a mineral calcium carbonate, as marble, limestone, or seashells, yielding the anhydrous calcium oxide called *quicklime*, which, when moistened with water, forms *slacked lime*. Quicklime readily absorbs moisture from the air, forming *air-slacked lime*. The artificial manufacture of lime is conducted on a large scale by burning or cal-

cining different varieties of limestone in a kiln, but the product is not sufficiently pure to be utilized for chemical purposes. Pure lime is a white substance, and is obtained from pure carbonate of lime, such as Iceland spar or Carrara marble. This is effected by heating the pure carbonate, thereby expelling the carbonic acid and obtaining the lime as a residue. There are almost innumerable uses for chemical and commercial lime. The more common uses are for fertilizing, removing hair, fat, and other foreign matters in tanning, to prepare cements and mortars for building, to causticise alkaline liquors in soap making, to disinfect and destroy noxious insects and vegetable matter, and to purify coal gas. It is used for many other purposes in manufacturing. Lime is employed largely in medicine, serving as a tonic, as an antacid, and in diarrhoea and stomach complaints.

**LIME LIGHT**, an artificial light produced by directing an oxyhydrogen flame against pure quicklime by means of a blowpipe. The light produced in this way is very intense. It has been utilized as a signal light, for stage service, and in various optical instruments.

**LIMERICK** (lím'ēr-ĭk), a railroad and manufacturing city of Ireland, capital of Limerick County, on the estuary of the Shannon River, 120 miles southwest of Dublin. Among the principal buildings are the Anglican Cathedral of Saint Mary, the Roman Catholic Cathedral of Saint John, the city hall, the county courthouse and jail, and the military station. The manufactures include clothing, spirituous liquors, lace, flour, machinery, ironware, leather, and fishhooks. It is the seat of several large establishments for the manufacture of military clothing. The municipal facilities include sewerage, waterworks, electric lighting, and stone and brick pavements. It has extensive docks and wharves. The trade in cereals and live stock is important. Population, 1906, 40,045.

**LIMESTONE**, the general term applied to rock which are composed wholly or in part of calcium carbonate. The deposits answering to this description are very numerous, differing in composition and structure. They are widely distributed in all the geological systems, but occur most abundantly in the secondary rocks. In a pure state limestone contains about 43 parts of carbonic acid and 57 parts of lime, but the general intermixture of other minerals is very extensive. When containing magnesium carbonate, it is called magnesian; when clayey, argillaceous; when sandy, siliceous; and when the limestone is crystalline, it is termed marble. Among the principal varieties are compact, foliated, granular, oölitic, calcareous, peastone, and

statuary limestone. In many localities the name of the geological system in which it is found is applied to the product, such as Devonian, Silurian, etc. Iceland spar is a grade of limestone quite transparent and rich in lime.

**LIMOGES** (lê-môzh'), a railroad and manufacturing city in France, capital of the department in Haute-Vienne, on the Vienne River. The place is reached by a number of railroads and has communication by steamboats. Among the chief buildings are the Cathedral of Saint Etienne, the public library and museum, a theological seminary, and the observatory. It has sewerage, waterworks, public parks, and electric railways. The manufacture of artistic porcelain is the most important industry, but it has large manufactures of cotton and woolen goods, shoes, paper, clothing, and machinery. It is the seat of a bishop and has a large trade. Population, 1906, 88,597.

**LIMONITE** (lím'ön-ĭt), a common and important ore of iron, often called *brown hematite*. The deposits are not in continuous strata, but occur in the fissures and cavities of compact masses, or as a loose earth at and near the surface of beds of the carbonate of iron or iron pyrites. Limonite is of a brown or brownish-yellow color and, when pure or nearly so, has a submetallic lustre. Extensive deposits are found in the Appalachian region of North America and various parts of Europe, especially in England and Germany. An impure variety of limonite found in marshes is called *bog iron ore*. The limonite that gathers at the bottom of lakes and ponds from the drainage of regions that contain iron is called *lake ore*.

**LIMPET** (lím'pët), a genus of gastropod mollusks, more or less widely distributed. They are noted especially for their immense size in the tropical seas. Several well-known species occur off the Atlantic coast of America. The limpets commonly adhere firmly to rocks by means of the foot, which acts as a sucker. The shell is conical and has a more or less prominent apex, the latter turning slightly forward. The food consists of seaweed, which is rasped by the tongue. They are used for bait in fishing and for food. These animals are taken in large numbers as food by birds.

**LINCOLN** (lĭn'kūn), a city in Illinois, county seat of Logan County, 28 miles northeast of Springfield. It is on the Illinois Central, the Chicago and Alton, and other railroads, and is surrounded by a fertile agricultural country. Bituminous coal of a fine grade is mined in the vicinity. The noteworthy buildings include the county courthouse, the public library, the high school, and many churches. It is the seat of

the Odd Fellows' Orphans' Home of Illinois, the State asylum for feeble-minded children, and Lincoln University. The last named institution was founded in 1865. It has a fine library and is attended by 250 students. The manufactures include flour, cellulose, saddlery, caskets, clothing, and machinery. It was settled in 1835 and incorporated in 1854. Population, 1900, 8,962; in 1910, 10,892.

**LINCOLN**, a city and the capital of Nebraska, county seat of Lancaster County, on the Salt River, fifty miles southwest of Omaha. It is on the Union Pacific, the Chicago, Burlington and Quincy, the Chicago, Rock Island and Pacific, the Missouri Pacific, and the Chicago and Northwestern railroads. The surrounding country is fertile and devoted to agriculture, stock raising, and fruit growing. Among the manufactures are carriages, earthenware, clothing, cigars, canned goods, and machinery. The State capitol is a fine stone structure. It has a modern county courthouse and a United States government building. Other noteworthy buildings include the public library, the high school, Nebraska Military Academy, Union College, University of Nebraska, Nebraska Wesleyan University, Cotner University, Adventist and Episcopalian colleges, and several normal and musical schools. It is the seat of the State penitentiary and the State insane asylum. Electric lights and street railways, waterworks, pavements, and several fine parks are among the conveniences. It has a large local and wholesaling trade. The vicinity was first settled in 1859 and three years later the place was made the capital of the State. It was named in honor of Abraham Lincoln. Lincoln is the home of William J. Bryan. Population, 1910, 43,973.

**LINCOLN**, a city and the capital of Lincolnshire, England, on the Witham River, 130 miles north of London. It is surrounded by a rich agricultural country and is an important railroad center. The Lincoln Cathedral, one of the finest in England, is the largest building. It is 482 feet long and 80 feet wide. The tower is 300 feet high and contains the Tom of Lincoln, a famous bell cast in 1610. Other noteworthy buildings include the public library, the town-hall, the ruins of a Norman castle, and the remains of the palace of John of Gaunt. The site of the city is elevated, commanding a beautiful view of the surrounding region. The manufactures include flour, machinery, farming implements, clothing, and fabrics. It has modern facilities, such as telephones, electric lights, and rapid transit. Population, 1907, 53,672.

**LINCOLN CATHEDRAL**, one of the finest cathedrals in England, located in the city of

Lincoln, on the summit of a hill overlooking that city. It is in the early English style of architecture and contains the bell called Tom of Lincoln, which was cast in 1610. The building is 482 feet long, 80 feet wide, and the central tower is 300 feet high. Two other towers have a height of 180 feet. The cathedral is one of the finest specimens of architecture belonging to the Anglican church.

**LINCOLN'S GETTYSBURG ADDRESS**, a memorable address made by Abraham Lincoln at the dedication of the Gettysburg cemetery, Nov. 19, 1863. It is rightfully regarded a literary gem. The following is the address in its entirety: "Fourscore and seven years ago our fathers brought forth on this continent a new nation, conceived in liberty and dedicated to the proposition that all men are created equal. Now we are engaged in a great civil war, testing whether that nation, or any nation so conceived and so dedicated, can long endure. We have met on a great battlefield of that war. We are met to dedicate a portion of that field as the final resting place of the men who here gave their lives that the nation might live. It is altogether fitting and proper that we should do this. But in a larger sense we cannot dedicate, we cannot consecrate, we cannot hallow this ground. The brave men, living and dead, who struggled here have consecrated it far above our power to add or detract. The world will but little note, nor long remember what we say here, but it can never forget what they did here. It is for us, the living, rather to be dedicated to the unfinished work which they who fought here have thus far so nobly carried on. It is rather for us to be here dedicated to the great task remaining before us; that from these honored dead we take increased devotion to the cause to which they gave the last full measure of devotion; that we here highly resolve that these dead shall not have died in vain; that the nation shall, under God, have a new birth of freedom; and that government of the people, by the people, and for the people shall not perish from the earth."

**LINDEN**, a forest tree of Europe. The species native to America are commonly called *basswood* and *lime*. It grows to a great height, frequently from sixty to ninety feet. It yields a rather soft and light wood and bears sweet-scented flowers, growing in cymes and having the peduncle united to a leaflike bract. The wood is utilized by carvers and turners, for kindling purposes, and in the manufacture of powder. In nearly all the species the flowers furnish material for a tea and contain excellent qualities for honey. In many countries the

linden is cultivated near apiaries to supply food for bees. Many species are included in this class of trees, the European and American being quite similar. The linden is a favorite tree for gardens and house yards, having widespreading branches when isolated.

**LINDSAY** (lĭn'zā), a city of Ontario, county seat of Victoria County, on the Seugog River, 68 miles northeast of Toronto. It is on the Grand Trunk Railway and is surrounded by a farming country. The principal buildings include the county courthouse, the high school, the public library, and several churches. It has manufactures of flour, spirituous liquors, ironware, and lumber products. The municipality maintains systems of sewerage and waterworks. Population, 1901, 7,003.

**LINEN**, a fabric woven from the fibers of flax. Linen textile fabrics include many varieties, such as lawn, damask, cambric, sheeting, toweling, and ducks. The manufacture of this commodity dates from remote antiquity, a fact evidenced by Egyptian monuments and the embalmed dead found in the tombs, many of which are wrapped in linen products. Writers generally express the view that the Jews introduced its manufacture into Western Asia, and that it spread thence to Europe by way of Greece. It is probable that the Romans taught the art of making linen to the people of Western Europe, since the manufacturing establishments in those parts of the continent have been important for many centuries. The linens made in Belgium, Holland, France, Germany, and England are especially noteworthy, for the reason that the products are of a very high quality in fineness and the output is very large. Linen has been manufactured in the United States for many years, but the first extensive mill was built at Fall River, Mass., in 1834, since which time the industry has been gradually developing, though the finer products are still imported in large quantities.

When flax is received at the mill it has to undergo a line of preparatory operations before being spun into yarn for weaving. It is first heckled, by which the coarse parts are separated from the fine, and then is prepared for spinning, the latter being done by machinery. After being spun into yarn, the threads are woven into the different kinds of products by machinery, the apparatus depending upon the class of goods desired. However, the machinery does not differ materially from the devices used in the manufacture of cotton. The extensive production of cotton has affected the output of linen fabrics, especially in Europe, but linens have many advantages for various purposes.

Linen is much smoother than cotton, has a brighter luster, does not absorb moisture as easily, and is a healthful, clean, and cool material for sheeting and summer clothing. When bleached, starched, and dressed, it furnishes the beautiful material used for collars, shirt fronts, cuffs, and many other useful articles of apparel. It is stronger and heavier in weight than either cotton or yarn and, since machinery can be applied to every phase of its manufacture, it has assumed an important place among the textile fabrics. The common grades of linen are those used for bedding and plain clothing, while the heavy ducks enter into the manufacture of tents, sails, and coarse clothing.

**LING**, a species of sea fish found in the northern seas as far north as Iceland. It is allied to the cod family. The body measures from three to four feet in length, has a grayish back and sides, and the head is flat. The ling is very valuable as an article of commerce. It is caught most abundantly from February to May, when it is in the best condition, and begins to spawn in June. Split from head to tail and cured in salt brine and dried, it becomes known as *stockfish*. An oil is extracted from the liver, which is used as a substitute for cod-liver oil and for lighting purposes in lamps. Among the species are the common ling, the eel-shaped *blenny* found off Massachusetts, and the *gadoid* of Europe.

**LINNAEA** (lĭn-nē'à), a plant of the honeysuckle family. It is a small trailing evergreen herb, has round leaves, and bears fragrant flowers of a pinkish color. Only one species is contained in the genus. It is found in the northern regions of the Northern Hemisphere and occurs in mountainous places as far south as Maryland and California.

**LINNET** (lĭn'nēt), a singing bird of the finch family, native to North America and the northern portions of Europe and Asia. It is migratory, moving southward in autumn. The body is six inches long and the extended wings measure ten inches. Most linnets are yellowish in color with markings of brownish, but there are red, gray, and brown species. They change color somewhat according to the seasons of the year. Several species inhabit different parts of the Old World, those found in Egypt coming largely from the Levant to winter. The song is cheerful and lively and is distinguished by its pleasing notes, making the linnet a favorite cage bird.

**LINOLEUM** (lĭ-nō'lē-ŭm), an important product derived from linseed oil by the application of chloride of sulphur. It is useful for many purposes, its utility depending upon the

nature of the process to which the ingredients are subjected in preparation. In a common form it consists of thin sheets, which serve purposes quite similar to India rubber or gutta-percha. It is dissolved and used in preparing carpets, table covers, waterproof coats, etc. In a vulcanized form it serves for handles in cutlery and for moldings, and in other forms as a cement and for painting both iron and wood works.

**LINOTYPE** (līn'ō-tīp), a machine for producing stereotyped lines or bars of words as a substitute for typesetting. This machine uses matrices instead of type, each of these responding to the touch of keys, thereby falling into the proper place. When sufficient matrices to form a line have been set, they are moved automatically to the casting apparatus, where they are lined up, or justified, and molten metal is cast to form a solid line of type, after which the matrices are returned by the machine to their proper places by automatic action. The lines or bars containing the words are set up side by side to constitute a column. This machine was invented by Ottmar Mergenthaler (q. v.) and is one of the most practical inventions of the kind. Several styles of type, such as *brevier*, *nonpareil*, and *italics*, can be set at the same time by using different cases of matrices. See **Type**.

**LINSEED OIL**, an oil expressed from the seed of flax, which forms the type of the class known as *dry oils*, from their property of drying into a transparent, tough mass when exposed to the air. It is secured from the linseed either by heating to 200° Fahr. or by pressure without heating, the latter process being regarded the better, as the oil extracted by that method is less liable to chemical decomposition. If the raw oil is boiled until it loses about one-sixth its weight, it becomes of greater value, since it dries up more readily than in the fresh state and forms, when applied in painting, a turpentinelike mass which is scarcely soluble in oils. In that form it constitutes the basis of painters' and printers' varnishes. About 28 per cent. of the quantity of seeds pressed is the amount of oil secured, and the residuum constitutes a valuable product for domestic animal food, known as *linseed cake*. It is sold on the market either in solid cakes or as meal. The principal uses of linseed oil are for mixing paints, preparing varnishes, oil cloth, printers' ink, soft soap, and linoleum, an article used largely for covering floors. Linoleum is prepared by solidify-

ing linseed oil through the agency of chloride of sulphur.

**LINTEL** (līn'těl), a piece of timber or stone laid horizontally over a doorway or window for the purpose of furnishing support to the building. It is sometimes constructed in the form of an arch and sometimes as a short architrave.

**LINZ** (līnts), a city of Austria-Hungary, capital of the crown land of Upper Austria, 102 miles west of Vienna. It is located on the Danube River and is strongly fortified. The chief buildings include the cathedral, an armory, a public library, and a number of schools and churches. It has extensive railroad and electric railway facilities and is the seat of a large trade in tobacco, leather, cereals, and live stock. In the time of the Romans it was known as *Lentia*. Population, 1906, 60,872.

**LION**, a majestic carnivorous animal, the largest of the cat family. It is one of the most active of the large quadrupeds, has a yellow or tawny color, and measures from eight to ten feet in length. At the shoulder the height is about four feet. The tail is nearly four feet long, tufted at the end, and the male has a large, shaggy mane. In all species the lioness is smaller than the lion, but more impetuous and agile, and is destitute of a mane. The mane begins to grow at the age of three years, maturity is reached at about six years, and the average life is thought to be about twenty years. Lionesses bring forth from two to four young annually, and the whelps are nourished nearly a

LIONESS AND WHELPS.

year. While the favorite abode is an open plain, during the breeding season they remain secluded, and both parents give much evidence of energy in defending their young.

Like the cat, the lion is disposed to hunt its prey most commonly during the night, stealing upon it with great caution, and when at the proper distance it leaps with well-directed force and accuracy. The eyes are brilliant and the

body is muscular. The great strength of the lion has caused it to be called the *king of beasts*, though its noble appearance and kingly bearing no doubt contribute largely to this appellation. Travelers find it a protection to kindle a fire and keep it steadily burning, as the lion shuns flames, and rather avoids than attacks man unless induced to forceful means by hunger. Formerly lions were common to Europe, but the advent of civilization has caused their retreat to the wild regions of Asia and Africa. The African lions are by far the largest, and include a number of species. Those found in Asia are medium in size and in some species the males do not have a mane. The *puma* of America is often classed as a lion. If captured young, lions may be domesticated and trained to acts of skill, for which purpose they are frequently exhibited at exhibitions. At the time of the prosperity of Rome many exhibitions consisted of fights between lions and other animals, or even between lions and men. They were employed to some extent for the destruction of Christians and criminals.

**LIPARI** (líp'á-rē), or **Aeolian**, a group of seventeen islands, lying north of Sicily, but only six are of material size. The area is 58 square miles. It belongs to Italy and contains numerous ancient ruins and volcanic mountains. Earthquakes and storms are frequent. The industries include fishing, mining, and fruit raising. Pumice stone, soda, sulphur, niter, fish, wine, and tropical fruits are the principal products. Among the chief islands are Lipari, Vulcano, Filicuri, Salina, Panaria, and Stromboli, the celebrated intermittent volcano Stromboli being on the last named island. Lipari is the only island of the group that was inhabited anciently. Population, 1906, 20,806.

**LIQUEUR** (lê-kēr'), an alcoholic cordial sweetened and flavored with aromatic substances for the purpose of making it pleasing to the taste. Various products are used for the purpose, such as cumin and caraway seed in the preparation of kummel; cloves in preparing clove cordial; bitter almonds in making noyau; and aniseed in preparing aniseed cordial.

**LIQUID** (lik'wid), a substance whose parts retain no definite form, but change their relative position on the slightest pressure. The term liquids is applied to all fluids, but many fluids are not liquids, such as air and the gases. Water is the most common liquid. See **Hydrostatics**.

**LIQUID AIR**, the name applied to the product obtained by liquefying the so-called permanent gases, such as hydrogen, nitrogen, and oxygen. Though various gases were liquefied fully

a century ago, much attention has been directed to the process, particularly because of the invention of a new and more powerful apparatus. Faraday attained considerable success in liquefying nitrous oxide and ammonia, but renewed interest was directed to the process in 1898 by Chas. E. Tripler, of New York City, and subsequently by others. To liquefy gases two factors are necessary—pressure and cold. By the application of both these factors to a sufficient extent, any gas, so far as known, may be liquefied. The point at which liquefaction takes place is called the *critical temperature*, a term applied to both the temperature and the pressure at which a gas liquefies. These differ according to the nature of the gases. For instance, argon liquefies at the critical temperature of  $-250^{\circ}$  Fahr. and the critical pressure of 759 pounds; nitrogen, at  $-295^{\circ}$  and 525 pounds; and oxygen, at  $-245^{\circ}$  and 762 pounds. In an experiment it was found that liquid air freezes at a temperature of  $2,400^{\circ}$  below zero.

Besides Tripler, W. Hampson, of England, and Carl Linde, of Germany, have brought forth practical machines for producing liquid air. While different in many details, they are quite alike in general principles. Among the essential parts is an air compressor, by which air is compressed in a series of cylinders connected by automatic gauges, and the heat resulting from the compression is removed by intercoolers. The construction is such that the last of the series of coolers is in a large tank filled with running water, which serves to cool the air pipe, and the air is thence conducted through a separator to free it from moisture. It next passes to the liquefier, a device constructed of small pipe with many turns, which is surrounded by a heavy felt packing to protect it from external heat. When the pressure at the lower end of the coil becomes raised to a sufficient intensity, an expansion valve permits the cool air to pass between and around the coiled pipes.

As this operation is continued, it has the effect of gradually cooling the air until the critical point of temperature is reached, when portions of the air liquefy and the product falls into a receptacle, from which it may be taken and used for purposes intended. Formerly it was thought that liquid air would come into wide use, as for refrigeration, ventilating and cooling rooms, and divers hygienic purposes, such as the destruction of typhus bacilli and bacteria. Since it has a general temperature of  $312^{\circ}$  below zero, its usefulness for these purposes would seem practical, but the expense of producing and the difficulty of handling it have precluded its use, except in physical laboratories. Ice at  $30^{\circ}$  Fahr.

is as a furnace in comparison with liquid air, and, when placed on a block of it, liquid air boils in a manner quite similar to water affected by a hot fire.

**LIQUIDAMBAR** (lĭk'wĭd-ām-bĕr), a genus of trees found in Asia and North America. The common liquidambar is a tall tree, has lobed leaves, and is native to Mexico and the southern part of the United States. It grows to a height of 100 feet and is valuable for the timber, which is sometimes called *satin walnut* in the markets. Four species of these trees have been described, all of them more or less valuable in their production of fragrant resinous matter, called sweet gum, copal balsam, or liquidambar.

**LIQUORICE.** See **Licorice.**

**LISBON** (lĭz'bŭn), the principal seaport and capital of Portugal, on the Tagus River, about nine miles from the Atlantic Ocean. It has a very beautiful site, an important harbor, good railroad connections, and a number of modern municipal improvements. Among the public utilities are gas and electric lighting, stone and macadam pavements, sewerage, and an extensive system of electric street railways. The harbor is commodious and strongly fortified. It has a large export and import trade, especially with the colonies. The manufactures include cotton, woolen, and linen goods, jewelry, tobacco, hats, clothing, boots and shoes, machinery, earthenware and utensils. Some of the older streets are tortuous and have few sanitary facilities, but the newer parts are clean and well regulated.

Much of the architecture is of stone and brick. The principal buildings include the national library, the customhouse, the arsenal, the Church of Saint Rogue, the Monastery of the Heart of Jesus, and the national theater. The national library has 200,000 volumes. Many of the public places are adorned with fountains and statuary. The water supply of the city is secured through an aqueduct eighteen miles in length, which is regarded the most extensive bridge architecture in the world. Lisbon was founded by the Phoenicians and passed to the Romans, then to the Goths, and later to the Moors. In 1146 it was captured by Alfonso I. It became the capital of Portugal in 1422. In 1755 one of the greatest earthquakes on record visited the city, in which 35,000 persons were killed. Population, 1907, 359,044.

**LITANY** (lĭt'ā-nŷ), a solemn prayer or supplication addressed to God with the view of obtaining mercy and assistance. It is used chiefly on occasions of public calamity, especially in the case of prolonged drought and the prevalence of epidemics. The Kyrie Eleison (q. v.) is the

earliest and most simple form of litany and is repeated a number of times. Two other forms of litany are those known as the *Litany of Loreto* and the *Litany of the Name of Jesus*. The requirement to repeat the litany in the Roman Catholic church applies only on Rogation Days, or the Monday, Tuesday, and Wednesday before Ascension, and on Saint Mark's Day, but it is used by common consent at the time of great calamities and special occasions, such as consecrations and ordinations.

**LITCHFIELD** (lĭch'fĕld), a city of Montgomery County, Illinois, 43 miles south of Springfield, on the Wabash, the Illinois Central, the Chicago, Burlington and Quincy, and other railroads. The chief buildings include the public library, the high school, and a number of churches. It has waterworks, sewerage, and well-graded streets. Among the manufactures are threshing machines, earthenware, carriages, flour, and brooms. The surrounding country is agricultural and dairying. It has valuable deposits of coal, natural gas, and mineral oil. Litchfield was settled in 1853 and incorporated in 1859. Population, 1900, 5,918; in 1910, 5,971.

**LITER** (lĕ'tĕr). See **Metric System.**

**LITERATURE** (lĭt-ĕr-ā-tŭr), the written or printed productions of the human mind distinguished by vigor and elevation of thought. Our educational institutions and the general public are giving attention to home reading and the attainment of literary culture with an ever-growing interest. Never before has there been greater activity than at present among the American people to own and read good books. This desire is not confined to any particular class, and it exists with almost as much intensity in the country as it does in the cities and towns. Through the general diffusion of knowledge among the masses in the schools, the reading habit has become almost universal, and the school days, apparently stopping when the child leaves school, extend far into the adult life of the individual. The character of the reading is as diversified as the tastes of the human mind, and it covers topics in all departments of knowledge. In fact, there is no field left unexplored. Even in the same neighborhood may be found men and women pursuing subjects as widely separated as if they were inhabitants of two cities on opposite sides of the globe.

In the stricter and narrower sense literature belongs to the fine arts and embodies thought that is power-giving, or inspiring and elevating, rather than merely knowledge-giving. In this sense it excludes the writings that are merely technical or for a particular class, and embraces those that are of interest to man in an aesthetic

sense, that are characterized by an elevated tone and style, and shaped by the creative imagination or power of artistic construction. Literature may be divided into three classes, representative discourse, oratory, and poetry. *Representative discourse* embraces all the productions in which the writings are for the sake of the theme itself; *oratory*, where the representation is for the sake of the effect on another mind; and *poetry*, where it embodies in beautiful form the thoughts presented, largely for the sake of the form. Dean Stanley embraces in literature all those great works that tower above professional or commonplace uses, and take possession of the mind of a whole nation or a whole age.

"Literature in the higher sense" is a criticism of life, but it is usually defined as all that has been written that was worth reading years or centuries afterward. Not everything that has been written can be classed as literature. What there is that has "the potency of life in it" is for this reason worthy of consideration. Out of such material, either preserved in books or hidden away in diaries, true literature has been made. This is, in a large measure, the unwritten history of the people themselves, which in later years is gathered up and shaped into form. While the literature of this country is a vigorous offshoot from the parent stock, and is modeled largely after it, yet it possesses distinct national characteristics indicating the modes of thought and the persistent activity of the American people.

Coming from England, our ancestors brought some books with them, and the need of books written in the colonies was not felt at first, yet diaries were kept by some of the early settlers and from these jottings one is enabled to conceive with a very considerable degree of accuracy how the first settlers lived, worked, associated together, and what manners and customs they observed, and the general appearance of the country, the habits, modes of life, and the peculiarities and general traits of the savages with whom they came in contact. As the settlements prospered and their interests expanded in the different colonies and a wider acquaintance with the affairs of men in all parts of the world became necessary, attention was directed to other nations, their laws and institutions. However, the first settlers in the colonies had much hard work to do, but there were some men among them who had been liberally educated and their influence reached down among the masses in every settlement. There was then present, as there is now, an instinctive feeling among the masses to respect the man who

knows more in general than his fellows, and whose judgment is sound and whose opinions are based on a comprehensive view of a situation.

In the early history of the country, little time could be devoted to writing books that would now be worth reading, except to show how the people themselves lived. The younger living had to preserve the history of the older living for the benefit of the future historian, novelist, essayist, or antiquarian. Written thoughts live; oral tradition dies. Our ancestors were men and women of high and lofty purposes. They had cut themselves loose from all the old-world ties in order to carve out a mighty destiny under other skies, on an unexplored continent. Their higher thoughts were occupied with notions of divine and civil government. What was written then had a gloomy religious coloring, inherited from conditions that had in a large measure influenced them to leave the old world and to settle in the new. From 1607 to 1765, there were feeble attempts, as now judged, in writing some books chiefly on interpreting the Scriptures and the extent of the authority of kings and potentates. Our literature had its beginning during this period.

The literature of Canada and the United States is all of modern origin. None of it is three hundred years old. The study of American literature is the study of the best literary productions of the men and women who wrote them, and some account of the life of each. Books that have a permanent interest for all men, extending throughout all time, may be classed as literature in contrast with those writings that had only a temporary interest. Education along literary lines in recent years has invariably taken two directions—one is a return to the study of those productions which have stood the test of time, and incorporate the expressions of the race as well as the experience of the individual who reads such books for the first or the twentieth time; the other line is by absorbing the principles that are embodied in the highest forms of literary art, so that one is enabled, by superior tact, skill, judgment, and appreciation, to blaze out a line of work that in matter and form will command and hold the admiration of all who know how to appreciate and to enjoy the beautiful in literature.

However, it is most desirable to influence those who must do their reading chiefly at home, to read the best books and in the right direction. Home reading must furnish the essential basis for all extended education after one has finished his work in school and entered upon that broader sphere of activity in the in-

dustrial, commercial, or professional occupations of life. Men and women should be trained along two lines, and each should accomplish its purpose fairly well. The first has for its object the developing of the original powers of the mind so that the possessor shall be quick in observation, active in comprehending and in adapting himself to new and untried situations, clear and free in his thinking, and self-poised in his disposition. On the reflective side of life, he must fortify himself by gathering wisdom from the world's best books so that he may enjoy and participate in the experience of the race. Literature contains this knowledge, the invaluable lessons of human experience.

In reading the biographies of the most noted scholars and philanthropists, one is impressed with the important influence that some book had in shaping the character of each, or in directing his energies into a definite channel of investigation or action. An insight into the methods employed reveals how it was that one trained himself to become a naturalist, and another a writer of books, a linguist, a historian, a poet, a mathematician, or an astronomer. Studies of this kind have done more to stimulate the spirit of investigation, especially along the lines of research, than all other influences combined. It is consequently a matter of much greater importance to get a few of the right kind of books, than it is to have a good teacher whose influence may be only temporary. A book that teaches how a result was reached, indicating the steps in the discovery of a fact and the experiments made, will lead one to depend upon himself far more than when he is told how by a teacher. Such a book is stimulating, because it indicates clearly the entire process from the beginning to the end in the discovery of truth.

A library for home reading should contain different assortments of books—books that incite to reading and that arouse an independent, continuous spirit of self-activity. These books should treat chiefly of the spirit and methods of discovery, and of the processes of development to which each subject belongs. Where one is prepared to view the material world as an unfolding process, and that each fact in the process throws some light on every other fact in connection with the process, knowledge then begins to assume a scientific aspect in a classificatory form. The habit of study which leads to such classification of reading and investigation is invaluable to the young person who is beginning to form habits that will economize life's work. It is doubly important that the one who must map out his own course of reading should

adopt a plan that is somewhat scientific in its character and at the same time widening in its scope.

A simple method for gathering a library of books for home reading and progressive instruction is to select books grouped under a few general heads as follows:

*The First Division* should include history, biography, and ethnology. History and biography relate to the lives of nations and individuals; to the social lives of each; and to the collisions that the nation has had with other nations, or the individual with other individuals, or at times with the popular will. But the most interesting phase of national history is its peaceful relations with other nations in developing and extending commerce in times of peace; the forms of government, the modes of administering justice among the citizens, their manners and customs, social, political, and religious practices—all help one to see those of his own people in the light of others. In studying the less advanced peoples, one becomes familiar with the lives and habits of the backward races and he thus learns to understand their prejudices far better than he who holds himself aloof, and who would reform them by sheer force. One learns, too, how the will of the chief of the tribe or clan controls all those who belong to the tribe or nation. It is in this tribal will that the social will of a nation expresses itself and makes its power felt in books on ethics, social usages, laws, forms of government, and the public and private duties of the citizen. This division includes a large sphere of practical life, and embraces man's relations to his family, state, and humanity.

*A Second Division* is that of natural history, including nontechnical books on animals, plants, and descriptions of remarkable objects in nature, and especially descriptions of geographical localities, and particularly of travels in various parts of the earth on land and sea. This is one of the most inviting fields to the young, and work in any department of it leads to a wider view of organic nature under all of its phases. It is in this department, too, that the student is most apt to specialize in botany, biology, the weather, agriculture, horticulture, stock raising, or astronomy. He often becomes deeply interested in state and governmental publications of some phases of this large group of miscellaneous subjects.

*Third Division.* In this division should be embraced such books as treat of physics and chemistry. Under physics, attention should be directed to bodies in mass, whether at rest or in motion, thus giving the learner clear concep-

tions of statics and dynamics, or of the air, water, light, heat, electricity, and the properties of masses of matter in general. Such knowledge strengthens the reasoning faculties and leads out to a realization of some of the great problems in natural philosophy and astronomy. Chemistry will give a knowledge of those phases of organic and inorganic elements which enter into the structure of compounds, and the processes of combinations and analyses by and through which chemical knowledge has been built up into a great body of scientific information.

A last group of books that may be considered as a distinctive one is that relating to books of literature, and works that make known the beautiful in character, architecture, sculpture, painting, music, prose, and poetry. Literature and art exhibit human nature in the form of feeling, emotions, and higher and more beautiful ideals which terminate in a striving after the good, the true, and the beautiful in life. Such an influence refines human nature, enlivens and vivifies impressions, and results in clearer thought and more lasting impressions in shaping the life after higher ideals.

*For Home Reading* the student early in life should select his library books chiefly along the lines indicated for culture and general information.

Benjamin Franklin is the central figure in the early history of the United States. His writings are the very opposite, in many respects, of the somber theology of that age. He turned his attention mainly to practical life, dipping, as his time permitted, into scientific and curious subjects. He is associated with men who were destined to act through the Revolutionary period. They are, in the main, men of speech and action rather than authors who would sit down quietly and chronicle events. Yet there is a strong background upon which this striking national peculiarity is deeply engraved. Hallam has sketched the same characteristic in his "Constitutional History of England." It is the same life running down through the sturdy "House of Commons" from the time of James I. to the accession of William and Mary. It is preëminently the liberty-making period, and upon this very account the students of literature, and especially the readers of American history, should be perfectly familiar with *Magna Charta*, the *Petition of Rights*, the *Declaration of Independence*, and the *Constitution of the United States*.

This kind of literature has a firmer hold upon a people than the mere desire to do elegant writing, and the student of literature is impressed with the fact that the literary standard of one age is not the literary standard of all

ages, or for any other age, except that particular one in which it is written, unless it be a crystallized nation—and crystallization always means death to a living organism.

The political writings of the Revolutionary period were those chiefly of Thomas Paine, who exerted a tremendous influence throughout the colonies. He was preëminently a "war-arouser." Full of fire and enthusiasm, his blows fell with tremendous force. But for the inside thoughts of great men, notwithstanding the estimate of Von Holst, all literature affords no finer examples than the letters of Jefferson and John Adams after both had retired from public life. It is in these revelations that one learns to know these two great men.

"The Federalist" is the constitutional textbook of our country. In it one gets the best and clearest exposition possible of the Federal Constitution as it was understood by its authors. Strange, indeed, that two young men, Hamilton and Madison, one thirty and the other thirty-six, both slight in build, should come forward as the ablest champions of constitutional liberty in America! For an entertaining account of this period in our country's history, the reader is referred to that master work, "The Critical Period in American History," by Professor John Fiske.

During the constitutional convention various propositions were offered and discussed, adopted or rejected, after a session of four months behind closed doors, and as a result of their deliberations, the present Constitution of the United States was submitted for adoption by the people. When it was fairly before the people for ratification or adoption, then it was that men in every state began to pick it to pieces. Even in the convention where it was framed, it was agreed to finally "by a trade" between Massachusetts and South Carolina. The student of American history needs to know all these things before he is in a condition to understand clearly the sectional sentiments of the parties which sprang up in this country afterward. The slavery question was simply an inherited issue, and it was the entering wedge which widened the breach between the two sections more and more, till finally it was settled by the sword.

It is always decidedly refreshing to read a review of a noted man's character and services in which he is dissected skilfully, justly, and honorably. To throw the personal equation entirely aside and to judge of motives in the clear light of reason is a great step forward in ascertaining truth. One point will illustrate this statement. When the lamented Lincoln delivered his famous Gettysburg speech, it fell flat,

and so he felt it himself. But some years afterward an Englishman examined it, commented on its simplicity of style, its depth of meaning, and immediately it became classic as well as prophetic. Everybody knew it was a grand thing, then.

Real literature with us begins with Irving, Cooper, and Poe—three men so unlike, and yet, in a sense, two of them, at least, typical products of the country. What a curious contrast to the great men who had taken so active a part in forming the government. With the former it was the intelligence working through the will, actively employed in shaping into form the political, social, religious, legal, and commercial institutions of the country—a grand work from the will side of human nature. Opposite are set Irving, Cooper, and Poe, who work out from the intellect, taking in part of the feelings for a substratum. Each sets himself a different task. In studying each, it is necessary for the reader to put himself as nearly as possible in the place of each of these authors, yet this is rather a difficult task in the case of Poe. The smooth-flowing sentences of Irving, and the strong, deep insight of Cooper, have their charms as well as their pleasure; but who can describe, in a sentence, the wild and horrible, as prefigured in Poe's mind? Poe, as a writer, is much less read than either Irving or Cooper, yet, as a critic, he certainly occupies the highest rank.

N. P. Willis is another charming writer. He is one of the most unique characters in American literature. As a sketchy writer, few are known to excel him. His prose writings are delightful. Though his writings are partially forgotten, yet as a "hurrygraphist," he is without a peer in modern literature. Harriet Martineau, after listening to John C. Calhoun speak, said, "that he would make one believe in predestination." Carlyle, in his cynical way, called John Stuart Mill a "logic chopping machine," and no one can read "A Disquisition on Government" by John C. Calhoun without feeling the powerful force of his logic. He was not a great rhetorician, but a great logician. He and Jonathan Edwards, each in his own specialty, stand as the first logicians that our country has produced. Admitting their premises, their deductions are irresistible.

During the "statesman period," including Clay, Webster, Calhoun, Benton, and Cass, all notable men, the student of constitutional history will gain much from reading their speeches. There appears to be no doubt that so far as exact information was concerned, Benton was the "best posted one" of the galaxy. Literally, we might say—"There were giants in those days;" but

should an emergency arise, their equals would be found in the House and in the Senate again. The occasion has much to do in bringing out the latent energies of master minds. Along with this galaxy of statesmen and orators may be mentioned Phillips, Sumner, Choate, Everett, John Quincy Adams, Seward, Stephens, and Lincoln, whose speeches and state papers will always have a permanent value.

Among the earlier historians whose works are of a high order may be mentioned Bancroft, Prescott, Parkman, and Motley, and of the later, Fiske, Schouler, McMaster, and Rhodes. John Bach McMaster actually writes the history of the American people. But to understand fully how our institutions have impressed foreigners, the student should read "Democracy in America," by De Tocqueville, Von Holst's "Constitutional History of the United States," and Bryce's "American Commonwealth."

The development of poetry among the people of the United States has not followed the method of older countries of the world, and only a few poems of a high order have been produced; but a great deal on the average level. A great poem can be written only when the poet is inspired by a lofty ideal. Ideals rule the world of thought as well as of literature. We have a few great but short poems. Bryant's *Thanatopsis*, written at the age of eighteen, is his best poem. In this respect, he and Macaulay were both at their best early in life. Macaulay's first speech was as great or greater than any of the others delivered. On the other hand, Longfellow's growth was a gradual one. Halleck is known by one poem, "Marco Bozzaris," and George D. Prentice by "The Closing Year." This is one of the finest in our language.

Religion is one of the inherent elements in man's nature. The idea that it is an acquired faculty has no more truth in it than that a desire for food is an acquired appetite. The truth is, that the one is as natural as the other. As Kant puts it, there are three great questions in the world—God, nature, and immortality; or God, man, and immortality. The American mind is preëminently a speculative one, so far as it undertakes to reconcile nature and religion. Our literature is rich in speculative theology, and not a few persons have struck out new theories of doctrine when followers were not numerous and dogmas evoked little thought and less action. Hardly a religious idea has sprung up in any quarter of the globe that some one has not appropriated it here, and sought to found a sect. This movement goes on still. Our institutions invite these exotics, and when they are transplanted, they either take root or

die. So far, however, as pulpit literature and pulpit oratory are concerned, our country has produced some of the greatest men the world has ever seen. It is only a short step from religious and social issues to the realm of philosophy. At all times there were a few scholars in the United States who studied philosophical questions, but during the past thirty years the number has multiplied in every state.

In any treatise on American men of letters, Emerson is always destined to occupy a large space. The student turns to him instinctively for inspiration rather than for positive knowledge. He is always helpful, always suggestive. His charm lies in his sweetness, gentleness, and loveliness. To read Emerson is to make one better. His theology is the doctrine of manhood. Amos Bronson Alcott was another typical character. Whether the similarities be found between Plato and the Bible led him to his singular opinions concerning the instruction of the young is still a matter of debate. At any rate, he was a man of singular purity of character.

Charity keeps us from calling Thoreau a crank, and yet there are some traits in his character that one admires. He stood as a protest against the conventional side of life. He was a civilized man who never found a home in civilization. Margaret Fuller's life is one of inspiring interest to the girls of our country. Brains will tell. Her tragic death lends interest to her work. Channing, Dewey, Theodore Parker, Horace Bushnell, Henry Ward Beecher, Phillips Brooks, and other noted clergymen shed additional luster on our religious and political institutions. Their writings need to be studied in order to be thoroughly appreciated.

But the central figure as a writer of fiction is Hawthorne, *the elder*. Certainly Nathaniel Hawthorne occupies a unique place in fiction. He painted nearly as boldly as did Dante,—that the one who violates a law is plagued by the return of his own sins upon himself. The outcome of all this philosophy is that of personal freedom and personal responsibility. Just how much of one's writings can be set down as symbolic and how much as literal can never be quite definitely determined; yet Hawthorne seems to mix the two without a conscious effort. His mind was of that peculiar type that it specialized and generalized at the same moment. He had in the very fullest sense what philosophers call insight. He was much more than a clever writer, and yet he does not have that full sweep which takes in all humanity at a single stroke.

Passing to the "Autocrat of the Breakfast

Table," his versatility of mind has drawn all English-speaking people closely to him. To say that he is a profound writer on any subject would not be a correct estimate of his ability, but he is always interesting, always genial, never lags, yet, too, there is a ripple of mirth just beneath the surface of every pregnant truth he utters. He reaches the people, and he sets them into quiet, half-repressed chuckles. In reading Holmes one wants to get up every little while and walk across the floor and laugh. He lives in the hearts of the people more fully than any other American author. Every page of his quivers and thrills with human throbs. Going from Holmes to Lowell, the atmosphere changes—not that it is stinging cold or burning hot—but there is a sudden change. It is the difference between all of man's nature on one side and a distant, intellectual criticism on the other. The last element may be fitly described as massive power in repose, but illumined by bright, yet frigid sunbeams of the upper ether. Running down the list one comes to the poet Whittier whom everybody loves. He is one of the men whose influence has made the world wiser, better, and more human and spiritual.

There are many writers now in all departments of literary work, yet some have written well enough for their writings to live and to be read by future generations. Much that is now teeming from the press deserves an early death. A dialect literature can have only a momentary interest and an ephemeral existence. The permanent element of universality, that speaks to all people and through all time, is wanting in dialect writing. It runs in a limited channel, and it soon wears itself out. It starts in well, but dwindles away to nothing. Of course, those possessed of acute insight catch flavors of genuine greatness here and there in such author's productions, but the aroma is so delicate that it never reaches beyond a certain charmed circle. Such writers as Henry James and William D. Howells are not to be classed with those just described. As graceful, polished writers, these two men rank high. In a matter-of-fact way, they get at what they have to say. They may be properly classed as literary men of high working ability.

*Buying Books.* The person of ordinary means should keep all his school books and then first supply himself with a few choice reference books, and he should always buy books for the solidity of the matter they contain rather than on account of expensive bindings. Two or three of the very best books by recognized authorities on a subject are enough to give the average reader a clear and comprehensive in-

sight of a department of knowledge. One standard book is worth more than a dozen commonplace ones treating of the same topic. Books should be chosen with as much care and judgment as one ought to exercise in choosing his lifelong friends. See **American Literature; Canada, Sub-head Literature.**

**LITHARGE** (lith'arj), the general name of lead monoxide, made by moderately heating metallic lead in a current of air. It has a straw-yellow or reddish color. Litharge is used as a pigment, in making flint glass, and for glazing pottery.

**LITHIUM** (lith'i-ŭm), a rare metallic element discovered in 1807. It is widely distributed in nature, but does not occur in large deposits. Small quantities of it are found in certain mineral waters, in meteorites, in the leaves of certain plants, and with the rare minerals *petante* and *spodumenc*. It tarnishes quickly in the air, is one of the lightest of metals, and decomposes with much rapidity when placed in water. The properties of the citrate of lithis are similar to those of the carbonate, hence it is used to some extent by physicians. Compounds of lithium are useful in the manufacture of fireworks, since they give a characteristic red color to a flame. See **Chemistry.**

**LITHOGRAPHY** (lith'og'ra-fy), the art of producing printed matter from a flat stone on which an engraving or drawing has been made. The art was introduced by Alois Senefelder (1771-1834) in Germany about 1786, where the best so-called *lithographic stone* is obtained. This class of stone is almost the only one suitable for lithographic work, being a variety of fine limestone and having a light cream or gray color. It is formed into plates according to the size wanted, usually several feet square, and may be split easily into sheets of uniform thickness. Afterward it is cut and squared to the size required for a particular engraving. The artist prepares the design to be printed in various ways, but chiefly by engraving it on a prepared stone, by drawing it with a watery ink, or with a solid crayon, and by transferring from an inky design on paper by various means. The usual process is to cover the prepared stone with a greasy substance. This penetrates the stone, and can be removed only by cutting into it as deeply as the greasy substance has entered. The design is prepared by cutting in this manner, then filling with water the portions not covered by grease, after which an inky roller is passed over the stone with the effect that ink adheres to the greased parts, but is repelled by the portions moistened with water. In pressing the paper against the surface of the stone the

inky surface transfers an impression of the design drawn by the artist.

Boiled linseed oil is used commonly in preparing the greasy surface for lithographic work, and split diamonds are employed for preparing the script and finer lines, though these are made after the heavier designs have been engraved. The delicate tints and shades are obtained from fine parallel lines, numbering from 75 to 100 to the inch. Products similar to those secured by lithographing are obtained from zinc plates, when the process is called *zincography*. It possesses the advantage that plates prepared of zinc are less liable to breakage and are more easily portable than stone. *Chromolithography* is the art of producing lithograph pictures in the natural colors, which is done by making separate stones, there being as many different stones as tints desired, the number varying all the way from two to thirty. *Photo-lithography* is the process in which a photographic negative is transferred to the stone plate. This process is utilized in producing maps, plans, outlines, and various other matters.

Within recent years attempts have been made to utilize aluminum in lithography in place of the ordinary lithographic stone. It possesses the advantage of being lighter, takes drawings without much resistance, and, after being used, it may be melted and made to serve again by rerolling. The lithographic stone has been imported more or less by all countries from Solenhofen, Bavaria, on account of which the price has been quite high, thus supplying another reason why zinc or aluminum has been used to a larger extent than formerly. The United States is becoming a large producer of lithographic stone. It is found in Utah, Tennessee, Kentucky, and several other states, the production in Utah being the most important.

**LITHOTOMY** (lith'ot'ō-my), the surgical operation of cutting for stone in the bladder. Before resorting to so serious an operation the surgeon usually looks for evidence of stone in addition to the ordinary symptoms, which is done by a process known as *sounding* the patient. This consists of introducing a metallic instrument through the urethra, by which the stone may be heard and felt. The main operation, when properly performed, does not require more than three or four minutes. The wound in favorable cases heals in about thirty days. Operations of this kind are restricted almost exclusively to the male sex.

**LITHUANIA** (lith-ŭ-ā'nĭ-ā), a region of Europe, bordering on the Baltic Sea, now included in Russia and East Prussia. In the 11th century it constituted a grand duchy, but in the

14th century it was annexed to Poland. The first dismemberment of Poland, in 1772, caused the region to be divided and transferred to its present dependency. The area is about 100,000 square miles, of which all but 6,750 square miles belongs to Russia, and the latter portion is German territory, being a part of the kingdom of Prussia. The Lithuanians are classed with the Indo-Europeans. They are of a peaceable disposition, have fair features, blue eyes, light skin, and engage principally in agriculture and stock raising. In religion they are largely Greek and Roman Catholic. They are noted for their liberal support of schools and educational arts. In the beginning of the last century they began to acquire titles to land by purchase, being aided by government grants, and now own many fine stock, cereal, and dairying farms. The language spoken is related to the Old Prussian or Lettic. Their literature includes many religious works, some important history, and numerous popular songs and hymns. It is rich in legends and folklore. The legends are especially rich in primitive tales and fables. The entire Lithuanian race is estimated at 2,750,000, of whom about one-half speak the Lithuanian language.

**LITMUS** (līt'mūs), a vegetable color obtained from several species of lichen. It is used in chemistry to test the presence of acids and alkalies. Acid changes the blue color of litmus to red, and the read color is again changed to blue on being mixed with an alkali.

**LITTLE FALLS**, a city and the county seat of Morrison County, Minnesota, on the Mississippi River, 95 miles northwest of Minneapolis. It is on the Northern Pacific Railroad and is surrounded by a farming and lumbering district. The Mississippi River supplies an abundance of water power. Among the chief buildings are the county courthouse, the public library, the high school, an orphan asylum, and Saint Gabriel's Hospital. The manufactures include flour, paper and pulp, brick, machinery, and lumber products. It was first settled in 1849 and incorporated in 1889. Population, 1910, 6,078.

**LITTLE FALLS**, a city of New York, in Herkimer County, on the Mohawk River, 21 miles southeast of Utica. It is on the Erie Canal and on the West Shore and the New York Central railroads. Good water power is obtained from the river, which flows through a rocky defile and forms a number of cascades. It has a public library, municipal waterworks, pavements, and a city hospital. The manufactures include flour, woolen goods, bicycles, hardware, and machinery. It has a large trade in farm produce and merchandise. The first settle-

ment was made in 1782, but it was destroyed by Tories and Indians, and it was resettled in 1790 by a colony of Germans. Population, 1905, 11,122; in 1910, 12,273.

**LITTLE ROCK**, a city and the capital of Arkansas, county seat of Pulaski County, on the Arkansas River, 130 miles southwest of Memphis, Tenn. It is on the Southern, the Saint Louis, Iron Mountain and Southern, the Saint Louis Southwestern, and the Chicago, Rock Island and Pacific railroads. The site extends over a rocky bluff, about fifty feet above the river, and is noted for its beautiful and healthful location. Many of the streets are well graded and substantially paved with stone, brick, and asphalt. The principal buildings include the State Capitol, the Philander Smith College, the Arkansas Female College, a Roman Catholic academy, the Cathedral of Saint Andrews, the Federal building, the county courthouse, the Arkansas Military Academy, and many fine hotels and hospitals. Among the manufactures are cotton and woolen goods, furniture, cotton-seed oil, ironware, clothing, wagons, and machinery.

Little Rock is surrounded by a cotton and fruit growing district. It has a large local and wholesaling trade in merchandise and produce. The first settlement was made in the vicinity in 1814 and soon after it became the seat of the territorial government. It was incorporated in 1831. A Union army under General Steele captured it in 1863. Population, 1900, 38,307; in 1910, 45,941.

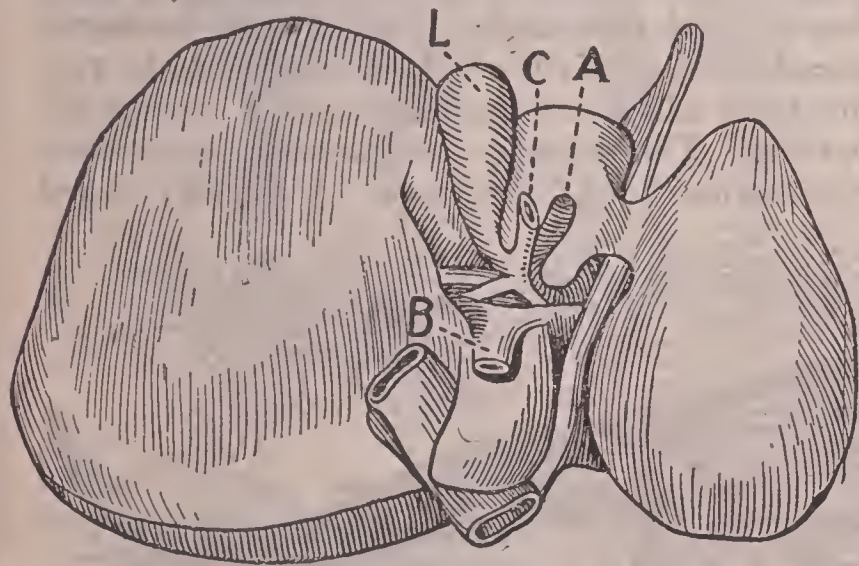

**LITTLE TURTLE**, a Miami Indian chief, remarkable for his intellectual strength and skill in war. On Oct. 22, 1790, he commanded an Indian force that defeated General Harmar on the Miami and on Nov. 4, 1790, gained a victory over General Saint Clair at Saint Mary's. He concluded peace with the whites in 1795 by signing the Treaty of Greenville, by which large tracts of land in Ohio were opened for settlement. In 1797 he met President Washington and several other high officials at Philadelphia. His death occurred July 14, 1812, at Fort Wayne, Ind.

**LITURGY** (līt'ūr-jÿ), the name of a form of Christian worship, applied especially to the celebration of the Lord's Supper. The Protestant churches in general use a form known as the vernacular liturgy, which has been in use in nearly its present form since the Reformation. The English Book of Common Prayer contains the form of communion service used in the Anglican churches, and the Protestant Episcopal church in America has substantially the same form, which was adopted by a gen-

eral convention held in 1789. It contains a number of changes from the liturgy of the English church, but the form of service is substantially the same. It provides for Scripture reading, a sermon, and a prayer, and these are followed by prayers and the administering of the consecrated bread and wine. The liturgies in general use may be divided into five groups, of which three are of Eastern origin and use, one Eastern in origin but Western in use, and one Western both in origin and use. They are known either by the names of the apostles with whom they are connected, or by the names of the countries in which they are believed to have been in use from an early date. The *Syrian rite* is in use in the Maronite Church of Mount Lebanon. The other Eastern rites are known as the *Persian* and the *Egyptian*, the former being in use by the Nestorians and the latter by the Copts. The Greek and Russian churches use the *Byzantine rite*, and the Roman Catholic church uses the the *Latin liturgy*.

**LIVER**, a large glandular organ situated in the upper abdominal cavity of vertebrates, whose function is to secrete bile, elaborate and

HUMAN LIVER.

store up glycogen, and otherwise change the blood that passes through it. The liver is the largest organ in the human body. It is situated on the right side, below the diaphragm, and weighs about four pounds. Its general form is broad, flat, thin at the left side, and thick toward the right. It has an arched upper surface, but the lower surface is irregular, divided into five lobes, and its tubes contain nearly one-fourth of the blood of the body. Arterial blood is brought to the liver by the hepatic artery A, directly from the aorta, while the portal vein B conveys to it venous blood from the stomach, intestines, pancreas, and spleen. The bile, a substance necessary to life in the digestion of food, is a dark golden colored liquid of bitter taste, and when not needed

for digestion is stored in the gall cyst L, with which the bile duct C communicates. About three pounds of bile are secreted per day.

The diseases of the liver include *hepatitis*, *jaundice*, *cirrhosis*, *acute yellow*, *atrophy*, and *fatty degeneration*. Diseases of the liver are accompanied by a yellowish complexion of the skin, owing to imperfect or inadequate bile secretion. The lower animals apparently have no liver, but rudiments of a similar organ appear in forms quite low in the scale of life. All vertebrates, except the lancelet, have a well-defined liver. This organ is found in many of the invertebrate animals. As we ascend the scale of animal life the liver assumes perfect form with much rapidity, and in the higher vertebrates it is very similar to the liver of man. See **Bile; Digestion**.

**LIVERPOOL** (lĭv'ēr-pōōl), the most important seaport of Great Britain, in Lancashire, England, on the Mersey River, three miles from the Irish Sea. Next to London, it is the largest and wealthiest city of the British Isles. It has extensive railroad connections, uniting it with all the trade emporiums of England and Scotland. The city is supplied with modern municipal facilities, including telephones, gas and electric lights, sewerage, pavements, public parks, and electric street railways. The wharves and docks are commodious and extensive, and are crowded with vessels that communicate with all parts of the world. Many of the thoroughfares extend from the margin of the river to the higher land some distance inland, where the general elevation is about 250 feet. They are mostly platted at right angles and kept remarkably clean in the better residential quarters. In several parts of the city are elevated railways.

Liverpool is generally well built. The noteworthy buildings include Saint George's Hall, the free public library, the Walker Art Gallery, the townhall, the Picton Lecture Hall, and the union railway station. It is the seat of the Liverpool College, Queen's College, Liverpool Institute, and University College; the last named has sixty professors and 750 students. It has many business colleges and schools of law, art, medicine, engineering, and charitable and benevolent societies. The places of worship are very numerous, a total of about 400 buildings, and represent all of the leading Christian denominations. It has many fine monuments, statues, boulevards, and public parks. Among the manufactures are cotton and woollen goods, spirituous liquors, cordage, ironware, sugar, clothing, chemicals, steamships, tobacco, and machinery. It is noted as the principal port for the departure of emigrants from Great Brit-

ain. The export and import trade is very extensive, and embraces all classes of products produced and consumed in the United Kingdom.

Liverpool was founded in 1190. At the middle of the 14th century it had a population of 840, but in 1561 it had declined to only 690. In 1647 it was made a free port, from which time its prosperity dates, being stimulated especially by its large trade in cotton. Docks were not built until 1700. Since then the dockage capacity has been enlarged until at present these improvements include a large area of water surface. The more recent improvements of value in promoting growth include the construction of a railway tunnel, in 1885, under the Mersey, by which connection is formed with Berkenshire; the opening of a ship canal to Manchester, in 1894; and the construction of an overhead railway in the same year. Politically Liverpool is strongly Conservative and sends nine members to Parliament. Population, 1907, 746,144.

**LIVERWORT** (lĭv'ēr-wŭrt), the name of any plant belonging to certain cellular cryptogams, comprising one of the two suborders of the *bryophytes*, the other suborder being the *mosses*. The liverworts rank next to the lichens, and in a higher development of their several organs are closely related to the true mosses. They grow in damp places, either on the ground or on trees and decaying wood. The tissue is closely cellular. They have an axis or stem which sends out roots from its under side, which is furnished with distinct leaves, or with leaves so intimately united to each other as to assume the form of a frond. The reproductive organs, differently situated in different species, are of two kinds, known as the *sexual* and *asexual*. The liverworts are native to all climates where there is sufficient shade and moisture. They are of very little known utility from an economic point of view.

**LIVINGSTON** (lĭv'ĭng-stŭn), a city of Montana, county seat of Park County, 122 miles southeast of Helena. It is finely located on the Yellowstone River and the Northern Pacific Railway, and a branch line extends to Yellowstone National Park, the entrance to which is about thirty miles south of Livingston. Electric lighting, waterworks, and several fine school buildings are among the public improvements. The surrounding country has large interests in farming and mining, hence it is the center of considerable trade in live stock, merchandise,

coal, and lumber. It has a fine railway depot and extensive roundhouses and machine shops. Population, 1900, 2,778; in 1910, 5,359.

**LIVRE** (lĭv'ēr), the name of a coin formerly used in France, but superseded in 1895 by the franc. It had a value of 81 as compared to the value of 80 francs. The same name was applied to a weight in France, which had a value of 17.267 oz. avoirdupois, but which was superseded by the kilogram.

**LIZARD** (lĭz'ērd), the popular name of an order of reptiles which have four well-developed limbs, each terminated by five toes of unequal length, and an elongated body. Many species are included in the order, the entire list embracing about 1,500. Fifteen genera have been described. They frequent regions from the Equator to high latitudes in the Temperate zones. In the tropical regions they are the most numerous and attain the largest size. The length of the body varies from a few inches to three or four feet. Some species are carnivorous in habit and feed on insects, small quadrupeds, and birds, but others live wholly by feeding on plants. The tail is long and powerful in most lizards, and this organ, like the legs, is reproduced in case it is lost. They propagate by laying eggs, which are hatched without care of the parents. The color is very various, most species having bright markings. A kind of lizard

LIZARD.

native to Mexico and Arizona is poisonous, the poison being connected with a grooved tooth, but all others are devoid of poison glands. The different families of the order embrace the iguanas, chameleons, skinks, and geckoes. In the winter time and during cold weather they are in a torpid state, but manifest much activity during the season of warmth.

**LLAMA** (lä'má), a ruminating quadruped closely allied to the camel, native to the southern parts of Peru and other sections of South America. Writers usually classify the llama, alpaca, vicuna, and guanaco as allied species, the former two being domesticated in large numbers and the latter living mostly in a wild state.

The llama is noted for its faithfulness in carrying commodities on its back and because of its ability to forage for its support, on account of which it is utilized in Peru and Chile as a beast of burden. The height is about three feet at the shoulder, and the color diversified, but usually is whitish or blackish. It has ability to travel about fourteen miles a day with a hundredweight across mountain districts. The hair

LLAMA.

is used in the manufacture of coarse material, and the flesh of young animals is valued for table use. Herds of llamas still frequent the plains of Patagonia and various places in the Andes Mountains, where they are hunted.

**LLANOS** (lă'nôz), the name applied by the Spanish to the level plains in the northern part of South America. They are situated principally in the basin of the Orinoco and in Colombia. In many places they are quite barren, but in some localities are good pasture and timbered areas. Similar plains are known as *pampas* in the southern part of that continent and as *savannas* in North America.

**LLOYD'S**, a vast corporation of London, having offices in the London Royal Exchange, so named because the early members met in a coffeehouse conducted in the 17th century by Edward Lloyd. The business of the corporation is to write insurance, collect and publish information in relation to commerce, and furnish a library, restaurant, and suitable quarters for

ship auctions. Membership is solicited with the understanding that those joining give security to discharge liabilities, and the general affairs are under the direction of a committee. The marine and general insurance carried by the company amounts to an average to about \$2,250,000,000. Among the publications are the daily *Lloyd's List*, the annual *Lloyd's Register of Foreign Shipping*, and several other periodicals.

**LOADSTONE** (lôd'stôn), or **Magnetic Iron Ore**, a mineral remarkable for its high magnetic quality. It consists of protoxide of iron mixed with peroxide of iron. It is found in primitive rocks, but sometimes in grains. The highly magnetic property caused the ancients to believe that it possesses a magical or divine effect, until the phenomena of magnetism became better understood. See **Magnet**.

**LOAM**, a mixture of various earths, but consisting principally of sand and clay, the latter predominating. With loam formations occur deposits of decayed animal and vegetable matter. Upon the proportion of the latter depends in a large measure the fertility of the soil.

**LOANDA** (lô-ăn'dà), **Saint Paul de**, a town of Angolia, a Portuguese possession of Western Africa, noted as a trading center. The noteworthy buildings include those of the government, a number of churches, a governor's residence, and a bishop's palace. The harbor is shallow, making it impossible for the larger vessels to reach nearer than one and a half miles from shore. It has several improved streets, modern municipal facilities, and railroad connections with interior points. Coffee, hides, ivory, palm oil, and grain are exported. About one-third of the inhabitants are Europeans. Population, 1907, 22,208.

**LOBELIA** (lô-bē'lî-à), a genus of herbs of the natural order *Lobeliaceae*. It includes many species that are widely distributed in various parts of the earth, but especially abundant in the tropical regions of America. They contain a milky juice, have alternate leaves, and produce many-seeded pods. The flowers and foliage are very beautiful. Several species possess medicinal properties useful for an expectorant and cathartic. The drugs obtained from these plants are prescribed in various doses for spasmodic asthma and as diuretics. When handled in a dry state, the herb irritates the throat and nostrils like tobacco. The medicinal preparations are known as the *tincture* and the *etheral tincture* of lobelia.

**LOBLOLLY PINE** (lôb'lôl-lÿ). See **Pine**.

**LOBSTER** (lôb'stêr), a marine crustacean which resembles a crawfish, but is much larger.

The common lobster of America is a typical species. It is ten-footed, has a long tail, is stalk-eyed, and often attains a weight of ten pounds. It is widely distributed in America, occurring in large numbers off the New England and New York coasts, but also in other waters of America and elsewhere. The front legs, which occur in pairs, are much enlarged and form the claws. Lobsters mostly frequent rocky coasts, feed on other animals, and have a bluish

LOBSTER.

or greenish colored shell, which becomes red by boiling. The tail spreads like a fan, is constituted of a number of flat plates, and serves in propelling the animal through the water. The young are able to swim with much rapidity, but the adults walk or crawl, and the molting occurs annually in adults. They are caught in baited traps for the market and are considered excellent food, the principal edible parts being the tail and claws. The season for catching is from the early part of October until May.

**LOBWORM**, or **Lugworm**, the name of a worm found in Europe and North America, used extensively for bait in fishing. It has a round head without eyes or jaws, and in size resembles the earthworm. It is found chiefly along the seashore, where it burrows in the sand, and its presence may be ascertained by noticing small coils of sand left while burrowing.

**LOCAL OPTION**, a term used in civics to express the right of determining certain measures of government by popular vote in each locality of a state or province, such as a county, township, or city. The term has come into extensive use in relation to the liquor traffic, and is applied to the system whereby each community may decide by vote whether or not the traffic may be licensed and maintained. In some states the local option is by petition, but it is exercised more commonly by an election.

**LOCH LEVEN** (lök lē'ven), a lake in the southeastern part of Scotland, 23 miles north-

west of Edinburgh. It has an area of 3,410 acres, is surrounded by prominent elevations, and drains to the Firth of Forth by the Leven. The lake has fine trout fisheries and several islands, the most important of the latter being Castle Island and Saint Serf's Inch. Mary, Queen of Scots, was imprisoned for ten months on one of these islands in 1567-68, and on July 4, 1567, signed her abdication.

**LOCH LOMOND** (lō'münd), the largest lake of Scotland, in the counties of Dumbarton and Stirling. It is surrounded by beautiful hills, has a number of wooded islands, and is noted for its excellent scenery. The length is about 22 miles and the breadth is from one to five miles. In its vicinity are several noted caves. Fifteen miles southeast of Loch Lomond is the city of Glasgow:

**LOCK**, an inclosure in a canal where boats are raised and lowered for the purpose of passing them from one level to another. It consists of a basin between the levels, having a pair of gates at each end communicating with the respective levels. In descending from a higher to a lower level the water is allowed to flood the lock until it reaches a common level with the water in which the vessel is located and, after the vessel enters, the lower gate is opened, whereby the vessel is lowered to a level corresponding to the surface of the next lower lock, and again moves forward. This operation is continued until the vessel is brought to the common level of the canal. When the boat is to attain a higher elevation, a process directly opposite is pursued. It would be quite impossible to build canals in many regions if it were not that a system of locks could be utilized.

**LOCK**, a fastening which has a bolt that is moved by a key, used to secure a door, lid, or other object against intrusion. Many different classes of locks are in use, depending upon the size and the character of the inclosure which is to be protected, and some of them date from the time of the Egyptians and Babylonians. For many years it was a matter of deep study to find how to construct a lock that no one could open unless he had a proper key. The first lock of this character was known as a combination lock and could be opened only by the proper key, after turning a knob on the outside for the purpose of placing the interior bolt in such a position that the key could be made to turn effectually. In 1820 an American inventor, Linus B. Yale, patented a lock that is combined with a clock mechanism, and by means of it the combination locks are so constructed that they can be opened only at a specified time.

The time locks and Yale locks with special keys are the ones used most extensively where large treasures and valuables are stored.

**LOCK HAVEN**, a city in Pennsylvania, county seat of Clinton County, on the Susquehanna River, 28 miles above Williamsport. It is on the Pennsylvania and the New York Central railroads and is surrounded by a rich farming and coal-mining country. The chief buildings include the county courthouse, the public library, the city hall, and the State Central Normal School. Among the manufactures are machinery, cigars, paper, leather, and earthenware. Pavements, electric lights, rapid transit, and waterworks are among the improvements. It was settled in 1769 and incorporated in 1833. Population, 1900, 7,210; in 1910, 7,772.

**LOCKPORT**, a city of New York, county seat of Niagara County, twenty miles east of Niagara Falls. It is on the Erie Canal and on the Erie and the New York Central railroads. The manufactures include woolen goods, paper, ironware, flour, machinery, engines, furniture, brooms, and carriages. Among the noteworthy buildings are the county courthouse, the high school, the Federal building, the Saint Joseph's Academy, and many churches. In its vicinity are productive limestone and sandstone quarries. Lockport was settled in 1825 and incorporated as a village in 1829, but was chartered as a city in 1865. Population, 1910, 17,970.

**LOCOFOCO** (lō-kō-fō'kō), the name of a radical faction in the Democratic party of New York, but later extended to an element in that party throughout the nation. It originated from a faction that opposed the rechartering of state and private banks by special legislation and advocated the rechartering of the United States bank. In 1835 there was formed in New York the Equal Rights party and a meeting of its representatives was held in Tammany Hall, of which the regular Tammany Democrats tried to gain control. When the latter found themselves outnumbered, they turned out the lights and retired, but the meeting was continued by the use of candles and locofoco matches. The Democratic newspapers began to call the faction Locofocos, and the name was later given to the whole Democratic party by the Whigs. This party was beaten at the election and through the efforts of President Van Buren became absorbed by the regular organization.

**LOCOMOTIVE** (lō'kō-mō-tiv). See **Steam Engine**.

**LOCUST** (lō'küst), the name of several species of trees of the order *Leguminosae*. They have a rough bark, pinnate leaves, and fragrant white flowers, and grow to a height of eighty

feet. The wood is pierced extensively by borers, but, when the bark is taken off and it is dried, it is serviceable in fencing, for furniture, machinery, railway sleepers, and in the construction of houses. The honey locust has pink flowers, which have a fine fragrance and grow in clusters. Several trees are closely allied, such as the *carob tree* and the *thorn acacia*, but they differ in minor points. The common honey locust is planted largely as an ornamental tree and for hedges, being suitable to bear trimming and dwarfing.

**LOCUST**, the name of several species of insects allied to grasshoppers and crickets. The term is applied conjointly by some writers with the name grasshopper to destructive and migratory species of insects common to many portions of the continents. However, the true locust is a distinct kind of orthopterous insect. Two particularly destructive species of these insects are found in America, one in the northeastern part of the United States and Canada, which is more properly the locust, and the other in the regions west of the Mississippi. Those common to the latter region have been especially destructive in parts of Texas, Colorado, Kansas, Nebraska, and Oklahoma at different times, but in recent years they have been less abundant. Species very similar have been known to swarm in vast numbers in various countries of Asia and Africa, darkening the sunlight in their flight. They devour all forms of vegetation. When most abundant in the Mississippi valley, they settled down in some regions in such large swarms that they destroyed all vegetable growth. In some places they accumulated so thickly upon the railways that it interfered with traffic.

The common locust has great leaping power because of its powerful hind legs, which are stronger than those of grasshoppers. They fly with a loud whizzing sound. The eggs are deposited in the earth by the females in the fall of the year and, when warmth returns the following spring, the young are hatched. The *Carolina locust* is pale yellowish-brown, has black wings, and is about one and a half inches long, the extended wings measuring three inches. It flies a considerable distance when it is disturbed by a traveler. The greatest danger to crops is while these insects are in an immature state, for soon after they take to wing and distribute in swarms. They sometimes effect much damage and cause disastrous famines in the regions where they settle.

The Arabs and some other nations use the locusts as an article of food. They are prepared for the table by pounding them into small particles and baking them as bread or frying them

as a delicacy in oil. In the island of Cyprus, India, China, and some of the American states preventive measures have been adopted by pulling large tanks of diluted kerosene across the ground. This serves to kill them by the thousands. Another method is to dig pits, lining them with zinc, and after the locusts fall in they are destroyed by fire or in some other way.

**LODI** (lō'dī), a city of Italy, in the province of Milan, on the Adda River, nineteen miles southeast of Milan. It is on several railways; has a Gothic cathedral erected in the 12th century, and contains important manufactures of silk and woolen goods, chemicals, and machinery. The old city of Lodi, situated about five miles west, is noted as the place where Napoleon forced the bridge on May 16, 1796, in spite of vigorous firing by the Austrian army. Population, 1906, 27,845.

**LODZ** (lōdz), a city of Russia, in the Polish government of Piotrków, on the Łódka River, 78 miles southwest of Warsaw. It is noted as a railroad and educational center, has electric lights and street railways, substantial pavements, public libraries, and a number of parks. The manufactures include cotton and woolen goods, machinery, earthenware, utensils, and vehicles. Large quantities of cereals and fruits are produced in the vicinity. The population is principally German. The city has had an extraordinary growth the past decade and has a large trade in merchandise. Population, 1906, 385,406.

**LOESS** (lēs), the name first applied to certain loose deposits along the Rhine, in Germany, and later extended to like formations in other countries. It has reference to a loamy or sandy deposit of the Pleistocene age. Loess is usually of a light yellow color and exceedingly fine, and somewhat resembles loose deposits of clay. It is thought that the loess deposits were formed at a time when the streams were broader and more sluggish than at present, and in some instances they are likely due to the action of glacial lakes. In the arid region of North America, extending southward from Alberta and Saskatchewan, these deposits are found in the valleys many hundreds of feet in depth. Along the Mississippi and Missouri rivers, especially in Iowa, are large bluffs of loess, such as are seen in the vicinity of Council Bluffs and Sioux City. Similar formations are more or less widely distributed in all the continents. As they contain the remains of considerable silt, many of these deposits are quite fertile, but they require more rainfall than loam, owing to their sandy character.

**LOFODEN** (lō-fō'den), or **Lofoten**, a chain

of islands situated northwest of Norway, stretching along the shore a distance of 175 miles. The area is 2,250 square miles. Much of the surface is mountainous, the highest elevation being about 3,500 feet. Among the larger islands are Hindö, Andö, Langö, Vest Vaagö, and Oest-Vaagö. The inhabitants engage largely in fishing and the cultivation of potatoes, oats, and barley. They rear cattle, horses, and poultry. The fisheries yield considerable quantities of cod, herring, lobsters, and oysters. A large trade is maintained in stockfish and cod-liver oil, but most of the fish are sold fresh. The celebrated Maelstrom off Norway is situated in their vicinity, being produced by the Great West Fiord flowing between the islands and the west coast of Norway. The Gulf Stream modifies the climate perceptibly, especially during the summer, and renders it favorable to sheep culture. Most of the inhabitants are Lapps and Scandinavians. Population, 1906, 42,972.

**LOG**, an apparatus for ascertaining the rate of a ship's speed in the sea. It is usually in the form of a triangular piece of wood, called the *log-chip*, curved at the bottom, and loaded so it may float upright in the water. A strong line is attached to the log-chip, being wound around a reel, the axis of which projects, allowing it to turn freely when held in the hollow of the thumb and fingers. The log-chip is placed in the water and remains at rest, while the ship moves continuously on, and the speed is measured by the rapidity with which the log line unwinds from the reel. The line is divided into sections and the rate at which the vessel sails is determined by the number of sections that pass from the reel in a given time, the time being measured by an hourglass, and the tests cover from twenty to thirty seconds of time. A *log book* is kept on the vessel, which contains a journal of the progress made from day to day, together with events occurring on board, the state of weather, the number and class of vessels sighted, and many other circumstances of interest in the tour. Most ships carry an official log book in which to keep an account of sickness, offenses committed, disobedience of officers, and all general matters pertaining to the crew and passengers.

**LOGAN** (lō'gan), a city in Utah, county seat of Cache County, on the Logan River, seventy miles north of Salt Lake City. It is on the Oregon Short Line Railroad and is surrounded by a rich farming and stock-raising country. An abundance of water power for manufacturing is obtained from the river. Among the noteworthy buildings are the State Agricultural College, the New Jersey Academy, the Brigham

Young College, the county courthouse, the high school, and a number of churches. It has manufactures of brick, beet sugar, clothing, hosiery, and machinery. The place was settled in 1859 and incorporated in 1866. Population, 1900, 5,451; in 1910, 7,522.

**LOGAN, Mount**, one of the highest mountains in North America, in the Dominion of Canada, near the Alaskan boundary, 26 miles northeast of Mount Saint Elias. In 1892 J. H. Turner, United States surveyor, placed its height at 19,514 feet, which is considerably higher than Mount Saint Elias, previously thought to be the most elevated peak in North America. It is exceeded in height by Mount McKinley.

**LOGANSPORT**, a city in Indiana, county seat of Cass County, at the confluence of the Eel and Wabash rivers, seventy miles north of Indianapolis. It is on the Wabash, the Vandalia, the Pittsburg, Cincinnati, Chicago and Saint Louis, and other railroads. Among the chief buildings are the county courthouse, the public library, the high school, the Holy Angels' Academy, and the Northern Indiana Hospital for the Insane. The municipal facilities include electric street railways, waterworks, sewerage, and several parks. It has manufactures of flour, ironware, machinery, woolen goods, clothing, cigars, and farming implements. The surrounding country is a fertile farming and dairying district. It contains natural gas and coal deposits. It was settled in the early part of the 19th century and was incorporated in 1838. Population, 1910, 19,050.

**LOGARITHM** (lög'ä-rith'm), one of a class of auxiliary numbers which are so related to the natural numbers that the multiplication and division of the latter may be performed by addition and subtraction. They facilitate the raising of numbers to powers and the extraction of roots by very simple multiplication and division. The logarithm of a number may be defined as the exponent of the power to which it is necessary to raise a fixed number, called the *base*, to produce the given number. The labor of performing these operations by the ordinary processes of arithmetic, when the numbers are composed of many figures, is very complicated. By the use of logarithms, for the invention of which we are indebted to John Napier (1550-1617), of Scotland, this labor is greatly diminished. However, several mathematicians have since prepared extensive tables so it is not difficult to perform these operations. In most tables the logarithms are calculated to base 10, but in the system of Napier the base is 2.718281828... The logarithm of 100 is 2, be-

cause 10 raised to the second power equals 100. Similarly, the logarithm of 1000 equals 3, of 10,000 equals 4, and so on. When the logarithms form series in an arithmetical progression, the corresponding natural numbers form a series in geometrical progression, thus:

Logarithms.....	0	1	2	3	4	5
Natural numbers.....	10	100	1000	10000	100000	

Between the numbers 1 and 10 the logarithms consist of decimals; between 10 and 100, of the integer 1 and a decimal; between 100 and 1000, of the integer 2 and a decimal, and so on. The integral part of a logarithm is called the *index* and is always less by one than the number of integer places in the corresponding natural number, hence the index of the logarithm of 3 is 0, of 30 is 1, of 300 is 2, etc. The decimal part of a logarithm is called the *mantissa*. The logarithms of decimals have negative indices and the number of units in the index is always greater by 1 than the number of ciphers immediately following the decimal point, hence the index of the logarithm of .3 is -1, of .03 is -2, of .003 is -3, etc. Karl Friedrich Gauss (1777-1855), the German mathematician, invented a system of logarithms which is of great value in astronomical computations.

**LOG BOOK**, a book kept on board a ship at sea, in which is entered the daily progress of the vessel, with notes on the weather and incidents of the voyage. The velocity of such a vessel is measured by a log, an apparatus constructed of a wooden float, weighted on one side to make it float upright, and the measurements are taken on a line, which is unwound from a light running reel, while the log remains stationary in the water as the ship moves forward. The results of these measurements are recorded in the log book together with other matters of interest, and usually the record is transcribed at noon. A log book is kept on all the vessels of the navy and the record is verified and signed each day. This record, when completed, is properly marked and filed for future reference in the Navy Department.

**LOGIC** (løj'ik), the science which treats of the formal laws of human thought. It deals with all the forms of thought, including conception, judgment, reasoning, and construction, and bases its principles on the logical axioms. As understood at present, it is a development and modification of the art of reasoning molded into consistent shape by Aristotle in his treatise entitled the "Organon of Aristotle." This work is based partly on the writings of Socrates, who treated the art in a general way, and notably on the treatises of Zeno of Elea. The Scholastics were the first to develop the logic of

Aristotle. They made the art an independent power in great theological debates. At the time of the Reformation, particularly in continental Europe, Scholasticism was depreciated, and down to the first half of the 19th century there was little dispute as to how logic should be defined, but since then have originated many different definitions.

According to Whately and Sir W. Hamilton, logic is limited in its application to the form of thought, and has nothing to do with the matter; that is, it deals with the form common to all reasonings, judgments, and concepts, but is not concerned about the content or subject of either. If this view is held, logic is only *deductive*, but John Stuart Mill founded the system of *inductive logic*, according to which the evidence, methods, and principles involved in scientific research must be regarded the principal subjects of interest in the art. Both the inductive and deductive systems are reviewed by the German philosopher Kant, who recognizes thought as the essential factor of cognition, thus holding the matter and not the form as the paramount element of importance in logic.

The system of Kant is now accepted as a standard, since it holds that thought or intelligence is realized through the system of forms used in logic, thus making thought instead of mere form the basic element in logical procedure. In method of procedure it is either inductive or deductive, the two methods being the reverse of each other. The former proceeds from particulars to the general, the latter from the general to particulars. One is a process of analysis, the other a process of synthesis. Logic is divided according to the forms of thought and expression into logic of concepts, treating of the term; logic of judgment, treating of the proposition; logic of reasoning, treating of the syllogism; and logic of construction, treating of the system.

**LOGWOOD** (lög'wōd), a tree which was originally found in Central America, but naturalized in and exported from Jamaica and other West Indian islands. It grows most vigorously in moist and swampy regions, has pinnate leaves and small yellowish flowers, and attains a height of from thirty to fifty feet. The wood is dense and solid, particularly the heartwood, which is so heavy that it sinks in water. This heartwood has a red color and is useful in the manufacture of dyestuff to produce dark red colors. To obtain the dyestuff the wood is ground into small pieces, after which the coloring matter is extracted, and, by applying alkalis, a purple color is secured, while acids give a paler tint to the red. The colors are not

permanent, but are made so by a mordant. When iron is used for mordanting the fabric, the color produced is black, but with chromium a green or black is secured, and with alumina a lilac and violet are obtained. Logwood dyes depend upon the crystalline principle known as

LOGWOOD, FLOWER AND SEEDS.

*haematoxylin*. They are used largely in giving a black or brown color to calico, in making ink, and for producing colors useful in painting. An astringent medicine is also extracted from logwood.

**LOIRE** (lwär), the most important river of France. Its source is in the Cevennes Mountains, from which it has a northwesterly course to Orleans, and thence flows nearly west into the Bay of Biscay. Canals connect it with the Seine, the Saone, and the harbor of Brest. Its basin, which includes about one-fourth of France, is noted for fertility of soil and much wealth. The entire length is 625 miles, of which about 500 miles are navigable. On its banks are the cities of Nantes, Mayenne, Vienne, and Allier.

**LOLLARDS**, the name of adherents to a semi-monastic society of the Netherlands. This organization was formed in Antwerp and Brabant about 1300. The chief object was to care for the sick and look after the burial of the dead. The name Lollards was applied to the followers of Wycliffe in England near the end of the 14th century. Oxford was long a central point of influence, whence the Lollards went to the smaller villages to preach a simple gospel. Later they developed certain economic theories

of a socialistic nature and were persecuted by the authorities, especially in the time of James IV. of Scotland and Henry V. of England.

**LOMBARDS** (löm'bērdz), a people distinguished for great valor in the early history of Europe, so named from the long spears they carried, or from their long beards. They were a branch of the Germans, occupied originally the regions of the Lower Elbe, and in the 4th century began to resist the Roman invasions. In the early part of the 6th century they came in contact with the Eastern Roman Empire by pressing southeast into the valley of the Danube. Later, in 568, their king Alboin invaded Italy, where they operated in conjunction with the Saxons and occupied the northern section, which has since been known as Lombardy. They did not only establish themselves firmly, but built churches and monasteries of much beauty, founded cities, and gradually became assimilated by the Italians. The Lombards possessed powerful kings in Autharis, Rotharis, and Luitprand, the last named securing temporary dominion over all of Italy. In 774 the last king of Lombardy, Desiderius, was overthrown at Pavia by Charlemagne, who became King of the Lombards and Franks. They embraced Christianity in the early part of the 7th century, made extensive internal improvements, and carried on a large foreign trade, Lombard street in London deriving its name from their business relations.

The *Lombard Architecture* is an outgrowth of the Lombards and the Gothic invaders of northern Italy. It dates properly from the early part of the 9th century to the 13th century, and was derived from the more inferior Roman style. Many buildings of this style of architecture still remain. Examples of it occur in Italy and in the continent as far north as the Baltic in Germany, the connection between the two countries coming about during the existence of the former German Empire, or Holy Roman Empire, which included Italy. The most important of those remaining are in Italy. They embrace churches and other buildings, notably in Verona, Pavia, and Milan, the Saint Michael Church at Pavia being the most prominent representative. The architecture differs from the classic largely in that it has a preponderance of vertical lines instead of horizontal, and in that it utilizes the dome extensively. Both the grouping of piers and the arrangement of the transepts and choir are highly artistic.

**LOMBARDY** (löm'bār-dī), a region of northern Italy, extending originally from the Alps to the Po River, so named from the Lombards. The region belonged to the Romans

prior to the Lombard invasion. In 774 it fell to Charlemagne, then passed consecutively to Germany and Spain, and in 1815 became a part of Austria, but since 1859 it has belonged to Italy. A department of Italy is now known as Lombardy, but it does not include all of the region formerly known by that name. It includes the seven provinces of Brescia, Como, Bergamo, Pavia, Milan, Cremona, and Sondrio. The area is 9,085 square miles. Formerly the province of Mantua was included also, but it is now a part of Venetia.

**LOMBOK** (löm-bök'), an island in the Indian archipelago, belonging to the Netherlands. The area is 2,108 square miles. It is situated a short distance east of Java, between the islands of Bali and Sumbawa. The island is of volcanic origin and has several mountain ranges, but is well watered and fertile. Among the products are cereals, fruits, live stock, tobacco, and coffee. Most of the inhabitants are Mohammedans. Mataram is the capital. Population, 1906, 644,208.

**LONDON** (lün'dūn), the capital of the British Empire, in the southeastern part of England, on the Thames River, about sixty miles from the sea. It is the most populous city in the world. It is located on both sides of the Thames River, which is spanned by many fine bridges. The river at this place is from 600 to 900 feet wide and flows slowly, and vast improvements by deepening and canalizing have tended to make it the center of an extensive system of navigation. Numerous railways extend from it to all parts of the United Kingdom, and it has additional transportation facilities by a vast network of electric railway lines.

**DESCRIPTION.** London is built on a low and level tract of land, hence there is no point of vantage from which the whole city may be viewed even on the clearest day. The Fire Monument, situated near the center of the city, affords the best view, but it is not sufficiently elevated to permit seeing beyond the outskirts of the closely constructed buildings. Many of the streets are narrow and crooked, hence pure air and sunshine are wanting in many of the more densely populated districts. Fog and mist characterize the atmosphere, due to the close proximity to the sea, and the bright sky of Paris and Berlin is wanting. This circumstance, taken in connection with the exclusive use of bituminous coal for domestic and manufacturing purposes, causes the aspect to be dark and gloomy the greater part of the day. London has a mean annual temperature of 50°, ranging from 40° in the winter to 62° in the summer, and the annual rainfall is about 25 inches.

The Thames River passes from east to west through the city. South of it are the counties of Kent and Surrey, which contain the portion that is of lesser importance. The county of Middlesex is north of the river. All of the larger commercial institutions are in the East End, which contains the customhouse, the docks, the general post office, the Bank of England, the Saint Paul's Cathedral, and other noted structures. However, the East End also contains the poorest quarters, in which myriads live in want and disease. Here and in some of the narrow streets in the Lambeth and Bermondsey districts, south of the Thames, are the abodes of many of the poorer classes. The West End contains the homes of many wealthy and fashionable people, especially in the neighborhood of Hyde Park and Kensington Gardens. In this section are many fine residences of the aristocracy, located a short distance from the government offices, the British Museum, the royal palaces, and the houses of Parliament. Formerly the palaces of the nobility were located within an area of 673 acres, but they were driven farther west through the extension of trade, and the limits of London proper embrace chiefly warehouses, banks, and office buildings. During the night it is almost deserted, while in daytime more than a million persons work within the confines of what is generally known as the Old City.

**STREETS AND PARKS.** The streets in the business districts are inadequate, since they are congested by the heavy traffic during the day. Many of the thoroughfares have been widened, but no general system of improvement in this line has been carried out. Along the Thames extends the Victoria Embankment, which is one of the most noted thoroughfares of the city. It affords communication along the north shore of the river eastward from the houses of Parliament, and is adorned by many fine statues and shrubbery. The most fashionable shops are on Regent Street, and numerous substantial structures of comparatively recent date have been erected on Oxford Street and its continuations. Fleet Street is devoted largely to the newspaper trade, Paternoster Row is headquarters for the book business, and the Haymarket has many fine hotels and theaters. Club life is well represented on Pall Mall, the jewelry trade is centered on Bond Street, and the police court is on Bow Street. Piccadilly has many fine shops and clubhouses. The Strand, Cheapside, and Holborn are other noted business streets, and they are particularly noted for being uncomfortably crowded during the day.

The parks and squares of London, though

very numerous, are inadequate to the requirement of so large a population. Trafalgar Square, one of the finest in the city, is surrounded by many fine buildings, including art galleries, hotels, and churches. Lincoln's Inn Fields, surrounded by offices of the law fraternity, is the largest open ground in the city. Hyde Park, containing 400 acres, is located between Mayfair and Kensington Gardens, and is surrounded by a noted carriage drive. Green Park and Saint James's Park, near Trafalgar Square, are among the royal parks that have been opened to the public. Greenwich Observatory, in the southern part of the city, is surrounded by the beautiful Greenwich Park. Black Heath and Hampstead Heath are among the many heaths, or commons, preserved for the use of the people in their natural condition. Many of the public places are adorned by monuments. These include Cleopatra's Needle, on the Thames embankment; the Nelson Column, in Trafalgar Square; the monument to commemorate the great fire of London, on Fish Street Hill; the national memorial to Victoria, in front of Buckingham Palace; the colossal statue of Achilles, at Hyde Park; and the Albert memorial, at Kensington Gardens.

**BUILDINGS.** London has many magnificent buildings, the most important of which include those erected by the government. The houses of Parliament, located on the banks of the Thames, are among the largest Gothic structures in the world. They cover eight acres, have a river front of 940 feet, and were erected at a cost of about \$15,000,000. Saint Paul's Cathedral, whose dome may be seen from most parts of the city, is a fine monumental structure. The Tower, formerly the scene of crimes and suffering, but now an arsenal and armory, is situated near the banks of the Thames. The Lord Mayor of London has his official residence in the Mansion House in the Poultry, a structure in the Corinthian style. Buckingham Palace, Saint James's, and Marlborough House are buildings of much historical interest. The British Museum contains a valuable national collection, which embraces specimens that represent all the arts and sciences and cover all the centuries included in the history of man.

Facing Piccadilly is the Royal Academy of Art, noted for its annual exhibition of sculptures and paintings. A great variety of art products are located in the Victoria and Albert Museum. The churches include White Field's Chapel, Saint Paul's Cathedral, Westminster Abbey, Saint George's Church, Saint Giles's, Saint Bartholomew the Great, and Saint Mary le Bone. Besides the fine system of public

schools, London has many noted institutions of higher learning. These embrace the University of London, Westminster School, Charter House School, Saint Paul's College, College of Physicians, and The Inns of Court. The more prominent theaters include the Covent Garden Theater, the Haymarket, the Drury Lane Theater, the Adelphi, the Strand, the Criterion, and Daly's Theater.

**INDUSTRIES.** London has a large domestic and foreign commerce. It is connected by steamship lines with Bremen, Hamburg, Antwerp, and other cities of Europe and the continents of both hemispheres. Being the largest consumer of food supplies in the world, it has a small export trade compared with the imports. Much of the foreign trade is with the East and West Indies and the colonies of Great Britain. The chief imports include tea, coffee, rice, sugar, tobacco, raw cotton, spices, petroleum, and fruits. London is the leading manufacturing city of Great Britain and the products make up an almost endless list. Though manufacturing enterprises are located in different parts of the city, they are more largely represented in a section extending in a semi-circle to the south and east. Among the principal products are clothing, furniture, machinery, glass, pottery, jewelry, clocks and watches, chemicals, saddlery, musical and surgical instruments, and spirituous liquors.

**COMMUNICATION.** London has one of the most efficient underground railways in the world, furnishing connections between the different parts of the city and the great railway terminal stations. About a million persons enter the city every morning, hence the enterprise of furnishing communication is very important. The London Bridge, which furnishes the chief communication over the Thames, is crossed by about 350,000 persons every day. Many stations of the underground railways are located within the city, such as Victoria, Waterloo, and London Bridge, and at many underground points are numerous shops. Four tunnels pass under the Thames, hence communication is continuous

between the north and south sides of the river, which is also crossed by many bridges and lines of ferries. Extensive tramways and electric street railways are in operation, but considerable communication is still furnished by horse cars. Carriages, cabs, and omnibuses supply a larger per cent, of the communication than is the case in American cities. It is customary in London to summon a cab by blowing a whistle at the doorstep.

**GOVERNMENT.** The government of London has been evolved from an experience extending over a long period of time, but the form now in force dates from 1900, when the administration was greatly simplified by consolidating various districts. At present the British government exercises the central control, and the du-

PARLIAMENT BUILDING AT LONDON.

ties and powers of the local authorities are defined and limited by acts of Parliament. Control is exercised over various local authorities by certain departments of the general government, similar in at least some respects to the influence of the national government of the United States over various regulations in the District of Columbia. For instance, the public utilities, such as electric lighting, are under the supervision of the Board of Trade. The board of control has certain jurisdiction over the parks and commons, while the board of education may withhold the government grant from a district where the school system is not maintained with a certain degree of proficiency. A special act of Parliament is required before local bodies can negotiate a municipal loan. From this it will be seen that the city must be

understood from various standpoints in order to appreciate the effort put forth by so vast a number of people to live together in the metropolis of the British Empire.

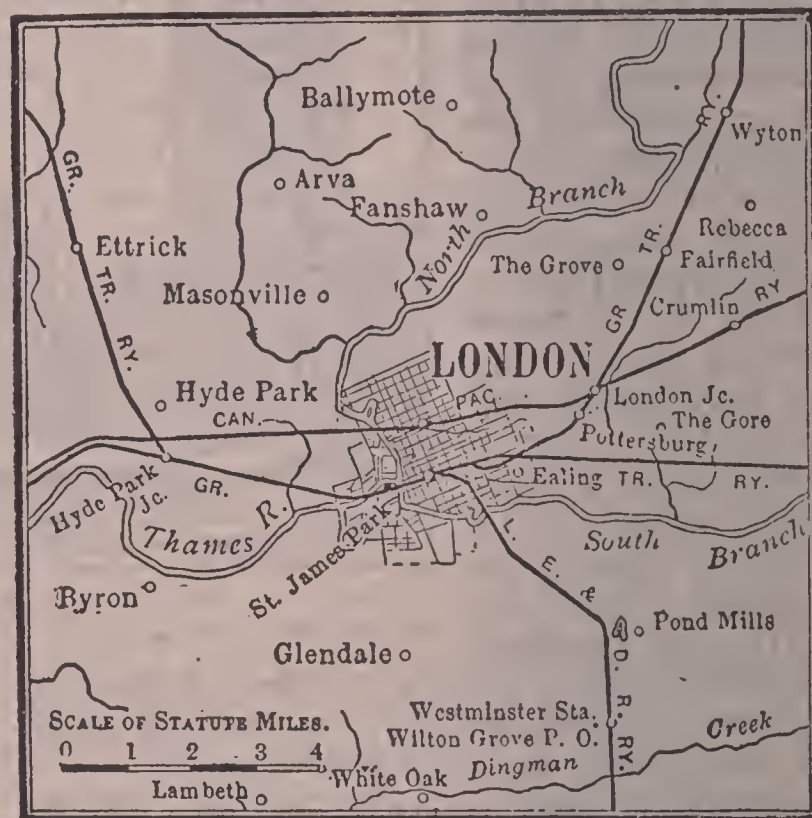

At least four Londons may be enumerated: One known as the ancient city of London, another under the county council, a third including boroughs for parliamentary representation, and a fourth embracing a number of suburbs. The first mentioned has come down from the Middle Ages, and has its own police regulations, a common council, and the chief executive, who is known as the Lord Mayor. All the affairs of the ancient city are controlled by the city government, except the main drainage system. The London under the county council is outside of the ancient city, but it does not include the urban district which has been annexed to form Greater London. The city is divided into thirty parliamentary boroughs, from which 58 members are returned to Parliament. A mayor, aldermen, and a common council comprise the chief officials of each administrative district, and these are responsible only to the central government, except that some minor matters are directed by the common council of London. The police force of the entire city is under the government of Great Britain, consisting of about 16,500 men, and the central offices are at New Scotland Yard, located near Westminster Bridge. For postal purposes Greater London is divided into a number of districts, and the delivery of mail is free.

**INHABITANTS.** The city contains a large mixture of different races of people. More than half of the inhabitants were born in London. The most numerous of those not English are included in the following: Irish, 300,000; Scotch, 185,000; Germans, 165,000; French, 60,000; and Jews, 50,000. In 1907 the county and city of London had a population of 4,758,218. In the same year Greater London had a population of 7,217,941.

**HISTORY.** The history of London begins about the year 43 A. D., when the Romans were in possession of the southern part of Britain and founded a military station on the present site of London. An insurrection of the British led by Boadicea caused it to be burned in 61 A. D. It was the center of various disturbances until about 306, when Constantine constructed walls and fortifications, and thereby established stability and laid a firm basis for commercial prosperity. From 369 until 412 it was the capital of Britain, when it was known as Augusta. Subsequently it became the chief seat of the Saxons. King Alfred expelled the Danes and fortified the city. It became famous as a com-

mercial center at the beginning of the reign of Edward III. In 1664-66 the plague raged, when about 69,000 persons succumbed to the dreaded disease, and in the latter year a destructive fire spread over 340 acres, burning about 15,000 houses. From these calamities the city recovered with marked rapidity. The Bank of England was established in 1694, Sir Hans Sloane founded the British Museum in 1759, the old walls were torn down in 1760, and about that time the streets were improved by pavements, lighting, and efficient sanitary regulations. In 1840 the present parliamentary buildings were commenced, and in rapid succession followed the construction of great aqueducts, parks, street railway lines, and many other modern municipal improvements.

**LONDON**, a city of Ontario, county seat of Middlesex County, on the Thames River, 121 miles southwest of Toronto. It is on the Canadian Pacific, the Erie and Detroit, and the Grand Trunk railways. The chief buildings include the county courthouse, the public library,

the Western University, Hellmuth's Ladies' College, and Huron College. It has gas and electric lighting, systems of sewerage and waterworks, and electric street railways. The manufactures include boots and shoes, leather, flour, ironware, chemicals, machinery, cigars, woolen goods, suspenders, and utensils. The surrounding country is agricultural and stock producing. London was platted as a town in 1826. Population, 1901, 37,981.

**LONDON, University of**, an institution of higher learning at London, England, founded in 1827. It was originally known as University

College, but in 1836 two charters were granted, one establishing University College and the other London University, the latter having power to grant degrees, but the former serving as a preparatory institution for the university proper. In 1878 these institutions were made coeducational. Admission may be secured at the age of sixteen years. Extensive courses are maintained. In connection with the institution is a fine library. In 1908 it had an attendance of 998 students, besides many evening students.

**LONDONDERRY** (lŭn'dŭn-dĕr-rĭ), or **Derry**, a city and seaport of Ireland, capital of a county of the same name, on the Foyle, three miles from Lough Foyle. It is connected with Waterside, an extensive suburb across the Foyle, by an iron and steel bridge. The chief buildings include the county courthouse, the Anglican and Catholic cathedrals, the public library, the Gwyn's School, and Magee College. It has railway communication, modern municipal facilities, and manufactures of spirituous liquors, shirts, ironware, lumber products, and ships. It is the residence of a bishop. The monastery of Saint Columba was founded on its site in 546, around which the city developed. In the early period of the Reformation in Britain it became a stronghold of Protestantism and in 1689 was besieged by James II. Population, 1906, 41,082.

**LONG BRANCH**, a town of Monmouth County, New Jersey, at the mouth of the South Shrewsbury River, 28 miles south of New York City. It is on the Central of New Jersey, the New Jersey Southern, and the Pennsylvania railroads. Electric street and interurban railways connect it with the beach and with other localities. It is noted as a fashionable summer resort, having many commodious hotels, fine residences, and a life-saving station. The town stretches about five miles along the beach. It has manufactures of shirts, flour, lumber products, asphalt, and machinery. Long Branch was settled in 1670 and has been popular as a summer resort since 1790. The summer population often exceeds 30,000, but the permanent population, according to the census of 1910, is 13,298.

**LONGEVITY** (lŏn-jĕv'ĭ-tĭ), the term employed to designate the duration of life of a people or an individual. Careful investigation has proved that women have an average duration of life somewhat longer than that of men, while a people combining intellect with virtue possesses the greatest longevity. In studying the tendency to live long three elements are taken into account: longevity, fecundity, and vigor. Human life does not generally reach seventy years, while ninety is very rare, but

there are instances in which persons of regular habits and extraordinary physical strength endured more than one hundred years. The elephant and the whale live to exceed a hundred years. Some writers assert that the swan, goose, and heron sometimes exceed a hundred years, but the instances are rare, and some fish are said to live 150 years.

The greatest duration of human life mentioned in writings coming to us from ancient times is that spoken of in the Bible, especially in the time before the deluge. Methuselah's age was 969 years, being the greatest on record, but some have subjected the accuracy of the record to adverse criticism. It is recorded that Abraham was 175; Isaac, 180; Jacob, 147; and Joseph, 110 years at the time of death. The average age of man was reported at 35.2 years by the census of the United States in 1900.

**LONG ISLAND**, an island of the United States, situated between Long Island Sound and the Atlantic Ocean, forming a part of the State of New York. The length from east to west is 117 miles, the width is from ten to 24 miles, and the area is 1,682 square miles. It is separated from New York City by the East River. Near it are several small islands. It has an undulating surface and contains a number of small lakes. Formerly the island was covered by a heavy growth of timber and still has small tracts of primitive forest, consisting largely of oak, chestnut, hickory, and pine. Much of the soil is productive, especially in the northern part, but in the southern portion are a number of sandy plains and a series of lagoons. The fisheries yield oysters and many species of fish. The coast has several large bays, supplying many convenient harbors, and railroad lines traverse its entire length. Coney Island is noted as a summer resort and Brooklyn is the principal city, but it was annexed to Greater New York in 1898. Long Island is subdivided into the four counties of Kings, Queens, Suffolk, and Nassau, Kings being entirely and Queens being partly in New York City. The Dutch founded the first settlement at the western end of the island in 1622. It was in the hands of the British during the greater part of the Revolution.

**LONG ISLAND, Battle of**, an engagement of the American Revolution, fought at Brooklyn Heights on Aug. 27, 1776. Washington occupied a strong position on Brooklyn Heights with 8,500 men and was attacked by 15,000 British under General Howe. The American outposts were commanded by Generals Sterling and Sullivan, who were routed and captured, the British losing 400 and the Americans about 1,400 in

killed and captured. During the night Washington conveyed his army over to New York, thus saving it from being captured.

**LONG ISLAND SOUND**, an extension of the Atlantic Ocean between Connecticut and Long Island. Its width is from three to twenty miles. The greatest depth is about 200 feet and it is navigable for the largest vessels. Several lighthouses are on or near its shore. The strait called East River connects it with New York Bay. It receives the water flowing from the Connecticut, Housatonic, Thames, and other rivers. The sound has valuable fisheries and is important as a sailing route to and from New York City.

**LONGITUDE** (lŏn'jĭ-tūd), the distance measured in degrees on the earth's surface due east and west from a given meridian. Latitude and longitude enable us to locate the exact position of a place upon a globe or map. Longitude is measured along the Equator or a parallel of latitude, and is generally reckoned from the meridians of Washington, Greenwich, Berlin, or Paris, the larger number of school texts used in America giving longitude east or west of Washington or of both Washington and Greenwich. It is expressed in degrees, minutes, and seconds, or in time, 15° being equal to one hour. At the conventional point the longitude is 0°, and degrees of longitude are reckoned east and west from it to 180°, or to twelve hours in time. The reason that degrees, minutes, and seconds of longitude are reduced to equivalent denominations of time by dividing by fifteen is that the earth turns through 360° of longitude from west to east in 24 hours, or 15° in one hour. At the Equator degrees of longitude are longest, being generally stated at 69½ statute miles, but more properly at 69.16 miles, while at the poles they are designated 0°. The cause of degrees of longitude being shorter as we approach the poles is due to the fact that the earth is a sphere. See **Latitude**.

**LONG PARLIAMENT**, a term used to designate the fifth Parliament summoned by Charles I. of England. It met Nov. 3, 1640, was twice expelled and twice restored, and dissolved of its own accord March 16, 1660. The name *Rump Parliament* is given to the members who remained, about sixty, after the others had been expelled by the army after the treaty of Newport was concluded, in 1648. It was the Rump Parliament that executed Charles I.

**LOO-CHOO**, Liu Kiu, or Riu Kiu, a chain of islands in the Pacific Ocean, between Formosa and Japan. The chain includes 55 islands and islets, 36 being inhabited, and the area is

934 square miles. It is of volcanic origin, but has a fertile soil and is populated principally with descendants of the Japanese. However, the prevailing customs are mainly of Chinese origin. Among the products are minerals, wheat, rice, sugar cane, maize, sago, sweet potatoes, tobacco, indigo, fish, domestic animals, and many varieties of fruits. Great Loo-Choo and Oshima are the two largest of the group, the former having an area of 500 and the latter of 290 square miles. The islands have belonged to Japan since 1774. They contain several market towns, among them Napa and Shuri, the latter being the capital. Population, 1908, 458,628.

**LOOM**, a machine in which yarn or thread is woven into fabric by the intercrossing of threads called *warp*, or *chain*, running lengthwise, with others called *woof*, *weft*, or *filling*. Looms were used for weaving fabrics by peoples in remote antiquity, Pliny attributing the invention of cotton weaving to Semiramis. The looms of Babylon maintained their celebrity long after the fall of the Assyrian Empire. The first machine-power loom was invented by Cartwright of England in 1787, since which time many valuable improvements have been made, but hand looms are still used for some purposes and in countries where manufacturing has not been modernized.

The principal parts of a loom are its frame, in which the row of yarn that forms the warp is held, and the harness or leshes, which govern the interlacing of the threads to form a shed for the woof. In 1876 an important improvement was made in the manufacture of looms by the Hunt Loom and Fabric Company of San Francisco. This consists of an attachment by which the loom becomes self-feeding and overcomes the waste of weft. In this machine there is no intermission in the operation of weaving, except to make repairs, and, if a break of the warp thread occurs, the loom is stopped automatically and a signal bell rings. This invention has made it possible for a large number of looms to be operated by a single attendant. Looms of different construction are used in the manufacture of all classes of fabrics, such as silk, woolen, cotton, and linen goods. They are employed in the manufacture of different classes of cloths, matting, and carpeting.

**LOPE DE VEGA**. See **Vega**.

**LOQUAT** (lŏ'kwät), a shrub native to China and Japan, but cultivated for its fruit in the warmer parts of the temperate regions. It grows to a height of about twenty feet, but yields the best returns when it is trimmed so as not to exceed twelve feet in height. The leaves are wrinkled and oblong, and the fruit is pear-

shaped and about an inch in diameter. Several species are grown in the United States, chiefly in Florida and California, and the seeds are used as a flavoring to tarts.

**LORAIN** (lō-rān'), a city of Ohio, in Lorain County, on Lake Erie, 24 miles west of Cleveland. It is on the New York, Chicago and Saint Louis, the Baltimore and Ohio, and other railroads, and has communication by steamboats and electric railways. Coal and natural gas are obtained in the vicinity. It has a public library, the Saint Joseph's Hospital, a fine high school, and many churches. The manufactures include iron and brass wares, clothing, earthenware, and machinery. It is the seat of the Johnson Steel Works, at which about 2,000 persons are employed. The place was first settled in 1822, became a town in 1875, and was chartered as a city in 1895. Population, 1910, 28,883.

**LORCA** (lōr'kā), a city of southern Spain, in the province of Murcia, 42 miles southwest of the city of Murcia. The surrounding country is fertile and contains lead mines. Lorca consists of two portions, the old and the new towns, the former dating from the time of the Moors. Among the chief buildings are the cathedral, the public library, the castle, and several schools and convents. The manufactures include linen and woolen goods, soap, leather, machinery, and earthenware. Lorca has modern facilities, such as electric lighting and street railways. Population, 1906, 71,147.

**LORELEI** (lō'rā-lī), a precipitous elevation on the Rhine River, half a mile above Saint Goar, Germany. It has a height of 427 feet, is now penetrated by a railway tunnel, and was made famous by Heine's celebrated "Volkslied." This exquisite poem represents a siren seated upon the Lorelei, by whose charms and beautiful song boatmen were attracted to a whirlpool at the base of the rock and there met destruction. The scenery at the cliff is the most beautiful on the Rhine, and near it is a basin noted for its productive trout fishery.

**LORETO** (lō-rā'tō), or **Loretto**, a small town of Italy, situated on a railway line, about fifteen miles south of Ancona and three miles west of the Adriatic. It is noted as the seat of the Holy House, which, according to tradition, was occupied as a dwelling by the Virgin Mary at Nazareth and, in 1295, removed to Loreto. The building was originally of simple construction, but it has been finely improved by sculptures in marble. The town is visited by many tourists annually, who go there to view the structure and witness an image of the Virgin, which is reputed to be a carving by Saint Luke. Population, 1906, 7,948.

**LORETO, Sisters of**, an order of Roman Catholic nuns, so named from the town of Loreto, Italy. It was founded by Charles Nerinck in 1812 and the first community was established in Kentucky, since which time it has spread rapidly, devoting its efforts to the care and education of poor orphans. The principal academy of the order is situated at Florissant, Mo. In 1908 it had 602 sisters and 65 academies and parochial schools.

**LORIS** (lō'rīs), the name of two species of lemurs native to Asia. They differ from the true lemurs in having a round head, large eyes, and no tail. They spend the larger part of the day by sleeping in the branches of trees, but come out at night in search of food, which consists of insects, small birds, and fruits. These animals are small, about as large as the domestic cat.

**LORRAINE** (lō-rān'), called *Lothringen* in German, a region of Europe, so named because it formed a possession of King Lothaire II. Originally it included Friesland, Alsace, and the regions lying between the Meuse, Rhine, and Scheldt, and in 954 became divided into Upper and Lower Lorraine. The latter now forms a portion of the kingdoms of Belgium and Holland, being known in Belgium as Brabant and as Brabant and Guelderland in Holland. France secured Upper Lorraine in 1766, but at the close of the war between Germany and France, in 1870-71, a large portion of it was ceded to Germany. The German portion includes the two fortified cities of Metz and Thionville and embraces part of Alsace-Lorraine (q. v.).

**LOS ANGELES** (lōs ān'gĕl-ēs), a city of California, county seat of Los Angeles County, 475 miles southeast of San Francisco. It is finely located on the Los Angeles River, about 20 miles from its entrance into the Pacific, and is on the Southern Pacific, the San Pedro, Los Angeles and Salt Lake, and the Atchison, Topeka and Santa Fé railroads. San Pedro, its seaport, is 25 miles distant, but the Pacific Ocean is only fifteen miles west, and north of it are ranges of the Sierra Madre. It is noted for its healthful climate and beautiful location.

The streets are broad and regularly platted and many of them are substantially paved with asphalt, stone, and brick. Fine gardens, vineyards, and orange groves surround the city. It is beautified with fine shrubs, flowers, and avenues of eucalyptus, palmetto palms, and other trees. Near the city are a number of celebrated health and seaside resorts, hence it is visited by many tourists at practically all times of the year. An extensive system of street

railways provide urban, suburban, and interurban communication. Griffith Park, located in the foothills near the city, is a beautiful public place. Elysian Park contains the famous Fremont's Gate, erected in honor of General Frémont, and is celebrated for its great variety of flowers and shrubs. The parks as a whole contain about 3,850 acres and without a doubt are equal to the finest public grounds in the United States.

The architecture is modern and substantial. The public buildings include the county courthouse, the city hall, and the Federal building. Among the notable structures erected through private enterprises are the opera house, the Huntington building, and a number of fine hotels, including the Angelus and the Lankershim. It is the seat of a State normal school, the University of Southern California, the Saint Vincent's College, and the Occidental College. Among the notable churches are the Roman Catholic Cathedral, the First Congregational, the Saint Paul's Cathedral (Episcopal), the First Methodist Episcopal, and the Old Plaza Church, once the headquarters of General Frémont. The public library has about 100,000 volumes. The city has several hospitals, a number of fine public schools, and beautiful cemeteries.

Los Angeles is surrounded by a fruit-growing country and is in the center of a region that contains valuable deposits of lead, gold, silver, coal, and petroleum. Among the manufactures are flour, canned fruit, fertilizers, confectionery, earthenware, and machinery. It has extensive interests in the refining of petroleum. Large quantities of fruit, wine, and merchandise are shipped and it has a growing jobbing trade with the cities of southern California and Arizona. The public utilities include waterworks, gas and electric lighting, sewerage, and telephone service.

The Spaniards first visited the region in 1769. In 1781 the place was settled and named *Puebla de Nuestra Senora La Reina de Los Angeles*, meaning "City of Our Lady, the Queen of the Angels." The Mexicans made it the capital of the Province of California, though the seat of government was alternately at this place and at Monterey. Commodore Stockton with a force of the United States navy captured it in 1846 and it was chartered as a city in 1851. Its prosperity began with the completion of railway lines to various points on the Pacific coast, and its growth was stimulated through the discovery of petroleum and the development of gardens and orchards in its vicinity. Population, 1900, 102,479; in 1910, 319,198.

**LOTTERY** (lŏ'tēr-y), an institution for the

distribution of prizes by lot or chance. The general plan is to prepare a number of tickets, which are sold at a specified price, the larger majority of which are blank, thus making the income much larger than the amount expended. Lotteries were of common occurrence among the Romans. They are now sanctioned for the support of charities and religion, but as a general institution are prohibited in most nations. The lotteries of many European countries took on the worst form of gambling and dishonesty in the middle of the 16th century, on account of which prohibitive measures were adopted and the institutions were suppressed. In America the first lottery was sanctioned by the Virginia Company in 1612, and in 1776 the American Congress passed an act legalizing lotteries for schools, roads, and other public improvements. Subsequently many frauds were perpetrated, which finally induced many legislative bodies to enact limiting and prohibitive legislation. The most extensive lottery ever maintained in America was the Louisiana State Lottery at New Orleans, which was finally suppressed by the State constitution in 1895, and an act of Congress prohibited the use of the mails in the management of its business. It is singular that there is a tendency in man which prompts individuals to invest their hard-earned money in lottery tickets, thereby taking chances along with others in winning prizes, knowing such an institution is absolutely certain to take more from the investors than is returned.

**LOTUS** (lŏ'tūs), a name derived from the *lotus* of Greek legend and applied to a large number of widely different plants. It is now used to designate several species of the water-lily family, particularly the so-called *sacred lily* that grows in the valley of the Nile. The same and allied species are found in other parts of Northern Africa and in the countries of Europe and Asia which border on the Mediterranean. The roots are eaten by people who reside in the vicinity of Lake Menzaleh. The name is applied in America to a water lily, commonly called *chinquapin*, and in Arabia to several species of thorny shrubs that grow in the desert. The lotus of Egyptian mythology is, perhaps, the same class of fruit referred to by Homer in the account where companions of Ulysses were persuaded to eat the lotus with the design that the participants would, as a result, desire to remain forever in the country where the lotus thrives, but the exact kind of fruit implied by the term is not known. The so-called *common lotus* is a favorite flowering plant grown extensively in gardens and houses. It has white flowers and large leaves. Lotus

plants of the clover family are called bird's-foot trefoil. They are creeping vines with perennial roots.

**LOUISBURG** (lōō'is-bûrg), a fortress built by the French on the southeastern coast of Cape Breton Island, in Nova Scotia, after the Peace of Utrecht in 1713. In the war between France and England, beginning in 1744, the fort was taken by New Englanders, but the Peace of Aix-la-Chapelle restored it to France in 1748. General Wolfe besieged Louisburg in 1758 and compelled the French garrison to surrender,

in 1781. In the same year, in the same manner, in their expedition they are attached to British New Guinea. These islands were discovered in 1606 and have belonged to Great Britain since 1888.

**LOUISIANA** (lōō-ē-zē-ā'nā), a southern state of the United States, popularly called the *Creole State*. It is bounded on the north by Arkansas, east by Mississippi and the Gulf of Mexico, south by the Gulf of Mexico, and west by Texas. The northern part is separated from Mississippi by the Mississippi River and the southern part by the Pearl River, and about two-thirds of the western border is formed by the Sabine River. From north to south the State has a length of 280 miles and its greatest breadth is 290 miles. The area is 48,720 square miles, which includes a water surface of 3,300 square miles.

**DESCRIPTION.** The surface has a general elevation of 75 feet above sea level, its highest altitude being not more than 500 feet. The highest point of land is in the northern part, in Claiborne and Union counties. Large areas of the surface are made up of alluvial deposits, which include many coast swamps and a considerable number of inland lakes formed through the deposit of silt by the Mississippi. Vast levees extend along both sides of the Mississippi in various sections to prevent the overflow of these alluvial lands during high water. The portion of the State lying south of a line drawn east and west a short distance south of Lake Pontchartrain is within the al-

COMMON LOTUS OF EGYPT.

after which the town was destroyed entirely and has since remained in a ruined condition. The fortress cost France \$5,000,000 and was regarded the strongest in America. The town situated on its site is made up largely of fishermen. It has a lighthouse, a good harbor, and a considerable trade in fish and produce.

**LOUISIADE** (lōō-ē-zē-ād'), a group of islands located near the southeastern coast of British New Guinea. The three largest islands are Rossel, Southeast Island, and Saint Aignan, with a total area of about 650 square miles. The surface is mountainous in the larger islands, while the smaller islets are level and of coral formation. The inhabitants consist chiefly of savage Papuans. For the purpose of admin-

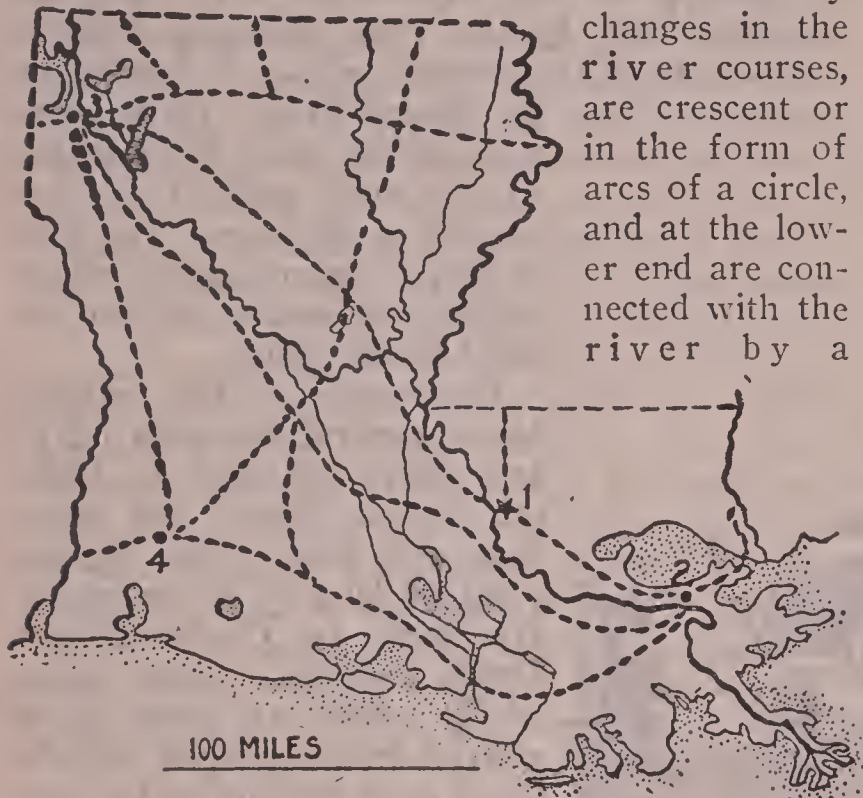

istration they are attached to British New Guinea. The region lying toward the north is gently undulated.

The general slope is toward the south, which is the direction of its water courses. The Mississippi, which forms a part of the eastern border and flows diagonally through the southern part, furnishes navigation for 600 miles. Its largest tributary within the State, the Red River, flows toward the southeast through the north central part. The Ouachita, Washita, Atchafalaya, Pearl, and Sabine are important for their navigation facilities. Many of the tributaries of the Mississippi are locally called *bayous*, many of which are navigable, and as a whole they are important in taking off the excess water during floods. Some of the streams,

like the Red and the Ouachita, have a width of from four to twenty miles at various points. The State has a large number of lakes, some of which are inland, but many of them form inlets from the Gulf of Mexico or from the larger rivers. Lakes Sabine, Grand, and Pontchartrain are connected with the coastal waters and are more or less brackish. Another class of lakes, those formed in channels which have been

cut off by changes in the river courses, are crescent or in the form of arcs of a circle, and at the lower end are connected with the river by a

LOUISIANA.

1, Baton Rouge; 2, New Orleans; 3, Shreveport; 4, Lake Charles. Principal railroads shown by dotted lines.

bayou. Many of these lakes have brackish water and the level rises and falls with the tide. All of the great delta of the Mississippi is within the State.

The soil and climate of Louisiana are alike favorable to the growth of luxuriant vegetation. Being located near the gulf, the State has an equable climate. At New Orleans the mean annual temperature is about 68°, while the general temperature ranges from 45° to 96°. However, it frequently attains to 100° in the summer season, but the freezing point is rarely reached in any section of the State. All parts of the State have an abundance of rainfall, which averages 50 inches in the northern part and 60 in the delta region. Clouds and mists obstruct the sunshine about half of the time in the winter and fully 40 per cent. of the time during the summer season.

**MINING.** The mineral resources are not extensive, but the production of petroleum is of growing importance. In the vicinity of Lake Charles, in the southwestern part, are large oil fields, which extend into the State from Texas. The salt deposits are next in importance, oc-

curing in solid beds of salt rock from 40 to 80 feet deep, found chiefly in a region stretching from the Parish of Plaquemines to Abbeville and in the parishes of Iberia, Vermilion, and Saint Mary. A good quality of lignite and bituminous coal is obtained in the southwestern part, the field extending into the State from Texas. Lead and sulphur deposits occur in different sections, and gypsum and limestone are worked extensively.

**FORESTS AND FISHERIES.** Louisiana is rich in timber and has more or less extensive forest areas in all parts of the State, especially in the northern section and along the Red River. Valuable cypress trees abound in the swamps and many species of oak, including the live oak, occur in large areas. Other trees that are well represented embrace the magnolia, pine, poplar, beach, cottonwood, cedar, and black walnut. Many varieties of fruits are cultivated, such as the fig, lemon, peach, plum, olive, banana, and pomegranate. The jasmine, oleander, and roses are well represented.

In the value of fisheries Louisiana holds second rank among the states bordering on the Gulf of Mexico. Along the southern shore are extensive oyster fisheries. The catfish and shrimp are caught more extensively than in any other State. Alligators, though formerly very abundant, are not found to any great extent at present, but the hide has increased greatly in value.

**AGRICULTURE.** A large per cent. of the surface is utilized for agriculture and the only uncultivated land is in the coast marshes and forests, but these furnish good pasturage. The soil is inexhaustible in fertility and all of the State has a favorable temperature and sufficient rainfall. Much of the farming is done by the plantation system of cultivation, hence many of the farms are large and are worked by tillers who reside on small divisions of the large estates. A majority of the tenants are Negroes, but the ownership of the land is vested very largely in white proprietors. Corn and cotton are the two leading crops, and the area cultivated in either exceeds largely that utilized in all other crops. Though the area devoted to the cultivation of cotton is about the same as that utilized in growing corn, the value of the cotton crop is about double that of corn, hence is the staple product. Sugar cane takes third rank in the area, but the value of the product rivals that of cotton. Rice is grown in the delta parishes and the prairie coast region toward the west, and in this product the State takes very high rank. Oats, hay, peas, fruits, and vegetables are other important products. Much attention is given to

the cultivation of strawberries and a large part of the yield is shipped to the northern markets early in the season.

Stock raising is of small importance as compared to the interests in the northern states. Horses and mules are reared for domestic use, especially for driving and tilling purposes. Considerable interests are vested in cattle raising, especially for the production of milk and butter. Swine are grown profitably and the young are able to thrive in the fields and forests almost without feeding. Poultry is grown extensively and some interest is taken in the raising of sheep.

**MANUFACTURING.** Rapid development has been made the last two decades in the output of manufactures. Cotton, rice, and sugar cane are important in the manufacturing enterprises of the State, and the refining of sugar has been growing in importance. In the value of the output sugar and molasses take first rank, but these are followed closely by lumber products and cottonseed and oil. Other manufactures include rice products, machinery, bags, railway cars, tobacco products, and canned fruit and oysters.

**COMMERCE AND TRANSPORTATION.** The port of New Orleans ranks third in the value of foreign trade, being exceeded only by Boston and New York. Among the chief exports are cotton, flour, sugar, lumber, rice, and cereals. The imports include machinery, coffee, and clothing. It has larger transportation facilities by water than any state in the Union, owing to its location on the Gulf of Mexico and many navigable streams, the latter affording transportation for a distance of 3,750 miles. At present 3,450 miles of railways and numerous electric lines are in operation. Though transportation facilities are afforded by railways in all parts of the State, the majority of lines run through it from north to south. New Orleans and Shreveport are the principal railway and manufacturing centers.

**GOVERNMENT.** The State is governed under a constitution adopted in 1898, by which the chief executive authority is vested in a governor, lieutenant governor, treasurer, auditor, and secretary of State, each elected for terms of four years. The Legislature consists of two branches, the senate and house of representatives, and members in each branch are elected for four years. The constitution provides that the number of senators cannot exceed 41 and the number of representatives cannot be more than 116 members. A chief and four associate justices constitute the supreme court, and these officials are appointed by the Governor and the senate for terms of twelve years. Subordinate to this

court are the court of appeals, the district courts, and the municipal and justice courts. The State is divided into parishes, which correspond to the counties in other states, and local government is administered according to the civil law introduced by the French.

**EDUCATION.** Public schools are maintained under a State board of education, consisting of the governor, superintendent of education, attorney-general, and one member from each congressional district. This board appoints the school directors for each school parish, these officials serving for terms of four years. Parish superintendents are elected by the school directors, who fix the salaries within certain limits. The general system provides for elementary and higher education, with separate schools for the white and colored children. Higher education culminates in the Louisiana State University and Agriculture and Mechanical College, at Baton Rouge, which is supported in part by the State and by the Federal governments. All residents of the State are admitted free of tuition into this institution. Teachers are encouraged to extend their academic courses by permitting graduates from the university and the State normal school to teach without passing an examination. Natchitoches is the seat of the State normal school. Although the per cent. of illiteracy is higher than the average for the Union, there has been a constant improvement. Among the native white population the illiteracy is 17.3 per cent. and among the Negro inhabitants of ten years and over it is 61.1 per cent.

Louisiana has a large number of excellent institutions of higher learning, including Tulane University, at New Orleans, which ranks as one of the leading educational centers in the South. Other noted institutions include the Methodist Episcopal University, New Orleans; the Thatcher Institute, Shreveport; the Baptist Leland University for Negroes, New Orleans; the Southern University for Negroes, New Orleans; the Saint Charles College, Grand Coteau; the Southwestern Industrial Institute, Lafayette; the College of the Immaculate Conception, New Orleans; and the Centenary College, Jackson. Baton Rouge has schools for the blind and deaf, Jackson has an asylum for the insane, and charitable hospitals are maintained at Shreveport and New Orleans. Formerly the convicts were leased, but they are now put to work upon farms or in industries owned and controlled by the State.

**INHABITANTS.** A large element in the present population is of French descent, due to the fact that Louisiana was settled in its early his-

tory by immigrants from France. The largest immigration from other states and foreign countries came in after the Civil War, though the foreign born population is not large. Baton Rouge, on the Mississippi, is the capital. The chief cities include New Orleans, Shreveport, Lafayette, New Iberia, Crowley, Carrollton, Alexandria, Plaquemine, Lake Charles, Donaldsonville, and Monroe. In 1900 the State had a population of 1,381,625. This included a colored population of 652,013, or 47.2 per cent. The colored inhabitants included 650,804 Negroes. Population, 1910, 1,656,388.

**HISTORY.** The history of Louisiana dates from 1541, when it was discovered by De Soto. La Salle took possession of it in 1642 for France, naming it after Louis XIV. Iberville ascended the Mississippi for 200 miles in 1699, but returned to the present site of Biloxi and established a fort and the first permanent settlement. Soon after Bienville, the governor of the colony, made a settlement at New Orleans, and John Law secured control of the colony in his Mississippi scheme about 1717. France ceded the territory to Spain in 1762, but again received title to it in 1800. It was Napoleon's ambition to found a New France in America, but in 1803 he was induced to sell it to the United States. The Territory of Orleans was formed in 1804, and in 1812 it was admitted into the Union as the State of Louisiana. The final battle of the War of 1812 was fought at New Orleans on Jan. 8, 1815, after peace had been made at Ghent, but before the news had reached America. From that time the development of the State made rapid strides, expanding agriculture and manufacture, New Orleans becoming the most important cotton market and port of the South.

On Jan. 26, 1861, the State seceded from the Union and cast its fortunes with the Confederacy. In the spring, on April 25, 1862, New Orleans was captured by the United States forces. During the war it was an important point because of the many engagements which occurred on the Mississippi River. After the war a carpet-bag element harassed the State during the reconstruction period. The Fourteenth amendment to the Federal Constitution was ratified in 1877 and the construction of levees and river jetties began about the same time. The Louisiana State Lottery was abolished in 1891. In the past quarter of a century the State developed rapidly in every material line, building railroads, canals, cities, and educational institutions.

**LOUISIANA**, a city of Pike County, Missouri, on the Mississippi River, 85 miles northwest of Saint Louis. It is on the Chicago and

Alton and the Chicago, Burlington and Quincy railroads and has a good landing for steamboats. Among the chief buildings are the public library, the high school, and a number of churches. The manufactures embrace flour, tobacco, building stone, lumber, and earthenware. The surrounding country is fruit growing and lumber producing. It has a large trade in grain and live stock. Population, 1900, 5,131; in 1910, 4,454.

**LOUISIANA PURCHASE**, the most important annexation made to the territory of the original thirteen states of the American Union. The purchase included a vast region extending from the Gulf of Mexico to the British possessions, west of the Mississippi River. Within its confines is included all the portion of the United States which is situated west of the Mississippi River, except Texas, California, a portion of Oregon, the Gadsden purchase from Mexico, the Mexican cession, and Alaska. It is now subdivided into thirteen states and embraces a population of nearly 20,000,000 people. The enterprise of coming into possession of this vast region was consummated by Thomas Jefferson, who appointed James Monroe as a minister to act with Robert R. Livingston at the French court. The treaty was signed April 30, 1803, and the stipulated price was \$15,000,000, of which the sum of \$3,750,000 represented claims of American citizens against France, which the United States agreed to assume. Livingston said regarding this purchase, "We have lived long, but this is the noblest work of our whole lives;" while Napoleon is quoted as saying, "I have just given to England a maritime rival that will, sooner or later, humble her pride." •

**LOUISIANA PURCHASE EXPOSITION**, an international exhibition of the United States, at Saint Louis, Mo., in 1904. It was held to celebrate the one hundredth anniversary of the purchase of Louisiana from France, which was consummated in 1803. The site included a tract of about 1,000 acres in the west part of the city, made up chiefly of Forest Park and the campus of Washington University. Forty-two states and many foreign nations were represented by buildings and exhibits of their arts and industries. The architecture of the buildings and the landscape gardening were exquisite in taste and effect, and both the grounds as a whole and the exhibits were never surpassed in any of the great international exhibitions. Fifteen large exhibition buildings were erected by the management, including the beautiful structure known as the Cascades, and in addition there were the large building designed by the United States government and numerous

structures erected by the several states and foreign nations. The sunken gardens, the floral clock, the network of lakes, the exhibit of Philippine life and products, the display of wireless telegraphy, the Ferris wheel, and the extensive display of electric machinery were among the notable features. The Pike was the popular amusement feature, similar to the Midway of the Columbian Exposition at Chicago.

To promote the exposition and insure its success, a fund of \$15,000,000 was pledged. This included a donation of \$5,000,000 by the citizens of Saint Louis and equal amounts by the city of Saint Louis and by the United States government. An expenditure of \$1,500,000 was made by Congress for the government exhibit and \$1,000,000 for the Philippine exhibit. The buildings erected by the several states cost about \$7,000,000, and a like sum was expended in the construction of buildings by foreign nations. The receipts from all sources were reported at \$10,162,380 and the attendance was 18,741,073.

**LOUISIANA STATE UNIVERSITY AND AGRICULTURAL AND MECHANICAL COLLEGE**, an institution of higher learning maintained by the State of Louisiana, at Baton Rouge. It was founded in 1855 as a State seminary and opened at Alexandria, La., in 1860 under the superintendency of William T. Sherman, who later became prominent as a Union general in the Civil War. The United States government granted the buildings and grounds at Baton Rouge, to which place it was removed in 1886. The courses include commerce, literature, classics, general science, agriculture, and mechanical and civil engineering. Associated with it are three experiment stations, located at Baton Rouge, Calhoun, and New Orleans. It has a library of 25,000 volumes and is attended by 450 students. The endowment is \$350,000, but a large part of the income is derived from the State and the Federal governments.

**LOUISVILLE** (lōō'is-vīl), a commercial and railway city of Kentucky, county seat of Jefferson County, on the Ohio River, about 400 miles above its mouth and 130 miles southwest of Cincinnati, Ohio. It is on the Baltimore and Ohio Southwestern, the Louisville and Nashville, the Pennsylvania, the Illinois Central, the Southern, and the Chesapeake and Ohio railroads, connecting it with the principal commercial centers in the central part of the United States. A series of rapids characterize the Ohio at this place, hence a canal is maintained so steamboats may avoid the rapids at the time of low water. New Albany and Jeffersonville, both

in Indiana, are connected with the city by three bridges, one of which is a mile in length.

The city is located on a site fully 60 feet above high-water mark, hence is free from the danger of overflow. It extends along the river front a distance of about eight miles and includes an area of twenty square miles. The country in its vicinity is rich in coal, iron, timber, and agricultural resources. It has regularly platted streets, many of which are paved with brick, asphalt, and granite, and the avenues are shaded with beautiful trees. The principal business establishments are located at Jefferson, Main, Market, and Fourth streets, and on the intersecting streets from First to Sixteenth. Electric street railways furnish communication to all parts of the city, and the system is connected with lines penetrating long distances into the country.

The rise of Louisville as a commercial center is due to its railway and river transportation facilities, through which it has acquired a large jobbing and export trade. It has obtained vast benefits from its location in a region which is rich in mineral and agricultural resources. As a market for tobacco it takes rank as of first importance in North America. Having large slaughtering industries, it is a center of pork packing, much of the output being exported. It has large grain elevators and an extensive trade in produce. Whisky and other spirituous liquors are manufactured extensively. Other manufactures include flour, leather, soap, ironware, cement, boots and shoes, clothing, brass fittings, and machinery.

The architecture is modern and substantial, which is evidenced by such structures as the city hall, the county courthouse, the Masonic Temple, the customhouse, the commerce building, and the board of trade building. It has about 200 churches, representing all the leading denominations. They include the Episcopal Christ's Church cathedral, the Broadway Baptist, the Roman Catholic cathedral, the Second Presbyterian, the Warren Memorial, the Church of the Messiah, and the Temple Adas Israel. It is the seat of the Polytechnic Society of Kentucky, which has a library of 52,500 volumes, and in connection with it are a museum and an art gallery. The public schools are well organized and buildings ranging from the lower grades to the high school are maintained in the different parts of the city. Special instruction is promoted by a normal school, two schools of pharmacy, a dental school, two law colleges, three seminaries, and nine medical colleges. It is the seat of the State school for the blind, with which is connected the American Printing House for the Blind. The public grounds em-

brace about 1,200 acres, included principally in Cherokee, Iroquois, and Shantee parks. The city contains a monument to Confederate soldiers, the grave of Zachery Taylor, and statues of Thomas Jefferson and Henry Clay. Cave Hill Cemetery is one of the finest burial grounds.

The first settlement on the site of Louisville was made in 1778, when Col. George Rogers Clarke and a number of others located near the Ohio Falls. The town had a population of 60 in 1780, when it was incorporated and named Louisville in honor of Louis XVI. of France. At that time it was under the jurisdiction of Virginia. The Legislature of Kentucky granted it a charter as a city in 1824, since which time it has enjoyed a constant growth. A majority of the people sympathized with the Union during the Civil War. It was visited by a tornado in 1890, when property valued at \$3,000,000 was destroyed. Population, 1910, 223,928.

**LOUSE**, a parasitic bug of the suborder *Parasita*, which obtains food by sucking the blood of animals and the juices of plants. These insects are widely distributed and include many species. The common louse is the best known of the species that prey on man. It has a suctional mouth, simple eyes, little marks of difference between the abdomen and thorax, and three pairs of legs attached to the segments of the thorax. The female is oviparous, producing eggs properly called *nits*. In five or six days the young are hatched, and after eighteen days they are capable of reproduction. Properly there are three species of lice parasitic on man under certain circumstances: the *head*, or *common louse*; the *body*, or *clothes louse*; and the *pubis*, or *crab louse*. Many species of lice are parasitic on birds, bees, wasps, beetles, fishes, and plants.

**LOUVAIN** (lōō-vān'), a city of Belgium, in the province of Brabant, eighteen miles east of Brussels. It is on the Dyle River and has steamboat facilities through the Louvain Canal. Among the noteworthy buildings are the Church of Saint Joseph, the Church of Saint Gertrude, the Union railway station, the athenaeum, the post office, and a noted university, containing a library of 250,000 volumes. This institution formerly had an attendance of 6,000 students, but at present has less than 2,000. The manufactures include machinery, spirituous liquors, cotton and woolen goods, lace, leather, and musical instruments. Its numerous parks and gardens are decorated with fine sculptures. Some of the public buildings are among the finest in Europe. Louvain was the capital of Brabant in the 14th century, when it had a population of 200,000. Nearly half of the inhabitants died of

the plague in the 16th century. Population, 1906, 41,146.

**LOUVRE** (lōō'vr'), a celebrated palace in Paris, France, situated near the Seine River, near the central part of the city. The name properly is *The Palace of the Louvre*, which includes an extensive group of buildings. The older portion of it was a royal residence of King Dagobert in 628. Louis XIV. enlarged and beautified the building. Napoleon I. commenced the new Louvre, and Napoleon III. completed it in 1857. The palace has several wings and galleries, all of which are distinguished for their elegance and sumptuous architecture. The more ancient part is now used as a depository for rare specimens of paintings, sculptures, and antiquities from all countries and all ages. In connection with it is a large public library with the national archives attached. Napoleon's expedition to Egypt and the Italian campaign added many valuable treasures to the already extensive collections in the Louvre. The only works admitted to its galleries are productions of deceased artists. In 1871 the Communists committed serious injury to several portions of the palace, when about 90,000 volumes of the imperial library in the Richelieu pavilion were destroyed. Baron Rothschild, in 1873, presented to the museum many relics discovered in the ruins of a temple of Apollo at Miletus.

**LOW ARCHIPELAGO**, a group of coral islands in the Pacific Ocean, located east of the Society Islands. They are sometimes called the *Tuamotu Islands* and are divided into a number of groups. The area is about 360 square miles. Fruits, pearls, and copra are the chief products. The islands have been a possession of France since 1844. Fakarava, the capital and principal port, is located on an island of the same name. Population, 1908, 7,125.

**LOWELL** (lō'él), a city of Massachusetts, one of the county seats of Middlesex County, on the Merrimac River, 25 miles northwest of Boston. It is on the Boston and Maine, the New York, New Haven and Hartford, and a number of electric railways. The site is hilly and the river has a fall of 33 feet, thus affording splendid water power for manufacturing. About fourteen square miles are included in the area of the city. The noteworthy buildings include the post office, the city hall, the Church of Saint Anne, the Lowell Textile School, the Saint John's Hospital, the Theodore Edson Orphanage, the State Normal School, and the public library of 70,000 volumes. Other features include the Ladd-Whitney Monument, the Fort Hill Park, and Pawtucket Falls.

Lowell is important as a commercial and manufacturing center. It is one of the largest producers of cotton and woolen goods in the world. Other manufactures include leather, machinery, engines, hardware, patent medicine, carriages, paper, clothing, carpets, and utensils. It has an extensive trade in manufactures and merchandise. Lowell was founded in 1822 and was named from Frances C. Lowell (1775-1817), a noted merchant and manufacturer. It was incorporated as a town in 1826 and was chartered as a city in 1836. Population, 1910, 106,294.

**LOYALTY ISLANDS**, a group of islands in the South Pacific, situated sixty miles east of New Caledonia. The area is 1,050 square miles. They are of coral formation and have a level surface. Among the products are cotton, cereals, live stock, and tropical fruits. The most important islands of the group include Lifu, Uea, and Maré. These islands have belonged to France since 1864 and for the purpose of government are attached to New Caledonia. Population, 1906, 19,493.

**LUBECK** (lü'bĕk), a free city of Germany, on the Trave River, 38 miles northeast of Hamburg. The area included in the free territory is 115 square miles. It has extensive railroad facilities, well graded and paved streets, and systems of waterworks and electric street railways. Among the chief buildings are the Church of Saint Mary, the Church of Saint Catharine, the public library, the Union railway station, and the post office. It is the seat of many hospitals and contains the Rathhaus in which the deputies of the Hanseatic League held their meetings. The manufactures include cotton and woolen goods, ironware, spirituous liquors, clothing, textiles, cigars, ships, and engines. It has an extensive import and export trade, especially in fish, cereals, live stock, and merchandise. The Trave River has been deepened so as to permit the largest vessels to reach the city, though its harbor properly is at Travemünde, sixteen miles down the river. Fully 98 per cent. of the people are Protestants. The Saxons founded Lübeck in 1143, and, on account of important privileges granted by the German emperors, it rose rapidly to commercial importance, being for many years at the head of the Hanseatic League. Frederick II. made it an imperial free city as early as 1226. The French captured it in 1806 and annexed it in 1810, but in 1813 it recovered independence, and is now a constituent part of the German Empire. Population, 1905, 105,857.

**LUBLIN** (lyŏ'blyĕn), a city of Russian Poland, capital of the government of Lublin, sixty miles southeast of Warsaw, on the Bistrzyca

River. It has railroad facilities, good schools, and a large trade. The chief buildings include the Church of Saint Nicholas, the city hall, and several convents and monasteries. Among the manufactures are cotton and woolen goods, soap, machinery, and hardware. Many of the inhabitants are Jews. Population, 1906, 52,084.

**LUCCA** (lŏok'kà), a city of Italy, capital of a province of the same name, on a railway line, thirteen miles northeast of Pisa. In the surrounding country are fine farms and orchards, including plantations devoted to the culture of silk and olives. The manufactures include stucco, silk, musical instruments, and machinery. It has a large trade in silk goods, olive oil, fruits, and cereals. The city has several fine churches, among them the Cathedral of Saint Martin, begun in 1063, the Basilica San Ferdiano, and a number of fine educational institutions. The province of Lucca was made a principality by Napoleon, though it later passed to Spain, and in 1847 was ceded to Tuscany. Population, 1906, 76,109.

**LUCERNE** (lŭ'sĕrn), a deep-rooting perennial plant, cloverlike in appearance, cultivated extensively for fodder. It is native to the southern parts of Europe, but has been naturalized extensively in America and other grand divisions. The plant attains a height of from twelve to fourteen inches, growing quickly after being mown. It supplies forage early in the season, and is especially valuable in its ability to endure great droughts, causing it to be cultivated to a considerable extent in arid regions. See **Alfalfa**.

**LUCERNE** (lŏŏ-sĕrn'), a city of Switzerland, capital of the canton of Lucerne, at the northwestern extremity of Lake Lucerne, on the Reuss River. It has good railroad connections, modern municipal facilities, and a number of excellent buildings. The chief buildings include the public library, the gymnasium, and the church known as Hofkircke. Among the manufactures are cotton, woolen, linen, and silk fabrics, gloves, carriages, musical instruments, and machinery. As a gathering place of summer visitors and tourists it takes high rank, owing largely to its interesting scenery, including the Lucerne Lion, a figure of a lion hewn in 1821 from the solid rock after a model furnished by Thorwaldsen. The Glacier Garden, a fine public resort, contains interesting formations caused by the action of ice, and in the vicinity are many scenic views in connection with the lake region. Population, 1907, 34,480.

**LUCERNE, Lake of**, frequently called Lake of the Four Forest Cantons, a lake of Switzerland, surrounded by the cantons of Unterwalden, Schwyz, Lucerne, and Uri. It is 1,400

feet above sea level. The shores are rocky and precipitous, the general form is irregular, and the scenery, as well as its historical associations, have been celebrated for many centuries. The length of the lake is about 22 miles, the breadth is two miles, and the area is 44 square miles. Steamboats navigate it, making it important commercially. On its shore are many harbors and beautiful villas. Near it are several important cities. Many of the early historical associations are connected with the name of William Tell. Many thousands of tourists visit Lake of Lucerne during the summer.

**LUCIA** (lōō'shá), **Saint**, an island of the West Indies, belonging to Great Britain. The area is 233 square miles. It has much fertility and exports cocoa, sugar, rum, and tropical fruits. Castries is the capital and chief town. Population, 1906, 54,073.

**LUCIFER** (lū'sī-fēr), an ancient name of Venus, applied when it was the morning star, as distinguished from Hesperus, the name given to it when it was an evening luminary. Early commentators mistook the reference made in Isaiah xiv., 12, to the kings of Babylon and ascribed the appellation to Satan. Lucifer is the name applied in Milton's "Paradise Lost" to the archangel who fell from divine favor and lowered a part of the host of heaven to the infernal regions.

**LUCKNOW** (lūk'nou), a city of British India, capital of the province of Oudh, on the Gumti River, 42 miles northeast of Cawnpore. It is surpassed in population only by Calcutta, Madras, and Bombay. Steamboats are able to reach the city by the Gumti River at all seasons. It has extensive railroad facilities, connecting it with all parts of India, and is the seat of a vast trade in farm produce and merchandise. The older part of the city has low houses constructed of mud and straw roofs. In the newer portions are many fine streets and numerous religious, educational, and government buildings. It is improved by many modern municipal facilities, such as telephones, waterworks, sewerage, and electric street railways. The early history is unknown, since it was founded at a very early date, probably before any of the other great cities of India. In 1857 it was the center of activities during the Sepoy mutiny and its garrison was besieged by a large army of natives. In making the defense Sir Henry Wallace was slain, General Havelock died of dysentery, and permanent relief was not secured until in 1858, when Sir Colin Campbell entered the city with an English force and put an end to the mutiny. Population, 1906, 274,356.

**LUDINGTON** (lūd'ing-tūn), a city in Mich-

igan, county seat of Mason County, on Lake Michigan, where it is entered by the Père Marquette River. It is on the Père Marquette and other railroads and has direct communication by steamboats with the principal ports on the Great Lakes. The surrounding country is rich in the production of fruits, salt, and lumber. Among the noteworthy buildings are the county courthouse, the high school, the public library, and many churches. The manufactures include ironware, carriages, cigars, lumber products, furniture, and machinery. The city has modern facilities, including electric lights, waterworks, and sewerage. It was settled in 1851 and incorporated in 1874. Population, 1910, 9,132.

**LUDWIGSHAFEN** (lōōt'vīgs-hä-fen), a city of Germany, in the Rhine Palatinate, Bavaria. It is located on the Rhine, opposite Mannheim, with which it is connected by railway and electric lines. The harbor is extensive and well improved. It has manufactures of vinegar, flour, chemicals, fertilizers, and machinery. Formerly it was of little commercial importance, but the development of manufacturing enterprises has caused its rapid growth. It was founded by Louis I. of Bavaria in 1843, and was made a city in 1859. Population, 1905, 72,286.

**LUMBAGO** (lūm-bā'gō), the form of rheumatism that affects the muscles of the loins. It sometimes extends to the ligaments underneath the muscles, and often occasions sudden and severe pain to the person afflicted.

**LUMBER**, the name applied to split or sawed timber, such as boards, beams, joists, planks, lath, and shingles. Usually logs and telegraph poles are included in the term lumber, and places where these products are kept for sale are known as lumber yards. Canada and the United States are at present the leading lumber-producing countries. Other countries where timber and lumber products are obtained in large quantities include France, Germany, Russia, China, India, and the equatorial regions of Africa.

Lumber has been an export of Canada since an early date in its history. It is said that the first shipload of lumber was transported from Canada to Europe in 1667, and shipbuilding began on a small scale about that time at Quebec. Stringent regulations were issued for the preservation of timber in Canada, and a large area of the forests are included in the Canadian timber preserves. It is estimated that 800,000,000 acres of woodland are in existence in that country, but probably not more than half of this area may be considered forest land fit for timber production. The valuable forest lands are located in Quebec, Nova Scotia, New Bruns-

wick, Ontario, British Columbia, and in a belt extending across the north of the continent from Labrador to Alaska. The value of the annual output in Canada is placed at \$135,000,000.

Originally the United States had the largest and most valuable forest area of North America, and the value of the lumber produced at present is larger than that of any country in the world. Extensive forests extend through many of the states in the south, especially those bordering on the Mississippi. Another large forest area is located in the vicinity of the Great Lakes, in the states of Michigan, Wisconsin, and Minnesota, and productive lumber regions abound in Maine. Forests of more or less commercial value are found in all the highlands of the west, but those of largest size and greatest value are in Oregon, Washington, and the northern part of California. In the value of the output the lumber industry takes rank as the fourth enterprise in the United States. The annual production has a value of \$565,500,000. In recent years the tendency has been for lumber products to increase in value, owing to the supply becoming more limited, or the larger tracts of timber being purchased by large investors. There has been a constant increase in the importation of wood and its products from Canada, which average annually about \$25,500,000. See **Forest**.

**LUMPFISH**, or **Lumpsucker**, a fish found in the Atlantic Ocean, chiefly along the coast northward from New York in America and from France in Europe. It is so named from its awkward shape. The back is characterized by an elevated ridge, which is notched quite like the comb of a cock. Bony tubercles cover the body and the ventral fins are formed into a sucker, enabling it to cling firmly to any solid substance. The color becomes brilliant crimson at the spawning season, though usually it is of a dull lead color. The lumpfish deposits its eggs in an improvised nest and hovers near to protect them against enemies. It is caught for its flesh, though it is quite soft and oily and not highly esteemed.

**LUMP JAW**, or **Lumpy Jaw**, a dangerous disease of cattle, due to fungi found on grasses and some of the cereals. It usually makes its appearance on the lower jaw, which is affected more or less by swellings, though other parts of the body are sometimes the seat of the disease. A single fungus may penetrate the gums and cause the disease, which is attended by irritation, abnormal growths, and tumors or abscesses. Lancing or removing the tumors at an early stage and treating the seat of the disease with iodine and iodide of potash constitute the

usual remedies, but unless skillful treatment is applied the disease is usually fatal.

**LUNACY** (lū'nā-sŷ), a term applied to persons born sane, but who have from some cause fallen into temporary or permanent aberration of intellect. Lunatics possess a brain of so little circumference that they are never capable of exercising much reason. Lunacy is distinguished from idiocy in that the latter is a designation of persons born with unsoundness of mind. See **Insanity**.

**LUNAR THEORY**, the deduction of the moon's motion from the law of gravitation, manifested in the attraction of the sun and planets. None of the heavenly bodies, except the sun, disturbs the moon to a considerable extent in its orbit. However, they affect the earth in this respect, and so in an indirect way influence the moon.

**LUNDY'S LANE**, the seat of an important battle near Niagara Falls, in Canada, fought in the War of 1812. The British had been defeated at Chippewa and General Drummond was sent forward to meet the Americans under Gen. Jacob Brown, but the latter dispatched General Scott to menace the forts on the Niagara River. On July 24, 1814, General Scott came in contact with the British forces under General Riall on a hill near Lundy's Lane, and sent Major Jesup forward to make a flank movement at the British rear, while Scott engaged the enemy. Action continued from the middle of the afternoon until midnight, the British troops being repulsed early in the engagement, but the American generals, Scott and Brown, were wounded, when the command devolved upon General Ripley. The latter withdrew from the field, and it was again possessed by the British on the following day. The Americans lost 850 men, while the British loss was near 900.

**LUNGS**, the organs for aërial respiration, situated in the thorax, on each side of the heart. In man the lungs are conical, with the base resting on the diaphragm and the trachea extending above the collar bone. They consist of two lobes, separated by a deep fissure, the right being somewhat larger on account of having a third lobe of triangular shape above and also because the heart lies toward the left side. The lungs are composed of honeycomblike cells to which air passes by means of the bronchial tubes, these being formed by divisions of the trachea, and at the upper part of the trachea is the larynx. Within the lungs are ramifications of the pulmonary artery and veins, bronchial arteries and veins, lymphatics, and nerves, the whole being bound together by fibrous tissue. Each lung is enclosed in a serous

membrane, the pleura, which extends to its roots, and is then expanded on the chest wall. All mammals, reptiles, birds, and some amphibians possess lungs, while in the lowest and simplest forms of animal life there are no traces of respiratory organs, equivalent action taking place by cilia or by the general movement of the body. Most mollusks possess gills in the place of lungs. Fishes sustain life by gills, though many have an air bladder. Animals which approach the reptiles in form have a well-devel-

flammation, and consumption. See **Respiration**; **Circulation**.

**LUNGWORT** (lŭng'wôrt), the name of a herb native to Europe and North America. It is cultivated for its tubular or trumpet-shaped flowers. The leaves are ovate and the flowers have a bright blue color. The name is likewise applied to a lichen of the Northern Hemisphere, which is used to some extent in treating diseases of the lungs.

**LUPERCALIA** (lŭ-pĕr-kā'li-à), a festival of ancient Rome, celebrated annually on Feb. 15 in honor of Lupercus, the god of fertility. It is related that the festival was celebrated at the Lupercal, a cave on the Palatine Hill, and that sacrifices of the first fruits of the last harvest were offered. Later the sacrifices consisted of goats, and two youths, known as the *Luperci*, clothed in goat skins, ran through the streets, striking those they met with thongs made of the skins of the slaughtered animals. These ceremonies were supposed to induce fertility.

**LURAY** (lŭ-rā'), a town and the county seat of Page County, Virginia, in a fertile valley of the South Fork of the Shenandoah, 77 miles west of Washington. It has woolen factories, mills, a tannery, an academy, and two seminaries. Near it is the celebrated Luray Cave, remarkable for its peculiar stalactites, many of which are fifty feet long. Hundreds of lakes are in the cave, varying in size from a few to fifty feet in diameter, and from six to fifteen feet in depth. The exact size of the cave is not known, but there are various chambers of large size and irregular outline, many of them having a height of 260 feet. It has a temperature of about 54° Fahr. The air is pure and por-

tions are lighted by electricity, thus forming a favorite attraction for thousands of visitors annually. The population of Luray, in 1900, was 1,146.

**LUTE**, a stringed musical instrument which somewhat resembles a guitar. Formerly it was popular throughout Europe. It was introduced into Western Europe by the Arabians, who used it in the performance of solos and duets and for accompaniments. Its antiquity is attested by representations on Egyptian tombs and sculpture. Originally the lute had five or six pairs of strings, each pair tuned in unison or octave, but later the strings were increased to 24 in order to accommodate the lute to the chromatic scale.

HUMAN LUNGS.

oped sac, in many of which it takes on a double form analogous to the double lung.

The important function of the lungs is to bring the blood in contact with the air for the purpose of purifying it. In this process the air gives up its oxygen to the blood in the delicate cells in the lungs, and in turn receives water and carbonic acid gas that have become foul with waste matter, accumulated by the blood in circulating through the body. The air exhaled carries off these impurities, while the purified blood bounds through the system and carries the inspiring oxygen to the different organs. Several acute and chronic diseases affect the lungs, among them pneumonia, a form of in-

The music is produced by striking the strings with the fingers of the right hand and stopping them on the frets with those of the left.

**LUTHERANS** (lū'thēr-anz), a body of Christians that adopted the principles of Martin Luther, and who constitute numerically the largest Protestant organization in the world. The two principal branches are designated as Evangelical and Reformed, the former holding closely to the teachings of Luther, while the latter constitutes a branch separated from the main body under Calvin. The largest number of adherents to Lutheran tenets are in Germany, Sweden, the United States, Holland, Switzerland, Austria, Norway, Denmark, and Russia, but there are branch organizations in all parts of the civilized world. The first Lutheran immigrants to America came from Holland and settled at New Amsterdam in 1624. Large numbers came from Sweden in 1637, from Germany in 1680, and Switzerland in 1734. In 1908 there were 265 ministers and 42,548 communicants of the Lutheran Church in Canada. In the same year the denomination had 8,348 churches and 2,450,380 communicants in the United States, while all of the Lutheran population, including several allied branches, was 6,842,590. They maintain 120 institutions of higher learning, support extensive missionary operations, and are grouped in sixteen independent synods. Among the important societies are the Luther League, Women's Societies, Walther League, and Christian Endeavor Associations. The chief Lutheran institutions in America are in Saint Louis, Mo., Fort Wayne, Ind., Springfield, Ill., Saint Paul, Minn., Milwaukee, Wis., and Neperan, N. Y.

**LÜTZEN** (lüt'sen), a town of Germany, in Prussian Saxony, celebrated because of two historic battles fought within its proximity. The first was between the Swedes under Gustavus Adolphus and the imperialists under Wallenstein in 1632, in which the former were victorious. The other occurred between the allied German and Russian forces against Napoleon on May 2, 1813, in which the victory was claimed on both sides. In this battle the French lost 12,000 men and the allies lost 10,000.

**LUXEMBOURG** (lüks-än-bōōr'), the name of a celebrated palace in the southern part of Paris, in the Rue de Vaugirard. It was built for Maria de' Medici in the early part of the 17th century and was designed to resemble her former home in Florence, the Pitti Palace. Subsequently it was greatly changed and enlarged, was destroyed by fire in 1859, and later was rebuilt. In 1879 it was made the meeting place of the Senate of France, though formerly it con-

tained a famous picture gallery. The latter was removed to a neighboring building. It includes 24 scenes in the life of Maria de' Medici painted by Rubens. The collection is known as the Musee du Luxembourg and is considered the most important accumulation of sculptures and paintings in the world. The walls of Luxembourg Palace are beautified by fine ceiling decorations. The gardens of the Luxembourg, noted as the most beautiful in France, comprise a large public park.

**LUXEMBURG** (lüks'ēm-bûrg), a grand duchy of Europe, surrounded by Germany, France, and Belgium. It was under the sovereignty of King William III. of Prussia until his death in 1888, when it passed to Adolph, Duke of Nassau. The area is 998 square miles. Luxemburg is the capital, a city of 31,225 inhabitants. The soil is fertile and well adapted to agriculture. Most of the drainage is by a number of streams into the Moselle. The government is constitutional, the duke being assisted by a chamber of deputies of 45 members, who are chosen by direct vote. For commercial purposes it is united with the German *Zollverein*. The language is German and the religion is largely Catholic. Population, 1908, 241,453.

**LUZÓN** (lōō-zōn'), the largest and most northerly island of the Philippines. The area, including several dependent islands, is 44,235 square miles. It has a fertile soil, vast forests of valuable timber, and a number of mountain ranges. Mount Mayón, the highest peak, has an altitude of 7,566 feet. The general contour is very irregular, especially in the southern part, which has many important bays and excellent harbors. Among the principal lakes are Laguna Bay and Laguna de Taal, both in the southern part of the island. The chief streams are the Pampanga, Agno, Abra, Cagayan, and Pasig rivers. It has extensive productions of manila hemp, rice, sugar, tobacco, ginger, coffee, pepper, and many varieties of fruits. The domestic animals include cattle, horses, buffalo, sheep, and swine. Several railway lines are operated, connecting Manila, the capital, with interior and coast points. In 1903 the population, including several adjacent islands, was 3,798,507. See **Philippines**.

**LYCEUM** (lī-sē'üm), the principal gymnasium of Athens, dedicated to Apollo Lyceus, whence its name. It was situated in the eastern part of the city and was surrounded with lofty plane trees. Aristotle and his disciples taught in the Lyceum, who, from their habit of walking while delivering their lectures, were called *Peripatetics*. In modern times the name lyceum came to be applied to schools for young men

and to organizations which maintain popular or technical lecture courses.

**LYCIA** (lĭsh'ĭ-à), an ancient country of Asia Minor, located south of Phrygia and west of Pamphylia. The region was colonized at an early period by the Greeks, who long maintained the independence of their territory. They formed a league of cities, including Patara, Xanthus, Myra, and Olympus. In the 6th century B. C. the Lycians were conquered by Persia and subsequently passed under the dominion of Macedonia. Later the country belonged to Egypt, Syria, Rome, and Turkey, and throughout the early history of Christianity it had no importance.

**LYDDITE** (lĭd'it), a modern high explosive, so named from its manufacture at Lydd, Wales, where the first experiments were made with it. The first use of lyddite in warfare was by the British in the war with the Boers in 1899-1901. Its method of manufacture has been kept a secret, but it is thought to consist of picric acid brought to a dense form by fusion and poured into shells in a liquid state. Though formerly restricted in use to five-inch howitzer guns, it is now employed in the larger fort and naval ordnance. When fired, the picric acid causes a dense fume of yellowish-green gas, and it is somewhat objectionable on account of requiring a primer.

**LYDIA** (lĭd'ĭ-à), an ancient country of Asia Minor, surrounded by Phrygia, Mysia, Ionia, and Caria, originally inhabited by a people called Maeonians. About 720 B. C. the Lydians occupied the country and developed a large interior commerce. Their greatest prosperity was reached in the period included between the years 716 B. C. and 546 B. C., but their king, Croesus, was conquered in the latter year by Cyrus of Persia. It is claimed that the Lydians were the inventors of musical instruments, of the art of coining money, and of wool dyeing, and that they discovered the art of working in ore. Sardis was the capital and after the Persian invasion became the seat of government of the western part of the empire, remaining such until its conquest by the Athenians.

**LYMPH** (lĭmf), a colorless fluid found in the lymphatic vessels. It is nearly transparent, has a saltish taste, and may be said to be blood with a somewhat different kind of corpuscles. See **Lymphatic System**.

**LYMPHATIC SYSTEM** (lĭm-făt'ĭk), the system in animals that absorbs lymph from the various organs and tissues, and conveys it by the lymphatic vessels toward the heart. It includes the lymphatic vessels, the glands, and the lacteals. The *lymphatic vessels* are delicate tubes of nearly uniform size, have a knotty ap-

pearance, and occur in every texture and organ of the body. The *lymphatic glands* vary in size from a hemp seed to an almond, are round and oval in form, and are made up of adenoid tissue. They occur in the course of the lymphatic vessels and the lacteals, and may be noticed particularly near the large blood vessels, in the armpits, and in the neck. The lymph is a clear, colorless, alkaline fluid, consisting of a plasma resembling that of the blood and of corpuscles like the white blood corpuscles, but the coloring matter of the blood is wanting. After being absorbed from the different tissues and organs, it is conducted to the general blood current. The lymphatics of the right thorax, the right arm, and the right side and neck convey their contents to the right lymphatic duct, and those of the rest of the body into the thoracic duct.

The *lacteals* serve to absorb chyle from the small intestines, which is elaborated in the lymphatic glands, and afterward carried to the thoracic duct. The important function of the system is to retain and elaborate portions of the waste matter of the body and render them suitable for further use. They likewise absorb the poison of disease and produce the phenomena of absorption of the skin. After an excess of matter is deposited to fill up a breach in the body, as in an open wound, it is removed to other parts of the body by the lymphatics. Hibernating animals are supported during the winter by the fat which the absorbents carry into the circulation from the extra supply accumulated during the summer. In sickness a man unconsciously consumes his own flesh through the activity of the lymphatics.

**LYNCHBURG** (lĭnch'bûrg), a city of Virginia, in Campbell County, on the James River, 123 miles west of Richmond. It is on the Southern, the Norfolk and Western, and the Chesapeake and Ohio railroads, and is surrounded by a fertile farming country. Among the noteworthy buildings are the public library, the high school, the Miller Female Orphan Asylum, and the Randolph Macon Women's College. It has manufactures of furniture, tobacco, ironware, flour, lumber products, machinery, cotton goods, and utensils. Extensive stone quarries and iron and coal mines are worked in the vicinity. It has systems of pavements, waterworks, sewerage, and electric street railways. An abundance of water power for manufacturing is obtained from the river. It was settled in 1786 and incorporated in 1823. Population, 1900, 18,891; in 1910, 29,494.

**LYNCH LAW**, the summary infliction of punishment by an informal and self-appointed body of men, who act as an extemporized court. It is used to designate such punishment either

with no trial at all or after trial by a court of law. The term is thought to have originated from James Lynch, mayor of Galway, Ireland, who sentenced his son to death for murder about 1526, and to prevent a rescue by a band of men executed him by his own hands without due process of law. The term became of common application in the United States from a Virginia planter named Charles Lynch, who acted with a number of associates to punish summarily Tories and British sympathizers. Lynch-law executions in the United States are about twice as numerous as legal ones.

**LYNN** (lĭn), a city of Massachusetts, in Essex County, on Massachusetts Bay, ten miles northeast of Boston. It is on the Boston and Maine and the Boston, Revere Beach and Lynn railroads. The harbor is comparatively shallow, but it has a shore line of three miles. The chief buildings include the public library, the city hall, the Lynn Home for Aged Women, the Lynn Hospital, and many schools and churches. Forest Park, Lynn Beach, and a soldiers' monument are other features. Lynn is noted particularly for the extensive output of boots and shoes. Other manufactures include electrical apparatus, clothing, machinery, agricultural implements, ironware, and fabrics. The city has all modern municipal facilities, including an extensive electric street railway system, waterworks, sewerage, and stone and macadam pavements. It was first settled in 1629, when it was known as Saugus, and the present name was adopted in 1637. Population, 1905, 77,025; in 1910, 89,336.

**LYNX** (lĭnks), a mammal of the cat family. It is characterized by ears that are tufted at the tips, a short tail, long fur, and comparatively long limbs. The name is given to several species of animals, most of which are larger than the true cats. They are light brown in color, with spots of black, and are fierce and savage in preying upon poultry, sheep, and other quadrupeds. In the common lynx the body is nearly three feet long and about twenty inches high at the shoulders, and the weight is from sixteen to twenty pounds. The eyes are brilliant and the sight is keen, enabling them to lurk about safely at night. Lynxes are found in America, Europe, and in other grand divisions. Several species are utilized in hunting, for which purpose they are domesticated.

**LYONS** (lĕ-ôn'), the third largest city of France, on the confluence of the Saône and Rhone Rivers, in the department of the Rhone, 240 miles southeast of Paris. The rivers divide the city into three parts, which are connected by many stone and steel bridges. It is noted as a railroad center, has a good river port, and is the center of a large commerce. The municipal

facilities are modern, including electric street railways, several parks, city waterworks, and a fine public library of 125,000 volumes. It is strongly fortified. A system of canals connects it with various trade centers. The manufactures consist chiefly of cotton, woolen, and silk goods, drugs, hats, jewelry, lace, machinery, earthenware, furniture, tobacco, and spirituous liquors.

Lyons is generally well built and has broad and well-paved streets. Electric street railways furnish intercommunication. The noteworthy buildings include the Cathedral of Saint Jean, the Hôtel-de-Ville, the Church of Notre Dame, the Palais des Arts, the Grand Théâtre, the Church of Saint Martin, the Gothic Church of

LYNX.

Saint Nizier, and the Palais de Justice. The University of Lyons, with an attendance of 2,650, ranks next to that of Paris. Lyons was founded in the year 43 B. C. by the Romans. It became the capital of a Roman province about the beginning of the Christian era, and in the Revolution of 1789 was enthusiastic in the common cause, but suffered greatly during the conflict. It is noted as one of the fashionable centers of France. Population, 1906, 472,114.

**LYONS** (lĕ-ôn'), Gulf of, a bay on the southeastern coast of France. It receives the water from the Herault, Rhone, and Aude rivers. On its shore are many ports, including those of Marseilles, Toulon, and Cette. It is the seat of an active commerce. Gales are not uncommon and, owing to their fury, it is said to have been named from the lion.

**LYRE** (lĭr), a stringed instrument of the harp class. It has been used from remote time. The invention of the lyre is ascribed to the Grecian Hermes, who is spoken of by Homer in that regard, and he is credited with giving it to Apollo, who was the first to play upon it with method as an accompaniment to poetry. The lyre was used by the early Assyrians, Baby-

Ionians, Egyptians, and Semites. At first this instrument had three strings, but the number was increased to seven, later to eleven, and finally to sixteen. This became necessary as the number of sounds cannot be greater than the number of strings. In playing the performer uses a lyre stick of polished wood or ivory, though some operate solely with the finger. The instrument has two hornlike pieces, with a crossbar at the upper ends, from which the strings are stretched to the lower parts. As a means of increasing the sound, the principal portions of the lyre are hollow. In modern times the lyre has gone largely out of use, but is still employed by pastoral people of Europe, Asia, and Africa. Lyric poetry was so named from the lyre, since it is the instrument used early as an accompaniment to that class of poetry.

**LYRE BIRD**, a genus of birds common to Australia and New South Wales. The body is not as large as that of a pheasant. It has a

LYRE BIRD.

brownish-black color above and is grayish-brown below. The male is remarkable for having sixteen tail feathers arranged in a lyre-shaped form, whence the name. Lyre birds are shy and solitary, running rapidly at the approach of danger, and are the largest of all song birds. They are noted for their peculiar ability to imitate the sounds of animals and the voices of other songsters. They are fast decreasing in

number and their acclimation in countries foreign to their nativity thus far has failed. The eggs are two in number. Lyre birds feed on worms, beetles, and bugs, for which they scratch in the ground. Only three species are included in the genus, of which the *common lyre bird* and the *rasorial lyre bird* are the best known.

**LYRIC POETRY** (lī'rik), a term which was originally applied to poems intended to be sung to the accompaniment of the lyre or harp, but now used to designate that form of poetry whose object is to give expression of thought as influenced by emotion. Among the various forms of lyric poetry are the sonnet and elegy, now not set to music, and the song, hymn, ode, and psalm, which imply a musical setting. Lyric is distinguished from epic poetry in that action is essential to the latter.

Lyric poetry may be said to have originated before the time of Christ. It inspired the Greeks and Spartans to march to battle, engaged the ingenuity of Horace and Ovid, and was an element of inspiration to the shepherds of the Middle Ages. The patriotic songs and love poems of Walther von der Vogelweide gave way in Germany to the purely lyric poems of the 14th century. Among the famous English lyrics are Shelley's "Clouds," Milton's "L'Allegro," Tennyson's "Tears, Idle Tears," and Burns's "Highland Mary." Holmes's "Chambered Nautilus" and Longfellow's "Hymn to the Night" are among the American lyric poems. Below is the beautiful lyric poem "Break, Break, Break" of Tennyson:

Break, break, break  
On thy cold gray stones, O Sea!  
And I would that my tongue could utter  
The thoughts that arise in me.

O well for the fisherman's boy,  
That he shouts with his sister at play!  
O well for the sailor-lad,  
That he sings in his boat on the bay!

And the stately ships go on  
To their haven under the hill;  
But O for the touch of a vanished hand  
And the sound of a voice that is still!

Break, break, break  
At the foot of thy crags, O Sea!  
But the tender grace of a day that is dead  
Will never come back to me.

**LYSIMACHIA** (lī-sī-māk'ī-à), a genus of plants of the primrose family. The species are widely distributed, but only a limited number are native to North America. The *moneywort*, which is cultivated in gardens, is a trailing vine with roundish leaves and bright yellow flowers. It is well fitted for covering rocks, and is used extensively as a plant for hanging baskets. Several species are known as the *loosestrifes*, which have large showy flowers and are cultivated as border plants in gardens.

## M

**M**, the tenth consonant and thirteenth letter of the English alphabet. In form it came from the Phoenician through the Greek and Latin with but little change. It has a labial and nasal articulation and is classed among the liquids. In the English it has but one sound, as in much, man, and time, but in some languages it indicates that the vowel before it is to be pronounced with nasal resonance. In the Roman notation M denotes 1,000, and when written with a dash over it ( $\overline{M}$ ), 1,000,000.

**MAB**, a mythical personage who was made queen of the fairies by Shelley in his "Queen Mab." She is likewise mentioned by other poets, including Ben Jonson and Shakespeare. In Shakespeare's "Romeo and Juliet" the mischievous ways of Queen Mab are described, but, according to that writer, the office of Mab properly belongs to Titania, the wife of Oberon Titania.

**McALL MISSION**, a Protestant mission instituted in France by Robert Whitaker McAll (1821-1893) in 1871, which is the largest of its kind in that country. The founder of this movement was born in Macclesfield, England, Dec. 17, 1821; died May 11, 1893. He was aided in the enterprise by his wife, the two visiting the laboring classes, establishing stations, and distributing literature. The workers engaged are largely French, but there are many persons of other nationalities connected with it. About \$50,000 is contributed annually by the people of the United States to this enterprise.

**MACAO** ( $m\grave{a}-k\grave{a}'\ddot{o}$ ), a seaport city of China, near the mouth of the Canton River, forty miles west of Hongkong. It is inhabited chiefly by Portuguese. The site is partly on an irregular tableland and partly on a small peninsula. A number of forts are located near its harbor, and a lighthouse 330 feet high is within the walls of one of the forts. The chief buildings include

## MACAW

a cathedral, several hospitals, and a number of schools and charitable institutions. It has a large trade in tea and rice, but its commercial importance has been lessened by the rapid growth of Hongkong. The Portuguese made the first settlement at Macao in 1577, but it remained Chinese territory until 1887, when it was made a Portuguese colony by treaty. A number of modern improvements, such as electric lighting and tramways, are maintained. Population, 1908, 78,650.

**MACARONI** ( $m\grave{a}k-\grave{a}-r\ddot{o}'n\ddot{i}$ ), an article of food composed of the dough of fine wheat flour, usually made into tubes one-eighth of an inch in diameter and about eighteen inches long. The smaller sticks, although made of the same material, are known as *spaghetti* or *vermicelli*. It is prepared most extensively in Italy and France, but the manufactures of Canada and the United States are steadily growing in importance. Machinery is used in the American manufactures for the purpose of kneading the dough and also for pressing it into sticks. Macaroni is sold in the market packed in boxes. It is a wholesome food and is used principally in the preparation of broth, soup, and pudding.

**MACASSAR** ( $m\grave{a}-k\grave{a}s's\grave{a}r$ ), a strait of the Pacific, extending a distance of 375 miles between Borneo and Celebes, and connecting the Java Sea with the Celebes Sea. It is about fifty miles wide at the northeastern point, and, as it extends toward the southwest, it widens to a breadth of from 100 to 140 miles.

**MACAW** ( $m\grave{a}-k\grave{a}'$ ), a genus of birds found in tropical South America, remarkable for their size and the beauty of their plumage. They range as far north as Mexico. The macaws belong to the parrot tribe. They may be taught to articulate a few words, but have a harsh and disagreeable cry. The species are designated as

red and blue macaw, blue and yellow macaw, and gray-green macaw. The red and blue macaw attains a length of forty inches, the tail measuring about twenty inches. These birds have two broods of young in the year.

**MACCABEES** (mäk'ká-bēz), in Jewish history, a name applied to a patriotic family of Hebrews who resisted with remarkable patriotism the persecutions of Antiochus IV., Epiphanes, a Syrian king. Mattathias was the original of the Maccabees, and the term became commonly applied to his descendants. It is recounted that Antiochus was expelled from Egypt by the Romans, after which he made a vigorous attempt to put down the Jewish worship. He endeavored to induce the aged Mattathias, priest of Modin, to adopt the Greek gods and the Grecian mode of offering sacrifices. The messenger sent by the king with bribes was slain by Mattathias, and, aided by his five sons, he destroyed the Grecian idols and escaped with their possessions to the mountains. From their mountain resort they went forth periodically to restore the faith in Jehovah, but Mattathias died in 166 B. C. In the following year his son Judas gathered a number of patriots and reconquered Jerusalem, purified the temple, and instituted the Feast of Dedication, a memorial held annually in succeeding years. A Maccabean dynasty ruled over Jerusalem about a century, the last scion of the house being Hyrcanus, whom Herod the Great, slaughterer of the infants of Bethlehem, put to death, though he was the high priest and a man of great piety.

**MACCABEES, Knights of the**, a fraternal association founded in 1883, now represented by a large number of subordinate tents and hives. The total membership of the order is 375,575. It is incorporated under the laws of the State of Michigan with headquarters at Port Huron. Benefits are paid in cases of accident, sickness, and death. The Ladies of the Maccabees is an affiliated order of the society.

**MACCLESFIELD** (mäk'k'lz-fēld), a town of England, in Cheshire, fifteen miles southeast of Manchester. It is on the Bollin River and several railways and has manufactures of machinery, earthenware, and cotton and silk textiles. The markets, gas works, cemetery, public baths, and electric railways are owned by the municipality. It has an infirmary, a townhall, and several schools and churches. Coal, stone, and slate are obtained in the vicinity. Population, 1907, 36,354.

**MACE**, an aromatic spice made from the dried membranous covering of the seed of the nutmeg. The portion used for its manufacture is the aril or inner covering, which is fleshy and

has a crimson hue when fresh. The flavor of mace resembles that of nutmeg. It is produced chiefly in the Spice Islands, and is used principally for making pickles and in cooking. Mace is also the name of a staff of office, usually borne by officials or displayed on the table of legislative bodies as a symbol of authority.

**MACEDONIA** (mä-s-ē-dō'nī-ä), an ancient country of Europe, lying north of Thessaly and the Aegean Sea. Its history dates back to the year 700 B. C., when Perdiccas I., according to tradition, was the first king, but all history regarding it prior to 490 B. C. is wrapped in obscurity. In the latter year it was invaded by the Persians, who compelled the Macedonian king, Alexander I., to join Xerxes in an expedition to Egypt. In the year 359 B. C. Philip II. subdued all opposition and established himself on the throne of Macedonia. His reign was successful and prosperous, and his son, Alexander the Great, strengthened the army, encouraged internal improvements, and made himself undisputed sovereign over large parts of Europe, Asia, and Africa. Among the flourishing cities of Macedonia in the time of Alexander the Great were Pella, Thessalonica, Pydna, Potidaea (Cassandria), Phillipi, and Olynthus. At his death Macedonia lost many of its possessions under a division of the empire into four kingdoms. Soon after Greece was separated from it, and the battle of Pydna in 168 B. C. made it a province of Rome. The region is now inhabited by Wallachians, Greeks, Albanians, and Turks, and forms part of the Turkish possessions in Europe. The inhabitants of this part of Turkey, which corresponds nearly to the vilayet of Saloniki, have been subjected to many atrocities by the Turks. An acute stage was reached in 1903, when Austria-Hungary and Russia interceded for the Christian inhabitants of that region.

**MACEIÓ** (mä-sä-yō'), or **Maçayó**, a seaport city of Brazil, capital of the state of Alagoas, 130 miles southwest of Pernambuco. It is pleasantly located on the Atlantic coast and has connection with interior points by several railways. The manufactures include cigars, cotton goods, and machinery. It has extensive shipyards and a large trade in corn, cotton, hides, and fruits. Population, 1908, 34,286.

**MCGILL UNIVERSITY**, an institution of higher learning at Montreal, Quebec. It is so called from its founder, James McGill, who, two years before his death, bequeathed his property of Burnside, then valued at £20,000, together with a sum of £10,000 in money, to found a college in a Provincial University, the erection of which had already been provided for by the generosity of the British government. This property

was, on his death, conveyed to the Royal Institution for the Advancement of Learning, a body which, in 1802, had been incorporated by the Legislature for the establishment of free schools and the advancement of learning in the Province of Quebec.

Owing to persistent opposition by a section of the people to any system of governmental education and to the refusal of the Legislature to make the grants of land and money which had been promised, the proposed establishment of the Provincial University by the government was abandoned. Thereupon, the Royal Institution took action on its own account and in 1821 obtained a royal charter. On account of protracted litigation, however, they were unable to obtain possession of the estate until 1829, when the work of teaching began with two faculties, those of arts and medicine. In 1852 a number of prominent citizens of Montreal became interested in the institution and a new charter was secured. At that time there were only three faculties, those of arts, medicine, and law, with sixteen professors and four assistants. Shortly after the William Molson Hall, erected by the generous donor whose name it bears, was provided to serve as a library and convocation hall. Subsequently other buildings were erected, including the new quarters for the faculty of medicine, but this structure was partly destroyed by fire in 1907, after which a magnificent new and wholly up-to-date building was erected. The course of medicine now extends over five sessions of about eight months each.

The faculty of applied science dates back to 1857, when a chair of civil engineering was established in the faculty of arts. However, the faculty cannot be said to have had an organic existence until 1893, when a separate building was provided for the work in applied science. This building, provided through the generosity of Sir William Macdonald, was destroyed by fire in 1907, but it has since been rebuilt on a larger scale. The equipment of this building is exceedingly valuable, comprising all the latest inventions and the newest machinery, especially in connection with the departments of mechanical, electrical, and civil engineering. Other noteworthy structures include the physics building, the chemistry building, the museum, the library, the McGill Union, the Strathcona Hall, the Royal Victoria College, and the Macdonald College. The last mentioned institution is on a tract of 560 acres, at Saint Anne de Bellevue, about 20 miles from Montreal. This property contains a total of seven buildings and all have been constructed and equipped in the most up-to-date fashion. No expense has been spared in

this respect by the founder, Sir. William Macdonald, who has endowed it with over \$2,000,000.

McGill University owes its foundation and its existence to private generosity. The greatest of its benefactors, as already indicated, is Sir William Macdonald, who has, in one way or another, donated to the university nearly \$5,000,000. Other generous contributors include Lord Strathcona, Peter Redpath, J. H. R. Molson, William Molson, and Thomas Workman. Apart from Macdonald College, the total endowments amount to \$4,500,000 and the value of the property, leaving Macdonald College out of account, is over \$2,500,000. The number of students in attendance is about 1,500 and there are in the several faculties 65 professors, 25 assistant professors, and 130 lecturers, tutors, and demonstrators. At present there are 112,000 volumes on the library shelves, but there is a working capacity for at least double that number. McGill University may be said to have had but two principals, Sir William Dawson and Dr. William Peterson. The former retired in 1893 and the latter was appointed in 1895.

**MACHINE GUN**, a designation commonly applied to any ordnance that may be loaded and fired in rapid succession by mechanical appliances and combinations. The first ordnance of this character was used in the Franco-German War of 1870-71, but soon after the celebrated Gatling gun was invented and manufactured in the United States. Among the different classes of machine guns utilized in warfare are the Gatling, Hotchkiss, Nordenfeldt, Gardner, and Maxim. These guns are capable of discharging from 200 to 350 rounds in half a minute with ease and accuracy. They differ more or less in size and efficiency, but may be grouped in two classes. The two classes include those in which the recoils of the barrel, or force of the powder gases, act to operate the gun, and those in which the gun is operated by some exterior force, as by the hand.

**McKEESPORT** (mă-kēz'pōrt), a city of Allegheny County, Pennsylvania, on the Monongahela River, twelve miles southeast of Pittsburg. It is on the Pennsylvania, the Baltimore and Ohio, and the Pittsburg and Lake Erie railroads. The chief buildings include the Carnegie Library, the high school, the Douglass Industrial College, the McKeesport Hospital, the Y. M. C. A. building, and many schools and churches. It has manufactures of ironware, electrical supplies, tin plate, machinery, engines, glass, lumber products, spirituous liquors, and tobacco. The surrounding country is fertile and contains large deposits of limestone and coal. It has a large commercial and jobbing trade, of which

a considerable portion is carried by river navigation. The city has extensive municipal facilities, including street railways, pavements, electric lights, and waterworks. McKeesport was settled in 1795 and incorporated in 1842. Population, 1900, 34,227; in 1910, 42,694.

**McKEES ROCKS**, a borough of Pennsylvania, in Allegheny County, on the Ohio River, a short distance northwest of Pittsburg. It is on the Pittsburg and Lake Erie and the Pittsburg, Chartiers and Youghiogeny railroads, and is noted for the manufacture of flour, glass, machinery, and steel and iron products. Electric lighting, waterworks, and electric railways are among the public utilities. The first settlement was made in 1830 by John McKee, and it was incorporated as a borough in 1892. The prosperity of McKees Rocks is due chiefly to extensive manufacturing enterprises. Population, 1900, 6,352; in 1910, 14,702.

**MACKENZIE** (mä-kěn'zī), a river of British America. It rises as the Athabasca River in the Rocky Mountains, thence flows a distance of about 600 miles, entering Lake Athabasca, thence has a course of 240 miles as the Slave River to Great Slave Lake, and thence takes on the name of Mackenzie River, flowing northwest for a distance of 1,050 miles into the Arctic Ocean. The entire course is over 2,000 miles and the basin drained equals 575,000 square miles. It was named from Alexander Mackenzie (1755-1820), who discovered and first navigated it in 1789.

**MACKENZIE**, a district of Canada, which occupies the greater part of the Mackenzie River valley and the north central part of the Dominion. It is bounded on the north by the Arctic Ocean and Franklin, east by Keewatin, south by Keewatin, Saskatchewan, Alberta, and British Columbia, and west by Yukon. It embraces an area of about 500,000 square miles. The eastern part is drained chiefly by the Phelon River into Hudson Bay, and the central and western parts by the Mackenzie into the Arctic Ocean. Nearly the entire region slopes toward the north and the surface is generally low. Numerous swamps and lakes abound, including Great Bear, Aylmer, Mackay, and Great Slave lakes. The valleys of the Coppermine, Great Fish, and Mackenzie rivers have extensive forests of pine, birch, spruce, tamarack, and aspen poplar. The minerals include salt and coal, both of which are found in the region of Great Slave Lake. Lumbering and furring are the chief industries, but agriculture is not practicable, except in a comparatively small region, owing to the short summers and long and severe winters. The settlements are confined

mainly to the valley of the Mackenzie. Since the region is sparsely settled, organized civil administration is impracticable, and the government is exercised largely through the north-west mounted police. Population, 1906, 5,950.

**MACKEREL** (mäk'ēr-əl), an excellent food fish, widely distributed, particularly abundant in the North Atlantic. It attains a length of from twelve to eighteen inches, weighing about two pounds. The color is steel blue with blackish markings above and silvery beneath. Usually these fish are caught in drift nets which reach about twenty feet below the surface. The mackerel move in schools, are carnivorous, feeding chiefly on the fry of other fish, and are caught

1, SPANISH MACKEREL.  
2, COMMON MACKEREL.

mostly when coming toward the shore for the purpose of spawning. The most extensive fisheries in America are off the coast of New England, where the *common mackerel* is very abundant. A species known as the *Spanish mackerel* is found in the Mediterranean, where it is caught in large numbers.

**MACKINAC** (mäk'ī-nä), or **Mackinaw**, a strait that connects lakes Michigan and Huron. The island of Mackinac is located in the strait, about three miles east of Saint Ignace, county seat of Mackinac County, Michigan, and is about two miles in width and three in length. The city of Mackinac is situated on the island. It has a good harbor and is noted as a favorite summer resort. Formerly a military post known as Fort Mackinac was maintained on an eminence 300 feet above the city of Mackinac, which was captured by Pontiac in 1669 and taken by the British in 1812. Mackinac remained a village until 1900, when it was chartered as a city. Population, 1904, 736.

**McKINLEY** (mä-kīn'li), **Mount**, an elevated peak in the south central part of Alaska, 150 miles north of Cook Inlet. The summit is

covered with snow perpetually and around the slopes are numerous glaciers. It is elevated 20,464 feet above the sea, hence is the highest peak of North America.

**MACOMB** (mă-kōm'), a city and the county seat of McDonough County, Illinois, 185 miles southwest of Chicago, on the Chicago, Burlington and Quincy Railroad. It is surrounded by a fertile farming country. Among the principal buildings are the county courthouse, the public library, and the Western Illinois State Normal School. It has manufactures of tile, earthenware, and machinery. Large deposits of fire clay are found in the vicinity. It was settled about 1840 and incorporated in 1857. Population, 1900, 5,375; in 1910, 5,774.

**MACON** (mā'kūn), a city of Georgia, county seat of Bibb County, on the Ocmulgee River, 98 miles southeast of Atlanta. It is on the Southern, the Central of Georgia, the Macon and Birmingham, and other railroads. The chief buildings include the county courthouse, the public library, the Mercer University, the Wesleyan Female College, the Saint Stanislaus College, the State Academy for the Blind, and the Federal building. Among the manufactures are cotton and woolen goods, clothing, lumber products, machinery, brass and iron wares, spirituous liquors, and utensils. The municipal facilities include pavements, electric lights, street railways, and waterworks. It has a large trade in cotton, produce, and general merchandise. Macon was settled in 1822 and incorporated in 1823. Population, 1900, 23,272; in 1910, 40,665.

**MACON**, a city of Missouri, county seat of Macon County, 70 miles southwest of Quincy, Ill., on the Wabash and the Chicago, Burlington and Quincy railroads. The surrounding country is a fertile section and has deposits of bituminous coal. Among the noteworthy buildings are the county courthouse, the high school, the county insane asylum, and a number of churches. It has manufactures of flour, brick, cigars, ironware, and machinery. The city has public waterworks and a sanitary sewer system. Population, 1900, 4,068.

**MADAGASCAR** (măd-ă-gās'kār), an island in the Indian Ocean, off the southeastern coast of Africa, separated from that continent by the Mozambique Channel. It ranks as one of the largest islands in the world. The length from northeast to southwest is 975 miles, the breadth at the widest point is 356 miles, and the area is 228,500 square miles. Much of the surface is elevated, the average height above sea level being about 3,500 feet, and the highest mountain ranges approximating 9,000 feet. The coast regions contain a number of large fertile tracts

and few large indentations, but have a number of good harbors. Among the principal rivers are the Mangoka and the Mangoro and the largest inlet is Antongil Bay. The highlands have a temperate climate, with an average of 72°, but some of the coast regions are hot. Excessive rains and extensive marshes render large areas unfavorable to European colonization. The wild animals consist chiefly of lemurs, crocodiles, lizards, chameleons, snakes, and many birds of fine song and plumage.

The productions of Madagascar are various, including principally farm produce, minerals, and fish. Among the products of the farms and gardens are manioc, cacao, sugar cane, rice, coffee, gum copal, vanilla, and many kinds of tropical fruits. Other products include India rubber, lumber, cattle, hides, silk, and sweet potatoes. The forests are abundant and yield many valuable woods, including numerous species of palms, and occur most extensively in a circle around the entire island and some distance from the coast. Among the minerals are iron, copper, lignite, galena, gold, graphite, sulphur, and various building stone. The chief manufactures include jewelry, carpets, silk goods, cloth, straw work, and lumber products. Roads and wheeled vehicles are being introduced rapidly. A line of railway has been constructed some distance from Antananarivo. At present the total lines of steam railroads aggregate 312 miles. A cable connects the island with Mozambique. Commercial relations are sustained with France, the United States, Germany, England, and other European countries. The principal imports are cotton and woolen goods, ironware, spirituous liquors, tinware, and tobacco.

The natives speak a Malayan language and belong to the Malayo-Polynesian class of people. They include a number of tribes, of which the Hovas are the most powerful, and the several classes are graded differently in civilization and religion. Mission, agricultural, public and normal schools are maintained by the government. Most of the architecture is of frame timber and bamboo, though rapid progress is being made in manual arts, especially in carpentry, weaving, and iron work. The religion is fetichism. Infanticide and polygamy are still practiced to some extent, but superstition is fast giving way to the influence exerted by Christian teachers and missionaries. About 50,000 natives are Roman Catholics and 475,000 are Protestants.

France has laid claim to Madagascar since 1642, but little was done until recent years to establish the claim and develop the natural resources. The earliest information of this island was published by Marco Polo in the 13th cen-

ture and the Portuguese cruised off its coast in 1506, publishing an account of it in which the name Saint Lorenzo was applied to the island. Radama I. was recognized as the reigning sovereign of the Hova tribe in 1810. He encouraged missionary work and authorized a translation of the Bible into the Malagasy language. At his death, in 1828, his queen, Ranavalona, became ruling sovereign. She resisted the extension of French influence and refused the Christians free access and communication. Her son, Radama II., succeeded to the throne in 1861. He not only admitted missionaries, but encouraged improvements and emancipated the slaves. His liberality caused much dissatisfaction among the natives and was the occasion of his assassination by a native in 1863, when Queen Ranavalona II. ascended the throne. Soon after a war broke out against France, but it terminated in the French being recognized as the rulers of the island and the establishment of a governor general at Diego-Suarez. The queen was formally deposed in 1897 and exiled to Algeria. Antananarivo is the capital. Other trade centers include Mojanga, Tamatave, Antombaka, and Fort Dauphin. Population, 1906, 2,651,762.

**MADDER** (măd'dēr), a family of plants, represented by about 4,500 species in the trop-

black. Many of the species yield coloring matter and products useful in medicine. The *common madder* of Europe is grown in many parts of the world for its roots, which yield a red dye, including a shade known as *turkey red*. Several species in South America belong to the trees that yield Peruvian bark, from which quinine is extracted. The coffee tree, though native to Abyssinia, is grown extensively in tropical countries. A small tree of Brazil belonging to this family yields the emetic drug *ipecacuanha*. The species common to the United States include the *bluets*, *bedstraw* and *buttonbush*. Though alizarin was formerly obtained chiefly from madder, this coloring matter is now produced artificially from anthracene. It produces the colors known as Turkish-reds.

**MADEIRA** (mă-dē'rà), a large river of South America, the most important tributary of the Amazon. It is formed at the boundary line between Bolivia and Brazil by the confluence of the Guaporé and Mamoré rivers, and after a course of 935 miles joins the Amazon about 98 miles below Manaus. It has a basin of nearly 500,000 square miles, and its total length to the source of the Mamoré is 2,210 miles. At a distance of 715 miles above its mouth are noted falls, the Falls of São Antonio, and above that navigation is impossible, the series of cataracts extending about 225 miles. The Madeira valley and the valleys of its tributaries are exceedingly fertile. They contain vast forests and the most productive rubber regions in the world. The country is being rapidly developed under governmental encouragement. A railroad has been projected around the rapids.

**MADEIRA**, a group of islands situated about 350 miles northwest of Africa, nearly due west of Morocco. The largest island, Madeira, is named after the group. It has a length of 35 miles, a breadth of from nine to fifteen miles, and an area of 300 square miles. The area of the entire group is 315 square miles. The surface is diversified by mountain ranges, the culminating peak of which has a height of 6,010 feet. Many small islands are situated adjacent to Madeira, the most important of which are Porto Santo and Deserta Grande. The productions are principally live stock, cereals, wine, sugar, and tropical fruits. It is noted for the excellence and abundance of its vines, which bear successively for many years. The island group belongs to Portugal, and has been in possession of the Portuguese since 1431, when it was colonized by them. It has some remains of Roman occupation, including ruins of several fortifications. The inhabitants consist principally of Negroes, Portuguese, and

MADDER.

ical and warmer temperate regions of both hemispheres. They include many herbs, shrubs, and trees, most of which are tropical. The leaves are opposite or whorled, the flowers are greenish-yellow, and the fruit is dark brown or

Moors. Funchal is the commercial center and capital. Population, 1906, 152,847.

**MADISON** (măd'ĩ-sŭn), a city of Indiana, county seat of Jefferson County, on the Ohio River, fifty miles northeast of Louisville, Ky. It is on the Pittsburg, Cincinnati, Chicago and Saint Louis Railroad and has regular steamboat communication. The surrounding country is agricultural and dairying. Among the manufactures are furniture, cotton and woolen goods, engines, steamboats, boilers, and machinery. It has a public library, the Saint Gabriel's Academy, and many fine schools and churches. Waterworks, sewerage, pavements, and electric street railways are among the improvements. It is the seat of a large trade in merchandise. Madison was incorporated in 1824. Population, 1900, 7,835; in 1910, 6,934.

**MADISON**, the capital of Wisconsin, county seat of Dane County, 83 miles west of Milwaukee, on the Illinois Central, the Chicago and Northwestern, and the Chicago, Milwaukee and Saint Paul railroads. It has a beautiful situation between lakes Menona and Mendota, which have been improved by parks and hotels and form a popular summer resort. It is improved by an electric street railway system, public lighting, pavements, waterworks, and sanitary sewerage. Among the principal buildings are the State capitol, the United States post office, the soldiers' orphans' home, the State lunatic asylum, the Carnegie public library, the public high school, and the University of Wisconsin. The State capitol is a fine structure, erected at a cost of about \$5,000,000, and near it is the library and museum building of the Wisconsin Historical Society. This association has a reference library of 250,000 volumes. Other learned societies include the Wisconsin Academy of Sciences, Arts, and Letters and the Wisconsin Geological and Natural History Survey. Madison is noted for its large Chautauqua assembly meetings.

Madison is important as an industrial and wholesaling center. The chief manufactures include flour, machinery, ironware, furniture, wagons and carriages, boots and shoes, books and stationary, and electrical appliances. It was selected as the site of the State capital in 1836, when Wisconsin was organized as a Territory. Two years later it was named after President Madison, since which time it has been the seat of government and was incorporated in 1856. Population, 1905, 24,301; in 1910, 25,531.

**MADONNA** (mă-dŏn'nà), the Italian equivalent for madam, but now applied specially to the Virgin Mary, and in the latter sense used as the English term Our Lady. In 431 the Council

of Ephesus declared that the Virgin Mary is the Mother of God, and since that time the title has come to be the name of a great number of pictures in which the Virgin forms the sole or prominent object. These include principally Raphael's "Madonna di Ansidai," Leonardo da Vinci's "Madonna of the Rocks," Raphael's "Sistine Madonna," Holbein's "Madonna of Burgomaster Meyer," Rubens' "Madonna of the Innocents," Perugino's "Enthroned Madonna and Child," Angelo's "Madonna of Burges," Lochner's "Virgin in the Arbor of Roses," Raphael's "Madonna of the Canopy," Correggio's "Madonna with Saint Francis," Jan van Eyck's "Lucca Madonna," and Murillo's "Madonna."

**MADRAS** (mă-drăs'), a seaport city of India, capital of the presidency of Madras, on the Coromandel Coast of the Bay of Bengal. Madras, the presidency, has an area of 141,726 square miles and a population of 39,826,450. The city has extensive canal and railway connections, is the center of a vast interior and foreign trade, and contains a well-equipped garrison. Its harbor is not naturally commodious, but has been improved materially by piers, and a splendid lighthouse towers to a height of 125 feet and may be seen a distance of fifteen miles. The manufactures are numerous, but they did not become particularly noteworthy until within comparatively recent times. They consist chiefly of clothing, machinery, earthenware, soap, flour, and canned fish. The principal buildings include the government house, the Scotch Church of Saint Andrew, the Saint George's Cathedral, the Madras Polytechnic Institution, and a large number of Hindu and Mohammedan temples. The English founded Madras in 1639, after obtaining a grant of land from a native prince. It has been affected materially by hurricanes that sweep from the sea over the lower parts of the site during the monsoon period, from May to October. The population consists mostly of Hindus, and about 50,000 Mohammedans and 4,250 Europeans. Brahmanism is the religion of a majority of the people. Population, 1906, 522,972.

**MADRID** (mă-dríd'), the capital of Spain, in the province of Madrid, on the Manzanares River, a tributary of the Tagus. It has a fine site on a plateau 2,450 feet above sea level, in the geographical center of Spain. The city is connected with the chief cities of Spain and Portugal by railroads and has important commercial and manufacturing enterprises. The extremes in temperature make it quite unhealthy, the rate of mortality being exceedingly large. It has important public institutions, among them

many excellent churches, hospitals, libraries, royal academies, public schools, and a splendid university. The royal palace is built of granite. It is a fine structure in the form of a square, 470 feet on each side and 100 feet in height. Its armory is counted among the finest in Europe. The municipal facilities are modern, including stone and asphalt pavements, public lighting and waterworks, and a street railway system. Philip V. founded the national library, which at present contains 600,000 volumes. The university has extended courses of study and an attendance of 6,100 students. The bullfights held annually at the Plaza de Toros, which has a seating capacity for 13,000 spectators, attract vast audiences, spectators coming from many countries of Southern Europe. Other places of amusement and interest are its public parks, promenades, and several museums, including the Royal Museum of Painting and Sculpture.

Madrid was a small fortified town in the 10th century, when it was known as Majoritum. Alfonso VI. captured it from the Moors in 1083. It was made the permanent capital of Spain in 1561, after which it was greatly improved by grading and the construction of government buildings. In 1808 it was the center of the rebellion against the French under Murat. Population, 1906, 542,385.

**MADURA** (mä-dōō'rà), a city of India, capital of a district in the province of Madras, 275 miles southwest of Madras. The streets are regularly platted and improved with substantial paving. It has several large market places and a large trade. Among the chief buildings are many Hindu temples, the government houses, and a palace built by Tirumulla Nayak. A number of Christian missions and two colleges are located here. The manufactures include cigars, cotton and woolen goods, clothing, and machinery. It has electric railways, waterworks, and railway transportation facilities. Population, 1906, 108,206.

**MADURA**, an island in the East Indies, separated from the northeastern coast of Java by a narrow strait. The area is 1,700 square miles. Much of the surface is mountainous and the soil is not very fertile. Salt, petroleum, cattle, maize, tobacco, and fruits are the chief products. It is a possession of the Netherlands and is governed with a number of other islands, the entire territory having an area of 2,060 square miles. Pamekasan is the seat of government. Population, 1906, 1,638,204.

**MAELSTROM** (mäl'strüm), or **Malström**, a celebrated whirlpool near Moskenäs, one of the Lofoten Islands, off the northwestern coast of Norway. Many legends have been published

of large vessels being sunk in the deep, but most of them are fabulous. It is dangerous in winter, when it rages so furiously that its roaring sound is heard many miles. This is also the case when a strong wind blows from the northwest. At those times it is capable of engulfing small vessels which approach it, but ordinarily it can be traversed without danger. The Maelstrom is due to the currents of the Great West Fiord.

**MAESTRICH** (mä's'trikt), or **Maastricht**, a city of Holland, capital of the province of Limburg, on the Maas River, eighteen miles northwest of Aix-la-Chapelle, Germany. It is connected by important railroads, giving it commercial advantages, and was once a fortress of great strength, but has been reduced to a garrison. It has a fine statue of Charlemagne. A fine stone bridge crosses the river and connects the city with Wijk. The manufactures, educational institutions, and jobbing trade are important. It has pavements, public parks, and electric street railways. The Spaniards captured it in 1579. Population, 1906, 36,474.

**MAFEKING** (mä-fâ-kīng'), a town of South Africa, in the Bechuanaland Protectorate, near the border of the Transvaal Colony, 95 miles northeast of Vryburg. It has railroad facilities and a growing trade in produce and merchandise. The place became noted in 1899, during the Anglo-Boer War, when Colonel Baden-Powell was besieged here by a force of Boers under General Cronje. The Boers had planned to capture the British force at this place, but Colonel Mahon came to the relief with a British column.

**MAFIA** (mä'fê-à), a secret society of Sicily, whose aim is to substitute its own authority for that of the law. It exercises a powerful influence in the social and political affairs in the island and the southern part of Italy, and branches have been founded by Italian immigrants in New York, New Orleans, and other cities of the United States. Among the objects are to control elections, obtain employment for the members, and protect those belonging to the society against the officers of the law. In 1890 the branch society in New Orleans became involved in considerable trouble, since it was thought to be the cause of the death of the chief of police. Eleven of the members were put in jail, but they were taken out and murdered by a mob. This involved the United States in diplomatic complications with the government of Italy, but the matter was settled by a payment of indemnity by the United States to the relatives of the victims.

**MAGDALENA** (mäg-dà-lâ'nà), a river of

South America, rises in the southern part of Colombia. It flows nearly north and discharges into the Caribbean Sea by a delta below Barranquilla. The Cauca is its principal tributary, which rises about ten miles from the source of the Magdalena and joins it near 9° north latitude. Other streams flowing into it include the Bogotá and Sogamoso rivers. The Magdalena has a length of 975 miles and is navigable to Honda, 450 miles from its mouth. Above that point is a series of rapids. However, they have been paralleled by a line of railway, by which connection is afforded with the navigation in the upper course. The delta of the Magdalena includes 3,000 square miles.

**MAGDALEN ISLANDS** (măg'dă-lĕn), a group of islands in Canada, located near the center of the Gulf of Saint Lawrence, belonging to Quebec. They are about fifty miles northwest of Cape Breton Island. The surface is made up largely of rocky cliffs, but they contain considerable land suitable for agriculture. The inhabitants engage chiefly in the herring, cod, and seal fisheries. In winter the sea freezes to the extent that communication with the outer world is shut off for four months, except by telegraph. Population, 1906, 5,120.

**MAGDEBURG** (măg'dĕ-böörg), a city of Germany, capital of Prussian Saxony, noted as a strong fortress. It is located on the Elbe River, 75 miles southwest of Berlin, with which it is connected by railways. The river navigation and canal improvements, together with its numerous railroads, make Magdeburg an important jobbing center. It has many educational institutions, including a fine public school system, two normal schools, two gymnasia, institutions for the dumb, blind, and deaf, and several industrial training schools. The Cathedral of Saints Maurice and Catharine, founded in 1208, is one of the most noted ecclesiastical buildings in Europe. It contains the graves of many noted sovereigns, among them Emperor Otho, the founder of the city. Other noteworthy buildings include the Church of Our Lady, the Church of Saint Paul, the public library, the city hall and courthouse, the commercial exchange, and the public museum. It has manufactures of gloves, leather, vinegar, cotton and woolen goods, silk fabrics, ribbons, machinery, pottery, and musical instruments. Wallenstein laid siege to Magdeburg for seven months in the Thirty Years' War, but in 1631 it was captured by Tilly, who not only sacked it, but caused the death of 30,000 of its people. In 1808 it became a part of France, but was returned to Prussia in 1814 by the Treaty of Paris. Most of the inhabitants are Protestants. Population, 1905, 240,633.

**MAGELLAN, Strait of**, the channel which separates the island of Tierra del Fuego from the continent of South America. It is from two to seventy miles wide and about 350 miles long, and forms a connection between the waters of the South Pacific and the South Atlantic. Its navigation is endangered by numerous islands. The name was applied in honor of Ferdinand Magellan, who discovered it and sailed through it in 1520. On its shores are thousands of aquatic birds, including ducks, geese, gulls, penguins, cormorants, and oyster catchers.

**MAGENTA** (mă-jĕn'tă), a town of Italy, in the province of Milan, on a railway line about seventeen miles west of Milan. It is noted as the scene of a celebrated battle on June 4, 1859, between the Austrians and French. The latter were commanded by Marshal MacMahon, who defeated the Austrians under command of Count Gynlai. It is estimated that the French lost 5,000 men and the Austrians about 10,000. MacMahon was soon after created Duke of Magenta.

**MAGGIORE** (măd-jō'ră), a lake on the boundary between Switzerland and Italy, but situated mostly in the latter country. It has a length of forty miles. The average breadth is about four miles and the greatest depth is nearly 1,500 feet. It is thought that its origin is from volcanic action. Fine vineyards and fertile fields surround the lake, but adjacent to its northwestern coast are mountains of solid granite. In its vicinity are several prosperous towns, including Magadino and Lacarno, in Switzerland, and Cannobio, Luino, Bavino, and Palanza, in Italy.

**MAGI** (mă'jī), a name first mentioned by the prophet Jeremiah, in connection with an officer of Nebuchadnezzar, and afterward applied by Herodotus to one of the six Median tribes. Subsequently the Magi became an hereditary priestly caste of the Medes and Persians, who were regarded the servants of God and the preservers and propagators of sacred rites and traditions. This priestly caste had much influence in the affairs of individuals and of the state, and, besides conducting religious worship, had charge of the educating of princes and nobles. In the time of Zoroaster the Magi were reformed and disciplined, but later they declined in influence until they developed into magicians and fortune tellers. The name magi is given to the three wise men who came from the East to worship the infant Jesus.

**MAGIC**, the alleged art of exercising supernatural powers by calling into activity the spirits of departed beings, or employing enchantment, sorcery, and witchcraft. Superstition and belief

in magical arts date from remote history, and, after passing through the various centuries, it is still adhered to among the unlearned Gypsies and other classes, who reap a rich harvest by acting upon the credulity of superstitious people. *Natural magic* is the name applied to the art of utilizing natural causes to produce effects apparently supernatural.

**MAGIC LANTERN**, or **Stereopticon**, an instrument invented by a German Jesuit, Athanasius Kircher, in 1645. It consists of a case or box in which the scattered rays of some powerful light are confined and made to pass through a tube. A concave reflector put opposite the tube, back of the lamp, aids in condensing the light and directing it through the tube, in which powerful lenses are arranged to condense the diverging rays upon paintings on glass, which slide in a sort of stage, and another object glass throws the image of the highly illuminated object upon a white wall or screen, the focus being adjusted by sliding this lens nearer to or farther from the object. The best effects are secured in a room which is highly darkened, but the size and beauty of the pictures cast upon the screen depend upon the distance of the object from the lenses, the position and character of the lenses, and the power of the light. A brilliant picture twenty feet in diameter may be secured from a slide three inches in diameter under a powerful light. To appear erect upon the screen, the picture slides must be inserted into the tube in an inverted position. Recently vast improvements have been made in the magic lantern by discarding the oil lamp and substituting for it oxy-hydrogen and electric lights. A very beautiful effect is secured by what is known as *dissolving views*. It involves having two reflectors so placed that the images of two pictures are thrown at the same time on the screen, causing one to fade or melt into the other. See **Kinetscope**.

**MAGNA CHARTA** (mäg'nä kär'tä), or **Great Charter**, an important document in British history, forming a part of the Constitution of Great Britain, and regarded as a basic guarantee of liberty. It was extorted by the people of England from King John at Runnymede, June 15, 1215. This document was brought about by the tyranny and oppression practiced by the Norman kings under the feudal system, on account of which the barons rose up with the hearty support of the people in their demand for reformatory measures. Among the reforms guaranteed were included the protection of property, liberty, and life against arbitrary kings. The barons were accorded certain privileges that tended to secure the proper enforcement of

civil rights and social freedom. Other measures embodied in the Magna Charta include the regulations of the business of traders, those in regard to the church, and those in relation to freemen generally, especially the protection guaranteed under a jury system. Several successors of King John confirmed the Great Charter and Edward I. embodied it in the statutes. The essential principles have been confirmed by many decisions of the courts and acts of Parliament.

**MAGNESIA** (mäg-nē'zhī-ä), an earthy powder. It is a tasteless white powder and possesses alkaline properties. Magnesia is used in medicine as a laxative and, administered in small doses, it acts as an antacid. Pure magnesia is obtained by exposing hydrated carbonate to a red heat. Treated in this way, it forms the pure commercial article known as calcined magnesia.

**MAGNESIUM** (mäg-nē'zhī-üm), a mineral of wide distribution, constituting a silver-white metallic element. It may be obtained by reducing magnesium chloride with metallic sodium, or by the electrolysis of fused magnesium chloride. At an ordinary temperature it is more brittle than silver, but becomes malleable when the temperature is increased, and may be formed into wire or ribbon. Its silver-white color is preserved in dry air, but when exposed to moisture it becomes tarnished. When heated in the flame of a candle, or in oxygen gas, it burns with a dazzling light. It is rich in chemical, actinic rays, a property that has led to its use in photography, but more recently the electric light has been utilized in its stead. In an atmosphere of carbonic acid gas it decomposes the gas in burning, constitutes magnesian oxide, and forms the carbon into a powder. Calcined magnesia is obtained by reducing magnesium to ashes. Magnesium deposits occur extensively in various metals, in serpentine rock, meerschaum, soapstone, asbestos, and other minerals.

**MAGNET** (mäg'nēt). See **Magnetism**.

**MAGNETISM** (mäg'nēt-iz'm), the science that treats of the laws and conditions of magnetic force. The name was coined from Magnesia, a town in Asia Minor, near which a black mineral known as loadstone is found embedded with iron ore in volcanic rock. This mineral is widely distributed, being found in New York, New Jersey, Siberia, and Sweden, and is generally termed *magnetite*. It has the peculiar property of not remaining at rest when suspended, except when certain points are directed north and south. This quality caused the ancients to use it to direct ships at sea, for which purpose the mariner's compass displaced

it. A piece of loadstone is called a *natural magnet* and differs from an *artificial magnet*, which may be made of a bar of soft iron or steel by imparting to it the peculiar magnetic property by friction from other magnets, or by the action of an electric spark. Artificial magnets retain their magnetic properties for a short or long time, depending on the quality of the iron of which they are made. Pure soft iron remains a magnet only while the magnetizing action lasts, and one so made is called a *temporary magnet*, while hardened iron and steel retain their magnetic properties a long time, these metals being used to make *permanent magnets*. The best permanent magnets are made of hardened steel. They are called *bar magnets*, if straight, and *horseshoe magnets*, if they are U-shaped. The two ends of a horseshoe magnet are connected by a soft iron called the *armature*.

The cause of magnetic force is unknown, but is generally believed to be due to molecular action. It is thought that every magnetizable

MAGNETIC NEEDLE.

*N N*, North Poles. *S S*, South Poles.

body, whether the body is magnetized or not, constitutes a permanent magnet, but before it is magnetized the poles of the molecules point in every direction, thus neutralizing one another. When increasing magnetization is produced by friction or electric induction, the action of the molecules becomes more and more nearly parallel, and a closed electric current flowing around each molecule results. Since both natural and artificial magnets, when freely suspended on a pivot, rest with their length in a direction north and south, they are used in constructing the compass. The attraction is greatest at the extremities, which are designated respectively the *north* and *south poles*, or simply the *poles*, and decreases toward the middle. The north-seeking pole is distinguished as the positive and the south-seeking as the negative, marked  $+$  and  $-$  respectively. The similar

poles of magnets repel and the dissimilar attract each other, the intensity of repulsion and attraction varying inversely as the square of the distance. All substances are attracted or repelled, though in most cases the action is very feeble. Those attracted are called *paramagnetic* and those repelled are termed *diamagnetic* substances, though the latter class is most numerous. To illustrate, iron is attracted by both poles of a magnet, while bismuth is repelled by both. The *magnetic field* is the space surrounding a magnet in which attraction or repulsion takes place, and corresponds to the electric field surrounding an electrified body. Magnets depend for their strength upon size, material, and construction, varying greatly with the modification of each. One of the largest magnets in the world is at the Stevens Institute of Technology, in New York, which weighs 1,600 pounds, and has a lifting capacity of about forty tons, exceeding its own weight about fifty times.

The circumstance that the poles of a magnet point to the north and south is accounted for by the fact that the earth is a great magnet. Its magnetic poles do not correspond with its geographical poles, but they are known to attract the poles of a magnet. The *magnetic needle* of a compass, therefore, does not point to the true geographical north in all parts of the earth, but slightly east or west of it. This deviation from the true north is called *declination*, or *variation*, and differs in different parts of the earth. Sir J. C. Ross, in 1831, discovered the magnetic north pole in latitude  $70^{\circ} 5'$  north and longitude  $90^{\circ} 46'$  west, which is about 1,000 miles from the geographical north pole. The magnetic south pole has not yet been discovered, but the magnetic equator has been partially traced, and is known to cross the terrestrial equator at several places, though never deviating more than  $12^{\circ}$  from it. The earth appears to owe its magnetism to the electricity circulating in the atmosphere. This atmospheric electricity is probably produced by the sun's rays heating unequally different portions of the earth's surface. In many places the lines of force of the earth's magnetic field are inclined to the earth's surface. Where this is the case one of the poles of a magnetic needle is inclined to the earth, which is called the *inclination*, or *dipping*, of the needle. The north pole is inclined in the Northern Hemisphere and the south pole in the Southern. At the magnetic poles the needle dips vertically downward, and at the magnetic equator it assumes a horizontal position.

**MAGNETITE** (măg'nēt-īt), an ore of iron, so called from its magnetic properties. In some cases it exhibits polarity, when it is known as

*loadstone*, or *lodestone*. It has a semimetallic lustre, is iron-black in color, and occurs both massive and crystalline. This product is mined in many parts of the world and is important as a commercial source of iron. Large deposits of it are found in Sweden, Siberia, Canada, and many parts of the United States, especially in the Adirondacks, in the iron range of Minnesota, and in various parts of Colorado, California, and Missouri.

**MAGNETO-ELECTRIC MACHINE.** See *Electric Machine*; *Dynamo*; *Electricity*, etc.

**MAGNIFICAT** (măg-nîf'î-kăt), the song of thanksgiving uttered by the Virgin Mary, as recorded in Luke i, 46-55. It is named from the first word in the Latin version *Magnificat anima mea, Dominum*, meaning "My soul magnifies the Lord." It was incorporated into the service of vespers, and is usually sung or said after the first lesson at evening prayer.

**MAGNOLIA** (măg-nō'li-ă), a genus of ornamental shrubs and trees, native to North America, China, India, Japan, and other portions of Europe and Asia. Many of the species are

MAGNOLIA.

noted for their great beauty, handsome flowers, and evergreen or deciduous leaves. The flowers of some are ten inches in diameter, but most bear smaller flowers. They are white or purple-white in color and are noted for their fragrance. The wood is of little value on account of its being soft and spongy, but some of the trees attain a large size and yield woods utilized in manufacturing ornamental products and baskets. Some species have roots of which the bark is serviceable in preparing a useful tonic. The *Virginian magnolia*, or *Magnolia Grandiflora*, has properties that are utilized in making medicine for treating rheumatic complaints, while the *Magnolia Umbrella* yields a tonic. The largest

American species is common to the region from North Carolina to the Gulf. It attains to the height of seventy feet, has evergreen laurellike leaves, and bears a whitish flower. The *Magnolia Yulan* has been cultivated nearly 2,000 years in China, where it thrives at high elevations and serves as a favorite ornamental tree.

**MAGPIE** (măg'pî), the name of a beautiful bird classed with the crow family, but differing from the common crow in having a smaller body, short wings, a long tail, and various colors. Several species of magpies have been described, two of which are native to America, and abound from the northern portion of the continent to the Gulf of California. The common magpie is from fourteen to eighteen inches in length, has black and white plumage with markings of purple and green, and is shy, but cunning in obtaining food and avoiding enemies. It subsists principally on animal food and preys upon the eggs and young of other birds, for which purpose it robs their nests promiscuously. The nests are built substantially, some species constructing a dome of interwoven sticks for protection, and the eggs are usually from six to nine in number, bluish-green in color, and blotched with ashen hues. The magpie is generally met with in pairs, issues a chattering note, and may be domesticated, even showing capability of learning to articulate some words by imitation, and is inclined to hide articles of bright color. Most species are shy in a native state, but in populated districts they become familiar and build their nests under the eaves of habitations and churches.

**MĀHĀBĀRATA** (mā-hā-bā'rā-tā), a celebrated epic in the literature of India, comprising a history of the war waged in the ancient kingdom of Bharata. It is sixteen times as long as the *Iliad* of Homer, and is usually divided into eighteen books. The principal part of the work treats of the contest between the Kauravas and the Pandavas. It recites in an interesting manner how the ancient families of the Kauravas, owing to their conceit and wickedness, were overthrown by the Pandavas, who are treated as the heroes of the epic. The latter are lauded as faithful in their worship of the true god Krishna, the human incarnation of Vishnu. It is the opinion of most writers that the poem originated through a collection of materials produced in different periods, and the Hindus attribute it to Vyâsa, who is spoken of as the *arranger*.

**MAHANADI** (mā-hā-nūd'ê), or *Mahanud-dy*, a river in the southern part of India, rises in the Central Provinces, and flows into the Bay of Bengal by a large delta. It receives the

inflow from several tributaries and has a total length of 520 miles. During the rainy seasons it carries a large volume of water, the surplus being utilized to irrigate a large scope of country. In the dry season it becomes very low.

**MAHANNOY CITY** (mä-hä-noi'), a borough of Schuylkill County, Pennsylvania, in the anthracite coal region, ten miles north of Pottsville. It is on the Lehigh Valley and the Philadelphia and Reading railroads. Among the chief buildings are the public library, the high school, and several fine churches. It has extensive iron works and is important as a mining and shipping center for anthracite coal. The vicinity was first settled in 1859 and the place was chartered as a borough in 1863. Population, 1900, 13,504; in 1910, 15,936.

**MAHDI** (mä'dë), the name given by the Mohammedans to the messiah that was promised by Mohammed, who is expected to appear and fill the world with righteousness by effecting the universal adoption of Mohammedanism. The appellation was applied particularly to a successor of Mohammed named Abu'l-Kasim, the twelfth Imam, who disappeared mysteriously in 879 A. D. It was generally believed that he had gone to an unknown abode for the purpose of preparing a place for the righteous, and that he would reappear on the last day. Since then there have been many mahdis who claimed power and authority, the most prominent of recent times being Mohammed Ahmed. He was born in Dongola, Nubia, in 1842, and died of smallpox June 25, 1885. This mahdi took a course in Mohammedan theology at Khartoum and Berber, and retired to the island of Aba in the White Nile at the age of 25 years, where he lived in studious solitude until 1882, when he proclaimed himself the messiah. The loose government of Egypt made it possible for him to raise a considerable army. He declared a Holy War ( *Jihad* ) and seized Kordofan in 1883, which he made his capital. In November of the same year he defeated an Egyptian army of 10,000 under Hicks Pasha, and in 1885 conquered Khartoum, where General Gordon was killed.

**MAHOGANY** (mä-hög'ä-nÿ), a large tree of the order Meliaceae, common to tropical America, noted for its close-grained and hard wood. The tree reaches maturity in a period of 200 years. It attains a height of fifty to ninety feet, with a diameter of from five to twelve feet, and has lofty and spreading branches. Its flowers are fragrant and the fruit is the size of a turkey's egg. The wood is one of the most valuable, being hard, reddish-brown, compact, and capable of taking a fine polish. It is useful in the manufacture of furniture, musical instru-

ments, and for veneering. Sir Walter Raleigh brought the first specimens of mahogany wood to Europe, but it was not used extensively in the industries until about 1725. Mexico, Honduras, and the West Indies are the countries where mahogany is produced most extensively.

MAHOGANY.

*a*, flower; *b*, partly opened fruit.

The term mahogany is often applied to any one of various trees yielding wood which resembles the true mahogany, such as the *rohuna* tree of India and the *mountain mahogany* of the western part of the United States.

**MAHRATTAS** (mä-rät'táz), a people of British India, who are supporters of the Hindu caste and religious systems, but are thought to be of Persian descent. The first mention of them in history occurred in the 17th century, when they came in contact with the Mongols, and in 1761 fought a series of battles against incursions of the Afghans. Their possessions extended along the western side of the peninsula. They were reduced to dependence by the British in the early part of the 19th century. The last Mahratta ruler held out against the Europeans by employing French troops and discipline, but he was defeated in 1843 by the British. The three Mahratta states of Indore, Gwalior, and Baroda did not participate in the Sepoy Mutiny of 1857 and are now governed respectively by officials who bear the titles of Holkar, Sindia, and Gaekwar. These people at present do not support caste laws with much strenuousness, but are noted as Brahma worshipers of considerable earnestness.

**MAIDENHAIR**, the name of a class of small ferns, including several species that are distributed in both hemispheres. They are delicate and graceful plants and thrive best on moist rocks and in shady places. Some of the species are cultivated as house ferns. The common maidenhair has pedate leaves and sweet rootstocks.

**MAIN**, a river of south central Germany, rises in the Fichtelgebirge. It has a general course toward the west, and joins the Rhine near Mentz. The Main is 306 miles long, is navigable about 200 miles, and affords connections with the Danube by Ludwig's Canal. Its valley is highly fertile, contains several prosperous cities, and is noted for the culture of cereals and the vine. Among the chief cities on its banks are Frankfort, Würzburg, Schweinfurt, and Offenbach.

**MAINE**, the most northeasterly state of the United States, one of the New England group, popularly called the *Pine Tree State*. It is bounded on the north and east by British America, south by the Atlantic, and west by New Hampshire and Quebec. The length from north

to south is 302 miles; breadth, 185 miles; and area, 33,040 square miles. The Atlantic coast has a length of 245 miles and is indented by numerous inlets, including Casco, Penobscot, Bluehill, Frenchman, Machias, and Passamaquoddy Bays. A large number of small islands lie off the coast.

**DESCRIPTION.** Much of the surface is moderately hilly, the general slope being toward the south. Through the center and along the western boundary are groups of mountains, including chiefly ranges of the White Mountains, which extend into the State from New Hampshire. The highest elevation is Mount Katahdin,

located in the north central part, and has an elevation of 5,250 feet. Other elevations of prominence are Saddleback Mountain, 4,000 feet, and Mount Baker, 3,390 feet. The coast is fringed and has many natural harbors, but these have the disadvantage of exceedingly high tides, which range from eight to fourteen feet. The islands and headlands of the coast are rocky.

Maine has many inland lakes. Fully 600 are of considerable size and the total lake surface is about 2,350 square miles. Moosehead Lake, the largest inland body of water, has a surface of 120 square miles and is the source of the Kennebec River. Rangeley Lake, the source of the Androscoggin River, covers 90 square miles. Other lakes of large size include Chamberlin, Eagle, Milinokett, Grand, Sebec, Richardson, and Sebago lakes. Many of the streams afford excellent water power. All of the larger rivers flow southward into the Atlantic. A part of the northern boundary is formed by the Saint John and on the eastern border flows the Saint Croix, which separates the lower part of Maine from New Brunswick. The Penobscot River, which rises near the western border, drains the central part of the State and flows into Penobscot Bay. The Allegash and the Aroostook are tributaries of the Saint John. Other rivers include the Kennebec, Androscoggin, Saco, Salmon Falls, Union, and Machias. Nearly all of the rivers are rapid and have many cataracts hence are not valuable for commerce. However, the Kennebec is navigable to Augusta, 26 miles, and the Penobscot to Bangor, 25 miles.

The climate is temperate and characterized in winter by severe cold and in summer by extremely warm weather. In January the mean temperature is 20° and in July it is 68°. The extremes of summer are from 90° to 98° and in winter from 20° to 30° below zero. Sudden and violent changes in the weather are quite frequent, owing to the winds blowing alternately from the north and south. Snow falls to considerable depths in the winter, but the excellent drainage renders the State one of the most healthful, malaria being of very rare occurrence. The rainfall for the whole State is forty inches and it is quite evenly distributed throughout the year.

**MINING.** The State is rich in fine building and monument stone. The coast and the region extending many miles inland are noted for the vast deposits of granite, which occur in great veins or in eruptive masses. Limestone is quarried extensively and much of the product is utilized in the manufacture of lime. Considerable profit is obtained from the output of slate, and many localities have sand well fitted for the

manufacture of a superior quality of glass. Small quantities of iron, gold, silver, tin, copper, and manganese are obtained. Large and beautiful crystals of tourmalin are found in Oxford County, and mineral springs yield waters that are of high commercial importance.

**FISHERIES AND FORESTS.** The fisheries take high rank among those of New England and a large number of people are engaged in the fishing industry. Lobster fishing has a high place, being more important in the State than in all the remainder of New England, and clam fishing is next in importance. The salmon fisheries are the largest on the Atlantic coast. Other catches include the herring, cod, halibut, and menhaden. Much of the product is cured and canned.

The State has forests estimated at 23,700 square miles, about 78 per cent. of the total land area, and the value of its timber products is \$15,000,000 annually. Although the primeval forests have been cut over, a large output of lumber is obtained from the second growth. The most valuable timber lands are in the basin of the Saint John River, but fine forests are available in the region drained by the Penobscot and the Androscoggin. Among the chief varieties are spruce, birch, poplar, fir, hemlock, and cedar.

**AGRICULTURE.** The rugged and broken surface renders much of the State unfit for cultivation, but many of the river valleys are very fertile. In the Aroostook valley, in the northeastern part of the State, is a large region of fertile farming land. Hay is the chief crop and is grown on a larger acreage than the aggregate of all the land devoted to the cultivation of cereals and vegetables. Among the products are oats, potatoes, buckwheat, corn, and barley, but the acreage devoted to each of these is not considerable. The raising of apples is an important and growing enterprise and the quality produced is of a high class. Sheep are represented by larger numbers than any other domestic animals, being due to the fact that much of the cut-over timber land yields suitable pasturage. Cattle are grown to some extent for the market, but principally for the dairy products, in which the State ranks next to Vermont in the New England group. Other domestic animals include horses, swine, mules, and poultry.

**MANUFACTURING.** Maine is particularly favored by having an abundance of water power. This factor, combined with its timber resources and large deposits of commercial stone, gives it considerable importance as a manufacturing State. Nearly twelve per cent. of the inhabi-

tants engage in this enterprise. Shipbuilding has long been an important industry, but it has declined somewhat with the increased use of steel for the construction of vessels. Bath has extensive shipyards and has produced many of the seagoing vessels made in the United States. The manufacture of cotton goods takes high rank and may be classed in importance with the industries of lumbering and paper making. Large returns are obtained from the canning and preserving of fish, from the manufacture of woolen goods, and from the products of foundries and machine shops. Other manufactures include flour, leather, furniture, clothing, slate shingles, monuments, lime, and earthenware.

**TRANSPORTATION AND COMMERCE.** The Atlantic coast, including the indentations, has a length of nearly 2,500 miles. At present there are in operation 2,150 miles of railways and 3,500 miles of electric lines. Though railroad transportation is extensive, the lines are confined chiefly to the southern and eastern parts of the State. They include the Maine Central, the Boston and Maine, the Canadian Pacific, and the Grand Trunk, the two last mentioned being transcontinental railways of Canada. Portland, on Casco Bay, is the principal railway center. Steamers ply regularly between the largest cities of Maine and the commercial centers of the United States and Canada. The exports greatly exceed the imports. The former consists largely of lumber, cotton goods, granite, and boots and shoes, while the imports embrace principally sugar, wool, coal, and food stuffs.

**EDUCATION.** The illiteracy is 5.1 per cent. of the population ten years of age or over, but among the native white inhabitants it is only 2.4 per cent. Much attention has been given to develop the educational interests from an early period. The town is the smallest unit for the management of the schools and the compulsory attendance period is from seven to fifteen years inclusive. High schools are maintained in all the towns and cities, all of which have well-articulated courses of study and prepare the students for higher work in the academies and colleges. Formerly much of the secondary instruction was given in private academies, but free academic instruction has been maintained in the towns since 1873. Towns have been permitted, since 1889, to contract with any academy or high school for the tuition of their students, hence such schools receive the same aid as those regularly maintained by public taxation. About 15,000 students attend the 215 high schools which receive aid from the State.

State normal schools are maintained at Castine, Farmington, and Gorham. Supplementary

instruction is given to teachers under the direction of the State superintendent, who is authorized to provide for a number of summer schools. The University of Maine is at Orono, in which the educational system terminates. Among the private and denominational institutions are Colby College at Waterville, Bowdoin College at Brunswick, Bates College at Lewiston, Westbrook Seminary at Deering, and Maine Wesleyan College at Kent's Hill. Portland has the school for the deaf and the Maine General Hospital, Bangor has an orphan asylum, and Bath has a military and naval orphans' asylum. The penitentiary is at Thomaston, the industrial school for girls is at Hallowell, and the industrial school for boys is near Portland. Augusta and Bangor have hospitals for the insane. A large number of the convicts are employed in industrial work, such as making furniture, harness, and brooms.

**GOVERNMENT.** The present constitution was adopted in 1819 and the State was admitted the next year. It vests the executive authority in a Governor, who is elected for a term of two years, a plurality vote being necessary to election. Other State officers include the treasurer and secretary of State, both elected by the people, and an adjutant general and superintendent of public instruction, who are appointed by the Governor and council. The Legislature is composed of a senate and house of representatives, the former having 31 and the latter 151 members. Meetings of the Legislature convene biennially on the first Wednesday in January. Eight judges compose the supreme court, and they serve under appointment by the Governor and council for a term of seven years. A superior court is maintained in Portland. Each county has a probate judge. The officials of towns have larger powers in local government in Maine than in most of the states, and in this respect it resembles the other states of the New England group.

**INHABITANTS.** The increase in population has not kept pace with the states of the northwest. At present the average is 24 persons to the square mile. Comparatively few of the people are of foreign birth and the foreign element is made up largely of Canadians and French. Augusta, on the Kennebec River, is the capital, and Portland is the largest city. Other cities include Lewiston, Bangor, Biddeford, Auburn, Bath, Rockland, Belfast, Westbrook, Calais, Gardiner, and Waterville. In 1900 the State had a population of 694,466. This included a colored population of 2,240, of which four were Japanese, 112 Chinese, 798 Indians, and 1,319 Negroes. Population, 1910, 742,371.

**HISTORY.** The Cabots visited the coast of Maine in 1497, being the first white men to explore that region after the discovery of America by Columbus. In 1524 Verrazano cruised along the coast and landed at several places, but the early attempts made by French, English, and Dutch to found settlements were unsuccessful. The first notable English colony was established in 1607 by George Popham near the mouth of the Kennebec River, where Capt. John Smith was located for a time, but it was abandoned the next year. Sir Ferdinando Gorges obtained grants to territory between the Piscataqua and Kennebec rivers, and that part of Maine passed to Massachusetts in 1652. The Duke of York came into possession of eastern Maine in 1664, which portion likewise was annexed to Massachusetts in 1691, while the whole of Maine remained a part of Massachusetts until 1820. On April 15, 1820, Maine was admitted into the Union as the twenty-third State, and the first constitution is still in operation. A dispute regarding the northeastern boundary was settled by the Ashburton Treaty in 1842, though its boundary with Massachusetts had already been settled in 1737. The Maine law prohibiting the manufacture and sale of spirituous liquors was passed in 1851, but was further strengthened in 1858. In both the Civil and the Spanish-American wars Maine furnished its proportionate share of men to support the government. It has considerable natural resources yet undeveloped, which are attracting the attention of both capitalists and laborers.

**MAINE, University of,** a coeducational institution of higher learning at Orono, Me. It was established in 1865 as the State College of Agriculture and Mechanic Arts, but was reorganized under its present name in 1897. The departments include those of agriculture, law, engineering, pharmacy, and arts and sciences. With it is affiliated the Maine Agricultural Experiment Station. It has a library of 25,000 volumes. The value of the college property is \$325,000. The faculty consists of 65 teachers and professors and the attendance is 550 students.

**MAINZ.** See **Mentz.**

**MAIZE.** See **Corn, Indian.**

**MAJESTY** (mäj'ēs-tÿ), a title of kings, queens and emperors. It is generally used with the possessive pronoun, as, his majesty, your majesty, or, in the plural, their majesties. The King of England is spoken to directly as your majesty, and letters are addressed "To the King's Most Excellent Majesty." Various appellations were made to divers sovereigns at different times. "Most Catholic Majesty" was

the former address applied to the King of Spain; "Apostolic Majesty," to the kings of Hungary; and "Most Christian Majesty," to the kings of France. "Imperial Royal Majesty" is a title now used in addressing the emperors of Germany and Austro-Hungary.

**MAJOLICA** (mă-jöl'ĩ-kă), a species of fine pottery manufactured extensively in Italy from the early part of the 15th century. It is thought to have been produced first on Majorca, an island called Majolica in the Italian. At first it was made of coarse material and was ornamented with a plumbiferous glaze, but later a more beautiful stanniferous glazing was invented, by which the pottery was rendered more durable and of a more enameledlike appearance. Later fine paintings of ruby and golden tints were applied, which have been remarkable in preserving their appearance and mold. Within recent years it has become possible to reproduce this ware with much success, and vases, tablets, friezes, and flower pots are now made of it.

**MAJOR** (mă'jēr), in military, the lowest in rank of the field officers, being classed below a lieutenant colonel and next above a captain. In the absence of the lieutenant colonel he discharges that officer's duty, his usual duties being to attend orders of superior officers and to have charge of exercises of the battalion or regiment.

**MAJORCA** (mă-jôr'kă), the largest island of the Balearic group, in the Mediterranean Sea, forming a part of the Spanish dominion. It has a length of 57 miles; breadth, 45 miles; area, 1,332 square miles. The soil is generally fertile and the coast line is irregular. At many places the shores are precipitous and lofty. Several railway lines are operated and others have been projected. The principal products include fish, fruits, cereals, silk, hemp, cattle, and a number of minerals. Palma is the chief railroad and commercial town. Population, 1906, 251,968.

**MAJORITY** (mă-jör'ĩ-tỹ), the term applied to more than half of a given number or group, and used to designate the excess by which one group of things exceeds another group. In elections it is employed to qualify the amount more than one-half of the votes cast for all the candidates who stand for the same office, and differs from a *plurality* in that the latter designates the number by which the votes cast for one candidate exceed those cast for another, but not constituting a majority. Thus, 75 is a majority of 21 over 54. On the other hand, no one of three candidates having respectively 25, 50 and 68 votes has a majority of all the votes cast, but the one who received 68 votes has a plurality over each of the other two. The term majority

is used to designate full age; the age at which, by the laws of any country, persons of sound mind are considered legally competent to manage their own affairs. In most countries the period of minority ceases and the age of majority begins at 21 years.

**MAKAW**, the name of a small tribe of Indians in the United States, who live upon a small reservation in the vicinity of Puget Sound. They appear to have crossed over from Vancouver Island. The women do fancy basket and bead work and the men are skilled as fishers and boatmen. The men are peculiar in that many of them wear beards, although this may be due to the fact that they are an admixture with the Russians.

**MALACCA** (mă-lăk'kă), or **Malakka**, a British possession on the southwestern coast of the Malay Peninsula, constituting a part of the Straits Settlement. The area is 650 square miles. Much of the surface is low and swampy. Sago, rice, and pepper are the chief products. Malacca, the capital, has a population of 20,500. The territory has been a British possession since 1874. Population, 1906, 93,274.

**MALACCA, Strait of**, an important channel between Sumatra and the Malay Peninsula, which connects the China Sea with the Indian Ocean. It is from 32 to 140 miles wide and about 475 miles long. A number of islands are located in the narrower part of the channel, including the British settlement of Singapore.

**MÁLAGA** (măl'ă-gă), a seaport of southern Spain, capital of the Málaga province, on the Mediterranean Sea, seventy miles northeast of Gibraltar. It dates from the times of the Romans, when it developed a large commerce, and during Moorish occupation its dockyard and quay were improved materially, much of the works still existing. The manufactures include cotton and woolen goods, leather, clothing, cordage, ironware, soap, and machinery. The export and import trade is large, consisting principally in cereals, wines, salt, iron manufactures, and fruits. Sugar is one of the leading products and exports. The construction of railroads to interior points has given the trade of the city a vast impetus. Among the improvements are several public schools, the government buildings, and modern municipal facilities. The climate is remarkable for its uniformity, healthfulness, and many days of sunshine. Ferdinand and Isabella expelled the Moors from Málaga in 1487, since which time it has been a Spanish city. Population, 1906, 132,630.

**MALAR.** See **Lake Malar.**

**MALARIA** (mă-lă'rĩ-ă), a morbid poison originated in swamps, or the effluvia from the

decomposition of vegetable or animal matter. When a large quantity of such a poison is inhaled, it affects the system through the blood often as long as twelve months after one has been exposed to it, and in many cases exerts its depressive influence through life. It emanates most readily from marshy land under the influence of heat at  $60^{\circ}$  Fahr., but is not generated under thorough drainage, or when the land is flooded with much water or is frozen. An elevation of more than 1,000 feet above sea level is proof against malaria. The diseases arising from it include intermittent and congestive

sites, carry them to human beings, as well as to the water and to other animals taken as food by man. As a means of protection against malaria, plans have been devised to destroy the mosquito, which is done by fumes of tobacco, gases, odors of turpentine, garlic, and by pouring petroleum upon the surface of ponds and marshes where the insects breed and propagate their species.

**MALAY ARCHIPELAGO** (mā-lā'), the most important group of islands in the world, situated southeast of Asia. This group is frequently called the Asiatic, Indian, or Eastern Archipelago. It is surrounded by the China Sea, Pacific Ocean, Indian Ocean, Australia, and Malaya; the last named region does not belong to the group. Within the confines of the archipelago are thousands of islands, many of which are small, but all are more or less fertile and produce luxuriant vegetation. The principal islands include Java, Borneo, Sumatra, Celebes, the Philippines, the Moluccas, Bali, Madura, Banca, Timor, Flores, Billiton, Sumbawa, Lombok, and Ceram. This group includes many active volcanoes in different parts of the archipelago. Malays constitute the principal race, but there are various other races and a small per cent. of Europeans. The productions are largely tropical, embracing minerals, fish, tobacco, fine fruits, gum elastic, coffee, tea, sugar, rice, timber, and various domestic animals. Holland has the principal possessions, to which the name Dutch East Indies is applied.

**MALAY PENINSULA**, Malaya, or Malacca, a long, narrow stretch of land extending from Burmah and Siam, in Asia, in a general southeasterly direction, separated from Sumatra by the Strait of Malacca. The eastern boundary is formed by the China Sea and the Gulf of Siam, and the Isthmus of Kra forms a connection with Lower Siam. The width is from 25 to 215 miles, and the area is about 91,500 square miles. It has extensive ranges of mountains, some of which are from 5,000 to 8,500 feet above the sea. Dense forests cover the mountain districts and many of the lowlands. The drainage is by numerous rivers, but they are generally small. A large part of the surface is very productive. Tin and other minerals abound, especially iron, coal, silver, and gold. The agricultural products include sugar, cotton, rice, yams, tobacco, pepper, and many varieties of fruit. Malays, Siamese, and Negritos constitute the principal native population, and a large per cent. of Chinese have settled in the region. The southwestern portion of the peninsula consists of British territory, to which the name Malacca is applied, and of which Malacca is the capital

Malarial Fever in the Philippines, showing Proportion of Deaths for each Month in 1903.

fevers, ague, and a class of yellow fever. Rice fields and marshy regions of tropical and semi-tropical countries are most commonly affected. The west coast of Africa and the Roman Campaign of Europe are noted malarial districts.

Charles Laveran, a French physician, in 1880, discovered that the disease known as *malaria* is due, not to poisonous emanations from certain soils, but to an animal parasite found in the blood of man and many animals. These parasites belong to a class of protozoa. Additional information on this subject was furnished in 1899 by Major Ross, who was stationed at Calcutta with the British army. With the aid of several physicians he found that mosquitoes fill themselves with the infected blood of birds and other animals, and then deposit their eggs and die near them. In this way the water becomes contaminated with the germs of the disease, is fed upon by the larvae, or is drunk by man. The young mosquitoes, being infected with the para-

city. Independent chiefs still control large tracts under treaties with Siam and Great Britain. The total population is estimated at 1,750,000.

**MALAYS** (mā-lāz'), one of the principal secondary races, closely allied to the Polynesian. This race of man is found largely in the Malay Peninsula, the Malay Archipelago, the island of Madagascar, and the islands of the Indian and Pacific oceans. The Malays are of low stature, less than medium weight, and bear some resemblance to the Mongolians, although the eyes are horizontal, the face is flat, and the hair is less coarse and straight. The beard is scant, the skin varies from a clear brown to a dark olive, and the language is characterized by much phonetic and grammatical simplicity. Arabic characters were used in their writing until comparatively recent times, when the Roman system came into use. They have constituted the best traders of the Malay Archipelago since the 13th century, engage in agriculture and rude manufacture, and build simple but fixed homes. According to their tradition and history, they first occupied portions of Sumatra, where they established the state of Menangkabo, and thence spread in large numbers to other sections, but at present they are tributary principally to Holland.

**MALCOLM** (māl'kūm), the name of four kings of Scotland, who reigned between 943 and 1165. Malcolm I. reigned from 943 to 954. He secured the cession of Cumbria from the English king, Edmund I., in 946. Malcolm II. became king in 1003 and died in 1033; Malcolm III. ascended the throne in 1056 and was slain in battle on Nov. 13, 1093; and Malcolm IV. succeeded to the throne in 1153 and died Dec. 9, 1165, in his 24th year.

**MALDEN** (māl'den), a city of Middlesex County, Massachusetts, on the Malden River, five miles north of Boston. It is on the Boston and Maine Railroad and has communication by many electric lines. Among the noteworthy buildings are the public library, the post office, the Y. M. C. A. building, and the Home for Aged Persons. The manufactures are very extensive, including principally large quantities of rubber shoes, clothing, carpets, cordage, paper, leather, boots and shoes, and machinery. Malden was settled in 1641, was a part of Charlestown until 1649, and was chartered as a city in 1881. Population, 1905, 37,990; in 1910, 44,404.

**MALDIVE ISLANDS** (māl'dīv), an archipelago in the Indian ocean, situated southwest of Ceylon and extending a distance of 540 miles from north to south. It includes seventeen groups of atolls, most of which have a fer-

tile soil and rich forests of palm and other trees. They produce tropical fruits and vegetation. Fish abound off the shores and many species of birds are native here. The inhabitants are governed by a Sultan under a British protectorate. They engage chiefly in agriculture and carry on trade relations with Ceylon, India, and other regions of South Asia. The island of Male, or Mohl, contains the capital, and is three-quarters of a mile wide by one mile long. Mohammedanism is the principal religion of the inhabitants, who number about 32,125.

**MALHEUR** (māl-ōōr'), a lake and river of Oregon. The lake receives the water from Silver River and several other streams, but has no outlet to the sea. It is about ten miles wide and eighteen miles long. The Malheur River rises in the vicinity of Malheur Lake. It has a general northeasterly course of 175 miles and flows into the Snake River at the boundary between Oregon and Idaho.

**MALLEABILITY** (māl-lê-â-bil'ī-tỹ), the property of matter by means of which it may be beaten or rolled into thin sheets. It is confined almost entirely to metals, and nearly all of the metals possess this property. Gold surpasses all the other metals in malleability and gold leaf is so thin that it is transparent. The malleability of some of the metals is in the following order: gold, silver, copper, platinum, palladium, iron, aluminum, tin, zinc, lead, and nickel.

**MALLOW** (māl'lō), a family of plants, consisting mostly of herbs and shrubs, but including a number of trees. About 800 species have been described, most of which are widely distributed, but the largest representation is in the warm climates. In North America this family is represented by about 125 native species and about a dozen more have been introduced. To this family belong the *rose mallow* and the *hollyhock*, both ornamental plants, as well as the *okra*, which produces edible pods that are used in the southern part of the United States. The plants that produce cotton are classed with the mallow family and belong to the species known as *marsh mallow*. The *musk mallow* is quite frequent in America and is characterized by a musklike smell. See **Marsh Mallow**.

**MALMÖ** (mālm'ē), a seaport city of Sweden, capital of the province of Malmöhus, situated across the sound from Copenhagen. The noteworthy buildings include the Church of Saint Peter, the governor's residence, the public library, the city hall, and many schools. It has a large number of important steamboat and railway lines, a growing commercial trade, and extensive manufactures of machinery, cotton and

woolen goods, clothing, spirituous liquors, and wearing apparel. The general facilities include a public library, electric street railways and lights, and an excellent system of public education. The inhabitants are chiefly Lutherans. Malmö has belonged to Sweden since 1658. Population, 1906, 75,691.

**MALPLAQUET** (mål-plà-kâ'), a village of France, in the department of Nord, nineteen miles east of Valenciennes. It is noted as the scene of a battle on Sept. 11, 1709, in which the French under Marshal Villars were defeated by the Dutch and British under Prince Eugene and the Duke of Marlborough. Each army consisted of about 100,000 men. The loss of each was nearly 20,000, but the victory of the allies was signal and resulted in the capture of Mons and Douai.

**MALT**, the name applied to grain that has been artificially germinated by moisture and heat. It is usually prepared of barley, which is steeped in water and fermented in order to convert the starch of the grain into saccharine matter, and is dried in a kiln, after which it is used in the distillation of whisky and for the manufacture of beer, ale, or porter.

**MALTA** (mał'tà), an island belonging to Great Britain, situated in the Mediterranean Sea, 58 miles south of Sicily and 180 miles north of Africa. The colony of Malta includes Gozo, Comino, and several other small islands. Malta proper has an area of 95 square miles, Gozo about 20, and the total colony 117. Several fine harbors are on the shore of Malta, that of Valetta being the best, and the colony includes one of the most important naval stations of Great Britain. Agriculture is the principal industry, yielding cotton, potatoes, corn, oranges, figs, and many species of tropical fruits. The manufactures embrace lace, cotton goods, clothing, matches, filigree, machinery, and utensils. It has an important commercial trade, Malta being a noted center for reloading and storage. A general public school system is maintained. Other educational institutions include a university and business, professional, and industrial colleges. The language spoken chiefly is Arabic, since the natives are descendants from the Arabians, but Italian is understood and spoken by a considerable number.

The government is administered by a resident governor. Roman Catholicism and Mohammedanism are the prevailing religions. Several railways, telegraph connections, telephone lines, and steamship communication are maintained. Valetta is the capital and most important city.

The history of Malta begins about 1,000 B. C., when it was settled by Phoenician traders, but

in 700 B. C. the Greeks conquered it. In 480 B. C. it fell to the Carthaginians, became a Roman colony in 216 B. C., and later was possessed by the Vandals and Goths. The Arabs conquered it in 870 A. D., and in 1814 it was recognized as a British dependency by the Congress of Vienna. Many antiquities are found on the islands of Malta and Gozo, and points of interest are shown to tourists in connection with the visit of Saint Paul, who remained on the island of Malta a period of three months. Population, 1907, 206,690.

**MALTA, Knights of**, a religious and military order dating from about 1048, when it was founded at Jerusalem in a hospital dedicated to Saint John the Baptist. It partook more largely of a military character some years after its organization, defended the Christian faith against the Moslems and other unbelievers, but began to decline after the Reformation. The Knights of Malta adopted the Maltese Cross, an eight-pointed figure, as their badge, and on it was the motto, "Pro fide," meaning for the faith. Several modern associations trace their origin to the Knights of Malta, among them the celebrated Red Cross Society.

**MALVERN HILL** (mål'vërn), **Battle of**, the last engagement of the Peninsular campaign, on July 1, 1862, after which General McClellan changed his base of operations to the James River. Malvern Hill is a town of Virginia, about fifteen miles southeast of Richmond. After the battle of Frazer's Farm, McClellan with 85,000 troops took a strong position on the top of a plateau. The Union army was strongly intrenched behind fences, ditches, and hedges. Their batteries and infantries commanded the slopes, which the Confederates had to ascend to make an attack. It was planned to move in a uniform and concerted attack, but the Confederate army was distributed so General Lee's order could not be communicated promptly to the different lines, and consequently the attack was not simultaneous. The brunt of the battle was borne by Generals Magruder and Hill, who led charge after charge, but the heavy artillery fire made their efforts of no avail. Heavy firing continued until nightfall, when McClellan withdrew to Harrison's Landing, thus ending the Seven Days' battles. The loss on both sides was heavy, and the result was that the attempted capture of Richmond failed.

**MAMARONECK** (mámär'ô-nëk), a town of New York, in Westchester County, on Long Island Sound, twenty miles east of New York City. It is on the New York, New Haven and Hartford Railroad and is a popular residential suburb of New York City. Besides many hand-

some dwellings, it has a number of fine schools and churches, and is the seat of the Larchmont Yacht Club. Population, 1905, 5,090.

**MAMELUKES** (măm'ê-lüks), or **Mama-lukes**, a term applied by the Arabians to the white slaves of Egypt, who were introduced originally into that country from Asia Minor in the 13th century. At first they were used as a mounted bodyguard of the Sultan, but afterward became the regular cavalry of Egypt. They increased in power so rapidly that in 1254 one of their number became the Sultan of Egypt. The Mameluke dynasty ruled Egypt and Syria until 1517, when it was overthrown by Selim I. Though their government was marked more or less by violence and war, it is noted in history as the most enlightened since the time of the Pharaohs. Under their administration cities rose to much prosperity, irrigation canals were established, a postal system was organized, manufactures were encouraged, and many industrial arts were promoted by the government. Both in Cairo and Alexandria are magnificent mosques that date from their time, while their works in metal, clothing, and utensils show them to have been both ingenious and enterprising. Even after their downfall, in 1517, they continued to be the virtual ruling class in Egypt, and in 1798 they made a memorable charge upon Napoleon in the Battle of the Pyramids. Mehemet Ali, Viceroy of Egypt, treacherously massacred 470 of the most important Mameluke princes in 1810, and soon after they practically disappeared from history. Mameluke is a term now applied in Turkey to a male servant, usually a Circassian slave.

**MAMMALIA** (măm-mā'li-à), the name given by Linnaeus to the highest class of the animal kingdom, now commonly employed by zoölogists to describe all those that possess mammae, enabling them to suckle their young. The term is sometimes applied erroneously to all quadrupeds. This classification is incorrect for the reason that some amphibians, as frogs and newts, and some reptiles, as lizards and crocodiles, are four-footed, but they do not possess mammary glands. On the other hand, the whales are not four-footed, but are allied to the warm-blooded quadrupeds, and like them bring forth their young alive and suckle them. The term is therefore properly applied to all animals that have red, warm blood, of which the female produces milk by the mammary glands, such as seals, bats, warm-blooded quadrupeds, and mankind. In mammals the skin is covered more or less with hair, which ranges from spines and bristles to the finest wool and silky down. Lips conceal the mouth, which is fitted for chewing

by means of enameled teeth or equivalent bone formations.

The skeleton of mammals generally agrees with that of man in having solid bones, or, when hollowed, the bones are filled with marrow, while the bones of the face are immovably fixed to each other. Most of the species have five toes. The front limbs are present in all mammals, but in some species, as the manatees and dugongs, the hind limbs are rudimentary or wanting completely. The respiration is by lungs, the diaphragm is complete, and the heart has two auricles and two ventricles. Different classifications have been made of mammalia by Linnaeus, Cuvier, and other writers. The classification made by Cuvier contains seven orders, as follows: Bimana, Quadrumana, Carnassiers, Marsupialia, Rodentia, Edentata, Pachydermata, Ruminantia, and Cetacea.

**MAMMOTH** (măm'möth), a large extinct elephant which closely resembled the Indian ele-

MAMMOTH.

phant, of which fossil remains have been found in the northern part of North America, Europe, and Asia. The first mammoth discovered was found in 1799 on the shores of the Lena River, where it was imbedded in ice, and since then many others have been discovered. In 1806 a mammoth in good condition was found enveloped in ice, which was afterward cut out and given a careful examination. The bones were not only intact, but the muscles, skin, hair, and internal organs were in a good state of preservation. Subsequently great numbers of bones and tusks have been taken from the northern coast of Asia, and from islands in the Arctic Ocean adjacent to Siberia. The extinct mammoth elephant had an average height of about thirteen feet and a length of fifteen feet, and its tusks extended outward in a curved form to the length of eight feet. The hair was tufted and thick and about a foot in length, and a finer wool was underneath the outer growth.

Writers generally agree in expressing the view that the average size of the mammoth was fully twice as large as the elephants now living. These animals lived before the glacial period, but seem to have been common for a long time after that period. The early cave dwellers of Europe utilized their tusks in making weapons and for engraving on them articles of ornament and utility. They were so abundant in Asiatic Russia that the fossil ivory found there became an article of commerce in the early part of the 19th century, although these remains were offered in the market as early as the 10th century. The extermination and disappearance of these species is assigned to changes of climate, but the disappearance of forests and the disadvantage of their great size in battling against flesh-eating animals and the advance of settlements are other probable causes. The remains of a mammoth found in 1846 had been inclosed apparently in ice immediately after death, and its flesh was in such a good state of preservation that it was utilized as food for dogs. The Russian government preserved some of the vital organs and the skeleton, which are now at the Royal Museum in Saint Petersburg.

**MAMMOTH CAVE**, a remarkable cave near Green River, about 82 miles southwest of Louisville, Ky. It is formed in the limestone region, which stretches through Indiana, Kentucky, and Tennessee, covering about 6,000 square miles. Exploring parties have penetrated fifteen miles in the cave, but the main cave is only about three miles long. It is estimated that all the rooms and their windings would permit traveling a distance of 175 miles. The largest apartment, known as the Chief City, is 125 feet high, 287 feet wide, and 544 feet long. A connection seems to exist between the Green River and the cave, since the water found in various parts of different chambers rises and falls in unison with that river. In the main it is dry, but there are several rivers and lakes, the largest of the former being Echo River, which is about three-fourths of a mile long and in places about 200 feet wide. The cave is well ventilated and has many beautiful halls with stalagmite and stalactite formations. Some of the domes reach a height of 300 feet, notably Lucy's Dome and the Egyptian Temple. Several species of animals are found in the cave, among them rats, wingless beetles, and grasshoppers, and amblyopsis fish, all of which are destitute of sight. A hunter by the name of Hutchins discovered Mammoth Cave in 1809.

**MAN**, a term used to designate the human race, as distinguished from other forms of animal life. In zoölogy it is applied to a primate

mammal, representing a special family of the genus *Homo*. It is recorded in the Scriptures that God created man in his own image on the sixth day of creation. At that time he was a creature little lower than the angels, but was driven from the Garden of Eden because of partaking of forbidden fruit, on account of which he became liable to death. It is further detailed that the duration of human life shortly after the expulsion from the Garden was nearly 1,000 years, but it was gradually curtailed on account of the wickedness of the antediluvian world until the limits which still continue were reached. By a plan of salvation man was given a Savior, and those believing on him should overcome the evils of Adam's sin, thereby securing everlasting life of the material body after death. The Jewish race was selected as a special people by God, from whom the Savior should descend, though there is some difference in opinion as to whether the Messiah has appeared, Christians holding that Jesus is the Savior.

Darwin accounts for man's creation through a process of evolution from a species of mollusks belonging to the *Ascidia*. From these he traces the line of ascent through the lancelet fish, later through the ganoids and other fish; thence up through the amphibians, reptiles, and birds; thence the line of ascent is through the monotremata, the lowest mammals, the marsupialia, the placentia, the lemurs, the simiidae, and finally the anthropoid apes. Naturalists have long discussed the question as to whether man constitutes a single species with several varieties, or more than one species. The general view is that there is but one species, and that all varieties descended from a single parent stock. Blumenbach divided mankind into five races—the Caucasian, Mongolian, Ethiopian, American, and Malay. Cuvier reduces them to three primary races, but mentions three secondary races. The primary races, according to Cuvier, are Caucasian, Mongolian, and Ethiopian, while the secondary races embrace the Malay, American, and Australian.

Accredited writers generally agree upon the points of similarity between man and other animal forms, as well as upon their differences. The points of similarity briefly stated include the functions of animal life and instinct; appetites, sensuous emotions, and emotional language; power of sensation and of faint reproductions in imagination; sensuous memory and dim sense perceptions; power of organic interference; and organic volition. The points of difference that distinguish man from the mere animals are abstraction, intellectual perception,

reflection, self-consciousness, intellectual memory, judgment, intellectual synthesis and induction, intellectual intuition, higher emotions or sentiments, rational language, and a true power of will. Man is also distinguished by his erect position and in that he is tool using. In the manufacture and use of tools he has undergone a series of marked progressions, the earlier consisting of flakestones and cracked bones. He is the only living being that uses fire, though fire may exist without the productive energies of man in the form of volcanic action, spontaneous combustion, and lightning.

Many of the primitive tools of man have been found in caves and alluvial deposits along with the remains of tropical fauna, like the hippopotamus, elephant, and lion. Discoveries of this character have been made in continental Europe, from which it is taken that the climate of that part of the earth was at one time similar to the region of the Equator. Geologists approximate the time at 50,000 years. That this long space of time has elapsed since man first left traces of his existence is verified by the remains of Arctic animals that were deposited above tools made by man, which have been found with the remains of tropical animals both in America and Europe. From this circumstance it is evident that the glacial period visited America and Europe after man had made considerable progress in constructing and using tools. Those holding this view generally agree that the days mentioned in the Scriptures as the distinct times for creating different objects and animals correspond to vast periods of time, thus establishing a fair agreement between science and the biblical view of creation.

**MAN, Isle of**, an island in the northern part of the Irish Sea, about midway between Ireland, Scotland, and England. It has a length of 33 miles, a breadth of 12 miles, and an area of 226 square miles. A chain of mountains with a general elevation of 2,000 feet stretches along the eastern shore, Snaefell, 2,024 feet high, being the culminating peak. Fully two-thirds of the surface is under cultivation, the principal agricultural products being wheat, oats, barley, rye, and fruits. It has deposits of zinc, lead, iron, and limestone. Cod and herring fishing is an important industry. The manufactures include machinery, cotton and woolen goods, utensils, wearing apparel, and earthenware. The government is administered by local authorities under the supervision of the crown, and laws become effective only after publication. Acts of the British Parliament do not affect the island unless it is specially mentioned. A Celtic dialect known as the Manx language is still

spoken, but the English is understood by most of the people and is coming gradually into use. Douglas, the principal seaport city, is the capital and has a large railroad and steamboat commerce. Railroad lines connect Douglas with Peel, Castletown, Ramsey, and other cities. A small island south of the Isle of Man is called the Calf of Man. Welsh kings governed the Isle of Man from the 6th to the 9th century, when it came into the hands of the Scandinavians, but in 1266 it was ceded by treaty to the Scotch king, Alexander III. The government of Britain purchased the Isle of Man for \$350,000 in 1765, and all special privileges were ceded by the duke in 1829. Population, 1907, 54,827.

**MANAGUA** (mä-nä'gwä), a city of Central America, capital of Nicaragua, on a railway at the southern shore of Lake Managua. The lake is forty miles long and from six to fifteen miles wide. It communicates with Lake Nicaragua through the Tipitapa River. The city is surrounded by a fertile region and has a large trade in coffee and sugar. It was made the capital in 1855. Population, 1908, 34,908.

**MANAR** (mä-när'), **Gulf of**, an inlet of the Indian Ocean, located between Ceylon and the southern part of India. It is separated from Palk Strait by a low reef called Adam's Bridge, which is situated between the islands of Manar and Rameswaram.

**MANASAROWAR** (mä-nä-sä-rō-wär'), a lake of Asia, in Tibet, located north of the Himalaya Mountains. It is situated between the sources of the Indus and the Brahmaputra and the overflow is carried through the Sutlej River. The lake is about twelve miles wide and eighteen miles long and is held sacred by the Tartars and the Hindus, who make pilgrimages to it.

**MANATEE** (män-ä-tē'), or **Sea Cow**, an animal found in the waters of South America, Australia, and West Africa. It is herbivorous, subsisting especially on sea moss and plants in shallow water. In many respects it shows affinity to the dugong. The body is from eight to twenty feet long, the skin is covered with grayish hair, and the tail is broad and oval formed. The fore limbs are in the form of flappers and are provided with a naillike formation, which aids the animal in moving along the shore or at the bottom of the water. It is the custom of manatees to go in herds, but they are extremely inactive and disappear in the water when danger becomes manifest. The mouths and estuaries of rivers are their favorite abode, where they are hunted for their skins, as well as for their flesh and the oil derived from it. They are not afraid of man and show considerable

affection for their young. The manatee may be tamed in captivity.

**MANCHESTER** (män'chēs-tēr), a town of Connecticut, in Hartford County, on the Hockanum River, five miles east of Hartford. It is on the New England Railroad, has an electric street railway system, and maintains systems of sewerage and public waterworks. The chief buildings include the public library, the townhall, and several schools and churches. Among the manufactures are woolen goods, paper, silk, needles, incandescent lamps, and electrical ma-

MANATEE, OR SEA COW.

chinery. Manchester was separated from East Hartford and incorporated in 1823. Population, 1900, 10,601; in 1910, 13,641.

**MANCHESTER**, a city of New Hampshire, one of the county seats of Hillsboro County, on the Merrimac River, 55 miles northwest of Boston, Mass. It is on the Boston and Maine Railroad and on a number of electric railway lines. The site extends along both sides of the Merrimac River, which is joined here by the Piscataquog River, and is well drained and improved by grading and pavements. Among the noteworthy buildings are the public library, the county courthouse, the Federal building, the Roman Catholic cathedral, the Saint Anselm's College, a State industrial school, and many churches and schools. The manufactures include cotton and woolen goods, boots and shoes, machinery, locomotives, agricultural implements, carriages, and edged tools. An abundance of water power for manufacturing is derived from the Amos'eag Falls of the Merrimac, which have a descent of 55 feet. Manchester was settled by Scotch-Irish in 1722 and was incorporated as Deerfield in 1751. It was renamed Manchester in 1810 and became a city in 1846. Population, 1900, 56,987; in 1910, 70,063.

**MANCHESTER**, a city of Virginia, in Chesterfield County, on the James River, opposite Richmond. It is on the Southern, the Sea Board Air Line, and the Atlantic Coast Line railroads. The surrounding country is agricultural and

contains productive coal deposits. Among the manufactures are ironware, cotton goods, flour, paper, machinery, furniture, oil, leather, ice, and hardware. In the vicinity of the city are large granite quarries. An abundance of water power is derived from the James River, which has a fall of 100 feet in six miles. Gas and electric lights, waterworks, pavements, and several fine schools are among the improvements. Population, 1900, 9,715.

**MANCHESTER**, a commercial and manufacturing city of England, in Lancashire, on the Irwell River, thirty miles east of Liverpool. It has extensive railroad connections, maintains modern municipal facilities, and is surrounded by a country which is noted for its productive manufacturing towns. On the opposite side of the Irwell River is Salford, with which it is connected by several railway viaducts and a large number of bridges.

It is beautifully built and contains much wealth. Among the noteworthy buildings are the Gothic assize court, the townhall, the Royal Exchange, the public library, the perpendicular Gothic cathedral erected in 1422, and the Victoria University, an institution founded by John Owens with a bequest of \$500,000, in 1846. The city contains several hundred churches, among them splendid specimens of Gothic architecture, representing the various leading Protestant sects. It has a number of German churches, two Jewish synagogues, and a Greek Catholic church. The educational institutions embrace high schools, professional and business colleges, industrial institutions, and several charitable and benevolent schools. It has many educational and scientific societies and a public library of about 200,000 volumes, these being distributed in several branches for convenient access. In 1887 the authorities erected a beautiful post office in the Renaissance style at a cost of \$500,000. Manchester has splendid parks, an electric street railway system, waterworks, pavements, gas works, electric lights, and numerous monuments, among them those erected in memory of Richard Cobden, Cromwell, Prince Albert, and other noted men of Great Britain.

Manchester is particularly noteworthy as an industrial and a wholesaling center. Among the leading manufactures are cotton, woolen and silk goods, steamships, machinery, ironware, spirituous liquors, soap, chemicals, paper, edged tools, and musical instruments. The export and import trade is extensive. Improvements in the city waterworks were made in 1894 at a vast expenditure, and the supply is now drawn from

Lake Thirlmere by means of tunnels and aqueducts. The city owns and operates the systems of waterworks, electric lighting, and gas plants and supplies a number of the neighboring towns at a large profit. It likewise owns the electric street railways, but they are operated by a private company at a profit of ten per cent.

The history of Manchester dates back to Roman occupation, when it was a base of military operations, and in the time of Edward III. became a manufacturing town. By the middle of the 18th century the factory system attained a foothold and it was the first town of England in which this system developed. The Bridgewater Canal was constructed in 1576 for the purpose of making an outlet to the sea and establishing convenient connections with the coal and salt mines situated in Cheshire and Lancashire. Railroads were put in operation in 1830, but the Civil War in America interfered greatly with its cotton manufacture, since it cut off its supply of raw cotton. A fine canal and inland harbor were completed in 1894, by which the foreign trade became vastly augmented, though this improvement cost fully \$75,000,000. Population, 1907, 643,148.

**MANCHESTER SHIP CANAL**, an artificial waterway of England, extending from Manchester to Eastham, on the estuary of the Mersey River. It is 26 feet deep, about 600 feet wide at the surface, and 35.5 miles long. The canal was completed in 1894 and on May 21 of that year was formally opened for traffic by Queen Victoria. Ocean steamers of the largest size enter Manchester, which has six miles of wharfage, and dock accommodations equal to 100 acres. The canal was constructed at an expense of \$75,000,000, of which one-third was contributed by the city of Manchester.

**MANCHURIA** (mǎn-chōō'ri-à), a territory in the northeastern part of China. The northern boundary is formed by the Amur River, which separates it from Siberia. It is bounded on the south and the southeast by the Gulf of Liao-tung, Corea, and the Gulf of Corea, and on the west by the Argun River and Mongolia. The total area is about 365,000 square miles. The territory is divided into the three provinces of Liao-tung, Kirin, and He-Lung-Kiang. Shing-yang, in the province of Liao-tung, is the capital of Manchuria. The native race is made up of Manchus, but at present the Chinese predominate. Manchuria has a temperate climate. Though severe in winter, it is healthful and favorable to various industries. The principal productions include wheat, millet, cotton, opium, tobacco, barley, lumber, and indigo.

The natives, known as Manchus, are a Tartar

people of Tungusic origin. In the 17th century they invaded and conquered China, which has since been governed by a Manchu dynasty, and the court and official language continues to be that of the Manchus. Russia obtained a lease of several harbors, including Port Arthur, in 1898, and two years later took possession of several ports and interior cities with the view of controlling Corea and the Yellow Sea by an extension of the Trans-Siberian Railway. Subsequently Russia refused to evacuate, but by the treaty of Portsmouth, in 1905, restored all of it to China, except the leased territory of Liao-tung. This treaty gave the Japanese possession of the chief towns, including Dalny, Mukden, and Port Arthur. A large majority of the inhabitants are Chinese. Population, 1908, 16,565,550.

**MANDALAY** (mǎn'dà-lā), a city of India, the former capital of Upper Burmah, on the Irrawaddy River, 350 miles north of Rangoon. In 1860 the King of Burmah transferred the seat of his government to Mandalay from Amarapura, when its present prosperity began, and in 1886 it was annexed to India by the British. The site of the city is on a fertile plain. It has railway connections, manufactures of silk and other textiles, and is an attraction for many Buddhist pilgrims. Among the interesting buildings are the Aracan Pagoda, several government structures, and numerous mosques. It has been damaged several times by floods and fires, but the city has been growing materially. Electric street railways, telephones, electric lights, and several fine schools and hospitals are among the improvements. The inhabitants include many classes of Asiatics and a small number of Europeans. Population, 1906, 185,761.

**MANDAN** (mǎn'dǎn), a city of North Dakota, county seat of Morton County, five miles west of Bismarck. It is located on the Missouri River and is on a division of the Northern Pacific Railway. The surrounding country has large interests in farming and stock raising. A good grade of lignite coal is mined in the vicinity. The chief buildings include the high school, the State Reform School, and several churches and business blocks. It was named from the Mandan Indians, who formerly populated a large part of North Dakota, but are now settled on Fort Berthold Reservation at the junction of the Little Missouri with the Missouri River. These Indians were first met by Lewis and Clark, when they were a powerful tribe, but at present they do not exceed 250. In the vicinity of the city of Mandan are numerous prehistoric remains that seem to indicate a former semicivilization. Population, 1905, 2,714.

**MANDARIN** (mǎn-dá-rěn'), a general name for a Chinese magistrate. It is applied by Europeans to any public official of China, either civil or military. Khan, the Chinese equivalent, implies a public official or character.

**MANDINGO** (mǎn-dīngō), the name of a tribe of Negroes in West Africa, who dwell in the region located between Monrovia and the Senegal and Upper Niger rivers. They are mixed more or less with Hamites, but have woolly hair and are unusually tall. Their state of society is semicivilized. In religion they belong to the Mohammedans. Many of their towns are walled, the houses are chiefly of clay and adobe brick, and the government is administered by independent states. The language is known as Mandi, but a large number have learned the use of French.

**MANDOLIN** (mǎn'dō-līn), a musical instrument which resembles the guitar, so called from its almond shape. It was first manufactured by the Italians, who now make several varieties, each with different tunings. The *Neapolitan mandolin* is considered the most perfect instrument of this class. It has four strings. The sound is made by a *plectrum* used in the right hand, while the strings are stopped on the fretted fingerboard by the fingers of the left. The compass is about three octaves.

**MANDRAKE** (mǎn'drāk), a plant native to Amercia, Europe and Asia, belonging to the order *Solanaceae*. A narcotic poison is found

MANDRAKE.

in all of its parts. The root is fleshy, often forked, and described as resembling a human being in general outline. The leaves are lanceolate, beneath which are concealed several pale violet-colored flowers, with a purple bell-shaped corolla. Its fruit is a fleshy,

orange-colored berry. Although a very different plant, the *May apple* of North America is sometimes called mandrake. In Europe and Northern Africa the mandrake is gathered for its narcotic properties, which are utilized as a purgative, but the use among professional physicians has decreased materially.

**MANDRILL** (mǎn'drīl), a large and powerful species of baboon, distinguished by having a short tail and a savage disposition. It is native to Africa, found chiefly in the northern and

western parts, where it is seen in large troops. The adult male is about five feet tall, when standing erect. These animals have a long muzzle, furrowed with purple and scarlet, and

MANDRILL.

the nose is bright red. The cheeks are enlarged by swellings. They are both strong and cunning. See **Baboon**.

**MANGANESE** (mǎn-gā-nēs'), a metallic element which is widely diffused, occurring chiefly as sulphide and carbonate and in the form of peroxide. It has a grayish-white color, but by being exposed to air readily oxidizes, and decomposes in water with an evolution of hydrogen. Extensive deposits are found in various countries, especially in Virginia, Arkansas, California, Spain, Moravia, and Germany. Manganese is serviceable under various conditions for numerous purposes, including its use in the manufacture of plate glass, bleaching powder, pottery, and enamel, and for various purposes in analytical chemistry.

**MANGE** (mānj), a skin disease of various domestic animals, due to the presence of a small mite upon the skin. It is most prevalent among cattle, dogs, swine, and horses. In sheep it is known as *scab*, or *scabes*. The early symptoms are heat and itching, after which the skin becomes bald and sore. In the early stages it may be treated by applying the tincture of belladonna or such tonics as iron or arsenic locally, but where the disease has spread over various parts of the body it is best to plunge the animals in dips or tanks containing solutions of lime and sulphur, or tobacco and sulphur. When arsenic and other poisonous materials are used, they must be diluted and applied with much care.
