No dread of toil have we or ours,  
We know our worth and weigh our  
powers ;

The more we work the more we win ;  
Success to trade !

Success to spade !

And to the corn that's coming in !

And joy to him who o'er his task

Remembers toil is Nature's plan,

Who, working, thinks

And never sinks

His independence as a man.

Who only asks for humble wealth,

Enough for competence and health

And leisure when his work is done

To read his book

By chimney nook,

Or stroll at setting of the sun ;

Who toils as every man should toil

For fair reward, erect and free ;

These are the men—

The best of men—

These are the men we mean to be.

—*Charles Mackey.*

Editor in Chief  
BERNHART PAUL HOLST

Teacher and Superintendent of Schools, Iowa; Institute Lecturer and Instructor; Author of Educational Literature; Editor of "The Teachers' and Pupils' Cyclopaedia," "Current Reference," and "Practical Home and School Methods of Study and Instruction"

Assistant Editor  
RURIC NEVAL ROARK

Teacher and Educational Writer; Author of Pedagogical Works; President Kentucky State Normal School, Richmond, Ky.

## LIST OF CONTRIBUTORS AND ASSISTANTS

HOWARD A. GASS,  
State Superintendent of Public Instruction,  
Missouri.

EFFIE SCHUNEMAN,  
Pratt Institute, Brooklyn, N. Y.

J. R. INCH,  
Chief Superintendent of Education, New Brunswick, Canada.

E. L. COBURN,  
Supervisor of Music, Saint Louis, Mo.

LAWRENCE DeGRAFF,  
Judge of District Court, Iowa.

CLARA E. THOMPSON,  
Superintendent and Teacher of Schools, Saint Paul, Minn.

HILL M. BELL,  
President of Drake University, Des Moines, Iowa.

GEORGE H. MARTIN,  
Secretary State Board of Education,  
Massachusetts.

J. J. DOYNE,  
State Superintendent of Public Instruction,  
Arkansas.

WILLIAM A. MOWRY,  
Historian and Author of School Text-Books,  
Boston, Mass.

GRACIA E. TUCKER,  
Teacher and Superintendent of Schools, Iowa.

MAURICE HUTTON,  
Principal of University College, Toronto, Ont.

W. H. MARTIN,  
Principal of the Morse School, Kansas City, Mo.

ESSE V. HATHAWAY,  
Authoress of "The Little Corsican" and High School Teacher, Marshalltown, Iowa.

J. W. OLSEN,  
Former State Superintendent of Public Instruction, Minnesota.

A. H. McKAY,  
Superintendent of Education, Nova Scotia.

J. L. NICHOLSON,  
Registrar of McGill University, Montreal, Que.

JOHN A. W. HAAS,  
President Muhlenberg College, Allentown, Pa.

DAVID R. BARROWS,  
Director of Education, Philippine Islands,  
Manila, P. I.

T. R. BALL,  
Registrar Johns Hopkins University, Baltimore, Md.

## EDITORS, CONTRIBUTORS AND ASSISTANTS

**J. Y. JAYNER,**

State Superintendent of Schools, North Carolina.

**G. R. GLENN,**

President of the North Georgia Agricultural College, Athens, Ga.

**J. M. GREENWOOD,**

City Superintendent of Schools, Kansas City, Mo.

**ISAAC M. COX,**

Secretary of the Department of Public Instruction, Hawaiian Islands.

**CHAS. F. ROLAND,**

Industrial Commissioner, Winnipeg, Man.

**J. L. McBRIEN,**

Superintendent of Public Instruction, Nebraska.

**EDWARD HYATT,**

State Superintendent of Public Instruction, California.

**H. M. MacCRACKEN,**

President New York University, New York.

**E. J. TAYLOR,**

State Superintendent of Public Instruction, North Dakota.

**ORVIS RING,**

State Superintendent of Schools Nevada.

**H. C. MORRISON,**

State Superintendent of Schools, New Hampshire.

**ARTHUR J. JONES,**

State Commissioner of Schools, Rhode Island.

**D. M. MacKENZIE,**

Deputy Minister of Education, Alberta.

**G. A. CLARK,**

Secretary of Leland Stanford Junior University, Stanford University, Cal.

**O. E. MATHIEU,**

Rector of Laval University, Quebec, Que.

**CHAS. W. NEEDHAM,**

President of George Washington University, Washington, D. C.

**FRANCIS M. AUSTIN,**

Librarian Illinois Wesleyan University, Bloomington, Ill.

**GEO. T. LITTLE,**

Librarian of Bowdoin College, Brunswick, Me.

**J. H. HERRON,**

Captain of Second Cavalry, United States Military Academy, West Point, N. Y.

**S. BELL CHAMBERLAIN,**

State Superintendent of Schools, Idaho.

**JOSEPH H. HILL,**

President of the Kansas State Normal School, Emporia, Kan.

State Superintendent of Public Schools, Pennsylvania.

**JOS. E. THOMPSON,**

Commissioner of Industries and Publicity, Toronto, Ont.

**ISABEL MADDISON,**

Assistant to the President of Bryn Mawr College, Bryn Mawr, Pa.

**B. F. KIZER,**

Teacher of English in the Manual Training High School, Kansas City, Mo.

**E. N. HENDERSON,**

Professor at Adelphi College, Brooklyn, N. Y.

**DEAN C. MATHEWS,**

Executive Secretary of Western Reserve University, Cleveland, O.

**O. A. THOMAS,**

President of Nebraska State Normal School, Kearney, Neb.

**L. L. WRIGHT,**

State Superintendent of Schools, Michigan.

**KATHERINE L. CRAIG,**

Former State Superintendent of Schools, Colorado.

**MARY E. WOOLLEY,**

President Mount Holyoke College, South Hadley, Mass.

**MARSHALL S. SNOW,**

Dean of Washington University, Saint Louis, Mo.

## PREFACE

**B**OOKS of reference have an abiding place in every modern library. They combine convenience in obtaining facts with a wide range of knowledge, enabling the student, the man of commerce, and the professional man and woman to remain in close touch with reliable and recent information.

In this age of the telephone, the automobile, the flying machine, and thousands of new and useful implements of civilization, the demand for books of reference has multiplied beyond the dreams of the past. Those who wish to remain in contact with the advancing spirit of the age, who desire to stand abreast with the intelligent in the struggle for place and power, need to have at their command information fitted for the spirit of the times.

When asked for an opinion in regard to the relative value of different kinds of books, Chauncey Mitchell Depew, famous among the public men of America, made the following reply:

“I look with great favor on and attach considerable importance to encyclopaedias, as may be judged from the fact that I not only paid \$250.00 for my first set, but have bought several others since then. I have always advised young men who could not afford to buy a library to get an encyclopaedia, which is a library in itself.”

This work of reference is more than a storehouse of knowledge, more than a collection of facts in the arts, sciences and literature, in that it contains the instruments which enable students to spell and pronounce correctly, as well as to define and properly use the thousands of titles which are treated. A fact without a mind to use it is valueless, hence the writers of this work have made it doubly valuable by dividing the difficult titles into syllables and by marking the vowels diacritically. This enables the student who needs help, aside from securing information about important subjects, to pronounce and use the words understandingly.

The subjects are treated with the view to furnish accurate information and at the same time to give prominence to the different titles in proportion to the places they occupy in the field of knowledge. Some are treated briefly, while others are explained exhaustively, this depending upon the average requirement for facts as reference is made to the different subjects of thought and conversation. To obtain this balance in the arrangement and to secure the greatest possible accuracy, many subdivisions of the titles treated were arranged by the writers, including such as agriculture, biology, education, geography, history, pedagogy, architecture, and hundreds of other vital topics. Editors of recognized ability gathered the information from the most reliable sources, corresponding with leading students and officials in all the civilized nations, after which the editor-in-chief compared and re-edited the entire productions so as to unify and systematize the scope and general plan of treatment.

Another feature to which the attention of the reader is directed, one which is of much utility, is the collection of illustrations. Practically all the leading plants and animals, the scientific and mechanical devices, the astronomical and geographical topics, are illustrated so as to combine the picture with the printed information. This method fixes in the mind facts of importance more clearly, almost indelibly, which otherwise might be lost or even uncompre-

hended. The artists employed to illustrate this work used in nearly all cases, in fact wherever it was at all possible, objects instead of pictures to make the illustrations as recent and practical as possible.

While scientific accuracy has been maintained, the language is clear and free from such technicalities as often tend to confuse. This feature of the work commends it to all students, who find the treatment such as to understand it. The different titles are not only pronounced diacritically, but cross references are employed to make the subjects plain. In references of this kind, certain titles or subheads are indicated, or the Latin term *quo vide* (q. v.) is used.

Attention is called to the numerous photographic plates and beautiful maps. These illustrations were made especially for this work, hence they aid in a direct way in simplifying the subjects and extending the information sought. Besides the colored maps of political divisions, the work contains wash drawings in the form of physical maps of the continents. The provinces of Canada, the states of the United States, and many of the islands are shown by small maps in the text, giving the outline, the water and land surface, the principal railways, and the capitals and other cities.

The pages are printed from entirely new plates, made by the most approved methods. The type is clear and easily read. This enables the student to search for information without waste of time and with no unnecessary tax upon the eye.

Attention is called to the need of reliable reference in commerce, banking, politics, social development, astronomical research, and the vast achievements of recent years in the arts and sciences. Those who rely upon the newspapers for this information soon find they are not in touch with the spirit of this progressive age, not that the periodicals fail to inform, but they are easily lost or mislaid, or the file on hand becomes too voluminous for practical use. With such a work as this, giving the titles in alphabetical order, brought up to the date of publication, the speaker, the writer, the student, and the teacher are all enabled to utilize facts to the best advantage.

No work has been spared in making this publication an accredited fund of knowledge. Many standard works of reference were consulted, including such as Webster's *International Dictionary*, the *Century Dictionary*, the *Standard Dictionary*, Muret's *Encyclopédie*, Spamer's *Konversation Lexikon*, Brockhaus' *Konversation Lexikon*, and numerous other American and European works of high repute, whose accurate details furnish essential aid in the verification of uncertain dates and controverted facts and events.

This work is offered to the reading public with the feeling of assurance that it will receive a hearty reception, that it will fill a useful place in the library of its owner. It is believed that the newer information, the record of ancient development and modern achievements, as treated and presented in this work, will help and gratify those who search for a larger view of civilization and its attainments.

Those who dedicate their lives to the work of research realize the truth of Charles Mackey's well-written words:

Blessings on Science! When the earth seemed old,  
When Faith grew dotting, and the Reason cold,  
'Twas she discovered that the world was young,  
And taught a language to its lispng tongue;  
'Twas she disclosed a future to its view,  
And made old knowledge pale before the new.

BERNHART PAUL HOLST.

# KEY TO PRONUNCIATION

## VOWELS

- ä (short), as in *hat, cat*.  
 ā (long), as in *ale, hate*.  
 ä (Italian), as in *car, mar*.  
 à (short Italian), as in *fast, class*.  
 ą (broad), as in *all, fall*.  
 â (circumflex), as in *care, snare*.  
 ą (short obscure), as in *final, spinal*.  
 â (long obscure), as in *surface*.  
 ą = ǒ, as in *was, what*.  
 ae = ē, as in *Caesar* (sounded as though they were *e* alone).  
 ě (short), as in *net, met*.  
 ē (long), as in *me, eve*.  
 ê (circumflex = â), as in *there*.  
 ě (tilde), as in *her*.  
 ę (short obscure), as in *patent*.  
 è (long obscure), as in *delay*.  
 è = ĭ, as in *pretty*.  
 ĭ (short), as in *hit, bit*.  
 ī (long), as in *kite, mite*.  
 ĩ (tilde), as in *sir*.  
 î (long obscure), as in *idea*.

- ǒ (short), as in *pop, hop*.  
 ō (long), as in *cone, bone*.  
 ô (circumflex = ą), as in *for*.  
 ô (long obscure), as in *hero*.  
 Ǔ (short), as in *book, brook*.  
 ōō (long), as in *moon, spoon*.  
 ȝ = û, as in *word*.  
 ȝ = ōō, as in *who*.  
 ȝ = Ǔ, as in *wolf*.  
 ȝ = ŭ, as in *son*.

- ŭ (short), as in *rut, cut*.  
 ū (long), as in *muse, fuse*.  
 û (circumflex), as in *turn, urn*.  
 ũ (long obscure), as in *unite*.

w is a vowel only after a vowel, when it forms the second element of certain diphthongs, as in *few, how*.

- ȳ (short) = ĭ, as in *hymn*.  
 ȳ (long) = ĭ, as in *by, cry*.

## CONSONANTS

- c (hard) = k, as in *cat, cape*.  
 ç (cedilla) = s, as in *cell, façade*.  
 ġ (hard), as in *dog, gave*.  
 ģ (soft), as in *gem, gentle*.

- k for the German ch, as in *ich, Bach* (bäk).  
 ü for the German ü, as in *Blücher, Grünberg*.  
 ö for the German ö, as in *Göttingen, Görgey*.  
 n for the French n, as in *bon, Bréton* (brâ-tôn').

A

AARHUS

**A**, the first letter in the alphabet of all Indo-European languages. In many modern tongues it has but one sound, that equivalent to *a* in *father*. In English this symbol represents nine distinct sounds, as in *fate*, *senate*, *fare*, *mat*, *arm*, *ask*, *final*, *all*, and *what*; besides variations when used in digraphs, as *ea* in *meat*, *oa* in *float*. The letter *a* is used as a mark or symbol on account of its place at the beginning of the alphabet. In music it stands as the sixth note in the diatonic scale of C major; in logic it represents a universal affirmation; while in algebra it is used with other letters to denote known quantities.

**AA**, the name of about forty small rivers in Central and Northern Europe derived from the Celtic *Ach*, or Teutonic *Aa*, meaning flowing water. Among the most important of them are the following: I. A river of Holland, in North Brabant, which, passing Helmond, joins the Dommel at Bois-le-Duc. II. A river in Groningen, called Westerwolden Aa, which falls into the Dollart. III. A river in Overijssel, which, after uniting its waters with the Vecht, flows into the Zuyder Zee. IV. A river of Belgium, in the province of Antwerp, which flows into the Neethe.

**AACHEN** (ä'ken). See **Aix-la-Chapelle**.

**A1**, a symbol used in Lloyd's "Register of British and Foreign Shipping" to designate vessels for the guidance of shippers and insurers. *A* designates the hull of the ship, and the figure 1 the efficiency of her stores, cables, and anchors. When these are insufficient for any reason, the figure 2 is united with *a*, and in like manner other figures and letters are used to constitute a complete nautical language.

**AALBORG** (a'l'börk), a seaport and city of Denmark, province of Jutland, situated on the south shore of the Lymfjord, near its outlet into the Cattegat. It has a school of navigation, a large herring fishery, and manufactures of clothing and machinery. Direct communication

is maintained by steam and packet boats with Copenhagen. The city library has 31,000 volumes. Population, 1906, 31,509.

**AAR**, or **Aare** (är), a noted river in Switzerland, next to the Rhine and Rhone the largest stream in that country. It contains the Falls of Handeck, 200 feet high, and joins the Rhine at Coblenz after a course of 200 miles. From Lake Thun it is navigable for small craft.

**AARD-VARK** (ärd'värk), a burrowing and insectivorous mammal common to large parts of Africa. Three species are known, one each in Senegal, Nubia, and South Africa. These animals have affinities with the ant-eaters and armadillos, and are timid and harmless. Both natives and Europeans regard the flesh of value as food. The hams, salted and dried, are especially favored for eating in the summer season.

**AARD-WOLF** (ärd'wöolf), a carnivorous burrowing animal of South Africa. In size and habits it resembles the fox, and is allied to the

AARD-WOLF.

African hyenas. It feeds on small mammals, white ants, and carrion. The aard-wolf is timid, spending most of the day in its burrow, but comes out at night in search of food.

**AARHUS** (ör'höös), a city of Denmark, capital of a district of the same name, 36 miles east of Viborg. It occupies a fine site on the Cattegat. The manufactures include clothing, earthenware,

and ships. Electric and steam railways furnish communication with the leading cities of the country. It has a fine cathedral, several schools of higher learning, and a library of 200,000 volumes. Population, 1906, 55,193.

**ABACUS** (ăb'ă-kŭs), a device used in kindergartens and primary schools to teach the elements of numbers. It consists of a rectangular

ABACUS.

frame, in which parallel wires are fastened to contain counters or beads. In architecture, the abacus is a square or oblong tablet on the crown of a column. In the new Ionic, Corinthian, and Roman styles the abacus has truncated angles and concave sides,

while in the old Ionic, Doric, and Tuscan styles it is oblong.

**ABALONE** (ăb-ă-lō'nĕ), the name of several species of marine gastropods common to California, and found more or less widely distributed throughout the warmer seas. The name *abalone* is of Spanish origin, in California, but these animals are better known generally as ear-shells or sea-ears. They are allied with the limpets, and, like them, when frightened or at rest, withdraw the soft part under the shell, which is a broad spiral and has a richly colored mother-of-pearl, used in making buttons and ornaments. Large quantities are gathered by the Orientals on the coast of California for food, to be consumed locally, and for shipment to China and Japan.

**ABATIS**, or **Abattis**, in military strategy, a bulwark made of felled trees, in frequent use in rude mountain warfare. On emergency, the trees are laid lengthwise, with the branches pointed outwards to repel the invaders, while the trunks serve as a breastwork for the defendants.

**ABBEY** (ăb'bĭ), a monastery or society of persons of either sex, who seclude themselves from the world and lead a life devoted to religion. The name *abbey* is also applied to the monastic building or buildings. Men located in these establishments are called monks, and are governed by an abbot; while the women are called nuns, and are governed by an abbess.

**ABBOT** (ăb'bŭt), a prelate in the Roman Catholic Church, who governs a principal con-

vent or monastery of the old religious orders. An abbot is solemnly consecrated by a bishop, though this is regarded as a merely ecclesiastical and not a sacramental rite. Abbots are allowed to use the mitre, pastoral cross, ring, and crozier, and to celebrate pontifical mass and are styled right reverend. Some of them, in former times, exercised a quasi-episcopal jurisdiction over a small district, and were allowed to confer tonsure and minor orders. During the Middle Ages many abbots, especially in England, were powerful feudal barons. In modern times they are simply superiors of religious houses. In ecclesiastical councils an abbot has a deliberative but not a decisive voice. Superiors of convents in the Greek Church are called *mandrites* and general abbots are known as *archimandrites*.

**ABBOTSFORD**, the country home of Sir Walter Scott, on the Tweed River, in Scotland, built in the Scottish baronial style of architecture. Scott spent large sums of money in adorning the buildings and grounds, a circumstance that was the chief cause of his financial failure. The mansion passed to the only surviving daughter of Scott, and was long used as a Roman Catholic seminary for girls. The Abbotsford Club was organized at Edinburgh for publishing literature and history connected with the writings of Sir Walter Scott. This organization issued thirty-four volumes in the years 1835-64.

**ABBREVIATIONS** (ăb-brĕ-vĭ-ă'shŭns), the name applied to certain contractions employed in writing and printing to represent a letter or group of letters taken from a word or group of words, and used mainly to save time and space. The most common form of abbreviations is the substitution for a word of its initial letter, or of some arbitrary sign. Most of the sciences and arts have sets of signs, abbreviations, or symbols peculiar to themselves. It is quite impossible to give all the abbreviations now in general use, but below is a list of those considered most important:

- |  |  |
|--|--|
| A. B. Bachelor of Arts.  | B. C. Before Christ, British Columbia. |
| Abp. Archbishop.   | B. D. Bachelor of Divinity.            |
| A. D. <i>Anno Domini</i> , in the year of our Lord.                              | B. L. Bachelor of Laws.                |
| Admr. Administrator.   | Bp. Bishop.                            |
| Ala. Alabama.  | B. V. Blessed Virgin.                  |
| Alas. Alaska.  | Cal. California.                       |
| Alb. Alberta.  | C. Consul, Caesar.                     |
| A. M. <i>Anno Mundi</i> , in the year of the world.                              | Can. Canada.                           |

**ABDICATION** (ăb-dĭ-kā'shŭn), the act whereby an office or dignity is given up before the expiration of the term of incumbency, and may be either voluntary or compulsory. The abdication of Diocletian and Maximian are the best known cases in antiquity. In absolute monarchies despotic sovereigns may abdicate at any time, but in a limited monarchy or independent state it usually requires the consent of the legislative branch of government. The following is a list of important abdications occurring in the last century:

Charles Emmanuel IV. of Sardinia.....	June	4, 1802
Charles IV. of Spain.....	March	19, 1808
Joseph Bonaparte of Naples.....	June	6, 1808
Gustavus IV. of Sweden.....	March	29, 1809
Louis Bonaparte of Holland.....	July	2, 1810
Napoleon I. of France.....	} April	14, 1814
		June
Victor Emmanuel of Sardinia.....	March	13, 1821
Charles X. of France.....	August	2, 1830
William I. of Holland.....	Oct.	7, 1840
Louis Philippe of France.....	Feb.	24, 1848
Ferdinand of Austria.....	Dec.	2, 1848
Charles Albert of Sardinia.....	March	23, 1849
Isabella II. of Spain.....	June	25, 1870
Amadeus I. of Spain.....	Feb.	11, 1873
Abdul-Aziz of Turkey.....	May	30, 1876

**ABDOMEN** (ăb-dŏ'mĕn), in anatomy, the lower part of the trunk of the body; the trunk being divided by the diaphragm into two cavities—the upper being the thorax, and the lower the abdomen. It is walled in by broad muscles, fasciae and skin, except behind, where the projecting processes and the bodies of the five lumbar vertebrae assist, above by the walled diaphragm, and below by the bones of the pelvis. The capacity of the abdomen varies according to the nature of its walls. It is lined by a clothed serous sac, the *peritoneum*, whose visceral layer is reflected over the contained viscera, forming a thin exterior coat. In entomology, the abdomen is the last of the three parts into which the body of an insect is divided. It is

composed of a number of rings or segments, frequently nine, more or less distinct from each other. In many insects the last part of the abdo-

THORAX AND ABDOMEN.

A, the heart; B, the lungs drawn aside to show the internal organs; C, the diaphragm; D, the liver; E, the gall cyst; F, the stomach; G, the small intestines; H, the transverse colon; I, muscles of the chest; J, trachea.

men contains pincers, stings, borers, and various other appendages for divers uses.

**ABERDEEN** (ăb-er-deen'), the chief seaport city in the north of Scotland, county seat of Aberdeen County, on the North Sea, at the mouth of the Dee River. The city is conveniently situated on a number of important railroads, has extensive wharfage, and a large export and import trade. There are manufactures of cordage, linen and woolen goods, chemicals, ships, machinery, stone and iron wares, paper, and spirituous liquors. The streets are substantially paved, and improved with gas and electric lighting, sewerage, and extensive street railways. Union Street is its main thoroughfare and its numerous notable buildings cause it to rank as one of the finest streets of Europe. Among the chief buildings of the city are the University of Aberdeen, the custom-house, the Royal Infirmary, and numerous hospitals, schools, and churches. The extensive use of granite in the larger buildings has caused it to be known as the "Granite City." It was chartered in 1179, and has long ranked as a city of great wealth, educational progress, and commercial importance. Population, 153,110.

**ABERDEEN**, a city of South Dakota, coun-

ty seat of Brown county, 120 miles northeast of Pierre, on the Chicago and Northwestern, the Great Northern, and the Chicago, Milwaukee and Saint Paul railroads. It is surrounded by a fertile agricultural country, and is an important shipping point for cereals and live stock. There are manufactures of farming implements and a considerable jobbing trade. It has electric lights, waterworks, sewerage, and many fine churches, and is the seat of a State normal school. The city was incorporated in 1882. Population, 1900, 4,087; 1905, 5,841.

**ABERRATION** (ăb-ēr-ră'shŭn), in optics, the wandering of rays of light from the normal path, caused when reflected from curved mirrors, or made to pass through curved lenses, which form portions of a sphere instead of portions of a parabola. This is due to the unequal refraction of the lenses of the rays of light and renders images formed about the edges in some degree undefined. In astronomy, aberration is the difference between the observed position of a heavenly body and the one really occupied, the result of the combined effect of the motion of the eye of the observer and that of the light caused by the annual or diurnal motion of the earth, or of the motion of light and that of the body from which the light proceeds. The aberration of light, discovered by James Bradley (1693-1762), an English astronomer, is proof of the motion of light and of the earth's motion.

**ABINGTON** (ăb'ing-tun), a manufacturing town of Plymouth County, Mass, twenty miles southeast of Boston. The principal manufactures are boots and shoes. It has a municipal waterworks plant, several fine schools and churches, and good railroad facilities by the New York, New Haven, and Hartford Railway. The first settlement in its vicinity was made in 1680. Population, 1905, 5,081.

**ABO** (ăb'ăbŏ), a city of Russian Finland, built on both sides of the Aurajoki, not far from where it flows into the Gulf of Bothnia. It was founded in 1157 by the Swedes, and was the capital of Finland until 1819. The bishopric established here in the 13th century was raised in 1817 by the Russian government to an archbishopric. In 1827 the greater part of the city was destroyed by fire, including the university buildings and the library containing 40,000 volumes. The university was rebuilt in Helsingfors, the new capital. It is important as a shipbuilding port and has extensive cotton mills and sugar refineries. Population, 1901, 39,238.

**ABOLITIONISTS** (ăb-ă-lish'ŭn-ĭsts), a political party in the United States, whose object was to secure the immediate abolition of slavery. Early in the 18th century a strong sen-

timent became widespread throughout the country in favor of the abolition of all slaves. As early as the close of the Revolutionary War a number of Northern states provided for immediate or gradual emancipation. Before the end of the century many abolition societies were founded. The movement secured new impetus when William Lloyd Garrison and his followers in 1829 demanded the immediate and total abolition of slavery throughout the country. Other influential advocates of abolition, besides Garrison, include Wendell Phillips, John G. Whittier, Edmond Quincy, Samuel J. May, and William Jay. The sentiment grew in popularity until the movement ended Jan. 1, 1863, when Lincoln emancipated the slaves.

**ABOMEY** (ăb-ô-mă'), a town in West Africa, in Dahomey, about sixty miles from the coast of Guinea. It is inclosed by an earthen wall, surrounded by a ditch, and the houses are mostly of mud or are wooden structures. Formerly it had some importance as a slave market, but at present its trade is chiefly in ivory, gold, and palm oil. Population, 21,000.

**ABOUKIR** (ă-bôô-kēr'), or **Abukir**, a village in Egypt, thirteen miles northeast of Alexandria, near the site of the ancient Canopus. Its harbor is spacious, and on its western side is a castle of considerable strength. In 1798 Aboukir Bay was the scene of the famous Battle of the Nile, in which an English fleet under Nelson defeated a French fleet commanded by De Bruyes, thus destroying the naval power of France in the Mediterranean. Napoleon defeated the Turks under Mustapha near Aboukir in 1799, and Sir Ralph Abercromby (1734-1801) repulsed the French in its vicinity in 1801, the engagement being known as the Battle of Alexandria.

**ABRACADABRA** (ăb-ră-că-dăb'ră), a word used as a magical formula to invoke the assistance of good spirits against all evils and sickness. It was probably first used by the Persians, who inscribed it in the form of an inverted triangle on gems that formed a class of Abraxas stones. Worn on the bosom for nine days and then destroyed secretly, it was supposed to cure fevers and other ailments. Severus Sammonicus, a Gnostic physician, recommended its use as early as 200 A. D.

**ABRASIVE** (ăb-ră'siv), the name applied to any natural or artificial material employed in the art of grinding and polishing. In modern

manufacturing the use of natural abrasives has given way to a large extent to the artificial substances in cutting and polishing stone, wood, and metal. To the former class belong sand, emery, quartz, garnet, and corundum. Sand is employed extensively in the sandblast and in the form of sandpaper for cleaning wood and ironwork, while emery is used in the form of powder to polish stones and plate glass. Emery wheels have faces coated with emery or are solid emery stone, and emery paper or emery cloth is paper or cloth coated with powdered emery. Quartz is used for buhrstones, and garnet, which, by its cleavage, presents new cutting edges instead of wearing smooth, is an excellent material for polishing wood and leather. Corundum is mined extensively in North Carolina and is made into an abrasive powder by crushing and grinding. Carborundum, pumice, tripoli, and crushed steel are other abrasives. Whetstones and grindstones are cut from natural rocks, while pumice is a volcanic ash and is used for polishing and scouring in lumps or in the form of powder. See **Emery**; **Carborundum**.

**ABSINTH** (ăb-sinth'), a liquor prepared from the leaves and the flowering tops of various species of wormwood with roots of sweet flags, angelica, the leaves of the dittany of Crete, star anise fruit, and other aromatics, usually by being steeped in alcohol. While the beverage is pleasant to the taste, it is quite harmful to the system and dangerous to health. It is manufactured in Switzerland and France, but is consumed chiefly in the latter country. Its introduction into France dates from the Algerian War of 1844-47, when the soldiers returning to France, who had acquired the habit of drinking it in Algeria, caused the custom to become widely disseminated in French society.

**ABSOLUTION** (ăb-sô-lū'shŭn), the pardon and remission of the sins of a penitent. In the Roman Catholic Church the priest pronounces absolution in *foro externo*, the remission of certain ecclesiastical penalties, or absolution in *foro interno*, the remission where mortal and venial sin is remitted. The Augsburg Confession of the Lutheran Church retained absolution as the individualization of the promise of Scripture to the penitent rightly disposed. In the Episcopal Church absolution is a formula of publicly praying for, or declaring, the remission of the sins of the penitent, and in visiting the sick pardon from sin is pronounced after private confession.

**ABSOLUTISM** (ăb'sô-lū-tiz'm), a form of government in which the executive power is

vested in a ruler who is not controlled by any constitution or law. It was the prevailing government of ancient time, and reached its highest development in Europe after the downfall of the feudal system. Louis XIV. of France was its most arbitrary modern champion, and declared, "I am the state." Japan and Russia a few years ago changed to representative governments. Turkey, though usually classed as an absolute government, has had a constitution since 1908.

**ABSORBENTS** (ăb-sôrb'ents), the vessels by which the nutritive elements of food are carried into the circulation of plants and animals. In plants this function is carried on by the extremities of the roots, and in vertebrate animals it depends chiefly upon the skin, lacteals, and lymphatics.

**ABSORPTION** (ăb-sôrp'shŭn), in physiology, the act of taking up material suitable for nourishment by means of tissues. The nutritious elements of foods are gathered by a system of minute vessels called absorbents, and are carried into the circulation. The vessels consist of two main classes, named, respectively, lacteals and lymphatics, but absorption is carried on to some extent by the skin and blood vessels. In plants, absorption is carried on chiefly by the roots.

**ABSTRACTION** (ăb-străk'shŭn), the mental act of withdrawing the consciousness from one or more subjects with a view to concentrating it on some definite one, or the act of the mind by which a part of the objects presented for observation are disregarded in order to concentrate the attention on the remainder.

**ABUTILON** (ă-bŭ'ti-lŏn), a genus of plants of the mallow family, widely distributed in warm climates, and including about seventy species. Some species are cultivated for their bell-shaped flowers. The common abutilon is a weed in many parts of the United States, where it is known as velvet-leaf.

**ABYDOS** (ă-bi'dŏs), an ancient city of Asia Minor, located at the narrowest part of the Hellespont. It is noted as the scene of a number of historic events, among them those of 480 B. C., when Xerxes crossed the straits on a great bridge of boats at the time of his invasion of Greece. Alexander the Great crossed at the same place when he marched into Asia in the year 334 B. C. Ancient writers credit Leander with swimming nightly from Abydos to Sestos, a distance of about a mile, to see his beloved Hero—a feat in swimming accomplished by Lord Byron to verify the story of Leander. Abydos is also the name applied to an ancient city of Upper Egypt, situated a short distance

west of the Nile, the site of which is now marked by ruins and tombs. It is famous for the palace of Memnon and the temple of Osiris. In 1818 and in 1864 various collections of the famous Abydos tablets were discovered in its vicinity. They contain a list of the successors of Rameses the Great, including the kings of the first three dynasties of Egypt, beginning with Menes.

**ABYSSINIA** (ăb-ĭs-sĭn'ĭ-ă), an independent political division of Eastern Africa, located between the Red Sea and the Blue Nile. Its boundary is formed by the Italian Colony of Eritrea on the northeast, a region known as Danakil on the east, British East Africa on the south, Egyptian Sudan on the west, and Nubia on the northwest. It is divided into the four provinces of Shoa, Tigré, Gojam, and Amhara, but the exact boundaries are not well defined. The four provinces, including the outlying dependencies of Enarea, Harrar, and Kaffa, have an area estimated at 150,000 square miles, and a population of 4,500,000. The seat of government is at Addis Abeba.

**DESCRIPTION.** Abyssinia may be described as an elevated plateau, its altitude being about 8,000 feet. Numerous mountain chains traverse the country, of which the Samen Mountains in the northern section are the most important. These mountains have an altitude of about 10,000 feet, while Ras Dashan, elevation 15,000 feet, may be regarded the culminating peak. The Talba Wakha Mountains are located south of the predominating group and are less elevated, their highest peaks being about 9,000 feet above the sea. The southern portion is less mountainous, but rocky hillocks characterize the surface. Numerous extinct volcanoes are found in both groups of mountains, and partly obliterated craters and hot springs are abundant.

Lake Tzana is the largest body of water and the source of the Atbara, or Black Nile. It is located at an altitude of nearly 6,000 feet, and occupies an area of 1,150 square miles. There is a general depression toward this lake. The chief rivers, besides the Atbara, are the Abai or Blue Nile, the Hawash, and the Takazze, a tributary of the Atbara.

Though wholly within the tropics, Abyssinia, owing to its elevation, has a temperate climate, and yields the usual products of the temperate zone. It is usually divided into three climatic areas, the regions below 4,800 feet, the sections between 4,800 to 9,000 feet, and the portions having an altitude above 9,000 feet. There are two seasons, the rainy and the dry, and the precipitation is greatest from December to May. From October to April, at Gondar, 7,420 feet

above the level of the sea, the average temperature is 68°, while the temperature in more elevated sections ranges from 45° to 50° Fahr. The soil is well adapted to the cultivation of the harder cereals, and the climate is generally healthful.

**INDUSTRIES AND RESOURCES.** Agriculture is the chief industry, though the methods of farming are primitive. Occupation is an evidence of title to land, which is divided principally among families. Wheat, barley, and cattle are the chief products. Oranges, bananas, and lemons thrive, but are not carefully cultivated. There are few manufactured products aside from wearing apparel and primitive implements. The minerals consist chiefly of coal, iron ores, silver, gold, and salt, but mining has not been developed to any great extent. Wild animals infest the forests and mountains, including the zebra, hyena, lion, wolf, leopard, buffalo and elephant, and in the regions of streams and lakes abound the rhinoceros and the hippopotamus. The chief exports include coffee, wax, gum, gold, tobacco, and ivory, while the imports embrace textiles, clothing, glassware, and military stores.

**EDUCATION AND RELIGION.** Until recently the country had no system of public education, the masses having had little opportunity to attend schools, and instruction was confined to the richer classes in the cities. However, all male children over twelve years of age are now required to attend school. Most of the educational work is in the hands of the clergy and Coptic teachers brought from Egypt. Christianity was introduced into the country in the fourth century, but in teaching and practice has been greatly perverted. The Gallas are Mohammedans and the Falashas profess Judaism. Polygamy is practiced extensively among the non-Christian classes.

**GOVERNMENT.** The government is an absolute monarchy, feudal in character, and the reigning sovereigns for centuries trace their lineage back to the Queen of Sheba, who visited Solomon, King of Israel, for the purpose of beholding his enterprise and power. Menelik II. is the present king or *negus*, and his official title is "King of the Kings of Ethiopia and Conquering Lion of Judah." He holds his office from personal qualities rather than by legal or traditional rights. The Maria Theresa dollar is the chief medium of exchange, but considerable of the business is carried on by barter, especially in cartridges and salt bars of uniform size. The chief cities are Addis Abeda, Gondar, Adua, Harrar, and Aukoher. Harrar is the leading commercial center.

**HISTORY.** The country is a part of ancient

Ethiopia, and the people are still called Ethiopians, but are a mixture of Hamites, Semites, and Negroes. The name Abyssinia came from the Portuguese and signifies that the people are a mixture of many tribes. Some think that the Cush of the Scriptures corresponds to Abyssinia. The country was invaded by the Greeks under Ptolemy Euergetes in 247 B. C., and some traces of Greek influence still remain. When Christianity was introduced in the fourth century, the Abyssinian Church had its seat at Axum; but the head of the church is now at Abuna. With the spread of Mohammedism near the close of the sixth century, Abyssinia was isolated from other countries and relapsed into a primitive half-barbarous civilization. It regained power in the fourteenth century, and in the sixteenth century strenuous efforts were made by Portuguese Jesuits to replace the national religion with Catholicism. In 1633 the Jesuits were expelled and the country relapsed and remained isolated until the nineteenth century, when European explorers interested themselves in that section.

Sir Robert Napier invaded the country with a British army in 1868 as a result of Abyssinian depredations in sections over which the English had established a protectorate, and King Theodore committed suicide, after having met with a thorough defeat. He was succeeded by King John, who fell in battle with the Dervishes of the Sudan in 1889. His successor, Menelek II., proved a progressive ruler, but the country is surrounded by territories under the flags of European nations and has become an object of interest for trade and colonization. Italy claimed a protectorate over Abyssinia under the Treaty of Uchali in 1889, but this was set aside in the Treaty at Addis Abeda in 1896. By the latter treaty the independence of Abyssinia was recognized. The king modernized the government in 1907 by establishing a cabinet of ministers, including those of finance, foreign affairs, war, justice, and commerce, but they are advisory rather than directory.

ACACIA.

**ACACIA** (à-kā'shà), a deciduous plant

widely distributed in various portions of the earth, but not found native in Europe. It is most abundant in India, tropical America, Africa, and Australia. About 300 varieties are native to Australia, including the wattletree, which is from fifteen to thirty feet in height, while in North America a form of the same plant is known under the name of locust or honey locust. The plant grows in height from a shrub to a tree ranging from twenty to thirty feet, and is cultivated for its foliage, flowers, and wood. Some species yield a bark containing a large per cent. of tannin, while others yield perfume and gum arabic.

**ACADEMY** (ä-käd'ë-mÿ), the name first applied to the school founded by Plato, and which originated from the place where that philosopher met and conversed with his pupils. The place was in a park or garden in the suburbs of Athens said to have belonged to Academus, and was presented by him to the city for a gymnasium. In modern times the name came to be applied to schools that communicate more than the mere elements of instruction, or schools instructing pupils that have already acquired the rudiments of an education, as colleges and some classes of universities. The name academy is also used to designate societies of artists linked together for the promotion of interest in art, and to various associations of scholars, scientists, and literary men who promote artistic and intellectual interests. Thus, Cardinal Richelieu in 1835 established the celebrated French Academy to fix and polish the French language. It included among its membership the best scholars of that country, but was dissolved by the Revolution in 1793. The greatest work of this organization was the publication of a complete French dictionary.

The Royal Academy, Burlington House, London, is an association of English artists, and is similar in organization to the French Salon. The Royal Academy of Berlin, founded in 1700 by Frederick II. of Prussia, has two sections—physics-mathematics and philosophy-history. Many such societies are maintained in the United States, the oldest of which is the American Philosophical Society, organized by Benjamin Franklin in 1743.

**ACADIA** (a-kä'di-a), the name given by the French to Nova Scotia, New Brunswick, and part of Maine, the most important portion being Nova Scotia. French colonists made settlements in Acadia in 1604 under De Monts. Argall conquered it for England in 1613, and it remained in English hands till 1657, but did not become their permanent possession until so declared by the Peace of Utrecht in 1713. In

1756 about 6,000 of the French inhabitants were forcibly removed from their homes by the British on account of opposition manifested by them to oppressive legislation, an incident on which Longfellow's "Evangeline" is based.

**ACANTHUS** (ä-kän'thüs), a genus of plants, chiefly tropical, found in the south of Europe, Asia Minor, and India, the most common species of which is the *acanthus mollis*, a native of moist shady places in the south of Europe. It has pretty foliage and large white flowers tinged with pale yellow. Several species are cultivated as greenhouse plants for their shining leaves and white flowers. The idea of the beautiful Corinthian capitals of the Greek columns is said to have been derived from a basket filled with the roots of this plant, set down carelessly by a girl, and covered with a tile; when the leaves, forcing their way through the crevices, and rising toward the light, until met by the underside of the cover, presented the effect of the foliage and volutes, simulated by the Grecian chisel.

ACANTHUS.

**ACAPULCO** (ä-kä-pööl'kô), a seaport of Mexico, in the State of Guerrero, about 230 miles southwest of the City of Mexico. Its harbor is one of the best on the Pacific Coast. It has considerable domestic and foreign trade, the latter with San Francisco, China, and the Philippines. The chief exports are indigo, fruit, wood, lumber, and cochineal. Acapulco reached its greatest importance at the time of the French occupation. Its trade suffered greatly by the construction of the railroad between San Blas and the City of Mexico. Population, 5,000.

**ACCELERATION** (äk-sël-ër-ä'shün), a term employed in measuring the rate of increase or decrease of the velocity of a body whose motion is not uniform. A common instance of increasing acceleration is found in a body falling from a height, and of negative acceleration in a ball thrown from a cannon. The term is also employed to denote the velocity of heavenly bodies in their orbits, especially when passing from perigee to apogee and vice versa. The numerical value of acceleration is about

32.2 feet per second; hence a body falling freely through the air has a velocity of 32 feet at the end of the first second, at the end of the next second the velocity is 64 feet, at the end of the third second it is 96 feet, and so on until it reaches the earth.

**ACCENT** (ăk'sěnt), in reading or speaking, the stress of voice placed upon the syllable of a word. English accent was placed originally upon the root, and not upon inflectionable syllables. A change in the position of accent distinguishes a noun from a verb, as ac'cent, ac-cent'; con'test, contest'. In like manner a change of accent distinguishes an adjective from a verb. Accent has exercised a marked influence in changing the form of many words in the English language.

Accent, in music, is a distinction of certain portions or places of measure, or a stress placed on certain tones. Long measures, as in words of several syllables, may have a primary accent and several secondary accents. A number of signs and marks have been invented to express the various shades of accentuation, as for instance, *f* (*forte*), *ff* (*fortissimo*), *p* (*piano*), *pp* (*pianissimo*), *mf* (*mezzo forte*); *sf* (*sforzando*), *cres* (*crescendo*), *deces* (*decrescendo*), and many others.

**ACCLIMATION** (ăk-klĭ-mă'shŭn), or **Acclimatization**, the process or art by which plants or animals are accustomed to a climate or locality not natural to them. The process depends upon the difference between the new locality and the one formerly occupied, as well as upon the nature of the plants or animals acclimatized. In recent times acclimatization has been made a subject for systematic study, and some valuable discoveries have resulted. The ability of the different races of man to bear changes of climate usually is in direct ratio to the intellectuality of the race. Civilized people display greater mental and physical endurance than savages in accommodating themselves to changes of climate, this resulting, of course, from their superior care and power to accommodate themselves to different modes of life. Modern civilization and commercial enterprise have been greatly benefited by the acclimatization of cereals, herbs, and animals. For instance, the reindeer and dog have been acclimated to the polar regions, silkworms have been brought from China to the Baltic regions of Europe, and, in like manner, animals and plants of various kinds have been made to serve man's purpose in greatly diversified parts of the earth. However, this is spoken of more properly as naturalization than acclimatization.

**ACCORDION** (ăk-kôr'dĭ-ŭn), a musical

instrument in the form of a small box, arranged to be drawn by the hands in such a manner as to supply wind to act on metallic reeds fixed at one or both extremities, thus operating to set the reeds in vibration. An accordion has two sets of metallic reeds, so constructed that the same tones are produced as a result of pulling or pressing the bellows. The harmonium and concertina are similar instruments, and are in more or less general use among Europeans.

**ACCOUNT** (ak-kount'), a list of items of debits or credits between two or more parties, or a statement of the particulars of such an account. When each of two parties has demands against the other, as in the case between two merchants, each of whom has sold goods to the other, the account is said to be *mutual*. The account is considered *open* or *current* until a statement is *rendered*. A *stated* account is one that has been accepted as correct by the one against whom it shows a balance. The recipient of a statement, if the account is found incorrect, should give verbal or written notice of that fact within a reasonable time, else its acceptance will be implied. However, corrections on account of fraud or mistakes can be made subsequently.

**ACCUMULATOR** (ăk-kŭ'mŭ-lă-ter), an apparatus by means of which electricity may be accumulated so as to produce directly an electric current. This apparatus is generally known as a storage battery, and its use depends upon the principle that a current acting upon grooved lead plates and lead electrodes causes certain chemical changes. In some cells two lead plates are immersed in dilute sulphuric acid in water, the mixture having a specific gravity of 1.17. When the circuit of a battery is closed, the chemicals recombine and give off a current almost equivalent to that which decomposes them. The two general classes into which accumulators are divided are those known as the Faure type and the Planté type. In the former some easily reducible salt of lead is applied mechanically, and in the latter peroxide of lead is formed by electrochemical action on the surface of the coiled plates used in constructing the cells. In order to charge the battery it is connected with a dynamo and the electricity is retained until required for use, though there is a very rapid depreciation if the batteries are not operated with care. Storage batteries are commonly employed in automobiles and in many central stations to aid the dynamos when the maximum output is required.

**ACETANILID** (ăs-ět-ăn'ĭ-lĭd), a crystalline powder obtained by the action of acetic acid

on aniline. It has a slightly bitter taste, is odorless, and is frequently taken as a medicine for allaying pain. It is used for headache, generally given in tablet or capsule, and its effect is injurious if not administered with great care.

**ACETATE** (ă's'e-tăt), See **Acetic Acid**.

**ACETIC ACID** (ă-sē'tic ă's'īd), an acid composed of oxygen, hydrogen, and carbon, and forming the sour principle of vinegar. In a pure state it is poisonous, has a sour taste and pungent smell, refracts light powerfully, and does not mix with water except at high temperature. It is the product of the acetic fermentation of many vegetable and animal juices, and in some plants is found naturally formed. It is solid at temperatures below 62° Fahr. The action of the micro-organisms of the air on wine or weak spirits produces vinegar, which is a dilute acetic acid. Many dilute and concentrated forms of acetic acid are employed in medicines and the arts. It aids digestion by its solvent action upon albuminous and protein compounds, hence the use of vinegar with foods that are not easily digested. When acetic acid is united with a base or radical, it forms a salt known as an acetate. The acetates of ammonium, iron, lead, potassium, sodium, and zinc are employed in medicine. Those of iron and aluminum are used in calico printing, while that of copper, known as verdigris, is useful as a color.

**ACETYLENE** (ă-sēt'ī-lēn), a pure hydrocarbon gas produced by passing an electric current between carbon poles in an atmosphere of hydrogen, also by hydro-carbon in a state of incomplete combustion. Small quantities of it are present in ordinary illuminating gas. It is colorless and clear, and burns with a bright flame. The flame is brilliant and steady, produces no smoke and little heat, and its intense brilliancy gives it preference for illumination. Until recently it was produced only in laboratories, being too expensive for use, except in experiments. It is now obtained at a very nominal cost by fusing coal dust and lime in an electric furnace, and then bringing the resultant calcic carbide in contact with water. The proportion of lime is 1,130 pounds to 1,750 pounds of coal dust, and the resultant is 2,000 pounds of calcic carbide. When the carbon of the calcic carbide is united with the hydrogen of water, the acetylene gas is formed and is utilized as it rises to the top.

The credit of discovering the method of producing acetylene gas on a commercial basis is due to T. L. Willson, who, as one of the promoters of the Willson Aluminum Company at

Spray, North Carolina, was aided by J. T. Morehead, a student and geologist. In conducting a line of experiments, they placed lime and coke in an electric furnace, which, after being fused together, was thrown into water with the result that gas was formed and when lighted it burned with a clear flame. This discovery caused calcium carbide to become an article of commerce. It is placed in portable generators and sold directly to consumers, who make their own illuminating gas by the use of small generators. At Niagara Falls and a number of other places are large electric furnaces for the purpose of making the commercial product. About 2,000 pounds of carbide are produced by 180 electric horse power in twelve hours, which quantity has an illuminating value equal to 100,000 cubic feet of ordinary gas. Its inexpensive manufacture revolutionized street and house lighting. Pure acetylene requires a special burner, by which it is sufficiently mixed with air before it begins to burn.

A new system of producing power was obtained by a mixture of acetylene gas and alcohol vapor in internal combustion engines. When a certain proportion of acetylene is added to alcohol vapor, a quicker burning, more explosive mixture results. This makes it possible to obtain from a given size of gasoline engine the same horse power when operated with alcohol as when gasoline is used, without the greatly increased consumption that ordinarily occurs when this is attempted. Acetylene gas is thus used as an enricher of commercial alcohol, and is likewise employed to increase the illuminating power of coal gas and other combustible gases.

**ACHAEA** (ă-kē'ă), one of the ancient divisions of the Peloponnesus, extending along the coast of the Gulf of Corinth. Its greatest length from east to west is about 65 English miles. It varies in breadth from 12 to 20 miles. Patras, formerly Patrae, is the only Achaean town that maintains any importance. After the Roman conquest of Greece and Macedonia, the province of Achaea included all of the Peloponnesus, with Northern Greece south of Thessaly. In the present kingdom of Greece it constitutes a division for the purposes of administration.

The Achaeans comprised one of the four main divisions of the ancient Greeks. Their mythological ancestor was Achaeus, son of Xuthus, and grandson of Hellen. They migrated from Thessaly to the Peloponnesus, where they held the preponderance of power, and for a long time maintained a confederacy of twelve towns, known as the Achaean League. It was

broken up after the death of Alexander the Great, reorganized in 280 B. C., and finally suppressed by the Romans in 146 B. C. The "Iliad" designates the whole Hellenic host before Troy as Achaens.

**ACHEEN**, or **Achin** (ăt-chĕn'), a city and state of northern Sumatra, the only state of that island long independent of Holland, but ceded to that power in 1879. It was a powerful state in the seventeenth century, and long resisted attempts at colonization made by the Portuguese, but gradually lost its power with the rise of Dutch supremacy in Sumatra. There are extensive productions of rice, pepper, gutta percha, bamboos, iron, sulphur, and camphor. The forests yield large quantities of merchantable lumber, and there are also productions and exports of fruits and live stock. The state has an area of 20,500 square miles.

**ACHELOUS** (ăk-ĕ-lō'ūs), a river of Acarnania, which, rising in Mount Pindus, and dividing Aetolia from Acarnania, flows into the Ionian Sea. Homer calls it "king of rivers." It is the largest stream in Greece, its length being 130 miles. It is now called Aspro Potamo.

**ACHERON** (ăk'ĕ-rŏn), in Greek mythology, a river of the lower world, and which is connected with many ancient legends. Around it were supposed to hover the shades of the departed, while Charon was reputed the ferryman who piloted those permitted to enter the realm of the dead across its water.

**ACHILL** (ăk'il), or **Eagle Island**, the largest island off the west coast of Ireland, and included with the county of Mayo. Its shape is almost that of a right-angled triangle, while its length is about fifteen miles, and breadth twelve miles. The surface is mostly marshy and boggy, and the inhabitants engage chiefly in fishing. The area is 51,521 acres, and the population, 4,975.

**ACHILLES, Tendon of**, the tendon which connects the heel bone with the muscles of the calf of the leg. It is so named from Achilles, a Greek leader in the Trojan War. This tendon is capable of resisting a force equal to 1,000 pounds weight, but is occasionally ruptured.

**ACHMIM**, or **Akhmim**, a town in Middle Egypt, on the right bank of the Nile. It is the Chemmis of Herodotus, and near it are ruins of two temples. The hills in its vicinity have many excavations, made originally to receive mummies, but which afterward served as a refuge for Christians during the persecutions of Diocletian.

**ACHROMATISM** (ă-krŏ'mă-tĭzm). See **Prism**.

**ACID** (ăs'id), in chemistry, a compound of hydrogen in which all or part of the hydrogen can be replaced for a metal or a basic radical, thus forming a new compound. A majority of acids, when placed to the tongue, produce a taste called sour. They change the blue colors of vegetables to a red, while some colors, previously converted to green by alkalis, may be restored by acids. However, these properties are variable. The acids generally contain oxygen united with another element that gives the name to the particular acid, as sulphuric acid, which contains sulphur, oxygen, and hydrogen. Many organic gases occur in the juices of vegetables and some in animals, such as the acid of ants, commonly known as formic. Hydrochloric, nitric, sulphuric, and many other acids are important in the industries. Vinegar contains acetic acid; lemons, citric acid; grapes, tartaric acid; and currants, gooseberries, and apples, malic acid. Prussic or hydrocyanic acid is found in leaves, almonds, and several varieties of fruits. Prussic acid is used for flavoring in small quantities, but is usually classed as a poison.

**ACIREALE** (ă-chĕ-ră-ă'lă), a seaport of Sicily, at the mouth of the Aci River, nine miles northeast of Catania. It has a considerable trade in wine and fruit, and manufactures silk and cotton goods. Near it are celebrated mineral springs and the famous grotto of Galatea and the cave of Polyphemus. Population, 27,875.

**ACLINIC** (ă-klĭn'ic) **LINE**, a line imagined drawn around the earth near the terrestrial equator, on which the magnetic needle has no

ACLINIC LINE.

inclinations. When the compass is placed on this line, the needle balances itself horizontally. It is known as the magnetic equator, being about 90° from the magnet poles, though this line is variable and irregular.

**ACONCAGUA** (ă-kŏn-kă'gwă), a mountain of Chile, situated near 31° south lat. and 70° west long. Its height is 23,910 feet. It is counted the highest peak in America, being 1,422 feet higher than Mount Sorata, Bolivia.

On its southern slope rises the Aconcagua River, which, after a course of 200 miles, flows into the Pacific.

**ACONITE** (äk'ō-nīt), a genus of plants so named from Acone, in Bithynia, which is famous for its poisonous herbs. It belongs to the natural order *ranunculaceae*; many of its species have long been known for their poisonous properties. Several are cultivated in our gardens, and are known by the familiar names of wolfsbane or monkshood. The latter term designates the distinguishing mark of the genus, which is the uppermost segment of the calyx overhanging the petals and other parts in the form of a helmet. The roots and leaves of the *aconitum napellus* are used for the preparation of some powerful medicines, which act as drastic purgatives, which are also externally applied as an anodyne remedy in acute pains affecting the nerves, and in rheumatic and syphilitic complaints.

**ACOUSTICS** (à-kous'tiks), the science that treats of sound and of the laws of its production and propagation. Sound is produced by the vibration of particles in a sonorous body, and is induced by a blow or in some similar way. It requires an elastic body for its transmission to the tympanum of the ear, and is heard when brought in contact with air, but becomes inaudible in a vacuum. Its rate of progress through dry air, at a temperature of 32°, is about 1090 feet per second, but its motion through metallic rods is much more rapid. Refraction of sound is a change of direction and velocity, which is caused by passing from one medium to another of a different kind. Reflection of sound is a change of direction caused by meeting a medium different from the one passed through, and, in addition to transmitting to it a refracted wave, induces it to pass in a different direction with an equal velocity. In this way sound may be repeated, as from an echo-producing cliff or hill. Pythagoras and Aristotle were aware that sound is propagated through air, and attempted to develop the science of acoustics, but its foundation was not laid until the time of Bacon and Galileo. Newton demonstrated by calculations how the propagation of sound is due to the elasticity of the conducting medium. The science of sound owes its progress particularly to the researches of Newton, Laplace, and the German physicist Hermann Helmholtz (1821-1894).

The subject of acoustics merits earnest consideration, since many public buildings are illy planned, and many principles of acoustics disregarded. As a general rule, ceilings should be of a medium elevation, many ceilings being too

high to facilitate both hearing and speaking. Stretching wires across halls and hanging draperies have a moderating effect. The whispering gallery of St. Paul's, London, is a fine example of successfully taking advantage of the basic laws of acoustics in public buildings.

**ACRE** (ā'kēr), a quantity of surface equal to 4,840 square yards. It came into use as a standard of measurement on account of the amount of land one man could plow in a day. The size of the acre differs in different countries, because the capacity of plows formerly used differed widely. The chain with which land is measured is twenty-two yards long, and a square chain consists of 22x22, or 484 yards, hence an acre contains ten square chains. The acre is divided into four roods; a rood into forty perches, and a perch into thirty square yards. Below is a table showing the relative measurements of the most important nations as compared with the acre used in the United States and Great Britain.

English, Acre.....	1.00
Scotch ".....	1.27
Irish ".....	1.62
Austria, Joch.....	1.42
Belgium, Hectare.....	2.47
Denmark, Toende.....	5.50

**ACRE** (ä'kēr), or **Akka**, an important seaport of Syria, on the Mediterranean Sea, and anciently called Ptolemais. It has experienced many notable changes through the calamities of war and revolution. In 1799 it was defended by the Turks against Napoleon, who laid seige upon it for sixty-one days, and by Mehemet Ali, Pasha of Egypt, in 1831-32, against a seige of six months by his son, Ibrahim Pasha. Acre remained in the hands of the Egyptians till Nov. 3, 1840, when it was taken by the British. It again came into possession of the Turks in 1841, to whom it now belongs. The city has a moderately good harbor, and is connected with Kersha and other interior cities by railways. Population, 10,500.

**ACROPOLIS** (à-kröp'ō-līs), the name applied by the Greeks to a prominent place in a city, usually to an eminence from which the

city can be viewed. In ancient times the Acropolis of Athens contained the Parthenon and other fine buildings.

**ACROSTIC** (ă-krōs'tīk), a stanza or stanzas of poetry, the lines of which are so arranged that the initial letters taken in order constitute a name or a sentence. In Hebrew writings this plan was used largely in poetry, and frequently the initial letters were made to cover the entire alphabet. In the original, the 119th Psalm and eleven others are written in this manner. Acrostics are frequently used in writing complimentary verses, when the initial letters usually form the name of the person complimented. The following will serve as a sample:

Electric essence permeates the air,  
Lighting the heavens with its brilliant glare,  
Encircling planets in its huge embrace,  
Controlling all the elements of space;  
'Tis this that sways the immortal mind,  
Refines and elevates all human kind;  
In it the spirit finds its highest light,  
Celestial source of God, the Infinite.

**ACTINISM** (ăk'tīn-iz'm), the peculiar property or force of that portion of the sun's rays which produce the chemical effects shown in photography, and the effect of causing the seeds of plants to germinate. That the actinic rays are different from those which produce heat and light was shown by J. W. Draper of New York, in 1842. The quantity of actinism in the sun's rays varies with the time of the day, and with the seasons. Its deficiency in the tropics renders it difficult to obtain good pictures there, except with the more powerful instruments. Its greater abundance in the spring of the year causes this to be the best period for taking pictures, as it is the season for the germination of seeds and the opening of buds. This principle is obstructed by the passage of rays of light through yellow glass. Hence the unsuitableness of this glass for greenhouses, while the use of blue or violet glass is recommended as a means to aid in the rapid growth of plants. Modern medical science has demonstrated the wisdom of employing blue and purple rays in treating certain diseases. That the different rays of sunlight possess a varying degree of power in producing chemical changes may be shown by spectrum analysis. See **Spectrum**.

**ACTIUM** (ăk'shi-ŭm), now called Akri, a town and promontory on the west coast of Greece, on the Gulf of Arta, and noted for the naval battle between Octavianus, who later became Emperor Augustus of Rome, and Mark Antony and Cleopatra, on Sept. 2, 31 B. C. Octavianus commanded 80,000 infantry, 12,000 cavalry, and 260 ships; while Antony had 100,000

infantry, 12,000 cavalry, and 220 ships, and was supported by Cleopatra with sixty vessels. Antony was defeated and fled with Cleopatra to Egypt. To commemorate the victory Octavianus enlarged the temple of Apollo, and instituted games to be celebrated every four years.

**ACTS OF THE APOSTLES**, the fifth book of the New Testament, written in Greek about 63 or 64 A. D., and generally thought to be the work of Saint Luke, a physician and painter of Antioch, who had been converted by the teaching of Saint Paul. The Acts embrace the history of the church in Judea and Asia Minor during the period of about thirty years after the death of Christ, from the time of the Resurrection until the second year of Saint Paul's imprisonment in Rome. While Philip and Saint Peter are mentioned in the Acts, the principal personage is Saint Paul.

**ACUPUNCTURE** (ăk-ŭ-pŭnk'tŭr), a surgical operation employed among the Chinese and Japanese, in headaches, lethargies, convulsions, colics, etc. It is accomplished by piercing the part which is the seat of the malady with a silver needle. Modified forms have been adopted by American and European physicians for the treatment of neuralgia, rheumatism, and other diseases.

**ADAMS**, a town of Berkshire County, in the northwest part of Massachusetts, forty-seven miles northwest of Springfield. It is situated on the Hoosac River, near Mount Greylock, altitude 3,600 feet, the highest point in the state, and on the Boston and Albany Railroad. There are manufactures of machinery, clothing, textiles, utensils, flour, and tobacco products. Gas and electric lights, street railways, waterworks, and sewerage are among the public improvements. The town has excellent public schools and numerous churches. It was platted in 1749, as East Hoosuck, and was incorporated in 1778, when it was renamed in honor of Samuel Adams. Population, 1900, 11,134; 1905, 12,486.

**ADDA** (ăd'dă), a river of Italy, a tributary of the Po. It rises in the Rhaetian Alps, flows through Valtellina and Lombardy, and enters the Po about eight miles from Cremona. Its course is about 180 miles, of which 70 miles are navigable. Lodi, the scene of one of Napoleon's triumphs, and Cassano, at which Moreau was defeated in 1799, are on its banks.

**ADDAX** (ăd'dăks), or **Addas**, a species of antelope related to the oryx, native to the deserts of Northeastern Africa. The form is robust, the color nearly white, tinged somewhat with reddish, and the height at the shoulders is

about three feet. It has a long tufted tail and long ears, and the horns are twisted spirally, turn outward, and measure about four feet in length. The Arabs hunt it for its flesh and skin. Only a small number of this animal remain.

**ADDER** (ăd'dēr), a general name applied to venomous snakes, but also the name of the only poisonous serpent in Britain. The latter is about two feet long, has a triangular head, and a short tail. A species known as *asp* or *puff-adder* is found in South Africa, where it is dreaded for its fatal bite. Adder's-tongue is a plant, a species of common fern, whose spores resemble a serpent's tongue. Adderwort is a name applied to snakeweed on account of its supposed virtue in curing the bite of a serpent.

**ADDIS ABEBA** (ăd'dēs ā-bā'bā), the capital of Abyssinia, located in the province of Shoa. It has a picturesque location at an altitude of 8,000 feet, but its streets are irregular and the buildings are poorly constructed. On an eminence is the royal palace, which consists of several buildings and is surrounded by walls. The city has a large floating population and is the mecca of many caravans. The commission that concluded peace between Italy and Abyssinia met at Addis Abeba in 1896, when the independence of Abyssinia was recognized. Population, 50,000.

**ADDRESS, Forms of**, the formal manner of beginning a communication, either written or spoken. In countries where rank and title prevail the forms of address are quite complex and adherence to them is considered necessary. Common usage has established some form of address even in republics, though in such countries they are less varied and numerous. "His Excellency, the President of the United States," is the form of address sanctioned by law that is to be applied to the President of the United States, and the same form is used in addressing the governors of states and ministers to foreign countries. Senators and representatives of the United States, or of the several states, judges, and consuls are addressed *The Hon. —*, while the form of addressing the Vice-President is *The Hon. —, Vice-President of the United States*. The following table gives a list of the more important addresses used in Great Britain, its dependencies, and most countries in which the personages are recognized:

Archbishop: *His Grace the Lord Archbishop of —*.  
 Baron: *The Right Hon. Lord —*.  
 Bishop: *The Right Rev. the Lord Bishop of —*.  
 Countess: *The Right Hon. the Countess of —*.  
 Duchess: *Her Grace the Duchess of —*.  
 Duke: *His Grace the Duke of —*.  
 Earl: *The Right Hon. the Earl of —*.  
 King: *His Most Gracious Majesty the King*.  
 Knight: *Sir —*.

Lord Lieutenant (of Ireland): *His Excellency the Lord Lieutenant*.

Lord Mayor: *The Right Hon. the Lord Mayor*.

Marchioness: *The Most Hon. the Marchioness of —*.

Maquis: *The Most Hon. the Marquis of —*.

Members of Parliament: The letters *M.P.* are added to the usual address.

Prince: *His Royal Highness the Prince of —*.

Princess: *Her Royal Highness the Princess of —*.

Privy Councilor: *The Right Hon. —*.

Queen: *Her Majesty the Queen*.

Viscount: *The Right Hon. Viscount —*.

Viscountess: *The Right Hon. Viscountess —*.

Youngest son of Duke or Marquis: *The Lord —*.

Youngest son of Earl or Viscount: *The Hon. —*.

**ADELAIDE** (ăd'ē-lād), an important city of Australia, about six miles southeast of Saint Vincent's Gulf, in the province of South Australia, of which it is the seat of government. The Torrens River divides it into South Adelaide and North Adelaide, the two divisions being connected by extensive bridges, and the stream is beautified by dams and dikes. There are excellent botanical gardens, which cover an area of 120 acres and may be classed among the finest in the world. Besides substantial government buildings, it contains telegraph, telephone, and railway offices, and is the seat of fine schools and churches. The city has a number of institutions of higher learning, including commercial schools, colleges, and a university. Port Adelaide, its port, has a commodious harbor and is protected by two forts. The manufactures include clothing, leather, woolen goods, ironware, machinery, tobacco products, furniture, and earthenware. It has an important commercial trade, both locally and with foreign countries. Among the municipal improvements are gas and electric light, street railways, pavements, waterworks, and other modern conveniences. The city was founded in 1836, and named in honor of the queen of William IV. Population, 1901, 39,200, including suburbs, 162,200.

**ADELPHI COLLEGE** (ă-děl'phi), an institution of higher learning in Brooklyn, New York City. It was incorporated in 1896 by the regents of the University of the State of New York, and with it is affiliated Adelphi Academy, a school founded in 1869. In the first eleven years of its existence Adelphi College grew to have a student body of about 500 and a corps of instructors numbering 42. The courses are grouped under three divisions: History and Philosophy, Language and Literature, and Mathematics and Science. The college grants only the degree of A. B. To graduate a student must have completed 124 points, of which 54 points must be in one division, 24 points in a second, and 12 points in a third, and the others may be selected freely. The college possesses excellent physical, chemical, and biological laboratories, an adequate library, and a gymnasium.

In connection with the college a flourishing normal school of kindergarteners is maintained. This offers a two years' course, which leads to a special course in kindergarten work. There is also a school of fine arts, which is the oldest institution of its kind in Brooklyn.

**ADEN** (ä'den), a seaport city and territory of Southwestern Arabia. The city forms an important commercial center owing to the increasing trade through the Suez Canal. Over 2,000 vessels stop at the port of Aden annually. The import trade amounts to over \$17,000,000 annually and is slightly greater than the export trade. As a naval and coaling station it is quite important, and there are strong fortifications. The government is administered by an English local resident. Population, exclusive of troops, 43,974.

**ADEN, Gulf of**, an inlet from the Indian Ocean, located between Arabia on the north and the African peninsula of Somaliland on the south. Its length is 500 miles, extending from the Strait of Bab el Mandab to the Indian Ocean. Some geographers call it the Arabian Gulf.

**ADHESION** (äd-hē'zhün), in physics, the force that holds together molecules of different kinds. It is distinguished from cohesion, which is a force that holds together molecules of the same kind, acting at insensible distances. Adhesion takes place between two solids, between a solid and a liquid, or between a solid and a gas, but acts only at insensible distances. It differs from chemical affinity in that it acts between surfaces of any size without changing the character of adhering bodies, while chemical affinity acts between particles of substances and generally changes the appearance.

**ADIGE** (ä'dê-jä), (German, Etsch), a river of northern Italy, which rises in the Rhaetian Alps, flows in a southeasterly direction, and discharges into the Adriatic Sea. It forms the boundary between Lombardy proper and the old Venetian territories. It is 240 miles long and is a transit river for German and Italian trade.

**ADIRONDACK** (äd-ĩ-rön'däk), a group of mountains belonging to the Appalachian system, located between Lakes Ontario and Champlain, in northern New York. The region is a popular resort for tourists and sportsmen, who delight to spend the summer season among its mountain scenery, beautiful parks, and picturesque lakes in pursuit of game or in pursuing the pleasures of vacation. There are very complete provisions for pleasure and profitable pastime. Owing to the altitude, the nights are cool and the days generally pleasant.

Mount Marcy is the most remarkable and the highest peak; height, 5,337 feet.

**ADJECTIVE** (äd'jék'tiv), the part of speech used to describe or define the meaning of a noun or a word or phrase equivalent to a noun. Adjectives may be divided into two general classes, descriptive and definitive. Descriptive adjectives describe the meaning of a noun by denoting some quality, as *square, round, sour*, while definite adjectives define the meaning or application without expressing quality, as *that man, the Ohio, the third seal*. The articles *a, an, and the* are sometimes included with the latter class. Adjectives that express quality admit of comparison, and are said to be either positive, comparative, or superlative in expressing different degrees of quality. In the English language the adjective precedes its noun, except when used as a predicate adjective.

**ADJUTANT** (äd'jũ-tant), or **Argala**, a large wading bird of the stork family found in the tropical parts of India. It has a large beak, a pouch hanging from the under side of the neck, and when standing erect is about five or six feet in height. The general color is an ashen gray mixed with white. At the apprehension of danger it inflates the large pouch in front of the neck with air, which is capable of considerable distention. In India it is protected by law, owing to its value in devouring carrion, reptiles, and offals. The adjutant bird is allied to the marabou of Western Africa, and, like it, furnishes from under its wings the light downy feathers known in the market by the name marabou. There are a number of different species, that of Senegal being an allied bird to those found in Southern Asia.

ADJUTANT BIRD.

**ADMIRALTY** (äd'mĩ-ral-tỹ), the name usually applied to the department of government which is at the head of the naval service. Most maritime nations maintain departments of admiralty, and from them charts are issued for aid in navigation. The United States Coast Survey details information of value in the naval service by issuing annual reports. Admiralty courts are peculiar to many European countries, and take cognizance of civil and criminal

causes of a maritime nature. In Great Britain a board of admiralty comprises five lords commissioners, who decide on all important questions collectively, but each commissioner also has special duties assigned to him, such as naval discipline, sailing orders, purchase and disposal of stores, manning the navy, etc. In the United States the jurisdiction of the district courts embraces all civil and criminal cases arising in the maritime service. However, the graver and higher crimes are referred to the circuit courts as courts of admiralty. In Canada the exchequer court is a court of admiralty and has rights and remedies in all matters arising out of or in connection with navigation and commerce.

**ADMIRALTY ISLAND**, an island off the northwest coast of North America, belonging to the United States. It is about eighty miles long and twenty miles wide. There are forests of considerable value, but the climate is cold and the inhabitants consist chiefly of Sitka Indians. Killisnoo, located about forty-five miles northeast of Sitka, is the chief town.

**ADMIRALTY ISLANDS**, a group of about forty islands lying northeast of New Guinea. The group constitutes a part of the Bismarck Archipelago. These islands were discovered by the Dutch in 1616, and now belong to Germany. They abound in cocoanut trees, and have considerable productions of fruit, fish, rice, and domestic animals. The inhabitants consist chiefly of tawny-colored islanders.

**ADOBE** (ă-dō'bă), a name of Spanish origin applied to brick made of a mixture of sand and clay and sun-dried. Buildings constructed of this kind of material are quite common in arid and semi-arid districts of North America, especially in New Mexico, Arizona, and Central America. In size these brick vary somewhat, the usual dimensions being 4 by 12 by 16 inches. The material is thoroughly mixed and exposed for drying to the sun about two weeks, during which time they are turned daily, though the treatment varies somewhat with the condition of the atmosphere and the season of the year. Brick of this kind cannot be used where rainfall is abundant as they will not bear a considerable amount of moisture. The Egyptians and Babylonians constructed buildings of this class of material, or used brick made of clay mixed with straw and baked in the sun. In some sections where building material is scarce, as in portions of the plains of America, sod is used to lay up the walls and an adobe soil is mixed with sand for plastering both the exterior and interior. Sod houses treated in this way are quite serviceable, especially if the floor and roof are constructed of lumber.

**ADONIS**, a genus of herbaceous plants native to Europe and belonging to the same family as the buttercup. The corn-adonis grows as a weed in the wheat fields of Great Britain and has become naturalized in some parts of the United States. Several species of the adonis are cultivated as garden plants, and in these the petals are a bright scarlet.

**ADRIAN** (ă'drĭ-ān), a city in Michigan, county seat of Lenawee County, seventy miles southwest of Detroit, on the Wabash, the Lake Shore and Michigan Southern, and other railways. It has a considerable jobbing trade and manufactures of street and railway cars, furniture, brick, cigars, machinery, and earthenware. It is the seat of Adrian College, established in 1859 by the Methodist Church for the coeducation of the sexes. The city has fine public schools, an excellent county courthouse, an opera house, and a Masonic temple. Gas and electric lights, waterworks, pavements, and sewerage are among the improvements. It was incorporated as a city in 1853. Population, 1910, 10,763.

**ADRIANOPE** (ăd-rĭ-ān-ō'p'l), the second city of the Turkish Empire, capital of the vilayet of the same name, 130 miles northwest of Constantinople. It was founded by Hadrian on the Hebrus River, now called Maritza River. The city was the capital of the Turkish Empire from 1361 to 1453, but in the latter year the capital was removed to Constantinople. In 1829 it was occupied by the Russians, and also in the War of 1878. Its improvements include a splendid aqueduct, several elegant mosques, and other religious and educational institutions. There are manufactures of silk and woolen goods, cotton textiles, leather, tobacco products, and machinery. It has railroad connections with Constantinople and other important cities, and enjoys a considerable commercial trade. About half of the inhabitants are Turks and the remainder Jews, Bulgarians, and Armenians. Population, 80,250.

**ADRIATIC SEA** (ăd-rĕ-ăt'ĭk), an extension of the Mediterranean Sea in a northwesterly direction from the Strait of Otranto, lying between Italy, Austria, Montenegro, and Turkey. Its greatest length is 480 miles; average breadth, 100 miles, and area about 60,000 square miles. Into it flows the Po River, which is producing notable geological changes by alluvial deposits. The sea was so named from Adria, which was once an important seaport, but is now seventeen miles inland, owing to the deposits of silt from the tributary rivers, the Po and Adige. The most important seaports include Trieste, Sinigaglia, Ancona, and Venice.

**ADULLAM** (a-dŭl'lam), one of the cities of the plain, in the tribe of Judah, fortified by King Rehoboam. The Cave of Adullam, where David hid when pursued by the Philistines, was probably near the Dead Sea. (I Sam. xxii, 1-2).

**ADULTERATION** (ă-dŭl-tēr-ă'shŭn), a term used to designate the debasement of a pure or genuine article by taking away some of its constituent parts, or adding to it some inferior article. The object of adulterations is usually for pecuniary profit, and has prevailed in all countries from ages far remote. It has been the subject of legislation, governments seeking thereby to protect the consumers of such products from deception by manufacturers and salesmen in many articles of commerce, particularly articles of food. Various European nations legislated regarding it as early as the 13th century, but none of the efforts have been more than partially successful. In the United States legislation has varied, but has been enacted more particularly by the states than the nation. Among the national laws is one regulating the sale of oleomargarine, an artificial form of butter.

The most common form of adulteration is the addition of a substance of little value to one of greater value, the design being to increase bulk and weight of different commodities, as mixing chicory with coffee, fat with butter, and water with milk. Fictitious value is often given to substances by improving the appearance or heightening the color, as coloring butter or pickles, or mixing salts of copper with preserves. Impurities are also frequent when it is designed to increase the flavor, as adding sulphuric acid to vinegar, while ingredients are often added to beverages to increase the thirst of the consumer, as the adulteration of beer by the addition of salt. While adulteration of food articles is quite common, it is not practiced so extensively as the public believe. As a rule the consumer of adulterated foods is more likely to sustain unnecessary expense than suffer a loss of health, yet many of these adulterations are extremely harmful, vicious in principle, and in direct violation of public policy.

**ADVENTISTS** (ăd'vent-ĭst), the name assumed by a Christian denomination, among whose tenets is the belief in the second advent

of Christ. Several branches have sprung from the teaching of William Miller, who prophesied that the world would come to an end in 1831. They differ more or less in points of doctrine, but the government is uniformly congregational. The Seventh-Day Adventists constitute the most numerous branch. They support forty educational institutions, issue numerous publications, and have a membership of 78,950 communicants, including 560 ministers. The denominational headquarters are at Battle Creek, Mich. The smaller denominations include the Evangelical Adventists, the Advent Christians, and the Church of God.

**ADVERB** (ăd'verb), in grammar, a word used to modify the meaning of a verb, adjective, participle, or an adverb. Adverbs are divided into five classes: adverbs of *time*, *place*, *cause*, *manner*, and *degree*. Most English adverbs are formed by adding the suffix *ly* to an adjective or its root, though many are not thus formed. A

TEMPLE OF ATHENA: WESTERN GABLE.

sentence or part of a sentence is frequently used to perform the function of an adverb. Many adverbs are compared by the use of *more* and *most*.

**ADVERTISING** (ăd-vēr-tĭz'ĭng), the method by which the sale or exchange of commodities is made known to the public. Advertising is not confined to the producing class, though this was originally the case, and the means to make known through publication the value and price of articles offered are very various. Many standard products useful in domestic economy are advertised on billboards, both in city and country, and in all the larger cities companies promote advertising in this way as a regular business. However, the greatest amount of advertising is done by circulars, catalogues, and through the columns of magazines and newspapers. The amount of money paid annually for advertising in the Dominion of Canada is estimated at \$60,000,000, while in the United States the annual expenditure for this purpose is placed at \$520,000,000.

The history of advertising may be traced to ancient times, especially to Greece and Rome, where signs were utilized to make announcements and criers gave information in regard to the value and price at which commodities were for sale at particular places. However, the invention of printing revolutionized advertising as a business, and at present there is scarcely a large periodical whose columns are not open to all classes of legitimate advertising. Indeed, the receipts from advertising in numerous classes of periodicals, especially magazines, are an important factor and in many cases exceed the money received for subscriptions. The value of modern advertising has secured such a hold upon business men and the public that success in almost any line depends in a great measure upon the manner of advertising. The theory and practice of writing advertisements is a branch of study placed in the curriculum of many schools and business colleges.

**ADZ** (ädz). See **Ax**.

**AEGEAN SEA** (ë-jě'an), a branch of the Mediterranean Sea extending west of Asia Minor, south of Turkey, and east of Greece. Its breadth is 200 miles, and the average length 400 miles. Within the sea are a number of fertile islands, many of which are cultivated in the production of cereals and fruit. They include Euboea, Lesbos, Lemnos, and Samos.

**AEGINA** (ë-jí'na), a small island belonging to Greece, situated in the Gulf of Aegina, and containing an area of about thirty-two square miles. The island is mountainous and sterile, except in the western portion, which is quite level and productive. The chief products include olives, almonds, grapes, and cereals. On the island are remains of the temple of Athena. In ancient times, about 256 B. C., the island belonged to the Athenians. Population, 9,135.

**AEGIS** (ë'jís), the shield of Jupiter and Minerva, which was covered with the skin of the goat Amalthea, by which Jove was nourished in infancy. According to Homer, Jupiter had but to shake the shield to cause thunder and lightning to descend upon earth.

**AEGOSPOTAMI**, or **Patamos**, a locality in the Thracian Chersonese, on the Hellespont, where the Spartans under Lysander defeated the Athenian fleet. This defeat, in 405 B. C., ended the predominance of Athens and brought the Peloponnesian War to a close.

**AENEID** (ë-ně'id), the great epic poem written by Virgil, which ranks with the "Iliad" and "Odyssey," and is classed as one of the three greatest poems bequeathed to posterity by the ancients. It was commenced about the year 30 B. C., and was left unfinished at the time of the

author's death. Virgil thought it of too little merit for publication and directed that his friends burn the manuscript, but Emperor Augustus saved it and gave it into the hands of two learned friends of the author for publication. The fact that many lines were left unfinished is proof that the poem was not carefully revised by the author.

The story of the Aeneid relates the adventures of Aeneas after the fall of Troy and his final settlement in Italy, where he and his followers became the founders of Rome. This writing consists of twelve books. The first accounts that Aeneas was driven by a storm on the coast of Africa, where he was hospitably entertained by Dido, queen of Carthage, to whom he related the story of the fall of Troy. His wanderings from Troy to Carthage are told in the second and third books. In the fourth book the poet relates the story of the passion conceived by Dido for her Trojan guest, the departure of Aeneas in obedience to the will of the gods, and the suicide of Dido. The visit to Sicily and the burning of the ships are described in the fifth book, while the sixth deals with the landing of Aeneas at Cumae in Italy and his descent to the infernal regions, where he saw his father, Anchises, and had a vision of the future glories of his race and the greatness of Rome.

While the first six books are modeled upon the "Odyssey," the six last books partake of the spirit of the "Iliad." They contain an account of the struggles of Aeneas in Italy, his alliances with Latinus, king of Latium, and his projected marriage with Lavinia, daughter of Latinus. The last volume closes with the fall of Turnus, king of the Rutuli, by the hand of Aeneas, and the projected marriage is left uncompleted. Virgil asserts that the Julian family of Rome descended from Aeneas, and traces the connection between him and Augustus Caesar, in whose honor the poem was written.

**AEOLIAN HARP** (ë-õ'lí-an), a harp played by Aeolus—that is to say, by the wind. It consists of a wooden sound-box with strings of catgut stretched over it. When exposed to the action of the wind, it produces a succession of pleasing sounds, bold when the breeze is forceful, but plaintive when slight. The invention was made by Athanasius Kircher (1601-1680), a German Jesuit of the 17th century.

**AEROLITE** (ã'ër-õ-lít), one of a class of meteorites, shooting stars, or meteoric stones which fall from the sky and generally, but not always, reach the earth. They are usually sub-angular, with the angular points rounded off, and generally reach the ground in an incandescent state. They usually contain quantities of mallea-

ble iron, nickel, magnesia, sulphur, alumina, lime, carbon, and other substances. The constituents are always the same as substances found in the earth, but the combination differs widely in different aerolites. Their origin is the same as that of meteors. See **Meteor**.

**AËRONAUTICS** (ā-ēr-ō-naŭ'tiks), the science that treats of aërial navigation. It embraces the two departments of pneumatics known as aërostatics and aërodynamics and involves the subject of fluid-friction and the resistance of the fluid to the motion of a solid body passing through its mass. Balloons, flying machines, and all other forms of apparatus used in aërial navigation are studied under this branch of science, which is a subject of growing interest. See **Balloon, Flying Machine**.

**AËROSTATICS** (ā-ēr-ō-stāt'iks), the department of science which treats of gases at rest, that is to say, with their particles at equilibrium. Aërodynamics treats of the phenomena observed when the forces acting within or upon aëriiform fluids produce motion, while aërostatics is confined to the relations of forces acting in or upon such fluids when no motion results. Both these are departments of pneumatics.

**AËROSTATIC PRESS**, a machine used for extracting by atmospheric pressure the coloring matter of dyewood and other materials, such as leaves, insects, etc. The material from which the color is to be extracted is placed in a vessel between two horizontal partitions pierced with small holes. An air pump, by which the air can be withdrawn, is placed at the bottom and the liquid to form the extract is poured on the top. When the suction pump is operated, the liquid is forced by the pressure of the air from the top through the material, carrying with it in solution the liquid coloring matter.

**AESTHETICS** (ēs-thēt'iks), the science that treats of the beautiful and pleasing. The term owes its origin to various writers, but primarily to Alexander Gottlieb Baumgarten (1714-1762), who held that as truth is the end and perfection of knowledge, and good that of the will, so beauty should be the end of all sensuous knowledge. According to Herbert Spencer, the aesthetic feelings have this characteristic, that they are not connected with the functions requisite to sustain life, and, for this reason, do not gain enough power to act until the functions necessary to sustain life have the proper scope.

The ancient Greeks, a people productive of noble and artistic creations, supply us with the first speculations on the culture of the beautiful and the aim of fine arts. They are gath-

ered from poetry and paintings, and particularly from Plato's "Dialogues." However, Socrates was the first Greek scholar whose views on this subject are definitely known. From Xenophon's exposition of the views of Socrates we learn that the latter regarded the beautiful as coincident with the good, and both susceptible to conversion into the useful. It was thought that every beautiful object serves some rational end, whether the gratification or security of man. From the "Dialogues" it may be concluded that Plato held to the theory of an absolute beauty. He tells us in the "Symposium" how love produces inspiration toward the pure idea of beauty. To his mind the only beauty that deserves the name is absolute beauty; that absolute beauty is beautiful in every respect, and the foundation of all beauty. Many modern writers agree that a delight in sculpture, poetry, music, the drama, painting, and even fine mathematical demonstrations is a source for the aesthetic growth. Kant held the view that the beautiful is the harmony between the imagination and the understanding, and this view is supported by a number of modern philosophers. Richter, Schlegel, Ruskin, Lessing, Hegel, Helmholtz, and Schelling are among the best known writers to contribute scientific treatises on aesthetics.

**AETNA**. See **Etna**.

**AETOLIA** (ē-tō'lī-à), a division of ancient Greece, bounded on the west by the Acheloüs River, on the north by Thessaly and Epirus, and on the south by the Gulf of Corinth. Along the northern part extends the range of Mount Pindus. In the time of Pericles the Aetolians were warlike and barbarous, but they became famous during the Macedonian wars and for their bravery in resisting the invasion of their country by the Gauls. Aetolia and Acarnania were united and now constitute a monarchy of Greece. The area is 3,013 square miles.

**AFFIDAVIT** (ăf-fī-dā'vīt), a legal document affirmed or sworn to before some authorized officer. A document of this kind is made without cross-examination and is much used in making various motions in court. It is customary to procure and place on record an affidavit to prove or correct conveyances of personal and real property.

**AFFINITY** (ăf-fīn'ī-tỹ), in law, the marriage relationship contracted between the husband and his wife's kindred, and between the wife and her husband's kindred. Marriage is forbidden by law in some countries between persons who are related by affinity within the third degree, which is the case in Great Britain,

and this is considered in accordance with the Scriptural injunction.

**AFFINITY**, in chemistry, the force by which union takes place between two or more elements to form a chemical compound, and which constitutes the force that produces all chemical phenomena. Unlike attraction of gravity, it does not act upon masses, but between atoms, and only when the atoms are at insensible distances. It differs from cohesion in that it unites atoms of different substances, while cohesion unites the particles of similar substances. The compounds formed by affinity are new bodies, often bearing no likeness in appearance or other properties to the elements by which they were produced, as water results from the union of two gases, hydrogen and oxygen. The strength of chemical affinity differs between different substances. Gypsum is formed by a combination of sulphuric acid and lime, but, if potash be added, the sulphuric acid repels the lime and unites with the potash. Affinity is dependent upon circumstances, such as the presence of light and a change of temperature. An increase of temperature has the effect of diminishing affinity in some substances and promoting it in others, and, when highly heated, the constituents of some compounds are separated. Heat is evolved by a combination of two elements in forming a compound, the amount evolved being termed a measure of affinity.

**AFGHANISTAN** (ăf-găn-ĭs-tăn'), a country in the southwestern part of Asia. Its boundaries are formed by India, Turkestan, Persia, and Baluchistan; the last named separates it from the Arabian Sea. The area is estimated at 280,000 square miles, and the population at 5,125,000. Its four provinces are Kabul, Kandahar, Herat, and Turkistan, and it includes the Badakhshan district. Kabul, in the east-central part, is the capital. Other cities of note include Kandahar, Herat, and Ghuzni.

**PHYSICAL FEATURES.** The region is mostly a mountainous country, including lofty uninhabited tablelands, barren plains, and numerous productive valleys. In the northern part are lofty ranges of the Hindu Kush Mountains, of which Mount Hindu Koh is the culminating peak, its snow-covered summit towering about 22,300 feet above sea level. The northern part is drained by tributaries of the Amu or Oxus River, while the southern and central sections drain westward by the Helmund into Hamoon, a salt-water lake. Though the climate is of a continental nature, the differences in elevation and unequal distribution of rainfall render it various. In the desert oases thrives the date

palm; cotton is cultivated in the sheltered valleys, while the elevated regions are exposed to severe cold and heavy fall of snow.

**PRODUCTIONS.** The chief industries are agriculture and stock-raising. The soil fit for cultivation is generally fertile and yields wheat, corn, rice, millet, barley, vegetables, and fruit. Much of the farming depends upon irrigation, and the supply of water is drawn by means of short canals from rivers and mountain streams. It has manufactures of carpets, silk and woollen goods, and utensils used locally. A mint and ammunition factory are operated at Kabul. The country has many minerals, but there is little mining, and the methods of farming have been little improved in the past decade. Cattle, sheep, horses, goats, and the dromedary are the principal domestic animals.

**GOVERNMENT.** The government of Afghanistan is a monarchy, semi-feudal in form, and the chief ruler is known as the ameer, who is a hereditary prince and whose power is absolute. Habib Ullah, the present ruler, has given encouragement to the construction of canals for irrigation, and has fostered the building of highways, bridges, and fortifications. Railroad and telegraph construction were long excluded on the ground that it is opposed to public policy, and trade is still carried on largely by camels and ponies, though wheeled vehicles are employed where highways have been built. India and Russia have had most of the trade, and both countries operate railway lines to the boundary, Russia from Merv on the north and the English through British Baluchistan on the south. Foreign enterprise has resulted in the construction of railways to some of the chief commercial cities, and there has been a perceptible extension of export and import trade. Most of the industries, particularly manufacturing, are in the hands of Europeans.

**INHABITANTS.** The word *Afghan* is of Persian origin, and the people themselves apply the term *Vilayet*, which signifies the original land of ancestors. The inhabitants are divided into numerous clans, of which the Ghilzais are the most numerous and the bravest. In their hands is the political ascendancy, and they occupy the country between Herat and Kandahar. It is thought that the Tafiks are the aborigines. They speak a Persian dialect, are scattered over the whole country, and are a frugal, industrious class. The Hazaras are of Mongol type and occupy chiefly the mountains of the northwest. Afghans proper, who are allied in blood to the Persians, constitute the larger part of the inhabitants. In language they have retained the essential characteristics of the Iranic group of

the Indo-Persian, but the spoken tongue is mixed with various Oriental dialects, and is written in Persian characters. The literature does not date back farther than the 15th century, and as a whole partakes largely of Persian features. Mohammedanism of the Sunnite sect is the chief religion, and much of the literature is based on the Koran.

**HISTORY.** The history of Afghanistan is an account of a mass of mixed elements held loosely together in one government. Most Afghans claim direct descent from King Saul and profess to be Bani-Israel, and their features show Jewish connection. The name was first found in the history of Sultan Mahmud, of the 11th century, and it is known that Alexander the Great reached India by the Kabul River. They were in the present country in the 13th century, and for a century and a half under Mongol rule, but later were under the dominion of the Persians. While the Persian people were in a state of discord, they attained independent power, and after the death of Nadir Shah finally became liberated from the Persian dominion by the Abdalli leader, Amed Khan, in the 18th century.

Dost Mohammed became ameer in 1826, having defeated Shah Suiah, who escaped to India and carried on futile intrigues to regain his sovereignty. In 1838 Afghanistan was invaded by a British army. Dost Mohammed lost his throne as a result of the invasion, but regained it two or three years later and reigned until 1863, when he was succeeded by Shere Ali Khan. A second British invasion occurred in 1878, when the ameer fled to Turkestan and was succeeded by his son, Yakub Khan, who concluded a treaty with the British and later with the Russians. Abdurrahman (q. v.) was accepted as ameer by the Afghan chiefs in 1880 and ruled successfully until his death in 1901. He was succeeded by his eldest son, Habib Ullah, who inaugurated reform by increasing the efficiency of the army and improving the system of taxation. The country occupies a position of importance between the territory of Great Britain and Russia, hence its political fortunes are uncertain.

**AFRAGOLA** (ä-frâ-gō'là), a city in Italy, five miles southeast of Naples, with which it is connected by a railroad. It is noted for its manufactures of straw goods. Population, 1901, 22,419.

**AFRICA** (ăf'rī-ka), a grand division in the Eastern Hemisphere, the second in size of the grand divisions, being exceeded only by Asia. Its length from north to south is about 5,000 miles, and the greatest breadth across the

Sudan is about 4,500 miles. The area comprises 11,514,985 square miles, about three times the size of Europe, and there is a coast line of fully 15,000 miles. The shape is that of an irregular triangle, with the vertex to the south. It is separated from Europe by the Mediterranean Sea, and from Asia by the Red Sea and the Gulf of Aden, and the only connection with other grand divisions is with Asia by the Isthmus of Suez, through which the Suez Canal has been cut. The eastern shore is washed by the Indian Ocean, and the western by the Atlantic.

**OUTLINE AND ISLANDS.** Among the larger gulfs and bays are the gulfs of Sidra and Cades on the north; Suez, Aden, and Delagoa on the east; Algoa Bay on the south, and the Gulf of Guinea on the west. The more prominent capes include Bon and Blanco in the Mediterranean, Guardafui on the Atlantic, Cape of Good Hope and Agulhas on the southern extremity, and Capes Verde and Blanco on the western shore. The four capes of Guardafui, Agulhas, Verde, and Blanco (in the Mediterranean) are the extreme points of the grand division. Few important islands and groups of islands belong to Africa, the most important being Madagascar, which is separated from the continent by Mozambique Channel. Among the chief islands are the Cape Verde Islands, St. Helena, St. Thomas, the Canaries, Fernando Po, Madeira, Ascension, Mauritius, and Prince's Island.

**PHYSICAL FEATURES.** The surface of Africa is mostly elevated, but not lofty, only three mountain regions having their summits above the snow-line. The southeastern one-third of the grand division is an elevated plateau, sloping largely toward the northwest, with a central elevation extending from the equatorial lakes to the Strait of Gibraltar. It may be said that a generally elevated region extends from the vicinity of Mount Kilimanjaro to the Mediterranean shore in Algeria. On the seacoast, along both sides of the continent, are plains more or less clearly defined. The surface in the northwest of the northern elevation descends toward the Atlantic nearly to the sea level, while to the east of it are portions below the surface of the Mediterranean. From the Mediterranean Sea to the southern extremity of the continent, along the eastern coast, extends the predominating mountain system. It is most highly elevated near the center, on the plateaus of Kaffa and Abyssinia, and in the region extending between Lake Victoria Nyanza and the Indian Ocean. The highest points are the volcanic peaks of Kenia and Kilimanjaro, both situated east of Lake Victoria Nyanza, whose

RELIEF MAP OF AFRICA.

estimated heights are about 20,000 feet. The highlands extending southward from Kilimanjaro are known as the Drakensberg Mountains, which culminate in peaks 10,000 feet high, and extend southward to the Cape of Good Hope. The Abyssinian plateau has a general elevation of from 6,000 to 8,000 feet, the highest peaks being about 15,000 feet. In the south are the Snow Mountains, with peaks of over 10,000 feet; on the west the Mocambe and Crystal Mountains, extending from the south to the Gulf of Guinea, and north of these are the volcanic peaks of the Cameroons, with altitudes approximating 13,000 feet. Along the northern shore of the Gulf of Guinea extend the Kong Mountains, and in the extreme north of Africa are the Atlas Mountains.

**RIVERS AND LAKES.** Africa possesses some of the greatest rivers of the world, among them the Nile, 3,900 miles long, the Congo, 2,800 miles, and the Zambezi, Niger, Orange, Limpopo, Tana, Juba, and Senegal. The rivers have their sources largely in the equatorial regions, where moisture is abundant. There also are located the principal lakes, including Lakes Tchad, Victoria Nyanza, Nyassa, Albert Nyanza, Albert Edward, Bangwedo, Tanganyika, Tzana, and Leopold. The fertility of the lake region is equaled only by the equatorial regions of South America. In these regions of the two continents thrives the most luxuriant vegetation of the world. Both toward the north and south of the equatorial region of Africa the rainfall diminishes and vegetation gradually decreases, and dense forests give way to shrubs and grasses. To the north this region is known as the Sudan, while in the south is included the grass country of the Zambezi River. Beyond these north and south lie deserts; the great Sahara on the north, and the Kalahari on the south. The extensive Sahara Desert (q. v.) is not a total sandy waste, but has a great variety of surface, rocky and mountainous in some regions, and level and fairly fertile in others.

**PRODUCTIONS.** In the western part of Africa vegetation is extensive and quite varied, particularly along the northern shores of the Gulf of Guinea and in the region of the Gambia and Senegal rivers. The desert regions contain numerous fertile oases, where grows the date palm, a tree of vast value on account of its food product for the natives and their animals. In the equatorial region the banana is the chief product. A large variety of European agricultural products are cultivated on the shores of the Mediterranean, while ebony and fine cabinet woods abound in the forests. In the valley of

the Nile agriculture is the chief occupation, but the methods are very primitive as compared with those prevailing in Europe and America. The soil is not plowed as in the highly civilized countries, but the work is done with rude machinery or the seeds are scattered and then trampled into the soil by oxen, though in some regions newer methods and machinery have gone into use. Extensive dikes and ditches have been built in many parts of the Nile valley, and other improvements have been made by which the water of the river may be utilized in irrigating the land. Southern Egypt contains some of the largest irrigation reservoirs maintained in the world, thus making it possible to utilize for agriculture and stock-raising areas formerly arid and sterile. The productions of this region include rice, cotton, corn, wheat, sugar-cane, live stock, and semi-tropical fruits. In the southern part of Africa agriculture, mining, and manufacturing have been developed largely by European people, who are rapidly introducing the modern appliances in all avenues of industry and civilized art.

**MINERALS AND TRADE.** Africa is rich in all kinds of minerals, though its geology is not known sufficiently to form a reliable outline of the extent of its mineral wealth. Diamonds in the rough valued at about \$460,000,000 have been taken out of the fields in the vicinity of Kimberley since they were opened in 1868. Coal deposits abound in the region of the Zambezi River and other sections. Johannesburg is the center of the gold fields, where mines were opened in 1883, and the annual product is valued at nearly \$60,000,000. Iron, copper, lead, granite, and many excellent building stones are widely distributed. The ivory and rubber trade continues to be important, especially in the west central region lying along the Gulf of Guinea and inland from that section. Chief among the exports are ostrich feathers, gold, diamonds, wool, ivory, hides, and fruits. Machinery, textiles, farming utensils, and drugs are imported. The exports for 1908 are placed at \$378,650,000, and imports at \$410,584,000. Great Britain and Germany had the largest share of trade, but important trade relations are maintained with the United States, France, Holland, Portugal, and Italy.

**TRANSPORTATION.** Railroad building is an important factor in the development of African trade, there being 15,450 miles in operation, and several thousand miles are projected and have been surveyed. The greatest single railway line projected is to extend from Cape Town to Cairo, a distance of 6,600 miles. One-half of this line is completed, and the entire enterprise

is expected to be finished by the year 1912. From Cape Town to the region beyond the Zambezi, which is about 1,950 miles, has been completed, and there are numerous branches into fertile regions. The line from Cairo to Khartum, 1,300 miles, is in successful operation, and telegraph connection extends much farther to the interior. The government of Egypt has given material encouragement to railroad and telegraph building, which is also true of Great Britain, France, Germany, and other European countries having African colonies. The estimated cost of the Cape-to-Cairo railway is placed at \$120,000,000. It is to extend north from Bulawayo along the east shore of Lake Tanganyika, passing through German East Africa, thence it will extend through British East Africa and follow the course of the Blue Nile to Khartum. The navigation of the Nile, Niger, Congo, and other streams, and on the equatorial lakes, is an important factor in developing trade. Transportation has also been improved by the building of wharfs and the deepening of harbors.

**ANIMAL LIFE.** Among the animals peculiar to Africa are the cape buffalo, two-horned rhinoceros, zebra, gorilla, quagga, gnu, giraffe, hyena, deer, aard-wolf, and many species of monkeys. The camel thrives throughout the desert region; the elephant is found in the central portion; crocodiles and hippopotami are met with in nearly all the great rivers, and the lion is common to all parts not inhabited by Europeans. An abundance of fish is common to the rivers and lakes, while ostriches roam in flocks upon the plains. In the warmer parts of Africa, as in all tropical regions, many varieties of insect pests prevail. The locust has been a scourge in some parts from remote antiquity, while vegetable and animal life is preyed on more or less by the scorpion, zebub fly, many species of ants, and other insects. All the domestic animals common to Europe and America have been successfully introduced in the regions partly or wholly occupied by Europeans, and there are considerable interests in raising buffaloes, elephants, and ostriches.

**INHABITANTS.** In population Africa occupies third place among the grand divisions, being exceeded only by Asia and Europe. The most accurate estimates made in 1909 place the total population at 148,388,682. Most of the vast populations are still savages, and are not well known to the civilized world. The people in the northern region may be classed as Hamitic and Semitic, while in the central and southern sections the natives belong to the Hottentot and Negro races. The Bushmen, Kaffirs, Hottentots,

and Hereros are the more important peoples of the southwestern sections. In the interior the different tribes are frequently at war with each other, though their primitive method of warfare is not particularly destructive. The weapons of the natives consist largely of such implements as clubs and spears, with which

AFRICAN NATIVES

they have shown great valor in the hopeless battles against conquest by the Europeans. As to religion, the people of Africa are classed largely as pagans and Mohammedans, though the Christian religion is professed by descendants of Europeans and by the people of some portions of Abyssinia and Egypt, and an effective missionary work is in successful progress.

**SOCIAL CONDITIONS.** The social conditions of Africa are transitory, with a tendency somewhat favorable to betterment, though polygamy and slavery are still widespread. Human life is not safe in large tracts of territory on account of the government being tribal, life is more or less savage, there is an absence of central authority, and many of the people are fettered with terrors and superstition. While European occupation is gradually tending to better social conditions by employment and education, many remote sections are densely populated by savages who wage persistent war against European progress. However, the savage and semi-civilized conditions are crumbling rapidly before the advance of European enterprise, and every department of life and industry is undergoing changes for the higher and better.

**PARTITION.** The partition of Africa has been going on for several decades and spheres of influence have been fixed to include various sections, but boundary lines between the several districts have been definitely fixed by only a number, and the remaining boundaries are yet to be established by surveys. At this time the following may be regarded approximately correct African possessions under the control of European powers:

COUNTRY	POPULATION	SQUARE MILES
France .....	32,800,000	3,950,000
Great Britain.....	41,650,000	2,690,000
Germany .....	15,350,000	1,000,000
Portugal .....	9,050,000	798,000
Turkey .....	1,250,000	400,100
Italy.....	450,000	198,800
Spain.....	135,500	81,000

The independent states are Liberia, Morocco, and Abyssinia, the Orange Free State and the Transvaal having lost their independence in 1902. Egypt is nominally subject to Turkey, though really under British control, and Great Britain and Egypt exercise concurrent jurisdiction over Eastern Sudan. The British colonies include Cape Colony, Transvaal, Rhodesia, British East Africa, British Central Africa, Natal, Gambia, Lagos, Orange River Colony, Gold Coast, Mashonaland, Matabeleland, Sierra Leone, Nigeria, British Somaliland, Uganda, Walfisch Bay, Zululand, and Zanzibar.

France possesses the largest scope of territory in Africa and also has Madagascar. Its continental possessions are Algeria, Tunis, Dahomey, French Guinea, French Congo, French Sudan, Algerian Sahara, Ivory Coast, Senegal, Sahara, French Somaliland, Wadai, and Obock. The Colonial possessions of Germany are German East Africa, German Southwest Africa, Kamerun, and Togoland. The colonies of Portugal are Angola, Portuguese Guinea, and Portuguese East Africa. Italy has Eritrea and Italian Somaliland. Spanish Congo and Rio d'Oro are Spanish colonies. The colonies of Turkey are Barca and Tripoli.

**HISTORY.** The history of Africa dates back to remote antiquity, in fact Egypt and Abyssinia ranked as ancient in the period when Greece attained to its height of power. It is uncertain when its historical era begins, possibly as far back as 5,000 B. C. The Romans came in contact with people who occupied the section of Northern Africa extending from the Red Sea to the Atlantic. Carthage reached its zenith before the rise of the Roman Empire. Cambyses conquered Egypt in 525 B. C. and Alexander the Great made a successful conquest of that country in 321 B. C., but even subsequent to the latter conquest the Egyptians were patrons of the arts and sciences. In the time of Solomon, about 1000 B. C., the Queen of Sheba visited Palestine, and at that time Ethiopia, now Abyssinia, ranked as a country of antiquity. Central and Southern Africa were less known for the reason that the powerful nations bordering on the Mediterranean prevented the exploration of the interior. Christianity was introduced into Africa in the second century, when synods

were founded at Carthage and Alexandria. The Vandals invaded the northern section in the second century, at which time Ptolemy flourished in Alexandria. The maps of Ptolemy indicate that the Nile basin was quite well known in his time, and he gave a fairly accurate account of the mountains and some rivers in the west central part of the continent. At the time of the Crusades Northern Africa was occupied by the Mohammedans and became a battle ground between the Cross and the Crescent, though the interior was not entered by Europeans at that time. In the 15th century the Normans visited the Gold Coast and in 1413 built a fort at Elmina.

Modern exploration of Africa may be said to have commenced in the year 1415, when Prince Henry of Portugal invaded Northern Africa and defeated the Moors at Ceuta. This stimulated interest in the unknown continent and caused explorations to be made both along its coast and toward the interior. Bartholomew Diaz discovered and sailed around the Cape of Good Hope in 1485, and in 1497 Vasco Da Gama doubled the Cape and sailed to India.

The more recent exploration of Africa may be said to date from 1768, when James Bruce, a Scotchman and consul for Great Britain at Algiers, began an exploration of the valley of the Nile. Mungo Park, also a Scotchman, in 1795 explored the Niger country. David Livingstone began his famous tour northward from Cape Town in 1840 and devoted more than 30 years to the exploration of the continent as far north as Lake Tanganyika. The peaks of Kenia and Kilimanjaro were discovered by the German missionaries Krapf and Rebmann in 1847, and Heinrich Barth, a German explorer, in 1850-52, explored the country from Tripoli to Timbuktu, whence he proceeded to Lake Tchad, and returned by way of Tripoli to Europe. Henry M. Stanley circumnavigated lakes Tanganyika and Victoria Nyanza in 1873, and about the same time two German expeditions under Gerhard Rohlfs and Dr. Nachtigal explored the region from Morocco to the Gulf of Guinea and the principal mountains in the Sahara and Sudan. The Portuguese made extensive explorations of South Central Africa, from Saint Paul de Loanda to Mozambique. The map of Africa as it appears at the present time is a fair indication of the explorations by European countries, since the partition of the continent is based quite largely on the tours made by explorers, though there have been some changes or modifications of boundaries. The present line of activity is concerned with the development of territory held by European countries rather than

an extension of possessions, especially in the development of mining and agriculture and the construction of railroads.

**AFRICAN METHODIST CHURCH**, the Negro branch of the Methodist Episcopal Church, which was organized in 1816. At present this branch includes 5,000 ministers and a membership of 750,000. The African Methodist Episcopal Zion Church is a branch of the African Methodist Church.

**AFRIKANDER** (ăf-rĭ-kăn'dĕr), a term of Dutch origin, meaning a white man of Dutch descent born in Africa. The term is used to distinguish from the word *Uitlander*, which signifies a foreigner.

**AGAÑA** (ă-găn'yă), a city of the Ladrones, capital of Guam, located on the Agaña Bay. Through the city flows a shallow stream, which is crossed by several stone bridges. The streets are wide and clean. It is the seat of an arsenal, a college, and several fine schools and churches. Though the bay is obstructed by reefs, the city has considerable shipping trade. Since its acquisition by the United States, in 1898, it has been improved by modern facilities, such as telephones and electric lights. Population, 7,595.

**AGANIPPE** (ag-a-nĭp'pe), a fountain of Greece, near Mount Helicon, discharging into the river Permessus. From it the Muses derive their name Aganippides, and it is said that its waters give a poetic inspiration.

**AGARIC** (ăg'ă-rĭk), a fungus growth belonging to the genus *agaricus*, of which there are numerous species. True agarics have radiant gills, tinged with brown, pink, white, purple, or black. The common mushroom belongs to this class of plants and is cultivated extensively as a delicate article of food. Some species are popularly called toadstools and a few are dangerous poisons.

**AGASSIZ, Mount**, a volcanic peak in Arizona, located 70 miles northeast of Prescott. It is one of several extinct volcanoes of the San Francisco Mountains and towers 10,000 feet above the level of the sea. A peak of the same name in Utah has an elevation of 13,000 feet.

**AGATE** (ăg'ăt), the name applied to a stone of the quartz variety, in which the colors are in bands, in clouds, or in distinct groupings. The principal varieties are known as plasma, onyx, mocha, bloodstone, carnelian, and chalcedony. The chief constituents are forms of silica, and the colorings are due mostly to iron. When polished, agates assume a beautiful appearance, and are used in the manufacture of bracelets, seals, and brooches, and in mosaic work. They are found in various parts of the

United States, and in Brazil, India, Arabia, Scotland, and particularly at Oberstein, a small town near Mentz, Germany.

**AGAVE** (ă-gă'vă), a genus of plants popularly known as American aloes, native to Mexico and Central America, and now extensively naturalized in Eurasia and Northern Africa. There are various species, the best known being the so-called maguey of Mexico. Its chief uses are for feed, and ropes are made from the fiber of the leaves. The Mexicans extract its sap, which, when fermented, yields a beverage resembling cider, and is known as *pulque*.

AGAVE.

**AGE**, a period of time, used in a variety of senses, but usually to denote the whole or part of the duration of any particular being or thing. The term *age* is used in law to designate the period at which individuals become eligible to do what they are otherwise legally disqualified from doing for want of years or maturity of mind. In England and the United States both males and females attain legal age at twenty-one, though the latter become of age in most states of the latter country at eighteen years for some purposes, as contracting marriage, while males are eligible to election as representatives of the United States at twenty-five years and as senators at thirty years. The military age is from eighteen to forty-five. The stages of civilization are spoken of in history and mythology as five distinct ages; namely, the Golden Age, the Silver Age, the Bronze Age, the Heroic Age, and the Iron Age. The term *age* is also used in various expressions, as the Dark Ages, the Middle Ages. Geological ages include the Archaean Age, or the time which witnessed the dawn of life; the Palaeozoic Age, including the time during which animals and plants bore little resemblance to those now living; the Mesozoic Age, including the time during which the animals and plants began to resemble those now living; and the Cenozoic Age, including the time during which the animals and plants bore decided resemblance to those now living. These four ages are divided into still other periods or ages, as the Archaean into Azoic and Aeozoic Ages, the Palaeozoic into the Silurian, Devonian, and Carboniferous Ages, and the Cenozoic into the

Tertiary and Quaternary Ages; the Mesozoic comprises the age of reptiles. Shakespeare divided the life of man into seven ages, and men of science usually divide it into four or eight ages.

**AGEN** (ä-zhän'), a city in France, capital of the department of Lot-et-Garonne, 75 miles southeast of Bordeaux. It is noted as a market for prunes and has cotton, linen, and woolen manufactories. It has railroad connection with the principal cities of France. The surrounding country is fertile. A college, a public library of 20,000 volumes, and several fine bridges across the Garonne River are among the chief improvements. The city was known by the Romans as Aginnum. It has a cathedral which dates from the time of Clovis, and is the birth-place of Bory de St. Vincent. Population, 1901, 22,482.

**AGENT** (ā'jent), in law, a person employed to act for another, called the principal, in dealing with third persons. The term is not used by Blackstone and occurs rarely in the decisions and law dictionaries before the 19th century. The term *agent* differs in meaning from the word *servant* in that the latter is applied to one who renders personal services to his employer, while an agent is authorized to act for and represent another in business transactions. An agent may be special or general, the former limiting to special business, while a general agent has power to transact all of the business in which the principal is engaged as enumerated in the contract, either verbal or written, existing between the two parties. The form of contract under which an agent may be employed varies greatly, but in special cases where the agent is authorized to sign the name of the principal the contract must be in writing and acknowledged under seal of a notary public or a similar officer, and in such cases the authority conferred is called power of attorney.

The principal is bound by the act of an agent when under contract, or in case he has ratified the act in the absence of a contract, and is liable to the third party in the same way as if he had done the act himself. If an agent makes known the name of his principal no personal liability is incurred by the agent, but if an agent does not disclose the principal for whom he is acting, and it is not known by the third party that he is acting for someone else, the agent himself becomes liable. Both the principal and agent are liable to third persons in case the agent commits a civil offense, though ultimately the liability rests upon the agent, but his principal cannot be held for a violation of the criminal

code by the agent. If no contract as to remuneration exists between the two parties it is understood that the agent is to be compensated for his services, including all proper expenditures arising from the conduct of the business, but the relations and limitations are usually defined in the contract. In most countries an agent has a lien upon the property in his hands held for sale or in his possession for delivery to third parties, and it serves as security to the agent that the principal will carry out his part of the contract, and an agent is entitled to damages if the principal does not comply with the contract as specified. In like manner the agent becomes liable to the principal for failure to use reasonable diligence in carrying out the terms of the agreement.

**AGINCOURT** (ä-zhän-kōör'), a village in the department of Pas de Calais, France, famous for the victory of Henry V. of England over the French on Oct. 25, 1415, after a struggle of three hours' duration. The English army numbered about 15,000 and the French 50,000; the latter were commanded by Constable D'Albert. The former lost 1,600 slain and wounded, and the latter 10,000, including many officers.

**AGNOSTICISM** (äg-nōs'tī-siz'm), a word coined by Professor Huxley, which implies the mental attitude in regard to the Deity of those who professedly "do not know." This school teaches that, beyond what a man can know of God by his senses or feel by higher affections, nothing can be known. One who holds to this view is called an agnostic.

**AGNUS DEI** (äg'nūs dē'i), a title applied to Christ in John i, 29, and used as the fifth and last section of the Roman Catholic mass. The mass begins with the words "Agnus Dei, qui tollis peccata mundi," meaning "Lamb of God, who taketh away the sins of the world." Agnus Dei is the name of a cloth bearing an

AGOUTI.

image of a lamb and used in the Greek church to cover the cup in the communion service. Luther retained the singing of Agnus Dei in

his reformation of the church service. In a modified form it is still used in the Lutheran church.

**AGOUTI** (ä-gōō'tī), a small rodent mammal related to the porcupine and common to the West Indies and South America. The common agouti, about the size of a rabbit, is native to Brazil. This animal ravishes on sugar cane and vegetables, especially potatoes and yams, hence it has been killed in large numbers and the species is almost exterminated. The black agouti is common to the West Indies. There are nine species, some of which are hunted for their flesh, which is white and quite nutritious. (See illustration on page 27.)

**AGRA** (ä'grá), a city of India, situated 783 miles northwest of Calcutta, and 115 miles southeast of Delhi. In ancient times the city was surrounded by walls that embraced an area of about eleven square miles, but of this space only about one-half is occupied at present. The city is the seat of several noted mosques and the Taj Mahal, a mausoleum dating from the 17th century, built by Emperor Jehan for himself and his favorite wife. Agra is now a commercial market for cotton, salt, sugar, cereals, and various manufactured articles. There are excellent railroad conveniences, gas and electric lighting, rapid transit, several schools and hospitals, and a number of government buildings. It rose to importance in the 16th century, and from 1526 to 1658 was the capital of the Mogul sovereigns. Population, 1901, 188,310.

**AGRAM** (ä'grám), a city in Austria-Hungary, capital of Croatia and Slavonia, 165 miles southwest of Vienna. It is located near the Save River, at the foot of the Agram Mountains, and is important as a railroad and commercial center. The manufactures embrace linen and silk goods, leather, porcelain, and clothing, and it has a large trade in wine and grain. It is the seat of an archbishop, has a Gothic cathedral dating from the 15th century, and is the seat of the Franz Josef University. The city was founded by the Romans and was partially destroyed by the Tartars in 1242. Population, 1901, 57,930.

**AGRARIAN** (ä-grā'rī-an), the name of a political party in Germany, whose avowed principles relate to the ownership or tenure of land. The subject of legislation in regard to land tenure dates from ancient history. Agrarian laws in the ancient Roman Republic were advocated and adopted under C. Licinius Stolo in 367 B. C., who was then tribune of the people. These laws made a division of the lands and enabled the plebeians to come into possession

of titles as well as the patricians. The land to which these laws related was public property belonging to the state, and not private property, as is popularly supposed. However, they prescribed, under a penalty of heavy fines, that no one should possess more than 300 acres of the public domain.

**AGRICULTURAL EDUCATION**, the plan or system of instruction designed to disseminate knowledge of agriculture and render this department highly efficient and profitable. While instruction in the art of farming and animal husbandry dates from antiquity, the agricultural college is a product of the 19th century. Originally the plan was to provide institutions in which exclusive attention could be given to agricultural subjects, in which agriculture was designed to be the leading, if not the only branch of study, but more recently schools and colleges devoted to this subject of learning adopted a diversity of courses. Though a college may be said to belong to the class known as agricultural schools, it is now the general rule for the faculty to take up a vast diversity of subjects, though each student is required to pursue study in one or more subjects relating especially to agriculture, such as agricultural chemistry, live stock husbandry, forestry, bee-keeping, farm management, rural engineering, agricultural technology, etc. Instruction in agriculture has been encouraged by all civilized countries, even where such training has not been provided for in colleges that may be termed distinctly agricultural.

**GREAT BRITAIN.** The first college devoted to agriculture was established in England, near Cirencester, where a company headed by Prince Albert in 1845 founded the Royal Agricultural College. This institution still holds rank as one of the most important institutions of the kind in the world, and in attendance holds rank with the national school of agriculture at Berlin, Germany. The University of Cambridge founded a professorship of agriculture in 1899, and the government renders aid to education in agriculture by grants of money paid through the Department of Agriculture. Canada has a fine institution at Guelph, Ontario. A dairy school is maintained in New Brunswick, and there are secondary schools of agriculture in Quebec and Nova Scotia. Agriculture is taught as a branch in the normal and public schools in many sections of the Dominion. Australian institutions devoted to this branch of knowledge are numerous, including those at Richmond, New South Wales; at Gatton, Queensland; and at Dookie, Victoria.

**UNITED STATES.** The government of the

United States has expended large sums of money for the establishment of schools of agriculture and mechanic arts, in which farming is taught as a science. An agricultural college is now maintained in every State, and these are largely in connection with State universities. The general assemblies of many states have also made appropriations to encourage the organization of agricultural societies for the purpose of aiding in placing the industry upon a practical and scientific basis. A large number of periodicals devoted to the discussion of dairying, stock raising, horticulture, farm architecture, care and tillage of the soil, and other branches of the industry have come into general circulation and have had a molding influence. In 1862 Congress passed an act for the purpose of aiding in the establishment of colleges of agriculture. The act originally provided for the payment of \$15,000 to each State and Territory, which sum has been increased until it now amounts to \$25,000 annually. At present the attendance at these colleges aggregates 36,950 students.

**AGRICULTURAL EXPERIMENT STATION**, an institution devoted to the scientific and practical investigation for the benefit of agriculture and the dissemination of information relating to plants and animals. The purpose of governments promoting stations of this kind is to diffuse knowledge in regard to plants that are useful or injurious to certain localities, the plants and animals that thrive best under definitely known climatic conditions, and the art of cultivating plants and rearing animals. The principal stations in Canada are at the Agricultural College of Guelph, Ontario, and the Central Experimental Farm at Ottawa. The latter has branches in Manitoba, British Columbia, Nova Scotia, and in several places of the Northwest. The station at Rothamsted, England, is noted for having made valuable discoveries in the art of fertilizing and the nutrition of plants and animals. Germany and Russia each have more than one hundred stations, chiefly connected with universities. Austria has 47; Norway and Sweden, 45; Italy, 22; Belgium, 15; and Japan, 16.

The first station of this class in the United States was established in 1875 by Connecticut, at Wesleyan University, Middletown, under the direction of W. O. Atwater. About the same time E. W. Hilgard was placed in charge of a station at the University of California, Berkeley, Cal. At present there are fifty-seven stations in the United States, supported by the national government under the Hatch Act; the annual aid extended by the government

amounts to \$720,000, and State governments devote \$500,000 to their support. About 700 persons are employed in the administration of the stations, and 500 bulletins are distributed for general information. The stations and a large number of institutions at which agriculture is studied, such as agricultural and mechanical colleges, are bringing about a deeper interest and a more practical application of methods tending to render the business of farming more lucrative and rural life more genial. Education along agricultural lines is also promoted by farmers' institutes, by university extension work, by study of courses in common and secondary schools, by departments in general college courses, and by instruction in universities.

**AGRICULTURE** (ăg-rĭ-kŭl'tŭr), the science that treats of the cultivation of the soil, with the view of disseminating knowledge in the production of grasses, vegetables, and cereal crops. The process of human and economical and social development has been from a savage state to hunting and fishing; from these to a nomadic pastoral state; then to a rude form of agriculture, and finally to manufacturing and commerce. However, all the stages, except the first, are still represented in the more advanced countries. Agriculture as an industry has existed from a remote period of antiquity, and, by practical experience from time to time, has been materially bettered by improvements in the implements employed and a diversification of the crops. It is but recent that material success in the occupation of the farmer has been thought to result from education in the arts and sciences of farming. For

EGYPTIAN SCULPTURE—PLOWING AND SOWING.

this reason it may be truly said that agriculture is the oldest of the arts and the most recent of the sciences.

From sacred history we learn to know Egypt as a land so rich in corn that it produced an abundance for the sustenance of its own dense population, and that it yielded large quantities for exportation to distant countries. These statements of the Bible are verified by profane history. We learn from Diodorus Siculus that Egyptian farmers were acquainted with the benefits of a rotation of crops, and that they knew how to adapt plants and their cultivation to both soil and seasons. They transported annually to Rome about 20,000,000 bushels of

corn. The same author informs us that the Egyptians garnered hay for their cattle during the annual inundations, and at times confined the domestic animals to meadows and green clover. They were large producers of poultry, and, to facilitate the industry, practiced artificial hatching, not unlike incubating of modern times. Their flocks were shorn twice annually and their ewes yeaned twice a year.

PRIMITIVE METHOD OF CUTTING GRAIN.

From Egyptian decorations we obtain a fair insight into the state of agriculture among these remarkable people. They employed a superintendent to direct laborers, kept account of productions and expenditures, and showed much system in husbandry. Corn was ground by hand-mills or in structures propelled by oxen, seed was sown by hand from a basket, and the ground was cultivated both before and after scattering the seeds.

Babylonia, Egypt, Rome, and the Israelites were the great agricultural nations of antiquity. In Egypt the Israelites were trained for an agricultural life, which fitted them to take possession of Canaan, where virtually the whole population engaged in tilling the soil. They found Canaan occupied by a dense population fortified in cities. The Canaanites possessed great wealth and subsisted on the products of their highly cultivated soil, which gave forth cereals, supported large herds of cattle, and abounded with vineyards and oliveyards. The Israelites found sufficient corn in the land to sustain them from the time they crossed the Jordan. As the laws of Moses contained an agrarian clause which provided for an equal division of the soil among adult males, provisions were made to allot from sixteen to twenty-five acres of the land to each of the 601,730 able-bodied men among the Israelites.

The people of Greece were given to poetry, philosophy, history, and the fine arts, and their unrivaled literature affords us little information regarding the practical details of agriculture. This circumstance is accounted for at least partly by the fact that Greece possesses a surface quite unfavorable to agriculture. However, we find that in Boeotia the lakes and morasses

were drained, that mountain surfaces were covered with transported soil, and that the people possessed fine breeds of domestic animals. In ancient Rome agriculture was highly esteemed, and it was only at a later period that commerce, trades, and the arts were introduced. In recent centuries, beginning with the 18th, agriculture has been augmented scientifically, and farmers have become more skillful and enterprising. Perhaps this may be accounted for because of a gradual advance in the price of produce, which has been occasioned by the increase of population and wealth derived from manufactures and commerce. Besides, the labor of agriculture has been greatly lightened and its cost lessened by means of machines and improved implements. Railroads have brought the farm nearer to the factory; that is to say, transportation from one to the other has been cheapened and quickened. There has been a decided advantage in diversifying the products of the farm and in naturalizing plants and domestic animals to countries favorable to their production. The area of tillable surfaces has been greatly augmented by redeeming swamp lands by tile-draining and other improved methods of draining, as well as by rendering fit for cultivation large tracts in arid regions by means of irrigation. Thus, the field of agriculture has been enlarged on the one hand and the consumption of farm produce greatly extended on the other.

Agriculture in the United States and Canada has grown to be one of the great industries, and as a fundamental enterprise is no doubt more important than any other. The 12th census of the United States, published June 30, 1900, gives the value of all farming property at \$20,439,901,164. The following statistics published in this report give a clear idea of the growth and permanent development of agriculture in the United States:

Agriculture in the United States and Canada has grown to be one of the great industries, and as a fundamental enterprise is no doubt more important than any other. The 12th census of the United States, published June 30, 1900, gives the value of all farming property at \$20,439,901,164. The following statistics published in this report give a clear idea of the growth and permanent development of agriculture in the United States:

YEAR.	NUMBER OF FARMS.	NUMBER OF ACRES IN FARMS.	AVERAGE NO. OF ACRES PER FARM.	VALUE OF FARM PROPERTY.
1850 ...	1,449,073	293,560,614	202.6	\$ 3,967,343,580
1860 ...	2,044,077	407,212,538	199.2	7,980,493,063
1870 ...	2,659,985	407,735,041	153.3	11,124,958,747
1880 ...	4,008,907	536,081,835	133.7	12,180,501,538
1890 ...	4,564,641	623,218,619	136.5	16,082,267,689
1900 ...	5,737,372	838,591,774	146.2	20,439,901,164

It will be observed that there has been a marked increase in the number of farms the past fifty years, which is more than equaled by the increase in value of all farm property, but there is a tendency to decrease the number of acres per farm as the country becomes developed and farming of a higher order is established. It is found that in general farming large scopes

of land are worked by improved farm machinery, the owner or lessee taking advantage of cultivating large tracts of land by modern methods, but as communities develop and settlements become more dense there is a tendency toward a more careful husbandry, under which

NEW STYLE OF HARVESTING.

lands are tilled and fertilized and the production per acre is enhanced materially. The possibility of increasing the fertility of the soil is fully borne out by experience in every section where rotation of crops and improvement in fertilization are practiced. Colored farmers cultivate tracts of land about one-third as large as those operated by white farmers, though 13.4 per cent. belong to the former class and 86.6 per cent. to the latter class. The value of farm implements and machinery, in 1900, was \$761,261,550, of live stock \$3,078,050,041, and of buildings \$13,114,492,056.

**AGRICULTURE, United States Department of**, a branch of the government, organized by an act of Congress in 1862, and whose chief officer, the Secretary of Agriculture, is a member of the presidential Cabinet. David P. Holloway published the first report as commissioner of agriculture, and his recommendation for such a department caused it to be established, but the chief officer was not a member of the Cabinet until 1889. The free distribution of seeds was begun by the commissioner of patents in 1836, and the practice has been maintained since with the view of introducing plants useful to different sections, the kinds depending upon climate and locality. The department issues bulletins and reports from time to time, which, together with the "Year Book," are published to be distributed gratis.

The Department of Agriculture as at present organized is effective in gathering and distributing knowledge useful in the cultivation of soils, the rearing of live stock and the propagation of plants. Its divisions are numerous, making it a serviceable working force. The library contains about 75,000 volumes relating to agriculture and agricultural science. In connection with it is the division of publication relating to printing, illustrating, and distributing of

publications. The division of biological survey deals with the geographical distribution of animals; the division of entomology relates to the distribution and repression of injurious insects. Experiments and information regarding road-making are directed from the office of public road inquiry, while the division of forestry has charge of research relating to forest trees. Students of agricultural physics and the investigation of soils are under the direction of the bureau of soils; research and agricultural chemistry, especially fertilizers and food-producing plants, are directed by the bureau of chemistry; and the bureau of animal industry investigates dairying and imports and exports of animals, and conducts research on diseases of animals. Forecasting weather and research in climatology and meteorology are under the direction of the weather bureau. The bureau of plant industry has charge of the publication and distribution of seeds, largely through members of Congress, the investigation of fruits adapted to various soils and climate, plant-breeding, the distributing and utilizing of forage plants, and the testing and propagation of useful plants. See **United States, Departments of**.

**AGRIGENTUM** (ag-ri-gĕn'tum), a city on the southern coast of Sicily, founded by a Greek colony in 582 B. C., now called Girgenti. In ancient times it was a rival of Syracuse in commercial importance and military power. The Carthaginians destroyed it in 405 B. C., and at the time of the Punic Wars it was occupied by the Romans. The Saracens had possession of it from 825 to 1086 A. D. It has ruins of ancient walls and several buildings of the Greek period, including the temple of Zeus. Though once a city of 200,000 people, its present population is only 22,500.

**AGRIMONY** (ăg'rĭ-mō-nĭ), the common name of a genus of plants belonging to the rose family, native to Great Britain and found in the southern section of the United States. The flowers are small and yellow and grow in a large cluster at the ends of the stems, and the whole plant has a bitter taste and slightly aromatic smell. The leaves are pinnate and are dried for a kind of herb tea, while the roots are used as a vermifuge.

**AGUE** (ă'gŭ), an intermittent fever accompanied by paroxysms, which occur at regular intervals. It is caused by effluvia from the surface of the earth, and is confined to warm, damp climates. Ague does not prevail within the polar circles, nor in arid and elevated regions. The malady is rather more troublesome than dangerous. Quinine, calomel, and cinchona bark are preventives. Ague contracted

in London caused the death of James I. and Oliver Cromwell.

**AGULHAS** (ä-gōōl'yās), **Cape**, the most southern point of Africa, situated about ninety-eight miles east of the Cape of Good Hope. Its highest elevation is 455 feet above sea level. In 1849 a lighthouse fifty-two feet above high water was built on its shore.

**AID-DE-CAMP** (ād'de-kän), a superior confidential attendant upon a general in active service, whose duty is to receive orders and communicate them to others. He exercises this function while battles are in progress, and at other times acts as secretary and confidential agent.

**AINO** (ī'nō), or **Ainu**, the name of an aboriginal people of Japan, found chiefly in Yezo, Saghalien, and the Kurile Islands. Though classed as uncivilized or barbarian, they are of a mild and amiable disposition. In stature they are short, averaging about five feet in height, but are active and strong. Hunting and fishing are their chief occupations. The complexion is dark brown or black. They are in general very hairy, the men wearing long beards. It is thought they were driven north by the advance of the Japanese, but more recently they have learned from their superiors, and many have been converted to the Protestant religion. It is estimated that the total number of Ainos does not exceed 15,000.

**AINTAB** (īn-tāb'), a city of Asiatic Turkey, in northern Syria, 60 miles north of Aleppo. It is important as a military post and is the seat of a Protestant missionary station for work among the Armenians. Being located on the route from Aleppo to Armenia, it has an important trade, especially in cotton and leather. The inhabitants are chiefly Armenians and Greek Christians. Population, 44,500.

**AIR**, the gaseous substance, composed of oxygen and nitrogen, which surrounds the earth. It is elastic, and is destitute of taste, color, and smell. Pure air is a mechanical mixture, containing by weight 23.10 parts of oxygen and 76.90 nitrogen, and by volume 20.90 of oxygen and 79.10 of nitrogen. To these must be added a nearly constant quantity of carbonic acid, usually about five or six parts to every 10,000 parts of air, and a very variable portion of watery vapor. Owing to a property of the gases called *diffusion*, these gaseous ingredients, though of different densities, are found in the same relative proportions at all heights. The oxygen and carbonic acid are the most important of the gases. Oxygen is necessary to the existence of animal life, since it supports combustion and respiration; carbonic acid is necessary to the existence of plant life, as it is composed of

carbon and oxygen, and is the source from which vegetation derives its woody fiber. In inspiration animals take in oxygen and give out carbonic acid; in sunlight plants take in carbonic acid and give out oxygen. This serves to maintain the relative proportion of substances necessary to the existence of animal and plant life.

Air is elastic; that is, it may be compressed so a given quantity may occupy a smaller volume than it does in nature, and, when the pressure is removed, it again assumes its original volume. It expands when heated and contracts when cooled. The oxygen of air is more soluble in water than nitrogen, and the air dissolved in water contains about one-tenth more oxygen than atmospheric air. The animals whose life is sustained by breathing in water, such as fish and polyps, and plants that thrive in water, take in oxygen less diluted with nitrogen, but more with water. The air in cities is less pure than in the country districts, since it is polluted by the breathing of large populations, and there are fewer plants to supply oxygen. In illy-drained districts, where miasma arises to pollute the air and gases from sewers and other impurities tend to poison it, the public health is endangered. A large number of persons breathing without sufficient ventilation soon poison the air by consuming the supply of oxygen and replacing it with carbonic acid gas. Thus, the ventilation of public buildings becomes a subject for considerate study, since health and public comfort depend largely upon the existence of pure air in sufficient quantities. See **Atmosphere**.

**AIR BRAKE**, a brake operated by condensed air, and used extensively on railway and street railway cars. The first patent on the air brake was issued in 1869 to George Westinghouse, an American engineer, but since that time it has been greatly improved. The first invention was what is known as the straight air brake, and in 1873 the automatic air brake was invented, which has an auxiliary reservoir and a triple valve as well as a train pipe and brake cylinder, thereby causing resistance to the several cars of a train instead of only to the forward cars, as was the case in the straight air brake. In 1897 a high-speed brake was placed on the market, which is used on passenger trains of very high speed. It uses very high air pressure when the train is at full speed, and by an automatic reducing valve the pressure is gradually reduced as the speed of the train diminishes. There are several forms of the air brake, being designed for light and heavy cars, and for cars used on steam railway, cable, and

electric railway lines. Labor organizations have been potent factors in securing the adoption of the air brake, and at this time it is very extensively used in Canada and the United States and to a less extent in other countries.

**AIR CELLS**, in physiology, the cells existing in the lungs, where they surround the lobular passages. They are very small, rarely exceeding one-hundredth of an inch in diameter. In birds they penetrate the quills and bones, thus facilitating flight through the air.—**Air engine**, a machine in which heated air is the propelling force, that is, air takes the place of steam in a steam engine. Air engines have an advantage over steam engines in that air can be raised with safety to a higher temperature than steam, and they have been found of much utility in mining and tunneling.—**Air shaft**, an opening from the surface of the earth to some portion of the galleries of a mine, constructed for the purpose of ventilation. Air shafts should be in two parts or at least have two longitudinal passages, the one for the ascending vitiated air, and the other for the descending pure air. Circulation can be induced by a fan, or by heat from a furnace.—**Air stove**, or furnace, a device used to generate hot air, which is then transmitted by means of an opening to the different apartments of a building.—**Air thermometer**, an instrument used in measuring the degree of heat by means of the expansion of air. Such an instrument can be utilized only to measure the lower temperatures, and agrees with the mercurial thermometer up to  $260^{\circ}$ , but above that point mercury expands more than air. It was invented by Santorio, a physician of Padua, Italy, in 1590.

**AIR COMPRESSOR**, a machine or air pump for compressing air by forcing it into a closed vessel. In the common bicycle pump, which is a simple form of an air compressor, there is a valve at the bottom of the cylinder opening outward, and in the piston is a valve opening downward. The cylinder is filled with air when the piston is raised, and the piston valve is closed with a downward stroke of the piston, hence the cylinder valve is forced open and the air escapes into the vessel. The air brake pump, with which nearly all locomotives are equipped, is a simple form of power air compressors. A  $9\frac{1}{2}$ -inch air brake pump consumes one pound of steam at 140 pounds pressure and yields 1.85 cubic feet of air at 90 pounds pressure, while a 2-stage Corliss air compressor with the same steam consumption yields 13.7 cubic feet of air at 90 pounds pressure. It will be seen that in the air brake pump economy of steam consumption is not

considered important, since the main consideration is to secure a machine light in weight, small in dimensions, and absolutely reliable in action. The principle on which air compressors act is the same in all machines, but the propelling force may be steam, electricity, or water power.

Otto von Guericke of Magdeburg, Germany, invented the air pump in 1650. William Cubitt, in 1851, invented the first modern air compressor and used it successfully in tunnel construction and for bridge work. In his machine and most others compressed air is drawn as needed from a reservoir, the machine storing it for use as required. In mining and tunneling very powerful compressors are employed, some exerting a pressure of 3,000 pounds to the square inch, and the highest known pressure obtained in laboratory experiments is 60,000 pounds to the square inch. Among other uses, air compressors are employed as rock drills, hoisting engines, polishing machines, sand blast apparatus, pumps, molding machines, air brakes on railroad and street cars, stone cutting apparatus, coal cutters, machinery in mines and tunnels, etc.

**AIR ENGINE**. See *Air*; *Air Cells*.

**AIR GUN**, an instrument for the projection of balls by the elastic force of compressed air, usually in the form of an ordinary gun. It contains a metallic globe furnished with a small hole and a valve opening into it, which contains a condensing syringe. By means of this apparatus the condensation is brought to a point of intensity. The globe is then detached from the syringe and fastened at the breech of the gun, which is of such construction that the valve may be opened by means of a trigger. A ball is then inserted, and, by pulling the trigger, is thrown with considerable force by the elasticity of the condensed air.

**AIR PLANT**, or *Epiphyte*, a plant attached to another plant and which derives its nourishment chiefly from the air. Plants belonging to this class receive no parasitic nutrition from the plants to which they are attached and the attachment is wholly mechanical. Orchids and ferns have many epiphytic forms, and in the tropics many tree trunks and evergreen forests abound with lichens and other forms of air plants. They are not numerous in the temperate and cold regions for the reason that they cannot endure drought or a low temperature, and in these sections are restricted to lower forms of plant life, such as mosses, liverworts, lichens, and algae. Nearly 300 species of air plants are common to Java, and numerous species abound in the tropical forests of America, Asia, and Africa.

**AIR PUMP**, an instrument invented by Otto

von Guericke (1602-1686), a German physician, in 1650. It is used to remove air or other gases from an inclosed space, or for compressing air within an inclosed space. Many improvements have been made on the air pump, but, since an actual vacuum can never result from the action of a pump, the machines now in use can do no more than reduce air to a high state of rarefaction. An air pump with a single cylinder is used to fill the pneumatic tire of a bicycle, while the machines used for general purposes contain two cylinders. The ordinary

AIR PUMP.

air pump contains a receiver of glass (R), which rests on a horizontal plate of strong glass (p), ground perfectly smooth. Under the receiver is an opening that has connection with the upright cylinder (C), and in the cylinder is a piston fitted sufficiently close to be air-tight. The piston is worked by a pinion, while in the cylinder is a valve (v) so constructed that when the piston is raised it communicates with the receiver, and the communication is shut off as the piston falls. As the machine is put in operation the air from the receiver fills the cylinder, and the longer the operations continue the more rarefied the air in the receiver becomes. By applying considerable force the air in the receiver can be almost wholly withdrawn. The air pump is used in preparing globes for electric lighting, in low pressure engines, for condensing milk and refining sugar, and in connection with many other processes in manufacturing.

**AIR SHIP.** See **Flying Machine.**

**AIX-LA-CHAPELLE** (āks-lā-shā-pěl'), or **Aachen**, an important city of Germany, in Rhenish Prussia, about forty miles west of Cologne. The city is the capital of an administrative district of the same name, and is the focus of an important network of railways connecting Germany, Holland, and Belgium. It is well and substantially built, has numerous schools, hospitals, and churches, and its appearance is that of a modern city aglow with life and activity, rather than that of an

ancient institution. There are gas and electric lights, stone and macadam pavements, rapid transit, sewerage, and many fine parks and monuments. It contains the magnificent coronation hall of the German emperors, whose length is 162 feet and width sixty feet, and there is a splendid fountain with the statue of Charlemagne, erected in 1620. The city enjoys a good trade with continental countries, and exports large quantities of manufactures to America. The chief articles of manufacture include shawls, silks, woolen goods, glass, pins, needles, machinery, tobacco, leather, and chemicals. Charlemagne made it the second city of his empire, and the seat of government of his dominions north of the Alps. It is generally assumed that this military leader was born here, while it is certain that he died in the city, and his tomb is in the beautiful cathedral. Aix-la-Chapelle was the place of coronation of the emperors of Germany from 813 to 1531, during which time it became one of the most important free cities, although it was twice ravished by the Normans, in 851 and in 882. The removal of the coronations to Frankfurt caused it to lose its leading position, and its prosperity was greatly injured by a destructive fire in 1666. At the time of the Revolution it was made a part of France, but in 1815 was ceded to Prussia. Population, 1905, 144,095.

**AIX-LA-CHAPELLE, Congress of**, the congress held in 1818 at Aix-la-Chapelle to regulate the affairs of Europe after the War of 1815. In this meeting were represented Austria, Prussia, England, Russia, and France, known as the five great powers of Europe, and the protocol agreed upon announced a policy known as the Holy Alliance. France was evacuated by the foreign forces as a result of this congress. Those in attendance included the King of Prussia, the Emperor of Austria, the Czar of Russia, Wellington, Metternich, Richelieu, and Castlereagh.

**AIX-LA-CHAPELLE, Treaty of**, the name given to two treaties concluded at Aix-la-Chapelle. The first, between England, Sweden, and Holland, known as the Triple Alliance, and Louis XIV., concluded May 2, 1668, settled the question of the possession of the Spanish Netherlands. After the death of Philip IV., Louis XIV. seized several forts and claim to that portion of the Netherlands which had been under the dominion of Philip. Holland, as a means of protection, concluded the Triple Alliance and France was forced to surrender possession except to the fortresses of Lille and Charlerois, while Spain retained

Franche Comté. The second, regarding the War of the Austrian Succession, was concluded in 1748. The treaty gave Maria Theresa possession of the throne of Austria. All the great powers of Europe had been involved in the war, but the treaty permitted the several states to retain possession of their territory nearly the same as before, though Silesia and Glatz were given to Prussia and Spain received Parma, Guastalla, and Piacenza.

**AJACCIO** (à-yät'chö), the capital of Corsica. It is important as a seaport and has a safe and commodious harbor. The surrounding country is fertile. Anchovy and pearl fisheries furnish the chief employment. The city has a good trade in wine and olive oil. It is the birthplace of Napoleon, and has a cathedral dating from 1585. Population, 20,197.

**AKABAH** (ä'kä-bä), **Gulf of**, an inlet at the north end of the Red Sea, extending into Arabia Petraea. It is from 12 to 17 miles wide and extends about 100 miles to the northeast. Golden Port, 29 miles east of Mount Sinai, is the only good harbor.

**AKHMIM** (äk-mēm'). See **Achmim**.

**AKRON** (äk'ron), a city of Ohio, county seat of Summit County, thirty-six miles south of Cleveland. It is situated on the highest elevation between the Ohio River and Lake Erie, about 500 feet above the latter, and has communication by the Pennsylvania, the Erie, the Baltimore and Ohio, and other railways. Among the public utilities are electric lights and street railways, waterworks, pavements, several libraries, and a fine system of public schools. The city is noted as a manufacturing center, employing about 8,500 persons, and the annual product aggregating about \$15,500,000. Among the chief manufactures are machinery, ironware, pottery, boilers, sewer pipes, books and stationery, rubber goods, cigars, and farming implements. It is the seat of Buchtel College, a Universalist institution of higher learning. In its vicinity are numerous lakes and hotels, hence it is popular as a summer resort. Population, 1900, 42,728; in 1910, 69,067.

**ALABAMA** (äl-ä-bä'mä), a southern State of the United States, bounded on the north by Tennessee, east by Georgia, south by Florida and the Gulf of Mexico, and west by Mississippi. Its greatest length from north to south is 334 miles, width, 154 miles, and area, 52,250 square miles, which is the exact area of North Carolina. It is popularly called the Cotton State.

**DESCRIPTION.** Ranges of the Alleghany Mountains stretch into the northern portion from Georgia and Tennessee, but do not attain

to great elevations. These highlands include the Raccoon Mountains, sometimes called the Sand Mountains, which extend well across the northern part of the State, and the Lookout Mountains, which terminate about sixty miles south of the border. The mountains are generally flat-topped and have an altitude of not more than 1,600 feet, while the coastal plain has a general elevation of 600 feet. The Cumberland Plateau is a low range of hills in the southwestern part. Much of the drainage is toward the south into the Gulf of Mexico, but the northern slope belongs to the Ohio River basin.

The Tallapoosa and Coosa rivers unite about ten miles above the city of Montgomery to form the Alabama, the chief river of the State, which is joined by the Tombigbee about forty-five miles above Mobile. From the junction to Mobile Bay the combined rivers are known as the Mobile River. The Chattahoochee forms part of the eastern boundary, and the Tennessee flows through the northern part of the State. Other rivers include the Choc-tawhatchee and Black Warrior. The latter is a tributary of the Tombigbee, and is navigable to Tuscaloosa, while the Tombigbee is navigable to Columbus, and the Mobile to Wetumpka.

The climate is pleasant and varies with the altitude and latitude. Breezes from the Gulf tend to render the southern portion both healthful and enjoyable, but some of the river valleys and lower portions of the state are unhealthy, and show a tendency to malaria and fevers. The State is well watered with good springs and water veins, and in many portions are artesian wells. In the winter the thermometer seldom falls below 32°, while the summers are generally pleasant. The prevailing winds are from the south and southwest. Snow falls rarely in the south, but in the northern part it falls quite frequently in January and February.

**NATURAL RESOURCES.** The northern and northeastern section are rich in mineral deposits, including coal, clay, iron, aluminum, and quarry products, particularly sandstone and limestone. Salt is obtained in the southwestern

ALABAMA.

1, Montgomery; 2, Birmingham; 3, Anniston; 4, Mobile. Chief railways are shown by dotted lines.

part, and the State has more or less profitable deposits of asbestos, asphalt, marble, and copper. The mining of coal and iron has been developed extensively, and Alabama in the production of iron ore ranks next to Minnesota and Michigan. The greatest development in iron ore mining has been made in the Birmingham region. In the output of bituminous coal the State takes fifth rank. Extensive forests abound, yielding excellent material for building and manufacturing. The forest trees embrace oak, hickory, pine, cedar, elm, and chestnut, and in the southern part are fine forests of cypress, magnolia, and yellow pine.

**AGRICULTURE.** Farming is the chief industry. The soil, except in the region of mountains, is fertile and well adapted to fruit raising and the culture of many varieties of cereal plants. The annual production of cotton is about 1,300,000 bales, cotton being the most important crop. Tobacco is grown profitably. Other products embrace corn, rice, sugar cane, cowpeas, potatoes, oats, wheat, and hay. Stock raising as an industry has not grown extensively the past ten years, owing to the fact that cotton is the predominant crop, though there has been a marked growth in rearing horses and swine. Interest in the rearing of sheep, cattle, and mules has not been extended materially, though the state has large interests in these classes of animals. More than one-third of the cattle are milch cows. The title in land is chiefly in large landowners, and most of the farming is done in small tracts by Negroes.

**MANUFACTURES.** Manufacturing is an important enterprise, owing largely to the fact that the State has much available timber and productive iron and coal mines. The construction of cars and machinery takes rank as a leading manufacturing enterprise, though it is exceeded in the value of the output by the manufacture of timber products, cotton goods, and iron and steel. Phosphates obtained from Florida are used in making fertilizers from cotton-seed meal. Other manufactures embrace boots and shoes, turpentine, flour, wagons and carriages, and farming implements. The output of coke has increased rapidly the past five years, owing to the large production of coking coal. Few states have enjoyed an equal growth in the total manufactures produced annually.

**TRANSPORTATION AND COMMERCE.** Although the State has only one good harbor on the Gulf, at Mobile, it has extensive transportation facilities by the Alabama, Tombigbee, Mobile, and Tennessee rivers. Iron products are transported in large quantities to Mobile as a result

of improving the water course of the Black Warrior River. In 1908 the State had 4,320 miles of railroads in operation, which provide transportation facilities in nearly all parts of the state, though some counties are still without steam railways. A considerable mileage of electric lines is operated, chiefly in the cities and more densely populated regions. Mobile has the larger part of foreign trade, but large quantities of products are transported through the ports of New Orleans, La., and Pensacola, Fla. Cotton, lumber, coal, pig iron, machinery, live stock, and fertilizers are the principal exports.

**GOVERNMENT.** The present condition was adopted in 1901. It vests the executive authority in the governor, lieutenant governor, attorney general, secretary of State, auditor, treasurer, commissioner of agriculture and industries, and superintendent of education, each elected for terms of four years. Legislative authority is vested in the General Assembly, which consists of a Senate and a House of Representatives, the former being limited to a maximum of not more than thirty-five and the latter to not more than 105 members. While members of the General Assembly may be reelected from time to time, none of the executive State officers is eligible for reelection. Judicial authority is vested in a system of courts, consisting of the supreme court, circuit courts, chancery and probate courts, and justices of the peace. Local government is administered by the counties, municipalities, and townships. In order to be eligible to vote, the citizen must have resided within the State two years, in the county one year, and in the precinct three months, and must be able to read and write in the English language.

**EDUCATION.** Educationally, Alabama is making rapid strides of advancement, both in its system of common schools and its numerous institutions of higher learning. There are four normal schools, located, respectively, at Marion, Tuskegee, Huntsville, and Florence, and normal instruction is given in several other institutions. Tuscaloosa is the seat of the University of Alabama; Mobile, of the State Medical College; Auburn, of the Agricultural and Mechanical College; and Greensboro, of the Southern University. Tuskegee is the seat of the Industrial Institute (colored), which is under the administration of Booker T. Washington. There is an insane asylum at Tuscaloosa, a blind asylum at Mobile, and an institution for the deaf, dumb, and blind at Talladega. The State has made ample provision for other classes demanding State care. It has many excellent public and private libraries, and numerous pri-

vate commercial and denominational institutions of learning. All the leading religious denominations are well represented by growing societies, though the Baptist denomination is the most numerously represented. The educational forces as a whole are represented in about fifty high schools, seventy private secondary schools, nine colleges and universities, and many scientific and educational associations.

**INHABITANTS.** A large proportion of the population is rural, and only about ten per cent. of the people reside in cities of 4,000 population and over. Montgomery, on the Alabama River, is the capital, and ranks as one of the largest cities in the State. Mobile is the only seaport and is important for its large export trade in lumber, coal, and cotton. Birmingham is noted for the extensive manufacture of iron and steel products. Other cities include Anniston, Bessemer, Florence, Huntsville, Opelika, Selma, Talladega, and Tuscaloosa. In 1900 the State had a population of 1,828,697. This included a Negro population of 827,307. Population, 1910, 2,138,093.

**HISTORY.** The history of Alabama begins with 1541, when De Soto made his famous exploring expedition to the Mississippi. In 1702 the first permanent settlement was established by the French on the Mobile River, and in 1712 the city of Mobile was founded. The region occupied by the State was originally a part of the Territory of Georgia, though the southern portion was the subject of dispute with Spain. Georgia ceded all its western lands to the Federal government in 1802, and what is now Alabama became a part of the Territory of Mississippi. Alabama was organized as a Territory in 1817, and so named from an Indian word meaning "Here we rest." It was admitted as a State in December, 1819, and since then has enjoyed rapid growth and development. In 1861 it seceded from the Union, but the act of secession was revoked in 1865, and a new constitution was adopted in 1868. The constitution adopted in 1901 requires a higher standard for voting, hence the right of suffrage is restricted largely to the white citizens.

**ALABAMA,** an important river of the State of Alabama, formed by the junction of the Tallapoosa and Coosa rivers, about ten miles above the city of Montgomery. It then flows about 300 miles toward the southeast until uniting with the Tombigbee forty-five miles above Mobile, where it assumes the name of Mobile. These rivers drain the northern part of the states of Mississippi, Georgia, and Alabama, and flow into Mobile Bay, an inlet from the Gulf of Mexico.

**ALABAMA, The,** a British vessel built at Birkenhead, England, by Laird & Sons, and used as a privateer to promote the interest of the Confederate States. She was provided with stores, coal, and guns at Terceira, one of the Azores, and on Aug. 24, 1862, was placed under command of Raphael Semmes, a native of Maryland, and manned chiefly by British subjects. Though she had no acknowledged flag or recognized nationality, she roamed the seas plundering and destroying vessels belonging to the Federal States and Union merchantmen. For more than two years she sailed upon the seas, captured 65 vessels, and destroyed property valued at \$4,000,000. Her policy was to avoid contact with American armed vessels, but in the summer of 1864 she finally encountered the Kearsarge off Cherbourg, France. On June 19 an encounter took place outside the harbor of Cherbourg, about seven miles from the Cherbourg breakwater, and after a fight of an hour the Alabama was sunk. Three men on board the Kearsarge were wounded, while the Alabama had nine men killed and twenty-one wounded. Captain Semmes was taken on board by an English yacht, the Deerhound, and escaped.

**ALABAMA, University of,** an institution of higher learning organized at Tuscaloosa, Ala., in 1831. At the time of the Civil War it was in a prosperous condition, but was burned by a force of Federals. It was rebuilt in 1868. It is coeducational, has 50 professors and instructors, and is attended by about 500 students. The endowment fund is \$300,000, which is about equal to the value of the buildings, and the annual income is \$42,000. The medical department is located at Mobile. A library of 25,000 volumes and a good working laboratory are maintained.

**ALABAMA CLAIMS,** the name applied to the claims of the United States government against Great Britain, which were settled after extended negotiations at Geneva, Switzerland, and are sometimes termed the Geneva Award. These claims were made on account of damage done by certain vessels, particularly the Alabama, which were equipped and manned from British ports at the time of the Civil War. A decision was reached by the commissioners on Sept. 14, 1871, to the effect that Great Britain was liable for equipping the Alabama and the Florida, two vessels that wrought serious devastation to the property of the United States and to property of certain citizens. The purport of the decision was that the general principles governing such cases are as follows: "Due diligence should be exercised by neutral govern-

ments in exact proportion to the risks to which either one of the belligerents may be exposed by failure to fulfill the obligations of neutrality on their part. The government of Great Britain cannot justify itself for its failure in due diligence on the plea of the insufficiency of legal means of action which it possessed." In making the decision the commission did not allow any claims by the United States for national losses, and the award was entirely restricted to compensate the American citizens for damages sustained by them. The award amounted to the sum of \$15,500,000 in gold. Sir Alexander Cockburn, one of the British representatives on the commission, was the only commissioner to cast a dissenting vote.

**ALABASTER** (äl-ä-bäs'tēr), the name applied to a very fine variety of gypsum, or hydrated sulphate of lime. The harder variety is used in the manufacture of statuettes, clock frames, and other ornamental commodities, while the softer serves in the manufacture of an inferior cement, known in the markets as plaster of Paris. Deposits of white granular gypsum are found in various portions of the United States, which occurs in pure and sound blocks, and from which the merchantable article is manufactured. However, the largest quarries are in Tuscany, Italy, where a fine grade is obtained. There are also deposits in Egypt and various regions of Asia.

**ALADDIN** (ä-läd'in), the hero of a tale of the "Arabian Nights' Entertainments." He is represented as the possessor of a remarkable ring and lamp, which, on being rubbed, would cause two genii to appear, whose office it was to do the bidding of the possessor of the ring and lamp.

**ALAMEDA** (ä-lä-mä'dä), a city of California, in Alameda county, about eight miles east of San Francisco, on the Southern Pacific railroad. It has extensive electric railway and steamboat facilities, and enjoys a considerable commercial trade. The chief industries embrace shipbuilding, refining of petroleum, and manufactures of machinery, earthenware, clothing, and utensils. Gas and electric lights, pavements, and sanitary sewerage are among the improvements. The city has excellent public schools and a number of substantial church buildings. It was incorporated in 1854. Population, 1900, 16,464; in 1910, 23,383.

**ALAMO** (ä'lä-mo), a fort near San Antonio, Texas, and frequently mentioned as the "Thermopylae of America." It is noted on account of the heroic bravery with which about 150 Texans resisted an attack of 2,500 Mexicans under Gen. Santa Anna from Feb. 11 to March

5, 1836. In the engagement 1,600 Mexicans and all but six of the Texans were killed. However, the latter were cruelly butchered after they had surrendered to the Mexicans. "Re-

THE ALAMO.

member the Alamo" became a popular war cry in the struggle for the independence of Texas from Mexico.

**ALAND** (ö'län), an archipelago of about 300 islands at the entrance of the Gulf of Bothnia and forming a possession of Russia. About eighty of these islands are inhabited, the balance being rocky and uninhabitable. Formerly they belonged to Sweden, and near them a decisive victory was won by Peter the Great over the Swedes in 1717. They were ceded to Russia in 1809. The population, consisting mostly of fishermen of Swedish descent, aggregates about 19,150. The islands have a total area of 468 square miles.

**ALASKA** (ä-läs'ka), a Territory of the United States, forming the northwest portion of North America, and comprising an area of 590,884 square miles. It is about twelve times as large as New York, and comprises a scope of country greater than the combined areas of France, Germany, Bulgaria, and the British Isles. The northern boundary is formed by the Arctic Ocean, eastern by the Dominion of Canada, southern by the Pacific Ocean, and western by the Bering Sea and Strait. About one-third lies within the Arctic Circle. From north to south it has a width of 800 miles, and from southeast to northwest the distance across the mainland is 1,150 miles.

**PHYSICAL FEATURES.** The territory is very mountainous, though it includes much level and gently undulating surface. Chains of the Rocky Mountains and the Alaskan Mountains, a coast range, embrace the chief elevated sections. Mount McKinley, 20,464 feet in alti-

tude, 100 miles north of Cook's Inlet, is the highest peak in North America. Its climate is extremely cold, almost unfit for habitation, and large portions are covered by snow, while the earth in the northern part is frozen the entire year. The Yukon River, which has been explored by steamer for 1,400 miles, is the most important water course, and has an estimated length of 2,000 miles. Besides the Yukon, the principal rivers include the Copper, Kuskokwim, Colville and Tanana, the last mentioned being an important tributary of the Yukon. The coast line of Alaska is placed at 7,875 miles, and is more or less indented by extensive inlets, particularly on the southern and western shores. Among the chief inlets are Kotzebue, Norton, Bristol, Cook, and Yakutat sounds or bays. Numerous glaciers discharge into the Pacific and Bering Sea, among them Muir Glacier, which is estimated the largest in the world. The discharges into the sea average a thickness of about 500 feet, and the river of ice has a length of 150 miles and a breadth varying from one to ten miles.

**MINERAL RESOURCES.** Lignite coal deposits occur on the Yukon, near Cape Lisbourne, at the head of Prince William Sound, and on the Aleutian Islands. The quality is not of a high grade, but it is used to a considerable extent for domestic purposes and for steam-making. Copper in paying quantities is found on Prince of Wales Island and in the Copper River country, and there are deposits of petroleum, silver ore, sulphur, and building stones. Gold is the chief source of wealth in Alaska, and is secured chiefly in the Yukon district, where valuable deposits were discovered in 1897. The following year large companies of people from the United States and other countries visited Alaska in the interest of the mining industry. The richest gold-producing region is situated at Dawson in the Klondike region, just east of the eastern line of Alaska, in British America, but rich discoveries have since been made farther west and at Cape Nome. While Cape Nome may be reached by water navigation, it has been quite difficult to make trips to the Klondike region. Expeditions to the latter region are usually made by way of Sitka and Skagway, and

thence through the mountain region toward the north, but it is possible to pass up the Yukon. The yield of gold in Alaska is placed at from \$7,000,000 to \$12,000,000 annually, the output varying greatly with climatic conditions.

**TRANSPORTATION.** The transportation facilities of Alaska depend largely upon navigation, and numerous excellent harbors are accessible the entire year as far north as Juneau and Sitka. River traffic on the Yukon is closed a greater part of the year, which is the case with many of the coast inlets, as they become filled with pack-ice in the winter, such as Cook's Inlet. Public stages and dog sledges are used in carrying passengers and the mails in some sections. A railway line extends from Skagway to Whitehorse Rapids, and several other railway routes have been projected, and work is being done to push them inland. The Alaskan Central railway, when completed, will furnish

ALASKA.

1, Sitka; 2, Juneau; 3, Skagway; 4, Dawson; 5, Circle City; 6, Nome; 7, Sunrise City; 8, Chitka; 9, Igagik.

transportation from Skagway to Nome, the line running through the Copper River valley to Tanana, thence to its terminus on the sea. An improved highway passes from Port Valdez to the Copper River. A telegraph cable extends from Saint Michaels to Nome, and telegraph lines are in operation between Saint Michaels, Nulato, and Eagle City.

**FISHERIES.** Edible fish abound in the rivers and coast waters. However, salmon fishing is the most important, and in value the output closely approaches the production of gold. The chief salmon fisheries are off the shore of

Kodiak Island, Kuskokwim Bay, and near the mouth of the Yukon River. An abundance of herring, cod, smelt, whitefish, and halibut are known to exist, though the fisheries have not been developed to their full productive ability. Formerly the fur-seal was abundant on most islands in Bering Sea and on both coasts of Bering Strait, but these fisheries are now restricted to the Pribilof or Seal Islands. Whaling continues to attract attention, especially the white whale and the great Arctic whale, and considerable fossil elephant ivory is collected by the Eskimos.

**AGRICULTURE.** In the coast district the soil is especially fertile, but the possibility of development in agriculture is limited by climatic conditions. Rye and barley can be grown quite successfully south of a line drawn from Eagle City to Saint Michaels, and there has been considerable development some distance south in the cultivation of oats and wheat. Vegetables, such as potatoes, turnips, rutabagas, beets, and carrots, thrive in the Yukon Valley and as far north as Dawson. Grasses of a highly nutritious quality grow luxuriantly, and stock is reared with considerable success, especially cattle, which are grown both for milk and meat. Foxes are bred for their furs, dogs and reindeer are reared and used for transportation, and in some sections ponies and horses are grown. The fur trade is important, and those engaged in it during the winter give attention in the short summer to the production of vegetables and other crops necessary as provision.

**EDUCATION AND GOVERNMENT.** Alaska was made a civil district by an act of Congress in 1900, but it still remains an unorganized Territory, has no legislative body, and is governed by laws passed by the Congress of the United States. The governor, judges, surveyor general, attorneys, and other officers are appointed by the President of the United States. Three judicial districts have been organized with courts at Juneau, Eagle City, and Saint Michaels. The bureau of education of the United States supports a system of public schools in the Territory, and the incorporated towns may appropriate for educational purposes one-half of the money collected from license fees. A number of industrial schools are maintained, and several mission schools are promoted under the direction of Protestant and Roman and Greek Catholic supervision. The first college in Alaska was established as a coeducational institution in Skagway in 1899 with an attendance of 50 students.

**INHABITANTS.** Three races of native inhabitants are found in Alaska. The Alutes occupy

the Aleutian Islands, the Eskimos are chiefly in the country north of the Yukon, and the Athabaskan Indians are the principal inhabitants of the valley of the Yukon and the region as far south and west as Cook's Inlet. A race nearly extinct, the Thlinkets, formerly occupied the section lying between Yakutat Bay and Puget Sound. Sitka, on Baranof Island, is the oldest town and was the capital of the Territory until 1906, when the seat of government was removed to Juneau, a thriving city of 3,000 people at the entrance of Taku Inlet. Eagle City, on the Yukon, and Skagway, the seaport of the White Pass Railway, are commercial centers. Nome, on Norton Sound, had a population of 12,486 in 1900, and its estimated population in 1908 was 25,500. Other towns include Circle City, Sunrise City, Chilka, and Igagik. In 1916 the Territory had a population of 64,356, as compared with 63,592 in 1900. With the latter were included 3,116 Chinese and 29,536 Indians.

**HISTORY.** Vitus Bering, a Danish navigator, in 1740, while in the Russian service, explored the peninsula and islands of Alaska. Captain Cook in 1778 visited the coast of Alaska, and explorations were made about the same time by the Spaniards and a company of Russians. In 1784 the first settlement was made on Kodiak Island and named Three Saints. The Russian-American Fur Company was chartered in 1799 to promote the furring trade but after futile efforts to establish a profitable business its members became dissatisfied and gave up the project. The Western Union Telegraph Company explored certain sections in 1864-67 with the view of connecting America with Europe by telegraph at Bering Strait, though the successful laying of the Atlantic Cable caused the project to be abandoned. The United States purchased Alaska of Russia in 1867 at a monetary consideration of \$7,200,000, and in the same year a military force at Sitka took formal possession.

Two international controversies, one relating to the control of the sea fisheries and the other to the boundary between Canada and Alaska, were made the subjects of negotiation between Great Britain and United States. In regard to the former the United States claimed that Russia and the United States had exclusive control of Bering Sea, but when this was referred to a commission it was decided that the claim was not well founded, but the commission recommended the restriction of the killing of seals in order to save the industry. The controversy as to the boundary was settled in October, 1903, when a commission of three representatives of the United States

and three of Great Britain decided that the boundary should follow the coast and be fixed ten marine leagues inland from the coast of the mainland. The decision divided the gold fields about equally between the two countries, but the United States secured exclusive control of the Pacific Coast.

**ALATAU** (ä-lä-tou'), a range of lofty mountains in Asia, forming the boundary between Mongolia and Turkestan. The Alatau mountain range is located at the northern limit of the vast tableland of Central Asia. The formations are largely granitic and the elevations approximate 15,000 feet.

**ALBA LONGA** (äl'ba löngä), a city of Latium, in Italy, situated near Lake Alban, about 16 miles southeast of Rome. According to tradition, it was founded by Ascanius, son of Aeneas. Tullus Hostilius, third king of Rome, destroyed it, and its inhabitants removed to Rome. At the time of its prosperity it was the most powerful city of Latium.

**ALBANIA** (äl-bä'ně-ä), the name applied to an extensive region in the southwestern part of Turkey in Europe, lying along the coast of the Adriatic and Ionian seas and the Strait of Otranto. It is about 300 miles long, and has a width ranging from fifty to eighty-five miles. The area is about 21,500 square miles. Though this region has been under Turkish dominion since the 15th century, it still retains some degree of independence. The surface is largely mountainous, embracing ancient Epirus, Illyris Graeca, and parts of Dalmatia. Most of the inhabitants consist of Albanian mountaineers, but there are also a considerable number of Turks and Greeks. Agriculture, fruit-growing, stock raising, manufacturing, and commerce are the chief industries, though there are also productive fisheries and some mining. A majority of the people are Mohammedans, but a considerable number of them belong to the Greek and Roman Catholic churches. The Albanians have made numerous efforts to throw off Turkish dominion, including the revolt under Ali Pasha in 1807 and the insurrection of 1908. Population, 1,500,000.

**ALBANY** (äl'bä-nÿ), a city of New York, county seat of Albany county, and capital of the State. It is finely situated on the Hudson River, 145 miles north of New York City, and is the focus of a large number of railroads, including the New York Central, the West Shore, and the Delaware and Hudson lines. It has additional transportation facilities by steamboats on the Hudson River, by numerous electric interurban lines, and by the Erie Canal, the latter connecting the city with Lake Erie. Near the

river is a narrow plain, but the ground rises gradually toward the west, hence the location is both convenient and healthful. State Street runs westward from the river, forming a fine thoroughfare, and the principal streets running parallel to the river are North and South Pearl

STATE CAPITOL, ALBANY.

and Broadway streets. The city has 150 miles of street more or less improved, and about 90 miles are paved substantially with stone, asphalt, and macadam. Washington Park, in the western part of the city, is the largest public resort. It contains a fine lake and Calverley's bronze statue of Robert Burns. Rural Cemetery, about four miles north of the city, is the burial place of President Arthur.

The architecture of Albany is substantial, and the buildings are constructed chiefly of brick and stone. The capitol building, constructed of granite in the Renaissance style, is one of the finest and most costly structures of its kind in America. It is 390 feet long by 290 feet wide, situated on an elevated plat of ground in the heart of the city, and was erected at a cost of \$23,500,000. Other notable buildings include the city hall, the customhouse, the Cathedral of the Immaculate Conception, the Albany Academy, the Union Station, the First Dutch Reformed Church, the post office, the Masonic Temple, and the State armory. Albany has a well-organized system of public schools and many charitable and educational institutions. It is the seat of a State normal school, of Dudley Observatory, and of the law and medical departments of Union University at Schenectady. The State library of 435,000 volumes is located in the capitol building, and several school institutional libraries are maintained within the city.

Albany is important as a manufacturing center and has a large trade in cereals, mer-

chandise, and live stock. The leading manufactures include ironware, clothing, tobacco and cigars, boots and shoes, machinery, spirituous liquors, books and stationery, and farming implements. It maintains adequate police and fire departments, has extensive systems of waterworks and gas and electric lighting, and has modern means of conducting its sewage and storm drainage. As a wholesaling and jobbing center it takes high rank, having a large trade with points in the New England states and Canada.

The city is the second oldest permanent settlement founded within the thirteen colonies. Verrazano, the French navigator, visited the region as early as 1524, and a trading post was planted soon after on the present site of Albany by the French. In 1614 it was known as Fort Nassau, but the name was changed to Fort Orange in 1624, when the first real settlement of colonists was made. When New Netherlands was transferred to the English, in 1664, the name was changed to Albany in honor of the Duke of York and Albany, who afterward became James II. The Albany Convention was held here in 1754, at which plans for uniting the colonies were discussed, and it became the seat of the State government in 1797. Its rapid growth began in 1825, when the Erie Canal was opened, and its larger commercial and manufacturing period began with the construction of railroads. Population, 1905, 98,370; in 1910, 100,253.

**ALBANY**, a city of Oregon, county seat of Linn County, 60 miles southwest of Portland. It is located on the Willamette River, which supplies good water power, and has transportation facilities by the Southern Pacific and other railroads. The river is crossed by a fine steel bridge. It has manufactures of furniture and farm machinery, flouring mills, brickyards, and a public high school. Electric lights and waterworks are among the public utilities. The first settlement on the town site was made in 1850, and it was incorporated in 1864. Population, 1900, 3,149.

**ALBANY**, or **Albion**, an ancient name for Scotland and sometimes applied to the whole of Britain, but later used to designate only the Scottish highlands. It is thought to be of Celtic origin. In 1398 a Scottish council at Scone conferred the title of Duke of Albany upon the brother of King Robert III. Subsequently the title was conferred upon a number of princes of the British royal family, though it soon became extinct. In 1881 it was restored and conferred upon Prince Leopold (1853-84), the youngest son of Queen Victoria.

**ALBATROSS** (ăl'ba-trōs), an aquatic bird allied to the petrels and gulls. It is the largest of the web-footed birds, weighing about twenty pounds, and its wings measuring from tip to

ALBATROSS.

tip twelve to seventeen feet. The beak is large and unusually straight and strong, and the upper mandible is characterized by sutures and a hooked point. These birds are frequently seen a great distance from land. They are most numerous in the South Seas, particularly near the Cape of Good Hope, but frequent the Arctic region as far as the extreme northern part of Bering Strait. A single albatross is often seen in the act of following ships several days in succession, though, more commonly, several fly within sight of each other, and appear to glide through the air rather than fly like other birds. When food is abundant, they gorge themselves like the vultures and then sit motionless on the water. The eggs are about four inches long, and are favored as articles of food. Natives of the Kurile Islands and Kamchatka blow up the entrails to make floats for their fish nets, and their wing bones are used for tobacco pipes and various domestic purposes. Sailors regard the albatross with superstitious affection, a fact made use of in Coleridge's "Rime of the Ancient Mariner."

**ALBAY** (ăl-bī'), the name of a bay, volcano, city, and province in the southwestern part of Luzon, an island of the Philippines. The bay is a fine landing place, and the surrounding mountains make it an important strategic point. Albay, the mountain, is an active volcano. The city of Albay is regularly platted, carries a considerable trade, and has a population of 14,360. The province has a population of 296,850.

**ALBEMARLE SOUND** (ăl'be-măr1), an inlet from the Atlantic Ocean, extending into the eastern part of North Carolina. Its length is sixty miles, the breadth is from four to fifteen miles, and it has a number of small coastal indentations. The Roanoke and the Chowan rivers flow into it, and it is connected by an artificial channel with Chesapeake Bay. An island separates it from the ocean.

**ALBERTA** (ăl-běrt'ă), a province of the

Dominion of Canada, bounded on the north by Mackenzie, east by Saskatchewan, south by the

ALBERTA.

1, Edmonton; 2, Calgary; 3, Banff.

Chief railways are shown by dotted lines.

United States, and west by British Columbia. Its length from north to south is 720 miles, the southern boundary is 175 miles, and the northern boundary, which reaches the parallel of  $60^\circ$ , is 220 miles in length. Its area is 254,559 square miles, being somewhat larger than Saskatchewan. The water surface is about 20,000 square miles.

**SURFACE.** The surface is mainly a great plain, with open prairie in the southern portion, extensive forests in the northern section, and elevated ranges of the Rocky Mountains in the western part. The drainage of the southern part is toward the southeast, and the streams of the northern portion flow into Great Slave Lake, from which the water flows through the Mackenzie River into the Arctic Ocean. In elevation above sea level the surface varies considerably, Fort Smith, on the northern border, being the lowest elevation, 680 feet above the sea, while the prairie steppe at the eastern side of the province is nearly 3,000 feet, and the highest peaks of the Rocky Mountains approximate 14,000 feet. The highest range of the Rocky Mountains in this section trends northwest and southeast, forming the southwestern boundary between Alberta and British Columbia. In the northern part are the Buffalo Head Hills, the Clear Hills, and the Cariboo Mountains, whose summits rise from 600 to 1,000 feet higher than the surrounding plain.

**RIVERS AND LAKES.** Alberta has four distinct drainage basins, one in the northern and three in the southern section. The Mackenzie basin is in the northern part and occupies two-thirds of the province. The most important streams of this system are the Peace and Athabaska Rivers, which merge and form the Slave River near the western end of Lake Athabaska, though the last mentioned is really the Mackenzie, being known as the Slave River between Lake Athabaska and Great Slave Lake and as the Mackenzie from Great Slave Lake to the

ocean. Both the Peace and Athabaska rivers are navigable, the former from the mountains to the lake, except below Fort Vermilion, where navigation is obstructed by Vermilion Falls. The Athabaska River rises in the mountains within Alberta, and is important as a highway for the trade carried between points in Alberta and the posts along the Slave and Mackenzie rivers. In the southeastern part the drainage is by the Saskatchewan River and its tributaries. The North Saskatchewan is important for navigation, and carries considerable trade from Edmonton to the country lying toward the east. Besides the Saskatchewan basin, the southern part of Alberta has sections lying in the basins of the Churchill and Missouri rivers. Lake Athabaska, partly in Alberta and partly in Saskatchewan, is the largest and most important body of water. Other lakes of considerable extent are Hay Lake, Lake Claire, Lesser Slave Lake, Whitefish Lake, Lac la Biche, Beaver Lake, and Sullivan Lake.

**CLIMATE.** The winters are dry and cold and the summers are warm. The average temperature at Fort Chipewyan, on Lake Athabaska, in July, is about  $61^\circ$ , and a temperature of  $90^\circ$  has been recorded at that place. Though extremely cold in the winter, a dry atmosphere makes the severity less oppressive, and in the southern part the warm Chinook winds sweep across the country from the mountains and influence the temperature favorably. In the northern part rainfall is abundant for the germination and growth of all crops adapted to the country, but in the southern part it is more or less deficient and agriculture is extended by means of irrigation, water being drawn from numerous mountain streams and rivers.

**INDUSTRIES.** Agriculture, stock raising, mining, lumbering, and commerce are the chief industries. Wheat is a staple product, especially in the section lying east of Calgary and between the Bow River and the Red Deer River, where irrigation canals designed to supply water to irrigate fully three million acres have been constructed. The beet sugar industry has received marked attention, especially in the vicinity of Raymond, near the international border. Stock raising is one of the chief business enterprises, large areas being devoted to ranching and dairying. Progress in lumbering has been slow on account of a lack of transportation facilities, but the improvement of several rivers as highways and extensive building of railroads are causing a great impetus in developing immense wealth from timber resources. Coal deposits are extensive below the

parallel of 56°, the veins in the southern section being bituminous, but in the mountains occur anthracite deposits of considerable extent. Salt and petroleum exist in the valley of the Athabaska River, and gold is worked east of Edmonton, on the Saskatchewan River. Oats, barley, flax, vegetables, and small fruits are profitable crops and considerable attention is given to the rearing of sheep, swine, horses, and poultry. Wild animals, such as antelope, geese, grouse, and partridges, are common. Deer and moose are met with in the northern section. The streams and lakes abound with edible fish.

**GOVERNMENT.** The chief executive power is vested in a Lieutenant Governor, appointed for five years by the Governor General of the Dominion. Four members constitute the executive council, each of which is at the head of a department, known as minister of education and provincial treasurer, attorney general, minister of public works, and minister of agriculture and provincial secretary. The legislative assembly has 25 members, chosen by popular vote. Support is given to public education through land grants and by taxation, and ample provision has been made for the training of teachers and improvement of facilities to promote collegiate and higher instruction. The towns and counties have charge of local administration, and common pleas and higher courts have jurisdiction of judicial affairs.

**EDUCATION.** Notwithstanding the recent establishment of the Province of Alberta, its educational facilities are remarkably well developed. The organization of elementary public schools follows close upon the advance of settlement, and such schools are maintained by a revenue derived from a moderate self-imposed tax and supplemented by very liberal legislative grants. The programme of studies for these schools is so formulated as to give the pupils whose education ends therein an equipment for life as practical and complete as possible. Secondary schools, where students may prepare for the professions or obtain a liberal general education, exist as an outgrowth of the elementary school system and are similarly maintained. The higher courses of these schools permit of specializing to a moderate degree. The regulations provide for uniformity in the system of inspection of schools and licensing of teachers. A number of private colleges of considerable importance have been established in the larger centers. The Provincial Normal School for the training of teachers is located at Calgary. The building is a magnificent one and is equipped in every department with modern appliances. The University

of Alberta, situated in Strathcona, received its first classes in the autumn of 1908. The courses already provided are those leading to the degrees of B. A. or B. Sc.

**INHABITANTS.** The inhabitants are largely Canadians who have come from the provinces farther east in the Dominion, but since 1905 there has been considerable immigration from European countries and the United States. Encouragement was given by the government through the enactment of homestead laws in the Dominion, and by extensive building of railroads. The trunk line of the Canadian Pacific passes through the southern section, with branches from Dunmore Junction and Macleod to Calgary and Edmonton, while a line of the Canadian Northern passes east and west through Edmonton. Other lines have been projected and are in course of construction. Edmonton, on the north bank of the Saskatchewan, is the provincial capital, and Calgary, at the confluence of the Bow and Elbow Rivers, is noted as a commercial center. In 1906 the former had a population of 11,163 and the latter 11,967, but since then both have grown materially in population and commerce. Strathcona, on the south bank of the Saskatchewan, has 3,500, and Medicine Hat, on the South Saskatchewan River, is an important business center. The census of 1906 credited Alberta with a population of 184,000. In 1908 the inhabitants were estimated at 275,000.

**HISTORY.** The territory now included in Alberta was long a part of the portion of the Dominion known as the Northwest Territories. In 1882 the district of Alberta was established for administrative purposes. Then autonomy in local affairs was not granted and the area was 106,400 square miles. The province of Alberta was organized in 1905, when the boundaries were extended by annexing to it parts of the districts of Athabaska, Saskatchewan, and Assiniboia. George Hedley Vicars Bulyea was appointed the first lieutenant governor, who, assisted by efficient deputy heads and executive councilors, rendered efficient services as administrator of public affairs.

**ALBERT EDWARD NYANZA** (-nĭ-än'-zä), an important lake of Africa, about fifty miles southwest of Lake Albert Nyanza, with which it is connected by the Semliki River. It was first discovered by Baker in 1862, and was visited by Stanley in 1876, who also visited the region while on his famous expedition to relieve Emin Pasha. Lake Albert Edward Nyanza is somewhat smaller than Lake Albert Nyanza, and its elevation above sea level is somewhat greater. Stanley named it in honor of the

Prince of Wales, now Edward VII. In its vicinity are excellent forests, and it abounds in fish, crocodiles, hippopotami, and many aquatic birds.

**ALBERT LEA** (lē), a city of Minnesota, county seat of Freeborn county, 108 miles south of Minneapolis. It is located on a small lake of the same name, and on the Minneapolis and Saint Louis, the Chicago, Milwaukee and Saint Paul, and other railroads. The surrounding country is a fertile farming and dairying region. It has manufactures of flour, machinery, lumber products, and earthenware. The city has several fine county buildings, excellent schools, and good municipal improvements. It is the seat of Albert Lea College, a Presbyterian institution for women. Population, 1905, 5,657.

**ALBERT MEMORIAL**, a monument erected in Hyde Park, London, to the memory of Prince Albert, husband of Queen Victoria. It was built from plans of George Gilbert Scott, who was knighted for his skill in designing the memorial. Four marble sculptures representing engineering, commerce, manufacture, and agriculture are at the four corners of the base, and in the center is a splendid statue of the prince. A Gothic spire, surmounted by a cross, crowns the canopy above the hall in the interior, which is elegantly ornamented with mosaics and has a height of 175 feet.

**ALBERT NYANZA** (nī-ān'zà), a lake in East Central Africa, one of the headwaters of the Nile. It is 22 miles wide and 100 miles long. Sir Samuel Baker first explored the lake in 1864, and estimated its surface 2,720 feet above sea level. It receives the White Nile from Victoria Nyanza, and its overflow is carried toward the north into the Mediterranean Sea. It is noted for its excellent fisheries. Extensive forests abound in the surrounding country, and its vicinity is infested with crocodiles and hippopotami.

**ALBIGENSES** (äl-bī-jěn'sēz), a religious sect organized in the 12th century, and which was formerly well represented in France. It differed in doctrine and practice from the Roman Catholic Church, by which it was severely persecuted, and was somewhat similar in origin and doctrine to the Paterins of Italy, the Catharists of Germany, and the Bulgarians of France, but was not identical with any one of them. This sect seems to have originated from the Paulicians, a branch of the Greek Catholic Church, which sprang into existence in the 6th century. In 1209 a severe war broke out between them and their allies on one side and the Catholics on the other. After many

thousands had perished on both sides, a peace was concluded in 1229. By the end of the 13th century this sect had totally disappeared.

**ALBINO** (äl-bī'nō), the name applied to a person whose skin and hair are perfectly white, a remarkable peculiarity of the physical constitution of some individuals. While albinism occurs in all parts of the world and in all races, it is most marked in Indians and Negroes. The skin has a pale, unhealthy white color, and the iris of the eye is pink or red. While the vision of albinos is better in the dark than that of others, they are unable to bear a strong light. The peculiarity of albinism is always born with the individual. It is not confined to the human race, but has been observed in rabbits, rats, mice, fishes, and birds, especially in those whose color is commonly black.

**ALBION** (äl'bī-ŭn), a city of Michigan, in Calhoun County, 20 miles west of Jackson. It has municipal waterworks and a public library, and is important as a railroad center, being on the Michigan Central and the Lake Shore and Michigan Southern railroads. Albion College is located here. Flouring mills, plowworks, and machine shops are its chief manufactories. The first settlement at Albion was made in 1830, and its charter dates from 1896. Population, 1910, 5,833.

**ALBION**, a town in New York, county seat of Orleans County, 30 miles west of Rochester. It has transportation facilities by the Erie Canal and the New York Central and Hudson River Railroad. Farming and quarrying are leading industries in the vicinity. It has several public institutions, including the Western House of Refuge for Women and a modern county courthouse. Population, 1900, 4,447; 1910, 5,016.

**ALBUMEN** (äl-bū'měn), an organic compound found both in animals and plants. It abounds in the blood and chyle, and more or less in all the serous fluids of the animal body. It is the principal ingredient in the white of eggs. Albumen occurs in the sap of vegetables, in their seeds, and in other parts of vegetable growth. Among the chief constituents are nitrogen, oxygen, carbon, hydrogen, and small proportions of phosphorus and sulphur. It is soluble in water, in which state it is found in the juices of flesh, serum of the blood, juices of vegetables, and in the egg, but when heated to a temperature of 140° to 160° it coagulates and becomes insoluble in water. When put in tannic acid, ether, creosote, and alcohol, it also coagulates. Since it contains more nutritious matter and is more easily digested than any other food, it constitutes one of the most important of food materials. The meat of young animals is more tender than that

of older ones, because in it are found larger quantities of this substance. Some forms of albumen are used to clear liquids, such as coffee and sorghum, because when boiled it collects impurities and rises as scum to the surface or sinks to the bottom, this depending upon the weight of the liquid containing it. With the knowledge of the amount of albumen contained in the different kinds of food, and the effect of heat upon it when mixed with other substances, the skillful cook can turn the art of cookery into channels both pleasing and healthful.

**ALBUQUERQUE** (ä-böö-kâr'kâ), a city of New Mexico, county seat of Bernalillo county, 72 miles southwest of Santa Fé, on the Atlantic and Pacific and the Atchison, Topeka and Santa Fé railways. It is finely situated on the Rio Grande, has a considerable local and jobbing trade, and contains a number of fine school and church buildings. Among its chief buildings is the University of New Mexico, founded in 1892, at which time an annual territorial appropriation of \$14,000 was granted. The university is non-sectarian and is open alike for the education of both sexes. The surrounding country is farming and stock raising. Electric lights, telephones, and waterworks are among the municipal improvements. The first settlement in its vicinity was made by Spaniards in 1706. Population, 1900, 6,238.

**ALBURNUM** (äl-bûr'nüm), or sapwood, the part of the wood of exogenous trees which is of most recent growth and near to the bark. In color it is pale or white. It gradually hardens with age, when it is converted into duramen, or heartwood, which is harder and more valuable than alburnum.

**ALCHEMY** (äl'kě-mÿ), the ancient name for the science of chemistry, and which in former times was much studied. Modern sciences may be said to date from three discoveries — that of Copernicus, whose effect was to expel the astrologers from the society of the astronomers; the discovery of the weight of the atmosphere by Torricelli and Pascal, which laid the foundation of physics; and the discovery of oxygen by Lavoisier, which destroyed the theory of Stahl, the last alchemist who can be excused for not being a chemist. The objects of former alchemists included the discovery of a universal solvent; the acquirement of ability to transmute all metals into gold or silver, especially the former; and to obtain an elixir or universal medicine which might cure all diseases and indefinitely prolong human life. In this they were open to ridicule rather than the object they aimed at. All these objects were

essentially laudable, and it could not be known whether or not they were attainable without vast experiments covering prolonged periods of time. To achieve success in the study of alchemy it was thought necessary for one to obtain first the *philosopher's stone*, which was described as a red powder with a peculiar smell, and was thought to possess the essential property necessary to turn to gold everything with which it came in contact. Though the alchemists failed in their immediate object, they discovered muriatic, nitric, and sulphuric acids, and laid the foundation for the whole science of modern chemistry. A skillful alchemist was called an *adept*. Alchemy flourished in the Middle Ages, but later sank gradually in repute, and ultimately became the object of ridicule to real scientific inquirers and the civilized world at large. However, it is to be noted that when the science of chemistry was fully established there were still many researches for the *philosopher's stone*, by which gold might be produced successfully. Jean Baptiste Dumas (1800-84), the eminent French chemist, thought the necessary solution might be found in the doctrine of molecular isomerism, while Sir Humphry Davy, the celebrated English chemist, refused to give an opinion contrary to its possibility. The much-discussed problem of producing gold as a manufactured product is still receiving attention from some of the leading scientists.

**ALCOHOL** (äl'kô-höl), the name applied to a series of substances formed of the same elements, alike in essential properties, but varying in composition. Wood alcohol is the simplest form, known in the markets by the name of methyl, and is obtained by distilling wood. While it has nearly the same properties as common alcohol, it has an unpleasant taste and gives off an offensive odor. It is used in manufactures and in the arts as a substitute for common alcohol largely on account of its cheapness. Amyl alcohol, or fusel oil, is made in considerable quantities by the fermentation of potatoes. It has a nauseous fermentation and odor, and is far more poisonous than common alcohol. After standing for some years, amyl alcohol is converted into the ordinary alcohol. Ethyl alcohol is the common alcohol made from beer, wine, and other beverages.

Fermentation of sugar or of saccharine matter is the only source of alcohol. Some plants contain free sugar, and others are rich in starch that can be converted into sugar. The vegetable substances best adapted for the manufacture of alcohol are those that contain the greatest abundance of sugar or starch. It cannot be

produced in a pure state by a single distillation, owing to its attraction for water and its tendency to mix freely with it. Common spirits, such as brandy, whisky, and others, contain from forty to sixty per cent. of alcohol; in other words, they are about half water and half alcohol. The milder beverages, such as beer, cider, and the light wines, contain from four to fifteen per cent. of alcohol. Distilled liquors are made by a process called distillation. The process requires an apparatus in which the substance to be distilled is heated. The alcohol rises and passes into a coiled tube, called the worm, which is located in a vessel called the worm-tub. The worm-tub is kept full of cold water, by means of which the alcohol passing through the worms is cooled and condensed and flows out of the end of the worm-pipe into a tank. Some watery vapor or steam always passes with the alcohol, hence distilled liquors usually contain from ten to sixty per cent. of water, but this can be largely extracted by a second or third distillation, or by mixing with the alcohol fused chloride of calcium, quicklime, or fused carbonate of potash. If the whole be allowed to stand for twelve hours and then distilled a second time, the resulting alcohol is quite free from water.

Alcohol is employed largely by some schools of medicine, while others discourage its use and claim it possesses no valuable medicinal properties for which some other preparation may not be successfully substituted. It is quite probable that there are conditions under which a limited and careful use of alcohol may be applied for preventive and curative medicinal purposes, though it is very injurious to the young or immature of either sex. Its effect is more marked in females than in males, and in the weak than in the strong. In hot climates it is a prolific source of disease, and scarcely possesses a compensative advantage. The Russian authorities do not permit a man who has indulged recently in the use of liquors to undertake a long march in the cold season. Livingstone found in his exploration tour of Africa that those addicted to the continual use of alcohol are most easily overcome by sustained exertion or excessive heat, while in the celebrated tour of Greely to the North Polar Sea it was proven that users of intoxicants more easily succumbed than nonusers. It is certain that alcohol is not a necessity nor beneficial in cold regions, and the majority of those addicted to it would be more vigorous if they did not use it in any form. Its present employment by mankind is more powerful for evil than good. While this is true, it is certain that

alcohol is one of the most valuable products in the culinary arts, in manufactures, and for preservative purposes. According to a report issued in 1900, the four countries consuming the largest quantities of alcoholic beverages per capita rank in the following order: Belgium, England, France and Germany.

**ALCYONARIA** (ăl-sī-ō-nā'rī-à), a group of invertebrate animals, mostly marine, in which the stomach and other cavities are united. They comprise a group of coral polyps, and are characterized by having eight tentacles around the mouth. Some writers extend the group to embrace sponges.

**ALDER** (ăl'dēr), a group of trees and shrubs native to the temperate and colder regions, and usually found in wet places. The wood has the property of remaining in an undecayed state for a long time while under water, hence it is used extensively in building sluices, pumps, millwork, and bridges. Tanners find the young roots of value, while the bark is used in the manufacture of bitters, astringents, and medicine useful in treating ague. The young twigs yield dyes of value in coloring different shades of red and yellow.

**ALDERNEY** (ăl'dēr-nī), or **Augrigny**, an island in the English Channel, eight miles from Cape la Hague, France, and about 60 miles from the nearest point in England. The area is three square miles. It is located about 15 miles from Guernsey, another of the Channel Islands. The climate is healthful and mild. The inhabitants are mostly of French extraction and are noted for rearing the Alderney cows, a small breed celebrated for their rich milk. Population, 1901, 2,062.

**ALDERSHOT** (ăl'dēr-shōt), a town in England, in Hampshire, 14 miles east of Basingstoke. Near it is the famous Aldershot military grounds, a permanent camp of the British army, at which splendid maneuvers are conducted in the spring and summer. The town is important as a railroad junction. It has a public library, a number of churches, and several benevolent institutions. Population, 1901, 31,120.

**ALDINE EDITIONS**, the title of various works published at Venice, Italy, by Aldus Manutius and his family. This family flourished in 1490-1597, and its members became famous as scholars because of the correctness and beauty of their publications. The editions include works of Latin, Greek, and Italian writers, all of tasteful manufacture, and many were counterfeited by printers in France and Italy. The establishment produced 908 works and remained the property of the family more

than a century. "The Hours of the Blessed Virgin" is one of the finest productions.

**ALE** (āl), a fermented beverage now extensively manufactured, and said to have been made originally in Egypt. It is brewed like beer, and differs from it chiefly in having a smaller proportion of hops. The value of ale depends largely upon the proportion of sugar that is converted into alcohol, which process takes place in part after the liquor has been drawn off into a barrel, hence age greatly increases its strength. See **Beer**.

**ALEMANNI** (äl-ê-män'e), the name applied to a large union of German tribes on the Upper Rhine, with whom the Romans first came in collision in the reign of Caracalla. Dion Cassius was the first to mention them in history, and he describes a victory over them in the year 213 A. D. by Emperor Caracalla. Being powerful and persistent enemies to the Romans and Gauls, they were attacked and defeated by nine Roman emperors at different times, but were never wholly conquered. Their later history is included with that of Germany. The Swabian and Swiss dialects of the German language have been traced more or less distinctly to these people, and the former is known generally as the Alemannic.

**ALENÇON** (â-län-sôn'), a city in France, capital of the department of Orne, situated near the junction of the Sarthe and Birante rivers. It is well built, has a public library, and is the seat of a church built in the Gothic style, dating from the 16th century. Alençon is noted for the manufacture of artificial flowers, embroidered fabrics, and a point lace known as point d'Alençon. In the vicinity are granite quarries from which fine rock crystal called Alençon diamond is obtained. Population, 1901, 17,280.

**ALEPPO** (â-lëp'po), a city of Syria, situated near the northwest extremity of the Syrian Desert. It is a place of great antiquity, and occupies the site of ancient Beroea. After the destruction of Palmyra, it became the great metropolis of trade between the Mediterranean and the nations of the East. The Saracen invaders conquered it in 638 and again in 1260, and in 1401 it was plundered by the Tartars. In 1517 it came into possession of the Turks, under whose dominion it has since remained. At the beginning of the 19th century its population numbered over 200,000, but at present it does not exceed 125,000, of whom 25,000 are Christians and 5,000 Jews. It has a large export trade in cotton, wool, oil, cereals, and live stock. The prevailing language spoken is Arabian.

**ALESSANDRIA** (ä-lës-sän'drê-ä), a fortress in northern Italy, capital of a province of

the same name, situated near the junction of the Tanaro and Bormida rivers. It is strongly fortified, the citadel being one of the most important in Europe. It has manufactures of silk and linen textiles, woolen goods, porcelain, and machinery. The surrounding country is rich in fruit and flowers. Marengo, the site of a battle in which Napoleon defeated the army of Austria, is not far from Alessandria. The city was founded in 1168. Population, 1901, 71,293.

**ALEUTIAN** (ä-lū'shan), the name of an American archipelago, including about 150 islands, of which about eighty are of considerable size. They are situated west of Alaska, separating Bering Sea from the Pacific Ocean, extending nearly 1,000 miles from east to west, and embracing an area of 6,391 square miles. The islands are of volcanic origin, and contain a number of volcanoes still active. The climate is cold, but somewhat modified by oceanic influences, and the entire group belongs to the United States. Hunting and fishing are the chief occupations, and there is a considerable trade in fish and fur. The natives are known as Aleuts and belong to the Eskimo stock. Most of the inhabitants have embraced Christianity as a result of active work of missionaries of the Greek Church. The Aleutian Islands were discovered in 1741 by Vitus Bering (1680-1741), and were subsequently acquired and occupied by Russia together with Alaska. They came into possession of the United States by the Alaskan purchase in 1867. Population about 8,275. See **Alaska**.

**ALEXANDRIA**, an important city of Egypt, on the Mediterranean Sea, 112 miles northwest of Cairo, and seven miles west of the Canopic mouth of the Nile. The city was founded by Alexander the Great after the destruction of Tyre, in 332 B. C., and at one time had a population of fully a million people, possessed great wealth, and was cultured by learning and civilization. It became celebrated for its lighthouse, situated on the island of Pharos, reckoned among the seven wonders of the world, and the island itself was connected with the mainland by a dike, through which vessels could pass by means of movable bridges. Much of its early success was due to Greek scholars, who fostered learning and aided in founding its great library. After the death of Alexander the Great, it became the residence of the Ptolemies and was next to Rome and Antioch the most magnificent city of antiquity. At this time it rose to prominence as the seat of Grecian learning and literature, which not only augmented its material prosperity, but spread its

influence over the greater part of the ancient world. The Romans came into possession of it about 30 B. C., from which period dates the decline of the city, largely because its wealth and treasures were carried to Rome, and many of

PHAROS LIGHTHOUSE, ALEXANDRIA.

its institutions were laid waste and pillaged. Besides, the rise of Constantinople, its powerful rival, aided in the declining tendency. The city wasted away so rapidly that in the 4th century A. D. the only building of any importance remaining was the Temple of Serapis. In the 7th century it was sacked by the Arabs, and in the 9th century was conquered by the Turks. It had a population of only about 6,000 in 1778, but soon after the conquest of Egypt by the French it began to regain importance.

The modern development of Egypt has again placed Alexandria with the foremost commercial cities on the Mediterranean. Among the causes affecting its modern growth may be named the discovery of America, the passage of commerce from India by the way of the Cape of Good Hope, and the construction of the Suez Canal. The former two had a more or less depressing effect by diverting its trade with India, but the building of the Suez Canal more than compensated by giving to the prosperity of Egypt a decided impetus. The present city is not situated on the exact site occupied by ancient Alexandria, but is built mostly on the island of Pharos and the mole connecting it with the land opposite. Though the mole was originally an artificial dike, it has been broadened by alluvial deposits into a considerable stretch of land, and occupies a position between the two harbors. Formerly two obelisks, known

as Cleopatra's needles, sculptured in the time of King Thothmes III., in the 16th century B.C., adorned the city, but these have been transported, one to the United States and the other to England. The city has exports valued at \$17,500,000, and imports aggregating about one-half that amount. It is the focus of many railways, and has rapid transit, electric lights, and other modern facilities. Among the leading exports are cotton, sugar, rice, grain, and fruits. The manufactures are chiefly clothing, utensils, jewelry, chemicals, toys, and articles of food. Its inhabitants are greatly diversified, including Turks, Greeks, Arabs, Persians, and many European tradesmen. Population, 325,575.

**ALEXANDRIA** (ăl-ĕgz-ăn'drĭ-à), a city of Indiana, in Madison County, 48 miles northeast of Indianapolis, on the Lake Erie and Western and the Big Four railways. It is surrounded by a fertile farming country and has a growing trade in produce and merchandise. The manufactures include glass, clothing, ironware, and machinery. Waterworks, sewerage, electric lighting, and pavements are among the public utilities. The first settlement in its vicinity was made in 1834. Population, 1900, 7,221.

**ALEXANDRIA**, a city in Louisiana, capital of Rapides parish, on the Red River, about 195 miles northwest of New Orleans. It is on the Southern Pacific, the Iron Mountain and Southern, the Texas Pacific, and other railroads. Having excellent steamboat and railway facilities, it exports large quantities of fruits, cotton, rice, and sugar. There are a number of fine parish and school buildings, numerous churches, and many municipal conveniences. Among the manufactures are tobacco products, machinery, and utensils. Alexandria was settled in 1820 and incorporated in 1840. Population, 1900, 5,648.

**ALEXANDRIA**, a city of Virginia, county seat of Alexandria county, on the Potomac River, seven miles south of Washington, D. C. It has transportation facilities by steamboat lines and by the Baltimore and Ohio, the Pennsylvania, the Southern, and the Chesapeake and Ohio railways. The streets are regularly platted, and improved by gas and electric lights, pavements, waterworks, and an extensive system of street railways. There are manufactures of machinery, tobacco products, earthenware, clothing, and farming implements. The city has excellent public schools and numerous churches, and carries on a considerable interior and foreign trade. General Braddock made it his headquarters in 1755, and the citizens contributed to the British in 1814 in order to save them-

selves from an attack by a fleet. Federal troops occupied the city during the Civil War. Population, 1900, 14,528.

**ALEXANDRIAN LIBRARY**, the most remarkable and largest collection of books of antiquity, founded by Ptolemy Soter in Alexandria, Egypt, and greatly enlarged by succeeding Ptolemaic rulers. It embraced the collected literature of Egypt, India, Greece, and Rome, and at the time of its first manager, Demetrius Phalereus, contained 50,000 volumes, but was subsequently enlarged to 700,000. A part of the library was situated in a museum in the portion of the city called Bruchium, near the royal palace of the Ptolemies, and the other part was in the temple of Jupiter Serapis. The former portion was destroyed in the siege of Alexandria by Julius Caesar, but was largely replaced by Mark Antony and presented by him to Queen Cleopatra. The portion of the library situated in the temple of Jupiter Serapis was destroyed in the time of Theodosius the Great, and the collection of Mark Antony was burned in 640, when the city was conquered by the Arabs. Some writers contend that this portion of the library was destroyed by fanatical Christians in 391, who were led by Archbishop Theophilus. See **Libraries**.

**ALEXANDRIAN SCHOOL**, a term used to designate the age or time, after the decline of Greece, when Alexandria, Egypt, became the seat of science and literature. It is usually divided into two periods, the first embracing the reign of the Ptolemies, from 323 to 30 B. C., and the second from 30 B. C. to 640 A. D., including the Roman supremacy and ending with the conquest by the Arabs. To the founder of the Alexandrian Library, Ptolemy Soter, is also ascribed the introduction of science and literature. The grammarians and poets of this period included Egyptians, Greeks, and Jews, and later also Romans. Their chief aim was to collect and preserve for future generations writings then existing, and to add to these the literature of subsequent years. The language of Alexandrian writers was remarkable for correctness, purity, and elegance of expression. Though distinguished for fine rhetoric, their productions lacked the spirit that animated Greek poetry. In a school where imitation and rule were substituted for inspiration, each generation became more artificial and lifeless than preceding masters. However, the school was long distinguished for culture in mathematics, astronomy, and physical sciences. It was here that Euclid in the 3d century B. C. wrote his great work on geometry, and Archimedes, Eratosthenes, and Philadelphus declared well-established mathe-

matical and scientific principles. For four centuries the Alexandrian School was the chief seat of learning and science of the world, and from its origin to its fall includes a period of 1,000 years.

**ALEXANDRIAN VERSION**, or **Alexandrian Codex**, an important manuscript written on parchment with uncial letters, now in the British Museum. It constitutes a transcript of the Old and New Testaments in the Greek language, but there are some omissions from the New Testament. The Old Testament is written in the translation known as the Septuagint, and, in connection with it, are epistles of Clemens Romanus. The manuscript is thought to date from the 6th century.

**ALFALFA** (äl-fäl'fä), or **Lucerne**, a deep-rooting clover-like perennial plant. It is cultivated extensively for forage in America and

Hop Lucerne.

ALFALFA.

Sand Lucerne.

in the European countries bordering on the Mediterranean Sea. Owing to rooting deep into the ground, it is the best known plant for dry localities, and is profitably cultivated in such regions. It yields from ten to thirty tons of fodder per acre, and has the advantage of being both nourishing and healthful as a food for stock. The stem is upright and branching, the leaves are purple colored, and the flowers grow in clusters. It has been cultivated in Europe as a forage plant more than 2,000 years and is grown extensively in the arid regions of Nebraska, Kansas, Texas, Colorado, and other states.

**ALGAE** (äl'jē), the general name applied to numerous plants that grow in water, both fresh and salt, comprising seaweeds and other species. In size they range from forms too small to be seen by the naked eye to the giant kelp common to the west coast of America, which attains a length of from 800 to 1,500 feet. They are devoid of true roots, and usually adhere to the bottom of the water or to rocks, and frequently are seen afloat on the surface.

In structure they are of cellular tissue, as the common carrageen, which, when bleached, is the Irish moss of commerce. This plant and many others are edible. Some species are used in the manufacture of iodine, kelp, and bromine, and many are of value as manure. Masses of gulfweed many miles in extent are met by navigators, such as the Sargasso Sea. Most species common to salt water are brown or red, and the fresh-water plants are greenish in color.

**ALGEBRA** (ăl'jê-brà), a branch of pure mathematics, which, like arithmetic, treats of numbers. This department of mathematics enables one to generalize by the aid of symbols, and therefore to abbreviate the method of solving propositions relating to numbers. It is a valuable medium in the solution of intricate problems, and by means of it results can be obtained that by arithmetic are impossible. Comte defines algebra as the calculus of function, to distinguish it from arithmetic, which he defines as the calculus of values, but this definition places some algebra in common arithmetic and some arithmetic in school algebra. However, in practice, this condition now exists in many common schools, since authors of texts in arithmetic have introduced more or less extensive applications of algebra with each division of arithmetic.

The symbols used in algebra are of three kinds, those of quantity, those of operation, and those employed as abbreviations for ordinary words. Symbols of quantity may be *known* or *unknown*, and consist of letters of the alphabet and of ordinary numbers, as  $2a+3b$  by  $2a-3b$ , meaning that the former quantity is to be multiplied by the latter. Numerals or the first letters of the alphabet are generally employed to represent known quantities, as  $a, b, c$ ; and the last letters of the alphabet to represent unknown quantities, as  $x, y, z$ . The symbols of operation are  $+, -, \times, \div, =$ , etc., and the symbols used as abbreviations are  $\sqrt{\quad}$ , denoting square root;  $\sqrt[3]{\quad}$ , cube root,  $<$ , greater than, etc. The divisions of algebra are addition, subtraction, multiplication, division, involution, evolution, and equations, though some authors of text-books and many institutions of learning make the last mentioned a distinct branch of study.

An equation is the statement of the equality of two algebraic expressions, the expression to the left of the sign of equality being the first member and the one to the right of the sign being the second member. Equations are designated by degree: one of the first degree is called a simple equation; of the second, quadratic; of the third, cubic; of the fourth, quartic or

biquadratic, etc. It has long been possible to solve general equations of the second, the third, and the fourth degree, but whether an equation of the fifth degree can be solved was in dispute for many centuries. This question was finally settled by Niels Henrik Abel (1802-29), an eminent Norwegian mathematician, who demonstrated the impossibility of solving general equations of any degree higher than the fourth. However, it is possible to construct special equations of the fifth or of a higher degree which admit of being solved, but such problems belong to the highest branch of algebra. Diophantus of Alexandria, Egypt, is thought to have originated this science in the 4th century, when that city was the seat of culture and learning. Europeans first learned of algebra from the Arabs, who derived it from the Hindus. The work from which Europeans drew largely was that of Mohammed Ben Musa, who lived in the 9th century. Leonardo Bonaccio, an Italian merchant, while traveling in the East, about 1200, acquired a knowledge of algebra, and on his return introduced it among his countrymen. Later it was introduced into all European countries, and its signs and symbols were greatly enlarged. It began to be taught with much enthusiasm in the early period of the revival of learning. It was first applied in a case of one cubic equation in 1505, later to two cubic equations, and still later to biquadratic equations. Descartes applied algebra to geometry, and was the first to represent the nature of curves by means of equation. Other eminent scholars applied algebraic methods to the sciences, including formal logic, economics, and psychology.

**ALGECIRAS** (ăl-jê-sê'ràs), a city of Spain, in the province of Cadiz, six miles west of Gibraltar. It is important as a seaport, has a well-protected harbor, and carries on a profitable trade. The Moors seized it in 711, and it remained in their possession until 1344, when it was besieged and captured by Alfonso XI. It was the seat of the Algeciras Conference in 1906, which considered the rival claims of Germany and France in Morocco. Population, 1900, 13,131.

**ALGERIA** (ăl-gê'rî-à), a colony of France in North Africa, bounded on the north by the Mediterranean Sea, east by Tunis and Tripoli, south by the Sahara Desert, and west by Morocco. The length from east to west is about 550 miles and it extends inland about 375 miles. It has an area of about 343,500 square miles, but the area exclusive of the Sahara region is 184,474 square miles.

**DESCRIPTION.** Algeria comprises a portion of

the plateau of North Africa, which rises from the sea in three terraces, but along the Mediterranean is an extensive and fertile coast plain. The Atlas Mountains traverse the entire northern part from east to west in two chains, known as the Great Atlas and the Middle or Maritime Atlas. These chains are more or less parallel to the coast, the former bordering on the Sahara and the latter trending between it and the sea. The Great Atlas includes some of the highest summits of Algeria, as Mount Shelia, which is 7,600 feet above sea level. Deep and tortuous defiles furrow the mountains in many places. The portion of the Sahara lying within Algeria is a rocky plateau with an elevation of about 1,500 feet. All of the streams are small and unimportant. They are confined almost exclusively to the coastal plain of the north, since the region included in the Algerian Sahara is arid. The Sheliff, which flows into the Mediterranean near Mostaganem, is the largest river. Numerous small lakes abound in the highland, some of which are saline and have deposits of salt on the bottom during the dry season.

The climate is moderate and healthful, but it varies largely with differences in elevation and local peculiarities, being generally arid toward the south and moderately humid in the northern part. The most productive and best watered section of the country is along the sea, extending inland about fifty miles, and most of the European settlements are within this belt. This section has a moderate temperature, but the summers as a whole are hot and dry. A large number of fertile oases are located in the desert on the south slope of the highlands. They are covered with vegetation and are well watered, but the greater part of the desert is devoid of vegetation and unfit for occupation.

**PRODUCTIONS.** Many minerals abound in the highlands, but mining has not been developed to any great extent. The more extensive deposits are those of iron, copper, zinc, lead, and quicksilver. Building stone, especially granite, is found in large quantities. Extensive deposits of salt occur in the southern part. Agriculture and stock raising are the leading industries, and these enterprises are largely in the hands of natives, while commerce is monopolized by Europeans, mostly Frenchmen. Wheat is the leading cereal, but comparatively large interests are vested in growing barley, oats, potatoes, alfalfa, and grapes. Other products include coffee, tobacco, onions, and fruits. A fine grade of horses are reared for draft purposes. Other domestic animals include cattle, sheep, camels, and poultry.

Algeria has large interests in timber and is an exporter of lumber and lumber products. As a wine-producing country it takes high rank, and it has manufactures of pottery, cotton and woolen textiles, clothing, utensils, and esparto goods. The foreign trade is chiefly with France, Great Britain, Spain, Italy, and Germany. The leading exports include cereals, wine, minerals, cork, alfalfa, and live stock. Among the imports are clothing, furniture, textiles, and machinery. Railroad building has received marked attention under grants made by France, and the lines in operation in 1908 included a total of 2,250 miles. Tramway lines have been constructed in the larger cities and in some of the mining districts, and a system of national highway has been inaugurated.

**GOVERNMENT.** The administration is vested in a governor general, who is responsible to the national assembly of France. He is assisted by a ministry, although a part of the territory is governed under military rule. For the purpose of government the country is divided into three provinces, called departments. These include Algiers, Constantine, and Oran. Each department has its own council, and these councils send delegates to the superior council, which meets annually at Algiers. Judicial authority is exercised by justices of the peace, commercial courts, courts of first instance, and a court of appeal located at Algiers. As a whole the country is organized and governed under the system of French laws, both in civil and criminal affairs. The state gives support to education and religion, but the instruction in elementary schools may be either in French or Arabic. Several institutions of higher learning and a number of commercial and technical schools are maintained under encouragement by the government.

**INHABITANTS.** Although Algeria has been a dependency of France since 1830, only about 350,000 of the inhabitants are French, and the total foreign population is given at 765,500. The two chief classes are Arabs and Berbers, the former being largely nomadic and engaging extensively in pastoral occupations. Formerly the region was occupied wholly by Berbers, who are generally termed Kabyles, and there are parts of the country which are still occupied almost exclusively by these people. The Berbers have a language peculiar to themselves, but they have been influenced more or less by the Arabs and Jews and use the Arabic characters in writing. Mohammedanism is the prevailing religion, but Judaism is well represented and many of the natives profess Christianity. A small element of the inhabitants consist of

Negroes and Turks. Algiers, the capital of Algeria and of the department of Algiers, is the largest city. Other cities include Oran, Constantine, Bona, Mustapha, Tlemcen, and Gardaja. Population, 1906, 5,231,850.

**HISTORY.** The region occupied by Algeria was known to the Romans as Numidia, but anciently it included Tunis. The Vandals conquered it in 1830 A. D., but it was occupied by an army of the Byzantine Empire in 1833, and became a possession of the Saracens in the 7th century. When the Jews and Moors were driven from Spain by Ferninand and Isabella at the close of the 15th century, large numbers of them located in Algeria, where they developed the arts and industries of the Europeans. Spain undertook a war against Algeria at the beginning of the 16th century, and by 1510 made much of the country tributary. The Turkish pirate, Horush Barbarossa, made himself Sultan of Algeria in 1516, but he was captured soon after and beheaded by the Spaniards. In the 16th century the country became a part of the Turkish domain, but the Turks did not establish complete supremacy over all the tribes, and in 1830 it became a colonial possession of France. At the time of the Franco-German War, in 1870-71, an uprising took place to throw off the dominion of France. Subsequently other attempts were made to secure independence, but in the main the country has been prosperous and peaceable. French occupancy has greatly facilitated commerce and manufactures, extended internal improvements, and stimulated a development of the natural resources.

**ALGIERS** (äl-jēr'z'), a seaport city on the Mediterranean, capital of Algeria, on the west shore of the Bay of Algiers. It occupies a fine site on the slope of a hill fronting the sea, the mountains back of it giving a beautiful background effect. The city consists of two parts, the old and the new divisions. In the former the streets are platted irregularly, giving an Oriental appearance, while the latter was planned and built by the French and is both modern and beautiful. Four aqueducts supply water, and the newer part of the city is lighted with gas and electricity. The old part is built in the Moorish style, and the architecture is plain from the outside, but the interiors are beautifully decorated in the Moorish art. Formerly the city had about one hundred mosques, but they have been partly displaced by synagogues and Christian churches. Among the educational institutions are schools of science, law, and medicine, and many secondary schools are maintained by the French and the Mussulmans.

The harbor is well fortified and spacious, furnishing landings for a large number of vessels. Considerable export trade is carried on with France and other European countries, and it is the most important coaling station on the Mediterranean. Tourists visit Algiers in large numbers during the winter, owing to its pleasant and healthful climate. Population, 1906, 138,240.

**ALGOA BAY** (äl-gō'a), an inlet on the southeastern coast of Africa, in Cape Colony, about 425 miles east of the Cape of Good Hope. The Sunday and Baasher rivers discharge into it, and it affords excellent anchorage for vessels. On the west coast is Port Elizabeth, near Cape Recife, which is the seat of a considerable export and import trade.

**ALGONKIAN** (äl-gön'ki-an), a division of geologic time, preceded by the Archaean and succeeded by the Cambrian. Traces of this period are most distinct in the vicinity of Lake Superior, both in the United States and Canada, and its name was derived from the Algonquin Indians who originally inhabited that region. The rocks are sedimentary and metamorphic, and consist chiefly of marble, schist, gneiss, quartz, granite, and conglomerates. Few fossils occur and those found are indistinct. In some regions volcanic rocks are imbedded in shale and limestone, while in other sections rich deposits of copper and iron are abundant, the former particularly in Upper Michigan and the latter in Northern Minnesota. The Hudson Bay country, Ontario, New England, and the Black Hills have large areas of the Algonkian system.

**ALGONQUINS** (äl-gön'kwinz), a family of North American Indians, the most prominent of three aboriginal races found in the great basin of the Saint Lawrence. They include the Mohegans, Pequots, and Narragansetts of New England; the Delawares, Powhatans, and Shawnees; and many tribes living in the vicinity of the Great Lakes. During the Colonial period they were friendly to the French and fought against the English, especially in the French and Indian wars, but later they became greatly scattered. At present about 81,200 of these Indians are living, the larger part of which are in Canada, notably in the provinces of Quebec and Ontario. The tribe known as Algonquins has dwindled down to about 1,200, and about two-thirds of these are in Canada.

**ALHAMBRA** (äl-häm'brä), a noted palace in Spain, situated about a mile from the city of Granada, to which it forms a citadel or acropolis. It was formerly the residence of the Moorish kings. It was founded and commenced

by Ibnu-l-ahmar, and completed about 1348. There are two oblong courts; the smaller one, known as the Court of the Lions, contains a fountain ornamented with twelve lions in marble, and is 66x115 feet; the other, called the Court of the Blessings, is 74x138 feet. The Alhambra is surrounded by gardens, in which are beautiful waterfalls, exquisite fountains, and decorative vines. Within are gorgeous colorings, whispering galleries, and geometrical designs interwoven with passages from the Koran. An Arab poet likened the Alhambra to "a pearl set around with emeralds," while it was once described as "the gem of Arabian art in Spain, its most beautiful and most perfect example." Washington Irving's "Alhambra" is the best known description written of this place in the English language.

**ALIAS** (ā'lī-ās), a term used in law to designate a name assumed by a person who wishes to conceal the name by which he passes or is known. An alias is usually assumed for purposes of deception, though this is not always the case, as it is quite proper under certain conditions to employ an alias, such as pseudonyms adopted by writers, stage names used by actors, and descriptions employed by detectives, all of which are properly comprehended under the term. The name is frequently used in law to describe a writ given after one of the same kind has been issued for an identical purpose.

**ALICANTE** (ä-lê-kän'tâ), a city of Spain, in the province of Alicante, located on the Mediterranean. Many of the buildings are of stone, and the streets are well improved and regularly platted. It is well fortified and ranks next to Cadiz and Barcelona as a seaport in Spain. The manufactures include tobacco, clothing, and machinery, and the city has a large trade in grain and fruit. It is the seat of two nunneries, a collegiate church, and several consulates. The Romans named it Lucentum. Population, 1900, 50,495.

**ALIEN** (äl'yen), a term used to designate a person born outside of the jurisdiction of the country in which he resides and who has not acquired the full rights of citizenship. In Great Britain the alien may become a citizen under the Naturalization Act of 1870. On the other hand, in the United States, the status of an alien is determined under the provisions of the National Constitution, or under the Constitution of the State in which such alien may reside. An alien, even after naturalization, is restricted in a number of respects, as, for instance, he is not eligible to a seat in Congress until after seven years after naturalization, and

may not hold the office of President or Vice President.

**ALIEN AND SEDITION LAWS** (sê-dī'-shŭn), the name applied to certain enactments of Congress passed in 1798, while John Adams was President. They raised the number of years necessary for naturalization from five to fourteen; provided for the arrest of subjects of any foreign power with which the United States should be at war; provided for the punishment of any person maliciously slandering the government or any of its officers, and gave the President power to banish or arrest any aliens he might deem dangerous. These laws proved a political blunder and were never enforced to any extent. They aided largely in the downfall of the Federal party.

**ALIMENTARY CANAL** (äl-ī-mën'tä-rŷ), the name of that portion of the digestive apparatus through which food passes after mastication. It includes the pharynx, aesophagus, stomach, and small and large intestines. These organs are lined with a mucous membrane, which possesses the function of absorbing certain substances and rejecting waste matter, and is modified in each region according to the function of the part. The length of the alimentary canal is five to six times the height of the individual, usually about thirty feet in the adult, measured from the base of the skull to the extreme end of the large intestines.

**ALIZARIN** (ä-liz'ä-rĭn), a coloring matter, derived from the root of the madder. This plant is cultivated in Southern Europe for its coloring principles, but alizarin is now derived largely from anthracene, a hydrocarbon contained in the refuse of coal tar. From it the Turkish red dyes are obtained.

**ALKALI** (äl'kä-lī), a term of Arabic origin, alki being the name of the plant from which an alkaline substance was first derived. The name is now applied to a class of substances that have similar properties, the most conspicuous being solubility in water, power of corroding vegetable and animal substances, ability to neutralize acids and with them to form salts, and the property of changing the tint of various coloring matter. Properly, there are four alkalies—soda, lithia, potash, and ammonia. The first three are oxides of metals; the last is called the volatile alkali, being in the form of gas, and compounded of nitrogen, oxygen, and hydrogen. Potash is called the vegetable alkali, being largely found in the ashes of plants, and soda is termed the mineral alkali, owing to its predominating in minerals. Alkalies have a soapy taste, form soap with fats, and act on the skin. They turn most

vegetables green, turmeric brown, and reddened litmus blue. When united with an acid, the peculiar qualities of each are destroyed or neutralized, as is exemplified when mixing soda with sour milk; the former an alkali, and the latter an acid. The term *alkali* as employed in commerce usually implies caustic soda or potash, and both are used in the arts for the manufacture of glass, soap, and many other products. Caustic potash is used in surgery for cauterizing.

**ALKALOID** (ă'l'kă-loid), a compound of vegetable origin, usually complex in composition, and found in living plants. All the alkaloids contain nitrogen and certain properties in common with ammonia, especially the power to form salts when combined with acids. Their properties, which are extracted from the plants by treating with dilute acids, are poisonous and medicinal. The list of alkaloids embraces quinine, cocaine, morphine, caffeine, strychnine, aconitine, narcotine, codeine, coniine, nicotine, theobromine, etc. Artificial alkaloids are derived from coal tar products.

**ALLAH** (ă'l'là), the Arabian name of God, whose attributes are thus summed up by the Koran: "There is no God but God. This only true, great, and most high God has his being through himself; is everlasting; is not begotten and begetteth not; is all-sufficient in himself; fills the universe with his infinity; is the center in which all things unite, as well the hidden as the manifest; is Lord of the world of bodies and spirits, creator and ruler, almighty, all-wise, all-loving, merciful; and his decrees are unchangeable." Allah Akbar, meaning God is great, is a popular war cry among the Mohammedans.

**ALLAHABAD** (ăl-lă-hă-băd'), an important city of India, capital of the Northwest Provinces, at the junction of the Ganges and Jumna rivers. It is strongly fortified, has extensive railroad facilities, and is regarded the holiest of all places by the Hindus. Those people make it one of their chief resorts, and thousands make pilgrimages to bathe at the junction of the two rivers. The Mohammedans also hold it sacred, and to them it is known as the "City of Allah." There are a number of fine government buildings, numerous mosques, temples, and educational institutions, and it is the seat of a famous annual industrial exposition. The manufactures include clothing, carpets, textiles, leather, pottery, and machinery. It was founded in the 3d century B. C., and has long ranked as an important trade and manufacturing center. Population, 177,210.

**ALLEGHANY** (ăl-le-gă'nî), a name some-

times applied to the great mountain system in the eastern part of the United States, though it is more commonly known as Appalachian. The Alleghany mountains proper are the ranges of the Appalachian system that traverse the states of Virginia, Maryland, and Pennsylvania. They comprise a number of parallel chains that trend from the southwest to the northeast. Their average elevation is about 2,500 feet, reaching their highest summits in Virginia, where they are over 4,000 feet high. These mountain ranges are well wooded to the summit and throughout the region are many fertile valleys. Large quantities of iron, bituminous and anthracite coal, limestone, and other minerals and quarry products are obtained.

**ALLEGHANY SPRING**, a village and post office of Virginia, in Montgomery County, 80 miles west of Lynchburg, near the line of the Norfolk and Western Railroad. It is noted for the large number of highly saline springs that are located in the surrounding country. The vicinity is known as Alleghany Springs and is much frequented as a summer resort. Shaws-ville, three miles distant, is the railroad station.

**ALLEGHENY**, a river of the United States, rises in Potter County, Pennsylvania, and unites with the Monongahela at Pittsburg to form the Ohio. It courses through a fertile valley; is about 365 miles long, and is navigable some distance above Pittsburg.

**ALLEGHENY**, formerly a city of Pennsylvania, in Allegheny County, opposite Pittsburg, but united with the city of Pittsburg since 1906. It is finely situated on the Allegheny River, is the focus of a network of railroads, and ranks as a favorite residence place for Pittsburg business men. A large number of bridges cross the Allegheny River, both for pedestrians and commercial traffic, and it has extensive electric railway facilities with many points within the State. It is important as a center for the manufacture of ironware, boilers, spirituous liquors, salt, locomotives, machinery, clothing, stoves, white lead, and leather. There are extensive municipal improvements, including waterworks, pavements, gas and electric lighting, and sewerage. Among the chief buildings are the Western University of Pennsylvania, the Allegheny Observatory, the Western Theological Seminary, and numerous libraries, schools, hospitals, and churches. Allegheny was first settled in 1788, and its incorporation as a city dates from 1840. Population, 1900, 129,896.

**ALLEGIANCE** (ăl-lē'jans), the term used to express that duty which a citizen owes to the State to which he belongs. or the tie or obli-

gation to one's country. The English doctrine which asserted that allegiance is indelible was early adopted by the United States, but this theory has since been modified by the enactment of naturalization laws.

**ALLEGORY** (ă'lĕ-gō-rĭ), a narrative or discourse in which the principal subject is described in a manner that really refers to another, which resembles it in many important characteristics. In a complete allegory, the characters or leading circumstances refer to some underlying thought. This is the case in Bunyan's "Pilgrim's Progress," in which is described a journey from the City of Destruction to the Celestial City by the faithful Christian. Chaucer's "House of Fame" and Tennyson's "Idylls of the King" are other examples of English allegories.

**ALLENTOWN** (ă'lĕn-town), a city in Pennsylvania, county seat of Lehigh county, on the Lehigh River. In its vicinity are extensive coal and iron ore mines and factories producing brick and tile. The city has convenient railroad facilities, being on the Central of New Jersey, the Lehigh Valley, and other railways. It is an important market for farm and dairy products, and has extensive manufacturing and commercial interests. The chief manufactures include leather, boots and shoes, machinery, boilers, hardware, furniture, and clothing. It is the seat of Muhlenberg College and of Allentown Female College, and has excellent public schools, numerous churches, and a fine county courthouse. Gas and electric lights, pavements, street railways, several libraries, and a number of parks are among the conveniences. William Allen, then the chief justice of Pennsylvania, after whom it was named, platted the town in 1752. It was incorporated as Northampton in 1811, but its original name was restored in 1838. Population, 1900, 35,416; in 1910, 51,913.

**ALLIANCE** (ă'lĭ-ans), a city of Stark County, Ohio, on the Mahoning River, fifty-seven miles south of Cleveland. The city has transportation facilities by the Pennsylvania, the Lake Erie, and other railways. It is surrounded by a rich agricultural country, which produces cereals, dairy products, fruit, coal, and mineral oil. Among the manufactures are hardware, carriages, farming implements, pottery, machinery, and clothing. Gas and electric lights, pavements, street railways, public parks, and extensive railroad facilities are among the conveniences. The city has fine public schools and churches, and near it is Mount Union College. Population, 1900, 8,974.

**ALLIGATOR** (ă'lĭ-gā-tĕr), a large carnivorous reptile peculiar to America, and found

mostly in the swamps and streams of the warmer regions. It is closely allied to the crocodile family, with which it is classed, but has a broader head, larger number of teeth, and feet less webbed, and its habits are less aquatic. Alligators are often seen in groups by day basking on the dry ground in the warm sun, but at night they become active and noisy. They burrow in the mud of swamps in the winter, where they lie torpid until the return of warm weather. The chief food of both alligators and crocodiles is fish, but they also devour small animals and carrion, and when pressed by hunger show considerable determination in attacking man. Some writers assert that the alligators possess a musky fluid secreted by the glands of the throat, which they throw out as a sort of bait to attract the fish on which they prey. The female lays a large number of eggs, ranging from forty to two hundred, which she buries in the sand or in heaps of vegetable matter to be hatched by the warm sun. At fifteen years the alligator is not more than two feet

ALLIGATORS.

long, and it requires from sixty to ninety years to develop the full growth of the adult. The skin on the back of mature alligators is so hardened by horny scales that a large rifle ball is required to inflict a fatal wound. These plates form two upright denticulated crests, which gradually converge toward the middle of the tail, and there unite and form a single row to the extremity. The skin of alligators is used in the manufacture of boots and shoes. A full-grown alligator is very large, attaining a length of eighteen to twenty feet, and its body is about eight times longer than the head. The flesh is sometimes eaten, though mostly by savages. A species known as *spectacled cayman* is native to South America.

**ALLIGATOR LIZARD**, a class of reptiles

common to Mexico and the southwestern part of the United States. These animals are active and are frequently seen on the sides of stone walls and adobe houses, and in forests hide near fallen trees or ascend to the branches of standing trees to escape from intruders. They are characterized by flat scales and the absence of spines, and when the head is raised the brilliant colors of the throat become visible. They multiply rapidly, laying their eggs in the sand to be hatched by the sun.

**ALLITERATION** (ăl-līt-ēr-ā'shŭn); the repetition of the same letter at the beginning of two or more words immediately succeeding each other, or at short intervals. It was used extensively in the Middle Ages, and in old German and Scandinavian poetry it took the place of rhyme. Spenser employed this style of writing extensively, and uses of it are made in the works of Pope and Gray. Tennyson employed alliteration combined with the distribution of vowels and in this practice was joined by many poets, but prose writers usually avoid it. "The fair breeze blew, the white foam flew" and "Many men of many minds" are examples of alliteration.

**ALLOPATHY** (ăl-lŏp'ā-thŷ), the term originated by Hahnemann (q. v.) to distinguish the ordinary practice of medicine from homeopathy. It was founded on the theory expressed by Hippocrates that "opposites are remedies for opposites." However, the term is gradually going out of use, since practitioners cannot confine themselves to such limitations in the treatment of diseases. In the development of new branches of science, as, for instance, bacteriology, new resources have become prominent and have been extensively developed.

**ALLOY** (ăl-loi'), a name given by the French to a compound or combination of two or more metals fused together. It is now applied to any mixture of metals, excepting cases in which mercury is one of the metals, when the compounds are called amalgams. Most metals mix in any proportion, but some form true mechanical compounds by uniting only in definite proportions, while others resist homogeneous combination and form a conglomerate of distinct masses. A very great variety of changes are produced by the combination of metals. An alloy may differ in color from either of the components, or may be very similar to one of them. While an alloy is generally harder than its components, it usually constitutes a body less malleable and ductile. Its specific gravity is sometimes less than the average of that of its ingredients, while it is always more fusible. Bronze, brass, pewter, and

type metals are alloys. The silver money of the United States is made up of nine parts of silver and one part of copper; the gold coins contain nine parts of gold, and the other part is one-fourth silver and three-fourths copper. The reason other metals are mixed with gold and silver is that they are too soft for money unless hardened by mixing with other metals. Some of the valuable bronze alloys compounded in recent years contain aluminum. In electrotyping, alloys are made by using thirteen parts tin with aluminum to form a nonshrinking combination. Arsenic adds strength to copper, while other chemicals increase the brightness of gold. Besides these, there are many other useful combinations.

**ALL SAINTS' DAY**, or **Allhallows**, a Christian festival instituted in 835, and celebrated in honor of the saints in general. This festival is observed by the Anglican, Lutheran, and Roman Catholic Churches on November 1, and by the Greek Church on the Sunday after Whit Sunday. It was introduced because a separate day could not be set apart for every saint.

**ALL SOULS' DAY**, a festival observed on November 2 by the Roman Catholic Church. It was instituted in 998 as a day for prayers offered publicly at the Eucharist for the faithful departed who have not attained to perfect life.

**ALLSPICE** (ăl'spīs), or **Jamaica Pepper**, a tree-like plant of the West Indies, whose fruit combines the flavors of cinnamon, nutmeg, and cloves. The fruit is used extensively in medicine and cookery and in the manufacture of an essential oil and other products. It also serves as an aromatic, and forms the basic ingredient of distilled water. The tree is of an ornamental character, usually twenty to thirty feet in height, with oval leaves and small flowers. A single tree produces about 100 pounds of the dried spice.

**ALLUVIUM** (ăl-lŭ'vī-ŭm), the deposits of soil by the action of water, consisting chiefly of clay, loam, marl, and sand. The term is used in reference to transported matter by the action of fresh water, which was deposited both during the Pleistocene and recent periods. When used in the former sense, it includes

ALLSPICE.

deposits formed on large bases in all geological ages, but in the latter sense it is confined more strictly to the action of oceanic waves, deposits of rivers as seen in deltas, and washes from hill sides, caused by recent rains. Lands made in this way are said to be alluvial in their origin. This action is going on constantly by various agencies. It is exemplified by the Ganges, Nile, Volga, Mississippi, and other rivers, particularly at their mouths, where the silt is deposited and forms deltas of considerable extent. An estimate recently made places the silt carried annually by the Mississippi at a volume sufficient to cover 275 square miles of land with a layer one foot deep.

**ALMA** (äl'mä), a small river in the Crimea, coursing in a westerly direction to Kalamita Bay, near Sebastopol. Prince Menschikoff, the Russian commander, selected the southern bank of this river as a defensive position in the Crimean War, where he was attacked by the allied army Sept. 20, 1854. The Russian army of 35,000 men was defeated by the allies numbering 62,000, and as a result of the battle the road to Sebastopol was opened.

**ALMANAC** (äl'mä-näk), a small book primarily designed to furnish a calendar or table of the days belonging to the several months of the year for which it is published. Besides serving as a guide to designate the days of the month, calendars usually contain data of the rising and setting of the sun and moon, the phases of the moon, the position of the heavenly bodies, important dates observed by the church and state, and much other information of use to the public. The term is of Arabic origin, but it is known that an almanac was published at Alexandria by the Greeks about the 2d century A. D. Almanacs were first published in Europe by Solomon Jarchus in 1150, and subsequently came into extensive use. Benjamin Franklin began the publication of an almanac in 1732, pretending it was written by one Richard Saunders, and his publication came to be called "Poor Richard's Almanac." Besides the monthly calendar and movements of the heavenly bodies, his almanac contained anecdotes, scraps of useful information, and odds and ends of literature, and was published annually for twenty-five years. In more recent times almanacs came to be published in connection with advertisements of large manufacturing and publishing companies, and many are now distributed free of charge to the public. Some of the great daily newspapers of the United States and Canada publish annually almanacs in which valuable information is detailed, many of these publications embracing

500 to 800 printed pages. A publication known as "The Nautical Almanac" is published annually by the United States Bureau of Navigation, and serves the purpose of a guide for navigators. By means of it any locality on mid ocean can be determined by the sailor. The computations are made for three years, and the publications serve for that period of time. Similar almanacs are published by the governments of France, Germany, and Great Britain.

**ALMERIA** (äl-mä-rí'ä), a seaport of Spain, in a province of the same name, 60 miles southeast of Granada. It is located at the head of Almeria Bay, an inlet from the Mediterranean, and the country adjacent is devoted to the culture of fruits and cereals. The manufactures include macaroni, sugar, white lead, and clothing, and there is a considerable trade in iron ore, fruit, and wine. It is the seat of a bishop, a Gothic cathedral, and several nunneries. The Church of San Pedro, a fine edifice, occupies the site of a Moorish mosque. Almeria was founded by the Phoenicians and by the Romans was called Magnus Pontus. Population, 1900, 47,202.

**ALMOND** (ä'münd), the fruit of the almond tree, which is native to Africa and Asia, but has been naturalized in America and Europe. There are two varieties, the bitter and the sweet. The sweet almond is an article of food, and when taken in moderate quantities is quite nutritive. Almond oil is obtained from the kernel of either the bitter or the sweet species, and is alike valuable for medicine and as a perfume. Prussic acid is obtained from the bitter almond.

**ALOE** (äl'ö), the name of a number of plants belonging to the order of lilyworts, some of which are not more than a few inches high, while others attain a height of thirty feet. The different species include herbs, shrubs, and trees, and are characterized by erect spikes or clusters of flowers. In the West Indies they serve as hedges. The juice is purgative in large doses and laxative in small quantities, and the fibers yield a product useful in making coarse cloth and cordage. See **Agave**.

**ALOES WOOD**, or **Eagle Wood**, the inner part of the trunk of trees native to the tropical parts of Asia. These trees are supposed to be the *lign aloes* mentioned in the Bible. They yield a fragrant resinous substance, which has a pleasant odor when burned, and is highly prized as a medicine by Asiatic people. Several species of this class of trees are found, some of which yield wood that takes a high polish and is used for ornamental work. The younger wood is white and almost devoid of scent,

while the older growth has a dark color and yields the most fragrant resinous substances.

**ALPACA** (äl-päk'ä), an animal native to the mountain regions of Peru and Chile, where it subsists on the coarse and scanty forage growing on the sterile soil. It is shaped much like a sheep, but is larger, and its color varies from grayish white to almost black. The wool is soft and silky, usually light chestnut brown,

ALPACA

nearly a foot long, and is strong and almost as fine as that of the Cashmere goat. Thin cloth called alpaca is made from alpaca wool mixed with cotton or silk. It is an important article of commerce, and is used largely for shawls, light clothing, and umbrellas. The alpaca is a mammal of the cud chewing class, and is classed with the same family as the camel. Its flesh is pleasant and wholesome.

**ALPENA** (äl-pē'na), a city of Michigan, county seat of Alpena county, on the shore of Lake Huron, at the head of Thunder Bay, on the Detroit and Mackinaw Railway. It has an excellent harbor and enjoys considerable trade advantages. It is the seat of a United States fish hatchery, and has a fine public school system, numerous churches, and several libraries. There are manufactures of furniture, machinery, cigars, canned fruit, and clothing. Electric lights, rapid transit, waterworks, sewerage, and several parks are among the conveniences. It has an extensive export trade in lumber. The first settlement in its vicinity was made in 1835, and it was incorporated in 1871. Population, 1904, 12,400; in 1910, 12,706.

**ALPHA AND OMEGA** (äl'fä ô-mē'gä), the first and last letters of the Greek alphabet, used as a symbol to denote the Divine Being, and often made to signify the beginning and

the end, or the first and the last of anything. The term is also used to signify the chief aim, as: "Ambition was the Alpha and Omega of his existence."

**ALPHABET** (äl-fä'bět), a list of symbols that represent to the eye the sounds heard in speech. The name originated from the first two letters of the Greek alphabet—alpha and beta. The alphabets of the different languages show marks of wide differences. In the English alphabet and many others are characters to represent both vowels and consonants, but the Hebrew alphabet contains letters only for the consonants, the vowels being distinguished by slight changes in some of the consonant letters. The alphabet of the Cherokee Indians and a number of others represents each syllable by a letter, while the Chinese have no alphabet as that term is understood, but instead use a sign or character for every word in their language. The English alphabet, like most of those of modern Europe, is of Latin derivation, the Latin in turn came from the ancient Greek, and that again from the Phoenician. The Phoenician alphabet is believed to have originated, like the Hebrew, from Egyptian hieroglyphics.

Most of the European alphabets agree in many respects, but some do not represent all the English sounds and do not contain all the letters. The Russian language has many sounds not common to other languages and contains thirty-six letters. The French have not the w; the Portuguese no k and w, and the Italian no k, w, x, and y. In the German alphabet are all the letters common to the English, but they differ somewhat in sound and in the number of sounds represented by the vowels. The English alphabet is both defective and redundant, and is a very imperfect instrument to serve the purpose for which it is intended. Its imperfection is at least partly due to a want of characters to represent all the simple sounds, and in having more than one symbol for the same sound. However, since sounds change as well as grammatical forms, it may never become possible to secure a perfect alphabet in any language.

**ALPS** (älp), the most extensive system of mountains in Europe, covering a region of 90,000 square miles, which lies chiefly in Italy, France, Germany, Austria, and Switzerland. The average height is about 7,700 feet, and many of the summits extend far above the snow line, and are covered with perpetual snow and ice. Mont Blanc, 15,781 feet, and Mont Rosa, 15,217 feet, are the culminating peaks, but several others rise almost as high. The system of

ranges is grouped as Eastern, Western, and Central Alps. They occupy the form of a semi-circle, with the Apennines, Balkans, Vosges, Hartz, and Carpathians extending out from the principal chain. On the north is the great glacier called Mer de Glace, which is five miles wide, fifteen miles long, and 100 feet thick. Other glaciers abound in different parts of this region of snow-capped peaks, from which great masses of snow and broken ice move into the valleys, bearing with them rocks and trees, and destroying many objects in their way. Forests and villages have often been buried beneath the avalanches of snow and ice, and when melted they have caused great floods in the valleys. There are now many roads leading over the Alps, some passable for carriages, and others only for travelers on foot. A number of these highways were built by Napoleon to convey his army and supplies over the Alps to the country beyond.

In ancient times it was thought a great feat to cross the Alps, the most successful exploit of the kind being achieved by Hannibal at the passage of the Little Saint Bernard in the year 218 B.C., when he set out from New Carthage to invade Italy. The Duke of Alva led 10,000 men over Mont Cenis in 1567, and in 1800 Napoleon crossed from Switzerland into Italy with 30,000 men. All the mountains being barren and covered with snow, it was thought a remarkable piece of military skill to take an army with horses, cannon, ammunition, and supplies safely over dangerous precipices and land them securely on the other side. In recent times railroads have been constructed over two mountains, and two great tunnels have been built for other railways. Saint Gothard Tunnel, leading from Switzerland to Italy, is the largest railroad tunnel in the world, being nine and one-half miles long. Next to it is Mont Cenis Tunnel, which is nearly eight miles in length. Vegetation in the Alps is varied, owing to the great altitude, and there are valuable deposits of iron, manganese, marble, and many other minerals. With the ascent of every thousand feet is a marked difference of temperature, until the region of perpetual snow shuts out all signs of plant life. The chamois and the mountain goat are animals peculiar to the Alps.

**ALSACE-LORRAINE** (äl-säs'lö-rän'), an imperial territory of the German Empire, situated north of Switzerland and east of France, and including an area of 5,668 square miles. The region lies largely in the valley of the Upper Rhine, is traversed by a network of railroads, and its inhabitants engage largely

in agriculture, fruit growing, and manufacturing. It was a part of the kingdom of Lothaire in the 9th century. When his dominions were partitioned between France and Germany in 969, it became an object of contention between these two powers, and has since been a source of dispute at various times. The region was the scene of several decisive battles in the Franco-German War of 1870-71. Strassburg and other fortified cities were besieged and captured by the German army. At the peace negotiations, Germany demanded the cession of Alsace together with what is called German Lorraine, this being one of the early conditions of peace laid down by Count Bismarck, and was accepted by M. Thiers, and afterward ratified by the national assembly at Bordeaux. The language spoken is German and the people are prosperous. Compulsory school attendance laws and a system of free schools are maintained. Strassburg, a beautiful city on the Upper Rhine, is the capital and chief commercial center. Population, 1905, 1,814,564.

**ALTAI MOUNTAINS** (äl-ti'), an important range of mountains in Asia, forming a part of the boundary between China and Siberia. Among the great rivers having their sources in these mountains are the Obi, Irtish, Yenisei, and Amur. The different chains lie partly in Russian and partly in Chinese territory. Byeluka is the highest peak, elevation 11,000 feet. A celebrated trade route from Peking to Saint Petersburg crosses these mountains some distance southwest of Lake Baikal, but it is not used as extensively as formerly, owing to the construction of the Trans-Siberian Railway. The Altai Mountains are rich in minerals, including iron, copper, silver, gold, and petroleum. Many of the people inhabiting the mountain region are Russians. Barnaul is the chief city.

**ALTAMAHA** (äl-tä-mä-hä'), a river in Georgia, formed by the confluence of the Oconee and Ocmulgee rivers. Its general course is southeast through a sandy plain, and it flows into Altamaha Sound, an inlet from the Atlantic. The Ochopee is its principal tributary. Darien, a thriving commercial town, is about 12 miles above its entrance into the sea.

**ALTAR** (äl'tur), an elevated place of worship in Christian churches. Altars are constructed of wood, stone, or marble, though they are of great variety in shape and structure. Most of the Protestant churches have not retained the altar, but generally apply the same name to the table-like structure on which communion is offered. The altar is still used in some of the Lutheran churches, and both the

SCENERY IN THE ALPS.

CHILLON AND THE DENT DU MIDI, CANTON OF VAUD, SWITZERLAND.

Roman and Greek churches contain altars. Pope Sixtus II. erected the first stone altar, and it is thought that Saint Wolstand introduced stone altars in England. The ancient Greeks and Romans had a number of altars in their places of worship, each dedicated to some particular deity, and sacrifices and blood offerings were made on altars in many countries, especially among the heathen. In some nations the altar was looked upon as a refuge in the time of danger. The Jews regard the altar a sanctuary.

**ALTENBURG** (äl'ten-böörg), a city in Germany, capital of Saxe-Altenburg, near the Pleisse River, about 24 miles south of Leipzig. It is the seat of several educational institutions and has a fine art gallery, a museum, and a hospital for the poor. Several railroads and manufactures of woolen goods, toys, cigars, and clothing make it important as a commercial center. Population, 1905, 38,818.

**ALTO** (äl'tö), a term used in designating voice, or pitch of sound. The term is applied to the lowest female voice, having a compass of about an octave and a half, and the term contralto signifies a tone quite similar, being the voice between the tenor and soprano. The term alto was formerly applied to the highest male voice.

**ALTON** (äl'tun), a city of Illinois, in Madison county, on the Mississippi River, twenty-one miles above Saint Louis. The city occupies a fine site about 200 feet above the river, and is on the Chicago and Alton, the Chicago, Burlington and Quincy, and other railways. It is a port city of entry, has extensive steamboat connections, and is an important trade center. Among the manufactures are quarry products, machinery, furniture, tobacco products, clothing, and earthenware. The streets are substantially paved with brick and asphalt. It has systems of electric lights and waterworks, a park, several libraries, and an extensive system of street railways. The city has excellent schools and churches, and is connected by electric railroad with Upper Alton, the seat of Shurtleff College, a Baptist institution founded in 1827. The census of 1910 accords Upper Alton a population of 2,918, while Alton has a population of 17,528.

**ALTONA** (äl'tö-nä), an important city of Germany, in the province of Schleswig-Holstein, on the Elbe River, and connected by railroads and electric car lines with Hamburg. It has excellent public schools, an observatory, an infirmary, a mint, several colleges, and many libraries. Among the chief buildings are the palace of justice, the city theater, the customhouse, and several cathedrals and other churches. The

manufactures include tobacco, sugar, soap, cordage, silk and cotton textiles, chemicals, and leather. It has an excellent harbor, modern municipal improvements, and a large domestic and foreign trade. The city was founded by the Danes as a rival to Hamburg, but in 1867 came into possession of Prussia. Population, 1905, 168,320.

**ALTOONA** (äl-töo'na), a flourishing city of Pennsylvania, in Blair county, near the Alleghany Mountains, on the Pennsylvania Railroad. It is an extensive commercial and manufacturing center, and produces locomotives, railroad cars, ironware, boilers, tobacco products, furniture, and machinery. About 7,500 persons are employed in the factories. The city has a fine public library, municipal waterworks, electric street railways, and pavements of stone and macadam. Lakemont Park is a fine public resort, and near the city is the famous Horseshoe Bend. The Pennsylvania Railroad Company founded Altoona in 1850. Population, 1900, 38,973; in 1910, 52,127.

**ALTORF** (ält'ôrf), or **Altdorf**, a city in Switzerland, capital of the canton of Uri, near the southern extremity of Lake Lucerne. It is nicely located at the foot of the Grünberg. The surrounding country is beautified with gardens and orchards. It is the seat of a monastery and has several modern school buildings. A fine bronze statue of William Tell ornaments the place where he is said to have shot the apple placed on the head of his son. Altorf is located on the railroad that passes through Saint Gotthard Tunnel, about 20 miles south. Population, 1908, 2,980.

**ALTRUISM** (äl'tröö-izm), a word coined by M. Comte and adopted with decided approval by Herbert Spencer. It is used to express that theoretical condition of human principle which the benevolent aim to attain in relation with their fellows. In popular use the term implies the finding of one's own highest welfare in seeking the welfare of others.

**ALUM** (äl'üm), a whitish astringent saline substance used in the arts and in medicine. Its constituents are alumina, alkali, sulphuric acid, and water. There are three general classes of alum, these depending on whether the alkali contained is potash, ammonia, or soda. Though found in a natural state, the alum of commerce is manufactured. In a natural state it is obtained from alum ore, which occurs in the lower coal measures. It was known and manufactured fully six centuries ago in Syria and other parts of Eurasia. Burnt alum is what remains after the water is taken out by heat, and in this form is used as a caustic.

**ALUMINIUM** (äl-û-mîn'ĩ-ŭm), or **Aluminum**, a ductile, malleable, sonorous metal of a whitish color. Though the most abundant of all the metals, it was not discovered until in 1827. It is found in slate, clay, mica, spar, and many other mineral substances, and until recently was not extensively manufactured owing to a lack of machinery with which to make its production sufficiently inexpensive. Electricity is employed largely in its manufacture from clay, since the process requires a very fierce heat, and the currents generated in some factories attain as high as 15,000 amperes and 30,000 volts. It can be drawn easily into fine wire, and may be converted into very thin foil by a process of rolling. In manufacture it is used with other metals for ornaments, scientific instruments, bells, and guns, and is mixed with different metals, such as copper, to serve very useful and ornamental purposes. Within recent years it has gone largely into the construction of bicycles, scientific instruments, chains used in mining, bath tubs, and automobiles. In large factories it has been successfully alloyed with steel in manufacturing war vessels, and a class of torpedo boats are constructed largely of it. Since it is the lightest in weight of all metals and yet exceedingly durable, it can be seen why its use is constantly increasing.

**ALUMNUS** (â-lŭm'nŭs), plural **Alumni**, a term used to designate a person educated at a school, university, or other place of learning. Thus, an alumnus of a particular school implies one whose education was obtained there by graduation.

**ALUM SHALE** (äl'ŭm shāle), or **Alum Stone**, a mineral consisting of clay combined with iron pyrites and mixed slightly with carbon or bitumin. This mineral is weathered by exposure to the air and rain, causing a dissolution of the pyrites and a union of the alumina with the sulphur, yielding a compound from which limonite and alum are obtained. In practice the shale is crushed before being exposed to the weather, or by burning slowly and leaching it.

**AMALGAM** (â-mäl'gam), a term applied to a class of alloys in which one of the combining metals is mercury. Though mercury readily unites with gold and silver, it does not combine with iron even when heated, and, for this reason, is used to separate gold and silver from the ores, the process being called amalgamation. When properly applied, mercury dissolves and combines with the precious metals and separates them from the waste matter, and afterward is itself driven off by heat. Numerous forms of amalgams are employed in the

arts. In this way zinc and tin are prepared for the rubbers of electrical machines, copper and cadmium for uses in dentistry, silver and gold for plating and resilvering, and tin for preparing mirrors. The process of effecting amalgamation differs widely, some forms being produced by rubbing together the two metals, while others are the result of applying electricity. Amalgamations are effected both in solids and liquids.

**AMANA COMMUNITY** (äm'a-na kôm-mŭ'nĭ-tŷ), a German-American society whose origin dates back to the 18th century. The most successful community now known is located in the northeastern part of Iowa County, in the State of Iowa. The members own in common a tract of about 26,500 acres of land, though less than two thousand persons belong to the society. They engage in farming, stock raising, and manufacturing on a large scale, and share the profits in common. They maintain well established schools and churches, and have a number of charitable institutions. The society has attained a reputation for excellence in the manufacture of woolen goods and other articles of commerce.

**AMARANTH** (äm'a-rānth), an order of plants containing nearly 200 known species, native to tropical and temperate countries, but most common in the tropics. The flowers are composed of separate sepals opposite the stamens, usually one-celled anthers, and a single ovary with one or more seeds, and are surrounded by dry, membranous bracts. The cockscomb, love-lies-bleeding, prince's feather, and globe amaranth are common kinds. The name *amaranth* is frequently applied in poetry to an imaginary flower supposed never to fade, and which serves as an emblem of immortality.

**AMASIA** (â-mä'sĕ-â), a city of Asiatic Turkey, on the Irmak River, 200 miles southwest of Trebizond. The surrounding country is fertile and well adapted to silk culture and fruit growing. It has several bazaars, numerous mosques, and a Mohammedan university. In the vicinity are ruins of an old castle and archaic remains. Strabo, the geographer, was born here. Population, 30,000.

**AMATITLAN** (ä-mä-tĕ-tlän'), a town in Guatemala, Central America, 15 miles south of the city of Guatemala. It is located on the transcontinental railroad passing from the Caribbean Sea to the Pacific Ocean, hence has a growing trade in produce, especially in salt, cochineal, fruit, and raw silk. Near it is Lake Amatitlan, which is three miles wide and nine miles long. The town was founded by Jesuits, who promoted agriculture and stock raising. The surround-

ing country produces large quantities of sugar cane. Population, 8,970.

**AMAZON** (ăm'a-zôn), the largest but not the longest river in the world, extending nearly across the northern part of South America. It is formed by a large number of head streams in the Andes, drains an area of about 2,500,000 square miles, and has an estimated length of 3,500 miles. It flows into the Atlantic at the equator, where it is 200 miles wide; 1,000 miles from the ocean it is four miles wide, and 2,000 miles from the ocean its width is about one mile. Among the chief tributaries are the Napo, Rio Negro, Jurua, Madeira, Japura, Tapajos, Xingu, and other streams. The Amazon and its tributaries afford about 30,000 miles of water surface suitable for navigation. In its valley is some of the most luxuriant vegetation on earth, being rivaled only in the equatorial region of Africa, and within its forests dwell many kinds of wild animals. The waters of the river system contain an abundance of fish. In the rainy season its banks and the lower courses of its larger tributaries are overflowed, and a large extent of country takes on the appearance of a vast inland sea. Large tracts of country traversed by the Amazon and its tributaries have not been carefully explored, but its basin is known to contain valuable natural resources, such as minerals, timber suitable for construction, and large tracts of fertile land. It is certain that the Amazon basin contains all the natural resources requisite to support vast populations. It is connected with the Orinoco by the Negro and Cassiquiare rivers. Yanez Pinçon discovered the Amazon in 1500, but Francis Orellana, one of Pizarro's officers, first navigated it in 1541. In his report is a description of a nation of female warriors, or Amazons, with whom he engaged in several wars, and from whom the river received its name.

**AMAZONAS** (ä-mä-zō'näs), the largest province of Brazil, situated in the northwestern part of that country. It is traversed by the Amazon, has an area of 733,000 square miles, and a population of 162,000. The name is also applied to a department in the northern part of Peru, of which Chachapoyas is the capital.

**AMAZONS** (ăm'a-zōnz), the mythical name of a warlike race of women who lived in Asia Minor, near the Black Sea. They were governed by a queen, and, to facilitate the use of the bow, burned their right breast. In Greek mythology it is related that Hercules defeated them, and that Theseus took captive their princess, Antiope. The Amazons fought on the side of Troy in the Trojan War, and

their queen, Penthesilea, was killed in a combat with Achilles. Among the many sculptures of the Amazons is that of August Kiss (1802-65), en-

AMAZON, BERLIN.

titled "Mounted Amazon Attacked by a Tiger," now in the Museum of Berlin, Germany.

**AMBALA** (üm-bä'lä), or **Umballa**, a city in India, in the Punjab, 150 miles northwest of Delhi. It has convenient railroad facilities and an extensive trade, and is surrounded by a fertile country. Its chief buildings are a hospital, a Presbyterian church, a dispensary, and the government house. Ambala was founded in the 14th century. Population, 79,300.

**AMBASSADOR** (ăm-bäs'sä-dēr), a minister of the highest rank sent by a nation to the capital of another to represent there the interests of his country. • Ambassadors are termed extraordinary when they are sent on a special mission, and ordinary when sent permanently to the seat of a foreign country. The United States did not appoint ambassadors until within recent years, but there was representation at foreign courts by officers termed ministers plenipotentiary, who were appointed by the President with the approval of the Senate. In 1893 the Diplomatic and Consular Appropriation Bill empowered the President to raise to the rank of ambassador extraordinary the American ministers accredited to any country which should previously confer a similar promotion upon its representative at Washington. Accordingly, Great Britain, Germany, Italy, and France raised their ambassadors at Washington to ambassadorial rank, and the representatives at the courts of Saint James,

Berlin, Paris, and Rome were similarly promoted. Japan and several other countries have since named ambassadorships.

**AMBATO** (ăm-bă'tô), a town of Ecuador, in the province of Leon, 75 miles south of Quito. It is located on the northeastern slope of Mount Chimborazo. It has a growing trade in cochineal and grain, and mining is carried on in the surrounding country. In 1698 it was destroyed by an eruption of Cotopaxi. Population, 14,000.

**AMBER** (ăm'bēr), a hard substance, usually yellow, but sometimes clouded with red or brown. It is brittle, yields easily to the knife, and is translucent and sometimes transparent. Amber is highly electrical, on account of which the Greeks called it *elektron*, and later the word *electricity* originated from it. It is obtained in oceanic and tributary waters, from which it is taken by divers, but also occurs in bituminous beds of wood. The origin of amber is assigned to the remains of timber and other plants that grew in remote ages, perhaps in the Pliocene. Many plant and animal remains have been found in it, about 163 of the former and over 800 of the latter; fully two-thirds of the organisms represented are now extinct. Amber is sold at from \$2 to \$75 per pound, depending upon its quality. It is used for making ornaments, tobacco pipes, beads, and other articles. An imitation of amber called amberine is a valuable product, and is harder and tougher than the genuine.

**AMBERG** (ăm'bērg), a city of Germany, in Bavaria, 32 miles north of Ratisbon. Through it flows the Vils River, and a railroad line connects it with Nuremburg and other important commercial centers. Earthenware, woolen cloths, and machinery are its chief manufactures, and the government maintains here a manufactory of arms. It has a library of 35,000 volumes, an industrial school, and several fine churches. Population, 1905, 24,303.

**AMBERGRIS** (ăm'bēr-grēs), a solid, fatty, inflammable substance derived from the intestines of the sperm whale. It has a gray or blackish color, the shades being variegated like marble, and possesses a peculiar earthy odor. The product is met with near the sea-shore and in the abdomen of the whales. It is an important article of commerce, and is used largely in the manufacture of perfumes. Genuine ambergris emits a fragrant smell and commands a high price.

**AMBOYNA** (ăm-boi'na), or **Amboina**, an island in the Indian Archipelago, classed with the Molucca group. The chief products include fruits, cloves, nutmegs, indigo, sago,

cocoanuts, and sea-shells. It is inhabited by natives of the Malayan race and a number of Chinese and Europeans, and is a possession of Holland. The city of Amboyna, on the Bay of Amboyna, is the capital. The island has an area of 280 square miles; population about 50,000.

**AMBROSIA** (ăm-brō'zhà), in mythology, the food and drink of the gods, and supposed to confer immortal youth. It was not only used for food and drink, but was employed to anoint the gods, and in it they bathed themselves. It was sometimes served to the mortals who were favorites of the gods to give them strength, and with it the hair of Venus and Jupiter was anointed. Later writers say that nectar was the drink and ambrosia the food of the gods.

**AMBULANCE** (ăm'bũ-lans), a covered wagon used in large cities for the conveyance of sick or wounded persons to the hospital. In times of war the name is applied to moving field hospitals, especially such as are constructed by the Red Cross and other societies. These are stationed at the rear of troops that engage in battle. Persons wounded in action are carried hastily to ambulance wagons and conveyed to the field hospital, where they are out of range of artillery fire and are treated by army surgeons. Ambulance wagons were first used in the French army in 1792. They are now in universal use in times of war, and all large cities employ ambulance wagons for the police department to convey both persons and animals that have been injured or wounded.

**AMENDMENT** (ă-mënd'ment), in judicial proceedings, a term applied to the correction of errors or the addition offered in the pleadings of a cause. It is also used to designate additions to the constitution of a society, State, or nation. In the Constitution of the United States the following conditions govern the addition of amendments to that document: "The Congress, whenever two-thirds of both houses shall deem it necessary, shall propose amendments to this Constitution, or, on the application of the legislatures of two-thirds of the several states, shall call a convention for proposing amendments, which, in either case, shall be valid to all intents and purposes as part of this Constitution, when ratified by the legislatures of three-fourths of the several states, or by conventions in three-fourths thereof, as the one or the other mode of ratification may be proposed by the Congress; provided, no amendment which may be made prior to the year one thousand eight hundred and eight shall in any manner affect the first and fourth clauses in the ninth section of the first article;

and that no State, without its consent, shall be deprived of its equal suffrage in the Senate."

**AMERICA** (ă-mĕr'ĭ-kă), the name applied to the land masses of the western hemisphere, which extend from an unknown region in the Arctic Circle to about 55° south lat. The Isthmus of Panama, a neck of land about twenty-eight miles wide at its narrowest point, separates the continent into two grand divisions, known as North and South America. America is bounded on the north by the Arctic Ocean, east by the Atlantic, which separates it from Europe and Africa, south by the Antarctic, and west by the Pacific, which separates it from Asia. The extent from north to south, from the ice fields of the Arctic regions to the southern extremity of Patagonia, aggregates 10,500 miles, and the greatest width is about 3,250 miles. There is a total land surface of 16,237,535 square miles. See **North America**, **South America**, **Central America**.

**AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE**, a scientific society organized and maintained in the United States. The forerunner of this organization was the association of American Geologists, which was organized in Philadelphia in 1840, and at a meeting held in Boston two years later its scope was enlarged and it became the Association of American Geologists and Naturalists. In 1847 the name was changed to American Association for the Advancement of Science, and to encourage and promote scientific work was declared to be its purpose. While there is no bar which would prevent any person becoming a member, the membership is limited in practice to citizens of the United States and Canada. The nine sections into which the association is divided are mathematics and astronomy, physics, chemistry, mechanical science, geology and geography, zoölogy, botany, anthropology, and economic science and statistics. The chief executive officer is the president, assisted by nine vice presidents, each of whom presides over one of the departments. The society meets annually in the summer in some city of North America, the sections holding separate sessions, and each year the proceedings are published. The reports contain information of great scientific value.

**AMERICAN BEAUTY.** See **Rose**.

**AMERICAN FEDERATION OF CATHOLIC SOCIETIES**, an organization promoted by the Roman Catholic Church, and whose headquarters are at Cincinnati, Ohio. The purpose of this organization is declared to be "the cementing of the bonds of Federal union among the Catholic laity and the Catholic societies of

the United States; the fostering and protecting of Catholic interests and works of religion, piety, education, and charity; the study of social conditions; and the encouragement of the spread of Catholic literature and of the circulation of the Catholic press."

**AMERICAN FEDERATION OF LABOR**, an organization of trade unions, whose object is to improve the condition of wage workers. It may be considered the successor of the Knights of Labor, a similar industrial organization. The first convention recognized as official was held in Pittsburg, Penn., in 1881, at which it was declared to be the Federation of Organized Trade and Labor Unions of the United States and Canada, and the present name was adopted at a trade-union meeting at Columbus, Ohio, Dec. 8, 1896.

On Jan. 1, 1908, the American Federation of Labor included 825 local unions, 473 city centrals, 26 State federations, and 101 national and international unions. The United Mine Workers of America continues to be the largest affiliated union, and others of great numerical strength are the Cigar Makers' International Union, the Brotherhood of Carpenters and Joiners, the Granite Cutters' National Union, and the International Typographical Union. In January, 1908, the membership, excluding all duplicates, was placed at 1,850,000. Samuel Gompers is president, with headquarters at Washington, D. C., and his publication, *The American Federationist*, is the official organ.

The primary object is to improve the condition and wages of laborers in all industrial pursuits, for which purpose unions of all classes of wage workers are to be organized and maintained. It is sought to form favorable public opinion through the press, platform, and legislatures, and to secure a reduction in the hours of labor to the toilers, the avowed purpose being to extend industrial progress and improve the status of civilization. It is sought to organize women wage workers, exclude Chinese immigration, establish shorter hours and better remuneration, and protect children under fourteen years of age from labor in factories and mines. To obtain the ends for which organization is maintained, funds are raised by assessment of its members. While it is recommended that all unions seek to prevent strikes and boycotts, they are permitted under extenuating circumstances, and assistance is given to affiliated organizations when necessarily engaged in protracted struggles to secure relief. The union labels being looked upon as important designations, efforts have been made by the executive committee to protect and legalize them.

**AMERICAN FORESTRY ASSOCIATION**, a society in the United States whose purpose is to promote interest in the forest resources of that country and its territories. It was organized in 1882 and incorporated in 1897, and has a membership of about 2,000. Annual meetings are held, and at these important topics relating to forestry are discussed. The aim is to influence public sentiment in favor of planting trees, preserving forests, and promoting legislation to accomplish these ends. This organization has accomplished much for the welfare of the country by arousing interest to the extent that Congress has been induced to increase the timber reservations, both in number and extent, and the nation and many states have enacted laws to encourage the planting of trees and the protection of forests. *Forestry and Irrigation* is the official organ of this society.

**AMERICAN INDIANS.** See **Indians.**

**AMERICAN INSTITUTE**, a society organized in New York City to promote domestic industries. It was founded in 1828 with the purpose of aiding in the development of the State, but ultimately the aim became broader and encouragement was given to agriculture, arts, manufacturing, and commerce in the entire country. Interest is promoted by fairs and exhibitions. This organization early recognized the value of the McCormick reaper and other useful inventions, such as the stocking loom, the telephone, the metallic lifeboat, the telegraph, and the milk separator, and by its recommendations and public reports stimulated interest in the use of these and others valuable in the productive industries.

**AMERICANISMS** (ă-mēr'ī-kān-iz'm), a term applied to certain expressions in the English language used extensively in the United States. They consist chiefly of words coined in America, or of words and terms obsolete in Great Britain, or which have been modified in meaning by usage. Some words and idioms are local, while others have come into general use. The following embraces a representative list, though it does not include all the Americanisms:

Advantage, as a verb instead of profit.  
 Backwoods, a partially cleared forest region.  
 Baggage car, instead of luggage van.  
 Blizzard, a storm of snow or sleet.  
 Bogus, meaning false, counterfeit, fraudulent.  
 Boss, an employer of laborers, a leader.  
 Broncho, a western horse of small size.  
 Bug, a beetle.  
 Buggy, a vehicle with four wheels.  
 Bulldoze, meaning to intimidate.  
 Buncombe, used in the phrase to "speak for Buncombe," a common quotation, meaning to speak only to catch applause or favor.  
 Bureau, a dressing table with drawers.  
 Calculate, to think, to suppose, to believe.  
 Calico, meaning prints, printed muslin goods.

Canebrake, a thicket of canes.  
 Canyon, a deep depression or gorge.  
 Caucus, a preliminary meeting of politicians, held either by the members of a party in a voting precinct, or by members of a convention or legislative body.  
 Chunk, a part or piece of any material.  
 Clever, meaning obliging or good-natured.  
 Cowboy, a western drover or cattle herder.  
 Creek, a small stream or river.  
 Cracker, a bake or biscuit.  
 Creole, in the Gulf States, a person of French or Spanish descent.  
 Cunning, sly or crafty, pretty or pleasing.  
 Deadhead, to make free use of public conveyances, or to have free entrance to places where admission is charged.  
 Depot, a tramway or railway station.  
 Down East, the New England States.  
 Drummer, a solicitor, a commercial traveler.  
 Dry goods, the articles sold by drapers, mercers, and haberdashers.  
 Dress, the gown worn by a woman.  
 Dude, a dandy, a man dressed in the height of fashion.  
 Endorse, to approve, confirm, sanction.  
 Fall, meaning autumn.  
 Fancy, the opposite of plain or common, as fancy horses, fancy silks, fancy store, fancy dress.  
 Fish dealer, a fishmonger.  
 Fix, to adjust, to put in order.  
 Gerrymander, a word derived from the name of Elbridge Gerry, a signer of the Declaration of Independence, who devised a scheme to divide Massachusetts into districts in such a manner that the political party to which he belonged could elect a majority of the General Assembly. The term is now applied to the arrangement of political divisions in the interest of one party over its opponent, and in such instances it is said that the district so organized has been gerrymandered.  
 Given name, the first or Christian name.  
 Hang around, to be near to or loiter about a place.  
 Hardware merchant, an ironmonger.  
 Help, a servant, servants, or service.  
 Homely, plain, simple, unadorned.  
 Hustle, to hasten, to hurry.  
 Improve, to ameliorate real estate by care or cultivation.  
 Jew, to haggle with the view of getting a better bargain.  
 Johnnycake, bread or cake made of Indian cornmeal.  
 Lasso, the art of catching horses or cattle with a rope.  
 Loafer, a vagrant, a lounge.  
 Lobby, to attempt to influence legislation by the personal solicitation of the members of a legislature. *To lobby through* is to get a bill adopted by such influence.  
 Logrolling, a system of management by which a member of a political party or a legislative body attempts to secure advantage for or the adoption of a favorite measure.  
 Lot, an allotment, a small piece of land.  
 Lynch law, capital punishment executed without legal authority or without a trial, either by a mob or by the populace.  
 Mail, used instead of post.  
 Moccasins, a shoe of soft leather, either made to button or to lace, and sometimes provided with a sole.  
 Notions, small wares.  
 One-horse, anything of little importance.  
 Pantaloon, meaning trousers.  
 Pickaninny, a small Negro child.  
 Platform, a declaration of the principles upon which a person, a sect, or a party proposes to stand, each division of which is called a *plank*.  
 Posted-up, to be well informed.  
 Rooster, the domestic cock.  
 Saloon, a taproom.  
 Sleigh, a sledge; sleigh riding instead of sledge driving.  
 Smart, meaning considerable or important.  
 Span, from the German, *gespann*, meaning a pair of horses or mules.  
 Stampede, to flee suddenly.  
 Store, a shop, as a drug store, a book store.  
 Suspenders, used instead of braces.  
 Succotash, maize and beans boiled together.  
 Tenderfoot, a western term, meaning a newcomer.

Transient, a stranger, a traveler.

Truck, small produce grown in gardens.

Typist, one who can operate a typewriter.

Wilt, to droop, to wither, to decay.

Woods, meaning a wood.

**AMERICAN LITERATURE**, the written and printed productions of American writers. The term is popularly applied in the United States to the productions of writers confined within the area or under the jurisdiction of that country, but in a broader sense it applies to the collective writings of all Americans. In the latter sense it embraces the literature of Canada, Mexico, Brazil, and the other American countries. The literature of Canada is more nearly associated with that of England than that of the United States, a condition arising from its colonial dependence, but, like the latter, is largely in the English language. The writings of the other American countries, except Brazil, are practically all in the Spanish, while those of Brazil are in the Portuguese. In the scope of this article it is possible only to give an outline of the literature of the United States. For Canadian literature, see Canada, subhead LITERATURE.

It may be said that the advantage of studying the literature of a nation consists in becoming acquainted with the best thoughts of its best minds. Such writings reveal to us the highest ideals and the noblest motives that prevailed while the nation passed through successive periods of growth and development. Thus, the reader becomes influenced by such thoughts and motives as actuated the writers of literature, and the best that is in him is called into action. In the literature of America we find much to commend, especially because it presents to us a remarkable transition from the literature of Europe to the writings that are purely American in thought and sentiment. Though principally in the English, there are a large number of American writings in the German, French, and Swedish. The German writers are particularly numerous, and include such eminent men as John Winebrenner, W. A. Muhlenberg, Carl F. W. Walther, Louis J. R. Agassiz, Henry T. Tuckermann, and Carl Schurz, all of whom are treated in special articles.

American literature may be divided into two general periods: from its beginning to 1840, and from 1840 to the present time. However, the former may for convenience be subdivided into the Colonial, the Revolutionary, and the Transcendental periods. If we speak of literature in the stricter sense, which embraces the writings characterized by beauty of form and artistic style, it may be said that American literature begins properly with Washington Irving. How-

ever, in the Colonial period we have writings closely associated with history, and, for that matter, there is a close relationship between all literature and history.

**COLONIAL PERIOD.** The early settlers were men of action, using the ax and the musket more than the pen, but we have a number of excellent works dating from the Colonial period, which embraces the epoch included in 1620-1775. Captain John Smith produced the first three books written in America. The first of these, "General History of Virginia," contains an account of the early colonists in America, and was printed in London shortly after the settlement at Jamestown. Smith's second book is a reply to complaints made by the London stockholders of the Virginia Company, and his third, published in 1612, is entitled "Map of Virginia." The writings of Smith consist rather of history than literature, but contain the first Virginian romance in the story of Pocahontas. George Sandys (1577-1644), in Virginia, made a version of Ovid's "Metamorphoses" in 1620, which was really the first purely literary production completed in America.

The establishment of Harvard College in 1636 gave an impetus to educational effort, and the desire for intellectual advancement was further extended by the founding of William and Mary College in 1693 and Yale University in 1701. In 1639 the first printing press was set up at Cambridge, Mass., and the first book printed in America appeared in 1640, entitled "Bay Psalm Book." It was not strictly original, and was edited by a number of eminent colonists, among them John Eliot, who also translated the Bible into the Algonquin language, but it proved very popular and went through many editions. Anne Bradstreet, of Massachusetts, issued a volume of poems in 1650, entitled "Tenth Muse," which was published in an enlarged form at Boston in 1678. William Bradford (1589-1657), Governor of Plymouth, published the first annals of New England, entitled "History of Plymouth Plantation," and John Winthrop wrote "History of New England." Both these works are of immeasurable value in describing the life and times of the colonists, and from them many subsequent writers have drawn inspiration for a number of valuable works, including Whittier's "John Underhill," Longfellow's "New England Tragedies," and Hawthorne's "Scarlet Letter." Samuel Sewall (1652-1730) was the first to denounce the crime of slavery in his tract, entitled "Selling of Joseph."

Many of the colonial writings were by Puritan pastors, and are devoted to a discussion

of the doctrines and history of the colonial church. These include Cotton Mather's "Magnalia Christi Americana," and other works from the same author, all of which are written more or less in the style of Milton. His "Wonders of the Invisible World" was a leading factor in the Salem witchcraft trials, while his "Essays to Do Good" was praised by Franklin, who declared it a potent factor in influencing his life for good. The writings of Cotton Mather embrace 382 publications, but most of them have not been preserved. Roger Williams was the foremost advocate of religious tolerance and a strong sympathizer with those who advocated kind treatment of the Indians, and criticized the intolerance of the Puritans in several excellent writings.

Jonathan Edwards, a student of Yale, minister, and president of Princeton College, attained the foremost place among the early preachers of America. He published "Freedom of the Will," a profound discussion of Calvinism, and "Treatise Concerning Religious Affections," a masterly analysis of the movements of the mind under religious influences. To this period also belongs Benjamin Franklin, who was presented by France with a medal bearing the inscription, "He seized lightning from heaven and the scepter from tyrants." He first attained fame by publishing "Poor Richard's Almanac," which he issued annually for twenty-five years, beginning in 1732. This publication was immensely popular on account of its concise calendars, and in the spaces between the notable days were pungent sayings containing excellent morals, such as, "It is hard for an empty sack to stand upright," "The cat in gloves catches no mice," "One to-day is worth two to-morrows," "Little boats should keep near the shore," "God helps them who help themselves," "He that goes a-borrowing goes a-sorrowing," "Little strokes fell great large oaks," "Dost thou love life, then do not squander time, for that is the stuff that life is made of," and "Who dainties love shall beggars prove." The longest and most interesting of his works is his "Autobiography," but his shorter writings are also of interest, particularly "Dialogue Between Franklin and the Gout," "Story of the Whistle," and his works on scientific subjects, entitled "Papers."

REVOLUTIONARY PERIOD. The literature of the Revolutionary period embraces many excellent works devoted to the discussion of political rights, much of which appeared in the form of speeches by eminent champions of liberty. These include Samuel Adams, Josiah Quincy, Patrick Henry, Thomas Jefferson, Alexander

Hamilton, James Madison, George Washington, and Thomas Paine. The most noted of these writings embrace the works of Thomas Jefferson, who wrote "Notes on Virginia," the "Declaration of Independence," and many able state papers. Alexander Hamilton, of whom Webster said, "He smote the rock of national resources and abundant streams of revenue burst forth," contributed many papers as treatises on government in the *Federalist*, and may be regarded the father of the American financial system. The *Federalist* published at various times a number of contributions from John Jay and James Madison. The latter made the first draft of the national Constitution and published the "Madison Papers," embracing the debates and speeches of the constitutional convention. Madison's "Notes on Virginia" and his first "Inaugural Address" take high rank in the literature of this period. The writings and state papers of George Washington fill twelve volumes, but his "Farewell Address," which was prepared and published in 1796, is the most celebrated. Fisher Ames produced many excellent orations during the administration of John Adams. The best of these were delivered in 1796 and relate to the treaty with Great Britain. Thomas Paine exerted a strong influence on the colonists by publishing his "Common Sense," which was issued immediately preceding the Revolution, and afterward went to France and published "Rights of Man" in reply to Burke's "Reflections," the latter relating to a justification of the French Revolution. Subsequently he forfeited his great popularity in America by publishing "Age of Reason," in which he attacked the Christian religion.

Little poetry of note was produced in the period of the Revolution, and the valor of its heroes remained unsung for more than a generation after independence was secured. The most noted poem of this period is "McFingal," by John Trumbull, which appeared in part in 1775 and in a complete form in 1782, and went through thirty editions in America. Though a fine American political satire, it is rather droll, but has touches of real humor, and was intended as a satire on the Tories of America. Some parts of it have come to us as proverbs, for instance:

"No man e'er felt the halter draw  
With good opinion of the law."

The "Columbiad," an epic in ten books, was published by Joel Barlow (1755-1812), who is also author of the humorous poem, "Hasty Pudding." Timothy Dwight (1752-1817), president of Yale for twenty-one years, is the au-

thor of an epic in eleven books, the "Conquest of Canaan," but is better known by his many church hymns, such as, "I Love Thy Kingdom, Lord." "Yankee Doodle" sprang up in the Revolutionary period, and was first played and sung by the British in derision of the New Englanders, who afterward adopted it as a military air. Francis Hopkinson (1737-1791), a signer of the Declaration of Independence, wrote the humorous ballad, "Battle of the Kegs," and his son, Joseph Hopkinson (1770-1842), wrote the popular song "Hail Columbia." The "Star Spangled Banner," another famous national song, was written by Francis Scott Key at the time the British invaded the United States, in 1814. Philip Freneau (1752-1832) attained fame by his "Wild Honey-suckle," "Indian Burying Ground," and other graceful poems regarded as forerunners of the lyrics of Bryant and Longfellow. The first American man of letters to maintain himself altogether by his writings was Charles Brockden Brown (1771-1810), a Quaker of Philadelphia, who may be regarded a forerunner of Poe and Hawthorne. His best-known writings include "Wieland," a heroic romance, and "Arthur Mervyn," a description of the plague which ravished Philadelphia in 1793.

TRANSCENDENTAL PERIOD. The American writings up to the close of the 18th century were largely imitations of the English models, and the *Edinburgh Review* sneeringly asked, "Who reads an American book?" Though there was no immediate reply that seemed to satisfy, a new era in American literature dawned when Washington Irving published his "Knickerbocker's History of New York." This work appeared in 1809, and not only stood on its own merits, but at once sprang into great popularity. From that time until 1826 Irving busied himself largely with the "Sketch-book," which includes the famous short stories of "Rip Van Winkle" and "Legend of Sleepy Hollow." Other writings by this famous author embrace "Tales of a Traveler," "The Alhambra," "Astoria," "Life of Washington," and "Life of Oliver Goldsmith." James K. Paulding (1779-1860) published "Life of Washington" and a number of novels; Gulian C. Verplanck (1786-1870) published an edition of the "Plays of Shakespeare;" Fitz-Greene Halleck (1790-1867) is the author of "Marco Bozzaris;" Joseph Rodman Drake gave us his poems "Culprit Fay" and "The American Flag;" and Nathaniel Parker Willis (1806-1867) founded the *Youth's Companion*, a publication famous for its literature suitable for youth. To this period of literature belong the

writings of James Fenimore Cooper, who may be regarded the earliest eminent novelist whose style is distinctively American. In 1820 he published "The Spy," the first American historical novel, in which he gave the American public an interesting story of the Revolution. He published "The Pioneers" in 1823, and soon after followed the first of the series of five "Leather Stocking Tales." Cooper himself invented "Leather-Stocking," *Natty Bumppo*, who is represented as a back-woods philosopher and is the most original invention of character added to the world's literature by an American. Subsequently he published a series of sea tales, including "The Pilot," "The Red Rover," and "Wing and Wing." Cooper could not easily endure adverse criticism, and as a defense wrote several tracts against his opponents and brought a number of suits for damages. The romances of the sea and of the forest are his invention, in which he excelled, but in humorous efforts he was not successful. Several poets of this period succeeded in writing single poems that became great favorites, among them "Home, Sweet Home," by John Howard Payne; "I Would Not Live Alway," by William Muhlenberg; "The Old Oaken Bucket," by Samuel Woodworth; and "My Life is Like a Summer Rose," by R. H. Wilde.

William Cullen Bryant may be classed in this period. A poet at the age of nine years, he published a volume of verse at fifteen, entitled "Embargo." His "Thanatopsis," written at eighteen, shows mature thought and stately expression, and its gravity and dignity in blank verse is unexcelled by any recent writer. No one knew better than Bryant how to give interest to the solemnity of the forest and mountain, and to paint the impersonal beauty of nature. His individual poems include "Death of the Flowers," "Forest Hymn," "To a Water-Fowl," and "Fringed Gentian;" while among his stories of interest are "Letters of a Traveler" and "Tales of the Glauber Spa." He made a translation of Homer, spending four years on the "Iliad" and two years on the "Odyssey." Edgar Allen Poe is best known as author of the "Haunted Palace" and of "The Raven," and his best work in prose is his "Tales of the Grotesque and the Arabesque." He is well known as a critic and classed Hawthorne as a great novelist and Longfellow as a worthy poet before either was known to the world. Nathaniel Hawthorne may be regarded the greatest American novelist. His first production to attract attention appeared in 1837 as a part of the series

known as "Twice-Told Tales." At Concord he published "Mosses from an Old Manse" and another installment of "Twice-Told Tales." The "Snow Image," the most beautiful of his tales, appeared some time later. In 1850 he published "The Scarlet Letter," which may be regarded the most artistic product in American literature. The scenes of his writings are laid within the limits of Massachusetts; "Marble Faun" is the only exception. Other well known writings from the pen of Hawthorne include "Great Stone Face," "Grandfather's Chair," "Tanglewood Tales," "House of Seven Gables," "Blithedale Romance," and "Legends of the Province House."

This period of American literature is famous as an epoch of orators, including such eminent statesmen as Daniel Webster, Henry Clay, John C. Calhoun, and Edward Everett. Daniel Webster may be regarded the greatest American orator, and his speeches rank in literature with those of Demosthenes, Cicero, and Burke. His membership in Congress covered a period that called for men of strong intellectual and oratorical powers, and the events connected with his life were such as to bring out to the best advantages his great fertility of mind. The most famous of his orations include the one delivered at the laying of the cornerstone of Bunker Hill monument in 1825; the one at the completion of the monument in 1843; eulogies of Presidents Adams and Jefferson in Faneuil Hall, Boston, in 1826; his reply to Hayne in 1830; and his oration on Washington in 1832. These orations embody the finest sentiments of Americanism, and convey as a central thought that the Union should be preserved at whatever cost. Henry Clay, the *Great Reconciler*, is the author of the Missouri Compromise; of the Act of 1833 settling Nullification, and of the compromise measures of 1850. Calhoun ranks rather as a debater than as an orator, but his sympathies extended more closely to his own section, the South, than to the whole country. A champion of state rights, he contributed the most able arguments in favor of that view in government. Everett belonged to the illustrious orators of Boston, but he did not possess the massive strength of Webster. None of his contemporaries had so complete an education, and his speeches are among the most polished contributed to American literature. Other eminent orators of this period include Rufus Choate, an orator of much intellectual strength, and William Ellery Channing, famous as a leader in the Unitarian movement. The latter is the author of two very able

works: "Life of Napoleon Bonaparte" and "Essays on John Milton."

Ralph Waldo Emerson, the friend of Carlyle, ranks as an eminent writer of this period, and is particularly famous as a factor in the Carlyle-Emerson correspondence. His prose works were mostly delivered as lectures, and include "Society and Solitude," "Representative Men," and "Letters and Social Aims." Many passages in his writings are majestic in thought and rhythm, but his style is the condensed epigrammatic. His oration on the "American Scholar," delivered in 1837, is an epoch-making production, and his chief poems are "Snow Storm," "Concord Hymn," and "Bumble Bee." The transcendentalists, who supported a form of idealism, include Emerson, who may be regarded the greatest of this class of writers. They represent the idealistic in poetry and prose, thus favoring the German philosophy rather than the English materialistic writings. *The Dial*, a periodical published at Concord, was the chief organ of the transcendentalists, and in it were published the chief poems and prose writings of this school. Louise M. Alcott, author of "Little Women," "The Old-Fashioned Girl," and "The Spinning-Wheel Stories," belonged to this class of writers. Other writers include Henry David Thoreau, who found intense enjoyment in simple life and spent two years in a cabin on the shores of Walden Pond, Concord, where he lived as a means of closely observing nature. The best known of his works embrace "A Yankee in Canada," "The Maine Woods," and "Cape Cod." Margaret Fuller (1810-1850) was prominent in this class of writers, and is well remembered by her plea for equality before the law, and by her "Woman in the Nineteenth Century," "A Summer on the Lakes," and "Papers on Literature and Art."

RECENT PERIOD. The second period of American literature, that from 1840 to the present time, begins with the so-called Cambridge poets, whose center was at Harvard College. These writers embrace four of the most famous Americans: Longfellow, Holmes, Lowell, and Whittier. Henry W. Longfellow, though influenced by the literature and historic associations of Europe, is eminently American in the treatment of his subjects. Endowed with an appreciative nature and enriched by college life, select reading, and foreign travel, he has never been surpassed in American literature. In 1841 he published such favorite poems as "The Village Blacksmith," "The Skeleton in Armor," and "The Wreck of the Hesperus," and soon after gave us "The Old Clock on the

Stairs." His greatest poem, "Evangeline," appeared in 1846, and is the story of an Acadian peasant girl. In 1855 he published "Hiawatha," an interesting poem, treating of the legends and traditions of the American Indians, whose plan was suggested by the German translation of the Finnish epic, "The Kalevala." Other writings of Longfellow include "Miles Standish," "Building of the Ship," and "Belfry of Bruges." Oliver Wendell Holmes is particularly famous for his "Autocrat of the Breakfast Table," which appeared in the *Atlantic Monthly* in 1857, and afterward followed "The Professor," "The Poet," and "Over the Tea-Cups." His three novels include "Mortal Antipathy," "Elsie Venner," and "Guardian Angel." "Chambered Nautilus," "Old Ironsides," "The Last Leaf," and "Height of the Ridiculous" are among his excellent poems. James Russell Lowell inherited culture, if that is possible, and acquired an excellent education at Cambridge. He published three books in the autumn of 1848: "Sir Launfal," "Bigelow Papers," and "Fable of Critics." He is not a mountain poet like Bryant, or an ocean poet like Whittier, but touches with great beauty the birds, trees, and flowers. In his poems are included "The Courtin'" and "Indian Summer Reverie." "Among My Books" and "My Study Windows" are excellent critical works. John Greenleaf Whittier, frequently called the poet of anti-slavery, is the favorite American poet of many students. His writings show that he lived a dual life, one in the world of fancy and one in the world of fact, as is shown in his "Bare-Foot Boy" and "In School Days." The first half of his literary career was marked by earnest opposition to slavery, the writings of this period embracing productions both in verse and prose. His "Laus Deo," written when the bells pealed for the abolition of slavery, is the last lyric of this period. "Snow Bound" is a winter idyl, "Maud Müller" and "Among the Hills" are exceedingly graceful, and "Telling the Bees" is the most pathetic of his productions. Whittier ranks with Bryant as a nature poet, but he reflects the calm and beauty of scenic nature, while Bryant relies upon placing strength in the objects of his descriptions.

Harriet Beecher Stowe is famous in the anti-slavery group of writers, and is best remembered by her "Uncle Tom's Cabin," "Dred: A Tale of the Dismal Swamp," and "The Minister's Wooing." Wendell Phillips was the orator of anti-slavery, and devoted his education, wealth, legal abilities, and oratorical powers to the cause he espoused. He was recognized

as the representative of the movement in Faneuil Hall in 1837, which continued active until the Emancipation Proclamation was issued in 1863. William Lloyd Garrison's writings are important in the history of the antislavery movement rather than in literature, but they contain many lofty and inspiring thoughts. The speeches of Charles Sumner, published complete in twelve volumes, are scholarly and powerful arguments and supply almost a complete history of the contest.

William Hickling Prescott takes high rank among the distinguished American historians, and his first famous work is "The Reign of Ferdinand and Isabella." He published "The Conquest of Mexico" in 1843, "The Conquest of Peru" in 1847, and "The History of Philip II." in 1855. No one has surpassed Prescott in his treatment of these themes, but his work was done under great difficulties, owing to the fact that he was partly blind during a large part of his life. George Bancroft is famous among the historians who wrote of the Colonial and Revolutionary periods, and published the first volume of his "History of the United States" in 1834, and finally completed it in 1885. In this work he spent over half a century, consulting the archives of America and Europe for that purpose, and his writings are remarkably accurate in descriptive details. John Lothrop Motley stands preëminent as a historian, and in 1856 published "The Rise of the Dutch Republic," a historical work of vast value. Other writings from his pen include "The United Netherlands" and "Life of John of Barneveld." Francis Parkman is another famous historian. The difficulty under which he labored resembled that of Prescott, and he was confined in a dark room and unable to read for three years. His writings include "The Oregon Trail" and "The Conspiracy of Pontiac." Other famous historians include Jared Sparks, author of "Library of American Biography;" George Ticknor, writer of "History of Spanish Literature;" Horace Greeley, author of "Prayer of Twenty Millions;" and Alexander H. Stephens, writer of "Corner-Stone of the Confederacy." Other names that belong to the group of historians include Benson J. Lossing, Jefferson Davis, John Fiske, John Clark Ridpath, Justin Winsor, Carl Schurz, John Bach McMaster, and Herman Eduard von Holst.

The famous pulpit orators include Henry Ward Beecher, author of "Lectures to Young Men," "Aids to Prayer," and "State Papers." James Freeman Clarke, a Harvard man, published "Ten Great Religions," and Thomas Starr King, the famous Unitarian pastor of Boston,

wrote on religious and patriotic subjects and published "White Hills." David Swing is the author of "Life Immortal" and "Truths for To-day;" DeWitt Talmage published many sermons and religious writings. Chas. M. Sheldon is the author of "In His Steps," "For Christ and the Church," and many other writings.

The recent writers are very numerous. Bayard Taylor, author of "Views Afoot" and "Songs of Summer," and translator of Goethe's "Faust," takes high rank. Walt Whitman won extensive notice by his "Leaves of Grass," which appeared in 1855, and afterward published "Drum Taps" and "Memoranda" during the war. Will Carleton is eminently popular as the author of "Poems of Farm Life" and as a lecturer, while James Whitcomb Riley has attained much popularity. His best-known writings include "Afterwhiles," "Knee Deep in June," and many popular poetical and prose writings in the hoosier dialect. Eugene Field is famous as a writer of poems for children, such as "Little Boy Blue" and "Wynken and Blynken and Nod," but we are also indebted to him for many humorous and satirical writings. Bret Harte is remembered for his "Luck of Roaring Camp" and "Outcasts of Poker Flat;" Joaquin Miller for his "Songs of the Sierras;" and E. E. Hale for his "Man Without a Country." A. E. Sweet, Josh Billings, Artemus Ward, Robert J. Burdette, E. W. Nye, Samuel L. Clemens, and Francis R. Stockton are among the well-known humorists.

The recent essayists include Josiah G. Holland, Charles D. Warner, John Burroughs, and Donald G. Mitchell. Edmund C. Stedman, Edwin P. Whipple, George W. Curtis, and Richard G. White are among the critics. The recent women verse writers embrace Alice and Phoebe Cary, Helen H. Jackson, and Lucy Larcom. Henry James, W. D. Howells, George W. Cable, Thomas W. Higginson, Edward Eggleston, Elizabeth Stuart Phelps, Edward P. Roe, and Henry James Howells are among the recent novelists. The miscellaneous writers embrace Maurice Thompson, Ella Wheeler Wilcox, George Ade, R. H. Stoddard, George Edward Woodberry, Richard Hovey, Thomas Bailey Aldrich, Theodore Roosevelt, Edward S. Ellis, Henry Harland, J. K. Bangs, and Marietta Holly.

**AMERICAN PARTY.** See **Know Nothings.**

**AMERICAN UNIVERSITY,** an educational institution situated in Washington, D. C., which is designed for post-graduate students. It was chartered in 1891, when the citizens of

Washington donated ninety acres of land for that purpose. The institution is under the patronage of the Methodist Episcopal Church. It is governed by a board of trustees of fifty members, among whom are included as ex-officio members the President, Vice-President, Chief Justice of the Supreme Court, and the speaker of the House of Representatives of the United States. The courses of study are designed especially for college graduates, and the bachelor's degree or its equivalent is necessary for entrance.

**AMERICUS** (ă-mēr'ī-cūs), a city in Georgia, county seat of Sumter County, 70 miles southwest of Macon, on the Georgia and Alabama and the Central of Georgia railroads. It has a considerable trade and is surrounded by a fertile country. There are excellent schools and churches, good municipal facilities, and a female college. The manufactures embrace machinery, tobacco products, utensils, earthenware, and clothing. The first settlement in its vicinity was made in 1832 and it was incorporated in 1855. Population, 1900, 7,674.

**AMESBURY** (āmz'bēr-ī), a town in Essex county, Mass., forty-two miles north of Boston, on the Boston and Maine Railroad. It has electric street railway facilities, waterworks, several libraries, and excellent school and church buildings. The manufactures include carriages, boots and shoes, woolen goods, and machinery. It was the home of the poet, John G. Whittier, who removed here in 1836 and made it his residence until his death. Amesbury was incorporated in 1666. Population, 1905, 8,840.

**AMETHYST** (ăm'ē-thīst), the name of a crystallized quartz or rock, usually purple or bluish violet in color. Varieties that are characterized by beauty and hardness command a high price. The color is not always uniformly diffused, and by candlelight it appears less brilliant than in sunlight. The best specimens are brought from Ceylon, Armenia, Arabia, and India. Amethyst is regarded a precious stone, and is used largely in making rings, seals, and other articles of jewelry. The Greeks supposed that it was a protection against drunkenness and recommended that it be worn by those addicted to that habit.

**AMHERST** (ăm'ērst), a town of Massachusetts, in Hampshire County, 23 miles north of Springfield, on the Vermont Central and the Boston and Maine railroads. It is beautifully situated in the valley of the Connecticut River, within sight of Mount Holyoke, and is the seat of Amherst College. It has manufactures of straw hats and a considerable trade in prod-

uce and merchandise. The first settlement was made in its vicinity in 1703. Population, 1905, 5,313.

**AMHERST**, a town of Nova Scotia, capital of Cumberland County, nine miles east of Sackville. It is located on the Intercolonial Railroad and on an arm of Cumberland Bay. Shipbuilding is the chief industry, and coal is mined in its vicinity. Population, 1901, 4,964.

**AMHERST COLLEGE**, an educational institution at Amherst, Mass., founded as the Collegiate Institute of Amherst in 1821, but changed to Amherst College in 1825. The property and endowments are valued at \$2,500,000. It has a faculty of thirty-eight instructors, 420 students, and a library of 78,000 volumes. The institution carries advanced courses of study, and numbers among its alumni some of the most prominent educators of America. It is maintained in the interest of Christian education, having been founded by an association of Congregational and Presbyterian ministers, and about one-fourth of the graduates enter the clergy.

**AMIENS** (ä-mĭ-än'), a city of France, capital of the department of Somme, seventy miles north of Paris. It is finely located on the Somme River, which is navigable for small craft, and has excellent railroad and electrical car line advantages. The streets are regularly platted and paved, and it is the seat of a Gothic cathedral, one of the finest in Europe. It has a fine public library of 100,000 volumes, several parks, and a statue of Peter the Hermit. Amiens is noted for its extensive manufactures of velvet and cotton goods. Other manufactures include silk, linen and woolen textiles, machinery, pottery, and clothing. The Treaty of Amiens, which restored peace between France, Holland, England, and Spain, was concluded in 1802. In 1870 it was taken by the German army, after a decisive victory over the French. Population, 1901, 90,758.

**AMMON** (äm'mŭn), an ancient diety worshiped in many countries of Africa and Europe. The Egyptians celebrated him in temples at Thebes and in the Libyan oasis of Ammonium, and dedicated many statues to his honor. He was worshiped by the Greeks as identified with Zeus, while the Romans associated him with Jupiter. In statuary he is represented as a man with a ram's head.

**AMMONIA** (äm-mō'nĭ-ä), a volatile alkali. It is a colorless gas, having a penetrating, pungent odor and a burning taste. Though combustible, it will not burn in air. It was first made in the Libyan Desert, in Africa, from

decaying animal matter gathered by the Arabs at the temple of Ammon, hence the name ammonia. The name *hartshorn* is frequently applied to this substance from the circumstance that it may be prepared by making shavings of horns. It is now derived chiefly by distilling coal and refuse animal substances gathered promiscuously, such as hoofs, horns, bones, etc. Ammonia is also obtained from vegetable matters, when it contains a considerable per cent. of nitrogen. The chief uses are for medicine, for motive power, and in the manufacture of ice.

**AMMUNITION** (äm-mŭ-nĭsh'ŭn), the primer, powder, and projectiles used in firearms. These articles are made up ready for use in small arms and small cannon, when it is known as *fixed ammunition*, and in the larger guns they are put in separately. The projectile used in a large gun is put in first, after which the powder, handled in a brass case or in cloth bags, is placed, and the primer explodes the charge. Fixed ammunition is put up in cases of brass and pasteboard, or in cases entirely of brass, and in this form is sold on the market, or the cases may be obtained separately and afterward loaded to meet the requirements. The government of most countries supervises and controls the manufacture of ammunition for the army, or it is manufactured to order under careful inspection. Formerly field artillery carried between 150 and 200 rounds per gun with the battery and a reserve of as much more, but at present the quantity kept ready for use is larger, since the rapid-fire and automatic guns make it necessary to have a large supply available. The ammunition in the caissons is used first, and further supplies are drawn from the ammunition columns, the rule being to use the ammunition in the limber only when no other is available.

**AMOEBA** (ä-mĕ'bä), a genus of microscopic animals, belonging to the lowest class of Protozoa. Several species have been described, all of which are viscid like glue, and the specific gravity is little greater than water. An amoeba is an irregular mass of protoplasm, semi-transparent, and has the power of locomotion by means of a streaming movement of the protoplasm. A small portion within the mass, called the *nucleus*, is somewhat darker than the general brown color, and small projections, known as *pseudopodia*, are thrust out at certain points of the body while others behind them are retracted, and it is by these processes that locomotion is possible. The same motion is essential in taking in food, which

is done by the pseudopodia flowing around digestible objects and extracting from them nutritious substances. In this animal the processes of nutrition, sensation, motion, and repro-

AMOEBEA.

Showing how an amoeba is divided in the process of growth.

duction are all performed by a single cell. Its power of sensation is such that it keeps in water of a medium temperature, and moves from the source of light and objects that endanger it. These characteristics have caused it to be selected as the subject of treatises on biological subjects. It is found in pools of water and swamps, and usually clings to some object, such as dead leaves and weeds.

**AMNESTY** (ăm'nēs-tỹ), an act of pardon, the effect of which is that persons guilty of political offenses will not be called upon to answer for them. The amnesty may be either *absolute* or *qualified*. An instance of the latter may be found in the proclamation issued by Napoleon on his return from Elba in 1815, in which amnesty was declared for the benefit of all except thirteen persons, whom he named. Only five amnesties have been issued in the United States. These were all relative to the Civil War, the first by Lincoln and the remaining four by Johnson.

**AMORITES** (ăm'ō-rīts), a powerful nation of ancient Canaan, whose possessions extended on both sides of the Jordan River. The Amorites occupied the whole of Gilead and Bashan, and formed two kingdoms—the northern governed by King Og, and the southern by King Sihon. The former is spoken of as King of

Bashan, and the latter as King of the Amorites. They were conquered by the Israelites, after the death of Moses, under the leadership of Joshua.

**AMOY** (à-moi'), a city in China, on an island of the same name, in the province of Fukien. It is located on the strait of Formosa, near the mouth of the Pei-chi or Dragon River, and ranks as one of the chief seaports on the Pacific, having long been an open port. The harbor is large and deep. It has a growing trade in tea, opium, paper, cotton, and earthenware. Deposits of coal abound in the vicinity. Population, 96,800.

**AMPHIBIA** (ăm-fīb'ĩ-à), the term used to designate a class of vertebrate animals which can live for a considerable time either on land or in water, and which for one part of their existence live in water and at another on land. They include the frog, tortoise, lizard, crocodile, snake, salamander, and many others. In the larval stage they possess gills, and some species, when fully developed, are able to breathe either by the gills or the lungs, and many retain the gills throughout life.

**AMPHITHEATER** (ăm-fĩ-thē'à-tēr), or **Colosseum**, a spacious building, usually oval shaped, used by the Romans for gladiatorial contests, wild beast fights, and other spectacles. The largest of these structures was the Flavian, known as the Colosseum, which was begun by Vespasian and finished by Titus in the year 80 A. D., ten years after the destruction of Jerusalem. This structure is now in a better state of preservation than any other. It covers five acres of ground, and had a capacity sufficient to seat 87,000 persons. The length is 612 feet and the breadth is 515 feet. Titus dedicated it by a celebration lasting a hundred days, during which time 5,000 wild beasts were slain. Many of the amphitheaters were used as castles and for fortifications in the Middle Ages. In modern times the name came to be applied to any oval or circular building with tiers of seats overlooking an arena or a central space.

**AMPUTATION** (ăm-pũ-tā'shũn), in surgery, the removal of any part of the body or limbs on account of disease or injury. An operation of this kind is advisable in cases of serious accidents and diseases, in which life would be endangered if the part were allowed to remain, especially in such diseases as gangrene and malignant growths. Amputations are either *flap* or *circular* with reference to the manner in which the flesh is cut. In the former the flesh is cut in a slanting direction to the bone so as to leave one or more flaps to cover amply the end of the stump, and in the

latter the skin and superficial fascia are divided by the knife around the limb, loosening the skin about three inches, then dividing the muscles and using sufficient to cover the bone. The flesh is removed before the saw is applied. Most surgeons consider an amputation at the joints more serious than in the continuity of the limbs, while an operation at the hip joint and near the vital organs of the trunk need a skillful operator and are attended with considerable danger. Amputations were practiced by the ancient, but a great many deaths resulted because practitioners did not understand the methods of preventing infection, severe bleeding, and blood poisoning.

**AMRITSAR** (üm-rit'sür), a city of India, in the Punjab, 40 miles east of Lahore. It is the capital of a district of the same name and the center of the Sikh religion and learning. An extensive commercial trade is carried on with Central Asia. The chief manufactures are shawls and silks. It is at the junction of several railroads and the seat of a number of schools, a dispensary, and the marble Darbar Sahib, the chief temple of the Sikh faith. Population, 1901, 162,548.

**AMSTERDAM** (äm'stēr-däm), a city of New York, in Montgomery County, on the Mohawk River, thirty-two miles northwest of Albany. It is on the Erie Canal and on the West Shore and the New York Central railroads. It is surrounded by a fertile region, and has an extensive trade in general merchandise. The chief manufactures are carpets, paper, brooms, hardware, vehicles, cigars, and clothing. The streets are substantially paved with stone and macadam. It has electric street railways, waterworks, sewerage, a public library, and other facilities. It is the seat of a fine public school system, several private educational institutions, and a number of excellent church buildings. The first settlement in its vicinity was made in 1778, when it became known as Veedersburg, and it was incorporated under its present name in 1830. Population, 1905, 23,943; in 1910, 31,267.

**AMSTERDAM**, one of the chief commercial cities of Europe, capital of Holland and of the province of North Holland, and the metropolis of the Netherlands. It is situated on an inlet of the Zuyder Zee, ten miles east of Haarlem, and is the converging center of many important railroads. Owing to the low and marshy condition of the site, the greater part of the city is built on piles driven deep into the ground. It is protected by dikes against the tides that rise higher than the level of the city. A system of canals divides it into about

ninety islands, which are connected by nearly 300 bridges.

The city has many excellent and substantial structures, among them the government palace building, erected in 1648. It contains many fine churches, a majority belonging to the Dutch Reformed Church, but the inhabitants include a considerable number of Lutherans, Catholics, and Jews. It is a noted educational center, being the seat of a thoroughly organized public school system, numerous colleges and academies, hospitals, and other public institutions. The chief manufactures are clothing, pottery, lumber products, sailing vessels, glassware, books and printed matter, engines, and machinery. A large majority of the inhabitants engage in manufacturing and commercial enterprises, and the domestic and foreign commerce has long taken high rank. Indeed, it ranks among the leading commercial centers of Europe.

In the 13th century Amsterdam was a small village with a few hundred fishermen, but it rose rapidly with the extension of the Dutch colonial interests. Owing to wars and other causes it declined somewhat in the 18th century, but in the last century it again rose to importance, and now surpasses its former high mark of prosperity. All the modern conveniences, such as telephones, electric lights, waterworks, libraries, and boulevards, have been provided for the convenience and enjoyment of its citizens. Intercommunication is facilitated by electric surface lines, by canals, and by a suburban system of steam railways. Population, 1906, 564,186.

**AMU**, or **Amu-Darya**, See **Oxus**.

**AMUCK** (ä-mük'), or **Amok**, a custom practiced in Java and other islands of the Malay Archipelago by natives who have become ferocious through the excessive use of opium. Maddened by the effect of the poison, the crazed victim of the opium habit rushes to the street with a dirk knife and seeks to stab those who may come in his way. On being seen in this condition, the population are aroused by the cry of *amuck* and the madman is captured and put to death.

**AMUR** (ä-mōor'), or **Amoor**, an important river of Asia, one of the great streams of the world, formed by the junction of the Shilka and Argun rivers. It has a basin covering an area of 796,000 square miles, and its estimated length is 2,739 miles. The Amur forms a part of the boundary between Siberia and China, penetrates the Khyngan Mountains, and flows into the Sea of Okhotsk, through the Gulf of Amur. Among its chief tributaries

are the Sungari, the Ussuri, the Seya, and the Bureya.

**ANABAPTISTS** (än-ä-băp'tists), a name sometimes applied to the denominations of Christians that deny the validity of infant baptism, but more properly used to designate a peculiar sect that laid claim to supernatural power. This sect was founded in 1517, under the leadership of Thomas Munzer, at Zwickau, Germany. They took part in the Peasants' War but were defeated near Muhlhausen in 1525. Munster, in Westphalia, became their center of influence in 1533, where they were defeated by a military force sent against them on a charge alleging that they practiced gross immoralities. This sect differed in many points of doctrine from the Baptists, but, like the latter, protested against infant baptism.

**ANABASIS** (ä-năb'ä-sis), the title of two Greek historical works. The "Anabasis of Cyrus" was written by Xenophon in the 4th century B. C., and in it is an account of the expedition of the younger Cyrus against his brother, King Artaxerxes of Persia, and of the retreat of the 10,000 Greeks. The other, known as the "Anabasis of Alexander," is the account of the campaigns of Alexander the Great, written by Arrian in 168 A. D.

**ANACONDA** (än-a-kön'da), a large serpent of the boa family, native to tropical America, but found chiefly in Brazil and Guiana. There are different well-known species, the typical form attaining a length of about thirty feet, but those usually seen in museums are not over twenty feet long. The eyes are small, the mouth is perfectly straight, the teeth are strong, and the color is blackish green above and yellowish below. These serpents feed on fish, small rodents, monkeys, and other animals, which they crush in their strong folds and usually swallow whole or only partly masticated. They are found mostly along the shores of lakes and streams. Their skins are used for making bags and shoes by the natives, who utilize their flesh as food.

**ANACONDA**, a city of Montana, in Deer Lodge county, about sixty miles southwest of Helena, on the Great Northern, the Northern Pacific, and other railways. It has a free library of 8,500 volumes, several fine school buildings, and good municipal improvements. The surrounding country contains valuable deposits of gold and silver, a circumstance that occasioned the rapid growth of the city. The manufactures are machinery, earthenware, clothing, brick, and smelter and machine shop products. It has a growing trade in merchandise, produce, and minerals. Anaconda has had a

rapid growth since 1884, when the copper reduction works were established. Population, 1900, 9,453.

**ANAEMIA** (ä-nē'mi-ä), the name applied to a morbid condition of the system produced by various causes, especially by a loss of blood and a deprivation of light and air in mines. A person afflicted with anaemia is characterized by great paleness and usually the blood vessels are easily traceable. The patient should have fresh air and good nourishment, especially such materials as tend to restore the vigor of the blood, including iron and arsenic treatment.

**ANAESTHETICS** (än-ës-thët'iks), a class of medicines used as drugs or inhaled in the form of vapor, which destroy consciousness for a time and with it the sense of pain. The value of such agencies was known to the ancients, but the scientific application dates from 1800, when Sir Humphry Davy recommended them for use in surgery. Homer and Herodotus mentioned the effects of nepenthe when used in surgery, and it is spoken of in that respect by Pliny, while various Chinese manuscripts allude to the use of a preparation of hemp for the same purpose. Faraday established the use of sulphuric acid in 1818, and Simpson in 1847 announced the value of chloroform, which has since been used as the chief anaesthetic agent. A solution of cocaine is injected by some practitioners to secure anaesthesia in certain parts of the body, a practice originated by August Bier, of Kiel, Germany. By this method the patient may witness in a conscious state the operation performed, as the amputation of a leg or arm, but this is not possible when the operation is in the trunk. A new anaesthetic known as *stovaine* was discovered by M. Fourneau, a French surgeon, in 1907, which is used in a similar way to produce paralysis of the body below the point of injection and removes all sensation from the limbs. With it properly administered it was found possible to amputate a limb while the patient retained consciousness, and, had he been allowed to do so, could have even witnessed the operation. Stovaine is a compound in the nature of cocaine.

**ANAGRAM** (än'ä-gräm), the transposition of the letters forming a word or sentence into a new word or sentence. The ancients constructed anagrams of divers words, often applying to the newly formed words a prophetic meaning. A true anagram is formed by transposing every letter in the original word and adding no new or different letter. For instance, the letters of Des Moines (Iowa) have been

transposed and the name *Seni Om Sed* originated, which is applied to an autumnal festival given in that city.

**ANAKIM** (än'ä-kim), a race of giants who lived in the southern part of Palestine at the time of the exodus of the Israelites. They are referred to as "the children of Anak," and settlements were made by them in the mountains of Judah and Israel. Joshua conquered them and destroyed many of their cities, but a remnant of them survived in Gath, Gaza, and Ashdod.

**ANALOGY** (ä-näl'ö-jī), a word used to express relation or close resemblance. It is used in grammar to express conformity with the structure of a language; in biology, to denote parts which agree in functions; and in mathematics, to designate similitudes of ratio.

**ANALYSIS** (ä-näl'i-sis), the process of resolving a whole into its parts, and opposed to synthesis, by which parts are combined to form wholes. The term *analysis* is applied in many branches of study, especially in chemistry, mathematics, and physics.

**ANALYTICAL GEOMETRY.** See **Geometry.**

**ANAM** (ä-näm'), or **Annam**, a country of Asia, situated south of China, east of Siam, and west of the South China Sea. Southwest of it is the Gulf of Siam. The drainage is chiefly by the Mekong River, which forms a part of the boundary between it and Siam, and flows through the southern portion. It embraces the once separated states of Tonquin and Cochin-China, and includes the ancient kingdom of Cambodia. At present it is divided into three parts: Tonquin in the north, the country of the Laos southwest of Tonquin, and nearly the whole of Cochin-China; a portion of the latter has belonged to France since 1867. The area comprises 170,100 square miles. In the north and south are rich alluvial plains, while the interior is more or less diversified by mountain ranges, and the coastal regions are generally fertile. There are extensive deposits of iron, copper, silver, gold, manganese, and coal. The commercial products take rank among the best of Southern Asia, and include cereals, live stock, fruits, tobacco, and fish. Anam is governed as an absolute monarchy, though it is largely dependent on France. In 1872 it was recognized as independent of China by the French, on condition that the king allow the free exercise of religion, open divers ports to foreign vessels, and grant special commercial advantage to France. The French claimed a violation of the treaty of 1872 and occupied Tonquin by a military force in 1883, which resulted in placing

the country practically under a French protectorate. Buddhism and Confucianism are the chief religions, but a number of the inhabitants profess Christianity. Hue and Saigon are the chief seaport cities. The population of Anam aggregates 18,125,000.

**ANARCHY** (än'är-chÿ), a theory of political science, which is based upon the principle that each individual is entitled to freedom from civil authority, and that he of right possesses liberty of action in social and economic matters. The theory of anarchism developed in the 19th century, having its most eminent advocate in Jean Proudhon, a distinguished French jurist. It seeks to abolish all systems of law and government, and gives to the individual the largest freedom in society. While it may be considered as an ethical ideal of social relations, the application of its principles, though only individual or local, have resulted in harm and disaster. If the tendencies of men were pure and unselfish, and there were a standard of right both correct in itself and accepted and practiced by all individuals, it might be possible to successfully build a state or nation upon its tenets, but in practice it has led to revolution and terrorism. Many adherents, though at first pure and sincere in the belief, became contaminated with thoughts of destruction and assassination that have placed anarchy in the category of lawlessness.

No doubt the aristocratic and absolute governments of Europe have tended to increase the adherents of this political and social dogma, and as a natural result a large number of anarchists have emigrated to America. Paterson, N. J., has long been noted for the number of anarchists who settled in that city, and there are also many adherents in Chicago and New York. From these cities as centers of influence, literature in the form of circulars and periodicals has been sent broadcast, and efforts to secure adherents have been made through personal solicitations and public meetings. In 1896 disturbances occurred in Chicago in which a number of anarchists took part, and three assassinations in this country are charged to perpetrators who were supporters of anarchism—the assassination of Lincoln in 1865, Garfield in 1881, and McKinley in 1901.

The most prominent agitators and advocates of anarchism in the United States were Johann Most and Emma Goldman, both of whom were convicted under the laws of New York for directly inciting crime. The assassinations of M. von Plehve of Finland and Grand Duke Sergius in Moscow, in 1905, are chargeable more or less directly to anarchists stimu-

lated by the feeling of unrest and revolution in Russia. No doubt the evil results incident to a general spread of its supporters can be lessened by federal legislation, which would operate to limit writing and speechmaking designed to extend its influence. An anti-anarchist conference was held in Austria in 1898, owing to the assassination of the empress, and at this time there is a movement in the leading nations to curtail, if not eradicate, the spread of anarchistic influences.

**ANATOMY** (ă-năt'ō-mŷ), the science that treats of the form and structure of organic bodies, and shows their distinct formation, and the relation of each part to the other parts of such bodies. It implies the cutting up or dissecting, and is generally understood to apply to the human body, while the anatomy of animals is known as zoötomy, and that of plants as phytotomy. Hippocrates is held to be the father of medicine, but, since his views of the structure of the human body were superficial, he is not regarded the father of anatomy. Aristotle based his views on the dissection of animals, and is regarded the founder of the science. Human bodies were not dissected until 250 B. C., when it became common to dissect the bodies of criminals. Celsus wrote much on anatomy, and after his time many discoveries were made by the dissecting of apes and the bodies of other animals. For centuries a popular prejudice existed against allowing the body of a relative or a corpse of any kind to be dissected, which long retarded the progress of this highly important and useful department of knowledge. Many investigators were obliged to limit their dissections to the dead bodies of the lower animals, drawing analogies thence to the human frame, instead of directly studying the corpses of mankind.

Superstition retarded progress in the study of anatomy for many centuries, and scientists who announced new and valuable discoveries were either ruined in their attempts to develop useful results from them, or were burned at the stake. The circulation of the blood was not known to the ancients and was discovered by Harvey in 1619, who for years hesitated to announce this valuable addition to human knowledge, but when he made his discovery known popular disapproval ruined his medical practice. Discoveries made in the 18th and 19th centuries are numerous, and have greatly extended knowledge in the practice of surgery and medicine. The adoption of improved methods of practice so revolutionized the external and internal treatment of the human body that the average of

human life has been prolonged at least several years.

Anatomy as a science has become so systematized that it has been divided into several departments, which are studied with the view of fitting practitioners for special lines of practice. The surgeon is required to understand the relation of the different organs to each other that he may know how and where to apply his instrument in operating on the living body, while the physician must necessarily understand the structure of all parts that he may successfully administer medicines to affect the different organisms in the most beneficial way. The study of the bones of the skeleton, muscles, nerves, skin, digestive system, and other systems of the body is called descriptive anatomy. Investigations of the special organs, as the coats of the stomach and the cells of the lungs, is termed general anatomy. Study relating to the tissue cells and atoms by the use of the microscope is known as microscopical anatomy.

For convenience in the study of anatomy, the body is considered from the standpoint of its principal parts. These include the skeleton, constituted of the bones, joints, and cartilaginous formations; the muscular system; the skin; the nervous system, including the ganglia, nerves, spinal cord, and brain; the throat and mouth; the vocal organs; and the organs constituting the seat of the senses—the ear, the eye, the nose, the mouth, and the papillae. To the digestive system, which includes the alimentary canal, the muscular membranous tube into which food is taken to be digested while undergoing its more or less complicated course through the body, and which is constituted of the mouth, oesophagus, stomach, and intestines, belong the accessory organs, including the salivary glands, the pancreas, and the liver. The organs of circulation include the capillaries, the arteries, the veins, and the heart, while to the organs of respiration belong the throat, the windpipe, and the lungs. Other principal parts include the kidneys, the organs of reproduction, and the lymphatic system, with its vesicles and glands. See **Heart, Ear, Eye, Skin**, etc.

**ANCHOR** (ăn'kēr), in navigation, an implement for retaining a ship at a particular place by temporarily chaining it to the bed of the sea or river, which is called an anchorage. In early times bags of sand, large stones or wooden anchors weighted with lead were commonly employed for this purpose. Iron anchors were first used by the Greeks, and their manufacture was one of the most laborious industries, this being due to the fact that very

large hammers are required to weld and shape the materials. In modern times the steam hammer came into almost exclusive use for this purpose. It is a powerful implement, having an enormous force, and is easily applied in comparison to the sledge hammers wielded by

ANCHOR.

men. Anchor-making is now conducted on a large scale, and the occupation of an anchor-smith is considered an important one. Ships that have a tonnage of 1,000 tons usually require anchors weighing thirty cwt.; those having a tonnage of 3,000 require an anchor weighing thirty-five cwt., and others in like proportion. Most ves-

sels carry from two to ten anchors, this depending on the size of the ships and the routes to be sailed.

**ANCHOVY** (än-chō'vŷ), a small fish common in the Mediterranean Sea and the Atlantic shores of Europe. It belongs to the herring family, but is somewhat thicker, has a pointed head, a projecting upper jaw, and is esteemed for its fine flavor. It is caught in seines and used extensively for sauces and pastes. Several species of anchovy are found off the coasts of Canada and the United States, both in the Atlantic and the Pacific.

**ANCIENT ORDER OF UNITED WORKMEN**, a fraternal, mutual benefit association organized in 1868 by John J. Upchurch at Meadville, Penn. There are limited restrictions of occupation and its aims and purposes are purely benevolent. Three degrees are recognized in the order, each having its appropriate grips, signs, and symbols. The association has forty grand or State lodges, about 5,000 subordinate lodges, and a membership of 360,000 in the United States. Since its organization it has paid annually an average of about \$2,000,000 as benefits to members, but the disbursements at present aggregate \$7,500,000 per year. The supreme officers are elected annually in the supreme lodge, which is constituted of delegates sent by grand lodges, and the latter in turn are made up of delegates from subordinate lodges.

**ANCONA** (än-kō'nà), an important seaport city in Italy, capital of a province of the same name, about 130 miles northeast of Rome. It is built in the form of an amphitheater on the slope of two hills rising from the shores of the

Adriatic, has railroad facilities, and carries considerable export and import trade. The manufactures are paper, woolen and cotton textiles, musical instruments, silk hats, and machinery. The city abounds with fine statuary, among which is a colossal statue of Count Cavour. In the harbor is a mole 200 feet long built by Emperor Trajan, on which is the famous triumphal Arch of Trajan. Ancona was founded in the 4th century B. C., by refugees from Syracuse, but became a Roman colony in the 3d century B. C. It has belonged to Italy since 1860. Population, 1906, 57,310.

**ANDALUSIA** (än-dà-lōō'shĭ-à), a region in the southern part of Spain. It was part of the Roman province of Baetica, is a fertile district, and comprises an area of 33,663 square miles. Along the northern border extend the Sierra Morina Mountains, and the southern part is traversed by the Sierra Nevada. The Guadalquivir is the largest river and has a southwesterly course to the Atlantic. Fruit, grain, wool, cotton, and wine are the chief products. Copper and iron mining is carried on extensively. The Andalusian breed of horses has long been famous. For the purpose of government it is divided into the eight provinces of Almería, Cadiz, Cordova, Granada, Huelva, Jaen, Málaga, and Sevilla. The language spoken is Spanish with a slight mixture of Arabic. Population, 1900, 3,562,650.

**ANDAMANS** (än-dà-mänz'), a group of small islands in the Bay of Bengal, politically attached to British India. These islands have an area of 2,508 square miles, are well timbered, and by the Duncan Passage are divided into the Great and Little Andamans. The natives are of small stature and engage chiefly in fishing and the manufacture of clothing and utensils. Since 1858 the islands have been used as a penal settlement of India. The government is under a commissioner resident at Port Blair. Population, 1901, 18,190.

**ANDERSON** (än'der-son), a city of Indiana, county seat of Madison County, thirty-five miles northeast of Indianapolis, on the Cleveland, Cincinnati, Chicago and Saint Louis and other railways. It occupies a fine site on the west fork of the White River. The surrounding country is rich in farm produce and deposits of coal and natural gas. It has electric street railways, pavements, waterworks, electric lights, and several libraries. Among its chief buildings are a number of excellent schools, the county courthouse, numerous churches, and many excellent business blocks. The manufactures include machinery, clothing, cigars, earthenware, and

farming implements. The first settlement at Anderson was made in 1823 and it was incorporated in 1865. Population, 1900, 20,176.

**ANDERSON**, a city of South Carolina, county seat of Anderson County, 125 miles northwest of Columbia, on the Southern, and other railroads. The surrounding country is fertile. It has manufactures of tobacco products, machinery, and implements. The city has several fine public buildings and modern municipal facilities. Electric power it obtained from a station on the Senaca River, about ten miles distant. In 1827 the first settlement was made in the vicinity. Population, 1900, 5,498.

**ANDERSONVILLE**, a village in Sumter County, Georgia, sixty-two miles southwest of Macon. It is famous as the site of a Confederate prison from 1864 to the close of the war. The total number of prisoners received at the place aggregated 49,485, of whom 12,926 died from lack of food and sanitation. The superintendent, Henry Wirtz, was tried on a charge of mismanagement, found guilty, and hanged on Nov. 10, 1865. A national cemetery now occupies the site of the prison. In 1900 the village had a population of 245.

**ANDES** (än'dêz), the predominating mountain system of South America, extending from near the island of Trinidad across the northern part of the grand division, thence in a direction nearly parallel to the Pacific, and continuing almost to the Strait of Magellan. It is composed of two approximately parallel chains, between which are located wide and comparatively fertile valleys. On the north they are separated into three chains, in the center mainly into two, and in the south they unite into one. The chains are connected by transverse ridges, forming numerous mountain knots. The system forms a continuation of the Cordilleras of North America, from which it is separated by wide depressions at the Isthmus of Panama. From this point the elevations increase in height toward the south, reaching their highest point in Chile, where they culminate in the volcanic peak of Aconcagua, 23,910 feet, which is the highest elevation. The average height of the Andes is about 12,000 feet, and the system is from forty to 350 miles wide. The total area covered by the base of the system is more than a million square miles.

The Andean mountain system includes numerous tablelands, the most important being the plateau of Quito, 9,543 feet; the plateau of Casco, in North Peru, 11,000 feet; and the plateau of Bolivia, 13,000 feet. From most of these higher plateaus rise volcanic peaks,

which, together with the volcanoes located in the mountain ranges, include from forty to sixty still active the greater part of the year. The system is the most compact of the great mountain systems of the world, and hundreds of the peaks tower to immense heights; at least ten of them exceed a height of 20,000 feet. The system contains the source of all the great rivers of South America, except the main source of the La Plata, the Tocantins, and the São Francisco, which rise in the highlands of Brazil. In the northern portion the Orinoco dashes its waters toward the island of Trinidad, from the center flow a large number of the sources of the Amazon, which discharges great volumes of water into the Atlantic Ocean under the equator, while farther south some of the sources of the La Plata and the Colorado carry their waters toward the south and east. In the center of the system, on the high elevation between Peru and Bolivia, is located the wonderful inland lake Titicaca, 12,847 feet above the level of the sea, which has no outlet to the ocean, and is perhaps the only inland fresh-water lake. Its surface area is 3,800 square miles. The countries that include parts of the Andean mountain system are Venezuela, Colombia, Ecuador, Peru, Bolivia, Chile, and Argentina. Between their elevations are many fertile valleys and plains, notably among them the plain of Cuzco, which, under the burning sun of the tropics, has the climate and productions of the temperate zone. In the territory occupied largely by Peru reigned the ancient Incas, who attained a high state of semicivilization and whose works are still attested by gigantic ruins and wonderful cemeteries. Here were constructed great highways for travel, which crossed summits of the lofty peaks or passed through them by tunnels and in their course they extended over cañons and rivers by works of solid masonry. Peru and Chile still retain the highest conditions of civilization that have developed in South America.

The plant and animal life of the Andean system differs widely from that of the eastern portions of South America. Among the wild animal forms are the alpaca, llama, jaguar, puma, and the fleet deer. Bird life is especially rich with song and plumage, and includes the great condor, besides hundreds of varieties of smaller birds peculiar to the different altitudes. This highland region has extremely rich deposits of minerals, such as iron, lead, platinum, copper, coal, petroleum, silver, and gold. These yield large profits where the apparently indifferent inhabitants of the south-

ern continent have put forth an effort to develop mining. Many cities located in the Andes are at a great elevation, and consequently enjoy a perpetual season of cool and bracing atmosphere. Chief among these are Cerre de Pasco, Potosi, and Quito, the historic capital of Ecuador.

**ANDORRA** (än-dör'rá), a republic of Europe, Eastern Pyrenees, between the Spanish province of Lérida and the French department of Ariège. The area is 175 square miles, divided for the purpose of government into six parishes. It is surrounded by high mountains, is rich in iron and lead deposits, has some forests, and agriculture and manufacturing are the chief enterprises. Dairying and fruit culture receive careful attention. Charlemagne made Andorra an independent state because its inhabitants had rendered services to him while he was conducting an expedition against the Moors, and its autonomy has been preserved until the present. It is governed by a council of twenty-four, elected for four years, and the laws are administered by two judges, one chosen by the Bishop of Urgel in Spain and the other by France. Andorra, the capital, has a population of 1,000 and is the chief town. The population of the republic is 5,231.

**ANDOVER** (än'dō-ver), a town of Essex County, Mass., on the Merrimac River, twenty miles north of Boston, on the Boston and Maine Railroad. It is the seat of the Andover Theological Seminary, which was founded in 1808. This institution has a library of about 60,000 volumes, is under the direction of the Congregational Church, and has sent forth fully 3,250 ministers. Andover has excellent public schools, is connected with other towns by electric car lines, and is substantially improved by modern facilities. The manufactures include clothing, textiles, earthenware, and machinery. Andover was first settled in 1643 and was incorporated three years later. Population, 1905, 6,632.

**ANDRIA** (än'drê-ä), a city of Italy, in the province of Bari, thirty-two miles northwest of Bari. It is situated on a fertile plain, has railroad facilities, and is the center of large commercial interests. The city is the seat of several noted educational institutions, a Gothic palace, and a fine cathedral. Andria was founded by the Normans. Frederick II. built the noted Castello del Monte, located nine miles south of the city. Population, 1901, 49,569.

**ANDROS** (än'drös), an island in the Grecian Archipelago, the most northerly of the Cyclades. It is about twenty-five miles long,

ten miles wide, and has a fertile though mountainous surface. Most of the inhabitants belong to the Greek Church. Andros, the capital, has a population of 2,160. It has a large trade in wine, fruits, and merchandise. The island has a population of 19,025.

**ANDROSCOGGIN** (än-drös-kög'gin), a river of New Hampshire and Maine, rises in Lake Umbagog, which is situated on the border between the two states. It flows through a portion of Maine, and discharges into the Kennebec River near Bath. The total length is 156 miles.

**ANEMOGRAPH** (ä-nēm'ō-gráf), a device attached to an anemometer to make it self-recording. Most forms of this instrument have a cylinder covered by paper, which moves uniformly by clockwork, and an indicator registers at the proper time both the changes in the velocity and the direction of the wind. The paper is ruled properly before being adjusted on the cylinder. The anemograph is frequently called a wind register.

**ANEMOMETER** (än-ē-möm'ē-tēr), an instrument for measuring the force and velocity of the wind. As ordinarily constructed, it consists of four hemispheres or cups mounted on the ends of crossed rods, on a horizontal plane, in such a manner that it may be rotated by the force of the wind. In a box below is a mechanism which records the revolutions made by a perpendicular shaft, and the indication is given by a hand moving round the dial. It has been found that the center of each cup moves with a velocity almost exactly one-third of that of the wind. Besides this contrivance, there are other instruments which serve the same purpose.

**ANEMONE** (ä-nēm'ō-nē), a genus of flowering plants having truncate leaf stems, calyx corollalike, and colored petals longer than the stamens. About sixty species are cultivated on account of their profuse and beautiful flowers. The flowers are either double or single and variously colored, usually white, red, blue, yellow, or creamy violet. These flowers thrive

ANEMOMETER.

best in a light, loamy soil. The plants are propagated by offsets, seeds, and cuttings.

**ANGEL** (än'jĕl), a ministering spirit employed by God to administer comfort to men.

ANEMONE.

While angels are mentioned frequently in the Bible, only two are designated by name, these being Michael and Gabriel. Tobit, a book of the Apocrypha, mentions Raphael. We have scriptural evidence that angels became visible to men (Gen. xviii. and xxxii.), and that there were several orders of these beings, among them the seraphim, the cherubim, and the archangels. The popular belief that angels have wings is not a revealed truth, rather a poetical invention.

**ANGELUS** (än'jĕ-lŭs), a short Roman Catholic prayer, beginning with the words, "Angelus Domini nuntiavit Mariae," and recited at the ringing of the Angelus bell. It is offered in devotion to the memory of the Annunciation, at six o'clock in the morning and evening and at noon. J. F. Millet made the sound of the Angelus bell reaching the ears of a man and woman working in a field the subject of his celebrated painting, which was purchased by M. Chauchard in 1890 for \$150,000.

**ANGERS** (än-zhā'), a city in France, capital of the department of Maine-et-Loire, sixty miles southwest of Le Mans. It has a college, a cathedral, and a library of 40,000 volumes. In the vicinity are slate quarries. Leather, silks, chemicals, clothing, and machinery are among the manufactures. Statues of J. Bodin and René of Anjou, who were born here, are in the Place du Lorraine. Population, 1906, 82,935.

**ANGINA PECTORIS** (än-jĭ'na pĕk'tō-rĭs), or **Heart Stroke**, an intense pain which occurs in paroxysms in the region of the heart, or extends from the lower end of the chest-bone to the left arm. It is accompanied by faintness and suffocation, and successive attacks weaken and ultimately cause death. Men are more susceptible to it than women, especially after the age of fifty years. The disease is due to a cramp of the heart muscle, or a neuralgia of the cardiac nerves.

**ANGLE** (än'g'l), a term ordinarily used to designate a figure of two straight lines emanat-

ing from one point, the vertex, as a corner of a room. In general the term is used to express the inclination of two lines to one another. Four kinds of angles are distinguished in geometry, the plane, spherical, dihedral, and polyhedral.

**ANGLER** (än'glĕr), a fish common to the coasts of North America and Europe, and known by the different names of monkfish, fishing frog, and gooselike. It is classed with the family of spiny-ray fishes, has a length of from three to five feet, and its mouth is very large and fringed with barbels. On the top of the head are spines which it throws out as bait to its prey, attracting the smaller fishes, on which it feeds. Several species abound on the American coast from Nova Scotia to Florida, most of which attain a length of three feet, and all have a large mouth and are very voracious.

**ANGLES** (än'gl'z), or **Angli**, an ancient German tribe that occupied the country lying northeast of the Elbe, and subsequently settled in Schleswig, between the Saxons and Jutes. In the 5th century many Angles emigrated, and with large number of Saxons and Jutes colonized portions of England and Scotland. The Germanic portion of these immigrants founded the three kingdoms of Mercia, Northumbria, and East Anglia.

**ANGLESEY** (än'g'l-sĕ), or **Anglesea**, an island and county in the Irish Sea, belonging to Wales, from which it is separated by the Menai Strait. It is seventeen miles wide and twenty miles long, and is connected by railway with the mainland, which crosses the strait by the Britannia tubular bridge. The surface is quite level and the soil productive, and much of the land is in pasture. Copper is mined quite extensively, though agriculture and stock raising are the chief enterprises. Wheat, oats, barley, and potatoes are grown. Anciently the island was inhabited by Druids, and at present the Welch language is spoken largely by the peasants. Holyhead, Beaumaris, and Amlwch are the chief towns. Population, 1901, 50,590.

**ANGLICAN CHURCH** (än'glĭ-kan), the name applied generally to the Church of England, and sometimes used in reference to all the societies embraced in the Protestant Episcopal Church. In its strict application it refers only to the Church of England and the Protestant Episcopal Church in Scotland, Ireland, and the British Colonies. The ritual is contained in the "Book of Common Prayer," and in the Thirty-Nine Articles are laid down the doctrines of the church. As a body it is represented by its bishops from all parts of the world in the Lambeth Conference, which is

held at Lambeth Palace, under the presidency of the Archbishop of Canterbury. This assembly meets at irregular intervals when called by the archbishop, usually about every ten years, and its value consists chiefly in the interchange of counsel. Its most important session was held in 1888, when it promulgated a basis for the establishment of Christian unity.

**ANGLING** (än'gling), the art of alluring and catching fish by means of a rod, line, and hook. The hook is furnished with a bait or lure, which is an object of prey, or the imitation of such an object. Usually the rod is about twelve to twenty feet long, the line being attached to the small end, and containing one or more hooks baited with the lure. The line is thrown into the water, in which it floats from a cork, the cork serving as an indicator of the nibbling or bite of the game. When the fish has been caught, it is drawn from the water and the line is thrown out for more game. The practice of catching fish by angling is of great antiquity. Mention is made of it by the prophet Isaiah, in Chap. xix, 8, in these words: "The fishers also shall mourn, and all those that cast angle into the brooks." The practice has prevailed throughout all ages and in all countries, and is still a favorite means for pastime and profit. Juliana Berners, the prioress of Sopwell Nunnery, is the authoress of the oldest English work on angling. It was published by Wynkyn de Worde in 1496 under the title "A Treatyse of Fysshynge wyth an Angle."

**ANGLO-SAXONS** (än'glō-säks'ŭns), the name commonly applied to the people formed by an amalgamation of the Angles, Saxons, and other Germanic tribes, and who constitute the English, the Lowland Scotch, and a large portion of the present population of the United States and Canada. By far the greater number of tribes from whom the English-speaking people descended had their seat in the northern part of Germany. The first of these came to Britain about the year 449. From a preponderance of the Angles the country came to be called England, and the language the Angles or English. From Anglo-Saxon institutions have come many modern terms, such as earl, alderman, sheriff, and town. The language spoken by them was largely the language of North Germany, called Plattdeutsch, or Low German. Later it was modified by the Danes, during the Danish supremacy from 1017 to 1042. Still later the Normans, a people of French-Germanic origin, conquered England and introduced a new element into the language, thus giving rise to a number of dialects. These mix-

tures of tongues were modified largely by the writings of Chaucer in the 14th century, and by successive modifications the spoken tongue eventually developed into the modern English language.

**ANGOLA** (än-gō'lä), or **Portuguese West Africa**, a Portuguese colony in Western Africa, in Lower Guinea, situated south of the Congo Free State, and north of German Southwest Africa. It includes an area of 490,000 square miles and has a population of 4,500,000. Along the Atlantic is a coast plain about fifty miles wide, and beyond that the surface rises rapidly and culminates in elevations about 7,000 feet high. The Coanza is the great water course of Angola. It rises in Lake Mossamba, is about 700 miles long, and flows into the Atlantic Ocean. This stream is scenic and, besides other natural attractions, contains several gorges and a falls with a drop of seventy feet. The inhabitants include every shade of transition from the Negro to the Hamitic type, and every degree of culture from the absolute savage state to the almost semi-civilized condition common to Southwestern Africa. The products and exports consist largely of coffee, gum, wax, ivory, hides, tobacco, palm oil, and cereals. Saint Paul de Loanda is the principal city. It is a thriving seaport and the seat of the government of the colony. Near it is the oldest Portuguese settlement south of the Equator. The city has a large export and import trade, and is provided with railway and other facilities. In 1908 the colony had about 1,200 miles of railways in operation, including a line that penetrates to the interior of Central Africa.

**ANGORA** (än-gō'rä), a species of goat native to Angora, a division of the Turkish Empire, situated in the mountainous interior of

ANGORA GOAT.

Asia Minor. The goat is celebrated for its beautiful silky hair, which attains a length of about eight inches. This goat hair is used in the manufacture of yarn, known in the market

as Turkish yarn or camel yarn. The skin of this animal is used in manufacturing oriental morocco leather. The climate seems to favor the growth of hair on dogs, rabbits, and other animals as well as on the goat. When these animals are transported, the vigorous growth of the hair soon disappears, or it loses much of its fineness. Angora goats are reared quite extensively in some parts of Canada and the United States. The town of Angora, situated about 220 miles southeast of Constantinople, is the capital of a vilayet of the same name. It has a large caravan trade and a population of 35,500.

**ANGOULÊME** (än-gōō-lām'), a city in France, capital of the department of Charente, about sixty miles south of Poitiers. It is an ancient city, and in the old part the streets are crooked, but the newer section is platted regularly and has substantial buildings. It is the seat of a naval academy, a college, and a library of 25,000 volumes. The cathedral of Saint Peter dates from 1101. Among the industries are potteries, paper mills, machine shops, and woolen mills. Its location on several railroad lines gives it commercial advantage. Population, 1906, 37,507.

**ANGRA** (än'grà), a seaport on the island of Terceira, one of the Azores, and capital of the Azore Islands, a colony of Portugal. It has a good harbor and is a station for ships between Portugal and the ports of South America. The place is strongly fortified, has a military college and arsenal, and is the seat of a Roman Catholic bishop. The trade is chiefly in honey, wine, flax, and fruit. Population, 11,500.

**ANGUILLA** (än-gwīl'là), or **Snake Island**, an island of the Leeward group, in the British West Indies. The area is 34 square miles. It is low and has considerable forest, but some sections are well grassed and furnish good pasture for stock raising. Salt is obtained from a lake in the center of the island. Maize, tobacco, sugar cane, and cotton are grown profitably. The inhabitants are mostly Negroes. Population, 3,950.

**ANHALT** (än'hält), a duchy in the central part of Germany, surrounded by the provinces of Saxony and Brandenburg, with an area of 906 square miles. About 48 per cent. of the people engage in mining and manufacturing. The minerals include coal, granite, iron, and clays. Among the chief manufactures are sugar, soap, cement, leather, clothing, and chemicals. A large majority of the inhabitants belong to the Protestant Church. Agriculture is the principal occupation, in which

industry a large diversity of products are obtained. The duchy has a network of railroads and is in a prosperous condition. The capital, Dessau, has a population of 55,134. Anhalt has been governed by the reigning family for several centuries, but its present autonomy dates from 1863. Population, 1905, 328,029.

**ANHYDRITE** (än'hī'drīte), a mineral composed of anhydrous sulphate of lime. It is harder and heavier than gypsum, takes a fine polish, and is used for sculpture. Large deposits are found in Nova Scotia, at Lockport, N. Y., and in Lombardy, Italy. The Italian product is considered of the best grade.

**ANILINE** (än'ī-līn), one of the numerous products secured by the distillation of coal tar, but first obtained by distilling indigo with caustic potash. The article of commerce is secured largely from benzene. It is a colorless, oily liquid, but when exposed to air absorbs oxygen and turns to a deep brown color. It has a vinous odor and a burning taste, and ignites readily. It is used to produce every shade and all tints of colors, and is employed in the industrial arts for numerous other purposes, besides its extensive use for dyeing materials. Large quantities are employed in the manufacture of inks, for tinting pulps, and for the superficial staining of finished paper. Aniline is also used for a large variety of purposes in manufacturing lithographic inks, perfumery, and fancy soaps. The discovery of aniline dates from 1826, but its larger manufacture for commercial purposes was introduced in 1856 by Perkins of London, who discovered mauve aniline.

**ANIMAL** (än'ī-mal), an organic being rising above the vegetable life, especially in possessing will, sensibility, and the power to move from place to place, although there are some animals that have not the power to move from the place occupied. While in general there is no difficulty in distinguishing an animal from a vegetable, yet some forms so closely resemble each other that it is difficult to say whether certain peculiar organisms belong to the vegetable or animal kingdom. All vegetable and animal life consists of various groupings of cells, in the form of jellylike matter called protoplasm. At its beginning all life consists of a minute cell, filled with more or less protoplasm, in which is contained a darker opaque spot called the *nucleus*. Living bodies contain organs, and living matter is therefore called *organic matter* to distinguish it from nonliving or inorganic matter. Every kind of animal has peculiarities that adapt it to live best in some particular place and under partic-

ular conditions. Those belonging to any one country are called its *fauna*. The faunae of regions having warm and moist climates are much more extensive than those common to the cold and arid zones, while the sea has a much greater diversity of animal life than the land. Most animals live in the light, but there are some forms that live in dark caves, and whose organs of sight are not fully developed.

For convenience in study, Cuvier divided the animal kingdom into four great subdivisions; but others, among them Huxley, classified animal life into a greater number of groups. The subdivisions made by Cuvier will answer the purpose of this article, and are the following: vertebrates, articulates, mollusks, and radiates; the last three are usually called invertebrates. Each of these divisions is again subdivided into classes; the classes are divided into orders, and the orders into families. Vertebrates are those animals that have an inside skeleton, the backbone of which is called the vertebral or spinal column. To this subdivision belongs man, and it also includes the four-footed animals, birds, reptiles, amphibians, and fishes. Though the skeletons of these animal forms differ in many essentials, they are alike in having a backbone made up of numerous bones fitted together, each one of which is called a vertebra. Articulates include all animals whose bodies are made up of rings joined together. They have no inside skeleton, but their outside shell answers a similar purpose, all the muscles being fastened to it. Mollusks are soft-bodied animals, most of which have shells that serve as a protection for the body. Radiates have a radiated or starlike formed body; they have no head, and many of them have not the power to move from the place where they grow, being fixed like plants to a common trunk. In former times many animals of this class were supposed to be plants on account of their resemblance to vegetables in some particulars, such as corals and sponges.

Animals depend upon organic matter for food, which they derive from plants or from other animals. On the other hand, plants feed upon inorganic matter, and the food, with only a few exceptions, is in the gaseous or liquid state. Carbonic acid, which is generally poisonous to animals, is an essential constituent of the food of plants, while animals require free access to oxygen to sustain life. The food of animals is taken into the body to be digested and the nutritious parts are assimilated, but plants take food through their external surfaces and assimilation is effected by the aid of sunlight.

**ANIMAL HEAT**, in physiology, a term used to designate the heat produced in the interior of animal bodies, due to the nutritive changes taking place in the blood and the tissues. Living protoplasm being constantly at work disintegrating, the changes produced by it are accompanied by the evolution of heat. The temperature is dependent largely upon the degree of activity and the nature of living organisms. In general it varies from 96° to 100° Fahr., but sometimes falls as low as 90° and rises to 108°, though these extremes are due to a diseased condition of the body. Cold-blooded animals and even plants evolve some heat, and thereby are rendered slightly warmer than the surrounding atmosphere. Cold-blooded and warm-blooded animals agree in the development of heat, but differ in that the former possess greater means of losing heat by the skin and otherwise. In that class of animals the means of losing heat are considerable as compared to the amount of heat produced, while in the warm-blooded animals the production and loss of heat are about equal. Some writers apply the term *animal magnetism* to certain phenomena connected with animal organisms, especially in relation to man, and attribute to persons an influence similar to that exercised by a magnet on iron. This property is generally known as mesmerism, hypnotism, and clairvoyance. See **Mesmerism**.

**ANIMAL INTELLIGENCE**, the capacity which some animals have to know or understand, which in many respects resembles some of the intellectual characteristics of man. Many animals possess in a more or less highly developed form the senses of hearing, feeling, sight, smell, and touch, but in the lower forms some of these are not highly developed or are entirely wanting. Whether they possess the power to reason has been a subject for extended discussion, and scientists have generally decided the proposition in the negative. Like John Burroughs, they assign the traits in animals that seem to indicate reasoning to animal instinct, or class it as simply physical.

Insects and fishes possess a keen sense of smell, and it is thought that they depend to a large extent upon this sense in selecting their food. On the other hand, in birds and reptiles the sense of smell is not highly developed, though it is thought that the crow and other scavenger birds are attracted by carrion at a long distance. Birds are able to hear with remarkable accuracy, which is evident from the peculiar exactness with which some birds of song are able to reproduce notes uttered by other birds. Fishes are dull in respect to hear-

ing, but the dog is keen both in hearing and smelling, as is seen from the ability with which pointers are able to locate game and bloodhounds trace footsteps. The sense of taste is not well developed in most animals, and they seem to prefer certain classes of food from the odor rather than from the taste, though there are notable exceptions. Birds possess a singular keenness of vision, which is evident from the fact that an eagle is able to distinguish a prey beyond the range of the human eye. The cat, the owl, and some other animals are peculiar for their ability to see more or less in the dark, while the frogs and toads are able to distinguish objects only at short range in daylight. Some peculiarities are found in the sense of touch among animals, especially in the location of the seat of greatest sensitiveness, which in the bat is in the wing and in the cat it is reached through the whiskers. The elephant and the alligator have a skin so thick that the sense of feeling is not easily excited through many portions of the surface.

Some writers refer many acts of animals to their power to *imitate* human acts. This has reference to the tendency of a horse to turn into gates along the highway, which is especially noticeable in an old animal that has been driven until it has become tired. Cats and dogs wait outside during cold weather for the door of the house to open and in summer-time seek the cool shade, but they do so from habit and memory rather than the faculty of reasoning. The so-called educated hog and the trained horse frequently seen at exhibitions do not reason, but learn to act in conformity with the questions of the trainer. It is no more difficult for the horse to select a particular color or object when requested to do so, than it is to follow the directions of gee and haw. *Trixie*, the famous trained horse that has been exhibited in Europe and America, is a marvel in this respect. Modern writers incline to the view that animals possess a high degree of affection and tenderness for their kind, especially the young, as is seen in the care given by some birds and the lion to their offspring. Ernest Thompson Seton, in his "Wild Animals I Have Known," brings this trait out with unusual interest.

**ANISE** (ăn'is), an annual plant native to Egypt and the Levant, and now cultivated in various parts of America and Europe. About seventy-five species have been described. The common anise is about two feet high, and the *star anise*, a native of China, is a small tree. The fruit is known as aniseed, which yields a volatile oil known as oil of anise. It is used

in the manufacture of liquors, as an aromatic in medicine, and for carminative and flavoring purposes.

**ANNAM.** See Anam.

**ANNAPOLIS** (ăn-năp'ô-lis), the capital of Maryland, county seat of Anne Arundel County, twenty-eight miles southeast of Baltimore. It occupies a fine site on the Severn River, has a good harbor, and is on the Annapolis, Washington and Baltimore and the Annapolis and Baltimore Short Line railroads. It has electric street railways and numerous public improvements, including waterworks, a sewerage system; and stone and brick pavements. Among the noteworthy buildings are the State capitol, the Governor's mansion, the county courthouse, and several fine schools and churches. It is the seat of Saint John's College and of the United States Naval Academy (q. v.). The manufactures include machinery, clothing, tobacco products, and utensils. It has a considerable trade, is a port of entry, and has an important market for fruits and oysters. The city was founded in 1649 and received a charter in 1708. Congress held a session at Annapolis in 1783, at which Washington resigned as commander-in-chief. Population, 1900, 8,402.

**ANNAPOLIS**, a seaport of Nova Scotia, 100 miles west of Halifax. It is conveniently situated on the Annapolis River, near its entrance into an inlet from the Bay of Fundy. The harbor is well protected, which, together with railway facilities, make it a convenient market for fish, fruit, and cereals. Formerly it was called Port Royal. It is the oldest European settlement in British America, and in 1604 it was made the capital of Arcadia. The English captured it in 1710, and soon after the name was changed to Annapolis in honor of Queen Anne. The seat of government was removed to Halifax in 1750. Population, 1901, 1,019.

**ANN ARBOR** (ăn är'bor), a city of Michigan, county seat of Washtenaw County, on the Huron River, forty miles west of Detroit. It is on the Ann Arbor and the Michigan Central railroads, has substantially paved streets, electric street railways, waterworks, and a number of parks and libraries. The leading manufactures are lumber products, musical instruments, ironware, tobacco products, clothing, and machinery. It has a fine county courthouse and numerous public schools and churches, and is the seat of the University of Michigan. This institution was founded in 1837, and is one of the most liberally endowed and successful educational institutions of the United States. The first settlement was made at Ann Arbor in

1824 and it was incorporated in 1851. Population, 1904, 14,599; in 1910, 14,817.

**ANNEALING** (än-nēl'ing), the process by which glass, steel, iron, and other substances are heated and then cooled slowly to render them less brittle, or to increase their degree of ductility and malleability. When metals are given form in the process of manufacture, as in rolling them into plates or drawing them into wire, they become somewhat brittle and are made more serviceable by annealing. By this process also is diminished the elasticity of metals, as to impart to springs the precise measure of elasticity deemed the most suitable.

**ANNIHILATIONIST** (än-nī-hī-lā'shūn-ist), the term applied to one who believes in the doctrine of man's annihilation at death. This doctrine had its origin in England in the 18th century, when several prominent writers, including Archbishop Whately, wrote on subjects relating to *eternal death*, and from these writings originated a widespread belief in literal destruction. As now understood, annihilationism is a belief in the bodily and spiritual extinction of man's being.

**ANNISTON** (än'is-ton), a manufacturing city of Alabama, county seat of Calhoun County, eighty-seven miles northeast of Birmingham. It is on the Louisville and Nashville, the Southern, and other railroads, and in the vicinity are extensive iron mines. The manufactures include ironware, machinery, cotton goods, clothing, and tobacco products. The city has electric lights, pavements, waterworks, and other municipal improvements. It has a number of fine public school buildings, about twenty-five churches, and several well-selected libraries. It is the seat of the Noble Institute, the Anniston College for Young Ladies, and the Barber Memorial Seminary (for colored students). The city was founded in 1873 by the Woolstock Iron Company, under the management of Samuel Noble. Population, 1910, 12,792.

**ANNUAL** (än'ū-äl), in botany, a plant whose whole course of development is completed in one season, during which it germinates, flowers, perfects its seeds, and perishes, never again to grow from the same roots. Some grains are the products of annuals, such as oats and corn. The cockscomb, phlox, and marigold are examples of garden flowers belonging to the annuals. Some hardy annuals, like the morning-glory, may be sown in autumn to germinate in the spring.

**ANNUITY** (än-nū'ī-tŷ), a fixed sum of money paid annually, or at intervals, either for a definite term of years or the continuation of a given life, or a combination of lives. The

term is used largely by insurance companies, who stipulate the payment of definite amounts. The theory is an application of algebra to the fundamental idea of compound interest. According to this idea, any sum of money invested at interest is increased at the end of interest-payment periods by the addition of accrued interest. The first addition is at the end of the first payment period. At the end of the second payment period a second addition of interest is added to the sum, and thus additions are made in the same way by interest accruing from time to time until a definite amount has been reached. Life annuities are based on a knowledge of the rate of mortality among mankind, or among the particular class of persons upon whose life the annuity depends. Annuities are the reverse of life insurance. An annuitant is paid to live, while an insured, through his representative, is paid to die.

**ANODE** (än'ōd), in electricity, the positive pole of an electric current, or that surface by which the current enters the body (electrolyte), undergoing decomposition. The negative pole, by which the current leaves the electrolyte, is called the cathode.

**ANSONIA** (än-sō'nĭ-ä), a city of Connecticut, in New Haven County, on the Naugatuck River. It is on the New York, New Haven and Hartford Railroad, has a considerable trade in merchandise, and is important as a manufacturing center. The products include carriages, clocks, iron and brass wares, machinery, electrical appliances, and textiles. It has a fine system of public schools, numerous churches, and a public library. Among the chief buildings are the opera house and the Y. M. C. A. building. The municipal improvements include electric street railways, waterworks, electric lights, and a sewer system. The first settlement was made on the site of Ansonia in 1840 and it was chartered in 1893. Population, 1910, 15,152.

**ANT** (änt), an insect belonging to the order of membranous-winged insects, of which there are several hundred species in different regions of the earth. They live in colonies or families,

sometimes many thousands in number, and are divided into three classes, females, males, and workers. The females and males have wings, but the workers, or neuters, are wingless. As to size, the females are the largest, the males

are slightly smaller than the females, and the workers are the smallest. The ordinary work is done by the workers and the principal part in warfare, both defensive and offensive, is taken by the soldiers, which are made up of the workers. The males and females constitute but a small portion of each community. After the pairing season, the males wander away and soon die. The females lay little eggs, so small that they can hardly be seen by the naked eye, and the eggs are scattered about in the nest wherever the females happen to be at the time the eggs are deposited. They are taken by the workers and put in the sun in the morning, and at night are stored in the nest until they are hatched. The larvae or grubs, hatched from the eggs, are small, white worms, and are carried back and forth in the same way as the eggs by the workers, who nourish them with a liquid from the stomach until they reach the proper age to spin their own webs around themselves, which cover them like the cocoon of a silkworm. The cocoons are carried into the sunlight the same as the eggs and grubs were, and, when ripe, for their second birth, the workers cut them out of their inclosed cells and they soon become perfect ants.

The workers are the most intelligent and interesting of the three classes of ants. They not only take care of the eggs, grubs, and cocoons, but do the work of the society, which includes the building of houses and streets and keeping them in repair. In their work they show wonderful ingenuity in carpentry, masonry and mining. Most ants build their houses or nests in the ground, and many construct cones or hills over them, which are known as ant-hills. In them are many rooms, with galleries connecting the different apartments. Others construct large pillars, from which arches are extended, and are covered with loose straw and sticks. In tropical regions the ant-hills are frequently from twelve to eighteen feet high. A class of ants, known as mining ants, construct long galleries in clay, in which pillars support the roof and many rooms and stories are provided. Carpenter ants build their houses in growing trees by boring deep cells into the wood and constructing rooms and galleries by unique partitions. In Australasia several species of ants are found that build their houses of leaves fastened together with a kind of glue. Oftentimes several ants unite to carry particles for the construction of their houses, and in this way they are able to move material much larger and heavier than the aggregate of the ants employed in construction work.

The chief substance used by ants for food is sugar taken from vegetables. Their sense of smell seems to be so acute that they can easily locate sugar substances in plants. Honeydew is a sugar fluid found in the aphid, a small insect, and is a favorite food of many kinds of ants. To obtain it they are often seen to touch the aphid with their antennae, and, after a drop has been obtained, they pass on to another aphid. The process has been likened to the milking of a cow or camel. Ants that feed upon animal food render important service in that they clear away carrion. The flesh of a small animal buried for a short time in an ant-hill will be entirely consumed, only the skeleton remaining. In tropical countries ants prey upon living animals and sometimes kill birds, reptiles, and small quadrupeds by attacking them in vast swarms. In some regions ants are so numerous that communities of them have been known to attack domestic animals when sick, and there are a number of instances in which man himself dreaded their ravages. On the island of Grenada, about one hundred years ago, vast numbers of a particular kind of ants appeared. They descended from the hills like torrents and filled every path and road for miles, preying upon rats, mice, and reptiles, and were stopped in their onward progress only by streams of water. Every means to destroy them was unsuccessful until in 1780, when a hurricane exposed them to a deluge of rain and freed the island of them.

Some ants carry on war against other species and take their young into slavery. The fighting ants are red, and are generally regarded too stupid to take care of themselves, and would die

ANT-HILL.

from starvation if they did not have in captivity others to provide for them. However, ants have many enemies, being consumed in large numbers as food by birds, while some quadrupeds, as the aard-vark and the ant-eater, dig

into their habitations and consume great numbers of them. *Termites*, or white ants, belong to a different order from the common ants, but are like them in their habits. They live in the tropics, in vast communities, and are regarded a very dangerous pest. In Africa they are found extensively, where several species burrow in wood or excavate dwellings underground, and some build mounds above the surface of the plain. These are very productive, a single female often laying over 80,000 eggs. They live mainly on dry and decaying woods. The natives use them as an article of food, for which purpose they are pressed or pounded into a jam, which they regard a delicacy.

The intelligence of ants is recognized as a remarkable circumstance of nature. They are sensitive to changes in temperature and moisture, and exceed the human range of ability to observe sound waves. They remove the dead promptly, care for the injured, and observe cleanliness in caring for the young. Naturalists assert that ants communicate with each other and are able to recognize each individual of a community.

**ANTANANARIVO** (än-tä-nä-nä-rē'vō), or **Tananarivo**, the capital and chief city of Madagascar, situated near the center of the island, 165 miles southwest of Tamatave. It is in a mountainous region with an elevation of 4,500 feet above the sea. The streets are irregular and crooked, most of the buildings are of wood, and the inhabitants are chiefly natives, including only about 200 French. Its commerce is not important, but it has manufactures of jewelry, silk stuff, clothing, and utensils. An improved highway extends to Tamatave, but the transportation facilities are inadequate. Population, 1906, 65,840.

**ANTARCTIC** (änt-ärk'tik), meaning opposite to the Arctic, and relating to the region surrounding the South Pole. The Antarctic Circle, a circle imagined drawn parallel to the equator, forms a small circle around the earth at a distance of 23° 28' from the South Pole. The Antarctic Ocean is that portion of the sea which surrounds the South Pole, and lies immediately south of the Atlantic, Pacific, and Indian oceans. It has been explored by navigators, and is known more or less satisfactorily as far as 75° south latitude. The highest southern latitude ever attained, that of 78° 50', was reached in 1900 by an expedition which sailed from Tasmania in 1898. Owing to great dangers and difficulties in southern navigation, only a small portion of the Antarctic region is definitely known. The land masses of this region of the earth include Graham's Land, En-

derby Land, and Victoria Land. A part of these land areas are accessible, and the sea in their proximity has yielded valuable returns through the seal and whale fisheries. However, they contain cliffs of perpetual ice and their valleys are covered with everlasting snow. A large part of the Antarctic Ocean is clouded with constant fogs. Baffling currents and numerous icebergs, together with extreme cold, make navigation difficult. The Antarctic Ocean is richer in life, especially deep-sea fauna, than the other oceans. On the coast of Victoria Land is Mount Erebus, a volcano 12,400 feet above the level of the sea.

**ANT-EATER** (änt ēt'ēr), the popular name of a quadruped mammal native to South Amer-

GREAT ANT-EATER.

ica, and belonging to the order *Edentata*. The mouth is perfectly toothless, and the food consists of insects, chiefly ants. It has small eyes, short and rounded ears, and powerful claws. The tongue is long and wormlike and coated with a sticky saliva, and is thrust out to catch the food. Though large and powerful, the ant-eaters are very stupid and inoffensive, and are an easy prey to animals weaker than themselves. The average length of the body is about four feet, not including the bushy tail, which is nearly as long as the body. The aard-vark, a species of ant-eater, is native to South Africa. It lives chiefly on the termites, whose nests it tears down in search of food. Other animals classed with this group include the manid, or scaly ant-eater, and the echidna, or porcupine ant-eater, of Australia.

**ANTECEDENT** (än-tê-sēd'ēt), a term used to express precedent in point of time. The term *antecedent* is applied in grammar to a word going before a relative pronoun, or a word to which the relative relates. In logic the antecedent is that part of a constitutional proposition upon which the other depends, and in mathematics it implies that quantity which is considered first in making comparison with another number.

**ANTELOPE** (ăn'tě-lōp), a genus of ruminating mammals quite similar to the deer. The horns are hollow and encircled by rings at the base, but are not renewed annually. They are swift of foot, have large lustrous eyes, and when fleeing before a foe take enormous leaps.

ANTELOPE.

The smallest species are found in South Africa, such as the guevi, or bluebuck, which is about thirteen inches in height, while the largest species are from five to seven feet. Two representatives of the antelope family are native to North America, and allied species are found in Eurasia, particularly in India. The American antelopes include the prongbuck and the mountain goat. The latter possesses a coat of long woolly hair, and in form is closely allied to the chamois of Europe. The eland and gazelle are species native to Africa, the latter being confined largely to the northern part of that grand division. A species of Northeastern Africa, the addax, has spirally twisted horns about four feet long. Most species are so fleet of foot that greyhounds cannot catch them, and are capable of leaping a height of from eight to twelve feet, while the length of their bounds is fully as great. The flesh is highly prized as food, for which they are hunted, and the skin is valuable in making gloves and other wearing apparel.

**ANTENNAE** (ăn-těn'nē), the organs of insects located nearly in the same position as horns in some of the animals, and composed chiefly of minute articulate rings. They are two in number and are found in nearly all in-

sects, only a very few excepted. In moths the antennae look like feathers, and those of butterflies have little knobs at the tip. Similar appendages are common to the lobster and other crustaceous animals. They serve the purpose of organs of touch and probably of hearing. With them the animal is enabled to feel its way and test surrounding objects. In some animals the antennae possess organs of taste, sound, and smell, and it is known that at least several species of the lobster are capable of hearing by organs located at the extreme end. Deprived of this organ, this class of animals becomes largely inactive, while the ant becomes helpless.

**ANTHER** (ăn'thēr), a part of the stamen of a flower, and generally attached to the apex of the filament. It is the male organ of the flower, and usually contains two cells, which are filled with the pollen. At shedding time the pollen escapes through a longitudinal fissure, which generally extends from the base to the apex. In some flowers the anther is a direct continuation of the filament, when it is said to be innate; in others it grows to the side or face of the filament, when it is designated adnate; and it is versatile when it is attached to the middle of the anther.

**ANTHRACITE** (ăn'thrā-sīt), a variety of coal differing from the common, or bituminous, in that it contains a larger proportion of carbon. It is distinguished by its compactness, bright luster, and high specific gravity. Though difficult to ignite, it is smokeless and gives an intense heat. The bituminous coal contains about eighty per cent. of carbon, while the anthracite possesses from ninety to ninety-five per cent. It is most abundant in the Alleghany Mountains and in the province of Shansi, China, but is found in considerable quantities in Wyoming, New Mexico, British Columbia, France, and Russia. Anthracite coal, next to diamond, is the purest form of carbon.

**ANTHROPOLOGY** (ăn-thrō-pōl'ō-gy), the science devoted to the study of man and mankind. It is the newest of the sciences and may be said to embrace the three departments of somapology, psychology, and ethnology. Somapology, or the biology of man, places mankind in the zoölogical system and treats man as an animal, while psychology is the science of the human soul and embraces comparative psychology, which investigates the mind of the lower animals. Biology is a study of man in relation to the arts of life. See **Biology**, **Ethnology**, etc.

**ANTHROPOMETRY** (ăn-thrō-pōm'ē-try), the measurement of the height and other di-

mensions of the human body, especially at different ages and under the influence of various habits and occupations, to aid in classification as to physical and mental characteristics. This subject has received growing attention in recent years, especially from the standpoint of education, medical treatment, physical culture, and in criminology. Since no two individuals are alike in all dimensions and are influenced variously by their environments, it has been found profitable to employ measurements when considering the treatment of individuals at different ages and for a variety of causes. Craniometry is a system of measurements of the skull, and some schools regard it the most important part of anthropology, while others do not look upon it as being of over-shadowing importance and think it expresses only trifling variations in individuals. The measurements regarded of primary importance in anthropometry are those taken while the body is at rest. They include facial angle (q. v.), position and size of ears, shape of head, position and attitude of eyes, size and form of nose, length of fingers, size of feet, length of thigh and forearm, circumference of waist and shoulders, length of limbs, sitting height, expansion and circumference of chest, stature, weight, age, etc. Considerable importance is attached to the color of the eyes and hair, beard and body hair, form and color of the mucous membrane and nails, and the peculiarities of features and movement of the visible organs. The habits of individuals are studied, especially in regard to the food eaten, clothing worn, and the character and amount of work done and rest taken. Some attach considerable prominence to the dynamic aspect of anthropology, and in consequence substitute largely the measurement of functions, such as the rate of pulsation and respiration.

**ANTICHRIST** (ăn'tī-chrīst), a name employed by Christian writers to designate a supposed powerful institution destined to stand in opposition to Christianity. It is referred to in I. John ii, 18-22; iv, 1-3, but the idea seems to have originated before the Christian era, at least some writers quote in favor of this view the prophecy of Ezekiel concerning Gog and Magog. A number of Protestant writers, both before and since the Protestant Reformation, have referred to the pope or the papacy as the antichrist, while both Protestant and Catholic writers have referred to Nero, Diocletian, and other emperors who persecuted Christians as the antichrist.

**ANTICOSTI** (ăn-tī-cōs'tī), an island in the Gulf of Saint Lawrence, belonging to the

Province of Quebec, near the mouth of the Saint Lawrence River. It is 40 miles wide and 135 miles long, and has an area of 2,500 square miles. Fox Bay, in the northwest, and Ellis Bay, to the west, are the larger indentations and have good harbors. Much of the interior is wooded, though a considerable part furnishes pasture. In the northern section are mountains, and numerous swamps and rocky districts prevail. Cōd, trout, salmon, and her-ring fisheries abound near the coast. Few settlements have been made, owing to the severe climate, and the population at present does not exceed 250.

**ANTIDOTE** (ăn'tī-dōte), a medicine employed to neutralize the effect of a poison. The antidotes are classed as chemical and physiological. The chemical antidotes neutralize the poison by converting it into an insoluble or harmless substance, while the physiological antidotes produce action within the body, by which it is enabled to resist the injurious effects of the poison. Acids and alkalis act upon each other as chemical antidotes, while morphine and atropine have opposite actions upon the body. Both opium and belladonna are poisonous, but act as antidotes to each other. Ammonia and alcohol are given in certain snake poisons, acting as physiological antidotes. See **Poison**.

**ANTIETAM** (ăn-tē'tam), a small stream of the United States, rises in Pennsylvania, thence flows into Maryland, and joins the Potomac about fifty miles from Washington. It is noted as the scene of an indecisive battle fought Sept. 17, 1862, between the Union army numbering 57,640 men under General McClellan, and the Confederates with 38,000 men under General Lee. The battle continued with great slaughter the entire day. The Union loss aggregated over 11,000 and the Confederates lost 10,000 men. Lee's army retreated on the 18th, recrossing the Potomac soon after. While the result was indecisive, it tended to give great encouragement to the Union cause, and, on the strength of this battle, President Lincoln issued the Emancipation Proclamation abolishing slavery.

**ANTI-FEDERALISTS** (ăn'tī-fēd'ēr-al-īst), a political party in the United States, organized in opposition to the Federal party. Thomas Jefferson was the principal leader, and it stood in favor of strict construction of the Constitution as against the centralizing tendencies in the administration of government. However, the ground originally occupied was at least in part abandoned after the election of Jefferson in 1800, since he favored the purchase of

Louisiana and other measures possible only under a liberal construction. The name was changed to Republican in 1793, and soon after the organization became known as the Democrat party.

**ANTIGO** (än'ti-gō), a city of Wisconsin, county seat of Langlade County, about seventy-five miles west of Menominee, on the Chicago and Northwestern Railroad. It has a fine public school system, and is provided with modern municipal facilities, such as waterworks and electric lights. The manufactures include furniture, flour, lumber products, broom handles, clothing, and machinery. It has a large trade in cereals, merchandise, and live stock. The first settlement was made in 1878 and it was incorporated in 1884. Population, 1905, 6,663.

**ANTIGUA** (än-tē'gwà), one of the Leeward Islands, twenty-two miles south of Barbuda. It belongs to the British West Indian Islands and has an area of 108 square miles. The coast is indented with small inlets, the surface is rugged, the soil fertile, and the climate favorable to the cultivation of sugar cane and fruit. Barbuda and Redonda are dependencies of Antigua and for government purposes are united to form one of the five presidencies of the Leeward Islands. Columbus discovered Antigua in 1493 and it was settled by the English in 1632. Saint John, the capital, has a population of 10,000. English Harbor is the best port. Population, 1901, 34,970.

**ANTILLES** (än-til'lēz), the name applied to the whole of the West Indies, except the Bahamas. They stretch eastward from the Gulf of Mexico and form a half circle. They are divided naturally into two sections: the Greater Antilles, lying to the north and west, and the Lesser, to the east and south. The Antilles include about 360 islands, all of which are more or less fertile, have a tropical climate, and are frequently visited by hurricanes. The chief products are rice, tobacco, corn, cotton, sugar, rum, coffee, vegetables, and tropical fruits. The Greater Antilles include Cuba, Jamaica, Porto Rico, and Hayti, and the Lesser Antilles embrace nearly all the remainder of the islands. The area of the entire islands aggregates about 94,398 square miles. See **Cuba, Porto Rico, Jamaica**, etc.

**ANTIMONY** (än'ti-mō-nŷ), a metal of a bluish-white or silver color, and commonly found in nature alloyed with other metals. Large veins producing antimony occur in California, Sweden, Chile, Mexico, Australia, Borneo, and many other countries. It is brittle and is easily reduced to a powder. It is hard-

ened by alloying with other metals. On account of not tarnishing or rusting, it is valuable as an alloy in making type metal. It is used extensively as a medicine and in the arts, especially for coloring and in the manufacture of lead pencils. A variety known as *yellow antimony* is well suited for painting porcelain and for enameling.

**ANTIOCH** (än'ti-ōk), an ancient city of Syria, on the Orontes River, founded by Seleucus Nicator in 300 B. C., and long celebrated as one of the finest cities of the East. It was one of sixteen cities of this name built in memory of Antiochus, father of the founder, who was one of the generals of Philip of Macedon. The people were noted for intelligence, wealth, and luxury, and it had a large commercial trade by caravans. In this city the name *Christian* was first applied to the disciples of Christ. Much human life and many of the chief buildings were destroyed by earthquakes in 526 and 587 A. D. In the ruins were found the remains of 250,000 people who had been killed by the great upheavals. It was conquered alternately by the Saracens and the Crusaders, and was razed to the ground by the Mamalukes in 1269. Since 1516 it has been a possession of the Turks. The ancients spoke of it as "Antioch the Beautiful." Its site is now occupied by Antakieh, or Antakiyeh, a market and residence town. Population, 27,500.

**ANTIOQUIA** (än-tē-ō'kē-à), a city of Colombia, in the state of Antioquia, on the Cauca River. It is situated on an elevation 1,890 feet above the sea. The surrounding country contains productive mining and lumbering interests. It has considerable trade in maize, sugar, and tobacco. Population, 9,150.

**ANTIPODES** (än-tip'ō-dēz), a word of Greek derivation, used to denote peoples or places on opposite sides of the earth, so situated that a line drawn from one to the other would pass through the center of the earth and form a true diameter. Thus the south pole is exactly antipodal to the north pole, noon at one place is midnight at the other, the longest day corresponds to the shortest, and the midsummer to midwinter. A voyager sailing east anticipates the sun and his dating at the opposite side will be twelve hours in advance, while one sailing westward will fall as much in arrear. At the point of meeting there will be a whole day, twenty-four hours, difference between them. This has been at least twice exemplified; the Russians sailing from the west to the northwest coast of North America were a day in advance of

the British who sailed from the east; while the Spaniards coming from the east of the Philippines were a day behind the Portuguese in Macao, who came from the west.

**ANTIPODES ISLAND**, a small island southeast of New Zealand. It has an area of eleven square miles and is uninhabited. It was so named because it is nearly the antipode of Greenwich.

**ANTIPOPE** (än'ti-pōp), a term applied to those persons who claimed an election to the Papacy by the suffrage of the cardinals, or otherwise, but whose claims were for some reasons not deemed valid by the church. Novatian, the first antipope and founder of the sect of Novatians, procured his election in 252 in opposition to Cornelius. According to some writers there were fourteen antipopes, but the number usually given is thirty-one, the apparent difference being due to the fact that a number of writers do not recognize the claims of all who are usually credited with some degree of right to recognition. The antipopes were elected by religious factions or set up by political parties. Felix V., the last antipope, was a Duke of Savoy and made claim to the See in 1431. See **Pope**.

**ANTIQUARIES** (än'ti-kwâ-rēs), **Society of**, the name of an association established by learned men of America and Europe, whose object is the study of antiquity. Beginning with the Revival of Learning, much interest was aroused in a study of classical productions of Greece and Rome. Accordingly every obtainable relic was secured and preserved. Organizations for the study of this branch of learning were not generally established in Western Europe until about 1572. The present Antiquarian Society of London consists of a council of twenty-one and one hundred fellows. This society and several others of Europe and America have published some valuable works and have added largely to the literature treating of antiquities.

**ANTISEPTICS** (än-ti-sēp'tiks), the substances that prevent or retard putrefaction of animal and vegetable matter. It has been demonstrated that putrefaction in fermentation generally depends upon the presence of microscopic vegetable organisms. Hence, to prevent it, an agent is necessary that will destroy these microorganisms, or exclude them entirely. Among the substances used are salt, alcohol, creosote, tannic acid, arsenic, aloes, camphor, benzene, chloroform, and many others. Salting is a common way of preserving herring, fish, and meats, or perishable commodities of this kind may be packed in ice

as a means of keeping the temperature too low to permit decay. Besides their use in the preservation of foods, many forms of antiseptics are used in the treatment of wounds and in the prevention of infectious diseases, as carbolic acid and formaldehyde. The properties of infectious matter commonly found in contagious diseases appear closely analogous to organisms that lead to putrefaction in fermentation. These can be rendered inert by exposure to a high temperature, or by the use of antiseptics, such as an application of chloride of zinc, carbolic acid, or other equally efficient agents. By a liberal application of these substances to the bedroom or house containing germs of contagious diseases, the infection may be destroyed and prevented from spreading. Besides, antiseptics are used in surgery for the treatment of wounds, with the view of preventing harmful organisms from developing. This is done largely by allowing air to reach the wounds only through substances capable of destroying the germs in the atmosphere, upon whose presence the generation of suppuration depends. The general term *disinfectant* is applied to any agent that destroys microorganisms, and at the same time removes the harmful products of fermentation and putrefaction.

**ANTITOXIN** (än-ti-tōks'in), the name of a preparation of value in treating diphtheria, cholera, bubonic plague, and other diseases due to the development of bacteria in the blood. Diphtheria antitoxin is prepared by injecting diphtheria poison under the skin of some animal, usually a horse, the quantity being sufficient to give rise to a slight illness in a few days. The injection is repeated as soon as the animal regains its health, but the quantity of the poison is increased after repeated recovery. In the course of several months a condition is developed in the animal under which it can bear the injection of several hundred times as much poison as the minimum quantity that at first would have resulted in death. When in a proper state of development, several gallons of blood are withdrawn from the horse, the serum or watery part constituting the antitoxin. Persons afflicted with diphtheria are relieved by injecting it under the skin, and such treatment also gives immunity to persons exposed to but not affected by the disease. Other antitoxins have been prepared and used successfully.

**ANT-LION** (änt lī'un), the larva of several species of insects, which, when fully developed, are similar in appearance to the dragon fly. These insects are common to the sandy regions

of many countries, and about fifty species of North America have been described. They are most numerous in semiarid districts, such as Mexico and the part of the United States lying north of the Rio Grande. The ant-lion is remarkable for the curious and ingenious method by which it catches the ants and other insects on which it feeds. A cavity in the form of a funnel is excavated in the sandy soil, the sides being smooth and sloping uniformly, and at the bottom the ant-lion waits until an insect comes so near to the edge that it falls into the pit, where the juices are sucked out of its body. When ready for another prey, the skeleton of the dead insect is removed and the ant-lion awaits another insect.

**ANTOFAGASTA** (än-tō-fā-gās'tà), a city of Chile, capital of a province of the same name, situated on the Pacific coast. In its vicinity are extensive deposits of saltpeter and some distance inland are the rich silver mines of Caracoles. A railroad extends inland, making it an important market for domestic and foreign trade. Formerly both the city and province belonged to Bolivia, but in 1882 they were ceded as the result of a war between the two countries. Population, 1906, 26,445.

**ANTWERP** (änt'werp), the principal seaport of Belgium, capital of the province of Antwerp, on the Scheldt River, about fifty miles from the sea. It is strongly fortified, being encircled by outer fortifications and inner lines of defenses, and is the converging center of many important railroad lines that connect it with commercial cities of Belgium, Holland, France, and Germany. The surrounding country is a fertile and well cultivated region. It has extensive manufactures of machinery, cotton and woolen textiles, silks, chemicals, leather, pottery, furniture, and canned and cured meats and fish. The city has important commercial relations with the leading ports of Europe, and is a point of departure for emigrants to Africa and America. Few cities of Europe rival it in the point of architectural beauty. Among its public buildings is a fine Gothic cathedral with a spire 400 feet high. This building contains the famous paintings of Rubens, entitled "The Descent from the Cross," "The Elevation of the Cross," and "The Assumption." The city has many hospitals, educational institutions, and public buildings, and supports a well-organized public school system. Gas and electric lights, numerous libraries, several fine parks and boulevards, and an extensive system of electric street railways are among the many improvements. Antwerp was a place of importance as

early as the 11th century, and in the 16th century attained to large commercial trade relations, when it had a population of 200,000. Its commerce was greatly injured by wars between Spain and the Netherlands. In the last century it made wonderful growth, and is now a center of wealth, intelligence, and industrial activity. German with the Flemish dialect is spoken generally, and most of the daily newspapers are in that language. Population, 1906, 304,032.

**ANVIL** (än'vil), an iron block with a steel surface on which metals are hammered and shaped. The common blacksmith's anvil is

ANVIL.

usually built of six pieces, which are welded to a central *core* or *body*, and has four corner pieces, a projecting end, and a conical end, or *beak*, for hammering curved pieces of metal. The projecting end has a square hole for the reception of a chisel, thus serving to facilitate punching holes in iron plates. The anvil is usually placed on a large wooden block. Heavy anvils for forging shafting and large portions of implements are placed on piles of masonry.

**AORTA** (ä-ôr'tà), in anatomy, the great arterial trunk from which branches proceed to penetrate the whole system. It rises from the left ventricle of the heart, where it is called the *ascending aorta*, then makes a curve called the *arch of the aorta*, from which branches pass to the head and other upper extremities. It then passes toward the lower extremities, where it is called the *descending aorta*. From this part and farther down innumerable branches proceed to the trunk and lower extremities, where, as elsewhere, minute branchlets ramify the different parts of the body.

**APACHES** (ä-pä'châz), a warlike tribe of North American Indians now principally resident in Arizona, New Mexico, and parts of Mexico, where they settled many years ago, after emigrating from the vicinity of Great Slave Lake in Canada. They harassed the pioneer settlers and government troops for many years, but civilization is steadily benefiting them, and large numbers have taken advantage of educational facilities provided by the government. Antonio Apache, a highly

educated Apache Indian, held an official position in the department of anthropology at the World's Columbia Exposition in Chicago in 1893. The total number of Apaches, in 1900, was 5,150.

**APATITE** (ăp'ă-tit), a mineral found in the older crystalline rocks, consisting of phosphate mixed with fluoride and chloride of calcium. Deposits are found in many parts of the world, being abundant in Canada, the United States, and Europe. This mineral is important as a source of fertilizer.

**APE** (ăp), an animal closely allied to the monkey, and in structure nearly approaching the human race. The word *ape* was formerly applied to all monkeys, but is now limited to the species that possess a manlike form and appearance. The principal kinds of apes are the orang-outang, chimpanzee, gorilla, and gibbon. These are classed as *anthropoid apes*, owing to their manlike structure. Their toes and fingers are very similar and much like human hands, by the aid of which they can swing from trees with much ease, but they are quite helpless when on the ground. The brain structure is similar to that of man, but it is only half as large. The food consists chiefly of fruits and the tender part of plants. They are native to Africa, Borneo, and the warmer parts of Asia.

**APENNINES** (ăp'en-ninz), an extensive range of mountains in the Italian peninsula, extending from the Maritime Alps to the Strait of Messina. They form the principle watershed of Italy. The Apennines are considered the southern branch of the great Alpine system of Europe, and are separated from other ranges in the vicinity of Genoa. Their length is about 800 miles, the average height is about 4,000 feet, and the highest peak, Monte Corno, near Aquila, is 9,580 feet above sea level. This range does not reach the limits of perpetual snow, owing to the mild climate of that section of Europe. The geological formations include immense limestone rock, and they are exceeding rich in the finest marbles and metal ores. Several of the mountains are volcanic, including Mount Vesuvius, which is the most active and noted of Europe. The slopes, even to a comparatively high altitude, are covered with abundant vegetation, while the summits are sterile.

**APHIS** (ă'fis), an insect commonly known as the plant louse. Many widely different species have been described. They propagate in large numbers, are soft, round-bodied, and carry a long beak coming from between the fore legs, from under the head, which is used to suck the juice of plants. The aphides are taken as food by the larvae of the ladybird.

Some species are pursued by ants for a saccharine liquid that contains a large portion of sugar, and of which they are very fond. This liquid is called *honeydew* and is secreted at the posterior end of the abdomen, from which it exudes a drop at a time. Its purpose is to supply food for its young. Tobacco is used as a means to protect plants against the ravages of these insects.

**APIA** (ă-pě'ă), a town in the Samoan Islands, on the island of Upolu, which is a possession of Germany. It has a good harbor and is the most important commercial center of the Samoan group.

The chief buildings include several schools, a Roman Catholic church, and the government house. It has a good trade in cotton, copra, tobacco, and fruits. Population, 1901, 3,750.

**APIARY** (ă'pĭ-ă-rĭ), a shed or stand for keeping bees, commonly constructed to protect bees from extremes of weather and temperature. In cold regions the apiaries are built so as to face toward the south or southwest, for the purpose of utilizing to the best advantage the warmth of the sun during the winter season. In the summer months the hives are set out in the open air near good feeding ground, as clover fields, gardens, or flowering heaths. Apiaries are not generally maintained in regions having a warm climate, but they are quite necessary to bee-keeping in the colder sections. See **Bee**.

**APIS** (ă'pĭs), the bull regarded sacred by the ancient Egyptians, and long worshiped as a symbol of Osiris, the husband of Isis. The day of his birth was kept as an annual festival, and his death was a season of public mourning. This animal was not allowed to live to exceed twenty-five years, and on attaining that age was killed and embalmed. The type by which Apis was represented is that of a human mummy containing the head of an ape. Figures

ANT AND APHIDES.

in bronze, stone, and porcelain were common in all cities, and many made of the first two mentioned materials are still abundant.

**APOCALYPSE** (à-pŏc'a-lĭps), a name applied frequently to the last book of the New Testament. In the English and most languages it is called the "Revelations of Saint John the Divine," and it is supposed to have been written by John the Apostle, but its authorship is much disputed. Those who assign it to the Apostle John think it was written while he was on the Isle of Patmos, about 95-97. A large part of it is devoted to predictions respecting the future of Christianity.

**APOCALYPTIC NUMBER** (à-pŏk-à-lĭp'-tĭk), the number 666, based on Rev. xiii, 18: "Let him that hath understanding count the number of the beast: for it is the number of a man; and his number is Six hundred threescore and six." In the 2d century it was discovered that the name *antichrist* was contained in the Greek characters expressive of this number, while it was held by some to express a date. The Roman nation was the most powerful pagan government, was the most mighty representative of antichrist, and its name is spelled in Greek by characters in which the number 666 appears. Some Protestants apply the prophecy to papal Rome, while it is applied by others to reformers of other denominations for, perhaps, no better reasons.

**APOCRYPHA** (à-pŏk'rĭ-fà), the term applied to professedly inspired writings, and sometimes to those whose public use was not thought advisable. It is used especially to designate books written in the two centuries preceding the birth of Christ, and which are omitted from the majority of Bibles now in use. These books include a total of fourteen, and, when published at all, usually appear in the Bible in the following order: I Esdras; II Esdras; Tobit; Judith; the Additions to the Book of Esther; the Wisdom of Solomon; the Wisdom of Jesus, the son of Sirach, or Ecclesiasticus; Baruch; the Song of the Three Holy Children; the History of Susanna; the History of Bel and the Dragon; the Prayer of Manasses, king of Judah; the First Book of the Maccabees; and the Second Book of the Maccabees.

**APOGEE** (ăp'ŏ-jē), a term used in astronomy to denote the point occupied by the moon at which, in its course of revolution, it is at the greatest distance from the earth. The ancients regarded the earth as the center of the solar system, and used the term apogee to designate the point most remote from the sun. When the sun became recog-

nized as the center, the expression for this relation was changed, and the term *aphelion* is used instead. Apogee is now used to express the greatest distance of the moon and the planets from the earth, and *perigee* the nearest. Aphelion expresses the greatest distance of any heavenly body from the sun, and *perihelion* the nearest.

**APOPLEXY** (ăp'ŏ-plĕks-ÿ), a serious malady that comes on suddenly, causing a loss of sensation and voluntary motion. A stroke of apoplexy suspends the functions of the cerebrum by a pressure on the brain, caused by a rupture of blood vessels or a congestion of the blood. It is accompanied by loss of the intellect or thought, while respiration and the action of the heart and of the general vascular system continues. In a severe stroke the person falls suddenly and gives no proof of consciousness. Persons at the age of from fifty to sixty are the most subject to it. Among the causes leading to apoplexy are continued anxiety, frequent indulgence of temper and passion, intoxication, luxurious living, and intense thought. Out of a large number of patients, carefully examined, only six per cent. were corpulent, thirty per cent. were thin, and the others were of ordinary form. Recovery after one or two attacks is quite common, but persons afflicted more than twice are almost certain to fail of recovery.

**APOSTLES** (à-pŏs's'lz), meaning a person sent, a term applied to the twelve men whom Jesus selected to aid Him during His ministry and to preach the gospel. They were chosen by Him promiscuously from among fishermen and others engaged in the more common occupations. The twelve were as follows: Simon Peter; James; John; Andrew; Philip; Thomas; Bartholomew; Matthew; James, the son of Alpheus; Lebbeus, or Thaddeus; Simon; and Judas Iscariot. On account of Judas Iscariot's betraying Christ, Matthias was chosen in his place, and later Paul and Barnabas are spoken of as apostles of Jesus. These apostles were commended by Jesus to preach the gospel, at first to the Jews, but a short time before his ascension they were instructed to preach to all nations. The day of Pentecost was the occasion when they received miraculous gifts for the public ministry. The chief events in the lives of the apostles are recorded in the Epistles and Acts of the Apostles. In a wider sense, the early Christian preachers sent to heathen countries are termed *apostles*, but usually, when speaking of the apostles, those named above are implied.

**APOSTLES' ISLANDS**, a number of small

islands in Lake Superior, near the western end, first settled by the French in 1680. They consist of twenty-seven islets and islands, and have an area of 200 square miles. Mandeline Island is the largest of the group and on it is the town of La Ponte. The islands have deposits of a fine quality of brownstone, which is quarried and shipped. For governmental purposes they belong to the State of Wisconsin.

**APOSTOLIC FATHERS** (ăp-ōs-tōl'ic), the name given to the disciples and fellow-laborers of the apostles, especially those who are supposed to have left writings. These writings are looked upon as a continuation of the epistles written by the apostles, but in form and contents are quite inferior to their predecessors. The essence and main purpose is to exhort to faith and holiness. The list of apostolic fathers include Barnabas; Clement of Rome; the Shepherd of Hermas; Ignatius, Bishop of Antioch; Papias of Hierapolis; and Polycarp, Bishop of Smyrna. Diognetus is sometimes included with the above list.

**APOSTOLIC SUCCESSION**, the uninterrupted succession of bishops, priests, and deacons from the time of Christ to the present day. It is considered essential and is observed strictly by the Anglican, Greek Catholic, and Roman Catholic churches, who do not consider the ordination of ministers or priests legitimate unless it is by a bishop.

**APOTHECARIES' WEIGHT** (ă-pōth'ē-kā-rīz), the system of measurement used in dispensing drugs. The pound contains twelve ounces, the ounce eight drams, the dram three scruples, and the scruple twenty grains. The grain is equivalent to that used in avoirdupois weight.—Apothecary, one who keeps a store or laboratory for preparing, compounding, and selling medicines, and for compounding prescriptions. In early times, even as late as the 17th century, apothecaries ranked with the grocers, but in the 18th century they were placed on a higher standard. In most countries laws have been enacted for the purpose of regulating the practice of compounding medicines. A person who engages in this line is called a *pharmacist*. He is usually required to hold a certificate showing that he is duly authorized by law to make up prescriptions and is qualified for such duties. The name *druggist* is usually applied to one who keeps a drug store.

**APPALACHIAN MOUNTAINS** (ăp-pā-lā'chī-an), a vast system of elevations in the eastern part of North America, located partly in Canada, but mostly in the United States. The system consists of a number of nearly parallel

chains extending from the Saint Lawrence River to Alabama and Georgia. It is highest in the north and south and slopes gradually toward the middle. Its length is about 1,300 miles and its breadth varies greatly in the different portions. Between the mountain system and the Atlantic Ocean stretches a fertile slope, known as the Atlantic Coast Plain, which is from fifty miles in breadth in New England to two hundred miles in the South. In the North are the Adirondacks, the Green Mountains, the White Mountains, and others; in the central portion, the ranges of the Blue Ridge, and the Alleghanies; in the southern, the ranges of the Blue Ridge, Black Mountains, Smoky Mountains, and others. The elevation of the system is from a few hundred to 6,500 feet above the level of the sea, though none of the higher peaks reaches the snow line, and the average height is about 2,500 feet.

The Appalachians are the source of a large number of rivers, and form the divide between those that discharge into the Atlantic Ocean and the eastern tributaries of the Mississippi River system. These highlands contain but one large body of water, Lake Champlain, which is located between the northern part of New York and Vermont, and has its outlet into the Saint Lawrence River. The mountains are covered entirely with vegetable growth and contain many fertile valleys. Near them have developed many of the large manufacturing cities and commercial centers of North America, due partly to their closeness to the sea coast, and partly to the large variety of rich minerals which these mountains contain. They yield, perhaps, the best anthracite coal in the world, and supply vast quantities of petroleum, gas, and iron. Besides, there are extensive deposits of other minerals, including lead, copper, marble, gypsum, salt, gold, silver, and bituminous coal. The forests yield many varieties and large quantities of valuable timber, consisting chiefly of white birch, beech, ash, sugar maple, walnut, cherry, and yellow pine. The timber product, of course, depends upon the altitude and latitude. In the northern part are the hardy varieties common to colder regions, while in the South abound magnificent forests of trees common to a southern climate, both sections yielding enormous quantities for manufacturing purposes. The wild animals have been largely extinguished, but in some localities the bear, panther, wild cat, and wolf still haunt the forests.

**APPALACHICOLA** (ăp-ă-lăch-ī-cō'là), or *Apalachicola*, a river in the United States formed in Georgia by the junction of the Flint

and Chattahoochie rivers. It flows southward through Florida and discharges into Appalachicola Bay, an inlet from the Gulf of Mexico. The entire course of ninety miles is navigable for steamboats. Near the mouth is the city of Appalachicola, the county seat of Franklin County.

**APPALACHICOLA**, a city in Florida, county seat of Franklin County, 85 miles southwest of Tallahassee. It is located near the mouth of the Appalachicola, on Saint George Sound, and is important as a port of entry. The chief exports are lumber, fruit, and naval stores. Population, 1900, 3,097.

**APPEAL** (ăp-pēl'), in law, the removal of a cause from an inferior court for the purpose of obtaining a review of the suit or a reversal of the decision. A writ of error and a certiorari differ from an appeal in that they merely bring up for review the questions of law involved in the proceedings of the lower court, while both questions of law and fact may be reexamined by an appeal. The rules under which appeals may be granted differ in the system of courts in different countries, but usually require that error be shown in the conduct of the trial, or that additional material evidence be presented.

**APPENDICITIS** (ăp-pënd-ĭ-sī'tis), a term used to denote inflammation of the vermiform appendix, a wormlike pouch or cavity projecting from the first part of the colon. In man it is small. It attains its largest size in such herb-eating animals as the horse, in which it is twice the size of the stomach. In man it has no definite function, and may be removed without any harm to the system. Appendicitis frequently results from cherry stones and round objects stopping in it, often causing death, if the patient is not operated upon by a skillful physician.

**APPERCEPTION** (ăp-pēr-sĕp'shŭn), a term employed in the study of mental science, and first used by Herbart, Kant, Liebnitz, and others. It is now a familiar term among teachers, and denotes a perception obtained by reflecting upon new elements of knowledge and comparing them with others previously obtained. In other words, the action of the mind upon a new idea is influenced by the masses of ideas the mind already has, and from this spring new ideas. Such action has come to be called *apperception*.

**APPETITE** (ăp'pĕ-tit), a term used to denote the natural desire for something, mainly the desire for eating and drinking. It is stimulated by exercise, work, cheerfulness, and plain living. A defective appetite is due generally to vicious habits, diseased action of the stom-

ach, impaired nervous system or circulation, and general debility. A depraved appetite results from unnatural food, excessive eating, and other causes. The technical meaning of appetite is, *I desire*. It is attended by two conditions: a desire of the stomach relieved by taking food, and state of the body changed as soon as the blood begins to take up the products of digestion. These are not yet accurately understood.

**APPIAN WAY** (ăp'pĭ-an), a famous road that connects Rome with the southern part of Italy. It was constructed mainly during the censorship of Appius Claudius Caecus, between the years 312 and 307 B. C. The course from Rome to Terracina is nearly straight, although the Pontine Marshes and the Alban Mountains made construction difficult. It was paved with large square stone and adorned with numerous magnificent sepulchers, the most noted of which were those of the Scipios and of Caecilia Metella. Pius IV. partially restored it, and in 1852 it was excavated as far as the eleventh milestone from Rome by Pius IX., near which it is now crossed by a railroad.

**APPLE** (ăp'p'l), a tree of the rose family of plants, native to the temperate region of Asia and Europe. It has been grown for its fruit since prehistoric times, and brought to America by settlers from England in the early history of this country. The tree has spreading branches, and attains a moderate height, seldom exceeding thirty feet. The wild crab apple of Europe

APPLE.

is the parent of all the varieties now grown. These have been largely improved by ingrafting and naturalization. There are three general classes, summer, autumn, and winter apples, and in each class are many varieties, perhaps 200. Many of the best known varieties are designated by names, as winesaps, Danvers winter-sweet, pippins, Ben Davis, willow twigs, Duchess of Oldenburg, etc. Apples are cultivated

extensively in Southern Canada and in nearly every section of the United States. They are especially productive in the middle Atlantic section, though fine orchards are common to the Mississippi Valley and the Pacific Coast.

The wood of the apple tree is hard, durable, and fine-grained. Some varieties of crabs are planted both for ornamental purposes and for the production of fruit. Besides being a wholesome food when ripe, the apple is used for many purposes in cooking, baking, preserving, and for jelly. From it is made a fermented liquor, called *cider*, and a fine quality of *vinegar*. By distillation a kind of spirits is manufactured. It is used for preparing compounds that have good medicinal qualities. Apples are important articles of commerce, great quantities being produced and exported to domestic and foreign markets in cases and barrels.

The seedless apple was evolved by propagation at Grand Junction, Colo., by John F. Spencer, who conducted experimental researches for several years and succeeded in producing five trees that bore seedless, coreless, and wormless apples, and from this little group there were budded two thousand more trees, which, in 1905, constituted the entire seedless apple stock of the world. This variety of apple trees has many peculiarities. While there is a stamen and a small quantity of pollen, exactly as in the blossom of the ordinary apple tree, yet the flower itself is missing, and several small green leaves grow around the apple to shelter it. The meat of the new apple, like that of the seedless orange, is quite solid, and at the navel end is a slightly hardened substance. In size these apples are of the usual average, of good flavor, and will keep well. The fact that the tree is flowerless renders it more hardy at the time of late frosts, and overcomes, to a large extent, injury by insects, since there is no place for the codling moth to lay its eggs.

**APPLE OF DISCORD**, in Greek mythology, the golden apple thrown by Eris into the midst of an assembly of the gods, at the marriage of Peleus and Thetis. It was intended "For the most beautiful," and was claimed by Juno, Venus, and Minerva, and Paris was chosen to decide the dispute. The award was given to Venus, which caused Juno to become inflamed with jealousy and hatred toward the Trojans.

**APPLETON** (äp'p'l-tun), a city of Wisconsin, county seat of Outagamie County, on the Fox River, about 120 miles northwest of Milwaukee. It is on the Chicago and Northwestern and the Chicago, Milwaukee and Saint Paul railways, has a growing trade in merchandise,

and is surrounded by a fertile farming and dairying region. The manufactures include paper, boots and shoes, furniture, machinery, clothing, tobacco products, and farming implements. Water power for manufacturing purposes is obtained from the Grand Chute Falls of the Fox River. The city has an excellent system of public schools, numerous churches, and is provided with extensive lines of street railways. It has modern conveniences, such as gas and electric lights, pavements, public parks, several libraries, and an extensive system of waterworks. It is the seat of Appleton Collegiate Institute and Lawrence University. The first settlement was made in 1840 and it was incorporated in 1857. Population, 1905, 17,000.

**APPLE-TREE BORER**, an insect native to America, and a common plague to apple and crab apple trees. It also attacks the mountain ash, pear, and quince trees, and does considerable damage to orchards. The larva of the insect is the borer, and when full grown is an inch long. It has a light yellow color and chestnut-brown head, and the jaws are a deep black. The best preventive is an alkaline wash, though soft soap mixed with lye made from wood ashes, applied to the base of the tree, serves practically the same purpose. This pest should be early exterminated from orchards so as to prevent its spread.

**APPOMATTOX COURTHOUSE** (äp-põ-mät'töks), formerly a village of Virginia, in Appomattox County, now called West Appomattox. It is situated twenty-three miles east of Lynchburg, on the Norfolk and Western Railroad, and is the county seat of Appomattox County. At this place was fought the final battle between the Confederates under Lee and the Federals under General Grant. Lee's army was retreating as rapidly as possible, but was met by General Custer, who fought the wearied Confederates till dark. On the following day, April 9, 1865, as Sheridan was preparing for a charge, a white flag was raised, and General Lee surrendered his army, numbering 27,805, to General Grant. This was the close of the Civil War, and the terms of the surrender accepted by General Grant included that Lee's officers and men should be released on parole and retain their horses, for, said he, "They will need them for spring plowing and farm work." The old courthouse building was destroyed by fire in 1892. In 1900 West Appomattox had a population of 267.

**APRICOT** (ä'prü-köt), a fruit of the plum order, though resembling the peach. It was first brought to Greece in the time of Alexander the Great from countries farther east, probably

from Armenia, where it is native. It is now extensively cultivated in the warmer parts of the temperate zone and in subtropical countries. The tree is of low and crooked growth, usually attaining a height of twenty or thirty feet. Its habit of blooming early renders it liable to damage by frosts in the spring, but it is fully as hardy as the peach. It can be propagated by budding and grafting on peach, plum, and wild cherry stocks. The fruit is an important article of commerce. It is preserved in cans or dried and shipped in boxes. The Pacific coastal region supplies a large portion of the markets of America with this fruit, its culture being an extensive industry in that section, both in Canada and the United States.

**APRIL.** See Month.

**APRIL FOOLS' DAY**, the name used to designate the 1st day of April. Custom has established this day as a time to send a person on a bootless errand, such as for horse milk, for the saddle of a nightmare, or to inform him there is a spot of mud on his face. When the person investigates he is laughed at and called an April fool. This practice is known in all civilized countries, but all do not observe the same day. In Hindustan the 31st day of March is set apart for this practice, at which time the Hindus celebrate the Kuli festival.

**APSE** (ăps), a term used by the Greeks and Romans to designate the projecting semicircular part of a building, or to describe a domical chamber and other vaulted structures. The interior was richly decorated and the most sacred subjects were placed on its walls and in the semidome. In temples the apse contained the cult image of the god, and in the basilica was the tribunal of the praetor, who sat in the center and was surrounded by his assessors. In later times the apse entered into the architecture of Byzantium and was adopted as a part of the architectural structure of Christian churches. The exterior of the Byzantium apse was polygonal in form, but the interior remained semicircular. In Christian churches it was modified both in size and structure, and in many cases the central apse was surrounded by smaller ones called *apsidols*, and sometimes the church was provided with a double apse, one at each end of the building.

**APSIDES** (ăp'si-dēz), the ends of the longest diameter of a heavenly body, applied chiefly to a planet, but frequently to a comet or a satellite. The apsides are the two extreme points in the orbit of a planet, one the nearest to and the other the farthest from its primary; a line drawn between the points is the major axis of the orbit, or the *line of apsides*. These points

move slowly forward in the same direction in which the revolving body moves.

**APTERYX** (ăp'tê-rîks), a running bird of New Zealand, belonging to the family which includes the emu, cassowary, and ostrich, but distinguished from the last mentioned by having three toes instead of only two. It is wing-

APTERYX.

less and tailless, and possesses a hairlike plumage. The nests are built in a hollow tree, or in deep holes in the ground, and it feeds on worms, insects, and seeds. From its cry, kiwi-kiwi, it is given that name by the natives. It is fast decreasing in number and probably will be extinct ere long.

**AQUARIUM** (ă-kwā'rî-ŭm), a tank or vessel in which marine or fresh-water plants and animals are kept in a living state. The fresh-water aquarium may be provided with a fountain to supply a change of water, or plants and animals may be kept in the proper proportion and the life of both sustained. It was long thought necessary to change the water frequently so as to sustain the life of the fish and other water animals, because when water animals breathe they give out carbonic acid and use up oxygen, just as land animals do, which renders water impure in a short time. But in 1836 M. Charles des Moulins, a Frenchman, discovered that if water plants are put into the same tank with animals they will take up the carbonic acid and give up the oxygen which the animals need. In this way the water may be kept pure and no change is needed. It has been found that salt-water plants can be kept as successfully and in the same way. As a result large aquariums have been established in cities for ornamentation and the study of both plants and animals. Many governments maintain aquariums as a source to study fish and other

animal life, and through these means numerous streams and lakes have been populated with fish and other animals valuable for food and commerce. At the Columbian Exposition at Chi-

FRESH-WATER AQUARIUM.

cago in 1893, the Louisiana Purchase Exposition at Saint Louis in 1904, and other expositions held in the United States, the government made exhibits by demonstrating the practical propagation of many kinds of fishes. At these expositions were eggs of fish in different stages of hatching, and young fish from one day to several months old could be examined and studied by those in attendance.

Aquariums on a large scale are maintained in many public parks for amusement and profit, and the animals treated quite the same as those kept in small tanks for ornament and study in the homes. The Battery, in New York City, formerly known as Castle Garden, has one of the largest aquariums in the world. It contains about 150 tanks, in which are small and large fish, turtles, alligators, and other aquatic animals. Many of the tanks are lighted from above and in the rear by electricity. Brighton, Paris, and Hamburg have large aquariums. In the one at Brighton are 125,000 gallons of water confined in a tank 125 feet long and 100 feet wide, which is covered by a plate glass, through which may be studied the form and habits of very large fish. Other great aquariums are located at Saint Petersburg, and in many natural parks in the United States. The aquarium at Saint Petersburg has been maintained over 150 years.

**AQUARIUS** (à-kwā'ri-ūs), or **Water-Bearer**, the eleventh sign of the zodiac, into which the sun enters about the 20th of January. The same name is applied to a constellation which was in the sign Aquarius at the time when the signs were named, but which, by the precession of the equinoxes, now occupies the sign Pisces.

**AQUATIC ANIMALS** (à-kwät'ic), a term applied to the animals that live in water, or frequent the water in quest of food. This class of animals is very numerous, including the fishes, whales, and dolphins, which live entirely in the water; many birds, reptiles, and mammals, such as the otter and the beaver, which frequent the water for subsistence; most of the mollusca; and many tribes of the articulata and radiata. The animals that live in and habitually frequent water are more numerous than those of the land. The structure and character of animals are influenced by their environments, and in this respect are quite analogous to plants.

**AQUATIC PLANTS**, the plants which live either entirely or partially immersed in water, or which require a preponderating quantity of water as the condition of their existence. Flowerless aquatic plants are more numerous than those that have flowers, and species of the lower types of organism are more abundant than the forms classed with the higher vegetable organisms. Some are entirely in water, as the algae (q. v.), and perform all their functions when submerged, while others are rooted to the ground and have their flowers and part of their foliage above the surface of the water. Some of the seaweeds and plants common to inland waters are provided with air bladders which serve to brace the stem and hold the leaves above the surface, while others, if torn up by the roots, or even if parts of the plant are severed from the main body, continue to grow and multiply. The cat-tail, or bulrush (q. v.), is a notable example of aquatic plants. Others are the water lily, the American lotus, the arrow-head, and the water hyacinth.

**AQUEDUCT** (äk'wê-dūkt), an artificial course or channel by which water is conveyed from one place to another by the force of gravity. Popular usage has limited the name to conduits built of masonry, such as are used in conveying water to supply large cities, and it does not include the pipes and ditches commonly utilized in mining and in irrigation. The practice of conveying water by aqueducts was in use in times far remote, and was well established in Judaea, Babylon, Persia, and many other countries of Asia. In Peru the Incas constructed aqueducts similar in many respects to those of modern times. In Rome such works were maintained in many parts of the dominion. The city of Rome secured a water supply by means of twenty-four aqueducts, extending many miles, and having a capacity sufficient to supply the entire city. Their construction was usually on a regular descent, winding through hills, crossing valleys by means of great arches,

and in many places even passing by tunnels through mountains.

Modern cities utilize aqueducts, but their construction is changing to a somewhat different plan. Instead of building them on a regular descent so the water may flow entirely by gravity, they are built in part of pipes through which large volumes of water are forced by steam or electric power. In New York City the Croton aqueduct, which supplies the greater part of the city with water, is about forty miles long. The water is conveyed through sixteen tunnels, many of them cut through solid rock. The Harlem River is crossed by a granite arched bridge 1,400 feet long, across which the water is conveyed in three large pipes. The water is carried into reservoirs in Central Park, and is piped from there through many parts of the city. At Boston the Cochituate aqueduct, which is fifteen miles long, supplies a large quantity of water, but the city has additional sources. San Diego, Cal., has an aqueduct or conduit built of redwood, thirty-five miles long, by which the water is conveyed from the mountains.

In recent years the development and application of pipes for conveying water under pressure, buried beneath the soil, have displaced to some extent the building of massive structures of masonry for that purpose. Some very extensive pipe lines, from twenty to fifty miles long, are used in many cities. Rochester, N. Y., is supplied in this way. Saint Louis has conduits that convey water to Bissell's Point, from which the city secures its supply. In many localities conduits of masonry are carried through hills and the valleys are crossed by iron pipe lines. Chicago and many cities secure their supply of water from the Great Lakes by means of tunnels. In most cases a large iron shaft is constructed several miles into the lake, and the water is pumped into a central well, from which it is forced through pipes to all parts of the

AQUEDUCT AT NIMES, FRANCE.

city. Aqueducts are used in hydraulic mining. The water is conveyed from reservoirs far up a river or smaller stream, or from a high point in the mountains, so as to obtain a working head of several hundred feet. The expense of these enterprises is marvelous. The Croton

aqueduct of New York cost over \$20,000,000, and many others cost as much.

**AQUEOUS HUMOR** (ā'kwē-ūs hū'mēr), a waterlike fluid that occupies the space between the cornea and the crystalline lens of the eye. The iris partially divides it into an anterior and posterior chamber, of which the former is the larger. The aqueous humor is almost pure water; only about one-fiftieth part of the whole consists of other constituents, of which fully one-half is chloride of sodium.

**AQUILA** (ä'kwē-lä), a city of Italy, capital of the province of Abruzzo Ulteriore, situated about fifty miles northeast of Rome. It was founded by Emperor Frederick II. in 1240, and is noted for ancient ruins found in its vicinity. It has railroad connections with seaport cities on the Adriatic. The chief manufactures are wine, textiles, and earthenware. A destructive earthquake in 1703 caused the death of about 2,000 persons. Aquila is noted as the birthplace of Sallust, the historian. Population, 1906, 21,188.

**ARABESQUE** (âr-â-běsk'), an Arabian style of architecture employed by the Arabs and by the Moors in Spain. Decorations in this style were used extensively in the Alhambra (q. v.) and by Raphael in the Vatican. The decorations consist mainly of scrolls and geometric devices, and in many of the buildings fruit, flowers, and leaves are mingled with the genii and animals.

**ARABIA** (a-rā'bī-a), the name of an extensive peninsula in the southwestern part of Asia. It is about 1,500 miles long and 750 miles wide, and has an area of about 1,150,000 square miles. This vast region is not well known to geographers and the area is variously estimated. The population is usually placed at 5,500,000.

**DESCRIPTION.** The surface features resemble those of the Sahara, of which it is considered an extension. It resembles the desert region of North Africa in that it contains many oases alternated by sandy and rocky wastes. Much of the interior is a vast tableland, with an altitude of about 8,000 feet, interspersed by mountains and arid deserts, and the whole surrounded by a coast plain near the adjacent waters. The northern and eastern boundaries are formed by Turkey, the Persian Gulf and the Gulf of Oman, and the southern and western by the Arabian Sea, the Gulf of Aden, and the Red Sea. On the northwest it is connected with Africa by the Isthmus of Suez. Anciently the peninsula was divided into three sections, known as Arabia Petraea, Deserta, and Felix. At present it is divided into seven districts whose boundaries are not fixed with any degree of

accuracy. These include Madian, Hejaz, Assir, Yemen, Nejd, Hadramaut, and Oman. The Euphrates River drains a portion of the northern section. Besides this stream there are no important rivers and no interior lakes, and the coasts are comparatively regular. As a whole the climate is healthful. The coastal plains have a scorching summer heat, while the more elevated interior is quite pleasant at most seasons of the year, though sand storms prevail periodically. Rain seldom falls in the interior, where the climate is excessively dry, and in most parts vegetation is very scant.

**INDUSTRIES.** Stock raising is the chief industry, and embraces the rearing of horses, camels, sheep, cattle, and mules. The mule is used largely as a beast of burden. Mining is not carried on extensively, but it is known that there are valuable deposits of salt rock, saltpetre, petroleum, coal, mineral pitch, and various kinds of building stone. Fruits are grown extensively on the coastal plains, especially the date palm. Other products include wheat, maize, tobacco, barley, millet, aloes, balsam, and gum arabic. The ostrich is grown for its plumage. In some sections this animal is found in a wild state, especially in the oases of the desert region. Among the wild animals still abundant are the panther, hyena, lion, jackal, gazelle, and many varieties of aquatic birds and birds of song.

**INHABITANTS.** The inhabitants of Arabia belong to the Semitic branch of the Caucasian family, but the tribes show marked differences in descent and tribal relations. Only a portion have fixed homes, the greater number leading a nomadic life. The wandering tribes consist mostly of Bedouins, who have allotted winter and summer camping grounds, entertain notions of the right of property, possess a strong home feeling, and are governed by a traditional code of law and honor. On the other hand, the Fellahs and Hadesi constitute the located tribes. In stature they are of medium height. They are muscular and strong, and have a brown complexion. The typical Arab is sharp-witted and quick by nature. He possesses a lofty pride and is fond of poetry. Most Arabs take much interest in rearing swift horses, and look upon a fleet animal as a most valuable possession. Education is at low ebb, and is largely in the care of the wife, whose duty it is to keep the house and educate the children. Mohammedanism of the Shiite sect is the chief religion, but the Sunnites and Wahabis are represented to some extent.

**GOVERNMENT.** The government is divided among numerous independent chiefs, who bear

the title of sheik, emir, or imam. The Sinai Peninsula is a dependency of Egypt; and Yemen, Hedjaz, and the region of El-Hasa are under the suzerainty of Turkey. Oman, in the southeastern part, is administered by an independent imam. A number of the chief cities are held by European powers, including Aden, which is a strongly fortified garrison on the Gulf of Aden and belongs to Great Britain. Other cities include Bagdad, Mecca, Medina, Mocha, Sana, Muscat, Basara, and Hodeida.

**HISTORY.** The history of the Arabs before the time of Mohammed is obscure, but under the teachings of that prophet, about 600 A. D., the different tribes became united and powerful. When his doctrines secured a strong foothold and Mecca was conquered, he brought nearly the whole peninsula into submission. He was succeeded in turn by Abu-Bekr, Omar, Othman, and Ali, who assumed the title of caliph, but the period was marked by struggles for supremacy among different tribal interests. Walid I., a sovereign of this line, abolished the Greek language and written characters and substituted the Arabic. Subsequently the capital was transferred from Cufah to Bagdad, where the Arab rulers held sway over a large part of the Mohammedan world from the 8th to the 13th century. At that time they possessed great military strength, conquered Northern Africa and Western Asia, and founded a kingdom in Spain. In the East they were generally known as Saracens, and in the West as Moors. They constructed fortifications, temples, and public highways, traces of which remain in the East and in Spain, especially in the latter country, where the Moorish temples are still sources of wonder. The British occupied Aden in 1839, and the following year most of Arabia became subject to Turkey.

**LANGUAGE.** The Arabic language is classed with the southern branch of the Semitic family of tongues, and next to the Hebrew ranks as the most important. It was generally spoken in Southwestern Asia, Northern Africa, Sicily, Malta, and a part of Spain at the time the religion of Islam spread over those regions, and is still used as the learned and sacred language of the Mohammedans. About one-third of the Turkish and Persian vocabularies consists of Arabic words. The alphabet consists of twenty-eight characters, but eleven of these are distinguished by placing diacritical points above or beneath, hence only seventeen distinct characters are used. The writing is from right to left. As a whole, the vocabulary is extensive and the grammatical forms are complicated.

**LITERATURE.** The literature had its beginning

in the time of the Queen of Sheba, who is the accredited author of several enigmas and poems. However, the rise of Arabic literature dates largely from the time of Mohammed, who gave it new direction and life. Abu-Bekr collected the precepts of faith and life laid down by the prophet, and these collections were afterward published by Othman, the third caliph, and constitute the Koran, the sacred book of the Mohammedans. The period in which literature, art, and science reached its zenith was in the time of the caliphs who ruled in 750-1258 A. D. Harun al Rashid (786-808) was a patron of learning, and by his interest and ability gave impulse to Arabic literature in his own country and many regions under Saracen and Moorish dominion.

The Moors in Spain wrote treatises of value on medicine, history, mathematics, geography, geometry, astronomy, and civics. Their writers in geography were the most noted of those who flourished in the Middle Ages, and their historians and philosophers also took high rank. Their philosophy was largely of Greek origin, chiefly after the teachings of Aristotle, and their most celebrated philosopher was Alfarabi, who flourished in the 10th century. Other philosophical writers included Ibn Sina, Alghazzali, and Ibn Roshd, who flourished in the 11th and 12th centuries. The Arabs excelled all other nations in medicine during the Middle Ages, the medical work of Avicenna, entitled "Canon of Medicine," being long an authoritative guide.

In mathematics and astronomy the Arabs patterned after the Greek writers, but they simplified and enlarged both sciences considerably. Algebra was introduced directly by them to the people of Europe. Their romances and legends are enriched by such familiar works as "The Exploits of Antar," "The Arabian Nights' Entertainments," "The Exploits of Bibars," and "The Exploits of the Champions." From these many European writers have drawn inspiration, and some of the tales drawn from "The Arabian Nights' Entertainments" are familiar to school children in America and Europe. The Arabians were devoted especially to astronomy, which they cultivated in observatories at Bagdad, Cordova, and other cities. Their chief textbooks in this branch of learning consisted of the "Almagest" of Ptolemy, which they translated into the Arabic. The literature of modern times is somewhat limited in scope, but they have several recent treatises on grammar, jurisprudence, and the Koran, and a number of newspapers and other periodicals are published. The Arabian writing, like all in the Semitic, is

written from right to left, and is essentially consonantal.

**ARABIAN NIGHTS' ENTERTAINMENTS** (a-rā'bī-an), a collection of Oriental tales first made known to Europeans by Antony Galland, a Frenchman, who published them in 1704-17. The origin of the work is still in doubt, and it is not known by whom or where it was written, but it is supposed to have been secured by the Arabs from India, and by the Hindus from Persia. The story assigned as the origin of these fables is both interesting and remarkable. It is said that Sultan Shahriyar had a faithless bride, which induced him to make a law that all his future wives should be executed the first morning after their marriage. This custom prevailed until Shahrazad, the generous daughter of the grand vizier, became his wife. She was so skilled in story-telling that she interested the Sultan with a tale every day, and broke off at a point which would lead to an interesting conclusion the next day. In this way the execution was deferred from day to day until the Sultan became reconciled. These stories of Shahrazad now constitute "The Arabian Nights' Entertainments," or "The One Thousand and One Nights," as they are often called.

**ARABIAN SEA**, a large extension of the Indian Ocean, whose northern and eastern coasts are formed by Persia, Baluchistan, and India, and its western by the Arabian peninsula. Its northwestern extension forms the Gulf of Oman, which is connected by Ormuz Strait with the Persian Gulf. On its eastern shore are the Gulfs of Cutch and Cambay.

**ARACHNIDA** (ā-rāk'nī-dā), a class of *arthropods*, variously limited by naturalists, but usually extended to include the mites, ticks, spiders, and scorpions. Most of the animals of this class have simple eyes, but they vary in number from two to twelve. The abdomen possesses no true legs, although these animals have four pairs of legs. Some species secrete poisons, and nearly all prey on other animals. Breathing is effected either by lungs or by means of tracheae, but some breathe by both these means. The history of the Arachnida has been traced to the Palaeozoic times.

**ARAD** (ör'öd), a city in Hungary, capital of the County of Arad, thirty-seven miles north of Temesvár. It is the seat of a bishopric and has a number of modern buildings, including the townhall and a Greek theological seminary. The manufactures include leather, tobacco, alcohol, and machinery. It is important as a grain and cattle market. Population, 1905, 56,260.

**ARAFAT** (ä-rä-fät'), **Mount**, a granite hill in Arabia, fifteen miles east of Mecca, elevated about two hundred feet above the plain. The summit is reached by steps cut in the rock or built of solid masonry. A great multitude of Mohammedans visit this place annually, owing to the belief that Adam and Eve met upon this hill after being expelled from Paradise. It is thought that Adam was cast upon Ceylon and Eve on Mount Arafat, and that after wandering 120 years Adam finally joined Eve on this hill. On the summit is a chapel, in which a sermon is delivered for the benefit of the visitor, who is afterward known as a Hadji, or pilgrim.

**ARAGON** (är'ä-gön), formerly a kingdom of Europe, but now a government in the north-eastern part of Spain. It was united with Spain on the marriage of Ferdinand and Isabella, in 1469, but a complete union did not take place until ten years later. It is divided into the provinces of Huesca, Teruel, and Sargossa. The area is 14,984 square miles. Saragossa is the capital. In 1907 the province had a population of 975,580.

**ARAGUAY** (ä-rä-gwī'), or **Grande**, an important river of Brazil, rises by several branches in the southern highlands of that country, and after a course of 1,350 miles joins the Tocantins River, which carries its water into the Para estuary. It incloses Santa Anna, an island 200 miles long, and is navigable for 1,000 miles. The Das Mortes is its chief tributary.

**ARAL** (är'al), an inland salt-water lake of Asia, including a surface of 26,650 square miles, and forming the outlet of the historic Oxus, or Amu River, and of the Kizil Kum. It has no outlet to the sea, but there are evidences that it was formerly connected with the Caspian Sea. The lake has valuable sturgeon and other fisheries. It is located wholly in Russian territory. At a remote period of history the lake bed was dry, and the waters of the rivers that now discharge into it flowed into the Caspian Sea.

**ARAMAIC** (är-ä-mā'ic), a language spoken in the country between the Mediterranean Sea and the boundaries of Persia and Media on the one side and Asia Minor on the other. This section of Asia contained Mesopotamia, Chaldea, and Assyria, and in ancient Hebrew histories the language is assigned to what is now known as Syria. There were two dialects, known as East Aramaic or Chaldee and West Aramaic or Syrian. The books of Ezra and Daniel and the Babylonian Talmud were written in Aramaic, and it was the official language in Palestine until Hebrew supplanted it.

**ARAPAHOS** (a-räp'a-hōs), an Indian

tribe of North America, formerly resident near the sources of the Arkansas and Platte rivers. Their survivors were transported to reservations now included in Oklahoma, where they were allotted land, and became prosperous as farmers and stock raisers. This tribe of Indians was generally friendly to the whites.

**ARARAT** (är'a-rät), a mountain of Western Asia, in Armenia, on the boundary between Persia, Turkey, and the Russian possessions. Its summit is covered perpetually with snow and rises 17,325 feet above sea level. Vegetation extends to the snow line, about 14,000 feet. It is volcanic, but is now thought to be extinct, the last eruption taking place in 1840. This mountain is historic on account of being the landing place of Noah's ark after the deluge, an account of which is contained in the Bible, in Gen. viii., 4.

**ARAUCANIA** (ä-rou-kä'nē-ä), a district in the southern part of Chile, inhabited by the Araucanians, a native race of South America. The district includes the larger part of the province of Arauco and its boundaries are not well defined. The inhabitants were the last native tribe to become subject to the Spaniards. From 1537 to 1773 they maintained their independence by force of arms, but in the latter year Spain recognized them as an independent people, and they did not submit until 1872, when their territory was made a part of Chile.

**ARAUCARIA** (är-ä-kä'rī-ä), a genus of large cone-bearing trees of the pine family, native to Australia, South America, and the islands of the Pacific. The branches spread greatly and are covered with flat sharp-pointed leaves. Several species furnish timber of value for building, especially the Chile pine of the Andes and the Moreton Bay pine of New South Wales.

**ARBELA** (ärbe'lä), an ancient town of Assyria, in the province of Bagdad, now the Turkish town of Erbil or Arbil. The modern town is built mostly with sun-dried brick, but has a number of large mosques and bazaars. It is famous on account of the last of the great battles fought between Alexander and Darius, in 331 B. C., though the battle took place at Gaugamela, about twenty miles distant. The present population is about 6,000, mostly Kurds.

**ARBITRATION** (är-bī-trä'shün), the settlement of disputes by submitting them to the decision of a private person or persons, instead of litigating in a court of justice. It is not permitted to arbitrate criminal cases, and adjustments and settlements in civil cases by this means are not necessarily binding upon the

parties thereto, even though an agreement to arbitrate be made in writing, since the contracting parties would in that case have no recourse to the jurisdiction of the courts.

It has been a direct object of trades unions to avoid strikes and lockouts through the medium of arbitration. A number of governments have laws authorizing arbitration, and in sixteen states of the United States boards of arbitration are specially provided by law. In some of the states the decision of a board of arbitration is binding on both parties for six months, or either party may give sixty days' notice to have the decision set aside, while in the other states proceedings of this kind may be enforced by judgment, or the party objecting may be punished for contempt. New Zealand has a compulsory arbitration law, which was brought about to set aside the injurious effect of strikes. It is claimed that the law has not closed a factory, that strikes and lockouts have been few, and that wages and conditions under which workmen have labored have been vastly improved. There men working on a salary as well as wage-earners may take advantage of arbitration. The last decade is notable for the growing tendency among legislators and the people to favor the principles of arbitration and gradually extend its benefits in personal cases as well as those affecting railways and other common carriers.

International arbitration refers to the settlement of disputes between states by judges chosen under an agreement, and the tribunals so constituted are governed by articles specifying the matters to be considered. In practice the judges or conference are special or general and are more or less restricted by agreement, and the relief granted may be temporary or permanent. Czar Nicholas II. recommended a peace conference, which met at The Hague, July 29, 1899, for the avowed purpose of effecting an understanding whereby a large part of the standing army might be disarmed and the general peace of nations preserved. While the object sought has not been attained, it has caused thought to turn toward means whereby prolonged wars may be avoided through peaceful means, and as a result several questions of international importance have been referred to arbitrators. The most important instance of this kind in 1905 was the arbitration of the case between Russia and Great Britain on account of Admiral Rojestvensky firing upon English fishermen in the North Sea. The result of this adjustment was that Great Britain was awarded damages amounting to \$325,000, which

sum was paid, and further difficulties were avoided.

Important among the list of arbitrations in which the United States was a party are the following:

I. Settlement of the northeastern boundary, under the Jay Treaty of 1794, in which the United States and Great Britain were interested.

II. The Treaty of Ghent in 1814, between the United States and Great Britain, which provided for determining the northeast boundary of the United States from the Saint Lawrence to the Saint Croix River, ownership of certain islands in the Bay of Fundy and the Passamaquoddy Bay, and to fix the boundary between the United States and Canada along the middle of the Great Lakes and to the Lake of the Woods.

III. Arbitration between the United States and Great Britain in 1818, relative to the ownership of slaves who had been taken possession of by the British, with the result that the United States accepted \$1,240,960 in full settlement.

IV. An adjustment between the United States and Spain in 1819, which had reference to the claims of the Americans against Spain that arose during the occupation of Florida by the latter country.

V. Adjustment of disputes regarding the northeastern boundary, in 1827, in which the case between the United States and Great Britain was referred to the King of the Netherlands, and subsequently the matter was compromised in the Webster-Ashburton Treaty.

VI. Settlement between the United States and France of claims on account of damage done at sea by the French in the wars of Napoleon. It was adjusted in 1831 by awarding \$5,558,108 indemnity to the United States. The claims were paid five years later, Great Britain acting as mediator.

VII. Settlement of the northwestern boundary, between the United States and Great Britain, in 1846, having reference to the San Juan de Fuca Straits and the Haro Canal.

VIII. Adjustment of fisheries rights, in 1855, along the shore of Canada, which was formally adjusted in 1866.

IX. Settlement of disputes between the United States and Venezuela, in 1866, on account of claims of American citizens against the latter country. An adjustment was reached under which more than a million dollars was to be paid, but a second commission reduced the award to \$980,750, which was paid to the United States.

X. Arbitration between the United States

and France on account of injury growing out of the Mexican War of 1862-67, the Civil War, and the war between France and Germany, in which \$612,000 was awarded to France.

XI. Arbitration of rights in Samoa affecting the United States, Germany, and Great Britain, in 1889, which was submitted to the King of Sweden and an agreement was signed at Washington in 1899.

XII. Arbitration of the United States and Great Britain, in 1892, regarding fisheries of the Bering Sea, in which an agreement was reached in 1896, and the United States paid \$471,151 to Canadian sealers.

XIII. Settlement of the boundary between Alaska and the British possessions, in 1897, which resulted in a final agreement in 1899.

**ARBOR DAY** (är'bēr), a day designated by legislative enactment for the planting of trees, and which has come to be a day regularly observed in many states of the United States by the pupils of the public schools. Most states of the central west publish annually a manual compiled by the State department of public instruction. This is sent to all the schools, and serves as a guide and program in conducting appropriate exercises. In some localities Bird Day is now associated with Arbor Day, the purpose being to stimulate interest in the study and protection of birds. The day came to be observed largely by the need of planting trees in the states of the Mississippi Valley. It was first inaugurated in Nebraska in 1874 by the State Board of Agriculture, at the suggestion of J. Sterling Morton, who afterward served as Secretary of Agriculture during President Cleveland's second administration. Besides planting trees for shade and ornamental purposes, it is customary to plant them in memory of authors, statesmen, and war heroes. The day is looked forward to with as much pleasure as Washington's Birthday or Thanksgiving Day, and is quite as appropriate. All other great days celebrate the past, but this day speaks for the future.

**ARBOR VITAE** (är'bēr vī'tē), a class of plants and shrubs allied to the cypress. They are evergreen, have flattened or compressed branchlets, and give off a pleasant balsamic smell. The arbor vitae common to North America is prolific and grows to a height of forty to fifty feet. Chinese arbor vitae is a species valuable for its resin, which yields a medicine useful in rheumatism.

**ARBUTUS** (är'bū-tūs), a genus of trees and shrubs belonging to the heath order. The *strawberry tree*, which is a species of arbutus, yields a fleshy fruit useful for food and in the

manufacture of beverages, especially alcoholic spirits. It is native to large parts of Southern Europe, and has been introduced to North America, especially California. The *trailing arbutus*, or may-flower, is an American species of this genus of plants. The leaves are opposite in most species, and the foliage is quite beautiful.

**ARCADE** (är-kād'), in architecture, a covered passage, either open at the side with a range of pillars, or completely covered with woodwork or masonry. The term is applied in Gothic architecture to a range of arches, supported on columns or tiers, either open or attached to a wall. In many structures of the mediaeval period they form the principal decorations both on the inside and outside, sometimes as real, and other times as blind, galleries. At present the finest arcades are in Paris, where they are convenient thoroughfares as well as decorations, and many are lined with elegant shops.

**ARCADIA** (är-kā'dī-ä), an inland and mountainous country of ancient Greece, next to Laconia the largest ancient division of the Peloponnesus. The most important mountain is Cyllene, the birthplace of Hermes. In the eastern portion are several lakes, whose waters form the great waterfall of the Styx, which was thought by the Greeks to be the principal river of the infernal regions. The inhabitants from times far remote possessed marks of simplicity and inertness, due largely to the condition of their rural life and their employment, which was principally pastoral. They conducted a number of wars against the Spartans and later joined the Achaean league, and still later their territory was merged into the Roman province of Achaia. At present Arcadia forms a province of the kingdom of Greece. The area is 2,030 square miles and its population, 147,650.

**ARC DE TRIOMPHE DE L' ETOILE** (ärk de trê-ônf' de lâ-twäl'), a triumphal arch located in Paris, at the head of Champs Elysées. It was begun by Napoleon I. in 1806 and completed 30 years later by Louis Philippe. The structure was designed by Chalgrin, is 150 feet

ARBUTUS.

long by 160 feet high, and is ornamented with reliefs representing the victories of Napoleon. It is the largest structure of the kind in the world.

**ARCH** (ärch), in building, a portion of masonry in the shape of an arc or bow, constructed in the form of truncated wedges, and arranged in a curved line in order to support weight by mutual pressure. It is usually constructed to support the building over an open space, as a doorway, in which a single stone often forms the entire arch. When constructed of a number of stones, it contains a middle wedge-shaped stone, called the *keystone*, its purpose being to lock the whole together. The exterior or upper curve is the *extrados*; the inner curve, the *intrados*; the highest part, the *crown*; and the lowest stone on either side, the *springer*. In constructing an arch a temporary frame of wood is first put up, the top of which is shaped like the arch; then the stones are laid up to it until they connect at the top, and the keystone is put in, when

the Great Lakes, and in extensive regions of the Appalachian and Rocky Mountains. It abounds in Eastern Asia, Central Africa, and Northern Europe, extending in the last-mentioned continent from the Arctic Ocean through the Scandinavian Peninsula to the Alps.

**ARCHAEOLOGY** (är-kê-öl'ô-jÿ), the name given to the study formerly known as that of antiquities. In its wider sense it includes a knowledge of the origin of the language, law, religion, institutions, literature, manners, arts, science, customs, in fact everything that can be learned of the habits and life of a people. In a narrower signification it is understood to mean and include all the material from which a knowledge of the ancient conditions are to be attained, but usually comprehends more or less of several branches of knowledge that are recognized as distinct lines of study. Archaeology divides the primitive stages of human life and occupation into various periods, such as the stone, bronze, and iron ages. These names are

the temporary structure is taken down. In Moorish architecture the arch is in the form of a horseshoe, while the Gothic is pointed at the top. The longest stone arch ever made is in the bridge over the Adda River Italy. It is 251 feet long and was completed in the 14th century.

**ARCHAEAN** (är-kê'an), the earliest period in geological history, extending up to the Lower Silurian. It includes two ages, the Azoic and Eozoic, the former embracing the time previous to the appearance of life, and the latter including the earliest forms of life. American writers frequently refer to the Archaean period or system as the Primitive, Laurentian, and Huronian. The rocks of this period consist largely of granite, gneiss, and schist, mixed more or less with igneous formations, and they are characterized by volcanic disturbances in periods far remote. In America this system abounds in British America from the Arctic to

used to designate periods of time on account of the materials employed during the different ages for implements and weapons. The word *age* designates the stage at which a people arrived, hence *stone age* means the period of time before the use of bronze, and the phrase *bronze age*, the time before iron was employed by any particular people. These ages are again divided and subdivided until all times, conditions, and phases of human life become classified for convenience in study. In the 19th century more was learned of the antiquity of man than in all previous centuries.

**ARCHAEOPTERYX** (är-kê-öp'tê-rîks), a fossil bird of which traces are found in the rocks of the Jurassic system. Fossil remains are more numerous in Bavaria than in any other region. This animal was about the size of a crow and had thirteen teeth in the upper mandible and six in the lower, each tooth set in a separate socket. The tail was long and the

wings were large, and that it was able to fly is not doubted, since its feet indicate that it had arboreal habits. Some naturalists have traced

ARCHAEOPTERYX.

through this animal a possible relationship between the birds and the reptiles.

**ARCHANGEL** (ärk-än'jël), or **Arkhangelsk**, a city in Russia, capital of a province of the same name, on the Dwina River, 740 miles northeast of Saint Petersburg. It has good railroad and steamboat facilities, and an extensive trade with Russian and other port cities by the White Sea. Being in a cold region, the port is closed for six months by ice. It was founded in 1584, and was long the only seaport of Russia. The shortest day at Archangel is about three hours, while the longest is twenty-one hours. Archangel province has an area of 331,490 square miles and a population of 356,675. The population of the city is 21,685.

**ARCHANGEL**, a term used to denote an angel superior in power and glory to other angels, but some think it has direct reference to Christ. In I. Thess. iv, 16, is given an account of the coming of the Lord on the last day, which is to be: "With the voice of the archangel, and with the trump of God."—Archbishop, a chief bishop, or one who superintends the conduct of other bishops. This position was established in the early period of Christianity, and is continued by the Roman and Greek Catholic and several Protestant churches.

**ARCHBALD** (ärch'bald), a borough of Pennsylvania, in Lackawanna County, 10 miles northeast of Scranton, on the Lackawanna River. It is conveniently located on the Delaware and Hudson and the New York, Ontario and Western railroads. Coal mining is carried on extensively in the surrounding country. Silk textiles, clothing, and machinery are manufactured. Population, 1900, 5,396.

**ARCHER FISH** (ärch'ër), a small fish common to the East Indies. A species native of Java is about six inches long, has an elongated lower jaw, and its body is covered with

small scales extending to the lower part of the dorsal fins. This fish is remarkable for the manner in which it ejects drops of water at insects, causing them to fall from the air into the water, where they are caught and devoured. The projectile force with which water is thrown is so forceful that it will strike a fly at a distance of three to four feet.

**ARCHERY** (ärch'ër-ÿ), the art or practice of shooting with the bow and arrow. The use of this weapon in war and for hunting dates from early antiquity. The ancients most skilled in archery were the Cretans, Thracians, Numidians, and Parthians, and in later years the Arabs, Saracens, and Germans. Long after the discovery of gunpowder we find the bow and arrow still used, even as late as 1572, when Queen Elizabeth promised to place at the disposal of Charles IX. 3,000 archers. In the 18th century societies were formed in England to preserve archery for the purpose of enjoyment and healthful exercise, and it is still popular as a recreation in the United States and Europe. The American Indians, at the time of the discovery of America, used the bow and arrow exclusively for defensive and offensive warfare, and they still practice the art for amusement.

In recent years archery, as a recreation and healthful exercise, has grown in popularity, and clubs to promote the amusement are quite common in the United States and Canada. The practice is confined chiefly to shooting at targets. The Potomac Archery Association and a number of others hold annual contests, the rounds consisting of ninety-six arrows at sixty yards. It is common to have team competitions as well as tests for the longest flight, and in amateur contests the rounds usually consist of sixty arrows at forty yards.

**ARCHIMEDES' SCREW**, a machine for lifting water, thought to have been invented by Archimedes while in Egypt for draining and

ARCHIMEDES' SCREW.

irrigating land. It is constructed of a tube fastened around a solid shaft or cylinder, and so framed that it may be turned around its axis.

The cylinder is hollowed out to form a double or triple threaded screw. The machine is placed in position with one end in the water and the other resting on a perpendicular pillar. When in this position, the lower end fills with water, and, when the shaft or cylinder is turned, the revolution carries the water upward to the perpendicular post and causes it to fall at its base. Similar machines are now built and largely in use in Holland for draining the lowlands.

**ARCHIPELAGO** (är-kĩ-pěl'ä-gõ), the name applied to a group of islands, such as the Caribbean, Patagonian, Aleutian, and others. However, the term was originally used to designate the archipelago located in the Mediterranean Sea, commonly called the Grecian archipelago.

**ARCHITECTURE** (är'kĩ-těk-tür), the art of building. The term is used more specifically to denote the art of building human habitations, temples, or edifices of any kind, either humble or splendid. It is limited generally to the art of constructing edifices to gratify the mind, please the eye, and answer primary purposes of utility. It is often classed as a science, because it draws upon geometry and carries out the principles of various sciences. The architecture of a people indicates their mental and moral qualities, and is an index of the state of civilization to which they have attained. As a whole it is commonly divided into three classes: military, naval, and civil. Military architecture embraces the construction of fortifications for defensive purposes, as a means of subduing insurrections or repelling an invasion by foreign enemies. Naval architecture comprises the art of ship-building and includes the construction of vessels for commerce and offensive and defensive action in war. Civil architecture comprises all other lines not included in the two former, and is generally studied from an artistic, scientific, and utilitarian point of view.

**REMOTE ANCIENT ARCHITECTURE.** Numerous styles of architecture have been known from times far remote. Their characteristics were determined largely by the social development and moral aptitude of the nations. The oldest architectural structures that still remain are those of the Egyptians. They are of immense size, simple in design, and of regular outline, and indicate that the builders took into account few rules that render a building artistic. Immense blocks of stone were raised to great heights, and used to complete plain, rough structures. Most of the larger buildings of Egypt were destroyed fully 500 years B. C. Those that do remain contain great walls and pillars ornamented with hieroglyphics and drawings on stone. They are rather inelegant, but service-

able in preserving the history of the builders. The most interesting structures that still remain are the pyramids, once the tombs of Egyptian kings, built of immense blocks of stone, and gradually narrowing from a broad base to a narrow apex. The largest still in existence is 498 feet high and 693 feet square at the base. The Grecian historian, Herodotus, in giving an account of these ancient wonders, ascribes their building to Cheops, who kept 100,000 men at work on the largest one for a period of twenty years. The obelisks were placed at the entrance of palaces and temples, and on their surface were descriptive hieroglyphics and symbols illustrating the successes achieved in war by the great kings and heroes. They were usually four-cornered shafts of immense height, cut from the quarry in single blocks, and used as ornaments in public places. Ruins of great palaces are found in Persia and Assyria, the oldest and most noted among them being the palace of Nimrod, probably built in the year 884 B. C. Others are found at Susa in Persia, and still others in Babylonia, where once reigned the great Nebuchadnezzar, a Chaldean King of Babylon, in the 6th century B. C. The brick found in these ruins bear the imprint of this famous sovereign of ancient history, and indicate that the architecture of his time was wonderful in its massive design and durable strength.

**GREEK ARCHITECTURE.** In Grecian architecture three styles are recognized, the Doric, the Ionic, and the Corinthian; the important differences in these styles consist rather in the finishing than in other respects. The most beautiful Grecian structures were erected in the period included between 650 and 324 B. C. In general, the Greek buildings were adorned with paintings and sculptures, and the details were enriched by magnificent colors. The most remarkable edifices of the Greeks were temples dedicated to the cause of patriotism, of which class the Parthenon at Athens, which still remains, is the most famous. They built large theaters capable of seating 20,000 spectators and provided them with general conveniences for the assemblage of large numbers. Ruins of many Grecian structures are still found in Sicily, Greece, and Asia Minor. With the death of Alexander the Great, Grecian architecture rapidly declined.

**ROMAN ARCHITECTURE.** The Romans patterned largely from the Greeks, and built after their style in the construction of theaters, temples, bridges, aqueducts, baths, triumphal arches, and private residences. Their orders included also the Tuscan and Composite styles. The Titus

arch at Rome is one of their finest structures. In the reign of Augustus the architecture of Rome attained its greatest perfection, which is evidenced by the fact that many magnificent edifices of his period are still intact. In the construction of aqueducts and sewers, the

COLOGNE CATHEDRAL, GERMANY.

Romans were especially skillful, in which they made extensive use of the arch. They built vast baths, or *thermae*, suitable for use by a multitude of people at the same time. Their architecture was not only utilitarian, but combined with that essential feature an imposing and costly appearance. Roman architecture began to decline soon after the death of Hadrian, in 138 A. D.

**BYZANTINE ARCHITECTURE.** At the time of Constantine the Christians were permitted to build places of worship. Their architecture still marks by its peculiarities many of the churches of Eastern Europe and Asia Minor. The style of architecture adopted by these Christians is known as the Byzantine, from Byzantium, once

the capital of Rome. Saint Sophia, at Constantinople, is one of the finest churches built in this style, but it has been converted into a Turkish mosque. It was constructed by Justinian, and to it were applied the fundamental principles of the Roman arch. Its magnificent dome is the most striking feature of the building. With the fall of Rome the most beautiful and valuable works of ancient architecture were destroyed by the Vandals, Goths, and other barbarians of Europe and Western Asia. Soon after other styles of architecture were introduced by the Normans and Lombards. The former flourished in England in the 13th century, while the latter originated in South Germany as early as the 8th century. With the conquest of Spain by the Moors in the 8th century, Moorish or Saracenic forms of architecture were introduced into Europe. The most noted Moorish building still remaining is the Alhambra, near the city of Granada, Spain. The early Germans were unskilled in architecture and did not make any progress in this line until the 8th century, when Charlemagne introduced the Roman and Byzantine styles. Later Romanesque architecture, in which the semicircular arch is prominent, became popular both in France and Germany.

**GOthic ARCHITECTURE.** Later the people of Germany and France began to develop the modern Gothic style, with its pointed arches, clustered pillars, vaulted roof, and profusion of ornaments. The best forms of architecture in England and Scotland are built after the styles introduced by the Normans, after their conquest of Britain. The finest specimen of Gothic architecture in Europe is the Cathedral of Cologne, Germany, and the best representative of this style in England is Westminster Abbey, London. At a later date the windows were divided into small panes, the doorways were constructed with square tops over pointed arches, and other departures from former styles were made, as, for instance, by tracery in straight lines instead of waving lines. In the 17th century England adopted largely what was known as the Elizabethan style, divers characteristics of which are still found in many buildings in that country. The Gothic style was superseded in Italy by the Renaissance style, which was in fact a revival of the classic style and aimed rather to make ornamental than useful.

**RECENT ARCHITECTURE.** Modern architecture is a term used to designate all varieties of styles in building since the Renaissance. Though not always, it is quite generally in imitation of older forms. Private dwellings are of the Re-

naissance style, while churches are constructed more or less after the Gothic. However, modern architecture employs different materials more largely than were employed in former times, especially iron and steel. Besides, in cities many buildings are of considerable height, largely on account of the enormous rise of values in real estate in the business centers and advantages gained by location in close proximity to the great avenues of business. However, a building with twenty to fifty stories is no disadvantage so far as convenience is concerned, for the reason that the general use of elevators has made access to the upper stories a matter of only a few moments. In some of the great cities of the United States and Canada structures have been erected in which more business is transacted in a year, and in many more lines, than in whole cities containing a population of 10,000 people. Such vast buildings are used for department stores and the jobbing trade, and in many cases for a large combination of interests.

Modern architecture is so diversified and partakes of such a large variety of forms that it has become difficult to classify all the different styles. The most modern structures erected in large cities, and which are designed for much capacity on a small foundation, contain a framework entirely of steel. In these buildings the steel frame carries the whole building. Among

MODERN RESIDENCE.

the advantages accruing from such architectural styles are rapidity in construction, large capacity, great durability, and entire safety from fire. Some of the most wonderful and finest buildings of recent design are the Masonic Temple, Chicago; the Union Trust Company's office, St. Louis; and the Singer Building and the Metropolitan Life Building, New York City. The last mentioned is 48 stories high and is the tallest office structure in the world. Other buildings quite as substantial and serviceable have been constructed in many of the large cities of Canada and the United States. A

personal inspection of any of these will inspire feelings of awe and admiration. What a wonderful transition from the Indian hut of prime-

MASONIC TEMPLE, CHICAGO.

val America to the colossal structures witnessed in the 20th century!

**ARCH TRIUMPHAL**, a decorated arch built by the Romans to celebrate a victory, and through which a victorious general and his army passed in triumph. This custom grew and caused permanent structures, richly sculptured in bronze and stone, to be built after the pattern of a city gate. Among the most remarkable of these arches still remaining in good condition are the arch of Trajan at Beneventum, the arches of Titus and Constantine at Rome, and that of Augustus at Armini. See *Arc de Triomphe de l' Etoile*.

**ARC LIGHT**, a kind of electric light produced by current of high electro-motive force passing between a pair of carbon rods, kept a short distance apart, one being in contact with the positive and the other with the negative terminal of a dynamo. It is unsteady because the arc leaps from side to side as the carbon wears away, the carbon rods being kept at the proper distance by an automatic regulator. The arc light is the most brilliant artificial light known, and is used for lighting halls, streets, and other public places.

**ARCOLE** (är'kō-lā), a village in Italy, on the Alpone River, a tributary of the Adige, 15 miles southeast of Verona. It is celebrated for

a decisive battle between the French under Napoleon and the Austrians under Aldinczy, on Nov. 17, 1796, in which the Austrians were defeated. The battle commenced on the 14th of November, and in the series of engagements the Austrians lost 18,000 men and were compelled to abandon the relief of Mantua, which was besieged by a French army. At present the population of Arcole is 5,259.

**ARCOS DE LA FRONTERA** (är'kōs dā lä frōn-tā'rā), a town of Spain, in the province of Cadiz, on the Gaudalete River, about 30 miles northeast of Cadiz. It is the seat of seven monasteries, a Gothic church, and a public library. Considerable trade is carried on in wine, fruit, and tanned leather. Magelhaens started from this place in 1569 on his first trip to circumnavigate the globe. Population, 1900, 14,393.

**ARCTIC** (ärk'tik), the term which implies the opposite to Antarctic and has reference to the region surrounding the North Pole. The North Pole was so named from its proximity to the constellation of the bear, called *Arktos* by the Greeks.—Arctic Circle, a circle imagined drawn parallel to the Equator, at a distance of 23° 28' from the North Pole. It includes the North Frigid Zone, and is of equal extent to the South Frigid Zone, which surrounds the South Pole. These are called the two polar circles. Within each of these circles occurs a period of the year when the sun does not set, and another when it is not seen. Each of these periods is longest at the poles, at which the days and nights are of six months' duration.

**ARCTIC EXPEDITIONS**, the designation applied to the expeditions designed to penetrate and explore the vast regions surrounding the North Pole. Formerly the prime object of Arctic explorations was to seek and establish a passage by way of the polar regions to Asia, but it was also thought for many years, and this view is still held by some, that an open sea lies near the North Pole. To explore this supposed open expanse and establish a passage by it were undoubtedly the objects that first led to these expeditions. When it became known that passage through these regions is impossible, expeditions were still sent for the purpose of scientific discovery, and to experiment in endeavoring to get to or nearest to the pole. Up to the present time the farthest point north was reached by the Duke of Abruzzi, Prince Luigi Amadeo, born in Madrid, Spain, in 1873. The following are among the points farthest north reached by famous explorers, including those of Nansen and of the Duke of Abruzzi, both these explorers sailing from Norway:

YEAR.	EXPLORERS.	N. LATITUDE.
1607	Hudson .....	80° 23' 0''
1773	Phipps .....	80° 48' 0''
1806	Scoresby .....	81° 12' 42''
1827	Parry .....	82° 50' 0''
1874	Meyer (on land) .....	82° 0' 0''
1875	Markham and Parr (Nares' expedition) .....	83° 20' 26''
1876	Payer .....	83° 07' 0''
1884	Lockwood (Greeley's party).....	83° 24' 0''
1896	Frithjof Nansen .....	86° 14' 0''
1900	Duke of Abruzzi.....	86° 33' 0''

See **Polar Expeditions.**

**ARCTIC OCEAN**, the ocean which surrounds the North Pole. It is bounded on the south mainly by the grand divisions of North America, Europe, and Asia, and is wholly included within the Arctic Circle. A wide expanse of the sea between Norway and Greenland connects it with the Atlantic, and it communicates with the Pacific by the narrow channel of Bering Strait. Within it are numerous islands, including Nova Zembla, Spitzbergen, Franz Josef Land, New Siberia, and the Arctic Archipelago of North America. Among the principal rivers that flow into it are the Mackenzie, Lena, Obi, and Yenisei. The Arctic Current flows southward between Iceland and Greenland, doubles Cape Farewell, and passes into Davis Strait, where it is joined by the Labrador Current. A small drift of water passes into the Arctic through Bering Strait.

A large part of the Arctic Ocean is frozen during the greater part of the year. Owing to dense fogs, floating icebergs, severe storms, and long nights, only a comparatively small part is accessible to navigators. However, it is a prolific source of whales, and many ships visit the southern portions annually. The most valuable regions for fishing are west of Spitzbergen, in the vicinity of Greenland, and in the waters contiguous to Alaska. The region of Bering Strait yields annually large quantities of whales, cod, and walrus. On the eastern coast of Siberia are found numerous bones of mammoths. These bones are inclosed in ice, and are released at the time of the thaws in the summer season. Besides fossil remains of ivory, there are large beds of wood, some of it petrified, and some in an advanced state of decay. Some of these wood deposits are forty feet below the surface, and indicate that in prehistoric times luxuriant vegetation existed in the far north, both in Eurasia and North America. Sea water freezes at about 28°, and the ice reaches a thickness of about seven feet in one season, from which the intense cold of the polar regions may be understood.

The icebergs met with in the Arctic Ocean reach an enormous thickness, being an accumu-

lation of snow and ice that is piled up for many years. The presence of these obstructions endangers navigation and makes it necessary that exploring expeditions proceed with great caution. While a region of about 2,500,000 square miles surrounding the North Pole is unknown to geographers, it is reasonably certain that the unknown part is a vast sea of ice. The northern lights, known as the aurora borealis, are beautiful illuminations of the Arctic seas, and extend far into the heavens, hence they may be seen a long distance toward the south from the north polar regions. They appear in a variety of forms. At times great pillars of light move rapidly across the heavens, or the entire northern sky is lit up by one great flash of rapidly moving beams. The illuminations more frequently observed consist of arches of fire, from which long streamers flash toward the zenith.

**ARCTURUS** (ärk-tū'rūs), a fixed star, the largest in the constellation of Boötes. It is a star of the first magnitude, in the northern heavens, and may be found by continuing the curve of the tail of the Great Bear.

**ARDMORE** (ärd'môr), a city of Oklahoma, in the Chickasaw nation, about ninety miles southeast of Oklahoma City, on the Atchison, Topeka and Santa Fé and other railroads. It is surrounded by a fertile farming region, and has a considerable trade in farm produce, live stock, and merchandise. Bituminous coal is mined in the vicinity. Among the public improvements are several fine school and church buildings, waterworks, and electric lights. It is the seat of Hargrove College. The city was incorporated in 1898. Population, 1910, 8,618.

**ARE** (âr), the unit of land measure used in France. It is equal to 100 square meters, or 1,076.44 square feet. There are 100 ares in a hectare, which is equal to 2.47 acres.

**ARECIBO** (ä-râ-sē'bô), a seaport of Porto Rico, on the north coast of the island, 50 miles west of San Juan. It is located at the mouth of the Arecibo River, but the harbor is shallow and cannot be entered by the larger vessels. Several churches, the government building, and a number of public schools are its chief improvements. It is on the railroad running along the northern coast and has considerable trade in sugar, tobacco, and fruit. Population, 1910, 9,612.

**ARENA** (ä-rē'nâ), the portion of a Roman amphitheater where the combats of wild beasts and gladiators were exhibited. It was provided with four main entrances, and was inclosed by a wall fifteen feet high to protect the spectators. The floor was covered with sand. The term is now applied to places of combat and large summer theaters.

**ARENDAL** (ä'rën-däl), a city in Norway, on Bohus Bay, 41 miles northeast of Christiansand. It is built partly on islands and partly on the mainland, hence it has been called "Little Venice." It has railroad facilities and a good harbor, and carries a large export trade in iron and timber. Population, 1900, 11,250.

**AREOPAGUS** (är-ë-öp'ä-güs), or **Mars Hill**, a rocky eminence in ancient Athens, situated near the acropolis, famous as the seat of the celebrated council or court known by the same name. In this court sat as judges all who had filled the archonship without having been expelled, though the number varies considerably. The judges occupied seats in the open air. It is said that Pericles deprived the judges of some of their power and later they became responsible to the people, but the court still flourished in the time of Emperor Theodosius. Paul plead the cause of Christianity before this august court, the highest that Athens could boast. See Acts xvii., 19-22.

**AREQUIPA** (ä-râ-kē'pä), a city of Peru, in a state of the same name, on the Chile River, near the volcano Arequipa. It is surrounded by a fertile region, which also produces valuable minerals, including gold and silver. The city has railroad connections with Molliendo, its seaport, and also with Cuzco and several cities on Lake Titicaca. In the 16th century it was nearly buried in ashes thrown from the volcano of Misti, and it has since suffered severely from earthquakes. Population, 1903, 35,500.

**AREZZO** (ä-rët'sô), a city in Italy, capital of the province of Arezzo, about 50 miles southeast of Florence. It has railroad conveniences, two colleges, and an extensive museum. The manufactures embrace silk textiles and ironware, and it has a brisk trade in fruit and cereals. Arezzo was founded by the Etruscans, and is the birthplace of Petrarch, Cesalpino, Maecenas, and Pietro Aretino. Population (commune), 1901, 44,316.

**ARGAND LAMP** (är'gänd), a lamp invented by Aimé Argand, a Swiss chemist, in 1782, and designed for burning oil. In this lamp a wick in the form of a hollow cylinder is used, which permits a current of air to ascend, so the supply of oxygen is increased, thus diminishing the waste of carbon and increasing the amount of light. This burner, supplied with a glass chimney to create a draft, is used extensively in kerosene lamps.

**ARGENTINA** (är-jën-tē'nâ), or **Argentine Republic**, a republic of South America, next to Brazil the largest country of that continent. It is bounded on the north by Bolivia and Para-

guay; east by Paraguay, Brazil, Uruguay, and the Atlantic; south by the Atlantic and Chile, and west by Chile. The length from north to south is about 2,100 miles, and the width ranges from 200 miles in the south to nearly 1,000 miles in the north. A portion of the island of Tierra del Fuego, the eastern part, and several islands along its coast are included as possessions of the republic.

**DESCRIPTION.** Along the western boundary are the elevated ranges of the Andes, which separate Argentina from Chile, and the northern part is more or less elevated and hilly. A few ranges of mountains characterize the country east of the Andean Plateau, such as the Sierra de Córdoba and the Ventana Highlands, but the larger part of the surface is slightly undulating in the central part and quite level along the Atlantic coast. Among the natural features of the country are its extensive plains, which occupy more than three-fourths of the surface. In the south are the plains of Patagonia, in the central part are the pampas, and in the northeastern section are the Chico plains. The plains are fertile in the region where rainfall is abundant and abound in luxuriant vegetation. Along the streams are belts of valuable forests, but the plains of Patagonia are almost treeless, though they have a growth of shrubs, herbs, and tufted grass. The soil is from three to eight feet deep, made largely by decaying vegetable matter, under which is a sedimentary subsoil made by alluvial deposits.

The drainage is wholly toward the south and east into the Atlantic. On the eastern border is the Uruguay, which separates the country from Brazil and Uruguay. The Paraná, which forms a part of the boundary with Paraguay, receives the Rio Salado and the Pilcomayo, and discharges a large volume of water into the Rio de la Plata. Among the streams that flow directly into the Atlantic are the Colorado, the Negro, the Chubut, the Deseado, and the Chico. Many fresh-water lakes abound in the tablelands east of the Andes, including lakes Chiquila, Amarga, Porongos, Musters, and Viedma. Lake Buenos Ayres, the source of the Deseado River, is in the south central part. Along the eastern shore are numerous inlets and bays, including the Bay of Samborombon and the gulfs of San Matias, Nueva, and San Jorge.

The climate ranges from the subtropical region of the north to the cold belt of the south. In the northern part the hottest months have an average temperature of 80°, while the extremes range from 30° in July to 105° in January. In the cold belt of the south the temperature frequently falls below the freezing point.

A semiarid region stretches through the southern part, but the central and northern sections have an abundance of rainfall, from 30 to 70 inches, amply sufficient for all agricultural purposes. Sudden changes occur in the weather on the pampas, where the cool, dry winds from the south are frequently followed by the moist, hot winds from the north.

**MINING.** Although the mineral resources of the country are extensive, they have received but little attention. Mining is confined chiefly to the mountain districts in the west, where considerable quantities of tin, nickel, copper, iron, gold, silver, and precious stones are obtained. Marble of a good quality is found in the Sierra de Córdoba, but it is not quarried extensively. Mineral waters of a superior quality are abundant in the western highlands. Other minerals include petroleum, natural gas, salt, mica, and borate of soda.

**AGRICULTURE.** Farming is the most important industry, but the country is sparsely settled and admits of material development. The leading cereals grown in Canada and the United States yield good returns, such as wheat, barley, oats, maize, and rye, but wheat continues to be the most important crop. Among the minor farm products are cotton, tobacco, linseed, canary seed, rice, and sugar cane. Silk culture has been introduced successfully in the northern part, where the climate is particularly favorable for the cultivation of the mulberry tree. Other products include coffee, potatoes, peanuts, and hay. The country has large interests in the live-stock industry, especially in cattle, horses, swine, and sheep. Among the minor domestic animals grown extensively are goats, mules, and poultry. Immigration from Europe is having a marked and favorable influence upon the development of the industries, especially upon farming and stock raising.

**MANUFACTURES.** Comparatively little attention has been given to the manufacturing enterprises until within recent years. A large majority of the products consist of materials that are produced and partially finished for exportation, such as leather, lumber, and packed or cured meat. Flour and grist mills are operated in many sections of the country, and sugar refineries are well distributed throughout the region where sugar cane is grown. Among the general manufactures are boots and shoes, clothing, earthenware, furniture, chemicals, and farming machinery.

**TRANSPORTATION.** Argentina has an extensive coast on the Atlantic, and many of the larger streams are important as avenues for transportation. This is true in particular of the La

Plata and the Paraná, which are navigated about 1,200 miles, and some of the larger tributaries are accessible by small craft. While the southern section is almost destitute of railroads, many lines have been built and are operated in the northern section. Buenos Ayres, Rosario, and Santa Fé are the chief railroad centers. A transcontinental line extends from Buenos Ayres to Valparaiso, a Pacific seaport in Chile. The lines in operation include a total of 15,500 miles. Electric railways are operated in many of the larger cities and towns, from which numerous branches extend to interurban points.

**COMMERCE.** Argentina stands at the head of countries in South America both in domestic and foreign commerce. Foreign trade is largely with Great Britain, Germany, the United States, Italy, France, and Belgium, in the order named, and the principal ports are at Buenos Ayres and Rosario. The imports somewhat exceed the exports, but both give evidence of considerable development the past decade. Among the leading imports are iron and metal goods, paper, textiles, chemicals, foodstuffs, and machinery. The exports include timber products, minerals, hides, cereals, flour, and dressed meat.

**GOVERNMENT.** Argentina is a constitutional republic, and the present constitution dates from 1853, but it was materially amended in 1860 and in 1898. The executive authority is vested in a president, elected for a term of six years, but he is not eligible to reelection. He is assisted by a ministry of eight secretaries of state, who, like the president, are responsible to congress, the legislative branch. The senate consists of thirty members, two from each province and two from the capital, and the house of deputies is composed of 120 members. Justice is administered by federal and provincial courts, and the highest authority is vested in the federal supreme court. At present the country is divided into fourteen provinces and ten territories. Each province has its local executive, legislature, and system of courts, but the territories are administered under the direct supervision of the national government. Gold is the standard of value. The peso is the monetary unit, valued at about \$.965 in the money of Canada and the United States. A peso has 100 centavos. The principal sources of revenue are import duties and excise taxes, but direct taxes are levied by the provinces and smaller subdivisions.

**EDUCATION.** The system of public schools was organized in 1870 and is supervised by the department of public instruction. Aid is given by the general government to numerous colleges and universities, but each province has

direct charge of the public schools within its own boundaries. In this respect the educational system resembles that of Canada and the United States. All children between the ages of six and sixteen years are required to attend school, but the compulsory attendance provision is not enforced strictly in the sparsely settled districts. A number of technical schools and normal institutes for the training of teachers are in a flourishing condition. Spanish is the official and spoken language. The Roman Catholic faith is that of the state, but freedom of religion is guaranteed to all under the constitution.

**INHABITANTS.** Nearly one-half of the people reside in towns and cities, a circumstance rarely met with in new and partially undeveloped countries. About one-third of the inhabitants are of foreign birth, and this element consists chiefly of Italians, Spaniards, Frenchmen, Germans, and English. Buenos Ayres, on the La Plata, is the capital and largest city. Other cities of importance include Cordova, Rosario, Tucuman, La Plata, Salta, and Corrientes. In 1905 Argentina had a population of 5,678,198.

**HISTORY.** The first European explorers of the region now included in Argentina were the Spanish, who visited the Rio de la Plata in 1516. They sailed under the leadership of Juan Diaz de Solis, who left Europe with an expedition to search for a southwestern passage to the East Indies. All who sailed with the company failed to return, and it is supposed they were captured and killed by the Indians. In 1519 the King of Portugal sent Magellan on an expedition to explore the southern part of South America. He sailed through the strait that bears his name and claimed a large portion of the mainland, including the Rio de la Plata and the present site of Buenos Ayres, for Portugal. By the end of the 16th century Argentina became a Spanish possession and continued as such until 1810, when it cast off the dominion of the Spanish crown. Ten years later independence was formally declared, but the country was not freed until after undergoing a series of wars. Spain recognized its independence in 1842. Buenos Ayres undertook to set up a republic in 1854, but it was defeated and obliged to reënter the confederation in 1859. A revolution in 1890 on account of political corruption and subsequent boundary disputes with Chile and Bolivia are among the more recent events.

**ARGENTINE** (är'jĕn-tĭn), a city of Kansas, in Wyandotte County, about four miles west of Kansas City, on the Atchison, Topeka and Santa Fé Railroad. It has electric lights, waterworks, and other conveniences. The city has manufactures of ironware, furniture,

and tobacco products, and is the seat of large gold and silver smelting works. Other industries include elevators and railroad repair shops. Population, 1904, 6,230.

**ARGON** (är'gön), an element contained in the atmosphere, which possesses the property of being chemically inert, and was recently discovered by Lord Rayleigh and Professor Ramsey of England. It is estimated that one per cent. of atmospheric air is argon. This element is heavier than nitrogen but somewhat resembles it. The discoverers were each awarded a prize of \$10,000, one from the French Academy of Science and the other from the Smithsonian Institution. The National Academy of Sciences of the United States awarded Lord Rayleigh the Barnard Medal in 1895.

**ARGOS** (är'gös), a city of ancient Greece, situated in the northeastern part of the Peloponnesus, in the region known as Argos. It was founded about 1500 B. C., and is believed to be the most ancient city of Greece. Homer mentions it in connection with the Trojan War, at which time it was a noted center of influence, and its people were called Argives. It contained many temples to the gods, among them the temple of Hera, of which remains have been excavated by recent explorers. Argos played an important part in the history of Greece, both in ancient and comparatively modern times. The modern city of Argos, a railroad and commercial town, has a population of 11,500.

**ARGUS** (är'güs), a creature mentioned in Greek mythology, and supposed to have had a hundred eyes, of which only two slept at a time. Juno employed Argus to watch the priestess Io, who had been transformed into a heifer. This being was lulled to sleep by Mercury, who played soothing tunes on the pipe of Pan, and was slain by Hermes. It is said that Juno afterward transferred the eyes of Argus to the tail of the peacock.

**ARID REGION** (är'id), a tract or district in which the rainfall is not sufficient for the successful cultivation of crops. The line of demarkation between the humid and arid regions is usually irregular, being influenced more or less by the direction of prevailing winds, the character of the surface, and the time of year when the rains occur. It is assumed by most writers that the plains of North America lying between the Rocky Mountains on the west and the 100th meridian on the east comprise an arid region, and besides this large scope of country there are districts in the Rocky Mountains and the Pacific coast plain where the precipitation is too small to con-

duct agriculture without irrigation. A mean annual rainfall of 20 inches is the approximate minimum, but if the rains occur principally in the growing season less is required. Between the arid regions and those having sufficient rainfall is usually a belt of country in which farming is successful in relatively moist years and a failure in others. However, it is thought that the improvement of a prairie country by cultivation and the planting of trees cause rains to become more regular and abundant. This, for instance, is true of a large part of the Staked Plains, or Llano Estacado of Texas, which was formerly thought to be too dry for farming, but in recent years has become well settled by those interested in mixed farming and stock raising.

The arid region of North America extends from central Mexico to north central British America, but its boundary east and west is very irregular. The southern part of Alberta, Montana, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada, and the north central part of Mexico are included in this region. In addition are to be included the western parts of North Dakota, South Dakota, Nebraska, Kansas, and Oklahoma, and a part of Idaho, northwestern Texas, eastern Washington and Oregon, and a large part of California. See **Irrigation**.

**ARIES** (ä'rī-ēz), the ram, a sign of the zodiac, the first 30° measured from the point at which the equator intersects the ecliptic. The sun enters Aries the 21st of March. At present the sign Aries is about 30° west of the original sign, in the constellation Pisces.

**ARISTOCRACY** (är-is-tök'rá-sÿ), a form of government by which the wealthy and noble, or any small privileged class, rule over the mass of citizens. It signifies a government of the best, or by the best. The ruling officers hold their position by right of birth or by appointment, and include mostly the nobility or chief persons of the state.

**ARITHMETIC** (ä-rith'mê-tík), a science that treats of numbers and of the art of computation by means of them. It is usually considered either abstract or practical. Abstract arithmetic includes notation, numeration, addition, subtraction, multiplication, division, fractions, measures, multiples, powers, and roots. Practical arithmetic embraces the application of the abstract with rules, such as reduction, compound addition, subtraction, multiplication, and division; proportion, aliquot parts, interest, profit and loss, etc. However, the fundamental principles of arithmetic are addition, subtraction, multiplication, and division, and these are em-

ployed more or less in all arithmetical computations.

The ancients, even the Greeks and Romans, made little progress in this science, owing to their clumsy means of notation. The most important writings that have come down to us from them are those of Archimedes, Euclid, Nicomachus, and Diophantus. After the introduction of the Arabic numerals, which occurred about the 11th century, arithmetic began to assume greater convenience in form and came to be better known. The Arabic scale of notation is the one now universally used and consists of the following ten digits: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0. Each digit is given a value dependent upon its place occupied in a number made up of several figures. It increases in a tenfold proportion from the right toward the left in whole numbers, and decreases in a tenfold proportion from left toward right in decimal fractions. Thus any value from the largest to the smallest can be definitely stated by this system.

The Roman system came into use with the ascendancy of the Romans. They employed several letters to express numerical values. The letters employed are the following: I, V, X, L, C, D, M, and express values in this order respectively: 1, 5, 10, 50, 100, 500, 1,000. When a letter is written after another letter of the same or greater value, they express together the sum of their value. Thus, II=2; XII=12; XXV=25; CX=110; MX=1,010. When a letter is written before another letter of greater value, the two together express the difference of their value. Thus, IV=4; IX=9; XL=40; XC=90; CM=900. A bar placed over a letter multiplies its value by a thousand. Thus,  $\bar{v}$ =5,000;  $\bar{l}$ =50,000;  $\bar{m}$ =1,000,000.

In the study of arithmetic the three stages of mental development involved should be carefully kept in view. The earliest stage requires a large proportion of work in the concrete. The faculties chiefly exercised at this time are observations, or perception, and memory, and a beginner is not able to formulate thought, or to derive benefit from abstract or formal statements of principles or processes. In the intermediate stage the reasoning faculties, such as abstraction and judgment, come into prominence, and at this time the student needs to acquire a clear perception of the definition and principle involved, and be able to state and define abstract terms intelligently. The ultimate stage is reached when the mental powers are so matured and trained that the student is competent to receive instruction from the abstract or formal

statement of propositions. Definitions, principles, propositions, and statements of processes may be stated to a student at this time before the illustration or demonstration of the processes involved is given.

**ARITHMETICAL SIGNS** (à-rĭth-mĕt'ĭ-cal), the signs or symbols used to designate the operations to be performed, or the facts to be obtained. The following are the common signs used in arithmetic: + signifies that the numbers between which it is placed are to be added;  $\times$ , that the former is to be multiplied by the latter;  $-$ , that the latter is to be subtracted from the former;  $\div$ , that the former is to be divided by the latter;  $=$ , that the number or the process is equal to the number following; and  $:$ ,  $::$ ,  $:$  are signs used between the members of a proportional series, as  $6:12::8:16$ . A period placed to the left of a figure, or a series of figures, indicates that they are decimal fractions, as .206.

**ARIZONA** (är-ĭ-zō'na), a Territory of the United States, bounded on the north by Utah, east by New Mexico, south by Mexico, and west by California and Nevada. The larger part of

ARIZONA.

1, Phoenix; 2, Tucson; 3, Prescott.  
Chief railways are shown by dotted lines.

the western boundary is formed by the Colorado River. The breadth from east to west is about 335 miles, and the length from north to south is 350 miles. It has an area of 113,020 square miles, of which about 100 square miles is water surface.

**DESCRIPTION.** The surface is largely elevated and mountainous. The highlands consist of a portion of the Rocky Mountains and attain

heights of from 12,000 to 14,000 feet. Among the principal ranges are the Mogollon Mesa, in the east; the Santa Ana and Dragon, in the south; the Granite Wash, in the west; the Santa Catalina, in the southeast; and the Gila, San Francisco, and Black Mesa, toward the center and northwest. The high plateaus and mountains are furrowed by rivers whose beds, in some places, are 6,000 feet below the level of the surface. Buttes and mesas characterize the aspect of the plains in many localities, and many of the streams are dry a large part of the year.

The drainage is by the Colorado and its tributaries. The latter include the Little Colorado, the Gila, and the Bill Williams Fork. The Salt and Rio San Pedro discharge into the Gila River. The Colorado, one of the great rivers of North America, passes through the northwestern part of Arizona and separates it on the western boundary from Nevada and California. It discharges into the Gulf of California after passing through a part of Mexico. It is navigable about 500 miles from its mouth, but navigation is somewhat hindered by the rapid flow of its waters. The total fall of the river within Arizona is more than 3,000 feet. In its course it flows through the Grand Canyon of the Colorado, whose vertical walls rise to a height of from 4,000 to 6,000 feet. These walls are vast sections of almost horizontal strata, and, with the smaller canyons of the tributaries of the Colorado, present well-marked geological formations in regular order to a depth of 25,000 feet.

Arizona is located in the arid region (q. v.) of North America, but the climate is healthful and the sky is clear a larger number of days than in any other part of the United States. The mean annual temperature of the northern part is 45°, while in the southern section it is placed at 69°. Rain falls more abundantly in the northern than in the southern part, being about 20 inches annually in the former, while in the southern half it ranges from 10 to 13 inches. Vegetation is correspondingly scant, but bunch grass and pasture lands are abundant. The soil in the valleys is fertile, which is true of most of the level land, but in some parts alkali occurs quite extensively in the soil. The plants and animals are about the same as those found in southern California and New Mexico.

**MINING.** Mineral-bearing land is found in a large part of Arizona, and the mining industry is being developed as rapidly as the transportation facilities will permit. In the production of copper the Territory takes high rank, having extensive and valuable deposits. In the output

of this mineral it is surpassed only by Montana and Michigan, and the product is about one-fifth of the total output of the United States. Gold mining is next in importance, the annual output being about \$2,750,000, and the output of silver is placed at \$1,130,000 per year. Other minerals are lead, salt, tin, quicksilver, gypsum, and precious stones, including onyx, opal, garnet, and sapphire. Marble and building stone are abundant. Near Holbrooke is a section where a large amount of petrified trees are found, frequently referred to as the petrified forest.

**AGRICULTURE.** Stock raising is the chief industry, but irrigation on a large scale is fast extending all classes of farming. The government constructed the Salt River Dam, thereby redeeming a large scope of arid land, and irrigation is employed in the vicinity of Phoenix and other places. Alfalfa is an important crop and is grown largely. The cultivation of wheat, barley, and oats is receiving marked attention, and the acreage devoted to fruit culture is being extended largely, especially in the southern part, where the semitropical varieties are grown, such as almonds, figs, and raisin grapes. Potatoes, apples, and vegetables flourish in all parts of the Territory.

**MANUFACTURING AND TRANSPORTATION.** Manufacturing enterprises have been developed to some extent, though the smelting and refining of copper remain the chief enterprises. Among the general manufactures are flour and grist, butter and cheese, earthenware, and timber products. An abundance of coal and considerable other material of value are factors contributing to the development of manufacturing enterprises, especially in the preparation of material used in the building trades. The only navigable river is the Colorado, but it is available for navigation only in its lower course. Railroad building has received marked attention, and trunk lines of the Southern Pacific and the Santa Fé cross the Territory, furnishing convenient means of transportation to the east as well as to the Pacific coast. In 1908 the lines included a total of 2,115 miles and several electric railways were in operation.

**INHABITANTS.** In 1900 there were only 1.1 inhabitants to the square mile, of which about twenty per cent. were of foreign birth, mostly Mexicans. Excellent schools are maintained by a system of taxation and public grants, including the two normal schools at Temple and Flagstaff and the university at Tucson. The asylum for the insane is at Phoenix and the penitentiary at Yuma. A number of libraries, benevolent and charitable institutions, and scientific and educational associations are maintained. Phoenix is

the capital. Jerome, Prescott, Tucson, and Yuma are thriving business centers. Arizona, in 1900, had a population of 122,212, a gain of 125 per cent. in ten years. The Indian population was 26,480. Population, 1910, 204,354.

**HISTORY.** A powerful race resembling the Aztecs inhabited the region occupied by Arizona before it was visited by white men. This is evident from the fact that ruins of aqueducts, fortifications, and cities have been discovered in many of the valleys, and there are traces of large irrigation canals maintained by the early inhabitants. A Spanish expedition explored the country in 1539, and the following year a second expedition visited the section. The Apaches and other tribes of Indians resisted the pioneers who undertook to make settlements, and little progress was made until after the Mexican Revolution of 1827, when the mines that had been opened at Tucson and Tubac began to attract considerable attention and ranching began to yield returns. Arizona was acquired by the United States, in 1848 as a result of the Mexican War, though a tract south of the Gila belonged to the Mexican state of Sonora, and this was secured by the Gadsden Purchase (q. v.). It was a part of New Mexico until 1863, when it was made a separate Territory. Efforts to have it admitted as a State were made in 1905, and Congress took some action to unite Arizona and New Mexico as one State, but the proposition was not accepted, and up to 1908 it still remained a Territory.

**ARIZONA, University of,** an educational institution located at Tucson, Ariz. It was established in 1885, is coeducational, and is attended by about 250 students. The library contains 7,500 volumes, and the courses include academic and higher branches of study. The buildings and ground are valued at \$165,000.

**ARJISH** (ar-jesh'), a river of Rumania, rises in the Carpathian Mountains, and flows into the Danube after a course of 175 miles. It passes through a fertile country.

**ARK** (ärk), the vessel built by Noah, and in which he and his family and many animals were preserved during the flood. It was 525 feet long, 87½ feet wide, and 52½ feet high, and was built to float and not for speed. In the Bible the word *ark* is applied to the basket in which Moses was found by the daughter of Pharaoh, and also to the ark of the covenant.

**ARKANSAS** (är'kan-sä), a south central State of the United States, bounded on the north by Missouri, east by Tennessee and Mississippi, south by Louisiana, and west by Texas and Oklahoma. The greatest length from north to south is 275 miles; breadth, 240 miles; and area,

53,850 square miles. It has a water surface of 805 square miles. The State was named from the Arkansas River, which flows diagonally through it from northwest to southeast. It is popularly called the Bear State.

**DESCRIPTION.** The surface slopes toward the southeast, and in the direction of the Arkansas River, from elevations in the northwest. Along the Mississippi, particularly in the southeastern part of

1, Little Rock; 2, Pine Bluff; 3, Hot Springs; 4, Fort Smith. Chief railways are shown by dotted lines.

the State, are low and marshy tracts, subject to overflow where the low bottoms are not protected by artificial embankments, while the interior of the State is generally undulating. Much of the surface is highly fertile, especially the alluvial tracts in the eastern part. In the northern part are ranges of the Ozark Mountains, which extend into it from Missouri, and attain a height of about 2,800 feet. Smaller elevations wholly within the State, known as the Black Hills and the Washita Hills, stretch over a considerable area, but are less elevated. The Arkansas River enters the State from Oklahoma, near Fort Smith, and joins the Mississippi 20 miles north of Arkansas City. This river and its tributaries drain the larger part of the State. The White River, which crosses the boundary from Missouri, receives the Black and the Cache rivers, and discharges into the Mississippi near the mouth of the Arkansas. The Saline, the Ouachita, and the Bartholomew are tributaries of the Red River. The Mississippi River, which forms the eastern boundary, is important as an avenue of commerce.

The climate as a whole is genial, though malarial fevers are not infrequent in the marshy districts during the warm summer season. The annual rainfall aggregates forty inches in the western part, and about sixty inches in the eastern part, while the mean annual temperature is placed at 61°. Hot Springs and other cities are popular resorts for invalids, especially those suffering with pulmonary diseases. The State has extensive and valuable forests, virgin growths of timber covering a large part of the surface.

Among the chief varieties are the oak, yellow pine, hickory, maple, sycamore, cypress, hackberry, elm, palmetto, cottonwood, and black walnut. In the lowlands are extensive canebrakes, and the wild plum, persimmon, whortleberry, and other native fruits abound.

**MINING.** The region traversed by the Arkansas River has deposits of a fine grade of bituminous coal, and oil and gas are found in paying quantities in several parts of the State. An excellent grade of whetstone is made from salicious rock abundant in the mountains. Other minerals mined largely are bauxite or aluminum ore, zinc, lead, nickel, granite, and manganese. Slate, sandstone, limestone, and granite are quarried. Mineral waters are obtained at Hot Springs and other localities.

**AGRICULTURE.** Farming is the chief occupation, more than half of the area being in farms. In the production of cotton, which is the most important crop, the State takes seventh rank. Corn, wheat, and oats are the most important cereals, in the order named, and hay and forage crops are correspondingly large. Apples, peaches, and strawberries are grown for the market. Stock raising is receiving marked attention, expanding as land is cleared and converted into pasture, and dairying has developed into a productive enterprise. Horses, cattle, mules, swine, and sheep are the principal domestic animals.

**MANUFACTURES.** Manufacturing has been of secondary consideration, but the large forests and extensive mineral interests are stimulating development of this branch of industry, particularly in the output of lumber products and machinery. Flour and grist, cotton-seed oil and cake, and tobacco products are manufactured extensively. The manufacture of cotton textiles has been increasing to a considerable extent the past decade, but the larger part of the raw cotton produced is still exported. Little Rock, Pine Bluff, and Fort Smith are the leading manufacturing and railway centers.

**TRANSPORTATION AND COMMERCE.** The Mississippi, which forms the eastern boundary, gives the State an outlet by water communication to many states of the Mississippi valley. Many of the rivers within the State are navigable during high water, including the Saint Francis, White, and Arkansas rivers. While communication by railway does not extend to all the counties, important lines pass through many sections of the State. These include the Saint Louis, Iron Mountain and Southern, the Choctaw, Oklahoma and Gulf, the Saint Louis Southwestern, the Kansas City Southern, and many other lines. In 1907 the State had 3,500 miles of railroads. Electric

railways are operated in the cities and many sections of the State where settlements are well established. Large quantities of fruit are transported to the northern markets during the early spring and summer. Among the leading exports are cotton, coal, timber products, and live stock. A large share of the foreign commerce is carried through the port of New Orleans, La.

**EDUCATION.** Advancement in educational affairs in Arkansas has been marked the past few years. This helpful uplift is due largely to laws passed by the Legislature in 1907, under which the county superintendency was established and the teaching of elementary agriculture was inaugurated in the rural schools. This law provided for the establishment of a State normal school for white teachers, located at Conway, a town situated about thirty miles west of Little Rock, and increased the State levy for school purposes from two mills to three mills. The University of Arkansas is located at Fayetteville and is in a flourishing condition, having more than one thousand students in attendance, and being supported by liberal appropriations from the State. Among the leading denominational schools are Ouachita College and Henderson College, at Arkadelphia; Gallaway College, at Searcy; Hendrix College and Central College, at Conway; Arkansas College, at Batesville; and Cumberland College, at Clarksville. Two institutions are maintained for the higher education of Negroes, including Philander Smith College and Arkansas Baptist College, both located at Little Rock. The State has about forty preparatory schools and academies of high rank. Most of the towns have good public school systems embracing work of the primary, grammar, and high school grades. Many educational associations are maintained and are doing much in arousing public sentiment in favor of better sanitary conditions, school libraries, and better equipment for the public schools of the State.

**GOVERNMENT.** The present constitution was adopted in 1874. It provides for State elections to be held biannually, at which the Governor and other State officers are elected for a term of two years. The right to vote is limited to those who have paid poll tax and resided in the precinct one month, in the county six months, and in the State a year. A Senate of 35 members and a House of Representatives in which the membership cannot exceed 100 comprise the legislative department. The judicial system embraces the supreme court, the circuit courts, and the county court. Local government is administered by the counties, municipalities, and townships. At Little Rock the State maintains

institutions for the blind and deaf and the State penitentiary, and there is a State prison and a hospital for the insane in Pulaski County.

**INHABITANTS.** In 1900 the State ranked twenty-fifth in the order of population, and the density was 24.7 people to the square mile. Immigration has not been large, averaging not more than about 14,000 per year. A large proportion of the people reside in small villages and rural districts, and not more than eight places have a population exceeding 4,000. The Negro population has been increasing more rapidly than that of the whites, and in the number of colored inhabitants the State ranks tenth. In religious affiliation, the membership in churches is represented largely in the Baptist, Methodist, Presbyterian, and Christian denominations, in the order named. Little Rock, the capital, is the largest city. Fort Smith, near the line of Oklahoma, Texarkana, Pine Bluff, Hot Springs, and Helena are among the thriving business centers. In 1900 the State had a population of 1,311,564, as compared with 1,574,449 in 1910.

**HISTORY.** The authentic history of Arkansas begins with 1641, when a portion of it was explored by the Spaniards under De Soto. Subsequently explorations were made by the French under Joliet, Marquette, La Salle, and Hennepin, and in 1682 the region was claimed by France. Later it formed a part of Spain, was then ceded to France, and in 1803 was secured as a part of the Louisiana Purchase by the United States. The first permanent settlement was made by the French at Arkansas Post in 1695. It was organized as a Territory in 1819 and became a State in 1836, and in 1861 seceded to join the Southern Confederacy. A constitution prohibiting slavery was ratified by a vote of the people in 1868, and a new constitution was adopted in 1874. Since 1876 it has made rapid development of its resources, especially in agriculture and mining.

**ARKANSAS,** an important river of the United States, rises in Colorado, flows through Kansas, Oklahoma, and Arkansas, and joins the Mississippi after a course of 2,170 miles. The chief tributaries include the Cimarron, Grand, and Verdigris rivers. It drains a basin of 190,000 square miles, and its lower course is navigable for steamboats nine months in the year. There are periodical overflows near its mouth, the difference in depth between the dry and the wet seasons being not less than twenty feet. A large proportion of its water in the upper course is used for irrigation. Among the chief cities on its banks are Pine Bluff, Little Rock, and Fort Smith.

**ARKANSAS, University of,** a State insti-

tution located at Fayetteville, Ark., established in 1872. It is supported by Federal and State endowments and appropriations, and with it are affiliated a normal college at Pine Bluff and the medical and law schools at Little Rock. The value of its grounds and buildings is \$300,000. It has forty professors and instructors and is attended by 1,200 students.

**ARKANSAS CITY,** a city of Kansas, in Cowley County, on the Missouri Pacific, the Atchison, Topeka and Santa Fé, and other railroads. It is finely situated on the Arkansas River about fourteen miles south of Winfield, and has considerable jobbing and retail trade. The manufactures include clothing, ice, furniture, flour, machinery, earthenware, and tobacco products. It is the seat of a United States Indian school, and has two parks, a public library, and city waterworks. In the vicinity are deposits of coal and natural gas. The city was incorporated in 1871. Population, 1904, 7,124.

**ARLBERG** (är'l'bërg), a mountain pass in Austria, between the Rhaetian and the Lech Alps. A highway was located and improved across the mountains in 1786 and it remained the only means of communication from points in Austria to Vorarlberg until 1880, when a railroad was built. This line passes through the Arlberg Tunnel, situated between Sanct Anton and Langen, a distance of six and a half miles. The tunnel has an elevation of 4,260 feet above the sea. The cost of construction was \$7,500,000.

**ARLES** (ärlz), a city of France, on the Rhone River, 44 miles northwest of Marseilles. It has remains of a Roman amphitheater, and was the meeting place of several important councils of the church between 314 and 475 A. D. A cathedral and a college are its chief buildings. Silk textiles, hats, and wine are manufactured here. Population, 1901, 15,506.

**ARLINGTON** (är'ling-tün), a town of Middlesex County, Massachusetts, six miles northwest of Boston, on the Boston and Maine Railroad. It has a fine public library and several commodious church buildings, and is popular as a residence suburb. It was formerly a part of Cambridge, from which it was separated in 1807 and called West Cambridge. Since 1867 it has been known by the present name. Population, 1905, 9,668; in 1910, 11,187.

**ARLINGTON,** a village in Alexandria County, Virginia, across the Potomac River from Washington, D. C. It was the home of Robert E. Lee, but was seized by the government at the time of the Civil War, and at present is the site of of the Arlington National Cemetery. The Lee mansion can be seen from Washington's Monument and other prominent

places in the city of Washington, and is a fine specimen of Colonial architecture. The cemetery surrounds this building and is the last resting place of about 18,500 persons, including many of high military rank. The village is reached by the Alexandria and Arlington Electric Railway. Population, 1900, 3,200.

**ARM** (ärm), the upper extremity of the human body, on either side, extending from the shoulder to the hand. It consists of two portions: the arm proper, called the upper arm, and the forearm, or lower arm. The former has one bone, the humerus, which moves freely by a ball and socket joint upon the scapula, forming the shoulder joint, while the forearm has two bones, the ulna and radius. These two bones move on the lower end of the humerus, thus forming the elbow joint, and below articulate with the bones of the carpus, forming the wrist. Motion depends largely upon several well-defined muscles, including the deltoid, which lifts the arm from the side; the triceps, which extend the forearm; and the biceps, which govern largely the flexion or bending of the ulna and influence the movement of the humerus. Blood is supplied to the arm by the brachial artery, by the side of which large cords of nerves pass. The arm furnishes a fine example of muscular development, whose structure affords excellent illustrations of some of the principles of mechanics.

**ARMADA** (är-mä'dä), or **Invincible Armada**, a Spanish term applied to a powerful expedition sent by Philip II. of Spain in 1588 to conquer England. The prime object of the expedition was to strike a decisive blow against the Protestant interests, an enterprise that Pope Sixtus V. had assigned to him. It was placed in command of the Duke of Medina-Sidona. In July, 1588, the fleet set sail with 130 large war vessels, thirty smaller ships of war, 19,900 marines, 8,460 sailors, and 2,080 slaves, and was armed with 2,631 cannon. Soon after leaving Lisbon a heavy storm effected much damage, which required a refitting at Corunna. The design was to pass through the channel and at Flanders coöperate with the Duke of Parma, who had gathered a force of 35,000 men. Large forces were to be landed at several points on the British coast, and the Armada was to ravage the sea and occupy the English Channel. The English organized strong defenses and put their fleet under the command of Lord Howard, with Drake, Frobisher, and Hawkins as lieutenants. By prompt and brave attacks the landing of Parma was prevented, and by dexterous seamanship the English were enabled to inflict severe damage to the lumber-built vessels of

Spain. At Dunkirk many Spanish vessels were destroyed or captured. It soon became apparent to the Duke of Medina-Sidona that the enterprise must be abandoned; accordingly, he attempted to sail round the north of Great Britain and return home, but his fleet was almost destroyed by severe storms. Many of the Spaniards attempted to save themselves from drowning by escaping to the shore of Ireland, but were captured and slain. The enterprise was entirely unsuccessful in accomplishing the object for which it started out. Spain lost seventy-two large vessels and over 10,000 men.

**ARMADILLO** (är-mä-dil'lö), an animal native of South America, where it inhabits the selvas and pampas in large numbers. It is commonly classed with the *Edentata* or toothless animals, but is not entirely toothless. Its teeth are molars and are so constructed that the upper fit in between the lower. It is covered with a hard, bony shell, made up largely of bony bucklers and polygonal plates, into

ARMADILLO.

which it draws its head and limbs for protection. The different species attain a length of from ten inches to three feet. Their food consists chiefly of roots, fruit, worms, and insects. The flesh is relished as an article of food by the native Indians. Armadillos are mammals; the female brings forth from two to ten young at a birth.

**ARMATURE** (är'mä-tür), an appliance used in permanent and electro-magnets, and first introduced in 1895. Its purpose is to preserve and increase the magnetism of the original bars. It is usually, but not always, constructed of thin sheet-iron rings, around an inner soft iron ring, with coils wound between toothed edges, and is held in place by wooden wedges. The shaft carrying the armature is made to revolve rapidly before the poles of the permanent magnet. By these means the electro-magnetic forces are caused to constantly change their direction, hence the currents produced are alternating. The number of magnetic poles in the field frame and the speed of rotation determine the number of times per second such currents change their direction. In the arc and incandescent lamps, and for certain kinds of electric motors, the alternating

current is used largely. Other armatures are used for various purposes. A common form of armature consists of a piece of soft iron placed in contact with the pole of a magnetic bar to preserve its magnetism while not in use. When used in this form, it is commonly termed the *keeper*. When a horseshoe magnet is laid aside, it should not be separated from its armature, and straight-bar magnets should be laid side by side in pairs.

**ARMENIA** (är-mē'nĭ-à), an ancient country of Western Asia, located between the Caspian Sea and Asia Minor. It includes the northwestern part of Persia, the southern region of Transcaucasia, and the northeastern section of Asiatic Turkey, and embraces an area of about 137,000 square miles. The surface is characterized with high tablelands traversed by mountains, of which Mount Ararat is the most prominent, and much of the region is drained by the Tigris and Euphrates rivers. A part of the drainage is by the Hayls into the Black Sea and by the Aras or Araxes into the Caspian Sea. The climate is variable but generally heathful. The rainfall is scant, the winters are severe, and the summers are hot.

The district includes numerous Persian and Turkish settlements, and in the cities are many Jews. The Armenians, like the Jews, are widely scattered in different countries. Wars between them and the Turks have been numerous and were frequently attended with massacres and rank cruelty, causing Russia and other countries to threaten intervention and the establishment of a protectorate. In 1895 incursions of Kurdish soldiers committed revolting atrocities with the avowed intention of exterminating the Armenians and populating the district with Mohammedans. This almost led to international complications and a dismemberment of the Turkish empire, for the reason that the Sultan of Turkey, who is sometimes called "The Sick Man of the East," is largely in sympathy with the opponents of Christianity. The Turkish government promised reforms to a joint commission made up of representatives of England, France, and Russia, but the pledges were not carried out and indiscriminate massacres, though less frequent, occurred as late as 1908. The total number of Armenians is estimated at about 2,500,000, including those embraced in the region as described.

Armenia was once a powerful kingdom, and was conquered in 325 B. C., by Alexander the Great. It remained subject to the Macedonians or Syrian-Greeks nearly 200 years, when it

became independent and was divided into Armenia Minor and Armenia Major. The former was made a Roman province in 70 A. D., and was for a time governed by the Byzantines, the Arabs, and the Persians, and became a possession of Turkey in 1541. Armenia Major was conquered by the Parthians about 150 B. C., and passed through successive wars and under the control of different nations until 1828, when it was made Russian territory. At present the entire region that comprised ancient Armenia is divided among the Turks, the Russians, and the Persians. To unite the Armenians into a nation has been the ambition of these people, but they remain scattered over Asia Minor and a considerable number have emigrated to Europe and America.

The Armenians were adherents to the Zoroastrian religion until about 285, when Christianity was introduced by Gregory the Illuminator, under whose missionaries the king, Tiridates III., was converted. A considerable number belonged to the Roman and the Greek Catholic churches, but the greater part adhere to a sect of Christians formerly known as the Monophysites, from which the Armenian church was evolved at an early period in the history of Christianity. They are industrious, intelligent, peaceable, and faithful to their church and to their traditions. The Armenian language is classed with the Indo-European family of languages, being associated with the Iranic group, but the spoken form is somewhat mixed with words derived from the Turkish and Persian dialects. They have a considerable literature, which includes a number of representative works on religion, history, and the sciences. The Bible was translated into the Armenian language as early as the 5th century, the translation being by Isaac, the Armenian patriarch, and is from the Septuagint version.

**ARMISTICE** (är'mĭs-tĭs), a short suspension of hostilities between two armies or two nations at war, concluded by mutual agreement. An armistice is usually agreed upon when an endeavor to make peace is pending, or when both parties are exhausted. A very notable example is the armistice of the 25th of February, 1856, when five nations of Europe, then at war, agreed to a temporary suspension of hostilities with the view of concluding peace. The armistice may be either *general* or *particular*. In the former a general cessation of hostilities results, while in the latter there is a suspension only between two contending armies of the nations at war.

**ARMOR** (är'mĕr), the defensive arms used as a covering to protect the body, worn espe-

cially in war as protection against the weapons of a foe. In ancient times this custom was general. Homer describes the heroes of the Trojan War as equipped with armor. The custom of wearing armor reached its greatest development in the age of chivalry, when a warrior was almost entirely covered. The early Britons bore little other armor than their shield, but during the Norman conquest the Anglo-Saxons were fully equipped with this character of protection. When gunpowder began to be used largely in warfare, these appendages went rapidly out of use. In modern warfare life is protected by the construction of breastworks and forts, and armor plate is used to protect ships for the same purpose.

**ARMOR PLATE**, the name applied to the strong iron or steel plates used to cover warships with the view of rendering them proof against gun and cannon fire. The first use made of armor plate in naval warfare was in 1782, in the attack on Gibraltar, when the French used bars of iron to protect the hulls of their wooden ships. An increased demand for armor followed the combat of the Monitor and the Merrimac on Hampton Roads in 1862, and since then much thought has been given to the problem of obtaining the best protection that can be devised to overcome the destructive force of a modern steel-capped projectile. It has been found that the best armor plate is made of different varieties of steel, a hard surface to break up the projectile, or to deform it so as to lessen its power to penetrate, and this is backed up by a tough composition which will not crack easily. Nickel steel combines hardness with toughness and its power to resist penetration is about twice that of wrought iron. The larger warships are protected by plates about a foot thick, and a single plate is about nine feet wide and eighteen feet long. Between the plates and the iron frame of the ship is a packing of teakwood or something similar, which serves to lessen the concussion when the armor plate is struck by projectiles. A large ship carries about 4,000 tons of armor. The Mersey works in England, the Krupp works in Germany, the Carnegie works in Pittsburg, and the works of the South Bethlehem Steel Company at South Bethlehem, Pa., are the most noted manufacturing establishments where armor plate is made.

**ARMS** (ärmz), the weapons used for offense and defense in times of war. Some arms are used both for offensive and defensive operations, but there are some designed only for one of these purposes. Among those intended for offensive operations are pistols, rifles,

muskets, swords, bayonets, machetes, and cannon; while those designed for defensive purposes are shields, cuirasses, greaves, and helmets. The class of arms used in warfare depends entirely upon the state of civilization common to a people. In ancient times, and among savage people in modern times, the bow and javelin were favorites for long range, and the straight dagger for close fighting. The Greeks used heavy spears at long range, and generally employed short swords when contending parties engaged, in a hand-to-hand combat. In Macedon, Alexander the Great used the pike, a weapon about twenty feet long, to form a phalanx with the view of presenting an impregnable wall against both infantry and cavalry. This form of weapons continued in use more or less during the early civilization of Europe, although the Romans preferred and used extensively a short massive javelin six or seven feet long, which they hurled at their antagonists, and in short-range fighting employed the broadsword. They moved and operated in such a manner that each man had ample room to wield his instrument of war and inflict the greatest possible damage upon the enemy.

The Middle Ages witnessed the use of cavalry armed with steel-pointed weapons. The lance, battleax, two-handed sword, and mace were peculiar to this period. At that time the lance was a weapon about eighteen feet in length, with a butt end almost a foot in diameter some distance from the extremity, and was designed to fit the arm. The warriors of Scotland, Gaul, Germany, and other regions used either pikes, spears, halberds, or bills with heavy sideblades.

Modern firearms date from the 16th century. The first to be used was the matchlock musket. However, the early pattern was so heavy that a rest was required when taking aim, and later it was supplied with a bayonet, designed to give the musketeers means of defense when in close contact with the enemy. The invention of the musket added greatly to the use of powder as a means of aggressive operation. Arms of this class were used largely in the American Revolution, and in the Revolution of France in 1789. Subsequently many improvements were made in all classes of firearms. The percussion lock, revolving pistols, breech-loading rifles, self extracting and loading magazine guns, and arms especially designed for the use of powerful explosives have all had a marked influence in offensive and defensive warfare. In the war with Spain in 1898 the United States supplied her army with the Krag-Jor-

gensen gun, one of the newer inventions. Equipped with these, a skillful soldier can take aim and fire twenty or more shots per minute. Since several of the great powers employ these guns for use in the infantry, they may be considered among the best military rifles now made.

**ARMY** (är'my), a body of men enlisted, brought together, and so drilled, disciplined, and armed as to form a vast movable force for offense and defense in warfare. It may comprise the entire body of military men employed by a nation, or a portion of it under a particular commander. To be of greatest efficiency it must be perfect in organization and discipline, otherwise it is not available for the highest utility in action. A well constituted and disciplined army implies a trained leader, who communicates orders to subordinate commanders, and they again transmit to others of inferior rank, until, by regularly recognized order of transmission, the original command is communicated to the private soldier. It is necessary that the army be divided into groups gradually decreasing in size so that every portion may be not only commanded with facility, but clothed, fed, armed, and paid. In early times warfare was conducted in a stealthy manner from forest, marsh, and wilderness, led by the most daring and reckless. In modern times war has advanced to an art and is conducted by men who have been trained at institutions designed to give insight to and skill in managing large affairs.

**ANCIENT ARMIES.** The earliest history of organized armies comes down to us from the 16th century B. C. From this it appears that Sesostris, an Egyptian king, maintained a regular army, equipped, disciplined, and salaried. He divided his kingdom into thirty-six military provinces, established a national militia, allotted lands for the support of the soldier, and used this army both in offensive and defensive warfare. With it he became a conqueror of Northern Africa and a large part of Western Asia. Later the Persians extensively fostered military art. They organized a standing army, established garrisons, equipped infantry and cavalry, and provided rules of discipline. The Greeks maintained a national militia in various small states, which united in one great army in times of foreign war. By means of their superb organization and strict discipline they gained the great victories of Marathon and Plataea. The phalanx was originated by the Spartans, while the Athenians organized troops of cavalry to cover the front of their army and harass the enemy in the rear. Philip, the father of Alexander the Great, established the

world's second standing army, added to the efficiency of the phalanx, and made Macedonia strong in war. To him is due the early use of the pike, a weapon about twenty feet in length and efficient in warfare, which, glittering in the hands of a solid phalanx, made an almost impregnable array of muscle and steel. In Rome, about 200 B. C., all able-bodied men between the ages of seventeen and forty-six were liable to service upon a call for military duty. The Roman soldiers were trained from early childhood, as a means of securing both muscular development and efficiency in discipline. Magistrates enrolled the names of those liable to military duty, from which lists were chosen the legions of the Roman army, a military force excelling all others then known. With a gradual decline in discipline, and a draft of slaves and criminals into the service, the decline of Roman power commenced.

**MEDIEVAL ARMIES.** It is not strange that the decline of Rome and the barbarian conquests paved the way for a decline of skillful warfare, which continued until all organized tactics were lost. The invaders from the north possessed little learning, and relied upon personal bravery and daring to secure the fortunes of war. The armies of the Gauls and Germanic tribes represented the nation. During the prevalence of the feudal system national armies again appeared, and each chief or baron possessed a small army, well equipped, but too small for great effect. When the Crusaders organized under a great cause to oppose a common enemy, they discovered the need of organization and discipline. They, accordingly, began to organize large forces of foot soldiers, which took the place of cavalry. The invention of gunpowder effected great changes, but progress in securing its general use was not rapid for the reason that guns and cannon were unknown, and the art of making them was slow in developing. Besides, each knight was ambitious to distinguish himself, and preferred to dash forward by himself and engage in personal combat, rather than lead an army, direct its movements, and gain distinction by leadership.

**MODERN ARMIES.** With the use of firearms and increased facilities for providing them on a larger scale, came gradual changes in modern military affairs. The first standing army of modern times is ascribed to Turkey, where the Janizaries organized an efficient military body in the 14th century. However, the modern military system dates from the time of Charles VII. of France. About the middle of the 15th century that king of France first organized an army of 9,000 men, and afterward added 16,000 more.

During the Thirty Years' War, including the period of 1618-48, Gustavus Adolphus experimented in the use of infantry. His method was to spread the forces of infantrymen out to a great width, while his opponent, Wallenstein, preferred to mass them in a more solid front. In the reign of Louis XIV. armies were grouped into brigades and divisions; while Frederick the Great, a hundred years later, won his victories because of skill in discipline. On account of prolonged wars military service was made legally compulsory in France in 1798. Under this statutory requirement every male citizen between the ages of twenty-one and twenty-five years was liable to four years' service. This plan of Napoleon was later adopted by other European nations.

At present most nations have a standing army constituted of several corps, with which is associated a body of cavalry, together with army reserves of two classes, one subject to immediate call and the other a militia or second reserve. England is the only one of the great powers of Europe in which military service has not been made compulsory, but the recent war in South Africa and the unrest shown in India caused a general agitation more or less to such measures. The time of actual military service varies in different countries from six months to fifteen years, and, besides this, there are annual periods when those subject to military duty are required to pass a limited time in drill and reviews by officers high in authority. The cost of maintaining these armies is enormous, and in recent years several organized efforts were made to secure a general reduction in standing armies. An international conference was held at The Hague in May, 1899, at the suggestion of Czar Nicholas II., for the purpose of promoting general disarmament. All the great powers were represented at this conference and at several held since, and the evils of militarism were freely discussed. While the deliberations have led to no immediate results, they have awakened inquiry, and may yet lead to a condition under which the industrial classes will be largely freed from excessive taxes necessitated by large standing armies and enormous navies.

In the United States the army is authorized by the Constitution. According to its provisions the President is commander in chief of the army and navy. Congress has the power to raise and support armies, to regulate them, and to provide for the execution of the law, the suppression of insurrections, and the repulsion of invasions. Congress several times placed a general limitation on the number of

men that are to constitute the regular army, but in times of war the President calls for volunteers that aggregate many times the number usually maintained. In 1790 the regular army as fixed by Congress included 1,216 men; at the commencement of the War of 1812, 25,000; during the Mexican War, 29,000; at the beginning of the Civil War, 12,000. The law of 1874 limited the standing army to 25,000; and in March, 1899, the regular army was limited to 65,000, with a volunteer service of 35,000 at the option of the President. The highest number of men ever called into service in the United States was during the Civil War, when it aggregated 2,759,049 men and officers. The army of the Confederate States aggregated 1,100,000 men, thus making the total number engaged on both sides about four million men. An order issued in 1901 under an act of Congress placed the numerical strength of the regular army in enlisted men on the basis of one enlisted man for each 1,000 of population. According to this provision, the total of enlisted men is placed at 77,287.

**ARMY WORM**, the larva of a night flying moth, so named from its habit of moving in colonies of large numbers. It attains a length of about one and one-half inches, and may be distinguished easily by the greenish-gray color and yellowish stripes. Army moths make their appearance periodically, and sometimes prove very destructive to crops and other form of vegetation. The best method to destroy them is to plow deep furrows, and, when large numbers of the worms have fallen into the channel, they may be killed by burning straw spread loosely, or by dragging a heavy log over them. The log should be about ten feet long and slightly pointed at the end to prevent pushing the ground as it is pulled by a team of horses. These pests are quite common in North America, especially in the United States, but they do not frequently become troublesome.

**ARNHEM** (är'n'hēm), or **Arnheim**, a city of Holland, capital of the province of Gelderland, situated on the Rhine, thirty-five miles southeast of Utrecht. It has a Reformed Church dating from 1452, in which is the tomb of the Duke of Gelderland. Other buildings of note include a museum, a public library, and a normal school. The favorable location on the Rhine and several railroads make it important as a commercial center. The trade is chiefly in cereals and clothing, and it has manufactures of furniture, machinery, and scientific instruments. Population, 1906, 62,279.

**ARNICA** (är'nī-kā), a genus of plants belonging to the *Compositae* order, many species

of which yield an essential oil and a resinous matter called *arnicin*. A tincture of it is used as an external application for chilblains, bruises,

ARNICA.

and wounds. The plant is native to the mountain districts of Middle Eurasia. It grows to a height of about two feet, has a perennial root, and bears a dark golden yellow flower. A species sometimes called mountain tobacco is native to Central Europe.

**ARNO** (är'nō), an important river of Italy, rises in the Apennines, and after a course of 140 miles flows into the Mediterranean Sea. The source of the Arno is 4,450 feet above the level of the sea. It is navigable for barges as far as Florence. A canal connects the Arno with the Tiber at Arezzo. The valley through

which it flows is highly fertile.

**AROMA** (ä-rō'mā), a term employed to designate the constituents of substances that possess minute particles which affect the organs of smell and produce fragrant odors. These odors are diffused without a perceptible loss of bulk or weight of the substances producing them. Among the chief aromatic substances are cloves, vanilla, coffee, and lavender.

**AROMATICS** (är-ō-mät'iks), the medicines or drugs that owe their properties to the essential oils, and which are secured from the plants that yield camphor, odorous resins, or essences. Many have a warm, pungent taste, as pepper, ginger, cinnamon, saffron, and nutmeg. Some have a bitter taste, as tansy and wormwood, while others are highly fragrant, as myrrh, musk, and storax. In the United States medicines are usually associated with aromatics, but in some countries they are added only on prescription.

**ARRAH** (är'rā), a city of India, in the presidency of Bengal, 33 miles west of Patna. The surrounding country is fertile. It is important as a railroad and commercial center. In 1857 it was the scene of a battle in which the British gained a decisive victory over 3,000 Sepoy insurgents. Population, 1907, 51,500.

**ARRAN** (ä'ran), an island of Scotland, in the Firth of Clyde, about 13 miles west of Ayrshire. It is a narrow strip of land, about 20 miles long, and has an area of 165 square miles. The surface is mountainous, culminating in Goatfell, which has an elevation of 2,860 feet above the sea. The island is remarkable because of its numerous strata of rock, including trap, limestone, mica, granite, and sandstone. Population, 4,950.

**ARRAS** (är-räs'), a city in France, capital of the Department of Pas-de-Calais, 100 miles north of Paris. It has manufactures of lace, hosiery, and cotton goods, and carries a large trade in cereals and live stock. The public library has about 36,000 volumes. In the Middle Ages the city had extensive manufactures of tapestry, and its name has been given to a grade of highly figured hangings. Population, 1901, 20,697.

**ARROW** (är'rō), a missile weapon to be shot with a bow, the latter being bent for that purpose into an angular form. Arrows are usually straight and sharply pointed, and, to inflict a more deadly wound and prevent them being easily pulled out, are often barbed and poisoned at the point. The arrow is frequently mentioned in the Bible as a weapon used in war, and is still employed by savage people. Arrowheads of flint stone were made by the American Indians, many of which are still found in different parts of the continent.

**ARROWROOT** (är'rō-rōōt), the name of a variety of starch derived from the roots and grains of several plants and used as an article

ARROWROOT.

of food. The best quality is secured from the roots of a plant cultivated in tropical countries, especially in the West Indies. The roots of this plant are about twelve inches long and nearly an inch thick. They are peeled and ground into a pulp, from which the starch is taken by means of bathing in water, and it is then spread out and dried in the sun. In Brazil a class of arrowroot known as tapioca meal is

secured in great quantities from the roots of several plants, and a fine quality is made from Indian corn, known in the market as Oswego arrowroot.

**ARRU** (ä'rōō), the name of a group of islands in the Arafura Sea, southwest of New Guinea. The group consists of a number of small islands. The surface is low and the area is about 3,000 square miles. Some of the natives have adopted Christianity. Dobo is the chief town. It is a market for pearls, trepang, and edible birds' nests, which are exported. The islands belong to Holland and have a population of 15,000.

**ARSENAL** (är'sē-nal), an establishment for the manufacture and repair of munitions of war. In most instances separate arsenals are maintained for the manufacture of guns, though formerly all the munitions of war, including explosives and cartridges, were made in general establishments. Great naval arsenals are maintained at Venice, Toulon, and Cherbourg, at which ships are built, repaired, and fitted out. The royal arsenal at Woolwich was established by England in 1720. It comprises a laboratory, and manufactures warlike implements for the army and navy. In the United States each State has an armory for storing arms and ammunition. Large arsenals are located at Fort Monroe, Va., Rock Island, Ill., San Antonio, Tex., and Benicia, Cal.

**ARSENIC** (är'sē-nīk), a chemical element found widely distributed in nature, closely resembling a metal in physical properties, but ranking with the nonmetals. Pure arsenic is a shining, steel-gray, hard, and brittle substance. The white powder known as arsenic in the market is an oxide, and is secured largely from vapors that rise in extracting pure arsenic from the ore. Arsenic is a deadly poison, and when taken into the system causes cramps and a burning pain. The workmen who engage in the manufacture of arsenic, or products in which it is used extensively, are very liable to become unhealthy unless the best possible sanitary regulations are observed. Arsenic is found chiefly in Germany, Chile, Mexico, New Zealand, and in the northern section of the Appalachian Mountains, especially in New Hampshire. It is used in medicine and in the manufacture of shot, glass, and other products. When mixed with copper, it produces a beautiful green color, which is used extensively for coloring wall paper. See **Poisons**.

**ARSON** (är's'n), the willful and malicious burning of a dwelling or outbuilding belonging to another. The crime of arson includes willfully setting fire to any barn, ship, church,

produce, coal mine, or other valuable property. Arson is punishable by common law as a felony, and when death results from it the offender may be punished by inflicting capital punishment, or its legal equivalent. An attempt to set on fire valuable property of another is also punishable as a penal offense. In case the offender sets fire to property for the purpose of defrauding an insurer, the penalty is usually increased.

**ART** (ärt), the principles of artistic construction and aesthetic criticism, or the application of such principles to artistic works. In an extended sense the word implies everything which may be distinguished from nature. Art and nature are the two most comprehensive subjects of human study. In Pope's familiar expression, "Blest with each grace of nature and of art," is included everything that exists independent of our study and all that can be added by human exertion to render beautiful, appropriate, and pleasing. The term is commonly used to designate skill in performing some specified kind of work, either physical or mental. Usually the several arts are arranged in two groups: the mechanical and the liberal or fine arts. The former engage workmen who successfully follow an occupation in which genius is not the most material element, but rather skill and facility to work with an efficiency imparted by long practice, as the arts of the watchmaker, carpenter, blacksmith, and others. These are usually called the trades. Liberal or fine arts are such as require, not only manual skill, but great genius. These include sculpture, painting, music, architecture, and all that minister to the sentiment of taste by means of the beautiful in color, form, rhythm, or harmony.

**ARTERY** (är'tēr-ÿ), the name of any one of the vessels through which the blood is conveyed from the heart to the different parts of the system. These organs are so named because the ancients found that the arteries of dead bodies contained air, and supposed them to be air tubes leading through the body. The arterial system starts from the left ventricle, where it consists of one trunk, called the *aorta*. From it several branches pass to the head, after which it makes a bold curve, known as the *arch of the aorta*, and sends numerous branches to all parts of the lower extremities. Arteries are tubelike canals, by which the pure blood is carried from the heart to the cells. They are nearly straight and are located as near the bones as possible, so as to be less liable to injury. In composition they are elastic, which causes them to

yield to every pulse of the heart. They are made up of three layers or coats, including the external or cellular, the middle or fibrous, and the internal or serous, and are encased in a sheath. Where they penetrate muscles, they are often protected by fibrous rings to prevent compression by muscular action. A large canal, not a part of the general arterial system, carries the impure blood from the heart to the lungs to be purified. It is called the pulmonary artery.

**ARTESIAN WELL** (är-tē'zhan), a boring in the ground through which currents of water rise from various depths toward or

ARTESIAN WELL.

above the surface. The possibility of securing a flow of water in this way depends upon the geological structure, though water is found more or less abundantly in all rock formations. Soil and rock constituted largely of sand contain pores and cavities that easily fill with water, which flows out in case a well is sunk to a depth below the regular cavities in which the liquid is stored. Nearly one-third of the apparent sand mass at the seashore or near water beds is made up of water. Artesians wells are sunk in comparatively low places, and in districts where the lower or older strata are formed into basin-shaped curves. Rain falling on the outer portion of the strata saturates the whole porous bed, and, when the bore reaches below the common water surface, the water rushes up toward the level by hydraulic pressure, the height of the flow being equal to the height of the water in the basin-shaped strata. Wells with a good supply of water can be obtained in nearly all parts of Canada and the United States, but artesian wells are not so common. However, in many localities where holes have been sunk in prospecting for coal, salt brine, gas, petroleum, and other minerals excellent flows of water have been found.

In the eastern part of the United States, particularly in the manufacturing centers of New York, Ohio, and Pennsylvania, and in many of the Southern States, such wells are utilized extensively for industrial purposes. In New York City a vast supply of water is secured at a depth of 500 feet; at Saint Louis a well at a depth of 2,250 feet discharges seventy-five gallons of water per minute. At Terre Haute, Ind., are several wells from 1,500 to 2,000 feet deep; and at Columbus, Ohio, a good flow is obtained at a depth of 2,275 feet. New Orleans, La., has several such wells, and many have been obtained in the states on the Pacific coast. These wells supply water for city consumption, manufacturing, and irrigation. In South Dakota and in portions of the Sahara Desert wells have been sunk that yield vast volumes of water for the irrigation of large tracts of arid land. The census returns show that over 10,000 of these wells are used for irrigation purposes in the western half of the United States, of which number about 3,000 are in California. These wells are secured at a depth of from twenty to nearly 3,000 feet.

In late years the process of boring wells for oil, gas, and other minerals has become a distinct branch of hydraulic engineering. Usually a hole is bored for some distance, which is cased by driving an iron pipe into it, and this is lengthened from time to time in the process of construction by attaching other sections. Iron piping is used in constructing drill rods, and a valve opening from beneath is attached about every thirty feet. The drill below the rod contains a hole, through which the borings pass, through the agency of a supply of water poured into the well. These borings work upward through the drill rods as they are moved up and down by machinery on the ground above. In this way drilling becomes a process of pumping, which is not only effective in all grades of clays, but is capable of penetrating through the hardest kind of granite. As the drill passes downward into the earth, iron casing is driven down to prevent caving, and additional rods are put in from time to time as the work progresses. In some localities large augers are used a portion of the time, but in most instances the best steel drills are suitable to carry on the work. However, in the harder substances, such as granite and other rock, the diamond drill is used, which is set with black diamond. In making tests for minerals, a careful account is kept of every strata and formation through which the drill passes, by

means of which an accurate knowledge of the various deposits is secured and the expense of further improvements can be easily estimated.

**ARTHROPODA** (är-thröp'ô-dâ), or **Articulata**, one of the divisions of the animal kingdom. The body of animals belonging to this family is divided into segments, each of which has a pair of jointed feet or appendages, hence Cuvier named the whole group articulata. Many species have been described, including a class that is parasitic in its habits, and in these some of the organs disappear or lose their functions as the animal grows older. In most species the mouth is upon the lower surface of the anterior end; the seat of the nervous system is above and in front of the mouth, and the heart is dorsal and propels the blood forward, but, as the veins are often lacking, the venous circulation, in some species, is returned to the heart through the tissues of the body. The nerves pass from the brain to the eyes, which are simple in some species and compound in others, and the outer wall of the body is usually hardened by a peculiar substance known as *chitine*. They reproduce exclusively by eggs. The three divisions of articulata are arachnida, crustacea and antennata. The first mentioned group breathe by lungs, gills, or air tubes; the second by gills entirely; and the last mentioned by air tubes. Those belonging to the antennata are provided with antennae. Among the animals classed in this family are lobsters, spiders, cockroaches, butterflies, mites, flies, bees, etc.

**ARTHUR'S SEAT**, a famous hill near Edinburgh, Scotland, so named from King Arthur. It is 822 feet above the level of the sea; contains many beautiful drives and valuable monuments, and furnishes an excellent view of the city. It has come to be a favorite pleasure resort of Edinburgh, which is frequently called "Modern Athens."

**ARTICHOKE** (är'ti-chök), a perennial plant resembling the thistle, found native in Europe and Asia. The stem is from two to ten feet high. It is cultivated for food in many parts of Southern Europe. The unripe flower heads and the lower part of the surrounding leaf scales are the chief parts taken for food. The Jerusalem artichoke, a species of sunflower, is cultivated for its root tubers, which resemble potatoes. These may be prepared for the table like potatoes, or eaten raw with vinegar and salt in the form of a salad.

**ARTICLE** (är'ti-k'l), in grammar, one of a class of limiting adjectives, which embrace the adjective elements *a*, *an*, and *the*. *A* is

used before consonant sounds and *an* before vowel sounds; both are called *indefinite* articles, because they refer to any one of two or more objects. *The* is called the *definite* article.

**ARTICLES, The Thirty-Nine**, a statement of the points of doctrine agreed upon by the Church of England. These articles, 39 in number, were confirmed by royal authority after having been agreed upon by a convocation held in London in 1562-63. They are articles of religion, a formula, rather than a creed, and originally were 42 in number. A convocation of the Irish Church adopted them in 1635, and they were ratified by the Scottish Episcopal Church in 1804. The General Conference in 1801 made them applicable to the American Episcopal Church, but inaugurated a few slight changes. Formerly the clergy was required to subscribe to the articles, but now they give assent to them and to the Prayer Book. The Methodist Episcopal Church of America reduced these articles to 25, which is the number now published in its Book of Discipline.

**ARTICLES OF CONFEDERATION**, an instrument adopted by the thirteen colonies of America for their mutual protection and general government. Congress proposed them in 1776 with the condition that they should not be binding until ratified by all the states. Maryland ratified them on March 1, 1781, the last of the States to grant approval, and Congress convened the next day. The delay on the part of Maryland was due to the fact that it demanded that the states cede their claims to territory in the Northwest Territory to the Federal Government, which was done by all the interested states. The instrument united the colonies under the title *United States of America*. While they did not provide a satisfactory plan for government, they remained in force as the fundamental law until March 4, 1789, when the Constitution became operative and the first Constitutional Congress assembled.

**ARTIFICIAL ICE** (är-ti-fish'al). See **Ice**.

**ARTIFICIAL LIMBS**, the mechanical contrivances employed to fill the functions of a lost limb or part thereof. The construction of artificial limbs possessing considerable merit dates from the beginning of the 19th century, although Herodotus and others mention their use in early history. A Roman artificial leg discovered in a tomb in Capua, and which was used about 300 B. C., is now in the London Royal College of Surgeons. The German Knight, Gotz von Berlichingen, in 1504, wore an iron hand constructed to

grasp a sword, which weighed three pounds. Many other remarkable incidents in history may be cited as evidence that artificial limbs have been worn for many ages.

Artificial limbs of recent manufacture possess many points of utility and show much skill in construction. Various kinds of substances are used in the manufacture, but mostly such as possess lightness, strength, and noncorrosive qualities. Aluminum possesses all these elements and has gone largely into the manufacture of these appliances. Arms are often contrived so the hand may be unscrewed and a hair brush, knife, fork, or some similar instruments can be put in its place. Cork, rubber, and wood with leather bands have gone largely into the manufacture of devices to replace lost limbs. Artificial fingers, ears, and noses are skillfully shaped from papier mache. This material may be waxed and varnished so as to have in effect the same complexion as the real organs of the individual. Such an artificial part, if carefully made, cannot be distinguished from the real, except by the very closest examination. Glass is used in the manufacture of artificial eyes, which are so skillfully made that they agree in size, measurement, color, and other essentials with the real eye. They serve a useful purpose in preserving the natural appearance, especially where the wearer still possesses one of the natural eyes.

**ARTILLERY** (är-til'lēr-ÿ), the term formerly used to designate any instrument of war, even bows, slings, and arrows, but now applied to cannon and general ordnance, including guns, mortars, howitzers, and machine guns. It is also applied to officers and men of the army to whom the care and management of the artillery is intrusted. It may be taken for granted that the history of artillery proper commenced with the discovery of gunpowder. The first large implements of war to throw missiles of considerable size were constructed of stone. The scientific casting of cannon did not begin until the 17th century, but there is evidence that implements of rough construction were used as early as the 12th century.

With the advent of field guns came the necessity of employing a special body of men skilled in the management of heavy masses of field artillery, though this branch of warfare received little attention until the beginning of the last century. Early experiences showed the large cannon to be unwieldy and it was often lost by mismanagement or rendered of small effect for want of means to move it about. Besides, there was a want

of men skilled in the arts of taking aim and calculating distances and the range of guns, whereby effective results might follow. This led to the establishment of artillery schools, where men might be trained to efficiency and skill. These schools date from 1675, when Louis XIV. founded such an institution and organized a special artillery force. France and Germany long possessed the best artillerymen and artillery service of the great powers of Europe. They were trained, not only in institutions, but by personal inspection at the seats of war. This was the case in the war between the English and the Boers, in South Africa in 1900, when Germans and French managed largely the artillery of the latter. However, it was demonstrated in the Spanish-American War of 1898 that the United States cannot be excelled in military marksmanship.

Woolwich is the seat of the artillery and engineering school of England. However, most countries of Europe separate the school of artillery from that of the engineers. In the United States the organization of batteries is largely under the direction of the President. In time of peace the mounted artillery organization is small, while in time of war it constitutes a considerable portion of the general army. At least one battery for every regiment is required to be mounted. Owing to the late wars in the colonial possessions, garrisoned fortifications have been constructed at which a large portion of the artillery is utilized. To enlarge the skill of the American army and secure expert artillerymen, a school with a suitable course of study and a practical department is maintained at Fort Monroe, Va. The course consists of two years, and is a post-graduate adjunct to the United States Military Academy, at West Point, N. Y.

**ARTILLERY SCHOOLS**, the institutions designed to impart skill in artillery practice. The first was established in France in 1675, which was followed by one in Germany in 1766, and England founded the Royal Military Academy at Woolwich in 1741. The artillery school of the United States is located at Fortress Monroe, Va. It was founded in 1824, and has a course of study covering two years.

**ARUWIMI** (ä-röö-wē'mě), a river of Africa, one of the tributaries of the Congo. It rises west of Lake Albert Nyanza and flows westward through a region of dense forest. At Yambuya, to which it is navigable, are a number of rapids. In different parts of its course of about 800 miles it assumes the names of Ituri and Bijerre.

**ARYANS** (är'yans), the name applied to the Indo-European races. The Aryans originally inhabited the region of Asia near the upper Oxus or Amu River. They engaged in farming and stock raising, and were advanced in some of the arts of civilization. Their origin is traced to the Japhetic nations from Japheth, son of Noah, of whom they are held to be descendants. These people spoke one language, the Sanskrit, from which the modern languages spoken by their descendants have originated. Although many of these languages appear to show no affinity, yet upon close examination it is found that all were derived from the same source and had one common origin. The Aryan nations of Asia are the high-caste Hindus and the ancient Persians, while those of Europe include the Greeks, Latins, Slavs, Leets, Celts, and Teutons; the last mentioned include the Germans and Scandinavians. While little is known of the ancient Aryans, it is thought they engaged chiefly in tilling the soil and in pasturing their flocks. They lived in villages, practiced the grinding of grain and weaving of cloth, and possessed well-formed ideas of government. The English are a branch of the Aryan race, and descended from them through the German people.

**AS** (äs), or **Libra**, a Roman weight, divided into 12 *unciae*, and nearly equal to the English pound. A Roman coin called *as* originally weighed a pound, but it was afterward reduced in size and weighed one thirty-sixth of a pound.

The older coins bore the figure of some domestic animal, as an ox or a sheep, and on one side of those of more recent date was stamped the head of an important personage.

**ASAFETIDA** (äs-ä-fēt'ī-dä), the name of several plants common to Persia and the East Indies. These plants yield a drug useful in medicine, especially for asthma, hysteria, worms, and gaseous distentions of

ASAFETIDA.

the intestines. To secure the drug old plants are tapped for their juice, which is dried in the sun and hardened, in which state it is ex-

ported largely. This drug has a very disagreeable odor, but is used for seasoning articles of food among some tribes in the East.

**ASBESTOS** (äs-bēs'tös), a substance named from its property of not being affected by fire. It is a highly useful mineral of a silky luster, having fibers that in some species are delicate, flexible, and elastic, and in others brittle and stiff. Its chief property is that it will not burn, which renders it highly important as a means of protection against fire in buildings and as a sheath or covering to confine heat to a particular channel. The ancients knew of it and used it in preparing flexible cloth for shrouds to cover dead bodies. Deposits of this mineral are found in various localities of all the grand divisions. It occurs in Montana and Georgia in paying quantities, where it is mined profitably. The quality of the American product is equal to any in the world. At Sall Mountain, a foothill of the Blue Ridge in Georgia, an asbestos ledge has been discovered that is more than 800 feet long, about 250 feet wide, and of great depth. Canada has large deposits of white asbestos, which can be spun into fine thread and woven into yarn and rope. Large quantities of this product are marketed annually and its use is extensive. Electrical supply companies employ it in the manufacture of insulators. It is used extensively in making asbestos cement, quick-setting plasters, fireproof roofing, deadening for walls and floors, sectional covers for steam pipes, refrigerator insulation, and many other useful purposes in manufacturing. It has proved especially beneficial in the manufacture of stage curtains in theaters and for the protection of dead bodies that have been embalmed.

**ASBURY PARK**, a town of New Jersey, in Monmouth County, on the Pennsylvania and the Central of New Jersey railroads. It is finely situated on the Atlantic coast, six miles south of Long Branch, and is one of the most famous health and pleasure resorts of the Eastern states. A short distance south is Ocean Grove, from which it is separated by Wesley Lake. It is visited by many thousands of people annually, who are amply accommodated by facilities for entertainment. Population, 1905, 4,526.

**ASCALON** (äs'ka-lön), or **Askalon**, an important city of ancient Palestine, situated midway between Gaza and Ashdod, on the Mediterranean Sea, thirty-eight miles southwest of Jerusalem. It is mentioned several times in the poetical books of the Scriptures, but is noted more particularly on account of its history in connection with the Maccabees and the Cru-

saders. The Christians under Godfrey de Bouillon and Tancred attained a noted victory at Ascalon in 1099, and Baldwin III., King of Jerusalem, also gained a victory here in 1153. It was recaptured by Saladin in 1187, and three years later was destroyed by a joint treaty under the Moslems and Christians. The ancient city contained a number of noted temples and was celebrated for the production of wine in the time of Pliny. On the site of the ancient city are ruins and a small village of Turks and Christians.

**ASCENSION** (äs-sën'shün), an island in the Atlantic Ocean, 750 miles northwest of Saint Helena. It has an area of 35 square miles, is of volcanic origin, and belongs to Great Britain. Green Mountain, the highest elevation, rises 2,870 feet above the sea. It is important as a coaling station. Georgetown, the chief business center, is a naval station. Population, 390.

**ASCENSION DAY**, often called *Holy Thursday*, the day on which the ascension of Christ is commemorated. It has been observed as a feast since about 68 A. D., and is movable, occurring on the second Thursday before Whitsuntide.

**ASH**, a genus of forest trees common to North America and Eurasia. More than fifty species have been described, of which the common ash is the most widely distributed. The species native to North America include the red ash, white ash, blue ash, and swamp ash. The ash tree is distinguished by its size and graceful foliage. It attains a height of sixty to ninety feet and has widespreading branches. It yields a good quality of timber for the manufacture of plows, vehicles, furniture, and agricultural implements. The weeping ash is a species with drooping branches, and the mountain ash is planted largely as an ornamental shade tree. A species native to Palestine, the flowering or manna ash, yields the substance called manna. This product exudes from incisions made in the bark. Some varieties yield a sap useful in the preparation of medicine.

**ASHANTEE** (ä-shän'tê), or **Ashanti**, a country in Western Africa, situated north of the Gulf of Guinea, and extending toward the interior from the Gold Coast. Though its boundaries are not accurately defined, its area is placed at 50,000 square miles, and the population at 3,000,000. It is one of the largest native kingdoms of Africa, but within recent years many changes have been wrought on account of the extension of European interests, particularly those of France, England, and Germany. The country is rich in gold dust and

ivory, and there are considerable productions of fruits, cereals, vegetables, and fish. Several wars have been carried on with European powers. The government is a despotic monarchy, in which slavery is still recognized. In 1896 it was placed under British protection and was annexed to that country in 1901. The chief seat of government is at Kumassi, which, in 1905, had a population of 5,940.

**ASHBURTON TREATY**, a treaty negotiated between the United States and Great Britain at Washington in 1842, the former country being represented by Daniel Webster and the latter by Lord Alexander B. Ashburton. By this treaty the northeastern boundary between the United States and Canada was finally settled, the United States securing about seventwelfths of the territory in dispute. It was also stipulated that the slave trade should be mutually suppressed.

**ASHEVILLE** (äsh'vil), a city in North Carolina, county seat of Buncombe County, on the French Broad River, 210 miles west of Raleigh, on the Southern Railroad. It is finely situated in the midst of the Blue Ridge Mountains, at an elevation of 2,300 feet, and enjoys a large manufacturing and jobbing trade. The city has well-paved streets, rapid transit, electric lights, and excellent school and church buildings. It is the seat of Asheville College, a Methodist institution founded in 1843. Among the chief buildings are the city hall, the post office, the Auditorium, the Asheville Normal and Collegiate Institute, and the Battery Park Hotel. Richmond Hill, Overlook Park, Pisgale Forest, and the Vanderbilt estate are among the points of interest. It has manufactures of cigars, clothing, earthenware, machinery, flour, and furniture. Its favorable location has made Asheville famous as a health resort, both for summer and winter visitors. The region was first settled in 1792. Population, 1900, 14,694.

**ASHLAND** (äsh'land), a city of Boyd County, Kentucky, on the Ohio River, and on the Norfolk and Western and the Chesapeake and Ohio railroads. It is surrounded by a fertile farming country, which contains extensive deposits of coal. The manufactures include ironware, boilers, furniture, nails, and machinery. The city has good municipal improvements, and enjoys the advantages of good school and church facilities. It was first settled in 1854 and became an incorporated city in 1870. Population, 1900, 6,800.

**ASHLAND**, the county seat of Ashland County, Ohio, 65 miles southwest of Cleveland, on the Erie and other railroads. It has a

large trade in grain and produce. A public library and the county courthouse are among the chief buildings. It has waterworks, electric lights, and manufactories of machinery. Population, 1900, 4,087.

**ASHLAND**, a city of Oregon, in Jackson County, fifteen miles southeast of Jacksonville, the county seat. It is on the Southern Pacific Railroad, in a fruit growing country, and granite quarries and gold mines are worked in the surrounding country. Railroad shops, lumber yards, and flouring mills are among the industries. It is the seat of a State normal school. In the vicinity are mineral springs. Population, 1900, 2,634.

**ASHLAND**, a borough in Schuylkill County, Pennsylvania, twelve miles northwest of Pottsville, on the Philadelphia and Reading and the Lehigh Valley railroads. It has large foundries and machine shops, and anthracite coal is mined in the vicinity. The State Miners' Hospital is located at this place. It has a municipal system of waterworks and several fine schools. Ashland was incorporated in 1857. Population, 1900, 6,438.

**ASHLAND**, a city in Wisconsin, county seat of Ashland County, on Ashland Bay, 200 miles north of La Crosse. It is on the Northern Pacific, the Wisconsin Central, the Chicago and Northwestern, and other railroads, and has a large trade in lumber, iron, and building stone. The manufactures include lumber products, ironware, machinery, furniture, and clothing. Among the chief buildings are the county courthouse, the post office, the North Wisconsin Academy, the Vaughn Public Library, and the Knight Hotel. The city has a fine system of public schools and numerous churches, and is substantially improved by pavements, electric lights, and street railways. There are several fine parks and libraries. It was first settled in 1854 and was chartered as a city in 1887. Population, 1905, 14,519.

**ASHTABULA** (ăsh-tă-bŭ'lă), a railroad center and manufacturing city of Ohio, in AshTABULA County, at the mouth of the Ashtabula River, on the New York, Chicago and Saint Louis, the Lake Shore and Michigan Southern, and other railroads. The surrounding country is productive, yielding considerable quantities of cereals, live stock, and fruits. The city has a fine harbor on Lake Erie, and direct steamboat connections are maintained with Chicago, Cleveland, and other lake cities. The manufactures include ships, boilers, engines, leather, machinery, furniture, clothing, and tobacco products. It has a fine system of public schools, many well-built churches, and good municipal

improvements, including electric street railways, pavements, waterworks, and several fine parks. The first settlement was made in 1803. Population, 1900, 12,948.

**ASHTON-UNDER-LYNE** (ăsh'tun ũn'der lĭn), a manufacturing town of England, in Lancashire, six miles east of Manchester. It is nicely situated on the Tame River and several railroads, and has large industries in calico printing and the manufacture of machinery. A canal connects it with Manchester and other important towns. It was founded by the Saxons and has a church built in the time of Henry V. Population, 1901, 43,900.

**ASH WEDNESDAY**, the first day of Lent, so named from the Roman Catholic ceremony of sprinkling ashes on the heads of penitents then admitted to penance. It is thought probable that this custom was established by Gregory the Great. The ashes are secured by burning palms, after which they are consecrated on the altar and sprinkled with holy water, and a small portion is then cast on the head of the penitents as they kneel at the altar.

**ASIA** (ă'shĭ-ă), the largest of the grand divisions, comprising an area of 16,775,000 square miles, about twice the extent of North America. The principal boundaries on the north are formed by the Arctic Ocean, east by the Pacific, south by the Indian, and west by Africa and Europe. As a whole, the coast line is indented by numerous inlets, many of which are deep and expansive seas. On the north are the Kara Sea and the Gulf of Ob. The eastern shore is indented by the gulfs of Anadir, Tartary, Pechili, and Tonkin, and by the Sea of Okhotsk, the Japan Sea, the Whang Hai or Yellow Sea, and the East China Sea. On the south are the gulfs of Siam, Martaban, Cambay, Cutch, and Oman, the Bay of Bengal, the South China Sea, and the Arabian Sea; to the southwest are the Gulf of Aden and the Red Sea; and the western boundary is formed partly by the Mediterranean, the Black Sea, and the Caspian Sea. Few great lakes or inland waters characterize the continent, those of most importance being Lake Baikal, the Aral Sea, and lakes Tenis, Balkash, and Tungting.

The continent is separated from Europe by the Ural Mountains, the Ural River, the Caspian Sea, the Caucasus Range, and the Black Sea. It is connected with Africa by the Isthmus of Suez, through which the Suez Canal has been cut, and it is separated from Africa mainly by the Red Sea and the Gulf of Aden. Near the continent are a large number of islands, especially off the eastern coast, many of which are the peaks of volcanic mountains

belonging to systems partly submerged. The East Indies constitute the largest group of islands, and include Borneo, Sumatra, and New Guinea. North of the East Indies are the Philippines, Formosa, and the group included in Japan. North of the continent, in the Arctic Ocean, are Anjou or New Siberia, and a number of small groups not well known. Small islands are located in the seas east and south of the continent, including Hainan in the China Sea, the Andaman islands and Ceylon in the Sea of Bengal, and numerous small groups in the Arabian Sea.

**PHYSICAL FEATURES.** The altitude of Asia is varied to a greater extent than that of any other portions of the earth, ranging from a considerable tract below sea level to the highest mountain summits in the world. A tract of 50,000 square miles in the region of the Caspian Sea is below sea level, while the highest extensive region on earth is included in the lofty highlands of the interior. The Plateau of Pamir is situated about 1,000 miles southwest of the center of the continent, where the boundaries of Afghanistan, India, and Turkestan meet. This plateau is near the center of the mountain systems, which radiate from it in various directions. Southeast of it are the Himalayas; northwest, the Hindu Kush; and northeast, the Thian Shan. East of the Pamirs are the Kuenlun Mountains, which extend east into China, and southwest of them is the Plateau of Tibet. The Hindu Kush attain a height of 25,000 feet and are extended westward by the Elburz in the northern part of Persia, where Mount Demavend has a height of 18,500 feet. South of the Elburz is the great Plateau of Iran, situated mostly in Persia and Afghanistan.

The Himalaya Mountains trend in a slight curve from the northwest to the southeast, forming a natural barrier between India and China, with many chains and groups of mountains both north and south of the central ridge. Mount Everest, the highest peak, has a summit 29,002 above sea level, and, like many others in the continent, is covered perpetually with snow. The Desert of Gobi occupies a large part of Northern China, east of which are the Great Khinghan Mountains, trending north and south, and north of it are the Yablonoi Mountains. Arabia is a tableland, made up largely of the Desert of Roba el-Khali, with a narrow coast bordering on the surrounding waters. The mountains of Armenia culminate in Mount Ararat, famous as the landing place of Noah after the Deluge, and Asia Minor is characterized by the Taurus Range and other moun-

tains. The Deccan, a region elevated about 2,000 feet, stretches over a part of India, and the Altai Mountains extend from Siberia into the northern part of China. Although most of the rivers have their source in the Himalayas, the Hindu Kush, and the Altai mountains, the drainage is practically in all directions from the borders of the Desert of Gobi. Asia contains large tracts that belong to the desert and arid regions, including the Tarim Desert, the Desert of Gobi, the Arabian Desert, and a portion of the Kirghiz Steppe.

**RIVERS.** The continent has seven great river systems, which include a number of the largest water courses on the globe. Since railroad building has not been developed to a large extent, these water courses remain as important in transportation as they were in remote antiquity. The Tigris and Euphrates discharge into the Persian Gulf; the Ob, the Lena, the Indigirka, and the Yenisei flow into the Arctic Ocean; the Ural flows into the Caspian Sea; the Amur, the Hoang Ho, the Yang-tse-Kiang, and the Si-Kiang flow east into the Pacific; and the Mekong, the Ganges, the Indus, the Irrawaddy, and the Brahmaputra carry their drainage south into seas and bays connected with the Indian Ocean. Some of the rivers are inland and have no visible connection with the sea. This class of streams include the Amu Darya and the Sir Darya, flowing into the Aral Sea, and the Ili, which discharges into Lake Balkash.

**CLIMATE.** In the northern part the climate is cold during most of the year, the extreme northern point, Cape Chelyuskin, being somewhat farther north than Nova Zembla. Here the temperature rises quite high during the short summer season, though the warm portion of the year is only momentary as compared with the long winters, and in a large portion of Northern Siberia; particularly in the Tundra, the ground never thaws out entirely. In the central region the temperature is extremely cold in the winter, and hot in the summer; on the southern slope of the great mountain systems the climate is warm, while along the southern coast it is very hot, though all parts are comparatively healthful. In the southern portion, owing to the equatorial winds, rain falls abundantly about one-half of the year, while the other half is practically rainless. The northern part, owing to the presence of lofty plateaus in the interior, is generally arid. As a whole, the climate is not wet, which is due partly to its vast extent and partly to the absence of a considerable water surface in the interior. The continent has a wide range of temperature, the maximum ranging from 75°

on the northern coast to  $120^{\circ}$  in Persia and Arabia, and the minimum is from about  $65^{\circ}$  in the southern part to  $58^{\circ}$  below zero in the northern section. In Northeastern Asia, at Verkoyansk, the temperature falls as low as  $92^{\circ}$  below zero. Hot winds from the deserts, oceanic currents, and the monsoons of the Indian Ocean affect the climate to a considerable extent in different sections.

**ANIMAL LIFE.** The animals of Asia are very numerous and include the largest species of mammals. Tropical Asia has the Asiatic elephant, a species different from the elephant of Africa. The buffalo, rhinoceros, deer, porcupine, squirrel, and many varieties of apes and monkeys are found in the southeastern part. In the highlands of Tibet and the plateaus of the Himalayas the yak is common. This animal is used extensively as a beast of draft and burden. The camel is native to Asia and fills an important function in the industries. Other animals common to different sections are the goat, lion, hyena, and many species of birds and reptiles. The domestic animals, besides those common in America, are the buffalo, Angora goat, camel, elephant, and sacred ox. In Central Asia the mountaineers rear the sheep, horse, goat, and ass extensively, while the camel is almost indispensable in the arid region, and the yak is reared and used chiefly in the highlands and regions having a temperate climate. Fish are abundant off the Asiatic coast and in the interior waters. The dolphin, dugong, crocodile, boa, and cobra de capello are Asiatic animals.

**PLANT.** Many species of plants abound that are common to the same latitudes in Europe, but the variety is greater than the plants classed in the flora of that grand division. Some of the deserts are barren and almost destitute of vegetation, but they are bordered by vast areas of pasture land, and where the climate is sufficiently moist and the temperature favorable plant life thrives luxuriantly. In the north are vast forests in which the willows, pines, and birches predominate. Maples, oaks, poplars, walnuts, limes, and the mulberry are found in Japan, China, and the regions having a similar climate. Aromatic shrubs abound in Persia and Arabia and in most of the southern sections thrive the date palm, the banyan, the mahogany, the magnolia, and the gum-producing acacias. A large variety of the cultivated plants of Europe are common to Asia and have been cultivated for many centuries. The chief economic plants are rice, maize, wheat, oats, barley, tea, sugar cane, cotton, tobacco, buckwheat, millet, potatoes, and rye. Fruits are cultivated

on a large scale for the market in the south, especially the banana, yam, plantain, and raisin grapes. Spices, pepper, and the opium poppy are grown extensively.

**MINERALS.** The minerals are very abundant, but mining has not been developed as extensively as in Europe and America. Petroleum and mineral oil abound in many places, especially in parts of India and in the vicinity of the Caspian Sea. Coal is mined in Siberia, Eastern China, and India, and salt and saltpeter are abundant in Persia and Asia Minor. Limestone, sandstone, and granite are quarried for building purposes, and beds of gypsum have been developed and are used in the manufacture of Portland cement. Other minerals more or less predominant are silver, gold, manganese, copper, lead, iron ore, and precious stones, including rubies, diamonds, and sapphires.

**INHABITANTS.** The people of Asia are greatly diversified, and at least five races or divisions are well represented. These include the Mon-

CHINESE.

THIBETAN.

golian in the eastern and central parts, the Caucasian in the western part and India, the Malay in the Moluccas and the Indian Archipelago, the Drividas in southeastern India and Ceylon, and the Papuans and Negritos in the Philippine Islands. With respect to society the people of Asia are largely diversified from the lowest savage state to the higher civilizations. Within the last few decades the Mongolian races, which in numbers greatly exceeds all others, has been influenced materially by the education and political advancement of Europe, especially the Japanese, who have reformed their government in a large measure and reorganized their educational system to conform to the needs of an advancing civilization. The spirit of progress has influenced to a considerable extent the people of China, India, and some sections of Western Asia, but the stationary condition that has prevailed among the Malaysians remains the same. Mohammedanism, Brahamanism, Buddhism, and Confucianism are the chief religions in numerical strength, but the Christians and

Jews are quite well represented. In 1907, the population was 874,409,856; hence more than half of the human race live in Asia.

**GOVERNMENT.** The systems of government differ widely and have been influenced more or less noticeably by the people of Europe and America. A considerable area is at present controlled or governed by nations that are not Asiatic in location or racial affiliation. The independent countries are Japan, Persia, Asiatic Turkey, China and its dependencies (Eastern Turkestan, Mongolia, Tibet, Sungaria, and Manchuria), and portions of Arabia. Corea belongs to Japan and Afghanistan and Baluchistan are under the control of Great Britain.

Russia possesses the largest scope of territory which is under the government of nations not located in Asia. The Russian possessions comprise Turkestan, Siberia, and Transcaucasia, and embrace an area of 6,390,000 square miles. The British possessions, comprising about 1,800,000 square miles, include Ceylon, India, and the Straits Settlements. France has territory equal to 25,000 square miles, confined to the peninsula known as Indo China, which embraces Cambodia, Oman, Tonkin, and Cochin China. The Philippine Islands are territory of the United States and the larger part of the East Indies belong to the Netherlands. Germany has a small territorial possession in China, known as Kiauchau, and the Caroline and other islands, and Portugal has a small possession in India.

The great diversity of races, languages, customs, and religions has given rise to varied economic conditions. Until recently there were no telegraph and telephone lines, and railroads were unknown. With the growth of European influence and the consequent reforms in government and methods of commerce, wonderful changes have been wrought. Russia constructed and operates the great transcontinental railroad, a continuous line from Saint Petersburg, across the northern portion of Eurasia, to Vladivostok on the Sea of Japan. India alone possesses 30,000 miles of railroads, and several trunk systems and many shorter steam and electric lines have been built in the Philippines, Japan, Turkey, and Turkestan. Many of the seaport cities have extensive and well improved harbors, but the foreign trade is handled largely by European vessels. Numerous telegraph and telephone lines have been constructed and modern municipal facilities have been introduced into the larger cities.

**HISTORY.** The history of Asia is recounted in the oldest historical documents, and that continent is generally regarded the cradle of

the human race. In Genesis is an account dating back to a period about 1,600 years before the Christian era, in which Moses details the biblical history of the creation of man, and gives a recital of the facts relating to the Deluge and to the establishment of the Mosaic code. Western Asia contains antiquities quite as old as those of Egypt, while authentic history in China is traced to a period fully 1,000 years before the Christian era. These early dates are more or less associated with the kingdoms of Egypt, Assyria, Media, Babylon, Persia, and Phoenicia. Not only do we trace the early seat of the Aryan race to the vicinity of the Amu or Oxus River, but we find in Asia the origin of practically all popular religions, including the Jewish, Christian, and Mohammedan. From Asia vast populations moved westward over Europe, distributing themselves more or less from the Caspian Sea to the British Isles, but in the long period of the Middle Ages little was known of the original seat of mankind.

With the modern rise of European civilization, and the spread of Christianity and education, we are brought in closer contact with the people of Asia. The natural desire to learn as much as possible of former development in the arts and sciences induced the scholars of modern times to explore the ruins of former states and the seat of ancient civilizations. With the invention of the steamboat came a new era of navigation and large armies were transported to the continent with the view of extending the trade of the leading nations of Europe. Although unwilling to cooperate in the new order of things the native races were unable to prevail against the improved implements of war and the superior discipline of the armies with which they were confronted. Thus, we find practically all parts of Asia overrun with Europeans in the eager strife for political and industrial advantage. This impetus of the newer and larger commercial life, though opposed by the native races, is developing the mines and forests as well as building up the higher educational arts. For further information, see special articles on the different countries, especially subheads *History* and *Description*.

**ASIA MINOR**, a peninsula at the western extremity of Asia, situated between the Black Sea and the Mediterranean, and forming a part of Asiatic Turkey. The area is about 220,000 square miles. The surface is an elevated plateau, with a narrow coast on the bordering seas. Among the chief mountain ranges are the Taurus and the Anti-Taurus, between which

are extensive and fertile valleys. There are many lakes, some of which are salt, but only few rivers of importance are within the region. The chief drainage is into the Black Sea by the Sakaria and the Kizil Irmak rivers, and by the Meander into the Grecian Archipelago, or Aeagean Sea. Most of the inhabitants are Turks, though there are a variety of races, and the total population is about 7,000,000.

The region included in Asia Minor was once the seat of many great cities linked closely with history. Anciently it was divided into Ionia, Lydia, Phrygia, Galatia, Caria, Bithynia, Pontus, Mysia, Paphlagonia, Lycia, Pisidia, Cilicia, Isauria, Cappadocia, and Pamphylia. Among its chief cities were Smyrna, Ephesus, and Troy, and there were fought some of the most renowned battles of the world. The coast regions and many valleys are fertile and are cultivated. Though the interior is arid, it yields nutritive grasses. Cereals, fruit, wine, minerals, timber, and domestic animals are the chief products. Angora, Smyrna, Scutari, and Erzerum are among the present cities of Asia Minor.

**ASP** (äsp), a species of snake native to Egypt and Libya, and distinguished for its venomous bite. It became well known in ancient times by the circumstance that Cleopatra chose the bite of an asp to accomplish her suicide. This species is quite similar to the cobra found in various parts of Arabia, but differs from it in having a narrower neck and some slight differences in color. The bite produces acute

pain in the first instance, and the poison is said to act so quickly that the application of an antidote is impossible. The Bible makes mention of the asp in Romans iii, 13.

**ASPARAGUS** (äs-pär'ä-güs), a perennial plant of the lily family, largely developed by cultivation, and now grown as an article of food. It is propagated in beds heavily mulched, the young shoots being the only portions eaten. These boiled and enriched with butter and seasoning are nutritious and healthful. This plant was ex-

ASPARAGUS.

and enriched with butter and seasoning are nutritious and healthful. This plant was ex-

tensively cultivated by the Greeks and Romans, but is found in a wild state in the warmer parts of Europe and Asia. It is grown extensively for market in the United States. The best yield of young shoots is obtained from plants at least three years old.

**ASPEN** (äs'pën), a species of poplar sometimes called trembling poplar on account of the highly tremulous motion of the leaves. It is native to the mountainous regions of both Europe and Asia. The wood is light, soft, white, and smooth, and is used chiefly to make troughs, pails, trays, and arrows. The tree usually is slender and rootstalks spring in large numbers at a considerable distance from the main stem. This species of tree is planted largely for ornament, but in many regions, as in the Mississippi valley, the tops die when the rootstalks begin to spring from the roots.

**ASPHALT** (äs'fält), a mineral pitch, so called from the name applied by the Greeks to the Dead Sea, where it was anciently obtained in considerable quantities. It is probably composed of decayed animal and vegetable substances, and belongs to the series of hydrocarbon compounds, which include petroleum and natural gas. The odor resembles that of pitch, the color is black or dark brown, and it is not soluble in water. It melts easily when heated and may be dissolved in ether or turpentine. The pure article burns without leaving ashes. It is artificially produced in making coal gas, but the article of commerce is taken from the beds of lakes. Asphalt occurs most abundantly in Cuba, California, Venezuela, Palestine, and various parts of Europe. However, the largest asphalt districts are in the northern parts of South America, in the regions lying west of Lake Trinidad. The product obtained there is used in manufacturing varnish and patent leather, and for street paving. In constructing pavements a limestone mixed with asphalt is used to some extent, but asphalt paving is made more largely of cement covered by coats of asphalt, put on at a temperature of from 275 to 300 degrees.

**ASPHODEL** (äs'fö-dël), a genus of plants found in Southern Europe and the countries bordering on the Mediterranean Sea. Two species, the yellow and the white asphodel, are cultivated as garden flowers. The former has a stem from two to three feet high, which is covered with long narrow leaves, and flowers late in the spring. In the white asphodel the flowers are in clusters. The genus is represented in England by the bog asphodel, which is the daffodil of English poets. Allied species

are found in the United States and the southern part of Canada.

**ASPHYXIA** (äs-fix'ĩ-à), a term used to signify a loss of pulsation resulting from an arrest of the function of respiration. This state may be produced by breathing gas destitute of oxygen, by submersion in water, strangulation, or suffocation, or by any cause that tends to prevent the breathing of pure air. Death results from asphyxia, if the person affected is not relieved in a very short time. Relief in a case of apparent death by this cause is often obtained by maintaining the heat of the body and inflating the lungs.

**ASPINWALL** (äs'pĩn-wal), or **Colón**. See **Colón**.

**ASPIRATE** (äs-pĩ-rât). See **Voice**.

**ASS** (äs), an animal of the horse family, but differing from the horse in being smaller, in having no hard, bony warts on the hind legs, and in its ears being longer. The hoof is smaller than that of the horse. It is thought to be an offspring from the wild ass of Abyssinia, because of its unwillingness to cross streams and its great fondness of rolling in loose soil. Asses are used more or less as beasts of burden and for draft purposes. A light, graceful breed is used in Syria by women for pleasure riding. In Arabia it is bred for the saddle, while in Damascus and other coun-

DOMESTIC ASS.

tries it is used for draft and plowing. It excels the horse on account of possessing better health in diversified climates and consumes a smaller quantity and coarser quality of food, and is superior as a beast of burden in mountainous districts, being safer on foot than any other domesticated animal. In some localities the flesh is valued as an article of food, and its skin is used in the manufacture of parch-

ment, drum covers, shoes, and for other purposes. The hybrid offspring of this animal and the female horse is known as the mule, which is a very valuable animal for many purposes, and is extensively reared in America. It is almost as large as the average horse. The mule is reared more extensively in the southern part of the United States than in the North.

**ASSAM** (äs-säm'), a province of British India, bounded by Bengal, Manipur, Burma, and China. The area is 52,057 square miles. It embraces the valley of the Brahmaputra and several tablelands and mountain districts. It has a heavy rainfall and a moderate climate, but in the southern part, near the lower course of the Brahmaputra, is an extensive region of swamps and jungles where the climate is unhealthful. The jungles are infested by tigers, leopards, elephants, rhinoceroses, and other wild animals. Rice is the chief product, but tea, cotton, and fruits are grown to a considerable extent. Iron, coal, and petroleum are the chief minerals. This section is populated largely by Hindus, most of whom are Brahmans, and about one-fifth of the people are Mohammedans. Schools and colleges are maintained and there is considerable Assamese literature. Assam has been a British possession since 1826. Sylhet, the largest town, has a population of 15,000. Shillong is the seat of government. Population, 1901, 6,122,201.

**ASSASSINATION** (äs-säs-sĩ-nã'shũn), the crime of murder committed treacherously, without immediate provocation, and usually without resistance from the person whom the assailant seeks to kill. The word originated from a secret military and religious society of Persia, founded by Hassan ben Sabbah in the 11th century, and those who are guilty of the crime are said to be *assassins*. A number of assassinations have been committed in all periods of history. In most cases perpetrators hope to further their ideas by causing the death of some public official, which is the case with anarchists and others who labor under illusionary hopes. Among the most noted assassinations during the last half century are the following:

Montenegro, Prince Daniel, killed Aug. 13, 1860.

United States, President Lincoln, shot April 14, 1865.

Servia, Prince Michael, killed June 10, 1868.

Turkey, Sultan Abdul Aziz, stabbed June 16, 1876.

Russia, Czar Alexander II., killed with dynamite March 13, 1881.

United States, President Garfield, shot July 2, 1881; died Sept. 19, 1881.

France, President Carnot, stabbed June 24, 1894.

Italy, King Humbert, shot July 29, 1900.

Uruguay, General Borda, killed Aug. 26, 1897.

Guatemala, President Barrios, killed Feb. 9, 1898.

Austria, Empress Elizabeth, stabbed Sept. 10, 1898.

United States, President McKinley, shot Sept. 6, 1901; died Sept. 14, 1901.

Servia, King Alexander I., shot June 11, 1903.

Russia, Katcheslav von Plehve, minister of the interior, assassinated in Saint Petersburg, by a Finn, July 28, 1904.

Russia, Grand Duke Sergius, killed by the explosion of a bomb near the Kremlin, Moscow, Feb. 17, 1905.

Russia, General Sakharoff, assassinated at Saratov, Dec. 5, 1905.

Portugal, King Carlos I. and Crown Prince Luiz, shot in Lisbon, Feb. 2, 1908.

**ASSASSINS** (äs-säs'sins), a secret military and religious society founded in Persia by Hassan Ben Sabbah, in 1090 A. D. The principal aim was the assassination of those not members of the society. It was most prosperous shortly after its organization, but later fully 12,000 were massacred for the purpose of exterminating the order. A few adherents still remain in India.

**ASSAULT AND BATTERY**, a misdemeanor punishable by fine or imprisonment. An assault consists of physical force partly or fully put in motion, contrary to law, as the act of pointing a loaded gun at a person, or raising a cane to strike some one. Battery consists of actually inflicting injury upon the person of another in an angry, spiteful, or insolent manner. It may consist of striking or constraining him, or in touching him in any way while angry. An assault is assumed when the offense of battery has been committed, hence, in law, it is customary to use the phrase *assault and battery*. The crime varies in degree according to the intents with which the offenses are committed. Thus, we have the simple assault, assault and battery, assault with intent to commit great bodily injury, and assault with intent to commit arson, robbery, murder, etc.

**ASSAYING** (äs-sä'ing), the art or process of subjecting coins, quantities of bullion, or alloys to examination and experiment for the purpose of ascertaining what proportion of each of the various metals they contain, as to find the amount of copper in a quantity of ore, or the amount of gold in a coin. The process of assaying depends upon the kind of metal or ore to be tested. In assaying ore containing

silver the apparatus employed is a *cupel* and a muffle, a kind of fire-clay oven. The ore is placed in the cupel, which is then put into the muffle, and is heated to such an extent that the ore is melted. Some parts of the ingredients are carried away by union of the oxygen in the air with lead, and the silver remains in the cupel in the form of a molten metallic globule. When all of the ingredients have been driven out, the silver lightens in color and becomes a brilliant white. When cooled, the silver is weighed, and the amount of pure metal determined. This process is called *cupellation*. When silver contains copper, it is necessary to mix lead with the alloy before attempting to separate the copper. Another process, called *humid*, consists of dissolving the compound containing the silver with a solution of nitric acid, and afterward adding a solution of common salt. The salt causes a precipitation of the chloride of silver into white globules or small lumps. When no further precipitation is obtained by adding the salt solution, the operation is concluded, and the quantity of silver is measured by the quantity of salt solution employed. The process of assaying, of course, depends upon the kind of metal or ore tested. A skilled assayer is able to form a fair estimate of the richness of the ore from the weight and color, but accurate knowledge can be obtained only by a careful chemical test.

**ASSEMBLY** (äs-sēm'blŷ), a convention or body of men gathered to deliberate, as a convention of a religious society or a political party. The legislative branch of many states of the United States is known as a General Assembly, as in New York, Iowa, and other states, while in New Jersey the lower house is known by that term. An unlawful assembly is a gathering of a number of persons, usually three or more, bent on aiding or performing an unlawful act.

**ASSIMILATION** (äs-sim-ĭ-lā'shŷn), a term used in physiology to designate the action of the vital organs whereby food, in the course of digestion, is modified in various ways and fitted for the use of the body, of which it finally becomes a part. The materials assimilated are brought by the blood in the capillaries to the cells, where the development of living tissues takes place. See Absorption.

**ASSINIBOIA** (äs-sin-ĭ-boi'ä), formerly a district in the southern part of the Dominion of Canada, but divided in 1905 and made a part of the two provinces of Alberta and Saskatchewan. See Alberta, Saskatchewan.

**ASSINIBOIN** (äs-sin'ĭ-boin), a tribe of Indians, so named because they dropped hot

stones into water to heat it. This tribe formerly occupied the region between the Missouri and Saskatchewan rivers, on both sides of the boundary of Canada, but these Indians are now on reservations in Montana and Canada. They seceded from the Sioux and speak a dialect of the Sioux language. The total number of Assiniboin is 2,670, about half of whom are in Canada, and the balance are at Fort Peck and Fort Belknap, Mont.

**ASSINIBOINE** (äs-sin'i-boin), a river in Canada; formed in Macdonald County, Manitoba, by the junction of the Mouse or Souris and the Qu'Appelle. From the head water of the latter to its junction with the Red River of the North, at Winnipeg, it has a length of about 475 miles. The river is so named from the Assiniboin Indians, who formerly inhabited the region through which it flows.

**ASSISI** (äs-së'zë), a small town of Italy, in the province of Umbria, fourteen miles east of Perugia. It is noted as the birthplace of Saint Francis, the founder of the Franciscan Order of Monks, and his remains are in the first monastery of this order built in Assisi. The town is visited by many pilgrims every year. It is a beautiful place, surrounded by olive groves, and is the seat of several churches and twelve monasteries. The commune, in 1901, had a population of 17,378.

**ASSOCIATED PRESS** (äs-sö-shi-ä'tëd), an organization founded for the purpose of collecting and distributing news. The first association for this purpose was formed in 1849 by the owners of several New York newspapers, among them the *Herald*, *World*, *Times*, *Sun*, *Tribune*, and *Express*. Since then other associations of the kind have been organized. The object is to systematize the gathering of news by sending correspondents to different sections of the country, or even to foreign countries, by employing cable and telegraph lines and by utilizing any other means for the rapid accumulation and distribution of news. These associations not only use the news themselves, but sell all or certain classes of news in different parts of the world for use in making up daily and weekly periodicals. The Associated Press is now the largest association of the kind in America. It controls over 30,000 miles of telegraph wire and several cable lines, and is in touch with news centers in all parts of the world. The cost of the service is about \$150,000 each month, and over 2,000 newspapers, published in the region from Maine to California, are furnished news daily from time to time. To facilitate the transmission of news,

it is divided into Eastern, Southern, Central, and Western branches.

**ASSOCIATION** (äs-sö-si-ä'shün), in psychology, the mental process by which the mind unites objects or ideas in thought so that one tends to recall the other, especially in matters relating to memory. For example, in coming to a place where some important event occurred, or something unusual happened, the sight of the place is certain to recall the occurrence. Again, two objects long associated together, when separated, one suggests the other much more easily than if it had been associated with several different objects. This may be illustrated by the habit of a person who is accustomed to wear a coat of a peculiar color; such a coat seen under different circumstances is much more liable to suggest that person than if similar coats were worn by a large number of persons. Psychologists have formulated certain primary laws of suggestions, which, if understood by the teacher, can be made highly serviceable in the instruction of pupils. By means of a knowledge of these laws, the mind may be led from things known to a wider field through association of similar objects, or a contrast of dissimilar objects. These primary laws include similarity, under which a precept tends to suggest the concept of something like it; contrast, by which a mansion may suggest a cottage; continuity of time or place, as objects associated in time or place suggest each other; cause and effect, which tend to suggest that a certain instrument caused a wound. Under the same law the sight of a weapon suggests its danger.

**ASSUAN** (äs-swän'), a town in Egypt, located on the Nile, near the boundary of Nubia. It is about two miles below the first cataract, and is important as a station for the caravan trade with the Sudan. Near it is the great dam built across the Nile by the British government, and it has railway connection with Alexandria and other commercial centers of Egypt. In its vicinity are granite quarries and the ruins of a town built by the Saracens. Population, 10,000.

**ASSUS** (äs'sus), or *Assos*, anciently a city and seaport of Asia Minor, on the Gulf of Adramyttium. It was built by the Greeks and in its vicinity are ruins of a theater and several temples. It remained important as a shipping point up to the beginning of the Christian era. In Acts xx., 13, it is related that both Saint Paul and Saint Peter visited Assus on their way from Troas to Mitylene.

**ASSYRIA** (äs-sir'i-a), an ancient country of Asia, in Mesopotamia. The boundary on

the north was formed by the highlands of Armenia, east by Media, south by Susiana and Babylonia, and west by the Tigris. It is thought that the larger part of the valley of the Euphrates was included, but the country cannot be accurately separated from Babylonia either in the light of history or geography. The history of these two nations seems closely intertwined, and to measure the power of one is to know the weakness of the other. However, each has a history common to itself. Assyria was known to the Hebrews as Asshur and to the Persians as Athurd. The region included in Assyria is thought to have had a length of about 380 miles, a breadth of 250 miles, and an area of not less than 100,000 square miles. It is known to have possessed one of the oldest

ASSYRIAN GOD NINIP.

civilizations, an extensive literature, and considerable advancement in the arts and sciences. A decipherment of the cuneiform documents, inscriptions that contain much valuable information, has added materially to the knowledge of this interesting and ancient people. Besides, by the discovery of certain fragments of literature, that lay buried underneath rubbish and ashes until the middle of the last century, and by locating the site of many of the larger cities, the knowledge of this nation has been generally widened. In the Bible we are told that Nineveh, the capital city, was founded by Asshur of Babylonia, and it is probable that Assyria became powerful long after Babylonia had risen to the dignity of a mighty empire.

Assyria and Babylonia were interdependent, and the early rulers of the former were appointed by the kings of Babylonia. After many years Assyria became independent, and by the year 1320 B. C. attained much power. The first empire was founded about 1140 B. C. by Tiglath-Pileser I., and under his reign Assyria expanded its dominion over Western Asia. He was succeeded by his son, who proved an in-

competent ruler, and two centuries later Assyria was in a state of decadence. At the time of the decline of Assyria, the Hebrew kingdom developed power under David and Solomon, but in the year 930 B. C. it again grew to importance. With the ascension of Shalmaneser II., in 858 B. C., the empire reestablished its dominion over Western Asia. This king reigned for thirty years and fought against the kings of Damascus, Hamath, and Israel. A Babylonian named Pul usurped the throne in 745 B. C. and assumed the Assyrian name Tiglath-Pileser II. However, a successful revolt occurred under Sargon, a great general of Assyria, who carried 27,000 Babylonian citizens into captivity. Later his son Sennacherib conquered Judaea and besieged Jerusalem, where a pestilence destroyed his army and saved the city from being captured. In 681 B. C. Esar-Haddon organized great military forces, effected internal improvements, made Assyria a powerful empire, and brought under its dominion, not only Western Asia, but Egypt and large portions of Northern Africa. This monarch reigned thirteen years and was followed by three others, the last of whom was known as Sarakos, whose reign terminated in seven years with the fall of Nineveh in 606 B. C., when it was captured by the allied army of the Medes and Babylonians.

Assyria was far advanced in industry, art, and civilization. In its cities were many large buildings and palaces constructed of brick, alabaster, and stone. The interior of many of these structures contained exquisite sculptures, principally figures in relief. They consisted chiefly of scenes of war and of the chase, besides other favorite subjects. It is evident from literature and ruins that have been uncovered that the Assyrians understood the construction of arches, tunnels, drains, and aqueducts, and the use of the lever, the roller, and the pulley. They engaged in the manufacture of various ornamental figures and articles of household utility, such as jars and dishes of metal, porcelain, and glass. They were acquainted with the lens, practiced the arts of inlaying and enameling, designed ornaments of ivory, bronze, gold, and silver with marked skill, and displayed a rare taste in designing and making household furniture. To the Assyrians is ascribed considerable knowledge in astronomy, since they made star charts, divided the year into twelve months, naming them after the signs of the zodiac, and divided the week into seven days, observing the seventh as a day of rest. Records were kept of the eclipses of the sun and moon, which they learned to foretell with considerable accuracy, and there

is evidence that they studied the transits of stars. An astronomical work, entitled "The Illumination of the Bell," is an Assyrian publication, copies of which are now in several European museums, and in which are treated the motions of Mars and Mercury, the north polar star, the phases of the moon, the conjunction of the sun and moon, and several planets observed anciently. A department of knowledge termed *Assyriology* relates to the modern study of Assyrian antiquities. Formerly our fund of knowledge in relation to Assyrian history was based largely upon Jewish records and the writings of Herodotus, but since 1842 many extensive explorations and excavations of ancient ruins have added material of considerable extent and value.

That the Assyrians possessed an extensive literature is evidenced by various explorations of their ruined cities and excavations leading to a restoration of numerous sculptures and monuments. The most important objects of discovery were several palaces, including the palace of Assurbanipal at Nineveh, where the remains of a large library were found. The contents included numerous tablets, text-books—some of these relating to mathematics, zoölogy, and astronomy—and various devices for representing geographical and astronomical phenomena. The literature included many poetic productions and extensive and interesting mythological writings. There were included descriptive works in geography, botany, history, architecture, chemistry, and various other lines of study, though in some of the theories held a marked similarity was shown to those entertained by other ancient nations. This circumstance is evidenced by the story of a flood represented to have destroyed all forms of life, the description being quite similar to that of the flood mentioned in the Scriptures, and they possessed a history of the creation quite like that described in Genesis. Though many of the writings were produced in the reign of Assurbanipal, about 650 B. C., many seem to date from an earlier period.

**ASTER** (äs'tēr), a genus of plants of the *Compositae* order, so called from the close resemblance of the expanding leaves to a star. These plants are native to America and Eurasia. Many species have been developed under a long line of cultivation, some including beautiful flowering forms. The flowers are greatly variegated in color, including purple, white, blue, yellow, and reddish, and from their tendency to flower late in the season, together with their resemblance to the daisy, they are frequently called Christmas daisies. Though

several American species are counted among the finest, the China aster, a double flowering species, is generally admired as the most beautiful and showy.

**ASTEROID** (äs'tēr-oid), or **Planetoid**, the name of any individual of a great group of small planets known to exist between the orbits of Mars and Jupiter. Their origin is thought to be due to the influence of gravity exercised by Jupiter in the early formative stage, by which the formation of a separate planet was prevented according to the general principles of the evolution of planets, and as a result a large number of small bodies were composed of the existing materials. The asteroids are not evenly distributed, but occupy a position at irregular intervals, either separately or in groups. Bode's law, which indicates that a large planet should lie between Mars and Jupiter, led to an association of twenty-four astronomers in 1800, whose object was to search for the missing body. The first discovery was made by Guiseppe Piazzi (1746-1826) of Sicily in January, 1801, when he located an asteroid which he named Ceres. Three others, named Pallas, Juno, and Vesta, were discovered in 1807. A fifth was discovered in 1845, and since 1847 new bodies have been found almost every year, the whole number now being placed at about 500. They revolve around the sun at a distance of from 200,000,000 to 300,000,000 miles. Their total mass is equal to about one-fourth the mass of the earth. The asteroid Flora revolves around the sun once every 1,191 days and Hilda completes one revolution in 2,868 days, and the length of the year of the others is between these extremes.

**ASTHMA** (äz'mä), a disease characterized by shortness of breath, and whose effects are spasmodic after intervals of comparatively good health. In common asthma the lining membrane of the air passage is affected somewhat similarly to the affections experienced in chronic bronchitis, but the affection of the mucous membrane is seated farther down in the bronchial tubes and lungs. Chronic asthma, though disagreeable and weakening, seldom shortens life. Asthma is most common among persons advanced in years, and frequently affects those of a nervous temperament. It is more common among men than women and frequently follows attacks of measles and bronchitis.

**ASTIGMATISM** (ä-stig'mä-tiz'm), a defect in eyesight, which arises from the defective structure or malformation of the eye. It results in defective vision by inclining the affected individual to fail to see objects in the

same place, though they really may be so. This is due to the rays of light converging to a point on the retina, thereby forming a line of light instead of a circular apparition. It can be remedied by the use of glasses.

**ASTORIA** (ăs-tō'ri-ă), a port city of Oregon, county seat of Clatsop County, on the Columbia River, seventy miles northwest of Portland. It is situated on the Astoria and Columbia River Railroad, has an excellent harbor, and is surrounded by a cereal and fruit-growing country. The industries include a large trade in lumber, salmon packing, and manufactures of furniture, clothing, machinery, and earthenware. It has several excellent public school buildings, a fine county courthouse, a public library, a United States custom house, and a hospital. Electric lights, pavements, telephones, waterworks, and sewerage are among the facilities. Astoria was founded by John Jacob Astor in 1811 and was chartered as a city in 1876. Population, 1900, 8,381.

**ASTRAKHAN** (ăs-tră-kăn'), a city of Russia, capital of a government of the same name, situated on an island at the mouth of the Volga, about twenty miles from the Caspian Sea, on which it is the principal Russian seaport. It has traffic connections by railroads and steamboat lines, electric street railways, and numerous schools, hospitals, and churches. The city has extensive stockyards, engages largely in manufacturing, and is important as a commercial city. Among the chief manufactures are clothing, machinery, cured meat, and canned fish. Salt is obtained in large quantities in the marshes of the steppes, near the city. Population, 1907, 121,580.

**ASTRINGENT** (ăs-trīn'jēt), in medicine, an agent which causes contraction in the organic tissues and canals of the body, and used to check discharges and excessive purging. The astringents include both vegetable and animal substances. Vegetable astringents used commonly are derived from blackberry root, kino, oak bark, rhatany, and logwood. The chief mineral astringents are nitrate of silver, acetate of lead, alum, carbonate of lime, and the sulphate and chloride of iron.

**ASTROLOGY** (ăs-trōl'ō-jy), a term meaning originally the knowledge of the stars, but later limited to the practice of predicting future events from the position of the heavenly bodies. In ancient times the practice of undertaking to foretell the fortunes of men and nations was looked upon as a real science, while the mere knowledge of the fixed stars and the planets, and of their motion and volume, was considered secondary. Astrology was one of the most ex-

tensive forms of ancient superstition, and had a wide foothold at the dawn of early history among the Egyptians, Chaldaeans, Hindus, Chinese, and other people of Asia and Africa. From the East this superstition spread to Western Asia and Europe, and became firmly lodged at Rome at the beginning of the Christian era. Old writings cannot be well understood without a knowledge of astrology, while the Bible contains many allusions to this so-called science. The utter fallacy and worthlessness of this study or science was not discovered until some advancement had been made in astronomy. By the so-called "viewers of the heavens" the successes or misfortunes of a nation were predicted, this depending upon the signs that prevailed at the time of its founding, and the temperament of a child was designated from the planet under which it was born, as jovial from Jupiter. The medicinal virtue of herbs was supposed to be due to their ruling planets, and phases of the moon were taken as the index of the future greatness of a newborn child. In some countries almanacs are still published that contain astrological predictions, though the "science" has fallen into disrepute, and the authors themselves do not believe in them.

**ASTRONOMY** (ăs-trōn'ō-my), the science which investigates the distances, magnitudes, motions, and various other phenomena of the heavenly bodies. While the parent of all the sciences, it is truly the most perfect and beautiful. Besides, it is a science both old and ancestral, coming with resistless progress from shepherds of the Orient watching their flocks by night, thence passing to the rulers of ancient empires and the giants of modern thought until to-day it has attained a state which combines the beauty of poetry and the exactness of geometry. It has caused the civilized world to be dotted with observatories in which a great variety of instruments are utilized for weighing, measuring, and studying the celestial bodies, each striving for new discoveries and greater knowledge of the infinite space that surrounds us.

The ancient nations, including Assyria, China, Hindu, Egypt, Chaldaea, and Greece, had made material progress in studying this science long before the Christian era. A law of China required the astronomer to foretell eclipses under penalty of death. The Chinese thought that the eclipse represented a great monster, in deadly conflict with the sun, and to drive him off it was necessary to employ the gong and other instruments to frighten him away. Thales, a Grecian astronomer of 640 B. C., is regarded the early founder of the science, since he was

among the first to teach that the earth is a sphere, and gave valuable aid to navigation by pointing out that the Lesser Bear is a better guide upon the sea than the Great Bear. In the year 500 B. C. Pythagoras taught that the sun is the center of the universe, around which the earth circulates. By demonstrations he made it clear that a morning and an evening star may be the same body, the difference being due to a change of position. The history of astronomy proper begins with Hipparchus, who lived in the 2d century B. C. His observations enabled him to make a chart of the heavenly bodies, which included 1,081 stars. He was succeeded by Ptolemy in the 2d century A. D., who published a book called the "Almagest," in which the Ptolemaic system was explained. He erroneously taught that the earth is the center of the universe and that the heavens revolved around it, each period of revolution occupying twenty-four hours.

Copernicus in the 16th century disproved the teaching of Ptolemy, and held that many of the theories of Pythagoras are true. His system places the sun as the center of the universe, from which the planets receive light and heat in their revolution around it. At that time his discovery could not be clearly demonstrated, and for this reason it was not generally accepted. Later Kepler announced his famous laws, and Galileo studied the heavens with a telescope. Newton won fame and added the greatest assistance to promulgate scientific study by the discovery of gravitation. By means of this discovery it became possible to account for the revolutions of the planets and satellites, and to assign a cause for their occupying exact positions in space. The satellites of Jupiter and the rings of Saturn were observed by Laplace, who also gave much valuable assistance by the publication of many works of merit. Since that time, especially during the latter part of the last century, divers notable discoveries have been made through the medium of improved instruments.

Astronomy is a very useful science, since a knowledge of the natural phenomena governing the sun, planets, and stars has made it possible to fix disputed dates of ancient battles and of the reigns of kings. It has enabled us to establish definitely the exact length of the units of time requisite for the calendar, and has aided in navigation by making it possible to guide ships from port to port at a smaller cost and a material saving of human life. Astronomy has given us a knowledge of the exact size of the earth, thereby enabling us to make accurate maps of the continents and oceans,

and it is of material value in general surveying. It has enabled us to determine the exact units of time, which has made it possible to construct clocks and watches with such a degree of exactness that we may be guided by them without error in all parts of the earth.

Astronomy is interested chiefly in a consideration of the earth, sun, moon, satellites, planets, comets, meteors, and fixed stars. It teaches that the sun is the center of the universe, from which all other bodies in our solar system receive light and heat, as they revolve around it in regular orbits under the laws of gravitation. There are eight so-called planets, including Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune, the first two having their orbits within that of the earth, and the last five having orbits larger than that of our planet, and to these Vulcan, a supposed inferior planet, is sometimes added. Various symbols are used to express in an abbreviated form certain astronomical terms and the names of the sun, satellites, and planets. Below is a list of the more important symbols:

- |                            |                         |
|----------------------------|-------------------------|
| ☉ = The sun.               | ♊ = The ascending node. |
| ☾ = The moon.              | ☿ = Mercury.            |
| ● = The new moon.          | ♀ = Venus.              |
| ○ = The full moon.         | ⊕ = The earth.          |
| ♌ = Conjunction.           | ♂ = Mars.               |
| ☽ = Quadrature, or differ- | ♃ = Jupiter.            |
| ing 90°.                   | ♄ = Saturn.             |
| ♁ = Opposition, or differ- | ♅ = Uranus.             |

With the invention of elaborate instruments and the construction of gigantic observatories, great strides of advancement have been made, both in the discovery of heavenly bodies and in their measurements and analysis. This has caused astronomy to be divided into several branches. Astronomical geography treats of the earth, and uranography of the heavens. The study of the fixed stars is called sidereal astronomy. Physical astronomy not only investigates, but accounts for the facts observed.

Several observatories have been giving considerable attention to the study of sun spots. The authentic records of meteorological research do not extend back more than about fifty years, and in the study of solar phenomena the investigator is still more restricted. There is no record of solar prominences earlier than 1872. The largest sun spot has a diameter of 70,000 miles, and two other large spots have each a diameter of 40,000 miles. It has been found that the spots vary periodically in size, the cycle being 11.1 years, and there is also a marked variance in the number of spots visible at different times. When examined through a telescope spots appear like large irregular holes in the surface of the sun, and it is rea-

sonably certain that they are cavities and not elevations. The sloping sides, when seen through a large telescope, seem to be made up of white filaments, while the central part resembles a great flame ending in fiery spires. It cannot be doubted that these solar phenomena have an influence on terrestrial life, but science has yet to discover their effect and purpose. See **Earth, Sun, Asteroids, Moon, Jupiter, Satellites**, etc.

**ASUNCION** (ä-söön-sê-ôn'), the capital and most important city of Paraguay, on the Paraguay River, 645 miles north of Buenos Ayres. It is the converging center of several railroads, and has a number of fine public buildings and modern municipal improvements. A college, the custom house, a hospital, a cathedral, and the national capitol are among the chief buildings. It has an important trade by steamship navigation on the Paraguay River and by railroads with the interior. The manufactures include clothing, machinery, tobacco, and textiles. Among the chief articles of commerce are cereals, lumber, hides, tea, coffee, and fruits. It was founded on Assumption day in 1536, hence its name, and in 1869 was occupied by a Brazilian army. Population, 1905, 60,259.

**ATACAMA** (ä-tä-kä'mä), a vast desert region on the west coast of South America, belonging to Chile. It is rich in gold, silver, iron, nickel, copper, lead, and cobalt mines, and there are deposits of guano on the coast. The district has an area of about 66,000 square miles. The occupation of this region has caused some contention between Chile and Bolivia, from which several wars have resulted. Formerly it belonged to Bolivia, but it was ceded to Chile in 1884. The area is about 28,500 square miles.

**ATCHAFALAYA** (äch-af-a-lí'a), the name of a river and bayou in Louisiana, serving as a secondary channel of the Mississippi. It is connected with the Mississippi near the mouth of the Red River, and after a course of 225 miles toward the south enters the Gulf of Mexico by Atchafalaya Bay, 120 miles west of the main outlet of the Mississippi. Some geographers assert that the Atchafalaya constitutes the old bed of the Red River, its name signifying lost river.

**ATCHISON** (äch'i-son), a city in Kansas, county seat of Atchison County, on the Missouri River, forty-eight miles north of Kansas City. It is on the Missouri Pacific, the Chicago, Burlington and Quincy, and other railroads, has steamboat connections with Mississippi River and Gulf ports, and enjoys a large com-

mercial trade. The manufactures include flour, machinery, hardware, clothing, tobacco products, and earthenware. It is the seat of the State Soldiers' Orphans' Home. Besides an excellent public school system, it has several colleges and private schools. Electric lights and street railways, waterworks, pavements, several libraries, and a public park are among the utilities. The city has a fine county courthouse and other substantial buildings. The first settlement in its vicinity was made in 1854 and it was incorporated in 1858. Population, 1904, 16,925.

**ATHABASCA** (äth'a-bäs-kä), formerly a district of Canada, but in 1905 divided and made a part of the two provinces of Alberta and Saskatchewan. See **Alberta, Saskatchewan**.

**ATHABASCA**, or **Elk**, a river in Canada, rises in the Rocky Mountains, near Mount Brown, and has a length of 630 miles. The general course is toward the northeast until it reaches Fort McMurray, where it receives the Clearwater River, and thence flows north and passes through the west end of Lake Athabasca. About 35 miles beyond Lake Athabasca, which is sometimes called the Rocher River, it unites with the Peace River to form the Slave River.

**ATHABASCA LAKE**, a large body of fresh water in the Dominion of Canada, situated in the northern part of Alberta and Saskatchewan. The length from southwest to northeast is 200 miles and the breadth is about 30 miles. Surrounding the lake is a timbered country, mostly of poplar, fir, and spruce. It receives the water from the Athabasca River and by that stream, or the Rocher River, discharges through the Slave River into Great Slave Lake.

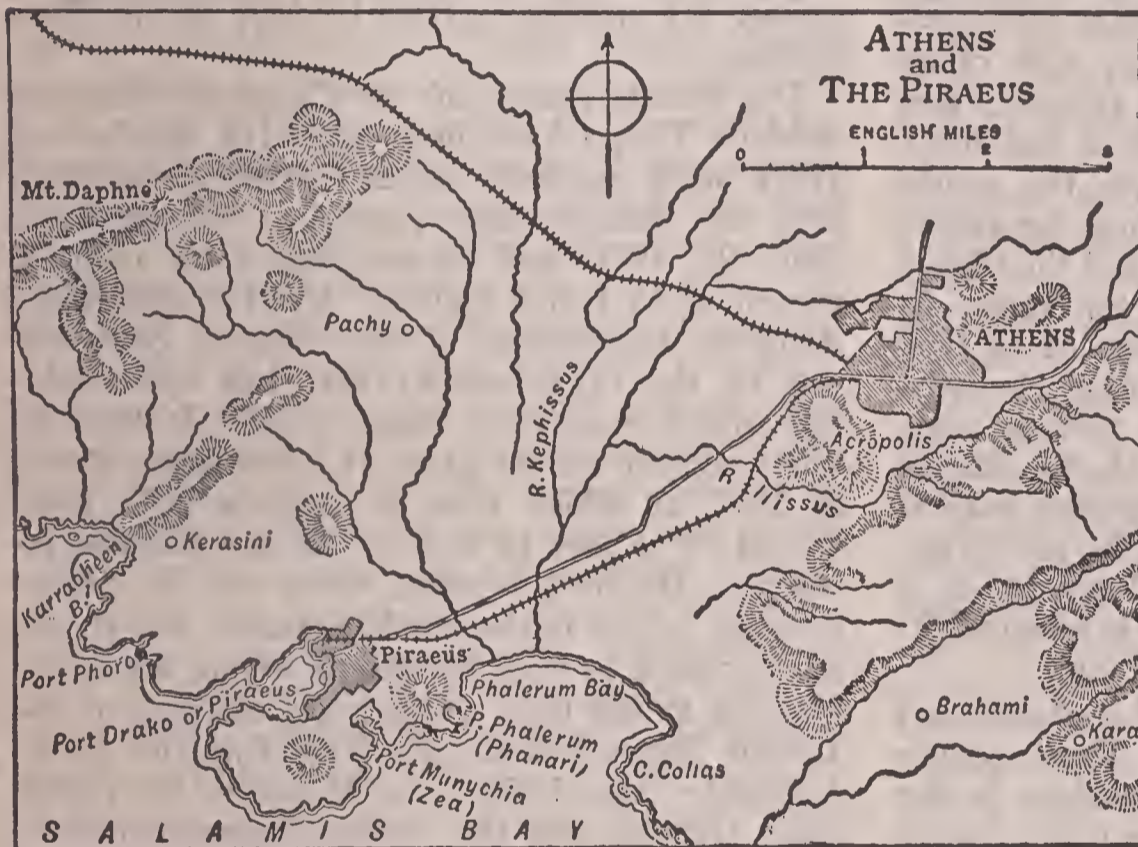

**ATHEISM** (ä'thê-iz'm), the doctrine that disbelieves or denies the existence of God. Among the Greeks and other ancient people atheism consisted of a denial, or nonrecognition, of the gods of the state. Some writers have doubted whether there ever were any atheists, since the doctrine of atheism is contrary to the instincts of man.

**ATHENS** (äth'ënz), a city in Georgia, county seat of Clark County, on the Oconee River, and on the Central of Georgia, the Southern, and the Seaboard Air Line railroads. It is surrounded by an agricultural and fruit-growing country and has a large trade in cotton and merchandise. The manufactures include flour, paper, ironware, cotton goods, tobacco products, and machinery. Besides having a fine public school system, it is the seat

of the Lucy Cobb Institute, the State Normal School, the University of Georgia, and the State College of Agriculture. Electric lights, street railways, pavements, several libraries, and a fine county courthouse are among the improvements. Athens was founded in 1800 as the seat of the State University. Population, 1900, 10,245.

**ATHENS**, the capital of ancient Attica, the center of Greek culture, now the capital of the kingdom of Greece. It is situated in the Plains of Attica, four miles from the Saronic Gulf, a branch of the Aegean Sea, and about an equal distance from the port town of Piraeus. The city is built around a central rocky height, called the Acropolis, an elevation about 300 feet high, and rising 600 feet above the Mediterranean. Around

it are grouped the Areopagus, or the Hill of Mars; the Manseion, or the Hill of the Muses; the hill of the Nymphs; and the Hill of Pnyx. The Plains of Attica are bounded by hills, through which flow the Ilissus and the Cephissus rivers. According to tradition the city was founded in 1550 B. C. by Cecrops, a mythical hero, and was originally named Cecropia, but the name was afterward changed to Athens in honor of the goddess Athena. King Theseus, a mythical king, was an incentive to the building of the ancient city, while the great Solon made it famous for its democratic government and led to the erection of many magnificent buildings, among them the Temple of Zeus, known as the Olympium, of which ruins still remain.

When Europe was overrun by the Persians,

the city was burnt, but, after the victories of Salamis and Plataea, Athenian ascendancy caused it to be rebuilt in great splendor. In the days of Themistocles were built the walls surrounding the Acropolis and many massive towers and gates, and the city was inclosed with impregnable walls. Its greatest glory was attained in the time of Pericles, when it was beautified by splendid architecture and sculpture. Important schools of history, philosophy, and poetry flourished in the time of Herodotus, Socrates, and Simonides. This period witnessed the construction of its beautiful monuments and public buildings, among them the Parthenon.

The decline of Athens began with the close of the Peloponnesian wars. At that period its walls were destroyed, many beautiful structures demolished, and, worst

of all, the spirit of Grecian ambition broken. True, Demosthenes and Lycurgus still defended the freedom of the city and constructed amphitheaters for the entertainment of thousands of people, but the spirit of her greatness was largely lost. When Athens became a part of Macedonia, it continued to be the seat of philosophy and rhetoric, and, when conquered by Rome in 146 B. C., it became the teacher of that great nation. It enjoyed periods of prosperity and depression successively on account of its conquest by the Romans, Goths, Christians, and Turks. Greece was freed from Turkish dominion in 1833,

since which time it has been a kingdom with its seat of government at Athens.

Modern Athens is alike prosperous in its industries and material growth, and in the development of the arts, sciences, and general education. The National University, founded in 1837, is attended by about 3,000 students, and is equipped with extensive laboratories and a library of 225,000 volumes. It is the seat of the National Museum, located in the Polytechnic School, and of schools for the study of antiquities under the direction of French, English, American, and German societies. Chief among the public buildings is the royal palace, constructed in the modern Greek style and decorated with fine paintings and frescoes. The city is traversed by electric street cars, both urban and interurban, and has railroad connec-

tion with the principal cities of Greece. Municipal systems of gas and electric plants and public waterworks, which include the ancient aqueduct of Hadrian, and other public facilities, are maintained. It is the financial center of the nation, the seat of its art and learning, and does not engage extensively in manufacturing enterprises. Those maintained are operated by private companies and make clothing, chemicals, musical instruments, earthenware, and spirituous liquors. Trade is chiefly in silk textiles, rugs, wearing apparel, and cereals used in domestic consumption. Population, 1906, 170,125.

**ATHLETICS** (ăth-lět'iks), the general name applied to a large variety of sports which are recognized as contests of physical skill, or are played for the purpose of developing physical strength. In a wider sense, the term embraces polo, baseball, basketball, lacrosse, and other games that are played extensively as sports and for profit. The term athletics in a narrower sense is applied more generally to the sports which hold a prominent place among the games played by students in the schools and the higher institutions of learning. Those who engage in athletics for pay are usually spoken of as *professionals*, while all others, including the athletes of schools and colleges, are termed *amateurs*. Indeed, it is the object of the educational institutions to encourage athletics only in the line played by *amateurs*, since the sports are intended especially for the development of a degree of physical strength which is essential in the educational growth of the student.

The games recommended for the educational institutions are very numerous. They include those that are fitted for the gymnasium in the winter and for the campus and the green sward in autumn and spring. Another distinction is made in regard to the sexes, the games for both male and female being numerous and well understood. In most institutions the various games are promoted by organizations, frequently including one or more complete teams. The most skillful team is constituted of the best players, who are selected after competitive tests have been made, and it devolves upon this team to play competitive games with the select teams of other schools and colleges. The members of the select team have the benefit of training by the coach, who strives to bring out the greatest possible skill with the least necessary expenditure of energy. In most cases suitable clothing or specially designed suits are worn in the competitive games. The suits depend upon the game to be played, but usually include a light leather shoe, tight stockings,

knee pants of light cloth, and a loose fitting shirt or waist.

The popular sports that belong essentially to athletics are classified as those of the *field* and those of the *track*. These terms have reference to a circular track and the inner field inclosed by the same. Among the *field events* are hurdling, pole vaulting, broad jumping, high jumping, hammer throwing, and discus throwing. The *track events* consist of sprinting, including sprints from fifty yards to 440 yards for short distances and from a half mile to two miles for long distances. The rules for playing are extensive and vary somewhat according to the age and experience of the players. Several competitive games are played each year by the unions and associations of school and college athletes. The national and intercollegiate games are usually played in May or in September.

The annual games of the Canadian Amateur Athletic Union have been played a number of years with marked success. This association held its championship games at Montreal on Sept. 21, 1907, and in the pole vault made a record of 11 feet 5 inches. The Intercollegiate Athletic Association of the United States is one of the organizations that has been holding annual games for many years. It held its thirty-second annual game at Cambridge, Mass., in 1907, at which time it made a pole vault record of 11 feet 11 inches. At the same meeting the 112-yard hurdles were run in fifteen seconds, which is the world's record, but it was not accepted as such because a strong wind was blowing at the time. Other associations of the United States include the New England Intercollegiate Association, the Western Intercollegiate Games, and the National Amateur Athletic Union.

**ATHOL** (ăth'öl), a town of Massachusetts, in Worcester County, 22 miles west of Fitchburg. It has railroad and suburban electric railway facilities, and is a manufacturing center of furniture, utensils, clothing, and cotton goods. A high school and several fine churches are among the public buildings. It was known as Pequig until 1762, when it was incorporated under its present name. Population, 1900, 7,061.

**ATHOS** (ăth'ös), a mountainous peninsula of Turkey in Europe, the most easterly of the three peninsulas projecting into the northwestern part of the Aegean Sea. It is from five to seven miles wide, thirty miles long, and at its extremity is Mount Athos or Holy Mountain, rising 6,350 feet above the sea. When Xerxes invaded Greece, he cut a channel across the north end of the peninsula to avoid the

dangers of sailing around Mount Athos. There are several famous monasteries at Mount Athos, some dating from the time of Constantine, and they are occupied by about 7,000 monks. The occupants engage largely in gardening, fishing, bee-keeping, and the manufacture of rosaries, amulets, crucifixes, images, and furniture. The monasteries have valuable libraries containing considerable treasures in literature and manuscripts. All the monasteries are associated with the Greek Church.

**ATITLAN** (ä-tē-tlän'), a lake of Central America, in Guatemala, probably formed by the crater of an ancient volcano. It is ten miles wide, twenty miles long, and of considerable depth. Though several small streams flow into it, there is no visible outlet to the sea. Near the lake is Mount Atitlan, an active volcano, 12,160 feet high.

**ATLANTA** (ät-län'tä), the capital of Georgia, county seat of Fulton County, familiarly called the "Gate City to the South." It is situated in the northwestern part of the State, about 100 miles northwest of Macon, and it is the focus of a network of railroads that furnish transportation facilities to many points north and south, including the Southern, the Seaboard Air Line, the Western and Atlantic, the Central of Georgia, and a number of others. The city is platted in the form of a circle, with an area of about 12 square miles, and is the largest and most important commercial center of the State. Many of the streets are paved with stone and asphaltum, and avenues of trees ornament the residential centers. Piedmont Park, the site of the Atlanta Exposition in 1895, is a beautiful and interesting tract of land. Several memorial buildings and monuments, including one erected to the memory of H. W. Grady, adorn public places. Electric street railways traverse the principal thoroughfares, and interurban lines furnish facilities to reach many points in the vicinity. Grant Park is popular as a place of recreation. Fort McPherson, four miles distant, is a government army post.

As an educational center Atlanta takes high rank, being the seat of numerous societies and educational institutions. Atlanta University, Atlanta Baptist College, Clark University, Gammon Theological Seminary, Morris Brown College, and a number of professional and business colleges are among the educational institutions. It is the seat of the Georgia School of Technology, a branch of the State University at Athens. A Carnegie library and the State library have collections of well-selected books and documents. The Grady Hospital, the Pres-

byterian Hospital, a Florence Crittenden home, an orphan asylum, and other charitable institutions are maintained. The State capitol, built of limestone and decorated with Georgia marble, cost about \$1,000,000. Other public buildings include the custom house, the county courthouse, the city hall, a Federal prison, a fine union passenger station, and many modern business blocks. The manufactures are extensive and consist chiefly of cotton goods cotton-seed oil and cake, earthenware, machinery, hardware, cigars, and farming implements. A large export trade is carried in live stock, especially horses and mules, and in cotton and raw and manufactured tobacco.

The first settlement on the site of Atlanta was made in 1836, but it was some time before many business establishments located here. In 1843 it was incorporated as Marthasville and two years later the name as changed to Atlanta. In 1861, at the beginning of the Civil War, the population was about 11,000. The Confederates fortified it strongly and held it until 1864, when it was captured by General Sherman and nearly destroyed by fire. Soon after the close of the war it began to rebuild, and its growth and development have been constant since that time. It was made the capital of the State in 1878. Conveniently located, having numerous substantial institutions, and being the center of a large trade, its future prosperity is assured. Population, 1910, 154,839.

**ATLANTIC** (ät-län'tik), a city in Iowa, county seat of Cass County, on the East Nishnabotna River, and on the Chicago, Rock Island and Pacific Railroad. It is surrounded by a fertile farming and dairying country, and has manufactures of canned goods, ironware, and machinery. Among the chief buildings are the county courthouse, the high school, and several churches. It has electric lights, sewerage, and waterworks. Atlantic was incorporated in 1869. Population, 1905, 5,180.

**ATLANTIC CABLE** (kă'b'1), a cable line laid from America to Great Britain. The project of providing means to communicate by cable connections with Europe was successfully completed in 1866, though two attempts had failed previously. The *Great Eastern* laid 1,200 miles in 1865, when the cable broke, but the next year connection was established. The cable line connects Heart's Content, Newfoundland, with Valentia, Ireland, a distance of 2,300 miles. Since then other lines have been laid to Europe, and there are numerous similar lines in different parts of the ocean. In 1908 there were twenty cables at the bottom of the Atlantic. It is now possible to effect rapid com-

munication with practically all important parts of the earth.

**ATLANTIC CITY**, a city of New Jersey, in Atlantic County, on the Atlantic seacoast, sixty miles southeast of Philadelphia. It is situated on the Pennsylvania and the Reading railroads, and has transportation by a network of electric lines. The city is located on Absecom Beach, an island about ten miles long and three-fourths of a mile wide, and is popular as a pleasure and health resort. The manufactures include clothing, tobacco products, machinery, earthenware, and canned fruits and fish. Electric lights, pavements, waterworks, and a public library are among the facilities. The prominent institutions include the Children's Seashore Home, the Atlantic City Hospital, and the Mercer Memorial Home for Invalid Women. The first settlement was made in 1780, but its prosperity dates from 1854, when the Camden and Atlantic Railroad was completed. During the summer it has a transient population of about 275,000, for which there are ample hotel and villa accommodations. Population, 1905, 37,539; in 1910, 46,150.

**ATLANTIC OCEAN**, the great expanse of sea between the western coasts of Europe and Africa and the eastern coasts of North and South America, and extending from the Arctic to the Antarctic Ocean. Its width between Norway and Greenland is 930 miles, between Brazil and Africa, 1,600, and from North Africa to Florida, 4,250, and its area aggregates about 30,000,000 square miles. The shape of its shore line is that of a long trough-like valley with nearly parallel sides. It has a broad connection with both polar oceans, and forms the only open channel for the intermingling of warm and cold currents. By recent soundings, it has been found that the Atlantic possesses a large submarine plateau, extending in mid-ocean parallel to the coasts of the continent, from the southern portion of Africa to Iceland; thus dividing the basin into eastern and western valleys. The western valley is the deeper, the average depth of the two being 18,000 and 13,000 feet respectively. From Newfoundland to Ireland extends a remarkable plateau across these valleys, known as the Telegraph Plateau, on which a number of cable lines are located. The general depth along this swell ranges from 10,000 to 13,000 feet.

The true bed of the Atlantic Ocean commences some distance from the eastern coast of North America. Its depth for a distance of seventy-five to one hundred miles is about 600 feet, but from this region it descends to great depths. A large submerged plateau connects

the British Isles with the continent of Europe, which passes through the North Sea, and extends for a considerable distance off the western and southern coasts. The greatest depth yet discovered in the Atlantic is north of Porto Rico, where it exceeds 27,300 feet. While the Atlantic is smaller than the Pacific Ocean, it is much stormier and vastly more important to trade, for the reason that the great commercial nations of the world occupy its shores. Thousands of ships sail upon it, and from its ports extend steamboat lines to all parts of the world. This has caused many improvements in the form of lighthouses to be made, and its shores and important points in mid-ocean have been carefully surveyed.

The Atlantic is divided into the North Atlantic and the South Atlantic by the Equator, the former containing in the neighborhood of 17,000,000 square miles, and the latter about 13,000,000. Nearly one-half of the water discharged by the rivers of the world flows into it. Through it flow many useful warm and cold currents, which have been carefully surveyed and are extensively utilized in commerce. They have much value in tempering the climate of various countries. The most important is the Gulf Stream. This makes a bold curve from the Gulf of Mexico, flows northward in high ocean, modifies the climate of Newfoundland, and then divides. From its division one current passes to the vicinity of Iceland and the British Isles, and the other returns to the tropical seas by the way of Spain and Africa. Thus, it has a favorable effect upon the former as a warming influence, and upon the latter as a moderating factor of the tropical climate prevailing along its western coast.

**ATLANTIS** (ăt-lăn'tis), an island mentioned by Plato as the home of a great nation, and which was submerged in the sea. It was said to have existed several thousand years before the time of Plato, in the Atlantic, west from the Strait of Gibraltar, and in size was larger than Libya and Asia Minor. It was the reputed home of a great nation that conquered western Europe and Africa, and, to relieve humanity, the gods sent an earthquake to submerge it in the sea. By some the legend has been accepted as true, and the shallowness of the ocean at that point is cited in proof, while others think it refers to an early discovery of America.

**ATLAS**, a chain of mountains in North Africa, between the Mediterranean and the Sahara Desert. They start near Cape Nun, on the Atlantic coast, and extend to Cape Bon, passing through Morocco, Algeria, and

Tunis, a distance of about 1,500 miles. There are two parallel ranges called the Little and the Great Atlas; the former is nearest the coast, and the latter borders on the desert. Mount Jehel Ayashi, in Morocco, attains a height of 14,600 feet above sea level and is the highest peak. Fine forests and vegetation common to Europe abound, the former including the oak, pine, ash, cork oak, and poplar. They yield large quantities of valuable minerals, including gold, silver, coal, copper, iron, lead, and antimony. In 1900 valuable petroleum wells were found in Algeria. In some of the valleys are fine cities, and there are several railroads crossing different sections.

**ATMOSPHERE** (ăt'mös-fēr), the invisible elastic envelope that surrounds the earth, but the term is applied to the gaseous envelope surrounding any heavenly body. The atmosphere consists of gaseous matter extending from thirty-five to 200 miles above the surface, and is of varying density, this property depending upon its height. The lower layers are more dense than the others because they bear the weight of those above them, and the density diminishes rapidly as we ascend. It presses uniformly in all directions, and for this reason its weight remained longer undiscovered. Torricelli, an Italian philosopher and a pupil of Galileo, discovered its weight by the use of an instrument called the barometer. That the atmosphere possesses weight can be proven successfully by filling a bottle with air, weighing it, then extracting the air by means of an air pump, and when weighed it will be sensibly lighter than at first.

The pressure of air at the level of the sea is 14.73 pounds per square inch, and the total weight of the atmosphere is  $11\frac{1}{2}$  trillions of pounds, or about  $\frac{1}{188,000,000}$  of the total weight of the earth. This enormous pressure is exerted on the human frame and all objects on earth's surface. The pressure sustained by a single individual is estimated at fourteen tons, but, as it is exerted equally and in all directions and permeates the whole body, no inconvenience is caused by it. The more striking phenomena, which are to a large extent dependent upon the atmosphere, include animal and vegetable life, disintegration of rocks, polar and terrestrial radiation, storms and weather, twilight, and the propagation of sound. The atmosphere contains, among other constituents, oxygen, nitrogen, argon, aqueous vapor, carbonic acid gas, and ozone. In general it contains more or less sulphuric acid gas and hydrogen. Nitric acid is often noticeable in the atmosphere after thunder storms. It also contains minute par-

ticles of organic and inorganic substances. See **Air**.

**ATOLLS** (ä-töls'). See **Coral**.

**ATOM** (ăt'üm), according to some philosophers, the primary part of molecules not further divisible. The atomists believe that atoms are unalterable in size and shape; that they cannot be cut nor scratched by the sharpest tools; neither can they be twisted, flexed, or bent by the most powerful forces, and are not affected by cold or heat. They reason that in each kind of elementary substance the atoms have the same weight and size, but that in different kinds of elementary substances the atoms are of different size and weight. Thus, all atoms of gold are of the same weight and size, no matter from what part of the earth the gold may come. In like manner, the atoms of iron are of the same weight and size, but the atoms of gold are not of the same weight and size as the atoms of iron. Among the chief writers of ancient times who held to this theory are Moschus of Sidon, Epicurus, Democritus, and Lucretius, and they believed that atoms possessing various properties and motions are found in all substances. Newton thought original matter to consist of impenetrable, inactive, and immutable particles.

**ATOMIC THEORY** (ä-töm'ik thē'ō-rÿ), the theory according to which all the elements in compound bodies combine in certain uniform proportions. According to this view it is assumed that all bodies are composed of ultimate, indivisible atoms, the weight of which varies with the different kinds of matter. The opposite of this theory is that bodies, particularly those having no apparent organization, such as water, are continuous and homogeneous, and may be divided and subdivided indefinitely. The atomists assert that after a definite number of subdivisions the parts can no longer be divided, as each of the primary parts constitutes an atom. The theory owes its origin to John Dalton (1766-1844), who published his "New System of Chemical Philosophy" in 1807. He held that the atoms of each element are incapable of being subdivided, and that each has a definite relative weight, which is as one compared to hydrogen. While some of his theories are not well established, many chemists have followed him in adopting the terms used by him; namely, atom and atomic weight, in preference to proportion, combining proportion, and equivalent.

**ATOMIC WEIGHTS**, the proportions by weight in which chemical elements unite. Chemists, after carefully weighing numerous compounds, have determined the weight of the dif-

ferent elements as compared with the weight of the atom of hydrogen, which is taken as 1. All the other elements are represented by a quantity equal to the minimum amount in which they unite with 1 of hydrogen. A committee of German chemists prepared the standard system of atomic weights now in general use, in which the atomic weight of hydrogen is 1 and that of oxygen 16. See **Chemistry**.

**ATONEMENT** (ă-tōn'ment), literally at-one-ment, the act of reconciling persons at variance with each other, or the reconciliation of God to men, and men to God. The term is also used to designate the means by which the reconciliation is accomplished. It is used fifty-eight times in the Old Testament, and all but five of the places where it is found occur in the Pentateuch.

**ATRATO** (ă-tră'tō), a river in Colombia, in South America, which rises near the Cordilleras and flows into the Gulf of Darien. Its course of about 400 miles is northward, and it is navigable about half that distance. Formerly the Atrato was considered in connection with the construction of a canal between the Atlantic and the Pacific, but surveys made in 1870 proved it unsuited and the project was abandoned.

**ATROPHY** (ăt'rō-fy), a morbid condition in plants and animals, causing a waste or decrease in size of a part or of the entire body. It causes interference in nutrition, hence the substance in the parts affected either decays or is wasted. Atrophy occurs normally in old age, when all of the organs undergo atrophic changes, but young life is affected by it through severe exposure, unwholesome food, impure air, and arsenic and other poisons.

**ATTACHMENT** (ăt-tăch'ment), a legal process issued by a court, under which the sheriff or a like officer is directed to seize a person or property. A writ of attachment is issued in connection with an action at law, and the person or property taken into custody is held until the proceedings are completed and final judgment is rendered, when disposition is made under an order of the court. Writs of this character were formerly issued against persons by most governments, but they have been discontinued in many countries, and writs to seize property are used chiefly as a means of protection against fraud, to prevent their removal before a debt or judgment can be satisfied.

**ATTAINDER** (ăt-tăn'dēr), a legal term used to designate a special act of a legislative body inflicting capital punishment, or declaring a forfeiture of civil rights, upon a person

for high crimes, without having been first convicted in a court of law. The person against whom such an act is passed is said to be attainted. As a result the person attainted forfeits his property and is debarred from inheriting from any one. These laws do not exist in highly civilized countries. The Constitution of the United States contains the following provision: "No bill of attainder shall be passed, and attainders of treason, in consequence of a judicial sentence, shall not work corruption of blood or forfeiture except during the life of the person attainted."

**ATTAR** (ăt'tēr), a name used in the East Indies to designate a perfume made from flowers. The name is generally applied to *attar* or *ottar of roses*, which is an oil extracted from the petals of roses. It is secured largely from the musk rose and the damask, and is very expensive owing to the difficulty of obtaining it. Fifty thousand roses yield only about ninety grains of attar. It is manufactured in Cashmere, Damascus, and Rumelia, where large rose farms are profitably cultivated. The oil is of various tints, usually yellow, green, or red, and liquifies at about 84°. An adulterated form is made by adding geranium, sandalwood, and rhodium. The pure oil is expensive, usually selling at about \$40 per ounce.

**ATTENTION** (ăt-těn'shŭn), the act of fixing the mind upon any one object or class of objects, or directing the energies of the mind to a definite purpose. It is voluntary or involuntary, and may be trained and its power of concentration increased by practice. Voluntary attention is controlled by the will and requires effort, while involuntary attention is without effort and predominates in young children. Memory depends in a large measure upon attention, and the power to recall at will our mental impressions and acquisitions is perhaps directly in proportion to the attention given to the subject at the time mental effort was put forth. The mind has imperfect control of its thoughts when the attention, while directed to some subject of study, was feeble, loose, or accidental, and formed with little volition. Since attention is the foundation of all knowledge, it requires careful training and exercise, else the mind will be wanting in the chief quality of a sound intellectual character.

Attention is dependent in a large measure upon the physical condition. When the body has been exhausted by labor, either bodily or mentally, or is weakened by disease, it is not possible to concentrate the attention upon an object of thought. An effort to exercise the attention under such conditions causes nervous-

ness. If trained rightly during childhood and youth, the power to fix the attention upon objects for a definite purpose becomes habitual, and this training, combined with healthful physical functions and the selection of worthy objects of thought, make easy the accomplishment of difficult tasks. Attention is dependent in a large measure upon interest.

**ATTICA** (ăt'tī-ka), a state of ancient Greece, including an area of 840 square miles, and lying east of the Saronic Gulf. The surface is diversified by several mountain ranges, which rise to heights approximating 4,600 feet, though the mountain slopes and intervening valleys possess considerable fertility. This region was cultivated to fruits and cereals in the time of Solon, and still yields considerable quantities of olives, figs, grapes, cereals, goats, sheep, and cattle. At present Attica and Boeotia form a state in the kingdom of Greece, which has an area of 2,475 square miles and a population of 313,069.

**ATTLEBORO** (ăt'tl-bŭr-rō), a town of Massachusetts, in Bristol County, thirty miles southwest of Boston, on the New York, New Haven and Hartford Railroad. It is an important manufacturing center, producing considerable quantities of textiles, buttons, braid, jewelry, clothing, and machinery. The public library has about 9,750 volumes. It contains an almshouse and the Attleboro Home Sanitarium. The city has an extensive system of electric railways, pavements, electric lights, and sewerage. The first settlement was made in 1669 and it was incorporated in 1694. Population, 1905, 12,702.

**AUBURN** (a'bŭrn), a city in Maine, county seat of Androscoggin County, on the Androscoggin River and on the Grand Trunk and the Maine Central railroads. The river supplies an abundance of water power for manufacturing purposes, and the surrounding country is generally fertile. The manufactures include boots and shoes, cotton and woolen goods, flour, earthenware, and machinery. Among the chief buildings are the county courthouse, the public library, and several schools and churches. Electric street railways, waterworks, and sewerage are among the public utilities. Lake Auburn, Lewiston Falls, and Poland Springs are scenic points near the city. The first settlement was made in 1786 and it was incorporated in 1842. Population, 1900, 12,951.

**AUBURN**, a city in New York, county seat of Cayuga County, on the outlet of Owasco Lake, and on the Lehigh Valley and the New York Central railroads. It is handsomely built, has extensive water power, and is the

seat of numerous factories. The chief products include threshing machines, harvesters, mowers, textile fabrics, earthenware, tobacco products, and machinery. The surrounding country is farming and dairying, and contains extensive orchards and vineyards. Auburn is the seat of a State prison, at which the *silent* system of discipline was first inaugurated, so named because the prisoners are not permitted to talk to each other while at work and at other times are confined in separate rooms. Other institutions located here include an asylum for the insane, an armory, and the Auburn Theological Seminary. Auburn was the home of William H. Seward and has a bronze statue of him. Gas and electric lights, street railways, waterworks, a public library, and a number of parks are among the conveniences. The first settlement was made in 1792, when the place was called Hardenburgh's Corners, from Capt. John L. Hardenburgh. In 1805 it became the county seat and was named Auburn from the village described in Goldsmith's "Deserted Village." Population, 1905, 31,423; in 1910, 34,668.

**AUCKLAND** (ak'land), an important city of New Zealand, in the province of Auckland, and formerly the capital of New Zealand. It is supplied with excellent railroad facilities, has regularly platted streets, and enjoys a considerable export and import trade. It has a number of fine school buildings and churches, and it is the seat of Saint John's College. A public library, sewerage, waterworks, and electric street railways are among its utilities. The manufactures include clothing, earthenware, machinery, and railroad cars. The city was founded in 1840, and its rapid growth dates from 1857, when valuable deposits of gold, copper, iron, and coal were discovered in the vicinity. Population, 1906, 37,736.

**AUCKLAND ISLANDS**, a group of volcanic islands lying about 180 miles south of New Zealand. The soil is generally fertile. They have extensive forests, productive fisheries, and a considerable trade. The entire group includes a large number of islands, but only three are of considerable extent. Auckland, the largest island, is thirty miles long and fifteen miles wide. These islands were discovered by Captain Briscoe in 1806, and are mainly important as a whaling station in the south seas.

**AUGER** (a'gēr), a tool used for boring holes larger than those bored by a gimlet. The auger is drawn into the wood by a screw at the point, above which, at each side, is a cutting lip and a spiral pod, the cutting lip to cut and the spiral groove to discharge the chips. At

the upper end is a handle placed crosswise by which the auger is turned with both hands. The smaller augers usually consist of bits that fit into a brace or bitstock, and have the advantage of being more easily handled.

**AUGSBURG** (owks'bōorg), a city of Germany, in Bavaria, at the confluence of the Lech and Wertach rivers, thirty-two miles northwest of Munich. It is the converging center of several important railroad lines and has a considerable commercial trade. Within the last decade it has grown rapidly as an industrial center. The manufactures include machinery, paper, jewelry, musical instruments, and clothing. Augsburg has long ranked as an important money market of Europe, and as the seat of extensive book-printing establishments. It has electric street railways, sewerage, stone and asphalt pavements, a large public library, and several fine parks. Among the chief buildings are the Church of Saint Anna, the memorial chapels of the Fugger family, the Church of the Holy Cross, the city hall, and the theater. Many of the streets are adorned with fine fountains and statues. The city is famous as the place where the Confession of Augsburg was concluded, which constitutes the confession of faith adopted by the Protestants on June 25, 1530. The first settlement was established on the site of Augsburg by Augustus in 12 B. C., when that Roman general conquered the Vindelicians. Population, 1906, 94,923.

**AUGSBURG CONFESSION**, the first Protestant confession of faith, containing the doctrinal definition of the Lutheran Church, and adopted at Augsburg, Germany, June 25, 1530. The confession was prepared by Melancthon and approved by Luther, and was read in a diet convened by the German princes and estates. It was written in Latin and German and read aloud before the diet in German, but both have probably been lost. In this document the belief of its supporters is set forth in a terse and dignified manner in twenty-one articles. This confession and the two catechisms written by Luther constitute the accepted confessional theology of the Lutheran Church.

**AUGUST** (a'gust), the eighth month of the Gregorian year, so named in honor of Emperor Augustus. In the Roman calendar it was the sixth month, hence was named *Sex-tilis*.

**AUGUSTA** (a-güs'tà), a city in Georgia, county seat of Richmond County, on the Savannah River, 135 miles northwest of Charleston, S. C. It is situated on the Central of Georgia, the Southern, and other railways, and has a large trade in cotton, cereals, and mer-

chandise. The streets are broad and well improved by pavements, sewerage, waterworks, electric lights, and avenues of shade trees. Transportation to urban and interurban points is by an extensive system of electric railways. Among the noteworthy institutions are the Medical College of Georgia, the Richmond Academy, the Masonic and Odd Fellows' halls, the Louise King Home, the Paine's Institute for Colored Students, and the Augusta Orphan Asylum. It has a number of parks, a Confederate soldiers' monument, and a monument dedicated to the Georgia signers of the Declaration of Independence. The public library contains 12,500 volumes. It has a fine courthouse and many large business buildings, such as the Cotton Exchange and the Georgia Railroad Bank. The Augusta Canal, a watercourse about nine miles long, supplies an abundance of water for city use and for manufacturing purposes. The chief manufactures are cotton and woolen goods, clothing, tobacco products, machinery, and earthenware. The city was platted under a royal charter in 1735, and is one of the oldest cities in the State. In the Revolutionary War it was captured by the British and held for two years, but was recaptured in 1781 by Gen. Henry Lee after a siege of thirteen days. Population, 1900, 39,441; in 1910, 41,040.

**AUGUSTA**, the capital of Maine, county seat of Kennebec County, at the head of tide water on the Kennebec River. It is on the Maine Central Railroad and has connection by steamer with Boston and Portland. The city is finely situated and improved by an abundance of shade trees, and the river is crossed by a handsome bridge. The river furnishes an abundance of water power, thus giving it considerable advantage for manufacturing purposes. The chief products include paper, cotton and woolen goods, furniture, clothing, and machinery. Electric street railways, waterworks, pavements, and sewerage are among the utilities. The capitol building is the most prominent structure and is built of granite. Other buildings include the county courthouse, the post office, the city hall, and the United States Arsenal. It is the seat of Saint Catherine's School, an institution for the education of young ladies. In 1831 it was made the capital of the State. Population, 1900, 11,683.

**AUK** (ak), the name of several sea birds, including a large number of species, of which the great auk and the little auk are the best known. The great auk is about three feet high when sitting in an upright position. It has short wings, which are almost useless in flight,

but they aid the bird to move with great rapidity in the water. At present it is found only in North America, but bones discovered in Den-

GREAT AUK.

mark and other regions of Europe indicate that it was formerly common to Western Europe. The little auk is about the size of a large pigeon, and is met with in great numbers in the Arctic seas, where it nests in crevices of the bare rocks. The razorbill is allied to the auk, and like the great auk frequents the crannies of rocks. The young razorbills feed from the crop of the parents even after they are able to move about quite freely. Auks yield feathers of much value for bedding, for which purpose they are hunted with considerable persistency, while their flesh and eggs are eaten by the Eskimos and other peoples of northern regions. These birds migrate in early winter from the land to the open sea, where they float on the water or perch on the drifting ice.

**AURORA**, a city of Illinois, in Kane County, on the Fox River, about forty miles west of Chicago. It is on the Illinois Central, the Chicago, Burlington and Quincy, and the Chicago and Northwestern railroads, and is the seat of important railroad shops. The manufactures include carriages and wagons, flour, woolen goods, cigars, earthenware, machinery, and farming implements. Among the notable buildings are the post office, the Carnegie library, the high school, and the Jennings Seminary. The streets are handsomely paved with brick and asphalt, and improved by avenues of shade trees, electric lights, waterworks, and an exten-

sive system of street railways. Population, 1900, 24,147; in 1910, 29,807.

**AURORA**, a city of Missouri, in Lawrence County, thirty-five miles southwest of Springfield, on the Kansas City, Fort Scott and Memphis and the Saint Louis and San Francisco railroads. The surrounding country is agricultural and fruit-growing, and has deposits of lead and zinc. It has a public library, waterworks, a fine high school, and a large trade in produce and merchandise. The manufactures include flour, cigars, clothing, and machinery. Population, 1900, 6,191.

**AURORA BOREALIS** (bō-rē-ā'līs), or **Northern Lights**, a phenomenon of great beauty in the northern hemisphere, corresponding to the phenomenon occurring in the southern hemisphere known as *Aurora Australis*, or **Southern Lights**, both being called **Polar Lights**. The lights are visible in autumn and winter, occurring at opposite times at the two poles, and are of utility in aiding to illumine the long nights. The shapes assumed by the lights are infinite in number and very transient, sometimes appearing of an ordinary flame color and sometimes assuming a greenish hue. The most frequent appearance is that of an arch of fire, from which great streamers flash towards the zenith, which range from a pale red or yellowish to a deep red color. Auroras are caused by the passage of electricity through the rarefied air of the upper regions of the atmosphere. This is proven by the fact that during the continuance of an extensive aurora telegraph wires give evidence of unusual disturbances in electrical action, and the magnetic needle is subject to frequent movements. It has been proven by tests that an effect similar to the aurora is produced by the passage of electric currents through rarefied gases.

**AUSCULTATION** (as-kŭl-tā'shŭn), the art of discovering diseases within the body by means of the sense of hearing. It involves a knowledge of the natural sounds produced within the body in health and disease, especially those of the thorax and abdomen. An instrument used in this art, to facilitate investigation, is called a stethoscope.

**AUSTERLITZ** (as'tēr-līts), a small town in Moravia, in the northwestern part of Austria, twelve miles east of Brünn. It is celebrated on account of Napoleon's victory over the Austrians and Russians on Dec. 2, 1805. After Napoleon occupied Vienna, his headquarters were fixed at Brünn, to which place the allied armies advanced. The French army numbered about 80,000, and in the battle lost 12,000 men; while the allied forces numbered

84,000, and sustained a loss of nearly 30,000 men in killed, wounded, and prisoners. This battle resulted in the peace of Pressburg, and a large part of Central Europe became subject to Napoleon. In 1906 Austerlitz had a population of 3,980.

**AUSTIN** (as'tin), a city in Minnesota, county seat of Mower County, on the Red Cedar River, about 100 miles south of Saint Paul. It is situated on the Chicago Great Western and the Chicago, Milwaukee and Saint Paul railroads, and is surrounded by a fertile farming country. The chief buildings include the county courthouse, the high school, the Carnegie library, and the Southern Minnesota Normal College. It has municipal waterworks and manufactures of flour, machinery, and farming implements. The first settlement was made in 1854 and it was incorporated in 1873. Population, 1905, 6,489.

**AUSTIN**, the capital of Texas, county seat of Travis County, on the Colorado River, about 200 miles northwest of Galveston. It is on the International and Great Northern, the Houston

STATE CAPITOL, AUSTIN.

and Texas Central, and the Austin and Northwestern railroads. The city is surrounded by a fertile farming region, which produces large quantities of cereals, fruit, and live stock, and is important as a market for produce and merchandise. It has electric lights, electric street railways, waterworks, sewerage, and pavements of stone and macadam. The State Capitol building, located on Capitol Hill and built of Texas marble, is one of the finest structures of the kind in America. Austin has a large number of State and county buildings, a fine public school system, numerous churches, and several educational and scientific associations. It is the seat of the Texas Military Institute, the Texas State University, a Roman Catholic academy, and several benevolent institutions. The manufactures embrace clothing, machinery,

tobacco products, vehicles, and farming implements. The city was named in honor of Stephen F. Austin (q. v.). It became the capital of the Texan Republic in 1839, and in 1850 was made the capital of the State. Population, 1900, 22,258; in 1910, 29,860.

**AUSTRALASIA** (as-tral-ā'shī-ā), a division of Oceanica, located southwest of Asia. It comprises the continent of Australia and the islands adjacent to it. Among the chief islands of Australasia are New Zealand, Tasmania, New Caledonia, the Solomon Islands, the New Hebrides, New Britain, New Ireland, Admiralty Islands, the Arru Islands, New Guinea, and many smaller islands and island groups. It comprises the largest of the three portions of Oceanica, the other divisions being Polynesia and Malaysia. The area of Australasia is 3,259,200 square miles, and the population is estimated at 5,275,000.

**AUSTRALIA** (as-trā'li-ā), the smallest of the six continents, located southeast of Asia and the East Indies. The eastern shore is washed by the Pacific, and the southern and western by the Indian Ocean. Its greatest length from east to west is nearly 2,500 miles, the greatest breadth from north to south is about 2,000 miles, and the area, including Tasmania, is 2,974,581 square miles. The coast line is quite regular, but many islands dot the adjacent waters, except toward the southwest, where the sea is open. The most important indentations include Queen's Channel and the Gulf of Carpentaria on the north, Spencer Gulf and the Great Australian Bight on the south, and Shark's Bay on the west. South is the island of Tasmania, separated from the continent by Bass Strait, and southeast is New Zealand. Torres Strait separates Australia from New Guinea and in the same vicinity, off the northern shore, are Arafura Sea, Timor Sea, and Coral Sea. North of it is the great island group that extends southwest of Asia, which includes New Guinea, Java, and Borneo, and many other islands and groups of islands dot the sea lying north. Toward the northeast is the Great Barrier Reef, a chain of coral islands and reefs extending a distance of 1,260 miles. The continent is divided by the tropic of Capricorn, though the greater portion lies south of that line, but it extends only to about 39° south latitude. Hence, the northern portion is located in the Torrid Zone and the southern part is in the South Temperate Zone.

**PHYSICAL FEATURES.** The interior of Australia is formed largely of sandy hillocks or plains, which are covered with coarse grass or brushwood. It is generally arid and hot, though at

RELIEF MAP OF AUSTRALIA.

different seasons occur heavy rains and hail storms, when shallow lakes form in the depressions, to which the water is carried by inland streams. As the waters from these lakes evaporate they become brackish or salty, some yielding considerable quantities of saline products. Along the eastern coast trend the Australian Alps, which are highest in the southeast, where Mount Kosciusko, about 7,000 feet high, forms the culminating peak of the Australian continent. In Victoria these mountains are known as the Australian Alps, or the Liverpool Range. Besides these mountains are various smaller chains and groups, most of which are in the interior and along the western shore. Low plains make up a large part of the surface along the southern and northern coasts.

The Murray, which rises on the west side of the Australian Alps, is the largest stream and has a basin of about 300,000 square miles. It receives the drainage from the Darling and the Murrumbidgee rivers, and discharges into the Indian Ocean, near Adelaide. In the north is the Victoria, in the west the Murchison, and in the interior is the Cooper, which flows into Lake Eyre, a salt-water lake that has no outlet to the sea. A large number of rivers in the interior discharge into salt lakes and are of no service as means of communication, but may be utilized for irrigation purposes. In the central part is Lake Amadeus, in the south are lakes Eyre, Gairdner, and Torrens, and in the western part is Lake Austin. Most of the interior lakes have no connection with the ocean and their waters are quite brackish and salty.

The climate is naturally hot and dry, but along the sea coast it is modified by healthful and pleasant sea breezes and rains, thus making large areas agreeable and productive. On the eastern and southern slopes the sea winds carry an abundance of moisture, and these regions are the most productive and densely populated. The temperature at Melbourne averages about 56°, at Sidney about 63°, and at Palmerston, in the northern part, about 80°. In the interior the mean annual temperature ranges from 60 to 80°, and the climate is characterized by great changes owing to excessively hot winds.

**VEGETATION.** The soil of Australia, though arid and sandy in the interior regions, is as a whole quite fertile, and yields an abundance of vegetation in all districts that have an adequate quantity of rainfall. Many distinctive types of plants thrive and range from the tropical luxuriance of the moist east and north coasts to the arid interior, where vegetation is scant and the species are peculiarly adapted

to endure excessive drought. Tree ferns, canes, palms, and bamboos thrive in the northeastern part, and here the forests contain many orchids and other parasitic plants. The bottle tree and the grass tree thrive here, and in the southeastern part, especially in Victoria, are the eucalyptus, acacia, fan palm, honeysuckle, and paper-bark tree. The gum-trees are very numerous and more than 150 species abound, and there are fine forests of the oak and other valuable woods. Not only are the forests of the eastern section beautiful, but both here and on the fertile plains are luxuriant growths of grasses and flower-bearing vegetation. The steppes of the interior take on summer verdure where rain is sufficient, and in the western part the country is alternated with forests and prairies, though large tracts of Western Australia are arid and vegetation is scant. Cereals, vegetables, and tropical fruits thrive abundantly.

**MINERALS.** Gold is the most important mineral and was discovered in 1823, but mining was not developed on an extensive scale until 1851, when prospectors and miners in large numbers came to the country. The most productive fields are in the mountains of Eastern Australia. Victoria produced about two-thirds of the output, though the productions of Queensland and New South Wales were considerable. Copper is mined in South Australia and other states, and silver is obtained in paying quantities both in Australia and in Tasmania. Other minerals more or less abundant are coal, mercury, iron, antimony, zinc, bismuth, diamonds, and manganese. Granite and building stone are abundant.

**ANIMALS.** The continent possesses no large animals, the largest being the kangaroo, of which a number of species abound. The *marsupialia* or pouch mammals, which include the kangaroo, are represented by 30 species, and the *monotremata*, or egg-laying mammals common to Australia, include the spiny ant-eater and the platypus or water mole. The last mentioned reproduces from eggs and is confined to Australia. Among the flesh-eating animals are the rat, the mouse, and the native cat, and the insect eaters include the bandicoots. The kangaroo, the rock wallaby, and the hare kangaroo are the chief grass eaters. It is thought that the *dingo*, or wild dog, though sometimes classed as a native of Australia, is a descendent from the domestic dog. Bats are very numerous and the rabbit, which has been naturalized from Europe, has become a pest because of its rapid increase. Most of the animals are small and the fur-bearing

species are limited, but the continent is especially rich in birds of song and plumage. Here thrive the tue, emu, owl, parrot, brush turkey, crested pigeon, lion bird, oriole, jackass, cockatoo, crowned pigeon, parrakeet, and bird of paradise. The species of poisonous snakes are numerous, which is true of the lizards, frogs, and fish. Insect life is not well represented, though the species of butterflies, ants, bees, and beetles are quite numerous.

**GOVERNMENT.** The entire continent is a colonial possession of Great Britain. For the purpose of government it is divided into five states. The eastern section comprises the three states of Queensland, New South Wales, and Victoria; the central part is embraced in South Australia, which includes the Northern Territory; and the western part is the State of Western Australia. These five states, including Tasmania, are organized as the Commonwealth of Australia. See **Australia, Commonwealth of.**

**INHABITANTS.** The population of Australia, including Tasmania, in 1906, was 4,119,481. This number included about 60,000 natives and 40,-

AUSTRALIAN.

MELANESIAN.

000 Chinese. Fully one-third of the inhabitants are of foreign birth, of whom a large majority came from the United Kingdom and about 50,000 from Germany. The aborigines are the lowest of the human races as regards intelligence and are of the Negroid type, resembling those of Africa. They are indolent, but peaceful, and engage largely in hunting and fishing. Some regard them incapable of being civilized and educated, and there has been a steady decrease in number for the past forty years. In color they are dark brown or black, have straight or wavy hair, sometimes curly, and are of medium size and inferior muscular strength. The favorable climate has not required them to provide for heavy clothing or substantial shelter, hence they live in illy constructed huts and subsist on insects, reptiles, roots, and the native animals. Little, if any, development was made in their habits or modes of living since Australia has been occupied by Europeans, though some engage in light work

for short periods of time when they are in need or want. They are skillful with the boomerang and spear, are fond of dogs, and still employ wooden axes and stone hatchets in cutting wood and building their huts.

**HISTORY.** Australia was first discovered by Europeans about the middle of the 16th century, probably about 1531. In 1542 the Portuguese published an account of a number of explorations and about that time the continent became known to explorers of different nations. Manoel Godinho de Eredia, a Portuguese navigator, in 1601, set foot upon the continent and explored a part of its coast. The Dutch sent an expedition from Bantam, in Java, in 1605, and explored a part of the northern coast lying immediately south of New Guinea. In 1606 a Spanish expedition under Luys Vaez de Torres, from whom Torres Strait was named, sailed through the narrow neck of water between New Guinea and Australia. Several expeditions sailed under Dutch navigators from Java in 1616, and named the continent New Holland. They surveyed a large portion of the northwest coast, where they planted several settlements.

In 1770 Captain James Cook sailed by way of New Zealand and landed on the eastern coast of Australia, surveyed and explored a number of localities, and took possession for England. He named the region New South Wales. An English settlement was made at Botany Bay, near Sydney, in 1788, where a penal station was established for convicts transported from England by the government. Fully 150,000 convicts were taken to Australian stations, and about the same time settlers began to occupy the coasts and to press inland. The mountains were not crossed until 1813, when it was thought a great inland sea stretched far toward the west, and in 1847 the German explorer, Ludwig Leichhardt, started with a small company from Moreton Bay to cross the continent, but was not heard of again. Immigration and development began with the discovery of gold in 1851, and since that time there has been constant progress in the material industries and the growth of cities. The government was administered under the jurisdiction of the five colonies of Victoria, Queensland, New South Wales, South Australia, and Western Australia, until Jan. 1, 1901, when Tasmania joined them to form the Federal State known as the Commonwealth of Australia, which see.

**AUSTRALIA, Commonwealth of,** a colonial possession of Great Britain, consisting of Tasmania and the five federated states of Australia. The area, population, and natural re-

sources are treated in the article entitled Australia and additional information is given under Tasmania, which see.

**AGRICULTURE.** Both farming and stock raising began to be developed as early as settlements were made, but the latter enterprise received the larger share of attention. Agricultural products thrive abundantly where the rainfall is sufficient to germinate and mature crops, and in many sections of the interior arid lands have been redeemed for cultivation by irrigating ditches and canals which draw a supply of water from rivers and mountain streams, and in some localities artesian wells are utilized successfully. Victoria holds first rank in the number of acres under cultivation, but is followed closely in this respect by South Australia and New South Wales. Tasmania has a larger area of cultivated land than Western Australia, but is surpassed in the acres under cultivation by Queensland. Wheat is the most important cereal product and is grown on about half of the total acreage, and hay takes second rank in the value of the quantity produced. Other crops are corn, barley, oats, sugar cane, potatoes, and tropical and semi-tropical fruits. Development in fruit raising has been constant, especially in the cultivation of grapes, bananas, peaches, and apples. Coffee is grown successfully on the coast of Queensland, and development in silk culture has stimulated attention in growing the mulberry.

Sheep raising has received the larger attention, though it is by no means the only animal industry. In the number of head of sheep, Australia surpasses all of North America, having about one hundred million head, and the annual production of wool aggregates about five hundred million pounds. The favorable climate and the extensive area of grazing lands account for large interests in sheep growing, and the quality of both wool and mutton is of a high class. Cattle are grown profitably for beef and dairy products. Horses are reared both for domestic use and for exportation. Goats, mules, poultry, and bees yield good returns.

**MINING.** The discovery of gold in 1851 stimulated immigration, and from that time mining has continued to be an industry of much importance. The first mines were opened in New South Wales, but development was made soon after at Ballarat, Victoria, and in different parts of Queensland. The Coolgardie district of Western Australia and the fields of Tasmania were open more recently. Victoria had a larger output of gold up to 1899 than all the other

states combined, but the production is now greatest in Western Australia. The annual output of gold is about \$86,500,000 and of silver about \$16,150,000. Iron ore is abundant in the mountains and there are extensive deposits of bituminous coal, particularly in New South Wales. Tin and copper are mined profitably especially in Tasmania, and there is a small output of antimony, bismuth, lead, and diamonds.

**TRANSPORTATION.** As the commonwealth has no large lakes and few streams that can be navigated, transportation is dependent almost exclusively upon the construction of highways and the building of electric and steam railways. The government owns and operates most of the railroads of the continent and Tasmania, and less than 500 miles of lines are managed under private ownership. In 1908 the total railroad mileage was 15,500 miles, of which about 600 miles were in Tasmania. All the principal cities and many interurban points have electric lines, and macadamized highways have been constructed and are maintained largely by local authority. Several telegraph lines extend across the continent, both north and south, and cable lines connect the chief port cities with all countries of the world.

**COMMERCE.** The trade with foreign countries is very large, especially in raw materials. Manufacturing enterprises have not been developed as extensively as mining and agriculture, and are confined principally to products used in domestic consumption. They consist chiefly of textiles, utensils, clothing, machinery, and food products, hence large quantities of the commodities produced are exported and many supplies are obtained by importation. Though smaller in the number of inhabitants than Canada, it has a larger export and import trade. The duties collected are uniform throughout the commonwealth. Great Britain has the largest share of the foreign trade, about eighty per cent., and next in order are the United States, Germany, and France.

**EDUCATION.** The state of education is improving perceptibly, owing to a reasonable enforcement of the compulsory school attendance law in all the states. In 1860 sixteen per cent. of the people were illiterate, but at present illiteracy is placed at 8 per cent., each decade showing a satisfactory improvement in public instruction. Besides public schools and numerous academies and colleges, there are universities supported by the states at Adelaide, Sydney, Hobart, and Melbourne. The educational institutions are coeducational and are modeled after the English universities at Manchester

and Liverpool. English is the spoken language, and the social and industrial conditions of the regions fairly developed are quite similar to those of Canada and the United States. In religion there is no restriction, and numerically the Episcopal church is the strongest. Other denominations represented by large numbers are the Presbyterians, Roman Catholics, and Lutherans.

**GOVERNMENT.** The commonwealth is governed under a constitution which went into effect in 1901. This constitution delegates to the central government all power not reserved by the state, and is modeled upon that of the United States rather than upon the constitution of Canada, in that it does not provide for a strongly centralized state. The governor general is appointed by the sovereign of Great Britain, is assisted by a ministry made up of members of Parliament, and has the power to summon and dissolve Parliament, which is made up of two branches, a senate and house of representatives, and is required to meet every year. Each state has six senators, elected for six years. The membership in the house, chosen for three years, is twice as large as the number of senators, and any state cannot have less than five representatives in the lower house. The judicial department culminates in a high court of justice, to which appeals may be taken from the Federal court, from the interstate commission, and from the supreme court of the Federal states, and the acts of the highest court is subject to review by the British Privy Council, though only in questions pertaining to the constitutional powers of the different states or of the commonwealth.

Local government is vested in counties and municipalities, both politically and educationally, and the right of suffrage is in male citizens and may be extended, but not restricted, by the Federal Parliament. At present the house of representatives has a membership proportioned as follows: Western Australia, 5; Tasmania, 5; South Australia, 7; Queensland, 9; Victoria, 23; and New South Wales, 26.

Bombala, in New South Wales, was made the capital in 1903. Wellington, Adelaide, Sydney, Melbourne, and Hobart are the largest cities.

In 1906 the area and population were given as follows:

	AREA.	POPULATION.
Tasmania .....	26,215	180,156
West Australia .....	975,920	261,746
South Australia .....	903,690	383,829
Queensland .....	670,500	535,113
Victoria .....	87,884	1,231,940
New South Wales .....	310,372	1,526,697
Total .....	2,974,581	4,119,481

**AUSTRALIAN BALLOT** (as-trā'li-an), a ballot first used in elections held in New South Wales, in 1858, and subsequently in all the subdivisions of Australia. It has been modified more or less and adopted in many countries. In some form it is in use in nearly all the states and countries where the elective franchise is recognized. The main features are that ballots used in voting are printed at public expense, the different party tickets are printed on the ballots, and each voter is supplied with one copy when he presents himself at the polls to vote. There is a legal provision against

Map showing the proposed Transcontinental Railways of Australia.

electioneering near the polls, and secrecy in voting is guaranteed by prohibiting an elector, under suitable penalty, from exhibiting the ballot to any one after it is marked. Separate voting booths are provided in which the voter must by himself mark and prepare his own ballot, if he is capable to do so, otherwise it may be marked at his direction by two of the judges, who must belong to different parties, after which it is handed to the proper officer, by whom it is deposited in the ballot box. The system is universally popular, and has tended to preserve both the secrecy and sanctity of the ballot.

**AUSTRIA-HUNGARY** (a's'trĭ-à-hŭn'gà-rĭ), or **Austro-Hungarian Empire**, an extensive monarchy in Central Europe, bounded by Germany, Russia, Rumania, Servia, Turkey, Montenegro, the Adriatic Sea, Italy, and Switzerland. It embraces an area of 261,034 square miles, being larger than any other European country except Russia. The monarchy embraces two semi-independent countries, Austria and Hungary, each of which has a separate local government, but both are under the direction of a national parliament and an emperor.

**DESCRIPTION.** The surface of Austria-Hungary is characterized by three great mountain systems, which, in the northwestern part, assume elevations very similar to the mountainous regions of Switzerland. In the northern part trend the Carpathian and Moravian Mountains; in the southern part are the Transylvanian Alps, which form a part of the boundary with Rumania; and along the Adriatic shores are the Austrian Alps. The Carpathians are connected by the Moravian Mountains with the Bohemian Highlands, which embrace the Riesen-Gebirge, the Böhmerwald, and the Erzgebirge. The Austrian Alps extend from Switzerland to the Danube and embrace the Rhaetian, the Noric, and the Dinaric Alps, and their highest peak, Ortler Spitze, has an elevation of 12,800 feet above the sea. The Carpathian Mountains are less elevated, ranging from 3,000 to 8,700 feet and culminating in the Gerlsdorfer Spitze, which is 8,735 feet high. Fine scenery and numerous caverns and mineral springs abound in the highlands, making some sections the most picturesque regions of Europe.

The drainage is almost exclusively to the southeast by the Danube and its tributaries, which include the Drave, the Theiss or Tisza, and the Save rivers. In the northern part is the Moldau, a tributary of the Elbe, while the Dniester traverses part of Galicia, and the Vistula forms part of the boundary between Galicia and Russian Poland. Other streams include the Adige, the Inn, and the Raab. Although Austria-Hungary is classed as an interior country of Europe, it has about 500 miles of sea coast along the Adriatic. Lake Balaton, in Hungary, is the most important inland water, but numerous small lakes diversify and add beauty to the mountain scenery.

The uneven surface of the country causes it to have considerable diversity in climate. In the western part the rainfall is very abundant, about 100 inches annually, and in Moravia and Silesia it is not more than 25 inches, being limited on account of high altitudes causing precipitation before the moisture is carried to

that section by the clouds. However, there is sufficient rainfall in all parts for the successful cultivation of plants adapted to the different temperatures. At Vienna the mean average temperature is about 50°, and in the southern part of Dalmatia, at Ragusa, it is 62°.

**ANIMALS.** The native animals are like those found in most of central Europe, but the number and kind have been limited by the fact that the country has been populated for centuries. In the mountains, especially in the Alps, are a considerable number of ibex and chamois. Wolves, bears, lynxes, and other species are met with in considerable numbers. The fisheries of the Adriatic Sea and of the larger streams yield sturgeon and other commercial fish. Birds of song and plumage are abundant. The domesticated animals consist of those common to European countries. Horses and sheep are not reared as extensively as in former years, but cattle are grown in large numbers for beef and dairy products. Goats are reared for their flesh and skins, and swine are grown in all parts of the country, but receive special attention in Hungary. Bee-keeping and silk culture are important enterprises and yield large returns.

**AGRICULTURE.** Agriculture is the chief occupation, fully three-eighths of the people engaging in that enterprise. Hungary is noted for its production of cereals and exports large quantities to Switzerland and Germany. Oats, potatoes, rye, barley, and wheat are grown on a large acreage, and interest in the culture of corn, buckwheat, and millet is extensive. The sugar beet, tobacco, flax, and fruits are grown. Among the chief orchard products are grapes, oranges, apricots, chestnuts, almonds, apples, and figs. Rice is cultivated in Hungary, though not enough for domestic consumption.

**MINERALS.** Mining has been an important enterprise in some parts of the country for centuries, and there are traces of mines worked by the Celts and Romans. Almost every known mineral is found, and considerable deposits of mineral oil, precious stones, and useful earths exist in paying quantities. In Galicia, at Wieliczka, are the most famous salt mines in the world, and they are controlled by the government. Salt is also derived from evaporating sea water on the coasts of the Adriatic and the waters of salt springs. Gold is produced in larger quantities than by any country in Europe. Other mine products include silver, coal, iron ore, copper, lead, zinc, gypsum, antimony, and manganese.

**MANUFACTURING.** The last few decades have witnessed a marked advance in the manufactur-

ing enterprises of the empire. This industry has been encouraged by the government through a reduction of freight rates on state railroads in favor of manufacturers and by bounties paid to aid new enterprises. The clothing industry is developed to a high extent in the western part, which is true also of the manufacture of textiles, articles of food, building materials, and steel and iron. Bohemia holds high rank in the manufacture of glass. Bohemian art ware is seen in large quantities at international expositions and sold extensively in all civilized countries. Hungary has the largest milling enterprises of Europe, taking rank in the output of flour with Canada and the United States. Beet sugar, pottery, machinery, earthenware, firearms, and dairy products are among the important industrial products.

**COMMERCE.** The country has large commercial interests, the exports exceeding the imports. A merchant marine is aided and encouraged by the government, though the short coast line on the Adriatic prevents the empire from taking rank with the nations more fortunately situated. Only 15 per cent. of the entire foreign commerce is carried by water, the remainder going by land, either to be consumed in Europe or shipped to foreign countries from ports located outside of the monarchy. Wheat, fruit, flour, sugar, earthenware, leather, clothing, and minerals are the chief articles of export. Fully three-fourths of the trade is with Germany, and the nations coming next in order are Italy, Great Britain, Rumania, and Russia. The trade with American countries is not large.

**TRANSPORTATION.** Railroad building did not receive attention until 1837, when a short line was built in Austria. The government nationalized the railways in 1846, since which time most of the lines have been owned and operated as public property. In 1908 the total railroad mileage was 28,400 miles, exclusive of electric lines, which have been constructed on a large scale in the principal cities and through many sections of the country. Transportation by water is promoted from ports on the Adriatic and on the Danube, which is navigable by steamboat throughout the course and furnishes a direct outlet to the Black Sea. Communication by telephone and telegraph lines is ample.

**EDUCATION.** While education has received much encouragement, there are districts in which illiteracy still prevails to a considerable extent, some regions having as high as sixty per cent. The highest intellectual culture of the people prevails in the German provinces, where compulsory school attendance laws have long been in force, and all children from six

to twelve years inclusive are required to attend school. The system of schools is modeled after that of Germany, and embraces the *gymnasia*, the *realschulen*, and the higher institutions. The elementary schools take high rank, and the interweaving of practical education with the common school studies is an objective point. Articulated with the common schools is a system of academies and colleges, and there are various schools devoted to commerce, agriculture, music, and arts, besides a number of well-equipped universities. The empire has twelve excellent universities, situated, respectively, in the cities of Vienna, Gratz, Innsbruck, Budapest, Prague, Cracow, Lemberg, Agram, Czernowitz, and Klausenburg. These institutions embrace courses in theology, political economy, law, medicine, philosophy, engineering, and other lines of higher work. Roman Catholic is the state religion, but all forms of religious worship are permitted. The denominations taking rank numerically next to the Roman Catholics are the Orthodox Greek, Protestants, Armenians, and Jews.

**INHABITANTS.** The people are greatly diversified in races and languages, and in this respect the monarchy resembles Russia. About two-fifths are German, while the remainder are either of Germanic, Slavonic, Magyar, Latin, or Hebrew origin. In Hungary the Slavs and the Magyars predominate and the Slavic and Hungarian languages are spoken. German is the language of the Austrian provinces, where the people of German descent predominate. Vienna, the capital of Austria and of the dual monarchy, is one of the largest and finest cities of Europe. Other cities of importance include Budapest, the capital of Hungary, Trieste, Lemberg, Prague, Gratz, Brünn, Szegedin, Pressburg, Czernowitz, and Arad. In 1900 the population of the empire was 47,073,359, of which number 26,150,708 were in Austria; 19,254,559, in Hungary; and 1,568,092, in Bosnia and Herzegovina. The total population, in 1905, was 51,250,380.

**DEFENSE.** Austria-Hungary has long ranked as one of the great military powers, being classed among the most powerful modern nations of Europe. The military service was placed on a basis requiring universal service in 1889, and the armed forces comprise the navy, army, landwehr, and landsturm. All able-bodied citizens of the empire are required to serve in the army three years, beginning at the age of twenty, or in the navy four years, but they are not released after such service until they have had additional practice or training for a period ranging from three to twelve

years. The peace footing is 380,786 men and officers. There is a war footing of about 2,000,000 men, but in cases of emergency fully double that number of reasonably well-trained soldiers can be placed at the disposal of the monarch. The navy consists of about 140 vessels, including twenty armored battleships, and 170 torpedo boats. The military forces are equipped with the most modern arms, including the Mannlicher rifles and modern machine guns.

**GOVERNMENT.** The present dual government was adopted by the *Ausgleich* of 1867, under which the ruling sovereign is Emperor of Austria and King of Hungary, which may be considered two independent states, and the crown of both is hereditary in the house of Hapsburg. Legislation is vested in the Austrian and Hungarian diets, but two bodies known as the delegation control the ministries, each delegation consisting of sixty members. Twenty of the delegates are elected by the upper house and forty by the lower house, and in alternate years the delegations hold sessions in Vienna and Budapest. They represent the parliaments of the two countries and have legislative power relating to the army and navy, finance, foreign relations, diplomatic service, and other affairs of interest to both countries. Each country has an independent local parliament, in which the several provinces are represented according to population.

The divisions that constitute the lands of the Hungarian crown, besides Hungary, are Fiume, Croatia, Slavonia, and Transylvania. The crown lands of Austria, besides Austria proper, include Salzburg, Styria, Carinthia, Carniola, Tyrol, Vorarlberg, Bohemia, Moravia, Silesia, Galicia, Bukowina, Dalmatia, and the coast districts of Görz, Trieste, Istria, and Gradiska. The provinces of Bosnia and Herzegovina constitute imperial territory of the Austro-Hungarian empire. Francis Joseph I. is the reigning sovereign, whose official title is Emperor of Austria and King of Hungary. Financially the country is on a gold basis, though the krone, the standard coin, is not coined in that metal. The monetary system is on a decimal basis or scale of numeration.

The government of Austria, independent of Hungary, is an empire. Legislative power is vested in the *Reichsrat*, which consists of two branches, the *herrenhaus* and the *abgeordnetenhaus*. The emperor has concurrent legislative power with the *Reichsrat*, and concludes treaties, grants pardons, issues decrees, and may summon or dissolve the *Reichsrat*, but his decrees and acts must be countersigned by the prime minister, who is held responsible to par-

liament. Eight ministers, each presiding over a department, and two ministers at large, discharge the advisory functions of the executive department. The emperor appoints a governor for each province or department, which is divided into *districts* and *communes*. The supreme court of justice and cassation, located at Vienna, has supreme jurisdiction over the system of district, circuit, and inferior courts.

In Hungary the constitution is based on the Golden Bull of 1222 and succeeding statutes and decrees relative to the autonomy of that country. The king does not exercise so great an influence in the government as in that of Austria, and decrees, like in Austria, become valid after being countersigned by a responsible minister. Legislative authority is vested in the Parliament, which is composed of the two houses known as the table of magnates and the house of representatives. In the upper house, or table of magnates, the membership consists of the nobility, the royalty, and certain dignitaries of the churches, and in the lower house the members are elected by popular male suffrage. A minister president and nine ministers, each ruling a department, exercise executive power and are responsible to the Parliament. Local government is administered by the 63 *counties*, each having a governor, and the counties are divided into districts known as incorporated *towns*, *communes*, and *presidencies*. The judiciary branch of the government is modeled after that of Austria.

**HISTORY.** The history of the region now included in Austria-Hungary is more or less associated in its early phases with that of Rome and the empire of the West, and subsequently with the Germanic tribes that passed in successive waves from the regions farther north. Austria as a political power may be said to have taken its rise in 791, when Charlemagne took possession of the region between the Ens and the Raab, driving the Avars from that territory. The Hungarians invaded Germany in 900, when part of the region now included in the country became subject to that people, under whose control it remained fifty-five years, when it was again united with the German Empire under Otho I. From 932 till 1156 it was under control of the counts of Babenberg, became a duchy in the latter year, and received additional territory in 1192, when Vienna became its capital. In 1246 the male line of the house of Babenberg became extinct, and the German emperor, Frederick II., proclaimed the region hereditary property of the German sovereigns. It passed to the house of Hapsburg in 1282, whose original possessions were in Switzerland,

IN 1910 THE UNITED STATES PRODUCED \$250,000,000 WORTH OF AUTOMOBILES. THIS PICTURE WAS TAKEN  
AT AN AUTOMOBILE SHOW THAT YEAR.

and is still the ruling house of the empire. Rudolph of Hapsburg was one of the early sovereigns, was succeeded by his son Albert, who in 1301 obtained the Swabian Margraviate, and at his death in 1308 Austria had an area of 26,000 square miles. Albert V., son-in-law of Emperor Sigismund, is the next monarch of marked influence. He was complicated in the Hussite War, assisting Sigismund in that contest, became Emperor of Germany in 1438, and was succeeded in 1457 by Ladislaus, his posthumous son, and since then the Austrian monarchs are represented in an unbroken German line.

The subsequent history of Austria is more or less closely associated with that of Prussia until in 1866, when the latter country established its preponderance of power at the Battle of Sadowa. Subsequently Italy, which had been more or less under the influence of Austria, became an independent and united state, and Prussia became the head of the German Confederation in the North. Within the period of alliance between Austria and Prussia, the former was involved in many noted conflicts. It bore a prominent part in defending Christianity against the advances of the Turks from Constantinople, was an important battle ground in the Thirty Years' War, exercised a wide influence in the War of the Spanish Succession, and shared in the Napoleonic Wars. Among its most eminent sovereigns are Maximilian II., Maria Theresa, and Emperor Francis Joseph I. Francis II. of Austria was the first sovereign to take the title of Emperor of Austria, which he did as Francis I. in 1804, and it was within the period of his reign that the German provinces became united and sent a powerful army to join the Russian and British allies against Napoleon, thus causing the overthrow of the latter. He was succeeded at his death in 1835 by his son, who ascended the throne as Ferdinand I., and in 1848 succeeded in overthrowing the revolutionary movement led by the Hungarians under Kossuth. Ferdinand abdicated in favor of his nephew, Francis Joseph I., who joined the German states in 1864 in taking territory from Denmark, but two years later Austria and Prussia became permanently separated.

Since the *Ausgleich* of 1867, the government has given marked attention to the internal affairs of the empire, encouraging railroad building, the extension of educational arts, and the furthering of industrial and commercial enterprises. In 1878 the domain of Austria was enlarged by the addition of the provinces of Bosnia and Herzegovina, this resulting in con-

sequence of the war between Russia and Turkey. These provinces were placed under the crown by the Treaty of Berlin for administration and military occupation only, which remained their condition until 1908, when they were annexed as imperial territory by a proclamation of Francis Joseph I. Subsequently Austria entered the famous *Dreikaiserbund* with Germany and Russia, which pledged friendship and cooperation among the three great powers. Though materially progressive in furthering the industries and the educational arts, the government has experienced various difficulties regarding the use of a language as a universal tongue of the empire, though German is official and is most generally spoken. However, the Czech, Polish, and other constituents have insisted upon a recognition of their languages in the schools and in the general assemblies. The literature of Austria proper belongs almost exclusively to the German, but there is a considerable accumulation of valuable writings in the Polish, Czech, and Bohemian, the latter having its greatest representative in John Huss. See **Hungary**.

**AUTODAFÉ** (a'tô-dâ-fâ'), a public ceremony instituted at Seville in 1481, and used in connection with the inquisition in Portugal and Spain. It consisted of a sermon preached to those charged with crime, and at its close the names of those found guilty were announced, while those found not guilty were discharged. The guilty were soon after executed.

**AUTOMATON** (a-tôm'â-tôn), a self-acting machine, such as a clock or watch. The name is likewise applied to a figure made in imitation of an organic being, as a toy turtle with means to propel itself, or a machine performing actions like a human being. The construction of automata dates from a period far remote, before the Christian era, and some of the devices produced became noted. In 1851 a mechanism was exhibited at London which fluttered its wings and imitated the note of the bullfinch. Another product was in the human form and did writing and drawing by clockwork. The famous clock at Strassburg, Germany, is the most noted automaton in existence.

**AUTOMOBILE** (a-tô-mô'bîl), a vehicle propelled by electric power, gas, steam, or any other force stored or located within the machine. These mechanical structures may be divided into three general classes, including those used on roads for carrying passengers or goods, those designed for vehicles to be employed in place of carriages, and those in the form of bicycles or tricycles to increase the

speed and relieve the rider from the exertion accompanying the treading of pedals. The first automobiles were manufactured as early as 1860, but a high state of perfection was not

TOURING CAR (AUTOMOBILE).

reached until about 1898. While the early vehicles were too clumsy to insure great speed, those of recent manufacture serve a useful purpose by combining speed with utility.

Automobiles are made in a great variety of forms and differ vastly in size and capacity. This was demonstrated at the Saint Louis Purchase Exposition, where fully 500 styles of American and foreign manufacture were exhibited. The electric vehicles, in which current is supplied from a storage battery, continue to remain popular, owing to the movement being attended with less noise and the propelling force supplying power for longer distance than in any other form. However, gasoline vehicles are used most extensively, partly from the fact that electric power cannot be secured in all places and its expense is somewhat greater. Electric batteries of a high class are capable of propelling the machine a distance of 500 miles where reasonable precaution is used.

Much has been done in recent years to make the automobile more popular and extend its use both in pleasure-riding and for the more practical purposes in business. The industry of manufacturing has grown to such proportions that it has been possible to turn out a standard car which is superior in construction and lower in price. At present the most popular vehicle is a four-cylinder touring car of twenty-four to twenty-eight horse power, weighing from 2,000 to 2,200 pounds, or a thirty to thirty-five horse power, weighing from 2,200 to 2,400 pounds. The wheels are thirty-two to thirty-four inches in diameter, with large tires about four inches in diameter. It has a four-cylinder motor housed in a bonnet in front, and the power is transmitted by shaft-drive and bevel gears to a live rear axle. Almost perfect lubrication of the engines is obtained by a continuous circulation secured from a mechanical

forced-feed oiler, the oil passing through feed glasses carried in sight at the front of the machine on the dashboard. The cone clutch has given place to a multiple-disk clutch, whose disks run continually in oil, and the clutch takes hold without jar or jerk. By this simple arrangement it is possible to start a car from a standstill to a high speed without danger of breakage.

Automobiles are used extensively in cities for draying and as passenger omnibuses. In some places boulevards and automobile tracks are maintained, and a great many sight-seers prefer to use automobiles rather than teams in pleasure-riding and touring. The speed has been enormously increased until now a rate of fifty to sixty miles an hour is considered fair riding in long-distance races.

Several manufacturers brought out two-cylinder motor cars with twenty-five horse power, the touring car weighing 1,700 pounds. There is a manifest advantage in a two-cylinder motor car, since lighter weight and greater simplicity can be obtained. This model will gain favor as soon as the small range of speed and the difficulty of keeping the crank case tight can be overcome. Probably the two-cycle, four-cylinder, mechanically air-cooled type will be the popular structure for the future. However, a majority of cars still use water-cooling by means of a centrifugal circulating pump, even for the high-powered cars, but the air-cooled type is gaining ground and will likely prove the more desirable. Air-cooled motors of the two-cycle type, 200 horse power, are in use by railroad companies. Several manufacturers of farming implements have put out a large number of low-g geared automobiles for farm use, fitted to move harrows, plows, and other farm implements. It is claimed by the manufacturers that this new departure will displace the horse to a large extent in the course of time.

The sixth annual automobile race for the James Gordon Bennett cup took place in France, July 5, 1905. It was run over the Auvergne course, which describes a circle eighty-five and a half miles, the total distance in four rounds being 342 miles. R. B. Thery, of France, won the race in seven hours two minutes and forty-two seconds, making an average speed of 48.5 miles an hour. The fourth race for the Vanderbilt cup was won by George Robertson, representing an American machine, Oct. 24, 1908, on Long Island. The total distance was 258 miles and the winner made an average speed of 67.6 miles per hour. H. W. Fletcher made a notable record in the races at Ormond, Fla., running one hundred miles in one hour eighteen

minutes and twenty-four seconds. Records of this class are made in eighty to ninety horse power cars. They stand as representative in the matter of speed and were not materially surpassed up to 1909.

Long trips in motor cars have become popular, and much touring is done by those who otherwise would travel by railway in foreign and remote countries. It is not uncommon for tourists to cross the American continent from the Atlantic to the Pacific, or to drive automobiles long distances across plains and over mountains. Of such trips made in 1908 the run from New York City to Paris may be taken as the most important. Ten cars were entered for the trip, of which four were American and six of European manufacture, one German, two Italian, and three French. The route across the American continent was from New York to San Francisco, whence it was to be by steamboat to Valdez, Alaska, and thence northwest to Bering Strait. From Bering Strait the route was planned through Siberia by way of Saint Petersburg to Paris, but deep snow in Alaska and Eastern Siberia made it necessary to ship the machines by steamboat from the Pacific coast to Vladivostock. The German car reached Paris ahead of the others, but the decision was given in favor of the American car, as the German driver had been required by reason of a breakage to ship his car by rail some distance in California.

**AUTONOMY** (a-tŏn'ō-mŷ), the self-government of a city or state. The term probably originated in ancient Greece, in which country most of the cities were independent for general purposes.

**AUTOPLASTY** (a'ŧō-plās-tŷ), a surgical operation in which lesions are repaired by using tissues taken from another part of the body to supply deficiencies caused by disease or wounds. Operations of this kind are performed to restore the use of an organ or improve the appearance, and the parts taken may be from the same or some other individual. In many cases the skin is taken from the body of an individual to repair lesions resulting from scalds or burns, or in the case of hairlip. In India autoplasty was practiced in ancient times and it is referred to by Celsus, but in Europe and America the practice is comparatively recent.

**AUTUMN** (a'ŧŭm), the season of the year which follows summer, and frequently referred to as fall, referring to the fall of the leaves. In the northern hemisphere it extends from about Sept. 22 until Dec. 22, from the autumnal equinox to the winter solstice. In England it embraces the months of August, September, and

October, while in America the autumnal months are September, October and November.

**AUVERGNE** (ō-vārn'ŷ), formerly a province in Central France, now merged into Cantal, part of Haute-Loire and Puy-de-Dôme. The region is traversed by the Auvergne Mountains, a branch of the Cevennes Mountains, and their peaks are the highest of Central France. Among the most lofty summits are Puy-de-Dôme, 4,806 feet; Cantal, 6,095 feet; and Dore, 6,188 feet. Owing to peculiar volcanic and geologic formations, the region is one of scientific interest, and has been much studied by students. There are deposits of coal, copper, iron, and lead, and numerous mineral and thermal springs. The mountain slopes are covered with a fine growth of grass, while the valleys abound in fruits, cereals, and live stock.

**AVA** (ä'vā), the former capital of Burma, on the Irawadi River, opposite Mandalay, the present capital. It is surrounded by walls and has several Buddhist temples. Formerly it was a large city and commercial center, but it was destroyed by an earthquake in 1839. Population, 1901, 38,500.

**AVALANCHE** (äv'à-lānch), the name applied to masses of ice or snow that slide down the sides of mountains to lower levels. These masses differ somewhat in the nature of the falling material, this depending upon climatic conditions and the season of the year. Drift avalanches consist of dry or loose snow set in motion by the wind, and in falling or sliding accumulate larger masses in the descent, finally reaching the valley in clouds of dust-like snow. This class occurs in the cold seasons, and is attended by danger on account of a liability to destroy animals and buildings. Avalanches of a somewhat different character occur in the spring and at the seasons of melting snows. These cause the sod to be detached and carried with the snow down the mountain side, and in falling frequently create a draught of wind sufficiently strong to destroy buildings and even forest trees. Ice avalanches consist of ice masses that detach from glaciers in upper regions and slide with great force down the mountain-sides. The latter class are most common in the Alps of Europe, where much property and many lives have been lost on account of their damaging effects. A class of avalanches called snowslides occur in the Rocky Mountains, where they frequently form an obstruction to railroad trains. The term is also applied to landslides, which arise from quantities of earth becoming loosened near the upper part of an eminence and sliding to a lower elevation.

**AVE MARIA** (ä'vā mā-rē'à), meaning hail

Mary, a form of address used among Roman Catholics in addressing the Virgin Mary, as an expression of honor and when requesting her intercession. It is usually coupled with the recitation of the Lord's Prayer and is repeated three times each morning, noon, and evening at the ringing of the bells known as the Ave Maria or *Angelus Domini*. The term came into use from the salutation of Mary by the Archangel Gabriel, Luke i., 28, and the form of address was sanctioned by a papal edict in 1326. Pope Pius V. ordered the daily use of the whole prayer in 1658, consisting of the three parts: 1, "Hail Mary, full of grace, the Lord is with thee;" 2, "Blessed art thou, among women, and blessed is the fruit of thy womb;" 3, "Holy Mary, mother of God, pray for us sinners now and in the hour of our death."

**AVERAGE** (äv'ēr-āj), the mean proportion between two certain given quantities. To obtain the average the given number of quantities are added, and the sum is then divided by the number of quantities given. For instance, to find the average number of days in the months, add the days of the months, which, in a year not a leap-year, equal 365, then divide by twelve; the quotient is the average. In a similar way the averages of different quantities may be ascertained.

**AVERNUS** (ä-vēr'nūs), a small lake in Italy, about eight miles west of Naples, and now called Lago d'Averno. It occupies the crater of an extinct volcano, is a mile and a half in circumference, and about 190 feet deep. There is no natural outlet, but Agrippa made an artificial passage for its overflow into the Gulf of Baiae. Since then the passage has been closed up by volcanic action, and there is now no visible outlet. The scenery around the lake is wild and grand, and at various times sulphurous vapors arise, circumstances by which the people in ancient times were led to believe that Lake Avernus is the entrance to the infernal regions. It was dedicated to Proserpine, and, according to legend, Ulysses frequently visited there the ghosts of the dead. On the south side of the lake is a formation mentioned as the grotto of the sibyl, and near it are ruins of a temple dedicated to Apollo.

**AVESTA** (ä-věst'á), or **Zend-Avesta**, the sacred scriptures of the religion of Zoroaster, and in use by the Parsees as their Bible. The French scientist, Anquetil Duperron, translated it in 1771. This work in size is about one-tenth of our Bible, and at least portions of it date from remote antiquity. The Avesta represents the oldest faith of Iran and was the law of ancient Media and Persia. See **Parsees**.

**AVIARY** (ā'vī-ā-rŷ), an inclosure for breeding, rearing, and keeping birds. The first mention of aviaries is in connection with the ancient Persians, but later like structures were built in Greece and Rome, and in the 16th century similar inclosures were constructed in Western Europe. Excellent aviaries are now maintained in many of the zoölogical gardens of America and Europe, and in them may be seen beautiful birds of song and plumage from many climes.

**AVIGNON** (ä-vên-yôn'), a city of south-eastern France, on the Rhone River, capital of the department of Vaucluse. The city has extensive railroad facilities, is improved by gas and electric lights, pavements, and several fine parks, and is the seat of a number of schools. It has many fine churches, on account of which it is familiarly mentioned as the "City of Bells." These include the Notre Dame, a fine cathedral, which served as the residence of Pope Clement V. and six of his successors. The city was also the residence of Petrarch, and it was here that he formed the acquaintance of Laura, the lady whom he mentioned in several sonnets. In the 14th century the city had a population of fully 100,000, but it lost its importance through the fortunes of war. It has been a part of France since 1791. At present it has a considerable trade in silk, fruit, and manufactured articles. Population, 1906, 48,312.

**AVOIRDUPOIS** (äv-ēr-dū-poiz'), a standard of weights used for all articles of merchandise, except gems, medicines, and precious metals. The grain is the foundation of both the troy and avoirdupois systems. In avoirdupois weight the pound is divided into 16 ounces, the ounce into 16 drams, and the dram into 27 11-32 grains.

**AVON** (ā'vün), the name of several rivers in Europe, including one in France and several in the British Isles. The most important is the Avon River in England, which rises in Leicestershire, flows past Stratford, the birth-place of Shakespeare, and enters the Severn at Tewkesbury. It has a length of 100 miles, and its valley is noted for fertility.

**AVOSET** (äv'ō-sēt), or **Avocet**, the name of a bird belonging to the order of the *grallatores*, and represented by one species in America and one in Europe. The structure is quite similar to that of the snipe. The bill is long and feeble, the legs are long, the feet are webbed, and the plumage is variegated with black and white. These birds frequent low and marshy places, where they feed on worms, insects, mollusks, and aquatic animals. The avocet is a common bird in many parts of the United States and

Canada, but is met with most extensively in the regions of large marshes. The flesh is highly prized as food.

AVOSET.

**AX** (ăks), an instrument for cutting or chopping wood or timber, usually made with an iron head and a handle of wood. One edge is sharp for cutting. The ax is used with both hands, but a smaller instrument called a *hatchet* is intended for one hand. It has been in use from remote times, forming a useful implement for savage and civilized people. The first axes were made of flint rock, later of bronze, and finally of iron. In modern times axes came to be made of wrought iron with a cutting edge of steel, while some kinds have two cutting edges. The American Indians made hammers and hatchets of stone, the latter being popularly known as *tomahawks*. The *adz*, a tool used by carpenters for smoothing timber, has a chisel-shaped edge from four to five inches long.

**AXIOM** (ăks'i-um), a general statement which admits of no demonstration, and is taken for granted as a self-evident truth. Fundamental propositions and established principles underlie every science, and are to be taken by the student without proof as a basis for further argument. That he who admits a principle admits its consequences is an axiom in logic. Again, that the whole is greater than its parts is an axiom in geometry.

**AXIS** (ăks'is), a straight line, either real or imaginary, drawn through a body, around which that body may revolve. The term is applied in geometry to a line imagined drawn

through a plane figure, about which the parts of the figure or body are symmetrically arranged. In botany the term is applied to the central portion of the higher plant, on which are borne the appendages or lateral members. The root is termed the *descending axis*, and the stem the *ascending axis*.

**AYACUCHO** (ī-â-kōō'chō), a city of Peru, capital of a department of the same name, 240 miles southeast of Lima. It is located on a tributary of the Mantaro River, about 7,500 feet above the sea, and the surrounding country is agricultural. A fine church building, a university, and the government house are the chief public improvements. In 1824 it was the scene of a battle between the allied forces of Peru and Colombia and the Spaniards, in which the latter were defeated. Population, 1900, 22,000.

**AYE-AYE** (ăi'ăi), a small quadruped native to Madagascar, so named from its peculiar cry. It belongs to the lemur family, is about the size of a hare, and has a long bushy tail.

AYE-AYE.

The fingers are long, which it uses to secure the grub of wood borers, upon which it feeds, but it also eats fruits and the tender part of plants. During the daytime it sleeps and at night it goes out in search of food.

**AYR** (âr), a seaport of Scotland, in Ayrshire, at the mouth of the Ayr River. It is located about 35 miles west of Glasgow, with which it has connection by railway. The buildings include an academy, a public library, and several churches. The manufactures include carpets, boots and shoes, textiles, and earthenware. Having a good harbor on the Firth of Clyde, it exports coal and imports grain and iron ore. The cottage in which Robert Burns was born is about two miles south of Ayr, and near it are the Alloway Church and the Doon of Tam o'Shanter. Population, 1901, 28,624.

**AZALEA** (â-zâ'lê-â), a genus of plants of the heath family, many species of which are

cultivated in greenhouses and flower gardens for their beautiful and fragrant flowers. Fully 100 species have been described, though only

AZALEA.

a small proportion has been developed into cultivated plants. The flowers form in profuse umbelled clusters and in color are either purple, orange, white, or variegated. They thrive best in a sandy soil of peat or loam, and are well adapted to cultivation in shaded places. The azaleas are native to America and Eurasia; all the American species are deciduous.

**AZOIC.** See **Archaean.**

**AZORES** (ä-zörz'), an island group in the Atlantic Ocean, situated west of Portugal, and forming a part of that kingdom. The islands nearest Portugal are about 800 miles west from the coast, but the entire group is considered as belonging to Europe. These islands are of volcanic origin and are subject to earthquakes. Pico Alto, the highest volcanic summit, has a height of 7,540 feet. Pico, São Miguel, Santa Maria, and Terceira are the most important islands, and the entire group embraces an area of 1,005 square miles. The chief productions are tropical fruits, cereals, vegetables, and live stock. Vegetation partakes of luxuriant forms, the soil possesses fertility, and the climate is favorable to Europeans. The larger part of the inhabitants are Portuguese and Spaniards, most of whom are quite poor. The government has promoted the building of several railroad lines, and it has a number of canal and harbor improvements. Cabral discovered the Azores about 1431, claiming them in the name of Portugal. At that time they were entirely uninhabited by man, but plants, birds, and small quadrupeds were abundant. A species of hawks, called *açores* by the Portuguese, gave the name to the islands. Ponta Delgada is the capital and chief town, but Angra is the usual residence of the governor. Population, 268,590.

**AZOV** (ä-zöv'), or **Azof**, an inland sea of Southern Russia, forming a branch of the Black Sea, with which it is united by the Strait of Kertch. Though the sea is comparatively shal-

low, it is valuable for navigation by vessels of small draught, and yields an abundance of fish. Its greatest length is about 230 miles; breadth, 112 miles; and area, 14,000 square miles. The water is nearly fresh, owing to the large inflow from the Don River and several minor streams. In the Crimean War, in 1855, the Sea of Azov was the seat of great naval activity, which was directed with the view of cutting off the food supply and otherwise affecting Sebastopol.

**AZTECS** (äz'tëks), the name of the inhabitants of Mexico at the time of the Spanish invasion in 1513. Though the name is frequently applied to all the native inhabitants of Mexico at that period, it strictly belongs to only one of a number of tribes. According to tradition, the Aztecs came from a country which they named *Aztlan*, a region reputed to be situated northwest of Mexico, though its exact location has never been ascertained. The date of the exodus from *Aztlan* is fixed at 1164 A. D., and their arrival in the valley of Mexico is placed at 1216, when they succeeded the Toltecs, a superior race. In 1325 they founded the City of Mexico, naming it the City of Tenochtitlan from their chief Tenoch.

At the time of the Spanish invasion the City of Mexico offered considerable resistance to the Spaniards, owing largely to strong natural and artificial fortifications, and partly to the overwhelming numbers of the Aztecs. After successive assaults the city was occupied by the invading army under Cortez. At that time the people were given to war and idolatry, but they had obtained marked advancement in astrology and astronomy, taught the arts of reading and writing, and possessed considerable knowledge of architecture. They maintained many temples, which were built on substantial terraced pyramidal bases, numerous ruins of which still remain. The horse, ox, and other domestic animals were unknown to them, but, notwithstanding this disadvantage, they evidenced material advancement in agriculture, and cultivated large tracts of land in maize and agave. They possessed material skill in weaving, feather work, pottery, and metal work.

Much of the history of the Aztecs was recorded in hieroglyphics on the walls of temples and pyramids, and they not only prepared lunar calendars, but devised astronomical apparatus and designs of considerable value. However, they were given to superstition, and sacrificed human beings to their gods. Their legendary was quite extensive, containing numerous interesting details and accounts of heroes, teachers, and priests. The education of the young

devolved on a priesthood, which they supported by tithes. Their last ruler, Montezuma, was reigning when the Spanish made their invasion under Cortez. He was imprisoned and afterward killed by the Aztecs in their revolt against Spanish dominion. These people are of great interest to the student of history, since their civilization and government, though springing up mysteriously, resembled in many respects the archaic oriental institutions. Bancroft's "Native Races of the Pacific States" and Mara L. Pratt's "Cortez and Montezuma" contain interesting accounts of the earlier inhabitants of Mexico.

**AZURITE** (ăzh'ŭ-rīt), a carbonate of copper, found as an ore of copper and as an ornamental stone. It is crystalline, deep blue in color, and not hard enough for jewelry. Deposits of it occur in Arizona, where it is found in limestone and is accompanied by other ores of copper, such as limonite and malachite. It oc-

curs in small quantities near Lyons, France, and in Siberia. The Siberian azurite is cut in slabs and used for table tops. Some grades are useful as a pigment and others are quite hard and suitable for settings in jewelry.

**AZYMITES** (ăz'ī-mītes), the name used by the Greek Church to designate the Roman Catholic Church, because the latter had decided that unleavened bread should be used in the sacrament. The controversy as to whether leavened or unleavened bread should be used began about 1045, when Michael Caerulairus, patriarch of Constantinople, designated the use of unleavened bread as a remnant of Judaism. To this the Latin Church retorted by calling the adherents of the Greek Church Pro-zymites and Fermentarians. The unleavened bread or wafer is still used by the Roman Catholic Church, while many of the Protestant churches use the leavened bread.

## B

## BAB-EL-MANDEB

**B**, the second letter and the first consonant in the English alphabet, and in that of most Indo-European languages. It is a sonant element of speech of the class known as labial mutes. In some languages it is interchangeable with *p*, especially when it occupies a terminal position in a word or syllable. It is produced mostly by the lips, and combines the utterance of voice and breath. In music *B* is the seventh note of the diatonic scale of *C*, in which connection it is termed the *leading note*, calling for the octave *C* to follow it.

**BAAL** (bā'al), or **Bel**, a Hebrew and general Semitic term which implies lord, and used to designate different divinities. It was the name of the principal god worshiped in the nations of Canaan and Phoenicia, with whom Ashtoreth ranked as the principal goddess. These people regarded Baal the god of the sun, ruler and life-giver to the universe, and opposed to Moloch, who ranked as the god of destruction. Worship was at first conducted on the mountain tops among the Midianites, Moabites, and other peoples of Western Asia. In Greece the practice of mountain worship was attached to Hercules. Baal was an important divinity among most Semitic peoples, even among the children of Israel, from whose midst his worship was ultimately banished under severe punishment. From the word *Baal* other words commonly used have originated, among them Baalgad, Jezebel, Hannibal, Asdrubel, and Belshazzar.

**BAALBEK** (bäl-běk'), an ancient city in Syria, forty miles northwest of Damascus, famous for its ruins of magnificent structures of antiquity. One of the chief temples was dedicated to the sun. In its construction blocks of stone twelve feet thick and sixty feet long were used, as is evident from some of the columns and walls that are still standing. In the time of Julius Caesar the city formed a Roman

possession. It was sacked by the Arabs in 748, pillaged by Timur in 1400, and completely destroyed by an earthquake in 1759. Some of the ruins are the most massive as well as extensive in the world, among them those of the temple of Jupiter, which is still larger than the Parthenon at Athens.

**BABBITT METAL** (băb'bit mět'al), a soft alloy made by melting together two parts of copper, six parts of tin, and four parts of antimony, and then adding six parts more of tin. A little powdered charcoal is used to prevent the metal from oxidizing. Babbitt metal was first made by Isaac Babbitt, a goldsmith in Boston, and is used to reduce friction, abrasion, and heat in the bearings of axles and journals.

**BABEL** (bā'běl), **Tower of**, a great tower mentioned in Genesis xi. It was situated in the land of Shinar, Mesopotamia, and was built by the descendants of Noah. The tower was to reach unto heaven, but the language of the builders was confused by God, so they could not understand each other, and the work was abandoned. The Babylonians and Greeks had a similar account of a great tower. It is said that when the giants sought to scale the heavens they were overthrown by Zeus. Several ancient writings make it probable that the Tower of Babel was located at Babylon, and that it was completed by Nebuchadnezzar, the great king. Tourists are referred to several ruins on the site of the ancient city; those most probably authentic are at a place called Amram, and form a mound 150 feet high, with a base over 3,000 feet long and 2,500 wide.

**BAB-EL-MANDEB** (băb-ěl-măn'děb), meaning *Gate of Tears*, a cape and strait in the southern extremity of Arabia. The strait is fifteen miles wide, and connects the Red Sea with the Arabian Sea and the Indian Ocean through the Gulf of Aden. The island of Perim divides the strait into two channels, the western

of, which is twelve and the eastern two miles wide.

**BABIRUSSA** (băb-ĭ-rōōs'să), or **Babyrussa**, a wild hog native to the islands of Buru and Celebes. It has slender legs, is almost without hair or bristles, and feeds upon fruits and plants instead of rooting in the ground. In the male the canine teeth grow upward and form tusks, sometimes from eight to ten inches in length, and curve backward like horns. The flesh is eaten by the natives.

**BABISTS** (băb'ĭsts), the name of a sect of Mohammedans founded in 1843 by Ali Mohammed ibn Redha. Babism teaches that Christ, Moses, and Mohammed were prophets and forerunners of the Bab, who is considered the greatest of the prophets. It recognizes the equality of the sexes in social matters, opposes polygamy, and permits the remarriage of the divorced women, though in spirit it opposes the granting of divorces. A civil war resulted from the agitation of the Babists, who secured many adherents, and the Bab was captured and shot at Tabriz in 1850. The total number of Babists is about two million.

**BABOON** (băb-ōōn'), the name applied to a division of apes and monkeys found in Asia and Africa. They are among the largest of this class of animals and possess great strength. Most species have long, abrupt muzzles, like a dog, short tails, deep eyes, large eyebrows, and strong teeth. They belong to the quadrupeds, run swiftly on all fours, and cannot maintain themselves with ease in an upright posture. They are fierce, ugly, cunning, and dangerous

BABIRUSSA.

when attacked. Their size is that of a large dog, but the *mandrill*, a species of baboon, is about the size of a man when standing erect. These animals live in colonies or herds, have recognized leaders, and carry on warfare against

kindred herds and against other wild animals. Their food consists of twigs, roots, fruits, and grasses, but they sometimes eat lizards, birds,

BABOON.

and similar small animals. The *common baboon* is found in large parts of Northern Africa, the *gelada* in Abyssinia, the *chacma* in Southern Africa, and the *black baboon* in Celebes. In many localities incessant war is waged against them on account of their ravages in the gardens, cultivated fields, and meadows.

**BABYLON** (băb'ĭ-lōn), the capital of the Babylonian Empire, on the Euphrates River, anciently one of the largest and most beautiful cities of the world. It was founded by Queen Semiramis, who spent many years and employed thousands of workmen in its improvement. Mention is made of it as a great city as early as 1500 B. C., but its importance dates from about 680 B. C., when it was reconquered by Sennacherib, and made one of the two capitals of Assyria. After the fall of Nineveh, in the time of Nebuchadnezzar, it was improved in magnificent style, and at that time attained its greatest glory. The city was built in the form of a square, each side of which was fifteen miles long. High and massive walls fortified it against its enemies, while in it were the most beautiful edifices, terraced structures, pleasure gardens, verdant parks, and the *hanging gardens*, one of the seven wonders of the ancient world. The celebrated Tower of Babel, or Temple of Belus, a remarkable structure of brick and stone, stood within the city, and was 625 feet high. The surrounding country was beautified by gardens, orchards, canals, and commercial highways. Both sacred and profane history make mention of this city as the

most beautiful and one of the greatest of remote antiquity.

Babylon was conquered by Cyrus, King of Persia, in 538 B. C., who entered it by the river channel, having previously turned the water from its course by a great canal. It then became a part of the Persian dominion, and with this conquest began a rapid decline. When Alexander the Great led his expedition into Asia, he found the city greatly damaged, but still beautiful. He undertook to rebuild it with 10,000 men, but after two months' labor gave up the enterprise. Subsequently, the city declined rapidly, crumbling away on account of successive wars. In its ruins were found many curious and valuable relics, among them divers cuneiform inscriptions and casts, some of them throwing much light upon ancient history. Most of the material, such as brick and stone, was used in building up the new City of Seleucia, which was founded by Seleucus, the successor of Alexander the Great.

**BABYLONIA** (băb-ĭ-lō'nĭ-ā), the name of an ancient country on the Lower Euphrates; the region occupied by it is now called Irak-Arabi. Ancient writings indicate that the empire was located south of Mesopotamia, west of Assyria, north of the Gulf of Persia, and east of the Desert of Arabia, but during its greatest prosperity it included Assyria, Mesopotamia, and practically all of Western Asia. In sacred history it is referred to as the land of the Chaldees, and also mentioned as Babel and Shinar. The region has ranked for ages as one of the most fertile districts in Southwestern Asia. Anciently its fertility depended, not alone upon nature, but a large number of irrigating canals and aqueducts were maintained to supply the soil in arid districts with moisture sufficient to insure production. From the Grecian historian, Herodotus, who made several visits to the site of this once great empire, we learn that it supplied its own people and one-third of the population of Persia with corn and other cereals. Its civilization is as ancient as the civilization of Egypt, perhaps, beginning with the year 4000 B. C., but historic records reveal nothing back of the year 2400 B. C.

**PEOPLE.** The inhabitants of Chaldea consisted of a mixture of Hamites, Semites, and other classes. Their languages and races were mixed at all times. One of their earliest leaders was a noted hunter named Nimrod, who organized separate tribes under a single government. Later Abraham, the first of the Israelite fathers, ascended the Euphrates and subsequently the Assyrians built great cities on the Middle Tigris. Some writers regard the Babylonians as a

branch of the Semitic stock and class the non-Semitic elements as primitive Aryan tribes. They assert that the inscriptions found on monuments prove beyond a doubt that the cuneiform writing was first used for a non-Semitic language. This language they term Sumerian and trace it to the Aryans, whom they regard the real fathers of Babylonian culture. Babylon, known to the Hebrews as Shinar, was the capital and largest city of Babylonia. It was the center of Babylonian culture and influence. Besides Babylon, the principal cities were Euech, Ur, Calneh, Nippur, and Sippara.

**HISTORY.** Little is known of the early history of the Babylonians, though they possessed many works in geography, history, astronomy, and poetry, and accumulated extensive libraries. The earliest writer of whom we have any information is Berosus, a priest, who lived in the time of Alexander the Great, and wrote a history of his country largely from the records of the Temple of Belus. While this work is lost, portions were quoted in other books, and from them we have secured considerable information of the early history and customs. According to this source of information, the Chaldean dynasty reigned from 2001 to 1543 B. C., the Arabian dynasty from 1543 to 1298, and the dynasty of forty-five Assyrian kings from 1298 to 772, and that the reign

OBELISK OF NIMROD.

of Pul extended from 772 to 747 B. C. From this history and the descriptions of Herodotus we learn that successive wars brought Babylon and Nineveh into close relationship. Pul reigned twenty-five years as Emperor of Assyria and Babylonia, and was known in the

former by the name of Tiglath-Pileser III. and in the latter by the name of Pul.

In 722 Assyrian sovereignty was thrown off under the leadership of Baladan II., but twelve years later Babylonia was again conquered. When the northern neighbor declined, Babylonia regained its power and rose to a height never before attained. Nebuchadnezzar was its greatest king. He reigned from 604 to 561 B. C., reconquered lost provinces, rebuilt canals, erected palaces and temples, constructed great aqueducts and lighthouses, and made Babylon, the capital, once more the greatest city of the nations. He conquered Jerusalem, carried the king and a large portion of his subjects into captivity, and later destroyed the Jewish capital. To gratify his Median wife and remind her of her mountain home, he built great towers, the hanging gardens, and beautiful parks, and ornamented them with rare trees, grasses, foliage, and flowers. After the death of this mighty king, the empire survived but twenty-four years, when Nabonidus and Belshazzar were conquered by Cyrus the Great, King of Persia, in 538. About two centuries later, in 328, it was made a part of the dominion of Alexander the Great, who undertook to rebuild the capital city, and subsequently was conquered by rulers of Syria, Parthia, Rome, and the caliphs of Bagdad. Later it fell under the dominion of the Turks and Tartars. The only remains that mark the once powerful empire are scattered tribes who descended from the ancient Babylonians and the ruins of its great cities.

**BABYLONISH CAPTIVITY** (băb-ĭ-lō'-nĭsh căp-tĭv'ĭ-tŷ), the deportation of a large portion of the leading inhabitants of Judah, under Nebuchadnezzar, in 588 B. C., after the fall of Jerusalem. The term is likewise applied to a prior captivity, in 597, when many Israelites were deported to Babylonia. While the principal part of the Jews were in captivity, Zedekiah became king over the remainder, but he was vanquished and the kingdom of Judah was brought to an end by the powerful Chaldeans. While in captivity, they were allowed religious freedom. At this time Ezekial, one of the great prophets, gave spiritual inspiration to the despondent people, and they were finally liberated when Cyrus overthrew the Babylonian Empire in 538 B. C.

**BACCALAUREATE** (băk-kă-lă'rê-ăt), the degree of bachelor of arts, which is the lowest of the academical degrees conferred by the institutions of higher learning. A baccalaureate sermon is a farewell discourse to a class of graduates, usually delivered the last Sunday before graduation.

**BACHELOR** (băch'ê-lěr), a male of marriageable age, but who is unmarried. When he passes the age at which most men are married, thirty years, he is called an old bachelor. In many countries a special tax is imposed upon male celibates, on the ground that every citizen should bring up legitimate children as a support of the State. In Greece and Rome bachelors were denied many of the privileges accorded citizens.—Bachelor of Science (B. S.), Bachelor of Arts (B. A.), and other similar terms are used to designate the completion of certain college or university courses of study.

**BACKGAMMON** (băk'găm-ŭn), a game played with dice upon a board or table made for the purpose. The table has two compartments, each with twelve points, six points on each side, or twenty-four in all, and the points are colored alternately red and black. Two persons play the game, each of whom has a dice, which is thrown with the view of moving the "men" or checkers, of which there are fifteen for each player, onward or in such a manner as to bring his own men into his own inner table and to prevent his adversary from doing the same. The game requires skill and has long been a favorite pastime in England, where it is said to have originated.

**BACON** (bă'k'n), the name of a kind of cured pork, taken from the sides and back of the hog. It is cut in large pieces and salted in a dry condition, after which it is smoked. The best grade is derived from the part of the hog in which the fat is mixed with lean meat. Large quantities of bacon are prepared in packing houses and sold in markets or exported, and considerable is packed in sealed tin cans ready for domestic consumption. Bacon is either boiled or fried before being served. It is a favorite article of food, especially when fried with eggs.

**BACTERIOLOGY** (băk-tē-rĭ-ōl'ō-gŷ), the division of botany that treats of *bacteria*, which are minute vegetable organisms. Few sciences have more practical value to mankind, since a knowledge of it tends to promote the protection of the human body, as well as that of plants and animals. There are many species of bacteria, some harmless and others harmful to man, but all are of more or less value in the economy of nature. They are extremely minute organisms, consisting of single cells; either single spherical, rod-shaped, oval, corkscrewlike, or of aggregates of such cells. They multiply by transverse division and by spores, some species increasing so rapidly that a single bacillus will produce several million new organisms in twen-

ty-four hours. These forms of life are not only among the smallest, but also among the simplest. The spherical bacteria appear as mere specks of protoplasm under the microscope, in which it is impossible to detect either cell wall or nucleus. This class include the *micrococci*, many of which are colored, and some cause dreaded diseases in man and the lower animals.

Such diseases include erysipelas and acute croupous pneumonia. Measles, yellow fever, cerebro-spinal meningitis, typhoid fever, diphtheria, leprosy, consumption, and tetanus are other diseases due to different forms of bacteria.

*Bacterium* and *bacillus* are generic names of most of the straight-rod forms, *spirillum* is a long wavy form, and *vibrio* is a curved form. The form that causes the Asiatic cholera is shaped like the comma of punctuation, and is called *bacillus comma*. A form of bacillus about a third longer and more slender causes the disease known as consumption, and may be seen by examining the sputum of a consumptive. *Saprophytic bacilli* are organisms that live on dead organic matter. They are of great value in the economy of nature in that they resolve the tissues of dead matter into simple compounds, as water, ammonia, and carbonic acid, thus supplying these necessary substances for growing plants.

Bacteria are widely diffused in the air, water, soil, clothing, mucous membrane, and on the surface of bodies. The poisonous effect is due to the growth of bacteria, the poisons being known as *ptomaines*, or *saprophytic*, and *tox-albumins*, or *parasitic*. As an example of the former we have the poisoning caused by eating sausage and ice cream; and of the latter, the poisonous effect of the toxin to which diphtheria is due. The forms of bacteria which cause putrefaction are convenient in laboratory study, but different forms may be artificially cultivated.

For the study of the life history of these organisms, the bacillus of hay is commonly suggested. If a quantity of hay be moistened with water, it will become cloudy in a few days. The

microscope will reveal an innumerable number of bacilli swimming in a drop of the water, but after several days the solution will become clear and all evidences of life cease. However, it will be found that long threadlike forms have gathered in the scum, each thread consisting of a number of cells. The cell walls of these threads break after some time and sink to the bottom along with the spores that have developed. These spores remain at rest as long as they are not taken out of the solution in which they are formed. They now constitute a jellylike mass, which is called the *zoogloea* stage. In this spore form the mass will stand drying, and small particles may be carried as dust in the atmosphere, thus giving rise to infection.

Most forms of bacteria are destroyed by boiling a few minutes, but some kinds, as certain bacilli, in the spore form resist a temperature of 212° Fahr. several hours. Bacteriology as a study had its beginning in 1675 when important discoveries were announced by Anthony Leeuwenhoek (1632-1723), a native of Delft, Holland. However, it was not fully grounded as a science until 1881, when Dr. Koch (q. v.) gave the world important reports of discoveries regarding bacillus tuberculosis, the causal agent in the disease tuberculosis.

**BACTRIA** (băk'trĭ-ă), or **Bactriana**, the name of an ancient country of Asia, located between the Amu or Oxus River and the Hindu-Kush Mountains. It is supposed to have been identical with the modern province of Balkh, and is regarded the native country of the Aryan people. In the 3d century B. C. Bactria was a powerful kingdom, and was ruled by a dynasty of Greek origin. Buddhism obtained a strong foothold at the beginning of the Christian era. Subsequently it became subject to Bokhara and with it passed under the dominion of Russia in 1868.

**BADAJOS** (bă-dă-hōs'), a town in Spain, capital of a province of the same name, on the Guadiana River. It is near the boundary of Portugal, 130 miles east of Lisbon, with which it has connection by railway. An old cathedral, a Moorish castle, and several monasteries are among its buildings. The manufactures consist chiefly of delftware, woolens, and leather goods. Wellington captured it in 1812. Population, 1900, 30,899.

**BADEN** (bă'dĕn), a watering place in Austria, 15 miles southwest of Vienna. It is noted for the warm sulphur springs in its vicinity, whose temperature ranges from 72° to 97°. The town has a number of fine buildings and fashionable hotels, and near it is the royal hunt-

ing lodge known as Meierling. The springs were known in the time of the Romans and a number of coins and antiquities of Roman origin have been found in the vicinity. Population, 1906, 18,750.

**BADEN**, or **Baden-Baden**, a city of Germany, in the duchy of Baden, famous as a summer resort. It is situated eighteen miles southwest from Karlsruhe, on the hills of the Black Forest. Near it are some of the most noted and healthful thermal baths in Europe. These cause it to be visited by many thousands annually. The city is well known in history, having been founded by the Roman Hadrian in the 2d century, when it was known as *Civitas Aurelia Aquensis* (watering-place of Aurelius). Its springs were famous throughout the Middle Ages, and long attracted all classes who were in search of pleasure or health. The springs have a temperature of from 100° to 150°, and discharge about 4,500 cubic feet of water daily. The water is used for bathing, manufacturing, and shipping purposes. It is applied medicinally in cases of gout, skin diseases, rheumatism, and other ailments. The city has fine public promenades and gardens, and the highways are ornamented with flowers and foliage. From the heights near the city may be seen the waters of the Rhine. Population, 1905, 16,237.

**BADEN, Grand Duchy of**, a state in the southwestern part of Germany. It is bounded on the north by Bavaria and Hesse-Darmstadt, east by Wurttemberg and Bavaria, south by Switzerland, and west by Rhenish Bavaria, Alsace, and Lorraine. Toward the south of it flows the Rhine, which separates it from Switzerland. The area is 5,821, exclusive of Lake Constance, and in size it takes fourth rank among the states of Germany. It contains the Black Forest, or Schwarzwald, on the highlands of the southern part, and its northern portion is a plain. The drainage is to the North Sea by the Rhine, and to the Black Sea by the Danube. The soil is fertile, especially along the Rhine valley. Its highlands abound in valuable minerals, including iron, zinc, coal, nickel, salt, and limestone. Mineral and thermal springs are abundant at Baden and in the highlands.

Baden is governed under a constitution that dates from 1818, and by which the sovereignty is vested in the eldest of the male line. The grand duke and one-third of the inhabitants are Protestants; while two-fifths are Roman Catholics. Two universities are maintained at Freiburg and Heidelberg, with an attendance of 2,500 students, and the public school system is on a popular and progressive

basis. The state has extensive railroad lines, well built highways, many manufacturing cities, and large vineyards. The manufactures consist of woolen and silk goods, beet sugar, musical instruments, machinery, wine, soap, and earthenware. Large interests are vested in the manufacture of clocks, employing about 12,000 people. The government of the state is under a duke and a Parliament located at Karlsruhe; the latter consists of two departments, but is limited in its legislative powers by the constitution of the German Empire.

In early history Baden was inhabited by savage tribes classed with the Alemanni, who were subdued by the Romans under Hadrian. The controlling house now in power began in the 11th century. In 1815 Charles Ludwig joined the German Confederation, in which Baden held the seventh rank. In 1866 it sided with Austria against Prussia, but was united soon after with the North German States. When the Franco-Prussian War broke out, in 1870, Baden took an active part against France, and was restored to the German Empire on Nov. 15, 1871. Karlsruhe is the capital, and Mannheim is the chief commercial center. Population, 1905, 2,010,728.

**BADGE** (băj), a mark, sign, or token worn on the dress to show the relation of the wearer to the government, or to some society or organization. It is either conferred by the State or assumed by the individual for the purpose of distinction. The garter of the English knight was conferred by public authority, so also were the golden fleece of the Spanish grandee and the button of the Chinese mandarin. Societies, as the Good Templars, the Grand Army of the Republic, and civic societies, confer badges as marks of distinction. Many conventions, notably those of political parties, authorize badges as a symbol to distinguish delegates claiming seats.

**BADGER** (băj'ěr), a quadruped mammal common to America and Eurasia. It is clumsy and awkward in its movements. The legs are thick and short and the feet are straight, while the forefeet are armed with long claws. Among the typical species are the American, the European, and the balisaur, or sand badger, of India. The American badger is grizzled-gray with one or more white stripes on the face. It is about two feet long, including the tail, which is short. It burrows in the ground and spends the days in sleeping, but comes out at night to feed upon roots, small animals, and insects. Its fur is a valuable article of commerce and its flesh is eaten. This animal was once very abundant in Wisconsin, hence its

popular name—Badger State. The European badger resembles the American in size and

EUROPEAN BADGER.

color, but the balisaur is larger and resembles a small bear.

**BAD LANDS** (băd lăndz), a region of North America, situated principally in the upper drainage basin of the Missouri River. The section of country designated as bad lands is made up largely of sand and gravel, with here and there rocks and irregular horizontal strata of clay and limestone, and is peculiarly destitute of vegetation. The rainfall is scant, though small grasses are met with in some sections, and in others the vegetation consists largely of sage brush. Medora, N. D., is surrounded by bad lands, and from that point they extend north and south. Tracts of considerable size that may be classed as bad lands occur in the vicinity of the Black Hills, and in some sections of Texas, New Mexico, Arizona, Nebraska, and Colorado.

**BAFFIN BAY**, a gulf or sea on the northeast coast of North America, extending between British America and Greenland. It is about 800 miles long, has an average breadth of 280 miles, and a depth of about 7,000 feet. It is connected with the Atlantic Ocean by Davis Strait, and with the Arctic Ocean by Lancaster and Smith sounds. Through it pass currents to the south, but at least one is known to move northward around Cape Farewell. The tide waters rise about ten feet. Its shores are steep and lofty, and are inhabited by fur-bearing animals common to the northern climates, and thousands of gulls and sea-fowls. It was discovered in 1616 by William Baffin, after whom it was named. It is navigable only four months in the summer, owing to its waters being frozen. The bay is valuable for whale fishing, and the adjacent region is rich in minerals and fur-bearing animals.

**BAFFIN LAND**, an island west of Greenland, a colonial possession of Great Britain, and a part of the Canadian district of Franklin. The climate is severe, similar to that of Greenland, and the surface is mountainous. Along the coasts are a few settlements of Eskimos, but there are few inhabitants and the area is unknown.

**BAGATELLE** (băg-à-těl'), a game played on a cushion-rimmed table with a cue and spherical balls. It resembles billiards. The table is about seven feet long and three feet wide. Nine cups or sockets large enough to receive the balls are at the end, and the game consists of driving the balls into the openings.

**BAGDAD** (băg-dăd'), or Baghdad, the seat of government of a vilayet of the same name, in the southeastern part of Asiatic Turkey. It is situated on the banks of the Tigris River, which is crossed by several pontoon bridges. The city is surrounded by a wall forty feet high, with four gates, and is otherwise well fortified. It was founded about 762 A. D., and built of material taken from the ruins of Seleucia. The streets are mostly narrow and illy paved, but some of the bazaars are large depositories of Asiatic and European manufactures. Among the chief buildings are the citadel, the governor general's palace, and many mosques. Bagdad was enlarged in the 9th century by Harun-al-Rashid, who built a palace for himself, and a tomb for his favorite wife, Zobeide. He erected numerous edifices and bridges. In the 10th century it was ravaged by the Turks, and in the 14th century by Timour. Subsequently it passed over to Persia, and then back to the Turks, who have had it under sway since the 18th century. The inhabitants engage largely in trade and produce a variety of manufactures, such as silk, carpets, drugs, and ornaments. They consist chiefly of Turks, Arabs, Jews, Hindus, Afghans, Persians, and Armenians. The city is important on account of its location on the Tigris, which affords a highway for navigation to the sea and many interior points. It forms the principal telegraphic connection between Western Asia and British India. Its manufactures are developing under European stimuli, and it is the seat of a large trade in agricultural products and manufactured articles. Population, 150,275.

**BAGPIPE** (băg'pīp), a musical instrument of unknown antiquity. Up to the 18th century it was used in all the countries of Eurasia, and it is still popular in Scotland, France, Spain, Italy, and many countries of Asia. It consists of a leather bag, generally covered with cloth,

which is inflated by the player blowing with his mouth through a tube. Three or four pipes are connected with the bag, through which the wind is forced by pressing the bag under the arm. The player uses one of the pipes, called the *chanter*, which is supplied with finger holes, and serves for playing the tune. The three or four others, called *drones*, sound a continuous low tone. The instrument is still used extensively by Asiatic people, and is seen at all the great expositions where Turks and others make exhibits.

**BAHAMA** (bà-hā'mà), a group of islands in the West Indies, nearly 600 miles long, and located southeast of the coast of Florida. The total area is 5,450 square miles. The group includes nearly 700 islets and islands and over 2,000 coral reefs. Among the principal islands are Andros, New Providence, Grand Bahama, Great and Little Abaco, Crooked Island, Great Exuma, San Salvador, or Watling Island, Great Inague, and Harbor Island. About twenty of the islands are inhabited. The leading products include cotton, sugar, maize, cocoanuts, sponges, and a great variety of fruits. In recent years the culture of sisal fiber has been largely developed and is a growing industry. The exports from these islands aggregate about \$1,050,500 annually; the imports, \$1,725,525. Mail steamship service is maintained among the islands and with American and European ports. Many of the islands are noted for their fine climate and are visited by tourists and pleasure seekers. The history of the Bahamas dates from Oct. 12, 1492, when Columbus discovered them, the first land viewed by him in America. These islands now form a British colony. The government is administered by a local department under the direction of the English Parliament. Nassau, on New Providence, is the capital. In 1901 the entire group had a population of 53,735.

**BAHIA** (bà-ē'à), or **São Salvador**, the second city of Brazil, on the Bay of All Saints, and capital of the province of Bahia. It occupies a fine site, and has one of the most commodious harbors in the world. The principal streets are substantially paved with stone and asphalt, and the city has gas and electric lights, drainage, and waterworks. It is the seat of a university, an arsenal, and the palace of an archbishop. It has railroad connection with the interior, and submerged telegraphic communication with Europe. Intercommunication is provided by an extensive system of electric railways, with which suburban and interurban lines are connected. The manufactures include leather, tobacco, sugar, clothing, lumber prod-

ucts, and machinery. It has a large export trade in cotton, sugar, rice, live stock, minerals, and fruits. Bahia was founded in 1549 and was the capital of Brazil until 1763. Population, 1906, 230,120.

**BAHIA HONDA** (ôn'dà), a seaport of Cuba, in the province of Pinar del Rio, about 56 miles west of Havana. The harbor is about two miles distant and is one of the best in Cuba. It is five miles long by three miles wide, with an average depth of 28 feet. The surrounding country produces sugar cane and has copper and coal mines. Population, 1899, 1,278.

**BAIAE** (bī'ē), or **Baja**, an ancient town of Italy, located on a bay in Campania, 10 miles west of Naples. In the time of the Romans it was popular as a watering place and contained the villas of many wealthy citizens, who were fond of its pleasant climate and warm mineral springs. The society of Baiae was noted for its luxury and dissolution. Many ruins of Roman baths and temples are on the site of the town.

**BAIKAL** (bī-käl'), a large fresh water lake in Siberia, near the Chinese frontier, about 400 miles long and from ten to fifty miles wide; area, 14,000 square miles. The greatest depth is 4,500 feet. It is located among great mountain peaks, which yield valuable minerals. In the summer season large vessels sail upon it, and in winter it is crossed on the ice. Salmon, pike, sturgeon, and seals abound. Immediately south of the southern shore passes the great Trans-Siberian railway from Saint Petersburg to Vladivostock, and on its southwestern coast is the city of Irkutsk, the seat of a government of the same name. The Angara River, a tributary of the Yenisei, is the outlet of Lake Baikal.

**BAIREUTH** (bī-roit'), or **Bayreuth**, a city of Germany, in Bavaria, 40 miles northeast of Nuremberg. It is located on the Red Main River, has a railway connecting it with Munich, and its streets are straight and well improved. The chief buildings include an opera house, an art gallery, the town hall, and several churches. It was the residence of Richard Wagner, Franz Liszt, and Jean Paul Richter, who are buried in its grounds, and a fine monument of Richter stands in one of the principal streets. The city is famous for its Festival Theater, erected with the assistance of Louis II. of Bavaria, and in it are performed classical plays and musical selections from Wagner. Baireuth has manufactures of textiles, machinery, sewing machines, and musical instruments, and is a market for produce and earthenware. Population, 1905, 31,903.

**BAKER CITY**, a city in Oregon, county seat of Baker County, on the Powder River, and on the railway of the Oregon Railroad and Navigation Company. The chief buildings include the Masonic temple, the high school, the county courthouse, and a natatorium. The city has waterworks, sewerage, and a considerable trade. The surrounding country is fertile, producing fruits, cereals, and live stock. It is surrounded by a region that contains large interest in gold mining, and has manufactures of brick, lumber products, machinery, and spirituous liquors. It was settled in 1860 and incorporated in 1872. Population, 1900, 6,663.

**BAKING**, the art of preparing food in a chamber or oven. It differs slightly from broiling and roasting. For domestic use the heat is usually supplied by burning wood or coal, but gas, steam, and heated water are used to a large extent. The oven for baking is closed, but should be well ventilated. The term is sometimes applied to the hardening of porcelain and brick, when subjected to heat, but burning is more commonly applied.

**BAKING POWDER**, a substitute for yeast used in baking. It consists of tartaric acid, bicarbonate of soda, and potato or rice flour. The flour is added to keep the powder dry, but the ingredients are first dried separately and afterward mixed. When baking powder is added to flour, in making bread or biscuits, the carbonic acid gas is liberated by the action of the water used in the process, and this gives it the requisite lightness by puffing or blowing up the doughy mass. Bicarbonate of ammonia is sometimes used instead of bicarbonate of soda, which is objected to as injurious to the health. In some cases alum is similarly substituted. Both are objectionable adulterations.

**BAKU** (bä-kōō'), a port city of Russia, in the government of Baku, on the western shore of the Caspian Sea. The city is strongly fortified, has a fine harbor, and is the terminus of the Trans-Caucasian Railway. Most of the buildings are low and flat, but there are a number of fine schools and churches, several government structures, and extensive dock and harbor improvements. The exports include salt, opium, cotton, live stock, silk, and saffron. The manufactures embrace machinery, ships, ironware, pottery, clothing, tobacco products, and salt. Baku is one of the most noted centers of trade in petroleum and naphtha in the world. About 500 petroleum wells are in its vicinity, most of which are eight or nine miles north of the city. The annual production of crude petroleum aggregates 9,225,000 tons. Some of the wells have been flowing fully two thousand

years, but the larger ones are the result of deep borings made within recent times and are pumped by machinery. The waste is used for fuel in manufacturing enterprises and to generate steam on railways and vessels. A pipe line 600 miles long conveys oil from Baku to the Black Sea. Some of the wells emit inflammable gases, and have been the objects of pilgrimages of the Guebers or Fire Worshipers. Population, 1900, 179,133.

**BALAKLAVA** (bäl-ä-klä'vā), a small port on the Black Sea, in the southwestern part of the Crimea, Russia, near Sebastopol. It was the headquarters of the British during the Crimean War, and from which they undertook the construction of a railroad to Sebastopol, a distance of about six miles. The harbor affords secure anchorage for the largest ships. It is a natural fort, the entrance being so narrow that only one vessel can pass into it at a time. The Russians made an attack upon it Oct. 25, 1854, but were repulsed. The famous charge of the light brigade of 600 men under Lord Cardigan took place at this time. They cut their way with great bravery to the Russian guns, and afterward cut their way back again. In the charge all but 150 perished. Tennyson's "Charge of the Light Brigade" was written in commemoration of this daring, but misdirected deed.

**BALANCE** (bäl'ance), an instrument used to ascertain the relative weight or masses of

bodies. There are various forms, but the most common are *hydrostatic balances*, *torsion balances*, and *steelyards*. The hydrostatic balances are used to ascertain the specific gravity of water; torsion balances, to ascertain the intensity of very small forces; and steelyards, for weighing both small and large articles. *Spring balances* are used to weigh articles in which a high degree of exactness is not required. They are constructed of a device whereby a spring is drawn out or compressed to register the weight.

**BALANCE OF POWER**, an expression

BALANCES.

1. Spring balance. 2. Chemical balance. 3. Coulomb's torsion balance. 4. Antique Roman balance from Pompeii. *b*, beam; *i*, indicator; *p*, pan.

used to indicate the condition under which a party in a Legislature or Congress has sufficient votes to secure the passage of a measure by casting them in favor of either one of two or more parties. The term is used in diplomacy among nations to indicate a condition whereby the influence of one or more may be cast so as to overcome the influence of other powers by a preponderance of strength. Thus, some of the European states cast their influence against Spain, then against France, and subsequently against Russia, whereby the balance of power was sufficient to secure certain concessions or to establish and maintain conditions of independence for other governments. Among the notable instances in which the balance of power was maintained in Europe may be cited the coalition formed against Napoleon I., in 1814, the concerted action to check the ambition of Russia in the Crimean War, and the conclusion of the Treaty of Berlin, in 1878, to maintain the autonomy of the Balkan States.

**BALATON** (bǎ'lō-tōn), or **Platten**, a lake in Hungary, located 55 miles southwest of Budapest. It is seven miles wide and fifty miles long, and has an area of about 450 square miles. A number of small streams flow into it, and the outflow is through the Sio River, the Kapos River, and the Kapos Canal into the Danube. Many edible species of fish are common to the lake.

**BALEARIC ISLANDS** (bāl-ē-ār'ik), a group of islands in the Mediterranean Sea, off the east coast of Spain. They include Majorca, Minorca, Iviza, Formentera, Cabrera, and several others. The total area is 1,860 square miles. Majorca is much the largest of the islands; its area is 1,430 square miles. Palma, on Palma Bay, in the southwestern part of Majorca, is a fine city, the largest in the islands, and has a population of 63,937. These islands were visited by the Greeks before the rise of Roman power. They were long subject to Carthage, and in 123 B. C. became part of the Roman Empire. James I., King of Aragon, held them in 1220-34, and in 1375 they became united to Spain. They are a Spanish possession at the present time and constitute a province of that kingdom. The soil is productive and yields large quantities of cereals and tropical fruits, especially olives, bananas, and grapes. Population, 1900, 311,649.

**BALI** (bā'lè), an island in the East Indies, located east of Java, and a colonial possession of the Netherlands. It has an area of 2,060 square miles. The surface is mountainous and volcanic, but the coast and valleys are fertile and the climate is healthful. Among the

chief products are sugar, rice, tobacco, cotton, indigo, and fruit. The natives are Malayan and adhere to the Brahman religion. Population, 680,000.

**BALKAN** (bāl-kän'), anciently called *Hæmus*, a range of mountains in Eastern Europe, which includes the Montenegro, Herzegovina, and Dinaric Alps, but the name is commonly applied only to the mountains extending through Bulgaria. The elevations are from about 4,000 to nearly 10,000 feet. Tchar-dagh, in the western part, is the highest peak; elevation, 9,700 feet. The mountains are crossed by highways and several railroads, and yield minerals, lumber, and vegetation. They form the watershed between the Lower Danube and the streams flowing into the Aegean Sea.

**BALKAN FREE STATES**, a term applied to the independent states of Rumania, Servia, and Bulgaria (including Eastern Rumelia), located on the Balkan peninsula, a region of Europe lying between the Black and Adriatic seas. It is sometimes extended to include parts of Turkey, parts of Austria, and Montenegro.

**BALKH** (bälk), a town in Afghanistan, on the Balkh River. It is surrounded by a fertile country and has considerable trade in produce, carpets, and shawls. Timur destroyed the larger part of its buildings and it was plundered in 1825. It has not been improved to any extent since that time. Anciently the site was occupied by the city of Bactra. Population, about 12,000.

**BALKHASH** (bäl-käsh'), or **Balkash**, a large lake in Siberia; the fourth in size of the lakes in Russian Asia. In breadth it varies from six miles to fifty miles; length, 330 miles; and area, 8,500 square miles. The lake is 780 feet above sea level, is salty, and has no outlet. A navigable stream, the Ili River, and several others, flow into it. The lake is quite shallow, ranging from 30 to 80 feet in depth, and its fisheries are not important.

**BALL** (bäl), a game in which a spherical body is thrown, rolled, or struck with a mallet. As an outdoor exercise it is a very healthful and popular amusement, and it is extensively played for financial profit and to test skill. The different games of ball include baseball, football, cricket, basketball, polo, golf, lawn tennis, etc. Mention is made in the "Odyssey" of games played with balls by both sexes, and ball playing was popular in the gymnasia of Greece and at the baths of Rome. In the 16th century the game became fashionable in the courts of Europe. Lacrosse is a game originated by the Indians of North America. Cricket is much played by the English, and baseball is the most popular game in the United States.

**BALLAD** (băl'lad), a poem much briefer and less elaborate in composition than an epic. Ballads were written by nations whose life was simple and in which learning was not so far advanced as to facilitate more elaborate poems. Before the revival of letters native ballads were highly appreciated, even by persons of culture and rank, and the bard was held in esteem in the home and at social entertainments. Some of the ballads that are best known include Scott's "Minstrelsy of the Scottish Border," Goldsmith's "Edwin and Angelina," "Little Guest of Robin Hood," and "Chevy Chase." The "Nibelungenlied" is a famous German ballad.

**BALLARAT** (băl-lă-răt'), a city of Australia, in the State of Victoria, and next to Melbourne the largest city in that subdivision of the Australian Commonwealth. It is located 90 miles northwest of Melbourne, has good railroad connections with other cities, and is in the center of a productive gold field. The largest gold nugget ever discovered was found near this city in 1858, and was valued at \$50,000. Mining is now carried on in the quartz deposits. The auriferous reefs are worked with profit at a depth of 1,000 feet, and large smelting institutions are utilized to carry on the industry. The city is the seat of extensive commercial interests and is enjoying an era of prosperous growth. It has stone and asphalt pavements, electric street railways, waterworks, two colleges, a fine city hall, and a large public library. Among the manufactures are machinery, clothing, earthenware, flour, and leather goods. It was incorporated as a city in 1870. Population, 1906, 48,565.

**BALLAST** (băl'last), a heavy substance used in weighting ships when the cargo is too light to sail safely with spread canvas. The amount of ballast depends upon the size of the ship, its construction, and the cargo carried. Ballast, as used in construction work, applies to gravel, rock, or any material with which highways and railroads are made solid and durable. All first-class railroads and highways in thickly populated countries are improved by a dressing and finishing of ballast.

**BALLET** (băl'lă), a dramatic representation consisting of dancing and pantomime with music. It originated in ancient times, possibly among the Greeks, who looked with favor upon dancers that expressed action and passions by rhythm applied to gesture. In 1580 ballet dancing became popular in France, where it was encouraged by Catherine de' Medici. In modern times the ballet came to be used as an interlude in theatrical performances, intended

to please the eye rather than impress mentally. Classical operas, such as "Faust" and "Tannhauser," employ the ballet much the same as it was used in former times.

**BALLOON** (băl-lōon'), a machine designed for the navigation of the air. The name was derived from a French word meaning ball, because the early balloons were round in shape. The construction of such a machine was first suggested by the flight of birds and the rising of soap bubbles into the air, which led to the construction of two classes of airships, one propelled upward by mechanical contrivances and the other by rarefied gases. Balloons propelled upward by means of gases were the first of several devices for aerial navigation with which it was possible to secure definite and satisfactory results. They depend upon the principle that a body lighter than air will rise with a force proportional to the difference between the weight of the air it displaces and its own weight. The gas employed is usually hydrogen, which is about fourteen times lighter than air, but coal gas is also used, which is about three times lighter than air. Balloonists who ascend into the atmosphere merely for exhibition purposes commonly confine heated air in the balloon bag, a portable quantity of which will carry them from 3,000 to 10,000 feet. During the time of inflating the balloon, it is fastened to the ground with ropes, and, when a sufficient amount of heated air has been confined within, it is loosened and ascends just as a cork rises in water.

The first deliberate scheme to navigate the air of which we have definite record was made in 1670 by Francis Lana, a Jesuit, who proposed to raise a vessel by metallic globes, containing vacuum inside, but it is asserted that the Chinese made successful ascents at Peking as early as 1306. However, the scheme proposed by Lana was not practical, because metallic tubes that would raise a vessel could not be made strong enough to resist the pressure of the surrounding air, or, if made strong enough, they would be too heavy to rise. The type of balloon which has been most serviceable to make long flights was invented in 1782 by Stephen Montgolfier and his brother Joseph, paper-makers of Lyons, France. They gave a successful public exhibition June 5, 1783, with a balloon filled with air rarefied by means of a fire lighted in the car. Later M. Charles, professor of physics in Paris, succeeded in successfully substituting hydrogen gas for rarefied air, by means of which an ascent of 3,000 feet was made, the balloon passing over Paris and landing safely. The next year M. Blanchard made an ascent

and carried with him a parachute to assist in making an escape in case of accident. He crossed the English Channel from Dover to Guiennes, and in 1802 M. Garnerin made the same exploit and landed safely in London by means of a parachute. Two years later M. Gay-Lussac made an ascent from Paris to a height of 23,000 feet, and demonstrated beyond a question that aërial navigation is practical.

The reader will observe that France takes undisputed precedence of all other countries in the early history of balloons. These machines have been so perfected that ascent and descent is entirely under the control of the guide, when the conditions of the atmosphere are favorable, but their movement through the air depends entirely upon the impetus of currents in the atmosphere. However, the type known as the *dirigible balloon*, which combines the common balloon with the flying machine, possesses the requisites necessary for the aëronaut to guide it successfully. This machine may be said to date from 1900, when Count Zeppelin, a German cavalry officer, traveled a distance of three and a half miles in his dirigible balloon. By 1908 he had improved his machine so he was able to travel at the rate of forty miles per hour.

Balloons are made of long bands of silk sewed together, and rendered air tight by coats of varnish, put on at different times. They are filled with coal or hydrogen gas to render them enough lighter than air so there is a material difference between the weight of the bag and an equal body of air displaced by it. A safety valve is placed at the top, under the control of the aëronaut. Below the bag, suspended by means of a network of ropes, is a wicker-work boat or car in which the aëronaut sits. The boat or car is light, and in it are supplies necessary for the safety of persons making the trip upward; these consist, among others, of a long rope to aid in descending, and sand bags, which give weight, and in case of danger are thrown overboard to lighten the balloon, if necessary. A balloon about forty-eight feet long and thirty-five feet wide and

thick will carry three persons, and with its appliances weighs about 300 pounds.

The highest ascent made by a gas balloon was that of Glaisher and Coxwell in 1862, from England. They ascended to a height of nearly six miles, about 29,000 feet, and landed safely. Aside from ordinary dangers in aërial navigation, nature seems to have planned other barriers against it. The higher altitudes are extremely cold. In the ascent mentioned above Coxwell became insensible; his hands were frozen and he became numb from exposure while in a low temperature. Besides, the air in the higher altitudes is greatly rarefied, and at a height of about six miles is incapable of sustaining human life.

Many national and international associations are maintained to develop skill and interest in ballooning. The International Balloon Congress, one of the most noted organizations of

THE WELLMAN POLAR AIRSHIP.

(Length, 164 feet; greatest diameter, 52.5 feet; volume, 224,244 cubic feet.)

this class, has held several important meetings at Brussels and in other cities of Europe. In 1907 the second competition for the Gordon Bennett Cup was held at Saint Louis. The contestants included one British, two French, three American, and three German balloons. The cup and a cash prize were won by the German balloon *Pommern*, which flew to Asbury Park, N. J., and covered a distance of 901 miles in 39 hours and 55 minutes. The balloons in this contest were not dirigible. The largest dirigible balloon on record is the one built in 1908 for Walter Wellman, who planned to use it in an attempt to reach the North Pole. It was constructed partly of bamboo, with a frame of steel, and was fitted with two screw propellers and three gasoline motors. Although the balloon worked successfully, the trip to the North Pole was not undertaken within the year.

In military service balloons have become highly efficient. During the siege of Paris by the German army, the celebrated French deputy, Gambetta, on Oct. 7, 1870, escaped from the city in a balloon, and utilized his freedom in organizing a large army in the provinces with the intention of compelling the Germans to raise the siege. It is estimated that during this siege fully 2,500,000 letters were sent from the city to people outside by means of balloons. Some of these were captured, others landed safely, and one was found as far northeast as Central Norway. Large numbers contained carrier pigeons, that were utilized by friends to send answers back to those in the city. In the war between China and Japan in 1894-95 the Japanese made remarkable success in the use of balloons. At daytime they took extended observations of the opposing army, and at night carried electric arc lights far up into the air, from which the light was reflected into

RACE FOR THE GORDON BENNETT CUP IN 1907.

1, The Pommern; 2, L'Isle de France; 3, the Düsseldorf; 4, the Saint Louis; 5, the America; 6, the Abereron; 7, the United States; 8, the Anjon; 9, the Letus II.

the enemy's camp by means of powerful reflectors. By these means they were able to observe the location and movements of the enemy, and harass the opposing army by directing missiles against it at night. In the Anglo-Boer War of 1900-01 the balloon was made serviceable in many respects. It is now regarded as useful in war as the most powerful arms and the most skillful spies. See **Aëronautics; Flying Machines.**

**BALLOON FISH**, a kind of fish native to the tropical seas. They are peculiar for their power to inflate themselves with air, which they do to evade pursuit, and when in that condition float on the surface of the water with their back down. The flesh is not eaten.

**BALLOT** (bäl'lüt), a term derived from the

French, signifying a little ball used in voting. In ancient Greece balls made of stone or metal were used to express verdicts. This custom still maintains in some countries for limited purposes, and generally in civic societies on the admission of applicants to membership. In Greece the practice was called the *dic-cast*, while it is now generally termed *balloting*. In civic societies a given number of black balls thrown in will defeat the candidate, who is then said to be *blackballed*. Various forms of ballots of paper, wood, and stone have been used for centuries. The common ballot now used in governmental affairs is of paper, and its honesty and secrecy is protected by the law. See **Australian Ballot.**

**BALL'S BLUFF** (bälz blüf), a steep bank on the Potomac River, in Loudoun County, Virginia. It was the scene of a battle between the Union forces and the Confederates on Oct. 21, 1861, when a small Federal army was surrounded and defeated. The latter lost heavily, and their leader, Colonel E. D. Baker, was slain.

**BALM** (bäm), a plant of the mint family, noted for its fragrance. It is perennial, has ovate and crenate leaves, and is used in medicine as a stimulant and aromatic. The oil of balm, derived from this plant, is an essential oil. Several species are found in Eurasia, especially along the Mediterranean, and some varieties have been naturalized in England and America. The catmint, or catnip, resembles the balm

but does not belong to the same class. The Moldavia balm is used for flavoring in Germany and the bastard balm is cultivated in England for its fragrance, which the leaves retain a long time after being dried.

**BALM OF GILEAD** (gäl'ë-üd), the resinous substance derived from a tree native to Arabia Felix. It is referred to in the Old Testament and is still sold extensively in Arabia and other Asiatic countries, where it is obtained by making incisions in a small tree. At first it is white, but afterward turns to a golden yellow color and resembles honey in consistency. By boiling the fruit and the wood an inferior quality is obtained. It is irritating to the skin and has a bitter taste. The odor is highly fragrant.

**BALMORAL CASTLE** (bäl-mör'al), the autumnal residence of the royal family of England, situated 45 miles west of Aberdeen, Scotland. It occupies an elevated site 920 feet above the sea, a natural platform that slopes gently to the Dee River, and is surrounded by beautiful mountain scenery. The estate contains about 40,000 acres, purchased in 1852 by Prince Albert, and on it is the magnificent castle built at his own expense at a cost of \$500,000. It is constructed of granite in the Scotch baronial style of architecture. Edward VII. made a number of important changes in its furnishings and decorations.

**BALSAM** (bal'sam), an aromatic, resinous substance secured from plants containing volatile oil and resin. Many substances sold in the market are known as balsam, but the balsams of Peru and Tulu are most generally used in medicine. The former is obtained from a tree native to tropical America and the latter from the forests of Tulu, on the Magdalena River. The balsam of copaiba is a yellowish liquid with a bitter taste, with a more or less viscid consistency, and is the product of trees found in South America and the West Indies. Another product of this class, the balm of Gilead (q. v.), is imported from Arabia. These products are generally used in the arts, for medicine, and in making perfumery.

\* **BALSAM**, a flowering plant of India, but naturalized in all the continents. It has been cultivated for more than three centuries for its beautiful flowers, some of which are double and are known as *camellia*. The plant grows from one to two feet in height and branches freely. Many varieties of colored flowers have been secured by propagation.

FLOWERING BALSAM.

**BALTIC** (bal'tik), **Battle of the**, a naval contest on the Baltic Sea, April 2, 1801, between the English under Sir Hyde Parker and Lord Nelson and the Danish fleet, in which the latter was defeated.

**BALTIC PROVINCES**, a section of Rus-

sia bordering on the Baltic Sea, and including the three governments of Courland, Esthonia, and Livonia. The area is 36,560 square miles, much of which is fertile and is used for agriculture and stock raising. Letts and Esths make up the bulk of the people, and the burghers and nobility are chiefly Germans. Formerly Courland was a dependency of Poland and Esthonia and Livonia belonged to Sweden. Peter the Great annexed Courland in 1795 and the remainder was previously acquired by conquest from Sweden. The people are largely Protestant and not in strict harmony with the policy of the Russian government, which has been seeking to dictate in the use of the Russian language in the schools and the adoption of the Greek faith. These provinces revolted and declared a republic at the time of the Russo-Japanese War, in 1904, but the movement was suppressed partly by military force and partly by granting minor political and social reforms. Riga is the chief city and the seat of administration. Population, 1906, 2,576,900.

**BALTIC SEA**, the inland sea that washes the shores of Denmark, Sweden, Russia, and Germany, and communicates with the North Sea by the Cattegat, the Sound, and the Great and Little Belt. The length is about 800 miles; breadth, 100 to 200 miles; depth, forty to 140 fathoms; and area, including the Gulfs of Bothnia and Finland, 184,497 square miles. The islands within the sea have an area of about 12,000 square miles. In the northern part is the Gulf of Bothnia, which is separated from the southern portion by a chain of islands, and in the eastern part are the Gulfs of Finland and Riga. It receives the inflow from 250 rivers, which renders its waters almost fresh, and increases its tendency to freezing in the winter season, thus impeding navigation from three to five months of the year. The largest rivers that flow into it are the Niemen, Duna, Oder, Neva, Vistula, Narva, and Trave. It has a large trade, both with ports in Europe and in other continents. The leading harbors are at Stockholm, Memel, Danzig, Riga, Cronstadt, Kiel, Stettin, Copenhagen, and Helsingfors. It is connected with the North Sea by the Kaiser Wilhelm Canal (q. v.) and other canals furnish communication with divers trade centers. Navigation is dangerous on account of breakers at numerous islands, sudden changes of wind, and violent storms. Valuable amber is cast ashore by waves in Prussia and Courland. There are extensive salmon, trout, and herring fisheries. The southern coast of Sweden is gradually sinking and the upper coast rising, the rate of change being estimated at about

three feet in a century. The name Baltic was derived, from the island Baltia, but it is called East Sea by the Germans.

**BALTIMORE** (băl'ti-môr), the largest city of Maryland, county seat of Baltimore County, on the Patapsco River, fourteen miles above Chesapeake Bay. It is at the head of tide water navigation, 42 miles northwest of Washington, D. C., and is the focus of important steam railway and electric interurban lines. Among the railroads entering the city are the Pennsylvania, the Baltimore and Ohio, the Wabash, and the Western Maryland railways. Rapid and extensive intercommunication is afforded by a vast system of electric lines.

The principal streets running east and west are Lexington and Baltimore, and Charles is the main thoroughfare running north and south. A small stream called Jones's Fall divides the city into two nearly equal parts. Near the Patapsco River, from which the ground rises gradually toward the north, are the largest wholesale and manufacturing establishments, and much of the shipping is done from docks on a branch of the river which extends well into the heart of the city. At the northern limit of the harbor is Pratt Street, from which the wholesale district extends toward the north, and is bounded by Paca, Light, and Baltimore streets. The retail shopping district is toward the west, and the fashionable residential quarter is toward the north. In numbering the houses the decimal plan is used, the numbers extending east and west from Charles Street and north and south from Baltimore Street.

**POINTS OF INTEREST.** Druid Hill Park is one of the finest public grounds in America and contains Druid Lake. This park is ornamented with fine walks, statuary, and beautiful avenues of trees. It is situated in the northwestern part of the city and contains 671 acres. Clifton Park is in the northeastern part, and near the river, in the eastern part of the city, is Patterson Park. Carroll Park, Wyman Park, and several others add beauty to the city.

Baltimore is called the Monumental City because of its fine Washington Monument, erected about 1820, and located at the intersection of Washington and Mount Vernon streets. It is 164 feet high and the marble shaft is surmounted by a colossal statue of Washington. Battle Monument, in Monument Square, was erected in 1815 to commemorate those who fell in 1812, while defending the city against the British. In Mount Vernon Place are statues of Chief Justice Taney and George Peabody. A monument to the memory of Columbus, a statue of Sir William Wallace, and the Ridgely and

Willey monuments are among a number of others that merit special mention. Green Mountain Cemetery contains the graves of Johns Hopkins, John McDonogh, and other illustrious men, and is noted for its beautiful trees and fine statuary. The National Cemetery contains the graves of many Union soldiers and Westminster is the burial place of Edgar Allen Poe.

**INSTITUTIONS.** The city is noted as an educational center and as the seat of many benevolent and scientific societies. Its system of public schools has courses ranging from the primary to the collegiate branches, and instruction in kindergarten work and manual training has been provided for amply. George Peabody endowed the Peabody Institute, which has a library of 140,000 volumes and a conservatory of music. Johns Hopkins Hospital is a charitable institution. The Saint Paul's Orphan Asylum, the Saint Joseph's Hospital, the Hebrew Orphan Asylum, the Maryland University Hospital, the Baltimore Orphan Asylum, and the State Asylum for the Insane are among the leading charitable institutions. The professional schools include the Maryland College of Pharmacy, the medical and law departments of the University of Maryland, the Women's Medical College, the Baltimore College of Dental Surgery, and a number of others. Baltimore is the seat of the famous Johns Hopkins University, one of the most noted institutions of higher learning in America, which is attended by a large number of students and has a library of about 200,000 volumes. The Enoch Pratt free library has about the same number of volumes and many pamphlets and manuscripts.

**BUILDINGS.** Solidity and convenience are combined in the architecture of Baltimore, which has been greatly improved since the disastrous fire in 1904. Its business buildings are notably well constructed, both from the standpoint of durability and appearance. The post office, the city hall, the city jail, and the United States courthouse are among the chief structures erected by the city and the Federal government. The last mentioned is a massive granite structure in the Renaissance style, and its interior is decorated with mural paintings and busts of prominent men. Near the intersection of Saratoga and Charles streets is the Masonic Temple. Johns Hopkins Hospital, the Enoch Pratt free library, and the Peabody Institute have substantial quarters. Among the noted churches are the Roman Catholic Cathedral, the Grace Episcopal Church, the Mount Vernon Methodist Church, the First Presbyterian Church, the Eutaw Place Syna-

gogue, and the Unitarian Church. Baltimore is the seat of a Roman Catholic archbishop and a Protestant Episcopal bishop.

**INDUSTRIES.** Ample railroad facilities and a favorable location for transportation by water have made Baltimore a great center of manu-

CITY HALL, BALTIMORE.

facturing and commercial enterprises. • The harbor is amply deep for the largest seagoing vessels, and regular communication is afforded by the principal lines with Bremen, London, and other foreign ports. As an export city it takes high rank and ships more corn to foreign countries than any other port of America. Flour, tobacco, coal, and cotton are among the chief export articles, while large quantities of iron ore, sugar, fruit, and general merchandise are imported. In manufacturing there is scarcely an industry that is unrepresented. Oyster packing and fruit canning are represented by large investments. Machinery, boots, and shoes, textiles, clothing, and fertilizers are among the products that are manufactured on the largest scale. Shipbuilding is developing steadily as an industry, and the extensive fisheries of Chesapeake Bay have made Baltimore a shipping center of fresh and canned oysters.

**HISTORY.** Baltimore was founded in 1729 and named in honor of Lord Baltimore (q. v.), proprietor of the colony of Maryland. In 1796 it was incorporated as a city. The harbor was greatly improved in 1780, when it became a port of entry, and since then its commerce has progressed steadily. In the War of 1812 it was held in a state of blockade, but a gallant

defense at Fort McHenry and other fortifications prevented its capture. It was at the time of the bombardment of Fort McHenry, in 1814, that Francis Scott Key, inspired by the bravery of the Americans, although detained on board a British vessel, wrote the well-known song "The Star Spangled Banner." The first electric telegraph line in the United States was built from Baltimore to Washington in 1844. The city was occupied by the Federals at the time of the Civil War, when its industrial life became prostrated, but since then it has grown steadily in every material enterprise. A destructive fire in 1904 consumed buildings and property valued at about \$80,000,000, but the district visited by the conflagration was rebuilt on a substantial scale within two years. In population the city takes rank as the sixth in the United States, being exceeded in this respect by Boston, Saint Louis, Philadelphia, Chicago, and New York. Population, 1900, 508,957; in 1910, 558,485.

**BALTIMORE ORIOLE** (ō'rī-ōl), a common bird in America, allied to the starlings. It is more properly called *Baltimore bird*, since there are only suborioles in America. It is about seven inches long and has pointed wings, a sharp bill, and a rounded head. The plumage is beautiful; the head and upper parts are black mixed with bright orange and yellow. It was named from Lord Baltimore's livery, or coat of

BALTIMORE ORIOLE.

arms, as its colors agreed with that of the bird. The nest is built pouchlike of grass and twigs interlaced like threads and is suspended from the branches. It feeds on beetles, caterpillars, and insects. The Baltimore oriole is noted for bravery in defending its young and

for its pleasant and clear song. See illustration on preceding page.

**BALUCHISTAN** (bā-lōo-chīs-tān'), or **Beluchistan**, a country in Asia, bounded on the north by Afghanistan, east by India, south by the Arabian Sea, and west by Persia. The area is 131,855 square miles. It has a mountainous surface and contains some sandy deserts, with intervals of productive and fertile regions. The highlands belong to the plateau of Iran, which extends into Baluchistan from Persia. It has a coast line of 600 miles on the Arabian Sea, which affords few harbors. A large part of the country is arid and requires irrigation to make agriculture profitable, but the rivers are few and too short to supply much water for that purpose. The principal products are cotton, indigo, tobacco, cattle, hides, wool, and tropical fruits. Minerals are found in the mountain districts, the most important of which are copper, lead, saltpeter, coal, and petroleum. Large numbers of animals, especially camels, graze upon its plains. The country has several railroads, but depends largely upon the camel for transportation. The inhabitants consist chiefly of Baluchis, a native race of Aryan people, who speak an Iranic dialect and adhere to the Islam faith, professing the Sunnite creed. Since 1877 the country has been under the government of Great Britain for military and strategical purposes, but it is administered nominally by the Khan of Kelat. Quetta, in the northeastern part, is the largest city, and Kelat is the capital. Population, 1901, 914,551.

**BALUSTER** (bāl'ūs-tēr), or **Banister**, in architecture, the name of small shafts or pillars used to support a cornice or coping. Balusters are employed in stairways as guards, in bridges as parapets, and for a number of other uses. The material used in construction may be wood, cement, metal, or stone, and in form they differ largely, being usually ornamented in workmanship and beautified by polish and paint.

**BAMBERG** (bām'bērg), a city of Germany, in Bavaria, near the confluence of the Main and Regnitz rivers. The chief buildings include a cathedral in the Byzantine style, the palace of the former prince bishops of Bamberg, the city hall, and many educational and charitable institutions. It has manufactures of cotton and silk textiles, gloves, musical instruments, and machinery. The municipal improvements consist of waterworks, electric street railways, and pavements of stone, macadam, and asphalt. Bamberg dates as a city from 973. Population, 1905, 45,483.

**BAMBOO** (bām-bōō'), a giant grass or reed

native to tropical America, Africa, and Asia. Many species have been described, ranging from the smaller forms to those which attain a height of 80 to 100 feet. They have a root-stock which is jointed under the ground and throws out numerous stems, and in the larger species the main stem or trunk is often twelve inches thick. Although the stems are jointed and very hard, they are both light and elastic. These plants are widely distributed, ranging from the marshes and swamps near the level of the sea to altitudes of 12,000 feet, and they grow both in wet and dry soil. They can be propagated from the young shoots or from the seeds, which resemble rice. The seeds and young shoots are eaten, while the stalks are used for building purposes, fences, water pipes, masts for boats, walking sticks, ladders, in the manufacture of paper, and for many other purposes. Some of the finest cottages in Southern Asia are constructed wholly of bamboo. In America we frequently see it in fans, fish-poles, and walking sticks.

**BANANA** (bā-nā'nā), a plant of the plantain family, which somewhat resembles the palm tree. It was first found in the East Indies,

BAMBOO.

a, section of the stem at node.

BANANA.

but has been brought to and is successfully cultivated in all tropical and semitropical climates. The trunk is not like that of a tree, since it

consists of the closely compacted sheaths of the fallen leaves. It often grows to a height of twenty-five feet, but dies down each year, and is replaced the next season by new sprouts, of which two or three are allowed to bear. The leaves are ten feet long and three feet wide, and are of a beautiful emerald green. The fruit is from four to twelve inches long, and grows in bunches often weighing seventy-five pounds. It is one of the most important foods known and is used extensively, being transported in large quantities to the northern markets. The bunches are picked green and ripen in transportation or in stores. Land will produce about twenty-five times more food if planted in bananas than if sown to wheat. Besides being valuable as a food plant, the fibers of its stalks are used in weaving cloth, an indelible ink is made from the juices of the skin, and the leaves are employed to cover the roofs of houses.

**BANANA**, a seaport city of the Congo Free State, on a small peninsula of the same name, at the mouth of the Congo River. It is not important as a commercial center, having been displaced by Matadi, a town on the mainland, from which a railroad line extends to Leopoldville. The inhabitants are chiefly natives and not more than 125 white people reside in Banana.

**BANCA** (bän'kä), or **Banka**, an island in the East Indies, separated from Sumatra by the Banca Strait. It has an area of 4,446 square miles. The climate is moist and the surface is level. Tin is the most important product and is mined by the government. The annual exportation is about 4,500 tons. Fruit is grown extensively and salt and rice are the chief imports. The island is a colonial possession of the Netherlands. Population, 1906, 106,242.

**BANDAGE** (bänd'āj), a band or wrapper used by surgeons to retain dressing or bind the injured parts of wounds. Strips of muslin are used to make the common form of bandages, and in some cases linen, flannel, or cheese cloth serves the same purpose. Bandages are applied to the fingers or limbs spirally, each turn lapping partly over the last, but many forms are needed to fit special cases of different kinds. In applying the bandages much care must be exercised lest the pressure obstructs the circulation, causing gangrene or blood poison.

**BANDA ISLES** (bän'dä), a group of islands in the East Indies, about fifty miles south of Ceram, a colonial possession of the Netherlands. The group includes about ten

small islands of volcanic origin, of which Banda Neira and Banda Lontar are the largest. Gulong Api, the highest peak, has an elevation of 2,250 feet above the sea. Banda, the capital, has a good harbor. Nutmeg and fruits are the chief products. The total area is about seventeen square miles. Population, 8,000.

**BANDICOOT** (bän'dī-kōōt), a species of rat native to Ceylon and India. It is the largest representative of the rat family, measuring about one foot in length. The tail is long and very thick at the base, and the color is

BANDICOOT.

black above and gray beneath. It subsists on rice and other cereals and is fond of vegetables. The flesh is eaten by the natives. The bandicoot of Australia and Tasmania is a marsupial. It resembles a rabbit and is a pest in the wheat fields and gardens.

**BANDIT** (bän'dīt), a person who has become outlawed, wages war against civilized society, and resorts to robbery. Banditti are common in Albania, owing to the incompetence of the Turkish government to suppress large bands who have become outlawed. These bands frequently take travelers captive and hold them for a ransom.

**BANEBERRY** (bän'bēr-rÿ), a common plant of America and Europe. It is a species of crowfoot and has a terminal cluster of flowers, and the fruit is a red or white berry, which is poisonous. Several species are common to the woods of North America.

**BANFF** (bänf), a town of Canada, in Southwestern Alberta, on the Bow River. It is located on the transeontinental line of the Canadian Pacific Railroad, and is surrounded by fine mountain scenery. In the vicinity are hot sulphur springs. The springs have made the region famous and are visited both for health and pleasure. A fine hotel, a sanitarium, and a number of other buildings are noteworthy. Population, 325.

**BANGALORE** (bän-gā-lōr'), a city of India, in the state of Mysore, 175 miles west

of Madras. It is located on an elevation 3,000 feet above sea level, and has a remarkably healthful climate. The streets are well improved and beautified with trees and parkings. Among the chief buildings are the high school, the military cantonment, and several temples. It has electric and steam railway facilities. Silk textiles, carpets, clothing, earthenware, and machinery are the chief manufactures. Bangalore dates from 1537. It was stormed and captured by the British under Lord Cornwallis in 1791. Population, 1901, 159,046.

**BANGKOK** (bǎng-kǒk'), the capital of Siam, located on the Menam River, about twenty miles from the sea. The river is navigable to the city for vessels, but their passage at its mouth is somewhat impeded by silt deposits, which render it only six feet deep at ebb tides, but at flood tides the water is fully fourteen feet. The city is the seat of vast commercial interests and carries on extensive manufactures. It is connected with other cities of Southern Asia by telegraph and railway lines, and is one of the largest cities of Southern Asia. Its population is mixed largely with all classes common to Asia, but the Chinese constitute fully one-half of the inhabitants and control the largest part of the trade. Most of the city is built over the water of the river. Many of the houses are constructed of bamboo and are connected by bridges, thus presenting a peculiar contrast to the architecture of Europe. On account of the site of the city being flat, many buildings located on the land are on piers about six feet above the ground. The palace of the king is surrounded by a high wall and with it are enclosed a number of temples, public offices, and a theater. Within the walls are the royal harem and the residences of many servants and attendants. Transportation within the city is by a line of omnibuses and a system of electric railways. The municipality has waterworks and electric lighting. Its modern prosperity dates from 1766, when it became the capital. Population, 1905, 585,380.

**BANGOR**, the county seat of Penobscot County, Maine, on the Penobscot River, and on the Maine Central and other railroads. On the opposite side of the river is the town of Brewer, with which it is connected by a bridge. The river is navigable for the largest vessels. Among the chief buildings are the county courthouse, the public library, the custom house, and the Bangor Theological Seminary. The manufactures include boots and shoes, clothing, flour, trunks and valises, and ships. It has a large trade in ice and is one of the lead-

ing lumber depots in the world. Gas and electric lights, pavements, waterworks, sewerage, and electric street railways are among the improvements. The vicinity was first settled in 1769, when it became known as Kenduskeag Plantation, and it was incorporated as Bangor in 1791. Population, 1900, 21,850.

**BANGWEOLO** (bǎng-wě-ō'la), or **Bemba**, a large lake in Africa, in the northern part of Rhodesia. The length from north to south is 150 miles and the width is about 75 miles. It has an elevation of 4,000 feet above the sea. The Chambezi flows into it from the east, and it discharges a part of the year by the Luapula. Several small islands within the lake are inhabited by natives. The lake was discovered by Livingstone in 1868 and was visited by Stanley in 1876.

**BANJO** (bǎn'jō), a musical instrument with three strings, having a head similar to a tambourine and resembling a guitar. It is played by striking or twitching the strings with the fingers of the right hand. Joel Walker Sweeney, an American musician, is the inventor, who learned to play on the rude instruments used on the southern plantations and patterned largely from them. He was born in 1813, and died at Appomattox, Va., in 1860. His reputation as a banjo player extended to Europe, where he performed many times before Queen Victoria.

**BANKING** (bǎnk'ing), the occupation or business that relates to the care, custody, and handling of money. Banks are of very great antiquity. Babylonian tablets bearing distinct records of transactions in banking in the time of Nebuchadnezzar are in the Metropolitan Museum of Art in New York City. Modern banking had its origin with the money dealers of Florence, who attained high repute as receivers and lenders of money in the 14th century. The name *bank* is from the Italian *banco*, a bench, from the practice of the Jews in Lombardy, who had benches in the market places while in the business of exchanging money. The bench of the banker was broken by the populace when the banker failed, and from this we have the word *bankrupt*. Goldsmiths undertook the business of borrowing and lending money at an early date, largely because people desired to pawn their jewelry with them as security, although banking has no direct connection with their art. With the diversification of industries, which is one of the characteristics of higher society, banking became an independent institution.

**EUROPEAN.** Among the early banks of Europe are the Bank of Barcelona, founded in 1401; the Bank at Genoa, for centuries one of

the most stable banks of Europe, organized in 1407; and the Bank of Amsterdam, founded in 1609, a great storehouse for bullion in the 17th century. The last-mentioned bank issued receipts for the bullion and coin deposited, and these circulated as money. The Bank of Venice was the first national bank founded in Europe. The Bank of England was established in 1694, as the fourth important national bank, and is acknowledged to be one of the strongest financial institutions in the world. It was organized as a joint-stock association with a capital of £1,200,000. In return for loaning its entire capital to the government, it received a monopoly of the corporate banking in England and the right to issue notes for circulation as currency. In 1908 it had eleven branches, a capital and reserve of £18,125,000, a circulation of £30,250,000, and deposits of £48,750,000. The Bank of France was founded in 1800 and ranks next in repute to the Bank of England. It has a capital and reserve of 90,000,000 francs and the sole right to issue paper currency in France. The Imperial Bank of Germany, established in 1875, has a capital of \$28,575,000, but it is not the only bank of issue in the German Empire, this function being vested in a total of eight banks, whose authorized issue is \$91,630,000. Besides, the government itself issues a large amount of currency in the form of small notes for the convenience of the public. The National Bank of Belgium is modeled after the Bank of France.

AMERICAN. The Bank of North America was established in 1782 at Philadelphia, and was the first *bank of issue* founded in America. However, the first bank of issue in the United States was organized in 1791, under a plan proposed by Alexander Hamilton, with a capital of \$10,000,000. This bank was discontinued as a bank of issue in 1811, and five years later Congress granted a twenty years' charter to a new United States bank, with a capital of \$35,000,000, but on the expiration of that term refused to grant a renewal. About that time State banks were established and continued to do business a number of years, but they proved unsatisfactory and unstable. Under this plan the several states had different systems of banking, which caused inconvenience in exchanging money when passing from one State to another. This tended to increase the rate of interest, rendered currency subject to excessive discount, and caused numerous panics. However, they continued to do business until 1866, when a tax of ten per cent. was imposed upon their notes, which caused them to surrender their charters.

At the recommendation of Secretary Chase, a national banking system was established in 1863, under which the paper currency became uniform in all the states. The plan provides that a portion of the banking capital must be invested in government bonds. These bonds are deposited with the treasurer at Washington, upon which paper currency to the full amount of the face value is issued to the bank making the deposit, and this currency is put into circulation. The plan is so formulated that the bonded indebtedness of the country becomes the basis of this class of banking. These bonds deposited with the United States are security, whereby the currency is guaranteed and its value is maintained at parity with gold.

CLASSES OF BANKS. Several classes of banks are maintained in most countries, depending upon the charter under which they operate, or the nature of the business which they transact. While all banks receive deposits, only a comparatively few are banks of issue or circulation; that is, they do not issue paper currency for general circulation. A small rate of interest is paid on *time* deposits, but, when the deposits are made *subject to check* by the depositor, usually no interest is paid. All banks loan money from their own funds and from the deposits. The loans are largely for short periods, but sometimes for a year or more, when mortgages or deeds of trust are taken as security for the loans. Banks effect exchanges between their depositors and others, a department of banking which has grown into importance. The individual who wishes to send money to some other city usually buys a draft and transmits that instead of the currency, and it is received in other money centers as equivalent to the cash. It is estimated that not more than from twelve to fifteen per cent. of the entire business transacted through banks in Canada and the United States is effected by the payment of currency.

Clearing houses are associations of banking houses to aid in the settlement of balances between given banks. In this way much time is saved in making exchanges, and it is not necessary to make an actual count of the money. Savings banks are institutions in which small sums of money are deposited from time to time, as they accumulate in the hands of persons limited to moderate earnings. The depositors are supplied with a small deposit book in which they are given credit for each deposit, and receive a moderate rate of interest on these deposits, together with a small additional contingent. The money received on deposit, and a portion of the capital, are

loaned to trustworthy borrowers at a rate of interest determined by the market value, and the greater part of the earnings is set aside for the depositors. Banks of loan and discount buy credit paper, usually at a discount, and do a loan business. Private banking institutions are conducted by individuals, or an association of individuals, who do a general banking business. The business of banking is regulated by laws, which provide that the books be examined by competent accountants, and frequent statements are published to convey to the public information as to the stability of the enterprise. The laws and the condition of business requirements have made banking and banks secure, and render them absolutely necessary to promote successfully modern commercial enterprises.

**VOLUME OF BUSINESS.** In 1908 there were 23,937 banks in the United States, which number included 6,429 national banks. The total capital was \$1,783,226,179, and the individual deposits aggregated \$13,654,535,348. In June of the same year the banks of Canada had a paid-up capital of \$98,750,850, a circulation of \$76,850,400, and deposits of \$745,682,680. The government of Canada has had charge of a system of post office savings banks since 1868, which had 1,080 offices in 1908, while the total number of incorporated banks was 37 and the number of branches, 1,640. See **Clearing House.**

**BANKRUPTCY** (bānk'rūpt-sỹ), a term equivalent to insolvency, and generally applied to the financial condition of one who has failed in business. In general, a bankrupt or insolvent is one who is unable to pay *all* his debts. Bankruptcy laws have been enacted in most countries for the protection of both the debtors and the creditors. These provide for the fair distribution of the property remaining after bankruptcy among the creditors of the bankrupt. In some instances bankruptcy laws provide for a release from all debts remaining after applying the property in payment. The object of this is to release a bankrupt and offer to him an incentive to devote himself to business again. From 1867 to 1878 a national bankruptcy law was in force in the United States, while another was enacted in 1898. It applies to all individuals, but not to corporations. Both in England and the United States proceedings in bankruptcy may be instituted by the debtor or by creditors.

**BANNER** (bān'nēr), a flag or standard carried at the head of a band, either in a general parade or for military purposes. It may be national, state, local, or private. Its use is to indicate the line of march, or the rallying point

in war, in case of defeat. Banners are made of good grade of cloth, with one side attached to a pole.

**BANNOCKBURN** (bān-nōk-bûrn'), a village in Scotland, two miles southeast of Stirling, on the Bannock Rivulet. It is famous for a decisive battle, in 1314, between King Robert Bruce of Scotland with 30,000 men and Edward II. of England with 100,000. The latter was defeated with a loss of 30,000 men.

**BANTAM FOWL** (bān'tam), a small domestic fowl that derived its name from Bantam, in Java. A well bred bantam does not weigh over a pound when full grown.

**BANX RING** (bānx'rīng), an insectivorous animal native to India and the East Indies. It has an elongated muzzle and a bushy tail. It is active and spry and spends much of its time in climbing the limbs of trees, resembling in this respect the lemurs and squirrels.

**BANYAN** (bān'yān), or **Banian**, a tree native to the East Indies, Ceylon, and Australasia, and remarkable for its branches and

BANYAN TREE.

roots. Every branch of the main tree throws out its own roots, which become parent trees and throw out other branches. The wood is light and of little value, but the tree yields lac and the bark possesses a tonic property useful in treating diabetes. This tree lives many years and often covers large areas. One in India furnished shelter for 7,000 men, while another found in Australia covered nearly seven acres. A tree in India, known by the name *cubbeer burr*, has 350 large trunks and over 3,000 smaller ones. In these trees dwell large numbers of birds and monkeys, which are fond of their fruit, a kind of fig. The tree is held sacred by the Brahmans.

**BAOBAB** (bā'ō-bāb), a tree native to tropical Africa, and met with in Senegal, Abyssinia, and the region of the African lakes. The trunk grows to a height of from 60 to 70 feet, and the growth of its limbs press outward about the same distance, making the diameter in many cases 150 feet. In the larger trees the roots are sometimes over 100 feet in length. The leaves are large and abundant and of a dark green color, and the large flower is white and has beautiful snowy petals. The fruit is a soft pulpy but dry substance, about the size of a quart flask, inclosed in a long dull-green woody pod. Between the seeds is a pulp which tastes like cream of tartar, and is used by the natives to give flavor to their porridge. The wood is soft and light, and when decay sets in the woodish structure becomes porous and finally falls to pieces. Cloth and rope are made of the fiber, and the juice of the fruit is used as a drink, but the wood is not particularly valuable. It was discovered by Michael Adanson and is sometimes called *adansonia*. Livingstone reported that one of the trees seen by him was at least 1,400 years old.

**BAPTISM** (bāp'tiz'm), a name derived from a Greek word which means to dip or wash, and is applied to a rite of many churches. The rite of baptism is administered by immersing in water, or by sprinkling or pouring water upon the person, and signifies purification or spiritual burial and resurrection with Christ or a union with Christ as our Savior and Lord. Early in the history of the Christian Church it was held that the two outward essentials of baptism are the use of water and the words of Christ as given in Matt. xxviii, 19. It is probable that immersion was the exclusive form used in the primitive church, which later became a trine immersion in respect to the Trinity. At that time sprinkling or clinical baptism, as it was called, was confined to the sick and aged. The Greek Catholic and a number of Protestant denominations practice immersion, while the Roman Catholic and most Protestants sprinkle or pour the water upon the head.

**BAPTISTS** (bāp'tists), one of the most numerous divisions of the Protestant church, whose origin in America is traced to Roger Williams, who embraced the Baptist faith in 1639. The creed is a modified form of Calvinism and the government is a pure democracy, in which all members have a right to vote on important church matters. They hold that infant baptism is not authorized, and that the ordinance of baptism should be administered by immersion. Most Baptist churches

have a baptistry, either as a separate building or as an annex, in which the rites of baptism are administered. The number of Baptists in Canada is placed at 112,264. In the United States there are not less than thirteen separate organizations known by the name of Baptists. They have about 46,000 churches, valued at \$83,500,000, and a membership of not less than 4,450,000. They possess 175 educational institutions in America, the property of which is valued at \$25,000,000.

**BAPTIST YOUNG PEOPLE'S UNION**, a society organized under the direction of the Baptist church, and intended as a federation for young people. The object is to develop Christian character, to encourage the study of the Bible, and to bring together its members for the purpose of stimulating interest and building up membership in church and missionary work. *The Baptist Union*, a weekly publication, is the official organ, and the headquarters are in Chicago. This society has about 500,000 members.

**BARABOO** (bār'ā-bōō), the county seat of Sauk County, Wisconsin, thirty-five miles northwest of Madison, on the Baraboo River, and on the Chicago and Northwestern Railroad. It is surrounded by an iron, fruit, and grain producing country. The chief buildings include the high school, the county courthouse, and several fine churches. It has manufactures of machinery, dairy products, and linen and woolen goods. Waterworks, electric lights, and sewerage are among the improvements. Baraboo was incorporated in 1882. Population, 1905, 5,853.

**BARBADOS** (bār-bā'dōs), an island in the West Indies, of which it is the most easterly. It is twenty-one miles long and fourteen wide, and has an area of 166 square miles. It contains Mount Hillaby, 1,125 feet above the sea, and is surrounded by coral reefs. The soil is exceedingly fertile and produces tobacco, cotton, sugar cane, cereals, and tropical fruits. Among the exports are molasses, rum, sugar, and fruits. The imports include flour, rice, meat, clothing, and machinery. The little island, smaller than five congressional townships, is densely populated, and has considerable commerce. It was settled by the British in 1625 and is still a possession of Great Britain. Bridgetown is the capital and largest city. Population, 1906, 196,287.

**BARBARIAN** (bār-bā'rī-an), a term originated by the ancient Greeks, who called all foreigners and those unable to speak their language barbarians. According to Plato there were but two classes in the human family, the

Greeks and the barbarians. The term was not used originally in reproach, but after the Persian invasion it implied hostility to the Greeks and their civilization. After the Roman conquest of Greece, the word *barbarian* was used in reference to all nations except the Greeks and Romans.

**BARBARY** (bär'ba-rĭ), a name sometimes applied to the northern portion of Africa, which includes Fez, Morocco, Tunis, Barca, Fezzan, and Algeria. The name was taken from the original inhabitants known as Berbers, who were conquered by the Arabs in the reign of the caliphs. The country was prosperous in the time of the Carthaginians, and, next to Egypt, it became the richest Roman province. In ancient times the district included Numidia, Mauritania, and Cyrenaica. It became infested with pirates in the 15th century, and was finally civilized after the conquest of Algeria by the French. At present it is inhabited by Berbers, Turks, Bedouins, Jews, Negroes, and French.

**BARBARY APE**, or **Magot**, a small tailless ape found in Northern Africa. It walks on four feet and is skillful in passing from tree to tree. The color is greenish-gray and in size it is not much larger than a cat. It is capable of being trained to perform tricks.

**BARBECUE** (bär'bĕ-kū), a term derived from the natives of the West Indies, now applied to the practice of roasting an ox or other large animal at a social entertainment on a large scale. In the southern part of the United States the name has reference to a jollification, especially to a political jubilee.

**BARBEL** (bär'bĕl), a fish of the carp family, of which species are found in the fresh waters of America and Europe. The common barbel of England is a game fish, but its flesh is coarse, and it measures from two to three feet in length. The binny or barbel in the Nile weighs about 60 pounds and is esteemed for food. Several species closely resemble the American sucker, but all have soft barbels growing from the snout and upper jaw, hence the name.

**BARBER** (bär'bĕr), a person whose business is to shave, trim, and cut hair. Formerly surgery was combined with the craft. In the time of Henry VII. laws defined the duties of barbers, and forbade higher surgical operations than bloodletting and tooth pulling. Barber shops were noted as news centers in classic times and they are still notorious for gossip. In many countries, as in some of the states of the United States, the practice of the barbers' art is limited by law to persons skilled by train-

ing, who are required to hold a certificate of qualification. A spirally decorated pole has long been the principal sign of barbers' shops.

**BARBERRY** (bär'bĕr-rĭ), a class of shrubs native to the temperate zones. Many of the species are evergreen, and some yield a sour berry which is useful in making jelly and preserves. The bark yields medicine and the roots are of value in preparing a yellow dye. The common barberry of Europe has been naturalized in Canada and the United States. It is thorny, has serrated leaves, and bears yellow flowers. Several species are native to North America.

**BARBER'S ITCH**, a disease of the bearded parts of the face, caused by a parasitic fungus. Postular eruptions of the face are sometimes confused with this disease, but they are really the result of close and too frequent shaving. In the true barber's itch, sometimes called ringworm in the beard, parasitic scales or sporules cover the infected beard, giving it the appearance of having been covered with a whitish powder. It may be cured by careful treatment. The affected part should be kept clean and bathed frequently with cold water, and the parasite may be killed by applying lotions of different kinds, such as opium, carbolic acid in glycerine, and ointments of sulphur and nitrate of mercury.

**BARBUDA** (bär-bōō'dà), one of the Lesser Antilles, in the West Indies, 20 miles north of Antigua. It is of coral formation and has an area of 60 square miles. The surface is level and partly covered with forests, and cattle raising is the chief occupation. The island is a British possession. Population, 600.

**BARCA** (bär'kà), a district located between Egypt and the Gulf of Sidra, belonging to the Turkish Empire. It is bounded on the north by the Mediterranean and south by the Libyan Desert. The surface is hilly and mountainous, being traversed by highlands which reach an altitude of 3,310 feet. Agriculture and cattle raising are the chief industries. The exports are cattle, grain, ivory, and ostrich feathers. It was known to the Greeks as Pentapolis and contained five large Greek cities. The inhabitants consist mostly of nomadic Arabs and Berbers. Bengazi is the seat of government and the largest city. Population, 300,250.

**BARCELONA** (bär-sĕ-lō'nà), a city in Venezuela, capital of a state of the same name, 150 miles east of Caracas. It is situated on the Neveri River, three miles from its entrance into the Atlantic Ocean, and has railroad facilities and a good harbor. In the vicinity are coal and salt mines. Considerable trade is

carried on in coal and fruit. A government house, the theater, and a number of educational institutions are located here. The first settlement was made at Barcelona in 1638, and in 1881 it became the capital of Bermúdez, which has been divided to form the two states of Sucre and Barcelona. Population, 12,785.

**BARCELONA**, formerly the capital of the kingdom of Catalonia, and now an important city in a province of the same name. It is the principal seaport on the Mediterranean, has railroad connection with the chief towns of the Iberian Peninsula, and next to Madrid is the most flourishing city of Spain. It consists of two parts, the new and the old. The former is modern and is platted on a regular plan, while the latter is irregular and ancient. A fine promenade extends from the Columbus monument to the Plaza de Cataluña. The cathedral occupies an elevated site that was formerly the location of a Roman temple and a Moorish mosque. It has manufactures of cannon, paper, machinery, woolen and silk goods, chemicals, wines, and clothing. It is an important city of commerce and has a large import and export trade. Gas and electric lights, pavements, waterworks, and street railways are among the improvements. It is the seat of a museum, an arsenal, a public library, a university, and other public institutions. The city was under the government of a line of counts until the 12th century, but in 1137 it became a part of the kingdom of Aragon. In 1640 it became French territory, but was made a part of Spain in 1652, and was retaken by the French in 1697. The Peace of Ryswick, in the same year, restored it to Spain. Population, 1905, 534,250.

**BARD** (bärd), a poet who celebrated in verse and song the exploits of heroes and chiefs. Mention was made in Roman writings of the bards of Gaul two hundred years before the advent of Christ, but these singers disappeared early among the people of the continent. The bards of the insular Celts continued important as social factors throughout the Middle Ages, probably because they maintained a form of organization. The Welsh bards are especially noted for their writings on a variety of subjects, including secular and religious themes. It is related that the Scottish bards were skilled in singing their productions to the accompaniment of the harp. Gray's "The Bard" is based upon the persecution of the Welsh bards by Edward I. of England, who looked upon them as promoters of sedition. In modern times the term is used as a synonym of poet.

**BAREILLY** (bä-rä'lë), or **Bareli**, a city in

the Northwest Provinces of India, 151 miles east of Delhi. It is located on the Juá River, and has manufactures of carpets, cutlery, perfumery, and earthenware. The trade is chiefly in grain, sugar, and cotton. In 1857 it was the scene of a Sepoy mutiny, but the following year was recaptured by Lord Clyde. Population, 1901, 131,208.

**BARGE** (bärj), a double-decked passenger or freight boat that has no motive power of its own. It is attached to a towboat and used for conveying freight and passengers to shore from large vessels, or for pleasure excursions.

**BAR HARBOR**, a noted summer resort in Mount Desert Island, off the coast of Maine, 45 miles southeast of Bangor. It is beautified by evergreen groves, mountain scenery, and highland lakes. The island has an area of 98 square miles and is famous as a resort for tourists. Bar Harbor has steamboat connections with the mainland and numerous hotels and villas. Population, 1900, 1,888.

**BARI** (bä'rë), a city in Italy, capital of a province of the same name, on the Adriatic Sea. It has a good harbor and railroad facilities, and is the seat of a brisk trade in almonds, cotton, cereals, fruit, and woolen goods. The chief manufactures are musical instruments, chemicals, soap, and furniture. It is the seat of an archbishop and has a number of fine ecclesiastical buildings, including the priory of Saint Nicholas. Anciently it was known as Barium and was a flourishing city in 200 B. C. Population, 1901, 77,478.

**BARIUM** (bä'rī-üm), a metal resembling strontium, found in nature in the form of sulphate, carbonate, and silicate. It is an alkaline earthy metal, fuses at a low temperature, and oxidizes readily. Baryta is an oxide of barium, an alkaline earth, and is sometimes called *heavy earth*. It is a virulent poison and is used in making white paint, such as *Hamburg white*. The chloride of barium is used to prevent boiler incrustations and the nitrate is employed to test sulphuric acid and soluble phosphates. Both are used in making fireworks.

**BARK** (bärk), the outer covering of trees and plants, called *cortex* by botanists. The term, in a more limited sense, can be applied only to trees and shrubs of certain classes. In general it is found only on exogenous plants, while endogenous plants are destitute of true bark. The bark consists of several layers, as the inner or *bast*, which transmits the plant food; the intermediate or *green zone*, which fits the food for absorption, and the outer or corky layer, which protects the more tender inner layers. It contains valuable ingredients,

such as gum and tannin, and also yields cork, fibres, and properties valuable in tanning. In nautics, a bark is a three-masted vessel with riggings on the fore and main masts like those of a ship.

**BARK BEETLE** (bē't'l), a small insect which is very injurious to trees. A number of species have been described, most of which are native to America and Eurasia. The female deposits her eggs in or under the bark, usually between the bark and the wood, and the young dig a series of burrows which cause decay. The trees are either killed outright or the value of the wood is injured. In 1783 the pine forests of Germany were invaded by great swarms of these insects. They are frequently destructive to orchards.

**BARKER'S MILL** (bärk'ërz mīl), a machine invented in the 17th century, and used to produce rotary motion. It consists of an upright tube held in place by a frame, and at the lower end are two horizontal arms, on opposite sides of which are two small openings. The water is poured into the vertical tube and flows out of the small opening, causing the apparatus to revolve in the direction opposed to that of the water emitted. Devices to distribute water in sprinkling lawns and for making demonstrations in laboratories employ modified forms of this apparatus.

**BARLETTA** (bär-lët'tà), a city of Italy, located on an island in the Adriatic, and connected by a bridge with the mainland. It is about 35 miles northwest of Bari, with which it is connected by steam railway and electric lines. The streets are paved substantially with stone and asphalt. The city is surrounded by walls of stone. It contains a cathedral in the Byzantine style, a castle built by Charles V., and several fine statues and monuments. The export trade is largely in grain and fruits, and the manufactures consist of earthenware and cotton and woolen goods. Cannae, where the Romans were defeated by Hannibal in 216 B. C., is nine miles west of Barletta. Population, 1901, 42,022.

**BARLEY** (bär'lÿ), a valuable cereal plant, which is said to be more widely distributed than any other grain. It was an important food product in the early times of the Assyrians and Hebrews, and was used in the manufacture of beer by the Egyptians. It is now used mainly as feed for domestic animals, for making barley-meal bread, and in the manufacture of beer, porter, and whisky. The production is extensive in the Temperate Zone, where it yields from ten to fifty bushels per acre, the quality and quantity depending upon cultivation and

richness of the soil. The heads of most species are bearded and contain two, four, or six rows of seeds. It colors easily, especially if harvested in damp weather. The best quality of barley is obtained in a moderately dry climate. Canada produces large quantities of a fine grade, especially the Provinces of Manitoba, Alberta, and Saskatchewan, the first mentioned leading with an annual yield of about 15,500,000 bushels. The production of the United States has been about 175,500,000 bushels per year since 1908. California, Minnesota, South Dakota, and Wisconsin are the leading barley producing states.

HEADS OF BARLEY.

**BARMECIDE'S FEAST** (bär'mê-sīd), an "Arabian Nights" tale, in which it is related that a member of the Barmecide family set empty dishes before a beggar and invited him to partake of imaginary dainties. The beggar took the joke good-naturedly and pretended to eat and drink. Becoming intoxicated on imaginary wine, he cuffed the ears of the host. This so pleased the latter that the beggar was served with a bounteous meal.

**BARMEN** (bär'men), a city of Germany, in Rhenish Prussia, on the Wupper River, about 25 miles northeast of Cologne. The chief buildings include the city hall, the municipal theater, a gymnasium, a public library, and numerous hospitals and educational institutions. Barmen has six railroads and a network of electric railways. It is one of the most important manufacturing cities of Germany, and produces the principal part of the ribbons made in Europe. Its fabrics, laces, thread, cotton, silk, and woolen goods are transported to all parts of the world. Other manufactures include musical instruments, buttons, machinery, and metal ware. The city has all modern municipal facilities, such as public parks, sewerage, stone and asphalt paving, electric lights, and central heating. In 1815, after the Napoleonic wars, it was annexed to Prussia, since which time it

has grown rapidly in commerce and wealth. Population, 1905, 156,080.

**BARNACLE** (bār'nà-k'l), a marine animal of the lower order, generally called a *cirriped*. Many species are common to all the oceans, differing in the manner of life and the method by which the adult is attached to some object. Among the best known are the *acorn barnacle* and the *goose barnacle*. The latter is so named because the ancients supposed that it produces the *barnacle goose*, a wild goose of the north-western part of Europe. It is enveloped by a

GOOSE BARNACLES.

mantle and shell, possesses a long, flexible stock or peduncle provided with muscles, by which it fastens itself to floating objects, such as submerged timber or the bottom of ships. Its food consists of small marine animal life, which it secures from the water by its tentacles. The acorn barnacle, which has no stalk, is enveloped by a shell formed in the shape of an acorn, but composed of numerous valves. Some species were eaten by the ancients and are still esteemed as food by the Chinese. Darwin made a more extensive study of barnacles than of any other group of animals.

**BARNACLE GOOSE.** See **Barnacle**.

**BARNBURNERS** (bārn'būrn-ērs), a name given to the followers of Martin Van Buren at the time the Democratic party in New York was split into two factions. The name was derived from the case of the farmer who burned his barn to kill the rats, to which the party was likened, owing to the eagerness of some of the leaders to secure reforms. Their opponents were called the hunkers. In 1848 the Barnburners generally voted with the Free Soilers, making possible the election of the Whig candidate, Zachary Taylor.

**BARODA** (bā-rō'dā), a city of India, 230

miles north of Bombay, with which it is connected by railway. It occupies a prominent site on the Vishvomitri River, which is crossed by several stone and steel bridges. The chief buildings include an ancient palace, the Anglican church, the Baroda College, a public library, and the Dufferin hospital. It has a large trade in grain, merchandise, and live stock. The district of Baroda, of which it is the capital, has been tributary to the British since 1802. Many modern improvements, such as waterworks and electric lights and street railways, have been built since European occupation began. Population, 1901, 103,790.

**BAROMETER** (bā-rōm'ē-tēr), an instrument used in measuring atmospheric pressure. Owing to the even pressure of air on all sides of an object, many centuries elapsed before it was demonstrated that air possesses weight. The discovery was announced by Torricelli, an Italian, in 1643. By the use of the *Torricelli tube*, which is essentially the same as a barometer, he discovered that the pressure or weight of the atmosphere supports a column of mercury thirty inches high. The same experiment was repeated by Pascal in 1645. In 1656 Perrier discovered that the height of the mercury varies with the weather; when the air is moist it is lighter than when dry, and, therefore, the mercury rises in the dry air and falls when it becomes more humid. This fact discovered, it became possible to note the state of the atmosphere as to the quantity of moisture contained in it, and to determine the altitude of a given locality above the level of the sea, for the rea-

ANEROID BAROMETER.

LIQUID BAROMETER.

son that the pressure of the atmosphere is greatest at the level of the sea and gradually decreases toward the higher altitudes. Hence, in low altitudes mercury rises in the tube, and it gradually falls as the barometer is carried upward from the level of the sea.

The barometer is constructed according to well established rules. A glass tube about

thirty-three inches long, closed at one end, is filled with mercury. After closing the open end with a finger, the tube is reversed and dipped below the surface of the mercury in a vessel. When the finger is removed from the opening, a column of mercury remains in the tube, being sustained there by the pressure of the atmosphere. This column is about thirty inches high near the level of the sea; in high elevations it is much lower. The weight of the mercurial column is equal, in all cases, to that of a column of air equal in weight, extending from the level of the vessel to the top of the atmosphere. As above stated, the mercury rises or falls in proportion to the pressure of the atmosphere, which is varied by altitude and moisture. Thus, the mercury rises with increased pressure and falls when pressure is diminished. At the top of Mont Blanc, about 5,243 yards high, mercury falls to sixteen and one-half inches. In 1875 two Frenchmen, Sivel and Corce-Spinelli, lost their lives from asphyxia while ascending in a balloon; at the height of 9,370 yards the mercury fell to ten inches. This was due to the fact that the higher the ascent the less air remains overhead. For this reason, the less the air presses down, the less power it has to sustain a column of mercury. In the *aneroid barometer* no liquid is used; it depends for its operation on the pressure exerted by the air upon its surface.

Much study has been given to weather forecasts based on the condition of the atmosphere as indicated by the barometer. A number of governments and yachting clubs make careful observations with the barometer. They are guided largely by its registrations. A rapid rise of the barometer indicates unsettled weather; a gradual rise indicates settled weather; a rapid fall indicates stormy weather. Besides these rules are a number of others dependent largely upon location and the direction of the winds. It is certain that many lives and much property have been saved by careful observations of coming storms indicated by barometric action.

**BARQUISIMETO** (bär-kē-sê-mâ'tô), a city in Venezuela, capital of the state of Lara, on the Barquisimeto River. It is surrounded by a fertile plain and has a good trade in cereals and live stock. A cathedral, the government palace, and a college are among the public buildings. The first settlement made in its vicinity by the Spaniards dates from 1522, hence it takes rank with the oldest cities in America. In 1812 it was destroyed by an earthquake, but was soon rebuilt, and became the capital of a state of the same name in

1830: The state of Lara is part of the former state of Barquisimeto. Population, 1903, 41,360.

**BARRANQUILLA** (bär-rän-kêl'yà), a seaport in Colombia, on the Magdalena River, fifteen miles from the Caribbean Sea. It is connected with Sabinilla, its port on the Caribbean, with a railroad. Formerly only the smaller boats could navigate the Magdalena at this point, but it has been improved by dredging and now admits the larger vessels. The city has a large trade in produce and is improved with modern public utilities. Population, 1905, 40,115.

**BARRE** (bär'rê), a city in Washington County, Vermont, about six miles southeast of Montpelier, on the Vermont Central and the Montpelier and Wells River railroads. The manufactures consist chiefly of monuments and building materials made of Barre granite, which is quarried extensively in the vicinity. Among the principal buildings are the public library, the Goddard Seminary, and the high school. The first settlement was made in the vicinity in 1788 and it was incorporated in 1894. Population, 1900, 8,448.

**BARREL** (bär'rêl), a vessel formed of *staves* and surrounded by *hoops*. The staves are fitted carefully and held together tightly by the hoops, and at the two ends of the barrel are circular boards called the *heads*, which are fitted in grooves. Most barrels bulge in the middle, in which the staves are wider in the middle than at the ends, but some are larger at the lower end. A *bunghole* is provided for the purpose of allowing the inflow and outflow of liquids.

Many articles of commerce are sold in barrels, but the market value is based upon the quantity in pounds. Thus, a barrel of flour contains 196 and a barrel of pork 200 pounds. The barrel, in wine measure, contains 31½ gallons, and the imperial barrel of England contains 36½ gallons of beer. A barrel of butter consists of 224 pounds.

**BARRIE** (bär'rî), a town in Ontario, capital of Simcoe County, fifty-six miles northwest of Toronto. It is nicely situated on Lake Simcoe, a beautiful sheet of water about thirty miles long and twenty-six wide, and the surrounding country is fertile. It is the seat of a collegiate institute and several churches and schools. The manufactures embrace leather, woolen goods, flour, and machinery. Steamboats run on the lake from the town, which is popular as a summer resort. Population, 1901, 5,919.

**BARRIER REEF** (bär'rî-êr rêf), a coral

reef extending from ten to one hundred miles off the northeast coast of Australia, 1,265 miles in length. The reef is precipitous and rises from great depths. The trip from Sidney to Torres Strait is usually made by the inner route, where the sea is twelve fathoms deep. The passage is narrow, but it is less dangerous than the outer route. A vast region is covered by the Barrier Reef, about 100,000 square miles, and the surrounding waters yield pearls and trepang.

**BARROW** (bär'rô), the name given to mounds of earth constructed anciently for burial and monumental purposes. Many found in Great Britain are supposed to belong to the period of the Roman invasion. Eurasia, Northern Africa, and the Mississippi valley of North America are especially rich with these evidences of former populations. Many are long, others are in the form of a bell or cone, and some are broad barrows. Homer's "Iliad" mentions similar artificial mounds in connection with the obsequies of Achilles and Hector. See **Mound Builders**.

**BARROW**, a river of Ireland, rises in Queen's County, on the northeastern slope of the Slieve Bloom Mountains. After a course of 120 miles it unites with the Suir River and flows through Waterford Harbor into the sea. It is navigable twenty-five miles from its mouth, as far as New Ross.

**BARROW STRAIT**, a narrow channel extending from Lancaster Sound and connecting Baffin Bay with Melville Sound. It was so named from Sir John Barrow, a British traveler, though Parry discovered it in 1819.

**BARTER** (bär'tēr), the term used in economics to express the exchange of one commodity for another, as contrasted with the sale of commodities for money. In primitive times barter was extensive, each individual exchanging the surplus of his own products for such surplus products of others as he himself might desire. Instead of paying money for clothing or food, the primitive man traded a pig for a sheep, or several commodities for one of greater value than either. This system was conducted in the primitive states of all communities, and still prevails more or less among savage people. The terms *barter* and *sale* are used at present as interchangeable by many courts.

**BARTHOLOMEW FAIR**, an exhibition held under a charter issued by Henry I. at West Smithfield, London, from 1133 till 1855, on Saint Bartholomew's day, Aug. 24th. It was long a center of amusement and games, but began to lose its trade after 1685.

**BARTHOLOMEW, Massacre of Saint,**

the name applied to a slaughter of French Protestants on the night of Saint Bartholomew's day, Aug. 24, 1572, with the sanction of Charles IX., influenced by his mother, Catherine de Médici. She was the regent of her son Charles during his minority, and a long war raged between the Catholics and Huguenots. With the pretense of friendship, she made overtures to the Huguenots, which resulted in a peace treaty. She married her daughter Margaret to Prince Henry of Navarre, later Henry IV., who was leader of the Huguenots, and appointed Admiral Coligny, an influential Huguenot, to an important position in the kingdom. Admiral Coligny was invited to the court of the king and honored as a father. The admiral was wounded by a shot on Aug. 22, and the king hastened to his relief and promised punishment to the offender, but later his mother induced him to believe that the admiral desired to take his life. A council was held, and Aug. 24 was fixed for the night of the execution. Accordingly, Admiral Coligny was murdered, and a bell from the royal palace at midnight gave the signal for the commencement of the massacre. The bloody slaughter was promptly commenced and carried to all parts of France. It is said that the two Huguenot princes, Condé and Henry of Navarre, saved their lives by denying their religion, but this is not admitted by good authorities. According to Sully, 70,000 Huguenots, including women and children, were murdered. However, the object designed was not accomplished, and the king was required to grant liberty of conscience soon after to all citizens of France.

**BARYTA** (ba-ri'ta). See **Barium**.

**BASALT** (bâ-salt'), an igneous rock belonging to the trap-rock variety, frequently columnar in structure. Its origin is due to great pressure on the interior of the earth, in remote geological ages, forcing melted rock through fissures of other rock formations. On cooling, the mass formed what is known as *dikes*. These vary in width from several inches to three or four yards. They are much harder than the rock through which they were forced, and usually extend above the general surface, owing to the fact that they are less subject to corrosion. Many attain a height of five to 160 feet. The columns are generally in the forms of a pentagon, hexagon, or octagon. They are found in various parts of the continents, and are most numerous near the borders of mountainous districts. There are columns of basalt at the Giant's Causeway in the northern part of Ireland, in Scotland, at Fingal's Cave, and various parts of the Island

of Staffa. On the northwestern coast of Lake Superior are examples of basalt. The Columbia River, in Washington, has extensive cliffs formed of basaltic columns.

**BASE** (bās), a term used in chemistry to describe a substance which has the power to unite with an acid and with it form a salt. Water is formed in the process and the metal takes the place of the hydrogen of the acid. A base may be either an oxide or a hydroxide, lime or calcium oxide being an example of the former and potassium hydroxide of the latter. The salt potassium nitrate, or saltpeter, is formed when potassium hydroxide acts upon nitric acid, while the salt sodium sulphate results from the uniting of sodium hydroxide and sulphuric acid. Bases may be either oxygen, as those mentioned above, or they may contain sulphur, iodine, chlorine, bromine, and fluorine. The alkaloids, or organic bases, found in many plants, contain nitrogen. They are considered as substitution compounds of ammonia.

**BASEBALL** (bās'bal), an athletic game regarded national in America. The simpler game known as *town ball* was played in the United States until 1857, when baseball began to be played by amateurs. It continued to attract little attention until 1871, when professional organizations were instituted. Soon after it was introduced into England and other countries. In 1884 the National Association of Baseball Players was organized, and this was succeeded two years later by the National League of Professional Clubs.

The game has been brought to a high standard by the development of professional skill, the adoption of standard rules, and the cultivation of a public interest sufficient to cause attendance in large numbers at public exhibits. Many high schools, colleges, and universities have clubs and give much time and attention to the development of professional skill. The larger number of the clubs of the National League and of the American League devote most of their time, in the playing season, to public exhibits and from gate receipts secure handsome incomes. In 1874 several clubs visited England and Ireland, where they played fourteen exhibition games. One of the most noted tours was made in 1888-89, when the Chicago club and a team gathered promiscuously, known as the All-American, made a tour of the world. They visited and played at Honolulu, Sidney, Auckland, Melbourne, Colombo, in Ceylon, at the Pyramids of Egypt, Rome, Naples, Paris, London, and many other great cities of the world.

The game is played with a ball and bat.

The ball weighs about five ounces avordupois, and is about nine inches in circumference. The bat is made entirely of wood, but may have twine wound around the handle, and cannot exceed forty-two inches in length. There are nine players on a side, who play on a diamond-shaped piece of ground ninety feet on each side, the corners being bases. The field is taken by one side, and the other side has a man at the bat. The field side has a pitcher located inside the ground, near the center in front of the batsman; he throws the ball to the batsman, who has a position on the home base, and who makes an effort to drive it with the bat out of the reach of the fielders and to such a distance as to enable him to run around the bases and

*AA*, Reservation for batsman, catcher, and umpire; *BB*, for captain and assistant; *CC*, benches for players; *D*, visiting players' bat-rack; *E*, home players' bat-rack.

make a score. If he fails to drive the ball far enough to make a complete round, he stops at one of the bases and is followed by another batsman. If he is touched by the ball before reaching a base, he is out, and, when three of his side are out, the side at the bat takes the field. A game includes nine innings, and the side making the highest score wins.

The games played by the professional clubs are attended by newspaper reporters and telegraph operators are located at instruments near at hand, who send the news of the progress

made to all parts of the country. Many times bulletin boards are posted in conspicuous places at the games and in many cities far remote, at which interested spectators may learn of the progress and results. It is not unusual for the national and international games to be attended by 15,000 to 40,000 spectators, as was the case at the great games played between the teams of Chicago and New York in 1908. While the game is easily understood, much practice is required to become skilled in its arts. Elaborate rules have been provided for the guidance of individual players and associations. These are changed or amended by national representative conventions from time to time, and are consulted as a guide in all the amateur and professional games.

**BASEL** (bä'zəl), or **Bâle**, a city and canton of Switzerland. The canton has an area of 177 square miles and a population of 195,017. It borders on Alsace and the inhabitants are German. The city of Basel is one of the largest in Switzerland, situated forty-three miles north of Berne, on both sides of the Rhine, and the two parts are connected by a number of bridges. It occupies a fine site about 800 feet above the level of the sea. The two parts into which it is divided by the river are known as Grossbasel and Kleinbasel. It is the seat of a cathedral founded in 1010, which contains the tombs of Erasmus and other distinguished persons. It has a fine university founded in 1459. The university library contains 232,000 volumes and many pamphlets. With it are affiliated an institute of natural sciences and the botanical gardens. Among the noted buildings are the museum, the Bible Institute, the city hall, and the Church of Saint Elizabeth. The manufactures include silk, ribbons, machinery, leather, paper, spirituous liquors, clothing, and aniline dyes. It has a large and growing commerce. A network of railroads connect it with other cities, and the Rhine furnishes water navigation. It is considered the wealthiest city of Switzerland. Gas and electric lights, street railways, waterworks, and excellent schools are among the modern improvements. Basel was a Roman military post in the 4th century, when it was known as Basilia. In the 10th century it became a free city, when it was ruled by its bishop and chief nobility, and it was joined to the Swiss Confederation in 1501. Population, 1907, 131,687.

**BASEL, Council of**, the last of the three great ecclesiastical councils convened in the 15th century, held at Basel, Switzerland, in 1431-49. The first of these councils was held at Pisa, Italy, in 1409, and the second at Constance, Switzerland, in 1414-18. The council of Basel

was called by Pope Martin V., who died shortly after its convocation, and was succeeded by Eugenius IV. Its objects were to deliberate with the intention of extirpating heresies and to discontinue wars among Christian princes. However, the council got into disputes with the Pope, deposed him, and elected Felix V. in his stead. At the death of Eugenius IV., Nicholas V. succeeded to the pontificate, who brought about a reconciliation which resulted in the abdication of Felix V. and the official sanction of the decrees of the council of Basel. Final adjournment was agreed upon May 4, 1449.

**BASE LINE**, in surveying, a line measured with precision and used as the basis for government surveys, from which townships are numbered. Ranges are numbered east and west of prime meridians.

**BASIL** (băz'īl), a plant native to the warmer temperate parts of the Northern Hemisphere. It is an annual and has a fine odor. The leaves are long and the flowers appear in whorls of six. It is cultivated for seasoning and for its medicinal virtues. The *sweet basil* is native to the East Indies. It is grown extensively in Europe.

**BASILIAN MANUSCRIPTS**, the name of two valuable Greek manuscripts in the library at Basel, Switzerland. One is a copy of the whole new testament, except the Apocalypse, written in the characters of the 10th century. The other is in uncial characters, written at Constantinople in the 8th century, and contains the Gospels, except Luke iii, 4-15, and xxiv, 47-53.

**BASILICA** (ba-zīl'ī-kā), in architecture, a public hall or a courthouse. The term was used extensively among the ancient Greeks and Romans, and had reference to the public buildings in which princes and magistrates administered justice. The Basilica Portia, built about 182 B. C., is among the first mentioned in Roman history. Structures of this class were very numerous in Rome and the provincial towns, especially before the time of Constantine I., and subsequently they were converted into Christian churches. They were usually surrounded by a peristyle of columns, and at one end was a semicircular or square apse. The five great patriarchal churches in Rome are still called basilicas. The term is used more or less in speaking of cathedrals, among them the cathedral in Quebec, Canada.

**BASILISK** (băz'ī-līsk), in fable, a creature variously represented to resemble a serpent, lizard, and dragon, and reputed to possess a fatal breath. In modern zoölogy the name is applied to a small reptile with four feet, a long

tail, and a broad, membranous hood at the back of the head. These animals inhabit tropical regions, especially Central and South America, where they live near or in the water. They swim and climb trees with ease. Some species attain a length of thirty inches. They are hunted for food in some parts of the West Indies.

**BASIN** (bā'sin), in geography, a term used to describe a collection of water, as a river,

BASKETS.

sea, or bay. In physical geography the term is applied to the area drained by a river or a river system. The highest line between two basins is the *divide* or *watershed*. In geology it is used to designate a depression of a strata which has later become filled with deposits. Some geologists think geological basins were cut out\* by the action of glaciers.

**BASKET** (bās'kēt), a light, airy vessel used for domestic purposes. Baskets were made long before the Christian era, and remains of them have been found in the tombs of Egypt.

In ancient times they were made water-tight by a coat of asphalt, and used as vessels to convey liquids. Now many kinds of splints and twigs are woven into baskets, but willow shoots are most commonly used for that purpose. They are prepared by soaking in water, and then peeled by tools and split. Some workmen make a rude product by using willow, ash, elm, and birch shoots without peeling them. Beautiful baskets are made with splints finely worked and nicely decorated with artistic colors. In France, Japan, and China large quantities of elegant baskets are made for the market. The Indians of North America still make very handsome baskets ornamented with beads and shells.

**BASKET BALL**, a popular game played indoors, with a ball thrown by hand into goals. The room in which the game is played is oblong, and the ground or floor contains about 3,500 square feet. At each end is a goal or basket, made by suspending nets of cord from metal rings. The goals are ten feet above the floor and eighteen inches in diameter, and the ball, made of inflated rubber bladder covered with a leather case, is round and from thirty to thirty-two inches in circumference. Two teams of five players each take part in the game, each side having a left and right guard, a center, and a left and a right forward. A referee, who has general supervision, puts the ball in play by throwing it into the center of the field somewhat higher than either of the centers can jump, and at right angles from the side lines. As soon as the ball leaves the referee, each team makes an effort to throw the ball into the basket of the other, and to prevent the opposing side from making a similar goal. The ball cannot be kicked or carried, but must be thrown or batted with the hand. If a player pushes or kicks an opponent or is intentionally rough, the opposing team is permitted to have a throw free at a distance of not less than fifteen feet. A goal from the field counts three points, and a goal made by a free throw counts only one.

Basket ball was invented by James Naismith in 1891. It became popular soon after, and is played extensively by militia companies, by the Young Men's Christian Association, and in many of the schools and colleges. Official rules were drawn up by the Amateur Athletic Union to govern the practice. The game furnishes healthful exercise and calls into use the principal muscles of the body. It requires quickness of perception, attention to points of advantage as the game progresses, and rapidity of thought and action. Besides, it furnishes pastime in the

winter season as well as at other times of the year, and is played when football and baseball are out of season.

**BASQUES** (bâsk) a peculiar race of people which probably occupied the whole Iberian Peninsula at a remote date. At present the Basques are confined to the Spanish provinces of Biscay, Alava, Guipuzcoa, and Navarre, and the department of Basses-Pyrénées of France. The total number in Spain and France aggregates about 600,000. Their language, known as the Basque language, has no close affinity with any European tongue. They are considered descendants of the people of ancient Iberia. Their industries are chiefly agriculture, mining, and fishing. They are fond of music and celebrate their holiday, Sunday, in singing and dancing. The name *basque* is applied to a short waist worn by ladies, which was probably copied from the Basque costume.

**BAS-RELIEF** (bâ-rê-lêf'), in sculpture, a kind of art work in which the figures project slightly from the background. In this style the height is about equal to half of the thickness of the figure, but in many sculptures of the 16th century the Italian artists had the figures project very slightly. The palaces of Assyria had bas-relief work set in alabaster, and in the halls were elaborate figures representing their deities and scenes of war and hunting. Bas-reliefs are common in Egyptian monuments, but the most famous examples are those which form the frieze of the Parthenon at Athens. Cavo-relievo are a kind of bas-reliefs in which the whole figure is set below the general surface, and the relief is in a sunken panel.

**BASS** (bâs), a strong, active game fish. The name is applied to widely different fishes of the perch family. Among the common

STRIPED BASS.

American varieties are the *rock bass*, the *black bass*, the *spotted bass*, and the *ruddy bass*. Different species of bass are found both in the sea and in fresh water. Most of them are good for food and make fine sport for anglers, while others are coarse. The usual weight is about two pounds, while the *striped bass*, an American species, attains a weight of thirty pounds.

**BASSETERRE** (bâs-târ'), a city of the British West Indies, capital of the island of Saint Christopher, or Saint Kitts. It has a good harbor and a trade in sugar and fruit. The streets are improved and many of the buildings are modern and substantial. Population, 1906, 9,962.

**BASSETERRE**, a town of the West Indies, capital of the French island of Guadeloupe, at the mouth of a small river. The harbor is poor, but the town has considerable trade. It is the seat of a bishop and has some modern utilities. Population, 1906, 8,626.

**BASSIA**, the name of a genus of plants native to warm climates, including several species of trees valued for their fruit. The *Mahwa tree* of the East Indies is valuable for its timber, and oil is obtained from the seeds. A species yields the shea butter, which is an important article of commerce in the central part of Africa, and is considered quite palatable.

**BASSORA** (bâs'sô-râ), or **Basra**, a commercial city of Asiatic Turkey, capital of a vilayet of the same name, on the Euphrates River. The surrounding country is fertile and produces rice, vegetables, and the date palm. Though poorly built and without modern facilities, the city has an important trade in coffee, drugs, rice, camels, and manufactured articles. A stone wall surrounds the city, and within are several monuments and mosques. It has a military station and is the seat of British and American consulates. Population, 40,000.

**BASS STRAIT** (bâs), a channel north of Tasmania, which it separates from Australia. It is 120 miles wide and is studded with many islands. Flinders Island is on its eastern extremity and Kings Island on its western. The strait was discovered in 1798 by George Bass, a surgeon in the British navy.

**BASSWOOD.** See **Linden**.

**BASTIA** (bâs-tê'à), a seaport and fortified city of Corsica, opposite the Isle of Elba, eighty miles northeast of Ajaccio. Many of the buildings are modern, but the streets are narrow and crooked, and the older part of the city has many small structures. Two harbors, the old and the new, are utilized in its commerce, which includes trade in oil, leather, macaroni, and marble. Dye, soap, and wax candles are manufactured. It was founded in 1380 by the Genoese. Population, 23,675.

**BASTILLE** (bâs-têl'), a word formerly used in France to designate any strong castle defended by bastions, but now specially applied as the name of the prison and citadel of Paris built by Charles V. about 1370. This

structure, though designed as a defense against the English, was used as a state prison for persons of rank who had lost standing in the government and had forfeited public confidence. It had a capacity for seventy or eighty persons, and during the reigns of Louis XIV. and Louis XV. was used most extensively. Those confined were rarely criminals, but rather people who had displeased the king and his associates. These included political offenders, scholars, advocates, and priests, who were often confined so long that they were entirely forgotten by the public. On July 14, 1789, it was captured by a Parisian mob, which signaled the beginning of the Revolution. The next day it was destroyed and not a vestige now remains. Its site is marked by a column in the Place de la Bastille. The *fall of the Bastille* is an important epoch in French history and marks the downfall of the old monarchy.

**BASUTOLAND** (bâ-sōō'tō-länd), a British possession in South Africa, northeast of Cape Colony. The area is 10,293 square miles. It is bounded by the Orange River Colony, Natal, and Cape Colony, and is drained largely by head streams of the Orange River. The region is well watered and has a fine growth of grasses and forests. The climate is healthful and well fitted for Europeans. Coal, iron, and copper are the chief minerals. Agriculture is the leading industry. The possession was annexed to Cape Colony in 1871, and placed under the authority of the crown in 1884. Its government is administered under the direction of a high commissioner for South Africa, through a resident commissioner; the legislative power of the former is exercised by proclamation. The colony has about 260 schools, at which 13,120 pupils receive instruction. Several highways have been constructed and communication has been established with other South African countries by telegraph and railway lines. The native Basutos are a superior race of South Africa and are somewhat advanced in the arts of civilization. Maseru, the capital, has a population of 1,350. In 1904 the total population was 348,626, of which number 895 were whites.

**BAT** (băt), an animal with wings composed largely of a thin, membranous skin, which is stretched from the fingers of the fore limbs and along the sides back to the hind limbs and tail. It moves about in the twilight and darkness and is the only mammal that can fly with facility. The bat is found in the temperate and warm regions, but attains its greatest size and is most numerous in the tropics. The

bats of the temperate climate are mouselike in appearance, and, when stretched, their wings measure about sixteen inches. In the daytime they frequent caverns, hollow trees, crevices of ruins, and isolated lurking places, and at night come out to feed upon insects. During the entire winter season they sleep, except in warm climates. Many species sleep in daytime, hanging by their hind legs, head downward. Bats are more or less abundant in all countries, except in the extreme north and south. Some varieties are fruit-eating animals and live in orchards and vineyards, while others support themselves by sucking the blood of other mam-

HANGING BAT.

mals; this class is known as *vampire bats*. There are no less than 450 species of bats, but all are classed as mammiferous quadrupeds. They show great attachment for their young, often endeavoring to protect them in case of danger, even submitting to captivity rather than forsake them. The Australian *kalong* is the largest of the bats.

**BATANGAS** (bâ-tân'gäs), a city of the Philippines, capital of a province of the same name, in Luzon, fifty-two miles south of Manila. It is a seaport city of considerable importance and has a good harbor on Batangas Bay, an inlet from the Pacific. Among the chief buildings are the public library, a convent, and a palace. It has a large export trade and telegraph connections with interior and continental points. The manufactures include cigars, earthenware, clothing, and utensils. Waterworks and electric lights have been installed. It was captured by the United States in 1899, in the war against the natives. Population, 1901, 37,400.

**BATAVIA** (bâ-tâ'vî-à), a seaport city on the north coast of Java, capital of the Dutch East Indies, in the Province of Batavia. It is located on a large bay and is unhealthy, owing to its hot climate and low site. Europeans have improved the city by a system

of drainage and by building the new part on a more elevated tract of land. The chief buildings include the post office, the Java Bank, the Exchange building, the museum, and several Javanese temples. Among the modern improvements are electric lights, waterworks, and electric street railways. It has a large export trade in sugar, rice, coffee, tea, oil, indigo, and hides, principally with Holland. It was founded in 1619 by the Dutch, who improved it by building canals and an extensive harbor. A large per cent. of the inhabitants are Chinese and Malays. Population, 1906, 116,887.

**BATAVIA**, county seat of Genesee County, New York, 36 miles east of Buffalo, on the Lehigh Valley, the Erie, and the New Central railways. It is surrounded by a productive agricultural country, and is the seat of manufacturing establishments producing implements, machinery, shoes, textiles, canned goods, and flour. The chief buildings include the public library, the county courthouse, and the State School for the Blind. A monument to William Morgan, noted for his connection with the anti-Masonic movement in 1826, stands in a public place. It has a growing trade in merchandise and is improved by numerous municipal facilities. The city was founded in 1800. Population, 1905, 10,080; in 1910, 11,613.

**BATH** (bāth), a city of Somersetshire, England, on the Avon River. It is noted for its mineral water and baths. The mineral springs were known to the Romans, and remains of baths constructed by them in the 1st century B. C. have been discovered. The city is built largely of white stone obtained from quarries in the vicinity. Victoria Park, a beautiful public ground, contains fifty acres. The chief buildings are a public library, the theater, the Abbey Church, and the city hall. It is the seat of Bath College and Wesleyan College. It has important manufactures and a large railway and canal trade. Population, 1907, 48,885.

**BATH**, a city of Maine, county seat of Sagadahoc County, on the Kennebec River, about thirty-eight miles northeast of Portland. It is on the Maine Central Railroad and has extensive navigation facilities, as the water of the river rarely freezes. The manufactures include cigars, furniture, iron and leather wares, clothing, and machinery. It is surrounded by an agricultural country and has modern conveniences, including pavements and street railways. The first settlement was made in 1660, when an Indian mission was established. It was incorporated as a city in 1847. Population, 1900, 10,477.

**BATH**, a town in New York, county seat of

Steuben County, 98 miles southeast of Buffalo, on the Erie and other railroads. It has manufactures of harness, shoes, and clothing. The surrounding country is agricultural. It is the seat of an orphan asylum and a soldiers' and sailors' home, and has a public library and several county buildings. The first settlement was made on the site of Bath in 1793. Population, 1905, 4,894.

**BATHING** (bāth'ing), the immersion of the body, or a part of it, in water for the purpose of maintaining cleanliness and stimulating health. It was a part of the religion of many ancient nations, including the Egyptians, Hebrews, and Greeks, to bathe the body. The Koran makes it mandatory on Mohammedans to wash the face, hands, and feet five times a day. This command is observed so carefully that when the Moslem is in a desert and out of the reach of water the ceremony is performed with sand. The Romans built the most splendid baths constructed by the ancients. In the time of Emperor Diocletian the Roman baths had a capacity sufficient for 18,000 persons to bathe at once, while Emperor Caracalla built baths nearly a quarter of a mile square. These structures were provided with washing rooms, courts for games, gymnasiums, hot and cold water baths, vapor baths, swimming baths, and hot-air baths, and their walls were decorated with marbles, statues, mosaics, and historic paintings.

Baths are variously designated from the character of the process to which the body is subjected. A *Turkish bath* is applied by admitting hot air into the room where the bather sits, and the heat of the air is constantly increased until he perspires freely, when he goes into a washroom, where his body is briskly scrubbed with water and soap and cooled by a shower bath. He next plunges into a swimming bath of cool water, where he bathes freely, and, after emerging, he is dried, wrapped in a blanket, and lies down on a lounge until the natural warmth of the body returns. A *Russian bath* differs from the Turkish in that the hot air is displaced by hot steam, but in other respects they are similar.

A hot bath brings the blood near the surface, which reddens the skin, the veins become enlarged, and a heaviness is felt in the head. The effect of violent heat is to fatigue the body, hence warm baths should be carefully administered. The better way is to take lukewarm baths and increase the heat from time to time as the body becomes accustomed to it. A warm bath gives no shock to the bather and is always pleasant. It has a tendency to quiet the nerves

and increase the flow of blood, and is the best form for most persons. A cold bath causes a sudden chill, and is followed by a feeling of warmth, which is called a *reaction*. The bather should remain in water only until he feels the reaction, when he should come out and rub himself dry with a coarse towel. None but the strong are able to endure a cold bath, and this administered carefully is of much utility. *Sea bathing* is one of the most pleasant and beneficial exercises for the body. The salt water seems to have a wholesome effect upon the skin and is quickening to the organs, if the bather does not remain too long in the water.

Baths are usually known by the degree of temperature at which the water or vapor is administered. The average temperature of a cold bath is about 48° Fahr.; cool bath, 58°; tepid bath, 88°; warm bath, 95°; and hot bath, 100°. In many cities mineral water flowing from the ground is utilized for bathing purposes. Some of the most noted mineral baths in Europe are at Baden, Karlsbad, and Aachen, Germany; Spa, Belgium; and Teplitz, Bohemia. The leading natural hot baths of North America are at Hot Springs, Ark., and Hot Springs, S. D. The water is both mineral and thermal, ranging in temperature from 100° to 160°. Thousands of people patronize these health resorts, and indulge in bathing both for pastime and to regain lost health. Many physical ailments can be cured and the system can be greatly strengthened by the use of these natural remedies. In recent years it has become quite general to construct water systems, by which dwelling houses having bath tubs are supplied with water. In this way every member of the family can avail himself of a healthful bath without inconvenience, and have it administered at the proper time. Though bathing is generally healthful, a person should not remain too long in the water, and bathing within three hours after a meal should be carefully avoided.

**BATH, Knights of the**, a military order in Great Britain, the largest in number and the highest to which a commoner can attain. It was so named from the ceremony of bathing, which was formerly practiced when a knight was initiated, hence indicated that both purity and chivalry were required. The order probably dates from the early part of the 12th century, and it is thought that it was instituted by Henry I., who is said to have made Geoffrey of Anjou and others "Knights of the Bath." It was used in the coronation of Charles II., in 1660, and later fell into disuse, but was revived by George I. in 1725. At present it com-

prises three classes, Knights Grand Cross (G. C. B.), Knights Commander (K. C. B.), and Companions (C. B.).

**BATHOMETER** (bà-thöm'è-tër), an instrument to indicate the depth of water. It was invented by C. W. Siemens and is used on vessels, indicating the depth of the water below the ship or steamer. The instruments belonging to this class differ materially, ranging from the simpler forms used to measure shallows to the more complicated apparatus necessary to determine great depths. In general they depend upon the principle that underlies the law of gravitation, and that the attraction exerted by the land is stronger than that of water. The essential part is a vertical steel tube, at the lower end of which is a cup-shaped expansion, and the depth of the water is indicated on a micrometer scale as the mercury rises or falls in the tube. In some instruments oil or water is used instead of mercury. The column in the tube lowers in shallow water, since greater force is exerted in drawing down the mercury, and it rises in deeper water to the extent that the force is diminished. A sounding line is used to sink the instrument to the bottom.

**BATON ROUGE** (băt'ün-rōōzh), the parish seat of East Baton Rouge parish, and capital of Louisiana, on the east side of the Mississippi River, about ninety miles by railroad and 130 by river from New Orleans. It is on the Texas Pacific and the Yazoo and Mississippi Valley railroads, and occupies a prominence about twenty-five feet above high-water mark. The city is the seat of the State University, an asylum for the deaf and dumb, a military hospital, an agricultural experiment station, and a State penitentiary. Among the prominent buildings are the State capitol, the courthouse, the post office, the high school, and the city hall. It has manufactures of sugar, ice, clothing, cotton products, and machinery. Electric street railways, waterworks, and paved streets are among the improvements. It was founded by the French and was the capital from 1847 to 1864, when the seat of the State government was removed to New Orleans, but it was again made the State capital in 1880. The Union army occupied it in the Civil War, after New Orleans had been taken, and it suffered a Confederate attack under General Breckinridge, but was held by the Union army under General Williams, who was slain in battle. Population, 1900, 11,269.

**BATTALION** (băt-tăl'yün), the tactical unit of infantry. It constitutes the most numerous body of unmounted men in charge of one commanding officer who gives personal super-

intendence. It is made up of from four to ten companies, has a normal war strength of 1,000 men, and is commanded by a field officer. A regiment is constituted of two or more battalions; a brigade, of two or more regiments; a division, of two or more brigades; an army corps, of two or more divisions, and an army, of two or more army corps. See **Army**.

**BATTERING-RAM** (băt'tēr-īng-rām), an ancient war machine to batter down walls of forts and cities. It consisted of a great wooden beam with a heavy bronze or iron head. The length was from 50 to 180 feet, and the head of large rams weighed a ton. Many were built in frames, while others were on rollers or wheels with a cover over the front to protect the workers from falling missiles. The work of the ram was effected by about one hundred men, or by the use of ropes and pulleys. It was regarded an essential implement in the time of the ancient Greeks and Romans, who employed it extensively while laying siege to fortified cities.

**BATTERY** (băt'tēr-ĭ), the tactical unit of artillery. The term is applied to the largest number of mobile guns, with full equipments, that one man can personally superintend. They are usually distinguished as horse, field, and garrison. The first two consist of six guns each. Along with each battery are gunners to work the guns. Each battery includes a number of drivers who manage the horses by which the guns are transported from one locality to another. See **Artillery**.

**BATTLE** (băt't'l), a combat between two or more armies, or divisions of armies. Battles are fought either with the view of attaining local advantage, or influencing favorably the whole contest. The skillful commander aims to reach a decisive point in each engagement. This is *strategy*, while skill in active battle is called *tactics*. Each victory must be followed up in order to fully disable the beaten army and thereby gain the advantage of success. Battles do not depend upon their magnitude for importance, but rather upon their enduring effect upon social and political conditions. In Creasy's "Fifteen Decisive Battles of the World, from Marathon to Waterloo," a list of the battles is given that have largely influenced history and made civilization, more or less, what it is. The mind fills with awe when contemplating what human institutions might have been had these battles terminated differently. The following is a complete list as given by Creasy:

- B. C.  
490. Battle of Marathon.  
413. Defeat of the Athenians at Syracuse.  
331. Battle of Arbela.  
207. Battle of the Metaurus.

A. D.

9. Defeat of the Romans under Varus.  
451. Battle of Chalons.  
732. Battle of Tours.  
1066. Battle of Hastings.  
1429. Joan of Arc's victory at Orleans.  
1588. Defeat of the Spanish Armada.  
1704. Battle of Blenheim.  
1709. Battle of Pultowa.  
1777. Defeat of Burgoyne at Saratoga.  
1792. Battle of Valmy.  
1815. Battle of Waterloo.

**BATTLE CREEK** (-krĕk), a city of Michigan, in Calhoun County, on the Kalamazoo River, and on the Chicago and Grand Trunk, the Cincinnati Northern, and the Michigan Central railroads. The chief buildings are the post office, the high school, the public library, and the Post Theater. It has manufactures of threshing machines, knit goods, flour, furniture, hardware, carriages, machinery, and farming implements. Battle Creek College was founded here by the Seventh Day Adventists, in 1874, and later they established a sanitarium, which is attracting a large patronage. Health foods are made on a large scale at the sanitarium. The city has fine municipal facilities, and is noted as an educational and commercial center. It was incorporated as a city in 1860. Population, 1904, 22,213; in 1910, 25,267.

**BATTLEFORD** (băt't'l-fôrd), a town in Saskatchewan, at the junction of the Battle and North Saskatchewan rivers, near the line of the Canadian Northern Railway. It was the capital of the Northwest Territory from 1876 to 1883, and near it was organized the insurrection headed by Louis Riel. The surrounding country is devoted to farming and ranching. Population, 1901, 797.

**BAUTZEN** (bou'tsen), a city of Germany, in the kingdom of Saxony, on the Spree River, thirty miles northeast of Dresden. It has railroad and electric railway facilities and manufactures of leather, textiles, and clothing. A cathedral, a castle, and the royal palace are among the chief buildings. It became a town in the 10th century, in the reign of Otho I., and suffered greatly during the Thirty Years' War. In 1813 it was the scene of a great battle between Napoleon, with an army of 130,000 men, and an allied army of 90,000 Germans and Russians. Napoleon had made the attack and after a contest of two days retreated, having lost about 20,000 men. Population, 1905, 29,419.

**BAVARIA** (bâ-vâ'rĭ-â), Kingdom of, a crown state of Germany, next to Prussia the largest state of the German Empire. It consists of two separate portions, the eastern and larger part, or Bavaria proper, and the western, or Rhenish Bavaria. Eastern Bavaria is surrounded by Austria-Hungary, the Thuringian states, Hesse-Nassau, Saxony, Württem-

berg, Baden, and Hesse. Rhenish Bavaria, or Palatinate, is bounded by Prussia, Alsace-Lorraine, Hesse, and Baden. The area is 29,282 square miles.

**PHYSICAL FEATURES.** The surface is more or less mountainous and most of the boundaries are formed by mountain ranges. In Southern Bavaria are three ranges of the Alps, known locally as the Algäuer Alps, the Salzburger Alps, and the Bavarian Alps. Of the last mentioned the Zug Spitze, 9,725 feet, is the highest peak. The Böhmerwald is in the northeast, and in the north are the Rhöngebirge and the Fichtelgebirge. An elevated plain stretches through the interior of Bavaria, and in the Palatinate are the Harz Mountains, whose peaks reach an elevation of 2,500 feet above the sea. Most of the drainage is by the Danube and its tributaries. These tributaries include the Altmühl, Regen, Vils, and Wörnitz from the north, and the Lech, Inn, Iller, and Isar from the south. The Main River drains the northwestern part. Amersee and Chiemsee are among the lakes in the southern part. The rainfall is greatest in the eastern part of Bavaria, about seventy-five inches, and in the Palatinate and the higher altitudes it averages twenty-four inches annually.

**NATURAL RESOURCES.** Nearly one-third of the kingdom consists of forests, which yield large returns from the sale of timber. The minerals are valuable, especially coal and iron, and there are deposits of salt, graphite, and building stone. The soil is noted for its fertility.

**INDUSTRIES.** Agriculture is the most important enterprise, and is developed to a higher state of perfection than in most of the European countries. Associations and institutes for the purpose of teaching farming are maintained, and the matter of storing seed, selecting choice grades of domestic animals, and harvesting cereals and forage are carried on through coöperative associations. Hay, rye, and oats take the highest rank in the quantity produced. Other products embrace barley, wheat, potatoes, sugar beets, hops, and rape seed. Stock raising is conducted with much care, and the cattle and horses of Bavaria are among the best seen on the European market. The vine-growing industry receives marked attention, especially in the Palatinate.

Manufacturing as an enterprise has developed to a great extent the last two decades, especially in the output of steel and iron. In the manufacture of beer the kingdom takes high rank and its production of spirituous liquors is a notably important enterprise. The manufacture of textiles, leather, tobacco, earthen-

ware, chemicals, and agricultural implements is developed to a considerable extent. Navigation by water is furnished by the Main and Danube rivers and by Lake Constance. The Ludwigs Canal serves as a connecting link between the Black and North seas, since it connects the Main, a tributary of the Rhine, with the Altmühl, a tributary of the Danube. Transportation by steam railways and electric lines is well provided for in all parts of the kingdom.

**GOVERNMENT.** For the purpose of government Bavaria is divided into seven districts. These are Upper Bavaria, Lower Bavaria, Swabia, Upper Palatinate, Lower Franconia; Middle Franconia, Upper Franconia, and Palatinate. The government of the kingdom is a constitutional monarchy; of which the king is the chief executive, and the crown is hereditary in the male line. Six ministers constitute a council of state and assist the king. The legislative power is vested in the king and the parliament, or *landtag*, which consists of the two houses known as the chamber of councilors of the realm, or upper house, and the chamber of deputies, or the lower house. In the former are eighty members and in the lower 159. Bavaria is represented in the *Bundesrat* of the German Empire by six members and in the *Reichstag* by forty-eight. The state provides amply for education, which is free and compulsory. Three famous universities are located at Würzburg, Munich, and Erlangen.

**INHABITANTS.** The inhabitants are almost exclusively German, including only about 50,000 Jews. About thirty-three per cent. are Protestants and more than half of the entire population are Roman Catholics. Munich, the capital, is located on the Isar River. Augsburg, Nuremberg, Ratisbon, Bamberg, Erlangen, Baireuth, and Schweinfurt are the principal commercial centers. In 1905 the kingdom had a population of 6,176,057.

**HISTORY.** In ancient times the territory comprised in Bavaria was inhabited by Celtic tribes, known as the Boii, and the region was conquered by the Romans about the year 15 B. C. It became a possession of the Franks in the time of Charlemagne, in the 8th century, and in 1070 was acquired by the Guelph family. The territory was transferred to Otho, Count of Wittlesbach, in the latter part of the 12th century, and its government has been administered by this family almost without intermission to the present time. Napoleon raised Bavaria to the dignity of a kingdom in 1805, and the king aided France in the Napoleonic wars. The present constitution was adopted in

1818. In 1866 Bavaria sided with Austria in the Austro-Prussian War and lost some territory annexed to it by Napoleon. When Napoleon III. declared war against Germany in 1870, Bavaria joined Prussia and took a prominent part in the military movements against France. It was largely at the suggestion of the King of Bavaria that William of Prussia accepted the title of Emperor of Germany. It has since remained important as an integral part of the empire, influential in its councils, and a leader in promoting the commercial and colonial development of Germany.

**BAY** (bā), or **Bay Tree**, the general name of several trees and shrubs which resemble the laurel, and applied both to the fruit and the trees. The red bay is native to the southern part of the United States and has wood colored much like mahogany. Bay laurel is a term sometimes applied to the common laurel or cherry laurel. The bay tree of California is a fine species, and rose bay is the name sometimes given to species of the azaleas and rhododendrons. Some trees belonging to this class have berries that yield a fatty oil used in veterinary medicines. The leaves are sometimes used in cookery for the flavor, and in England and some other countries as decorations for Christmas. In ancient times sprigs of the bay tree were worn as a signal of victory.

**BAYA** (bā'yà), a kind of weaver bird common in the East Indies. The color is yellow mixed with brown, and the beak is large and conical. Its nests are built in the form of a flask, suspended from a high branch, and the entrance is from below. The male and female birds have separate chambers. It is easily trained to obey and is fond of small articles of ornament.

**BAYAMO** (bā-yä'mö), a town of Cuba, in the province of Santiago, sixty miles northwest of the city of Santiago. It is surrounded by an agricultural country. The Spaniards founded it in 1514. At the time of the Spanish occupation it was prominent as a stronghold of insurgents and revolutionists. Population, 1899, 3,022.

**BAY CITY**, county seat of Bay County, Michigan, on the Saginaw River, seventy-five miles northeast of Lansing. It occupies a fine site about four miles from Saginaw Bay, and is on the Peré Marquette, the Michigan Central, and other railroads. The county courthouse, the post office, the city hall, the Masonic Temple, and the First Presbyterian Church are among the chief buildings. It has city waterworks, fine public schools, and a large library.

The manufactures include furniture, salt, earthenware, machinery, hardware, clothing, and tobacco products. The city is one of the most prosperous in the State, situated in a fine farming and dairying country, and has a large jobbing trade. Its streets are well paved and lighted, and traversed by electric street railways. It was settled in 1836 and chartered as a city in 1865. Population, 1910, 45,166.

**BAYEUX** (bā-yē'), a city of France, in the department of Calvados, Normandy, twenty miles northwest of Caen. It is nicely situated on the Aure River, five miles above its outlet into the English Channel, and has a trade in cattle, grain, and dairy products. The chief building is a cathedral said to be the oldest in Normandy. It occupies the site of the Roman town known as Augustodurum. Population, 1901, 7,315.

**BAYEUX CATHEDRAL**, the oldest cathedral in Normandy, located at Bayeux, France. Most of the present buildings date from the 11th to the 13th centuries. Many notable improvements were made in 1077 by William the Conqueror, and various additions have been added since. To the west are two steeples and several beautiful sculptured porches built in the 12th century.

**BAYEUX TAPESTRY**, a linen cloth twenty inches wide and 214 feet long, on which scenes of the invasion and conquest of England by the Normans were skillfully worked. It is said to be the work of Matilda, the wife of William the Conqueror. The scenes begin with Harold's visit to the Norman court and end with the defeat of the English and the death of Harold at Hastings. It is divided into seventy-two compartments, and on each one the subject of the scene is indicated in Latin inscription. It was discovered in 1730, and is now kept in the library of Bayeux, France, as a valuable record of scenes and customs in the early period of Norman-French history.

**BAYONET** (bā'ö-nēt), a short weapon of steel, constructed something like a dagger, and attached to the end of a musket or rifle. It was so named from the circumstance that the bayonet was first used at Bayonne, France, and it came into general use about the middle of the 17th century. The first bayonets were carried by the soldiers, and when used to repel a cavalry charge, or when making an advance upon the enemy, they were thrust into the muzzle of the gun. Later they were fastened on the outside so as to permit both the use of the bayonet and the gun for firing upon the enemy. With the introduction of modern firearms the bayonet lost some of its impor-

tance as a weapon, but many military men still regard it highly serviceable in making a charge, especially when culminating an infantry attack.

**BAYONNE** (bā-yōn'), a city of New Jersey, in Hudson County, situated immediately southwest of Jersey City, from which it is separated by the Morris Canal. The site is adjacent to New York and Newark bays, on the New Jersey Central Railroad, and within it are included the villages of Bergen Point, Salterville, Bayonne, and Centerville. It has dock facilities, electric street railways, waterworks, pavements, public lighting, and numerous schools. The manufactures embrace lumber products, chemicals, machinery, textiles, and clothing. Many New York business men reside in Bayonne. It was chartered as a city in 1869. Population, 1910, 55,545.

**BAYONNE**, a city of France, in the department of Basses-Pyrénées, on the Adour River, near the Bay of Biscay. It is well built and strongly fortified. It has a commodious harbor, in which three lighthouses are maintained, and its export and import trade is considerable. Sugar refineries and shipyards are among the industries. A cathedral built in the 13th century is its chief building, and it is the seat of a naval school and a public library of 12,000 volumes. Charles IV. of Spain renounced the crown at Bayonne in 1808. Anciently it was called Lapurdum. Population, 27,500.

**BAYREUTH.** See **Baireuth.**

**BAY RUM**, a liquid used for toilet purposes and as a liniment in treating rheumatism. It is obtained by distilling with rum the leaves of the bayberry tree (*Myrcia acris*), which is native to the West Indies.

**BAZAAR** (bā-zār'), or **Bazar**, an exchange or market place where goods are kept for sale. The term is in common use in Eurasia, especially in the East, where a number of shops, either open or covered, are grouped about a square or in a series along the streets. Retail traders occupy the bazaars and offer for sale a variety of small articles, such as shawls, jewelry, household utensils, and wearing apparel. The term is applied in America to places where fancy work and other articles are sold to raise money for the support of an enterprise or for charity.

**BEAD** (bēd), or **Bede**, a small globular or cylindrical body, thirty or forty of which are strung together and worn for ornament or used for decoration. The name is from the Anglo-Saxon word *beade*, or *bede*, signifying a prayer. The Roman Catholics string beads together, to the number of thirty or forty, to

keep count of prayers offered. In this form they constitute a *rosary*. Every tenth one is larger than the rest, called a *gaude*. The *gaudes* are used for counting paternosters, and the ordinary beads for Ave Marias.

**BEAM** (bēm), in architecture, a piece of timber or other material placed across the walls of a building and which serves to support the rafters. It binds together the parts of the frame as a tie and supports weight. Wood was employed chiefly in architecture as beams until in more recent times iron and steel came into very extensive use, and in some cases beams are now made of cement.

The word *beam* is applied in different ways and has several technical uses. A plow beam is the main piece, either of wood or steel, and to it the colter, plowshare, and moldboard are fixed. The main cross timber in a ship is called a beam, and serves to support the deck and prevent the sides from falling apart. The beams used in large steamboats are of iron, extend across the hull, and are supported near the middle by pillars. In a balance the beam is the part from which the scales are suspended, and the term is applied to a part of a weaver's apparatus, usually a wooden cylinder, on which the web is wound.

**BEAN** (bēn), an agricultural product grown for food in early history in Egypt and Palestine, and now largely cultivated in gardens and fields as food for man and beast. It is an annual, from two to twelve feet high. The seeds, usually from four to ten, grow in pods about ten inches long. They are kidney-shaped and measure from one-sixth of an inch to over an inch in length. Beans are nutritious food, containing twenty-three per cent. of nitrogenous matter, similar to casein in cheese, and thirty-six per cent of starch. There are many varieties, colors, and sizes. The so-called *kidney* bean is grown extensively in the gardens of Canada and the United States. Other popular species include the *lima* bean, which is quite large and is harvested for cooking before it is ripe, and

CLIMBING BEAN.

the *string* bean, a variety with fleshy pods. Beans produce from fifteen to fifty bushels to the acre, a bushel weighing sixty pounds.

**BEAR** (bâr), the name of an animal common to both the warm and cold climates. Numerous species are found in America and

GRIZZLY BEAR.

Eurasia, but they do not occur in Australia and Africa. They belong to the carnivorous or flesh-eating animals, but show considerable fondness for honey and some kinds of vegetables, and several species live largely on fruits. In cold climates they attain a larger size and greater strength than in the warmer regions, and are much more savage. The body is stout and muscular, with strong legs, a short tail, and long shaggy fur, and the feet are supplied with strong claws well adapted for climbing and digging. They delight to roam in mountain districts and on the seaside, and are skilled as swimmers. The winter season is spent largely by sleeping in caves, especially by the females, which rear their young in the winter.

Among the many species is the *grizzly bear* of North America, which is found largely in the region of the Rocky Mountains. It is the most ferocious animal of North America and attains a large size, sometimes a length of nine feet, measuring from the nose to the tail, which is very short. It is colored brown, white, and black, and possesses grizzly or shaggy hair. The *black bear* has its home in all the uninhabited parts of North America. It is much smaller than the grizzly bear, about five feet long, has smooth, glossy, black fur, and lives largely on vegetable food, but in case of hunger will attack and carry off small animals like calves and hogs. It delights to climb trees and rob wild bees of their honey. Its character and habits are similar to those of the *brown bear* of Europe, which is solitary and subsists on animal and vegetable foods. The *cinnamon bear* has a color much like cinnamon and re-

sembles the black bear in its habits. The *polar bear* inhabits the northern portions of America and Eurasia. This species is white and of large size, some species being as large as a horse and weighing 1,400 pounds. It hibernates in the winter season, usually in a deep hole dug in the snow or hillside. It lives near the sea or lakes, since it depends upon sea birds, seals, and fish for its principal food. In Southern Asia the *Malayan bear* is found. It is the smallest of the bears and lives exclusively on insects and vegetables and vegetable fruits.

The bear is a cunning animal, both in obtaining its food and in its habits when trained. In a wild state it often watches other animals from behind shelter, such as a rock or a tree, where it carefully studies their habits, and employs ingenious devices whereby it may make a capture. Under training the bear becomes skilled in many arts of amusement and exhibition. It can be taught to carry a gun like a soldier, to dance to music, to beat a drum, and to perform various capers, and, therefore, is employed to a considerable extent in shows and exhibitions of trained wild animals. The clumsy motions, grave manners, and solemn face make its actions interesting. However, it loses none of its cunning in captivity, and has learned to secure rare bits of food from manager and spectators as compensation for exhibiting its best skill.

The bear is hunted for its fur and flesh. Rugs, robes, and overcoats are made of the fur, which has become very expensive within recent years. The flesh is eaten and the fat is used in making bear's grease. Ornaments are made of the teeth and claws.

**BEAR, Great and Little**, known in astronomy as *Ursa Major* and *Ursa Minor*, two constellations in the northern sky near the north star. *Ursa Major* contains 138 stars visible to the naked eye. Among them are seven stars—six of the second and one of the fourth magnitude—which form the *Great Dipper*. *Ursa Minor* contains twenty-four stars, seven of which constitute the *Little Dipper*, and at its handle is *Polaris*, known from time immemorial as the North Polar Star. The latter was called *Cynosure* by the Greeks, and before the invention of the mariner's compass it was the star

“Whose faithful beams conduct the wandering ship  
Through the wide desert of the pathless deep.”

**BEAR and BULL**, two terms applied in the stock exchange and at the board of trade. They were first used in London with reference to two parties having contracted, the one to deliver and the other to take stock at a future time

at a specified price, and in the intervening time the party to deliver sought to depress the price and the party to receive sought to raise the value. From this circumstance the former came to be called a bear, in allusion to the habit of that animal to pull down with its paws, and the latter a bull, from the custom of that animal to throw up its horns. At present the term is used very generally in America and Europe. Those who wish to lower the price are said to *bear stock*, and those who wish to raise it, *bull stock*.

**BEARBERRY** (bâr'běr-rÿ), a small shrub native to America and Eurasia, and found widely distributed in Canada and the northern part of the United States. It has evergreen leaves and produces red berries, which are eaten by wild fowl and other wild animals, especially the bear, hence the name. Some species are used in medicine as an astringent tonic.

**BEARD** (bērd), the hair on the lower part the face of a man, which appears at the age of puberty. Its color is usually lighter than the hair of the head. It is a protection against cold, and serves in preventing dust from being inhaled. Among ancients a long beard was a mark of manliness, and slaves were deprived of beards, though Alexander the Great required his army to shave. The barber's art was first introduced in Rome about 300 B. C. The Normans, at the time of their invasion of England, shaved the entire face and part of the back of the head. Louis XIII. of France was not endowed by nature with a beard, and during his time ornamental trimming of the beard and mustache became general in France, and thence spread over the continent. In the 16th century clergymen generally wore long beards, a custom still common among the priests of Western Asia. The face was wholly shaven at the beginning of the 18th century, but the practice of wearing beards and mustaches was again inaugurated by France in the early part of the last century, and the custom is now quite general.

**BEAR LAKE, Great.** See **Great Bear Lake**.

**BEAR RIVER**, a river of northern Utah and southern Idaho. It rises in Summit County, Utah, in the Uinta Mountains, flows north into Idaho, and after a circuitous course of about 400 miles discharges into Bear River Bay, an inlet from Great Salt Lake. It is geologically an interesting stream and passes through a region greatly diversified by mountains and desert tracts of land. The Oregon Short Line Railway follows the valley through

a portion of Wyoming and Idaho. In Bear Lake County, Idaho, it passes through the northern extremity of North Lake, which is considered a part of Bear Lake lying immediately south.

**BEATRICE** (bē'à-trīs), county seat of Gage County, Nebraska, on the Big Blue River, about forty miles south of Lincoln, on the Chicago, Rock Island and Pacific, the Union Pacific, the Burlington Route, and other railroads. Besides numerous substantial buildings, it has a fine stone courthouse, a Federal building, and a public library. The city has excellent public schools and a business college, and is the seat of the Nebraska Institution for Feeble-Minded Youths. It is noted for its quarries of magnesian limestone, which is used largely for building material. The manufactures consist of clothing, cigars, and machinery. Large quantities of cereals and live stock are shipped to eastern and southern markets. Population, 1900, 7,875.

**BEAUMONT** (bō'mönt), a city in Texas, county seat of Jefferson County, on the Neches River. It is situated on gently rolling ground and has transportation facilities by the Kansas City Southern, the Texas and New Orleans, and other railroads. The surrounding country contains productive deposits of petroleum and natural gas, which take high rank among the most important of America. The chief buildings include the county courthouse, the central high school, the post office, the public library, and many churches. It has electric street railways and other municipal improvements, and is an important market for petroleum, lumber, and farm produce. The manufactures include lumber products, machinery, cigars, flour, utensils, and clothing. Its rapid growth dates from the discovery of petroleum in 1901. Population, 1900, 9,427.

**BEAUVAIS** (bō-vă'), a city in France, capital of the department of Oise, on the Thérian River, forty-one miles northwest of Paris. It is nicely situated in a fertile valley and has manufactures of Goeblin tapestry, woolen goods, carpets, and cotton textiles. Railroad and electric facilities are among its improvements. The chief building is the cathedral of Saint Pierre, in the Gothic style, but it is not entirely finished. Beauvais was besieged in 1472 by Charles the Bold, Duke of Burgundy, who was repulsed after a heroic defense under the leadership of the heroine Jeanne Lainé. Population, 1901, 17,265.

**BEAVER** (bē'vēr), a rodent quadruped valued for its fur. The body is about two feet long, has a flat, scaly tail ten inches long, and

weighs from thirty to sixty pounds. Its color is chestnut or reddish-brown, but sometimes black ones are found, and some are white. The feet have five toes. The fore feet are designed for work in preparing material for habitations, and the hind feet are webbed for swimming. Beavers are found mostly in the northern parts of North America and Eurasia, but small colonies still exist in Central Europe. They are most numerous in the northwestern parts of North America and Central Russia, but formerly they were very common in all parts of these divisions.

Beavers are classed among the semi-aquatic animals that live near lakes, rivers, and other waters where trees and shrubs abound. Their houses are built at the edge of the water, and they dam bodies of water that are sufficiently shallow to freeze solid in the winter, in order to increase the water mass and thus prevent it from freezing to the bottom. These dams are

BEAVER.

constructed of small trees, stones, and grasses mixed with mud. The mud is put on with the feet and smoothed down by the tail, which resembles a trowel. They are skillful at cutting down trees, even as thick as one foot in diameter, and usually cut in largely from the side near the water so as to cause the tree to fall in that direction. Their work is done at night. They subsist on roots, bark, and water plants, of which they lay by a sufficient supply for the winter.

The beaver is valuable for its fur, which is used for ladies' cloaks, for dress trimmings, and for men's collars and gloves. In the 17th century beaver fur was used largely in the manufacture of men's hats, from which high hats came to be called *beavers*. Similar hats are now made with silk plush covering. In the early part of the last century fully 200,000 beaver skins were exported annually from America, but the trade has become greatly limited, owing to a general destruction of the

beaver in settled districts. The meat of the beaver is prized as an article of food, but the tail is a delicacy. The animal yields an anti-spasmodic medicine.

**BEAVERDAM**, a city of Wisconsin, in Dodge County, about sixty miles northwest of Milwaukee, on the Chicago, Milwaukee and Saint Paul Railroad. It is beautifully situated on Beaver Lake, near the outlet, which furnishes water power. It has a public library and is the seat of Wayland Academy. The manufactures include flour, hardware, machinery, cigars, and farming utensils. It was settled in 1841 and incorporated in 1856. Population, 1905, 5,615.

**BEAVER FALLS**, county seat of Beaver County, Pennsylvania, on Beaver River, near its junction with the Ohio, thirty miles northwest of Pittsburg. It is located in a fertile district, which produces cereals and live stock, and is on the Erie and the Pennsylvania railroads. The city has an abundance of water power, and coal and natural gas are obtained in the vicinity. The manufactures include cars, fence wire, ironware, stoves, machinery, flour, and farming implements. The chief buildings include the county court house, the public library, and Geneva College. It was formerly called Brighton. Population, 1900, 10,054.

**BECHUANA** (bĕch-ŏŏ-ă'nā), a race of people that occupy the interior part of South Africa, including the region north of Cape Colony and a large part of the Kalahari Desert. They have frizzled hair, but not kinky, thick lips and nostrils, and are of a dark brown or bronze color. The language spoken belongs to the Bantu family and is copious and expressive. Their chief occupation is cattle raising and agriculture, and they engage in a small way in mining and manufacturing. In the mode of life they are not nomadic, but live in villages. The section occupied by them is known as Bechuanaland, which was long a crown colony of England, but was annexed to Cape Colony in 1895. See **Cape Colony**.

**BED**, an article of household furniture in which to sleep. Savages sleep on the ground or on skins of animals, while the Japanese sleep on mattresses, using a wooden rest for their heads which closely fits to the neck, and the Chinese use low bedsteads generally elevated only a small distance above the floor. The beds used in America are similar to those common to Europe. They consist of a mattress supported from the ground by a bedstead. Some use folding beds, which serve for beds at night and articles of furniture in the daytime. In former times feathers were the principal articles used

in making beds and bed coverings, and they are still used, but mattresses now form one of the chief articles used for bedding. Bedsteads were formerly made exclusively of wood; now they consist largely of iron frames with steel springs covered with mattresses. The best mattresses are made of horsehair, while cheaper grades are made of shavings of paper and wood.

**BED**, or **Stratum**, in geology, a layer of stratified sedimentary rock of similar materials. Formations of this kind are due to the ebb and flow of the tide, and to the movement of silt or material deposited by rivers and the action of waves. The strata differ materially, consisting of several layers or of single sheets or beds. A thin layer is called *lamina* or seam, and where several beds of the same kind of rock are deposited the aggregate is termed a formation.

**BEDBUG** (bĕd'bŭg), an insect found in pigeon houses, nests of swallows and bats, and in beds. It hides away in the daytime and comes out to seek its food at night. The body is flat and the head small. The younger insects are almost white, while the adults have a reddish color. Their food consists largely of blood drawn from the body by pricking through the skin and sucking it out. Bedbugs are eaten by cockroaches, by which they are killed in large numbers.

**BEDFORD** (bĕd'fĕrd), a town in England, capital of Bedfordshire, forty-five miles northwest of London. It is pleasantly situated on the Ouse River and has railway facilities. The public buildings include a library, a prison, an insane asylum, and a fine Gothic church. Ironware is manufactured extensively, especially farming implements, and it has a large trade in lace, corn, and straw hats. Near the town is Elstow, the village where John Bunyan was born, and he wrote his "Pilgrim's Progress" while a prisoner in the town jail of Bedford. Population, 1901, 35,114.

**BEDFORD**, county seat of Lawrence County, Indiana, in the southern part of the State, on the Baltimore and Ohio and other railroads. In its vicinity are important deposits of limestone, which is quarried extensively for building purposes. It has railroad shops, roundhouses, machine shops, and other industries. The city has a considerable trade and fine public buildings, and is the seat of Bedford College. It was settled in 1756 and incorporated in 1817. Population, 1900, 6,115.

**BEDLAM** (bĕd'lam), or **Bethlehem**, a celebrated hospital for the insane in London. It was formerly the priory of Saint Mary of Bethlehem, and was converted into an asylum in 1647. The patients were removed to Saint

George's Fields in 1814, where the accommodations are first class. Bedlam became notorious because the inmates were treated very brutally, hence the name is synonymous with a place of uproar or wild confusion.

**BEDLOE'S ISLAND** (bĕd'lōz), so named from the former owner, and secured as property of the government in 1800. It is located in New York Harbor, within the corporate limits of New York City, about one mile southwest of the Battery. The area is thirteen acres. In 1841 the government erected a fort upon it, known as Fort Wood, and in 1884 it became the site of the statue of "Liberty Enlightening the World."

**BEDOUINS** (bĕd'ōō-ēnz), meaning *dwellers in the desert*, a Mohammedan people of the Arab race who lead a wandering life in the deserts of Northern Africa and Western Asia. Originally they were confined to the deserts of Arabia, but at the present time they occupy many regions. They engage in the occupation of shepherds, horse breeders, and herdsmen, and often secure means of subsistence by robbery and plunder. Their government is in families under shieks, or tribes under emirs. Though ignorant of written books, they know history by tradition, most of which relates to the genealogy of their own people. The men dress in long shirt-skirts, protect their feet with sandals, and wear red and yellow handkerchiefs to cover their heads. They manufacture their own material for clothing, subsist largely from their herds, and eat locusts, rice, honey, and the flesh of small animals. Some tribes are advanced in agriculture and have fixed homes. The lance is the weapon in general use among the Bedouin tribes.

**BEE**, the name of any one of a large group of insects, of which the honeybee is the most important representative. In the classification of Linnaeus, all the insects of this group were assigned to the genus *Apis*, but this term is now generally restricted to the honeybee, and the group is classified as two families, the *Apidae* and the *Andrenidae*. In general, it may be said of bees that the head and thorax have feathery hairs, the hind feet are flattened, and the tongue is fitted to lap the nectar of flowers. Probably about 5,000 species are included in the group. The honeybee is considered the most intelligent of the insects. Owing to its industry and the useful product resulting from its labor, it has from remote times attracted general attention and interest. It is probable that more has been written about bees than about any nation of people. At present they abound in almost all parts of the world, except in extremely cold regions.

**THE HONEYBEE.** The honeybee lives in communities or *swarms* made up of three classes: *queens*, *workers*, and *males*. The workers are females whose generative organs are imperfectly developed and they rarely produce eggs. In each swarm there is but one true female, called the *queen*. She is impregnated by the male while in the air and never leaves the hive at any other time, except when swarming. A few days after impregnation she begins to lay the eggs, one in each cell, and some days she deposits as many as 3,000. The queen bee is longer than either the males or the workers

A. Drone; B, Queen; C, Worker; D, Leg of Worker; E, Cells for Honey.

and can be easily distinguished from the others. The males are called *drones* from the low humming sound which they make in their flight. They do not work and average usually about one drone to every thirty bees. All the work of the society is done by the workers. They gather the honey, make the wax, build the cells, and feed and take care of the young. After the swarming season is over, they kill or expel the drones, as if to economize the food which they lay up for winter.

The eggs are deposited in different cells, some for workers, and others for drones and queens. The eggs produce small white larvae in about three days. They are fed with pollen or dust of flowers mixed with water and honey by the workers. After being fed five or six days, they begin to spin a cocoon around themselves. The young bees mature from the cocoon in about sixteen days. The queen bee inspects the size of the hive and the number of young queens about to leave the cocoons, and if she finds the swarm small the young queens are killed, but if the society is large one is permitted to come out.

When the young queen appears, the old queen goes from the hive and takes with her a part of the bees, forming a new community. This is called swarming and takes place in the summer season; in the temperate climates this

occurs two or three times each season. The new swarm may be easily secured by watching the society in the swarming season, and keeping an empty hive near by, in which the bees will soon begin to make honeycomb and deposit honey. But if no such hive is provided, and in timber districts where communities live in trees, the new swarm moves from place to place until it finds a hollow tree or some suitable place in which to found its home. The old hive is governed by the new queen until another queen appears, when she forms a swarm and seeks a new location. In cases where two queens come out at the same time, as they sometimes do, they fight each other until one of them is killed.

Bees are very active and strong. They make flights to gather food at great distances, which they easily endure without stopping to rest. When they are some distance from the hive, they fly up into the air to observe the direction, and then take the shortest line for the hive. In timber districts, where bees hive in trees, they seek water at the brooks, and their location may be found easily by observing the direction in which they fly after leaving the brook, or the flower where they gathered food. From this habit of bees we have the term *bee line*. The workers and queens each have stings in the back of the body, while the drones are stingless. The sting of a bee is effected by making a wound with a sheath, into which poison is injected and a dart is thrust in to deepen the

OLD STYLE BEE HIVE.

wound. When the sting is lost, the bee dies. Insects die from the effect of a bee sting, while man and animals have been killed by the attacks of large swarms. The health of bees is remarkable and their diseases are few. The greatest cause of harm is want of good sanitation, too close confinement, dampness, and want of ventilation. In caring for bees it is necessary to provide them with abundant pasture. New swarms should be fed with syrup. An abundant supply of water is essential to good health.

Pollen and the sweet juices of flowers are the food of bees. They go from flower to flower and gather the pollen on the hairs of their legs, while the sweet juices of flowers are taken up by the trunk. The trunk is made up of several divisions so it can be turned easily, bent, shortened, or lengthened to fit the flower cup, which enables them to easily gather the sweets. The front legs and trunk serve to gather juices and pollen from flowers not full blown. The juices are passed from the trunk into a kind of stomach or honey-bag, where they are changed into honey. This stomach serves only for the purpose of making honey, as they possess a second stomach for the digestion of food. The stomach for honey is so constructed that its contents may be utilized at any time for storing in the cells or feeding the young. The workers make the wax by a process of growth on the back part of the body, where a pouch is located filled with wax sticks, from which it is taken by the bees and used in making honeycomb. The honeycomb is constructed of cells, some being used for honey and others for eggs. These cells are in the form of a hexagon, which form serves the best purpose and economizes space.

The cells in which honey is deposited are slightly larger than those intended for hatching, and are constructed nearly horizontally, which admits of easy filling, and the honey is retained in the cells chiefly by capillary attraction. In constructing honeycomb the bees begin at the top of the hive and build downward, placing cells back to back in the process of construction. When the cells are filled with honey they are carefully sealed up with wax to prevent it from escaping. In the construction of honeycomb the entire space is utilized, with here and there small openings to allow the passage to and from the different parts of the hive. Large bee-keepers supply the hive with small frames containing the foundations for honeycomb, which, when filled with honey, are taken from the hive, put in a honey extractor, and the frame with the comb is afterward put back into the hive. In this way the bees are enabled to use one set of comb a number of times, thereby increasing their production of honey. Many bee-keepers feed their bees with syrup, more or less, the entire year, thereby maintaining the swarm and utilizing practically all the honey production. A fair-sized community includes one queen, from five to eight hundred drones, and from fifteen thousand to twenty-two thousand workers. The weight of a good swarm is from six to ten pounds.

**CLASSIFICATION.** Bees have been variously classified according to their habits. The newest

classification, which has been suggested by W. H. Ashmead of the United States Museum, divides them into fourteen groups. Of these the first two, the honeybee and the bumblebee, are called social in their habits, because they live in communities. All other bees are solitary in their habits, each one living and working alone. They include some very interesting species, such as the leaf-cutting bee, which cuts off the leaves of plants to line its nest. Another is the carpenter bee, which bores tunnels into the stems of pithy plants, such as the brambles, in which the eggs are laid. The mason bee builds its nests of mud or moistened clay. Bees as a whole are extremely useful in the cross fertilization, since they carry the pollen as they pass from bloom to bloom. Indeed, clover can be grown successfully only where this work is done by bees.

**BEECH** (bēch), a useful and well known deciduous tree of America and Eurasia. It grows to a height of about one hundred feet and a diameter of four feet, and is a fine ornamental tree, especially when standing alone. Its wood is solid, but brittle, and when exposed to air rots easily or is eaten by worms. Under water it is very durable, and thus serves a good purpose in constructing sluices and water mills. In France it is used in the manufacture of wooden shoes, and in many countries for furniture. The fruit is a three-sided nut and is used as a substitute in making coffee and a kind of bread. In some countries the fruit is pressed to express the oil, known as *beech oil*, which serves for food and lighting purposes. The common species include the *white beech*, *red beech*, and *copper beech*. Large beech forests were abundant in England and Western Europe in ancient times, where herds of swine were fed on the fruit.

**BEE-EATER** (bē'ēt-ēr), the name applied to several birds related to the kingfisher. They have long wings and a greenish color, resemble swallows in flight, and prey upon wasps, bees, and other insects. Their nests are built in holes, which they construct in river banks or on the seaside. In many places, especially on the Volga and Don, they have honeycombed the banks by excavations. In some countries they are a pest on account of their destruction of bees, which they catch on the wing. Their feathers are valuable as an article for ornaments.

**BEEF** (bēf), the flesh of the ox or cow, used either fresh or salted. It is the most nutritious of all meats, and is well adapted to the most delicate constitutions. A beefsteak is known by the part of the animal from which

it is taken, as rib, sirloin, or round. Porterhouse, sirloin, and prime are considered the best cuts. The best quality comes from well-fed animals. The cut edge of good beef is bright red in color, and should be of a uniform tint, except where marked by fat and connective tissues. It loses twenty per cent. of its weight in roasting and thirty per cent. in boiling. In the raw state it contains fifty per cent. of water. It possesses the greatest amount of nutrition when fresh, but is preserved by canning, salting, drying, and many other ways with good results. Beef producing and beef packing are two highly important industries in the United States and Canada.

**BEEFEATER**, the name of a bird of the starling family, native to South Africa. It associates with the buffalo, camel, and cattle, and feeds upon the larvae of flies. Birds of this class are sometimes called *ox-peckers*. The name "beefeaters" has been applied for many years to the yeomen of the royal guard in Great Britain. Their costume is in the fashion of the time of Henry VII. and has been changed but slightly for four centuries.

**BEEF EXTRACT**, an article of diet obtained by extracting the juice of beef and then evaporating the water. It is prepared by placing the meat in a large kettle with a dome-shaped cover, and extracting the juice by heat. An outer jacket, filled with water, surrounds the lower part of the kettle, serving to apply the heat uniformly, and after the juice is drawn off it is strained and put into jars or cans and sealed hermetically. Beef extract has about forty times the nutriment of beef, and is important as a food for infants and invalids. It is prepared for service in the form of soup or beef tea.

**BEER** (bēr), a beverage prepared by means of a process of fermentation from malt, hops, and water. The malt for general manufacture is made of barley, but wheat, oats, rye, corn, and India rice are used to some extent. The different kinds of beer are usually classed as *porter* and *ale*; the latter is prepared chiefly from pale malt and has a pale amber color, while the former is prepared by using a portion of roasted or black malt along with the pale malt. This has the effect of giving porter a somewhat bitter flavor and a darker color. These two classes are again subdivided into a great many varieties, depending upon the strength of the hops and the malt added. Mild ale, bitter ale, barley wine, pale ale, and table beer are terms by which the different varieties are known.

From history we learn that beer was a well

known beverage among the Egyptians 3,000 years B. C., and was extensively manufactured by the early nations. Larger quantities of it are consumed than of any other beverage. In its manufacture Germany ranks first, Great Britain second, and the United States third. In the United States there are over 2,000 breweries that manufacture annually over 40,000,000 barrels, which is largely consumed within the country, together with several varieties imported from Europe. The consumption of beer in the United States averages about fifteen gallons for each person, while the consumption in some of the countries of Europe is much larger. In Belgium the consumption per capita is fifty-one gallons; in Great Britain, thirty-six, and in Germany, thirty.

The process of making beer is called *brewing*. The first step in the process is to place the barley or cereal in an iron cistern, where it is soaked or steeped from 70 to 95 hours, when the water is drawn off and the barley placed on the floor of a dark room, where it swells and sprouts as if planted in the ground. This process is called *germination*. When the little sprouts have grown about half an inch long, the largest possible quantity of sugar has been formed. The malt is then taken to a drying kiln, where it is dried for a period depending upon the kind of beer to be made. In making light-colored ales the malt is dried only a short time, while in darker colored ales a longer time is allowed; this depends entirely upon the strength and color desired. After the malt is dried, it is crushed and mixed with hot water in a mash tub. Here another change takes place, by which the starch is converted into sugar, called *grape sugar*. After a few hours the liquid, now called *sweet wort*, is drawn off and boiled with hops in a copper kettle. It is next strained and cooled and put into a fermenting tun, where a little yeast is added, which causes it to froth and bubble up, which indicates that an important change is taking place; that is, the sugar is changed by the action of the yeast into carbonic acid and alcohol.

Beer contains from one to ten per cent. of alcohol, the quantity depending of course upon the amount of sugar contained in the malt. Any liquor which has passed through the change of fermentation is known as *fermented liquor*. When this process has been completed, the beer is drawn off into hogsheads and allowed to settle. From this it is pumped into kegs or barrels and stored in cellars for use. While stored, fermentation goes on slowly for some time; the beer remaining in this state for a long time is called *lager beer*, meaning, in Ger-

man, stored beer, and the beer used immediately after fermentation is called *schenk beer*. The process differs somewhat in different breweries, but the general method is practically the same. The largest breweries in the United States are located at Saint Louis, Chicago, Milwaukee, Philadelphia, Baltimore, and New York. Montreal and Toronto are leading brewing centers of Canada.

**BEERSHEBA** (bē-ēr'shē-bà), meaning *well of the oath*, a locality about fifty miles southwest of Jerusalem, now called Bir-es-Se-ba. At this place Abraham made an alliance with Abimelech, the Philistine King of Gerar, which he ratified with an oath and a valuable gift of lambs. It was a place of some importance down to the Crusades, but now is a dismal ruin.

**BEESWAX** (bēz'wāks), the fatty substance secreted by bees and used by them in constructing the honeycomb. It is not collected from plants, but is a secretion elaborated within the body of the animal from saccharine matter or honey, and extruded in scales from beneath the rings of the abdomen. It is an article of commerce, useful in modeling, for candles, and divers other purposes. Before being put on the market, it is purified and bleached or whitened.

**BEET** (bēt), a well known vegetable valued as food owing to the large quantities of sugar it contains. Four kinds of this vegetable are

RED BEET.

SUGAR BEET.

cultivated—the *common beet*, the *chard*, the *sea beet*, and the *mangel-wurzel*. The common beet embraces several species, differing in size, color, and shape. The yellow and red beets, usually classed as common beets, are the best for table use, though the chard is a favorite among laborers and agriculturists in France and Ger-

many. Gardeners cultivate the sea beet largely for greens. The mangel-wurzel is a coarse, large beet. It is sweet and nutritious, and is stored in cellars for winter use as cattle feed. The white beet is used in the manufacture of sugar.

In 1810 Napoleon began to encourage the manufacture of sugar from beets, but the industry developed largely from the discoveries of Count von Arnim (q. v.). Since then large quantities of sugar have been manufactured in Europe from this vegetable, particularly in the German Empire. In the United States experiments in beet sugar manufacture were not extensively made until 1890, when the Department of Agriculture at Washington sent 5,000 packages of beet seed to different parts of the country for the purpose of experimenting in different localities. These seeds were distributed through twenty-eight states and territories, with directions for planting and the culture of the plant. After maturing the crop, about 1,000 localities sent samples to Washington to be used in making tests of their value in beet sugar manufacture. It was found by careful examination that a zone about 200 miles wide, extending from the Atlantic to the Pacific, through portions of New York, Pennsylvania, Ohio, Indiana, Illinois, Iowa, and Nebraska, possesses admirable qualities to develop this industry. California produces more beet sugar than any other State, while Washington, Nebraska, Kansas, Utah, and Colorado rank high. It is thought that by the larger development of the beet sugar industry the United States will be able to produce sufficient quantities of this product to supply the demand of the domestic market. California alone has sufficient available territory to produce all the sugar now imported, and many other states possess almost equal natural advantages. Canada has a large area of land suitable for the culture of the sugar beet, particularly in British Columbia, Ontario, and Alberta. The industry is developed most extensively in Ontario.

**BEETLE** (bē't'l), an order of insects called by naturalists *Coleoptera*, which means sheathed wings. They possess four wings, an inferior pair, which are the real wings used in flying, and a superior pair that form a protection for the others. In walking they appear to have no wings, so nicely are the real wings covered and protected. The real wings are membranous, while the wing covers are horny, often beautified by green, yellow, blue, and diversified colors. There are no less than 150,000 species showing slight differences in color, size, form, or habits, of which fully 11,000 are native to

the region of North America lying north of Mexico. They undergo three full stages in life. At first they are *grubs* or *larvae*, in which form they have three pairs of legs, horny heads, and wormlike bodies; those hatched in fruit and nuts have no legs. The second stage is entered after a case or cocoon has been prepared,

A, LARVA; B. PUPA; C. BEETLE.

though a cocoon is not always provided. This is called the *pupa state*, in which many varieties lie for years before developing into beetles. Most species live on land, though there are a large number that live in water. Land beetles live under rocks, logs, or leaves, among stones, and in holes drilled in wood.

Various beetles have been named from their size, form, and habits of life. The *carrion beetles* are those that feed upon dead animals. *Scavenger beetles* live on filth and refuse matter, and are provided with feet fitted to dig holes in the ground. *Sexton beetles* have a very strong scent so they can easily find the dead bodies of small animals, such as frogs, snakes, and mice. These they take to a place where the ground is soft and bury them safely under cover. In these remains they deposit their eggs, and when the young are hatched they feed upon the food provided in this way. The *ambrosia beetle*, of which there are several species, bores in oak and other wood, often doing great damage. A class

of beetles extensively known as *tumble bugs* belong to this class. In ancient Egypt they were called *sacred beetles* and were worshiped, for the reason that they are useful in clearing up manure and burying it below the surface. This they do by making round balls, in which they lay their eggs, and then bury them deep in the ground. *Tiger beetles* have stripes and are fierce in combat with other insects. They prey upon other beetles, flies, and caterpillars, and possess cannibalistic tendencies among themselves. The *bombardier beetles* possess a strong liquid, which they shoot at their enemies. Similar beetles include the *spring beetles*, *horned bugs*, and *curculios*. The last mentioned live in orchards and feed upon fruits and grains. The worms often found in plums, nuts, apples, and various other fruits are hatched from eggs laid by beetles. A species of beetle known as *Spanish fly* is used in making powder and blistering plasters. Other well known beetles are the *potato bug*, *squash bug*, *oil beetle*, *ladybird*, *glow worm*, *blister beetle*, and *firefly*. See illustration below.

**BEGGAR** (bĕg'gĕr), one who continually implores people for alms. The practice of begging may be a necessity with some aged and physically defective persons, while others engage in it from the dislike for work. In 1572 a law of England provided a severe penalty for all able-bodied persons convicted of the offense. Laws prohibiting vagrancy are on

OAK WOOD DAMAGED BY THE AMBROSIA BEETLE.

a b, two species of beetles; c, log cut from damaged timber.

the statute books of many countries, the purpose being to prevent beggar vagrants from roaming over the country.

**BEGONIA** (bĕ-gō'nĭ-à), the name of a large family of plants, of which several species are cultivated in flower pots and green-

houses. The plants are perennial and include both herbs and shrubs. Among the popular species grown in gardens as flowering plants are those known as *Begonia*, *Beefsteak Geranium*, and *Glory of Lorraine*. The flowers are largely pink or red. Young plants are raised from the seed, or they may be obtained by

BEGONIA.

dividing the bulbous roots and by cutting and placing the stems in the soil. Many varieties of fine flowers have been propagated from the tuber-root kind.

**BEHEMOTH** (bē'hē-mōth), a large animal described in the Bible (Job xl, 15-24). The description indicates that the animal referred to is grass-eating and lives in or near the water, hence it is thought the author referred to the hippopotamus. In Job xl, 25-31, it is associated with the leviathan. Some writers think that the crocodile, the ox, or the elephant was meant, while others associate the two names with primeval monsters.

**BEHISTUN** (bā-hīs-tōn'), or **Bisutun**, a town in Persia, located near a mountain of the same name, and celebrated for the remains of ancient sculptures and inscriptions found in the vicinity. The mountain has an altitude of 1,700 feet, and the most remarkable inscription is in the limestone about 300 feet high. Sir Henry Rawlinson copied the inscription, which was made in the time of Darius I., King of Persia, about 518 B. C., and contains an account of his military triumphs. These inscriptions were made after polishing the rock and applying varnish harder than the limestone. The writing is in the cuneiform characters and in the Median, Persian, and Assyrian languages.

**BEHRING SEA.** See **Bering Sea.**

**BEIRUT.** See **Beyrout.**

**BEJAPoor** (bē'jā-pōor), or **Bijapur**, a ruined city of India, in the presidency of Bombay, 245 miles southeast of Bombay. The site is on a tributary of the Kistna River, and surrounding it are lofty walls of hewn stone. Anciently the city was a great commercial center, and its downfall dates from 1686, when it was captured by Aurungzebe. The tomb of Mahomet Shah and other remains of Mohammedan construction are among the ruins, most of which indicate splendid workmanship and fine examples of eastern art. The modern town is not important and has a population of 17,500.

**BEL AND THE DRAGON**, a book of the Old Testament, belonging to the Apocrypha. The Roman Catholic Church regards it a canonical book of the Bible, and the Anglican, Lutheran, and a number of other churches recommend it to be studied for edification. It was probably written in Alexandria in the Greek, and dates from the 3rd century B. C. In the Vulgate version it is part of the Book of Daniel.

**BELFAST** (bēl'fäst), a city in Maine, county seat of Waldo County, thirty miles southwest of Bangor, on the Maine Central Railway. It has a good harbor on Penobscot Bay and railroad connection with the principal cities of the State. Shipbuilding, printing, and the manufacture of shoes and lumber products are among the chief industries. Granite quarries are worked near the city, and the surrounding country is agricultural. A Masonic temple, a public library, and an Odd Fellows' building are among the chief architectural structures. The first settlement on its site was made in 1870 and its incorporation as a city dates from 1850. Population, 1900, 4,615.

**BELFAST** (bēl'fäst'), a city of Ireland, county seat of Antrim County, capital of the province of Ulster, about twelve miles from the Irish Sea. It has railway connection with the leading cities of Ireland, is on the Ulster Canal, and has a fine harbor on Belfast Lough. Near it flows the Lagan River, which is crossed by several bridges that connect the city with adjacent villages. It occupies a fine site, but most of the ground is reclaimed marshland. The city is the seat of vast commercial and manufacturing interests, the most important in Ireland. Its products and exports consist of cotton and woolen goods, linen fabrics, ropes, canvas, ships, clothing, and machinery. It is the seat of fine schools and several institutions of higher learning, including Queen's College and the Royal Academic Institution. Among

the chief buildings are the museum, the government offices, the Corn Exchange, and the public library. It has extensive botanical gardens, electric street railways, and municipal waterworks. The city is largely Protestant; among whom the Presbyterians predominate. Population, 1901, 349,180.

**BELGIUM** (běl'gĭ-ŭm), a kingdom of Europe, whose northern boundary is formed by Holland, eastern by Germany, southern by France, and western by the North Sea. In latitude it lies between 49° 30' and 51° 30' N., and in longitude 2° 33' and 6° 6' E. Its greatest length from southeast to northwest is 165 miles; breadth, 120 miles. The area is 11,373 square miles.

**PHYSICAL FEATURES.** The surface is made up largely of fertile lowland, though there are some sandy and marshy tracts. A range of the Ardennes Mountains, highest altitude 2,200 feet, traverses the section lying southeast of the Meuse River. From the southeastern part the surface inclines toward the northwest, where dikes are utilized to prevent overflows from the sea. An unfertile tract, the Campine, is in the northern part of the province of Antwerp, but this has been greatly improved by superior husbandry.

The Meuse and Scheldt rivers, though both rise in France, are important for drainage and navigation. The Dender, Lys, and Rupel are tributaries of the Scheldt, and the Lesse, Sambre, and Ourthe flow into the Meuse. Rainfall is abundant and the average temperature is about 50° Fahr. In summer the climate is somewhat hotter than in Great Britain, and the winters are longer and more severe.

Coal is the chief mineral and is found in fields having an area of about 550 square miles, chiefly along the Sambre and Meuse rivers. Marble, slate, and limestone quarries are worked extensively in the eastern part. Other deposits worked more or less extensively include copper, lead, iron, peat, and calamine.

**AGRICULTURE.** Agriculture has declined somewhat with the development of other enterprises, in which capital and labor became interested. The demand for cereals and other farm products is greater than the supply. All of the domesticated animals of Europe are grown profitably, especially cattle, and the dairying interests have been developed very efficiently. Hogs, sheep, and horses are grown in all the provinces. Among the cereals may be mentioned rye, which is grown most extensively, oats, barley, buckwheat, spelt, and sugar beets. The vine is cultivated on large tracts along the Mass River, and tobacco, hops, rape, flax, fruit,

and vegetables are grown. About one-sixth of the surface is covered with forests, including beech, oak, elm, and poplar. Forestry is important as an enterprise, and the products have a high annual value. The fisheries of its coast and inland waters yield large returns.

**MANUFACTURES.** Manufacturing takes first rank among the industries of Belgium and is the chief source of its prosperity. Modern machinery is utilized extensively, but most of the work is done in small shops, in which only two or three workmen are employed. In 1908 there were fully 80,000 establishments in the dwelling houses of workmen who carried on small manufacturing industries without any paid labor. Chief among the larger enterprises is the manufacture of textiles, both linen and woollen, and this industry is represented at Bruges, Brussels, Limburg, Ghent, Liège, and Mechlin. Carpets are made in large quantities at Brussels and Tournay, and Brussels and Bruges are centers for the manufacture of lace and fine lawn and damask fabrics. Other products ranging high in value are machinery, leather, chemicals, glass, furniture, clothing, jewelry, and spirituous liquors. Cheap fuel has caused the development of large steel and iron works, though the ores are mostly imported.

**TRANSPORTATION.** A network of railroads covers the entire country, and in proportion to its area Belgium has the greatest railroad mileage in the world. In 1835 the first line, from Mechlin to Brussels, was open for traffic. The government owns nearly all of the railroads, which aggregate a total of over 3,000 miles. Electric lines are operated in all the cities and many suburban districts. Canal transportation of much value is utilized, and the Meuse and Scheldt rivers are navigable throughout their entire length in Belgium. The import and export trade is carried largely through Ostend and Antwerp, and the imports have exceeded the exports for the past fifty years. France, Germany, Great Britain, the Netherlands, and the United States have the largest proportion of trade in the order named.

**GOVERNMENT.** For the purpose of government Belgium is divided into the nine provinces of Limburg, Namur, Luxemburg, Brabant, Antwerp, Liège, Hainaul, East Flanders, and West Flanders. The executive power of the nation is vested in the king, and the crown is hereditary in the direct male line of descent. A council of ministers responsible to the chambers assist the monarch, and every royal act must be validated by the signature of a minister. Chief

legislative power is vested in the king and the chambers, which consists of the senate and chamber of deputies. The senate has 102 members, of whom fifty-six are appointed by the provincial councils and the remainder are elected by direct suffrage of male citizens. The chamber of deputies has 152 members, elected by direct suffrage, and in this branch originate all bills dealing with the revenue. Each province has a council chosen by direct vote, in which is vested the power to legislate in matters of local government. The provinces are divided into *arrondissements*, and these are again divided into smaller districts known as *communes*. Cases tried by the lower courts are subject to review by the court of cassation or supreme court.

The standing army numbers 51,552 men, and the war footing is about 148,500. Wars of aggression are prohibited by the constitution, hence the army is intended only for national defense and the preservation of neutrality. The coins, weights, and measures correspond in name and value to those of France.

**EDUCATION.** The church and state were separated by the constitution of 1831, but religious instruction is directed in the public schools by the Roman Catholic clergy. Support is given to the schools by the state and local governments, and the classes range from the elementary schools in the communes to the higher schools and universities. Higher education culminates in the state universities at Ghent and Liège, and free universities are maintained at Louvain and Brussels. In the higher institutions instruction is given in law, medicine, engineering, arts, and manufactures. Roman Catholic is the religion of most of the people, and this church maintains many parochial schools.

**INHABITANTS.** Belgium is so named from the people anciently called Belgae, who were of the ancient Celtic family. Two types make up the present population, those who descended directly from the ancient Belgae, and those who are a mixture of Celts and Germans. Flemish and French are spoken in the southern part, while German is the language of the northern section. However, these three are the national languages. Brussels, the capital, is a large and prosperous commercial center. Other cities of importance include Antwerp and Ostend, both important seaports, and Ghent, Bruges, Liège, Verviers, and Ixells. Belgium is the most densely populated country in Europe. Population, 1906, 7,238,622.

**HISTORY.** Anciently Belgium was a part of Rome, when it was included in the territory

known as Belgae. It was the battle ground and center of contention in many European wars, and its territory has belonged to many different nations. The Battle of Waterloo was fought in the province of Brabant, in 1815, after which it was united to Holland, the two countries forming the kingdom of the Netherlands. In 1830 Belgium was separated from Holland and became a distinct kingdom, forming a constitutional monarchy. Prince Leopold of Saxe-Coburg was elected its first king, in 1831, with the title of Leopold I. He was succeeded after a prosperous reign of thirty-four years by his son, Leopold II. At present its political parties are known as the Liberals and the Radicals, which are about evenly divided, and each has been in the ascendancy at different times. In 1885 King Leopold II. gave efficient and vigorous support to the explorations of Stanley in Central Africa, and consistently opposed the maintenance of slavery in that region. The Congo International Congress held at Berlin made his government the controlling influence in the Congo Free State, Belgium reserving the right of annexation after 1900. Albert, born April 8, 1875, son of the Count of Flanders, the brother of King Leopold, is the presumptive heir to the Belgium throne. He married Princess Elizabeth of Bavaria in 1900.

**BELGRADE** (běl-ġrād'), the capital of Serbia, called by the Turks "the House of the Holy War." It occupies an important site at the junction of the Save and the Danube rivers, thus making it the southern key to the Austro-Hungarian Empire. It is connected by railroads with the countries to the north and south, and has a fine system of electric street railways. The chief buildings include the cathedral, the public library with 100,000 volumes, the national theater, the royal palace, and a number of fine churches. It has waterworks, electric lights, pavements, a considerable trade, and numerous manufactures. Several fine gardens and drives beautify it, and statuary adorns its public places, among them the statue of Prince Michael III. The Greeks were in possession of Belgrade until 1073, when it was captured by the Hungarians. Later it fell into the hands of the Bulgarians, Servians, Austrians, French, and Turks. In 1862 it became the capital of Serbia, and was finally evacuated by the Turks in 1867. The Treaty of Berlin, in July, 1878, after the close of the war between Russia and Turkey, recognized Serbia as an independent state, thus giving Belgrade considerable governmental advantages. The city is fast losing its Turkish ap-

pearance and partaking of European characteristics. Population, 1905, 77,816.

**BELIEF** (bê-lêf'), the mental act or operation of accepting as true and real any proposition on proof afforded by reasoning, or any alleged fact or opinion on evidence of testimony. It stands in opposition to the conviction that results from personal observation or experience, which is stronger than that resting on testimony or reasoning. The term *belief* is also used to express unwavering acceptance of anything as true.

**BELIZE** (be-lêz'), the capital of British Honduras, Central America, located on Honduras Bay, at the mouth of the Belize River. It is the center of a growing import and export trade in rosewood, cedar, logwood, mahogany, sugar, cocoanuts, and other tropical productions. The city is well built. It has extensive telegraph connections, a good harbor, and several fine schools and churches. Population, 1905, 9,113.

**BELL** (bêl), an instrument for producing a ringing sound, made chiefly of a kind of bronze called *bell metal*. It consists of a reversed cup, at the apex of which an ear or canon is formed, used for suspending it from a beam or some fixed body above. On the inside is a hammer or clapper, which generates the sound by percussion on the reversed side of the cup. In Exodus xxviii, 33-34, golden bells are mentioned in connection with worship. The antiquity of bells is also shown by the discovery of Sir Austin Layard (1819-94) at the site of the ancient city of Nineveh, where he secured bells made of one part tin and ten parts copper. In Greece and Rome bells were used, not only in religious observances, but were common at the markets, camps, and baths. Those made at an early date were of a comparatively small size until about the year 400 A. D., when the Bishop of Nola introduced the use of larger sizes in Campania. Their use in England began in the 7th century, and they were first cast in that country about 940, but in Ireland and Scotland they were probably used at an earlier date. The great bell of Saint Paul's Cathedral in London was cast in 1882. It has a diameter of 9.07 feet and weighs 35,470 pounds. The bell of Westminster, known as Big Ben, was cast in 1856 and has a weight of 30,324 pounds.

Bells are now in common use in churches, either singly or in a series, and are employed extensively in city buildings, at private houses, and in offices and hotels. Some bells are famous in history on account of their large size, beauty, and clearness, or some important historic event announced by their ringing. Among the most famous are the following:

WHERE LOCATED.	WEIGHT IN TONS.	WHEN MADE.
Cologne, Germany .....	11	1448
Halberstadt, Germany .....	8	1457
Rouen, France.....	16	1501
Breslau, Germany.....	11	1507
Lucerne, Switzerland.....	8	1680
Paris, France .....	15	1680
Vienna, Austria.....	18	1711
Moscow, Russia .....	216	1736
Montreal, Canada.....	14	1847

Several of these bells have been recast, notably the Keiserklocke at Cologne, in 1875, which now weighs twenty-five tons. The great bell of Moscow is the largest ever made, and hung

GREAT BELL OF MOSCOW.

suspended only a short time, owing to a fire. It now serves as a dome to a chapel that was excavated below it. The famous Liberty Bell, which rung when the Declaration of Independence was issued in 1776, was made in 1751. Montreal, Canada, has the largest bell in America, weighing thirteen and a half tons.

The material used chiefly in making bells, known as bell metal, consists of an alloy of tin and copper with a little zinc and lead added. In England and Germany good results have been secured by casting bells of cast steel. Glass has been used with excellent results as to tone, but durability is wanting. Bells are cast in molds made of fine sand. The molten metal is drawn off from a great furnace into an

earthen or crucible pot, which is swung by a crane. The molten metal is poured over the mold into a pit beneath the floor of the foundry. When the bell has been cast, it is drawn out of the pit and its rough places are finished with files and chisels. The size of the bells and their thickness depends upon the purpose they are to serve. The small bells are proportional in weight to the larger ones, and are rung by means of ropes, which cause them to swing to and fro. Others are struck by hand, and some by means of a hammer on the outside. *Curfew bells* are rung in some towns to warn the people that it is time to retire, *fire bells* give warning of and indicate the location of fire, and *church bells* call to service, or toll the announcement that death has visited the com-

LIBERTY BELL, PHILADELPHIA.

munity. Many churches in the larger cities have chimes, which consist of a set of bells, and the sounds produced are pleasing and musical. The most recent inventions in bells include electrical contrivances, such as are used for danger signals and to call attendants in hotels and offices. They provide both rapidity and convenience at short and long distances. Bells of this kind are constructed of two electro-magnets, provided with an armature, to which a clapper is fixed that vibrates between two gongs. When an alternating current is generated, the attraction and repulsion of the armature causes the bell to ring.

**BELLADONNA** (bĕl-lă-dŏn'nă), or **Deadly Nightshade**, a plant native to Eurasia, but some species are now cultivated successfully in America. It is widely distributed over Europe,

where it grows wild in forests, near fences, and in waste places. The berries are shining black and, like all parts of the plant, are very poisonous. Vinegar is an antidote to counteract the effects of this poison. The plant attains a height of four or five feet. Its leaves, roots, and fruit are used in making medicine, which is useful in palsy, fevers, epilepsy, and other ailments. Some species are beautiful flowering plants.

**BELLAIRE** (bĕl-âr'), a city of Belmont County, Ohio, five miles from Wheeling, W. Va., on the Ohio River. It is on the Pennsylvania, the Baltimore and Ohio, and other railroads, and is important as an industrial and commercial center. It has a public library and several fine school and church buildings. The manufactures include window glass, pig iron, farm machinery, nails, hardware, cigars, and clothing. Gas and electric lights, pavements, waterworks, and street railways are among the improvements. In the vicinity are extensive deposits of coal, clay, and limestone. Population, 1900, 9,912.

**BELLBIRD**, a bird native to South America and the West Indies, so named from the metallic sound of its voice, which resembles the tolling of a bell. The bill is broad and depressed and flexible at the base, and at the upper side is a tubular appendix about three inches in length. This hornlike growth stands erect when the bird becomes excited, or when it utters its note. A similar bird is found in Australia and New Zealand.

**BELLEFONTAINE** (bĕl-fŏn'tân), a city in Ohio, county seat of Logan County, forty-five miles northwest of Columbus, on the Ohio Central and other railroads. It is located on the highest ground in the State. The chief buildings include the county courthouse, the high school, and several churches. Railroad machine shops, flouring mills, and carriage works are among the chief manufacturing establishments. It has a growing trade in farm produce and merchandise. The waterworks and lighting plants are municipal properties. The first settlement was made in 1818. Population, 1900, 6,649.

**BELLE ISLE**, an island north of Newfoundland, at the northern extremity of the Strait of Belle Isle. Much of the surface is rocky. The area is about fifteen square miles. At the southern extremity is a lighthouse 470 feet high. The Strait of Belle Isle separates Newfoundland from Labrador, and is the connecting link between the Atlantic and the Gulf of Saint Lawrence.

**BELLEVILLE** (bĕl'vîl), a city in Illinois, county seat of Saint Clair County, about four-

teen miles southeast of Saint Louis, on an elevated district in the midst of a fertile farming country. It is on the Southern, the Illinois Central, and the Louisville and Nashville railroads. The city is a prosperous commercial and manufacturing center, and has modern municipal facilities, and adjacent to it are productive coal mines. Its manufactures consist of ironware, woolen goods, fermented and distilled liquors, flour, and machinery. It has a public library, the Saint Peter's Cathedral, a fine courthouse, and a convent for the education of young ladies. The municipal improvements include electric street railways, brick and macadam pavements, and waterworks. The first settlement was made in 1814 and it was incorporated in 1846. Population, 1910, 21,122.

**BELLEVILLE**, a city in Ontario, Canada, and county seat of Hastings County, on the Grand Trunk Railroad. It is located on the Bay of Quinte, at the mouth of the Moira River, and is an important commercial center. The manufactures include ironware, clothing, fermented and distilled liquors, and dairy products. It is the seat of several educational institutions, including an asylum for the deaf and dumb and Albert University, founded in 1857. The principal improvements include waterworks, sewerage, and street pavements. Population, 1901, 9,117.

**BELLEVUE** (bĕl-vū), a city of Kentucky, in Campbell County, on the Ohio River, opposite Cincinnati, Ohio. It has a growing trade, is improved by good municipal facilities, and has several fine schools and church buildings. Many Cincinnati business men reside here. It was incorporated in 1871. Population, 1900, 6,332.

**BELLINGHAM** (bĕl'ing-am), a city in Washington, county seat of Whatcom County, seventy-eight miles north of Seattle, on the Northern Pacific, the Great Northern, and other railroads. It is located on Bellingham Bay, an inlet from the Gulf of Georgia, and has a large coastwise trade. The harbor is safe and well improved. It is important as an export market for merchandise and produce. Sawmills, tanneries, brickyards, flouring mills, and machine shops are among the leading manufacturing enterprises. The trade is largely in fruit, cereals, live stock, fish, and products from the farm and dairy. Coal mines, and stone quarries are operated in the vicinity, and the surrounding country is devoted to farming and fruit culture. It is the seat of a State normal school and has a public library, a substantial courthouse, and numerous schools and churches. The public improvements include a library,

waterworks, and electric street railways. Settlements were made in the vicinity in 1858 and the town was named Whatcom. Bellingham dates from 1903 when Fairhaven and Whatcom were united to form the city. Population, 1900, 6,834; in 1910, 24,298.

**BELLOWS** (bĕl'lūs), a machine or instrument for producing a blast of air, used principally for blowing fires in furnaces, forges, and mines, or for filling pipe organs. It was used by the ancients, both nomadic and civilized. The common bellows are made by joining two wooden sides together with leather stretched entirely around, and so fastened that two handles moved back and forth cause air to be forced out through the nozzle. A valve on the side admits the air as the handles are moved apart, but closes when brought together. This results in the air being driven out with much force. More powerful instruments designed for factories or workshops are provided with machinery to obtain propulsive force. In the larger industrial establishments where large quantities of coal are burned fan-blast machines are used for the same purpose. They have the advantage of furnishing a continuous current of air.

**BELL ROCK**, or **Inch Cape**, a reef of rocks in the North Sea, opposite the mouth of the Tay, about twelve miles from Arbroath Scotland. The danger of this reef to navigation has been partly overcome by the erection of a large lighthouse, in 1810, under the direction of Robert Stevenson. The lighthouse is 120 feet high, has an alternating red and white revolving light, and is enforced by the ringing of two bells during storms. The reef, which is about 2,000 feet long, is partly uncovered at spring tides.

**BELOIT** (bĕ-loit'), a city of Rock County, Wisconsin, on the Rock River, about forty-seven miles southeast of Madison, on the Chicago and Northwestern and the Chicago, Milwaukee and Saint Paul railroads. It is the center of a fine agricultural country and the seat of large factories engaged in the construction of plows, reaping and mowing machines, boots and shoes, engines, and machinery. Besides having good public schools, it is the seat of Beloit College, a well established institution of higher learning under the direction of the Congregationalists. The chief buildings include the public library, the city hall, and the central high school. Gas and electric lights, street railways, and waterworks are among the municipal improvements. It was first settled in 1824 and became an incorporated town in 1856. Population, 1905, 12,855; in 1910, 15,125.

**BELT**, or **Belting**, in machinery, an endless flexible cord or band used to transmit power or motion between two parallel shafts. Driving belts are usually broad or flat bands of leather or rubber, but there are a vast number of forms made of different materials, such as ropes, chains, and cables, which are used to transmit power from one roller, wheel, or pulley to another. The best leather belts are made of oak-tanned leather, cut from the back of hides and curried in tallow and cod oil. Under suitable care and with proper connections, belts of this kind can be used to drive machinery from twenty to thirty years. India rubber is preferred as a material for belting by a number of manufacturers, as it does not absorb moisture or stretch and decay, but its tendency to deteriorate with age makes it less durable. Iron and steel wire and chains are used extensively, but they require a peculiar construction of pulleys. A variety of woven-fabric belts are employed, including hair, cotton, and various textile fabrics, though in general they are most serviceable in smaller machinery. The two ends of a belt may be united together by riveting, or by clamps of various construction, and in the lighter class of belting it is customary to lace the ends together with a strap of leather. Where great power is transmitted, it is necessary to have leather belts of several thicknesses, frequently as much as four layers, and the width ranges from twenty to fifty inches. Heavy rubber belting is sometimes six-ply thick, from thirty to fifty inches wide, and about 300 feet long, depending, of course, upon the construction of the machinery and the power to be transmitted.

**BELT, Great and Little**, the names of two narrow channels which connect the Baltic Sea with the Cattegat. The Great Belt is thirty-seven miles long and about eighteen miles wide, and passes between the islands of Fünen and Zealand. It has dangerous shoals and sand banks, and a swift current prevents the strait from being frozen over except in very severe winters. The Little Belt separates Fünen from Jutland. It is thirty miles long and from one to twelve miles wide, and in general respects resembles the Great Belt.

**BELUCHISTAN.** See **Baluchistan**.

**BELTEIN** (běl'tân), or **Beltane**, a festival common among the Celtic people in former times, which was celebrated annually in the beginning of May down to the early part of the 19th century. Some writers have associated it with fire worship or with the worship of the sun, while others regard it a season for burning rubbish at the time of cleaning house

yards. In some localities festivals known by this name were celebrated in the month of November.

**BELUGA** (bě-lū'gā), or **White Whale**, a kind of whale or dolphin found in the Arctic Sea. It has a broad head and is from ten to fifteen feet long, and is hunted for its skin and oil, known as *porpoise oil*. The sturgeon of Southern Russia is known as beluga, and is hunted for its flesh and a kind of isinglass obtained from it.

**BELVIDERE** (běl-vī-dēr'), a city of Illinois, county seat of Boone County, on the Kishwaukee River, seventy-six miles northwest of Chicago, on the Chicago and Northwestern Railroad. A public library, an opera house, and the county courthouse are among the chief buildings. The manufactures include flour, farming implements, and machinery. The city has several fine churches and schools, waterworks, and an electric system of lighting. It was settled in 1836 and incorporated in 1857. Population, 1900, 6,937.

**BEMBA.** See **Bangweolo**.

**BENARES** (běn-ă'rěz), a city in the northern part of India held sacred by the Hindus. It is the focus of a network of railroads, on the Ganges River, which makes a turn at this place. The site on which the city is built rises like an amphitheater, thus presenting a magnificent view of its beautiful palaces, mosques, and other buildings. The city is the residence of many priests. Vast numbers of religious mendicants and Hindu pilgrims wend their way to this revered city to worship in its ancient edifices, or to temporarily wash away their sins in the sacred waters of the Ganges. Historically sacred bulls wander at large to indicate the sacredness of the city. There are no less than 1,500 Hindu temples within the city limits, besides 275 Mohammedan mosques. Benares is surrounded by a fertile district and has a large trade in merchandise. The manufactures include utensils, embroidered cloth, clothing, shawls, silk, jewelry, and other Eastern products. A portion of the city is occupied by Europeans, who founded a government college which is now attended by about 1,250 students. They constructed a beautiful bridge across the Ganges River, containing sixteen spans. Little is known of the early history of the city. According to Hindu tradition it was founded at the time of the creation. Population, 1905, 225,173.

**BENDER** (běn'děr), or **Bendery**, a town of Russia, in the government of Bessarabia, sixty miles northwest of Odessa. It is located on the Dniester River, fifty miles from its mouth,

and has a large trade in grain and live stock. The manufactures embrace machinery and clothing. A fine Greek church, a gymnasium, and the government buildings are its chief improvements. Many of the people are Jews and Armenians. Russia captured it in 1770, but it was ceded to Turkey in 1774, and in 1812 it was finally given to Russia by the Peace of Bucharest. Population, 32,350.

**BENEDICTINES** (běn-ě-dĭk'tĭns), an order or society of monks, who observe the rules of Saint Benedict. It dates from 529, when Saint Benedict founded the first monastery of this order on Monte Cassino, near Naples. The rule of living requires that its members be industrious, avoid laughter, take the vow of poverty, and exercise frugality in living. They teach the trades and industries, especially weaving, dyeing, tanning, glass-blowing, sculpturing, masonry, and other industrial and fine arts. In the Middle Ages the Benedictines were concerned in the preservation of the ancient classics, and through them many art and literary treasures have been transmitted to modern times. The monks of this order include many scholars and learned men noted for their piety and interest in disseminating knowledge. The order lays claim to the distinction that twenty-four of its members became popes; 200, cardinals; and 4,250, bishops. It is known and exercises influence wherever the Roman Catholic church has a foothold.

**BENEFIT ASSOCIATIONS**, or **Fraternal Societies**, the organizations whose chief objects include the cultivation of social relations, the assistance of members during the time of sickness and disability, and the payment of specified benefits in case of death. A number of these associations are secret societies, in a certain sense, but only so far as their lodge meetings are concerned, while their general business is open to public scrutiny. They have allied certain forms of insurance and friendly intercourse, thus aiding in educational advancement and distributing benefits on a fraternal basis to the members. Their business, so far as it pertains to life insurance, is conducted on an assessment basis, classified in accordance with the age of the assured. They are particularly numerous in the United States, where the annual income of this class of fraternal societies is about \$63,500,000, while the expenditures are about \$61,285,000. The largest among these are the Odd Fellows, the Knights of Pythias, the Ancient Order of United Workmen, and the Knights of the Maccabees, but many others have a large membership. A comparatively large business is transacted in

Canada, where they are generally termed *friendly societies*, and many are established by the workmen themselves. Although life insurance is issued by most of the societies named below, it is not strictly compulsory. A member may belong to and enjoy all the privileges of many of them without carrying life insurance, and under such circumstances his privileges are fraternal and for personal edification. These associations have been a source of benefit to many homes on account of the payment of small life policies, and because of the friendship and acquaintance of friends of deceased members. Below is a fairly complete list of benefit associations, together with the dates when organized:

NAME OF ASSOCIATION.	ORGANIZED.
American Legion of Honor .....	1877
Ben Hur, Tribe of .....	1894
B'nai B'rith, Independent Order of .....	1843
Brith Abraham Order .....	1859
Catholic Knights of America .....	1877
Catholic Mutual Benefit Association .....	1876
Choppers, Order of .....	1900
Chosen Friends, Order of .....	1879
Druids, United Ancient Order of .....	1839
Elks, Benevolent and Protective Order of .....	1868
Equitable, Aid Union .....	1879
Foresters, Ancient Order of .....	1832
Foresters, Ancient Order of, of America .....	1874
Foresters, Independent Order of .....	1874
Golden Chain, Order of .....	1880
Golden Cross, United Order of .....	1876
Good Fellows, Royal Society of .....	1882
Heptasophs, Improved Order .....	1878
Hibernians of America, Ancient Order of .....	1836
Home Circle .....	1880
Independent Order Free Sons of Israel .....	1849
Irish Catholic Benevolent Union .....	1869
Knights and Ladies of Honor .....	1877
Knights of Honor .....	1873
Knights of Pythias .....	1863
Knights of Saint John and Malta .....	1884
Knights of the Golden Eagle .....	1873
Knights of Maccabees .....	1880
Mystic Circle, The Fraternal .....	1884
National Provident Union .....	1883
National Union .....	1880
New England Order of Protection .....	1887
Odd Fellows, Independent Order of .....	1819
Pilgrim Fathers, United Order of .....	1879
Rechabites, Independent Order of .....	1842

**BENEVENTO** (bă-nă-věn'tō), a city of Southern Italy, in a province of the same name, near the junction of the Sabato and Calore rivers. It occupies the site of the ancient Beneventum, and is noted for its remains of antiquity. The famous arch of Trajan, built in 114 A. D., and its cathedral, constructed after the Lombard-Saracenic style in the 12th century, are among the most noted buildings. Population, 1906, 24,893.

**BENGAL** (běn-gāl'), the largest of the gov-

ernmental divisions of British India, containing an area of 151,543 square miles. It constitutes a lieutenant governorship and, besides Bengal proper, includes Behar, Orissa, Chota Nagpur, and the tributary states. The tributary states have an area of 58,500 square miles. Bengal is located south of the Himalaya Mountains, and north of the Gulf of Bengal. Through it flow the Brahmaputra and Ganges rivers, two valuable water courses, which, below their confluence, form the greatest delta in the world. The glaciers of the Himalaya Mountains supply the two chief rivers of the district with immense volumes of water in the months of June and July, and cause a large region to be inundated similar to the inundations of the Nile. As a result of this the low lands of the delta are fertile and produce large quantities of cereals and fruits.

The mean temperature of Bengal for the year is about 80° near the coast, and in the elevated regions to the north it is about 54°. In the eastern part the rainfall is extremely large, averaging over 100 inches in a year, and is equaled only by the precipitation of the Amazon valley and the lake region of Africa. Three seasons make up the year, including the hot, from March to June; the rainy, from June to October; and the cold, from October to March. The district is generally unhealthy for Europeans on account of its variations in moisture and temperature. Along the coast extend great trackless forests, in which the Bengal tiger and the rhinoceros are numerous. Many reptiles and carnivorous animals infest the swamps and canebrakes of the low and marshy coast and the delta. The district is frequented by destructive floods and occasionally by cyclones, while earthquakes have visited it at numerous times. Among the chief products are opium, cane sugar, tobacco, indigo, cotton, rice, and many varieties of tropical fruits. In the northern portions, adjacent to the foothills of the Himalayas, are extensive deposits of copper, petroleum, and coal, while salt beds are common in various parts of that region. A large commerce is carried on with Great Britain, China, Germany, the United States, and the Straits Settlements.

The first British settlement in Bengal was made by the East India Company in the early part of the 17th century. Calcutta was founded in the latter part of that century, and is the largest city and most important commercial center of British India. Large additions of territory were made subsequently by conquest, and the country became a crown province in 1858. It is the most highly developed district of

British India, and has made material advancement in educational arts and sciences. At Calcutta several colleges and a fine university have flourished for many years. The district has a well organized system of public schools, at which the fundamental arts of an education and higher instruction are given free of tuition. A number of industrial, professional, and denominational institutions are in a flourishing condition. Bengal contains many cities and is penetrated by a network of telephone and telegraph lines. It has transportation facilities by the Indus, the Brahmaputra, and about 24,850 miles of railways. The dialect spoken chiefly is known as *Bengali*, but the people of some of the regions speak the *Hindi* and *Uriya* dialects. The inhabitants belong largely to the Hindu race, but along the river valleys the Burmese predominate. About one-third of the people affiliate with the Mohammedan religion and the remainder are Animists, Buddhists, and Christians. Population, 1901, 78,448,735.

**BENGAL, Bay of**, a part of the Indian Ocean, south of Asia, located between India and Farther India. It is visited by southwest monsoons in winter and northeast monsoons in summer. The Andaman and the Nicobar Islands are the chief land masses within the bay. It receives the inflow from the Ganges, Irawadi, and Brahmaputra rivers. The tides sometimes rise to the height of seventy feet where the shores are elevated. Rangoon, Calcutta, and Madras are the chief cities tributary to the Bay.

**BENGALI** (běn-gă'lě), a branch of the Aryan language spoken in Bengal and other parts of India. Calcutta is the chief center of influence among the people who speak this language. It is thought to be an outgrowth from the Sanskrit and bears to it about the same relation that the Romance languages have to Latin. About 45,000,000 people speak the language. It has an interesting literature and numerous periodicals are published in the Bengali.

**BENGUELA** (běn-gă'la), a district in the western part of Africa, one of the divisions of the Portuguese colony of Angola. It is situated in a mountainous section between Mossamedes and Loanda. It has deposits of sulphur, copper, and petroleum, and the region is considered rich in mineral wealth and fertility of soil. Benguela, the capital, is a market for rubber, coffee, and fruit. It was founded in 1617 and was long a center of the slave trade.

**BENI** (bă'ně), a river of Bolivia, rises in the Bolivian Andes, and after a course of 900

miles unites with the Mamoré to form the Madeira. It is navigable about half its length, and provides direct communication for a large part of Bolivia with the Amazon.

**BENIN** (běn-ēn'), a district of Western Africa, in Upper Guinea. It is bounded by Dahomey, the Niger, and the Bight of Benin, an extension from the Gulf of Guinea. The soil is fertile and produces yams, cotton, fruit, and sugar cane. The region was discovered and partly explored by the Portuguese in 1484. It became a possession of Great Britain in 1897, when it was incorporated in the protectorate of the Niger coast called Nigeria.

**BEN LOMOND** (běn lō'münd), a mountain in the Grampian Highlands of Scotland, twenty-seven miles northwest of Stirling. It is on the east side of Loch Lomond and rises to an elevation of 3,192 feet. Duchary Water, a feeder of the Forth, has its source in Ben Lomond. On clear days a fine view may be had of the surrounding country, including Loch Lomond and the fertile plains of Ayrshire and Renfrewshire. Scott in his "Lady of the Lake" makes this mountain a place of prominence.

**BEN NEVIS** (běn nē'vīs), a mountain in Inverness-shire, Scotland. Its height is 4,406 feet, with a precipice of 1,500 feet on the northeast side. It is the highest eminence in the British Isles. In 1883 an observatory was erected on its summit, and subsequently a carriage road was established to its top.

**BENNINGTON** (běn'ning-ton), the county seat of Bennington County, Vermont, famous for the battle fought here in the Revolution. It is located on the Rutland and the Lebanon Springs railroads, thirty-seven miles northeast of Troy, N. Y., and is a manufacturing center of considerable importance. The leading manufactures are woolen goods, pottery, ironware, furniture, and machinery. The chief buildings include the county courthouse and several public schools. It has waterworks and a system of electric lighting. It is the seat of a soldiers' home, and near the city is a monument 300 feet high to commemorate the Battle of Bennington. This engagement took place on Aug. 16, 1777, when General Stark at the head of the "Green Mountain Boys" defeated a detachment of Burgoyne's army commanded by Colonel Baum. It resulted in the capture of public stores and 600 British prisoners, and a complete victory for the Americans. Before the battle the American commander made his well known statement, "We will bag the fox, or Mollie Stark will be a widow." A successful celebration of the centennial of the battle was held in 1877, at which the President of the

United States, his Cabinet, and many prominent men took part. Population, 1900, 5,656.

**BENTON HARBOR**, a city of Michigan, in Berrien County, sixty miles east of Chicago, Ill. It is situated on the Saint Joseph River and has transportation facilities by the Peré Marquette and other railroads. The Benton Harbor Canal connects it with Lake Michigan, which is about one mile from the city, and steamers from all principal points on the Great Lakes enter its harbor. The manufactures include furniture, flour, machinery, and clothing. It has a growing trade in fruit, cereals, and merchandise. In the vicinity are mineral springs whose water has medicinal properties. Population, 1904, 6,702; in 1910, 9,185.

**BENZENE** (běn'zēn), or **Benzole**, a mineral fluid obtained from the distillation of coal tar and usually classed with the hydrocarbons. It is secured from a grade of oil that floats on water when coal tar is distilled. At about the freezing point of water it solidifies and forms a mass of crystals. It is a good solvent for fatty substances, hence is much used for cleaning purposes. It burns with a bright flame. Nitrobenzene is formed by mixing benzene with nitric acid. Aniline (q. v.) is made from nitrobenzene.

**BENZINE** (běn'zīn), a liquid obtained from coal tar and petroleum, consisting of hydrocarbon. It is highly inflammable and nearly colorless, and has a peculiar but agreeable odor. It is used in the manufacture of gutta-percha and India rubber on account of its solvent powers. Benzine is also used in removing grease spots from clothing, for cleaning gloves, in the manufacture of paints and varnishes, and as a burning fluid.

**BENZOIN** (běn-zoin'), or **Gum Benjamin**, a resinous substance obtained from a tree native to Southern Asia and the East Indies. It is fragrant and is used in perfumery and in medicine. The trees that yield benzoin, of which there are several species, are cultivated, and the resin is obtained by making incisions in the bark. The Roman and Greek Catholic churches use it as incense.

**BEOWULF** (bā'ō-wulf), an epic poem of the Anglo-Saxons dating from the 8th or 9th century, the original manuscript of which is in the British Museum. The manuscript is imperfect and many points are obscure, but it is regarded the longest and most important writing in Anglo-Saxon literature. In it the adventures of Beowulf, an Anglo-Saxon hero, are recounted, particularly his defense and delivery of the Danish kingdom from the monster Grendel and his ferocious mother.

**BERBERS** (bēr'bērz), the name of a historic people in Northern Africa, found mostly in the mountainous districts of Morocco, Algeria, and Tripoli, and in the northern part of the Sahara Desert. They are of middle stature, possess dark hair and dark, piercing eyes, and are austere in manner and cruel in disposition. Their life is largely pastoral, but they engage to a limited extent in hunting and trading, and in some districts follow agriculture and mining. They manufacture various rude implements for cultivating the soil, clothing, water mills, and implements of war. In government they are subject to the Turks in Tripoli, to the French in Algeria, and to the Sultan in Morocco, but large numbers are still unconquered, or live in tribes under independent chiefs. In early history they were conquered successively by the Phoenicians, Romans, Vandals, and Arabs. The predominating religion is Mohammedanism, and the spoken language is classed with the Hamitic tongues. Their peculiar characteristics show that they are a distinct and peculiar race. They number about 5,000,000. The four different classes of Berbers are known as the Amazirgh in northern Morocco; the Shulah in southern Morocco; the Kabyles in Algeria, and the Berbers in the Sahara Desert.

**BERGAMO** (bēr'gā-mō), a city of Lombardy, in northern Italy, twenty-eight miles northeast of Milan. It is an important market and manufacturing center. The city consists of two sections, the upper and the lower, which are connected by a system of street railways. A fine statue of Garibaldi stands in Garibaldi Place. The public library contains 70,000 volumes. Other buildings include the city hall, the cathedral, and an academy of arts. In early history it was strongly fortified. It was destroyed by Attila in 452 A. D., and later became one of the chief cities of the Lombard kings. Population, 1906, 47,772.

**BERGAMOT** (bēr'gā-mōt), the name of a genus of fruit trees, including several species of pears and citrons. Bergamot oil is made of the citron, or bergamot orange. It is cultivated in Eurasia, and bears a fruit shaped like a pear, yellow in color, which yields a fragrant oil valued as a perfume. This oil is obtained by pressure or by distillation. It is used for flavoring, and in the manufacture of cologne, pomades, and essences.

**BERGEN** (bēr'gen), a seaport city of Norway, on the coast of Vaagen Bay, in the province of Bergen. The chief buildings include the Lutheran cathedral, the museum, and the nautical school. It has a fine library of 80,000 vol-

umes. Bergen is the second city of Norway, carries on extensive manufactures, and is noted for its fisheries. The stock fisheries yield an income of about \$2,500,000 annually, while its cod-liver oil industry, distilleries, and shipbuild-

BERGAMOT ORANGE.

ing are likewise extensive. It has railroad and electric street railway facilities, electric lighting, pavements, and good schools. Population, 1905, 72,251.

**BERHAMPUR** (bēr'ūm-pōor), a town of India, in the lieutenant governorship of Bengal, 115 miles north of Calcutta. It was long a military station of Great Britain. A college, several churches, and the government buildings are among the most important structures. It was the scene of hostilities in the Sepoy mutiny of 1857. Population, 25,380.

**BERIBERI** (bā-rī-bā'rī), or **Kakke**, a disease more or less prevalent in Japan and Southern Asia. It is a form of neuritis, but is known as kakke in Japan and beriberi in India. The patient becomes numb or paralyzed and sometimes madness and paroxysms occur. Death frequently results from this disease in from twenty to thirty hours, though many cases are protracted or do not prove fatal.

**BERING SEA** (bē'rīng), the northern extension of the Pacific Ocean, bounded on the north by Asia and Bering Strait, east by Alaska, south by the Aleutian Islands, and west by Kamchatka. It communicates with Bering Strait, which separates Asia from North America, and connects Bering Sea with

the Arctic Ocean. Bering's Island is northwest of the Aleutian chain, off the coast of Kamchatka, and is of no value except as a station for seal fishing. It is not inhabited and possesses no timber. The island has an area of thirty square miles, and is noted as the burying place of its discoverer, Vitus Bering.

**BERING SEA QUESTION**, a controversy between the United States and Great Britain, which originated after the transfer of Alaska from Russia in 1867. In 1870 the Alaska Commercial Company leased of the United States the Pribilof Islands, in Bering Sea, and the Commander Islands of Russia. The company was limited to capture not over 100,000 seals each year, and was required to pay the government \$50,000 rental annually. The seals taken from the territory in twenty-three years and sold in the London market were valued at \$33,000,000. A dispute arose between Great Britain and the United States as to the control of the seal fisheries, both claiming the territory in dispute. An arbitration commission met at Paris, March 23, 1893, to settle the controversy, after receiving a report from experts. The result of the arbitration was that definite boundaries were fixed for the sealers of Canada and the United States, and proper precaution was taken for the protection of young seals. This adjustment led to a satisfactory conclusion, both on the part of England and the United States, and the maintenance of the law, whereby the seal fisheries are regulated and the seals protected from extermination.

**BERING STRAIT**, the narrow passage of water which connects the Arctic with the Pacific Ocean, separating Asia from America. The distance at the narrowest point, between East Cape in Asia and Cape Prince of Wales in America, is about thirty-eight miles. Three small islands lie about midway between these points. The depth ranges from 150 to 200 feet. It is frozen in winter, when the ice is formed in great ridges due to the action of the waves, and fog prevails most of the time in the warmer season. It was discovered by the Russians in 1648, and subsequently explored by Vitus Bering and Captain Cook.

**BERKELEY** (bĕrk'li), a city in Alameda County, California, nine miles northeast of San Francisco, on the California and Nevada and the Southern Pacific railroads. It is the seat of the California State College of Agriculture, the University of California, and the California Institution for the Deaf, Dumb, and Blind. Other institutions include the Berkeley Bible Seminary, the Bowen Academy, and

the Boone University School. The city is noted as one of the leading educational centers of the far west. Its industries include planing mills, canning factories, machine shops, and commerce. It has waterworks and electric street railways. It was settled in 1868 and incorporated in 1878. Population, 1910, 40,434.

**BERKSHIRE HILLS** (bĕrk'shĭr), the name of a hilly region of Massachusetts, situated in Berkshire County. These highlands are an extension of the Green Mountains of Vermont, and trend in chains north and south through the western part of the State. Graylock, the highest peak, has an elevation of 3,500 feet, and Mount Everett is about 2,600 feet high. The scenery is beautiful in the summer season, when many tourists visit the points of interest.

**BERLIN** (bĕr'lin), a city of Coos County, New Hampshire, on the Androscoggin River, about twenty miles east of Lancaster. It has transportation facilities by the Boston and Maine and the Grand Trunk railroads, and about fifteen miles distant is Mount Washington. The public improvements include a public library, electric lights, waterworks, and several fine school and church buildings. The chief manufactures are pulp, flour, machinery, earthenware, vehicles, cigars, and clothing. An abundance of water power is obtained from the river, which has a fall of 400 feet in six miles. Population, 1900, 8,886.

**BERLIN**, the county seat of Waterloo County, Ontario, on the Grand Trunk Railway. It is located on the Grand River, about sixty miles west of Toronto. The manufactures include butter, malt liquors, leather goods, clothing, and machinery. It has a public library, street railways, waterworks, and electric lighting. The chief buildings include a high school, the city hall, and a Catholic college. Population, 1901, 9,747.

**BERLIN**, the third city in Europe, and the capital of the German Empire. It is situated in the province of Brandenburg, on the Spree River, and is the capital of the kingdom of Prussia. The city is located in the center of what was originally a sandy plain, but the region has been improved by fertilization and cultivation and produces abundantly. In the 13th century it was a small fishing village inhabited by Wends. Its growth and prosperity date from the reign of Frederick William, the Great Elector, from 1640 to 1688, who united the separate duchies of which Prussia is now formed and made Berlin the capital, largely because of its central location. In 1861 it covered an area of 14,000 acres; in 1888, over 1,000,000 acres,

and at the present time it is the largest city in the German Empire.

The original or older part of Berlin has narrow streets and is built irregularly, but the newer part is well platted, has wide streets covered with substantial paving, and its edifices and public buildings are constructed of durable stone in fine architectural forms. Frederick I., successor of Frederick William, devoted much energy to enlarging and beautifying the city, and at the end of his reign it had a population of 50,000. Many substantial improvements made by him are still intact. At the end of the reign of Frederick II. the city had grown to a population of 145,000. After the defeat of Napoleon in 1815, the rise of German power made Berlin a center of art and science, and an important seat of commerce, while, following the successes of Germany in 1870-71, its growth

was stimulated with a rapidity never before known. In 1905 it had a population of 2,040,148.

Berlin is one of the great centers of art and intelligence. The royal library contains more than a million volumes, besides 16,000 manuscripts and charts. Its museums are among the most famous, containing magnificent specimens of ancient and modern treasures. Eight public museums, besides the National Gallery and Royal Museum, are maintained and liberally endowed. Each has an old and new part, in which the different exhibits are located. Among them are antiquities of remote ages; casts of ancient, mediaeval, and modern sculptors; pictures representing the six great epochs in human progress; collections of engravings; and galleries of curiosities.

Among the many elegant churches of Berlin are the Michaelskirche (Catholic), and the Protestant Dankeskirche, Heilige-kranskirche, Zionskirche, and Thomaskirche. The system of education is compulsory. Schools, public and private, are divided into kindergarten, elementary, middle, and higher. There are about thirty high schools, some of which have gymnasiums attached, while others are called *real-schulen*, in which Latin, higher mathematics, modern languages, sciences, and commercial pursuits are taught. The universities, normal schools, and academies culminate in the University of Berlin, one of the great seats of modern learning.

Among the noted thoroughfares of Berlin is Unter den Linden, reputed to be the most beautiful street in the world. It is adorned by magnificent structures its entire length of two-thirds of a mile. Many public places are beautified with costly monuments. The most noted is the one dedicated to Frederick the Great, opposite the emperor's palace, which was completed by Rauch in 1703, and is regarded the finest monument in Europe. Other noted monuments are those dedicated to Frederick William III., those commemorating the generals of the Seven Years' War and the generals who fought against Napoleon I., and a beautiful bronze Gothic monument erected by Frederick William III. to commemorate the victories of 1813-15. The monument built by Emperor William I., in the Königsplatz, to commemorate the triumphs of 1864, 1866, and 1870, rises to a height of 187 feet. These and others represent by statues and busts the celebrated

German promoters of literature, science, and political and military life. There are zoölogical and botanical gardens remarkable for extensive and beautiful collections of animal and plant growth. The city has 750 public buildings, including the Royal Palace, the Reichstags Building, and the Brandenburg Gate.

The interior of the city is devoted almost exclusively to commerce, while the residence portion is distributed around the outside. Railroads, electric street railways, extensive canals, and tramways are accessible in all parts of the city, and make it at once a notable center of modern convenience and business activity. The electric lights, gas system, telephones, and tramways are owned, controlled, and operated under the government of the city. The sewer system

of Berlin is not only complete and serviceable, but is counted one of the most practical in the world. All the refuse matter is carried to a central point, from which it is pumped by means of great tunnels to outlying districts and used for fertilizing the soil. This condition makes it possible to utilize the refuse animal and vegetable matter of the city for the purpose of increasing the production of vast areas of tillable land, a result that should be obtained in all cities. Manufactures and trades are conducted on a large scale. The production of ladies' mantles alone is over twenty-five million dollars annually, while sewing machines, clothing, machinery, hardware, jewelry, musical instruments, and other productions are of equal proportions.

The government of the city is under the direction of a mayor and thirty-four magistrates, who are elected without regard to politics. The council consists of 108 members, elected for six years, the term of one-third expiring every two years. Voters are divided into three classes; those who pay one-third of the whole city tax, those who pay taxes equal to two-thirds, and the remainder. Each of these classes has an equal representation on the council. Under this system the problem of city government has been successfully solved, and Berlin is not plagued with the usual corruption in government common to most large cities.

**BERLIN, Treaty of**, a treaty concluded at Berlin, Germany, July 13, 1878, by the Berlin Congress, made up of representatives from Turkey and the six great powers, at the conclusion of the war between Russia and Turkey. The six great powers are Russia, Germany, England, France, Italy, and Austria. It was called at the suggestion of Prince Bismarck. By its terms Greece was enlarged, Britain got Cyprus, Russia took Bessarabia, Austria received Bosnia and Herzegovina, Bulgaria was divided into Rumelia and Bulgaria proper, Persia and Russia got part of Armenia, and the independence of Servia, Rumania, and Montenegro was recognized.

**BERLIN, University of**, the great national university of Germany, and one of the largest and best equipped institutions of higher education in the world. It may be said to date from 1807, when Frederick William III. called a convention of the most noted German scholars to consider the establishment of an academy or university. The plan was supported by Wilhelm von Humboldt, a brother of Alexander von Humboldt, and he was made first minister of education in 1808 to cooperate with the ministry of the interior in securing support. The palace of Prince Henry and a stipulated annual

income were assigned to the foundation in 1809, from which year the present organization may be said to date. It has departments of medicine, theology, philosophy, including the arts and sciences, and jurisprudence, and with it are affiliated several institutions, such as museums, seminaries, and observatories. The minister of education has general control, and support is given by the state through endowments and appropriations. The library has 175,000 volumes, and students have access to the royal library, which has more than a million volumes and many ancient and modern manuscripts. Admission is granted to men of all nationalities and to women under certain restriction. About 400 professors and instructors have charge of the work, and the attendance approximates 12,000 students.

**BERMUDA** (bēr-mū'dà), or **Somers Islands**, a group of 360 islands in the Atlantic Ocean, about 675 miles southeast of New York. Only twenty islands of the group are inhabited and the total area is only twenty square miles. Their formation is largely of coral remains, and they are surrounded by living coral growths. The productions consist of vegetables, including onions, potatoes, and lily-bulbs, and some cereals. A public school system of fifty-five schools, with 1,790 students, is supported by government grants. The islands are a favorite summer resort for people from the United States and Canada, and furnish the New York markets a considerable supply of vegetable products. The value of exports aggregates \$600,000, while the imports are somewhat larger. They have a favorable, healthful, and pleasant climate, but the soil is sandy and not productive without fertilizing. These islands are divided into nine parishes that are represented in an assembly and council, and are under the direction of a governor appointed by Great Britain, to which country they belong. They were first discovered by Juan Bermudez, a Spaniard, in 1522, and rediscovered by Sir George Somers in 1609. A cable line connects the group with Halifax, Nova Scotia. Hamilton, the chief town, has a population of 2,246. The total population, in 1905, was 17,860.

**BERMUDA GRASS**, a kind of grass thought to be native to India, but now cultivated extensively for fodder. It grows in height from one to two feet, depending upon the quality of the soil, and roots at the joints. In many regions it is esteemed as a lawn grass, since it is hardy and remains green until late in autumn. It does not endure in shade, but thrives in either dry or wet places, though it is killed by standing water.

**BERNARD DOG, Great Saint**, a variety of dog that derived its name from the hospice of Saint Bernard, where a number are kept for the purpose of assisting in the rescue of perishing travelers. The monks of the hospice are accompanied by these dogs when in search of travelers. They have long been trained to search for persons who might be lost in the mountain passes of the Alps, and are still used for that purpose. When sent in search of persons they carry a flask of wine or brandy about the neck for the relief of the travelers. These dogs have saved many lives in the regions of perpetual snow, not only in the Alps, but elsewhere.

**BERNARD, Great Saint**, a celebrated pass in the canton Valais, Switzerland, leading over the Alps between Switzerland and Italy. At the crest of the pass is the famous monastery of Saint Bernard, a mile and a half above the sea, the highest dwelling in Europe, first established in the year 962. The snow covers the pass nearly the entire year, and terrible storms often overtake the travelers. This pass has been a famous outlet across the Alps. The armies of Charlemagne, of Frederick Barbarossa, and of Napoleon crossed at this pass. The last mentioned took his army in 1800, including infantry, cavalry, and artillery, numbering about 30,000 men, safely into Italy. It is thought that Hannibal also crossed by the Great Saint Bernard.

**BERNE** (běrn), or **Bern**, the seat of government of a canton by the same name and the capital of the republic of Switzerland. It is located on the Aar River, on a beautiful promontory, and is the center of numerous railroads and extensive commercial enterprises. It is one of the pleasantest cities of Europe, built largely of freestone, and walks and trees extend along both sides of the streets. The public buildings include the Gothic Cathedral, built in the latter part of the 15th century, the Federal Building, the Church of the Holy Spirit, the university, the townhouse, the public mint, and the theater. It has a city library of 100,000 volumes and the finely constructed Swiss National Library. Other institutions include the public museum, the armory, and many academies and hospitals. All modern municipal conveniences have been provided. Canals wind through the streets from the Aar River, and numerous fountains and monuments adorn its public places. The manufactures include gunpowder, leather goods, dress fabrics, firearms, paper, musical instruments, and other products, although it is not a great manufacturing center. The city was founded

by Berthold V. in 1191. It became a free city in 1218, and in 1353 united with the Swiss Confederacy. The spoken language is German and the people are mostly Protestants, only a small per cent. being Catholics and Jews. Population, 1907, 73,185.

**BERRY** (běr'ry), a small, fleshy and juicy fruit which does not open when ripe. It contains a pulpy mass in which the seeds are immersed. Some varieties are one-celled, but others contain compartments united at the axis, and from the axis to the rind. Good examples are gooseberries, currants, grapes, and belladonna. The term is applied to strawberries, which bear seeds on a pulpy receptacle.

**BERYL** (běr'il), a mineral found in many parts of Canada, the United States, and other countries. It crystallizes in six-sided prisms, and ranges as colorless, blue, green, or yellow, though always quite pale. Those of a sea-green or clear yellow color are preferred as gems, and the rich green kinds are emeralds. Jewelers call the finer grades *acqua marine*. Brazil furnishes the best grade of beryls, but choice varieties occur in Ceylon, the Urals, and in the Rocky Mountains, especially in Colorado.

**BESANÇON** (be-zōn-sōn'), a city of France, located on the Doubs River, and capital of the department of Doubs. It is considered one of the strongest cities of France, owing to its citadel, which is located on an elevated rock 410 feet high. The chief buildings include the cathedral, the museum, the public library, a college, and the prefecture. In the time of the Caesars it was known as Vesontio and was occupied by the Romans a long term of years. It has many structures dating from the Romans, including a triumphal arch built by Marcus Aurelius. The Burgundians held it in the 5th century, and the Germans in the 12th. In 1679 it was ceded to France. The city now is a railroad and manufacturing center. Its products include cotton, woolen, and silk goods, machinery, ironware, and watches. The latter industry employs over 3,400 hands. It is the birthplace of Abel Rémusat and Victor Hugo. Population, 1906, 56,168.

**BESSARABIA** (běs-sā-rā'bī-à), a province of Russia, bordering on Rumania and the Black Sea. The surface is level except in the northwest, where timbered ranges of the Carpathian Mountains attain to considerable elevations. Much of the soil is fertile and in a state of good cultivation, and all classes of live stock and cereals common to Europe are grown profitably. The inhabitants are made up of different races and include Bulgarians, Russians, Poles, Jews, and Tartars. Turkey

governed the region from 1503 until 1812, when it was ceded to Russia by the Peace of Bucharest. The Treaty of Paris gave the south-eastern part to Turkey in 1856, but it was restored to Russia in 1878 by the Treaty of Berlin. Kishinev, the capital, has been the scene of many massacres of Jews. The area is 17,600 square miles and the population 1,933,500.

**BESSEMER** (bēs'ē-mēr), a city of Jefferson County, Alabama, fifteen miles southwest of Birmingham, on the Southern, the Louisville and Nashville, and other railroads. It is noted as the center of an iron producing region, and is the seat of extensive rolling mills and blast furnaces. The manufactures include tobacco, machinery, clothing, and brick. It has a large trade in cereals and merchandise. The city is improved by waterworks, sewerage, and excellent school and church buildings. Population, 1910, 10,864.

**BETEL** (bē't'l), or **Betle**, the name of a narcotic stimulant derived from a certain species of pepper. In the market it is known as betel pepper or as betel nut, depending upon the form in which it is sold. The betel nut used as a stimulant in Asia is made by slicing the nut of *areca palm*, flavoring with a little quicklime, and wrapping it with the leaf of the betel pepper. It has aromatic and astringent properties, colors the teeth black and the tongue and lips scarlet, and is bitter and unpleasant to a person not in the habit of using it. Both male and female, young and old, chew it habitually. A supply is carried in small cases, and people offer it to each other as snuff or cigars are offered by Europeans. The plant, of which there are several species, is cultivated extensively. The fruit of the areca palm is about the size of a cherry and is grown for the market in Ceylon and Southern Asia.

**BETHANY** (bēth'ā-nī), a village about two miles east of Jerusalem, Palestine, containing at present about 200 inhabitants. It was the home of Mary, Martha, and Lazarus, where Christ often visited and worked numerous of his greatest miracles. Near this place Christ's ascension took place. Travelers are shown a cave near Bethany in which Lazarus was buried and the site of his home.

**BETHESDA** (bē-thēz'dà), which implies "home of the stream," a pool near Saint Stephen's Gate and the Temple of Omar in Jerusalem. It is associated with the healing of the impotent man. The length of the pool is 460 feet; width, 130; depth, seventy-five feet. It is now called Birket Israel. See John v, 2-9.

**BETHLEHEM** (bēth'lē-hēm), a borough of Northampton County, Pennsylvania, about

fifty miles north of Philadelphia, on the Lehigh River. It is on the Lehigh Valley, the Central of New Jersey, and other railroads, and a bridge across the Lehigh River connects it with South Bethlehem, the seat of Lehigh University and the Bethlehem Ironworks. The chief buildings include the public library, the Church of the Nativity, and Saint Luke's Hospital. It has manufactures of silk textiles, graphite products, brass and iron implements, machinery, flour, and cigars. A system of theological institutions is supported by the Moravians, in one of which General Lafayette was nursed after being wounded at the Battle of Brandywine. Bethlehem was founded by the Moravians in 1742 and was chartered in 1851. Population, 1900, 7,293.

**BETHLEHEM**, "the house of bread," a small town six miles south of Jerusalem, in Palestine, the birthplace of Christ. It contains the Convent of the Nativity, built by Empress Helena in 327 A. D., destroyed in 1236 by Moslems, and restored by the Crusaders. It is in charge of Armenian, Greek, and Latin Christians. Under a richly adorned grotto are crystal and silver lamps that mark the exact spot where Christ was born. The manger in which he was laid is one of the central attractions. An elaborate inscription in Latin contains the information, "Here Jesus Christ was born of the Virgin Mary." The town has three convents for Greeks, Armenians, and Roman Catholics. The inhabitants engage largely in trades and the manufacture of crucifixes and rosaries to sell to pilgrims. Population, 7,885.

**BETHSAIDA** (bēth-sā'ī-dà), the "house of the fish," the name of two villages on the Sea of Galilee, one of which still remains. These villages were on the western and northern shores of the lake. The former was the birthplace of three of Christ's disciples, Peter, Philip, and Andrew; the latter was the scene of the feeding of five thousand by Christ.

**BEVERLY** (bēv'er-ly), a city of Essex County, Massachusetts, on a bay of the Atlantic, eighteen miles northeast of Boston. It is on the Boston and Maine Railroad and is connected with Salem by a bridge which spans the bay. It has a good harbor, extensive leather and shoe factories, and grain elevators, and has modern municipal facilities, including gas and electric lights, pavements, and street railways. The public library contains 12,000 volumes. It is the seat of the New England Institute for the Deaf and Dumb. The region was settled in 1630 and the city was chartered in 1894. Population, 1905, 15,222.

**BEYROUT** (bā'rōōt), or **Beirut**, formerly called Berytus, the chief seaport of Syria, sixty miles northwest of Damascus. It is of commercial importance, being visited by steamers of the regular service from French, German, British, and Egyptian ports. Its exports consist largely of tobacco, wool, olive oil, cereals, and gums. The chief manufactures include cotton and silk goods, jewelry, and clothing. Its commerce with foreign powers is tending to give it a modern appearance and many European facilities. It has a number of fine schools, churches, synagogues, and government buildings. It was an important city in the time of the Phoenicians. The Byzantine emperor, Theodosius II., greatly enlarged it, and its greatest importance was reached in the time of the Crusades. Subsequently it fell into the hands of the Druses, was bombarded by the British in 1840, and is now under Turkish dominion. Population, 1905, 118,890.

**BÉZIERS** (bā-zyā'), a city of France, in the department of Hérault, thirty-eight miles southwest of Montpellier. It is on the Orb River and the Canal du Midi, and has steam railroad and electric railway facilities. It is the seat of a fine Gothic cathedral, a college, and a public theater. Glass, silk textiles, leather goods, and machinery are among the manufactures. It was a fortified town in the time of the Romans, and the scene of a massacre of the Albigenses by Simon de Monfort, who killed about 20,000 of its citizens. Population, 1906, 52,268.

**BHUTAN** (bōō-tān'), or **Bhotan**, an independent state of India, located south of the Himalaya Mountains and west of Tibet. The surface is greatly diversified by mountain ranges, some of whose peaks have an altitude of 16,500 feet above the sea. Stock raising and agriculture are the chief industries, and the manufactures are confined largely to textiles, musk, and utensils. The people are a mixture of Aryan and Tibetan stock, and practice both polygamy and polyandry. Buddhism is the chief religion. The government is administered by two rulers, one a secular and the other a spiritual official. Dosen, or Punakha, is the capital. Great Britain annexed a part of the territory of Bhutan in 1865. Population, about 200,000.

**BIAFRA** (bē-ā'frā), **Bight of**, an inlet on the Atlantic coast of Africa, the eastern part of the Gulf of Guinea. It lies between Cape Lopez and Cape Formosa, and borders French Congo and the German possession of Kamerun. Prince's Island and the islands of Saint Thomas and Fernando Po are near or in the bight.

**BIBLE** (bī-b'l), the book held by Christians

to contain the word of God and regarded as infallibly true. The word *Bible* is derived from mediaeval Latin, in the singular number, and means a book. The Greek form of the word is plural and means books. As commonly used it signifies *the book*, in comparison with which other books or writings are unworthy; or, if they be called books, then the Bible becomes *the book of books*. The Latin words *scriptura*=writing, *scripturae*=writings, convey the idea that the Scriptures are the only writings worthy of being called writings; therefore, they stand higher than all other books. This use came from the Latin fathers and has met general acceptance by all Christian nations.

The Bible consists of two parts, the Old and the New Testament, meaning covenants between God and his people. It includes also the *Apocrypha*, which is held to be canonical by some, and as good and useful for family reading by others. The Roman Catholics and several other Christian churches hold the Apocrypha canonical, but combine with it church traditions regarding faith and morals. Protestant churches do not accept more than the Old and New Testament as the canonical word of God. Jews accept only the Old Testament. The Jewish religion holds that a compact exists between God and the Jews, while the Christian religion holds that God has given the Bible as a compact between Himself and the human race.

The Greeks of Alexandria completed a translation of the Old Testament about 230 B. C., known as the *Septuagint*. This is the earliest and most famous version, and was adopted by the early Christian Church as well as by the Jews, and has always held an eminent place in Bible history and interpretation. There are other celebrated versions, known as the *Syriac version*, made in the 2d century B. C.; the *Coptic version*, in the 3d or 4th century A. D., and the *Gothic version*, in the 4th century. Both the Coptic and Gothic were made from the Septuagint. Jerome in the year 405 A. D. completed the most important Latin version, largely on the basis of the original Hebrew, which is known as the *Vulgate*. The first edition of the entire Hebrew Bible was published in 488 in Soncino. It was written on linen cloth, skins, or papyrus kept in rolls. The books of the New Testament were written in Greek, with the possible exception of Saint Matthew, which was, perhaps, originally written in Hebrew, but was early translated into the Greek. No other book has been so largely translated and generally read as the Bible. In

modern times it has been extensively circulated in all languages.

In 1382 the first English translation was made, known as the *Wyclif's Bible*, but the first printed version of the New Testament was Tyndale's, and in 1535 Miles Coverdale published the first complete English Bible. In the reign of Mary the English refugees at Geneva published the *Great Bible* through the efforts of Lord Cromwell, and later several other editions were issued. In 1611 the authorized version of King James appeared, which is known as the *King James Bible*. It was instigated by Hugh Broughton, and undertaken after the Hampton Court Conference was suggested by King James I. Six companies, two at Cambridge, two at Oxford, and two at Westminster, consisting of forty-seven scholars, undertook the work, while at London a general committee revised the portion translated by each committee. The entire work was done in three years. Owing to the purity of style and the general accuracy with which the translation was made, it has superseded all other versions in the English. The version recognized by the Roman Catholic Church is a translation made from the Latin Vulgate; the New Testament translation was completed at Rheims in 1582, and the Old Testament at Douay in 1609-10.

In 1870 the convocation of Canterbury appointed a committee to investigate the necessity of making a new version in English. They reported favorably, and accordingly two companies were organized, one each for translating the Old and the New Testament. The company consisted of members of the convocation and other eminent scholars, and was aided by two similar companies organized in America to aid the British scholars. They published what is known as the Revised Version of the New Testament in 1881 and that of the Old Testament in 1884. Although some alterations were made and a number of points in accuracy, clearness, uniformity, and grammatical constructions were effected, the King James edition still occupies a larger field. The German translation holds equal rank with the English, and is the most famous for clearness and accuracy of the early translations into the modern languages. It was made by Martin Luther in 1534, and is generally accepted by German speaking people as the most accurate in that language.

The Jews divide the Old Testament into three divisions: the law, the prophets, and the sacred writings. *The Pentateuch*; as the five Books of Moses are usually called, contains the Jewish law, but of course includes also prophecy, history, and biography. The law

is included in three parts: the *Book of the Covenant*, followed by the Israelites till the reign of Joshua; *Deuteronomy*, from Joshua to the exile; and the *Priestly Code*, which became authoritative after the Restoration. The prophets were divided by their scholars into the Former and the Latter. The Former Prophets embrace the historical books containing much of interest regarding the Jewish nation and their statesmen. They begin with Joshua and include all of the Old Testament books up to the prophet Isaiah. The Latter Prophets include the portion from Isaiah to Malachi, with the first and last included. The sacred writings of the Old Testament embrace the history of the Jewish people, their praise of God in psalms, their lamentations, proverbs, and prophecies. The whole contains many promises that the people are to be delivered out of all earthly troubles, and attain perfect bliss by the advent of a Messiah. These prophecies are still held by the Jews to indicate the coming of a deliverer, to whose advent they still look with hopeful confidence, while to Christians the prophecies mean a promised delivery which has been effected by the birth of Christ.

The New Testament commences with the *Gospels*, four accounts of the life of Christ by his followers; the first by Matthew, the second by Mark, the third by Luke, and the fourth by John. Matthew and John were disciples of Christ, while Mark was a companion of Peter, and Luke a companion of Paul. The Gospels are followed by the *Acts of the Apostles*, which gives an account of the early church and its foundation. Later come the twenty-one letters of the apostles to the churches, and some to the apostles as they were engaged in the active work of organizing and spreading the gospel. The last Book of the New Testament is the *Revelation of Saint John*, commonly called the *Apocalypse*. The books of the New Testament usually appear in uniform order, while the order of the Old Testament depends largely upon its translation. In the Hebrew Bible the divisions are different from those of the English, which in this respect follows the Greek Septuagint and the Latin Vulgate. The Jewish division into the law, the prophets, and the psalms is quoted in Luke xxiv, 44, in these words, "that all things might be fulfilled that are written in the law, and in the prophets, and in the psalms." While the books are arranged differently, we give below the order in which they usually appear. The sixteen prophets, which belong to the Old Testament, are separated for convenience in reference:

## BOOKS OF THE OLD TESTAMENT.

Genesis,	II Kings,
Exodus,	I Chronicles,
Leviticus,	II Chronicles,
Numbers,	Ezra,
Deuteronomy,	Nehemiah.
Joshua,	Esther,
Judges,	Job,
Ruth,	Psalms,
I Samuel,	Proverbs,
II Samuel,	Ecclesiastes,
I Kings,	Song of Solomon.

## THE SIXTEEN PROPHETS.

Isaiah,	Jonah.
Jeremiah,	Micah,
Lamentations,	Nahum,
Ezekiel,	Habakkuk.
Daniel,	Zephaniah.
Hosea,	Haggai,
Joel,	Zachariah,
Amos,	Malachi.
Obadiah,	

## THE APOCRYPHA.

I Esdras,	Song of the Three Holy
II Esdras,	Children,
Tobit,	Susanna,
Judith,	Bel and the Dragon,
The Rest of Esther,	Manasses,
Wisdom of Solomon,	I Maccabees,
Ecclesiasticus,	II Maccabees.
Baruch,	

## BOOKS OF THE NEW TESTAMENT.

Matthew,	I Timothy,
Mark,	II Timothy,
Luke,	Titus,
John,	Philemon,
The Acts,	Hebrews,
Epistle to the Romans,	Epistle of James,
I Corinthians,	I Peter,
II Corinthians,	II Peter,
Galatians,	I John,
Ephesians,	II John,
Philippians,	III John,
Colossians,	Jude,
I Thessalonians,	Revelation.
II Thessalonians,	

No matter under what form of translation the various books appear, the contents of the Bible has for its object to give an account of the world as the creation of an Almighty Creator, always and everywhere present. It accounts both for the origin and government of mankind, and exhibits the relation of man to his Creator. While it teaches him how to live and die, it inspires him with thoughts of the most momentous proportions that can occupy the human mind. It is the aim of all sacred books, no matter of what religion, to explain the origin of all things and account for the relations of nature and humanity to something divine. The Bible is immeasurably superior to all other sacred books in that it leads to a conception, and unfolds to the soul the divine nature, of one personal God, who exercises a divine love and care for his creatures. On this quality ascribed to God by the Bible many rest their claim that it is divinely inspired by direct revelation from heaven.

The *Mazarin Bible* was the first book to be printed from movable type. It was issued by Gutenberg (q. v.) at Mainz, Germany, in 1450

and it is in the Latin. The name is from Cardinal Mazarin (d. 1661), in whose library the first copy to attract attention was found in 1760. A number of Bible curiosities, including some points of general interest, were ascertained by a convict who was sentenced to solitary confinement. Among them the following are the most noteworthy: The Bible contains 3,586,489 letters, 773,692 words, 31,173 verses, 1,189 chapters, and 66 books. The word *and* occurs 46,277 times; *Lord*, 1,855, and *reverend* but once, which is in the 9th verse of the 111th Psalm. The middle verse is the 8th verse of the 118th Psalm. In the 21st verse of the 7th chapter of Ezra are all the letters of the alphabet except *J*. The finest chapter to read is the 26th chapter of the Acts of the Apostles. The 19th chapter of II Kings and the 37th chapter of Isaiah are alike. It was found that the longest verse is the 9th verse of the 8th chapter of Esther, and the shortest is the 35th of the 11th chapter of Saint John. The 8th, 15th, 21st, and 31st verses of the 107th Psalm are alike. Each verse of the 136th Psalm ends alike. There are no words or names of more than six syllables.

**BIBLE DISTRIBUTION**, an enterprise having for its object the translation of the Bible into all spoken languages and its circulation for the dissemination of the Christian cause. The enterprise dates from the early part of the 19th century, but received its greatest impetus in 1820, up to which year 2,843,291 Bibles had been circulated. The circulation in the past four decades has averaged about thirty million copies each ten years. Since this work was begun the total circulation exceeds 185,000,000 copies. The languages into which the Bible has been translated have now reached 363. They are distributed as follows: the British Isles 6, Continental Europe 71, Asia 103, the Oceanic Islands 52, Africa 96, and America 35. There are no less than one hundred societies promulgating the spread of light and knowledge by means of the Bible through the world. No less than \$25,500,000 has been spent for this laudable purpose the past seventy-five years. The societies that have been most potent in this enterprise are the American Bible Society, the British and Foreign Bible Society, the Prussian Bible Society, and the Imperial Russian Bible Society. In 1829, 1856, 1866, and 1882 it was the aim of the American Society to place a Bible in every home in America not already supplied.

**BIBLIOGRAPHY** (bĭb-lĭ-ŏg'ŕà-fĭ), the science or knowledge of books, relating both to the external features and the value of their

contents. The subject is sometimes divided into *pure bibliography*, which relates to the external feature of books, and *applied bibliography*, which takes cognizance of their repute and degree of value. A classification of a list of works treating of some particular branch of knowledge is called a *bibliography*, such as a bibliography of electricity or one of political economy. Conrad von Gesner (1516-65), of Switzerland, prepared his "Bibliotheca Universalis," in which he published a very extensive list of books issued in the Hebrew, Greek and Latin languages. The work known as "The American Catalogue," published in New York City, contains a comprehensive list of authors and a title index of books published in the United States, supplemented with an annual issued from time to time. The "English Catalogue" contains a similar list of books or works published in Great Britain. A large number of German works of this kind have been issued, notably among which is Kayser's "Complete Book-Lexicon." Lorenz's "General Catalogue" is a very comprehensive French work. American works that should be mentioned in this connection are Baker's "Guide to the Best Fiction," Scribner's "Bibliographical Guide to American Literature," and Duyckinck's "Cyclopaedia of American Literature." Allibone's "Critical Dictionary of English Literature" contains a comprehensive list of both English and American books.

**BIBLIOMANIA** (bīb-lī-ō-mā'nī-à), the name used to describe the passion for acquiring or possessing books, especially those considered rare and of unusual value. Persons who make such collections regard rarity more important than utility and seek to acquire books issued from a certain press, of early and rare editions, or those in which the author personally signed his autograph. *Editions de luxe* were the first to be gathered, and later books issued by Caxton, Gutenberg, and other early printers came into great demand. The Mazarin Bible, with imprint of 1450, said to have belonged to Cardinal Mazarin, sold in 1804 for £3,950. Books in which certain faults or typographical errors were overlooked by noted authors sometimes bring high prices, and copies of "Decameron" of the first edition are especially valuable. The Grolier Club of New York City is a society of book lovers who reprint rare works for their own use.

**BICEPS** (bī'-sēps), the large muscle of the upper arm, which gives a full appearance to the front part of that limb. At the lower end it is attached to the radius by a tendon, and at the upper extremity to the scapula. The

action of the biceps is to bend the elbow. At the outer and posterior part of the thigh is another biceps. The muscle back of the arm, which works in unison with the biceps, is called triceps.

**BICYCLE** (bī'-sī-k'l), a two-wheeled machine for riding by pressing the feet on pedals. The modern safety bicycle has been brought to a high state of perfection and has assumed an important place as a means of locomotion. It not only serves for pleasure and for convenience in travel, but is utilized in war by the equipment of soldiery for military service. In many countries large bodies of armed men are drilled and equipped to use the bicycle as a means of transportation and for service in the intelligence department. It is a popular machine for long trips into the interior of continents, or for the

1. SAFETY BICYCLE. 2 AND 3. HIGH-WHEELED BICYCLES.

purpose of crossing large bodies of land for exploration and newspaper reporting.

The first bicycle was introduced into England in 1818. It consisted of a two-wheeled contrivance with a seat affixed to a wooden beam, on which the rider sat astraddle, and by kicking the ground facilitated moving forward. This finally led to the conclusion that two-wheeled machines could be made in such a manner that the rider would not need to depend upon his feet for aid in keeping it in an erect position. In 1869 a bicycle was manufactured in Europe known as the *bone-shaker*, which consisted of a wood and iron frame, and later rubber tires and steel frames were added. The bicycles made in 1880 weighed about fifty pounds and were high-wheeled machines with rubber tires.

The manufacture of high-grade bicycles dates from about 1895, when machines having a weight of twenty pounds were introduced. This pattern is now in general use. It is provided with pneumatic tires, tubular steel frames, ball bearings, and endless chains, and some patterns have chainless appliances. The pneumatic tire is made of several thicknesses of canvas enforced by vulcanized rubber, and contains an endless air-tight rubber tube. It is held to a steel or wooden rim. By means of ball bearings

friction is greatly reduced, and tubular frames aid in the reduction of weight. The modern *safety bicycle* is a popular invention and serves a variety of useful purposes. The most recent improvement is the addition of an electric storage battery, or a gas engine, by which the rider is aided in the use of the machine. The difficulty of riding against a strong current of wind or up grades is thus overcome, and facilities are provided to enable making greater speed at less exertion of the body. This machine in its various forms is popular and has displaced the use of the horse to a certain extent as a business conveyance. It is called a *motor bicycle*.

**BIDDEFORD** (bĭd'dĕ-fĕrd), a city of York County, Maine, on the Saco River, fifteen miles southwest of Portland. It is on the Boston and Maine Railroad. The city has excellent street railway service, fine schools, gas and electric lighting, and other modern conveniences. Its public high school is one of the finest in the State. The granite in its vicinity is inexhaustible in quantity and superb in quality. The city is surrounded by an agricultural country and has extensive factories and a large commerce. It was settled in 1630, incorporated in 1718, and became a city in 1855. Population, 1900, 16,145.

**BIELA'S COMET** (bĕ'là), a comet discovered in 1772, again in 1805, and again in 1826, the last time by an Austrian officer named Wilhelm von Biela (1782-1856), from whom it was named. He calculated its orbit, and showed that the period was six and one-half years. It appeared in 1832, 1839, 1846, and 1852, but since then has not been observed. At its appearance in 1846 it was split into two parts, which phenomenon was also observed six years later. It is thought that the meteoric showers in 1885, 1892, and 1899 were due to the earth passing through the orbit of the lost body.

**BIGAMY** (big'á-mĭ), the offense of marrying while the first wife is still living, or while the first husband is still alive, without first obtaining a divorce. It is defined in the criminal law as a statutory offense and is punishable by fine and imprisonment, or both.

**BIG BETHEL** (bĕth'el), a village of Virginia, between the James and York rivers, ten miles northwest of Fortress Monroe. It was the scene of an engagement in the Civil War, on June 10, 1861, when Gen. B. F. Butler with 2,500 Federals made an attack upon 1,800 Confederates under Gen. F. W. Pierce. Several attempts were made by the Federals to carry the works by assault, but the attacks were repulsed, and the Confederates retired during the night.

**BIG BLACK RIVER**, a tributary of the Mississippi, rises in Choctaw County, Mississippi. It is about two hundred miles in length, fifty miles of which are navigable. In 1863 General Grant operated on the banks of this river and carried the works of the Confederates under General Pemberton May 17, and compelled the remaining forces to retreat to Vicksburg.

**BIG HORN**. See **Rocky Mountain Goat**.

**BIG HORN RIVER**, a tributary of the Yellowstone, which rises in the northwestern part of Wyoming, in the Wind River Range. In its upper course it flows toward the southeast, which part is known as the Wind River, then north through the Big Horn Mountains in Montana, and joins the Yellowstone near Big Horn, Mont. The scenery in the upper part of its course is grand. Its length is about 380 miles.

**BIGNONIA** (big-nō'nĭ-à), a genus of flowering shrubs, so named from the Abbé Bignon. About 100 species have been described, most of which are native to South America. Many are twining shrubs with tendrils and are cultivated extensively in gardens. The *trumpet flower* is a well-known species.

**BIG RAPIDS**, a city in Michigan, county seat of Mecosta County, fifty-five miles north of Grand Rapids, on the Peré Marquette and the Grand Rapids and Indiana railroads. It is on the Muskegon River, which is crossed by a number of bridges, and is surrounded by a fertile region. The chief buildings include a public library and a courthouse, and it is the seat of the Ferris Institute. The chief manufactures are furniture, hardware, and machinery. Big Rapids was settled in 1859 and was incorporated ten years later. Population, 1905, 4,852.

**BIG SANDY**, a tributary of the Ohio River, formed at Louisa, Ky., by the junction of the Tug Fork and West Fork. The West Fork has its source in the southwestern part of Virginia and flows through Kentucky, and the Tug Fork rises in West Virginia. The latter and the Big Sandy form a part of the boundary between Kentucky and West Virginia. The Big Sandy is navigable its entire course of eighteen miles, from Louisa to the Ohio River, and the West Fork is navigable for eighty miles.

**BILE** (bĭl), the fluid separated from the blood of the portal vein by the cells of the liver, where it is collected by the biliary ducts. These unite to form larger ones and finally merge into the right and left hepatic ducts, which unite to form the common hepatic duct. The last mentioned unites with the cystic duct to form the common bile-duct, which opens on

the mucous surface of the second part of the duodenum. Bile is secreted continuously, though most rapidly an hour after eating, and a supply is retained in the gall bladder, whence it flows continuously. It is of a golden-red color, and bitter taste, and is somewhat viscid. In the process of digestion, it serves to aid more or less, especially in reducing the fatty substances and stimulating the peristaltic motion of the intestines, and in disenfecting the contents of the large intestine. The amount secreted daily is from twenty to fifty ounces. Gall stones result from solidification of the bile, and biliousness is caused when bile is not secreted in due quantity.

**BILL**, in legislature, a form of statute proposed for passage in either branch of the legislative department, which, after passing both houses and receiving the executive's signature, becomes a law. In the United States and most countries a bill for raising revenue must originate in the Lower House, but amendments may be proposed and made in the Senate.

**BILL**, the statement of an account for goods sold, services rendered, or work done, either written or printed. It may state the amount claimed by the creditor in gross or by items. When the term is used to describe a legal or commercial document, it is associated with some other word or words that define its application. The principal kinds of bills are defined in the following list:

**BILL OF ATTAINDER**, a legislative enactment to punish the person or persons guilty of treason or felony, involving the loss of all personal and real property and the infliction of cruel and unusual punishments. A person attainted cannot sue or testify in any court, or claim any civil rights or legal protection, and cannot receive or transmit any property by inheritance. Great Britain abolished bills of attainder in 1870, and the Constitution of the United States prohibits the passage of such a bill.

**BILL OF COSTS**, an itemized list of the costs of an action at law. It is filed by the successful party and is subject to the approval of the clerk or some similar officer, and the amount verified is added to the judgment.

**BILL OF EXCHANGE**, a written order signed by the person issuing it, in which another is directed to pay a third party a specified sum of money and charge it to the account of the first. The person issuing it is the drawer; the one receiving it, the payee; and the one to pay it, the drawee, and frequently triplicates are written, one for each of the three parties interested. A foreign bill of exchange is

drawn in one state or country and payable in another, and a domestic bill is drawn and payable within a State. Bills of exchange are commonly called drafts, and the largest volume of business in all commercial centers is transacted in drafts and personal checks.

**BILL OF EXCEPTION**, in law, a statement of objections made by an attorney in the course of a trial to the ruling of a judge. The objections are made for the purpose of putting the points decided on record so they may be reviewed by the full bench or by a higher court to which an appeal may be taken, and if the exceptions are well founded the case is reversed or remanded for new trial.

**BILL OF INDICTMENT**, a written document presented to a grand jury, accusing one or more persons of having committed a felony or high crime. If the grand jurors consider the evidence sufficient to support the accusation, they indorse it *A true bill*, but if the evidence is insufficient it is marked *Not a true bill*.

**BILL OF HEALTH**, a certificate issued by a consul or other proper officer to the master of a ship clearing out of a port in which contagious diseases are epidemic, or are suspected to be, certifying to the state of health of the crew and passengers on board.

**BILL OF LADING**, a memorandum of goods shipped by vessel bearing the signature of the master of the vessel, who acknowledges the receipt of the goods and agrees to transfer them in good condition to the point of destination, natural damages excepted. The term is applied in the same manner to bills covering shipments made by railroads, but they are frequently called waybills or freight receipts.

**BILL OF RIGHTS**, in government, a summary of the fundamental rights and privileges claimed by the people. The principles of political liberty in Great Britain are defined in the *Bill of Rights* adopted by Parliament in 1689, after the Prince and Princess of Orange became king and queen, and it is one of the three great documents of that country. The first twelve amendments to the United States Constitution are referred to by the same name, since they set forth specifically certain inalienable rights of the people. After the revolution in France, in 1789, a number of bills of rights were enacted by the conventions.

**BILL OF SALE**, a formal statement issued as evidence of the sale of personal property. Such an instrument is necessary when the property sold does not pass into the possession of the purchaser, but remains in the custody of the party who sold it. To make such a bill valid in some states or countries, against the claim

of a third party, it is necessary to have it recorded in the public records of the town or county. A bill is frequently given to a creditor as security for borrowed money or as surety that an account will be paid.

**BILLIARDS** (bĭl'yĕrdz), an indoor game played with ivory or paste balls on a rectangular table. The balls are driven by a cue made of an ash rod or stick against each other or into pockets. The game is one of the most popular and extensively played of all indoor games. Rules and regulations guide the player in the manner of driving the balls and in the number of points to be made. Among the games played are the *five-pin pool*, *fifteen-ball pool*, *Chicago pool*, *bottle pool*, *Parisian pool*, and many others variously designated. The origin of the play dates far back in history. Contests for the world's championship are frequent.

The table used in playing billiards is covered with cloth, has raised, cushioned edges, and its dimensions are about six by twelve feet. The cue is a straight, round staff of wood from four to eight feet in length, tapering from the butt to the tip, and tipped at the point with a thin leather, which is chalked to cause it to take hold of the smooth and polished surface of the balls. The balls are usually of ivory, measure two and one-sixteenth inches in diameter, and are differently colored. A popular game is played with three balls, one red and two white, and one of the white balls has a spot to distinguish it from the others. At the beginning of the game the red ball is placed upon the top of the table, at a point about twelve inches from the top cushion and in the center width of the table, and the other two balls are placed at different points at the opposite end of the table. The game is won or lost according to the ability of the players to strike their own ball against that of the adversary or the red ball so either may be driven into the pockets, or to strike both balls with that of the player. In America the game is played very generally with three balls on tables not provided with pockets, and the object of the player is to effect a *cannon*, that is to drive his own ball so it will strike the red ball and that of his adversary.

**BILLINGS** (bĭl'lingz), a city in Montana, county seat of Yellowstone County, 240 miles southeast of Helena, on the Northern Pacific and the Chicago, Burlington and Quincy railroads. It is nicely situated on the Yellowstone River, which furnishes an abundance of water for irrigation. The surrounding country is well adapted to stock raising. As an

inland market for wool it takes high rank, and much live stock is shipped to domestic and foreign points. Coal is mined in the vicinity, and marble and limestone quarries are worked profitably. A public library, a city hall, an opera house, a courthouse, and numerous schools and churches are among the public buildings. It has a growing trade in merchandise. Population, 1900, 3,221.

**BILLINGSGATE** (bĭl'lingz-gāt), a wharf and fish market in London, England, located near the London bridge, on the Thames. This market was established in 1699, and has continued to be free and open for the sale of all kinds of fish. The term *billingsgate* originated from this market, due to the coarse or abusive language heard there in former times.

**BILOXI** (bĭ-lōks'ĭ), a city of Mississippi, in Harrison County, on the Gulf of Mexico, and on the Louisville and Nashville Railroad. It has a well improved harbor and is the seat of several schools and a convent. It carries a large trade in fruit, vegetables, oysters, and merchandise. The canning industry is a growing enterprise, and large quantities of canned goods, such as oysters, crabs, fruit, and vegetables, are exported. Shipyards and machine shops are growing enterprises. The first settlement in its vicinity was made across Biloxi Bay, on which the city is located, by a company of French under Iberville and his brother, Jean Bienville (q. v.), in 1699, and named from the Biloxi Indians. Its growth is due to its convenient location as a trade center, and as a popular winter resort. Population, 1900, 5,467.

**BIMETALLISM** (bĭ-mĕt'al-lĭz'm), the doctrine that both gold and silver should be adopted at the same time, in the same country, as standard money, and bear to each other a fixed ratio established and recognized by the government. It is opposed to monometallism, which is the doctrine of a single monetary standard. The two doctrines have caused political dissension in all civilized countries. The contention reached the culminating point in the United States in 1896, although much discussion was given to this phase of the money question from the early organization of the government. Bimetallists contend that the coinage of gold and silver should be alike free and unlimited, that the coined metals should bear to each other a fixed value, which, when so fixed, will be maintained by reason of the law and commercial necessity; both metals should be equally standard money, full legal tender for all debts private and public, and should be the basis of the entire monetary sys-

tem. The parity of both gold and silver has been disturbed by various causes, such as the adoption of the single gold standard in some countries, whereby the demand for gold was correspondingly increased; the discovery of large quantities of gold and silver, whereby the relative quantity of the world was varied; and the demonetization of silver in a number of countries, whereby the use of silver was materially limited.

The proper ratio of the coinage is generally held to be about sixteen to one by the advocates of bimetallism, for the reason that the production of silver in the world has been in weight about sixteen times that of the production of gold. However, other ratios are advocated and have been maintained. The *battle of the standards*, as the conflict between the two doctrines is called, owes its origin largely to the discovery of vast gold fields in California in 1849 and in Australia in 1851. The relative values of gold and silver from 1600 B. C. to the beginning of the Christian era stood about as one to twelve to each other, never falling below one to nine and never exceeding one to fourteen. From the Christian era to 1640 A. D. the ratio of the market value of gold and silver stood from one to ten to one to fifteen, while from 1640 to 1872 it stood uniformly from one to fourteen to one to sixteen. A legal ratio of one to fifteen and one-half was long maintained by a number of European governments. The greatest variations in ratio have occurred since 1872. The partial demonetization of silver in the United States in 1873 caused the ratio to be about one to twenty-three, and with the act of 1878, which partly restored silver, the ratio stood at one to seventeen. Since that time, owing to legislation and the discovery of vast quantities of gold in South Africa and the northwestern part of North America, the value of silver has fallen until it has reached about one to forty. See **Money**.

**BINDING TWINE**, an article of commerce which attained its greatest utility with the general use of the self-binding harvester. The best quality is made of Manila hemp produced in the East Indies, particularly that secured of the banana palm, which abounds in the Philippine Islands. Other hemp of use in its manufacture grows in Yucatan and Southern Mexico. The sisal twine is secured from the American aloes. The binding twine sold on the market is wound into balls of 650 feet each, so wrapped that they unwind from the inside.

**BINGEN** (bĭng'en), a city in the grand duchy of Hesse, Germany, on the Rhine, 20

miles west of Mainz. It is surrounded by a fertile country which produces a superior quality of grapes and cereals. The manufactures include wine, leather, woolen goods, and clothing. It has a number of fine public buildings and a growing trade. The Mäuse-thurm Tower rises from the middle of the Rhine, a little below the city. It was erected about the 10th century by Willigis, Archbishop of Mainz. It is celebrated on account of the legend that Bishop Hatto was eaten by rats, which were attracted to the tower by large quantities of grain stored by him during a famine. In legendry it is recited that the treasures of King Nibelung were sunk in the Rhine near Bingen, from which the name was given to the Nibelungenlied. The place is also famous for the popular school song, "Bingen on the Rhine." Population, 1905, 9,878.

**BINGHAMTON** (bĭng'am-tŭn), county seat of Broome County, New York, on the north branch of the Susquehanna River. It is on the Delaware and Hudson, the Lackawanna, and other railroads, and occupies a fine site overlooking the Susquehanna and Chenango rivers, which unite in the city. Bennett Park and Ross Park are fine public grounds. It has a modern courthouse, post office, high schools, opera house, and city hall. It is the seat of the New York State Asylum for Inebriates, Binghamton Academy, Susquehanna Valley Home, and Saint Mary's Home for Indigent Children. The manufactures include machinery, clothing, furniture, cigars, shoes, and farming implements. The city has electric street railways, waterworks, gas and electric lighting, and fine public schools. It was founded in 1787 by William Bingham, incorporated in 1818, and made a city in 1867. Population, 1910, 48,443.

**BINOMIAL** (bĭ-nō'mĭ-al), in algebra, an expression that consists of two terms, such as  $a+b$  or  $7-3$ ; a *trinomial* consists of three terms, as  $a+b+x$ , or  $5+3-2$ . An algebraic expression consisting of three or more terms is called a *polynomial*. Sir Isaac Newton was the first to employ the binomial theorem, using it to raise a binomial to any power or extracting any root of it by approximating series. The discovery is engraved on his tomb.

**BIOBIO** (bē-ō-bē'ō), the largest river in Chile, rises in the Andes, and after a course of 200 miles discharges into the Pacific near the city of Concepcion. At its mouth it is about two miles wide.

**BIOGRAPHY** (bĭ-ōg'rā-fy), the department of literature which treats of the lives of individuals. When written by the subject himself, it is called *autobiography*. Biography dif-

fers in its mode of treatment in that it assumes the form of descriptive criticism, or approaches the sphere of history or philosophy. Modern biography includes numerous criticisms and elucidations, and differs from the classic in that it is more acute, expansive, and lively. Modern biographies are very numerous, and many of them possess remarkable literary charms, partake of the eminent character of their subject, and throw a light of interest about men and the events of their times. Among the early biographies are Plutarch's "Parallel Lives," written in the 1st century after Christ; Nepos' "Lives of Military Commanders," and Suetonius' "Lives of the Twelve Caesars." Biographical literature of modern times originated in the 17th century, since which time it has multiplied extensively and entered largely into the popular writings. In 1671 the publication of biographical dictionaries was inaugurated by Moreri, who published "Dictionnaire Historique et Critique." In the last century numerous publications of merit were completed and extensively circulated. Many of them contain encyclopaedic treatises and constitute practically universal biographies. Dr. Johnson thought every man best fitted to write his own life, and yet the best biography ever written is, perhaps, that of Dr. Johnson, as written by Boswell.

**BIOLOGY** (bī-ōl'ō-jy), the science that embraces all phenomena of life. It includes the scientific inquiries into the first origin of life and its various changes from the earliest period until now. Some of the phenomena of life, including psychology, the study of the human soul, and sociology, the study pertaining to man in society, are often grouped apart, but these and all phenomena of life properly belong to biology. Biology was not recognized as an important science until the latter half of the 18th century, nor was it thought possible until comparatively recent times to deduce laws which would equally pertain to all forms and manifestations of vegetable life. By means of a general tendency to inductive reasoning and the work of some scholars, as Cuvier, Lamarck, Darwin, Kant, von Baer, and numerous others, it has become possible to define all life with one definition, and classify its laws uniformly, no matter in what shape or function we find it.

All living matter has three distinctive properties. The first of these is its *chemical composition*, which invariably contains one or more forms of a complex compound of oxygen, hydrogen, nitrogen, and carbon, called the *protein* and found only as a product of living bodies. The protein is united with a large pro-

portion of water and forms a kind of fluid called *protoplasm*. The next distinctive property is the *universal waste* by being oxidized, and its conjoined restoration to a whole state by the infusion of new matter. Life is always attended by the decomposition of molecules of protoplasm. The waste products consist largely of carbonic acid, while the other elements of protein enter into the composition of protoplasm. The new matter is supplied by some other living being, or contains elements of protoplasm which go to build up the living matter. The addition unites with the existing molecules of the living mass by *interposition*. While in the stage of infancy the reconstruction exceeds the waste, the two are balanced at a period of complete development, and later the waste exceeds the reconstruction. When reconstruction exceeds the waste, the living mass grows, but when waste exceeds it, it begins to decline and death eventually results. The third distinctive property is that all living matter tends to undergo *recurring changes*, or life proceeds from *preëxisting life*; in animals the new life is born from eggs, while in plants, from seeds. Varied forms propagate themselves by offshoots, which, like their predecessors, after a time cease to live and resolve into oxidated elements. New forms in life invariably partake of the characteristics of the forms from which they originated, although by a process of propagation changes to a higher or lower state may be effected.

All living matter depends upon a supply of heat and moisture, which dependence varies in kind with its organization and structure. Life forms cannot exist unless surrounded by a temperature suitable to their growth and development. Movement, nutritive growth, and reproduction are possible only within certain limits of temperature, which, when excessively raised or lowered, cause death. The minimum limit of temperature that living matter can bear is greatly variable, depending upon the nature of the life. Pasteur found that the spores of fungi, when dry, could be exposed to a temperature of 250° Fahr., while when moistened they were killed at 112°. Bacteria lose life at 14° above zero, while experiments with other forms of life show that the power to resist cold is very various. On the other hand, the maximum limit of heat at which living matter can exist is equally variable; some forms of marine life are able to withstand a temperature of only 95°. The simpler forms of vegetable organisms lose life at a temperature of 140°. However, there are thermal springs with a temperature of 168° to 208° in which living

plants are found. Scientists ascribe their ability to withstand this high temperature to habit, this having been formed by slow degrees through long periods of time. Life does not always cease with destruction of form, but often becomes extinct only with coagulation of certain substances in the protoplasm.

Numerous forms of life are invisible to the naked eye, in many of which the most powerful microscope does not reveal the vital parts. The living forms that are found to contain different parts, with distinct functions, when examined by the microscope, are said to be organized living bodies. However, life extends beyond organized forms. Besides, there are bodies of considerable size that manifest such a peculiar structure that it is difficult to determine whether they are plants or animals. The most important distinction among animals is in the food partaken. Animals feed upon plants and other animals, and breathe in oxygen; while plants take in food from the earth and the air by means of their roots and leaves. The divisions of biology are *morphology*, *distribution*, *physiology*, and *aetiology*. The first relates to the anatomy and history, the second to geography and geology, the third to organic functions, and the last to the causes and origin of life. The study of plant life is called *botany*; of animal life, *zoölogy*.

**BIRCH** (bĕrch), a genus of trees found in the colder regions of America and Eurasia, including no less than 25 species. In the temperate climates they attain a height of seventy feet, while in cold climates, as in Greenland, they dwindle down to a mere bush, known as the *dwarf birch*. The wood is tough, firm, and light in color; the bark is smooth, shining, and whitish or a chalky white. It is one of the most useful of woods. The bark is used by savages in building huts and canoes, and by civilized people for tanning and in the production of valuable oil. Birch wood enters into the manufacture of furniture, wooden shoes, barrels, and water wheels, and is used for construction purposes. It is found farther north in North America than any other tree, and is the only tree in Greenland. For this reason it serves a valuable purpose as fuel in the cold regions inhabited by the Laplanders and Eskimos. The *white birch* and the *yellow birch* are familiar trees in many parts of Canada and the United States.

**BIRD OF PARADISE** (pâr'â-dĭs), a bird of beautiful plumage allied to the crows, found chiefly in New Guinea and the adjacent islands. The family includes a number of species, some of which are remarkable for beauty in color and

plumage. The *king bird of paradise* has a magnificent plume of feathers, which comes up from under the wings and branches over the back. It is the most beautiful bird of this family and is quite rare. Other species include the *red bird of paradise*, the *golden bird of paradise*, and the *emerald bird of paradise*. Most of these birds are small; the largest species attain a length of about two feet. The plume is found only in the male, whose feathers form an article of commerce. It is used for ornamentation and for trimming hats. The plumage is so rich and varied that in this respect these birds excel all others, even the

KING BIRD OF PARADISE.

humming birds. Knowledge of these birds dates from 1857, when A. R. Wallace discovered them while on a voyage to Australasia.

**BIRDS**, the second class of the subkingdom of vertebrate animals, which stands between the mammals above and the reptiles below. They agree with the mammals in being warm-blooded and with the reptiles, amphibia, and fishes in being oviparous, that is, their young are born from eggs, while the mammals bring forth their young alive and suckle them for a time. They are

bipeds and are feathered, and wings are used by all but a few species in flight. The blood circulates rapidly and is warmer than in other vertebrates, and consequently they are animals of great energy. They breathe not only through the lungs, but have air cells in various parts of the body, which aid in respiration. The feathers essentially resemble hair of other animals, and are found only in the bird class. The plumage on the lower parts of the body of most birds is formed by a thick coating of feathers embedded in the skin, called *down*. The shape, the light feather coating, the powerful wings, the peculiar tail, the air cells, and the strong muscles are important factors in fitting them for flight. Their feathers are renewed periodically; the plumage of winter in many species differs from that of the summer time. The young change their plumage many times before they attain their full-grown shape.

The lightness of birds enables them to fly, swim, and move rapidly on land. Their bones are thin and contain numerous air cells, while air is also found in the feathers and in various parts of the body. The swift-flying birds have more air cells than those of slower flight, while birds that do not fly possess very few, as the ostrich, which has cells only in the thigh bones. In breathing, the air passes from the lungs into the cells at will; some birds have the capacity to fill even the quills of large feathers. All this and the long feathers of the tail and wings aid in carrying the birds through the air. Birds of colder regions are covered with much warmer coating than those of hot climates; this is necessary owing to a need of greater ability to withstand the cold.

The food of birds differs widely. Some live on a mixture of plant and animal food, while others live entirely on insects and some entirely on flesh. The food is swallowed in large particles, or whole, and passes through the gullet into the first stomach, or crop, in which it is softened by soaking. It then passes by another part of the gullet into the gizzard, a strong and muscular cavity, in which it is mixed with gastric juices. The grain-eating birds have a large crop into which the seeds swallowed by them pass, where they are moistened by a liquid secretion. The strength of the gizzard depends upon the kind of birds; those that eat flesh have a weaker gizzard than those that eat plants and seeds. It is to be noted that the gizzard has a grinding motion and crushes the food, and to facilitate this action many birds swallow small stones. The in-

testines are smaller and simpler than those in mammals, but in the main all the organs, like the kidneys, gall bladder, and other vital organs, are common to them.

Birds possess all the senses, more or less fully developed. The senses of touch and taste are quite dull in all the birds, while the senses of sight and hearing are highly developed. Birds of prey possess a strong sense of smell. Many birds have no song, but all are known to be able to make a noise or cry. Only the male birds possess the power of song, but females have ability to call other birds. When domesticated, the song is beautified and enlarged, but birds of the finest plumage are not the best singers; their richness in dress is compensated for by the song in the plainer birds, a truly admirable compensation. Many birds migrate in the spring to the colder regions and return in autumn, but there are also summer birds of passage.

In nest building there is a wide range of difference. Some lay their eggs on the warm sand of the seashore or on desert oases, while others build nests in trees and bushes, or burrow in the banks of rivers or oceans. The eggs are hatched by incubation; that is, by sitting on them and keeping them warm until young birds are produced, but there are some birds that lay their eggs to be hatched by the warmth of the sun or the heat generated by decaying vegetation. The mother bird guards the nest at short range, while the males are seen at some distance watching the enemy. Many kinds of young birds are able to leave the nests and gather food for themselves shortly after hatching, but the young of some species are fed for days and even weeks.

For the purpose of study there are various divisions of birds, but the following seven are those commonly given:

1. *Raveners (raptors)* are birds of prey. They have strong, curved beaks with sharp edges. Their feet possess claws with sharp hooks, useful in catching and destroying other animals, and their wings are well developed for flight. This class includes such birds as owls, vultures, hawks, and eagles.

2. *Climbers (scansores)* are birds that climb, such as the woodpeckers, toucans, parrots, and cuckoos. Their power of flight is not well developed, but they possess feet and toes well adapted for climbing and moving about on the limbs of trees.

3. *Perchers (insessores)* are the birds that perch habitually among trees. This class of birds includes all the birds of song and most

birds that live in trees. It constitutes the most numerous order.

4. *Runners (cursores)* include the emu, ostrich, and cassowary. Their wings are rudimentary and useless for flight, while their legs are powerful. They are otherwise distinguished by their breastbone being without a keel and their hind toes wanting.

5. *Scratchers (rasores)* embrace the domestic pigeons, fowls, and pheasants. The bill is short and thick, the legs are strong and large, and the feet are suitable for scratching.

6. *Waders (grallatores)* include the snipes, herons, sandpipers, cranes, and many others. Their legs are long and destitute of feathers above the heel, and their toes are usually half webbed. The bill is long and slender, adapted for fishing under water.

7. *Swimmers (natatores)* are web-footed birds, as gulls, geese, swans, and ducks. The feet are webbed; that is, the toes are connected by membrane and formed for swimming. Most species have flattened bills, and are expert divers.

**BIRDS' NESTS**, the habitations of birds, in which they lay their eggs and hatch their young. In the construction of nests birds differ largely, from the rude and simple to the wonderful and skillful. Two classes of birds are usually recognized by writers, including those that build their nests in trees and structures above the ground and those that build in cliffs or on the ground. Nearly all birds that swim and dive, and those that live along the shore, build their nests on the ground. Some birds lay their eggs on rocky cliffs or in the sand on the shore of the sea or inland lakes. The nighthawks and whip-poor-wills lay their eggs on dry leaves or on the roofs of houses. Many water birds build nests by means of sticks and leaves entwined among the reeds of swamps. This class usually feather their nests with the down taken from beneath the breast.

Writers have divided birds into different classes, using the kind of nests they build as a basis for classification. Such birds as the canary are called *felt-makers*, because they weave their material much like the fibers of felt are arranged. Some of the birds in India are classified as *tailors*, because they sew leaves together and build their nests in a pouch-like formation, hanging downward. Many species of birds, including the mocking bird, red-winged blackbird, and many others, are classified as *basket-makers*, because they construct basket-shaped nests that resemble the seed-vessels of

plants in which they build, to deceive those who chance to visit the locality in search of eggs. *Platform builders* are such as the pigeon and eagle, which arrange platforms on the branches of trees to utilize them for the nests and for perching. *Mining birds* dig holes in the ground, or use the holes made by other animals for the purpose of making nests. A small owl of the western plains is a good example of this class. It lives with prairie dogs and hatches its young in their holes, and is closely associated with snakes. *Mason birds* build nests in cliffs and under the eaves of houses, constructing them of mud in the shape of a flask. *Carpenter birds*, such as woodpeckers, chop holes into the trunk or limbs of trees and build their nests in airy tunnels. *Ground-builders* make their nests in small holes in the ground, usually under a tuft of grass or near a large stone. The subject of birds' nests is an interesting study. However, it is remarkable that birds of all classes, no matter where found, construct the same kind of nests, and that there is no change or improvement in the construction. Cuvier asserted that birds known to the Egyptians and Babylonians built identically the same kind of nests as those that live at the present time. Many birds can be induced to nest in small houses constructed for them and placed in a convenient locality of the barn or house yard.

**BIRDS OF PASSAGE**, the birds that migrate from warmer to colder climates, and from colder to warmer climates; these include two classes, known as *winter birds of passage* and *summer birds of passage*. Winter birds of passage migrate in the spring toward the polar regions to breed, and return toward the warmer zones in autumn, while the summer birds of passage pass toward the colder regions in the fall and return toward the warmer in the spring. These classes vary according to the different latitudes. The wild duck and the goose are familiar winter birds of passage, while the robin is a good example of the other class in some countries. Among the birds that do not migrate may be mentioned the quail, grouse, and snowbird.

**BIRKENHEAD** (bĕrk'en-hĕd), a seaport of England, on the estuary of the Mersey, opposite Liverpool. It has a large steamship and railway commerce and an immense jobbing trade. Engineering and shipbuilding are its principal industries. It has communication with Liverpool by a ferry owned by the municipality, and a railway tunnel under the Mersey 30 feet below the bed of the river. The tun-

nel is 36 feet wide and 22 feet high, and was constructed at a cost of \$6,250,000. The city has fine public baths and a public library, and is the seat of Saint Aidan's College. Among the chief buildings are the city hall, the market hall, and many villas and churches. The city dates from the 12th century, but its importance as a trade center began with the latter part of the last century. Population, 1907, 118,553.

**BIRMINGHAM** (bĕr'-mĭng-əm), county seat of Jefferson County, Alabama, 95 miles northwest of Montgomery, on the Southern, the Central, of Georgia, the Louisville and Nashville, and other railroads. It is located in a beautiful valley about 600 feet above the level of the sea. The city is surrounded by the richest iron and coal region of the State, contains blast furnaces and rolling mills, and has extensive interests in manufacturing. Steel products are made in large quantities from ore found in the vicinity. Among the general manufactures are cotton-seed oil, car wheels, engines, and boilers, cotton goods, earthenware, and machinery. It has many large buildings, such as the county courthouse, the Union Depot, the Jefferson Theater, and Saint Vincent Hospital. Lakeview and Capital parks are fine public grounds. The streets are paved with stone and asphalt. Other public improvements include electric street railways, sewerage, a public library, and city waterworks. Howard College, a Baptist institution, is five miles northeast of the city. Birmingham is one of the most prosperous cities in the South. In 1880 it had a population of 3,886; in 1890, 26,241; in 1900, 38,415, and in 1910, 132,685.

**BIRMINGHAM**, an important manufacturing city of England, in Warwick County, 112 miles northwest of London. It is celebrated for its immense production of metal ware. Over 10,000 workmen are engaged in the manufacture of brass products, while large numbers engage in manufacturing firearms, steam engines, sewing machines, railroad cars, gas fittings, swords, articles of papier-mache, and other products. It has connection by many lines of steam and electric railways. The Central Railway Station covers about thirteen acres of ground. Among the chief buildings are the post office, the city hall, the Anglican Church of Saint Martin, and the Baptist Wyclif Chapel. It is the seat of Mason and Queen's colleges and other educational institutions. Among the memorials are beautiful statues of Sir Robert Peel and Nelson. The city contains seven districts, from each of which a representative is sent to Parliament. Population, 1907, 553,155.

**BIRNAM** (bĕr'nam), a hill of Scotland, in Perthshire, twelve miles northwest of Perth. From its summit, 1,580 feet above the sea, a fine view of the Tay River and valley is afforded. Formerly it was covered by a royal forest made famous by Shakespeare in "Macbeth."

**BISCAY** (bĭs'kâ), a large bay on the western coast of Europe, forming the principal eastern boundary of France and the northern boundary of Spain. Its French coast is low, but the Spanish coast rises in rocky cliffs. Navigation is dangerous, owing to storms and breakers. The tide sweeps to a height of forty feet. The water from the Garonne and Loire flows into it. On its shores are numerous sea-ports, including Nantes, Brest, Bordeaux, and Gijón.

**BISCAY**, or **Vizcaya**, a province of Spain, in the northern part, one of the so-called Basque provinces. It has an area of 836 square miles. The surface is mountainous. Bilboa is the capital and largest city. Other cities include Orozco and Bermeo. Population, 311,361. See **Basques**.

**BISCUIT** (bĭs'kĭt), a kind of bread formed into small cakes, either fermented or unfermented, and made chiefly of wheat and rye flour. Many kinds of biscuits are made in large bakeries for the trade and sold on the market, both in bulk and in small packages designed for household use. The work of kneading, cutting, and stamping is done almost exclusively by machinery, and an oven serves to turn out about two thousand pounds of biscuit in a day of nine hours. Biscuits are baked so they become hard and dry, hence may be kept without spoiling for a long time. *Sea biscuits* are made of flour, water, and salt and keep easily for two years. The biscuits of the market are made chiefly of flour, butter, eggs, soda, and salt, the proportions of the ingredients used depending upon the kind and quality desired, and in making sweet biscuits sugar and flavoring are used. To make soft biscuits larger proportions of sugar and butter are required. *Meat biscuits* are made of wheat flour and the soluble parts of meat. In Scotland some varieties are called *bakes*, while *crackers* is the name usually applied in America.

**BISHOP** (bĭsh'ŭp), a title applied to the highest order of the clergymen in the Christian church. In the Roman Catholic, Protestant Episcopal, and Greek Catholic churches bishops claim apostolic succession. In the Methodist Episcopal and other churches less formal dignity is maintained and no claim is made to

apostolic succession. In Great Britain the bishops of the Church of England are called lord bishops. Two of the archbishops and a number of the bishops of Wales and England have seats in the House of Lords. The general duties of bishops vary greatly in different denominations, but usually include the power to appoint clergymen to churches, the dignity to preside at conventions of the clergy, and oversight over the churches and the clergy within the diocese.

**BISMARCK** (biz'märk), capital of North Dakota, county seat of Burleigh County, on the Missouri River. It occupies an elevated site on the Minneapolis, Saint Paul and Sault Sainte Marie and the Northern Pacific railroads. The chief buildings include the high school, the county courthouse, the State capitol, the State penitentiary, the State library, and the Saint Paul Seminary. It has electric lights, waterworks, and fine schools and churches. It is surrounded by a fertile region and is a market for large quantities of wheat, oats, potatoes, and merchandise. The industries include flouring mills, machine shops, and grain elevators. It was settled in 1873 and became the capital of the State in 1889. Population, 1910, 5,443.

**BISMARCK ARCHIPELAGO** (bis-märk), a group of islands in the Pacific Ocean, about 56 miles east of New Guinea. The principal islands were formerly known as New Britain, New Ireland, and Duke of York, but when the archipelago became territory of Germany, in 1884, the names were changed respectively to Neu Pommern, Neu Mecklenburg, and Neu Lauenburg. The possession contains a large number of islands, but those named are the principal land masses of the group, and the total area is about 18,500 square miles. Copper and trepang are exported, and the trade in fruit and merchandise is important. Matupi is the principal commercial town. The possession has a population of 212,000.

**BISMUTH** (biz'müth), a brittle metal of a reddish-white color and crystalline texture. It is somewhat harder than lead and can be reduced easily to powder when cold by means of a hammer. In a native state it frequently consists of crystallized rhombs, but also exists with other metals, especially gold, sulphur, arsenic, and oxygen. It is useful in making printers' type, ink, and medicines, and in assaying gold and silver by cupellation. A compound of three parts of tin, five of lead, and eight of bismuth is known as *fusible metal*. The medical properties of bismuth are tonical and antispasmodic.

**BISON** (bi'sön), the name of a kind of wild

cattle found in Europe and North America, and sometimes incorrectly called *buffalo*. The European bison, or *aurochs*, is now nearly extinct, being confined to parks and in a wild state to the forests of the Caucasus, and the total number now living is thought not to exceed 800. The American bison existed in large numbers in almost the whole of North

AMERICAN BISON.

America, but was most numerous in the Mississippi valley and the great plains of Central Canada. Herds of tens of thousands roamed across the plains, usually traveling in solid columns, traces of their tracks still remaining in the sod on the western prairies. They grazed upon the plains and traveled to watering places and alkaline licks, which is evidenced by the old trails which stretch for miles over hills and through valleys. They were one of the main sources of food supply for the Indians, and served a valuable purpose when the transcontinental railroads were in process of construction, since they were a prolific source of wholesome food for the workmen. The animal attains a height of about six feet, has short horns, a large hump back of the head formed of muscles, and shaggy hair of a dusky-brown color. It lives on grass, the bark of trees, and brushwood. Full development is reached at six years, and it attains to an age of thirty-five years. Only a few hundred still remain in the wild state, and these are protected by the government in Yellowstone National Park. A small remnant of the so-called *wood buffalo* has survived in the forests of Great Slave Lake. However, a number of buffalo ranches for the purpose of rearing them have been established in various sections. The skins of these animals are very valuable, while the hump is prized for its rich and delicate flesh. The small herd in Yellowstone Park is slowly increasing. Buffaloes, when tamed, are peaceful and docile, but their number and strength made them a terror to all other animals in the early history of America.

**BISSAGOS** (bis-sä'gōz), or **Bijuga Islands**, a group of small islands near the west coast of Africa, opposite the mouth of the Rio Grande. They are of volcanic origin and inhabited by Negroes. Orange and Bulama are the chief islands, and Bulama, situated on the latter, is the leading town. Maize and fruit are cultivated, and goats and cattle are reared. These islands were discovered by the Portuguese, who made a settlement on Bissao, one of the group. They are governed as a dependency of Portuguese Guinea. Population, 3,750.

**BITHYNIA** (bī-thīn'ī-ā), an ancient country of Asia Minor, separated from Europe by the Sea of Marmora and the Strait of Constantinople, then known respectively as the Propontis and Thracian Bosphorus. It extended east to Paphlagonia, and contained the cities of Prusa, Heraclea, Chalcedon, Nicomedia, and Nicaea. The Persians annexed it in 543 B. C., but it became an independent kingdom in 278 B. C. under Nicomedes I. Prusias II. was King of Bithynia at the time of the Punic Wars, when Hannibal sought refuge at his court. The Romans made it a province in 74 B. C., and it was governed under Pliny the Younger. In 1298 it was conquered by the Turks, and the seat of the Turkish government was at Prusa for many years.

**BITTERN** (bit'tēr-n), the name of several wading birds of the heron family, common to America, Africa, and Eurasia. They attain a

BITTERN.

length of 30 inches, and the wings, when extended, measure about 45 inches. Their color is yellowish-brown with bars and spots of black. They frequent low, marshy districts, remaining at rest during the day and

coming out at twilight to seek insects, reptiles, fish, and small quadrupeds for food. They are remarkable for their ability to stand on one leg, or hold their head in the same position for several hours. The male produces a curious bellowing cry, which booms like a drum and may be heard fully a mile.

**BITTERNUT.** See **Hickory.**

**BITTERROOT** (bit'tēr-rōot), an American plant found extensively in the Rocky Mountains, both in Canada and the United States. It has an edible root, sometimes called *tobacco root*, and in cooking gives off an odor much like that of tobacco. The root is long and fleshy and from it grow a fleshy stalk and numerous leaves. The flower is solitary, beautifully colored, and remains open only during sunshine. The Bitterroot Mountains and the Bitterroot River were named from this plant, and the flower was adopted by Montana as the State flower.

**BITTERWOOD**, the name of several trees and shrubs native to Brazil and the West Indies, so named from the bitterness of their wood. The fruit is aromatic and the wood is used in making furniture, being valuable because insects do not attack it. The name is applied to a tree native to Jamaica, nearly allied to the quassia, the wood of which is used in medicine. See **Quassia.**

**BITUMEN** (bī-tū'mēn), a mineral pitch of vegetable origin remarkable for its odor and inflammability. It is secured both in a fluid and solid state, and consists of about eighty-five parts carbon and fifteen parts hydrogen. The term is sometimes extended to include the hydrocarbons, as petroleum, naphtha, asphalt, and mineral tars. It is found more or less commonly in many parts of the earth, but the largest deposits of what may be classed as mineral pitch are in the vicinity of the Dead Sea. It is useful for building purposes to make floors, roofs, and arches water-tight, and in the construction of walks and pavements. The brick used in the walls of ancient Babylon were cemented with bitumen to increase their durability and solidity. See **Asphalt.**

**BITUMINOUS COAL** (bi-tū'mī-nūs). See **Coal.**

**BITUMINOUS SHALE** (shāl), a kind of clay found in the coal measures, so named from the carbon and volatile matter mixed with the clay. Large beds are quite common, and in some places the bituminous shales are used as fuel.

**BIVALVES** (bī'vālvz), the general name of mollusks having their shells in opposite portions, which open by elastic hinges and are closed by muscles. Among the bivalves are the cockle, clam, mussel, and oyster. With few exceptions, they are marine animals, while a number of univalves, single-shelled mollusks, are common to the land. The fossil remains of bivalves indicate the depth and extent of the ocean in early geological ages, and give

evidence of their existence in the former part of the age of invertebrates, the Silurian age.

**BLACKBERRY** (blāk'ber-rĭ), the name of a large bushy plant resembling the dewberry and raspberry, also called *brambleberry*. The bushes are armed with prickles, and the fruit is sweet and luscious. It is valuable for making jam, jelly, and preserves, and is eaten as a dessert. Blackberry wine is manufactured extensively, while astringent tonics derived from the berries are used largely in medicine. The fruit grows in the wild state, but it is greatly improved by cultivation. These plants are widely distributed in both hemispheres and thrive as far north as Central Canada. They are propagated from suckers and root cuttings. New varieties are secured by planting the seed.

**BLACKBIRD**, the name applied to a large family of birds of America and Europe, generally called *merle* in Western Europe. The *crow blackbird* and the *rustycrow blackbird* are of the starling family and nest largely in trees. *Red-winged blackbirds* constitute a widely dis-

CROW BLACKBIRD.

tributed species, ranging throughout Southern Canada and in the United States from Maine to the Pacific. They live in meadows, marshes, and swamps, where they nest and rear their young. In autumn they gather in flocks and delight to frequent meadows and stubble fields in large swarms. The food of blackbirds comprises worms, berries, and insects. Blackbirds are a protection to orchards in that they devour insects, but they also consume several kinds of fruit, such as cherries and grapes. A number of species are eaten by the Indians.

**BLACKBURN** (blāk'bŭrn), a manufacturing city of Lancaster County, England, about twenty-one miles northwest from Manchester. It is on the Leeds and Liverpool Canal and

has extensive railway facilities. The chief buildings include the town hall, the Saint Mary's Church, the Draper's Hall, the county courthouse, and the municipal offices. Corporation Park and Queen's Park are fine public grounds. The importance of Blackburn as a commercial city dates back to the 17th century, when it began to manufacture large quantities of cotton goods. It is the seat of many cotton mills, and has large facilities for manufacturing steam engines, hardware, clothing, and cotton machinery. The cotton factories employ about 15,000 men and 20,000 women, and the annual output of the cotton industry is valued at \$30,000,000. Blackburn maintains public baths, a public library, an art gallery, and many fine schools, including one founded by Queen Elizabeth. It has gas and electric lighting, street railways, pavements, waterworks, and two hospitals. Population, 1907, 134,980.

**BLACKFEET**, a tribe of Indians distributed more or less through the Rocky Mountains of Montana, Wyoming, and British America, and classed with the Algonquins. In early history they constituted a powerful tribe, but were quite peaceful. In 1865 they became involved in trouble with western miners, and for five years a number of skirmishes took place in which considerable life was lost. At present they number about 5,000, of which about one-half are in the United States.

**BLACKFISH** or **Tautog**, the name of a large fish common along the Atlantic coast, much valued as a food product. It is allied to the dolphin and somewhat resembles the perch. The skin can be slipped off like that of an eel. It is one of the leading food fishes of the Eastern market, being pleasant and nutritious for table use.

**BLACK FOREST**, or **Schwarzwald**, a chain of mountains in Europe, located in Baden and Württemberg, where it stretches almost parallel with the Rhine for ninety miles. It is the source of the Kingiz, Neckar, and Danube rivers. The highest summit is Feldberg, which attains a height of 4,900 feet. The mineral products include iron, lead, cobalt, copper, and silver. Numerous mineral springs abound. There is a fine growth of timber, consisting mostly of pines on the foothills. In the valleys farming is extensively carried on, while in the towns manufacturing abounds. The manufactured articles consist of furniture, toys, wooden articles, and clocks. About 50,000 persons are engaged in the manufactories in the regions, and there is a considerable trade in merchandise and cereals.

Railroads have been constructed along the mountain sides and through the valleys, and large centers of industry are building up rapidly.

**BLACK FRIDAY**, a term used to designate any Friday on which some great calamity occurred. In England it refers to Dec. 6, 1745, when Charles Edward, the pretender, reached Derby, and to May 11, 1866, when a general commercial panic reached its most oppressive phase. In the United States the name applies generally to Sept. 24, 1869, when a financial panic was caused by speculation in gold in the city of New York, and to Sept. 18, 1873, when a similar panic commenced.

**BLACK GUM**, or **Sour Gum**, a species of forest trees of North America, known in some localities as *tupelo* and *pepperidge*. The branches are crooked and bear tufts of leaves at the ends, and the wood is tough but not durable. Hubs of wheels are made of the timber. The tree has been introduced in Europe for ornamentation.

**BLACKHEATH** (blāk'hēth), a village and commons of seventy acres in Kent County, England, about seven miles from London. It is a favorite resort for pleasure parties, and is famous in history on account of insurrectionary gatherings. Among these are the gatherings of Wat Tyler, Jack Cade, and the Cornishmen. In 1011 it served as the camping ground of the Danes. Henry V. was welcomed on the Blackheath by the people of London, and the army of the Restoration was met in the vicinity by Charles II. while on his way from Dover. It is also famous as the scene of exploits of various highwaymen.

**BLACK HILLS**, a mountain group in the southwestern part of South Dakota and the northeastern part of Wyoming, which is crossed by the boundary line between these two states. It is about 100 miles long and 60 miles wide. Harney Peak, in South Dakota, rises 7,216 feet above the sea level and is the highest elevation. The region of the Black Hills was one of the best hunting grounds for the Indians, and was purchased of them in 1876. Agriculture is carried on in some districts under a system of irrigation, but in others the rainfall is sufficient to mature crops without artificial watering. Large portions of the Black Hills are covered with an abundance of timber, consisting largely of pine forests. The district is exceeding rich in thermal and mineral springs, which have been improved and now form favorite pleasure and health resorts. Mining is the chief industry and is carried on very extensively, producing lead, tin, gold, silver, copper, iron, limestone, and other minerals.

The annual production aggregates many millions of dollars. Gold is the most important product, aggregating about \$3,800,000 annually. The district contains a number of growing cities, among them Deadwood, Hot Springs, Lead City, and Rapid City.

**BLACK HOLE**, or **Black Hole of Calcutta**, a prison dungeon in the old fort of Calcutta, India, about twenty feet square, in which 146 men were confined by Surajah Dowlah on June 20, 1756, of whom all but 23 suffocated. A monument fifty feet high has been erected to commemorate their memory.

**BLACKING**, a preparation used to blacken leather. Numerous recipes for making blacking are in use, most of which are made of bone black with a small quantity of sugar, oil, and sulphuric acid. In some recipes the bone black has been displaced by lamp black or ivory black. Blacking intended for boots and shoes is usually put up in boxes as a paste, in which form it is applied with a brush, but some kinds are in the liquid form.

**BLACKLIST**, a list kept by business men on which the names of defaulters and delinquents are recorded, and by industrial societies to designate persons as untrustworthy. Such lists are prepared to warn others. Blacklisting has been included among the statutory crimes in some countries.

**BLACKMAIL**, a certain tribute levied, in early history, in the north of England and Scotland by robbers in consideration of which they promised protection from their attacks. The term is now used to designate the efforts made to secure hush money, or extort a valuable consideration by threats of public accusation, censure, or exposure.

**BLACK MOUNTAINS**, a group of mountains in North Carolina, belonging to the Appalachian system. Mitchell's Peak, its highest summit, is the loftiest mountain east of the Mississippi River; height, 6,710 feet. It was named in honor of Dr. E. Mitchell, of the University of North Carolina, who died here while making an exploring tour. Other high peaks include Clingman's Peak, 6,700 feet, and Guyot's Peak, 6,660 feet.

**BLACK SEA**, a large inland sea located south and west of Russia, north of Asia Minor, and east of the Balkan states. It has a superficial area of 173,000 square miles; its greatest depth is 6,420 feet, and its mean depth about 2,472 feet. The surface, including the Sea of Azof, is about 175,000 square miles, or more than five times larger than Lake Superior. It receives the water of the Dnieper, Dniester, and Danube from Europe, and of the Sakaria

and Kizil Irmak from Asia, while the outflow of the Don reaches it through the Sea of Azof. Its waters are less salty than those of the Mediterranean and not so clear, owing to the large inflow from these rivers. It is the site of an important commerce, largely because of its connection with the Mediterranean by the Sea of Marmora and the Bosphorus, and many navigable rivers and canals that are tributary to it. In the summer season the surface is at rest and secure for steamboat and ship navigation, but in winter fierce and dangerous storms sweep over it. However, this disadvantage is compensated for in part by its shores and interior being free from rocks and shallows. Oceanic currents are wanting, but the inflowing rivers cause a very similar effect upon its waters. The most important ports include Samsun, Batum, Trebizond, Sinope, Kherson, Odessa, Sebastopol, and Varna. It yields fish in large quantities. Subsequent to the Turkish conquest of Constantinople it remained under the exclusive control of the Turks until 1774, when joint control was ceded to Russia, and later the same rights were granted to Austria, Great Britain, and France. At present the waters are open to the commerce of all nations. In ancient times the Black Sea was known as *Pontus Euxinus*. On its eastern shore was Colchis, the goal of the Argonautic expedition.

**BLACK SNAKE**, or **Blue Racer**, a large snake widely distributed over North America, but most abundant east of the Mississippi River. The eyes are large, the head is oval and long, the nostrils lateral, and the body is slender. It attains a length of nine feet, is not poisonous, and lives on birds and small quadrupeds. It is especially fond of rats. The Australian black snake is closely allied to the cobra and is very poisonous.

**BLACKSTONE** (bläk'stôn), a town of Massachusetts, in Worcester County, on the Blackstone River, and on the New York, New Haven and Hartford Railroad. It is about two miles northwest of Woonsocket, R. I., and has electric railway conveniences. The manufactures embrace cotton and woolen goods, rubber shoes, and machinery. A public library and several schools and churches are among the chief buildings. It has a brisk trade in merchandise and fruit. The first settlement was made on its site about 1700 and it was so named from William Blackstone, who was the first settler at Boston. Population, 1905, 5,786.

**BLACKWELL'S ISLAND**, a narrow and rocky island of New York, so named from its former owner, located in the East River, and now a part of New York City. It has an area

of 120 acres. On it are situated an insane asylum, an asylum for the blind, a penitentiary, a charity and fever hospital, and several work and alms houses. A lighthouse about sixty feet above the sea is located at its northern end.

**BLADDER**. See **Kidneys**.

**BLADDER NUT** (bläd'dēr nüt), the name of several plants native to North America and Eurasia. They are so called from the fruit, which is an inflated bladder, and within are a number of hard seeds. In some localities the bladder nut is planted as an ornamental tree, and the seeds are used in medicine as a mild aperient.

**BLADDERWORT**, a genus of aquatic plants found in the marshes and lakes of most countries. In the tropics they grow luxuriantly, and their flowers, like those of water lilies, adorn the surface of ponds and other shallow bodies of water. Australia is exceptionally rich in plants of this kind and they grow abundantly in Great Britain and the United States. Most of the Canadian varieties have yellow flowers, and those of the United States have blossoms of violet, yellow, or purple. Little bladders or vesicles on the leaves and stems become filled with air about flowering time, causing those parts to be held above the surface, where the flowers expand, and afterward the air escapes and the plant sinks to the bottom, where the seeds ripen. In some species the bladders hold moisture after the air escapes, and the plant is kept fresh and alive even if the water in the pool or marsh sinks away.

**BLADENSBURG**, a village of Maryland, in Prince George County, six miles northeast of Washington, D. C. It is on a branch of the Potomac River, and is noted for a battle fought here Aug. 24, 1814, between the British under General Ross and a force of American militia under General Winder, in which the British were successful and shortly after captured Washington. Population 1900, 463.

**BLANC, Mont.** See **Mont Blanc**.

**BLANK VERSE**, a term generally applied to poetry without rhyme, and first adopted in English literature from the Italian by the Earl of Surrey. The classical productions of the Greek and Roman poets are composed in blank verse. It has never been popular in Spanish and French, but in English and German it has been largely followed. Bryant's "Thanatopsis" and Longfellow's "Hiawatha" are good examples of productions written in blank verse.

**BLARNEY** (blär'nī), a stone built in the wall of an old castle in the village of Blarney, Ireland, four miles northwest of Cork. There

is a tradition that the kissing of this stone will confer the ability to use the peculiar flattering, persuasive speech known as *blarneying*. In Oliver Goldsmith's "The Vicar of Wakefield," the *Lady of Blarney* is represented as a bad character.

**BLAST FURNACE** (blást fûr'nâs), a furnace designed for smelting iron ore and extracting from it the iron by means of a powerful blast of air. The Egyptians are represented

in their early sculpture with a blowpipe to increase the current of burning fuel in furnaces, while the Indians and Oriental classes still use bellows for that purpose. Both the Germans and Gauls employed the hot blast in manufacturing lances and spears, while the Roman's, during their invasion of the British Isles, employed iron, secured by smelting in blast furnaces, which is evidenced by cinders still remaining as a result of their work. However, their process was so crude that iron was illy extracted from the ore. Large heaps of the refuse matter found in the Forest of

Dean furnished a good supply of ore for nearly

BLAST FURNACE.

a, hearth; b b, tuyères; c, boshes; stack; e, hopper for charging the furnace.

300 years, which clearly demonstrates that their process was inefficient. The furnaces used by the Romans were built largely on the top of hills, for the purpose of obtaining the best possible currents of air for heating the ore and extracting the iron.

Blast furnaces are used at present principally for smelting iron ores. They are constructed of solid masonry, sometimes to a height of

over 100 feet. This construction enables utilizing an upper current of air by assisting natural draft with artificial appliances, thus largely increasing the amount of oxygen necessary to a mineral under treatment. As seen in the illustration, the air-blast, which is propelled by a blowing engine, is injected into the furnace through the hearth by means of pipes called *tuyères*. Immediately above the hearth are the *boshes*, forming a conical wall, the upper part of which forms the *stack*. The *charges* are fed into the furnace from above so as to keep the receptacle completely filled as the layers within melt and are removed.

The process of smelting consists of pouring into the top, or at the mouth, of a heated furnace a proportional quantity of fuel, limestone, and ore. When the hot air is blown through a blast pipe it strikes the charges deposited in the furnace. As a result of the intense heat coming in contact with the charge gas is formed, which escapes upward, through the mouth, and the metallic iron, thus set free, drops into a lower and hotter part of the furnace, where it melts. On the application of heat the lime and earthy matter of the ore become united, thus forming cinder or fluid slag that floats on the top of the melted iron. When a sufficient quantity of molten matter has accumulated, the slag is thrown away and the iron cast into molds. Iron thus cast is called *pig iron*. The furnace is modified according to the amount of heat required for the purpose of melting the kind of metal smelted from ore, and the heat generated is governed accordingly. In the blast furnaces of newer construction the gas formed is conducted by pipes to be utilized in making steam or as fuel in heating the blast.

In recent years material improvements have been made in smelting. By means of these the daily output of blast furnaces has been vastly increased and the cost of iron and steel has been correspondingly lightened. These improvements, besides increasing the output, have made it possible to apply a greater intensity of heat, thus extracting a larger per cent. of valuable metals from the ores and bringing the products to a higher degree of utility. In the production of Bessemer pig, by the common furnaces, it has become possible to produce 540 tons in a day. The furnaces, as well as bosh walls, have been made more durable by the use of carbon to protect the parts coming in contact with the intense heat required in blasting, and also by the use of water cooling. Improvements in methods of constructing lining for blast furnaces have enabled manufacturers to produce

400,000 tons of pig by a single lining. Besides, with the use of natural gas and electrical appliances, material saving has resulted, although coke, anthracite, and charcoal furnaces are still generally used. Owing to recent and numerous improvements in machinery, it is likely that these materials will always continue to serve for smelting purposes to the best advantage, with possible exceptions in districts favorably located to natural gas and petroleum deposits.

**BLASTING** the process of disintegrating portions of rock, or other solid substances, by means of an air explosive agent, such as powder or dynamite. It is resorted to in mining, tunneling, and quarrying. The usual plan is to bore holes in the rock to be blasted, placing into them the explosive and tamping the hole with clay, sand, or broken stone, and then firing the charge by a time fuse or an electric spark. The discovery of new explosives and the invention of machinery useful in boring and firing have enabled rapid advancement in the art. Dynamite and gun cotton are used where rapid destruction is desired, but where a moderate cleaving or splitting effect is needed, as in blasting for building purposes, powder is superior. Rock-boring machines have been largely substituted for hand labor. By means of these compressed air is utilized to bore holes, in which the blasts are fired. The greatest enterprise in blasting ever undertaken was the removal of the Flood Rock at Hell Gate, New York City. This ledge of rock covered nearly nine acres. To effect the blasting about 240,000 pounds of powder, dynamite, and other explosives were used. The rocks broken up weighed millions of tons.

**BLEACHING** (blēch'ing), the art of rendering materials perfectly white or nearly so. The ancient methods of bleaching consisted of exposing the fabrics to the action of the sun. The fabrics were laid out and frequently wetted, and, after remaining exposed to the actinic rays of the sun, they became greatly whitened. A class of fine fabrics are known as *lawn*s from the methods of bleaching them by spreading the goods on plots of grass. Likewise, the best grade of linens are known as *hollands*, since the Dutch excelled in bleaching that class of fabrics. The present process consists of employing bleaching agents, as diluted sulphuric acid or chloride of lime. Some fabrics are bleached by alternately dipping them into a bleaching powder made of chloride of lime and sulphuric acid. The process is modified in accordance with the material bleached; calico, silk, wool, linen, and various other fabrics require a greater or less dilution of the chemicals and a varied number of dippings. Bleaching is

practiced to a considerable extent in treating paper, ivory, oils, and wax, which are greatly enhanced in value by whitening.

**BLLENDE** (blënd), or **Sphalerite**, the native sulphide of zinc, from which zinc is obtained. It occurs both massive and crystallized, either in primary or secondary rocks, and is yellow or brownish in color. Deposits occur in many parts of the United States and Canada. It is especially abundant in Missouri, Illinois, and Wisconsin. At Cornwall, England, it is found with lead ores and is worked for the zinc and sulphur, the latter being used in making sulphuric acid. The best grade contains about thirty per cent. of sulphur and sixty-five of zinc.

**BLLENHEIM** (blēn'īm), a village in Bavaria, Germany, about 23 miles northwest of Augsburg, on the Danube River. It is noted for the great battle fought here on Aug. 13, 1704, in which the allied forces of England and Germany gained a complete victory over the Bavarians and French. Each of the contending armies consisted of about 53,000 soldiers. The former were commanded by Prince Eugene and the Duke of Marlborough and the latter by Prince Rupert and Marshal Tallard. The defeated army lost 12,000 in killed and 14,000 prisoners, while the remainder retreated in disorder. The present Duke of Marlborough, Count of Blenheim, married the daughter of W. K. Vanderbilt, of New York City. In 1800 the French defeated the Austrians near Blenheim. The village has a population of 825.

**BLIND**, the state of being deprived of the sense of sight. Blindness is most prevalent in the tropical regions, and least common in the temperate. It is more general in the Eastern Continent than in the Western. A very small number of children are born blind, although there are hereditary tendencies more or less prevalent. By far the greater number of cases result from accident, smallpox, or diseases of the eye, such as inflammation, cataract, or defect of the optic nerve. Old age is frequently accompanied by blindness, owing to a drying of the lachrymal canal and humor of the eye, or to an impairment of the crystalline lens or other vital organs. Frequently some slight deformity of the parts of the eye or its surrounding lead to a loss of sight. Blindness is generally attended by an increased vitality of the other senses, thus in part compensating for the loss of the visual faculty.

Asylums for the blind were established in Germany and France as early as 1260, the prime object being to relieve the Crusaders who had lost their sight in the East. Subsequently asylums of this character were estab-

lished and are at present supported in all civilized countries. In the United States a large number of institutions are maintained, both for adult and minor blind, by the several states under a system of general taxation. Among a number of such schools in Canada may be mentioned the Ontario Institution for the Blind at Brantford. In these institutions the industrial arts are taught successfully, usually with a view to aid in making the students self-supporting. The courses of study generally include all the common and high school branches and industrial arts, such as knitting, sewing, weaving, rope making, broom making, and divers household duties.

Many systems of alphabets for the blind have been invented and are now in successful use. The print consists of characters raised above the surface of the paper and is read by means of passing the fingers over the characters, thus determining their signification by means of the sense of touch. The text-books used are made on this plan both for teaching and for general reading. Another method of teaching is by what is known as the *point system*. It consists of a number of dots instead of the letters of the alphabet, and has largely superseded all other systems for teaching both reading and writing. In writing the blind use a dotted or grooved appliance over which they lay paper and with a style dot on the surface. Raised characters then appear on the underside, the meaning of which can be determined by passing the fingers over the lines.

Books for the blind have been published on a very large scale, including works on the sciences, novels, romances, poetry, large portions of the Scriptures, and many other valuable literary productions. The system of writing used by the blind has been so perfected that by means of texts, and skill in determining the different characters, it is possible for those who have lost their sight to become quite as well trained as the more fortunate who have full use of the eye. Among the publications for the blind recently produced in large numbers are "Practical System of Tangible Music Notation" and "International Sunday School Lessons for the Blind." The Congressional Library at Washington, D. C., contains about 100,000 books and has a special reading room for the blind.

**BLIND FISH**, a class of fish common to the waters of caves. These fish have rudimentary eyes covered with skin, but are totally destitute of sight, and the body is covered with small sensitive projections, or papillae, which serve as organs of touch and partly compensate for

the absence of vision. Like all other cave animals, they are colorless or pale. The body ranges in length from three to five inches and has fully developed fins, enabling the fish to move about with facility. They feed upon small insects and crustaceans common to caves. Many species are found in the Mammoth Cave of Kentucky (q. v.), in the cave of Cacahuamilpa, Mexico, and the caves and wells of New Zealand.

**BLISTER** (blis'tēr), a vesicle of the skin, either the result of an injury or of certain medical applications, and filled with a collection of serous fluid. The term is applied to various compounds and applications employed in medicine, such as the Spanish fly blister. They are used in the treatment of ulcers and tumors, and for the relief of muscular pain. Among the common blisters, besides Spanish fly, croton oil, mustard, ammonia, and many others are used.

**BLIZZARD** (bliz'zērd), a fierce storm attended with falling or driven snow and a low temperature. Blizzards are common in the north central part of North America, especially in the great central plain of Canada and the northern portion of the Mississippi valley, where the thermometer frequently falls as low as from 10° to 50° below zero in the colder part of winter. The movement of the wind is usually from the northwest and storms frequently extend as far south as the Ohio River.

**BLOCK.** See **Pulley**.

**BLOCKADE** (blök-ād'), the act of closing all trade with certain seaports or the coasts of an enemy. It was the ancient practice of belligerents at the beginning of hostilities to forbid by proclamation all trade of neutral nations with the enemy, and to treat as enemies those who did not act in compliance with the proclamation. Since the 17th century it is required by the law of nations, to announce a blockade so neutrals may have notice of it, and any attempt on the part of a neutral merchant to ship supplies to the infested ports is regarded a direct interference with the operations of the war, and his vessels and cargoes are liable to confiscation if captured. It is now the general practice to refer the questions involved in the violation of blockades to prize courts for adjudication, and where the cargo does not belong to the owner of the ship it is released, provided the owners of the cargo had no knowledge of the blockade at the time the shipment was started, but the ship is subject to confiscation by the captors. The term *blockade* is sometimes used to describe the condition of a city surrounded by the enemy and with

which all outside communication has been cut off, but siege is the more common word employed to describe this condition.

**BLOCKHOUSE**, a kind of fort used in early times as a means of protection against an enemy. It was constructed of timber, usually of heavy logs or blocks, and had openings for musketry on all sides to enable firing upon those making an attack. Originally it was built of one story, but later an upper story was constructed to overhang the lower and in the overhanging floors were holes to permit firing upon an enemy who might attempt to gain entrance or set the structure on fire. Blockhouses were used extensively in the early settlement of America, when timber was plentiful and attacks by artillery were not to be feared.

**BLOCK SYSTEM**, a system used in traffic on railroads by which signals are given so two trains on a single track may be kept a certain distance apart. The system owes its origin to Sir Charles Gregory of England, in 1841. It is now used by ninety-eight per cent of the double-track lines of England and most countries of Europe. In recent years all the great trunk lines of America adopted the block signaling system. It is in general use, not only on double-track railways, but by the principal single-track lines. By means of it the loss of property and human life is largely overcome.

**BLOEMFONTEIN** (bloom'fön-tin), a city in South Africa, capital of Orange River Colony, 95 miles east of Kimberley. It is located on a plateau about 4,500 feet above the sea, on the Modder River, and is surrounded by a fertile region. Among the chief buildings are several schools, the Dutch Reformed church, the Anglican cathedral, the public library, and the government building. It is the seat of a hospital, an asylum for the insane, and a number of educational institutions. The trade is chiefly in wool, cereals, and merchandise, and the manufactures consist of utensils, machinery, and clothing. It has modern facilities, such as gas and electric lights, and is on the main line of the Cape-to-Cairo Railroad. At the time of the war between Great Britain and the Boer republics it was a center of hostilities, but in 1900 surrendered to Lord Roberts. Population, 1904, 33,883.

**BLOOD**, the fluid that circulates through the arteries and veins of animals and is essential to the growth of the tissues and to the preservation of life. In the human body it varies from a brownish-red to a bright red color. It constitutes by weight one-thirteenth of the body; thus, a man weighing 169 pounds has about thirteen pounds of blood. Under the micro-

scope it appears as a pale yellowish fluid, called *plasma*, in which float a large number of discs, called *corpuscles*, some white and others red, of which the red are more numerous. The red discs are circular, with rounded edges, and concave on the upper and lower surfaces. These discs are so small that if 3,500 were placed

A  
CORPUSCLES (HIGHLY MAGNIFIED).

A, Human Blood. B. Non-Mammal Blood.

side by side they would measure a linear inch, and about 15,000 placed one upon another would make a column about one inch high. It is estimated that about eighty-three million are contained in one cubic inch of blood. The size of the discs in human blood differs somewhat from that found in other animals, but it is uncertain whether microscopists can determine the difference with accuracy. They have a well known tendency to collect in piles like rolls of coins. With every breath about twenty million new discs are formed in the blood and the old as constantly die.

The plasma contains *fibrin*, a form of albumen which resembles the white of an egg, and various mineral substances, including potash, lime, phosphorus, magnesia, and iron. In the blood are all the materials required for the growth and maintenance of every organ. It is rich in albumen for the muscles and mineral matter for the bones. The red discs are the *air cells*. They carry the essential oxygen necessary to every operation of life, and it is carried to all parts where repairs are made and growth takes place. It stimulates action and tears down worn-out parts. In serving its purpose the muscles and tissues are burned much like fuel in a stove. Made impure by this action, the blood is caught up by the circulation and carried back to the lungs, where it is purified and again thrown back into the system. The vessels carrying the blood from the heart are called *arteries*, those carrying the blood back to the heart are called *veins*, and the two are connected by minute tubes about  $\frac{1}{2000}$  to  $\frac{1}{5000}$  of an inch in diameter, called *capillaries*.

When blood is exposed to the air, it forms clots; the process is called *coagulation*. This serves a useful purpose in many ways. It checks bleeding in ordinary cases by the fibrin forming a temporary plug, which is later absorbed when the healing process is finished. *Transfusion* is the process of restoring vigor in feeble persons by infusing healthy blood into their veins. In the 17th century it was thought to be the means of prolonging indefinitely human life. The blood of dogs and calves was experimented with by infusing certain quantities into the circulation of human bodies. It was found possible to restore breathing in animals and in one case a maniac was restored to reason. The practice proved objectionable in many respects, was forbidden by law, and later fell into disuse.

The blood of animals is an important commodity of commerce. It is used as an article of food, and for making blood sausage and blood cake. To prepare it a pan is placed at the mortal wound of the animal slaughtered, in which it is caught and whipped rapidly to gather the fibrin. The remaining parts, consisting of *albumen* and *serum* are the portions used as food. In large packing houses blood is one of the most important products of commerce. It is caught in large pans and carried to drying vats, where the albumen is coagulated into a thick mass. This mass is compressed by means of great hydraulic presses and sold for fertilizing. It is valued at \$30 to \$40 per ton. Blood is also valuable in the manufacture of buttons and Japanese lacquer work. Many of the richly colored buttons sold in the market are made of blood, which has been compressed by means of hydraulic machines, and afterward cut in shape by edged instruments.

**BLOOD CIRCULATION**, the movement of the blood in living bodies, consisting of the *systematic* and *pulmonic*. The blood is propelled from the left ventricle, thence passes through the aorta and its arterial branches, and reaches the capillaries in all parts of the body; it then passes into the small veins and from them into the larger ones, and is carried to the right auricle; this is the *systematic circulation*. The *pulmonic circulation* consists of its passage from the right ventricle into the pulmonary artery and its branches in the lungs, thence flowing through the capillaries, it collects in the pulmonary veins, and passes from them through the left auricle into the left ventricle from which it again enters the systematic circulation. The heart is the cause of circulation. It is aided by the chest movement in breathing, the elastic and muscular walls of the arteries, and

the intermittent muscular pressure on the veins. Harvey (q. v.), an English physician, discovered the circulation of the blood in 1628, but how the blood passes from the arteries to the veins was not known to him. The capillaries and their functions were not discovered until three years after his death.

**BLOODHOUND**, a kind of dog distinguished for its keen scent and the persistency with which it follows the track of game. The ears are long and smooth, and both the ears and lips are pendulous. It is a trustworthy animal in the chase, and is employed to track escaped prisoners and suspects of recently committed crimes, though its value for the latter purpose is not generally conceded. The Cuban, English, and Russian bloodhounds are among the best known species.

**BLOODROOT**, a plant of the poppy order, native to many parts of North America. It takes its name from the sap of the root, which is a deep orange color, and contains the alkaloid *sanguinaria*, used in medicine as a stimulant and expectorant. The plant grows wild in many parts of Canada and the United States, has heart-shaped and deeply lobed leaves, and flowers early in the spring.

**BLOOMFIELD**, (blōm'fēld), a manufacturing city of New Jersey, in Essex County, five miles northwest of Newark, on the Erie and the Lackawanna railroads. It is situated on the Morris Canal and has a large trade in merchandise and produce. The chief buildings include the Jarvie Library, the Westminster and First Presbyterian churches, and the German Theological Seminary of Newark. The manufactures are paper, ironware, machinery, textiles, cigars, and musical instruments. Many New York business men reside here. It was settled in 1675 and was incorporated in 1812. Population, 1905, 11,668; in 1910, 15,070.

**BLOOMINGTON**, county seat of McLean County, Illinois, 125 miles southwest of Chicago, on the Illinois Central, the Chicago and Alton, and other railroads. It is located on the highest land in the State and almost in the geographical center. It is surrounded by a rich agricultural country. The county courthouse, the public library, the city hall, and the central high school are among the chief buildings. It is the seat of the Major Female College, a Roman Catholic academy, and the Illinois Wesleyan University, and at Normal, two miles north, are the State Normal University and the State Soldiers' Home. The city has large railroad shops, flouring mills, a meat packing establishment, brickyards, foundries, and fruit canning interests. Waterworks, elec-

tric street railways, and gas and electric lighting are among the improvements. It was settled in 1831 and was incorporated in 1850. Population, 1900, 23,286; in 1910, 25,768.

**BLOOMINGTON**, county seat of Monroe County, Indiana, 50 miles southwest of Indianapolis, on the Chicago, Indianapolis and Louisville Railroad. The chief buildings include the county courthouse, the central high school, and the Indiana State University. Among the manufactures are leather goods, machinery, and clothing. In its vicinity are productive limestone quarries. The municipal improvements include waterworks, sewerage, and electric lighting. It was settled in 1818. Population, 1900, 6,460; in 1910, 8,838.

**BLOOMSBURG** (blōomz'bērg), a town of Pennsylvania, county seat of Columbia County, 40 miles southwest of Wilkesbarre, on the Philadelphia and Reading, the Lackawanna, and other railroads. It is nicely situated on the Susquehanna River and the Pennsylvania Canal. The surrounding country has extensive iron mines. Among the industries are flouring mills, carriage works, foundries, and textile works. It has a State normal school, several fine churches, and substantial county and public school buildings. Population, 1900, 6,170.

**BLOWFLY** (blō'fli), or **Flesh Fly**, a class of large flies, usually green or dark blue, which lay their eggs upon meat or dead animals. The eggs hatch in from 20 to 24 hours, and the young larva buries itself in the flesh for two weeks, when it transforms into the pupa stage, and develops into the matured blowfly about two weeks later. The eggs are called *fly blows* and are invariably laid on the lean meat. While in the larva stage the insects are known as *maggots*, and play an important part in the removal of the decaying carrion. However, the blowfly is somewhat dangerous to living animals in that it lays its eggs in fresh wounds, in which case the maggots may cause harmful effects.

**BLOWING MACHINE**, a mechanical contrivance for producing blasts of air. The earliest form was a bag made of skin or leather, from which the bellows used by blacksmiths was developed. Now blowing machines are very important in manufacturing and for various purposes, and they range from the simple fan blowers used in ventilation to the complicated piston blowing machines employed in driving rock drills and other machinery. The *piston-blower*, or *Chinese bellows*, has been displaced largely by more powerful machinery. It has a square chamber of wood, fitted with a piston, which, when drawn back, admits air through a valve at the end, and the air is com-

pressed and forced out through a nozzle when the piston is moved forward.

A modern blowing machine in which steam is used as a propelling force has two cylinders, one for steam and the other for air, usually set side by side, and has reached a high degree of perfection both in power and the efficiency with which it is used in different classes of machinery, especially in blast furnaces. Another class is known as *disk blowers*, which consist of several blades, usually six, fastened to an axle much like the blades of a screw propeller, and a swift current of air is secured when the axle turns rapidly inside of a cylindrical casing. The propelling force is either steam or electricity. It is used extensively in securing continuous currents of air in ventilating buildings, while the *fan blower*, which resembles it, is employed more generally in supplying air for mines. *Jet blowers*, in which steam creates a current of air in the direction of the escaping jet, are used to produce a draft in the smokestacks of fire engines and locomotives.

The *trompe* is a water jet blower, in which a current of air is created by streams or jets of water falling through a vertical pipe, the air being admitted at the top and forced by the falling water into an air-tight reservoir, from which it is piped for use, while the water gathers in a reservoir below and is drawn off through suitable openings. It has been superseded in most countries by newer machines. Recently a *rotary blower* has come into extensive use and with it greater pressure can be secured than is possible with either the disk or fan blowers. It has two devices known as *revolvers* set on horizontal shafts, which are moved by gear wheels outside of the casing, and when set in motion the air is drawn from below the casing in which they revolve and is forced out through an opening at the top.

**BLOWPIPE**, an instrument for blowing, used to direct the flame of a lamp, candle, or jet of gas against a spot on which is placed a body designed by the operator to be subjected to more than ordinary heat. While there are various kinds of blowpipes, the ordinary form consists of a conical tube of metal, open at the narrow end, which forms the mouthpiece, and closed at the lower part. From the side of the lower end projects a small brass tube, about an inch long, which serves for the passage of a fine current of air. When the operator blows into the open end, a current of air passes out through the air passage and causes the flame to be blown into a long point, much hotter than the common flame, owing to a

greater supply of oxygen. Blowpipes are of great antiquity; a man using one is shown in an ancient Egyptian painting found at Thebes. They are used by chemists, jewelers, and gold and silver smiths.

**BLUBBER** (blüb'bēr), the fat which lies just beneath the skin of the whale and other large sea animals. In some whales it is from eight to ten inches thick, and under the lip it is sometimes three feet in thickness. A single whale often furnishes thirty tons of blubber, from which about twenty tons of oil are extracted. Blubber is eaten by the Eskimos and many inhabitants of the Japanese Islands. It is highly esteemed as a food by the natives because it contains elements that protect against severe cold.

**BLUE** (blū), one of the seven colors into which the rays of light are divided by refraction through a glass prism. The various shades of blue are seen in their highest perfection in the sea and sky, and are most brilliantly displayed in the sapphire and the turquoise. It is derived for dyes, in the arts, from various products of the vegetable and mineral kingdoms. Indigo, derived from the indigo plant, is the most common vegetable dye. Logwood blue is an extract of logwood. The minerals that yield blue coloring matter are very numerous. They include those known as aniline blue, cobalt blue, Prussian blue, and ultramarine. Cobalt blue, Berlin, and Bremen are the principal blues used in painting.

**BLUEBIRD**, or **Blue Warbler**, a well-known and favorite American bird, which appears in the northern part of the United States and Southern Canada in early spring, especially in populated regions. It is a common bird in the Bermudas, West Indies, Mexico, and Northern South America, and in some sections is known as a summer bird of passage. The plumage is sky-blue above and yellowish-brown below, and in size the bird resembles the robin. Bluebirds are fond of little boxes in which to nest, and frequently build close to houses and barns. The eggs number five or six, and several broods are reared each season. Both the male and female show much courage in protecting the nest.

**BLUE BOOKS**, the official papers and reports published by order of the British Parliament, so called because they are usually stitched up in blue covers. The practice of making published reports began in 1681, when the succession of the Duke of York to the throne of England was agitated. At present the blue books contain information relating to state matters, statistics of trade, and reports of com-

mittees. In Germany the corresponding official books are called white; in France, yellow; in Italy, green; and in Spain, red. In the United States the name *blue book* is applied to a report of the names and salaries of persons in the government employ.

**BLUEFISH**, a fish common off the northeastern coast of North America, closely allied to the mackerel. The upper parts are of a bluish color and the lower parts are white. At the base of the pectoral fins is a black blotch. It attains a length of one to three feet, and a weight of two to fifteen pounds. In the winter it goes southward and in the spring moves toward the north. It feeds upon other

BLUEFISH.

fish, especially the mackerel and menhaden, which it pursues with much greed. It is caught by trolling and angling. As an article of food it takes high rank and is considered one of the best fish for table use.

**BLUE GRASS**, a permanent grass found in America and Eurasia. It is valuable for pasture on account of its growth both early and late in the season and its remarkable ability to bear pasturage. The Mississippi valley is especially celebrated for its prolific growth, where it has taken the place of native grasses in many pastures and meadows. It was first grown extensively in Kentucky, which is known as the Blue Grass State. This grass, though cut for hay in some places, is of greatest value for the lawn and pasture.

**BLUE ISLAND**, a city of Illinois, in Cook County, two miles south of the city limits of Chicago. It is located on the Calumet River and on the Grand Trunk, the Illinois Central, the Chicago, Rock Island and Pacific, and other railroads. It is the residence of many Chicago business men, having rapid transit facilities by electric lines and steam railway trains. Smelting works, brickyards, breweries, and machine shops are among the principal industries. It is important as a commercial and railroad center and has a brisk trade in merchandise and manufactures. It has many fine churches, schools, and business buildings. The first settlement was made on its site in 1833 and its incorporation dates from 1872. Population, 1900, 6,114.

**BLUE LAWS**, the name often applied to

laws adopted in the middle of the 17th century for the early colonies of New England. Being stringent in their regulations of social life, much opposition to them was aroused among the more liberal colonists. The name is now applied to any legislation whose aim is to interfere with the personal and domestic liberties of an individual. Among the blue laws of New England were included the prohibition of a mother kissing her child on the Sabbath or on a fasting day, They provided a penalty for shaving on the Sabbath, an imprisonment of married persons not living together, a penalty for furnishing food or lodging to a Quaker, an imprisonment for debt, and a long list of other similar prohibitive measures.

**BLUE MOUNTAINS**, a range of mountains in New South Wales, Australia, which lie eighty miles inland and trend parallel to the coast. The highest point, Mount Beemarang, is 4,100 feet above the sea level. The same name is applied to a range of mountains in the eastern part of the island of Jamaica, which includes peaks 8,000 feet high. Another range of the same name are the Blue Mountains in Pennsylvania, New Jersey, and New York, which lie east of the Blue Ridge, but they are more properly called the Kittatinny Mountains. A range in Oregon and Washington known as the Blue Mountains separates the Great Basin from the basin of the Columbia River.

**BLUEPRINT**, in photography, a picture obtained by the use of a cyanide. To make a blueprint, the sensitive paper is prepared by brushing it with a solution of iron and oxalic acid, and afterward treating it with a solution of potassium ferricyanide. The drawing is made on a very translucent paper, such as vellum, under which the sensitive paper is exposed to light and receives a photographic imprint. It is then washed in pure water and the blue print is developed, after which it is dried. The cyanide is protected from the action of the sun by the lines of the drawing, and is dissolved and removed by washing, hence the black lines in the drawing appear as white lines in the picture. Blueprints may be developed either in sunlight or electric light. They are used extensively by architects and engineers for copying plans since any number of duplicates can be made with little expense.

**BLUE RIDGE**, the most easterly range of the Appalachian Mountains, bordered on the east by the Piedmont Plain. The range is known as Blue Ridge from the extreme northeast until it crosses the James River, thence to North Carolina as the Allegheny Mountains, and in North Carolina again as

the Blue Ridge. This mountain range trends through Pennsylvania, Maryland, Virginia, North Carolina, and Georgia, and was the seat of the most important battles of the Civil War.

**BLUSHING**, a sudden reddening of the face, due to a rush of blood into the capillary vessels of the skin. The cause is chiefly mental confusion, which results from surprise or apprehension, especially when accompanied with a feeling of modesty or shame. The passions and emotions influence the nervous system so they do not act regularly on the muscular coat of the capillaries, hence they enlarge and permit the entrance or passage of more blood than ordinarily, giving the cheeks a flushed or reddish appearance. On the other hand, fear and terror cause the face and lips to become pale by exciting the nerves to the extent that they cause the capillaries to contract, hence the flow of blood is diminished.

**BOA** (bō'á), a genus of large serpents found in America, including the *chevalier boa*, the *emperor boa* of Mexico, and the *boa con-*

BOA CONSTRICTOR.

*strictor*. The last mentioned is so named because it entwines its prey and swallows it whole. Indeed, many of the species are equipped with jaws so constructed that the mouth may be dilated sufficiently to enable them to swallow bodies much thicker than themselves. These snakes are devoid of poisonous fangs. Their length is usually from twelve to twenty feet, but specimens fully sixty feet long have been captured. They have a red-

dish-gray color with broad stripes on the head and the body is covered with small scales. Their food consists chiefly of small quadrupeds, which they capture by leaping from trees or while hanging suspended from the branches. The true boas are distributed throughout tropical America, but are found most abundantly in Brazil and Guiana. Some species inhabit dry localities, others dense forests, while others frequent banks of lakes and streams, often living partly in the water. The water boa is known as the *anaconda* and attains a length of fully forty feet. It feeds on fishes and animals that come to the banks of the streams to drink, often lying in wait for them hidden away under water. It attains a great strength and is able to carry off poultry, swine, and young cattle. The *python* is found in Africa and Eurasia and is allied to the *anaconda*.

**BOAR** (bōr), the name applied to either sex of the wild swine found in Africa, Asia, and Europe. These animals attain about the same

WILD BOAR.

size as the domestic hog, which is thought to have descended from the wild boar. They have coarser bristles and larger tusks than the domestic stock, and are vicious when attacked. In the swamps of Turkestan they abound in large numbers and in size exceed those of Africa. In Europe they are found chiefly in the forests under government protection. The flesh of the wild boar is valuable for food. Some regard it even superior to that of the domestic swine, as the animal feeds mostly on fruits and roots and is cleaner in its habits. The wild boar of India is a favorite animal of the chase and is pursued by mounted men, who look upon *pig-sticking* as a favorite sport.

**BOARD OF TRADE**, or **Chamber of Commerce**, an association of traders, merchants, or persons engaged in commercial pursuits to promote trade by a union of action, or attain advantages in trade by combinations which are beyond the reach of individuals acting separately. The first board of trade was

established at Marseilles, France, and it was promoted partly for political advantages as well as to stimulate trade. The Chamber of Commerce organized in Paris in 1700 corresponded to similar institutions in other cities of France. In London, the Chamber of Commerce is the center of a general trade, while similar organizations at Liverpool, Hull, Leeds, and Manchester exercise a marked influence on the commerce of Great Britain. Associations to promote trade are maintained in Berlin, Hamburg, Copenhagen, Stockholm, and other European cities. Among the larger boards of trade in the United States are those of New York, Chicago, Boston, Baltimore, Philadelphia, Saint Louis, and San Francisco. The leading exchanges of Canada are at Montreal, Toronto, Quebec, Winnipeg, and Vancouver.

A custom long established and extensively practiced on boards of trade is to deal in margins by putting up with brokers an amount sufficient to cover the ordinary fluctuations of the market, while the other capital necessary is furnished by the brokers. Transactions on the board of trade are often intensely exciting, since large quantities of produce are frequently involved and even a very small rise or fall in the market price is an important factor. Many men follow trading and exchange as an occupation, while others engage in it as a speculation or side line to other business. Fortunes are sometimes made or lost in a day, especially when men of much experience and capital succeed in securing an artificial scarcity in a commodity of trade and sell when prices are abnormally high. Such a scarcity is said to be a *corner* on the market. The commodities handled on the board of trade include many lines, but cereals, live stock, lumber, and food-stuffs are the most common.

**BOAT**, the name of a small open vessel, usually propelled by oars or paddles. Boats are variously made for pleasure riding and for draught service, usually without sails, but some have one or more sails. A large class of boats of newer construction are propelled by electric motors and steam and gasoline engines. These boats have a capacity to move at the rate of ten to forty miles per hour. All steamships and passenger vessels carry boats to provide some degree of safety in case of accidents or shipwreck. They are variously named, as, for instance, launch, long, barge, pinnace, yawl, galley, skiff, gig, cutter, jolly, and dingy. Ships of war carry, among others, the first four named.

**BOATBILL** (bōt'bīl), a bird of the heron family, native to South America. It was so

named from the large bill, which is broad and shaped somewhat similar to a boat, the keel being uppermost. The lower mandible has a pouch to retain food. This bird frequents marshy places and the banks of rivers. It frequently perches on trees overhanging water, whence it darts to catch fish and crustacean animals for food.

**BOBBIN** (bōb'bin), a small spool or roller used in spinning. At each end is a flange or border, and through it is an opening to receive a pivot. The bobbin used in weaving has a flange on one end only, but the small metallic bobbin which holds the thread in the shuttle of a sewing machine has a flange on both ends. The common spool on which thread is wrapped is an example of a wooden bobbin.

**BOBOLINK** (bōb'ō-link), a migratory bird of America. It is seen most frequently in the southern part of the United States, whence it passes northward in summer and to the West

BOBOLINK.

Indies and south in the winter. It is known in various sections as *ricebird*, *reedbird*, and *ricebunting*. The bobolink feeds on rice and other cereals, and is extensively used for food. In the Carolinas and other states of the South it is dreaded on account of its ravages in the fields of rice. When passing north from the rice fields of the South to the section farther north and to Canada, it is rich with fat and almost incapable of enduring long flights. The male is mostly black, sprinkled with white and yellow, and the female is largely marked with shades of brown. The song of the male is merry, quick, and musical.

**BOCHUM** (bōk'ōm), a city of Germany, in the province of Westphalia, 30 miles north-east of Düsseldorf. It is surrounded by a coal-producing country and is the seat of extensive iron and steel works. The general manufactures include woolens, hardware, machinery,

cigars, and paper hangings. It owns and operates the municipal slaughterhouse, waterworks, and sewage system. Bochum is a modern city and its recent growth is due to the rapid development of its manufacturing enterprises. It has a public theater, a gymnasium, electric street railways, and stone and asphalt pavements. Population, 1905, 118,464.

**BODLEIAN** (bōd'lē-an) **LIBRARY**, the library of Oxford University, England, organized by Sir Thomas Bodley in 1598 and opened in 1602. For rare collections it is excelled only by a few of the great libraries, although it is surpassed greatly in that respect by the Vatican in Rome. In it are copies of all the works published in Great Britain, and in addition to the English publications it contains numerous works issued in other countries. At present there are about 1,500,000 volumes in the library.

**BOEHMERIA** (bē-mē'rī-ā), a genus of plants native to China and the East Indies, important for the tough fiber used in making twine and rope. The plants belonging to this genus are related to the nettle, but do not possess the stinging properties. They yield the valuable rhea fiber, or grass-cloth fiber, known in commerce as *ramie*. The species from which

BOEHMERIA.

this product is obtained principally is the Chinese grass. This plant is perennial, grows best in shade and moisture, and yields three crops in a season, new shoots coming up after each harvesting. It is cultivated in the south-

ern part of the United States and the warmer parts of Europe. Species known as false-nettles are annual plants and grow in waste places in Canada and the United States.

**BOEOTIA** (bĕ-ō'shĭ-à), one of the ancient divisions of Greece, situated south of Phocis and west of the Euboean Sea, and now united as a province with Attica. The two as now organized contain an area of 2,475 square miles. Boeotia has an area of 1,635 square miles. It was one of the most progressive and celebrated divisions of ancient Greece, and is noted as the birthplace of the historian Plutarch, the general Epaminondas, and the poets Hesiod and Pindar. It was the seat of fourteen cities that formed the Boeotian League. The surface is quite level, but near its boundaries are chains of mountains. In the time of Alexander the Great a vast tunnel was constructed through the mountains to drain the district of the interior that was subject to overflow by the waters of the Cephissus, which discharges into Lake Copias, but later it became damaged and failed to discharge the water, thus rendering the district marshy and unhealthful. Extensive canals and tunnels were made in 1886, and now the district is rendered productive, though the atmosphere still remains heavy.

**BOER** (bōōr), meaning farmer, the name applied to the descendants of the Dutch, German, and French who settled in South Africa in the 16th century and since. Their first settlements were made in the vicinity of the Cape of Good Hope, from which they spread over the territory now known as Cape Colony. Owing to English encroachments and annexation in 1795, many of them removed farther north to Natal, later to the Orange Free State, and still later across the Vaal River, where they organized the Transvaal Republic. They constructed railroads, built cities, developed agriculture and mining, and gave to South Africa a civilization and commerce never before known in that portion of the earth. Their governments of Cape Colony, Natal, Orange, and Transvaal were at all times constitutional republics. The Boers rank as a people of industry, splendid marksmanship, sober habits, and Christian devotion. See **Cape Colony**.

**BOG** (böğ), a morass or quagmire in which the soil is composed largely of decayed and decaying vegetable matter. Some bog districts yield large quantities of peat for fuel, while others are reclaimed by drainage and converted into the most productive soil. Large basins and lake beds have been redeemed in this manner. The soil, often from twelve to fifty feet deep, is enriched for production by decayed

vegetable matter that has gathered for ages. In the Chatmos bogs of England and the Allen bogs of Ireland the deposits vary from ten to forty feet, and yield large quantities of peat and fuel materials. The largest lowland bog in the United States is known as the Great Dismal Swamp, in Virginia and North Carolina, which has an area of about 950 square miles and is 25 feet deep.

**BOGOTÁ** (bō-gō-tä'), the capital of the United States of Colombia, South America, and the largest city in that country. It is located on a table-land 8,695 feet above the Andes, near Mount Guadalupe. The surrounding table-land district is fertile and produces large quantities of cereals and fruit. The climate is healthful, partaking of the nature of perpetual spring. Vast quantities of salt, coal, iron, gold, silver, and other minerals are mined in the mountains tributary to the city. The national capitol is a fine edifice, and, besides it, there are other public buildings, including national and provincial structures. A free library, an astronomical observatory, several theaters, a university, and a museum are among the public institutions. While the city does not have the thrift of North American cities, it is supplied with many modern conveniences, among them telephones, gas and electric lights, street railways, waterworks, and railroad facilities. However, the pack mule and other evidences of southern life are still largely manifest. The manufactures include soap, leather, clothing, cordage, porcelain, and machinery. Near the city is the cataract of Tequendama, in the Funeha River, where the water falls over a precipice 650 feet high, which furnishes an abundance of power. Bogotá is popularly called the "Athens of South America." Population, 1905, 112,580.

**BOHEMIA** (bō-hĕ'mĭ-à), a crown land of Austria, bounded on the northwest by Saxony, on the northeast by Prussian Silesia, on the southeast by Moravia and Lower Austria, on the south by Upper Austria, and on the southwest by Bavaria. It extends from latitude 48° 34' to 51° 3' north latitude and from 12° 7' to 16° 50' east longitude. The area is 20,060 square miles.

**DESCRIPTION.** The surface consists mostly of a high table-land surrounded by mountains. In the southwestern part is the Bohemian Forest, in the northwest are the Erzgebirge, and in the northeast the Riesen-Gebirge. The principal drainage is toward the north. Among the chief rivers are the Elbe, the Moldau, the Eger, and the Luschnitz. It has a continental climate, mild in the valleys and cold in the highlands,

but it is healthful throughout the year. At Prague the temperature varies from 16° to 76°, and the average is about 49°. Snow covers the higher peaks most of the year. The rainfall is sufficient and abundant for agriculture.

The mines yield copper, iron, coal, alum, arsenic, sulphur, and antimony, though mining has not been developed to the extent of its possibilities. Coal is mined most extensively and supplies fuel for manufacturing enterprises. A fine grade of sand abounds, useful in the manufacture of glass, and granite, marble, and sandstone quarries are worked. Famous mineral springs abound at Carlsbad, Teplitz, and Marienbad. The forests are extensive and furnish valuable timber for export.

**INDUSTRIES.** Agriculture is the chief occupation and about ninety-eight per cent. of the surface is fertile. Most of the land is divided into small holdings and farming is conducted on a careful and economic basis. Fully sixty-four per cent. of the arable land is cultivated in cereals, such as wheat, rye, and maize, and potatoes, sugar beets, hops, fruit, and vegetables are grown profitably. All the domestic animals common to Europe thrive well, but special attention is given to cattle raising for flesh and dairy products. Sheep, goats, and horses take rank with swine in the value of the products, and large investments in poultry are maintained. Silk culture and bee-keeping receive careful attention in the districts adapted to these enterprises.

Bohemia has made rapid strides of advancement in manufacturing the past two decades. Glass is an important product and large quantities of glassware are manufactured for export. The textile industries and the manufacture of beet sugar have developed materially, and large steel and iron works are operated. Carlsbad china and Pilsen beer are made in large quantities for export. Clothing, cigars, paper, and machinery are other manufactures that take high rank. The knitting industry and the manufacture of toys and musical instruments receive considerable attention. Transportation is facilitated by navigation on the Elbe and Moldau and a network of canals, and a considerable mileage of steam railway and electric lines is operated.

**GOVERNMENT.** Bohemia is classed as a crown land of Austria, hence is an integral part of the Austro-Hungarian monarchy, which has its executive head in the emperor. Legislative power is vested in the Diet, consisting of an upper and lower chamber. Representation in the upper chamber is vested in the Archbishop

of Prague and representatives from the universities, the sees of the church, the large landowners, the towns, the chambers of commerce, and the rural communities, and in the lower chamber by members elected by direct vote of the people, who are restricted by a small property qualification. In the lower house of the monarchy Bohemia is represented by 110 members. At Prague are two noted universities, a German and a Czech. The system of schools include those classed as elementary, preparatory, commercial, and real gymnasia.

**INHABITANTS.** The inhabitants number 315 to the square mile. About two-fifths are Germans and the balance are largely Czechs, including a small per cent. of Jews. Roman Catholic is the religion of most of the inhabitants, but some Protestant and Jewish churches are maintained. Prague, the capital, on the Moldau, is the most important city. Pilsen, Reichenberg, Eger, Budweis, Teplitz, and Aussig are commercial centers. Population, 1900, 6,318,697

**HISTORY.** Bohemia was occupied at the beginning of the Christian era by a Celtic people called *Boii*, and in the 1st century they were made tributary to the Germans. In the 6th century the region came into the hands of a Slavic race, who became known as the Czechs. They were warlike and held sway for several centuries against the attacks of the Goths and other people of Central Europe. Christianity was introduced about the year 900 by the Germans, while the Moravians, who resided in adjoining territory, were converted to the Greek Church. Powerful invasions were made by the Alemanni and other Germanic tribes, and Bohemia became a part of the Moravian kingdom of Svatopluk, who was vanquished by the Magyars in the early part of the 10th century. It remained a powerful kingdom from 1278 until 1305, extending from the Elbe to the Adriatic, and in the latter year became subject to the house of Luxemburg and later to the emperors of Germany. It was the seat of religious wars in the time of and subsequent to the Hussite movement, in 1400, and for many years remained Protestant. In 1526 it was merged with Austria and since has been governed by the house of Hapsburg. In 1848 a well-organized effort was made to secure independence and reestablish its former position among the nations, but the bombardment of Prague and several decisive battles ended the insurrection. The feeling of antagonism between the two chief elements, the Germans and the Czechs, has been sharply drawn at different times, but educational and commercial progress has exercised a wide influence in

developing the resources and making stable the government of the house of Hapsburg, which has done much in promoting the material welfare of Bohemia.

**BOHEMIAN FOREST**, a chain of mountains in Central Europe, between Bavaria and Bohemia, and extending from the Danube to the Fichtelgebirge. It separates the basins of the Elbe and the Danube and culminates in Mount Arber, which is 4,650 feet above the sea. Granite, iron ore, and gneiss deposits occur.

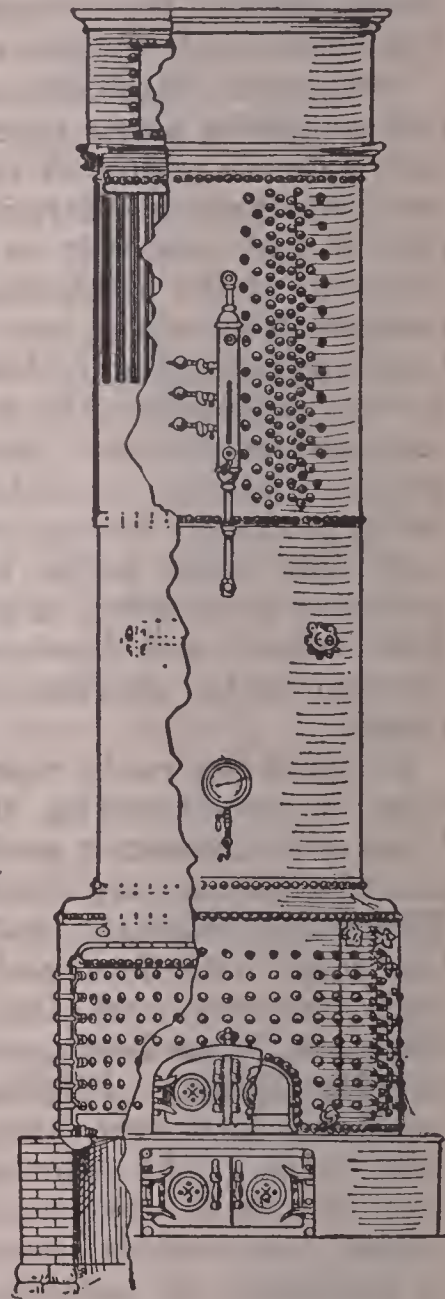

**BOHOL** (bō-hōl'), an island of the Philippines, located north of Mindanao and southwest of Leyte. It has an area of 1,440 square miles. The distance across it from east to west is about forty miles, and, from north to south, thirty miles. Groups of mountains and forests make up the principal part of the surface, but the soil is fertile and produces rice and many kinds of fruit. Gold and silver are mined. Population, 1903, 243,148.

**BOIL**, a swelling of the epidermal tissues, due usually to a change of diet and the habits of living. It starts in a small pimple, caused by poisonous bacteria under the skin, and becomes hard at the base and quite soft at the apex as it develops. For several days it is quite painful and highly inflamed, and when it opens a pus is discharged. The maturity of a boil may be hastened by the use of a poultice or the application of sulphide of calcium, and in some cases it is advisable to open it by lancing.

**BOILER** (boil'ēr), a vessel for boiling liquids, usually constructed of iron or steel, and named from its particular use. In the list are included household boilers, used in the arts of cookery and for laundry purposes. The larger boilers employed in the industries are variously constructed. Those used for stationary steam generators are usually enclosed in brickwork, in order to prevent a loss of heat by radiation. In all modern stationary and portable engines the water is subdivided by a number of tubes, thus allowing free contact of the heat with the boiler surface, by which it is more rapidly and effectually distributed to the water. In recent years tubular or water-tube boilers have grown in popularity for the reason that they allow more grate area as well as heating surface, and facilitate a greater concentration of power within a small space. Boilers of this construction are used quite generally in steamboats and for warming buildings, as well as in factories and for portable purposes.

The *tubular boilers* as now made are mostly cylindrical in form and in regard to position are either *horizontal* or *vertical*. In these boilers the water is in small tubes instead of a

single large one, as in the *flue boilers*, which have one or more large flues passing through the center. This causes a rapid generation of steam, as the fire and burning gases come in contact with a large surface area. The vertical boiler shown in the illustration is constructed on this plan. At the bottom are the *ash pit* and the *grate*, above which is the *furnace*, in which the fire burns. The *tubes* contain the water, which is brought to the boiling point as the fire surrounds them, and the steam collects at the upper part in the *steam dome*. A *steam gauge* indicates the pressure of steam and a *water gauge* shows the height of the water, while the *safety valve* permits the steam to blow off when the maximum pressure is reached. Wrought iron and steel are used in constructing the shell, the different parts of which are carefully fitted and securely riveted together to insure safety against explosions. Other materials used are brass, bronze, copper, cast iron, and malleable iron. Most small boilers and those used in the marine service are vertical, while the large boilers on land are chiefly horizontal. In the last mentioned the grate or furnace is located beneath the front end of the boiler or shell, hence the hot gases pass along the inner tubes to the rear end of the shell.

VERTICAL BOILER.

**BOILING**, an important operation in the preparation of food. It has the effect of softening nutritive articles, causing a solution of sugar and starch grains, and making them more easily digested. In boiling meats they should be suddenly plunged into boiling water so as to cause a coating or protective layer of coagulated albumen to form on the surface. This serves

to retain the more nutritious portions within. After a few minutes the temperature may be considerably lowered. For soups and broths the meats should be heated gradually so as to allow the more nutritious elements to escape from the meat into the soup. Boiled food is more digestible than when stewed, roasted, or fried.

**BOILING POINT**, the degree or point at which any liquid boils. This depends upon the constituents of the liquid and the conditions of the atmospheric pressure. The boiling point is always the same, if the physical conditions are the same. It is highest at the level of the sea, and is lowered one degree Fahr. with every 597 feet of ascent; this is due to a decrease of atmospheric pressure as we ascend. After liquids begin to boil, their temperature is not raised. The following is the boiling point of the liquids named below; the degrees given are according to Fahrenheit's thermometer:

Mercury .....	662°	Water .....	212°
Sulphuric acid .....	610°	Nitric acid .....	210°
Olive oil .....	600°	Alcohol .....	173°
Phosphorus .....	554°	Bromine .....	145°
Iodine .....	347°	Sulphuric ether .....	113°
Naphtha .....	320°	Muriatic ether .....	52°
Oil of turpentine .....	314°	Ammonia .....	28°

**BOISE** (boi'zâ), the capital of Idaho, county seat of Ada County, on the Boise River and on the Union Pacific Railroad. It occupies a fine site at the head of the Snake River valley, about 3,000 feet above the sea, and has a delightful climate. The chief buildings include the State capitol, the high school, the Soldiers' home, the United States assay office, and the penitentiary. It has manufactures of flour, lumber products, and machinery. Water power is secured from the river for irrigation and manufacturing purposes. The thermal springs furnish hot water for heating the buildings. Gold, silver, and other minerals are obtained in the vicinity. It was first settled in 1863, incorporated in 1865, and made the capital of the State in 1890. Population, 1910, 17,358.

**BOJADOR** (böj-ä-dör'), a cape on the west coast of Africa, in north latitude 26° 7'. It is southeast of the Canary Islands, a projecting point of the Sahara, and is dangerous for navigation. It was discovered by the Portuguese in 1433.

**BOKHARA** (bö-kä'ra), meaning "treasury of science," a khanate of Central Asia, belonging to Russia. It is bounded on the north by Russian Turkestan, east by the Pamir region, south by Afghanistan, and west by the Trans-Caspian Territory. The area is 93,850 square miles. The Russian railroad from the Caspian Sea passes through the district from Charjui

on the Oxus River to a point near Bokhara, and thence to Samarkand. Much of the surface is fertile, but arid, and large tracts of land are irrigated by water taken from the Zerafshan River. The mineral wealth embraces alum, sulphur, gold, and slate. The silk production aggregates over 1,000 tons annually, and the yield of cotton is about 30,000 tons. Other products include cereals, domestic animals, minerals, and various Eastern manufactures. The important cities are Bokhara, Karshi, Hissar, and Charjui. The military forces consist of a standing army of 25,000 men. They are armed with Russian rifles and instructed in Russian military drill. The government of Bokhara is under an emir, who, in 1873, acknowledged Russian supremacy and granted concessions to the czar. In ancient times the district was called Sogdiana. It was conquered by the Arabs in the 8th century, and in 1220 by Genghis Khan, in 1370 by Timur, and in 1505 by the Usbeks. Bokhara is the capital, located near the Oxus River, southeast of the Aral Sea, and has a population of 92,350. It is surrounded by a mud wall, which was built anciently for the protection of the city against invaders. It contains 350 mosques and a number of other interesting edifices. Population, 1907, 2,563,500.

**BOLAN PASS** (bö-län'), a defile in the Hala Mountains of Baluchistan, on the highway between the table-land of Afghanistan and the Lower Indus River. It consists of a succession of ravines along the course of the Bolan River and is about 60 miles long. This river rises in the mountains and flows through the ravines with a rapid descent, about 90 feet per mile, and the eminences on each side rise abruptly 500 feet above the stream. The British constructed a military railroad through this pass to connect Sind with Kandahar.

**BOLIVIA** (bö-liv'ĩ-ä), a republic of South America, in the western part of the continent. It is bounded on the north and east by Brazil, south by Paraguay and Argentina, and west by Chile and Peru. It extends from south latitude 8° to 22° 50', and from west longitude 58° to 73° 20'. The area is 557,430 square miles, exclusive of some territory held by Chile since the War of 1879-80.

**DESCRIPTION.** In the southwestern part are some of the most elevated summits of the Andes, including Mount Sorata and Mount Illimani, the altitude ranging from 15,000 to 21,000 feet above the sea. The western part has two parallel ranges of the Andes, which traverse the country from southeast to northwest. The general surface slopes toward the

east and north, forming a large part of the central plain of South America. On the western boundary is the wonderful Lake Titicaca, with an area of about 3,250 square miles and a depth of 120 fathoms. In the north is Lake Rogagus, in the east is Lake Oberaba, and in the central west is Lake Poopo Choro. Most of the rivers rise in the western and central parts and belong to the Amazon and La Plata river systems. Among the chief rivers are the Pilcomayo, a tributary of the Paraná, and the Mamoré and Beni, which discharge through the Madeira into the Amazon. The Bermejo is an important river in the southern part of the country.

Bolivia has three climatic regions, the eastern llanos, the highland region, and the mountain region. In the eastern llanos the climate is humid and hot, in the highland region it is temperate, and in the mountain region it is cold. A favorable climate prevails in the region of the Medio Yunga, which embraces an elevated plateau. At La Paz, elevated 12,500 feet above the sea, the temperature averages about 50°.

**NATURAL RESOURCES.** The forests are of incalculable value, cover a vast extent of the surface, and have many varieties of useful trees. Here thrive the mahogany, ebony, cork, cedar, rosewood, and many species of palm. A treeless region occupies the Bolivian highlands, where large areas are covered with nutritious grasses. The mineral resources are especially noteworthy. In the extent of productive silver fields Bolivia takes high rank, and gold deposits are likewise extensive. Other minerals found in paying quantities are copper, lead, tin, zinc, borax, coal, and manganese. Many wild animals infest the unpopulated regions, such as the puma, jaguar, tapir, and armadillo, and the birds of song and plumage, including the toucan, parrot, and pigeon, are very numerous.

**INDUSTRIES.** Mining continues to be the leading industry of Bolivia, but agriculture is gaining a larger foothold on account of the favorable conditions in the development of trade. It is known that gold was mined by the Incas long before the Spanish conquest, and interests in gold, silver, and tin mining have received special attention for a long period of years. In the output of silver Bolivia takes from third to fourth rank. The government has granted liberal concessions to those who open and operate new mines, and has extended appropriations to promote the construction of railroads as a means of securing transportation facilities to convey the ore to smelters and elsewhere.

Much of the land fitted for agriculture is owned by large investors and by the Indians. Farming is primitive, especially in the matter of cultivating the soil. It yields little more than is needed to supply the local demand, although the country is susceptible of large production. Many varieties of fruit are cultivated, especially the banana, pineapple, peach, lemon, fig, and the vine. All the cereals, such as wheat, corn, and barley, are grown, and considerable interest is taken in the cultivation of alfalfa, coffee, sugar cane, and vegetables. Stock raising is largely in the hands of Indians, who have herds of cattle in the grazing districts, and give some attention to the rearing of horses and sheep. Other animals reared to a considerable extent are mules, swine, alpacas, llamas, and vicuñas.

Little progress has been made in manufacturing, and the output consists mostly of wearing apparel and utensils. The exports embrace hides, rubber, coffee, wool, metals, lumber, and products derived from medicinal plants, such as cinchona and sarsaparilla. Germany has the largest share of foreign trade, and the trade with the United States and Great Britain is making a steady growth. Among the leading imports are cotton goods, furniture, and manufactures of iron and steel. Bolivia has no seaport, and foreign trade is carried on largely by the Peruvian port Molliendo and the Chilean port Antofagasta, from which railroads are operated to the inland points of the eastern part of Bolivia. The highways are in a bad condition and are improved only to a limited extent. Few railroads are operated, and most of the mileage is made up of narrow gauge lines, but telegraph and telephone connections are quite common. Much of the inland trade is carried by pack animals, and rivers furnish an outlet to the Atlantic, but the distance across the continent is so great that the river trade has not been developed to any great extent.

**GOVERNMENT.** Bolivia is a republic and its government is organized as a representative democracy. The president, elected by direct vote for four years, is the chief executive, and is assisted by a vice president and five ministers. The legislative authority is vested in a congress of two houses, the senate and chamber of deputies. In the former are eighteen members, elected for six years, and the latter has 64 members, elected for four years. The system of department courts includes judges of district and supreme tribunals. The national supreme court is the highest judicial authority. Local government is administered by the eight departments, and these are divided into prov-

inces and cantons. Education is free and obligatory, but the public schools do not provide sufficient facilities to accommodate those of school age and the compulsory school attendance law is not well enforced. The common schools are maintained by municipalities and cantons, and in addition there are eight colleges and six universities. Several theological seminaries and a number of missionary and parochial schools are maintained.

**INHABITANTS.** The white inhabitants are largely of Spanish origin, but immigration from Europe, especially from Germany, is adding quite a number of whites. Mestizos and Indians make up a large per cent. of the population. A number of the Indians are still uncivilized, especially the Guarani tribe. Roman Catholic is the religion of most of the people, but there is no restriction as to religious worship, and a number of Protestant churches and missionary schools are maintained. Sucre is the capital and La Paz is the largest city. Oruro, Cochabamba, Santa Cruz, Potosi, and Huanchaca are the leading cities. The population has not increased materially for twenty years, but there has been a steady growth, especially in the towns. Population, 1906, 2,267,935.

**HISTORY.** The history of Bolivia is characterized by many wars and insurrections. It was a part of the ancient empire of the Incas, and was conquered by Hernando Pizarro in 1538 for Spain. At that time it was made a part of Peru and later of the government of La Plata, but in 1825 was organized as a separate state and named in honor of Simon Bolivar (q. v.), who became its first president under a constitution drawn by him and adopted in 1826. In 1836 it was annexed to Peru under President Santa Cruz, but the union was soon set aside and Bolivia has been the scene of many revolutions and civil wars. Chile declared war against Bolivia and Peru in 1876, and as a result the port of Antofagasta and adjacent territory were lost to the Bolivians, thus cutting them entirely off the Pacific coast. A revolution took place in 1898, when a change was brought about in the administration by force of arms.

**BOLOGNA** (bō-lōn'yà), an ancient city in Italy, capital of a province of the same name, located in a fertile plain near the Apennines, about eighty miles north of Florence. It is surrounded by a brick wall and penetrated by canals, which serve as arteries of commerce. The city is adorned by many palaces in which are historic paintings of the leading artists of Italy. As a whole the general architecture is

massive and substantial, but the styles are mediaeval in appearance, since the façades of most of the buildings overhang the second story. A number of monuments adorn the parks and squares. The principal buildings include the Palazzo del Podestà, the Palazzo Pubblico, and the basilica of Saint Petronio, the largest church in the city. The leaning towers, Degli Asinelli and Garisenda, built in the 12th century, are among the noted structures in the city. There are over one hundred churches remarkable for beauty and wealth. Near the city is the church of Madonna di San Lucca, at the foot of the Apennines, which is reached by an arcade of 640 arches. Other noted buildings include the university, the Academy of Fine Arts, the city hall, and many schools and hospitals. It has manufactures of clothing, macaroni, silk and linen textiles, leather, canned fruit, and machinery. Among the modern facilities are steam and electric railways, gas and electric lighting, and pavements of stone and asphalt.

Bologna was founded by the Etruscans and is counted one of the oldest cities in Europe. It became a Roman colony in 189 B. C. In 728 A. D. it was taken by Longobards, but later was held by Charlemagne, who made it a free city. Since 1860 it has been a part of Italy. It contains some of the most interesting and beautiful edifices and adornments of antiquity and is visited by many who travel for study. Population, 1906, 152,009.

**BOLOGNA, University of**, an institution of higher learning at Bologna, Italy, noted as one of the most famous centers of education in the world. It is thought that the foundation was laid at the beginning of the Christian era, but its early history is obscure, and, according to some writers, it was founded by Theodosius in 425. Subsequently it was destroyed as a result of wars and insurrections, but Charlemagne restored and enlarged it. In point of attendance it reached its greatest prosperity during the Middle Ages, when it had about 8,000 students, but with the rise of the great universities in Germany the attendance began to decline and at present the enrollment is about 1,500. The scholars who made this institution famous include Luigi Galvani, Vesalius, Mme. Mazzolini, and the female professor Clotilda Tambroni. It is coeducational, and is equipped with a library of 260,000 volumes and excellent chemical and physical laboratories. The faculties include those of mathematics and sciences, philosophy and letters, medicine and surgery, jurisprudence, pharmacy, engineering, drawing and

architecture, politics, criminal law, and veterinary surgery.

**BOLOMETER** (bō-lōm'ē-tēr), an instrument used to measure minute quantities of heat, especially in different portions of the spectrum. It is sometimes called *actinic balance* and *thermic balance*. The essential part is an electrical apparatus known as Wheatstone's Bridge, which has two arms, one of which consists of three strips of platinum blackened and exposed to the rays of the sun, and the other arm is connected with a small but sensitive galvanometer. A current of electricity is developed as soon as the platinum area is exposed to the sun, owing to the fact that it is highly sensitive, and the degree of heat is indicated by the needle of the galvanometer. This instrument, though so delicate that it is influenced by minute changes of temperature, is the most useful and reliable device for studying radiation.

**BOLTON** (bōl'tūn), or **Bolton-le-Moors**, an important manufacturing city in Lancashire, England, on the Croal River, about ten miles northwest of Manchester. The chief buildings include the town hall, two museums, the church of Saint Peter, the public baths, and five public libraries. Large quantities of coal are mined in the vicinity. It was noted for its manufacture of cotton and woolen goods as early as the 14th century, when Flemish merchants stimulated the industry. The opposition of the laboring classes long prevented the adoption of the machinery invented by Arkwright, and thereby retarded its growth to some extent. It now has some of the largest and finest cotton mills in the world. The manufactures, besides cotton goods, include ironware, paper, chemicals, clothing, machinery, and pottery. It has electric street railways, waterworks, and a large trade. Population, 1907, 182,917.

**BOMA** (bō'má), the capital of the Congo Free State, on the Congo River, not far from its entrance into the Atlantic. It is regularly platted and has a number of fine buildings, including those erected by the government. The largest vessels enter its port, giving it direct steamship communication with Ostend, Antwerp, and other cities of Europe. It has a large interior and foreign trade, manufactures of utensils and clothing, and is the political center of the district of Boma and the country lying inland. Population, 1906, 4,360.

**BOMB** (bōm), an agent of destruction used in war. It is usually a large iron ball or shell filled with explosives and fired from a mortar or howitzer. Bombs are provided with a time or percussion fuse. They were first used at

Naples in 1434. The conical shells fired from rifled cannon have largely supplanted the older bomb. A class of bombs to be thrown by hand are sometimes used with murderous effect. The most noteworthy instances of such use in the latter part of the last century were at Saint Petersburg, Madrid, and Paris. They are constructed of a shell filled with high explosives, together with nails, scraps of iron, and bullets. The explosives used are nitroglycerin, fulminate of mercury, or chlorate of potash and picric acid. The explosion in the common bomb is effected by concussion, and in those depending wholly upon chemical action, as in one containing picric acid and chlorate of potash, it is effected by a coming together of the two liquids.

**BOMBARDIER BEETLE** (bōm-bēr-dēr'), a kind of beetle found in temperate and tropical countries. Many species have been described. Fully 25 species are found in different parts of the United States and Mexico. These beetles are remarkable for the secretion of a pungent fluid in the anal glands, which, when they are attacked by an enemy, is discharged with explosive force as a means of protection. This fluid somewhat resembles nitric acid in that it leaves a stain and has a burning sensation when applied to the skin. Immediately on making the discharge, the insect makes good its escape, but, if needed as a means of defense, the fluid can be thrown out several times consecutively.

**BOMBARDMENT** (bōm-bārd'ment), the act of attacking a city or fort by throwing bombs and shells to destroy the buildings and fortifications. This manner of attack is made chiefly on the larger cities and more important fortresses, usually on those that occupy a strategic point or in which a powerful army or valuable stores are kept by the enemy. In modern times most bombardments involve both naval and military operations. The attacking party usually gives notice of the impending attack 24 hours before opening fire in order that noncombatants may protect their lives and property by moving out of the range of the guns, though in some cases the enemy is surprised by a sudden attack, when no notice is given. In many cases excavations are made underground or bomb-proof masonry is built as a means of protecting life. Sebastopol, in the Crimean War, is an example of heavy bombardment, and Port Arthur, which the Japanese captured after repeated assaults, is an instance of combining the naval and military operations to good advantage.

**BOMBAY** (bōm-bā'), the chief seaport city

of India and capital of a province of the same name. It is located on a small island in the Arabian Sea, which was visited by the Portuguese in 1509 and annexed by them in 1532. It was ceded to Charles II. as a part of the dowery of his bride, the Infanta Catharine. In 1668 it was transferred to the East India Company, and in 1685 became the principal presidency of their possessions. There is a closer resemblance between it and European cities than is seen in any other city of Asia. The harbor is one of the finest in the world, and is both commodious and sufficiently secure for the heaviest ironclads. It has many substantial business blocks and magnificent homes in the newer suburban districts, where the larger numbers of its European inhabitants reside. The public buildings include the customhouse, the city hall, the public mint, several cathedrals, the offices of public works, the government courts, and the university. It has a well-organized and liberally patronized public school system, which is supported by taxation and government grants. Bombay has extensive manufacturing enterprises. The products include machinery, clothing, earthenware, textiles, and utensils. Its export and import commerce is very extensive, each aggregating about \$175,000,000 annually. The city has railroad connections with the country in all directions, is lighted by electricity, has street railway service, and is extensively connected by telegraph and telephone lines. Although the city presents elements of prosperity, it contains many poor and destitute. The life of the native laborer is one of misery and destitution, often reaching the point of starvation. Large numbers of the poor die in consequence of the famines that are quite frequent in western and northwestern India. Population, 1906, 786,806.

The province of which Bombay is the capital lies in the western part of India. It is bounded on the north by Baluchistan; east by Rajputana, Central India, the Central Provinces, Besar, and Hydenabad; south by Mysore and Madras; and west by Baluchistan and the Arabian Sea. The area is 184,235 square miles, of which 122,778 square miles are under direct British administration. The climate at Bombay is unhealthful, owing to its low and moist location, but toward the northeast the district is favorable to Europeans. The chief rivers include the Indus, Tapti, and Nerbudda. Among the mineral deposits are gold, iron, coal, salt, and petroleum. The rainfall is very heavy in the coast district, sometimes reaching 300 inches, and heavy monsoons are frequent. Large areas still contain valuable forests, but

in some regions deserts and saline lakes abound. The agricultural products embrace rice, wheat, barley, millet, cotton, and many varieties of tropical fruits. Railroads have been built through all the fertile districts, on which are located numerous cities with large populations. In 1907 the lines in operation had a length of 6,890 miles. The government of the district is administered by a resident governor, appointed by the crown, and a local legislative council. For administrative purposes it is divided into the four divisions of Central, Northern, Southern, and Sind. Population, 1906, 18,840,520.

**BONA** (bō'nà), or **Bône**, a seaport city of Algeria, on a bay of the Mediterranean, 85 miles northeast of Constantine. It has a good harbor and a large interior and foreign trade, and is connected with Constantine, Algiers, and other cities by railway. The chief buildings include those erected by the government and a number of mosques and churches. It has manufactures of tapestry, clothing, saddlery, and earthenware, and its trade is chiefly in live stock, wool, cereals, wax, fish, and tobacco. Iron mines and marble quarries are worked in the vicinity. The French have occupied Bona since 1832, from which time it has been growing steadily in commercial importance. Population, 1906, 42,934.

**BONANZA** (bō-năn'zà), a term applied originally to the discovery of a vein of rich ore in a mine. It came into use in connection with the Comstock Lode in Nevada, where a number of rich deposits were found. Now it is used in speaking of any successful enterprise or good fortune. The term is one of the popular Americanisms (q. v.).

**BONE**, the hard material that constitutes the skeleton or framework of mammals, reptiles, and birds. Its three purposes are to preserve the shape of the body, to protect the delicate organs and to serve as levers on which muscles may act to produce motion. In the early stages of life bones consist of *cartilage*, that is, cells massed together, except in the flat bones of the skull and shoulder blade, which consists largely of *fibrous tissue*. At maturity they contain about one part of animal and two parts of mineral matter. The proportions vary with the age; in early life they consist of nearly one-half to one-half, while in old age the mineral matter is greatly in excess. The mineral matter may be dissolved by soaking the bone in weak muriatic acid, which will make it possible to bend it like rubber. The animal matter may be burned in fire, the remaining portion forming a brittle mineral

mass. From this it may be seen that bones obtain their elasticity from animal matter and their hardness from mineral substances.

The cartilage found in young persons or animals turns gradually into bone by a process called *ossification*, but the portions near the joints are long delayed in ossifying, as a means to overcome to a great extent the shock of a fall or sudden jar. For this reason the bones of children are tougher than those of older people, and are less readily fractured and heal much quicker. In the body bones are moist, pinkish white in color, and covered with a tough membrane called *periosteum*. The interior is filled with marrow and permeated with blood vessels. All portions contain little cavities, from which tiny tubes radiate that serve as passages for the blood vessels to nourish the bones. These vessels permit the blood to circulate as freely through the bones as any part of the body, supplying new material when needed and carrying away the worn out parts. From the broken ends of a bone the blood oozes and soon forms a gristly substance, which holds them in place. The blood then slowly deposits bone matter, and in about six weeks a broken bone becomes united.

The bones of the human system resemble those of other animal organisms, but in shape and structure are peculiarly adapted to serve the human body. For convenience in study they are considered as bones of the three divisions: the *head*, the *trunk*, and the *limbs*. In form they are flat, as the shoulder blade; long, as the bones of the limbs; and short and irregular, as those of the wrist and ankle. The bones of the head are classified as eight skull and fourteen face bones. These bones form a cavity for the protection of the brain and the organs of hearing, taste, smell, and sight. All these are immovable, except the lower jaw, which swings on a hinge. The bones of the trunk include eight in the cervical region, thirty-seven in the thorax, five in the lumbar region, and four in the pelvis. The bones of the limbs include sixty-four in the upper extremities, and sixty in the lower extremities. The total number of bones in the body is about 210, these differing somewhat according to age, since several bones unite later in life. The size, form, and structure of the bones depend entirely upon the purpose they are to serve. Some are round and hollow and add lightness and strength; others are flat and broad to admit of large muscular attachment; while still others are short and solid to enable rapidity and facility in movement and to supply sufficient strength.

The bones of animals are gathered from

slaughter houses and converted into articles of commerce. Ground into powder, they supply a valuable fertilizer for the production of cereals, vegetables, and fruits. In some localities their fats are first extracted, which are used in the manufacture of soap and lubricants. In powdered form they are prescribed as medicines and add largely to the elements that build up a system wanting in material strength. They also serve for making handles in cutlery, for sugar refining, and for making boneblack.

**BONEBLACK**, or **Animal Charcoal**, a commercial product obtained by heating bones in closed retorts, until the gases escape and the residue is carbonized. The portions remaining in the vessel weigh about half as much as the original bones. They are reduced by passing them between rollers and separated by means of sieves into different grades, the sizes ranging from small grains to particles as large as navy beans. Boneblack is used to decolorize liquids, such as the syrup of sugar, and is employed to deodorize and to separate mineral substances from their solutions. Animal charcoal serves to remove the chemical impurities from water, but its use in refining sugar is the most important. Deodorization and decolorization take place by allowing the substances to be purified to percolate through layers of the charcoal, and in some cases the liquids are filtered several times to secure the best results. After using the boneblack a number of times it becomes saturated, when the ability to absorb may be restored by reheating it.

**BONESET**, or **Thoroughwort**, a perennial plant of America, distinguished by large hairy leaves, light purple flowers, and a stem from three to five feet in height. The leaves and flowering tops have a bitter taste and are used as a tonic. Boneset tea is made by steeping the leaves in hot water, and, when taken in this form, as warm as possible, it produces perspiration. It is recommended for ague, influenza, and muscular rheumatism.

**BONHAM** (bōn'am), a city in Texas, county seat of Fannin County, about thirty miles east of Sherman, on the Denison, Bonham and New Orleans and the Texas and Pacific railroads. It is surrounded by a fertile region and is a market for tobacco, cereals, and cotton. Among the chief buildings are the county courthouse, the Carlton College, and the Bonham Masonic Institute. The manufactures include cigars, flour, machinery, vehicles, and textiles. It has waterworks, electric lighting, and a large trade in farm produce. Population, 1900, 5,042; in 1910, 4,844.

**BONN** (bōn), an important city of Germany,

in Rhenish Prussia, on the Rhine River, about fifteen miles southeast of Cologne. It is connected by railroads with all parts of Germany and carries on a large manufacturing and jobbing trade. The chief buildings include the railway station, the museum, the city hall, and the Münster Church, which dates from the 11th century and is in the Romanesque style. It is the seat of the famous University of Bonn (q. v.), in which Schlegel, Niebuhr, Brandis, and Ritschl were leaders in educational thought. The Beethoven House, in which the composer was born, now contains the Beethoven Museum. In its burial grounds are the graves of Schlegel and Schumann. Many tourists visit the city, being attracted by its pleasing villas and historical surroundings. Bonn was the seat of the electors of Cologne, and by the virtue of the Congress of Vienna it passed into the hands of Prussia in 1815. The city is beautifully improved with monuments, parks, electric railways, and waterworks, and is celebrated for its sanitary regulations. Population, 1905, 81,996.

**BONN, University of**, an institution of higher learning at Bonn, Germany, which ranks next to that of Berlin among the German educational institutions. The foundation was laid in 1777 by Maximilian Frederick, Archbishop of Cologne, who established an academy, but this was changed to a university in 1818 and removed to its present location in Bonn. The departments are law, medicine, philosophy, and theology. In its library are 280,000 volumes and many valuable manuscripts. The chief buildings include the university proper, and the laboratories, the observatory, and the physiological institute. Niebuhr, Arndt, and Schlegel were connected with this institution. The attendance 2,550, including a number of students from foreign countries.

**BONY PIKE**, a ganoid fish native to North America, found chiefly in the brackish waters of rivers and lakes. It is covered with hard, bony scales and the vertebrae are completely ossified. It breathes atmospheric air, coming to the surface for that purpose, and feeds on other fishes. Several species are found in Central America and the United States. These fish are interesting because they represent a fossil species and their type is almost extinct. The *gar pike* and the *alligator gar* belong to the same genus. The average length is three feet, but sometimes specimens six feet long are found.

**BOOBY** (bōō'bŷ), a swimming bird closely allied to the gannet, whose name was derived from its apparent stupidity. Audubon as-

serted that several specimens studied by him learned to be upon their guard and that they became difficult to approach after they had been harmed and frightened several days in succession, but usually this bird has neither fear nor apparent desire to flee from danger. It inhabits the eastern coast of North America as far north as Cape Hatteras. The nests are rudely constructed on rocky ledges, usually near the sea, and two or three eggs are laid at a time. While its flesh is not agreeable, it is sometimes eaten, though mostly by natives.

**BOOK**, the common name applied to a written or printed composition forming a single volume. The early writings were preserved largely on monuments, on the walls of buildings, and on ledges of stone. These were chosen because of their endurance against the corrosions of time. The Egyptians used the papyrus, a plant native to Egypt, to prepare writing material as early as 2000 B. C. It was prepared by cutting the stem of the plant into longitudinal slices, which were then pressed and gummed together. The Babylonians and Assyrians used either papyrus or preserved their writings on a kind of clay tablets that were hardened by baking. It is claimed that the Koran was written on the shoulder blades of sheep, and there are numerous instances in which pieces of beechen boards were used in making books. The early books made of papyrus and skins of animals were in the form of a roll, written on both sides, and when used in study or for reference were wound back and forth. In Ezekiel ii, 9-10, reference is made to this form in these words: "Lo, a roll of a book was therein; and he spread it before me; and it was written within and without." Books made in this form and transcribed by hand were very expensive. Plato paid \$1,560 for a book; Aristotle, \$2,900 for another; and Alfred the Great, about the year 872, gave an estate for a single volume.

The invention of paper and the printing press greatly cheapened books, but enormous prices are still paid for rare and copiously illustrated works. A copy of Machlin's Bible, illustrated by Tomkins, was valued at \$2,625 when the first edition was published. Another Bible in fifty-four large folio volumes with 7,000 illustrations, some of them hand-drawn, was sold for \$25,000. Formerly the size of a book was taken from the number of leaves it contained. A fine example of this is found in the library of the University of Göttingen, which contains a Bible that has 5,373 leaves. The leaves were represented in number by the folio,

quarto, and octavo, and the page by the size of the paper, designated as royal, demy, or crown. Now the size of the page depends upon the number of leaves into which the sheet of paper that enters the book is folded. However, to express the size definitely, it is necessary that the size of the sheet be given in inches. A sheet of paper folded once, such as makes two leaves and four pages, is called a folio; folded twice, making eight pages, is called a quarto; folded three times, making sixteen pages, an octavo. The common sizes used are 8vo for large books and 12mo and 16mo for ordinary sizes. Folio and quarto books are rare, owing to their size being too large and difficult to handle. Illustrations have been used in books from an early date. The books now commonly sold in the market contain illustrations of the two kinds known as half tones and zinc etchings, these having largely superseded the wood engravings used early in the printer's art, and the finer and more expensive steel engravings of recent times.

When the Alexandrian Library became generally known, a market for books originated, and since that time the bookstore has been a common institution. The book trade is now one of the most important industries, employing large numbers of men and women and involving investments of enormous sums of money. When papyrus and parchments constituted the books in use, the printer's ink of the present time was unknown, but instead vegetable inks were made. Others were secured from animals, especially from the cuttlefish. These were applied to the permanent material, after the writing had been temporarily placed on the leaves of the palm and the inner bark of the elm, ash, and maple, which were used instead of tablets. When the manuscript writing was completed, it was coated over with a durable and transparent varnish. This served to protect the writings, whether on vellum, parchment, or any other material used in writing.

The subject-matter of a book is called the *text*. It is preceded by the *title page*, on which are the title of the contents, the name of the author and publisher, the date of publication, and sometimes the notice of copyright, but the last mentioned usually follows the title page. The *preface* is a statement of the author or editor in chief, explaining the plan and scope, after which is the *table of contents* and the *text*. Some books have an index, which may either precede or follow the text. A collection of books constitutes a *library*.

**BOOKBINDING**, the art of stitching or fastening together the leaves of a book for convenient use and covering them with a suitable cover. When books were rare and costly because of great patience and time required for writing them, the binding was done and the covers decorated on the most elaborate plans obtainable. The type-setting machines and high-speed printing presses are modern, but even with the invention of rude printing in the first half of the 15th century the production and cost of books were revolutionized. To prepare a page in type form and take off impression after impression was a vast improvement over the slow work of the Egyptian vassal and the Roman slave, who were employed to do much of the copying in ancient Egypt and Rome. In those early ages the books in common use were inclosed in a binding of boards with corners plated and sides clasped. The books of the wealthy and noble were encased with ivory, embellished with gold, and ornamented with costly gems. Not only were the bindings elaborate, but the title pages were very costly. The rolls included in the writings on scrolls were richly carved and finished in ivory and costly gems.

Binding has become a separate industry in the larger cities, and in many instances it is entirely apart from the printing institutions. The printed pages are sent to the binder, where much of the folding and other essentials in binding are done by machinery. The chief processes in binding are the following: Folding the printed sheets; gathering them in consecutive order; pressing them to secure compactness; setting the back for cords and sewing them; rounding the back edges and applying glue; trimming the edges; binding the book to the sides in the binding material, whether paper, cloth, or leather; lettering back and sides; and completing edges by gilding or otherwise. Books may be *full*, *half*, or *quarter* bound. A full-bound book is with the back and sides leather; half-bound is with the back and corners leather, and the sides cloth or paper; and quarter-bound is with the back leather and the sides cloth or paper. Many books are bound entirely in paper, cloth, and cloth-vellum. Books of law and medicine are bound largely in sheepskin, and the finer library books are in calf, morocco, or russia.

**BOOKKEEPING**, a system of recording the mercantile or pecuniary transactions so as to exhibit the condition and progress of business in a plain and comprehensive manner. It is an important branch of instruction in all commercial schools and business colleges and

is studied by both sexes. Bookkeeping is taught in many institutions in connection with arithmetic and penmanship, and quite uniformly enters into the course of study in the evening schools of the larger cities of Canada and the United States. The institutions which teach it regularly conduct exercises that nearly approximate the operations of actual business. Thus, students carry on business correspondence, make and receive formal consignments of merchandise, buy and sell exchanges upon the different sections of the country, and become quite well informed in the business methods of banking. The functions of students are changed from time to time, hence they take the place of the shipper for a brief time, later that of a bookkeeper, afterward that of a collector, etc., and in this way learn to transact the business in various lines of trade and industry.

Bookkeeping as now taught is of two kinds, *single entry* and *double entry*. The terms *debit* and *credit*, meaning debtor and creditor, usually marked Dr. and Cr., are employed arbitrarily. The books used include a *daybook*, a *journal*, and a *ledger*. In the daybook are entered the transactions on the date and in the order of their occurrence, while the ledger contains the accounts. The journal is used to separate each transaction so as to simplify its transfer to the ledger. On the left-hand side of the ledger are the items of debit, as cash received, and on the right-hand side are the items of cash disbursed, and the difference is known as the *balance*. A payment in cash is called a *liquidation*. When the items are transferred from the journal to the ledger, they are said to be *posted*. An examination to verify the two columns of an account is known as taking a *trial balance*. In a large business establishment, where the double entry system is used, several account books are employed to permit checking different phases or departments with the view of knowing the condition of each. Such books include the *bill book*, *stock book*, *invoice book*, *cashbook*, and *account sales book*.

Single entry bookkeeping involves less labor than double entry, but does not provide the same degree of safety against errors. Accounts are usually kept in two records, the daybook and the ledger. The customer is charged on the debit side with debts he is to pay, and is credited on the credit side with cash or merchandise he may turn in for value received. To find the balance, the sum of the credits are compared with the sum of the debits. Double entry requires that a much more com-

plete record be kept, and under this system every transaction is entered in two places, in a debit and a credit column. In this system a daybook, a journal, and a ledger are used. The transactions are entered in the daybook the same as in single entry, but from it they are transferred to the journal, classified according to the names or titles of the ledger account, and afterward are posted in the ledger.

**BOOK OF MORMON**, the book held sacred by the Mormons and by them regarded as a part of the Holy Scriptures. It assumes to contain a record of a chosen people in America, from the confusion of tongues at Babel until the time of Maroni, the last survivor of his race, who is thought to have died about 420 A. D. See **Mormons**.

**BOOKPLATE**, the name of a label used to indicate the ownership of a book or its place in a library. In recent years many wealthy persons have collected these plates and much has been written in current literature in regard to the different styles used by various persons and organizations. It is thought the first bookplates were made in Germany, whence they were taken to England, and subsequently brought from that country to America. They were plain and rude until about 1516, when Albrecht Dürer began to design and engrave many artistic forms. Others of much beauty are those made by Hans Holbein and Jost Amman, who gave special attention to selecting quotations from the classics, which were engraved in artistic forms and accompanied with the name and coat of arms of the owner. The best known designs of England are those in the Chippendale style, characterized by graceful effects instead of the somber designs, and in them were introduced pictures of flowers, fruit, landscapes and human figures. Many of these plates have been commanding high prices and are listed by sellers of old and rare books.

**BOOM** (bōom), a word frequently used to denote rapid development in a particular industry or locality. When shares in business enterprises are increasing in value, or the development of a city or state is progressing rapidly, it is said they are *on a boom*.

**BOOMERANG** (bōom'ēr-äng), a missile weapon invented and used by the natives of Australia. It is made of a curved stick, flat on one end and round on the other, about two feet long, two inches wide, and half an inch thick, and rounded at the ends. The savages grasp it at one end and throw it upward or forward. When thrown forward it has a skipping motion until it strikes the object aimed at or falls to the ground. When

thrown upward, it slowly ascends and in its backward flight falls to the ground behind the thrower, near its starting point. It is a powerful weapon in war and in the pursuit

BOOMERANGS.

of wild game. A similar missile was used by the Assyrians and Egyptians.

**BOONE** (bōon), a city of Iowa, county seat of Boone County, forty-two miles northwest of Des Moines, on the Chicago and Northwestern, the Chicago, Milwaukee and Saint Paul, and other railroads. The chief buildings include the post office, the Boone National Bank, the Eleanor Moore Hospital, the high school, the Ericson Library, and the county buildings. About two miles west of the city the Des Moines River is crossed by the famous Boone viaduct, the highest double-track railroad viaduct in the world, 185 feet above low-water mark. In the vicinity are extensive deposits of coal and fire and pottery clay. Among the industries are brick-making, railroad machine shops, coal mining, an artificial ice plant, and grain and live stock shipping. The city has systems of gas and electric lighting, waterworks, sewerage, pavements, and electric urban and interurban railways. It was incorporated as the town of Montana in 1866, but the name was changed to Boone two years later, when it became a city. In 1887 the town of Boonsboro was annexed. Population, 1910, 10,347.

**BOOTH** (bōoth), a stall or tent erected at fairs. In early times trade in Europe was carried on chiefly by fairs. The huts or temporary movable structures in which the traders exposed their goods for sale were called booths. The term is also applied to the stalls or apartments used by voters in the Australian voting system.

**BOOTHIA FELIX** (bōō'thī-à fē'līx), a peninsula of North America, the most northerly point of that continent, located between Boothia Gulf and McClintock Channel. Its length from north to south is 150 miles and the width is fifty miles. Bellot Strait, on the north, separates it from North Somerset Island, and in the south it contracts to a narrow isthmus, which connects it with the mainland. Sir John Ross discovered it in 1829 and named it after Sir Felix Booth, who had contributed to the expe-

dition. The northern magnetic pole was located on this peninsula in 1831, near the west coast and not far from Cape Adelaide.

**BOOTLE** (bōō't'l), a city of England, in Lancashire, on the Mersey River. It has transportation facilities by the Leeds-Liverpool Canal and several railroads, and is a manufacturing center of flour, clothing, and machinery. Many business men of Liverpool, near which it is located, reside in Bootle. Its institutions include a gymnasium, a public library, a museum, and a technical school. Population, 1907, 67,114.

**BOOTS**, the articles of dress worn to protect the feet and lower legs. They are a variety of *shoes*, but differ from them in that they extend higher up the leg, sometimes above the knee. They were developed from the *sandal*, which is the simplest and oldest kind of foot protector, and are used more commonly by men than by women. The boot was worn by the Greeks and Romans, who made ornamental designs, both on the part covering the foot and the portion extending above the ankle. In Greece buckskin was used in making the principal upper parts, and the soles were heavy so as to apparently increase the stature of the wearer. An elaborately adorned boot with wide tops came into general use in continental Europe in the 14th century, and subsequently the matter of regulating the styles was a subject for legislation by various governments.

The introduction of machinery in the manufacture of all classes of boots and shoes has greatly revolutionized the trade in these articles. A combined lasting and sole-nailing machine was invented in 1810 and soon began to be used with marked success in England and America. It was followed by the discovery that wooden pegs can be utilized in fastening the uppers and soles together, which was the common method until 1860, when the McKay sewing machine came into general use for this purpose. Another important invention is the Goodyear machine, which fastens the uppers and soles together by means of a welt. Later screw-wire machines, heeling machines, and other inventions followed, enabling the work of cutting, sewing, trimming, and polishing to be done almost entirely by machine labor. Now the work is greatly diversified, each part being done by different workmen on machines designed specially for particular purposes. The facility with which boots and shoes of all kinds are made has been demonstrated many times at the great expositions, where exhibits of the complete routine of work were made and the machines exhibited in their working capacity.

The manufacture of footwear is a vast industry in America, both in Canada and the United States. In the number of articles and the value of the product, the New England States take a high rank in the manufacture of boots and shoes, including those made of rubber and leather. Chicago, Saint Louis, and many cities of the Mississippi valley, and the cities of Montreal and Toronto, are centers of boot and shoe manufactures. According to the census of the United States in 1900, the annual product was valued at \$261,028,580 and the laborers employed numbered 142,922, about one-third of whom were women. See **Shoes**.

**BORAX** (bō'rācks), a crystalline salt found native in certain mineral springs and on the shores of many lakes. The chief supply is derived from Tibet, Peru, Chile, Tuscany, Germany, and several sections of North America, especially Nevada and California. It is prepared for commerce by washing the tincal, the crude material, with a solution of sodium hydroxide, and after dissolving in water it is treated with caustic alkali, after which the solution is evaporated and the borax crystallizes in six-sided prisms. The treatment varies somewhat with the condition in which the deposits are found. At Alameda, Cal., are refineries which treat the product secured from Clear Lake and other localities. There the crude material is dissolved in water and then treated with sodium carbonate, and the resulting solution is cooled in tanks, in which the borax forms on steel rods. Borax is used chiefly in soldering metals, glazing pottery and china-ware, preserving milk and meat, treating ulcers and skin diseases, and loosening dirt, and as an antiseptic and disinfectant.

**BORDEAUX** (bōr-dō'), an important city in France, capital of the department of Gironde, on the Garonne River, about sixty miles from its mouth, but accessible by all vessels. It has railroad connection with the leading cities of France, electric urban and inter-urban railways, and finely paved streets and public drives. Shipbuilding is an extensive enterprise. It is important as a commercial center on account of its location and large manufacturing interests, especially its ropeworks. It produces large quantities of woolen goods, paper, earthenware, wine, clothing, and machinery. Bordeaux has some of the most noted cathedrals, palaces, libraries, theaters, and other edifices of Europe. Its museum, observatories, and art galleries have been famous for ages. It is the birthplace of Montesquieu, Montaigne, and other celebrated scholars. In the Roman period it was known as Burdigala, when it

ranked as a commercial emporium. It was taken by Charles Martel in 735, captured by the Normans in the 9th century, transferred to the English crown in 1152, and restored to France in 1451. In the latter part of the war of 1870-71 it was the seat of the French general assembly, which had been driven there by the German army of invasion. Population, 1906, 251,917.

**BORDENTOWN**, a city of New Jersey, in Burlington County, six miles southeast of Trenton, on the Pennsylvania Railroad. It is on the Delaware River and the Delaware and Raritan Canal and is important as a manufacturing point for the production of worsted goods, ironware, machinery, and clothing. Its public institutions include a convent, a school for girls, and the Bordentown Military Institute. The city was incorporated in 1849. Near it is "Ironsides," the home of Charles Stewart, and a number of fine estates, including the former residence of Joseph Bonaparte. Population, 1900, 4,110.

**BORDER**, **The**, the territory lying immediately on both sides of the frontier between England and Scotland. The region is noted for many historical battles and invasions important in the history of the Scotch and English. Among the noted forays of the Border is the Chevy Chase (q. v.). The writings of Sir Walter Scott commemorate the history of the Border warfare.

**BORE**, or **Eagre**, a tidal phenomenon at the mouths of certain rivers. Bores are common to rivers that gradually expand toward a wide mouth, and in which high tides occur. The spring flood tides drive great quantities of water from the sea into the river and form a kind of watery ridge, which rushes upward with great violence. The most celebrated bores are those of the Indus, Ganges, and Brahmaputra, of Asia, but the phenomenon is observable in other streams. In one of the branches of the Ganges the bore travels seventy miles in four hours, sometimes forming a wall of water ten feet high. In the Amazon it rises from ten to twelve feet. The bore of the Petitcodiac River extends from the Bay of Fundy to Moncton, N. B., about 95 miles.

**BORIC ACID** (bō'rīk), a compound of boron, oxygen, and hydrogen. It is found native in Tuscany, the Lipari Islands, California, and elsewhere. The first discovery of this substance was made in 1777 in the lagoons of Tuscan, which are still the principal source of supply. Several lakes in California and Nevada yield borax in combination with various elements. It is derived from hot vapors which come naturally from thermal lakes and springs,

and these vapors, which are largely boric acid, are absorbed by being passed through water. The acid turns blue litmus purple. It is used chiefly in the manufacturing of borax, in glazing porcelain, and in preparing certain pigments.

**BORING MACHINE**, a mechanical device used in boring holes in wood, rock, and metals. The *auger* (q. v.) is a simple tool for making holes in wood, while the *gimlet* and *awl* are used where smaller openings are required. *Drills* are used in piercing stone and metal. The *diamond drill*, constructed of a hollow tube with diamond cutters at one end, is the most effective in boring rock. The larger boring machines are operated by steam or compressed air. They do the work quickly and without danger of loss from obstructions that

1, Brace with bit; 2, auger; 3, adjustable bitstock.

usually prevent the lighter apparatus from cutting through to the depths desired. Boring machines intended to be operated by hand usually have a metallic framework mounted on a wooden base, and the bit is turned by means of a handle or brace acting upon small cog-wheels, one of which turns horizontally with the bit or auger.

**BORNEO** (bôr'nê-ō), one of the largest islands of the world, located in the center of the East Indies. It has an area of 290,000 square miles. A large number of small islands are located near the coast, of which Labuan, off the coast of Brunei, is the most important. Darwin considered Borneo and the East Indies to be the elevated portions of a vast continent submerged in the Pacific, which is probable. The surface is mountainous, attaining its culminating summit in Mount Kini Balu, in the northern part, which has a height of 13,690 feet. While the island has no active volcanoes, it is frequently subject to earthquakes, however, not of a serious nature. It is watered

by numerous rivers, among them the Barram, Limbang, the Rejang, and the Batang Lupar. Many of the rivers are navigable and add largely to the transportation facilities of the island. The rivers and lakes are infested by crocodiles and various animals common to swampy and marshy districts. Other wild animals include the tapir, elephant, deer, leopard, rhinoceros, buffalo, many varieties of monkeys, and birds of song and fine plumage.

The productions of Borneo consist of sago, rice, tobacco, pepper, gambier, coffee, cotton, and many varieties of tropical fruits. The forests yield an abundance of excellent timber and edible birds' nests. It has extensive mineral deposits, including zinc, gold, quicksilver, tin, antimony, and diamonds. The manufactures are not extensive, the most important being cotton fabrics, utensils, matting, and fancy baskets. A large part of the interior is inhabited by the Dyaks, a native race mixed more or less with the Malays, and other races include the Chinese, Japanese, and Europeans. Moham-medan is the principal religion. The exports are large and greatly exceed the imports. General fertility of the soil, good climate in the larger portions, and growing European influence are collectively a potent factor in widening commerce and increasing wealth. Both the Dutch and British have constructed telephone, telegraph, and railroad lines to connect the interior parts with the coast.

The history of Borneo dates from 1578, when it was discovered by the Portuguese, but the first European settlement was not made until the seventeenth century, by the Dutch, who visited the island in 1598. British North Borneo includes the extreme northern peninsula of the island. It has an area of 31,106 square miles. The north central part is called Brunei, which consists of about 3,000 square miles, and is under the semi-independent government of a native sultan, who is subject to Great Britain. The capital of the state is Brunei, located on a river of the same name, and has a population of 10,500. To the south and west of Brunei is the English possession Sarawak, which has an area of 42,000 square miles, with the seat of local government at Sarawak, a city of about 18,000 inhabitants. The larger part of Borneo belongs to Holland. The Dutch possessions contain an area of 213,894 square miles. The region belonging to Holland is divided into two districts, that of the South and that of the East. Pontianak, population 9,500, is the capital of the former, and Ban-germasin, 30,380, of the latter. British North Borneo has a population of 250,000; Brunei,

25,000; Sarawak, 500,000; and Dutch Boreno, 1,225,000.

**BORNU** (bôr-nō'), a kingdom of Negroes, in the central part of the Sudan, Africa, with an area of 50,000 square miles. It extends southwest from Lake Tchad, which forms its north-eastern limits. The two principal rivers are the Shari and Yeou, which flow into Lake Tchad from the west. The district is more or less included in the German possession of Kamerun and the British Niger Territories. It is exceedingly fertile and produces rice, indigo, cotton, tobacco, corn, cocoa, palm oil, ivory, and fruits for export. Domestic animals, including horses, cattle, sheep, elephants, and buffaloes, are reared extensively. The religion is Mohammedan and the labor is largely based on a system of slavery. Kuka is the capital and chief trading point. It has a population of about 60,500. Other cities include Bundi, Yola, Birni, and Gummel. The army of the reigning sultan numbers about 30,000 men. Population, about 5,250,000.

**BORODINO** (bâ-râ-dyê-nô'), a village of Russia, in the government of Moscow, on the Kologa River, a tributary of the Moskva. It is celebrated as the site of a battle on Sept. 7, 1812, between the Russians under Kutusoff and the French under Napoleon. The French army consisted of about 150,000 men and the Russian army was somewhat smaller, and the struggle was chiefly an attempt of the French to capture the lines of redoubts and press on to Moscow. Napoleon made three assaults and remained in the field, while the Russians retreated in good order, but Moscow was soon after occupied by the French. Both sides claimed the victory, but it was disastrous to the French in that the Russians burned Moscow and destroyed the stores. About 75,000 were killed and wounded in the Battle of Borodino, which is called the Battle of Moskva by the French, from the river of that name.

**BORON** (bō'rōn), a chemical element discovered by Sir Humphry Davy in 1808. It is not found native, but occurs in combination with *borax*, *ulexite*, and *sassoline*. It fuses only at a very high heat and has a specific gravity of about 1.84. Its principal commercial use is in making boric acid and certain borates.

**BORROMEAN ISLANDS** (bôr-rō-mā'an), a group of four small islands in northern Italy. They are rocky and famed for their beauty. Isola Bella, the most celebrated of the group, has a beautiful palace of the Borromeo family, from whom they were named. Isola Madre, the largest island, has fine groves of orange trees and gardens of tropical flowers. These islands

were improved in 1671 by Count Borromeo (1538-84), a celebrated Roman Catholic cardinal.

**BOSNA-SERAI** (bōs'nâ-sēr-ī'), or **Serajevo**, the capital of Bosnia, on the Miljacka River, 120 miles southwest of Belgrade. It has extensive railway facilities, potteries, dye works, machine shops, and silk-weaving establishments. In the vicinity are iron mines and mineral springs. The chief buildings are those erected by the government, including the governor's residence. Other buildings of note are the seminary, a Catholic cathedral, and the mosque of Husref Bey. Many fine bazaars are maintained and the trade is important, owing to its location between Turkey and Austria-Hungary. Population, 1905, 38,083.

**BOSNIA** (bōz'nī-ä), a province of Austria-Hungary, transferred with Herzegovina and Novibazar from Turkey by the Treaty of Berlin in 1878. The area, including Herzegovina and Novibazar, is 19,702 square miles. In Bosnia the surface is mountainous, including ranges of the Dinaric Alps, but toward the south, in Herzegovina, it is level or gently undulating. A large part is fertile and well adapted to agriculture. It is well watered by the Bosna, Save, Drina, and Verbas rivers and is rich in forests and minerals. The products are wheat, barley, tobacco, hemp, rye, buckwheat, and domestic animals. Copper, iron, antimony, chromium, and salt are mined profitably. It has manufactures of sugar, matches, chemicals, woolen and cotton goods, iron products, firearms, machinery, leather, and dairy products. Bosna-Serai (q. v.), or Serajevo, is the capital and largest city. The principal cities, besides the capital, are Mostar, population 15,500, and Banjaluka, 14,380. The district is well traversed by telephone, railway, and telegraph lines. For the purpose of government (Landesregierung) it is divided into four departments and these are subdivided into six district (Kreis) and fifty-four county (Bezirk) authorities. The chief religious affiliations are with the Mohammedan, Greek Catholic, Roman Catholic, and Jewish faiths. A Servian dialect is spoken chiefly, but German is the official language and is taught in the schools. The territory included in the province was a part of Dalmatia and Pannonia in the time of the Romans. It belonged to Turkey from 1463 until it was given to Austria-Hungary in 1878. Francis Joseph annexed it in 1908 by proclamation and it is now a crown land of the dual empire. Population, 1905, 1,698,375.

**BOSPORUS** (bōs'pō-rūs), a strait connecting the Black Sea with the Sea of Marmora,

and separating Europe from Asia. It was so named because, according to legend, Io was transformed into a cow and swam across it. It is about nineteen miles long, 190 feet deep, and from one-third to two miles wide. To distinguish it from the *Cimmerian Bosphorus*, which is between the Black Sea and the Sea of Azov, it is properly called the *Thracian Bosphorus*. It is under the control of Turkey and is defended by a series of forts. On its shores are many lighthouses, especially at its northern and southern ends, and it is improved for extensive commercial activity. In ancient times the kingdom of Bosphorus was located on both sides of the strait. It was founded in 502 B. C., became tributary to the Scythians in 290, and was vanquished by Pontus in 116. The region was long under Roman dominion, when it formed a part of the Eastern Empire.

**BOSTON** (bôs'tūn), the capital of Massachusetts, chief city of New England, and fifth in size of the American cities. It is located in Suffolk County, of which it is the county seat, on Boston Bay, and at the mouths of the Mystic and Charles rivers. It is 232 miles by railway northeast of New York, and is the focus of many steam railway and electric lines. The principal railroads include the Boston and Maine, the Boston and Albany, the Fitchburg, and the New York, New Haven and Hartford lines. On Boston Harbor, an arm of Massachusetts Bay, is the older part of the city, situated between it on the east and the Charles River on the west. Originally large tidal marshes occupied a considerable area along the shore, but these were filled in and many acres were added to the area of the city, for which purpose a number of elevated points, such as Beacon and Fort hills, were cut down.

The city has an area of about 43 square miles. This is made up of the original site and the additions annexed from time to time. East Boston, on Noddle's Island, was added before the Revolution; South Boston, annexed in 1804; Roxbury, in 1868; Dorchester, in 1870; and Brighton, Charlestown, and West Roxbury, in 1874. Practically all the streets are paved substantially, including pavements constructed of Belgian blocks, macadam, gravel, and asphaltum. Scollay Square is located near the center of the peninsula, between Boston Harbor and the Charles River, and from it radiate the streets in the compactly built business portion. Many of the streets do not extend uniformly with the cardinal points of the compass, but the main thoroughfares have a direction approximately north and south to a point nearly opposite Fort Point Channel, whence they turn

to the southwest. State Street is the important financial center, corresponding to Wall Street in New York, and Tremont, Hanover, and Washington streets are among the business thoroughfares. Commonwealth Avenue, 240 feet wide, is one of the finest boulevards in America. The Fenway, Massachusetts Avenue, and the Strandway are boulevards of much beauty. Many cross streets facilitate intercommunication, and an efficient street railway system has lines extending to all parts of the city, except East Boston, which is connected by ferry. A subway and an elevated railway carry a large portion of the travel in the crowded part of the city.

Northwest of the peninsula, across Boston Harbor, is East Boston, connected by ferry with the main business section. Charlestown is located north of the peninsula and Cambridge is west, across the Charles River, and South Boston lies east of South Bay and Fort Point Channel. The fashionable residential section is in the southwestern part, extending to Roxbury.

**BUILDINGS.** The architecture is generally substantial and commodious and the buildings include many of historical interest, both from the style of construction and their association with great events. On Beacon Hill is located the State House, built in 1795, and in its vicinity are statues of Daniel Webster and Horace Mann and Saint Gaudens' Shaw Monument. The city hall, on School Street, and the customhouse, on State Street, are fine structures, and near the former is the county courthouse, erected at a cost of \$2,500,000. In the vicinity of Copley Square are many of the larger buildings, including the museum of fine arts, the public library, and the Second Unitarian Church. Here also is the New Old South Church, a fine Gothic architectural structure. The First Church of Christ (Scientist), the First Spiritual Temple, and the Roman Catholic Cathedral of the Holy Cross are among the finest ecclesiastical buildings. Boston has fully 300 churches, representing the leading Christian denominations, and its public library is the largest free circulation library in America.

Many of the office buildings, department stores, and public institutions are models of substantial construction and convenient architectural design. These include the Massachusetts General Hospital, the Chamber of Commerce, the Masonic Temple, the Sears and Ames building, the Tremont Temple, the Natural History Museum, the New England Conservatory of Music, and the Youth's Companion building. Boston has many theaters and other

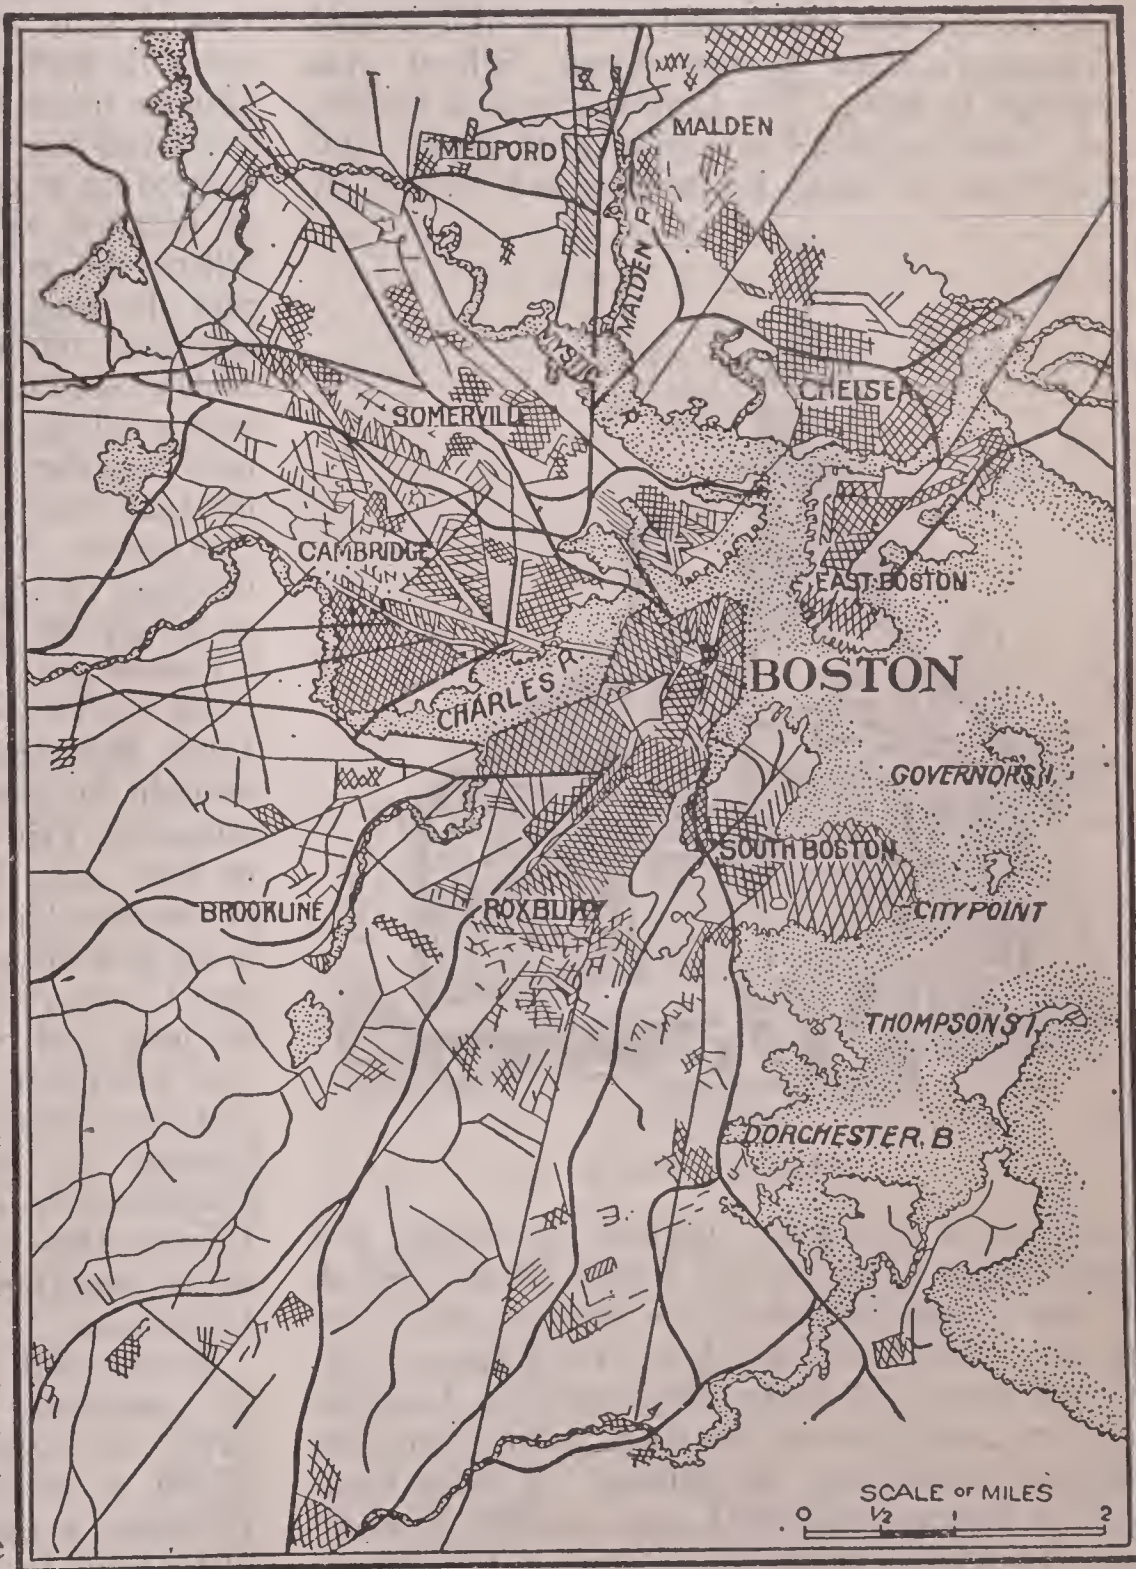

places of amusement, foremost among which is the Boston Theater. The Vendome and Touraine are residential hotels, and the Quincy House, the Adams, the Parker House, the Lenox, and the United States are among the larger commercial hotels.

Foremost among the historical buildings is the Christ Church, known as Old Church North, erected in 1723, in whose spire were hung the lanterns for Paul Revere. The Old State House, on Washington Street, at the head of State, dates from 1748. It was restored to its provincial appearance in 1882 and it contains a collection of interesting relics and paintings. King's Chapel, at the corner of School and Tremont streets, established in 1689 and rebuilt in 1754, was attended during the colonial period by the royal governors and has the oldest cemetery in Boston. At the corner of Milk and Washington streets is the Old South Meeting House, built in 1729. Other noteworthy structures are the Faneuil Hall, known as the "Cradle of Liberty," and the Old Corner Bookstore. Among the old cemeteries are Old Granary Burying Ground, containing the graves of Paul Revere and Samuel Adams; Central Burying Ground; and Copp's Hill Burial Ground, which contains the graves of Irving Cotton Mather and others of his family. King's Chapel Burying Ground contains the graves of John Winthrop and many early colonists.

**PARKS.** Foremost among the public grounds is The Common, one of the oldest and most interesting public parks in America. It is located in the heart of the city, containing 48 acres, and has been preserved for public use since 1674. The "Great Elm" stood near the center until 1876, when it was blown down, and at nearly the same place now stands the Soldiers' Monument, erected to the soldiers who fell for their country. The Boston Massacre is commemorated by the Crispus Attucks Monument, which stands near the Tremont Street Mall. The Public Garden, containing 24 acres, is near The Common, and in it are an artificial lake and

statues of Washington, Charles Sumner, and Edward Everett. Commonwealth Avenue, the finest boulevard of Boston, extends from the Public Garden into the Back Bay district, which is famed for its beautiful lawns and fashionable buildings. Marine Park, which includes Castle Island, North End Park, at the northern extremity of the peninsula, and the beautiful park of "The Fens" district are other points of interest and beauty. In the Arnold Arboretum are all the shrubs and trees that can be grown in the climate of Massachusetts.

Boston is noted for its many fine monuments, some of which have already been named in this article. Charlestown is the site of Bunker Hill monument (q. v.), a granite obelisk, and here also are a soldiers' monument, a monument to John Howard, and statues of Colonel

Prescott and General Warren. A statue of Beethoven is in the Music Hall; one of Governor Winthrop, in Scollay Square; one of Leif Ericson, in Commonwealth Avenue; one of Samuel Adams, in Adams Street; one of Admiral Farragut, in Marine Park; and one of Columbus, near the Roman Catholic cathedral.

**INSTITUTIONS.** Many educational and charitable institutions are maintained and liberally patronized. They embrace the Boston University, Massachusetts Normal Art School, Boston College, Massachusetts Institute of Technology, Perkins Institute, Tufts College Medical School, and the medical and dental schools of Harvard University. The Boston Latin School was founded in 1635. The Lowell School of Design, the New England Conservatory of Music, and a number of other institutions are centers of

FANEUIL HALL.

training in the arts. Besides the books and manuscripts in the Boston Public Library, which is one of the largest in the country, there are noted collections in the Boston Athaeneum, the Congregational Library, the American Academy of Arts and Sciences, the State Library, and the leading educational institutions. A large number of literary, historical, and scientific societies are maintained and much is done in the way of charity. Boston holds high rank in the maintenance of reformatories. The principal almshouses and penal institutions are on the islands in the harbor.

**INDUSTRIES.** Boston is preëminently a center of manufacturing, but many of the factories

owned and operated by citizens are located in towns of the surrounding country. The extensive transportation facilities make it possible to reach these factories, and the products are handled largely through the business houses of the city. The census of 1900 places the value of the manufactured product within the city at over \$205,000,000 per year.

The terminus of important railroads are located on a safe and commodious harbor. Boston is noted as the financial center of New England. Its foreign commerce ranks next to that of New York, and as a wool market it is exceeded only by London. The largest vessels enter its harbor, which is eight miles wide and sixteen miles long, and is protected by strong fortifications. Lighthouses and beacons are located on a number of the islands. The trade is handled at a system of freight terminals, where the railroads and ships come together, and the passenger traffic is cared for at two terminal stations, the South Station and the North Station. The export and import trade carries all articles of manufacture and production familiar to the American people, and the internal revenue collected annually is \$8,500,000.

**HISTORY.** The history of Boston may be said to begin in 1626, when the first settlement was made on the peninsula, and a few years later a company of colonists removed from Charlestown to join the settlement. These included John Winthrop and a number of colonists brought by him to Salem. The place was first known as Trimontaine, but was renamed Boston in 1630, and two years later the first meeting house was built. It soon became the principal town and business center of the Massachusetts Bay Colony, and was the chief seat of Puritan learning and religious life. In the movement for American independence, it took a leading and aggressive part. Here occurred riots following the Stamp Act, the skirmishes at Charlestown, the Battle of Bunker Hill, the Boston Massacre, the Boston Tea Party, and many important events following the Battle of Lexington.

Its material growth in wealth and as a center of commerce dates since the Revolutionary War. In 1822, when it had a population of 47,000, it received its charter as a city. The *Brittania*, a Cunard liner, was the first steamer of that line to enter the harbor, in 1840. William Lloyd Garrison and others did much to promote sentiment in favor of the abolition of slavery, and the city was enthusiastic in its support of the Federal government during the Civil War. A destructive fire swept over it in 1872, when about fifty acres of its business section were

laid waste. However, it was rebuilt to much better advantage and substantial modern structures replaced many of the older ones dating from colonial times. As a literary center it has taken a prominent place in learning and culture. In or near it lived Hancock, Motley, Thoreau, Lowell, Whittier, Longfellow, Prescott, Holmes, Parkman, and Emerson. The inhabitants are largely American, but include many Irish, Germans, English, and Italians. It is exceeded in population only by New York, Chicago, Philadelphia, and Saint Louis. Population, 1900, 560,893; in 1905, 593,598. and in 1910, 670,585.

**BOSTON MASSACRE**, an affray at Boston, Mass., on March 5, 1770, between seven British soldiers under Captain Preston and a mob of citizens. Several minor riots had taken place from time to time, owing to opposition by the people of Boston to the stationing of troops in the city. It took place on State Street, formerly King Street, where the soldiers were attacked with stones and other missiles. One of the soldiers who received a blow fired, and his companions, mistaking an order, followed in shooting at the mob. Three of the populace were killed and seven were wounded. The mob retreated and the bells of the city rang an alarm, causing several thousand people to gather, but no further hostilities took place. Several of the soldiers were tried on a charge of murder, but were acquitted. This affray did much to create a sentiment in favor of treating the colonists with consideration, and the garrison was removed to Castle Island.

**BOSTON TEA PARTY**, a popular name of an occurrence in Boston Harbor on Dec. 16, 1773. The American colonies had protested to Parliament against placing a tax on articles imported, and the American merchants entered into an agreement not to import from Great Britain while such tax was collected. However, that body declared their right to tax the colonists without their consent, and, when the English East India Company sent cargoes of tea to the port of Boston, the Americans resisted the collection of the duty. A conference was held in the Old South Meeting House, after which sixty men, disguised as Indians, boarded the vessels in the harbor and threw 342 chests of tea into the water. To retaliate, the government closed the port against all commerce and navigation.

**BOSTON UNIVERSITY**, an institution of higher learning at Boston, Mass. It was chartered in 1869 and is under the auspices of the Methodist Episcopal Church. The foundation was laid by Isaac Rich, who bequeathed a large part of his great estate for that purpose. It

offers both college and graduate courses, and has departments of liberal arts, agriculture, theology, law, and medicine. The post-graduate department is known as the School of All Sciences, which is affiliated with the University at Rome and the National University at Athens. Its agricultural department is at Amherst, Mass., known as the Massachusetts Agricultural College. The faculty consists of 150 professors and instructors, and the attendance is about 1,500 students.

**BOSWORTH** (böz'worth), a small town of Leicestershire, England, noted for the Battle of Bosworth Field, on Aug. 22, 1485. The battle was fought between Richard III. and the Earl of Richmond, afterward Henry VII. The former was deserted by his troops and rushed into the camp of the enemy, crying "Treason! treason!" and was slain. His death ended the Wars of the Roses. The town has a population of 1,150.

**BOTANY** (böt'ä-nÿ), the science that treats of plants—their structure, the functions of their parts, and the conditions governing their growth. It embraces a general description and classification of plants. The three kingdoms of nature are designated as *animal*, *vegetable*, and *mineral*. Life is a condition common to animals and plants, but the representative species of the two kingdoms are marked by a wide range of difference in form and structure. There are three main physical characteristics by which animals differ from plants. These consist in their food, the ability to move some or all of their parts, and the power of volition or will. Plants subsist on water, earth, and air, which they take in by their roots and leaves, while animals feed upon other animals and plants. The principal uses of plants are for animal food and protection, and to preserve the fertility of the soil and the purity of the atmosphere. The elements necessary for plant growth are light, heat, and moisture, and, since the requisite amount of these varies with different kinds of plants, we find in every climatic zone a flora peculiarly adapted to local conditions. Plants are propagated by seeds, spores, or particles of the main stock.

Botany treats of plants as wholes and also as consisting of various organs. The organs of vegetation are the *roots*, *stems*, and *leaves*. The roots grow downward and gather moisture and nutrition from the soil. They commonly divide into many small branches or fibers called *rootlets*. The part which grows upward and bears the leaves and blossoms is called the stem. It usually has many branches and branchlets, each having leaves in various proportions, but

in some species the leaves are wanting. The leaves are green or brownish, and grow mostly from the upper part of the stem. They are of different forms and sizes, with one side toward the sky and the other toward the ground. The foliage of plants is constituted of leaves. Plants and their organs and functions are treated under plants, which see.

**CLASSIFICATION.** The classification is now based on the particular species of plants and their principal affinities. By *species* is meant an assemblage of individual plants having characteristics in common, coming from the same original stock, and having seeds or spores that produce similar individual plants. The view is held that species of the same kind may exhibit differences which are characteristic of distinct plants, but this is true only after long periods of time and under vastly different conditions. Study is now generally confined to the affinity of plants of the same and different regions; to the cells and tissues by means of the microscope; to the growth of new species from different kinds; and to the relation of plants to their environments. The four principal divisions of botany now are: Structural or morphological, dealing with plant-structure; physiological, treating of the function and vital actions of plants; descriptive or systematic, relating to classification and arrangement; and paleontological, treating of fossil plants. Phanerogamic botany treats of flowering plants, and cryptogamic botany, of flowerless plants. See **Plants**.

**HISTORY.** The study of botany is not as old as astronomy or geography, but some branches of it were taught as early as the time of King Solomon, who spoke of plants "from the cedar in Lebanon even to the hyssop that springeth out of the wall." The first work on botany dates from Theophrastus, a pupil of Aristotle, who lived in the 4th century B. C. His classification of plants is unsatisfactory, but he showed much greater skill in the description of plant organs than scholars who lived in the centuries immediately following his time. In the 1st century of the Christian era Dioscorides, of Asia Minor, described about 600 plants in a work that was considered good authority until the revival of learning. About the same time Pliny the Elder described more than 1,000 species of plants. His work contains numerous errors and bears evidence of having been compiled from various sources, rather than written from personal investigation.

The Arabians gave much attention to this science in the 8th century, but material progress was not made until the 16th century, when Otto

Brunfels, a German writer, published an extended work in two volumes with able descriptions and cuts, under the title "History of the Plants of Strasburg." Other German writers soon followed with publications, and the store of knowledge was largely extended through works in the Dutch, Italian, and French. Before the end of the century the principal universities of Europe established chairs of botany and organized botanical gardens. Many scholars traveled throughout the latter part of the 16th and 17th centuries for the study of plant life and structure in both hemispheres. The microscope opened a new epoch in the science about the middle of the 17th century and led to the study of minute portions and sap pressure, and brought vegetable philosophy forward as a very important branch of knowledge.

Linnaeus, a Swedish naturalist, prepared and published a classification of plants in 1735, which was speedily adopted in place of those formerly used and served the purpose of study for many years, although it has long since been displaced. It is based largely on the characteristics and the production of the flowers and the seed. In the 18th century scholars investigated large groups or families of plants, and added many valuable discoveries to the science. The system promulgated by Bernard Jussieu (1699-1777), a French scholar, is based on previous discoveries and natural affinities of plants. He devoted much time to the culture of plants in gardens, took personal observation of their growth, and lectured extensively in the leading universities of Europe. His system is now the basis of the classifications that are generally approved. The system is set forth in his "Elementary Principles of Botany," published in 1804. He taught the subject according to this classification at Montpellier as professor of botany and later at Geneva. Other writers contributed valuable publications and lectures on the subject; those of Darwin rank among the highest.

**BOTANY BAY**, an inlet five miles south of Sydney, on the east coast of Australia. It was discovered in 1770 by Captain Cook, and so named on account of the large number of formerly unknown plants found there. The first English penal colony was founded at Botany Bay in 1788, and later it was removed to Port Jackson, near the site of Sydney. It was long known as Botany Bay Settlement. A monument was erected on the place where Captain Cook landed.

**BOTFLY** (böt'flī), a large, yellowish fly, parasitic in its early stages upon certain animals. The fully developed fly is more than

a half inch in length, and the female has an extensile abdomen. They lay their eggs upon the hair of the horse, which the animal removes to the stomach by the tongue. There they are hatched and the larvae hang to the coats of the stomach, where they remain about a year, when they are discharged with the excrement, and after a brief time become perfect flies. The bots are very injurious to the horse, when a large number infest the stomach. Botflies are likewise troublesome to sheep, cattle, and some of the wild animals, but the species differ, and those that infest sheep bore through the skin, under which the larvae mature.

**BOTHNIA** (bōth'nĭ-à), **Gulf of**, the northern extension of the Baltic Sea, between Sweden on the west and Finland on the east. It is about 430 miles long, 85 to 135 miles wide, and from 100 to 130 feet deep. The water is but slightly salty, owing to the inflow of numerous rivers and the limited evaporation due to its location in a cold region. It contains a number of good harbors and is the seat of much activity in the summer season for lumber, mineral, and fish exports by water navigation. In the winter it is frozen over and is crossed on the ice. It yields large quantities of fish, including herring, salmon, and mackerel.

**BO TREE**, or **Peepul**, the sacred fig tree of India and Ceylon. Trees of this kind are planted by the Buddhists near their temples. They yield a small edible fig, which is of little value, but the sap yields caoutchouc and the lac insect makes the tree its abode. At Anarajapura, in Ceylon, is a famous bo tree that was planted about 288 B. C. It is venerated by the Buddhists, since it is said that Vishnu was born under this tree. In 1887 it was partly destroyed.

**BOTTLE**, a vessel with a small neck, usually made of glass, and used to contain liquids. In ancient times bottles were made of leather, especially by the Egyptians and Greeks, and bottles of this class are still used in Spain, Sicily, Africa, and the East. Glass bottles have been found in the ruins of Pompeii similar to those in common use at present. They are manufactured by a process of glass molding. The small bottles are made of flint glass and the large ones of a cheaper grade of glass. In manufacturing a blowtube is used, and the molten material is placed in an iron mold.

**BOULDER** (bōl'dēr), a city in Colorado, county seat of Boulder County, on Boulder Creek, 5,835 feet above the level of the sea. It is situated twenty-five miles northwest of Denver, on the Union Pacific, the Colorado and Southern, and other railroads. The surround-

ing country is fertile, yielding considerable quantities of cereals, vegetables, fruits, and live stock. There are vast mining interests, especially those devoted to the production of gold and silver. Its manufacturing establishments include iron foundries, flouring mills, and smelting works. The climate is pleasant and healthful. It is a favorite resort for tourists and invalids, who come here on account of numerous thermal and mineral springs. Among its public institutions are a large sanitarium, the county courthouse, and the University of Colorado. It was incorporated in 1871. Population, 1900, 6,150.

**BOULDER**, a large rock found at a distance from the formation to which it belongs. The term *erratic boulder* is generally applied to rocks found lying detached on the surface, and *boulder clay* is used to describe the glacial drift, usually a compact blue or red clay, in which the boulders are found. These formations belong to the early quaternary times and are widely distributed. Boulder clay has been traced over vast regions of British America and the northern part of the United States. In Scotland it is known as *till*. Boulders belonging to the rocks of the Scandinavian peninsula are scattered over the plains of Denmark and northern Germany. Rocks of this class are abundant in the central section of North and South Dakota. It is thought that they were deposited from icebergs and glaciers.

**BOULOGNE-SUR-MER** (bō-lōn'sur-mâr'), a seaport city of France, at the mouth of the Liane River, on the Strait of Dover, about twenty miles southwest of Calais. The city is divided into the older and the newer parts, or the old and new districts, and has a castle which dates from 1231. It has vast commercial interests, owing to its fine harbor, extensive wharves, and excellent steamboat and railroad facilities. The manufactures include linen and woolen goods, machinery, earthenware, soap, clothing, and canned fish. It has a large export trade in coal, wine, dairy products, fish, corn, and various manufactured articles. Municipal facilities include waterworks, electric lighting, and a system of electric railways. Population, 1906, 51,201.

**BOULOGNE-SUR-SEINE** (-sân), a town of France, in the department of Seine, five miles west of Paris. It is on the Seine River, a suburb of Paris, with which it is connected by a fine stone bridge. The celebrated park and promenade in Paris, Bois de Boulogne, was named from this town. Population, 1906, 49,969.

**BOUNTY** (boun'tĭ), in economics, a pre-

mium paid by the government to the producers, exporters, or importers of certain articles. This is done to aid in fostering a new enterprise during its infancy, or protecting one long established, owing to its special benefit to the country. In 1890 the Congress of the United States authorized the payment of a premium to producers of sorghum, cane, and beet sugar by way of a bounty. This was done with the view of eventually increasing the production of sugar to equal the annual consumption. By reason of this encouragement large investments were made in sugar-producing interests and the production has been correspondingly increased. The term is applied to a government grant made to induce enlistments in the army, as at the time of the American Civil War, when from \$50 to \$900 was paid as an inducement for men to enter the service. Men serving in the British army in India receive a bounty as an inducement to extend the time of service.

**BOUNTY JUMPERS**, a term applied during the Civil War to persons who volunteered to secure a bounty and then deserted to enlist again in some other locality, under a different name, in order to secure another bounty. The government applied a severe penalty, but a number of persons took great risks, owing to the bounty being quite large.

**BOURGES** (bōōrzh), a city of France, capital of the department of Cher, 135 miles south of Paris. It is located at the junction of the Auron and Yèvre rivers, and is the focus of important railroad lines. In the old part the streets are crooked and poorly improved, but the newer section has many fine public and residential buildings. It is the seat of a college, a public library, a normal school, and a magnificent Gothic cathedral, known as the Cathedral of Saint Etienne. The trade is chiefly in wine, cereals, and live stock. Among the manufactures are clothing, leather, wine, and machinery. Julius Caesar captured it in 52 B. C., when it was known as *Avaricum*. Charles VII. of England made it his capital when Orleans was in the hands of the English. Population, 1906, 44,133.

**BOW** (bō). See **Violin**.

**BOW**, a weapon used in the chase and in war from remote antiquity, and still employed by savages in warfare and in many countries as a means of amusement. Two forms of the bow are in use, the *longbow* and the *crossbow*. The former is the earlier kind and the more celebrated, having been used as the weapon of archers in the Middle Ages. It passed out of use as a military weapon with the improve-

ment of firearms. The crossbow is now used in some field sports. It is made by attaching a bow to a stock resembling a musket, and discharges a short and stout arrow called a *quarrel*. The longbow is about five feet long, and discharges an arrow three feet long, furnished with a steel head. Wood is used most generally, such as yew, elm, and wych-hazel, though steel and other elastic materials make good bows. The savages usually poison the end of the arrows used in war.

**BOWDOIN COLLEGE**, the oldest seat of learning in Maine, and one of the earliest educational institutions established in the United States. It was incorporated at Brunswick by the General Court of Massachusetts on June 24, 1794, and received an endowment of six townships of wild lands in the then District of Maine. It bears the name of Governor James Bowdoin, a friend of Washington and Franklin, and who was eminent in the councils of his native State. His son, Hon. James Bowdoin, United States minister to France and Spain, was its earliest individual benefactor. His paintings, drawings, and private library were donated to the institution, and the last mentioned is now in Hubbard Hall, a fire proof building erected at a cost of \$300,000.

Upon the foundation of the traditional four years of classical and disciplinary studies, there have been added the numerous elective courses in history, modern languages, and the social sciences, so arranged that the well prepared student of more than average ability can complete the requirements for the degree of A. B. in three years. Special facilities for the study of natural sciences are afforded by the laboratories of the Searles Science Building. Throughout the curriculum all the teaching is done by professors in distinction from temporary instruction. The present endowment is about a million dollars and its plant is estimated at as much more. In 1820 the Medical School of Maine was established under the control of the president and trustees of Bowdoin College and its graduates now number several thousand. The first two years of the course are pursued at Brunswick and the last two at Portland, on account of clinical advantages from the hospitals. Bowdoin is remarkable in the number of its alumni, who have won national prominence. They include Chief Justice Fuller, Nathaniel Hawthorne, Henry W. Longfellow, and Thomas B. Reed. The average attendance is about 400 students.

**BOWER BIRD** (bou'ēr), the name of certain birds belonging to the bird of paradise family, native to Australia and New Guinea.

They were so named from the remarkable bowers or galleries which they construct. In size the different species vary somewhat, but the representative class is about the size of a jackdaw, and the plumage in the males and females is dissimilar, being a satin black in the former and a grayish-green in the latter. The bowers, built of twigs and leaves, are decorated with shells, flowers, bones, feathers, and other

SATIN BOWER BIRD.

conspicuous objects. They are not nests, but places of amusement, and in them the male performs queer antics to attract its mate. Both in architecture and ornamentation, these birds show remarkable skill and taste.

**BOWLING** (bōl'ing), an athletic game and popular amusement originated in England by the Anglo-Saxons. It is played chiefly indoors, though formerly it was an outdoor amusement and was played on a level piece of greensward. No game is more popular now at the practice rooms of athletic societies and in the gymnasiums of social and commercial clubs. In many cities the game is played in halls built especially for the purpose, and in which it is the only form of amusement. Each hall has one or more platforms called *alleys*. The alleys are carefully fitted with a hard floor, slightly convex in the center, and on each side is a gutter to catch the ball if it is not accurately rolled. At the further extremity ten pins are set up by an attendant, usually a boy. The pins are in most

cases of ash wood, about a foot in height and about two pounds in weight, and are arranged in the form of a pyramid, with the apex toward the bowler. A slanting roadway at one side of the alley serves to return the balls to the player. Each player may roll two balls, which are about twenty inches in circumference and sixteen pounds in weight. The balls are provided with thumb holes to enable the player to secure a firm hold. A *strike* is made when all the pins are knocked down with a single ball, and a *spare*, when all are knocked down with the two balls. Ten *innings* or *frames* make the game, and the one who knocks down the largest number of pins is the winner. The sizes of the pins and of the balls vary somewhat, and various games or matches are played, but these are too complicated to admit of full description except in a book of rules.

**BOWLING GREEN**, the county seat of Warren County, Kentucky, on Barren River, about seventy miles north of Nashville. It is on the Louisville and Nashville Railroad. The city has electric lights, waterworks, a fine courthouse, and two parks. It is the seat of numerous factories, including iron foundries, saw mills, flouring mills, and distilleries. The surrounding region is agricultural and has natural gas deposits. Besides having good schools, it is the seat of a Catholic academy and of Ogden College. It was incorporated in 1812. Population, 1900, 8,226.

**BOWLING GREEN**, a city in Ohio, county seat of Wood County, twenty miles south of Toledo, on the Toledo and Ohio Central and the Cincinnati, Hamilton and Dayton railroads. The chief buildings include the city hall, the county courthouse, and the central high school. It has manufactures of cut glass, canned fruits, ironware, and machinery. The municipal improvements include waterworks, gas and electric lighting, and a central heating system. It has a large trade in grain and farm produce. Bowling Green was settled in 1832 and was incorporated in 1854. Population, 1900, 5,067.

**BOX-ELDER**, or **Ash-Leaved Maple**, a small tree of North America, widely distributed in Canada and the United States. It is planted very extensively as a shade tree and for wind-breaks, because of its ability to withstand almost any extremes in climate. It grows rapidly and begins to bear seed in four or five years. The wood is of little value, but is used as fuel where timber is scarce.

**BOXING**, a match between two persons who strike each other with the fists. Formerly this art of amusement or exercise was an exhibition of pugilistic skill, in which the participants

sought to punish each other, but modern boxing has partaken form among the athletic exercises. When conducted under recognized rules, such as the *Queensberry Rules*, the elements that enter into a prize fight are eliminated and it is placed among the more meritorious amusements. The participants are classified according to their weights in six divisions, known as bantam, feather, light, welter, middle, and heavy. The maximum weights in each class are: *Bantam*, 105 pounds; *feather*, 115 pounds; *light*, 135 pounds; *welter*, 145 pounds; *middle*, 158 pounds; *heavy*, over 158 pounds. Boxers wear, as a means of preventing injury, thickly padded gloves, made of soft and pliable leather, to cover the back of the hand, the fingers, and the thumb. The rules are very numerous and provide regulations for matches of different kinds. In 1866 the Amateur Athletic Club was founded in England, and later the Amateur Athletic Union was organized in the United States. Contests for championships have been numerous, and the art of boxing will likely be maintained as an active and healthful exercise, but pugilistic contests in the nature of prize-fights are prohibited by law in most countries.

**BOX TREE**, an evergreen tree, from 12 to 15 feet high, native to Europe and Asia. It was cultivated by the ancient Greeks and Romans as an ornamental shrub in their gardens, and the wood was used for making boxes and ornaments. It is native to England and thrives in the countries bordering on the Mediterranean. The wood is hard, heavy, and yellowish in color, and takes a high polish. Most of the boxwood of commerce comes from the regions adjoining the Caspian and Mediterranean seas, where it is cultivated.

**BOYCOTTING** (boi'köt-ing), the name generally applied to a system under which a society or class decline to buy or sell to some individual or class of individuals. The name came from Captain James Boycott, who was the land agent at Mayo, Ireland, for Lord Erne, an Irish nobleman. On account of gross offenses to the people no one would assist in gathering his crops. The case was publicly reported and resulted in a *Boycott Relief Expedition* by which the crops were secured and the owner protected. Boycotts are prohibited by law in many states of the Union and have been a subject for legislation in most countries.

**BOYNE** (boin), a river in Ireland, rises in the Bog of Allen, and flows into the Irish Sea, after a course of about sixty miles. Along its banks are many institutions of learning, which has caused it to be called the "Boyne of Science." It is not only celebrated for magnifi-

cent scenery, but also for great events occurring near it. The adherents of James II. and William III. fought a battle on its banks in 1690, in which the former were utterly routed and compelled to flee in disorder. The anniversary of this victory, July 12, is still celebrated by Irish Protestants. The scene of the battle is marked by a monument 150 feet high.

**BOZEMAN** (böz'man), a city of Montana, county seat of Gallatin County, 95 miles southeast of Helena. It is located on the Gallatin River and the Northern Pacific Railroad, and has a large trade in agricultural products, merchandise, and live stock. The surrounding country has gold, silver, coal, and iron ore deposits, and large interests in farming and stock raising. Among its industries are flouring mills, brickyards, stone quarries, and machine shops. It is the seat of the State College of Agriculture and Mechanic Arts. Among the public buildings are a library, the county and municipal buildings, and several schools and churches. Population, 1900, 3,419.

**BRABANT** (brä'bant), a district in the central lowlands of Holland and Belgium. It formerly constituted an independent duchy, but has had many rulers and alliances in the past four centuries. In 1648 it was incorporated with the United Provinces, after the famous revolt of the Netherlands against King Philip. It was divided by the Peace of Utrecht in 1714, when a portion passed to the Spanish crown. It became a part of the Netherlands in 1814, and was again divided in 1830 into the provinces of Antwerp, North Brabant, and South Brabant. In the same year Antwerp and South Brabant were made a part of Belgium. North Brabant has an area of 1,980 square miles and a population of 605,420, and belongs to Holland. The province of Antwerp has an area of 1,093 and a population of 860,150; and South Brabant, an area of 1,268 square miles, and a population of 1,375,490. The southern portions are inhabited by Walloons, the central by Flemish, and the northern by Dutch. South of Brussels the language is chiefly French, and in the northern part it is Flemish, Dutch, and German. The subdivisions are all densely populated. The soil is fertile, producing cereals, sugar beets, vegetables, and grasses, and large interests are vested in manufacturing. Among the large cities included are Antwerp and Brussels.

**BRADDOCK** (bräd'dük), a borough in Allegheny County, Pennsylvania, on the Monongahela River, ten miles southeast of Pittsburgh. It is on the Pennsylvania, the Baltimore and Ohio, and other railroads. Among the

chief buildings are the public hall, several schools, and the Carnegie Library. The manufactures include ironware, cement, plaster, boilers, steel rails, and railway cars. It has waterworks, street pavements, and electric street railways. It is noted as the scene of the Battle of Braddock's Field, in 1755. The first settlement was made in 1795 and it was incorporated in 1867. Population, 1900, 15,654; in 1910, 19,357.

**BRADFORD** (bräd'fērd), a city in McKean County, Pennsylvania, sixty-three miles southeast of Dunkirk, N. Y., on the Erie, the Pennsylvania, and other railroads. It is located in a productive oil field, and is surrounded by a rich agricultural district. The city has large petroleum works, railroad machine shops, planing mills, glass works, brickyards, and nitroglycerin and torpedo works. There are street railways, electric lights, waterworks, a public park, and several fine schools. It has a fine public library and many schools and churches. The first settlement was made in 1823 and it was incorporated in 1879. Population, 1900, 15,029.

**BRADFORD**, a manufacturing city of Yorkshire, England, about twenty-eight miles southwest of York. It is noted for its manufacture of yarn and woollens; not less than 350 mills are in operation. It is beautified by several fine public parks, and has many charitable and educational institutions. The chief buildings include the town hall, the public library, the commercial exchange, the United Yorkshire Independent College, and the Art Museum. Several Protestant denominations have colleges in or near the city. The transportation facilities include the Bradford Canal, electric railways, and four lines of railroads. Among the manufactures are cotton and woolen goods, clothing, soap, ironware, boilers, and spirituous liquors. It has public waterworks, slaughterhouses, electric and gas lighting, and stone and asphalt paving. The growth of the city in wealth and population has been very rapid the past decade. It was incorporated as a city in 1897. Population, 1907, 290,323.

**BRAHMA** (brä'mä), the first person in the Hindu trinity, which consists of *Brahma*, *Vishnu*, and *Siva*. Brahma is worshiped as the universal power or basis of all existence, by certain castes of India. The three taken separately represent the *creator*, the *preserver*, and the *destroyer*. Brahma, the creator, as a personal god, is represented as a personage of a red color, with four heads and four arms. In one of the hands he holds a portion of the Vedas, in one a lustral vessel, in one a rosary, and in one a sacrificial spoon. As a person he

represents merely the agent of Brahma, the universal power, and is the god of the fates and master of life and death. His worship is common among the Brahmans.

**BRAHMANISM** (brä'man-iz'm), the religious and social system developed and expounded by the Brahmans, a religious caste among the Hindus. The ancient religious writings called the *Vedas*, the basis of the system, are held sacred and inspired. It is thought that the oldest of the writings were composed and uttered from 2400 to 2000 B. C. Max Müller, the German antiquarian, translated the Rig-Veda and regarded the whole as dating from about the 15th century B. C. However, its origin dates from no particular century, but seems to have been added to at many different periods as the priestly caste increased in number and power. In time the system became complex, and at least three other great castes originated.

The four early castes were the Brahmans, Kshatriyas, Vaisyas, and Sudras. The first are the philosophers, scholars, statesmen, and administrators of the Aryan people of India. To them the Sanskrit language and literature owes its origin. The second class consists of the warriors, the third class is constituted of the merchants, and the fourth class comprises the laborers. The Brahmans now represent about one-tenth part of those who hold the Vedas sacred. They are the most intellectual of all the classes and possess admirable ability for mathematical reasoning and metaphysical speculation. It is probable that the castes previously represented different races. The great diversity of modern industry and various intermarriages have given rise to innumerable distinctions. There are at least several hundred castes among the Brahmans alone, and quite a large number belong distinctively to each of the other three principal divisions. Many of the castes cannot partake of food prepared by others and are not allowed to intermarry.

From the 5th to the 1st century B. C. Brahmanism implied the worship of the one god, *Brahma*, with the three personages, or trinity, *Brahma*, *Vishnu*, and *Siva*. The idea of a one god and the belief in the first person, Brahma, were too abstract to endure for a long period of time. This led to a general worship of Vishnu, the preserver, and Siva, the destroyer, and the worshipers of these two deities now constitute the two great religious sects of India. The higher classes choose which of the two they prefer and hold the worship only as a means to reach the one first cause, or Brahma. The worship of Vishnu is conducted under

the forms known as Krishna and Rama, and that of Siva under the form called Lingam, with the power of Sukti—the power and energy of the divine nature in action. Hindu reformers are falling back to the teaching of the Vedas, that is, Brahma, with the triad Brahma, Vishnu, and Siva, being regarded the one god.

**BRAHMAPUTRA** (brä'mä-pōo-trä), meaning "son of Brahma," one of the great rivers of India. It rises in the plateau of Tibet and has a length of 1,800 miles. In the upper part of its course, where it is known as the Sanpo, it flows southeast along the northern slope of the Himalayas, and as it turns southward through the mountains it assumes the name of Dihong. In Assam it receives the inflow from a number of tributaries and is generally known as the Brahmaputra, a name applied by some writers to its entire course. It joins the Ganges about ninety miles from the Bay of Bengal, where they discharge after forming a common delta. The stream overflows in the rainy season and when the mountain snow melts, usually in June and July, and floods vast plains, rendering them fertile for the production of great quantities of cereals. More than 800 miles are navigable for commercial traffic, while the several channels of the delta furnish excellent inland connection. The river was first explored by Europeans in 1765.

**BRAIN**, that part of the central nervous system of animals that is found within the skull. It is held to be the seat of intellectual and mental power in man. The shape, when viewed from above, is somewhat like that of an egg. In composition it is soft and yielding, closely filling the cavity of the skull. It is inclosed in a double membrane called the *arachnoid*, which is as delicate as the web of a spider, and which forms a close sack filled with a liquid resembling water. Within this and within the spaces of the brain is a fine tissue. The tissue, called *pia mater*, is penetrated by hollows. The flow of blood to the brain is so copious that about one-fifth of the entire circulation of the body is used. The *dura mater* many blood vessels, which pass through the is a tough membrane which lines the bony cavity of the skull and incloses the entire brain mass, and separates the various parts of the organ by strong partitions.

The brain consists of three main parts called the *cerebrum*, the *cerebellum*, and the *medulla oblongata*. The cerebrum consists of two lateral hemispheres united by a thick, strong band of white tissue, and comprises about seven-eighths of the weight of the entire brain. In the lowest animals the cerebrum is wanting. It

makes its appearance as the scale of animals rises to higher forms. This part of the brain occupies the front and upper part of the skull. The bulk is composed of white nerve fibers. The fibers intimately connect with the fibers of the gray layer of nervous matter, which is found at the surface. The surface is wrinkled and folded, which gives ample surface for the gray matter, in some individuals as much as 675 square inches. The cerebrum is the center of thought and intelligence. The cerebellum is located in the back of the head, below the cerebrum. It is smaller than the cerebrum, but in construction is quite similar, except that it has parallel ridges instead of convolutions. This enables the gray matter of the cerebellum to lie in the white matter within. The cerebellum is

b—CEREBELLUM.

d—CEREBRUM.

the center for the control of the voluntary muscles, particularly those of motion. The various movements of the body, such as grasping, balancing, and walking, arise in the cerebellum, while the nerve-cells of convolution in the cerebrum are the seat of volition, consciousness, and educational intelligence, and of the faculty of language.

The medulla oblongata is the upper enlarged part of the *spinal cord*. It extends from the upper border of the first vertebra to the *pons*, which are connected at each side with the cerebrum above and the cerebellum behind. It is divided by tissue into a right and left portion, and the latter is separated by grooves into four columns. When the cerebrum is injured by disease or otherwise, persons become unable to converse intelligently, both from inability to remember words and a loss of power to articulate them. In an idiot this portion of the brain is not well developed. In persons having an injured or diseased cerebellum there is a tendency to totter and walk with uncertain movements as if intoxicated; all their movements and work are irregular and uncontrollable.

Man possesses a large cerebrum in proportion to the weight of the brain, while in lower animals the cerebellum is larger than the cerebrum. The cerebrum seems to be large in order to provide for an emergency in case of injury. Small parts of the human brain have been lost by accident and in war, and, after recovery from the wounds, men suffered little or no impairment of their mental faculties. This is somewhat analogous to an instance in which a person has lost the use of one eye, the other eye supplying him with the sense of sight. Brain force is developed by activity and grows by exercise.

The average weight of the human brain is about forty-five ounces in females and fifty ounces in males. In some notable instances it attained a weight of seventy-five ounces. The brain of an idiotic boy weighed eight ounces, and a female idiot had a brain weighing ten ounces. The brain of Agassiz weighed 54.4 ounces, that of Byron 63.7; Cuvier, 64.5; and Turgeneff, 74.8. The ability of a man does not depend upon the size of the brain so much as upon its quality, but it is known that men of great ability possess large brains, and that the brains of cultured races are much larger than those of savages. The brain being a delicate organ, it is influenced largely by the condition of the body, requires food adapted to its growth and sustenance, and needs the recuperation which results from healthful rest. It is subject to many diseases, which usually prove either decidedly harmful or fatal. They include *brain fever*, *tumors*, and *inflammation of the brain*.

**BRAINERD** (brān'ērd), county seat of Crow Wing County, Minnesota, about 115 miles southwest of Duluth, on the Northern Pacific and the Minnesota and International railroads. It is surrounded by a rich agricultural country, is a grain and jobbing center, and has modern municipal facilities. The manufactures include flour, machinery, clothing, cigars, and earthenware. It has flouring mills and extensive railroad shops. The school system is well established and carries an excellent course of study. It has electric lights, pavements, waterworks, and a fine courthouse. In 1883 it received its charter as a city. Population, 1905, 8,133.

**BRAINTREE** (brān'trē), a town of Massachusetts, in Norfolk County, ten miles south of Boston, on the New York, New Haven and Hartford Railroad. It is the seat of Thayer Academy and the Thayer Public Library. The manufactures include cotton goods, boots and shoes, hardware, paper, and machinery. Large granite deposits are worked in the vicinity. The first permanent settlement was made on its site

in 1634, and the town was incorporated in 1640. Population, 1905, 6,879; in 1910, 8,066.

**BRAKE**, a device for retarding or arresting motion by means of friction. In railroad cars and machinery it usually consists of a simple or compound lever, connected with a shoe or band, which is forcibly pressed on the periphery of the wheel that is to be stopped or reduced in its speed. The problem of supplying suitable brakes for railroad and street cars has engaged the attention of inventors for several decades. Hand brakes are now used largely for retarding motion in small machines, while air and electric brakes are common on street and railway cars and in large machinery. In an air brake either the compression or vacuum may be used. In the former the air is compressed by a pump attached to the engine and is conveyed to cylinders under the cars by means of pipes, where it acts on the brake-levers. The vacuum method is the reverse; the air is exhausted from the device beneath the car, and the brake-levers are acted on by atmospheric pressure. The electric brake is used largely on electric railways. It is constructed so the car-motor will become a dynamo as soon as it is disconnected from the trolley wire, and as such it generates a force sufficient to act upon the brake-levers.

**BRAKE**, or **Bracken**, a class of ferns found in many parts of America and other continents. It is large and coarse and has a creeping root-stalk, from which naked stalks about fifteen inches high grow up. It grows in rocky regions and on hillsides. The early frosts kill the annual growth, and in the spring new shoots come up from the rootstalk or rhizome, which has a bitter taste and is used to a limited extent as a substitute for hops.

**BRAMBLE** (brām'b'l), the name of a kind of blackberry native to Great Britain. This plant is not cultivated for its fruit, which is of a fair quality, because it spreads rapidly and in this respect resembles an obnoxious weed. The word *bramble* is used in America to describe collectively such plants as the blackberry, raspberry, and blueberry.

**BRANDENBURG** (brān'den-bōōrg), a province and city of Prussia, in the German Empire. The province has an area of 15,383 square miles. It is fertile and farming is conducted with much care. Rye and barley are the chief cereals, and tobacco, fruit, and vegetables are grown. Brown coal is mined extensively, but manufacturing is the leading industry. The chief towns are Königsberg, Potsdam, and Frankfort-on-the-Oder. In 1905 the population was 3,108,554, nearly all of whom

were German Protestants. The present ruling family of Germany, the Hohenzollerns, came into the possession of Brandenburg in the 15th century; in 1711 they ascended to the kingly line of Prussia; and in 1871 became the imperial family of Germany. The city of Brandenburg is on the Havel River, thirty-five miles southwest of Berlin. It has extensive factories producing woolens, leather, silk, pottery, machinery, chemicals, and clothing. It is the seat of excellent schools, churches, and higher institutions of learning. The city is a focus of important railroads, has electric lights and street railways, several parks, and a large trade in merchandise. Population, 1905, 51,239.

**BRANDON** (brăn'dün), a city of Canada, in Manitoba, 132 miles west of Winnipeg. It is pleasantly situated on the Assiniboine River, on an elevated site, and on the Canadian Pacific and the Canadian Northern railways. It has a large trade in grain and live stock. The chief buildings include a courthouse, a convent, and a collegiate institute. The manufactures consist of machinery, flour and oatmeal, ale and porter, earthenware, pumps, and clothing. Near the city is an experimental farm that is con-

ducted by the government. Brandon was founded in 1881 and has had a rapid growth, owing to its car shops and its location in a fertile farming country. Population, 1906, 10,408.

**BRANDY** (brăn'dÿ), a liquid secured by distilling grape wine, manufactured chiefly in France. Both red and white wines are used. The brandy known as *Cognac* manufactured in the department of Charente is considered the best grade, and is transported to America in large quantities. *Catawba* brandy is made in Ohio from the *Catawba* grapes, while high grades of other varieties are made on the Pacific Coast, where the vine attains a prolific growth. Brandy is used in medicines, for stimulants and restoratives, and as a beverage. The

amount of alcohol contained in brandy depends upon the wine from which it is distilled. Some of the higher classes contain a larger per cent. of alcohol and are expensive; as much as twenty dollars per gallon is paid for genuine cognac. The product now made in California is considered equal to the French varieties. The pure quality consists almost entirely of alcohol and water, and is wholly colorless until it is put in kegs, when it takes on the color of wood. *Apple-jack*, a kind of brandy, is made from apple cider, while another variety is made from peach wine.

**BRANDYWINE**, a small stream in Pennsylvania, passing into the State of Delaware, and flowing into the Christiana Creek at the city of Wilmington. The stream became historic on account of the Battle of Brandywine, which was fought on its banks Sept. 11, 1777, between the British and Americans, in which the latter were defeated. The American forces consisted of 13,000 men under General Washington, and the British of 18,000 under Lord Howe.

**BRANTFORD** (brănt'fērd), a city of Ontario, in Brant County, seventy miles east of London, on the Grand Trunk Railway. It is nicely situated on the Grand River, which is navigable within two miles of the town, and from that point it is connected by canal with Lake Erie. It has manufactures of stoneware, machinery, engines, clothing, and flour, and has a brisk trade in farm produce and merchandise. Many of the buildings are of pressed brick and stone, and modern utilities, such as gas and electric lighting, are well patronized. The public buildings include a number of fine schools, and it is the seat of the Ontario Institution for the Education of the Blind and of Wickliffe Hall. A fine monument of Brant, the famous Mohawk chief, stands in Victoria Square. Population, 1901, 16,631.

**BRASS** (brăs), an important alloy of zinc and copper. It is hard, ductile, and malleable, and the color is a bright yellow. Formerly it was made from calamine mixed with copper and charcoal. This process is easier than the fusion of copper and zinc. The proportion of copper and zinc varies, but ordinarily from twenty-eight to thirty-four per cent. of zinc is used. It is harder and yet more easily fusible than copper, and is more sonorous. Brass resists the influence of the atmosphere better than copper, but requires a varnish or lacquer to prevent tarnishing, and is readily turned on a lathe, rolled, and stamped.

Brass was used in very ancient times, and is mentioned in the cuneiform writings of the

Chaldeans and the Assyrians. In the Middle Ages it was made chiefly in the form of sheets, and was used for household utensils and for a number of purposes in churches. The ancient method of making brass was by heating copper with calamine, a native ore of zinc, and charcoal. James Emmerson patented a process for the direct production of brass from copper and zinc in 1781, and this has superseded the older methods. It consists of first melting the copper in a crucible, then adding small quantities of the zinc, and when the two metals are thoroughly mixed, which is brought about by stirring, the molten brass is cast into molds made of sand or iron. Owing to the volatility of the zinc, considerable of this metal is lost during the operation unless much care is exercised.

One part of zinc and two parts of copper, by weight, is a good working basis in making brass. If the proportion of zinc is increased, the compound loses in tenacity, while an increase of copper adds to its strength and tenacity. When the proportion is one part of zinc to ten of copper, the result is a reddish-yellow brass. If a small per cent. of lead is added to the alloy it diminishes its ductility. The addition of tin increases the hardness of brass. *Tombac* and *pinchbeck* contain eighty parts or more of copper to twenty or less of zinc. *Bristol brass*, *similör*, *Mannheim gold*, and *prince's metal* are names used to describe brass made by using different proportions of zinc and copper. In the arts, brass is of importance next to iron and steel. It is used largely in making buttons, pipes of organs, household utensils, and many parts of machinery.

**BRATTLEBORO** (brät't'l-bür-rô), a town in Wyndham County, Vermont, on the Connecticut River, about eighty miles southeast of Rutland. It is located on the Vermont Central and the Boston and Maine railroads. The manufactures include furniture, carriages, organs, and machinery. It is the seat of the Vermont Asylum for the Insane and has fine churches and schools. The famous writer, Rudyard Kipling, made Brattleboro his home for some time. Brattleboro was chartered in 1753 and named from William Brattleboro, one of the original grantees. Population, 1900, 5,297.

**BRAZIL** (brá-zil'), county seat of Clay County, Indiana, about fifteen miles east of Terre Haute, on the Chicago and Eastern Illinois and other railroads. It is located in a rich farming country, and near it are productive coal fields. The manufactures include pig iron, terra cotta, boilers, machinery, and pottery. It has a good jobbing trade, a public library, waterworks, and a courthouse and other public

buildings. The region was settled in 1856 and it was incorporated in 1873. Population, 1900, 7,786.

**BRAZIL, United States of**, the largest country of South America, occupying the eastern and central part of that grand division. It extends from north latitude 5° to south latitude 34°, and from west longitude 35° to 74°. Its extreme length from north to south is 2,665 miles, extreme breadth, 2,688 miles. In extent of territory it is one of the largest political subdivisions, exceeds in area the Commonwealth of Australia, and is somewhat smaller than the United States exclusive of Alaska and the insular possessions. It is bounded on the north and east by Colombia, Venezuela, Guiana, and the Atlantic; while its southern and western boundaries are formed by the Atlantic, Uruguay, Argentina, Paraguay, Bolivia, Peru, and Ecuador. It lies entirely east of the great Andean system, and touches every South American country except Chile. Area, 3,218,991 square miles.

**SURFACE.** The surface consists of two great sections, the lowlands known as the Amazon basin and the elevated plateaus of the central and eastern parts. The lowlands comprise the basins of the Amazon and other great rivers, extending from the Tocantins to the Guiana Plateau, which rises gradually toward the north and forms the larger part of the northern boundary, culminating in the Tumuc-Humac Mountains, between Brazil and Guiana, and the Parima Mountains, which lie on the boundary line of Venezuela. The elevated plateaus of the central and western parts are made up largely of the Highlands of Brazil, which have an elevation of from 2,000 to 10,000 feet above the sea, culminating in Mount Itatiaia, west of Rio de Janeiro. These highlands are made up of many ranges, one of which separates the basin of the Paraná from that of the Paraguay, and trends northward between the Tocantins and the São Francisco. The highest of these ranges trends parallel to the coast, which is known as the Serra do Mar south of Rio de Janeiro, and as Serra do Espinhaco north of that city. Brazil has a coast line of about 4,000 miles. The coast south of Cape Saint Roque is more or less broken and furnishes good harbors, while north of that point it is comparatively low with an extensive coast plain. The surface contains more fertile land than is found in any other country, most of which is in the basin of the Paraná and the Amazon. Marshes and swamps characterize different sections of the country, especially the valley of the Paraguay and of the regions in the lower valley of the Amazon.

**DRAINAGE.** The Amazon and the Tocantins drain more than two-thirds of Brazil. About one-fourth of the drainage is by the Paraná, the Paraguay, and the Rio de la Plata, and the remainder is carried by the São Francisco and smaller streams. The Amazon, which is formed by the union of streams that rise in the Andean Mountains, has a general easterly course toward the Atlantic, and receives a large number of important tributaries. These include, besides the Tocantins, which joins it in one branch of the delta, the Purus, Javari, Juruá, Madeira, Tapajos, and Xingu from the south, and the Iça, Yapurá, and Negro from the north. This river system has a length of about 19,000 miles, and the navigable distance is placed at 13,000 miles. Near the delta the basin is narrow, not more than about 150 miles wide, but it expands inland and occupies all of the northeastern part of Brazil. The São Francisco and a number of smaller streams drain the eastern section, and the southern part is drained by the Paraguay, Paraná, Iguassu, and Uruguay rivers. These rivers are of more than passing importance in the commerce of the country, chiefly for the reason that they furnish the only means of transportation in the vast interior.

**CLIMATE.** The tropic of Capricorn passes on a line drawn a short distance south of Rio de Janeiro, hence Brazil lies almost entirely within the tropics. Rainfall is abundant in all parts of the country, ranging from seventy to one hundred inches annually. It is distributed quite uniformly in all sections, but is greatest in the valley of the Amazon. Two seasons, the wet and the dry, alternate each other, the greatest amount of precipitation extending between January and June. The seasons are influenced by the movement of the trade winds, which follow the sun from north to south, and depend somewhat upon the character and elevation of the surface. Near the mouth of the Amazon, particularly toward the south, and in some parts of the plateau region, the rainfall is limited, especially between the Paraná and the São Francisco. The climate is quite even throughout the year. The maximum temperature is  $95^{\circ}$ , and in most places does not fall below  $70^{\circ}$ , except in the higher altitudes, where it ranges from  $30^{\circ}$  to  $90^{\circ}$ .

**MINERALS.** All the important minerals are found in Brazil, and it is probably the richest country in this respect. The gold deposits are chiefly in Bahia and Minas Geraes, and these two states have the largest interests in mining this mineral and in the output of diamonds. Iron ore is found in many sections of the Brazilian Highlands and in the mountains of the Guiana Plateau, but little progress has been

made in mining this ore on account of a scarcity of cheap fuel and labor. Santa Catherina and Rio Grande do Sul have extensive deposits of bituminous coal and a good grade of lignite is found in many sections, but mining has not been developed to any considerable extent. Other deposits include silver, copper, zinc, rock salt, and kaolin. Many mineral springs and deposits of gas and petroleum abound.

**MANUFACTURING.** Brazil has not taken a foremost position among the nations in the output of its manufacturing enterprises, chiefly for the reason that it is not densely populated and consequently lacks both in labor and capital. However, the vast natural resources and a steady growth in agriculture are rapidly directing attention to this enterprise. The textile industry is the most important, and includes the spinning and weaving of cotton and wool. The cotton and woolen mills are located chiefly in the states of Minas Geraes, Rio de Janeiro, and São Paulo. Next in importance is sugar refining, which is developed to the greatest extent in the states of Bahia and Pernambuco. Shipbuilding is an important enterprise at Rio de Janeiro and a number of other seaports. Cigar making and the manufacture of rum and other spirituous liquors are important industries. Leather is made in large quantities. Other manufactures include matches, soap, clothing, machinery, and straw hats.

**AGRICULTURE.** The valley of the Amazon is the most fertile region and contains the largest forests in the world, but many parts of it are covered with dense tropical vegetation. This accounts largely for the section not being developed for farming. However, it is important for its timber, which yields vast quantities of dyewood, rubber, nuts, and lumber.

Farming is developed most extensively in the southeastern part, in the states of São Paulo, Bahia, Minas Geraes, and Rio de Janeiro. In this section are large coffee plantations, and in the production of coffee Brazil takes first rank. Sugar cane is cultivated profitably in these states and in Pernambuco, and cotton is grown in all of the Atlantic states. Tobacco is grown largely, especially in Bahia, and rice and maize are cultivated extensively in São Paulo and Minas Geraes. The smaller cereals are not cultivated extensively in this section, but experiments made in the higher altitudes have demonstrated that they may be grown profitably. Other products include potatoes, beans, yams, vegetables, and Paraguay tea. All the domestic animals reared in North America thrive, but attention is given chiefly to the rearing of cattle and breeding of horses.

**FLORA AND FAUNA.** The flora is tropical and may be classified according to three zones, that of the southeastern plateau, that of the lower Amazon basin, and that of the west central section. The plants in the southeastern part, near the tropic of Capricorn, are numerous and luxuriant, but somewhat farther northwest the rainfall diminishes and the region is diversified by open country and small forests. In the lower Amazon basin the vegetation is most luxuriant, and includes a large variety of grasses, vines, and forest trees. Here thrive the mangoes, mangroves, palms, silk-cotton tree, rosewood, cinnamon, Brazil nut tree, and the *seringa* or rubber tree. The eucalyptus, which has been introduced from Australia, thrives in this section. Vegetation in the southwestern part is smaller and the number of plants are fewer, owing to a somewhat scant rainfall, but the prairies are covered with nutritious grasses and contain scattered groves of trees.

Many animals abound in the forests and on the plains. The larger animals include the puma, ocelot, jaguar, and tapir. Monkeys are very abundant in the selvas, and deer abound in the southwestern region. Ant-eaters, armadillos, sloths, opossums, and peccaries are plentiful. The boa, jararaca, and rattlesnake are among the reptiles. The Atlantic coast and the larger streams are rich in fish, and the varieties exceed those of any other country. Birds of plumage and song abound in all sections, but they are especially numerous in the forests.

**TRANSPORTATION.** The railroads are regulated by law and about two-thirds are owned by the government. They include lines that aggregate 15,000 miles and many lines have been projected. Nearly all of the railroads are near the Atlantic coast, in the southeastern part, and the vast interior is entirely destitute of railways. However, shipping is facilitated by navigation on its extensive systems of rivers, a number of which have been improved by constructing canals and removing obstructions. The government has encouraged shipbuilding by appropriations, hence an excellent merchant marine has been built up, but the vessels take care of domestic commerce rather than foreign trade, which is carried largely by the vessels of other countries. Telegraph and telephone lines connect the larger cities, but these facilities are practically unknown in the remote interior.

The exports greatly exceed the imports, and the total foreign trade annually has a value of \$390,500,000. Great Britain has the largest share of the trade. Next are Germany, France, and the United States, in the order named. Coffee is the most important article of commerce and

constitutes about sixty per cent. of the total exports. About two-thirds of it is exported to the United States and the balance to Europe. Sugar ranks next to coffee in value as an article of export. Other exports include rubber, cotton, tobacco, hides, lumber, drugs, dyewoods, and minerals. The imports consist chiefly of machinery, cotton and woolen fabrics, flour, breadstuffs, wine, corn, and chemicals.

**EDUCATION.** Public education is regarded with deep concern by the people, but is still in a very primitive state, and about seventy-five per cent. are unable to read and write. The school system includes three classes: the primary, secondary, and superior. Higher education is controlled by the state and general governments, while the other institutions of learning are under local control and supervision. The higher schools include colleges and universities devoted to medicine and law, and to the industrial, naval, and military arts. Several normal schools are maintained for the training of teachers in the fundamental elements of their profession. Some of the states have compulsory attendance laws, but they are not enforced, while in others attendance is voluntary. The language of the country and that taught in the schools is the Portuguese.

**GOVERNMENT.** Brazil is a republic and for the purpose of government is divided into twenty states and a federal district. The constitution vests the chief executive authority in a president, who is elected for a term of four years by popular vote. He is assisted by a cabinet of six ministers, who preside over the departments of war; finance; industry, railroads and public works; navy; interior and justice; and foreign affairs. The legislative power is in a congress composed of a senate and a chamber of deputies. Each state has three senators, making a total of sixty members, who are elected by direct vote for nine years, one-third being elected every three years. Representation in the chamber of deputies is based upon the population of the several states, and the members are chosen by popular vote for four years. The system of courts culminates in the national supreme court, which is the highest judicial authority. Each state maintains its own executive, legislative, and judicial authority, and for the purpose of local government is divided into *municipalities* and *districts*.

**INHABITANTS.** The population of Brazil is greater than that of any country in America except the United States, but the average density is only 4.5 persons to the square mile. About one-half of the people are whites, one-

third half-breeds, and the balance Negroes and Indians. Immigration has been encouraged by the government, which sold the land at prices ranging from \$1.00 to \$2.00 per acre, payment to be made in about seven years. The largest number of immigrants come from Germany and Italy, and it is due to this influx of Europeans that Brazil is gaining in national strength. About ninety per cent. of the people are Roman Catholics, but the church and state are entirely separated and all faiths are tolerated. Rio de Janeiro, the capital, is the most important financial and commercial center. Other cities of importance are Bahia, São Paulo, Santos, Pernambuco, Pará, Campos, Belem, Maranhão, Ceará, and Pelotas. The total population of Brazil in 1900 was 17,371,069.

**HISTORY.** Brazil was discovered in 1500 by Vicente Yañez and Pinzón, who landed at Cape Saint Augustine and explored the coast north to the Orinoco River. Two Portuguese expeditions were sent to explore the coast and plant colonies as early as 1501 and 1503. However, the settlement of Brazil was not decided upon until 1530, when grants were given to individuals who received power to establish colonies and develop trade. Many of the early attempts failed on account of contact with the Indian natives, who were decidedly unfriendly to the settlements of the whites. A colony was established on the Bay of Rio de Janeiro in 1567. The royal family of Portugal, the house of Braganza, was expelled from Portugal by the French in 1808 and took refuge in Brazil, under whose guidance the country enjoyed marked prosperity in commerce and internal improvements. The eldest son of the king declared Brazil independent of Portugal and was crowned emperor as Dom Pedro I. in 1822.

The discovery of gold and diamonds early in the 18th century led to a number of settlements and these minerals soon became a source of profit. This proved an effective incentive to immigration from Europe, especially from Portugal and Spain, and the government began to develop greater stability. Not long after the adoption of a constitution in 1824, serious international complications arose, but Portugal, although losing its largest and most productive colonial possession, formerly recognized the independence of Brazil. Later opposition arose to the reign of Dom Pedro I., and he voluntarily abdicated in 1831 in favor of his eldest son and returned to Portugal. The government was administered by regencies for the next nine years, when a popular agitation led to the declaration of the young prince's majority, then fifteen years of age, and his corona-

tion as Dom Pedro II. He reigned successfully for forty-eight years, when a revolution broke out and he was dethroned on Nov. 15, 1889. The country then became a republic without bloodshed, and the government was entirely reconstructed and reorganized.

**BRAZIL NUT**, or **Cream-Nut**, the seed of the *Bertholletia excelsa*, a beautiful tree native to the northern part of South America. The tree grows to a height of 120 feet and is valuable both for its seeds and the wood it yields, which is known as brazil wood. The seeds

BRAZIL NUT.

grow within a woody pericarp, or seed vessel, and vary in number from fifteen to twenty. They are popularly called nuts and are sold on the market by the popular name of *Nigger-toes*. The nuts are triangular in form, and within the hard shell is a white kernel, which is very agreeable to the taste. It yields a large per cent. of oil, which is used for burning in lamps by the natives. Large quantities of Brazil nuts are exported from Pará and French Guiana to the markets of Europe and America.

**BRAZIL WOOD**, a kind of wood derived from several trees native to the tropical regions of the Western Hemisphere, and exported largely from Brazil and the West Indies. A number of grades are known in commerce, such as *Lima wood*; *Pernambuco*, *Santa Martha*, *Sapan*, and *All Saints*, the names indicating products of different value. Brazil wood is yellow when newly cut, but when exposed to air it becomes red, and as a dyestuff is exported after being ground down to the size of sawdust. It is a heavy, hard wood, and is used in cabinet making. The coloring matter is obtained by weathering the ground wood, then

boiling it in water or alcohol, when it yields its coloring matter known as *brasilin*. It is used in making red ink and in calico printing.

**BRAZOS** (brä'zôs), the largest river located wholly in Texas. It rises in the northwestern part, has a southeasterly direction, and flows into the Gulf of Mexico. It is 940 miles in length, of which over 200 miles are navigable in the rainy season, from February till May.

**BRAZZA** (brät'sâ), an island in the Adriatic Sea, belonging to Austria-Hungary. It has an area of 150 square miles and is diversified by mountains and valleys. The soil is generally fertile and produces grain and fruit. Marble quarries are worked profitably. For the purpose of government it is annexed to Dalmatia. San Pietro, the chief town, has 3,500 inhabitants. The island has a population of 24,465.

**BREAD**, an article of food made of the flour or meal of grain, especially wheat and rye. The flour is mixed with water or milk and salt so as to form a consistent paste known as *dough*, and it is then baked in an oven. Bread is either *leavened* or *unleavened*, depending upon the ingredients used. Leavened bread is made by mixing the dough with yeast

OVEN FOR BAKING.

A, receptacle for loaves; B, fire-box.

or baking powder to produce fermentation and rising, or lightness, and the mixture is kneaded twice, once at the time of mixing and a second time after the first rising, and it is then made into the form of biscuits or loaves, which are given a brief time to rise before baking. Unleavened bread is heavy and compact, since it is made by using only flour and water, but it has the advantage of keeping longer, therefore is used more generally by those who cannot secure leavened bread regularly. However, leavened bread is used generally.

A light and porous unleavened bread is made by using an acid and a carbonate of ammonia, or a carbonate of soda. The carbonate is driven off by the heat in the process of baking. This is known generally as *aërated bread* and is used extensively in London and other cities of England. *Whole-wheat bread* is made by using

unsifted ground wheat. It is the true *Graham bread* is more nutritious than white bread, as it contains about fourteen per cent. of nitrogenous matter, while white bread contains only about seven per cent. An excellent bread is made of rye, and this kind is a popular food in many countries of Europe, while in others rice, corn meal, potatoes, and beans are utilized in the production of bread. It may be said that the temperature of a country is an important factor in determining the kind of bread eaten. Barley, rye, and oats are used most extensively in the colder regions, wheat and maize in the temperate portions, and rice and millet in the hotter countries. The principal adulterations of bread are made by the addition of a cheaper flour, such as adding that of rice and beans to the flour of wheat. They are harmless, but add weight and diminish the cost of production.

Grinding grain and baking bread, both leavened and unleavened, have come down to us from remote antiquity. The ancient Egyptians and Assyrians were skilled in these arts. It is thought that the Greeks and Jews learned how to make leavened bread from the Egyptians, and after the rise of Rome this knowledge was carried to the nations of Central and Western Europe. The yeast now used is constituted mainly of the minute cells of a fungous plant and multiplies by budding. It was used in making beer before it became known as a valuable requisite in making bread. When brought in contact with water and flour, it develops alcohol and carbon dioxide, and the former passes off in the process of baking, while the latter is retained in the dough. Bread becomes light and porous from the amount of gas which acts to distend it, and when the dough is sticky and does not allow the gas to escape the bread becomes heavy. Since 1858 machinery has been used extensively in bread making, and in the course of time caused it to develop into one of the most important enterprises. Most of the bread now consumed in large cities is made in bakeries, and is delivered direct to the customers, while the people in the country bake their own supply, which consists largely of leavened bread and light biscuits.

**BREADFRUIT**, the large fruit of the breadfruit tree. It attains a globular form, about the size of a child's head, and is used largely for food. It is baked, stewed, roasted, or fried in palm oil. The eatable part lies between the hard outer skin and the core. When baked, it is white and about the same consistency as wheat bread. The tree is cultivated in the West Indies and the South Sea

Islands. It attains a height of forty feet. The wood is valuable for building and the bark yields material for cloth.

BREADFRUIT.

**BREADNUT**, the fruit of a tree closely allied to the breadfruit, native of Jamaica. It has evergreen leaves and yields a gummy milk. The fruit is a one-seeded drupe, which is edible, and forms an agreeable article of food after being boiled or roasted. It has the taste of hazelnuts and is eaten as bread. The wood of the tree is used in veneering.

**BREAKWATER** (brāk'wā-tēr), a wall, mole, pier, or some similar structure placed at the entrance of a harbor with a view of deadening the force of the waves which roll in from the ocean. Breakwaters are variously constructed of floating bridges, made of wood, brick, stone, and iron, or suspended from chains, and of solid walls or mounds built up from the bottom of the water, with stone inclosing large blocks of concrete. Among the notable breakwaters in the Great Lakes is the one at Chicago, protecting the harbor of the city against the waves of Lake Michigan. It is built on a solid stone basis and incased with wooden beams. Another solid structure is at Buffalo, on Lake Erie, another at Cleveland, and a third in Delaware Bay. Among the most noteworthy in Europe are those at Cherbourg, France, and Plymouth, England. The one at Cherbourg was proposed by M. de Cessart to the French government, and is the largest and most expensive ever constructed. It was completed by Napoleon III. at a cost of nearly \$3,000,000. The ancient Romans constructed several breakwaters at Italian ports, and other

similar structures were made very early in history. In some places they serve for fortifications and residences. In most cases they are constructed from one to five miles from the shore, this depending upon the depth of the water and the conditions surrounding the city or harbor to be protected.

**BRÉCHE-DE-ROLAND** (brāsh'de-rō-lān'), a pass in the Pyrenees, between Spain and France, located a short distance west of Mont Perdu. It was so named from Roland, who, according to a legend, opened the rock with his sword Durandal so the army of Charlemagne could pass through. The defile is about 200 feet wide and is bordered by rocks that rise almost perpendicularly on both sides.

**BREDA** (brā-dä'), a city of Holland, in the province of North Brabant, at the confluence of the Aa and Mark rivers. It has railroad facilities and an important trade. Among the manufactures are cigars, clothing, carpets, and machinery. Formerly it was strongly fortified, but the fortifications were dismantled several centuries ago. In 1566 it was the meeting place of the Dutch nobles, who drew up the "Compromise of Breda," which was presented to the King of Spain. Population, 1906, 27,644.

**BREECH-LOADING GUNS** (brēch'-lōd'-īng), a term applied to firearms in which the charge is introduced at the rear end of the barrel instead of the muzzle. The mechanism is so constructed that the breech can be opened and closed for the purpose of receiving the charge. This gives a decided advantage in small arms for cleaning and rapid firing. While the use of this class of guns dates back to the 16th century, the general introduction of them is quite recent. The efficiency of these firearms for military use was demonstrated in 1864 and 1866 in the Prussian campaigns against Denmark and Austria, and they contributed largely to the victories of the German army in 1870-71. The Prussian gun (Zündnadelgewehr) has been superseded by the Mauser, a needle gun with metallic cartridges on much the same principle. There are now many kinds of breech-loading guns, both for the purpose of hunting and for military use. Germany and most of the nations use the Mauser; England, the Lee-Netford; Austria and Brazil the Mannlicher; and the United States, the Krag-Jörgensen.

**BREEDING**, the art of continuing or improving breeds of domestic animals by continuous care in feeding and pairing. All animals and plants are susceptible to modification under systematic cultivation. This fact has been

turned to advantage by combining in individual specimens a number of good qualities found in several different kinds of original stock. The principles taken advantage of are those of heredity, variability, selection, and crossing. The germs of all that is desired must be found in the specimen to be improved, and the process must be by slow development during long periods of time, else an essential loss will occur in some line at the expense of the higher qualities desired. Breeding for the improvement of all kinds of domestic animals has shown excellent results since the beginning of the last century, although considerable attention was paid to horse breeding from remote periods. The production of increased yields in quantity and fineness of wool in sheep, and beef and milk in cattle, is especially marked, while breeding in swine has largely increased the annual returns to farmers. One important principle to be observed is that the best results are produced between animals comparably similar, changing the breed gradually to the higher quality.

**BREMEN** (brēm'en), an important free city in Germany, on the Weser River, about fifty miles from its mouth. The free district has an area of ninety-nine square miles, and, besides the city, includes Bremerhaven, a port on the estuary of the Weser. The port has wet and dry docks, an excellent harbor, and a hospitiun for emigrants; population, 23,991. Bremen is one of the most important and historic cities of Europe. It was made a bishopric in the year 788 by Charlemagne, and was for some time a member of the Hanseatic league of cities. The government is by a senate and a council, under a constitution which is republican in form. Bremen is the principal seat of the German export and import trade, and the most important port for emigrants. Its foreign commerce extends to all the countries of the world, including a large trade with the United States. The imports aggregate about \$95,500,000 worth of commodities, while its exports are correspondingly large. The manufactures include sugar, tobacco products, ironware, machinery, pottery, fabrics, chemicals, cordage, steamboats, and engines. Among the chief buildings are a Gothic council house, the town hall, the merchants' house, the exchange buildings, and a cathedral founded in 1050. The school system is open to free admission and the attendance is compulsory. The public schools carry courses which range from the kindergarten to the high school, and the instruction is closely articulated with that given in the gymnasiums and trade schools. It has a large public library, many well kept promenades, two extensive parks, and

modern harbor and wharf improvements. The city is a focus of many railroads and canals. Telephone and telegraph lines connect it extensively, and it is finely paved and beautified by statuary, electric lighting, and equestrian fountains. Intercommunication is by a system of electric railways, with branches to Bremen-haven and many inland points. Population, 1905, 214,861.

**BRENHAM** (brēn'am), county seat of Washington County, Texas, in the south central part of the State, on the Houston and Texas Central and the Gulf, Colorado and Santa Fé railroads. It is surrounded by a fertile grain and cotton country, and is an important business and shipping center. The chief buildings include the courthouse, the public library, the Blim Memorial College, and the Evangelical College. Among the manufactures are carriages, ironware, machinery, and furniture. It was first settled in 1844, and was incorporated in 1866. Population, 1900, 5,968.

**BRESCIA** (brā'shē-à), a city in northern Italy, capital of a province of the same name, about 150 miles from Turin, with which it is connected by railroads. The manufactures include silk and linen textiles, machinery, pottery, and firearms. The surrounding country produces considerable quantities of raw silk, fruits, and cereals. Brescia is noted for its fine churches and cathedral, and contains several botanical gardens, hospitals, museum of antiquities, a theater, and an extensive public library. It is mentioned in history as early as 15 B. C., when it became a Roman colony. Charlemagne captured it in 774, and it was long a possession of Germany. In 1859 it was ceded to Sardinia and the following year was united with Italy. Population, 1906, 70,614.

**BRESLAU** (brēs'lou), a city in Germany, capital of Prussian Silesia, at the junction of the Ohlau and the Oder rivers. It is one of the largest cities in the German Empire, containing a growing population and varied industries. A number of handsome bridges across the Oder connect the two parts of the city. It is joined to the marts of trade by several canals and railroads, and has an extensive urban and inter-urban system of electric railways. The municipal facilities include a public library, waterworks, stone and asphalt paving, and systems of gas and electric lighting.

Breslau is the seat of a university founded by Leopold I. in 1702, which is attended by 1,750 students. The institution has a library of 350,000 volumes, and carries courses of study in all the higher branches, which are taken advantage of by students from remote countries. It has

a large number of magnificent churches, among them the Protestant church dedicated to Saint Elizabeth, with a steeple 364 feet high and a splendid organ. While the city contains a number of old parts, it has been largely affected by modern trade, and has responded liberally to the demands of modern culture and architecture. It has manufactures of woolen, silk, linen, and cotton goods, jewelry, machinery, lace, earthenware, soap, firearms, and various other staple products. Its commerce in flax, timber, hemp, metals, corn, and coal is very extensive. While the city is German in language and government, it is of Polish origin and was long occupied by Poles and Bohemians. It afterwards passed to Austria, and was conquered by Frederick II. of Prussia in 1741. It has been frequently besieged and was the scene of many fierce battles. At present it ranks as one of the most important cities of Europe from the standpoint of manufacture and commerce, as well as for educational advancement. Population, 1905, 470,904.

**BREST** (brĕst), a seaport city of France, in the department of Finistère, 385 miles west of Paris. It occupies a fine site on the Bay of Brest, at the mouth of the Penfeld River, and is connected by railways with the leading cities of the country. Its harbor is one of the best in France and it is an important marine station. The manufactures include clothing, wine, soap, and machinery. Its commerce consists mainly in machinery, brandy, wine, cereals, fish, and colonial goods. A cable line connects it with America, near Duxbury, Mass. It is beautified by paved streets, modern municipal facilities, promenades along the coast, and several ancient castles. It has been the scene of many severe struggles. Owing to its location near the English Channel and its nearness to the Bay of Biscay, it was made a naval arsenal by Louis XIV. and was rendered almost impregnable. In 1694 the English and Dutch were repulsed at this fortification, and in 1794 Howe blockaded it and won a great victory over the French fleet off the coast. Population, 1906, 85,294.

**BREVIARY** (brĕ'vĭ-ă-rĭ), the book which contains the ordinary and daily services of the Roman Catholic Church. The contents of the Breviary include all of the service except those for funerals, baptisms, and other special occasions, which are in the Ritual or Pontifical, and those used in the celebration of the Eucharist, which are in the Missal. The clergy and religious are obliged to recite the service for the canonical hours every day. It is divided into two parts, one containing the morning and the other the evening service.

**BREWING** (bru'ing), the art of making malt liquor. The term is applied to the extracting of wort or any saccharine substance from grain. In making beer, three raw materials are used, that is, hops, barley, and water. The first process is known as *maling*, which consists of causing the grain to germinate so the starch is changed into sugar. It consists of *steeping* the barley three or four days, during which time it absorbs some of the water and begins to swell and soften. It is then spread to a depth of about one foot in the malthouse, where it germinates and throws out sprouts. After about ten or twelve days it is taken to the dry kiln, where it is heated to a temperature of 90° to 150°, depending upon the kind of liquor desired, pale beer requiring the minimum and brown beer the maximum temperature. When the malted grain is fully dried and crisp, it is in a condition for brewing.

The next step is to pass the malted grain between two rollers so as to bruise or crush it, when it is known as *grist*. In this form it is put in the malt tub and mixed with water heated to 170°. It is constantly stirred with mechanical mixers and in this stage is known as *mash*. It requires three or four hours to complete the process, after which the liquid, now known as *wort*, is drained off and run into vats containing the yeast, in which fermentation (q. v.) takes place.

In the United States the brewing business is one of the chief sources of revenue, paying as an internal tax \$35,500,000 to the general government. Its sale is also taxed by many of the states and cities. Over 60,000 men are employed directly as laborers in brewing, and many thousands are engaged in the wholesale and retail trade. There has been a contention for many years regarding the liquor question. In some states it has become the principal political issue between the parties. With the adoption of improvements in manufacture, as the use of sterilized water, filtered air, and artificial refrigeration, beer is made free from bacteria and injurious organisms, and is greatly less perishable. Pasteur made several discoveries in scientific brewing. He was among the first to announce why beer, like the lip that quaffs it, is subject to disease. See **Beer**; **Bacteriology**.

**BRIBERY** (brĭb'ĕr-ĭ), a reward or valuable consideration given or accepted by any one with a view of unlawfully influencing judgment or conduct in a public office or some other capacity. This definition is the one usually applied at present, and includes alike the giver and the receiver, both being considered equally guilty on conviction. The charge of bribery is sometimes

alleged against candidates for office, voters, and members of legislative bodies. Legislation with suitable penalties has been directed against it. It is a crime even if the party accepting the bribe does not pursue the course agreed upon. Officers of the general government may be removed from office on conviction of bribery.

**BRICK**, a molded and burned block of clay, forming a species of artificial stone. The name is also applied to the unfinished product when in a molded plastic state, or when it has been dried and repressed, before being burned. Brick were made at remote periods of antiquity by the Egyptians, Babylonians, Assyrians, and other people of ancient history. They mixed sand and straw with the clay and baked the brick in the sun. When made in this way they are known as *adobe* brick. In cold countries freezing would soon dissolve these brick, but they are valuable in warm and dry climates, and some of them have been preserved for more than three thousand years. Many contain written characters, especially those of Babylon, to indicate the name of the reigning king, and are of priceless value in conveying historic facts to the present age. Brickmaking was introduced in Western Europe by the Romans in the year 44 A. D., and in England by the Anglo-Saxons under King Alfred, in 886. In the time of Henry VIII. and Queen Elizabeth the manufacture became vastly important, the product entering largely into the construction of forts and public edifices. Kiln-baked brick are found in the larger ruins of ancient Babylon, where they were used to face or bind together walls of sun-dressed brick in a manner quite similar to the plan of constructing buildings with hard and soft brick at the present time. However, it appears that the kiln was not used much before the time of the higher Babylonian civilization. The people of Holland have long ranked as skilled manufacturers of brick. In the early history of New York they brought large quantities of their product to America, many of which may still be found in the older part of New York City.

Various clays are used in brickmaking. They consist chiefly of silicates, the simplest, and are known as *fire clays*, of which *fire brick* are made. Clays that contain iron burn red, while those containing no iron appear white, although the brick commonly manufactured vary greatly in color. Fire brick are made from clay that contains little material which burns easily. The size of brick varies on account of the different clays used and the amount of heat applied in burning; those subjected to intense heat shrink somewhat. The usual size employed in build-

ing is about eight inches long, four inches wide, and two and one-half inches thick, while sidewalk brick are sometimes made eight inches square and two and one-half inches thick.

In making brick it is best to dig the clay in autumn and expose it to the influence of the rain and frost in order to break it up easily. It should be worked over a number of times and the brick may be molded and burned the following spring. On a small scale brick are made by hand, but for larger productions large machinery is used. The clay is mixed with sand and thoroughly worked in a pug mill, after which the material is put into molds and placed in a drying shed or in the sun. They are taken to the kiln to be burned when dry, which usually takes place in from eight to ten days. The kilns have flues or cavities for the insertion of fuel, and spaces for the passage of the fire and hot air to penetrate the brick stacked in regular order within. The burning is done by gas, wood, or coal, and varies from a few days to two weeks according to the method employed.

In recent years many improvements have been made in the manufacture of brick, particularly in 1893, when the dry-press system came into use. By means of this system the clays are subjected to a pressure of about six hundred tons, in the dust form, and molded ready to put into the kiln. The number of brick burned in a single kiln varies from a few thousand to a million. The dry-press machine has been brought to a high point of perfection and by it from 7,000 to 20,000 brick may be prepared for the kiln in a single day. The pressed brick are the most expensive and are used mostly in the construction of the medium-sized business buildings and in residences. Those used in sidewalks, chimneys, and outside walls are burned harder than those that enter into the inside walls, because of the greater wear when exposed to the weather. Machine-made brick are more durable and heavier than those made by hand because of the greater pressure applied in manufacture.

Pavements are constructed to a large extent of *paving* brick, which are made of a clay that contains a considerable amount of lime. The lime fuses in burning and causes the finished product to become very hard. In the market they are frequently called *vitriified* brick. The larger use of steel frames in constructing the tall buildings of modern times has caused brick to be employed extensively for filling the interior walls, though in some instances they have been replaced by cement. In many buildings, especially in the larger fireproof structures, *hollow* tiles are used for the inside walls.

**BRICKLAYING**, the art of building with brick. The principal implements of a bricklayer are a *trowel*, for spreading mortar; a *hammer*, for dividing and driving brick; a *plumb line*, for carrying the wall up perpendicularly; a *compass*, for maintaining longitudinal levels; a *rod* five or ten feet long, for taking measurements; and a *hod*, for carrying brick or mortar to the workmen. In small buildings brick and mortar are borne on the shoulders of laborers, but in large ones elevators are used. The mortar is made of lime and sand. The foundation of a brick building is an essential part, as buildings crack by settling unequally, if the basis is defective or the foundation is not based on a solid bottom. Bricklaying has been greatly lessened in larger cities by the newer process of constructing large buildings with steel framework and the use of stone.

**BRIDEWELL** (brīd'wĕl), a well in London, between Fleet and Thames streets, from which the name was given to a palace, parish, reforma-

of that country. The first Roman bridge was built across the Tiber under Ancus Martius. Permanent bridges are now constructed in all civilized countries, though in some countries they are few and imperfect. In India few were erected before the British occupancy of the country.

Bridge building became very common in Europe with the extension of the military influence of Charlemagne, and he also established ferries for the safe and permanent crossing of streams. Societies were organized in France and Germany in 1720 to promote the construction of bridges in all parts of those countries. It is thought that the first stone bridge in England was built in 1087 near Stratford, and the second in London in 1186, which was not finished until 1209. Many of the early bridges were erected by companies as business investments and tolls were charged for crossing them. Others were erected by the general government and paid for by tolling. The largest bridges of the world

EADS'S BRIDGE, SAINT LOUIS, MO.

tory, hospital, and industrial school. It is now quite generally applied to a police station or a house of correction.

**BRIDGE**, a structure for carrying a highway over a stream, river, valley, or other impediment to its course. Bridges are constructed of stone, brick, wood, and iron, and seem to have existed from a period of considerable antiquity. The Chinese built them for many ages, perhaps the earliest among the ancients. The first bridges or passages made over streams or ravines were no doubt of trees. Bridges for military purposes were devised long before permanent structures for the convenience of the inhabitants were erected. These bridges were often of boats made to float on the water, with connections for the safe passage of armies. Some bridges were constructed by Cyrus about 536 B. C.; Darius, about 490; and Xerxes, about 480. The Romans seem to have been the first to use stone or brick. They carried the art of bridge building to Greece, after their conquest

were not built until after steam machinery was invented, which caused a demand for immense iron structures for the passage of railroad trains across streams and cañons.

The construction of bridges varies greatly with the time they are to be used and the purpose they are to serve. *Stone* bridges usually consist of an arch or series of arches. The length of the arch is called a *span*, the perpendicular supports are the *piers*, and the portion that receives the thrust or lateral pressure of the arch is called the *abutment*. The height of the pier depends entirely upon the land adjacent to the stream and the depth of the basin, usually from fifty to one hundred feet high, and the length of the span also varies greatly. The *girder and truss* bridges, especially those using the tubular girder, have largely superseded the arch. Other forms are the *steel arch* and the *cantilever* (q. v.) bridges.

The small bridges of one span have no piers and are supported entirely by the abutments.

GRAND TRUNK DOUBLE-TRACK STEEL ARCH BRIDGE OVER NIAGARA RIVER.

It often adds strength to have the abutments solidified so a single span will answer the purpose, thus avoiding the necessity of a pier in the strong current. In some cases two or more piers may be distributed so as to occupy positions which are not in the main channel. *Arched* bridges proceed from the sides of the space which they span and are keyed by a *keystone*, sometimes a number of arches constituting the groundwork of a single bridge. *Suspension* bridges span the entire stream, the weight resting entirely upon the piers at the two ends. A number of different methods of construction are employed, but usually the roadway is suspended by chains or wire ropes anchored securely to the masonry or iron at the ends of the bridge. *Swinging* bridges are common in large cities where traffic is carried by boats on canals, or across rivers navigable by large vessels. These bridges are so constructed that they may be turned or swung on a center so as to provide an opening for the passage of vessels, and, when closed, furnish safe passage for

called the Brooklyn Bridge. It was commenced under the direction of J. Roebling, in 1870, and completed in about thirteen years. It is 135 feet high, 5,989 feet long, and cost nearly \$15,000,000. About two miles north of the Brooklyn Bridge is the East River or Williamsburg Bridge, on which work was commenced in 1898. It connects Brooklyn with Manhattan Island, is 118 feet wide, and its longest suspension span is 1,600 feet. Its entire length is 7,200 feet. Midway between the two is the newer East River Bridge, on which work was commenced in 1907.

The Cantilever Bridge over the Niagara is built almost entirely of steel. Its total weight is 3,000 tons, length 810 feet, and cost about \$900,000. A similar cantilever bridge spans the Saint John River, in New Brunswick, which has a length of 813 feet. The Poughkeepsie Bridge, across the Hudson River, was built in 1889 and has a length of 6,767 feet. It has five spans, but only three are cantilever spans.

The bridge over the Firth of the Forth, near Edinburgh, Scotland, is 7,295 feet long. It has

WILLIAMSBURG BRIDGE, NEW YORK CITY.

street cars, railway trains, and pedestrians. Many such bridges cross the Chicago Drainage Canal, some having as high as eight railroad tracks, weighing over 7,000,000 pounds, capable of supporting about 9,000,000 pounds, and costing nearly a million dollars. Bridges that may be opened and closed are collectively termed *drawbridges*. They include a class known as *lift bridges*, the ends of which are anchored to framework towers so the span may be raised by means of winding drums.

Below is given a list of the notable bridges of the world:

The new London Bridge is constructed of granite, designed by John L. Rennie. It was commenced in 1824 and completed in about seven years, costing \$7,290,000.

The Bridge of the Holy Trinity at Florence, Italy, was built in 1569. It is almost entirely of white marble, 322 feet long, and stands unrivaled as a work of art.

The first large suspension bridge in the world was built across the East River in New York,

two spans of 1,710 feet each. It is about 370 feet high, contains 51,000 tons of steel, has twenty-five acres of surface to paint, and cost about \$15,000,000. It was commenced in 1883 and completed in seven years.

The Victoria Bridge across the Saint Lawrence River at Montreal, Canada, is tubular and nearly two miles long. It was completed in 1860 at a cost of \$6,300,000.

The Eads's Bridge across the Mississippi River from Saint Louis, Mo., to East Saint Louis, Ill., was designed by James Eads, begun in 1869, and completed in five years. It is regarded one of the most wonderful engineering products in America. The cost of the bridge and an immense tunnel under the city of Saint Louis was over \$10,000,000.

The bridge across the Ohio River at Louisville, Ky., is one of the largest iron bridges in America. It has twenty-seven spans, and is 5,310 feet long.

The Omaha Bridge, across the Missouri River, has eleven spans of 250 feet each, and a

total length of 2,800 feet. It is the longest swinging bridge ever constructed, having a swinging span of 520 feet.

The largest bridge ever built was the Tay Bridge near Dundee, Scotland. It was completed in 1877, and destroyed by a gale in 1879. This bridge had eighty-five spans, was 10,612 feet long, and cost \$10,750,000.

**BRIDGEPORT** (brīj'pōrt), a seaport in Connecticut, county seat of Fairfield County, at the mouth of the Pequonnoc River, fifty-eight miles northeast of New York. It is on the New York, New Haven and Hartford Railroad, has a good harbor on Long Island Sound, and carries an extensive navigation and railroad trade. The large sewing machine factories of Wheeler, Wilson & Co. and Elias Howe made the city famous. Besides sewing machines, it manufactures clothing, saddlery, carriages, cigars, machinery, and cartridges. Among the chief buildings are the public library, the county courthouse, the post office, and the customhouse. It is noted for its fine schools and numerous institutions of learning, which include the Barnum Memorial Institute. The city has extensive systems of waterworks, sewerage, and electric street railways. It was chartered as a city in 1836. Population, 1900, 70,996; 1910, 102,054.

**BRIDGETON** (brīj'tūn), county seat of Cumberland County, New Jersey, on Cohansey Creek, thirty-eight miles south of Philadelphia. It is conveniently located on the West Jersey and Seashore and the New Jersey Central railroads, and is a thriving business center. Its manufactories produce clothing, nails, glass, carriages, and woolen goods, and include rolling mills and tanneries. There are numerous beautiful churches and educational institutions, including the West Jersey Academy, South Jersey Institute, and Ivy Hall Seminary. The city has rapid transit, pavements, waterworks, and several libraries. It was settled before the Revolution and was incorporated in 1864. Population, 1905, 13,624.

**BRIDGETOWN**, a city of the West Indies, capital of the island of Barbados. It is located on the western coast, along Carlisle Bay, and is the terminus of a railroad. The chief buildings include a hospital, the town hall, and the government building. It has several fine churches, including the Church of Saint Mary and the Church of Saint Michael, and in Trafalgar Square is a statue of Lord Nelson. It is fortified, having a well-equipped garrison. Bridgetown was originally called Indian Bridge. It was partly destroyed by fire in 1845 and has been visited by several hurricanes. Population, 1906, 31,500.

**BRIDGEWATER** (brīj'wā-tēr), a town of Massachusetts, in Plymouth County, twenty-six miles south of Boston, on the New York, New Haven and Hartford Railroad. It has modern municipal facilities, including waterworks and electric lights. Among the chief industries are brickyards, a shoe factory, and machine shops. It is the seat of a State normal school, a State workhouse, and has several fine school buildings. The first settlement was made on its site in 1645, when it was known as Nuncketest, and in 1656 it was incorporated as Bridgewater. Population, 1905, 6,754.

**BRIDGEWATER**, a town of Nova Scotia, in Lunenburg County, twelve miles west of Lunenburg. It is located at the head of the La Have Estuary, and has the main offices of the Nova Scotia Central Railway. Its buildings include several schools and churches, and it has a good trade in merchandise. In 1899 it was partly destroyed by a fire. Population, 1906, 5,462.

**BRIGANDAGE** (brīg'and-āj), the name applied to the system of robbery organized by gangs of highwaymen, who make their home in secluded places in the forests or among the mountains. Brigandage was at its height in the period of barbarism, when might was recognized as the only right, and those engaged in it practiced robbery upon wayfarers or held them for ransom. It is older than human history, dating back to times before civilization had its rise. The history of Greece accounts that heroes distinguished themselves by suppressing it, and Hercules rid the country of robbers who infested the caverns. In Germany the so-called robber barons practiced brigandage, and we have examples of it in British history in Robin Hood and Dick Turpin. In France the name *brigands* was first applied to the mercenaries who occupied Paris in 1358, when King John was imprisoned.

Brigandage is still practiced in semicivilized countries, or where the government does not exercise a vigorous policy in protecting the life and property of its citizens or those who may sojourn in the country. Regions not densely populated, even in highly civilized countries, are sometimes infested with brigands. We have examples of brigandage as late as 1901, when Ellen Stone was kidnapped in Macedonia and held for a ransom. She and her companion, Madame Tsilka, were detained about five months, until Feb. 6, 1902, when they were released at Strumitza, Turkey, on payment of a ransom of \$72,000. Several other noted cases of brigandage took place recently in Morocco and other countries bordering on the Mediterranean. Jesse James (q. v.) and other brigands

committed train and bank robberies in the western section of the United States. These crimes were committed usually in small towns or in regions not densely populated, and to escape arrest the robbers destroyed telegraph connection.

**BRIGHTON** (brī'tūn), a seaport on the English Channel, in Sussex County, England, fifty miles south of London. It was made the summer residence of George IV., then prince of Wales, in 1782, and has since been popular as a fashionable resort in the summer season, when about 30,000 visitors are here constantly. It is located on elevated cliffs and has many mineral springs. A promenade and drive over three miles long stretches between the city and the coast, one of the finest in Europe. It has beautiful edifices, fine gardens, and several colleges and institutions devoted to learning. The aquarium contains a fine collection of marine life. Although Brighton has some trade and manufactures, it is noted particularly as a center of art and education and as a seaside resort. Population, 1907, 129,023.

**BRIGHT'S DISEASE**, a granular disease of the kidneys, so named because Robert Bright (1789-1858), an English physician, first made a diagnostic description of it. Its early symptoms consist of the secretion of urine containing a large amount of albumen and less specific gravity than natural, attended by pain in the loins, frequent urination, indigestion, and finally dropsy. It is a fatal disease, remedies having only a palliative effect. It is sometimes induced and always greatly aggravated by the use of alcoholic drinks. The most skillful treatment should be obtained on the appearance of the first symptoms.

**BRIMSTONE.** See **Sulphur.**

**BRINDISI** (brēn'dē-zē), a seaport city of Italy, in the province of Lecce, forty-five miles northeast of Taranto. It is situated on a bay of the Adriatic Sea, on a small promontory, and has railroad conveniences and a considerable trade in produce and merchandise. The chief buildings include an ancient castle, a cathedral, and several schools and monasteries. The harbor was dredged by the government in 1860, and it is now entered by the largest sea-going vessels. Anciently it was important as a commercial center, but it declined until the opening of the Suez Canal, when it began to gain in foreign trade. Vergil died at Brindisi in 19 B. C., and at the time of the Crusades it was important as their chief port for embarking to the Holy Land. Population, 1906, 26,347.

**BRISBANE** (brīz'bān), the capital of Queensland, Australia, on the Brisbane River,

about twenty-five miles from its mouth. It occupies a fine site, has an extensive harbor, and is the terminus of several railways and electric railroad lines. The river divides the city into two parts, known as North and South Brisbane, which are connected by the Victoria iron bridge. Among the chief buildings are the post office, two cathedrals, a university, and the State capitol, which was erected at a cost of about one million dollars. Brisbane has four parks and many large stone business buildings. It has waterworks, sewerage, stone and asphalt paving, and gas and electric lighting. The city was founded in 1825 as a penal colony by Sir Thomas Brisbane. When Queensland was set off as a separate colony in 1859, it became the capital, and has since made rapid progress in commerce and wealth. Population, 1906, 132,468.

**BRISTLES** (brīs's'ls), the coarse hairs of the hog and some other animals. They are glossy and stiff, and are largest on the back, especially in the wild boar. Bristles are used for various purposes in manufacturing, in making brushes and saddlery, and to some extent by shoemakers. The best grade is obtained from swine grown in cold countries, where the bristles are longer and stiffer. Large quantities are secured from slaughterhouses in the United States and Canada, where they are a by-product. The best grades are imported from Russia and Germany.

**BRISTOL** (brīs'tūl), a borough of Connecticut, in Hartford County, twenty miles southwest of Hartford, on the New York, New Haven and Hartford Railroad. It has a public library, a fine high school, and well-paved streets. The manufactures consist largely of machinery, clocks, ironware, and woolen and cotton goods. Among the municipal facilities are electric street railways, waterworks, and a system of sewerage. It was incorporated as a borough in 1893. Population, 1910, 9,527.

**BRISTOL**, a borough of Pennsylvania, in Bucks County, twenty-two miles northeast of Philadelphia, opposite Burlington, N. J. It is on the Delaware River and on the Pennsylvania Railroad. Fine mineral springs abound in the vicinity. The manufactures include leather, yarn, woolen and cotton goods, machinery, iron tools, and farm implements. It was settled as early as 1681, when it was called Buckingham, but was incorporated as Bristol in 1720. Population, 1900, 7,104; in 1910, 9,256.

**BRISTOL**, a port city of Rhode Island, county seat of Bristol County, fifteen miles southeast of Providence, on the New York, New Haven and Hartford Railroad. It is situated on Narragansett Bay, which affords anchorage for

large vessels, and has a lively trade in merchandise and manufactures. The harbor is safe and commodious, and it is the seat of shipbuilding yards. The manufactures include cotton, rubber, and woolen goods. A library and several schools and churches are among the public buildings. It is supposed that the Northmen built dwellings in the vicinity in 1000. The first settlement was made on its site in 1675, and it was incorporated in 1746. Population, 1910, 8,565.

**BRISTOL**, a city of Tennessee, in Sullivan County, 128 miles northeast of Knoxville, on the Norfolk and Western and the Southern railroads. It has a growing trade in merchandise and farm produce. Among the manufactures are flour, cigars, cotton goods, ironware, and machinery. Besides having several fine public schools, it contains Kings College, Southwest Virginia Institute, and Sullins College. It has a public library, waterworks, and electric street railways. Opposite the State line, in Virginia, is the town of Bristol, with a population of 4,579. Bristol, in Tennessee, in 1900, had a population of 5,271; in 1910, 7,148.

**BRISTOL**, an important city between Gloucestershire and Somersetshire, England, but forming a county in itself. The city is prominent partly because of its mercantile business and partly on account of its early history. It was made a county by itself in 1373 by Edward III. Henry VIII. made it the seat of a bishopric in 1542. It is the seat of many notable buildings, among them a cathedral founded in 1142 and Saint Mary Redcliff Church, founded in 1293. The newer buildings include the public library, the University College, the Queen Elizabeth Hospital, an observatory, and the Clifton College. Large coal mines are operated in the vicinity. The city has chemical works, sugar refineries, soap works, glass works, potteries, tanneries, ship yards, and machine factories. It carries an important jobbing business and a large export and import trade. It is built on both sides of the Avon River, which is crossed by the famous Bristol suspension bridge, 705 feet long and 245 feet above high-water mark. Extensive docks are maintained on the Avon and at Avonmouth and Portishead. The *Great Western*, one of the first steamers to cross the Atlantic, was built in Bristol in 1838. The noted philanthropist Colston founded a number of charities in the city, and a holiday is set apart to his honor. It has gas and electric lighting, stone and asphalt pavements, waterworks, a system of sewerage, and many hospitals and charitable institutions. Bristol was known as *Bricgstow* to the Saxons. Population, 1907, 367,979.

**BRISTOL CHANNEL**, the largest inlet of Great Britain, extending from the Atlantic Ocean, between the southern peninsula of England and the southern shores of Wales, and forming the estuary of the Severn. It is about eighty-five miles long, from five to forty-five miles wide, and has a coast of about 225 miles. It is remarkable for its high tides, or bores, which roll up the channel at a height of from six to forty feet. Among the rivers that flow into it are the Severn, Avon, Wye, Axe, and Torridge. Lundy Island is near the entrance.

**BRITISH AMERICA**, the possessions of Great Britain in North America, located north of the United States, and including the Dominion of Canada and Newfoundland. Its area is 3,677,500 square miles and population 5,987,698. See **Canada** and **Newfoundland**.

**BRITISH ASSOCIATION for the Advancement of Science**, an important society of Great Britain, whose object is to bring together eminent men to promote discovery and to diffuse the results of scientific research. This association was organized in 1831 under the leadership of David Brewster, and its first meeting was held on Sept. 26 of that year at York. The second meeting was held at Oxford in 1832, and since then the meetings have been regular each year, usually the latter part of August. Two meetings were held in Canada, one at Montreal in 1884 and the other at Toronto in 1897. The membership of the society is about 5,500. It is supported by fees and annual dues. The income is larger than needed for actual support, and the surplus is used to promote investigations and scientific researches. The general meeting is presided over by the president, who delivers an annual address, after which meetings are held by the ten sections, each having its own committee and presiding officer.

**BRITISH CENTRAL AFRICA**, or **Nyasaland**, a colonial possession of Great Britain in the east central part of Africa. It is bounded by Lake Nyassa, Portuguese East Africa, German East Africa, and the Congo Free State. Southeast of it is Rhodesia, of which it is an extension. The area is 41,800 square miles. The surface is an elevated plateau, and the drainage is chiefly by the Shire River. It has an abundant rainfall, but the climate is not as healthful as that of the country lying toward the south. Coffee, ivory, tobacco, and rubber are exported, and the chief imports are machinery and clothing. Blantyre, the largest town, has a population of 7,500, including about one hundred Europeans. The protectorate was organized in 1891, and since then mining and

farming have been introduced. Zomba, in the Shire region, is the seat of government. Population, 1907, 928,451.

**BRITISH COLUMBIA**, the most westerly Province of the Dominion of Canada, located between north latitudes  $49^{\circ}$  and  $60^{\circ}$ . It is bounded on the north by Yukon and Mackenzie, east by Alberta, south by the United States, and west by Alaska and the Pacific Ocean. From north to south it has a length of 740 miles; breadth from east to west, 620 miles; and area, 312,630 square miles. The coast line, including indentations, is about 12,000 miles.

**DESCRIPTION.** The surface is mountainous, except in the northeastern part, which lies in the

1, Victoria; 2, Vancouver; 3, Prince Rupert; 4, Fort Fraser; 5, Kootenay Lake. Dotted lines show chief railroads.

basin of the Mackenzie River. The mountains are outer fringes of the Cordilleras of North America, and the chains extend from southeast toward the northwest. Ranges of the Cascade Mountains, which attain elevations ranging between 7,000 and 8,000 feet, trend through the western part, and between them and the coast is the comparatively low Coast Range. In the southeastern part, extending almost parallel to the principal chain of the Rocky Mountains on

the line of Alberta, are the Gold Range and Selkirk Range. These mountains are the highest of those in the southern part, and their loftiest peaks, including Victoria, Leroy, and Dawson, have a height of from 9,000 to 11,600 feet. However, the highest summits are near the boundary of Alaska, where peaks of the Rocky Mountains rise to elevations which approximate 16,000 feet. These include Mount Columbia, 14,000 feet; Robson Peak, 13,700 feet; and Mount Fairweather, 15,340 feet. Kicking Horse Pass, where the Canadian Pacific Railroad crosses the continental watershed, is 5,300 feet, and north Kootenay Pass is 6,550 feet above the sea, while the mountains in the vicinity rise about 10,000 feet and are covered with snow the entire year.

The Columbia drains the southeastern portion and crosses into the United States, discharging into the Pacific. Through the south central part flows the Fraser, which rises near the line of Alberta, has a course toward the northwest, and then turns and flows almost due south to a point near the southern boundary, when it turns toward the west and discharges into the Strait of Georgia. In the northern part are the Taku, Stikine, Nass, and Skeena, which flow into the Pacific, the Liard, a tributary of the Mackenzie, and the Peace, which joins the Athabasca in Alberta. A number of lakes are distributed through the central part, all of them quite long and narrow. They include lakes Kootenay, Okanagan, Upper and Lower Arrow, Tacla, Babine, and Stuart. The sea coast is serrated and characterized by rugged cliffs and fiordlike estuaries. Near the mainland are a large number of islands, but all are small, except Vancouver and the Queen Charlotte Islands.

**CLIMATE AND SOIL.** The climate is warmer than that of any other province in Canada, on account of the warm winds from the Pacific, and differs greatly from that of the cold region of the Atlantic coast. These winds modify the temperature noticeably in most of the province, but much of their moisture is given up when they come in contact with the higher altitudes of the Coast Range; hence the climate is less uniform in the eastern part and the rainfall is less copious. At Victoria, on Vancouver Island, the average temperature for January is  $37^{\circ}$  and for July  $60^{\circ}$ , and flowers bloom in the garden the entire year. The climate at Vancouver is practically the same, but in the interior the temperature varies from  $40^{\circ}$  below zero in winter to  $100^{\circ}$  above in midsummer. Rainfall is most abundant along the coast, ranging from 40 inches at Victoria to about 100 inches in the northern part, and diminishing toward the east-

ern part, where some localities do not have sufficient to farm without irrigation. The rains and snows are heaviest on the western slopes, and the passes of the Gold Range and Selkirks have glaciers and snowfall to the depth of thirty feet. The Chinook winds make the Peace River valley pleasant and agriculture profitable in that section.

**FLORA AND FAUNA.** The forest resources possess much value, and the trees are of a northern type. Dense forests are particularly abundant on the western slopes of the coast ranges, and a heavy growth of timber covers the eastern slopes, but the high plateau of the interior is almost treeless. The white cedar is found in large quantities widely distributed, but the yellow cedar is confined to the northern region. Forests of spruce and hemlock abound. Other trees of commercial value are the oak, cherry, fir, yellow pine, yew, white maple, cottonwood, and arbor vitae. Fish are abundant in all the streams and off the coast, particularly the salmon, which is caught in large quantities at the mouth of the Fraser and other rivers. The wild animals include the moose, caribou, deer, bighorn, bear, puma, and wild cat.

**MINERALS.** Many valuable minerals are found in British Columbia. Gold was discovered in 1851 in the gravel along the rivers, from which it was obtained in paying quantities, but placer mining is not carried on to a great extent at present. The Kootenay district has been the chief source of gold, but mining has been developed in the mountains farther north. A fine grade of bituminous coal is obtained on Vancouver Island and in the Rocky Mountains. Copper is mined in the southeastern portion. Other minerals include silver, lead, and platinum.

**INDUSTRIES.** Agriculture is growing steadily, both in the production of cereals and in rearing live stock. Many of the valleys are remarkable for their fertility, such as that of the lower Fraser, where farming has reached a high degree of development. The cereals grown include wheat, oats, barley, rye, and millet. Fruit is cultivated successfully, including interests in most of the varieties common to the temperate latitudes. Irrigation has been introduced in the arid regions of the interior, but most of the farming is done where the rainfall is abundant, including some sections of the Peace River valley.

The salmon fishing and canning industry is an important enterprise. Many canneries are located on the coast and along the rivers, especially on the Nass, Skeena, and Fraser. The canneries of the Fraser River produce about

one-half of the salmon packed in British Columbia, and those of the Skeena are second in importance. Fur sealing is an important enterprise. Other fisheries which are prolific as a source of wealth include those of the cod, herring, halibut, and sturgeon.

While mining and the fisheries have ranked as the two leading industries, there has been much development in lumbering. The Douglas fir, or Oregon pine, yields vast quantities of choice building material. Many specimens of this tree have a diameter ranging from ten to eighteen feet and a height of three hundred feet. It is exceeded in size by the cedars, whose diameters reach twenty feet in some individual specimens. However, both furnish a valuable grade of lumber. Other varieties used in lumbering include the cypress, hemlock, yew, and yellow pine. Vast quantities of timber are exported to Europe, Africa, and South America.

Many of the rivers are navigable and furnish important transportation facilities to carry trade with interior points. Some of the lakes, though not connected with the ocean by navigable streams, are used in transporting locally by steamboat. The Canadian Pacific Railway has a transcontinental line through the southern portion with the terminus at Vancouver, whence traffic is carried by steamer to Victoria, which has railroad facilities by lines on Vancouver Island. The line of the Grand Trunk Railway passes through the central part, with the terminus at Prince Rupert, near the mouth of the Skeena River. Vancouver, Victoria, New Westminster, Prince Rupert, and Ladysmith are among the ports.

**GOVERNMENT.** The executive branch of government is vested in a lieutenant governor, appointed by the Governor General of the Dominion, and he is assisted by an executive council of five members. The legislative authority is vested in a single chamber of thirty-three members elected by the people. A system of public schools is supported by taxation, and includes common, graded, and high schools, all of which are free and undenominational. Many private schools and colleges are maintained, including denominational colleges at New Westminster and Vancouver. The people are very largely Protestants, including Anglicans, Presbyterians, Methodists, Baptists, and Lutherans. In 1901 the Catholics numbered 34,227 and the Buddhists, mostly Japanese, numbered 10,027.

**INHABITANTS.** The population is made up largely of Canadians and Europeans, including English, Irish, and German. The Indian population is about 25,000, and the Chinese and Japanese together number 20,000. Victoria, the

capital, is located on Vancouver Island. Other important cities include Vancouver, Nanaimo, Nelson, Rossland, Ladysmith, and New Westminster. The population of the province, in 1901, was 178,657.

**HISTORY.** Captain Cook explored a part of the coast of British Columbia in 1787, and a settlement was made by the English ten years later at Nootka. However, the settlement was broken up by the Spanish, who claimed the coast as far north as latitude 61°, where the territory of Russia was supposed to end. In 1846 the question of possession was settled by diplomacy, when the United States relinquished its claim and the territory now in British Columbia became a possession of the British crown. The claims of the United States were based on the Louisiana Purchase and explorations made by Lewis and Clarke, out of which grew the campaign cry of "54-40 or fight," at the time Polk was elected President of the United States. Vancouver Island was organized as a crown colony as early as 1849, but little progress was made in developing the country until the discovery of gold in 1858, when settlers began to pour into British Columbia, and it was made a crown colony the same year. The two colonies were united in 1866 as a political entity under the name of British Columbia. In 1873 a dispute in regard to the boundary was submitted to the Emperor of Germany, who awarded San Juan Island to the United States. The colony entered the Dominion in 1871, under an agreement that the federal government should provide railway connection with the Atlantic coast, and this was accomplished in 1887, when the Canadian Pacific Railway was opened for traffic.

**BRITISH EAST AFRICA**, a large territory within the British sphere of influence, located between Abyssinia and German East Africa, and extending from the Indian Ocean to the Congo Free State. The boundaries are not well defined, since there has been no definite agreement in regard to the boundary between it and Abyssinia. It includes the islands of Pemba and Zanzibar, and has an area of about 1,000,000 square miles. For the purpose of government, it is divided into the three protectorates known as Uganda, British East Africa, and Zanzibar. The former two are administered by British commissioners located at Entebbe and Mombasa, and the last mentioned is under a native sultan, who is advised by a British agent.

The region is rich in minerals, especially iron and copper. Fruit, palms, and spices are abundant on the coastal plain. The interior is not

rich in vegetation, especially in the arid highlands, where large tracts have a scanty growth of small grasses. Forests of evergreen trees abound in many parts, and in the jungles are vast growths of bamboo. The large mammals of Africa are numerous, including the hippopotamus, elephant, rhinoceros, giraffe, and antelope; the reptiles include the python, cobra, and crocodile; and the birds are especially numerous, among them being the pelican, flamingo, weaver bird, and sunbird.

A railroad extends from Mombasa, on the Atlantic, to Lake Victoria Nyanza, a distance of 584 miles, and will be connected with the Cape-to-Cairo line. Rubber, ivory, hide, grain, copra, and live stock are exported. The inhabitants are chiefly Arabs and Negroes. Most of the trade is in the hands of the Arabs at Zanzibar and near the coast, and the farming and pastoral regions of the interior are occupied by the Bantu and Nilotic Negro races. Population, 5,150,000.

**BRITISH GUIANA.** See **Guiana**.

**BRITISH HONDURAS** (hōn-dōō'rās), or **Belize**, a colony in Central America, belonging to the crown of Great Britain. It is situated east of Guatemala and southeast of Mexico, and has an extensive coast line on the Caribbean Sea. Its area is 7,562 square miles. The coast is quite low and swampy and the western part is diversified by hills and valleys. Among the chief products are fruit, mahogany, logwood, coffee, sugar, rubber, and live stock. This colony is still unprofitable, since the revenues seldom equal the expenditures, and it is necessary for the home government to grant aid. At present the indebtedness is placed at 170,000. Belize, population 9,113, is the capital and chief commercial city.

The inhabitants consist principally of Negroes and Indians, including only about 400 whites. A large number of elementary and three secondary schools are maintained. The language is a mixture of native tongues with English and Spanish. Numerous attempts have been made to throw off British rule, but English sovereignty has been recognized since 1783. Since 1884 it has been a separate colony. Population, 1906, 41,007.

**BRITISH ISLES**, an archipelago of Europe, located off the western coast of that continent. It is bounded on the north and west by the Atlantic Ocean, east by the North Sea, and south by the English Channel and the Strait of Dover. Great Britain and Ireland are the chief islands, besides which are included the Shetland Islands, the Hebrides, the Orkneys, and the Channel Islands.

**BRITISH MUSEUM** (mū-zē'um), the largest national institution of Great Britain, located on Great Russel Street, London. It was founded in 1753, when Sir Hans Sloane donated his library collection of about 50,000 books and manuscripts on condition that \$100,000 be paid to his heirs, which was much less than half the cost. The Montague House was purchased and opened as a seat for the library in 1759. A new building was erected in 1823, and the present large structure was completed in 1857, but extensive additions were made in 1882 and since. The main structure is 375 feet long. About 200,000 persons use the reading rooms each year, and it is visited by about 700,000 persons annually. The printed books include a total of about 2,000,000 volumes, being exceeded in number only by the Bibliothèque Nationale of France. In addition to this collection of books, it contains many pamphlets and manuscripts.

The museum is open and free to the public. It is lighted with electric lights and has every convenience of modern invention. Priceless rarities of every age and every country are on the shelves, constituting one of the most valuable collections in the world. There are a number of departments, each of which is located in a suitable part of the buildings, and the whole is under the direction of forty-eight trustees, of whom the chief officers are the Archbishop of Canterbury, the Lord Chancellor, and the Speaker of the House of Commons. The most important departments include those of Printed Books, Maps, Manuscripts, British and Mediaeval Antiquities, Egyptian and Assyrian Antiquities, Greek and Roman Antiquities, Coins and Medals, and Prints and Drawings. The collections represent every noted personage and all industries, sciences, arts, and discoveries of ancient and modern research. It has been fittingly said that the museum is a "perpetual monument of the munificence, judgment, and liberal taste of its royal founder, a splendid ornament to the throne and a perpetual benefit to learning."

**BRITISH NEW GUINEA.** See **New Guinea.**

**BRITTANY** (brīt'ta-nŷ), or **Bretagne**, an ancient province in western France, consisting of a large triangular peninsula that projects into the Atlantic. The region now includes the five departments of Morbihan, Finistère, Ille-et-Vilaine, Côtes-du-Nord, and Loire-Inférieure. It has an area of 13,644 square miles. The people, called Bretons, are descendants of the Bretons who were expelled from England in the 5th century. They retained their ancient language, known as the Armorign, which is similar to the Welsh, and is still used in the

rural districts. The people engage largely in fishing and agriculture, and are noted as brave seamen. This region of France has not been interested extensively in manufacturing and commerce, but these industries are beginning to assume considerable importance. Many remains of the ancient Druids have been preserved in Brittany. The folklore and songs of the Bretons are among the richest, many entering as modifying factors into the writings in other languages. The district has been subject to many military contentions, but the people have shown marked loyalty to the French government, especially to the house of Bourbon. A majority of the people speak French and belong to the Roman Catholic Church. Population, 1906, 3,258,314.

**BROCADE** (brō-kād'), a silk fabric, woven so the raised threads of the warp or woof produces figures of flowers, foliage, or other objects. The term is not applied to figures embroidered on silk textiles, but is restricted to those made in the loom. Originally the threads were made entirely of gold or silver, or of the two mixed, and cloth of this kind was used in making the most costly dresses.

**BROCKEN** (brök'ken), or **Blocksberg**, a mountain of Germany, in the province of Saxony, 20 miles southwest of Halberstadt. It has an elevation of 3,745 feet above the sea and is the highest summit of the Hartz Mountains. From its top the observer has a fine view of the surrounding country. It is famous in folklore, owing to the fact that the atmospheric conditions cause shadows of the spectators to be projected on the fog, which are best seen at sunrise. See **Walpurgis Night.**

**BROCKTON** (brök'tŭn), a city of Plymouth County, Massachusetts, about twenty miles south of Boston, called Bridgewater prior to 1874. It is noted for its great wealth and the manufacture of boots and shoes, in which it takes very high rank. The general manufactures include shoe tools, machinery, paper, and wooden boxes. It carries a large jobbing trade in merchandise. Gas and electric lights, waterworks, stone and asphalt pavements, and electric street railways are among the improvements. The city library has 45,500 volumes. It was first settled in 1700 and received its charter as a city in 1881. Population, 1905, 47,782; in 1910, 56,878.

**BROCKVILLE** (brök'vil), a city in Ontario, county seat of Leeds County, on the Saint Lawrence River, about forty miles from Kingston. It is conveniently located on the Grand Trunk Railway, surrounded by a rich agricul-

tural country, and engages extensively in the manufacture of flour, hardware, farming implements, engines, and large machinery. The chief buildings include the courthouse, the public library, the high school, and the town hall. It has a system of sewerage, waterworks, and electric railways. Brockville was named from Sir Isaac Brock. Population, 1901, 15,901.

**BROKEN WIND**, or **Heaves**, an incurable disease in horses, due to a rupture of the air cells in the lungs. It is accompanied by an enlargement of the lungs and heart. The symptoms are most noticeable when the horse is exercised, which causes the blood to be imperfectly purified, causing the nostrils to dilate and the breathing to become labored. The inspiration in breathing is rapid, but expiration is difficult and requires about double the usual time. In advanced stages of the disease two efforts are necessary in exhaling, one rapidly succeeding the other.

**BROKER** (brō'kēr), an agent who engages in the business of negotiating contracts relative to trade or commerce in consideration of a definite per cent. of the profits; or of a fixed salary. Brokers differ from other classes of agents in that they do not have the custody of the property they offer for sale. The compensation they receive is called *brokerage*, or *commission*. *Insurance brokers* are agents for underwriters, who insure owners of vessels and transporters of commodities against losses. *Stock brokers* deal in shares of stock companies and monetary investments, *ship brokers* transact business for owners of vessels, and *bill brokers* buy and sell bills of exchange for others.

**BROMINE** (brō'mīn), one of the nonmetallic chemical elements. It was discovered by Antoine Jerome Balard (1802-76), a French chemist, while he was extracting common salt from sea water. This element is not found in the isolated state, but occurs in minute quantities in sea water, in the ashes of marine plants, in combination with alkalis, and in the water of some mineral springs. It has a dark reddish color when in the liquid form, freezes at 19.4°, and boils at 145.4°. It is poisonous, has a suffocating odor, and combines readily with metals. The most important use of bromine is for the manufacture of bromide of potassium, which is used in photography and medicine, and it has value as a disinfectant and for bleaching. It is made extensively from the salt water of mineral springs at Stassfurt, Germany, Syracuse, N. Y., the Kanawha region in West Virginia, and other sections of the United States.

**BRONCHI** (brōn'kī), the divisions of the trachea or windpipe, which conveys the air into the lungs. The trachea divides in the chest, forming two bronchi, one of which enters the right and the other the left lung, where they divide and subdivide to form minute tubes. The walls of these tubes are composed of fibro-muscular tissue strengthened by plates of cartilage, and at the extremity is a cluster of air cells.

**BRONCHITIS** (brōn-kī'tīs), an inflammation of the bronchial tubes leading from the trachea to the lungs, and affecting the mucous membrane. There are several forms of the disease, designated as *acute*, *chronic*, *plastic*, *mechanical*, and *syphilitic*. All varieties are preceded by a cold in the chest, but later complications may set in and render the disease dangerous. The early symptoms include pain in the chest, shortness of breath, and the expectoration of mucus. Sometimes the disease takes on an acute form or merges into pneumonia.

**BRONCHO** (brōn'kō), a nearly unbroken native horse, usually an Indian pony or one bred from Indian stock, also called *mustang*. The term is used commonly in the western part of the United States, where it is applied to small, active horses. It is said to be from a Spanish word which signifies that they can never be broken.

**BRONZE** (brōnz), a fine-grained alloy of copper and tin, in variable proportions. It is harder and more fusible than copper, and is used chiefly in making church bells, cannon, statues, utensils, and various useful appliances. The ancients used it largely for weapons and utensils, and it has been found among the antiquities of China, Egypt, Assyria, Europe, and Mexico. In making the common bronze the proportions are about nine parts copper to one of tin; in instruments, twelve to one; in machinery, eight to one; in musical bells, six to one, and in large bells, three to one. The metals are melted separately, and they are afterward united in a molten state and cast in molds. In some kinds of bronze, zinc, silver, and lead are added, while aluminum and copper also make a bronze alloy. The bronze formed of aluminum and copper is strong, ductile, and malleable. The proportion is one of the former to nine of the latter.

**BRONZE AGE**, the term used to denote the stage of culture of a people at the time of using bronze for implements and weapons. The classification includes the three ages in this order: the *stone age*, the *bronze age*, and the *iron age*. It was adopted and developed

by Danish scholars, including Nilsson, Thompson, and Forchhammer. The classification does not apply equally to all nations, nor to different nations in the same period. The stone age existed in some countries while others were passing through the bronze and iron ages. In the stone age the weapons or implements consisted of stone and bone, metal being yet unknown. In the bronze age the method of alloying copper and tin had been discovered, but iron was yet undiscovered. Later iron took the place of bronze. These views have been adopted by geologists, though some think the age of copper intervened between that of stone and bronze. In Denmark, during the age of bronze, the oak was the dominant tree; the Scotch fir having flourished in the stone age, but became extinct in the bronze age, while the beech was and remains the prevailing tree of the iron age. Among the tools of the bronze age of different countries are found saws, hammers, awls, sickles, knives, daggers, swords, axes, spears, arrows, anvils, gouges, and shields. The composition of bronze varies with different periods and the size and form of the implements were changed frequently. The composition of bronze consisted mostly of ten parts of tin to ninety of copper. In some cases other metals were added.

**BROOK FARM**, a community established at West Roxbury, Mass., by George Ripley (q. v.) in 1841. The organizer associated with himself a number of men and women prominent in American History, and announced that the object was to substitute a system of brotherly coöperation for one of selfish competition. No distinction was made in regard to sex, but all were required to work a definite time each day for the common good, the proceeds to be shared equally by the members. All ate at the same table, had a share in the property, and had access to its social and literary advantages. The community was maintained by teaching children for a compensation, and by selling its products on the market. After several years a number of the leading members became discouraged and the community sustained financial loss. In 1846 some of the best buildings were destroyed by fire, and the enterprise was finally abandoned the following year. Among the members of this socialistic venture were Charles A. Dana, George W. Curtis, W. B. Channing, Nathaniel Hawthorne, Bronson Alcott, Margaret Fuller, and Theodore Parker. Hawthorne made use of many of his experiences at Brook Farm in writing his work of fiction entitled "Blithedale Romance."

**BROOKFIELD**, a city in Linn county, Mis-

souri, on Yellow Creek, twenty-four miles east of Chillicothe. It is on the Chicago, Burlington and Quincy Railroad, and is surrounded by a region rich in coal deposits. The chief buildings include the public high school, the library, and extensive railroad shops. It has manufactures of brick, flour, and machinery. Electric lights, waterworks, and sewerage are among the improvements. It was incorporated in 1865. Population, 1900, 5,484; in 1910, 5,749

**BROOKLINE** (brōok'lin), a town in Norfolk County, Massachusetts, four miles west of Boston, on the Charles River. It is on the Boston and Albany and other railroads, and is connected with Boston by a system of electric railways. Brookline is a suburban residence portion of Boston, and was originally a part of that city, but was incorporated separately in 1705. The chief buildings include a public library with 46,500 volumes, the Riding Academy, and many villas and country seats. It has manufactories of clothing, machinery, and electrical supplies. With it are included the villages of Longwood, Reservoir Station, and Cottage Farm. Population, 1910, 27,792.

**BROOKLYN** (brōok'lin), the "City of Churches," formerly one of the largest and most important cities in the United States, but united with the city of Greater New York in 1898 by a legislative bill passed May 11, 1896. This portion of New York City is located on the west end of Long Island, and is connected with the other portion of the great city over the East River by the Brooklyn Suspension Bridge, the Williamsburg Bridge, and the new East River Bridge. Intercommunication is further facilitated by the extension of the Subway under the East River and by many lines of ferries. It is noted as a financial center, has many valuable structures, is improved by all modern conveniences, and is beautified by parks and other public improvements. The first settlement on its site was made by the Dutch in 1636, and it was incorporated as a city in 1834. At the time of its union with New York the city contained a population of 995,276. It is now divided into twenty-one aldermanic districts and represented by that number of aldermen in the common council. Population, 1905, 1,358,891; in 1910, 1,634,351. See **New York**.

**BROOM** (brōom), a plant of the bean family, native to many parts of Europe. It has yellow flowers and grows in heaths and sandy soil. Several species have been described, some of which are shrubs. The common broom is planted for its fiber and a yellow dye obtained from its flower. The *white broom* is cultivated in England as an ornamental shrub. It bears

white flowers and attains a height of twelve to fifteen feet.

**BROOM CORN** (kôrn), a name applied to two plants with jointed stems belonging to the order of grasses. The panicles of a species belonging to the *sorghum vulgare* are made into brooms for sweeping and clothes brushes. The seeds are valuable as food for cattle and poultry. It grows to a height of twelve to fifteen feet, and is cultivated very much like corn. There are numerous species, all of which are produced chiefly in America, where the annual production is valued at several million dollars. See **Sorghum**.

**BROTHERHOOD OF ANDREW AND PHILIP**, a society organized in 1888 by Rufus W. Miller, a pastor of the Reformed Church at Reading, Pa. Its purpose is to foster good will and Christian fellowship and to spread the Christian faith by enjoining its members to bring people within hearing of the gospel. To this organization belong many members of evangelical denominations. In 1908 it had 920 chapters and a membership of 32,000, and was promoted by organizations in the United States, Canada, Australia, and Asia.

**BROTHERHOOD OF SAINT ANDREW**, an organization of the Protestant Episcopal Church. It was founded in Chicago in 1883, at Saint James Parish. The object is to spread the kingdom of Christ among young men. Two departments are maintained, the *junior* and the *brotherhood*, and the local chapter is the unit of organization. In 1908 the junior department had 8,000 members and the brotherhood proper had 15,000. Pittsburg, Pa., is the headquarters. Organization work is promoted in all the continents.

**BROWN**, in painting, a dark color formed by a mixture of red and black, and then modified by a small addition of yellow. It belongs to the colors known as russets and olives, in which a black or a dark pigment modifies the hue. Umber, bister, and brown madder are among the brown pigments.

**BROWNSVILLE**, a city and port of entry in Texas, county seat of Cameron County, on the Rio Grande, opposite Matamoros, Mexico. It is on the Rio Grande Railroad, is surrounded by a stock-raising district, and has a large railroad and navigation commerce. Besides having good schools, it is the seat of Saint Joseph's College and Convent, a Roman Catholic institution. Among the chief buildings are the post office, county courthouse, customhouse, and town hall. It has manufactures of cigars, clothing, earthenware, and machinery. Electric lights and waterworks are among the public

utilites. It was settled in 1848 and incorporated in 1853. In November, 1863, it was captured by the Federals under General Banks. Population, 1900, 6,305; in 1910, 10,517.

**BROWN UNIVERSITY**, one of the oldest educational institutions in the United States, founded in 1764 at Warren, R. I., and moved to Providence four years later. It has sixteen buildings, eighty instructors, and about 1,000 students. Its productive fund is about \$1,800,000, with an annual income of \$250,000. The library has 112,500 volumes. Degrees in sciences, arts, and engineering are conferred. It is under the direction of the Baptist denomination, but the instruction is nonsectarian. The college known as the Woman's College of Brown University was established in 1891. Nicholas Brown, in whose honor the university was named, was its principal benefactor.

**BRUGES** (brū'jĕz), an ancient city of Belgium, capital of West Flanders, about fifty-six miles northwest of Brussels and eight miles from the sea. It is known in history from the 3d century and was the center of the world's commerce in the 12th century, when it had a population of more than 200,000, and carried on an extensive trade with all the leading countries known at that time. It is inclosed within walls, has been the seat of great military contentions, and was an important factor in the history of the Middle Ages. It is now a railroad and canal center, commerce reaching it by the largest sea vessels through three canals which connect it with the sea. However, it has lost much of its importance, alike from the standpoint of commerce, manufactures, and population. There are numerous modern improvements, including fine schools, rapid transit, and several libraries. It has a remarkable tower 354 feet high, containing a set of excellent chimes. Other important structures include the palace of justice, the Hôtel de Ville, and the Church of Nôtre Dame. The last mentioned is in the early Gothic style of architecture and contains the tombs of Mary of Burgundy and Charles the Bold. In the art galleries are many paintings and sculptures, including productions by Jakob van Oost, Hans Memling, and Cornelius van Dyck. It was the residence of the printer Caxton. Besides commercial interests, the city has manufactures of textile goods, laces, ornamental work, and machinery. The shipbuilding yards and breweries are extensive. Bruges belonged to the Netherlands from 1814 until 1830, and in the latter year was annexed to Belgium. Population, 1906, 53,486.

**BRÜNN** (brün), a city of Austria, capital of

Moravia, ninety miles north of Vienna. It is beautifully located at the confluence of the Zwittawa and Schwarzawa rivers, at the foot of Mount Spielberg, and is connected with Vienna and other cities by important railroad lines. The principal building is the Cathedral of Saint Peter and Saint Paul, built in the 15th century, and it has several other noted churches in the Gothic style. The manufactures embrace woolen goods, leather, chemicals, and machinery. A system of waterworks is owned and operated by the city. Many of the streets are substantially paved with stone and asphaltum. It is the seat of several schools and business colleges. The trade is chiefly in grain, live stock, cereals, and merchandise. Brünn was founded in the 9th century and became a free imperial city in 1278. Population, 1907, 112,346.

**BRUNSWICK** (brūnz'wīk), county seat of Glynn County, Georgia, on Saint Simon's Sound, twelve miles from the Atlantic Ocean, on the Southern and other railroads. It has a safe harbor and enjoys a growing navigation and railroad commerce. Among the chief buildings are the city hall, the post office, the county courthouse, and the Oglethorpe Hotel. The manufactures include furniture, canned oysters, ironware, flour, cigars, and machinery. The city has street railways, electric lights, and pavements. It is popular as a summer and winter resort. The first settlement was made by James Oglethorpe in 1735. Population, 1900, 9,081.

**BRUNSWICK**, a town of Cumberland County, Maine, on the Androscoggin River, and on the Maine Central Railroad. It has several fine schools and is the seat of Bowdoin College. The manufactured products include cotton goods, machinery, paper, flour, and leather. It has a public library, waterworks, street pavements, and a considerable trade. The first settlement was made in 1628, when it was known as Pejepscot, and it was incorporated in 1717 as Brunswick. Population, 1900, 6,806.

**BRUNSWICK**, an important city of Germany, capital of the duchy of Brunswick, on the Oker River, thirty-two miles southeast of Hanover. The principal buildings are the Church of Saint Magnus, built in 1031; Catharine's Church, 1172; the Cathedral of Saint Blaise, 1173; a Gothic council house; and the Gewandhaus. It is the seat of many fine schools, two museums, a public library, and a gymnasium. The manufactures include fabrics, machinery, clothing, sugar, and earthenware. Rapid transit, gas and electric lights, telephones, several parks, and waterworks are among the improvements. It was founded by Bruno, Duke of Saxony, in the 9th century and was enlarged

by Henry the Lion. For many years it was an important member of the Hanseatic League of cities. A large majority of the inhabitants are Lutherans. Population, 1905, 136,397.

**BRUNSWICK, Duchy of**, a state in Germany, surrounded by the Prussian provinces of Saxony, Hanover, and Westphalia. It has an area of 1,418 square miles. It belongs mainly to the basin of the Weser River, but the southeastern part includes ranges of the Harz Mountains, which rise to an altitude of 3,000 feet. The inhabitants consist largely of Saxons. They are almost entirely Protestants, and engage in agriculture, mining, and commerce. The mines yield copper, lead, iron, and coal, while the agricultural products consist of cereals, vegetables, and fruits. Large interests are vested in rearing live stock, in dairying, and in growing sugar beets. The manufactured articles include beet sugar, tobacco, paper, soap, fabrics, wine, and leather. It is penetrated by many electric and steam railroads, the latter of which belong largely to the state system of Prussia. Its government is a constitutional monarchy, the duchy having two members in the national Bundesrath and three deputies in the Reichstag. In the time of Charlemagne the region was a part of Saxony, but it became independent in 1235. It was annexed to the kingdom of Westphalia by the Treaty of Tilsit, but again became independent in 1813. In 1866 it sided with Prussia, joined the German Confederation in the same year, and since 1871 it has been a part of the German Empire. Brunswick, on the Oker, is the capital and largest city. Population, 1905, 485,958.

**BRUSA** (brōō'sā), or **Broussa**, a city of Asiatic Turkey, capital of a vilayet of the same name, about twenty miles from Mudania, its port on the Sea of Marmora. It is surrounded by a fertile plain, and in its vicinity are thermal springs noted for their medicinal properties. It has extensive manufactures of carpets and silk goods, which are exported to the commercial centers of Europe and Asia. It is a market for produce and merchandise and the seat of numerous mosques. Several sultans and Turkish nobles were buried in tombs in its vicinity. Brusa was founded by Prusias II., King of Bithynia, and anciently was known as Prusa. It was captured by Orkhan, son of Othman, the second Sultan of Turkey, in 1327, and made the capital of the Turkish empire, but later Amurath I. removed the capital to Adrianapolis. In 1402 it was captured and plundered by the Tartars. The inhabitants consist mostly of Turks. Population, 1907, 76,303.

**BRUSH TURKEY**, a large bird native to

Australia, noted for the peculiar manner in which its eggs are hatched. The nests are built by several pairs of birds uniting in doing the work. They are made of grass and other vegetable matter. The eggs are laid into the same

BRUSH TURKEY.

mass by several females, and remain there until hatched by the heat of its decay. When the young come out of the eggs, they make their own way out of the nest and support themselves. The brush turkey is about the size of a common turkey, and like it has wattles on its neck and head. About twelve species belong to this family of birds, which are sometimes called *mound birds*. They are hunted for their flesh, and when pursued fly into the branches of trees or escape by running through tangled brush.

**BRUSSELS** (brüs'selz), the capital of Belgium, in the province of Brabant, on the Senne River. It is one of the most beautiful cities of Europe. Rapid transit, gas and electric lights, waterworks, and pavements are maintained. There are railroad connections with many of the principal cities of the continent, and it is the center of an important and growing commerce. The older part is located on the site of former fortifications and has crooked and ancient streets, while the newer portion has many substantial structures and contains the newer residences and public buildings. The king's palace, the palace of justice, the palace of chambers, the palace of fine arts, and the public library and museum rank among the finest structures of the kind in Europe.

The city has many fine public boulevards, botanical gardens, and public parks, a number of which are adorned by monuments and statuary of prominent men. Its educational institutions include schools for all grades of instruction, and terminate in the University of Brussels. It has about 1,050 students. With it are connected an observatory, a conservatory of music, and a fine library. This library has over 400,000 vol-

umes and 31,500 manuscripts. The city contains a large number of learned societies which maintain departments of Flemish art, and scientific and philosophic courses. Among the ancient buildings is the Cathedral of Saint Gudule, a fine structure in the Gothic style. The Hôtel de Ville, built in 1450, is in the Gothic style and has a spire 364 feet high, surmounted by a gilt statue of Saint Michael, the city's patron saint. There are several historic monuments, including the equestrian statue of Godfrey of Bouillon. The Grand Place and the Place of Martyrs are among its many noted squares.

The industries of the city consist, besides commerce, of manufacturing and jobbing. The production of lace, cotton and woolen goods, and machinery are important. It has large distilleries, foundries, sugar refineries, and breweries. Its lace production has long been important and its manufacture of Brussels carpets has given it and its suburbs renown. The language spoken is French, German, and Dutch. The appearance of the city is modern, although it dates back to the Middle Ages. In 1044 a wall was built around it by Baldric of Lauvain, in 1380 it was strongly fortified, and in the 15th century it was ravaged by the plague and twice damaged by fire. The French bombarded it in 1695 and conquered it in 1794. Under French occupation it became the chief city of the department of Dyle. In 1815, after the defeat of Napoleon, it was made the capital of the Netherlands. After the revolt of 1830, Belgium was separated from Holland. Population, 1906, including a number of suburbs, 623,041.

**BRYN MAWR COLLEGE** (brīn mār), an educational institution at Bryn Mawr, Pa., about five miles west of Philadelphia, on the main line of the Pennsylvania Railroad. It was founded for the education of women by Joseph W. Taylor, a member of the Society of Friends, and opened in 1885. The grounds include a plot of fifty-two acres, laid out in lawns, and beautifully fitted with tennis courts, hockey grounds, and an athletic field. The college buildings are of gray stone in the Jacobean-Gothic style of architecture. In the library building, completed in 1907, are 55,000 bound volumes and 8,000 pamphlets. Full graduate and undergraduate instruction is offered in Greek, Latin, English, German, and other modern languages, and in Sanskrit, history, political science, philosophy, mathematics, physics, geology, chemistry, and biology. Eight competitive matriculation scholarships are awarded annually. It has a fund aggregating about \$1,250,000. Undergraduate students are admitted by examination. The faculty consists of fifty-five professors and in-

structors, who are carefully selected for the particular work assigned to them, and the students in attendance number about 450.

**BRYOPHYTES** (brī'ō-fīts), one of the four divisions of the plant kingdom, including the members which do not produce flowers. It is divided into two divisions, one including the mosses and the other the liverworts. The former have a vertical axis and a leafy body, while the latter have a horizontal axis and a thalloid body. These plants do not have true roots, and propagate largely by spores and a class of cells known as *elaters*. See **Mosses**.

**BUBASTIS** (bū-bās'tis), or **Bubastus**, an ancient Egyptian city, situated in the delta of the Nile, now ruined and called Tel Bast. It was so named from the goddess Pasht, whose festivals were the most important celebrated by the Egyptians. The ruins excavated show that the city had magnificent temples, solid fortifications, and extensive baths. It was the seat of a great commerce and the center of much wealth.

**BUBONIC PLAGUE**. See **Plague**.

**BUCCANEERS** (bŭk-kā-nēr'z'), a celebrated association of pirates who plundered the West Indies and the Spanish colonies of South America from the 16th to the end of the 17th century. They consisted mostly of French and English. Their occupation was largely that of seafaring people, and they united by common enmity against the arrogant pretensions of the Spaniards. They were first fortified on the Tortugas Islands, off the southern coast of Florida, but later divided, when the French established themselves in San Domingo and the English occupied Jamaica. The chief leaders of the French were Montbar, known as the exterminator, and the Welshman, Henry Morgan. They adopted a code of laws for their government and organized in bands to plunder the Spanish vessels as they returned from Europe to supply the colonies with provisions and manufactured articles. In 1670 they made attacks upon Panama, where they defeated the Spanish troops and secured considerable booty. They took possession of Vera Cruz in 1683, carrying off booty valued at \$2,500,000 and 1,200 slaves. Later Morgan became deputy governor of Jamaica, and for many years was a terror to navigation and the early settlements. In 1697 Cartagena was taken and prizes valued at \$8,000,000 were secured by the buccaneers. At the beginning of the 18th century they were lost sight of as common pirates and subsequently were exterminated or conquered.

**BUCEPHALUS** (bū-sĕf'ā-lŭs), the horse purchased for Alexander the Great in Thessaly, and which was his favorite steed in all his cam-

paigns. It is said to have cost sixteen talents, about \$20,000. It died in India from the effects of wounds received in a battle about 326 B. C., and the great commander built the city of Bucephala in its honor.

**BUCHAREST** (bŭō-kā-rĕst'), capital of Rumania and of the principality of Wallachia, on the Dimbovitza River, a tributary of the Danube. The chief buildings include the town hall, the royal palace, the university, and the palace of justice. Germans and Hungarians control the larger commercial interests. The city ranks as one of the largest centers of the Balkan peninsula. It has extensive manufactures, railroad facilities, a public school system, and a number of splendid edifices, although it does not hold a high place in learning and culture. Its principal growth and improvements date since the war between Russia and Turkey in 1878. Within recent years electric lights, telephones, and rapid transit have been introduced. Bucharest was founded in the 13th century by Radul the Black, of Transylvania, after the conquest of Wallachia. In 1595 it was captured by the Turks under Linan Pasha, and became prominent in European history in the early part of the 18th century. It was occupied by the Russians in 1828, taken by the Austrians in 1857, and made the capital of Rumania by the union of Wallachia and Moldavia in 1861. Population, 1907, 276,178.

**BUCKBOARD** (bŭk'bŏrd), a light vehicle with four wheels, so named because of its bucking or bouncing. It has a floor or platform of elastic boards, attached to the crossbar in front, fastened to the axle with a bolt, and connected with the hind axle by small bolts or rivets. This vehicle may have one or two seats, though a one-seated buckboard is the most common. It is a good conveyance for rough and rocky ground, and came into use when the Adirondack region was first visited as a resort.

**BUCKEYE** (bŭk'ī), the American horse chestnut. It is found widely distributed in the Mississippi valley, where it attains a large size. The tree has small flowers, strongly scented bark, and bears considerable quantities of large nuts in a prickly inclosure. Owing to its general prevalence in Ohio, that State is called the Buckeye State, and the inhabitants are known as Buckeyes. See **Horse-chestnut**.

**BUCKINGHAM PALACE**, a palace in London, England, one of the residences of the royal sovereign. It is located opposite Saint James's Park, and was built in the reign of George IV.

**BUCKTAILS**, a name familiar in the politics of the State of New York, which originated

from the fact that the members of the Tammany Society wore bucks' tails as badges. It came into use about the time of the War of 1812, when the Democratic party was divided into two factions, one headed by James Madison and the other by De Witt Clinton, who were rival candidates for President. When Clinton was elected Governor of New York, in 1816, those who opposed him were known as Buck-tails and his supporters were called Clintonians. The Bucktails gained control of the Democratic State organization under the leadership of Martin Van Buren, and the State administration was styled "Albany Regency."

**BUCKTHORN** (bŭk'thōrn), the name of a class of shrubs and trees common to Europe and America. The common buckthorn has serrated leaves and produces a berrylike drupe, containing seedlike nutlets. The berries are used as a cathartic, and the bark is employed in medicine and for making a yellow dye. The wood yields a light charcoal used in making gunpowder. Many species of this class of plants have been described. The *alder buckthorn* is common in Southern Europe, and grows to a height of from six to ten feet.

**BUCKWHEAT**, a plant native to Eastern

Europe and Central Asia. It was first brought to Western Europe by the Crusaders and is now extensively cultivated in many countries. Buckwheat is grown quite extensively in the United States and Europe, owing to its ability to yield abundantly without much attention, even on stony soil. The seed weighs about forty-eight pounds per bushel, and forty bushels per acre is a fair crop. It

flowers profusely, is a favorite plant for the honey bee, and is cultivated largely to feed bees. In Europe the seed is ground into flour and used for gruel, breakfast cakes, and bread. In Canada and the United States it is used extensively for cakes, which are considered a great delicacy for breakfast. The annual production in the United States aggregates 14,750,000 bushels, New York and Pennsylvania producing about two-thirds of the total yield. Canada is peculiarly fitted for the cultivation of buckwheat. Ontario, where the production is largest, has an annual output of about 2,750,000 bushels.

**BUCYRUS** (bŭ-sī'rŭs), county seat of Crawford County, Ohio, on the Sandusky River, about sixty-five miles north of Columbus. It is on the Pennsylvania and other railroads, and is surrounded by a fertile farming country. The chief buildings include the county courthouse, the high school, and the city hall. It has manufactures of brick, wagons, and machinery. In its vicinity are a number of valuable mineral springs. Many of the streets are paved with vitrified brick. It was first settled in 1818 and incorporated in 1829. Population, 1900, 6,560.

**BUD**, the germ of the future leaves, branches, or flowers of plants. When large enough to have its parts distinguishable, it is seen that the bud is formed of undeveloped leaves. Large buds that are to remain over winter are covered by protecting scales, within which the life of the plant is stored, much the same as the embryo in seeds. The plumule of the embryo is a bud that makes the main stem, which is carried on year after year by a bud called the *terminal bud*. The buds that are to form the branches appear on the side of the stem, at the axils of the leaves, and are called *axillary buds*. The leaf buds contain the rudiments of the leaves and are classed as *leaf buds* and *flower buds*, the flower being a modified leaf bud. Some of the lower animals propagate themselves by buds.

**BUDAPEST** (bŭ'dā-pĕst), one of the capitals of Austria-Hungary, the second largest city in the empire, located on both sides of the Danube River. It is the imperial capital of the kingdom of Hungary, and at one of the capitals of the dual empire it is of minor importance, since only the two delegations meet alternately here and at Vienna. Its name was derived from Buda and Pesth, formerly two cities, but since 1873 united as one municipality. The two parts of the city are united by many bridges across the Danube. It is the seat of an imperial residence, has excellent transportation facilities by the Danube River and a large number of important railroad lines, and is the cen-

BUCKWHEAT.

a b, flowers; c, seed.

flowers profusely, is a favorite plant for the

ter of a vast commercial trade. It ranks as one of the important cities of Europe, being a center of wealth, industry, and intelligence.

The electric street railway system is one of the finest in the world, which has, instead of trolley wires, conduits between the tracks from which the power is gathered off metal strips, and lines are operated on all principal streets. Andrassy Strasse, one of the thoroughfares, has an underground road. It is one of the most beautiful streets in the world, containing stone pavements and having tall and well constructed buildings on both sides. The new house of parliament is an excellent structure, and, besides it, there are the Jewish Synagogue, the Leopold Basilica, a magnificent royal palace, excellent public schools, and other buildings devoted to higher education, including colleges and universities. The library contains 480,000 volumes and 65,000 manuscripts. There are well improved boulevards, public baths, and healthful mineral springs. The botanical gardens and public parks are among the most beautiful, while its promenades and stone quays along the river are delightful. The University of Budapest has 250 lecturers and professors and is attended by over 5,000 students.

The chief manufactures consist of gold, silver, copper, and iron wares, leather, silk, and woolen goods, tobacco, beverages, and machinery. It is one of the largest milling centers of the world, and in this respect has long ranked second to Minneapolis, Minn. Its sulphur springs have attracted health seekers and excursion parties from all parts of Europe, thus rendering the city a gathering place for many visitors to its baths, as well as to its libraries and institutions of learning. The language spoken is largely German, but the city has a considerable Bohemian and Hungarian population. Buda for many years contained the larger population, but was surpassed by Pesth in 1799, since which time the latter has greatly outgrown Buda in every respect. At that time the two cities contained a total population of a little over 50,000. Buda was known to the Romans as Aquincum. It was made the capital of Hungary by Matthias Cörvinus in 1444. Pesth was founded by the Germans in the 13th century. It became the capital of Hungary after the *Ausgleich* of 1867. Since 1873 they have been united as one municipality. Population, 1905, 798,692.

**BUDDHISM** (bōōd'diz'm), the system of faith introduced or reformed by Buddha. It was effective in counteracting the caste system of the Brahmans and other Aryan invaders of India, and therefore fitted to become the religion

of the Turanians. It existed in India as the principal religion for more than a thousand years, but has been almost entirely supplanted by Brahmanism. At present it is the religion of Ceylon, China, Japan, Tibet, and Burmah, and is the great Turanian faith of the modern as of the ancient world. It has existed for more than 2,500 years and numbers as its followers from one-tenth to one-eighth of the entire human race. One of its most prominent doctrines is that *Nirvâna*, a state of absolute release from existence, is the highest good. It is held that pain is inseparable from existence, thus it can cease only through *Nirvâna*; and, to attain to this state, our desires and passions must be suppressed and the most extreme self-renunciation practiced, while personality must be entirely subordinated.

The principles of Buddhism are stated in the so-called *Four Great Truths*, namely: 1. That misery always accompanies existence; 2. That all modes of existence result from passions or desires; 3. That there is no escape from existence except by destruction of desire; 4. That this may be accomplished by following the four-fold way to *Nirvâna*. The four stages, called *the passes*, begin with the awakening of the heart, called the first; in the second stage one loses all impure desires and revengeful feelings; in the third, one becomes free from all evil desires, from ignorance, from doubt, from heresy, and from unkindness and vexation; the fourth stage is that of Buddha, or the perfect state. Among the laws of the faith are those that require fundamental virtues to be practiced by all men alike, including patience, courage, purity, charity, contemplation, and knowledge. The five fundamental precepts of the moral code are these: Do not kill; do not steal; do not commit adultery; do not lie; do not give way to drunkenness. The greatest virtue is benevolence.

*Nirvâna* is not reached until all the conditions necessary have been complied with. If these conditions have not been met with at death, an individual does not attain rest until he is fitted for *Nirvâna*. In that case he is born again as a person, a plant, a spirit, an animal, an insect, or as some other animated organism, from which state his soul transmigrates again and again until *Nirvâna* is eventually reached. In outward form Buddhism resembles some of the Christian churches in at least a few respects. The priests wear dresses and caps, construct monasteries, hold to celibacy, use bells, practice incense, use the rosary of beads, have lighted candles at the altar, have intonations in the service, believe in a purga-

tory, offer prayer for departed spirits, and pray in an unknown tongue. However, there is no similarity between the two faiths. The original teachings of the founder have been perverted and distorted by a number of disciples in various ages, and now lack many virtues formerly common to the faith.

**BUDDING**, a form of grafting in which a leaf bud is used instead of a young shoot. It is preferred for plants that throw out much gum when wounded, as the cherry, peach, plum, and apricot, and also for roses and flowering shrubs. It is done by cutting a bud from one plant and inserting it in some species closely allied. The bud is inserted into an incision, shaped like the capital T, in the stock of the allied tree, and then tied round by a ligature of matting. See **Grafting**.

**BUENA VISTA** (bū'nā vīs'tà), a small town in northeastern Mexico, in the state of Coahuila, noted for a celebrated battle between the American forces under General Taylor and the Mexicans under General Santa Anna. It was fought on Feb. 22 and 23, 1847, and the Mexicans were totally defeated, owing to poor generalship. The American army numbered 4,767 and the Mexican 17,000. The American loss was 648, while the Mexicans lost nearly 2,000.

**BUENOS AYRES** (bō'nūs ā'rīz), an important city of South America, capital of Argentina, on the La Plata River, 160 miles from the ocean. The city is built on a modern plan with regular streets crossing each other at right angles. It is one of the most important trade centers south of the equator, and enjoys a large oceanic commerce. It is connected with the interior cities of South America by numerous railroads. The river is thirty-six miles wide at the city, and quite shallow, but has been improved for all classes of navigation by a vast system of harbor works. In 1887 alone the sum of \$20,000,000 was appropriated for harbor improvements, which has been expended to fit its wharves and dry docks for the largest vessels.

The city contains a general school system for free attendance, several colleges, and a central university with higher courses of study. The university is one of the best in South America and is attended by about 1,250 students. It is the seat of a fine cathedral, the Chapel of Santa Felicitas, a military college, the public mint, and government offices. The congress hall stands in a fine plot of sixteen acres and was erected in 1887 at a cost of \$8,000,000. About 200 periodicals are published in the city, principally in the Spanish, but a number in the French, German, English, and Italian languages.

It has several normal schools, a number of medical colleges, and a public library of 50,000 volumes. The city has 150 miles of electric street railway lines and extensive telephone systems, and is connected by cable communication with Europe and the United States. There are substantial stone and asphalt pavements, waterworks, several parks, and gas and electric lights.

The exports and imports are enormous, amounting annually to about \$285,500,000. They consist largely of live stock, tallow, hides, cereals, fruits, tobacco, and minerals. The manufactures are expanding rapidly, being stimulated both by local and European capital. Among the chief products are carpets, furniture, cigars, clothing, textiles, boots and shoes, machinery, musical instruments, and other articles of commerce. The city was founded in 1535 by Don Pedro de Mendoza. It was twice destroyed by the natives, but has grown steadily since 1580. In 1851 it seceded from Argentina and organized as a separate state, remaining independent until 1859, when it rejoined the Republic and became its capital. Population, 1906, 1,029,653.

**BUFFALO** (bŭf'fā-lō), an oxlike animal with long horns, found native in Asia and Southern Africa. The Asiatic buffalo is still found in a wild state in the jungles of India. From it the domestic kind now largely bred in Eurasia descended. It has short hair, is brown

CAPE BUFFALO.

on the back with a black head, and attains a height of seven feet. It is a better beast of burden than the ox, and the female yields a greater quantity of milk than the common domestic cow. In the wild state it is vicious, but when thoroughly domesticated it becomes gentle and docile. A species of this animal found in the Philippines is known as the *carabao*. The *Cape Buffalo*, found in South Africa, is larger than the Asiatic. It is famous for its vast horns, which start from a great bony mass at the head and often measure six or seven feet

from point to point. The hide of the buffalo is useful for boots and shoes, while the meat is regarded a wholesome article of food. In India these animals are trained for exhibition and used for dairying. The buffalo is fond of marshy places and seems to enjoy standing in the water during the warm days with only its head projecting. See **Bison**.

**BUFFALO**, the second city of New York, county seat of Erie County, at the eastern end of Lake Erie and at the head of the Niagara River. It is 20 miles above Niagara Falls and 410 miles by rail northwest of New York City. Fifteen great trunk lines of railway center at Buffalo, including the most important railroads of the eastern part of the United States and Canada, and it has additional transportation facilities by the Erie Canal, the Great Lakes, and urban and interurban electric railways. Among the chief railways are the New York Central, the Wabash, the Erie, the Grand Trunk, the Pennsylvania, the Lackawanna, and the Lake Shore and Michigan Southern. The site of the city gradually rises from the harbor to a height of 50 to 60 feet, and presents a view most beautiful from a distance on the lake. It is protected by an immense breakwater nearly a mile long, and its harbors are among the best on the Niagara and Lake Erie.

**DESCRIPTION.** The area of the city is 42 square miles, and the streets are broad and generally cross each other at right angles. Most of the pavements are constructed of asphalt, this class of paving having a length of 235 miles, and the total number of miles paved aggregate about 400. Main Street, which extends northerly from the lake front, is the principal business thoroughfare. At the center of the business district, which is near Lafayette Square, Niagara Street starts from Main Street, and is the main highway to Tonawanda and Niagara Falls. Lafayette Square, where a number of streets meet, is surrounded by large and substantial business buildings and contains the beautiful Soldiers' and Sailors' Monument. Delaware Avenue and North Street are the principal avenues of the fashionable residential district, and here and in many other places are fine homes surrounded by lawns and ornamental shrubs and trees.

Buffalo has numerous parks and other points of interest for those who seek the open air. At the place where the waters of Lake Erie form the Niagara, south of Fort Porter, is the Front, a tract of 45 acres, and near the State Insane Hospital grounds is Delaware Park, whose area is 365 acres. Humboldt Park consists of 56 acres, and in the south are the

three parks known as South Park, Stony Point, and Cazenovia Park. Forest Lawn Cemetery, a tract of 230 acres, is one of the numerous burial grounds of great beauty. Besides the Soldiers' and Sailors' Monument in Lafayette Square, are those of President Fillmore and Red Jacket in Forest Lawn Cemetery, and the fine monument dedicated in 1907 to President McKinley, who died in the city.

Buffalo is noted for its fine public school system, which includes kindergartens, grade and high schools, and a training school for teachers. It is the seat of a State normal school, the German Martin Luther Seminary, the University of Buffalo, the Saint Joseph's College, the Academy of the Sacred Heart, and many other institutions, including numerous denominational and parochial schools. The charitable and philanthropic institutions include a State insane asylum, an orphan asylum, the Home for the Friendless, the Church Home for Aged Women, Saint Mary's Asylum for Widows and Foundlings, and Ingleside Home for Erring Women. It has more than 175 churches, and these represent all the leading denominations. The municipality has two libraries, aggregating about 235,000 volumes, and in addition are maintained a number of libraries in the schools and colleges. The educational associations are well represented, including the Society of Natural Sciences, Young Men's Christian Association, Lutheran Young Men's Association, and numerous scientific and historical societies.

The United States government building is a substantial structure of gray stone, erected at a cost of about \$2,000,000. Other large buildings include the Chamber of Commerce, the city hall, the public library, the Fidelity Trust Company's building, the Ellicott Square building, the Grosvenor Library, and the Roman Catholic and Protestant Episcopal cathedrals. The Iroquois, Lafayette, Lenox, and Statler are among its larger hotels.

**INDUSTRIES.** Buffalo is preëminently a manufacturing and commercial city. This is due largely to the fact that its transportation facilities are very advantageous. A belt-line railroad encircles the city and furnishes facilities for intercommunication among the large number of trunk and branch lines, and enables transfers of freight with boats on the Erie Canal and steamships in its well-improved harbors. Though originally built for small tow-boats drawn by horses, the Erie Canal has been materially improved and will eventually furnish facilities for large vessels from the Atlantic by way of the Hudson River. The city has about fifty large grain elevators, including both trans-

fer and floating elevators, and is the largest market for wheat and flour in the Eastern States. The elevator capacity is sufficient for 35,000,000 bushels, equipped to enable handling 5,000,000 bushels of grain per day. It is the largest coal market and lumber port in the world. The storage capacity for coal is enormous, and its coal docks are sufficient to enable handling 30,000 tons a day. In the manufacture of iron and iron products it ranks next to Pittsburg. Among the manufacturing establishments are machine shops, soap works, carriage and wagon factories, shipyards, flouring and grist mills, stove works, distilleries, oil refineries, and breweries. Enterprise in manufacturing is facilitated greatly by electric power obtained from a large plant at Niagara Falls, which is brought through three circuits having a normal capacity of 30,000 horse power. It has a large trade in live stock, manufactures of all kinds, and merchandise, and is a center for both retailing and wholesaling.

**HISTORY.** La Salle was the first European to visit the locality. He landed at its site in 1679, and near the present city built the *Griffin*, the first ship to sail on Lake Erie. The first settlement was made by a trader in 1792, and the Holland Land Company purchased a tract of land and platted it into townships the following year. The work of surveying and platting was done by Joseph Ellicot, and he is regarded the founder of Buffalo. The village founded at that time was situated at the mouth of Buffalo Creek and named New Amsterdam, but it soon came to be called Buffalo. A force of British and Indians under Gen. Riall captured it in 1813 and much of it was destroyed by fire, but it was rebuilt in 1815. Its prosperity began with the completion of the Erie Canal in 1825, when it became the center of a large trade in produce and raw materials. Black Rock was annexed in 1853. It was the home of Millard Fillmore and Grover Cleveland, and the latter was its mayor in 1882. The Pan-American Exposition was held in Buffalo in 1901, at which President McKinley was assassinated. Population, 1905, 376,618; in 1910, 423,715.

**BUFFALO GNAT** (năt), a small insect found in the western section of the valley of the Missouri River and other regions. It attacks human beings and domestic animals, but differs from the mosquito in that it bites in the daytime. Swarms of these insects are most frequent when the sun shines brightly and there is no movement of wind. The bites are poisonous. The larva is aquatic and frequents well-aërated water.

**BUFFALO GRASS**, a short grass common

to the fertile soil of the western plains of North America, ranging from Texas to Alberta and Saskatchewan. It seldom grows higher than six inches, but is very important as pasture for domestic and wild animals, especially in the arid regions, to which it is best adapted. In the summer it covers the ground with a dense growth and turns brown at the first frost, but is eaten at all times of the year. It propagates by runners as well as by its seed. The male and female flowers grow on different plants.

**BUFF LEATHER**, a kind of leather made originally from the skin of the buffalo, but now chiefly from light hides of cattle. It is naturally of a light-yellow color, but is sometimes bleached white or tanned and stained a dull yellow or dark brown. When dressed with oil, it becomes soft and does not easily crack or rot. It is used for making belts, gloves, pouches, and cartridge boxes.

**BUG**, the name used frequently in describing the species of insects belonging to the order *Hemiptera*. The mouth is fitted for piercing and sucking, being in the form of a beak, and most of the species feed on the juices of plants. Some of these insects, such as the louse and bedbug, partake of animal fluid as well as that of plants. The cochineal and lac-dye insects, which belong to the bug family, secrete fluids valuable in commerce. The chinch bug, aphid, squash bug, and green bug are among the pests that destroy plants.

**BUGGY**, the name of a four-wheeled vehicle, either with or without a top or hood. The name is one of the *Americanisms*, and describes a vehicle called a *cart* in England, while cart in the United States is properly a vehicle with two wheels. Buggies are fitted for one horse, and are intended for light driving.

**BUGLE** (bū'g'l), a musical instrument made of brass or copper, used chiefly for signals. The bugle is the signal horn for the infantry, and has a shorter tube than the trumpet, which is used more generally for the cavalry. Bugle and trumpet calls remind the soldier in time of peace of daily routine duty, and in war they serve to direct and guide the marches and movements of troops.

**BUILDING.** See *Architecture*.

**BUILDING AND LOAN ASSOCIATION**, a society organized to promote interest in the accumulation of savings, and to provide facilities to secure the use of money at reasonable rates for those who desire to build homes. Associations of this kind are usually organized as private corporations, and are known by various names, such as coöperative banks, mutual loan associations, building societies, home aid

associations, etc. They may be classed under two general terms, the *mutual* and the *proprietary*. Mutual societies receive deposits from individuals, who become stockholders to the extent of their deposits. Those who wish to invest in land or erect a building borrow the amount needed and give a mortgage on the property, and, when the amount of deposits equals the sum borrowed plus the interest, the stock is surrendered and thus cancels the debt. Proprietary societies pay interest on deposits and loan money for building purposes, secured by mortgage and repayable by monthly installments. When the total installments amount to the loan plus the interest, the indebtedness is canceled. In this class of associations, the profit to the company depends upon the difference in the rate charged those who borrow and that paid to depositors. Building associations were organized in Great Britain and Germany in the 18th century, and in America they date more largely from the last century. All of the states, provinces, and nations in which they are promoted have laws regulating the transaction of business, intended as a safeguard to the people who put their savings into such organizations.

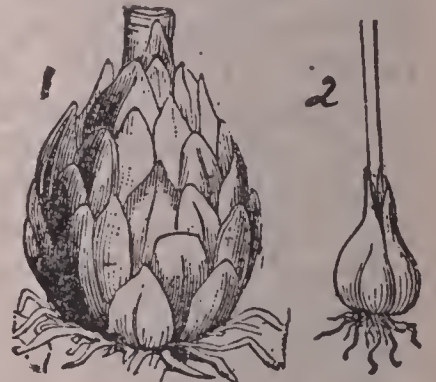

**BUILDING STONE**, any stone suitable for the construction of buildings or fitted for structural engineering. Many varieties of stone present a beautiful appearance in the quarry, but their composition is such that they disintegrate rapidly from the action of air and moisture. The disintegration may affect the appearance by reason of discolorations, or it may soften or dissolve the stone to the extent that the structure becomes unsafe. Stone of a porous nature, such as soft limestone, readily absorbs water, and it is greatly damaged by freezing and thawing. While material of this class may be suitable for the interior walls, it is not advisable to use it for exteriors. Some grades, especially those that contain iron, become discolored from the action of moisture.

The best building stones may be classed as fragmentary, calcareous, and crystalline siliceous rocks. Among the fragmentary rocks used in building are sandstone and slate. Sandstone is composed of grains of sand, either rounded or angular, and held together by a cementing material, such as silica or carbonate of lime. The color depends upon the nature of the cementing material. In gray sandstone the cementing material is carbonate of lime, in white colored stone it is silica, and in brownish or reddish stone it is mixed with oxide of iron. Slate is used largely in roofing and for floors. The calcareous rocks include the limestones and

marbles, and in color vary as much as sandstones and for the same reason. Granite is the most familiar example of crystalline siliceous rock, and is one of the most durable and valuable building materials. It is quarried extensively in Canada, especially near Kingston, Ontario; near Victoria, British Columbia; near Saint George, New Brunswick; and near Shelburne, Nova Scotia. Quarries are worked in the United States at Berry, Vt.; Saint Cloud, Minn.; Concord, N. H.; Westerly, R. I.; Richmond, Va.; and many other localities. Granite ranges from dark red to light gray, and includes many shades of bluish and dark brownish colors.

**BULACÁN** (bōō-lā-kān'), a town of the Philippine Islands, on the Island of Luzon, twenty miles northeast of Manila. It is conveniently located on a small river, and is surrounded by a fertile country, which produces sugar cane, rice, and tobacco. The buildings consist mostly of native huts. It was important as a military point and the scene of several insurrections during both the Spanish and American occupation of the islands. Population, 13,800.

**BULB**, in botany, a broad imbricated bud, either above or beneath the surface of the ground, having roots beneath and the stalk and foliage above. The leaves or scales with which it is clothed are thickened by the deposition of nutritive matter, stored for the future use of the plant. It differs from the tuber, which is the enlargement of a subterranean branch and forms the fruit or seed. Some plants have bulblets, or small aerial bulbs, as in some kinds of onions. Among the chief bulbous plants are the tulip, onion, and common lily.

BULBS.

1, Meadow Lily; 2, Tulip.

**BULGARIA** (bōōl-gā'rī-à), a principality of Europe, in the eastern part of the Balkan Peninsula. It is situated between north latitude 41° 30' and 44° 15' and east longitude 22° 30' and 28° 30'. It is bounded on the east by the Black Sea, south by Turkey, west by Servia, and north by Rumania. Most of its northern boundary is formed by the Danube River. The area of Bulgaria proper is 24,280 square miles, and of Eastern Rumelia 13,800, or a total of 38,080 square miles.

**DESCRIPTION.** Bulgaria is a mountainous

country, traversed by the Balkan Mountains. In the southwest corner of Rumelia are ranges of the Rhodope Mountains, between which are deep valleys isolated from each other except by elevated passes. The Balkans include Vitosha, 7,517 feet, and Musalla, 9,610 feet, which are the highest summits. The ranges of the southern section are less elevated.

Most of the drainage is into the Black Sea, chiefly by the Danube and its tributaries. The confluents of the Danube include the Lom, Vid, Osma, and Ogost. Those flowing into the Black Sea direct include the Devna and Kamtchik. The Maritza and Struma flow southward into the Aegean Sea. Its eastern boundary is indented by the Gulf of Burghas, an inlet from the Black Sea.

The climate is healthful and quite pleasant, though a district subject to malaria extends along the Black Sea. It may be said that Bulgaria has a somewhat colder climate than Eastern Rumelia, since the elevated Balkan Mountains obstruct the passage of breezes from the Mediterranean. In Bulgaria the climate ranges from eight degrees below zero to ninety above, with an average temperature of about 50°. Forests cover the mountains, but the valleys are mostly treeless. Among the wild animals are the deer, bear, boar, and many species of wild fowl.

**INDUSTRIES.** Agriculture is the chief enterprise, and the land is subdivided in small holdings among the peasants, who pay a nominal rent to the government, to which most of the land belongs. About twenty-five per cent. of the land is under cultivation and fifty per cent. is in pasture. Corn and wheat are the chief products, and next of importance are barley, rye, oats, and vegetables. Grapes are grown extensively. The government has control of all the minerals and operates the mines. Coal is the chief mineral product, but other minerals of value abound, including lead, copper, zinc, cobalt, and petroleum.

The Danube is important as an avenue of transportation. A number of its tributaries have been improved and canals have been constructed, which, together with the Black Sea, afford considerable shipping facilities. The railroad lines aggregate about 1,200 miles, most of which are owned and operated by the government, and telegraph and telephone lines connect the business centers with the cities north and south. Bulgaria has nine river ports and seven seaports, which are the seat of most of the trade. The exports are somewhat larger than the imports, and foreign trade is chiefly with Austria-Hungary, Germany, Great Britain, France, and Turkey.

**GOVERNMENT.** Bulgaria is a constitutional monarchy. Chief executive power is vested in the sovereign, and legislative authority is vested in him and the national assembly, or *sobranje*, which consists of deputies elected by universal manhood suffrage. The sovereign is assisted by a ministry responsible both to him and the assembly. For the purpose of local government it is divided into twenty-two *okrugs* and these are subdivided into eighty-five *okolics*. An obligatory school attendance law is enforced quite generally, and the school system includes both grade and high schools. Special and technical schools, gymnasia, and the University at Sofia comprise the facilities for higher educational work. The Greek Catholic Church is recognized by the state, though a considerable number of the inhabitants are Mohammedans and Jews.

**INHABITANTS.** The people of Bulgaria belong to the southern branch of the Slavic stock, and are made up of several more or less closely related branches, of which the Teuto-Slavic, Teutonic, and Finno-Tartaric are the most numerous. Some Greeks and Mussulmans are included, though the percentage is not large. The language is of Slavic origin and consists of the old and new dialects, the former being the richer and more generally spoken. Sofia is the capital of Bulgaria proper and of the principality, while Philippopolis is the capital of Eastern Rumelia. The former is the largest city and chief commercial and intellectual center. Other cities of note include Varna, Burghas, Shumla, and Rustchuk. In 1905 the population of the country was 4,035,623. This number included 497,818 Turks, 83,942 Rumanians, 69,757 Greeks, 94,649 Gypsies, and 36,455 Jews.

**HISTORY.** The history of Bulgaria is intimately connected with the early history of Eastern Europe. Most of the early occupants came from the banks of the Volga and overran the country in the 6th century. They built up a strong central government and for some time ruled Epirus, Thessaly, Albania, and Macedonia, and looked forward to the founding of a great Slavonic empire. However, they were conquered soon after the rise of the Byzantine Empire, and later fell under the dominion of the Turks, which caused them to lose much of their civilization, and their national spirit was broken. A new spirit of nationality rose about the middle of the 18th century, when they established newspapers, developed literature, and founded schools and colleges, but the Turks, jealous of their development, continued to hold them under subjection. The wholesale slaughter of Christians in 1876 by the Turks aroused the

spirit of Christian Europe. Russia soon after occupied the region with an army to defend them against the onslaughts of the Turks, which resulted in the War of 1878 and the final treaty of peace at Berlin.

Bulgaria was now made an independent state, with the condition that the choice of its chief ruler must be concurred in by the powers of Europe and Turkey. Prince Alexander of Battenburg was elected sovereign in 1881 and was authorized to convoke a constitutional convention to be promulgated in 1888. Two years previous to this he was kidnapped and compelled to abdicate on account of Russian hostility to him and to his followers. However, he was in touch with the spirit of the Bulgarians and only abdicated to avoid complications with Russia. In 1887 the vacant throne was filled by the election of Prince Ferdinand of Saxe-Coburg, youngest son of Prince Augustus of Saxe-Coburg. Eastern Rumelia was united to Bulgaria proper in 1885, which resulted in a war with Servia, but the latter power was defeated. In 1908 the *sobranje*, under the guidance of Prince Ferdinand, declared the country independent of Turkey and the latter assumed the title of Czar of Bulgaria. This action caused extended diplomatic complications, but the country maintained its autonomy.

**BULL**, or **Papal Bull**, an edict or decree of the pope, equal to the proclamations of secular sovereigns. The bulls are written in Latin for most countries, and are transmitted to the churches that recognize the pope as their head. The first words of the text usually designate the character of the contents. They are written on parchment, and those issued as a favor have a leaden seal appended by means of a silken cord, but those issued as a matter of justice have the seal attached with a cord of hemp. Edicts issued by secular sovereigns were formerly called bulls. The most important of these was the *Golden Bull* of Charles IV., Emperor of Germany, issued in 1356, which fixed the laws to regulate the number and privileges of electors and to govern the election of emperors.

**BULL**, **John**, a name used as a popular synonym for the English people. It originated in 1712, when Arbuthnot published his satire, "The History of John Bull," to intensify the feeling against the war with France and to ridicule the Duke of Marlborough.

**BULLDOG**, a kind of dog that has been bred as a distinct race for centuries. It is characterized by its thick, short, flat muzzle, a projecting under jaw, thick lips, half-pricked ears, flat forehead, and low but thick and strong

body. It is a good watchdog on account of its activity, courage, and intelligence. The *bull terrier* is smaller than the bulldog, and is a cross between the bulldog and the terrier. Formerly the sport of bull baiting was practiced in England. It consisted of blowing the nose of a bull full of pepper and setting bulldogs upon him, one at a time. The sport consisted chiefly in seeing the dogs tossed.

**BULLDOZE** (bul'dōz), a word derived from the practice of punishing those who, in 1876, were stealing and killing cattle in Louisiana. The punishment was with a bull whip and a dozen lashes were called a dose, hence the word bulldoze. In the same year it was applied in the political campaign, when some of the Negroes were prevented from exercising the elective franchise by *bulldozing*. The term now signifies to overawe, to silence by threat, to terrify.

**BULLET** (bul'let), a projectile discharged from a rifle and other small arms. Bullets are made chiefly of lead, and those intended for smooth bore arms are usually spherical, and those for rifled arms are elongated with the apex rounded or conical. Formerly bullets were cast, but now they are made largely by being stamped in steel dies. Copper-covered bullets poison a wound and are not favored in modern warfare.

**BULLFIGHT** (bul'fit), the national game of the Spanish and Mexicans. It was introduced into Spain by the Moors, and has continued popular ever since. The bullfighting season begins in April and ends in November. Bullfights take place in a kind of arena or circus. In most cases the fighters mount a horse, and, armed with a sword or lance, they worry the bull until he is killed. Often a horse is killed by the infuriated animal, when the fighter mounts another or combats with the animal on foot. In the larger cities where bullfighting is practiced regularly each season, there are three classes of fighters. They consist of the *picadores*, who are on horseback; the *banderilleros*, who are on foot; and the *matadors*, or the killers. When a bull has been killed, he is dragged away and another is brought from the stall into the arena. Nearly all Spanish cities have places to carry on these games, which are attended by thousands of people. In early history the game was popular in Greece, Rome, and other countries, but it was forbidden by the popes and later emperors, and was abolished by Charles IV., but was reinstated by Joseph Bonaparte, brother of Napoleon. At the great games of Madrid, in June, 1833, over a hundred bulls were killed in a single week.

It is still popular in Mexico and Spanish America.

**BULLFINCH** (bul'fīnch), a bird of the finch family. The male has a black tail, throat, bill, and head; the back is bluish-gray and the breast is red. It is nearly seven inches long. The female is less brightly colored. These birds feed on moss and buds of fruit. They are prized for their song and can be taught to sing musical airs. The bullfinch is found in Europe and on the islands adjacent to its coasts. Allied species inhabit Asia and one is found in Alaska.

**BULLFROG** (-frōg), a large aquatic frog widely distributed in Canada and the United States, but most abundant in the warmer regions. The larger species are common to the Southern States, and are found more commonly in marshes and swampy lands. The voice is a deep bass, loud and coarse, from which the name was derived. They feed on worms, insects, and crustaceans, and the larger species eat other frogs and young birds. The hind legs are edible and considered a delicacy.

**BULLION** (bul'yūn), the term used to describe uncoined gold or silver which has been reduced to the standard fineness of the coinage of a country. It is sometimes employed to designate these metals whether they are coined or uncoined, and is likewise applied to old or foreign coin held for recoinage. In England it is quite common to report as bullion the metallic reserve held in banks, but such money is more generally referred to as coin in the United States.

**BULL RUN**, a small stream in northern Virginia, a tributary of the Potomac through the Occoquan River, which was the scene of two great battles of the Civil War. The first was the great battle that took place on July 21, 1861, between McDowell, commanding 28,000 Union soldiers, and Beauregard and Johnson, leading 31,000 Confederates. The battle commenced early in the morning, the advantage remaining with the Federal forces until noon. They had crossed Bull Run and attempted to displace the enemy's left, but the Confederates received reinforcements in the afternoon and led a vigorous attack upon the Union forces, causing them to retreat in confusion and disorder, the panic reaching as far as Washington. The Confederates lost 2,000 men and the Union loss was about 2,800. Jackson rendered valuable services to the Confederate side and was named "Stonewall" ever after. The battle had an encouraging effect upon the South, and clearly demonstrated that the war would be a long struggle instead of a skirmish

of several months, as formerly supposed by the people of the North.

The second battle of Bull Run occurred Aug. 29 and 30, 1862. The Confederate forces were commanded by Jackson, who was awaiting reinforcements at Bristoe Station, and the Union army, consisting of 40,000 men, was commanded by General Pope. McDowell was dispatched to intercept Lee's conjunction with Jackson, but was recalled to join Pope. Jackson then moved to Manassas Junction and took a strong position near Gainesville behind an old railroad grading. The Union attack was led by General Sigel at daylight on August 29. The battle raged furiously in the forenoon, Pope expecting McDowell and Porter to join with reinforcements. However, the afternoon arrived, but Porter never came. The fighting ceased at night and was resumed the next day, but Pope's troops were so wearied that he was compelled to retire. Porter was afterward court-martialed for his conduct during the battle and dismissed from service. The losses, though never accurately determined, were heavy, about 9,500 for the Confederates and 14,500 on the side of the Federals. Lee took the aggressive immediately after the battle and invaded Maryland.

**BULL TROUT**, the name applied to certain species of fish belonging to the salmon family. They are fine game fish and are frequently mistaken for the salmon, from which they differ in having a body somewhat thicker than that of the salmon. The bull trout of England is found in large numbers in the mouths of rivers and approaches the salmon in size and habits. In some sections of the Rocky Mountains, where a fine species is abundant, it is considered a fine game fish, but is more popularly called the *Dolly Varden Trout*.

**BULRUSH** (bul'rūsh), the popular name of an aquatic plant. It is rushlike or reedlike, with a cylindrical stem growing from two to ten feet in height. In many species the sheath bears a small awl-shaped leaf, and the culm is tipped with an erect and pointed leaf. The roots are,

BULRUSH.

creeping and have astringent and diuretic properties useful in medicine. In some species the flowers are compound, with small spikes on their sides. The stems and leaves are the most useful parts of the plant, since their toughness renders them of service in thatching and for making chair bottoms and mats. The bulrushes are common to the rivers and ponds of many sections of America and Eurasia. Large tracts of Southern Asia are noted for a prolific growth of these plants, where they are used quite extensively by the natives for thatching cottages.

**BUMBLEBEE** (bŭm'b'l-bē), or **Humblebee**, a large bee found in nearly all parts of the world, except New Zealand and Australia. It has a hairy body and the tibiae of the hind legs terminate in two spines. The community ranges from fifty to two hundred. A large number of species have been described, most of which select as a nest some hole in the sod, frequently a deserted mouse nest, or an opening between rocks or in a log. About half of a colony are workers and the remainder are males and females. Rude cells are built by the workers, in which the honey is deposited and at the end of the season all except a few females die. In the spring the fertilized female gathers a mass of pollen and honey and deposits her eggs, and the scant store of honey is laid up by the workers as they mature, while the mother bee confines herself to the task of increasing the numbers of the colony. The females are longer than the males and workers, and they live together in the same colony without attacking each other. These bees are not valuable except that they fertilize plants, and some species of clover depend for their fertilization exclusively upon these insects. This fact has caused the bumblebee to be introduced in Australia.

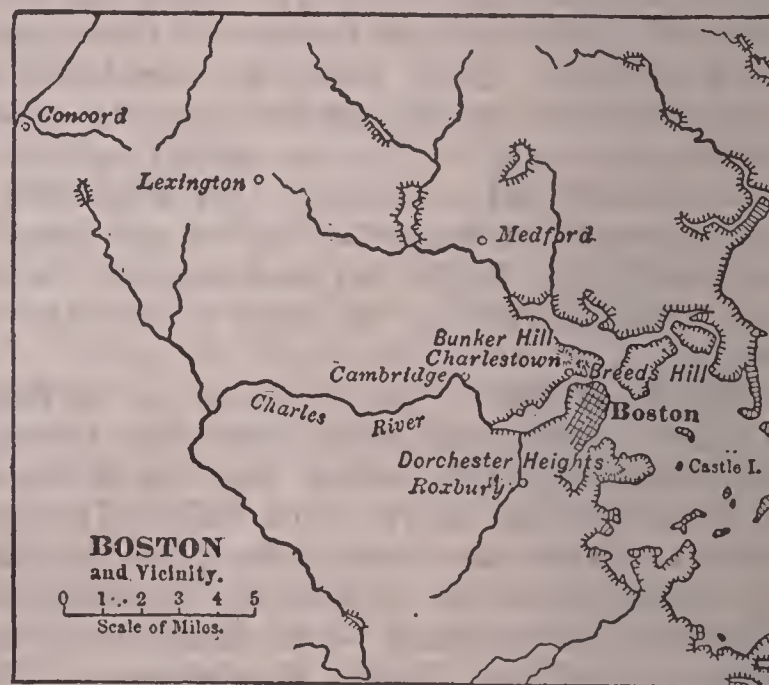

**BUNDESRAT** (böön'dēs-rät), the federal council of the German empire which represents the individual states, the nation being represented by the Reichstag. It is mainly a confirming body, but has power to reject measures passed by the Reichstag. The imperial chancellor is presiding officer and the members from each state vote as a unit.

**BUNGALOW** (bŭn-gā-lō'), the name of a kind of house built in the interior of India. It is of light construction, one-storied, and usually of sun-baked brick. The roof is thatched or tiled, and extends some distance over the walls so as to prevent them from becoming excessively wet during a rain. Bungalows are constructed for officer's quarters and by many Europeans, who furnish them elegantly. In some parts of India, where the country is not

well settled, structures of this kind are erected and maintained by the government for the benefit of travelers, who are charged a small fee per day when they occupy them.

**BUNION** (bŭn'yŭn), an inflammation and enlargement of the membraneous sack situated over the metatarsal joint of the great toe. It is caused by pressure, hence may be attributed to a tight or badly fitting boot or shoe. The attack begins with a small spot and gradually enlarges, and may be overcome by rest and poulticing. It is advisable to wear a shoe that will protect the bunion against pressure.

**BUNKER HILL**, a small elevation in Charlestown, now connected with Boston, Mass., the site of the famous Battle of Bunker Hill. The battle occurred on June 17, 1775, between the British, commanded by Generals Clinton, Howe, Burgoyne, and Gage; and the American army, by Generals Ward and Putnam, Colonel Prescott, and Major Brooks. The British army occupied Boston with 10,000 men and intended to occupy Bunker Hill and fortify themselves on the neighboring heights. The American army consisted of 15,000 men stationed at Cambridge.

MAP SHOWING BUNKER HILL AND THE VICINITY OF BOSTON.

Hearing of the intention of the British, the Americans hastened to fortify Breed's Hill, near Bunker Hill, and were attacked by the enemy from their ships and batteries in Charlestown harbor. They advanced upon the Americans from Morton's Point, who withheld their fire until the British were close upon them, when they made a vigorous defense and repulsed the British with great loss. A second unsuccessful attack was made, and soon after followed the burning of Charlestown. The British led a third attack and were resisted by the

Americans with stones and the butts of their rifles, on account of their ammunition being exhausted, but the latter finally withdrew from the scene of battle with small loss. The Americans lost 308 wounded, 30 prisoners, and 116 killed, among them General Warren. The British loss was 1,054. The Battle of Bunker Hill, although unfavorable to the Americans, was really a victory in that it taught the lesson that the patriots were fired with a great cause and that the British could be defeated. They were greatly encouraged in spirit and a general respect for their soldierly ability was inspired.

The Bunker Hill monument is located in the center of Breed's Hill. The corner stone was laid June 17, 1825, by General Lafayette in the presence of an enormous and enthusiastic crowd, among them many survivors of the battle fought fifty years before, who had gathered from far and near. After singing "Old Hundred," Daniel Webster delivered his famous address. The monument was completed June 17, 1843, when Webster delivered another address before a large audience, among them President Tyler and a number of his cabinet members. This monument is of beautiful granite, 221 feet in height. The chamber at the top is reached by a spiral stairway.

**BUNKER HILL MONUMENT.** See **Boston; Bunker Hill.**

**BUNTING** (bŭn'ting), the name of several birds native to Asia and Europe. It resembles the finches, but differs from them mainly in having a bony knob on the palate, which is an enlargement of the dentary edges of the bill. The *snow bunting* is common to the colder regions, and the *common* or *corn bunting* is seen in England and continental Europe in the fields, where it gathers food. About twelve species have been described, and to these may be added a large number of birds very closely allied in habits and structure. They gather in flocks on the approach of winter and move toward the warmer regions, and in the spring go far north to breed. The *cowbird*, or *cow blackbird*, is a familiar bird of North America of this class. See **Cowbird.**

**BUOYS** (bwói), the floating bodies that are fastened or anchored at a point near the location of reefs, shoals, or other dangerous objects in or near harbors as a safeguard in guiding ships. They are usually painted in bright colors, as red and white, so they may be easily seen. A class known as *whistling buoys* have an apparatus which is acted upon by the movement of the waves, causing compressed air to escape through a whistle. In recent years electric incandescent lights were introduced.

Buoys of this class are connected by wires with the shore, and are securely anchored by means of wire-rope moorings. Formerly large steamers could sail into harbor only in daytime, but with the use of electric buoys they pass safely at night. The lights used are of 100-candle power, and are fastened to cedar buoys anchored with 5,000-pound weights. Charts are made of the harbor, on which are shown the location and the special information to be conveyed by the buoys. These charts are placed in the hands of navigators for their instruction when entering or leaving the harbor. The Germans have invented and extensively use an electric life buoy. It is supplied with a storage battery that casts a light over a mile for six hours. It has proved of much value in the life-saving service.

**BURBOT** (bŭr'böt), a fresh-water fish of the cod family, the only representative of that class of fishes which does not enter salt waters. In appearance it resembles the ling, having an elongated form and a broad head. The skin is covered with imbedded scales and the mouth is large. It has two small barbels on the nose and a larger one on the chin. It inhabits the streams and lakes of North America, from Canada to Mexico, and is sometimes called *eelpout*, *coney fish*, and *fresh-water cod*. Several species closely related are well known in the United States, where they grow to a weight of twelve pounds, but the species of Europe are somewhat smaller.

**BURDEKIN** (bŭr'dĕ-kĭn), a river of Australia, in the northeastern part of Queensland. It rises in the Gilbert Range of the Australian Alps and flows southeast until it is joined by the Belyando River, when it turns abruptly and flows almost due north into Upstart Bay, an inlet from the Pacific Ocean. It is about 350 miles long.

**BURDOCK** (bŭr'dök), a coarse-looking weed with hooked flower heads that adhere to the wool of sheep, the hair of other animals, and to clothing. By these means the ripened seeds are widely distributed. It is regarded troublesome in Canada and the United States, but in some countries is cultivated for food. The roots and young shoots are the edible parts. It yields medicine useful for rheumatism and cutaneous diseases.

**BUREAU** (bŭ'rô), in government, a department of public business requiring a force of clerks, who labor under the direction of a chief. The term is confined to inferior and subordinate departments of England and the United States, such as the pension bureau, but most governments on the continent of Europe apply the term to the higher departments, as the bu-

reau of the minister of foreign affairs. In Russia the administration is carried on through a series of officials, each of which is at the head of a bureau, and from this has arisen the term *bureaucracy*.

**BUREAU OF THE AMERICAN REPUBLICS**, a bureau maintained in the United States with the view of collecting and distributing commercial information concerning the republics of America. It was established under the recommendation of the Pan-American Conference held at Washington in 1889, of which James G. Blaine, then Secretary of State, was the president. It is controlled by the Department of State and the chairmanship of the executive committee is vested in the Secretary of State. The general director of the Bureau of the American Republics has charge of its business and must be a citizen of the United States, but the executive committee is made up of one representative for each country that has membership in the union. The bureau is supported by the several American republics in proportion to their population.

The bureau continues to publish monthly bulletins of general information relative to commerce, resources, and political matters of general interest. A series of useful handbooks are issued as well as directories and bulletins treating of the patent, copyright, land, mining, and tariff interests of the countries concerned. In 1905 the members from the United States took position with those who favored a reduction of tariffs on some articles and reciprocity in trade, which, if successfully carried out, would no doubt increase the trade among the American republics.

**BURGOS** (bŭr'gŏs), a city of Spain, capital of a province of the same name, 130 miles north of Madrid. It is on the Arlanzon River, near the Sierra de Oca, and has railroad and electric railway facilities. The surrounding country produces cereals and fruit, and it is important as a market for wool, merchandise, and machinery. Hat making and weaving are among the chief industries. It has a Gothic cathedral founded in 1221, and contains the tombs of Cid and Don Fernando, who resided at Burgos. It was the capital of the kingdom of Castile until 1087, when Alfonso VI. removed the seat of government to Toledo. Population, 1905, 31,425.

**BURGUNDY** (bŭr'gŭn-dĭ), once an independent kingdom of Europe, but now included chiefly in the French provinces of Yonne, Côtê-d'Or, Ain, and Saône-et-Loire. The ancient Burgundians were a Germanic tribe that settled on the banks of Vistula and Oder, and afterward

spread to the Rhine and Neckar. In the year 407 A. D. they penetrated into Roman Gaul. Their kingdom was divided about 451, after a defeat of their King Gundicar by Attila the Scourge. In 534 they were conquered by the Franks, but a portion of their country became independent in 832. They again became powerful in 930, but in 1038 were annexed to the German Empire. Subsequently a number of changes in the ruling dynasties occurred which passed the title of their domain to various rulers. A portion of the region passed to Austria by the marriage of Mary of Burgundy to Maximilian, and a large part was acquired by Louis XI. as a male fief of France.

The first dynasty of Burgundy included twelve personages, who succeeded each other and ranked among the most powerful princes of their time; most of them were friendly with the kings of France. After the extinction of their line, the ruling influence passed to Philip the Bold, son of the French King John, and from him to his three successors: John the Fearless, Philip the Good, and Charles the Bold. These three sovereigns ranked among the most famous characters in the history of their time. During the reign of the last two mentioned, Burgundy included the Netherlands and several other countries.

The region included within Burgundy is fertile and productive. It is now penetrated by many railroads and contains the cities of Chalon-sur-Saône, Dijon, and Macon. The department of Côtê-d'Or is noted for its large output of Burgundy wines, which are celebrated for their rich flavor and delicate qualities.

**BURIAL** (bĕr'rĭ-al), the disposal of the bodies of the dead. The disposition of the dead and the funeral rites differ greatly. They are influenced more or less by the state of civilization and the moral and religious sentiments of the people. A natural tenderness is felt for the bodies of those who were dear in life, from which fact the mode of burial has been greatly influenced, and the need of removing from sight the body after life has departed has caused the subject to be considered with concern and interest. The pagan Greeks and Romans had elaborate burial ceremonials, and from them came the practice of three-fold sprinkling with earth, which is now practiced extensively when the casket is lowered in the grave or set in the tomb. The three principal methods practiced by mankind are *mummification*, *incineration*, and *interment*.

Many savage people expose the body of their dead to be devoured by animals and birds of prey, a custom still in vogue among the Bush-

men and other natives of Australia, who expose their dead in the limbs of trees. In India many bodies are thrown into the Ganges River, which the Hindus consider sacred as a stream flowing toward immortality. Mummification was the chief method in Egypt, where the bodies were embalmed and kept inviolate in expensive tombs, a custom that originated from the practice of burying in earthen jars, which was practiced to a great extent by the Babylonians. The Greeks and Romans patterned after the Egyptians to some extent in embalming the dead, but inhumation was a more general method, and later cremation came to be practiced. In some countries, especially in Assyria and Babylonia, the dead were buried very generally by placing the bodies on the surface of the ground and covering them with a mound, which was surrounded with stone and covered with decorations.

Interment in ancient times was more largely in tombs, and these were built on the property belonging to the family, but later burial grounds were set apart for the interment of persons

been subject to Russia since 1664. They inhabit the region about Lake Baikal and support themselves by farming and stock raising, but more recently they have taken up mechanic arts and some branches of trade. A number have been converted to the Greek Church, though the larger portion retain a preference for their worship of idols. Their dwellings consist largely of huts, or *yurts*, and these are protected from the colds of winter by coverings of leather and felt. These people number about 250,000.

**BURLESQUE** (*bûr-lĕsk'*), a dramatic or literary composition tending to excite contempt or laughter by extravagant images, or by a contrast between the subject and the manner of treating it. In this form of composition, insignificant things are described in glowing terms, while elevated and important subjects of thought are treated in the most commonplace language. The writings of William Schwenck Gilbert (q. v.) contain good examples of burlesque in which fads and affectations play an important part, and the highest dramatic excel-

EGYPTIAN SCULPTURE, SHOWING FUNERAL PROCESSION.

belonging to a certain society or church, and subsequently community or municipal cemeteries were established. The popular plan at present is to inter the bodies in the ground to a depth of from four to seven feet, but in many places tombs are erected to receive the bodies, which are invariably placed in caskets made of wood or metal. Tombs are usually large enough for a number of persons or even a number of families, and where the ground is low and wet, as in New Orleans, this method of disposal is very popular. Many cemeteries are established and maintained by churches, but the tendency now is toward municipal ownership and control. Cremation, though practiced very extensively among the Greeks and Romans, went out of use with the rise of Christianity, but it is now gaining in favor on the ground that it is a more sanitary method. See **Cemetery**; **Cremation**; **Embalming**.

**BURIATES** (*bōō-re-hĕs'*), a nomadic race of people native to southern Siberia. They are Tartars, a branch of the Kalmucks, and have

lence is attained in the works of Molière. Chaucer's "Rime of Sir Thopas" is a burlesque on the tales of the Middle Ages, and Cervantes' "Don Quixote" is a popular work intended to ridicule the romantic tales of chivalry. *Vaudeville* is of French origin and corresponds to burlesque, but more recently it, like burlesque, has become a mixture of ballet and travesty.

**BURLINGTON** (*bûr'ling-tŭn*), a city in Iowa, county seat of Des Moines County, on the Mississippi River, 135 miles southeast of Des Moines, on the Chicago; Burlington and Quincy and other railroads, and has connection by steamers with ports on the Ohio, the Mississippi, and the Gulf. The chief buildings include the courthouse, the city hall, the opera house, the Federal building, and the central high school. It has a public library of 22,500 volumes, and is the seat of Burlington Institute College. The municipal improvements include systems of gas and electric lighting, central heating, sewerage, and street pavements of brick and asphalt. An extensive system of electric

railways supplies urban and interurban communication. Near the city are rich coal deposits. The manufactures include furniture, packed meat, machinery, implements, flour, cigars, ironware, and soap. It has a large trade in lumber, cereals, and merchandise. It was first settled in 1833 and was chartered as a city in 1838. From 1837 until 1840 it was the capital of Iowa. Owing to its fine location and many parks and gardens it is called "Orchard City." Population, 1905, 25,318.

**BURLINGTON**, a city of New Jersey, in Burlington County, on the Delaware River, eighteen miles northeast of Philadelphia. It is on the Pennsylvania Railroad. It is surrounded by a fertile agricultural and fruit country, and has extensive manufactures of implements, ironware, flour carriages, and shoes. The chief buildings include Burlington College, Saint Mary's Hall, Saint Mary's Church (Episcopal), and a public library. The city has several fine schools and modern municipal facilities. It is the birthplace of James Fenimore Cooper. Quakers settled it in 1677, and it was incorporated in 1733. Population, 1905, 8,038.

**BURLINGTON**, county seat of Chittenden County, Vermont, on Lake Champlain, 35 miles northwest of Montpelier, on the Vermont Central and the Rutland railroads. It occupies a fine site on high ground overlooking the lake. In the center of the city is a large square, near which are the city hall, the county courthouse, the post office, the public library, and the customhouse. It has a large trade by steamboat navigation. The manufactories include cotton and woolen mills, marble and stone works, and flouring mills. The surrounding country is agricultural. Gas and electric lights, street railways, pavements, and waterworks are among the improvements. It is the seat of the State College of Agriculture, the University of Vermont, the Vermont Episcopal Institute, and many fine public schools and churches. Burlington was chartered in 1763, became a town in 1797, and was incorporated as a city in 1865. Population, 1900, 18,640.

**BURMA** (bûr'mà), a country of Southeastern Asia, the largest province of British India. It lies between north latitude 10° and 28°, and east longitude 92° and 101°. The boundary on the north is formed by Tibet; on the east by China, French Indo-China, and Siam; south by the Bay of Bengal; and west by the Bay of Bengal, Bengal, Manipur, and Assam. From north to south it has a length of 1,250 miles, and its breadth in the southern part is only 30 miles, while in the central part it broadens to a width of 550 miles. The area is 168,550 square miles,

exclusive of dependent states, which have an area of about 68,500 square miles.

**DESCRIPTION.** Lower Burma, which extends south from about latitude 22°, is a narrow strip along the coast of the Sea of Bengal and has a level surface, while Upper Burma is diversified by level lands near the gulf and elevated plateaus in the northern part. It is separated from Tibet by ranges of the Himalaya Mountains, which approximate altitudes of 15,000 feet above the sea. The ranges diminish in height toward the south, and at Mandalay, situated near the central part, the altitude is about 6,500 feet. The chief ranges are the Patkoi Mountains in the north and the Garo Hills in the northwest.

Burma lies chiefly in the basin of the Irrawaddy River, which rises in the Himalayas and flows south into the Bay of Bengal by an extensive delta. Near Mandalay it is joined by the Chindwin, its largest tributary. The delta is very extensive, covering an area of 18,000 square miles, and during the rainy season this section overflows. In the eastern part the drainage is chiefly by the Salwin and its tributaries. The Salwin flows south and discharges into the Bay of Bengal near Maulmain.

The climate is various, ranging from the torrid in the southern part to the temperate in the higher altitudes of the north. In most sections the climate is tropical and the rainfall is very heavy. The coast ranges have a precipitation equal to 120 to 165 inches, and in some regions of the northern part the rainfall is irregular, ranging from 30 to 150 inches. The temperature in the lowlands has a mean average of about 85°, and in the interior the summers vary from 80° to 95°, while the winters are about 30° lower. Europeans find the lowlands unhealthy and the monsoons unpleasant. These winds blow from the sea in the summer, causing heavy precipitation, and in the winter they move from the north toward the sea, hence a dry season in winter and excessive moisture in summer.

**FLORA AND FAUNA.** Burma is rich in dense tropical forests, which include the valuable teak, ironwood, palm, betel, and bamboo. The coconut, palmyra, mango, and other varieties abound. Crotons, screw pines, balsams, oranges, pineapples, begonias, and many others are cultivated. Wild animals are abundant, both in the jungles and the mountains. They include the crocodile, tapir, goat, gibbon, buffalo, elephant, and many varieties of birds and monkeys.

**MINERALS.** Though rich in mineral wealth, Burma has not developed mining to any great extent. Ruby, amber, and sapphire are obtained

in the sand of many streams, which is also a source of gold. Some mining is done for copper, iron, silver, lead, and antimony, but the output is not large. Coal and petroleum are abundant and considerable interest has been developed in quarrying white marble. This produce is obtained largely near Mandalay and is favored by the Buddhists in making sculptures and for decorating temples.

**INDUSTRIES.** Farming is the chief industry. The land is owned by the state and is leased to the farmer, who is required to pay a tax based on the extent and fertility of the land worked. Rice is the chief product and may be cultivated in about one-tenth of the country. Indeed, Burma takes first rank in the cultivation of this cereal. Other products embrace cotton, sugar cane, indigo, tea, rye, and vegetables.

The elephant is used extensively as a beast of draft and burden, but more recently the horse and mule have come to occupy an important place in farming. Cattle are grown extensively for dairying purposes, but the flesh is not eaten by the natives, since their religion prohibits meat eating.

Though quite important in the enterprises of manufacturing, no large establishments are maintained. The weaving of silk and cotton is a growing enterprise and is practiced in all of the cities. Earthenware of various kinds, jewelry, clothing, agricultural implements, and furniture are among the leading manufactures. Transportation is facilitated by the Irrawaddy, the Salwin, and a number of other rivers, some of which have been improved by embankments and connected with centers of trade by canals. A railroad line extends from Rangoon to Mandalay and other points of the interior and the northern section. Many highways have been improved and the chief cities have been fortified in modern style. The exports exceed the imports, and foreign trade is largely with China, Great Britain, Germany, and the United States. Rice, cotton, hides, India rubber, and lumber are exported. The chief imports include textiles, raw silk, fish, and metal products.

**INHABITANTS.** The inhabitants consist chiefly of Burmese, who are related to the Chinese. They constitute an important branch of the Mongolian race, and probably descended from people who came from Tibet. In stature they are medium and heavy-set, and have black hair, brown skin, broad skull, and black eyes. The language is monosyllabic, much like the Chinese, and their characters in writing are more or less circular. The civilization is stationary and stereotyped, maintaining its characteristic features from century to century. A large amount

of wealth is lavished on temples, which are of much greater concern to the average Burmans than highways and public utilities. The religion is Buddhism, and their monks, numbering about 20,000, have a marked influence socially and politically. Rangoon, on the Rangoon River, and Mandalay, on the Irrawaddy, are the chief commercial centers. Other cities of importance are Maulmain and Myitkyina. The total population, including that of the dependent states, is 10,650,000.

**GOVERNMENT.** The government of Burma is under the viceroy of India, and is administered locally under a lieutenant governor, who is assisted by a legislative council at Rangoon. For the purpose of local government the country is divided into eight divisions, each of which is presided over by a commissioner, who is the chief executive and judicial officer. The divisions are subdivided into townships and villages, and these are presided over by Burman magistrates. The educational work is conducted largely through monasteries, of which there are many in all parts of the country, but the government is promoting training in public schools and institutions of higher learning.

**HISTORY.** The ancient and modern history of Burma is not important as it affects the history and civilization of the East. It is thought that the Burmans came to the valley of the Irrawaddy more than 2,000 years ago. The region was long divided into two kingdoms, those of Pegu and Ava, which contended against each other for mastery many years. The former seems to have attained its zenith about 1580, when the Peguans became dominant over all Burma, and they held sway until 1752, when a temporary decline began through European influence in the delta of the Irrawaddy. About that time the kingdom of Ava began to rise and overthrew the domain of Pegu. In 1755 the city of Rangoon was founded by Alompra, an energetic Ava chief, who made it the commercial center of Burma, which attained its greatest power as an independent nation in 1822.

The British East India Company gained a strong foothold in the latter part of the 18th century, when it founded factories and opened an important trade in the interest of Great Britain. Difficulties in consequence of disputes about trading privileges and the frontier were numerous in the early part of the 19th century, and in 1824 the British invaded Burma with a large army. This resulted in Assam being relinquished by the Burmese, and a second war in 1852 resulted in the annexation of Pegu as British territory. The British again invaded Burma in 1885 on account of disputes in regard

to commercial concessions, relating chiefly to the transportation of timber, and the following year the remainder of Burma was proclaimed a part of Great Britain. In 1896 a treaty was concluded between France and Great Britain, by which the Mekong was made the boundary between Burma and Laos, a part of French Indo-China.

**BURNING GLASS**, an instrument to concentrate the rays of the sun. It consists of a double convex lens, hence is thick in the center and thin at the edges, and brings the rays of solar heat to a focus at nearly the same point to which it brings the rays of light. This instrument is used to set fire on various substances, such as paper and wood. Burning glasses were made by the ancients, and Aristophanes and several writers declare that Archimedes fired the Roman ships by means of burning mirrors. George Buffon (q. v.), the French naturalist and philosopher, made a large reflector with which he set fire to wood at a distance of 210 feet, proving the possibility of Archimedes having thus burned the Roman fleet.

**BURNLEY** (bŭrn'lĕ), a city of England, in Lancashire, 24 miles north of Manchester. It is located on the Burn River and the Leeds and Liverpool Canal, and has transportation facilities by numerous railway and electric railroad lines. The chief manufactures include textiles, clothing, machinery, and ironware. Slate quarries and iron mines are worked in the vicinities. The municipality owns most of the public utilities, including the gas and waterworks, slaughterhouses, public markets, and the electric lighting plant. It has public baths, a sanatorium, and several hospitals and technical schools. The trade is brisk, especially in cotton and worsted goods, machinery, and merchandise. Burnley is comparatively a modern city, and has regularly platted streets and many fine buildings of stone and cement. It was incorporated as a town in 1861. Population, 1907, 103,947.

**BURNT OFFERING**, the object offered as an atonement for sins and burnt on the altar as a sacrifice. The practice of burning objects of value was in vogue both among pagans and the Jews, the former offering their sacrifices to idols and the Jews to Jehovah. Both animals and vegetable products were burned. When the whole offering was consumed upon the altar, it was known as the whole burnt offering. The peace offerings consisted usually of parts of animals, of which portions were given to the priests for their families. See **Sacrifice**.

**BURRARD INLET**, a narrow inlet of British Columbia, an arm of the Strait of Georgia, a short distance north of the mouth of the

Fraser River. It is nine miles long and on its northern shore is the city of Vancouver. Its shores are covered with forests of firs, cedars, and pines, and it is noted for its fisheries.

**BURRILLVILLE** (bŭr'rĭl-vĭl), a town of Rhode Island, in Providence County, 22 miles northwest of Providence. It is situated on the New York, New Haven and Hartford Railway, and near it is Wallum Lake, a popular summer resort. The manufactures include textiles and machinery. Population, 1910, 7,878.

**BURTON-ON-TRENT**, a town of Staffordshire, England, on the Trent River, twenty miles east of Stafford. It is surrounded by a level country, producing cereals, fruits and live stock. The river is crossed by a stone bridge with twenty-nine arches, and it has transportation facilities by several railroads and the Grand Trunk Canal. Among the public buildings are a public library, a college, and many fine churches and hospitals. The manufactures include ale, clothing, cotton goods, and machinery. The breweries are among the largest in the world. Burton was incorporated in 1878. Population, 1907, 53,425.

**BURY** (bŭr'ĭ), a town in Lancashire, England, eight miles north of Manchester. It is the seat of immense manufactures of woolen goods, fabrics, machinery, ironware, and dyestuffs. A fine stone statue of Sir Robert Peel, who was born near here, adorns the public park. It has many fine churches and school buildings, several hospitals, and good municipal improvements. Freestone quarries and coal mines are worked in the vicinity. It was incorporated in 1876. Population, 1907, 58,918.

**BUSH BUCK**, or **Boshbok**, an antelope of South Africa, so named from its habit of frequenting the thick underbrush. It is easily caught in the open country. The body is from four to five feet long and about three feet high, and the horns are triangular. It is esteemed for its venison. A similar animal known as white-backed bush buck is native to Sierra Leone.

**BUSHEL** (bush'ĕl), a measure of capacity, containing eight gallons or four pecks, used in measuring dry quantities. The bushel contains 2,150.42 cubic inches, and the standard cylinder used is eight inches deep and 18½ inches in diameter, inside measurement. This particular bushel is used in the United States, while the imperial bushel of Great Britain has a capacity of 2,211.192 cubic inches, equal to eighty pounds of distilled water.

**BUSHMEN**, or **Bosjesmans**, a native race of South Africa, who dwell in the region of the Orange River. They are low in the scale of mankind and have made little progress in

the arts of civilization. Their habitations are caves and clefts in the mountains, or holes in the ground covered with roofs of reeds. They support themselves chiefly by hunting and trapping and by gathering berries, roots, insects and reptiles, which they eat about half cooked. The dog is their favorite domestic animal. They have numerous legends and do a rude form of painting, but their language is very simple.

**BUSHRANGERS** (bush'rān-jērz), a gang of escaped convicts who frequented the forests of New South Wales in 1810-80. They robbed banks, plundered villages, and laid tribute on the settlers. Subsequently they infested Van Dieman's Land and frequented the mountainous districts of eastern Victoria. They were exterminated under martial law proclaimed by the governor in 1815, but the last of their gang was not executed until 1880, when three were shot at Melbourne.

**BUSINESS COLLEGE**, an institution in which students of both sexes are trained for commercial employment. These schools have been promoted for many years, or departments doing similar work have been maintained in public schools or normal colleges, but since the middle of the last century they have multiplied greatly. This is due to the fact that stenography, typewriting, and telegraphy have demanded more attention, and through these branches of study all lines of office work have been modified to a great extent. Business colleges do not only teach the three branches mentioned, but in addition provide courses in book-keeping, commercial arithmetic, commercial law, commercial geography, and one or more modern languages, especially German, French, or Spanish. All the larger cities of the United States and Canada have one or more business colleges, and in these countries commercial departments are maintained in a large number of high schools. Writers of text-books have supplied outlines and texts suitable for class work in all the branches taught, and these are quite as numerous as those offered for use in public schools and colleges.

**BUST**, in sculpture, the representation of the chest and the upper part of the body. The earliest bust known is that of Scipio Africanus the Elder. Busts were very common in the literary period of Greece and quite extensive in Rome. By means of them we have good representations of the faces of Plato, Socrates, Demosthenes, and many other Greek characters; and of Caesar, Cicero, Cato, and other eminent Romans. However, they are less common among the latter. King Louis I., of Bavaria, made the most celebrated collection that exists, now at the Wal-

halla, about seven miles east of Regensburg (Ratisbon), Germany. Among the busts are 101 representations of eminent Germans.

**BUSTARD** (būs'tērd), a bird of the Eastern Hemisphere, belonging to the order of runners. The great bustard was once common to the British Isles, and is still found in the southeastern part of Europe and in Tartary. It measures six to seven feet from wing to wing

GREAT BUSTARD.

and weighs thirty pounds. The little bustard is common to Europe. Several species are found in Africa and one is native to Australia, but none is found in America. The bustard family is esteemed for food, but attempts to domesticate these birds have failed.

**BUTCHER BIRD.** See **Shrike**.

**BUTLER**, a borough in Pennsylvania, county seat of Butler County, about twenty-three miles north of Pittsburg, on the Bessemer and Lake Erie, the Pennsylvania, and other railroads. It has a growing trade in minerals and farm produce. Among the chief buildings are the county courthouse, the public library, and several banks and business houses. The city is in the natural gas and oil belt, and engages in the manufacture of machinery and implements. It has extensive flouring, woolen, and planing mills. Gas and electric lights, street railways, pavements, and fine schools and churches are among the conveniences. It was settled in 1798 and became incorporated in 1803. Population, 1900, 10,853.

**BUTTE** (būt), a name frequently applied to mountains whose peaks are more than 8,500 feet above the sea. In this sense the word is used quite frequently in Canada and England, and

to some extent in the United States, but in the last mentioned country it applies more generally to a hill or knoll rising abruptly on a plain or plateau. Many small buttes are located in the Rocky Mountains and on the high plains of North Dakota and eastern Montana. They were formed by the erosion of ancient plateaus, being the more solid portion of earth or clay mixed with rock.

**BUTTE**, a city of Montana, county seat of Silverbow County, sixty-four miles south of Helena, on the Great Northern, the Northern Pacific, the Chicago, Milwaukee and Saint Paul, and other railroads. In its vicinity are productive deposits of gold, silver, and copper. The chief buildings include the county courthouse, the Federal post office, the State School of Mines, the city hall, and the opera house. It has a public library of 35,000 volumes. The manufactures include cigars, clothing, earthenware, and machinery. It has a large local and jobbing trade. The municipal improvements are electric and gas lights, pavements, street railways, sewerage, and waterworks. Butte was settled in 1864 and was first incorporated in 1879. Population, 1900, 30,470; in 1910, 39,165.

**BUTTER** (büt'tēr), the fatty substance of milk or cream solidified by churning. Formerly butter was made wholly of cream that was collected from time to time by skimming the surface of milk, where it accumulates by gravitation. This method is still employed on the smaller farms, but in dairying it has been superseded by the use of the cream *separator* (q. v.). After a sufficient quantity of cream has been gathered, it is placed in a *churn*, or in some other suitable apparatus, and is agitated until butter forms. When the churning has been finished, the butter is taken out and is worked thoroughly to free it from milk, and about two per cent. of salt worked into it. The milk of a well-fed cow contains about four per cent. of butter. In the newer process of making butter by separating the cream from the milk by a separator, the centripetal principle of revolution is applied to the process, and later the cream is agitated in a churn propelled by steam or electric power. In the larger creameries the whole milk is churned. The agitation in churning ruptures the fat globules and causes them to collect in masses.

Much care must be exercised in the packing and storage of butter, as it is very sensitive to its environments and its flavor is easily impaired. When the butter is delivered by the creamery to the customer or is shipped only a short distance, it is usually put up in the form of bricks, but when shipped a long distance it

is packed in tubs or firkins. Farmers either make the butter themselves and sell it to grocers, or they sell the milk or cream to the creamery or cheese factory. The modern refrigerator cars and cold-storage plants permit transporting butter long distances or keeping it many months without danger of injury.

The production of butter is an important industry. Denmark and Holland excel all other countries in the quality of the butter produced, and both are large exporters. The butter industry of Canada and the United States has grown constantly the past decade, owing to the introduction of the creamery system. The annual production in the United States is valued at \$275,500,000. Chicago, New York, and Boston are the leading butter markets, but it is an article of extensive commerce in many localities and in most countries. An artificial butter, called oleomargarine, is made of beef fat, or suet. A general law places a heavy tax upon it, in order to protect the production of dairy butter. However, it is produced extensively and forms an important article of commerce.

**BUTTERCUP**, a name popularly given to several varieties of plants of the ranunculus family. The taller species grow to a height of two or three feet, the smaller varieties form runners, while others grow in water. They flower in May; the flowers have a shining yellow color and are double in several species. They were so named because formerly illy informed people thought the yellow color of butter was due to cattle eating them, which they never do.

**BUTTERFLY**, the common name of a large class of diurnal insects, that is, insects which are active during the daytime. The butterflies and moths constitute the Lepidoptera, or scaly-winged insects. They exhibit much similarity to other kindred insects. Many species are found in all parts of the world, though in some regions they are seen only in the summer season. They are more numerous in the tropical climates than in the colder zones. They are found as far north as Greenland and Spitzbergen, where they extract nectar from the flowers, while in warmer climates they inhabit the shade of moist foliage in the woods and jungles. Most species fly by day, while the hawk moths move about by twilight, and the moths by night.

The life of the butterfly may be divided into three periods or stages. It begins when the *larva* or *caterpillar* is hatched from the egg, when it is wormlike in form. In this stage it lives from three to ten months, depending upon the locality and the season, and during all this time it takes in food with much greediness.

During the second stage, when it is known as the *pupa* or *chrysalis*, it takes in no food whatever. While in this period of development, the pupa of the moth is inclosed in a cocoon of silk, while that of the butterfly is incased in a chrysalis with a hard outer case. Some species remain in this stage only a few weeks, but some do not emerge from it before the following spring. In the third stage the insect is known as the *imago* or *perfect insect*.

The eggs are laid on the leaves of plants, but only the kinds fed on by caterpillars are selected for the purpose, and they are hatched by the heat of the sun. When laid in the summer, they hatch in a few days, but in cold climates the eggs hatch in the spring following their deposit. When hatched in the spring, they

CATERPILLAR, PUPA, AND BUTTERFLY.

live as caterpillars during the greater part of the summer, while those hatched late in the summer remain in the chrysalis or pupa state during the winter and develop into butterflies in the spring.

Butterflies have four wings. They are richly colored on both sides and are separate from each other and held upright when at rest. The wings are covered with beautiful scales or feathers, as perfect as those found in the most beautiful birds, but are so small that several hundred thousand occupy a square inch. The wings possess great power, considering the size of the insect, and many species are able to soar in the air with a steady and continuous motion, while others in the tropical regions are migratory, often moving many miles in large numbers. The

smaller species have a zigzag flight, and stop to rest frequently on leaves of trees and grasses.

Butterflies are admired for their beauty. They are active in delightful weather, and are usually associated with the most beautiful vegetation and natural scenery, but the caterpillar is a very uncouth appearing insect and gives annoyance by its ravages in fields and gardens. Some caterpillars are associated in large colonies, sometimes several hundred, and in this form are very destructive to fruit trees, especially apples and plums. The fully developed butterflies are short lived, serving the purpose of depositing their eggs and then die. There are no less than 50,000 species in the different climates, and about one-eighth of them are found in America north of Mexico. The species include every color, and in size range from very small insects to the largest found in the tropical countries, some measuring nearly foot across the wings. Some are remarkable for the likeness they bear to the leaves, flowers, bark, or vegetable life on which they feed, this often serving as a protection against their enemies.

**BUTTERFLY WEED**, a plant native to North America, found widely distributed in Canada and the United States. It is allied to the so-called milkweeds, and is known in some sections as *pleurisy root*. It has bright orange-colored flower clusters and the root is used as a medicine, chiefly as an expectorant.

**BUTTERINE** (büt'tēr-in). See *Oleomargarine*.

**BUTTERNUT**, or *White Walnut*, a wide-spreading forest tree of America. It ranges from the Atlantic to the Missouri River and beyond, has nearly smooth bark and serrated and pointed leaves, and grows to a height of fifty to seventy-five feet. It flowers in May and bears an oblong-ovate nut that ripens in September. The kernel is much used for eating, while the bark yields a dye, and the wood is useful for cabinet work and for fuel. It is not so valuable as the wood of the black walnut, being lighter in weight and less hardy.

**BUTTERWORT** (büt'tēr-würt), a plant common to the marshy grounds of Europe and Canada. The flowers of most species are purple in color, and have a two-lipped calyx. The leaves are thick and somewhat greasy to the touch, and secrete a glutinous fluid that holds small insects, which are consumed by the plant for food. Some species, as the butterwort of the Alps, bear a yellowish flower. The leaves are used in northern countries, as in Sweden and Norway, to coagulate milk.

**BUTTON**, a small circular disk used chiefly to fasten together parts of a dress and for orna-

mentation. It is made of a large variety of materials, including pearl, bone, horn, wood, ivory, copper, rubber, and brass. A very durable button is made of the blood of animals, which is gathered at slaughterhouses and the liquid portions are evaporated. In style or pattern buttons differ very largely, but they may be classed as *shank buttons*, *hole buttons*, and *covered buttons*. Shank buttons are fastened to the garment by a loop of wire, called the *eye*, and are used extensively in overalls and other garments worn by men. Hole buttons are sewed to the cloth by means of thread, which is passed through the holes drilled in the center. Covered buttons are worn largely on garments of a better grade, and are covered with cloth or silk to conform to the pattern to which they are attached.

The manufacture of buttons is an enterprise of vast importance, though as such it does not date to remote antiquity. An article of this kind was not used by the Greeks and Romans to any great extent, who fastened their loose garments with strings and girdles, or used pins, brooches, or buckles. Hooks and eyes have been in use many centuries, but the extensive use of buttons does not date back farther than the 14th century. Birmingham, England, is the chief center of the manufacture of buttons in Great Britain, and this enterprise is developed quite extensively in Canada. In Germany, the United States, and many other countries buttons are made to some extent by convict labor in the penitentiaries. The pearl button industry is centered largely along the Mississippi River, in which fresh-water mussels are abundant. Extensive factories are operated at Muscatine and Fort Madison, Iowa, and in many places along the Mississippi River between New Orleans, La., and Red Wing, Minn. Buttons of this class are cut with tubular saws from the shells into the sizes of the buttons desired, after which holes are pierced or drilled, and the button is finished by polishing. Waterbury, Conn., is the center of the metal button industry in the United States, and large quantities are made in Philadelphia. Glass, porcelain, and gutta-percha buttons are manufactured to a considerable extent. Other kinds are those made of celluloid and papier-maché. Many civic societies and other organizations, especially the Grand Army of the Republic (q. v.), wear buttons of metal, usually bronze or brass, on the common garments, and of gold or silver for symbols or ornamentations.

**BUTTRESS** (bŭ'trĕs), in architecture, a support on the outside of tall buildings, used extensively in bridges which bear a heavy super-

structure. The Chaldeans built rudimentary buttresses to strengthen the walls supporting heavy vaults or roofs, but the more substantial forms came into use at the time of the Byzantine Empire. In Gothic architecture it is an essential feature, especially the so-called flying buttress, which has an arched form and springs from a heavy pinnacled buttress, serving to support a higher portion of the building by transferring its thrust downward to the exterior buttress. In many styles of buttresses more or less ornamentation has been introduced and some are paneled over the entire surface.

**BUTYRIC ACID** (bŭ-tĭr'ĭk), one of a number of acids obtained from butter, and contained in various other substances, such as perspiration and cod-liver oil. It is formed in milk by the action of caseine upon the sugar, lactic acid being first formed, and this by its decomposition producing hydrogen and butyric and carbonic acids. When obtained from butter, it is a colorless liquid, and is unpleasant to the odor and taste. Butyric acid gives the rank smell to rancid butter.

**BUZZARD** (bŭz'zĕrd), the name of a class of birds of prey belonging to the falcon family. The common buzzard of Europe is large and has a heavy body.

It is skillful in catching birds, mice, and poultry. About ten or twelve species are found in Canada and the United States, of which three deserve especial note; the *turkey buzzard*, the *brown buzzard*,

TURKEY BUZZARD.

and the *rough-legged buzzard*. The turkey buzzard is native to the Southern States, where it is very common and useful as a scavenger and carrion-vulture, and for that reason is commonly protected by law. This bird is allied to the condor of South America, and, like it, has the head and neck bare. It is about the size of a turkey, is dark or black in color, with wide-spreading wings, and is seen in large numbers hovering around the carcass of a dead animal. The brown buzzard is deep brown in color. It nests in trees and ledges of rocks and feeds on worms, insects, birds, and small mammals. The rough-legged buzzard is feath-

ered to the toes. Buzzards are distributed more or less in all the continents.

**BUZZARD'S BAY**, an inlet from the Atlantic Ocean, on the southeast coast of Massachusetts, extending in a northeasterly direction about thirty miles. It is from five to ten miles wide. The principal harbors on the coast are Fairhaven, Wareham, and New Bedford. It is famous for its abundance of fish, game, and fine summer resorts.

**BY-LAW** (bī'lā), an organic law or regulation made by the members of a corporation, society, or some similar body to govern its members and officers in the official proceedings. It is common for school boards, library trustees, town councils, railroad companies, and legislative bodies to agree upon by-laws. These are authorized by law or the constitution of the society and may be abridged, repealed, or amended as the corporation may direct.

**BYZANTINE ART** (bī-zān'tin), the art resulting as the outgrowth of the rise of Constantinople, when the barbarians of Western Europe were pouring into Rome. The city was then called Byzantium, hence the name of this peculiar art and of the mighty Eastern Empire. At Byzantium the artists gathered and nursed the sparks of artistic beauty in the Middle Ages, which kindled the fires of modern art, after the Revival of Learning. This peculiar art dates from the early part of the sixth century, called the Justinian Age. It was retarded by the fall of the Eastern Empire under the sway of the Crusaders in 1204, and finally terminated with its destruction in 1453. Byzantine painting was executed with care and some degree of skill. The illuminations of the scriptural manuscripts were especially fine, and many examples are still to be seen in the larger public libraries of Europe, as fresh and beautiful in appearance as when they were painted. The most remarkable are found in Italy and were made at the school of Sienna. Among them is a picture of the Virgin in the Church of Saint Dominico at Sienna, by Guido, which was executed in 1221, and is a production of exquisite beauty. Interest in the painting of this time is induced by its influence on the later paintings in Italy of Cimabue, Giotto, and even of Raphael.

The sculptures of Byzantium well deserve admiration and respect, especially when compared with the later plastic works of Rome. All the figures are laden with drapery and costume, which largely obscure the nobler and freer features admired by the ancients. It was influenced more or less in this respect by the spread of Christianity. The most beautiful specimens in-

clude the "Forty Saints," now in the museum at Berlin. While relief work and statuary were profuse, the crosses, candlesticks, plates, lamps, cups, altars, and all portions bore decorations and were richly adorned with precious metals, mosaics, or frescoes.

Byzantine architecture influenced largely the construction of public edifices of Western Europe, especially the churches of Germany and those built in the early Norman period. The finest work included in this form, and, in fact, typical of it, is the church of Saint Sophia, still the greatest mosque of Constantinople. It was rebuilt by the order of Justinian and completed

CHURCH OF SAINT SOPHIA.

in 537 A. D. It was the largest and most magnificent of twenty-five temples built in the capital, and many similar structures were erected throughout the empire by its pious emperor. Its style influenced the construction of the churches of Ravenna, the Saint Mark's at Venice, and many of Western Europe; among them is the notable Cathedral of Aix-la-Chapelle, which is purely in the Byzantine style. The style presents endless varieties of the Roman arch; characteristic cupolas, and profuse ornamentation. The fresco paintings, rounded windows, and bold projection mouldings, ornamented with foliage, are conspicuous.

**BYZANTINE EMPIRE**, a powerful country of antiquity, with its seat of government at Byzantium, now called Constantinople. In history it is sometimes spoken of as the Eastern, the Lower, the Greek, and the East Roman Empire. It was founded in 395 A. D., by the two sons of Theodosius the Great, Honorius and

Arcadius, when he divided the Roman Empire. Arcadius was made emperor of Western Europe, but that portion soon passed into the hands of the barbarians. Honorius became ruler of the Byzantine Empire, which existed nearly a thousand years, from the death of Theodosius the Great to the fall of Constantinople in 1453. The origin of the empire dates back to the removal of the capital of the Roman Empire from Rome to Byzantium by Constantine, in 330 A. D., which city was named Constantinople in his honor. The seat of government was changed partly because the barbaric Germanic tribes were pressing hard against Rome, and because of the spread of Christianity in the East, a consequence following the movement of the Roman influence toward the East. In its greatest prosperity the Byzantine Empire included Syria, Pontus, and Asia Minor in Asia; Egypt in Africa; and Macedonia, Crete, Greece, Thrace, and Moesia (now Bulgaria) in Europe. The territory was successively enlarged and diminished by victory and defeat until the fall of Rome in 476, when its territory was merged into other dominions by reason of the conquests attained by the Huns, Goths, and Vandals.

The first period of the empire proper dates from 395 to 716. The period is distinguished by the reign of Theodosius II. (408-450), partly under the regency of his sister, Princess Pulcheria, who carried on successful wars against the Persians in the East and the ravages of Attila and the Huns in Thrace, in the West. He was succeeded at his death in 450 by his sister, Pulcheria, who reigned with extraordinary dignity, and was succeeded by Leo I. He was succeeded by Zeno the Isaurian (474-491), in whose reign a disastrous fire destroyed the famous library of Byzantium. Within his reign also occurred powerful invasions of the Goths and Vandals.

The reign of Justinian I., known as the Age of Justinian, was the most efficient in the history of the empire. It is distinguished by the rise of painting, sculpture, and architecture. In this reign the empire was extended; the great churches were constructed, including Saint Sophia and several hundred others; and the famous "Code of Justinian" was written. He was succeeded by Justinian II., who was unfortunately harrassed by the Persians in the East and the Avars in the West. His reign was followed by Maurice, a weak and lawless ruler, who was overthrown by Heraclius. The latter reigned successfully from 610 to 641. His achievements in war are regarded equal to those of Scipio and Hannibal. Though several posses-

sions were lost, those remaining were closely united and the empire became more distinctly Greek.

From 716 to 1057 followed a period of prosperity. It was marked by successful defenses against the Bulgarians and Saracens. The period witnessed the great internal religious controversy that tended to weaken the empire against foreign foes. The controversy was between the Iconoclasts and the Established Church. The former, who opposed the presence of images in places of public worship, were led principally by Leo III. This long dispute resulted in the separation of the Greek Church from the Roman Catholic Church in the last half of the 9th century; the formal separation occurred at the excommunication of the Greek Church in 1054. In this period the empire possessed various distinguished rulers, among them Empress Irene, who sought to unite the Eastern and Western empires by an endeavor to marry Charlemagne, after blinding her own son, but she failed for want of support in her own nation. In the reign of Constantine VII., in the middle of the 10th century, many Russian and Hungarian princes embraced Christianity and Christianized their people. In the beginning of the 11th century the Bulgarians were conquered, but the Turks began to threaten Italy from the East, while the Normans became aggressive from the West.

From 1057 to 1204 the empire gave evidence of a slow but constant decline, owing to the attacks of the Crusaders and the rise of Turkish power. The Crusaders had a marked effect upon Constantinople as they pressed forward to Asia Minor, and finally came into open conflict with the emperors. Alexis made a treaty with the second Crusaders, by which he was to acquire territory conquered by them, but their plans were not carried out. The Normans in the West became even more powerful in their attacks. However, Constantinople was captured by the Crusaders in 1203, and by them Isaac was restored to the throne, having been previously dethroned by Alexis. The latter and his sons were put to death the next year.

From 1204 to 1261 the Latins occupied the empire, following the second capture of Constantinople by the Crusaders in that year. It was now commonly called the Latin Empire of Rumelia, and Count Baldwin of Flanders became the first emperor. At this time it was divided into various kingdoms and was made tributary to the Venetians and French. Latin occupation was marked by harmful influences, since both art and culture degenerated, and its former greatness was forever lost. In 1261 the

Latin Empire vanished, but many of the smaller principalities still remained.

From 1261 to 1453 the final fall was accomplished by the rapid rise of Turkish power. A dynasty was founded by Michael Palaeologus, the ruler of Nicaea, in 1261, which remained in control until the final fall of the empire, and is known as the dynasty of Palaeologi. He made fruitless efforts to reconcile the Latin churches and to unite the Greeks as one mighty people. He was hard pressed by the Turks, but they became even more powerful in the reign of his son, Andronicus II., who lost Adrianople, in 1361, and afterward Macedonia and Albania. Sultan Amurath was succeeded by Bajazet, a strong Turkish warrior, who captured Philadelphia, in Asia Minor, and laid siege to Constantinople, but the city was saved by the Tartars under Timour, who invaded Western Asia, which caused a retreat of the Turks to defend their countries in the East. Various rulers followed successively until the Turks attacked Constantinople with an army of 400,000 men under Sultan Mohammed, April 6, 1453. The garrison of 8,000 men made a noble defense, but was finally conquered, and Constan-

tine, the last of the Byzantine emperors, was slain in the battle. The cross on the dome of Saint Sophia was replaced by the crescent of the Moslem. Christianity was exterminated, and the surviving inhabitants were sold into slavery.

The Byzantine Empire had not stood in vain. It served as a mighty bulwark against the rising power of the Turks until the spark of Western culture and the spirit of advancement were fanned into a flame that developed the highest learning of modern civilization. It was the means of protecting the treasures of ancient Greece and Rome from destruction by the Western tribes in the long period of the Middle Ages, preserving them safely until the rise of learning, which spread like fire over Western Europe after the fall of the last Constantine.

**BYZANTIUM** (bĭ-zăn'shĭ-ŭm), a city founded in 667 B. C., on the Thracian Bosphorus, by emigrants from Megara, which rose rapidly into commercial importance. Its situation on the shores commanding Asia and Europe made it a powerful factor in early history. In 330 A. D. its name was changed to Constantinople and it was made the metropolis of the Roman Empire. See **Constantinople**.

C

**C**, the second consonant and the third letter of the English alphabet, and of all alphabets derived from the Roman. It has the same position in the alphabet as the Greek *gamma*, from which it was derived through curving the form. In the English it has two distinct sounds; before *e*, *i*, and *y* it is sounded as *s*, and before *a*, *o*, and *u*, as *k*. Before *k*, as in *trick*, it is silent.

In music *C* is used to represent the first note of the diatonic scale of *C* major, corresponding to *do* of the Italian. It is employed as an abbreviation for cent and in expressing the scale of the Centigrade thermometer. In combination with *B*, as *B. C.*, it signifies before Christ.

**CAB**, a vehicle drawn by one horse, having either two or four wheels. In large cities cabs are used commonly for conveying passengers and are under police regulations. The name is also applied to the part of the locomotive in which the engineer and fireman are stationed.

**CABAL** (*kā-bāl'*), a term used to denote a small party united for political or personal ends. Previously it was used to designate a secret body or cabinet organized to further political designs. It was applied especially to the infamous ministry of Charles II. of England in the 17th century, which was constituted of Clifford, Ashley, Buckingham, Arlington, and Lauderdale, the initial letters making the word *cabal*.

**CABATÚAN** (*kā-vā-tōō'án*), a city of the Philippines, on the island of Panay. It is located on the Tigum River and has a growing trade in fruit, tobacco, and merchandise. The buildings consist largely of small huts, but some of the business houses are substantial and are constructed of brick and stone. Population, 16,495.

**CABBAGE** (*kāb'bāj*), the name of a plant which is cultivated extensively for culinary purposes and for feeding cattle. It is native to Europe, and in its wild state attains a height

CABBAGE

of two or three feet. The wild plants have no heads, the heads of our garden and field plants having been obtained by propagation.

It shows a greater tendency to vary its form through cultivation than almost any other plant, and is esteemed very highly among the vegetables. The familiar species that are cultivated extensively include the *Savoy*, the *broccoli*, the *common*

PURPLE CABBAGE.

WHITE CABBAGE.

*cabbage*, and the *cauliflower*. The common cabbage is the most important. It includes the red, or purple, and the white varieties; the delicate Portugal, and the coarser tree or cow cabbage. The stems of the cow cabbage, which reach a height of ten to twelve feet, are used for walking sticks, umbrella handles, and as material for farm buildings. Cabbage is cultivated on a small scale in nearly all the gardens, usually in connection with other vegetables, but in some localities it is grown extensively in large fields. As a food it is boiled, made into *sauerkraut*, or is eaten as a salad. In most climates the seed is sown in a hotbed early in the spring, usually in March, and the plants are set in the ground as soon as the frost is out of the ground. Both early and late species are grown, the former

maturing in July and the latter in autumn. The heads may be kept over winter in a cold, damp cellar, or by putting them in pits head down and covering with straw and earth. In the southern portions of the United States the cabbage industry is a successful enterprise, and large quantities of the product are shipped to the northern markets almost the entire year.

**CABBAGE INSECTS**, the insects that infest the cabbage plants. These pests include a number of insects more or less harmful or destructive. The *cabbage moth* is widely distributed in North America. It is the most destructive in the larva state, when it is known as cabbage worm, or kale worm; and is particularly harmful to the young plants. About a dozen species are common to Canada and the United States, and most of them are very prolific, having two or three broods in a season. The caterpillar of these insects have a green color of about the same shade as the cabbage, and they attack the heads as well as the leaves. A plant louse, known as the *cabbage aphid*, infests the leaves of cabbages and turnips. It is greenish below and brownish above. The *cabbage bug*, a brilliantly colored insect, hibernates in tufts of grass and weeds and attacks the young plants.

**CABBAGE PALM**, the name of several species of palm trees, so named from their large terminal buds, which are eaten like cabbage. The trees in the West Indies belonging to this class are species of the *areca* palm, and the cabbage palm of the United States is the palmetto.

**CABBAGE ROSE**, a species of roses noted for its fragrance, and sometimes called the Provence rose. It is cultivated extensively for the manufacture of rosewater and attar.

**CABINET** (kăb'î-nět), a body of advisers or ministers, usually composed of the heads of executive departments, so named from the cabinet or private apartment in which the monarchs of England consulted their privy councilors. The present Cabinet of England may be said to date from the time of William III., who presided over its meetings, and during his reign the ministry was placed on a Parliamentary basis; that is, all of the members of the Cabinet were made members of one or the other of the houses of Parliament. The Prime Minister, who is appointed by the Chief Executive, selects from the chief officers of the government those he desires to have in his Cabinet. He submits their names to the crown for approval, and he is the presiding officer at the meetings. There is no restriction as to the division of the cabinet officers between the two houses of Parlia-

ment, or even as to their number, except that not less than eleven are to be chosen, including the first lord of the treasury, the lord president of the council, the lord chancellor, the chancellor of the exchequer, the lord privy seal, the first lord of the admiralty, and the five secretaries of state. The meetings are secret and no record of the proceedings is kept, and each member is bound by its decisions or must resign from the ministry. This body must stand or fall together and is the responsible government of the British empire. Though an essential part of the government, it has never been officially established by an act of Parliament.

In the United States the Cabinet is authorized by the Constitution. The President may require the principal officers of the cabinet departments to submit an opinion in writing on any subject relating to the duties of their respective offices. It is customary for the President to call the cabinet officers into sessions and act as the presiding officer, the meetings being designed for the discussion of matters of grave importance to the success of the government. There are nine departments, of which the Secretary of State, of the Treasury, of War, and Postmaster General were established in 1789. The Secretary of the Navy was raised to the dignity of a cabinet officer in 1798, of the Interior in 1849, the Attorney General in 1870, and the Secretary of Agriculture in 1889. The Department of Commerce and Labor was organized in 1903. The President nominates the cabinet officers, subject to the approval of the Senate. It is customary to select for cabinet positions public men who belong to the same political party as the President, though this was not followed by George Washington and several others. The cabinet officers receive a salary of \$8,000 per year.

In 1886 the so-called presidential succession law was passed, which provides for the succession to the office of President in case both the President and Vice President die or are removed from office by conviction after impeachment. The order of the succession begins with the Secretary of State, then Secretary of the Treasury, of War, Attorney General, Postmaster General, Navy, and Interior. The others are not affected by it, because they were not created until some years after the passage of this provision. It may be found convenient to use the word St. Wapniac to recall the order of the succession, as the letters in the word indicate the initials of the departments in regular order.

There is no principal cabinet officer in the United States, but the position as Secretary of State is usually regarded the most important. In most countries the cabinet has similar duties

to those discharged by cabinet officers in the United States, but many are given larger powers, or modified duties are placed upon them. In Switzerland and all the American republics the Cabinet is responsible, not to the Legislature, but to the Chief Executive, while in France the Cabinet is more largely responsible to the legislative branch of the government.

**CABLE** (kā'b'l), a strong rope exceeding two inches in circumference, originally made of hemp, but now made largely of iron or copper wire, and of iron links. It is used for anchoring ships, in building suspension bridges, for moving cable cars, etc. In making a cable of hemp or coir, the yarns are twisted to form a *lissum*. Three lissums twisted in an opposite direction form a *strand*, and three strands twisted in the direction of the yarns in a lissum form a *cable*. Chains are now preferred to hempen cables on board of ships, because of greater durability, compactness for stowage, and superior strength.

**CABLE CARS**, a class of vehicles used to carry passengers. They are propelled by an endless cable wire that makes a continuous circuit over pulleys, through a subterranean channel, by means of a stationary engine located at some point of the line where two loops of the cable meet. They are less expensive to maintain than horse cars, but are more costly than the electric system. The average cost of construction per mile of a cable railroad system is about \$350,000, but there is a considerable variation with differences in the geological strata. Cable car lines are being fast superseded by electric railroads in cities, but they continue to serve a useful purpose in mountain lines, as they constitute the only practical means yet devised to successfully ascend steep elevations. The Stanserhorn Railway in the Alps of Europe makes an ascent of sixty per cent. and attains an altitude of 6,235 feet. The cost per horse power, furnished by electricity and applied to cables, is only \$20 per year. The Catskill, New York, elevated cable railway, built in 1892, is 7,005 feet long and rises 1,605 feet. In this system the cable is supported by pulleys and the machinery is controlled by levers. The cable road at the Jungfrau, in the Alps, is tunneled the entire length and ascends a grade at an angle of 45°. It is the most remarkable yet devised. All the cars in ascending lines are provided with safety brakes for clutching the rails in case of accident.

**CABLES**, the lines used to carry electric currents, either under water or underground. They are usually known as electric and submarine cables, and the former are used as conductors

of electric currents underground, while the latter are those laid on the bed of the ocean, or some other body of water. Electric cables consist essentially of one or more copper wires, frequently a hundred, surrounded by insulators, and the whole is protected by a lead sheathing or a thin coating of rubber. The construction differs very largely, depending upon the use for which the cable is designed. In the larger cities cables are used extensively to carry a number of telephone wires, usually from 50 to 400, each wire protected by insulation and the whole covered by a lead tube, and in this form they may be either aerial or underground. Other forms are used to carry main currents of electricity from the plant to points where it is needed for power. A cable well insulated and protected from the moisture in the atmosphere, attached to glass or porcelain insulators and suspended upon poles, carries an electric current at least 200 miles. By this means power is transferred from Niagara Falls to Buffalo and other points for use in propelling electric cars and machinery.

Submarine cables are imbedded in a compound of gutta-percha and resinous substances, the wires usually consisting of several strands twisted into a spiral, but they are separated from each other by thin layers of india rubber or other padding. External protection is furnished by a coat of Manila yarn or canvas soaked in asphaltum. The cable is thoroughly tested in every part before placing it in the water, and is dropped from a steamboat by means of machinery. It lies on the bottom and is not fastened, except where it lands, and the ends are connected with transmitting and receiving apparatus. The message is recorded in the Morse alphabet by means of ink and a glass tube in the form of a siphon on paper, which moves uniformly over a small platform or table as the message is written.

The lines of ocean cables operated in 1908 aggregated about 250,000 miles, about one-fifth of which were owned by governments and the balance by private corporations. These lines furnish communication with all the leading ports of the world. The Atlantic cable, from Heart's Content, Newfoundland, to Valentia Bay, Ireland, was the first of the great oceanic cables, completed in 1866, but others were laid and ample telegraph communication is now maintained among the leading seaports and commercial centers of the world. Two great cables were laid recently across the Pacific Ocean, the British cable and the American cable. The former is 7,986 miles long and was completed in 1902. It was constructed conjointly by the

RIVERSIDE PARK, CALIFORNIA, CONTAINING ABOUT 300 SPECIES OF CACTUS.

governments of Canada, Australia, Great Britain, and New Zealand. The line extends from Vancouver, British Columbia, by way of the Fiji Islands to the Norfolk Islands, whence branches extend to Queensland, Australia, and to New Zealand. The American cable is owned and controlled by the Pacific Commercial Cable Company. It is 7,613 miles long and was completed in 1903. This line extends from San Francisco, Cal., to Honolulu, thence to the Midway Islands, thence to Guam, and thence to Manila, the capital of the Philippine Islands.

The first experiment with a cable was made by S. F. B. Morse, of New York, in 1842, from Castle Garden to Governor's Island. Cyrus W. Field organized a company with a capital of \$1,750,000, in 1854, with the intention of constructing a cable across the Atlantic. This company began active work in 1857, but the effort was unsuccessful and resulted in a loss of 280 miles of cable. In the following year the first cable was completed from Newfoundland to Valentia. The first message, sent on August 6, was: "England and America are united by telegraph; Glory to God in the highest; on earth peace, and good will toward men." About 400 messages were sent across the ocean, when the cable failed to work. The next attempt was made in 1866, which resulted in an entire success. It was laid by the *Great Eastern*. The news of a treaty of peace between Prussia and Austria was the first message sent across the ocean.

**CABUL** (kā'b'l). See **Kabul**.

**CACAO** (kā-kā'ō). See **Cocoa**.

**CACTUS** (kāk'tūs), a genus of plants which are found in the arid regions of America and Africa. About 1,000 species have been studied,

CACTUS PLANTS.

Cactus *Opuntia*.

*Cereus*.

but they are distinctly American plants, except a few found in Africa. However, the prickly pear, a species of *Opuntia*, has been grown in Greece and Italy for many centuries. The *cacti* have large, succulent, and fleshy stems with a watery or milky juice of sweetish taste. They

thrive best in arid districts, usually in sandy, rocky soil. In size they vary from very minute organisms to great trunks thirty feet high. The structure of many species is complex. Some are inclosed with a tough and impermeable skin and covered by pricks and needles. Many species flower profusely, the blossoms opening at night and closing some time after sunrise. The prickly pear and other species are grown extensively as ornamental plants. Some species of the prickly pear bear an edible fruit known as Indian fig. The cardon forests of Mexico, which are confined to the basin of the Gulf of California, are dense and have extensive growths of a species of the *Cereus*. Similar plants are found in southwestern Texas, but the size diminishes gradually as we proceed north to Colorado and Nebraska. Some species possess medicinal properties. The stems of the larger varieties are used for fuel and fencing.

**CADDICE FLY** (kād'dīs), or **Caddis Fly**, a small insect which resembles the moth in many respects. The adult female lays its eggs in water, usually in the form of a double mass attached to the surface of some plant, and the larvae are submerged until they reach the pupa state. The larvae subsist mostly on vegetable forms, but also eat insects and the spawn of fish. About 150 species have been studied and classified. The adult insect has a hairy body and wings, and in some species the body is covered with small scales and is supplied with four wings.

**CADET** (kā-dēt'), the name applied to the younger son of a noble house to distinguish him from the elder. In France the term is applied to any junior officer. In the United States it is applied to a youth pursuing a course of study at a military academy or school, as, for instance, at the West Point Military Academy or the Naval Academy at Annapolis.

**CADILLAC** (kād'il-lāk), a city of Michigan, county seat of Wexford County, 95 miles north of Grand Rapids, on the Ann Arbor and the Grand Rapids and Indiana railroads. It is nicely situated on Little Clam Lake. The surrounding country produces lumber and cereals. Among the chief buildings are the county courthouse and a number of schools and churches. The manufactures include earthenware, machinery, and lumber products. It has modern municipal facilities, such as waterworks and electric lights, and has a growing trade in produce and merchandise. The first settlement was made on its site in 1871, and its incorporation dates from 1874. Population, 1904, 6,893; in 1910, 8,385.

**CADIZ** (kād'iz), a seaport city of Spain, capital of the province of Cadiz, on Cadiz Bay,

an inlet from the Atlantic Ocean. It is strongly fortified, has well paved streets, and is noted for its cleanliness. Among the principal buildings are several hospitals, the customhouse, the Capuchin convent, the public library, and the old and new cathedrals. It has a bull ring in which seating room is provided for over 12,000 spectators. The lighthouse of Saint Sebastian is a conspicuous and beautiful structure. The city has railroad facilities and an excellent harbor, which furnishes anchorage for a large number of vessels. It has long been the principal naval station of Spain. There are four well-constructed forts, two of which form a defense for La Carraca, an arsenal four miles from the city. Manufacturing is an important industry; the products include woolen cloth, silk fabrics, wine, leather, glass, and machinery.

Cadiz was founded about 1100 B. C. by the Phoenicians, who named it Gadir, and it was long one of the chief commercial cities of Europe. It was conquered successively by the Carthaginians, Romans, Goths, Moors, and Spaniards. The English occupied it in 1596, and in 1810 and in 1823 it was infested by the French. Its greatest prosperity was reached when Spanish-America was in its most prosperous state. With the independence of the South American republics, and the loss of territory in Central America, it began to decline gradually. Population, 1905, 71,240.

**CADMIUM** (kăd'mī-ŭm), a metal found in zinc ores and rarely as a sulphide, of which greenockite is an example. It is allied closely to zinc. The metal was discovered in 1818 while testing for arsenic in zinc wastes. In color it is white, or has a slight bluish cast. It has a high luster when polished and is some harder than tin. The salts of cadmium are serviceable in medicine. Cadmium sulphide is a powder with a lemon-yellow color of great permanency. It is used in coloring soap and in making a pigment known as *cadmium yellow*.

**CAEN** (kän), a city of France, capital of the department of Calvados, 148 miles northwest of Paris. It is on the Orne River, about nine miles from its entrance into the English Channel, and is located in the center of a fertile plain. The streets are clean and well paved with stone and asphaltum. Among the chief buildings are the Church of Saint Etienne, founded by William the Conqueror, a public library of 100,000 volumes, a university with 650 students, and a fine art museum. The manufactures include lace, cotton textiles, cutlery, clothing, and spirituous liquors. Trade is facilitated by several railroads and a maritime canal. In the vicinity are several large establishments devoted to the rearing

of Angora rabbits, the skins of which are used in making gloves. Population, 1906, 44,442.

**CAESAR** (sē'zēr), the title of the Roman emperors and of the heirs presumptive to the throne. The title was borne by Octavian, the adopted son of Julius Caesar, and passed to his own adopted son, Tiberius. Afterward it was borne by Caligula, Claudius, and Nero. It is perpetuated in the czar of the Russian emperors, and the kaiser of the Holy Roman Empire and of modern Germany.

**CAESAREA** (sēs-ā-rē'ā), the name anciently applied to a number of cities, among them the capital of Cappadocia in Asia Minor, Caesarea Philippi in Palestine, and Caesarea on the coast of Syria, thirteen miles north of Joppa, now called Kaisarieh. The last mentioned city was built by Herod the Great in 22 B. C., and named in memory of Caesar Augustus. It was once a beautiful city, but is now in decay. Saint Paul was imprisoned in it two years. The Crusaders held it and built a cathedral on its site. It is now inhabited by fishermen and has a small harbor.

**CAESAREA PHILIPPI**, an ancient town of Asia, in Palestine, twenty miles north of the Sea of Galilee. It is mentioned in Matthew xvi., 13, and it was the center of a region given in 20 B. C. to Herod the Great, who constructed a temple of white stone and dedicated it to Emperor Augustus. The place was given to Philip, son of Herod the Great, after the death of the latter, and became known as the Caesarea of Philip. Jesus disclosed his mission on earth to his disciples while at this place. It was named Neronias in honor of Nero, but is now a small village of poor huts known as Banias.

**CAESIUM** (sē'zī-ŭm), an alkaloid metal found in very small quantities in certain minerals and mineral springs. Deposits of it are most abundant on the Isle of Elba, where it occurs in the rare mineral pollux, which contains about thirty-four per cent. of caesium oxide. Chemically it is closely related to potassium and rubidium. Bunsen and Kirchhoff discovered it in 1860 and obtained it as an amalgam with mercury. It absorbs oxygen with great rapidity, has a specific gravity of 1.88, and melts at 80.6°.

**CAFFEINE** (kăf-fē'in), or **Theine**, the active principle of coffee and tea. It forms tufts of white silky needles. The taste is bitter. It forms double salts with platinum and gold chlorides. Caffeine is contained in coffee in the proportion of from one to four per cent., and in tea from two to four per cent. It is a methyl substitution compound of theobromine, and serves as a hypnotic and a nerve sedative.

STREET SCENE IN CAIRO, EGYPT.

**CAGLIARI** (käl'yá-rē), a city of Sardinia, capital of a province of the same name, situated on the southern end of the island. It has a good harbor on the Gulf of Cagliari. In the vicinity are extensive salt-producing lagoons. A railway line connects it with the principal cities of Sardinia, and it has steamboat and submarine cable service with the leading cities of Italy. The university, founded in 1596, has an attendance of 275 students. It is the seat of several consulates, has three theaters, and maintains several fine schools and churches. Ship-building, cotton mills, brickyards, and machine shops are among the enterprises. It has a brisk trade in flax, grain, salt, and textiles. The Phoenicians founded the city. Its fine cathedral dates from 1312. Population, 1906, 53,747.

**CAHORS** (ká-ôr'), a town of France, capital of the department of Lot, sixty miles north of Toulouse. It is situated on a rocky peninsula formed by the Lot River. The chief buildings consist of a cathedral, a normal school, a college, and an Episcopal palace, now the prefecture. It has manufactures of textiles and glass, and is the center of considerable trade in merchandise and country produce. It has a fine statue of Gambetta, who was born here. Population, 1906, 12,240.

**CAIBARIEN** (kī-vä'rê-ân), a seaport of Cuba, in the province of Santa Clara, about 100 miles southeast of Cardenas. It has a good harbor and railroad connections with the principal commercial centers of Cuba. The trade is chiefly in rice, tobacco, and merchandise. Profitable sponge fisheries are located off the coast. Population, 1906, 7,213.

**CAICOS** (kī'kōs), a group of islands at the southeastern extremity of the Bahamas. It includes about thirty small islands, only six of which are inhabited, and the area is 200 square miles. Grand Caicos, the largest island, is six miles wide and twenty miles long. Salt raking and sponge fishing are the chief industries. These products are exported principally to Canada and the United States. The Caicos islands are a British possession, and with the Turk Islands, lying southeast, are politically under the government of Jamaica. Grand Turk is the seat of government. Population, 4,975.

**CAIRN** (kârn), a name given to a heap of stones placed on a grave, or built up as a landmark. Cairns are quite numerous in many places of America, especially on the plains, where they are found on hills, usually marking a group of graves. In Europe the Druids and other primitive peoples built cairns over their graves and, like the American Indians, placed rude weapons, such as stone axes and

arrowheads, with the dead bodies. They are met with in many parts of Scotland and Wales. The most remarkable one is near Drogheda, on the Boyne River, which is in the form of a mound nearly eighty feet high.

**CAIRO** (kā'rō), county seat of Alexander County, Illinois, at the junction of the Mississippi and Ohio rivers, on the Illinois Central, the Mobile and Ohio, and other railroads. It is located on a low tract of land, a part of which was formerly subject to inundations, but extensive levees have been erected that protect against overflows, and the city is increasing rapidly in commerce and wealth. The chief buildings include the county courthouse, a public library, the customhouse, and a United States marine hospital. It has a large trade in grain, coal, lumber, and merchandise. The industries include iron foundries, furniture factories, lumber mills, and extensive commercial interests, while the surrounding country furnishes a large trade in agricultural products. Charles Dickens described Cairo as *Eden* in his "Martin Chuzzlewit." It was first settled in 1854 and became a city three years later. Population, 1900, 12,566.

**CAIRO** (kī'rō), the capital of modern Egypt, on the Nile, about ten miles above the delta and 150 miles southeast of Alexandria. Its history is interesting and dates from the year 969 A. D., when it was founded by the Arabs, who brought the bones of their ancestors from Kairon, and reigned over Egypt for ten generations. It was conquered by Saladin from the Fatimite caliphs in 1171, when he became master of Egypt. His descendants ruled until 1517, when the city was stormed and taken by Sultan Selim, after which it was governed by a succession of Mameluke kings. The French took it in 1798 and three years later it was captured by the British, who restored it to the Turks. In 1882 it was occupied by the British and has since been the center of British influence in Northern Africa.

The old portion of the city is divided into a number of quarters, and has tortuous and narrow streets, while the newer part has several modern streets that are platted on a regular plan and improved by modern facilities. The inhabitants consist largely of Moslems, Jews, and Christians, each occupying different quarters of the city. The buildings include some of the finest remains of Arabian architecture, among them about 400 mosques, several of which were built as early as 915 A. D. Among the most important is the great Mosque of Mohammed Ali. Within the city are many tombs of caliphs and mamelukes, some of which are finely built and of large size. Formerly it had many obelisks, but nearly all of them have

been transported to European and American cities. The great pyramids and sphinx are about ten miles from the city.

Most of the streets are crowded with Eastern merchants, who display their goods in open stalls

MOSQUE MOHAMMED ALI.

and conduct trade largely in bazaars and markets. A number of railroad lines connect the city with Alexandria, Siout, and the Suez Canal, but river navigation is also a factor in maintaining its importance commercially. It is the seat of a university founded in 971, which carries courses that are directed by Moslems. No tuition is charged and the teaching faculties receive no compensation, hence they make their living by doing clerical and other work. It has ample accommodation for 10,000 students.

The narrow streets of Cairo are traversed by camels, human beings, horses, and asses, thus affording a strange contrast when compared to the modern cities of Europe and America. Under European influence a public school system is developing, and many residences and office buildings have been erected. The newer portion has electric street railways, pavements, sewerage and electric lights. The citadel is an interesting point, located on Mokattam Hills, and near it is Saint Joseph's Well, cut in the rock to a depth of 270 feet. The city is a center of interest for travelers and is visited by many tourists. Besides, many thousands of Mohammedans flock there annually to worship or carry on trade. The language spoken is Arabic. The city is the residence of consuls general from France, Germany, Russia, and other European countries, and is the official residence of the

Khedive of Egypt. Its name in Arabic is Musr-al-Kahira, meaning the victorious city. Population, 1905, 581,380.

**CAISSON** (kās'sōn), in military, a wooden box to hold shells and loose powder, or an ammunition wagon. The term is applied in nautics to a boat gate for closing the entrance to a dry dock, and in engineering to a wooden frame or case sunk in the beds of rivers to keep out the water during the building of piers or foundations for bridges. Caissons of the latter kind are constructed of strong timbers closely and firmly joined together. Among the largest caissons ever constructed was the one used at the New York tower of the Brooklyn bridge across East River. It was 82 feet high, 173 feet long, and 102 feet wide.

**CAJEPUT** (kāj'ê-püt), or **Cajuput**, a kind of tree native to Australia and the East Indies. It grows to a height of thirty feet, has alternate leaves, and bears white flowers on pendulous branches. The leaves yield the valuable product known in pharmacy as oil of cajeput. It is used as a stimulant, and in the treatment of gout, rheumatism, dyspepsia, and toothache. The high price at which pure cajeput oil has been sold has caused it to be adulterated by adding turpentine, oil of rosemary, etc. The trees from which this product is obtained includes a large

CAJEPUT.

number of species, and in Australia they are commonly known as tea trees.

**CALABAR BEAN** (kāl'â-bär), the seed of an African plant allied to the kidney bean. The

bean is poisonous. It is used in medicine chiefly as an external application in rheumatism and neuralgia, and to induce the contraction of the pupil of the eye. In this respect it has the opposite effect of belladonna, which causes the pupil to be dilated. Superstitious tribes of Africa administer it as an ordeal to persons suspected of witchcraft. If the suspect is caused to vomit, innocence is declared; if it purges, or the patient dies, the suspect is declared guilty. The plant has brownish-red or ash-gray leaves.

**CALABASH TREE** (kāl'ā-bāsh), the common name applied to an American tree cultivated in the West Indies and other tropical regions. It attains a height of thirty feet, has flowers variegated with red, yellow, and purple, and bears narrow elliptical leaves. Its fruit resembles gourds and is used in making household utensils, such as basins, water bottles, and drinking cups. The pulp of the fruit is used as a purgative, and to some extent as a poultice in treating bruises and inflammations.

**CALABRIA**, the name given in Roman times to the southeastern peninsula of Italy. The district included within the Calabria of the Romans corresponded nearly to the modern province of Lecce. On the other hand, the modern Calabria is nearly coextensive with the ancient Bruttium. It includes the three provinces of Catanzaro, Cosenza, and Reggio di Calabria. This region is enclosed by the sea on all sides, except the north. It is separated from Sicily by the Strait of Messina and is traversed by highlands which reach an altitude of nearly 4,000 feet. The area is 5,819 square miles. Rice, grain, hemp, flax, fruit, and live stock are the chief products. It has mineral deposits of value, such as rock salt, marble, alum, gypsum, alabaster, and copper. Population, 1907, 1,411,348.

**CALAIS** (kāl'is), a city and seaport of Washington County, Maine, on the Saint Croix River, twelve miles from Passamaquoddy Bay. It has transportation facilities by the Saint Croix and Penobscot and the Canadian Pacific railroads. The principal industry is shipbuilding. It has machine shops, tanneries, ax factories, iron foundries, and lumber industries. Electric lights, pavements, and waterworks are among the municipal improvements. It is the seat of the Calais Academy, and has a number of excellent church and school buildings. Navigation on the Saint Croix River is open the greater part of the year. It has an abundance of water power for manufacturing purposes and a considerable trade. Population, 1900, 7,655.

**CALAIS** (kā-lā'), a fortified seaport city of France, on the Strait of Dover, in the department of Pas-de-Calais, 150 miles north of Paris.

The harbor is deep and has a lighthouse 190 feet high. Among the chief buildings are the Church of Notre Dame, the public library, and the Hôtel the Guise. It has an important commerce in eggs, wine, grain, vegetables, fruits, and other products of the farm and garden. The chief manufactures include cotton, silk, and woolen goods, laces, gloves, fabrics, and machinery. Many boats that visit the cod and herring fisheries of Iceland make their headquarters at Calais. A number of electric and steam railways connect it with the interior of France. Edward III. of England laid siege to it in 1347 for twelve months, and the latter country held it until 1558, when it was retaken by the Duke of Guise. Population, 1906, 66,627.

**CALAMANDER WOOD** (kāl'ā-mān-dēr), a kind of wood used extensively in making furniture, obtained from a tree similar to the ebony and persimmon trees. It resembles rosewood, takes a fine polish, and exhibits a variety of colors. This wood is so hard that it can be worked only with the best edged tools and is preferred to most varieties as a veneer. The supply is secured largely from Ceylon and southern India.

**CALAMIANES** (kā-lā-mī-ā'mēs), a group of islands belonging to the Philippines, between Palawan and Mindoro, from which it is separated by Mindoro Strait. The surface is hilly, but fruits, tobacco, rice, and sugar cane are produced profitably. Gold and iron deposits abound, but they are not worked to any great extent. The area is 340 square miles. Population, 20,200.

**CALAMINE** (kāl'ā-mīn), a mineral consisting essentially of zinc. The two species were formerly known as carbonate and silicate, but the former is now classed as *smithsonite* and the latter as *calamine*. Pure calamine contains fifty-two per cent. of zinc and is valuable as an ore of that metal. It is found in America and Europe, occurring mostly in small crystals.

**CALAMUS** (kāl'ā-mūs), the name commonly applied to a genus of palms from which rattan canes are made for caning chairs. These trees hold a place midway between the grasses and the larger palms. They yield material useful in the construction of cables and bridges. The term is also used to designate the aromatic *sweet flag* that is native to the swamps and ponds of temperate zones, which yields essential oils used in perfumes, and to sweet-scented grasses of India valuable in the manufacture of incense.

**CALASH** (kā-lāsh'), or *Caleche*, a carriage with low wheels, fitted with a top or hood, and furnished with seats for four inside. The driver occupies a seat in the front. Some are

constructed with a movable front, making it possible to use the vehicle either as an open or a closed carriage. The name is applied in Canada to a cart or carriage with two wheels, fitted with a seat for two passengers, and a single seat for the driver on the dashboard.

**CALCITE** (käl'sīt), the carbonate of lime, distinguished from aragonite in that it crystallizes in the hexagonal system. It is a general term used to describe a variety of minerals, such as marble, chalk, and limestone. The colors are usually white or pale shades of gray, but include violet, green, yellow, blue, and red, owing chiefly to the presence of impurities. Iceland spar is a colorless variety found in the basalt rocks in Iceland.

**CALCIUM** (käl'si-ŭm), the metal forming the base of lime. Combined with other substances, it is one of the most widely distributed and abundant, but is rarely found in the native state. It was first obtained in the metallic state in 1808 by Sir Humphry Davy, by decomposing the chloride by electricity, also by heating in a closed vessel iodide with sodium, but not in sufficient quantities to determine its properties. Pure calcium is of a pale yellow color and is a ductile and malleable metal. It occurs in nature as a carbonate, silicate, and sulphate, and forms a large constituent of all soils, ashes of plants, limestone, chalk, and marble. It is the main constituent of the mineral matter of the bones of animals, and forms large deposits as fluor spar, limestone, and gypsum. With carbon it forms the compound known as *calcium carbide*, which is used extensively in the manufacture of acetylene.

**CALCULATING MACHINE** (käl'kü-lā-tīng), a machine for making arithmetical calculations with speed and accuracy. Various devices have been made for this purpose, the simplest one being the abacus (q. v.). Leibnitz published the first description of a calculating machine in 1673. The British government employed Charles Babbage to construct a mechanism of this kind in 1821, and, after spending twelve years on the project, completed quite a satisfactory machine. Dorr E. Felt, in 1889, constructed a calculating machine with a keyboard resembling that of a typewriter, on which calculations can be made satisfactorily. By means of it operations in the fundamental principles of arithmetic can be performed, and the square and cube roots can be successfully extracted. The cash registers used in many business houses are a form of the calculating machine.

Calculating machines of a high grade are now in use in nearly all the banks, counting houses, and insurance offices. They have a keyboard

like that of a typewriter, but the keys have figures so arranged that they stand in columns from 1 to 9. The figures are impressed upon a strip of paper as the keys are touched. By pressing a special key, it is possible to obtain the results, or addition, subtraction, or even multiplication. Many complicated patterns are in use. Electricity is used in some styles to perform the operations.

**CALCULUS** (käl'kü-lūs), in mathematics, any branch which may involve or lead to calculation by algebraic symbols. The term is used to embrace the whole science with the exception of pure geometry. The leading divisions of the subject are the differential and integral calculus, which two divisions are included in the infinitesimal calculus. Newton wrote a treatise on the principles of the infinitesimal calculus in 1669, which was published a number of years afterward, and he is sometimes spoken of as the founder of this science of calculation. However, it was first discovered by Leibnitz, who published the discovery before that of Newton became known. The Leibnitz system contains the better method of notation and is now universally used.

**CALCUTTA** (käl-küt'tä), the capital of Bengal and of British India, on the Hugli River, a branch of the Ganges, about eighty miles from the Bay of Bengal. The river is about three-fourths of a mile wide at the city, which extends five miles along the river bank and includes a site equal to ten square miles. Near the city and on the opposite side of the river are a number of suburban towns which are connected with the city by bridges and electric street railway lines. The city was founded in 1686 by the East India Company, with Governor Charnock as principal executive officer. In 1720 three villages were annexed to the possessions of the company by the Emperor of Delhi, which were later fortified and named Fort William in honor of the King of England. In 1707 Calcutta became the capital of the Bengal presidency. It was attacked by Sorajah Dowlah in 1756 and after a siege of two days was surrendered. At that time occurred the tragedy of the Black Hole, in which 146 English prisoners were confined on a hot summer night, and all but twenty-three perished. The city remained in the hands of Dowlah for six months, after which it was retaken by Admiral Watson. It became the seat of the British government of India in 1772.

Calcutta is the commercial metropolis of Asia. Its advantages in water navigation are very extensive, including, besides the river, several canals to facilitate trade with the adjacent territory. Railroad lines penetrate from it in all

directions toward the north, east, and west, and facilitate a large interior, export, and import trade. Several botanical gardens and public parks beautify the city, while Bishop's College, a well-organized public school system, and several academies offer educational advantages in courses extending from the kindergarten to the university curriculum. It has many fine mosques, cathedrals, and churches, besides substantial government buildings and a university for higher education. In recent years a large number of learned societies have been organized for the study of antiquity, geology, astronomy, literature, history, and other lines of research. A number of daily newspapers, and many weeklies and other periodicals, are published. The hotel service and theater accommodations are modern.

Many of the streets are paved with stone, wooden blocks, and asphalt. Branches of the street railway system extend to all parts of the city. A number of suburban railroad lines are operated to accommodate large numbers of laborers that come from the surrounding country to work in the factories and industries of the city. The manufactured products are extensive, including fabrics, machinery, leather, ironware, furniture, opium, cigars, clothing, and canned fruits. There are exports of cotton, indigo, raw silk, opium, wheat, rice, tea, gunny bags, and live stock. The principal imports include cotton goods, salt, stationery, and wearing apparel. Fort William is a strongly fortified portion of the city, its fortifications costing \$10,000,000, and at it are stationed 15,000 men with 600 guns and 80,000 stands of arms. The city has a number of banks and insurance companies and a chamber of commerce. It is the seat of the supreme court of justice and of the court of appeals in the province of Bengal. The customhouse and public mint are among the many governmental buildings. Calcutta is called the "City of Palaces." The inhabitants are mostly Hindus and Mohammedans. Other classes include Jews, Parsees, Negroes, and about 30,000 Europeans. Population, 1905, 1,348,265.

**CALEDONIA** (kāl-ĕ-dō'nĭ-à), the name formerly applied to northern Scotland, by which it became known to the Romans. Tacitus gives a description of the defeat of the Caledonians in the year 84 A. D., on the Grampian Hills. The Romans, under Agricola, overran Scotland as far as the firths of Forth and Clyde, but never reduced the country to a Roman province. Caledonia is now the poetical name of Scotland.

**CALEDONIA, NEW.** See **New Caledonia.**

**CALEDONIAN CANAL,** a canal in Scotland, which connects the North Sea with the

Atlantic Ocean. It is made up largely of a chain of natural lakes about sixty miles long, which have been united by artificial canals, thus making a waterway of much importance. The cut is 17 feet deep, 50 feet wide at the bottom, and 120 feet at the surface. It serves to shorten the route, which was formerly 500 miles long, by way of the Hebrides, but the route of the canal from Moray Firth to Loch Linnat is about half that distance. The canal is popular as a route for summer tourists.

**CALENDAR** (cāl'ĕn-dĕr), a register or list by which the year is divided into months, weeks, and days, and showing the various civil and ecclesiastical festivals and holidays. It is so named from the Roman word *calends*, which was the first day of the month. The Egyptians based the year on the changes of the seasons, dividing it into 365 days, and these into twelve months of thirty days each, with five days added at the end of each year. Among the Jews it was customary to reckon twelve lunar months, adding a thirteenth to maintain the recurrence of particular days in consecutive seasons. The Greeks based their lunar months upon the fact that the new moon returned upon the same day of their year in a period of nineteen years. It was found to be about six hours too long and calculators still failed to estimate correctly the beginning of the seasons on the same fixed day of the year.

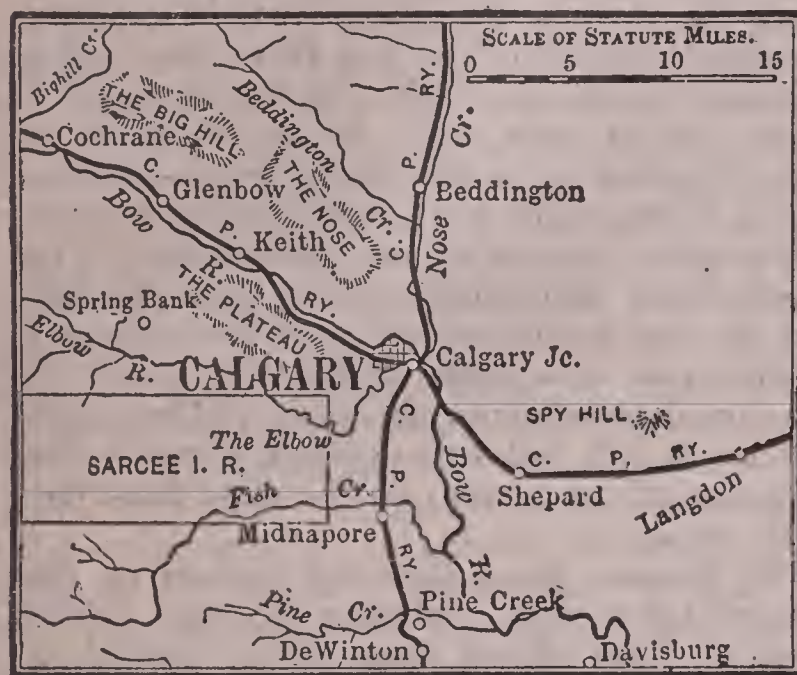

The Romans based their calculations on the year of ten months, including 365 days, which required about eleven days to be supplied at regular intervals. The great Greek astronomer Sosigenes, assisted by Marcus Fabius, at the request of Julius Caesar, devised the *Julian* calendar. In this system the equinox was restored to its proper place by counting two months between November and December, hence the year 707 (46 B. C.) contained fourteen months. The year was computed at 365 $\frac{1}{4}$  days; the quarter of a day was added to February as a single day every fourth year. The Julian calendar continued in use until the fall of the empire, and was used by Christians until 1582.

Pope Gregory XIII. abolished the Julian calendar in all Catholic countries and introduced a reformed calendar called the *Gregorian*. Accordingly, ten days were deducted from the year 1582, by which Oct. 5, according to the old calendar, was reckoned Oct. 15, 1582, by the new; and, to prevent displacement recurring, every fourth year was counted a leap year, in which February was assigned twenty-nine days instead of twenty-eight. Under this system, only one in four of the years ending centuries is a leap year; thus, 1700, 1800, 1900 were not leap

years; while 2000 will be. The Gregorian year contains 365 days, five hours, forty-nine minutes, and twelve seconds. To distinguish it from the other systems, it was designated the *new style*, and previous calculations became known as the *old style*. The new style was adopted in France, Spain, and Portugal in 1582, and in the Catholic portions of Germany, Switzerland, and the Netherlands in 1583. Poland adopted it in 1586; Hungary in 1587; Holland, Denmark, and Protestant Germany adopted it in 1700; Switzerland in 1701; England in 1752; and Sweden in 1753. Of the Christian countries, Russia retained the old style longest, until 1902.

**CALGARY** (käl'gä-rī), a city of Canada, in the province of Alberta, on the transcontinental line of the Canadian Pacific Railroad. It is in a

region that is devoted chiefly to cattle and horse ranching, 835 miles west of Winnipeg. The buildings are substantial and are constructed largely of light-gray stone. It has an electric light plant, a city waterworks, a sewer system, and several fine schools and churches. The chief enterprises are soap works, leather making, and railroad shops. It is important as a trade center for merchandise and as a shipping point for cereals and live stock. Calgary was incorporated in 1885. Population, 1906, 11,967.

**CALI** (käl'lē), a town of Colombia, in the department of Cauca, near the junction of the Cali and Cauca rivers. It occupies a fine site on a tableland about 3,150 feet above sea level, and has a brisk trade in grain and fruit. Transportation is furnished by a railway which connects it with Buenaventura, on Chocó Bay. The chief buildings include a college, the post office, and the Church of San Francisco. It was founded in 1556. Population, 15,800.

**CALICO** (käl'i-kō), the general name of cotton cloths having colored patterns printed on

them. Calicoes are coarser than muslin, and in Europe they include shirting and common white cotton cloth. Calico printing was first practiced in India and is used to some extent in stamping woolen, silk, and linen goods, but it is employed principally in stamping the cloth known in the market as calico. The process was brought to Germany and France by the Dutch, and later to England by a Protestant refugee who left France in 1696. Calico prints are now among the most staple articles of manufacture. The printing was first done by wooden blocks, on which the patterns were engraved. At the present time most of the printing is done by large machinery and cylinder presses, in which the colors are put on rollers and passed over the cotton cloth. There are as many rollers as colors to be printed, each roller containing a separate color, and each one filling its own place in the pattern.

Formerly as many impressions were made in printing as the number of colors that were required in completing the pattern, but by employing a number of rollers and the cylinder process all colors are printed by passing the cotton cloth through the press but one time. Each of the rollers is supplied with figures of the pattern raised above the surface of the roller, by means of which the dye colors or steam colors are fixed to the cloth in a becoming way. In printing the cloth passes through the machine, thence over a hot-air chamber, which dries the cloth. It is then steamed and washed and, after being starched and pressed, it is put in bales ready for the market. The colors used in printing are variously made of animal, vegetable, and mineral compounds, depending upon the class of prints to which they are to be applied. In the newer process of calico printing, which has largely supplanted all others, it is possible to combine printing and dyeing. Cloth on which the colors are merely stamped is apt to fade easily, and by the use of the newer process it is possible to obtain colors that will not fade, known in the market as *fast colors*. This process employs mordants to a large extent.

**CALICUT** (käl'i-küt), a city of India, in the Malabar district, 565 miles southeast of Bombay. It is important as a seaport and railroad center, and has a large trade in spices, cotton goods, lumber, and machinery. The manufactures include calico, utensils, cigars, clothing, and betel nuts. Calico cloth received its name from Calicut, where it was manufactured extensively at an early date. The Portuguese visited the city in 1486, when Pedro da Covilham landed here, and Vasco da Gama

reached the city on his tour after doubling the Cape of Good Hope. Population, 1906, 78,530.

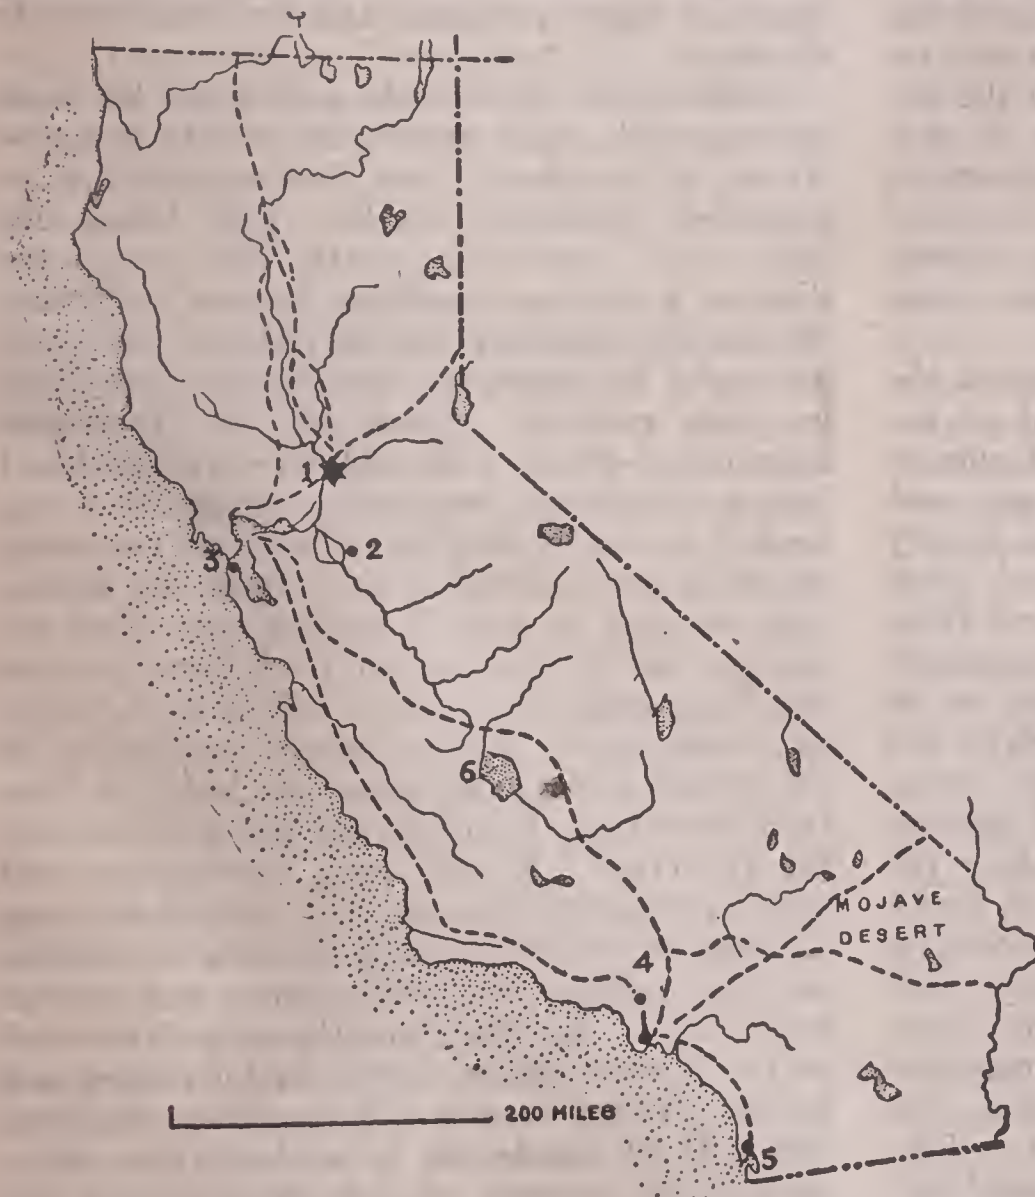

**CALIFORNIA** (käl-ī-fôr'nī-à), a State of the United States, on the Pacific coast, popularly known as the Golden State. It is bounded on the north by Oregon, east by Nevada and Arizona, south by Mexico, and west by the Pacific Ocean. The distance from north to south, measured through the center, is 750 miles, and the average width is 200 miles. The eastern boundary conforms quite nearly to the curve of the sea coast. The western shore is washed by the Pacific Ocean, from which the Bay of

Valley and the San Joaquin Valley, in which flow, respectively, the Sacramento and San Joaquin rivers, uniting near San Francisco Bay, with which their waters intermingle. Among the lofty peaks of the Sierra Nevada are Mounts Brewer, Tindall, Lyell, Dana, and Whitney, Merced Peak, Gray Peak, Pyramid Peak, Sonora Mountain, Stanislas Peak, and many others reaching heights of from 10,000 to 15,000 feet above the sea. Mount Whitney is the culminating peak, having an altitude of 14,868 feet. The Coast Range is less elevated, ranging from 5,600 feet to 9,214 feet, which is the altitude of Mount Pinos. Mounts Eddy, Scott, and China are elevated peaks of this system, which is connected by ranges of the Cascades, to which belong Mount Shasta, elevated 14,380 feet. The mountains abound in thermal and cold mineral springs with recognized medicinal virtues. They are utilized extensively for health and pleasure resorts. Between the mountain ranges are numerous scenic canyons and valleys, the most beautiful of the latter being the Yosemite and Hetch-Hetchy.

**RIVERS AND LAKES.** Besides the Sacramento and San Joaquin, which drain the great interior plain, formed of the Sacramento and the San Joaquin valleys, California has many rivers valuable for drainage and irrigation. The Salinas River drains the region lying west of the Coast Range, flowing into Monterey Bay, and in the northern part is the Klamath, which receives the drainage from the Trinity River and flows into the Pacific near Requa. The Kings is a tributary of the San Joaquin and the Kern, Eel, and Owens are other streams of importance. Many beautiful lakes are located in

different sections of the State, including lakes Tulare and Owens, in the central part; lakes Mono and Tahoe, near the eastern boundary; and lakes Honey, Eagle, and Middle, in the northern part. On the line between Oregon and California are Goose, Rhett, and Klamath lakes.

**CLIMATE.** The valleys of California have a delightful climate, and in most of these the year is divided into the wet and dry seasons. Rain falls chiefly from the middle of November till the early part of May, but of course is not continuous, and the average for the State is twenty-three inches, which is less than at Chicago or

1, Sacramento; 2, Stockton; 3, San Francisco; 4, Los Angeles; 5, San Diego; 6, Lake Tulare. Chief railroads are shown by dotted lines.

Monterey and the Bay of San Francisco are the principal inlets. Point Conception, Point Arena, and Cape Mendocino are the principal capes; the last named is the most western point in the United States proper. California has a coast line of 1,200 miles. The area is 158,360 square miles.

**DESCRIPTION.** Along the shore is a fertile coast plain, east of which, almost parallel to the coast, trend the Coast Range Mountains, and in the eastern part are the high elevations of the Sierra Nevada. Between the two great mountain ranges are the beautiful Sacramento

Montreal. The principal valleys and the sea-coast may be said to have sufficient rainfall, while many portions are adapted to irrigation by drawing water from the lakes and streams. Its great diversity of climate is due to the proximity to the sea and a vast difference in altitude of many localities. The greater part of the State has a very favorable climate, possessing all the elements essential to the growth of vegetation and the enjoyment of life. In some sections are desert regions from which the rainfall is almost entirely shut off by lofty mountains. The largest of these is the Mojave Desert in the south central part. The warm winds, influenced by the Japan Current, affect the coast region favorably, and here flowers bloom the entire year. Snow is almost unknown at San Francisco, where the average mean temperature is 49° in winter and 60° in summer. The plateaus have a temperate climate, while the mountains, especially the western slopes, have considerable snow.

**FLORA AND FAUNA.** Between the tropical climate of the Pacific coast and the cold of the elevated mountain peaks is a range of climate as great as that found between the tropics and the Arctic region, hence the plants are greatly diversified. All the forest trees are of great size. The redwood thrives along the coast from San Francisco Bay to the Oregon boundary, and east of the Coast Ranges are forests of fir and several species of conifers, especially the sugar and yellow pines. South of San Francisco Bay the coast plain is covered with grasses, though small groves of trees abound along the streams and among the hills. The oak is found in the northern part and in the Sierra Nevada are forests of sugar pine, cedar, cypress, and other woods, including the giant sequoia, ranging from thirty to thirty-four feet in diameter and reaching heights of 350 feet. These are the largest and oldest trees in the world. The State was formerly the home of many wild animals and still has quite a number of mammals, including the wolf, bear, lynx, puma, bighorn, deer, and beaver. Many species of birds abound, such as the quail, vulture, cuckoo, and woodpecker. Rattlesnakes, lizards, and turtles are among the reptiles. The fisheries of the inland waters and off the coast are important, especially those of the cod, herring, salmon, smelt, and trout.

**MINERALS.** Productive gold mines are worked in about thirty counties, and the State held first rank in the output of that mineral until 1897, when it was surpassed by Colorado. Formerly mining was confined to the river channels, and sluices were introduced as early as

1851, but now it is carried on by the most improved machinery, and the annual output averages about \$18,500,000. Most of the gold is obtained from the quartz and is produced extensively in Kern, Nevada, Trinity, Calaveras, Eldorado, and Sierra counties. Silver ore is not found in mines producing that metal exclusively, but is obtained in considerable quantities with other mineral products. The State ranks fourth in the production of copper, which is mined chiefly in Shasta County. Other minerals include quicksilver, petroleum, bituminous coal, gas, borax, manganese, and salt. Asphalt is found in large quantities and building stone is abundant.

**AGRICULTURE.** Interest in agriculture has been growing with rapid strides, due chiefly to an increase in population and the construction of extensive irrigation canals. The farms are quite large, averaging nearly 400 acres, but there is a constant tendency toward increasing the smaller holdings, chiefly because the profit in careful husbandry is very marked, especially in fruit growing. South of the Tehachapi Mountains, where fruit culture has developed into an important enterprise, irrigation is depended upon very largely. The State has about 250,000 acres devoted to the culture of grapes, and the crop is used in making wine and for raisins. In the production of beet-root sugar the State takes first rank. Wheat is the most important cereal and is grown extensively in the central valley, and steam machinery is utilized extensively in tilling the soil and harvesting the crops. Barley, oats, alfalfa, rye, and corn are grown more or less extensively, and all kinds of vegetables yield abundantly. Prunes, lemons, oranges, almonds, walnuts, and peaches are grown. All the domestic animals common to the United States thrive, and dairying and poultry raising receive a large share of attention. Truck gardening is an important enterprise in the vicinity of Los Angeles and San Francisco.

**MANUFACTURING.** Few states have better prospects in the line of manufacturing than California, being favored by an abundance of timber and minerals. Gas, and petroleum are factors in developing this enterprise, and the power of mountain streams is utilized in propelling mills and electrical machinery. San Francisco has extensive shipyards, where some of the largest seagoing vessels and warships are constructed. In sugar refining it takes first rank, and its output of canned fruit and lumber is extensive. Other manufactures embrace railway cars, flour, cured meat, molasses, leather, clothing, and machinery.

**TRANSPORTATION.** The Sacramento River is navigable from its mouth to Red Bluff and the Colorado, which forms a part of the western boundary, is important as a highway for commerce the entire course along the border. Few waters are more important than the Bay of San Francisco, which is a busy water commercially, and furnishes good harbors for San Francisco, Oakland, Martinez, and other centers of commerce. San Diego, Eureka, San Pedro, and other points on the coast have a large shipping trade. Electric railways are abundant in the cities and many interurban points, and few states are more favorably situated in respect to railroad transportation. Important lines cross the State in many directions, connecting the chief business centers with each other and with the cities of all parts of the country. The electric lines have 2,120 miles and the steam lines 6,750 miles.

**GOVERNMENT.** The State is governed under a constitution which was ratified by a popular vote and became operated in 1879. By its terms the chief executive authority is vested in the governor, lieutenant-governor, controller, attorney-general, treasurer, surveyor-general, and secretary of State, each elected for a term of four years. The Senate consists of forty and the General Assembly of eighty members, the former being elected for four and the latter for two years. Meetings of the Legislature are held biennially, beginning the first Monday of January of even years. The supreme court consists of a chief justice and six associates, elected for twelve years. It is divided into two departments and holds sessions either separately or as one court. A superior court is maintained in each county, elected for six years, and inferior courts are established by the Legislature. Local government is in the hands of municipal, township, and county corporations. The right of suffrage is extended to all males who can read the constitution and write their own names, with the requirement that they have resided in the voting precinct thirty days, in the county ninety days, and in the State one year, but Chinese are not permitted to vote.

**EDUCATION.** The educational institutions of California are organized on a satisfactory basis and are liberally supported by taxation and public appropriations. A State superintendent of public instruction is at the head of the educational system. District schools are maintained in all the populated rural districts of the State. The towns and cities have graded and high schools, and ample provision has been made for State support to colleges, normal schools, and universities. The State has five normal schools

for the training of teachers, and additional facilities are supplied by a number of private institutions. At Berkeley is located the University of California, which is aided by the government, and the Leland Stanford, Jr., University is at Palo Alto, and ranks as one of the leading centers of education in the United States. Lick Observatory, an adjunct of the State university, is located on Mount Hamilton.

The State maintains prisons at Folsom and San Quentin, a home for the feeble-minded at Glen Ellen, a State reform school at Whittier, and a number of orphan asylums. Asylums for the insane are located at Agnew, Napa, Stockton, and Ukiah; the institution for the deaf, dumb, and blind is at Berkeley; and the Preston School of Industry is at Ione City. All of the leading scientific, religious, and educational societies are well organized. Encouragement is given to libraries in the municipalities and the public schools, and the State maintains a fine library with about 100,000 volumes at Sacramento.

**INHABITANTS.** In population California holds twenty-first rank among the states. It is the most populous of the states in the far west. Fully one-fourth of the people are of foreign birth, including chiefly Germans, Irish, and English. It has 45,700 Chinese and 10,150 Japanese. Sacramento, the capital, is located on the Sacramento River. San Francisco, on the Bay of San Francisco, is the largest city of California and of the Pacific coast. Other cities of importance include Los Angeles, Oakland, San José, San Diego, Stockton, Alameda, Berkeley, Fresno, Santa Rosa, Pasadena, and Eureka. Population, 1910, 2,377,549.

**HISTORY.** The region now included in the State was first visited by Spaniards in 1534, and the Gulf of California is thought to have been surveyed by Cortez two years later. Sir Francis Drake cruised along the coast in 1578. The first settlement was made at San Diego in 1796 by Spanish priests, who established mission stations with the view of converting the Indians to Christianity. California belonged to Mexico during the early period of American history and with it became independent of Spain in 1822. After the Mexican War it was ceded to the United States along with other territory, and was admitted to the Union as a State in 1850. The first great rush of immigrants came to California in 1848, following the discovery of large gold deposits, and the State was soon settled by gold seekers and adventurers. In early history a spirit of lawlessness prevailed, which was eventually overcome by the establishment of societies and the building of cities.

It is now one of the richest and most productive states.

**CALIFORNIA, Gulf of**, an inlet from the Pacific Ocean, between Mexico and the peninsula of Lower California. It is from forty to one hundred miles wide and 700 miles long. It abounds in fish and is rich in oysters and pearly products. The principal rivers that flow into it are the Colorado, Altar, Miguel, and Yaqui. Among the chief seaports are La Paz, Guaymas, and, near its entrance, Mazatlan. Point Eugenia is an important cape on its western shore, north of which is Sebastian Vizcaino Bay.

**CALIFORNIA, Lower**, a territory of Mexico, located south of California, between the Pacific Ocean and the Gulf of California. It has an area of 58,785 square miles. The surface is mountainous, reaching its greatest elevations along the eastern coast and on the peninsula south of Sebastian Vizcaino Bay. The mountains are exceedingly rich in the mineral deposits that are common to California, but mining is yet in a primitive state. Most of the coast lands and valleys are fertile, in which are fine farms and productive orchards and vineyards. A large portion has a dry climate, but the greater part of the territory contains nutritious grasses for pasturage. Pearl fishing and whaling are profitable industries. A number of extensive colonies from the United States are building up various industries. La Paz is the capital. Other towns include Saint Felipe, Saint Lucas, and Saint Quintin. The population is 42,590, a large per cent. of which are Indians.

**CALIFORNIA, University of**, an educational institution at Berkeley, Cal., founded as a State university in 1868. It was organized as a college of agriculture under an act of Congress passed in 1862 and the College of California was united with it. At first it was located at Oakland and it was removed to its present site in 1873. A tax of two per cent. is collected for its support on the assessed valuation of the State, and it receives special State appropriations, government aid, and the benefit of certain endowments, including the income of large gifts by Mrs. Phoebe A. Hearst.

This institution has an astronomical department on Mount Hamilton, in Santa Clara County, which includes the Lick Observatory. It contains the departments of social sciences, natural sciences, agriculture, mining, commerce, mechanics, chemistry, civil engineering, and the college of letters, at Berkeley; and the Hastings College of Law, Mark Hopkins Institute of Art, medical department, dental department, post-graduate medical department, and California College of Pharmacy, at San Francisco. In

addition to these is the department of anthropology, which pursues linguistic and ethnological investigations and gives attention primarily to research of antiquities in Peru, Egypt, and North America. The faculty of instructors and professors consists of 480, the attendance is about 3,600, and the library has 120,000 volumes. Admission is free to residents of the State, while nonresidents pay a nominal tuition fee. The endowments aggregate \$3,500,000, its total income is \$560,000, and the value of the buildings and grounds is \$4,650,000. M. Emile Bénard, of France, laid out the plans, which provide for buildings and improvements that require an ultimate expenditure of about \$10,000,000.

**CALIPH** (kā'lif), a title of office assumed by the successors of Mohammed in temporal and spiritual power. From this name the early governments of Islam came to be known as the *Caliphate*. This title of office was assumed by three large divisions of Mohammedans. These included the Oriental, established at Medina in 632, which was afterward removed under the Ommyiades to Damascus and finally to Bagdad under the Abbassides; the caliphs of Cordova, founded by Abu al Rahman in 756; and the caliphs of Egypt, or the Fatimites, founded by Obeidallah in 909. With the Turkish conquest in the 16th century, the title was assumed by the Sultan, who retains it to the present time. Emir and Shah are other titles peculiar to the Mohammedan countries.

**CALISTHENICS** (kāl-īs-thēn'iks), the exercise of the body and limbs to promote health and grace, including the lighter forms of gymnastics, especially for girls. American colleges for girls contain departments in which members of the classes are trained by instructors. The results have been found wholesome, not only in increasing physical strength, but mental vigor. Calisthenics is now a department of all the larger colleges of America where females are admitted.

**CALIXTINES** (kā-līks'tīnz), the name given to the followers of Georg Calixtus, a Lutheran theologian of the 17th century. The same name refers to a sect of Hussites in Bohemia, who were so called from *calix*, the Latin word meaning cup, owing to their belief that communicants should partake of both the wine and bread in the Lord's Supper.

**CALKING** (kāk'ing), the process of driving a quantity of tarred oakum into the seams between the planks of ships, in order to render the joints water-tight. The oakum is drawn out and laid over the seams, and is then driven by a wedge-shaped instrument called the calking-iron. When sufficient oakum is forced into the seams,

it is covered with melted pitch to prevent water from getting to it. Calking is employed in making water-tight the edges of both wooden planks and iron plates, and in the latter the calking-tool straddles the seam or is driven under the lap of one of the plates, depending upon the construction of the ship.

**CALLA** (käl'là), a plant native to the temperate regions of most continents, found usually in the northern section in swamps and marshes.

CALLA LILY.

The leaves are heart-shaped, the rootstalk is creeping, and the fruit is a small red berry. It has a spreading spathe, and the oblong spadix is covered entirely with flowers. This plant is found in the northern part of Europe and North America, and the root

yields a starch used as food. The beautiful calla lily, known in South Africa as the Ethiopian lily, extensively cultivated for its fine flowers, is sometimes classed with the calla, though it is a different plant.

**CALLAO** (käl-lä'ò), a city of Peru, of which it is the principal seaport. It is situated on Callao Bay, seven miles west of Lima, and is the capital of the province of Callao. The harbor is safe and spacious, and the island of San Lorenzo furnishes a natural breakwater. It has connections with the interior by several railroads, is well fortified, and carries a brisk export and import trade. The manufactures consist chiefly of ironware, clothing, leather, and sugar. Some of the streets in the older part are narrow and poorly improved, but those in the newer part are broad and cross each other at right angles. The customhouse and several schools and churches are among the chief buildings. Callao is an old city, dating from the early part of the seventeenth century. It was destroyed several times by earthquakes and was a Spanish city until 1826. The fleet of Chile bombarded and captured it in 1890. Population, 1905, 31,690.

**CALLIOPE** (käl-li'ò-pè), in mythology, the chief of the Muses, daughter of Jupiter and Mnemosyne (Memory), who presided over eloquence and heroic poetry. She was the mother of Orpheus. The name calliope is now applied

to a musical instrument consisting of a series of steam whistles, toned to the notes of the scale, and played by keys like those of an organ.

**CALMS, Region of**, the parts of the Pacific and Atlantic oceans which are subject to total absence of winds for long periods of time. They are found between the region of trade winds and that of the variable winds. In the North they are known as the Calms of Cancer, and in the South as Calms of Capricorn. During former times, when navigation was carried on wholly by sail boats, these regions were dreaded by seamen as much as the regions of storms, for the reason that ships would lie at rest for several weeks, often exhausting food and water before sufficient movement of the air enabled sailing. With the introduction of large steamboats the former difficulties have been overcome. It is common for violent storms to follow calms that occur unexpectedly. See **Wind**.

**CALOMEL** (käl'ò-mël), a compound of mercury and chlorine, known to chemists as mercury subchloride. It is insoluble in water and is blackened by ammonia. A preparation of calomel is used extensively in medicine for liver complaints, as a vermifuge, and as a purgative. It should be taken with precaution, as it is likely to produce salivation. The calomel of the market is a white powder.

**CALORIMETER** (käl-ò-rim'è-tër), an instrument for measuring the amount of heat in bodies. The measurement of heat is divided into *thermometry* and *calorimetry*, the former having reference to the measurements of differences of temperature, and the latter to the quantity of heat which disappears when work is done, or develops when energy is expended. These instruments are known as water, ice, and steam calorimeters. In water calorimeters, a known mass of water is used to determine the amount of heat developed or expended; in ice calorimeters, the heat of fusion of ice is the basis of measurement; and in steam calorimeters, some liquid, usually water, furnishes the heat of evaporation to determine the quantity. Electro-calorimeters are used to measure the heat generated in an electric circuit.

**CALUMET** (käl'ù-mët), a kind of pipe used for smoking tobacco by the North American Indians. The bowl is generally made of stone and the large stem is ornamented with feathers. It serves as the emblem of peace and hospitality. The acceptance of it is the sign of friendship and peace, and the refusal of it is the proclamation of war and enmity. It is offered to strangers as a signal that they may travel with safety among the members of the tribe.

**CALVARY** (käl'vá-rÿ), the name applied to

the small eminence on the north side of Jerusalem on which Christ was crucified. It is the Latin translation of the Hebrew word *Golgotha*, meaning a skull. In Catholic countries the term is applied to the vicinity of a chapel, erected on a hill near the city as a place of devotion in memory of the Savior. It is common to decorate these places with three crosses, symbolic of Christ and the two thieves, and sometimes other figures are added to represent those who took part in the crucifixion.

**CALVINISM**, the system of thought named from John Calvin. The prominent tenets of Calvinism were presented by the Remonstrance at the Synod of Dort in five points, embracing the doctrines of the Original Sin, Total Depravity, Election or Predestination, Effectual Calling, and Final Preseverance of Faith. The doctrines of Calvin stand in contradistinction to those of the Lutheran and Anglican churches. The Westminster Confession of Faith is the most formal expression of the doctrines of Calvinism that exists. It is the standard of the Presbyterian churches, some holding to all the articles and others supporting them in a modified degree. A number of the branches have shown a tendency to Unitarianism, but this confession still stands as one of the most powerful creeds of the Reformation.

**CALYCANTHUS** (kāl-ĭ-kān'thūs), a genus of shrubs native to Asia and America. They have opposite leaves and purple flowers, and both the bark and leaves have an aromatic fragrance. Some species are cultivated in gardens for their flowers and foliage. The genus includes about six species, four of which are native to the United States. The bark is known as Florida allspice, or Carolina allspice.

**CALYX** (kā'liks), the name applied in botany to the outermost covering of a flower, consisting of an envelope that incloses and supports the whorl of leaves known as the corolla. The leaves of the calyx are called sepals, and are either united at the margins or are separate from each other. The sepals are less delicate than the corolla and are of a greenish color. In some flowers the calyx is united with the corolla and is difficult to distinguish, when the whole is called perianth. It usually falls off after flowering, but in some plants, as in the poppy, it remains until the fruit is ripe, while in others it becomes fleshy and forms the fruit, as in the rose and apple.

**CAM** (kām), a contrivance for changing motion in machinery, usually consisting of a small turning or sliding piece or of a projecting part of a wheel. The shape of its face or periphery is such that it imparts or receives vari-

able or intermittent motion by coming in contact with a rod or lever, or is in the form of a projection of some moving piece of machinery so shaped that it gives alternate motion to another piece against which it acts. Many forms of cams and cam-wheels are employed for various purposes in machinery.

**CAMBAY** (kām-bā'), a city, gulf, and district at the northwestern point of the peninsula of Hindustan. The district is a feudatory state of British India and is under the Bombay presidency. It has an area of 352 square miles and a population of 91,500. The city was formerly the chief seat of commerce. It is situated at the head of the Gulf of Cambay, and now contains a population of 34,160. The gulf is 25 miles wide and 85 miles long, separating the peninsula of Kathiawar from the northern coast of Bombay.

**CAMBODIA** (kām-bō'dī-à), or **Camboja**, a province of French Indo-China. It has an area of 37,400 square miles. The soil is fertile, producing coffee, pepper, sugar cane, cotton, indigo, rice, tobacco, betel, maize, and tropical fruits. Gold and precious stones are the chief minerals. It contains a number of beautiful lakes in which fish abound and has extensive marshes infested by crocodiles. The district is watered by a number of streams, contains evidences of ancient prosperity, and constitutes a valuable and productive region. It has been a French protectorate since 1863, though it is ruled by a native king. In 1887 it was united with Tonquin and Anam into a customs union, the three constituting a district under the direction of the supreme council of Indo-China. Railroads, canals, highways, and public schools have been established since French occupation. Kampot, on the Gulf of Siam, is the seaport, and Pnum Penh, on the Mekong, is the principal city. The inhabitants consist chiefly of native races. Population, 1905, 1,503,500.

**CAMBRAI** (kōn-brā'), or **Cambry**, a city of France, in the department of the Nord, 45 miles north of Saint Quentin. It is nicely situated on the Scheldt River, has extensive railroad conveniences, and is a center of trade. The manufactures include soap, leather, sugar, and machinery. The cathedral contains the remains of Fénélon, who was Archbishop of Cambrai. It has many buildings of stone and cement, including a town hall and a number of schools. It was the seat of an important conference in 1508, when the League of Cambrai was organized, which included the Emperor of Germany, the Pope, and the kings of Spain and France, and its object was to disrupt the republic of Venice. Population, 1906, 23,510.

**CAMBRIAN** (kām'brī-ən), in geology, a division of time, the earliest in which fossils of plant and animal remains are now distinguishable. The Cambrian Period was so named from Cambria, in Wales, where the system of rocks belonging to this age or time were first examined and studied. It is closely associated with the Silurian Period, which some writers regard more recent, and the rocks of this system are immediately below those of the Silurian. They contain fossils of crustaceans, corals, sponges, hydrozoans, starfishes, gastropods, brachiopods, and cephalopods. In Newfoundland the thickness of this system is about 6,000 feet, whence it thickens toward the south and west, being about 7,000 feet in New York and 10,000 feet in British Columbia.

**CAMBRIC** (kām'brīk), a very fine fabric of linen, named from Cambrai, France, where it was first made. Switzerland is now the leading center of manufactures of this article, and it is made extensively in Flanders and other countries. The name *cambric* is now applied to a fabric made of cotton in imitation of the linen product, such as Scotch cambric, which is a muslin made by twisting the cotton fibers very hard.

**CAMBRIDGE** (kām'brīj), a city of Massachusetts, in Middlesex County, separated from Boston by the Charles River. It is entered by the Boston and Maine and the Boston and Albany railroads, and has connection with Boston and other cities by electric railways. Cambridge is a suburb of Boston and the seat of the celebrated Harvard University. It includes Old Cambridge, North Cambridge, East Cambridge, and Cambridgeport. The university is located in Old Cambridge. Its beautiful campus is adorned by magnificent buildings, and its numerous excellent trees are among the most interesting of many noted objects of the city. The famous Wadsworth House, built in 1726, is located on the east end of Harvard Square, and is noted as the residence of the presidents of Harvard College for more than 125 years. A marble slab located under an elegant and venerable tree, surrounded by an iron fence, contains the inscription: "Under this tree Washington first took command of the American army, July 3, 1775." Cambridgeport is located between Old Cambridge and the West Boston bridge, and is noted for its factories, while North Cambridge is the most important commercial center of the city. East Cambridge is the newer portion and contains the public buildings.

The manufactures of Cambridge include machinery, steam boilers, packed meat, clothing, musical instruments and steam engines. It has a number of iron foundries and book publish-

ing houses. The municipal utilities include waterworks, stone and macadam paving, and an extensive sewer system. Cambridge was settled by Governor Winthrop and other men of the Colonial Period in 1630. At first it was known as New Town, but the name was changed to Cambridge in 1683. The Americans occupied it at the time Boston was held by the British, in 1775-76. It was chartered as a city in 1846. Population, 1905, 97,426; in 1910, 104,839.

**CAMBRIDGE**, a city of Maryland, county seat of Dorchester County, 60 miles southeast of Baltimore. It is on the Choptank River and on the Seaford and Cambridge Railroad. The surrounding country is agricultural, producing fruit and cereals, and it is a brisk market for merchandise and produce. Among the chief industries are oyster canneries, flouring mills, and factories producing clothing and machinery. The first settlement was made on its site in 1684 and it was incorporated as a colonial town, but its present charter dates from 1900. Population, 1900, 5,747.

**CAMBRIDGE**, a city in Ohio, county seat of Guernsey County, 58 miles north of Marietta, on the Pennsylvania and the Baltimore and Ohio railroads. It has a public library, a county courthouse, and a municipal system of waterworks. In the surrounding region are deposits of coal, gas, and petroleum. The manufactured products include pottery, machinery, cigars, ironware, and utensils. It was settled in 1806 and became an incorporated town in 1837. Population, 1900, 8,241; in 1910, 11,327.

**CAMBRIDGE**, a town of England, in Cambridge County, 48 miles north of London. It is supported mainly by the great university that bears its name. Trumpington Street, its principal thoroughfare, is lined on both sides by many fine buildings. Besides the University of Cambridge, it has a public library and the Church of the Holy Sepulcher. It has a considerable jobbing trade, modern municipal improvements, and a number of manufacturing interests. The surrounding country is fertile and produces large quantities of cereals and fruits. Cambridge was known as *Camboritum* by the Romans. It was chartered by King John in 1200. Population, 1907, 35,275.

**CAMBRIDGE, University of**, one of the two great institutions maintained in England for many centuries, located at Cambridge, on the Cam River, 48 miles north of London. It was founded at the beginning of the 12th century, tradition fixing the time at 1129. The entire university comprises twenty different corporate bodies, called colleges, founded in the following order: Saint Peter's College, 1257;

Clare College, 1326; Pembroke College, 1347; Gonville and Caius College, 1348; Trinity Hall, 1350; Corpus Christi College, 1351; King's College, 1441; Queen's College, 1448; Saint Catherine's College, 1473; Jesus College, 1496; Christ's College, 1505; Saint John's College, 1511; Magdalene College, 1519; Trinity College, 1546; Emmanuel College, 1584; Sidney Sussex College, 1598; Downing College, 1800; Cavendish College, 1876; Selwyn College, 1882; and Ayerst Hall, 1884.

Each of the colleges has a special governing body as well as teachers and students, but all are subject to the laws of the university as a whole. The university is governed by a senate, which is constituted of all the doctors and masters, but the electoral right is limited to those who reside in Cambridge. This body governs through the council of the senate, which is constituted of the chancellor, vice chancellor, four heads of colleges, four university professors, and eight associates. The ordinary administration of the university is exercised by the chancellor, the high steward, and the vice chancellor, the last mentioned being the head of some college. The discipline of the students is superintended by two proctors. Women are admitted to the examinations after having filled the commissions of standing and residences, but no degrees are conferred upon them, their names being published and certificates are issued. Girton and Newnham are two colleges that have been established for women, but they form no part of the university, though students of these colleges are admitted to many of the university lectures.

The university has an annual income of about \$300,000, which arises from fees at matriculation, for degrees, and from various other sources. There are about 3,000 undergraduates, 45 professors in the various departments, and over 400 fellowships. A beautiful botanical garden, an observatory, and an anatomical school are maintained to further study and for pleasure. The libraries contain over 200,000 volumes and include more than 10,000 manuscripts, while the laboratories for study and the museums are among the best in England. The branches studied cover all the arts and sciences, both ancient and modern. Among the eminent men who studied at Cambridge are Byron, Pitt, Chaucer, Bacon, Newton, Spencer, Ben Jonson, and Milton. Two members of Parliament are sent from the university, who receive their election by the votes of the members of the senate. See **Oxford, University of**.

**CAMDEN** (kăm'den), a city in New Jersey, county seat of Camden County, on the Delaware

River, opposite Philadelphia, with which it is connected by ferry boats. It is on the Pennsylvania, the West Jersey and Seashore, and the Atlantic City railroads. The industries include foundries, boot and shoe factories, machine shops, shipyards, and railroad works. There are no less than eight shipyards in the city, with dry docks and marine railways. Among the principal buildings are the West Jersey Orphanage, the city hall, the county courthouse, the public high school, and many schools and churches. The city has a Carnegie library and a fine Federal building. It has an excellent street railway service and electric and gas lighting, and is the center of a good jobbing trade. It was first settled in 1773 by Jacob Cooper and was incorporated in 1828. Population, 1905, 83,363; in 1910, 94,538.

**CAMDEN**, a city of South Carolina, county seat of Kershaw County, 32 miles northeast of Columbia. It is located on the Wateree River, which is utilized for navigation, and is on the Southern and the Seaboard Air Line railroads. The manufactures embrace cotton and woolen goods, brick, and machinery. It is popular as a winter resort, having a pleasant and healthful climate. It has a monument erected to the memory of De Kalb in 1825, when Lafayette laid the corner stone.

Camden is noted on account of two battles fought here in the Revolutionary War. The first took place on Aug. 16, 1780, when Lord Cornwallis with a force of 2,000 British defeated 3,000 Americans under Gen. Gates. In this engagement Baron De Kalb was mortally wounded. The second Battle of Camden took place on April 25, 1781, between a force of 950 British under Lord Rawdon and 1,400 Americans under Gen. Greene, in which the Americans were repulsed and fled in confusion. In the Civil War, while on the famous march to the sea, Gen. Sherman, on Feb. 25, 1865, entered Camden and destroyed many buildings and about 2,000 bales of cotton. Population, 1900, 2,421.

**CAMEL** (kăm'el), a large cud-chewing animal found native in Asia and Africa. The two species are known as the Arabian camel and the Bactrian camel. They belong to the ruminant quadrupeds, and are known by their long and arched neck, absence of horns, possession of incisive, canine, and molar teeth, upper lip fissure, and one or two humps on the back. These animals are native to an extent of country from Morocco to China. The dromedary, a species of fleet camel, has a single hump or protuberance and is found in a zone nearly 2,000 miles wide. The common, or Arabian, camel, has one hump and is found from Turkestan to China. The

Bactrian camel is larger and more powerful, and is taken as the best beast for service. Owing to its great utility in desert regions it is often referred to as the ship of the desert.

BACTRIAN CAMEL.

The camel travels from three to five days without drinking and with a small quantity of food. It is capable of carrying from 700 to 1,000 pounds 25 miles a day, while those trained for speed often travel from 60 to 100 miles a day.

Its power to endure thirst is due chiefly to the structure of its stomach, which is capable of draining off and storing water for future use by means of little pouches or water cells. The food is of the coarsest kind and consists of grasses, shrubs, twigs,

ARABIAN CAMEL.

and nettles. In a domestic state it subsists on the same general classes of foods as are fed to horses and cattle. Though appearing quite curved, the backbone is almost straight, the apparent curvature being due to its humps. These consist of accumulations of nutritious fat which is stored for future use. The owner of a camel carefully examines the humps before starting on a long journey. When they are plump and in a good condition, the animal possesses accumulated means of support and is able to endure long journeys and much exertion.

The camel lives from 30 to 50 years. It is not

as intelligent as the horse or elephant, and is quite vindictive when injured. Its milk is a nutritious and common food of its owner, while its flesh is highly esteemed. The hide of the camel is useful in manufactures, and the hairs serve a valuable purpose in making carpets and wearing apparel. Its nostrils and eyelashes are fitted to endure the sand storms of the desert. The sense of smell and sight are well developed. At night and when resting it chews its cud much like cattle and sheep. The llama and alpaca of South America belong to the same genus, but have no humps. The camel is used very extensively in Eurasia, Africa, and parts of South America, and has been introduced in Australia. It is one of the most valuable animals.

**CAMELLIA** (kă-mě'l'li-à), a genus of hardy evergreen shrubs or trees native to Asia, so named from G. J. Kamel, a German missionary in the Philippines. It includes many species, of which a large number are cultivated as greenhouse shrubs. The popular camellia has beautiful, double flowers, and was originated from the camellia of China and Japan. Under cultiva-

CAMELLIA.

tion it has developed red, yellow, white, and variegated colors, which differ somewhat in the form and position of the petals. These plants flower profusely in different seasons of the year, and thrive best in cool houses. They may

be propagated by layers or cuttings, and the single camellia is grown largely by planting the seed or by grafting. These plants are closely related to the tea-plant.

**CAMELOPARD** (kă-mě'l'ô-părd), the name sometimes applied to the giraffe, because it is formed like a camel and spotted like a pard. See **Giraffe**.

**CAMEO** (kăm'ě-ô), the general name given to gems cut in relief, in distinction from those hollowed out like a seal. The stones used have two or more different colored layers. The art of cutting is designed to show a layer of color with another color as a background, or an alternation of colors. In stones containing more than two colors one or more are cut so as to form ornamental wreaths or figures, as cups, flowers, or vases. Cameo cutting is of great antiquity. It was practiced by the Babylonians and from them passed down to all succeeding peoples. Some very fine specimens have been found in the ruins of Egypt and ancient Greece. Among the most celebrated cameos is the Gonzaga at Saint Petersburg, which is thought to represent Ptolemy I. and Eurydice. In the Marlborough collection of England is the "Cupid and Psyche," made by Tryphon, who lived in Macedon about the time of Alexander. Glass cameos are manufactured. The art of cutting cameos from shells of mollusks has long yielded excellent specimens.

**CAMERA LUCIDA** (kăm'ě-râ lû'si-dâ), an instrument invented by Dr. Wollaston about 1804, designed to facilitate sketching objects from nature by producing upon paper a reflected picture of them. The instrument contains a glass prism of such a form that its base has the general angles of  $90^\circ$ ,  $67\frac{1}{2}^\circ$ ,  $135^\circ$ , and  $67\frac{1}{2}^\circ$ . The objects, placed in a horizontal direction at the proper distance from one of the planes inclosing the right angles, convey rays, which in their passage through the prism are twice totally reflected, and finally, reaching the observer's eye, placed near one of the acute angles and, looking downward, enable it to see the object of which it is in quest, on a surface placed in proper focus beneath. This camera is usually called the "clear chamber" and has undergone a number of modifications, particularly in the improvement made by the addition of a glass prism, which enables the operator to observe both the figure and the point of the pencil at the same moment and greatly facilitates in sketching the objects. The camera is portable and may be carried to different points with facility.

**CAMERA OBSCURA** (ôb-skû'râ), an optical instrument by which the distant image of an object is thrown on a sheet of paper for con-

venience in sketching or for the purpose of viewing distant scenery. It was invented by Friar Bacon in the 13th century, but has been largely modified and improved. The simple form consists of a chamber from which light is everywhere excluded except at an opening about an inch in diameter, through which rays of light cast the image of the object on the opposite wall or screen. The form used for sketching usually consists of a tent surrounded by opaque curtains, at the top of which a mirror is placed in an inclined position. The light from a distant object is reflected from the mirror to the lens of a revolving lantern placed at the top of the tent, and behind it is a mirror at a slope of  $45^\circ$ , which transmits the image of the object to a sheet of paper placed at a suitable distance below.

Photographers employ the camera obscura, the form consisting of a box with two slides arranged to fit into each other, to one of which a tube is attached, containing an object glass at its extreme end. The camera is focused by sliding the two parts of the box and by means of moving the tube with a pinion. The image of the object is thrown on a ground glass slide in the back of the box. When the image has been focused to its clearest and sharpest point, a sensitive plate is exposed, which receives and retains an impression of it. In recent years the kodak, an instrument constructed on this plan, has come into general use for outdoor photography. See **Photography**.

**CAMEROON**. See **Kamerun**.

**CAMOMILE**. See **Chamomile**.

**CAMPAGNA DI ROMA** (căm-păn'yâ dê rō'mâ), the name applied to the plain surrounding Rome, which nearly coincides with the ancient province of Latium. It embraces the coast region of central Italy, a tract of country about 100 miles long and 30 to 40 miles wide. The northeastern part, lying on the slopes of the Apennines, is pleasant and healthful, but the lowlands are affected by malaria. Within the district are included the Pontine Marshes, formed by a number of small streams, which, having no outlet to the sea, spread over the land. The land is volcanic and a number of lakes, including Albano and Regillus, occupy the craters of volcanoes. It is certain that the plain was dry as late as 312 B. C., when the region was cultivated and the Appian Way was extended over a portion of it. The aqueducts of ancient Rome stretched across it, but the lines are now destroyed and only broken arches remain. The modern towns included in this region are Ostia, Frascati, Tivoli, and Palestrina.

**CAMPANIA** (kăm-păn'yâ), a portion of

ancient Italy, lying southeast of Latium, from which it was separated by the Liris River. The region was popular among the ancient Romans on account of its equable climate and great fertility. The scenery and soft sea breezes made it a favorite place for the residence of the wealthy, who erected villas of great splendor and employed slaves to cultivate the soil. Among the lakes, most of which fill the craters of extinct volcanoes, are Avernus, the fabled entrance to the lower world. Within it stands Mount Vesuvius, near which are the buried cities of Pompeii and Herculaneum. Capua, founded by the Etruscans; Cumae, the oldest Greek settlement in Italy, and Baiiae, the famous watering place of the ancient Romans, are among the noted cities. The Romans called it Felix in song and oratory, from its scenery and fertility, and it is still the *Campagna Felice* of Naples.

**CAMPANULA** (kām-pān'ū-lā), a genus of plants found widely distributed, including nearly 300 species. The plants are mostly herbaceous and many are cultivated. The flowers are greatly variegated, including blue, white, and violet, and are favored for bordering beds. The *Bellflower* is a common species in America, growing profusely in the temperate climates, and the *Canterbury bells* is a species common to Europe. The *harebell* is indigenous in Canada, the United States, and Great Britain.

**CAMPECHE** (kām-pā'chā), or **Campeachy**, a seaport of Mexico, on a bay of the same name, in the northern part of Yucatan, at the mouth of the San Francisco River. The chief buildings include a college and a cathedral. It has manufactures of cigars, machinery and clothing. Its shipyards are among the most extensive in Mexico. Lumber and fruit are produced in large quantities in the adjoining region. It is connected by railways with interior points and has a considerable foreign trade. Population, 1905, 17,248.

**CAMPECHE, Gulf of**, the name of the southern part of the Gulf of Mexico, situated south of north latitude 21°. It is bounded by the three Mexican states of Campeche on the east, Tabasco on the south, and Vera Cruz on the west. In the southeastern part is the Bay of Campeche, from which extends Laguna Terminos into the state of Campeche. Frontera, Campeche, and Vera Cruz are the principal ports.

**CAMPINE** (kām-fēn'), a purified oil of turpentine obtained by distillation over quicklime, or by rectifying it over dry chloride of lime. It forms camphor when united with oxygen. It was formerly used in lamps for light-

ing, but, owing to its explosive gases, it has been superseded for that purpose by kerosene or refined petroleum.

**CAMPHOR** (kām'fēr), a translucent substance obtained by distilling with water the leaves and wood of the camphor tree. It is whitish in color, difficult to powder, has a peculiar odor, and is slightly soluble in water. In alcohol, ether, and strong acetic acid it is highly soluble. It is used to preserve clothing, textiles, and books from ravages of insects. In medicine it is one of the most useful substances, being prescribed for many ailments, such as fever, hysteria, epilepsy, and whooping cough.

CAMPHOR: FLOWER AND FRUIT.

If taken in large doses it lowers the pulse, enfeebles the circulation, and even causes death. It is used both externally and internally. To animals and plants of the lowest forms it is a poison. Camphor is made in large quantities in Borneo, Japan, and China. The roots and wood of the tree are cut in small pieces before distillation is attempted. The best camphor is made from a natural exudation of the camphor tree which abounds in Borneo.

**CAMPOBELLO** (kām-pō-bēl'lō), an island of Canada, belonging to New Brunswick, near the mouth of the Passamaquoddy Bay, an extension from the Bay of Fundy. It is about ten miles long and three miles wide, and has a well-wooded interior. The minerals include lead and copper, but fishing is the chief industry. At the northern extremity is a lighthouse 60 feet

high. The island is popular as a summer resort, being nicely improved with walks and drives, and the permanent population is about 1,200.

**CAMPOFORMIO** (käm-pō-fôr'mê-ō), a village in northern Italy, in the province of Udine, 65 miles northeast of Venice. It is celebrated for a conference held here on Oct. 17, 1797, between representatives of France and Austria. By the terms of the treaty concluded, Austria received Istria and Dalmatia. Lombardy was made a part of the Cisalpine Republic, and France received Venice and the Belgian Netherlands.

**CAMPO SANTO**, meaning holy field, the Italian name of a burying ground. However, it is usually applied only to the burial grounds that are richly adorned and surrounded with arcades. Pisa contains the most remarkable campo santo. It was established in the 12th century, and walls richly frescoed were constructed around it in the 14th century. Genoa also has one of remarkable beauty.

**CAMPUS MARTIUS**, one of the most famous public parks of ancient Rome. It was located outside the walls of Rome, and was inclosed between the Capitoline, Quirinal, and Pincian Hills, and the Tiber River. The park was set apart for military purposes. It was sacred to the god Mars, and was one of the most noted meeting places for the people. In it were several crystal lakes and baths and it contained botanical gardens, theaters, and a race course. It now serves as a part of the site of modern Rome.

**CAMWOOD** (käm'wōd), or **Barwood**, a kind of wood used in making a brilliant red color, which, however, is not a permanent red. When prepared with the sulphate of iron, it yields the red color of the bandanna handkerchiefs. The red obtained from this wood is richer than that produced by Brazil wood.

**CANA** (kā'nā), an ancient village of Galilee, about six miles north of Nazareth, the scene of the first miracle of Jesus mentioned in John ii. It is called Cana-el-Jelil by the natives. Another village of the same name was located about three miles north of Nazareth, which some regard as the scene of the miracle mentioned.

**CANAAN** (kā'nān), meaning low land, a portion of the promised land of the Israelites, located between the Mediterranean and the Shur and Syrian deserts, bordering on the Jordan River. It was so named from Canaan, the youngest son of Ham (Gen. ix., 18), and was occupied by the tribe which descended from him.

The Canaanites were a heathen people, and at the time of the invasion of the Israelites were divided into the four nations known as the

Hivites, Hittites, Amorites, and Jebusites. It is probable that the different branches were mixed more or less with immigrants from other countries. They used the Babylonian language in diplomacy, and like the Phoenicians engaged largely in commercial pursuits. Their cities were protected by walls and fortresses, and more recent research has demonstrated that they were dependents of Egypt in 1400 B. C. They worshiped Baal and Astrate. After the Israelitish invasion, they were gradually conquered, and in the reign of Solomon all paid tribute to that king.

**CANADA** (kän'ā-dā), **Dominion of**, the region which includes all the British possessions of North America north of the United States,

FLAG OF CANADA.

except the crown colony of Newfoundland, of which Labrador is a part. The northern boundary is formed by the Arctic Ocean, Baffin Bay, and Davis Strait; eastern, by the Atlantic Ocean, Labrador, and Newfoundland; southern, by the United States; and western, by Alaska and the Pacific Ocean. North of the mainland is the great Arctic Archipelago, containing many islands of considerable size, among them Prince Albert Land, Baffin Land, Prince of Wales Island, Southampton Island, and Melville Island, and on the west are Vancouver Island and the Queen Charlotte Islands. The most prominent coast indentations are Hudson Bay, on the north, and the Gulf of Saint Lawrence, on the east. In extent it is the largest country of North America, being larger than the United States and almost as large as the whole of Continental Europe. The greatest length from east to west is 2,700 miles and from north to south, 1,600 miles. The area is 3,745,574 square miles, of which one-seventh is water.

**DESCRIPTION.** The surface of Canada is divided into the mountain regions of the east and of the west, and the great plain of the interior. These sections are distinguished by differences in climate, surface, and geological structure. Eastern Canada is not generally elevated, rang-

DUKE OF CONNAUGHT.

Arthur William Patrick Albert, Duke of Connaught, third son of Queen Victoria, was born in 1850. He studied at the Military Academy at Woolwich, after which he became general of brigade. In 1874 he was created Duke of Connaught and Strathern and Earl of Sussex. He became commander-in-chief of the forces in Ireland, in 1900, succeeding Lord Roberts, and in 1910 was appointed Governor-General of Canada.

ing from the narrow Atlantic coast plain to the highest points of Labrador, which do not exceed a height of about 8,000 feet. Most of the region ranges between 1,200 to 3,000 feet, with the depression chiefly toward the shores of Hudson Bay. North of the Saint Lawrence River, trending almost parallel to it, are the Laurentian Hills, which form the watershed between the basin of the Saint Lawrence and the rivers which drain into Hudson Bay and Ungava Bay. The altitudes do not exceed 4,000 feet, and detached from them are buttes or summits that trend toward the west, including Mount Royal, at Montreal, and a number of others south and west of that city. Near Niagara is the eastern extremity of a plateau, over the brink of which flow the waters from four of the Great Lakes, and thence it may be traced northward, where it finally rises and forms a series of rocky hills. The eastern shores, including the islands of Anticosti and Newfoundland, are extensions of the Appalachian Mountains, ridges of which appear to be partly submerged.

In the western portion of Canada are the elevated regions of the Rocky Mountains, many of which are covered with snow and glaciers. These extend into Canada from Montana, entering at the boundary between Alberta and British Columbia, whence they have a general direction toward the northwest to the vicinity of Mackenzie Bay. Immediately west of them, in southern British Columbia, are the Gold and Selkirk ranges, and near the coast, trending parallel with it, is the Coast Range. Mount Logan, in the southwestern part of Yukon, belonging to the Coast Range, is the highest peak, having an altitude of 19,514 feet above the sea. Other peaks are Mount Brown, 16,000 feet; Mount Murchison, 15,789 feet, and Mount Hooker, 15,700 feet. The summits of the Selkirks and Rocky Mountains are less elevated, ranging from 9,000 to about 14,000 feet. Among the highest peaks are Mounts Alberta, Forbes, Bryce, and Columbia.

The great central plain is a continuation of the plains extending northward from the United States. It lies between the Rocky Mountains and Hudson Bay, and continues to the shores of the Arctic Ocean. A slightly elevated ridge runs almost through the center, dividing the drainage between the eastern section, which flows largely into Hudson Bay, and the western section, which drains southwest into the Pacific Ocean and northwest into the Arctic Ocean. This region is a vast expanse of great fertility. It is covered with nutritious grasses in the southern part and with stretches of valuable forests in the northern section.

**RIVERS AND LAKES.** The rivers of Canada include some of the largest and most important streams of North America. In the eastern section is the Saint Lawrence, which, with its tributaries, is the chief highway of commerce. It furnishes transportation facilities by way of the Welland Canal from the Great Lakes to the Atlantic. Its northern tributaries include the Saint Maurice, the Ottawa, the Saguenay, and the Outarde, while those from the south are the Saint Francis and the Richelieu. Hudson Bay receives all of the drainage of the southeastern part of the great central plain, including the waters from the Saskatchewan, Nelson, Churchill, Hayes, and Severn. Drainage from the western part of the central plain is carried northwest by the Athabasca, Peace, Great Slave, Mountain, and Mackenzie rivers. British Columbia has two river systems, the Fraser in the southern part and the Nelson in the northern part, and the northwestern portion is drained into the Pacific by the Skeena and Stikine. Practically all of Yukon is in the valley of the Yukon, which rises in the southern portion and carries the drainage northwest through Alaska.

All parts of Canada are more or less diversified by lakes, except the regions of the far north. A number of small lakes are abundant in the eastern part, including the Payne and Michikamau lakes of Ungava; and the Mistassini and Saint John lakes of Quebec. Lake Nipigon is located in western Ontario; lakes Manitoba, Winnipeg, and Winnipegosis, in Manitoba; lakes Athabasca and Reindeer, in Saskatchewan; Great Bear and Great Slave lakes, in Mackenzie; lakes Okanogan and Kootenay, in British Columbia; and Lake Kluahne, in Yukon. On the southern boundary are lakes Ontario, Erie, Huron, Saint Clair, Superior, and Lake of the Woods.

**CLIMATE.** In extent north and south, Canada lies between the north latitude 40° and the north pole, though a large part of the southern boundary is formed by the Great Lakes and parallel 49°, the international boundary. The warmest climate is in the southwestern part, at Victoria, where the temperature ranges from 37° to 60°. From the Pacific coast, modified by the warm Japan Current, the Chinook winds move eastward and temper the severity of the winter, reaching as far east as Alberta. In Saskatchewan and Manitoba, which lie a considerable distance from the sea, the climate is less equable and is marked with greater extremes. At Winnipeg and the country west and for some distance north, the climate is warm in the summer and cold in the winter, reaching from 90° in the growing season to a point as low as 50° below zero in the winter. The arid condition

of the atmosphere, however, has a modifying effect and the cold appears less severe. In the southeastern part the climate is quite equable and is highly favorable to the arts of civilization, especially in all of Ontario and the larger part of Quebec, while the cold currents of the Atlantic cause Nova Scotia, part of Quebec, and all of Ungava to have a damp and cold climate. The northern section of Canada has an arctic climate, with reasonably warm summers in some localities, while in others the ground remains frozen the entire year and the thermometer frequently registers 75° below zero.

The rainfall is abundant in all parts of the Dominion, except in a number of localities of the plains. The arid region is chiefly in Alberta and Saskatchewan, where irrigation is employed, and a number of sections of British Columbia have a scant precipitation. In the eastern part rain and snow are abundant and the shores abound in fogs. The section between the Laurentian Hills and Hudson Bay has ample rainfall, but the soil is poor or rocky.

**FLORA AND FAUNA.** Large forests originally covered the eastern part of Canada, extending from the Atlantic through the Saint Lawrence valley and most of Ontario. Large areas have been cut, but this section, especially Ontario, is still rich in timber. Manitoba has groves and belts of timber along the streams and in the vicinity of the lakes, but a large part of it and much of Saskatchewan and Alberta are comparatively treeless. However, these prairies are covered with nutritious grasses valuable for stock raising. A belt of timber extends from Hudson Bay through the northern part of Saskatchewan and Alberta to the Rocky Mountains, most of which lies north of the Saskatchewan, made up chiefly of poplar, spruce, and tamarack. Vast forests of evergreen trees, such as cedar, pine, and spruce, abound in the Rocky Mountains and the Coast Range. Along the Fraser and other valleys are many specimens of the Douglas spruce that attain heights of from 200 to 300 feet.

The animals are quite similar to those of Northern Asia and Europe, and include many valuable fur-bearing species, such as the mink, sable, ermine, lynx, fox, and bear. In some sections of the Rocky Mountains the puma is still abundant, and the beaver inhabits a large part of the Dominion. The bighorn, elk, goat, antelope, and pronghorn inhabit the western section, and in the Arctic region are such animals as the moose, caribou, musk ox, and white bear. Smaller game, such as the duck, goose, snipe, brant, and grouse, are abundant. Few species of the reptiles are represented, but the country

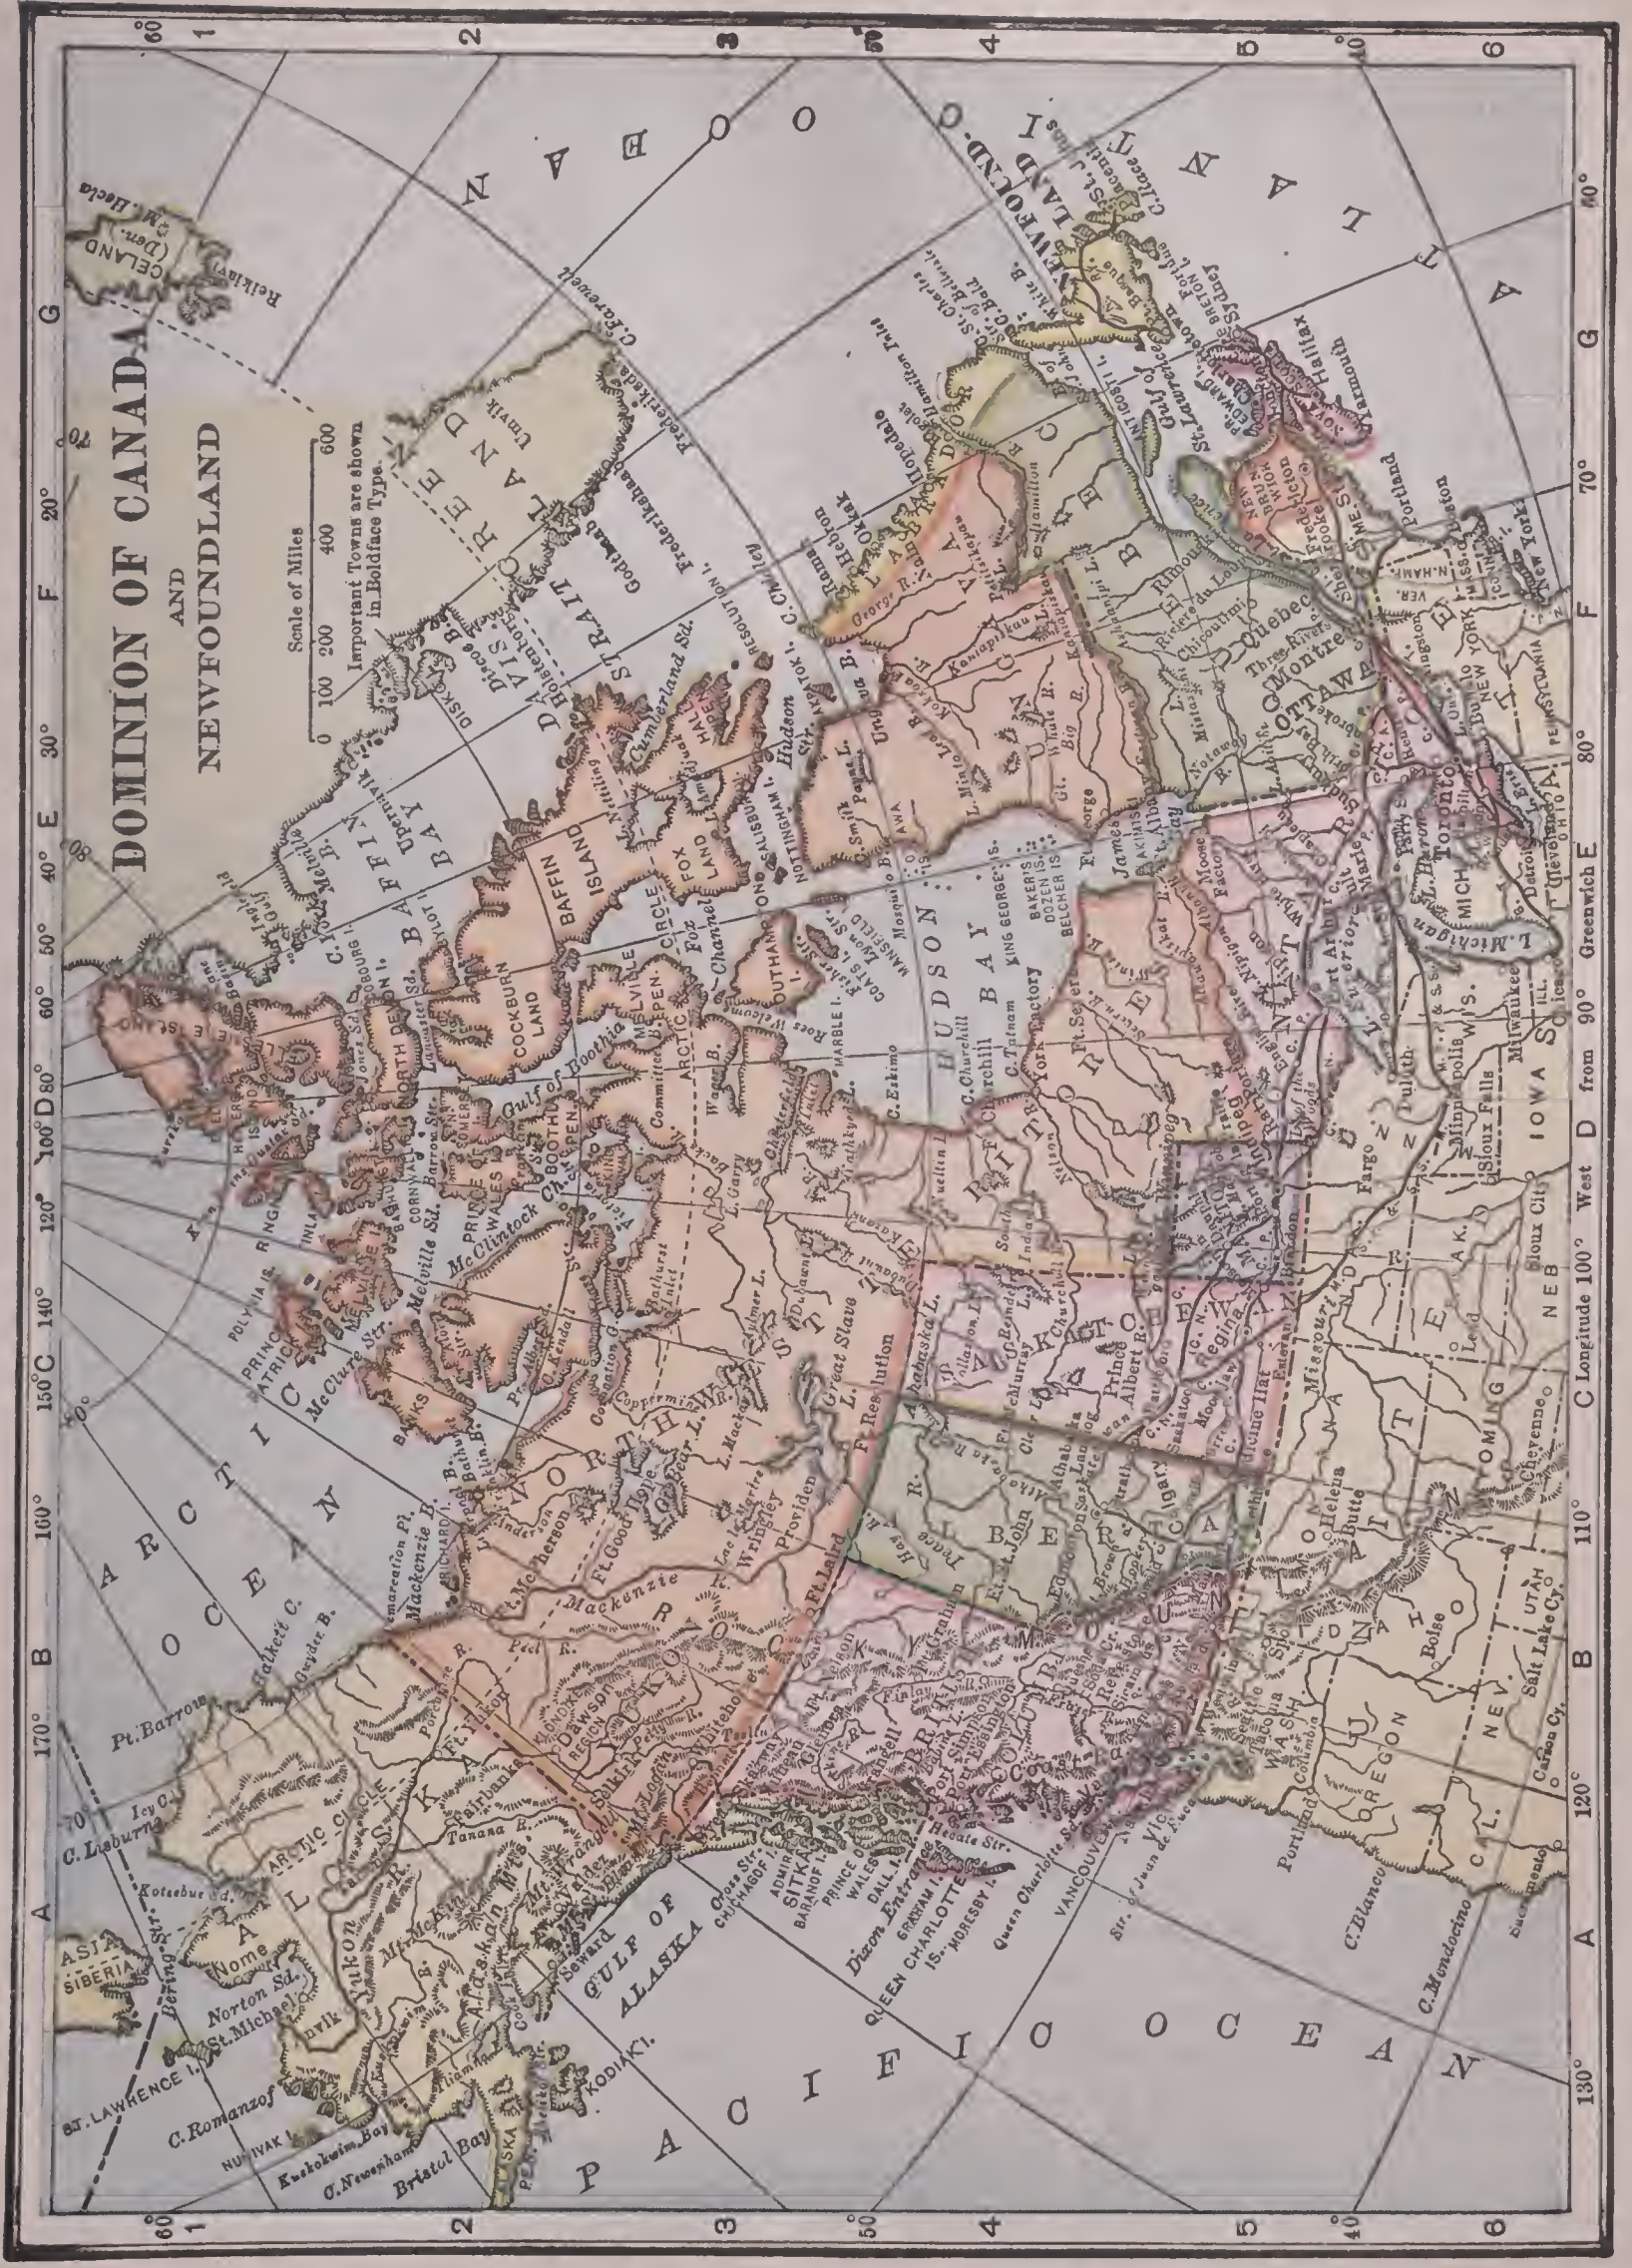

is rich in birds of song and plumage. All the inland and coast waters have valuable fisheries.

**MINERALS.** Canada is rich in minerals. It may well be said that all of the more valuable classes used in the industries are represented. Bituminous coal is abundant, but is confined largely to Nova Scotia and British Columbia, the two extremes of the country, and lignite coal is found in Saskatchewan and Alberta. Anthracite coal of a good quality is obtained at Calgary, Alberta, and in the Queen Charlotte Islands. Iron is mined in Ontario, Quebec, and British Columbia, and is probably the most widely distributed of the minerals. The output of iron is not large, due chiefly to the fact that coal for smelting cannot be obtained at a moderate rate. The output of gold takes first rank, having an annual value of about \$22,500,000, and the mining is done chiefly in British Columbia and the Klondike and other regions of Yukon. In the value of the produce coal ranks next to gold, averaging annually about \$19,500,000. Copper is mined in Ontario and British Columbia, but the ore is transported largely to the United States for refining. Ontario produces large quantities of salt and petroleum, and lead is obtained with silver in the Kootenay district of British Columbia. Nearly one-half of the world's supply of nickel is obtained from the mines in Ontario, which center largely in the Sudbury district northeast of Lake Huron. Quebec produces asbestos of a high grade. Other minerals mined more or less extensively are mica, graphite, gypsum, and pyrites. Building stone of a very high class is abundant, and quarrying is developed to a large extent in Nova Scotia, New Brunswick, Quebec, Ontario, and British Columbia.

**FISHERIES.** Few countries are favored like Canada in the quality and quantity of its commercial fish. The Great Lakes, the interior waters, and the coasts are productive as fisheries. In 1908 the output was valued at about \$29,500,000. Cod and lobster are the most important fisheries of the eastern coast, where the output is large, and in addition there are valuable catches of the hake, smelt, haddock, mackerel, and sardine. Trout, pike, and pickerel are caught in the Great Lakes, and the whitefish is the most prolific in the lakes of Manitoba. Salmon fishing is of first importance in British Columbia. Pelagic sealing is a productive enterprise, and off the northern coast is the best whale-fishing region in the world. The minister of marine and fisheries has general oversight of the fish industry, which is wisely guarded by the government.

**LUMBERING.** Lumber has been one of the

chief sources of wealth in Canada since its early settlement. Many of the forests of the eastern section have been exhausted, but partial protection against wastage is furnished by the laws now in force. The government has reserved as public property a large area of the public domain, and lumbermen secure it by paying a license to cut. For some years the value of lumber exports have had an average of about \$38,500,000, most of the shipments being in the form of sawed products. Ontario, Quebec, and British Columbia have the most important lumbering industries, but timber extends across the continent in a belt ranging from 150 to 300 miles, and the north central section bids fair to furnish heavy competition when railroads are more generally constructed. The most important varieties of timber utilized include the Douglas fir, balsam, pine, spruce, hemlock, and many kinds of hardwoods.

**AGRICULTURE.** Agriculture is the leading enterprise, and about seven-tenths of the people pursue this occupation. A wide range of climate makes it possible to greatly diversify the crops. Farming is carried on in the valleys of Nova Scotia, New Brunswick, Prince Edward Island, and other portions of the Maritime Provinces. The narrow valley of the Saint Lawrence River has the largest interests in agriculture that have been developed at this time in Quebec, and here general farming has attained a high degree of perfection. Ontario is the leading province in agriculture and has a very large output of oats, barley, wheat, and peas. It is practically the only section where corn is raised profitably. In Manitoba, Saskatchewan, and Alberta especial attention is given to the culture of wheat, oats, flax, and barley. British Columbia has some exceptionally rich valleys, notably that of the Fraser River, and is leading in the production of fruits.

The eastern section is most particularly concerned in general farming, and the agriculturist diversifies both the crops and the live stock, while farming in the interior consists more generally in special lines, such as growing cereals or conducting ranches as distinct enterprises. Truck farming is carried on largely in southwestern Quebec and many parts of Ontario. All classes of domestic animals are grown, and bee-keeping and dairy farming receive studious attention. In the exportation of cheese, Canada takes first rank among the countries of the world.

**MANUFACTURING.** Canada is favored in having an abundance of natural resources, including a vast number of raw materials, hence has a future of great promise in the manufacturing

enterprises. Lumber products take rank as the most important at present, and large quantities of sawed timber are exported. Salmon canning and pork packing are well represented, the former in British Columbia and the latter in Winnipeg and Toronto. Montreal and Quebec are centers in the manufacture of woolen goods, boots and shoes, and iron and steel products. Nova Scotia, having both coal and iron ore, has large developments in the manufacture of hardware and machinery. Other products include leather, furniture, cotton fabrics, paper, soap, cigars, chemicals, and clothing.

**TRANSPORTATION.** The Great Lakes and the Saint Lawrence River are important as natural highways, and with the construction of a system of canals it has been made possible for vessels drawing fourteen feet of water to pass from Lake Superior to the Atlantic. Montreal is at the head of ocean navigation and is the seat of a large commerce, being favored by its location on the direct route to the Great Lakes and a number of extensive railway systems. Vessels from Montreal to Port Arthur pass from Lake Ontario by the Welland Canal to Lake Erie, thence by the Detroit River and Saint Clair Lake and River to Lake Huron, thence by a ship canal along the east bank of the Saint Mary's River into Lake Superior. Navigation by water is possible for long distances on many of the rivers, including chiefly the Fraser, Thompson, Athabaska, Yukon, Mackenzie, and Saskatchewan. Transportation is important on the lakes of Manitoba, with which Winnipeg is connected by the Red River of the North. The Canadian Pacific Railway has been operated as a transcontinental line since 1887, having its eastern terminus at Halifax, in Nova Scotia, and its western at Vancouver, in British Columbia. The Grand Trunk Railway is the second line across the continent of Canada, extending from Quebec and Portland, Me., to Prince Rupert, on the Pacific. These great railways and others have numerous branches, and the latter has a line projected to Dawson, in the west central part of Yukon, which will be connected with navigation on the Yukon River.

Canada has an extensive foreign trade. The imports somewhat exceed the exports, which approximate an annual value of \$360,500,000, while the imports average about \$295,540,000. Animals and animal products are the chief exports, and next in order are lumber, cereals, dairy products, minerals, paper and wood pulp, leather, and fresh and canned fish. Among the chief imports are cotton and woolen fabrics, coffee, coal, tea, iron, machinery, and raw cotton. Great Britain and the United States have the

principal share of the foreign trade, and the former has a preferential tariff in its favor, goods being admitted about one-third less than the tariff rates on imports from foreign countries. The rate of postage and the monetary system are similar to those of the United States.

**EDUCATION.** The minister of education has general oversight of the public schools, though no centralized system of education is maintained for the whole Dominion. Each province has charge of its own system of schools and public instruction, and attendance is free in all the provinces, most of which have a nominal compulsory attendance law. The provincial superintendent and his council have general supervision, while the separate schools are looked after locally by trustees elected in the districts. In the rural communities each township is divided into school sections and three trustees manage the school affairs of each section, while the municipalities have a board of school trustees, who have general supervision, and usually place the direct management of instruction in the hands of principals and superintendents.

Canada has many institutions of higher learning as well as numerous academies and denominational schools. The Dalhousie College, Nova Scotia, founded in 1820, was the first to be established. The University of Toronto, Ont., was founded in 1828; Queen's College, Kingston, Ont., in 1841; Laval University, Quebec, in 1852; the University of Manitoba, in 1877; and the Royal Military College, Kingston, Ont., in 1874. Many educational and scientific societies are maintained. These include the Nova Scotia Institute, the Royal Society of Canada, the Natural History Society of Montreal, the Scientific and Historical Society of Winnipeg, the Canadian Institute of Toronto, and the Society of Natural History in Victoria.

All religious beliefs are tolerated and no state church is maintained. The province of Quebec has a large per cent. of Roman Catholics, who are guaranteed the privileges enjoyed while it was a colony of France. A larger per cent. of the people belong to the Roman Catholic church than to any other denomination, numbering about 2,230,000. The second in numerical strength are the Methodists, who have a membership of nearly half that number. Next in order are the Presbyterians, Anglicans, Baptists, Lutherans and Congregationalists. Comparatively few Catholics reside in Ontario, Manitoba, and Saskatchewan. The Methodists have the largest membership in Ontario and the Presbyterians are most numerous in Nova Scotia.

**INHABITANTS.** The government of the Dominion and of the provinces has encouraged

immigration and investments. The influx from foreign countries has been increasing steadily, and is largest from the United States, England and Wales, Scotland, Ireland, France, and Germany. Immigration from the United States may be said to date from about the beginning of the present century, when settlers were attracted by the fertile lands and vast resources of the western part of Canada. The Europeans represented most largely are the Germans, 310,501; the Scotch, 800,154; the Irish, 988,721; the English, 1,260,899; and the French, 1,649,371. These figures are based on the census of 1901, when the English of Canadian parentage included 683,480 and the French of Canadian parentage, 635,972 people. In that year the total number of persons of foreign birth was reported at 278,804. The Indian population is 107,978. These people consist chiefly of the four branches known as Algonquins, Eskimos or Innuites, Huron-Iroquois, and Tinnehs or Dine Dinijes. The Chinese and Japanese numbered 22,050, most of whom are in British Columbia.

Ottawa, the capital of the Dominion, is a thriving city on the Ottawa River, in Ontario. Montreal, the largest city, is at the head of ocean navigation on the Saint Lawrence, in Quebec. Toronto, the second city, on the north shore of Lake Ontario, is a center of commerce and manufacture. Other cities of importance include Quebec, Hamilton, Winnipeg, Halifax, Saint John, London, Charlottetown, Vancouver, Victoria, Kingston, Brantford, Brandon, and New Westminster. The population of the Dominion in 1901 was 5,371,315.

**GOVERNMENT.** For the purpose of government, the Dominion is divided into provinces and territories. The following table contains a complete list together with the area of each division, as reported by the latest census:

PROVINCES.	
Alberta.....	253,540
British Columbia.....	312,630
Manitoba.....	73,732
New Brunswick.....	27,985
Nova Scotia.....	21,428
Ontario.....	260,862
Prince Edward's Island.....	2,184
Quebec.....	351,873
Saskatchewan.....	250,650
Yukon (Territory).....	196,976

UNORGANIZED DISTRICTS.	
Franklin.....	500,000
Keewatin.....	516,571
Mackenzie.....	562,182
Ungava.....	354,961

The government is administered under a constitution drafted in 1864 and embodied in the act of 1867, when the union of the leading colonies created the Dominion of Canada, which was subsequently increased by accessions of territory.

Executive authority is vested in the Governor General, who is appointed by the King of England. He is assisted by a Privy Council composed of a premier and 15 ministers, 13 of whom are heads of departments. The departments consist of those of justice, state, trade and commerce, railways and canals, marine and fisheries, militia and defense, posts, finance, agriculture, interior, public works, customs, and internal revenue.

Appellate civil and criminal jurisdiction is exercised in all parts of the Dominion by the supreme court, which has its seat at Ottawa, and an exchequer court has general powers of admiralty. Each of the provinces has a judiciary system, including justices of the peace, police magistrates, county courts, and a supreme court, but the judges of the two courts last mentioned are appointed by the Governor General of the Dominion. All the provinces have a Lieutenant Governor General appointed by the Governor General of the Dominion and a legislative department, which consists of two branches in some of the provinces and in others only one chamber, as in Ontario and British Columbia.

A Parliament, consisting of two houses, the Senate and the House of Commons, has legislative authority in the Dominion. All bills providing for revenues must originate in the House of Commons, and the Senate may not amend these bills, though it has power to initiate legislative action in many matters. The Governor General may disallow a bill passed by the two branches, or he may refer it for consideration to the home government, but the former is not exercised in practice, and the latter is employed only where a measure has direct reference to the interests of the empire at large, or affects its relations to foreign powers. Members of the Senate receive their appointment from the Governor General. They must reside in the province from which they are chosen, be born or naturalized subjects thirty years of age, and possess property valued at not less than \$4,000. Membership in the House of Commons is based upon the population of the provinces, and the election is for five years by popular vote. The Senate consists of 87 members, of whom 24 are from Quebec, 24 from Ontario, 10 from New Brunswick, 10 from Nova Scotia, 4 from Prince Edward Island, 4 from Manitoba, 4 from Alberta, 4 from Saskatchewan, and 3 from British Columbia. Representation in the House of Commons is as follows: 110 members for Ontario, 89 for Quebec, 28 for Nova Scotia, 23 for New Brunswick, 14 for Manitoba, 10 for British Columbia, 10 for Saskatchewan, 8 for Prince Edward

Island, 8 for Alberta, and 1 for Yukon, making a total of 301.

The right of franchise extends to all male citizens 21 years of age, but various restrictions are imposed by the provinces, such as residence for a specified time and registration on the assessment rolls. The King of England is the commander in chief of the naval and military forces, but they are under the control of the Dominion Parliament. The militia include all British subjects between the ages of 18 and 60, and there is no standing army, except a garrison of British troops at Halifax. The active militia is limited by law to 40,000 men, who are raised by voluntary enlistment or by draft. No navy is maintained by the Dominion, and the naval defense of the country is entirely under the direction of the imperial government, which maintains forts at Halifax, in Nova Scotia, and Esquimalt, in British Columbia.

LITERATURE. The literature of Canada dates from the early settlements made by the French in the valley of the Saint Lawrence, and much of the product is still in the French language, although many writings of value have been published in the English. An Ursuline convent and Laval University were founded in the seventeenth century and became the center of educational influences at an early date. Many of the earlier writings treat of discovery, history, and tradition of the Indians. Champlain published a description of his first voyage and many interesting narratives in 1601, and his writings were edited and published in six volumes by Laberdère in 1870. Lescarbot, one of the settlers in Acadia, published "The History of New France." Another noted historical work is Gabriel Sagard's "Relations des Jésuites," which is replete with thrilling incidents of the life and adventures of missionaries. A line of poetic productions, interesting for their description of the scenery and the spirit of progress in the new land, were issued in the course of time. Ernest Gagnon, in 1865, published a collection of these popular songs. They were translated by William McLennan under the title "Songs of Old Canada."

After Canada became English territory under the Treaty of Paris in 1763, it lost much of its literary spirit by the strife between the French and the English. However, the contention was happily overcome when the provinces were united as the Dominion of Canada in 1867. This event was followed by a new era in the literature of the country. French Canada still holds its own language and has many native-born writers. In the list may be named Michel Bibaud, author of "Histoire du Canada sous la

dominion anglaise," and François Xavier Garneau, the writer of "Histoire du Canada." Other writers in the French language include Abbé Faillon, Benjamin Sulte, Abbé Tanguay, and Faucher de Saint-Maurice. Many newspapers and other periodicals are published in the French language, most of which are centered in Quebec and Montreal. The French writings are not only rich in history and romance, but include many poetic works in a finished style.

The English portion of Canada is settled largely by English, Irish, Scotch, Germans, and immigrants from the United States, though the last mentioned are most numerous in the western part. Samuel Hearne (born in 1745), though of English birth, is one of the earliest Canadian writers in that language. His "Account of a Journey from Prince of Wales' Fort in Hudson's Bay to the Northwest" is one of the earliest accounts of travels and explorations. William Smith, in 1815, published his "History of Canada." Another work of merit is David Thompson's "War of 1812," which was issued in 1832. Joseph Howe is among the early orators, and his speeches delivered in the Parliament of Nova Scotia were published in a collected form in 1858. Among the eminent statesmen may be mentioned Alexander Mackenzie, Sir Charles Tupper, Sir John Macdonald, and Sir Wilfrid Laurier. Goldwin Smith, an eminent journalist, is well known from his historical work, "The United States; an outline of Political History." Other historical writers include Robert Christie, William Kingsford, Henry Scadding, George Bryce, and G. M. Adams. "Canada Under British Rule," published by J. G. Bourinot in 1900, is one of many commendable historical writings.

The books on general literature, especially novels and romances, are very numerous. However, the works in fiction are comparatively recent. John Galt, who lived for three years in Ontario, published an account of frontier life in his "Lawrie Todd." Mary Catherwood published "The Romance of Dollard" and "The Lady of Fort Saint John." G. M. Adams, the Canadian journalist, completed "An Algonquin Maiden" in 1886. Sir Gilbert Parker is the author of "The Right of Way," "When Valmond Came to Pontiac," and "The Seats of the Mighty." Among the poetical writers may be mentioned Isabella Valancy Crawford, W. W. Campbell, Sir Gilbert Parker, Bliss Carman, and Charles Sangster. The later poets and historians take cognizance of the combined national elements in the Dominion.

**HISTORY.** The Norsemen were the first to visit the eastern coast of Canada, on which Bjarni

Herjulfson is thought to have landed in 986. Leif Ericson came across from Greenland in the year 1000, and is thought to have touched the shores of Newfoundland and Nova Scotia. John Cabot, a Genoese by birth and an Englishman by residence, sailed from Bristol and in 1497 landed on the coast of Labrador, claiming that district for England. Basque and Breton fishermen established cod fisheries off Newfoundland in 1504, and Jacques Cartier, the French navigator, came to Quebec in 1534 and took possession of the country for Francis I., King of France. He made a second voyage in 1535 and ascended the Saint Lawrence as far as Montreal.

Marquis de la Roche was commissioned as lieutenant governor of Canada by the King of France in 1598. He bargained to colonize New France, as the country was called, and planted a settlement on Sable Island, but this was not permanent. Sir Humphrey Gilbert made a settlement at Saint John's, Newfoundland, in 1583, but this did not prove successful. Samuel Champlain made his first voyage to Canada in 1603, sailed up the Saint Lawrence under the direction of the French, and in 1608 founded the first permanent settlement in Canada, at Quebec. A few years later he discovered lakes Champlain, Huron, and Erie, and in 1611 planted a settlement at Montreal. He concluded a treaty with the Hurons and Algonquins, which ultimately brought the French into conflict with the Iroquois, who formed alliances with the Dutch and afterward with the English.

The Jesuits came from France in large numbers in 1625, and for nearly half a century predominated over religious and secular affairs at Quebec. In 1627 the Company of New France was organized by Richelieu and held sway until 1663, when it was superseded in control by the government of France, though a new corporation, known as the Company of the West, was established in 1664, and, like its predecessor, exercised a monopoly over the fur trade. Louis XIV., who had sent Colbert to America, looked upon New France as a valuable possession and sought to establish a permanent foothold on the Saint Lawrence and the Great Lakes. Frontenac was sent to America in 1672 and gave new life to the enterprise of strengthening the colony. He coöperated with LaSalle in exploring the Mississippi and some of its tributaries, and in the establishment of military posts at Niagara, Mackinac, and within the territory of the United States.

The effects following the explorations of Henry Hudson and the settlements by the English in Virginia caused a feeling of rivalry

between England and France, and subsequently caused the so-called French and Indian Wars. The first clash took place as early as 1629, but France continued to retain a strong foothold until 1759, when Wolfe captured Quebec. The Treaty of Paris in 1763 ceded Canada, including all the territory between the Alleghenies and the Mississippi, to Great Britain, retaining only the city and district of New Orleans. From 1760 to 1764 Canada was entirely under military control, and in the latter year a provisional government was organized, which remained in force until 1774, when the Quebec Act was passed by the British Parliament. This legislation recognized the civil laws and institutions of the French in Canada, and provided that the Roman Catholics should exercise their religious practices without interference.

The American colonies that declared independence from England in 1776 tried to form an alliance with Canada, but it remained loyal throughout, and many loyalists left the United States during the Revolution. The number of immigrants from the United States within this period aggregates between 30,000 and 40,000, and these people not only founded New Brunswick and settled large parts of Ontario, but their descendants continue to constitute an influential element in the commercial and political affairs of the Dominion. The area of Canada was reduced by the Treaty of 1783, when the British relinquished their claim to the region now included in the states of Ohio, Indiana, Michigan, Illinois, and Wisconsin.

The provinces of Ontario and Quebec were founded in 1791 by an act of Parliament which divided the region into the two sections known as Upper Canada and Lower Canada. At that time the former was populated almost entirely with people of English descent, while the latter was inhabited by descendants of the French. In the War of 1812, between Great Britain and the United States, Canada was the scene of many battles, among them those of Chippewa, Queenstown, Lundy's Lane, and Moravian's Town. Lower Canada, or Quebec, had a popular assembly constituted largely of French, while the governor and legislative council was almost exclusively English. This caused much racial antagonism and in 1837 a considerable party under the leadership of Louis J. Papineau rose in revolt against the British authority, but the imperial government intervened and suppressed the revolutionary rising. It soon became apparent to the government that to unite the two sections would be the wisest policy, which was brought about under an act passed in 1839, and the union was completed in 1841. The Maritime

Provinces, which included Nova Scotia, Cape Breton, New Brunswick, and Prince Edward Island, meanwhile retained their separate governments. Under the new union the crown appointed the governor and a legislative council, while the upper and lower branches of the legislative assembly were constituted of members elected by popular vote.

The Dominion of Canada was created in 1867 by the Act of Union passed by the British Parliament, and at that time consisted of the provinces of Quebec, Ontario, Nova Scotia, and New Brunswick. British Columbia was united in 1871 and Prince Edward Island became a province of the Dominion in 1873. However, Newfoundland refused to enter the union and still comprises an independent colony. The more recent accessions are Alberta and Saskatchewan, which were united as provinces of the Dominion in 1905, formed of the region formerly included in the four territories of Alberta, Assiniboia, Athabasca, and Saskatchewan. At the same time the region known as the Northwestern Territory was reorganized, which is now embraced in the Territory of Yukon, and the two unorganized districts of Mackenzie and Keewatin. Two other unorganized districts, Ungava and Franklin, are included in the Dominion, the former lying north of Quebec and east of Hudson Bay, and the latter embracing Baffin Land and the islands of the Arctic Archipelago.

The Treaty of 1783 did not fix definitely the boundary between the United States and Canada, which was the subject of much contention for many years. However, the Ashburton Treaty, concluded in 1842, finally settled the northeastern boundary, and the northwestern boundary was finally adjusted in 1846. Treaties affecting the right of fishing in the Bering Sea and elsewhere have been the cause of some friction between the two countries. Reciprocal trade relations were established in 1854 and 1866, under which trade and commerce between Canada and the United States grew to much importance. In 1869 the Dominion acquired the vast territory held by the Hudson Bay Company since 1670, and this was followed by an uprising under Louis Riel in 1870, who headed a large number of discontents and organized a government in the territory now included in Manitoba, of which he was declared the president. A British army under Sir Garnet Wolseley was dispatched to the seat of trouble, and Riel fled to the United States.

**CANADA BALSAM** (baɪ'sam), a transparent liquid obtained from a species of fir native to Canada and the northern part of the

United States. It is resinous, has a pale yellow color and an acrid taste, and closely resembles turpentine. The name was derived from the balsam fir, from which it was first obtained, but it is likewise secured from the hemlock spruce and other species. It has the consistency of honey when it exudes from the bark, but becomes solid after exposure to the air. This product is valuable in making varnishes, in photography, and to some extent in medicine.

**CANADA GOOSE**, a wild goose which inhabits North America, breeding in the north and moving southward to the warmer region in autumn. It is about thirty-five inches long. The plumage is gray, with black on the head and the tail. Flocks of these geese begin to move north about the 1st of April, and are frequently seen at a considerable height, led by a gander who utters a loud honk at frequent intervals. These birds are hunted for their flesh, which is highly nutritious.

**CANADA HEMP**, a species of herbs native to America, belonging to the dogbane family. It abounds throughout the western part of Canada and the United States, and furnishes a fiber used by the Indians in making nets and numerous articles. The bark of its root has tonic properties.

**CANADIAN THISTLE**. See **Thistle**.

**CANADIAN RIVER** (ká-nā'dê-an), a river of the United States, 900 miles long. It rises near the line between Colorado and New Mexico, thence flows through New Mexico, Texas, and Oklahoma. It receives the North Fork of the Canadian River in Oklahoma, and flows into the Arkansas River about fifty miles west of Fort Scott.

**CANAL** (ká-nāl'), an artificial water course or channel. The construction of canals is of great antiquity. The earliest known in history were those built by the Babylonians, who utilized them for navigation and drainage. The Egyptians connected the Nile and the Red Sea by a canal at a remote period. Although it fell into decay through the fortunes of war, it was reopened by Pharaoh Necho about 605 B. C., and at intervals by others after him. Most of the ancient nations constructed canals. The great canal of China is 825 miles long. It was commenced in the 7th century A. D. and was completed in the 9th. Canals were first built in France, Germany, and England by the Romans, the canal at Caderike being the first artificial channel used for navigation in the British Isles. The Whitham and Trent rivers were joined by a canal in 1134, and in 1759 the Bridgewater Canal was commenced. The Erie

Canal of New York was begun in 1817 and was completed in eight years. Many noted canals were built in the 17th and 18th centuries in Holland, Germany, Belgium, and other countries of Europe. The construction of canals has been greatly modified since the beginning of the era of railroad building, though, instead of being lessened, the tendency has been to build larger canals than at any time in previous history. Canals are now built mainly as aqueducts and for boats, ships, drainage, water power, and irrigation.

**AQUEDUCTS**. Aqueducts are designed to carry canals across waterways or depressions in the ground. The Peruvians, Romans, and Grecians constructed aqueducts on a large scale, carrying water by these means for the irrigation of arid lands and to supply cities. Some of the most noted aqueducts of America are those of New York, Baltimore, and Saint Louis. They are maintained as a means of supplying water for city use. An aqueduct differs from a canal

LIFT LOCK CANAL.

mainly in that it is shallower and is built so the water will flow by gravitation in its entire course. Many large cities have one or more aqueducts. One of the most noted of recent construction is across the River Loire in France. It is 2,175 feet long, and 21 feet wide, and carries eight feet of water. Its importance is not in its size, because other similar constructions are much larger, but from the fact that it is constructed almost entirely of steel plate. Instead of having solid masonry, it contains piers of masonry and its several parts are riveted together.

**BOAT AND DRAINAGE CANALS**. Boat canals serve for transportation purposes, in which vessels are often drawn by horses or mules on a towpath. The Erie Canal of New York is one of the notable artificial channels of this class in America. It is 351 miles long and connects the Hudson River at Albany with Lake Erie at Buffalo. The State of New York appropriated \$9,000,000 in 1895 to deepen the canal and other-

wise improve it for the use of larger vessels. It is now nine feet deep. Most drainage canals are constructed for sanitary and drainage purposes, but in some cases they are used partly for navigation. Many of this class of canals penetrate various parts of the Netherlands. The canal which carries the surplus water from Lake Zumpango, in Mexico, was commenced in 1607. Many years were required for its construction, being completed in 1789, a period of 182 years. The canal was greatly improved by an expenditure of \$3,500,000 in 1889. It carries the sewage of the city of Mexico and drains the adjacent valleys. The greatest work ever attempted in this line is the Chicago Drainage Canal, which extends from the south branch of the Chicago River to the Des Plaines River, at Lockport, a distance of 28.05 miles. It was completed in eight years, beginning in 1892, at a cost of \$42,000,000. By means of this canal water from Lake Michigan flows into the Chicago River and carries the sewage from Chicago through the Des Plaines to the Illinois River, and is intended eventually to provide water navigation from the Great Lakes to the Mississippi River.

**SHIP CANALS.** Ship canals are constructed for the passage of the largest ocean vessels. The Suez Canal, connecting the Mediterranean with the Red Sea, is the first large ship canal to be completed in modern times. It was opened in 1869, is 99 miles long, 327 feet wide, and 26 feet deep. The Kaiser Wilhelm Canal, in Germany, was opened in 1895. It connects the North and Baltic Seas, passing through Schleswig-Holstein. It affords passage for the largest vessels afloat, and its opening was one of the most important events in the commercial history of Europe. The project to cut a canal across the Isthmus of Panama, with the view of connecting the Atlantic with the Pacific, was long a subject for serious discussion. The first attempt was made in 1878 under the French engineer, M. de Lesseps, the builder of the Suez Canal. The work was commenced in 1881 with the design of completing it in 1904, but the company became involved in monetary difficulties and by 1889 only one-third of the work had been completed, with an expenditure of \$156,400,000. In 1904 the project of constructing the canal was undertaken by the government of the United States, under whose direction the work is progressing with good prospects of eventually completing the enterprise. The Welland Canal, which connects lakes Erie and Ontario, is an important waterway of Canada.

**OTHER CANALS.** Water power canals are con-

structed to supply water power in propelling machinery. Among those noteworthy is the Sault Sainte Marie Canal, by which the water of the Saint Mary's River is utilized and furnishes force equal to 40,000 horse power. However, it is more important as a ship canal. It has an enormous traffic and the largest lock in the world. Irrigation canals were built by the Ptolemies in Egypt, and have been constructed more or less in all arid countries. The most extensive irrigation canals in America are located in Colorado, Nevada, Utah, California, and Alberta, where large areas of arid and desert land have been reclaimed and now yield abundantly, supporting large farming and dairying enterprises. Most of the boat and ship canals contain lift locks, by means of which navigation may be successfully promoted through hilly countries. A lift lock consists of a trough or tank holding water, into which vessels are floated, and which are raised and lowered bodily between the two canal levels by hydraulic or other power, aided sometimes by counterweights or flotation tanks. See **Suez Canal, Panama Canal, Welland Canal**, etc.

**CANAL DOVER** (dō'vēr), a city of Ohio, in Tuscarawas County, seventy-five miles south of Cleveland. It is situated on the Tuscarawas River, the Ohio Canal, and the Baltimore and Ohio and other railroads. In its vicinity are coal and iron mines. The manufactures include flour, wagons, carriages, boilers, and machinery. It has a number of substantial business buildings and is a trade center for produce and merchandise. The city has public waterworks and other utilities. The first settlement on its site was made in 1807, and it was incorporated in 1865. Population, 1900, 5,422.

**CANANDAIGUA** (kăn-an-dā'gwā), the county seat of Ontario County, New York, twenty-nine miles southeast of Rochester, on the Northern Central and the New York Central railroads. It has a fine courthouse, an orphan asylum, a public library, the Canandaigua Academy, and several charitable institutions. The manufactures include brick, leather, tinware, clothing, and malt liquors. The surrounding country is agricultural. It has a good jobbing trade in merchandise. The vicinity was settled in 1789 and it was incorporated in 1815. Population, 1900, 6,151; in 1910, 7,217.

**CANARY** (kā-nā'rŷ), a singing bird of the finch family, native to Madeira and the Canary Islands. It is easily tamed, thrives well in cages, and lives from twelve to sixteen years in captivity. It was introduced into Europe about 400 years ago, and is now extensively bred in all civilized countries. A large number of species

have been studied and the training of canary birds has long been a subject of much interest. In the wild state these birds frequent the vicinity of houses, where they build their nests. They feed on the seeds of grasses, buds, and insects. The size has been enlarged by domestication, some measuring five inches in length, but it is doubtful whether the musical tones of

GOLDFINCH CANARY.

WILD CANARY.

their voice have been improved. Large interests are vested in raising canary birds in some parts of Europe, especially in Great Britain and the Harz Mountains of Germany. The male birds of a yellow color bring the largest prices in the market, often as much as \$150 for a single bird. Other favorite colors are red, brown, and black. The seed of millet and canary grass is the favorite food.

**CANARY GRASS**, an annual grass native to the Canary Islands, cultivated for its seed, which is much used as food for cage birds. It has been introduced and is cultivated in many parts of Europe and America. A fine flour is obtained from the seed and is used for glue or sizing in making fine cotton textiles and finishing silken stuff. A species known as southern canary grass is abundant in the southeastern part of the United States, from Florida to South Carolina, and in many localities as far west as California. The ribbon grass cultivated in gardens is a variety with white-striped leaves.

**CANARY ISLANDS**, anciently called Fortunate Islands, a group of thirteen islands lying about seventy miles from the northwestern coast of Africa. The area is 2,808 square miles. The most important of the group are Teneriffe, Fuerteventura, Grand Canary, Lanzarote, Palma, Gomera, and Hierro or Ferro. The islands are of volcanic origin, and have a mountainous surface with precipitous cliffs near the sea. Among the most important peaks are Pico de Teyde, 12,190 feet, El Cumbre, 6,650 feet, and Mount Mudo, 2,160 feet. They have a mild and favorable climate and the soil is fertile. The exports aggregate nearly \$2,000,000 annually, and consist principally of cereals, potatoes, wine, raw silk, cochineal, and tropical fruits.

The Canary Islands were discovered by the Spaniards in 1316, who conquered the native tribes known as the Guanches, and have since been under the control of the Portuguese or Spaniards, who now constitute the principal part of the population. Laguna is a pleasant city and the seat of the resident Roman Catholic bishop. Santa Cruz is a well fortified city and the capital of the island group. The government is administered by a local governor under the supervision of Spain, to which country the islands belong. Population, 1905, 358,692.

**CANCELLATION** (kăn-sěl-lā'shŭn), the process of shortening indicated division by rejecting the same factors from both dividend and divisor. It depends upon the principle that if the same factor be rejected from the dividend and the divisor both terms are divided by that factor, or dividing both dividend and divisor by the same number does not affect the quotient. Cancellation was formerly treated by itself in a chapter in elementary text-books, but it is now generally placed with the definitions of elementary processes. The following serves as an illustration of the process:

$$\frac{\cancel{3} \times 7 \times \cancel{8}}{\cancel{3} \times \cancel{8}} = 7$$

**CANCER** (kăn'sēr), the popular name of a malignant tumor found in different parts of the body. Physicians generally divide the disease into two classes, the *sarcoma* and the *carcinoma*. The former is not considered a true cancer, since it is more vascular than the true cancer and is not epithelial in character. As a rule, it occurs before the age of forty years, while the true cancers occur most frequently after the age of forty. It frequently is caused by injury and is not hereditary. In many cases it does not affect the skin, but when the skin gives way the sarcoma is exposed as a mass of bleeding animal matter.

The true cancer is a tumorous growth and is composed essentially of epithelial cells. It has a central mass, or *aveoli*, from which isolated groups of cancer cells extend to the neighboring structures. The cause of this disease is not definitely known, but is variously assigned to heredity, constitutional vices, injury, and parasitic influences. The two general forms are known as *scirrhous*, or hard cancer, and *medullary*, or soft cancer, though there are several varieties of the latter. The hard cancer most frequently affects the axilla, the parotid glands in the neck, and the female breast; the soft cancer generally frequents the internal organs, such as the stomach, spleen, kidneys, liver, and oesophagus. Hard cancer mostly affects people

over fifty years of age and lingers many years, while the soft occurs mostly in those younger and is quite often of short duration. There is no definite cure; the chief remedy is excision, though the cancer often returns. In recent years it has been possible to obtain good results by the application of the X-rays, but the permanent cures have not been numerous.

**CANCER**, in astronomy, the fourth sign of the zodiac. The northern tropic is known as the Tropic of Cancer. See **Zodiac**; **Tropics**.

**CANDIA** (kǎn'dī-à). See **Crete**.

**CANDLE** (kǎn'd'l), a cylinder of wax or fatty matter containing a wick used for lighting. Candles are made principally of tallow, paraffin, bleached wax, spermaceti, bayberry tallow, palm oil, and stearin. They are primarily divided into *dipped* and *molded* candles, according to the mode of their manufacture. Dipped candles are made by stretching a number of wicks on a frame, and dipping them into melted tallow from time to time until a sufficient amount has accumulated around the wicks to form candles. Molded candles are made by melting the tallow and casting it in molds, in which the wicks have been previously fixed, and when cooled the candles are withdrawn. In ancient times candles formed the principal means of lighting. They were used very generally up to about the middle of the last century, when they began to be displaced by mineral oils. At present gas and electricity in cities and mineral oils in country districts have largely displaced the commercial importance of candles.

**CANDLEBERRY**, or **Bayberry**, a small tree native to the eastern part of North America, but most abundant in the southern part of the United States. It attains a height of about eighteen feet, but is usually a low-spreading shrub and has oblong evergreen leaves. The fruit consists of small berries, which, when ripe, are covered with a greenish-white wax, known as bayberry tallow. Four or five pounds of this product is obtained from a bushel of berries. It is used for candles, which burn slowly and emit a pleasant odor, and in some localities it serves to make a soap. A species of this tree, native to Japan, attains a height of fifty feet, and is cultivated to some extent in California for its edible fruit.

**CANDLEFISH**, a fish native to the Pacific Ocean, off the western coast of North America, from Oregon to Bering Sea. It is classed with the smelt family, has a somewhat pointed and conical head, and grows to a length of fifteen inches. The flesh is preferred to that of the trout, and an oil is obtained from it quite similar to cod-liver oil. The oil in these fish is used

by the Indians for lighting. A rude light is obtained by drawing a piece of rush pith through the fish, which, in burning, gives out a light quite suitable for the tents of the natives.

**CANDLEMAS** (kǎn'd'l-mas), the feast of the purification of the Virgin Mary, instituted in the year 492. It is observed on February 2. The feast is kept by the Roman Catholic Church. In its observance lighted candles are carried in a procession, and the candles to be used the ensuing year are consecrated on that occasion.

**CANDLE NUT**, a tree native to the East Indies and Madagascar. It bears a nut with a hard shell about the size of a walnut, the kernel of which is used as food and for the manufacture of oil, known as walnut oil and kekune oil. The natives obtain lampblack from the shell, and in some localities burn the kernels as torches.

**CANDY** (kǎn'dÿ), a form of crystallized sugar used as an article of confectionery. It is made by boiling sugar or syrup to render it hard and transparent. The industry of candy making has assumed large proportions and is an important enterprise in many countries. The people of France engage in the industry more extensively than any other. The candy market is well represented in nearly every country of the world. In most places candy is sold in connection with other articles, usually in drug and grocery stores, but in the larger cities it has come to be handled to a large extent as a distinct line. A place in which candy is the leading article of trade is generally known as a *candy kitchen*.

The art of candy making is concerned in producing a large variety of confections. Many of the sweetmeats are flavored with fruits or essences, such as lemons, strawberry, peppermint, vanilla, etc. The nuts, such as peanuts and walnuts, are used in making choice candies. Among the fancy varieties are caramels, chocolate creams, and rock candy.

In making candy the sugar is usually dissolved in water with a small amount of glucose added to give the necessary consistency, and this is boiled until the proper thickness is secured. It is next poured on slabs of marble to cool, after which it is worked to give it hardness and the desired color. It is cast in cornstarch molds to give it form and size, and a press is used to form figures or mottoes. The manufacture has grown to such an extent and has assumed such various forms that many classes and kinds of candy are produced, some of which are beautiful and quite nutritious. The harm attending the consumption of candy is due altogether to several unwholesome coloring substances often used, and to an excess in eating it.

**CANELLA** (kā-něl'lá), a small tree native to the warmer part of North America, often called wild cinnamon in Florida and the West Indies. It bears a small black berry, and its bark is known in commerce as white-wood bark. All parts of the tree are highly fragrant and the bark has an acrid, pungent taste. It is employed as a stimulant tonic.

**CANIS MAJOR** (kā'nīs mā'jēr), a constellation of the Southern Hemisphere, located under the feet of Orion. Its principal star, Sirius, is the brightest of all the stars. Near the constellation of Canis Major, just below Gemini, is Canis Minor, which contains Procyon, a star of the first magnitude.

**CANKERWORM** (kā'n'kēr-wûrm), the larvae of two species of moths, sometimes called measuring worms from their peculiar locomotion. They are abundant in Canada and the northeastern part of the United States, where they attack fruit trees, especially apples and pears. The eggs are deposited by the wingless female in orchard trees, and the larvae are de-

CANKERWORM.

1, Adult Male; 2, Larva; 3, Adult Female; 4, Eggs.

structive to the foliage in the early period of their life, but later they descend to the ground, where the metamorphosis takes place. Many fruit trees and current bushes are stripped of leaves in the spring by these insects, which are very voracious.

**CAN MAKING**, the art of making vessels for holding and carrying liquids, usually of tinned iron or other sheet metal. This enterprise has grown remarkably since the industry of canning vegetables, fruits, meats, milk, spices,

varnishes, and paints has been developed. In the United States there are ten or twelve large establishments engaged in can making for supplying canning factories. The larger establishments have a daily output of over 100,000 cans. Oysters, fruits, and vegetables are packed in round cans of various sizes, mostly from one to three pounds each, but some are as large as a half gallon or a gallon. Fish, sardines, and meats are packed in oval cans. Can making is carried on entirely by automatic machinery, which is used both in cutting and soldering the cans. The tops and bottoms are stamped by foot power, a boy or man being able to stamp a thousand cans per day.

**CANNAE** (kā'n'nā), an ancient town in Italy, on the Aufidus River, now called Ofanto, which became famous on account of a great victory won by Hannibal over the Romans, Aug. 2, 216 B. C. He commanded the Carthaginian army of 10,000 cavalry and 40,000 infantry. The Roman army under Aemilius Paulus and Terentius Varro consisted of 6,000 cavalry and 80,000 infantry. By skillful maneuvering Hannibal was able to force the Romans into a position in which they were required to face the sun and a strong wind, while he occupied points of advantage and led the attack with fearful slaughter to the Romans. Fully 70,000 Romans were killed and the Carthaginians lost only 6,000.

**CANNEL COAL** (kā'n'něl kōl), a variety of bituminous coal which is very dense and compact. It is of a dull bluish or grayish black color and has little luster. It is used mostly in the manufacture of gas and oils. On distillation it yields from forty to sixty-five per cent. of volatile matter. The cannel coal fields of the eastern part of Kentucky are the most extensive in America, but it is found in smaller deposits in Ohio, Indiana, and Scotland.

**CANNES** (kā'n), a city of France, in the department of Alpes-Maritimes, twenty-two miles southwest of Nice. It is located on the Mediterranean, has railroad facilities, and is the seat of considerable export and import trade. The vicinity produces large quantities of olives, figs, oranges, and other fruits. The chief building is the Abbey of Donjon, built about 1070. Among the newer structures are a library, a town hall, and a museum of antiquities. Cannes is the place where Napoleon landed in 1815, when he returned from Elba. Population, 1906, 30,318.

**CANNIBAL** (kā'n'nī-bal), one who eats human flesh. The practice of eating human flesh has existed from very ancient times, but the name now applied to it was originated about the time when Columbus discovered the

West Indies, where the Caribales were a man-eating race. The practice was known in the time of Homer, and he ascribes it as an unnatural attribute to Polyphemus. Cannibalism was practiced in North America by the Atakapa Indians and other tribes on the coast of the Gulf of Mexico. The Aztecs made human sacrifices to their gods and afterward the bodies were eaten by the populace. Cannibalism still prevails among certain tribes of Australasia and Central Africa. When a number of African tribes war with each other, they consume the slain and captives as food.

**CANNING** (kăn'nĭng), the industry of preserving fish, meats, fruits, and other articles of food in air-tight cans. Nicholas Appert, a Frenchman, discovered this process in 1795, and it was introduced in Canada and the United States in 1815. In canning it is necessary to destroy the germ which causes fermentation, which is done by cooking the product to be canned, either before or after it is placed in the can. The cans used in the industry are manufactured in large establishments and sold to canning factories. In canning vegetables or cereals they are placed in cans by machinery, after which the cans are carried to soldering machines and soldered by automatic devices. The labels are put on the cans by a machine, which spreads the paste and adjusts the label to its proper place. The most important products canned are fish, beef, corn, tomatoes, peas, beans, and fruits.

In the United States there are over 2,250 canning factories, the largest number being operated in Maryland, but there are more or less in all the states. The following states lead in the industry: Maryland, Maine, New York, Virginia, New Jersey, Delaware, and California. There are no less than 28,000 fishermen employed in gathering mackerel, white fish, salmon, and other fish for canning purposes, using 3,000 fishing vessels, while about 21,500 men are employed in dredging for oysters. The lands used in producing vegetables and cereals for canning purposes aggregate 1,500,000 acres. It is shown by the census that 3,000,000 persons are indirectly connected with the business, while 1,000,000 secure employment during the canning season. The canned meat produced annually is valued at \$25,000,000, while the fish, fruit, and cereals aggregate much more.

**CANNON** (kăn'nŭn), a conical tube for discharging projectiles. Cannon were first used in Europe in the 14th century, sometime after powder had been introduced as an ammunition of war. Those used at first were made of longitudinal iron bars hooped with rings, in which

the charge was placed in the socket of the breech, the shot consisting of stone, lead, or iron. They were employed successfully by Edward III. at Calais in 1346 and by the Turks at Constantinople in 1394, after which they came into general use. In the 15th century brass guns capable of throwing a thirty-pound shot were introduced, and soon after the balls were increased to forty-five pounds. At Edinburgh cannon of twenty-inch caliber were made before the end of the century, while those made at Ghent were twenty-six inch. In the early part of the 16th century bronze and iron guns were made in Western Europe, some of which were portable and others were used as siege guns, capable of throwing an eighty-pound ball. The guns of the 17th century were made lighter, with the object of having them more easily portable for field use, and cartridges were invented and successfully used in action. The guns made in the 18th century were cast solid and afterward bored, these containing smooth bores. Rifled field guns were first introduced in 1859, since which time rifling has been employed in making cannon of all calibers.

The cannon used in early times were known as bombard. They were short and clumsy, with a larger opening at the mouth than at the breech, and were held together by large hoops. Those used by modern nations include the *howitzers*, *mortars*, *Rodman*, *field* and *Gatling*. Howitzers are intended for short range and are used to throw shells into the enemy's ranks when near at hand. Mortars are intended to throw bombs or shells so as to fall into fortified places and do damage by exploding. They have short barrels with very large bores to admit large missiles. Some forms are used to shoot shells at the enemy horizontally. The Rodman gun is mounted on a carriage and is used at fortifications. Field guns are mounted on gun carriages and are drawn by horses from place to place as the requirement may demand. In some countries mules are used extensively for conveying cannon, being deemed more reliable in action than horses.

The Gatling gun has a number of barrels, usually ten, which are made to revolve on an axis by mechanical arrangement, and as each barrel passes an opening it receives a cartridge and is fired. It has a capacity of 400 shots per minute. The Armstrong and Krupp are the most celebrated guns of modern manufacture. The latter is especially popular. It is manufactured in Essen, Germany, at the most extensive cannon factory in the world. The largest size weighs 125,000 pounds, carrying a cannon ball about 9,000 yards, and is capable of penetrating

a 25-inch sheet of iron at a distance of 1,500 yards. The larger cannon are used at fortifications and on warships. All of the cannon of modern manufacture are rifled with a spiral groove to give the ball a rotary motion. They are cast solid and then bored by being made to revolve in a drill. Recently the Vickers-Maxim breech mechanism has been adopted for use in the large guns of the navy, which not only ejects the exploded primer automatically, but in addition raises the new load into position at the breech of the gun.

**CANOE** (kā-nōō'), a small boat that is narrow in the beam and is propelled by paddles. The name was derived from the boats made by uncivilized people. Many were constructed by laying thin strips of wood across each other at various angles, which were tied together, and then covered with pieces of bark or hide. They were generally propelled by paddles, but some of the larger ones carried sails. The American Indians made canoes of cedar wood covered with an unbroken sheet of the bark of the white birch, while the Indians of the plains used buffalo hides. Strong and durable canoes were made in forest districts by hollowing out birch logs, and this kind was probably the best made by primitive people. The Feejee Islanders now construct boats of very large size, some a hundred feet in length. The Society Islands contained a naval force, at the time they were visited by Captain Cook, consisting of 1,700 war canoes, manned by 68,000 soldiers. The Eskimos make canoes of walrus and seal skins stretched over whalebone, while those constructed by the natives of the Polynesian Islands are made of planks. Stanley, in his African travels, found canoes used by the natives on inland lakes that consisted of very light material, often of seaweeds, and larger ones of skin and bark capable of carrying eight or ten men.

The name *canoe* is now applied to any small boat made of paper, tin, wood, India rubber, or canvas, and used for making long voyages or in pleasure exercises. John Macgregor traveled 3,000 miles in his Rob Roy canoe. Some are made for only one person, while others are for two or more, with a seating convenience in the center. The American Canoe Association has several thousand members, and its official magazine, *The American Canoeists*, is devoted to the interests of sports and pleasures with the canoe. Other American organizations are the Northern Association of Canada and the New York Canoe Club. Indeed, many canoe clubs are maintained wherever lakes and rivers are accessible. An open and undecked canoe known as

the *Canadian canoe* is used extensively in canoeing.

**CAÑON** (kā-nyōn'), or **Canyon**, the Spanish name applied to a tube, and used by Spanish-Americans to designate deep ravines or gorges worn by water. It is now in general use in America. The cañons of the Rocky Mountains are particularly grand. The Grand Cañon of the Colorado, in Arizona, consists of immense gorges 200 miles long. It is from five to twelve miles wide, and from 5,000 to 7,000 feet deep. Many of the towering walls are sedimentary rock of gorgeous purple and vermilion color. Others are narrow channels cut several thousand feet deep, with terraced sides or perpendicular walls. These remarkable phenomena are widely distributed throughout the Cordilleras of America from Alaska to Panama. The most remarkable in the eastern part of the United States is the one in central New York, known as the Glen, at Watkins, near the headwaters of Seneca Lake.

**CANON** (kān'ŭn), a rule or ordinance made by an ecclesiastical council in relation to religious matters. A canon rule instituted by Gregory the Great provided for the celebration of the mass with more splendid accompaniments than had hitherto been used, while others of the Catholic Church constitute laws and regulations for observance by the lay members. Other canons of historical interest include those passed for the government of the Church of England and the anciently adopted Old Testament and New Testament canons. The Old Testament Canon, anciently adopted on the authority of the Jewish Talmud tradition, was designed to give public sanction to the Pentateuch. The New Testament Canon came into force about 170 A. D., by which the books of the New Testament were declared to be canonical.

**CAÑON CITY**, county seat of Fremont County, Colorado, on the Arkansas River, forty miles west of Pueblo. It is on the Denver and Rio Grande, the Atchison, Topeka and Santa Fé, and other railroads. The site of the city is 5,340 feet above the sea, surrounded on three sides by mountains, and is noted as a pleasure and health resort. The Royal Gorge and Grand Cañon are one mile distant. Cold and thermal mineral springs abound in the vicinity. The chief buildings include the public library, the high school, and the State penitentiary. Coal, iron, silver, copper, petroleum, and building stone are obtained in the vicinity. Population, 1900, 3,775.

**CANOPY** (kān'ō-pŷ), in architecture, an ornamental arched or rooflike projection, with a niche or doorway. The term is applied in

Gothic architecture to the rich covering over tombs, doors, and windows. In Germany and France the canopies of early times were elaborate and complicated, while those of England are usually simple in form. The cathedrals of Europe as well as many of the larger churches furnish examples of canopies.

**CANSO** (kǎn'sō), a seaport of Nova Scotia in Guysborough County, near Cape Canso. It has considerable trade in merchandise and is the seat of several consular agents. The waters of its coast have valuable fisheries. Canso is the landing place of several cables belonging to the trans-Atlantic lines. Population, 1905, 1,565.

**CANSO, Strait of**, a narrow channel separating Nova Scotia from Cape Breton Island. It is about two miles wide and seventeen miles long, and connects Chebucto Bay with the Gulf of Saint Lawrence. Cape Canso, the eastern extremity of Nova Scotia, is the east of Chebucto Bay, projecting into the Atlantic Ocean.

**CANTABRIAN MOUNTAINS** (kǎn-tā'-brī-an), a range of highlands in the northern part of Spain, near the shore of the Bay of Biscay. They extend a distance of 300 miles, from the Pyrenees to Cape Finisterre, and their loftiest summits are near the central part. Many promontories characterize the coast, but the slopes toward the east and south are gradual and have valleys of much fertility. The altitudes range from 2,675 feet to 8,790 feet.

**CANTALOUPE** (kǎn'tā-loōp). See **Musk-melon**.

**CANTATA** (kǎn-tā'tā), a poem or dramatic composition set to music, in which solos and choruses are rendered. It originally assumed the form of an opera, with voice parts and accompaniments of the violin and other instruments, but is now shorter than either opera or oratorio. The cantata includes compositions of either sacred or secular choral works, and may be lyric or dramatic. It differs from opera in having no stage accessories.

**CANTEEN** (kǎn-tēn'), a vessel of metal or leather used by soldiers in the army, which serves to carry water or some other potable liquid while on duty. It is made in the form of a flask or bottle and is strapped to the waist belt or strung about the neck. The capacity is two or three pints.

**CANTERBURY** (kǎn'tēr-bēr-ī), a city of England, 55 miles southeast of London, noted for its magnificent cathedral. The cathedral was founded in 596 by Saint Augustine. It was ravaged by the Danes in the 8th, 9th, 10th, and 11th centuries, but was enlarged to exceed that of London at the time of the conquest. It is 530 feet in length and 154 feet in breadth,

and has a tower 235 feet high. The Canterbury Cathedral was long an important ecclesiastical place, but lost a part of its prestige with the murder of Thomas à Becket. It has excellent painted glass windows. The chambers are the finest in England and are beautified by several chapels. Near by the cathedral is King's School, founded by Henry VIII., in which David Copperfield attended. The city has railroad facilities, a library, and several fine institutions of learning. Population, 1907, 26,208.

**CANTILEVER** (kǎn'tī-lēv-ēr), a bracket of wood, iron, or stone used in architecture for supporting balconies and cornices. The cantilever has been utilized in the construction of bridges, in which two brackets are built out, one from each side of the ravine to be spanned, to meet at the center without the support of intermediate piers. The first great bridge built in America in which the cantilever principle was used is the one which spans the Niagara River a short distance above the Whirlpool Rapids. It was completed in 1883 and is entirely of steel. The length is 910 feet; the two projecting arms or cantilevers are each 175 feet; and the truss span which they support is 175 feet long. The bridge is 245 feet above the water and is crossed by a double railway track. Another bridge of this class crosses the Saint John River, in New Brunswick. It is 813 feet long and the main span has a length of 477 feet. The Poughkeepsie Bridge is the longest structure of this class. It crosses the Hudson River with five spans and has a total length of 6,767 feet.

**CANTON** (kǎn-tōn'), an important commercial city and port in southern China. It is located in the province of Kwangtung, on the Si-kiang River, about 32 miles from the China Sea. The city is of great antiquity and is mentioned in history as early as 250 B. C. It became an important market and seaport in 700 A. D., and was long celebrated as a trading point for Arab voyagers. In the 16th century it was visited by the Portuguese and a hundred years later by the Dutch. England monopolized its commerce from the 17th century up to 1834, when trade with other European nations became important. In 1857 it was captured by the allied forces of French and English and was garrisoned by them until 1861, since which time it has been open to the commerce of all nations.

The city is surrounded by walls twenty feet thick and from twenty to forty feet high, with a partition wall dividing it into the old and new parts. The wall contains many gates, which are closed at night and open during the day. Many

of the streets are tortuous and some are less than eight feet wide. In the old portion of the city are many Buddhist temples, about 200. The largest of these is located on Honam Island, covers seven acres, and is called the "Temple of the Ocean Banner." It is one of the most celebrated Buddhist temples, with fine ornamentations, and 175 priests. Another famous temple is situated in the western suburbs, called the "Temple of Five Hundred Gods," in which 500 statues are located to commemorate Buddha and his disciples. The city has remarkable examples of life upon the water, a large number of residences being constructed of boats that occupy a space of four or five miles on the river opposite the city. No less than 40,000 of these residences are in the city, and the population occupying them aggregates 200,000.

Canton has large industries for the manufacture of porcelain, paper, glass, silk, cotton goods, sugar, ivory carvings, lacquered ware, and utensils. It was the chief city for foreign commerce of China until 1850, when it was surpassed by Shanghai, but its annual imports and exports still aggregate about \$40,000,000. Many foreign mercantile houses, among them German, French, British, and American, occupy the southwestern part of the city, and the consulates of foreign governments are also located in that portion. The religion of the Chinese in Canton is largely Buddhism. Education is provided for in elementary schools, and a number of institutions disseminate knowledge in the higher learning and the arts, especially sculpture and painting in the Chinese style. Population, 1908, 905,500.

**CANTON** (kǎn'tūn), a city of Illinois, in Fulton County, about 25 miles southwest of Peoria, on the Toledo, Peoria and Western and Chicago, Burlington and Quincy railroads. It has a growing trade in grain, lumber, and merchandise. The manufactures include cigars, brooms, machinery, marble products, tile, and flour. A fine high school is maintained. The city has a public library, waterworks, and gas and electric lighting. It was settled in 1832 and incorporated in 1849. Population, 1900, 6,564; in 1910, 10,453.

**CANTON**, a city in Ohio, county seat of Stark County, sixty miles southeast of Cleveland, on the Pennsylvania, the Cleveland, Canton and Southern, and the Baltimore and Ohio railroads. It is surrounded by a fertile farming and stock-raising country, and in the vicinity are deposits of clays, limestone, and coal. The chief buildings include the post office, the county courthouse, the city high school, the Aultman Hospital, and the city hall. Nimisilla Park is a fine public resort. It has a large public library

and several monuments, including one erected to the soldiers of the Spanish-American War and the fine monument dedicated to President McKinley in 1908. The manufactures include brick, tile, cigars, roofing material, clothing, saddlery and harness, machinery, agricultural implements, and railroad cars. It has an extensive trade in farm produce, merchandise, and machinery. The municipal improvements include sewerage, waterworks, gas and electric lighting, stone and asphalt pavements, and electric urban and interurban railways. It was first settled in 1805 and was incorporated in 1822. Canton was the home of William McKinley. Population, 1900, 30,667; in 1910, 50,217.

**CANVAS** (kǎn'vas), a kind of coarse cloth made of flax or hemp. It is used largely to make sails for ships. The strips are usually narrow; several are sewed together to make the large sails used on boats and ships. A similar cloth is used for tents and awnings, and a finer variety called *duck* is employed in making clothing for men and women. The canvas used by artists in painting is stretched on wooden frames the size of the picture desired. Its surface is made smooth by chalk and size, or white lead. The widths are from 28 to 94 inches.

**CANVASBACK**, a species of duck native to North America. It is about twenty inches long. The color is diversified. The male has reddish plumage on the head, the bill is nearly black, and the back and sides are grayish with sparse wavy lines, similar in appearance to the surface of coarse canvas. The female has more grayish plumage than the male and is somewhat smaller. They frequent the inland waters and estuaries of rivers, where they feed on roots and crustaceans, and visit fields in the spring and fall in search for grain. These birds are migratory, moving northward to breed the latter part of March, and are highly prized for their flesh.

**CAOUTCHOUC** (kōō'chōōk), an article used extensively in the arts. It is an elastic, gummy substance and is obtained from the juices of several species of trees found in South America. This product was first exported to Europe in the 18th century, and became useful in erasing pencil marks, bread crumbs having been previously used for that purpose. It is now employed largely in the manufacture of lead pencils, erasers, nonconductors of electricity, and many other purposes. Caoutchouc is of value in making waterproof fabrics; a patent for a process of this kind was granted to Samuel Piat in 1791. In 1823 Mackintosh was granted a patent on waterproof material known by his name, while Charles Goodyear invented the vulcanizing process by which caout-

chouc is rendered as hard as horn. Soft vulcanized rubber is made by adding twenty-five per cent. of sulphur and heating to about 270°. In making hard vulcanized rubber or ebonite, fifty per cent. of sulphur is added and it is heated to 300°. See **India Rubber**.

**CAPE ANN**, a cape in the northeastern part of Massachusetts, 30 miles northeast of Boston. It is the eastern point of Essex County, and the name is generally applied to the whole rocky peninsula, which extends about ten miles into the Atlantic Ocean. This peninsula contains the towns of Rockport and Gloucester, which are connected by railway with Salem and other cities of the State. Valuable stone quarries are worked, and off the coast are extensive fisheries. Cape Ann is popular as a summer resort.

**CAPE ARAGO**, or **Gregory**, a cape of Oregon, at the south side of Coos Bay, on the west shore of Coos County. Near this cape is a lighthouse 84 feet above the sea.

**CAPE BARROW** (bǎr'rō), or **Point Barrow**, a cape in the Arctic Ocean, the most northerly point of Alaska. The United States government located a signal service station here in 1881, and near it is the village of Barrow, a whaling station.

**CAPE BLANCO** (blǎn'kō), the name of three capes in Africa and one in North America. Cape Blanco, the most northerly point of Africa, is on the northern coast of Tunis and projects into the Mediterranean. Another cape of the same name is on the west coast of Morocco, and a third is on the western shore of the Sahara, near the boundary between the possessions of France and Spain. Cape Blanco, in America, is the most westerly point of Oregon, south of the mouth of the Sixes River, thirty miles north of the mouth of the Rogue River. At the western extremity of the cape is a lighthouse 256 feet above the sea.

**CAPE BRETON** (brī'tūn), an island of British America, at the northeastern end of Nova Scotia, to which it belongs. It is separated from Nova Scotia by the narrow Gut of Canso, about one mile wide, and has an area of 3,120 square miles. The coast contains a large number of bays, the most important of which is Bras d'Or, which forms an inland lake about fifty miles long and twenty miles wide. It is of much value for interior navigation. A canal has been cut to connect the lake with Saint Peter's Bay on the south coast, making it important as a connection with the Atlantic Ocean. The surface is rugged, but agriculture is carried on in the valleys and on the coast plains. The minerals consist of iron and coal, while the

waters yield an abundance of fish. The principal exports are coal, timber, and fish. It belonged to France from 1632 to 1763, with the seat of government at Louisburg, then an important military post. Though taken by the British in 1745 it was not finally ceded by France until 1763. The most important business centers are Sydney and Port Hood. Several railroad lines connect the principal business centers with Nova Scotia and other portions of British America. For the purpose of local government it is divided into the four counties of Inverness, Victoria, Cape Breton, and Richmond. Population, 1906, 98,345.

**CAPE CATOCHE** (kā-tō'châ), the northeastern point of Yucatan, a state of Mexico. It was discovered by the Spaniards in 1517, and was the first landing place of the Spanish explorers on the American continent. This cape must be rounded in sailing from the Caribbean Sea to the Gulf of Campeche.

**CAPE CHARLES**, a cape of Virginia, the southern point of Northampton County, 25 miles northeast of Norfolk. It is at the northeast side of the entrance of Chesapeake Bay, and across the bay, almost directly south, is Cape Henry.

**CAPE CLEAR**, the southern extremity of Ireland, located about seven miles southwest of Baltimore. It is at the southern extremity of Cape Clear Island, which is about a mile wide and three miles long. The cape is a rocky promontory and rises 400 feet above the sea, and near it is a lighthouse 455 feet high.

**CAPE COD**, a peninsula extending from the southeastern part of Massachusetts into the Atlantic Ocean, forming Cape Cod Bay between its northern arm and the mainland. It was so named from the great abundance of codfish caught off the shores of the peninsula. It was first discovered May 15, 1602, by Bartholomew Gosnold, and was the landing point of the Mayflower on Nov. 9, 1620. The surface is largely barren, owing to its sandy soil, but it is populated and has railroad connection with several cities, including Chatham and Woods Hole. The peninsula comprises the whole of Barnstable County, of which Barnstable is the county seat. A canal extends across the narrow isthmus between Cape Cod Bay and Buzzard's Bay.

**CAPE COLONNA** (kō-lōn'nà), a rocky cape of Greece, extending into the Gulf of Aegina, at the southern extremity of Attica. It is so named from the white marble columns of a temple of Minerva, which are the remains of that famous structure anciently erected on the summit of the cape.

**CAPE COLONY**, or **Colony of the Cape of Good Hope**, a British colony in the southern extremity of Africa. It is situated between south latitudes  $25^{\circ}$  and  $34^{\circ} 50'$ , and east longitude  $16^{\circ} 25'$  and  $30^{\circ}$ . The northern boundary is formed by German Southwest Africa, Bechuanaland, Orange River Colony, and Natal. It is bounded on the southeast by the Indian Ocean and on the southwest by the Atlantic Ocean. The Orange River forms a large part of the northern boundary. Walfisch Bay, on the western coast of German Southwest Africa, is included with this colony. The area is 276,750 square miles.

**DESCRIPTION.** The surface is diversified by a range of mountains trending nearly parallel to the southern coast. Along the coast and through the mountain ranges are belts of fertile land, and in the south central part is the plateau of Great Karroo, which has an average width of sixty miles. The surface rises gradually toward the interior, such as the Snow Mountains culminating in ranges from 6,000 to 8,500 feet high. These ranges include several elevated peaks, of which Compass, elevation 8,500 feet, is the loftiest summit. In the western part trend several ranges, including the Karre Bergen and the Roggeveld mountains. The Kathlamba Mountains are in the northeastern part and extend into Natal, where they are known as the Drakenberg Mountains. In the northern part, along the Orange River, is a valley diversified more or less by fertile tracts and sandy and elevated regions. On the southern shore is Algoa Bay, the principal inlet. False Bay and Walkers Bay are near the southern extremity, and Saint Helena Bay is in the western part. It may be said that the coast as a whole is regular and characterized by few indentations.

The drainage may be divided into three sections, including the rivers that flow into the Indian Ocean, those that discharge into the Atlantic, and the Orange River and its tributaries. The drainage into the Indian Ocean is by numerous small rivers, none of which is navigable. They include the Breede, Couritz, Gamtoos, Great Fish, and Great Kei. Most of the drainage into the Atlantic is carried by the Olifants River. Among the tributaries of the Orange River are the Hartebeeste and the Ongaars. The plateau of Great Karroo has a number of dry basins in which water gathers at some seasons of the year, and there are no lakes aside from a number of lagoons in the upper course of the Hartebeeste River.

The climate is healthful, being temperate in the southern part and semitropical in the north-

ern section. Rainfall is insufficient to produce a large variety of vegetation in the higher regions, but in the moderately elevated sections it is abundant. Irrigation is used extensively for the improvement of lands for cultivation and pasturage, and by means of it large areas have been made productive. Snow covers the higher summits a large part of the year. At Cape Town the average temperature is  $65^{\circ}$ .

**FLORA AND FAUNA.** Marked differences in elevation and in the character of the soil account for vegetation being considerably diversified. The coast region has many varieties of useful wood, such as palms, ironwood, and many species of hard timber. The acacia, aloe, and many bulbous plants thrive in the more elevated regions, especially in the vicinity of the Great Karroo. Many species of wild animals were abundant before the territory was occupied by Europeans, including the giraffe, rhinoceros, lion, elephant, and hippopotamus, but all of these have practically disappeared. Those still found include the hyena, jackal, and many species of monkeys. Birds are numerous, and fish are abundant in the streams and off the coast.

**MINERALS.** Mining is an important industry. The diamond fields, situated in West Griqualand, are the most important in the world. The exportation of this product aggregates about \$20,000,000 per year, and the total value of the output from 1867 to 1908 is placed at \$525,000,000. Kimberley, between the Vaal and Modder rivers, is the center of the diamond fields. Copper is mined chiefly in Namaqualand, and coal is found abundantly, the principal mines being in the Stromberg Mountains. Other minerals include gold, lead, iron, and salt.

**INDUSTRIES.** Mining ranks as the chief industry, but much attention is given to mixed agriculture. A large part of the country is well adapted to grazing, hence the rearing of horses, sheep and cattle is carried on extensively. Many large ranches are used in sheep raising, some including 15,000 acres. Ostriches are grown for their feathers, the number of these animals being about 300,000. Considerable revenue is secured from the growing of goats, chiefly the Angora, and mules and swine. Cereals are cultivated in the regions having sufficient rainfall and where irrigation is possible, and they consist chiefly of wheat, rye, barley, maize, and oats. Tobacco, hay, and fruits are grown profitably.

Manufacturing is limited to the products used in home consumption. They embrace chiefly flour, leather, clothing, tobacco, butter, and spirituous liquors. Transportation is favored by an extensive coast line and by numerous rail-

ways in all the sections where settlements are well established. Cape Town, the southern terminus of the Cape-to-Cairo Railway, is important as a seaport and has transportation facilities by rail to Kimberley, Bloemfontein, Johannesburg; and other cities of the interior part of the British possessions in Southern Africa. A number of railways extend inland from the southeastern coast, including lines from East London and Port Elizabeth, the chief seaports on the Indian Ocean. Fewer lines have been constructed in the northwestern section, but connections are made with the interior from Port Nolloth, a seaport on the Atlantic, about 50 miles south of the mouth of the Orange River. Foreign trade is largely with Great Britain and Holland, and the exports exceed the imports. The export trade is chiefly in minerals, hides, wool, and ostrich feathers, and the imports are principally foodstuffs, textiles, hardware, and machinery.

**GOVERNMENT.** The Governor of Cape Colony is high commissioner for the British possessions in South Africa. He holds office under appointment by the crown and is assisted by a ministry, which consists of the prime minister and treasurer, colonial secretary, attorney general, secretary of agriculture, and commissioner of public works. Two houses make up the Parliament; these are known as the Legislative Council and the House of Assembly. Members in the former are elected for seven years and are presided over *ex officio* by the chief justice, and members in the latter are elected for five years. Both the English and Dutch languages are used in the government. The Supreme Court is presided over by a chief justice and eight associate judges. For the purpose of local government, the country is divided into districts and municipalities, and these are governed largely by officials elected by the people. No distinction is made on account of race or color in extending the right of suffrage, and the qualifications for voters is based chiefly on citizenship.

**INHABITANTS.** The inhabitants include a large number of natives and their descendants, among them the Kaffirs, Bechuanas, Malays, and Hottentots. Most of the Europeans are Dutch or the descendants of Dutch settlers, and these are known as *Afrikanders*. About one-fourth of the people are whites, nearly all of whom are Protestants. The communicants of the different protestant denominations number about 975,000, while the Roman Catholics include about 25,500, the Mohammedans about 15,500, and the Jews about 3,250. Support is given to schools by the government of the colony, but attendance is not

compulsory and the rate of illiteracy is quite large, even among Europeans. The superintendent general has charge of the department of public instruction, which has general supervision of educational affairs, and local inspection is provided by deputies and officials elected by the people. Several institutions of higher learning are maintained, at the head of which is the University of the Cape of Good Hope. Cape Town, the capital and largest city, is near the southern extremity, on Table Bay. Kimberley, the center of the diamond fields, is near the Orange River, and Port Elizabeth, the second seaport, is on Algoa Bay. Other cities of importance include East London, Grahamstown, Paarl, and Port Nolloth. Population, 1904, 2,409,804.

**HISTORY.** The region included in Cape Colony was first visited in the 15th century by Dias, a Portuguese navigator, who doubled the Cape of Good Hope. Vasco da Gama landed on its shores in 1497, and trade was developed to some extent the following century by English and Dutch merchants. The colony was first organized in 1652 by the Dutch East India Company and was controlled by that organization until 1795, when it was annexed by the British, but was restored to the Dutch in 1802. Owing to trade difficulties, contentions soon arose between the colony and the British. It was annexed to England in 1806 with the understanding that the inhabitants should preserve all the rights and privileges enjoyed by them prior to that time, and since then it has been under British control, though it was not recognized as British territory until the peace treaty of 1815.

The history of Cape Colony is intermingled with accounts of many wars with the Kaffirs and other tribes. Many Dutch burghers became dissatisfied with British rule about 1836, and emigrated to the region now included in Natal, Transvaal Colony, and Orange River Colony. Immigration has been quite steady since the discovery of diamonds at Hopetown in 1867, and much development has been made in the cultivation of its soil and the building of cities. The colony is in a prosperous condition, showing a healthful growth in commercial and social affairs. The colored population is increasing faster than the whites, owing to the extensive employment of this class of laborers and the peculiar adaptation of climatic conditions to the development of the races native to the country.

**CAPE COMORIN** (kōm'ō-rin), the most southern extremity of India, in the Travancore. Comorin Peak, the highest elevation, is about eighteen miles north, and within a short distance of the cape is the town of Cape Comorin,

made up largely of fishermen's houses and several ancient temples.

**CAPE DIAMOND**, the extremity of a promontory in Canada, at the junction of the Saint Charles and Saint Lawrence rivers. It rises about 300 feet above the river and on it stands the citadel of Quebec. West of it are the plains of Abraham, where Wolfe with a British force defeated the French under Montcalm in 1755.

**CAPE FAREWELL**, the southern extremity of Greenland, near the entrance to Christian Sound. The locality is dangerous for navigators on account of the strong currents which flow around Greenland into Davis Strait.

**CAPE FEAR**, a cape in North Carolina, at the southern extremity of Smith Island, near the mouth of the Cape Fear River. Currents and breakers make the surrounding waters dangerous to navigation.

**CAPE FEAR RIVER**, a river of North Carolina, formed by the Hawk and Deep rivers, which unite in Chatham County, near the central part of the State. It has a general course toward the southeast and discharges into the Atlantic Ocean, near Smith Island. The principal towns on its banks are Wilmington, Elizabethtown, and Fayetteville. It is about 250 miles long and is navigable to Fayetteville, about 120 miles.

**CAPE FINISTERRE** (fīn-īs-tār'), or **Land's End**, a cape in the northwestern part of Spain, in the government of Coruna. Near it were fought two naval battles between the English and the French, in 1747 and in 1805, in which the former were victorious.

**CAPE FLATTERY**, a cape in the State of Washington, the extreme western point of the United States. It is located on the Strait of Juan de Fuca, at its southern entrance. About half a mile distant, on Tatoosh Island, is a lighthouse 155 feet above sea level.

**CAPE GIRARDEAU** (jē-rār-dō'), a city of Missouri, in a county of the same name, fifty miles above Cairo, Ill., on the Saint Louis, Memphis and Southern and other railroads. It is located on the Mississippi River in a fertile farming country, and is the seat of a brisk trade in cotton, cereals, and merchandise. The manufactures include flour, machinery, and earthenware. It is the seat of a normal school, Saint Francis Hospital, Saint Vincent's College, and the Convent of the Sisters of Loretto. Population, 1900, 4,815; in 1910, 8,475.

**CAPE HAITIEN** (hē'tē-ĕn), or **Haytien**, a city of Haiti, on the northern coast. It has a safe and spacious harbor, and inland are a number of elevated mountain peaks. The

streets are well platted and improved, but the buildings are low. It has an important export trade in coffee, sugar, cacao, and logwood. An earthquake destroyed most of it and killed several thousand people in 1842. Population, 1908, 29,150.

**CAPE HATTERAS** (hăt'tēr-ās), a cape at the eastern extremity of North Carolina, projecting into the Atlantic Ocean from Hatteras Island, which is separated from the mainland by Pamlico Sound. Many shoals abound near it, and storms and gales acting with the Gulf Stream make navigation dangerous. A lighthouse 191 feet above the sea is maintained near the outer point.

**CAPE HENLOPEN** (hĕn-lō'pen), a cape at the south side of the entrance to Delaware Bay, on the east coast of Delaware. It is about twelve miles southwest of Cape May, the nearest point in New Jersey, across Delaware Bay. The lighthouse maintained here is 126 feet above the sea.

**CAPE HENRY**, a cape of the United States, on the eastern coast of Virginia, at the south entrance to Chesapeake Bay, across which is Cape Charles. It has a sandy beach and a life-saving station. The lighthouse is 157 feet above sea level.

**CAPE HORN**, the southern point of Horn Island, an island of the Archipelago of Tierra del Fuego, noted as the southern extremity of South America. The headlands consist of precipitous cliffs 600 feet high. It was discovered by Sir Francis Drake in 1578. The Dutch navigators Lemaire and Schouten first doubled it in 1616, and named it from Hoorn, their native town. Steamboats now sail through the Strait of Magellan, thus gaining considerable advantage over the old route around the cape.

**CAPE LISBURNE** (līs'bŭrn), a point of land extending into the Arctic Ocean from the northwestern coast of Alaska. Near it are important coal mines, which furnish a supply of fuel for whaling and explorations in the Arctic Ocean. A strong current flows past it from Bering Strait.

**CAPE LOOKOUT**, a cape of North Carolina, about eighty miles southwest of Cape Hatteras. It has a lighthouse 156 feet above the sea.

**CAPE MAY**, a watering place and health resort on the point of land known by the same name. It is located at the southern end of New Jersey, in Cape May County, near the entrance to Delaware Bay, 81 miles by railroad from Philadelphia. The transportation facilities are by the West Jersey and Seashore and the Atlantic City railroads. Tourists find recreation

in fishing in the beautiful lagoons toward the inland, and in bathing and driving. Extensive hotel accommodations and many summer villas are located on the beach. Cape May has a number of industries, such as fish and oyster canning and gold beating, but it is more important as a resort for health and pleasure. Population, 1905, 3,005.

**CAPE MENDOCINO** (mĕn-dō-sē'nō), the most western point of California, in Humboldt County. It is a high promontory, 428 feet above the sea, and has a first-class lighthouse.

**CAPE OF GOOD HOPE**, an important promontory near the southwestern extremity of Africa, next to Cape Agulhas, the most southern point of the continent. It is the end of the Table Mountain, which recedes inland and rises 3,585 feet above the level of the sea, while the promontory rises nearly 1,000 feet above the sea. Near it is a British naval station. It was discovered by Bartholomew Diaz in 1486 and named Cape of the Storms, but its name was changed to Cape of Good Hope by John II. of Portugal. This name was applied because it marks the change of direction in sailing from south to east on the voyage from Europe to India. The completion of the Suez Canal has greatly diminished its commercial importance.

**CAPE PALMAS** (pāl'màs), the southern extremity of Liberia, Africa. It is near the place where the colony of Negroes from the United States landed in 1834.

**CAPE NOME** (nōm), a cape of Alaska, near the city of Nome, extending into Norton Sound. It is noted for the rich deposits of gold in the sand near the sea coast.

**CAPE PRINCE OF WALES**, a cape of North America, the extreme western point of that continent and of Alaska. It is opposite East Cape in Siberia, and between the two points is the narrowest water which separates the two continents. Dangerous shoals are located north of it, but toward the south is a deep sea.

**CAPE RACE**, a cape at the southeastern extremity of Newfoundland, extending into the Atlantic Ocean. It has a revolving lighthouse 180 feet above the water.

**CAPERCALLY** (kā'pĕr-kāl-lŷ), or **Caper-cailzie**, a species of grouse native to Europe, and quite generally known as *cock of the wood*. It has brownish-black plumage, a small scarlet patch of naked skin near the eye, and weighs about ten pounds. Its food consists largely of berries and insects, and it frequents the boughs of tall trees. These birds are highly favored for their flesh and may be easily domesticated. They are native to both Asia and Europe, and

are found chiefly in the forests of regions not generally settled. Quite a large number inhabit the northern part of Scandinavia, Russia, and the timbered sections of Siberia.

**CAPERNAUM** (kā-pĕr'nā-ŭm), an ancient city of Palestine, in Galilee, on the northwestern coast of the Sea of Galilee. Jesus made his home at Capernaum after leaving Nazareth (Matt. iv., 13), and it was the scene of many of his miracles and discourses. It had a synagogue, a customhouse, and a Roman garrison. Capernaum was the home of Andrew, Matthew, and Peter, and it is related that Matthew was at the custom station when called to be an apostle.

**CAPE SABLE**, the name of two capes in North America, one in Nova Scotia and one in Florida. Cape Sable, in Nova Scotia, is on Cape Sable Island, in Shelburne County, and off its shore are important fisheries. Cape Sable, in Florida, is at the most southern point of the State and of the United States.

**CAPE SAINT VINCENT** (sānt vĭn'sent), a headland at the southwestern extremity of Portugal, in the province of Algarve. It is noted for the victory of the British navy under Sir John Jervis over a Spanish fleet on Feb. 14, 1797.

**CAPE SAN LUCAS** (sān lōō'kās), the most southern point of Lower California, in Mexico. It is a rocky promontory of volcanic origin, almost directly west of Mazatlan, Mexico.

**CAPE SAN ROQUE** (rō'kâ), a cape in the northeastern part of Brazil, in the state of Rio Grande do Norte, north of the city of Natal.

**CAPE-TO-CAIRO RAILWAY**, a trunk line projected in Africa to furnish a direct means of transportation from Alexandria to Cape Town. It is the first direct transcontinental railway projected to extend from north to south, and will furnish an admirable line by which to cross the equator. It was first proposed by Cecil Rhodes, who looked upon it as an avenue by which British commerce and dominion could be enlarged. The cost was originally estimated at \$60,000,000 and it was thought possible to complete it by 1906, but the capital required will be more than double that sum.

The accompanying map shows the waterways and railroads in Africa in 1905. From Alexandria to Khartum, a distance of 1,300 miles, the line was built by the Egyptian government and has been in operation several years. The southern extension from Cape Town to Bulawayo, about 1,600 miles, is entirely in British territory. From Bulawayo lines have been built to Salisbury and Broken Hill, and the latter of

these will be constructed along the east side of Lake Tanganyika, through German East Africa, Uganda, British East Africa, and thence along the Nile to Khartum. It is likely that for some years advantage will be taken of navigation on lakes Nyassa, Tanganyika, and Victoria Nyanza. A line already extends through British East Africa, from Mombasa to Lake Victoria Nyanza, which will be a feeder to the main railway. The length of the Cape-to-Cairo Railway is 6,600 miles. By looking over the

Cape of Good Hope. It is the southern terminus of the Cape-to-Cairo Railway. The town was first built of poorly constructed houses with flat roofs, whitewashed on the outside. Later a site was platted in which the streets intersect each other at right angles, and many modern edifices have been constructed. It is now an important seat of commerce and manufactures. The modern facilities include sewerage, waterworks, electric and gas lighting, electric street railways, and extensive tele-

CAPE-TO-CAIRO RAILWAY.

map it will be seen that railroad construction in Africa is limited to the territory settled more or less by Europeans, but this line will extend fully 2,000 miles through a region totally undeveloped.

**CAPE TOWN**, the capital and seat of government of Cape Colony, at the head of Table Bay, on the north side of the peninsula formed by Table Mountain, thirty miles north of the

phone and telegraph connections. The Parliament building, the seat of justice, the public museum, the gallery of fine arts, and the public library are among the most important structures.

Cape Town has a fine school system, a number of high school buildings, and several colleges and institutions of higher learning. The university, founded in 1873, has an attendance of 700 students. It is beautified by a number

of parks, paved streets, and boulevards. The trade from the interior and its foreign commerce are alike extensive. What the city lost by the construction of the Suez Canal has been more than regained by the discovery of large deposits of gold and diamonds in the interior and the building of railroad lines. Among the industries are extensive machine shops, flouring mills, tanneries, woolen mills, and factories producing implements, hardware, and machinery. Cape Town was founded by the Dutch in 1652 and has been a possession of England since 1806. Population, 1904, 91,973.

**CAPE VERDE** (vērd), the most westerly cape on the west coast of Africa, between the Gambia and the Senegal rivers. The Portuguese discovered it in 1445, and it was so named from a grove of baobab trees, which gave the locality the appearance of a white coast.

**CAPE VERDE ISLANDS**, a group of fourteen islands belonging to Portugal, located about 320 miles west of Cape Verde, Western Africa. The islands have an area of 1,480 square miles. They are of volcanic origin and have at least one active volcano, located on the island of Fogo. The interior is elevated, while the coast is level and exceedingly fertile. The inhabitants consist largely of descendants from the Portuguese, whose language is official and is taught in the public schools. Among the leading products are indigo, tobacco, sugar, cotton, coffee, millet, chemicals, and tropical fruits. Rainfall is greatest from August to November, but droughts are not uncommon during the growing season. Among the domestic animals are goats, poultry, asses, and cattle. Roman Catholic is the state religion. The larger share of the trade is with Portugal. The governor is appointed by the King of Portugal and resides at Praya, the capital of the islands, which is located on Santiago, the largest of the group. Porto Grande, on São Vincente, is an important coaling station. The Cape Verde Islands were discovered by the Portuguese in 1450, and have since been under their control. Population, 1905, 147,665.

**CAPE WRATH**, a promontory at the northwestern extremity of Scotland, in Sutherlandshire. It consists of rocky cliffs, mostly of gneiss, which tower more than 500 feet above the sea. A lighthouse stands on the highest point and may be seen at a distance of twenty-five miles.

**CAPILLARIES** (kăp'îl-lâ-rÿz), the vessels of hairlike minuteness that form the connections between the extremities of the arteries and the beginning of the veins. The arteries form channels for the blood to pass from the

heart and become smaller continuously until they merge into the capillaries, tubes from  $\frac{1}{500}$  to  $\frac{1}{1,000}$  of an inch in diameter. The flow in these small vessels is about  $\frac{1}{80}$  of an inch per second in the systematic and  $\frac{1}{5}$  of an inch in the pulmonic circulation. The flow is constant, equable, and regular. They fit closely to the veins, which unite into larger and larger channels, as streamlets do to constitute a river, and carry the blood back to the heart. In the capillaries of the lungs, the blood receives oxygen and gives up carbonic acid. The capillary action can be easily seen in the foot of a frog by the use of the microscope.

**CAPILLARITY** (kăp-îl-lăr'î-tÿ), the branch of physics which treats of the properties of liquid surfaces. The tendency of the surfaces of all liquids is to contract, which is seen in the spherical form of falling drops and in the effort required to blow a soap bubble. When a tube of fine bore is lowered into a liquid, the fluid surrounding the walls of the tube rises above the level of the liquid. This is more noticeable in small than in large tubes, and can be observed very easily by placing small tubes or straws into water slightly colored with ink. The difference in the surface results from the difference between the cohesion of the liquid molecules for one another and their adhesion to the walls of the capillary tube. The outer surfaces of a liquid which wets a capillary tube rise, because the adhesion between the liquid and the tube draws or attracts it toward the walls of the tube. A liquid which does not wet the capillary tube is depressed at the outer surfaces, because the cohesion of the liquid draws it away from the walls of the tube. Water and mercury may be used in making experiments of this kind, since water wets the walls of a tube, hence the outside parts rise and the surface of the liquid is concave; and mercury does not wet the tube, hence the effect is reversed and the surface of the mercury is convex. Oil rises in the wick of a lamp through the capillarity of the spaces between the strands. In the same way plants absorb moisture from the air and the soil by their foliage and roots, and the sap rises in them through the capillarity of their tissues.

**CAPITAL** (kăp'î-tal), in economics, the portion of wealth which is employed for the further production of wealth. It is sometimes defined as that portion of stock which the owner expects to convert into revenue. Writers usually divide capital into two classes, known as *fixed* and *circulating* capital. Fixed capital is a kind that is used only once in the fulfillment of its purpose, such as machinery. In this form it represents a certain amount of

money invested, which will not be used a second time, since the machinery is supposed to be employed in the prosecution of a trade or business until it is worn out and must be replaced by new machinery. On the other hand, circulating capital consists of those forms of wealth which require renewing after having served a certain time for a specified purpose, such as a loan made for a definite time or an investment in land.

The nature of modern business enterprises differs very materially from those of society in the primitive state. Then it was thought that each individual should pursue a business and furnish practically all the capital, hence a laborer was skilled to the extent that he could complete almost the entire product without relying upon any one else. With the invention of modern machinery, capital has become invested very largely in fixed forms, and now the laborer is skilled more particularly to do certain parts of the work necessary to complete a commercial product. This *division of labor*, as it is called, has greatly revolutionized modern commerce by making labor more intelligent and skillful. However, it was long thought that every new machine invented would throw a certain per cent. of laborers out of employment, and thus deprive them of their means of support. This is shown in the invention of the harvester, which, with the aid of one man and two horses, does the work which formerly required four or five men. The invention of machinery to manufacture cotton is another illustration, and the inventors of these machines were treated violently by the laborers who considered them and their inventions highly detrimental. However, these and other inventions that might be mentioned, instead of having a harmful effect, have caused more laborers to be employed and at the same time have greatly improved the character of the product.

The *management* of capital may be rightly considered a theme of much importance. Modern business methods have greatly concentrated the management of large interests in the hands of a few, and the tendency has been for the larger institutions to absorb or displace the smaller ones. This may be seen clearly in the management of railroad business, both in Canada and the United States, where the smaller lines have been largely absorbed by the companies having control of trunk and transcontinental railways. The former management of smaller railways has given way to the management of systems, such, for instance, as the great systems of the New York Central lines, the Pennsylvania lines, and the lines of the

Canadian Pacific. In England many of the public utilities have come under the ownership of municipalities and of the government, and in America the tendency is manifestly toward municipal ownership of large properties, such as lighting plants and rapid transit systems, which are now operated generally by the capital of private individuals or corporations. It is quite apparent that the laboring class of people feel favorable to public ownership, at least to a very large extent, and that they look upon the private ownership of large utilities as a centralization of power in the hands of corporations that control them to the detriment of the industrial classes. See **Money**.

**CAPITAL PUNISHMENT**, in criminal jurisprudence, the infliction of the penalty of death upon conviction of a high crime. In early history it was the mode of punishment for felonies of all kinds, and all primitive people regarded it as the best remedy to induce observance of the law and for the prevention of crimes. A wider study of the causes of crime, including heredity and environment, has led to the conclusion that this mode of punishment is not the best means to overcome criminal conduct, although it is held by all governments that the severity of the punishment of crime should be based upon the nature of the crime committed. The Grecian scholars, Plato and Protagoras, favored the retention of capital punishment on the ground that it tends to deter men from committing the crime of murder, while others maintained positions diametrically opposed to this view.

Capital punishment was inflicted in early history for desecration of the Sabbath, cursing, idolatry, witchcraft, incest, and disobedience to parents, as well as murder. The Anglo-Saxons made such trivial offenses as robbing a rabbit warren, cutting down a tree or arbor, and offenses against the revenue acts capital crimes, but the theory of law was more severe than the practice. This is seen by the fact that the early laws contained 200 offenses punishable by inflicting this severe penalty, while it was inflicted upon persons guilty of committing only 25 of them. Sir James Mackintosh and others, about 1820, secured a repeal of the early English laws and confined the punishment by death to its present limits.

In Europe capital punishment is prescribed generally for persons guilty of murder, but it is rarely inflicted. The death penalty was abolished in Holland in 1870 and in Rumania and Portugal in 1864, while other countries have followed in the same course toward modifying the penalty for capital crimes. Many coun-

tries have laws whereby the form of punishment can be *commuted* to some other form; as, for instance, in Sweden only three persons were executed out of thirty-two sentenced to death in recent years. For the same length of time 484 persons were sentenced to death in Germany, but only one was executed; ninety-four in Denmark, only one executed; and 248 in Bavaria, only seven executed. This is the proportion usually maintained in the civilized countries.

In the United States, capital punishment is inflicted only in cases of murder, but in a few of the states it is extended to rape. In some of the states life imprisonment is the severest form of punishment, while in others this form may be substituted by the Governor in place of capital punishment. The form of execution is hanging in most countries, but in others beheading is the usual mode. The newer method adopted in New York, Ohio, and several of the states is that of electrocution. In the armies of the world capital punishment is usually inflicted by shooting or hanging for conviction as a spy or an aggravated form of desertion. Many societies have been organized and are now flourishing that have for their object the abolition of capital punishment, claiming that this form often induces crime, while life imprisonment and other severe forms akin to it are much more fruitful in securing obedience to law and regard for the life and property of others.

**CAPITALS**, the upper-case letters used in printing and writing. Each language has its peculiarities in the use of capital letters, and in some there is a difference of opinion upon the rules that should govern, hence individual scholars differ in their views as to where to employ them. In English the general rule is to begin all proper names, the first word of every sentence, the first word of each line of poetry, adjectives derived from proper names, and the names of deities with capital letters. The days of the week and of the month, the titles of books, the names of institutions, and the personal pronouns relating to God are capitalized. When an adjective directly precedes the name of a place it is usually capitalized, as Central Europe. Specific events, such as the French Revolution, are capitalized. However, there are differences of opinion for capitalization in English, hence the rules published are numerous and differ very materially. Every noun begins with a capital letter in the German, which was formerly the style used by English writers, and this system has many advantages over those now in vogue in many countries. Such a sys-

tem simplifies and leaves no question as to propriety in capitalization, the test being in determining the part of speech.

**CAPITOL** (kăp'ĭ-tŏl), the name applied to the main government building in which the legislative body of a State or Nation holds its sessions and the public business is transacted, located at the capital city. The name is from the Roman citadel known as the Capitol, which stood on Capitoline Hill, one of the seven hills of Rome. It was planned by Tarquinius and destroyed during the civil wars in the time of Sulla, but was rebuilt by the Senate on a larger plan. It contained an equestrian statue of Marcus Aurelius, the "Capitoline Venus," and "The Dying Gladiator."

In the United States, each State has a capitol building, of which the finest are at Albany, N. Y., and Austin, Tex. The corner stone for the national capitol was laid Sept. 18, 1793, at Washington, D. C., by George Washington. In 1800 the north wing was completed, and in 1808 the south wing, and both were greatly damaged by the British in 1814. In 1818 part of the foundation for the main building was laid, and the whole was completed in 1827. President Fillmore laid the corner stone for the south extension July 4, 1851. It was completed in 1857. The length of the entire building is 751 feet; breadth, 324 feet. It covers three and a half acres. The diameter of the dome is 136 feet and the height is 308 feet. The cost of the entire building was \$15,000,000.

**CAPITOLINE HILL** (kăp'ĭ-tŏ-lĭn), the name often applied to the Tarpeian Hill, one of the seven hills of ancient Rome. On it a temple or capitol was built to Jupiter. The first foundations were laid by Tarquinius Priscus about 600 B. C., but it was not completed until after the republic was established. In 83 B. C. it was destroyed by fire and was rebuilt by Sulla, but was again destroyed in the civil wars. Vespasian rebuilt it in 69 A. D., but it was again destroyed in the reign of Titus, and was rebuilt with great magnificence by Domitian in 80 A. D. Emperor Augustus donated 2,000 pounds of gold to decorate its roof, and the Roman consuls bestowed great fortunes on it. The interior was decorated with shields of solid silver and the thresholds were of brass. On the same hill were other buildings and a library. All parts of Capitoline Hill were decorated with statuary, and in the interior of the capitol were beautiful productions of sculpture and painting. In 387 B. C. the Capitoline games were introduced to commemorate the deliverance from the Gauls, and after a lapse of interest they were revived by Domitian in 86 A. D. The

modern structure is known as the Campidoglio, and was erected on the site of the capitol by Michael Angelo soon after 1536. It contains the palace of senators. In the hall of the illustrious men are busts of ninety-five famous Greeks and Romans, and in the hall of the emperors are sculptures of eighty-three emperors and empresses, while other interesting busts, statues, and pictures constitute a most wonderful collection of value and beauty.

**CAPPADOCIA** (kăp-pă-dō'shê-à), an ancient province of Asia Minor, most of which is now included in the Turkish province of Karaman. It was conquered by Cyrus and belonged to Persia. After the time of Alexander the Great, it became an independent kingdom and was ruled as such until 17 A. D., when Tiberius made it a province of Rome. Much is said of this section of Asia Minor in Christian literature, and it is recorded in the first epistle of Saint Peter that the Cappadocians were converted to Christianity.

**CAPRI** (kă'prê), a famous and beautiful island in the Mediterranean, near the entrance to the Bay of Naples. It is two miles wide and five miles long, rising to an elevation of 1,900 feet above the sea. The island is remarkable for its richness in fertile soil, beauty of scenery, historic interest, and ancient ruins. The last seven years of Emperor Tiberius were spent on this island amid riotous and voluptuous living. The present inhabitants engage in fruiting, trading, and the culture of vineyards and orchards. In the west end is the town of Anacapri and in the eastern part is Capri. A flight of 535 steps has been cut in the rocks to reach the former. Capri, the capital, has a population of 4,220 and the island, 6,252.

**CAPRICORN** (kăp'rî-kôrn), the tenth sign of the zodiac (q. v.), and the name of a southern constellation. The latter was represented on ancient monuments by the figure of a goat, or as having the fore part of a goat and the hind part of a fish. The ancients celebrated it as the harbinger of success. The two largest stars are of the third magnitude, hence it does not rank as a constellation of much brilliancy. The Tropic of Capricorn is the southern boundary of the Torrid Zone, at which the rays of the sun are vertical once a year, at noon, usually the 21st day of December.

**CAPSICUM** (kăp'sî-kûm), a genus of plants native to tropical America, from which four varieties of cayenne pepper are obtained. These plants belong to the nightshade family and are not related to those that yield the real pepper. About ninety species of capsicum have been studied. The leaves are simple and the fruit

is a berry with many seeds. The berry in all the species has an inflated appearance, the form being conical, round, or heart-shaped, and the seeds are flattened. A number are cultivated for the extremely pungent and stimulating fruit, which is used in medicine, in making sauces, and in preparing mixed pickles. Cayenne pepper is made from the fruit of several species, chiefly when the berries are ripe, when they have a scarlet or orange color. This product is made principally from *capsicum annuum*, known as chilli pepper, and is cultivated in the tropical and temperate climates of all the continents.

**CAPSTAN** (kăp'stăn), a strong, massive apparatus of wood shaped like a truncated cone, with holes for the reception of bars in the upper part, by means of which it may be revolved, and thus serve to raise or move a heavy weight by winding a rope around it. It is used for moving houses and on shipboard for weighing anchors. The smaller capstans are turned by hand, usually by two or three men, who work upon a lever which is inserted in holes at the tip or crown. Larger capstans are operated by horse, steam, or electric power.

**CAPSULE** (kăp'sûl), in botany, a seed vessel consisting of one or more cells, in which the seeds are stored, such as poppy heads. Some capsules break open and discharge their contents, while others fall off entire with the seed. The term is applied in medicine to a small hollow case of gelatin. It is used to inclose medicine so as to permit its being swallowed without coming in contact with the organ of taste. The gelatinous envelope melts when in the stomach, thus setting the medicine free to act.

**CAPTAIN** (kăp'tîn), in military, an officer in command of a company of infantry, a battery of artillery, or a troop of cavalry. In the United States navy a captain ranks next to a commodore, and his position corresponds to that of a colonel in the army. The term captain general is applied to the commander of the military forces of a province. In this sense the President of the United States is the captain general of all the military forces of the nation when in active service. In each State the supreme command of the State troops in times of peace is vested in the Governor, who is captain general of the military forces of the State.

**CAPUA** (kăp'û-à), a fortified city of Italy, twenty miles north of Naples, on the Volturno River. It has a cathedral and is the residence of an archbishop. Ancient Capua was about three miles southeast of the modern town, and was long as important as Rome and Carthage. The Romans considered it a favorite

place of resort on account of its agreeable climate and beautiful location. It is rich in ancient ruins, among which are those of an amphitheater with a capacity for seating 60,000 people. It was founded by the Etruscans in the year 800 B. C. who named it Vulturnum. Geneseric with a force of Vandals captured it in 456 A. D., and the Saracens finally destroyed it in 840. Capua became celebrated in literature as the scene of the play of "Romeo and Juliet." The modern town has a public library, a fine cathedral, and manufactures of earthenware and clothing. Population, 1906, 14,328.

**CAPUCHINS** (kăp-û-shēnz'), a religious congregation of the Franciscan order of monks, instituted by Matteo di Bassi in 1525. He desired to practice greater poverty than was required by the strict rule of the order of Saint Francis, and his congregation was validated by Clement VII. in 1526. The Capuchins were permitted to wear the habit and a beard, and their custom was to live in solitary places and as hermits. Their rules are very strict, requiring them to recite the canonical hours without singing, to spend an hour every morning in mental prayer and in silence, and to partake of the simplest kind of food. In climates and seasons of the year that permit the practice, they are enjoined to go barefooted. This class of monks is now most numerous in Austria, but they are represented in Canada and the United States. In the latter country they have provinces at Pittsburg, Pa., Leavenworth, Kan., Detroit, Mich., and at a number of other places. Bernardino Ochino, converted to Protestantism in 1542, and Theobald Mathew, the celebrated Irish advocate of total abstinence, are among the best known Capuchins.

**CAPYBARA** (kă-pē-bă'rá), a rodent animal of South America, allied to the guinea pig. It has the appearance of a hippopotamus on a

CAPYBARA.

small scale, but attains a length of only three feet. The legs are short, the head is large, and the hair is coarse and brown. It is tailless. It

feeds mainly on vegetation and lives near streams. The flesh is taken for food by the natives, who eat it either fresh or salted. This animal is well distributed throughout the warmer parts of the continent, but is most abundant in Brazil and the Guianas.

**CARACAL** (kăr'â-kăl), a kind of lynx found in Africa and the warmer portions of Asia. It is strong and fierce, about the size of a fox, and is deep brown in color.

**CARACAS** (kă-ră'kās), the metropolis and capital of Venezuela, located in a beautiful valley six miles from the Caribbean Sea. The site of the city is on the slope of Mount Avila, which attains a height of 8,640 feet, and the city is 3,020 feet above the tide level. It is connected by a railroad with its seaport, La Guayra, about eight miles distant. The plat of the city is regular, having streets at right angles, and many of its buildings are modern. Its altitude brings it within an equable temperature and healthful air. It is the seat of a school system for free attendance, and articulated with its courses are a number of professional colleges, technical schools, and the University of Caracas. The capitol building is a large and beautiful structure, and besides it there are federal buildings, the president's residence, several cathedrals, and the Basilica of Saint Ann. It is lighted by gas and electricity and has telephone and telegraph connection. Many of the streets are paved with stone and asphalt. Several public parks, gardens and promenades are maintained. The gardens and parks contain many rare and beautiful plants, and fine collections of wild animals. It has a growing import and export trade, the latter consisting chiefly of coffee, cacao, and tobacco. Caracas was founded in 1567. Population, 1906, 73,520.

**CARAT** (kăr'ăt), a weight equal to the twenty-fourth part of an ounce, or three and one-fifth grains Troy. Jewelers use the term to express the fineness of gold; the whole mass is represented by twenty-four parts, the number of parts taken expressing so many twenty-fourths. Pure gold is twenty-four carats; eighteen carats three-fourths gold; twelve carats, one-half gold, etc. Fine gold consists of two parts alloy and twenty-two of pure gold. The gold coinage of the United States is in these proportions. The double eagle weighs 516 grains, of which 464.4 grains are fine gold.

**CARAVEL**, or **Caravella**, a small vessel used in Southern Europe, fitted to carry from 25 to 150 tons. In Turkey the name is given to a ship of war, but in Portugal and Spain it has reference to a vessel with one or two sails, the

larger of which is on the foremast. Caravels were used extensively in 15th and 16th centuries, when they usually had a capacity for a burden of 300 tons. They were fitted with four masts, one of which was square-rigged and the others were lateen-rigged. Columbus sailed with three of these vessels in 1492, the Santa Maria, the Niña, and the Pinta, of which the first mentioned was the flagship.

**CARAVAN** (kär'ä-vän), the name applied to a company of travelers, merchants, or pilgrims passing through parts of Africa and Asia for purposes of safety and convenience. The Mohammedans form caravans annually to worship at Mecca; the most important caravans are assembled or organized at Cairo and Damascus. These often number from 30,000 to 50,000 pilgrims and move from fifteen to twenty-five miles a day. Much of the business of Northern Africa and Western Asia is carried on by caravans. The camel is used as a means of conveyance, owing to its strength and exceptional power of endurance in desert regions. Often 500 camels are used in a single caravan, the body moving in single file.

**CARAWAY** (kär'ä-wä), a plant native to Southern Europe and Western Asia, and culti-

CARAWAY.

vated extensively in all continents for its aromatic seed. It has a fleshy root, which resembles that of the parsnip, finely divided leaves, and umbels of whitish flowers. The stem is

from one to two feet high. The seeds are valued for their pleasant, aromatic flavor, and are used extensively by confectioners and bakers, and as a medicine to stimulate the digestive organs. The aromatic properties are derived from its volatile oil, known as *oil of caraway*, which is obtained by distilling. Caraway is grown in gardens for its seed in all the continents.

**CARBAZOTIC ACID** (kär-bä-zöt'ic), a substance of great value in dyeing wool and silks. It is obtained by combining carbolic acid with nitric or sulphuric acid.

**CARBOLIC ACID** (kär-böl'ik), an acid obtained by the distillation of coal tar. *Carbol*, *phenol*, and *phenic acid* are other names by which it is known. It resembles creosote, which is similarly obtained from wood, in that it possesses a pungent taste, strong odor, and other properties similar to it. Being an effective poison to low forms of animal life, it is valued as a disinfectant and to preserve meat, and is used as medicine internally and externally. As an external remedy it destroys germs admitted to wounds. To be effective as a germicide, it must be brought into contact with the germ to be destroyed. However, when applied to wounds, it forms a crust or coating sufficiently strong to destroy the germs that may come in contact when atmospheric air is admitted.

**CARBON** (kär'bön), an elementary non-metallic substance which is present in all organic compounds. It exists uncombined in three forms, as graphite, charcoal, and diamond. The diamond and graphite forms are crystalline and charcoal is amorphous. The diamond form is colorless or yellow, pink, blue, or green, and is transparent. It is the hardest substance known and the purest form of carbon. In the charcoal form it is mixed more or less with anthracite or bituminous coal and other substances. The pure charcoal is light, brittle, inodorous, and black in color. The graphite is gray-black with a metallic luster. It often separates in scales from molten iron, and is used for lead pencils and as carbons in electric lighting. Carbon consists more plentifully in compound form than all the other elements combined. It forms a number of compounds with hydrogen, called hydro-carbons, in which forms many properties, both chemical and physical, are possessed. It forms only two compounds with oxygen, although the two elements can be united without difficulty. Carbon is found as a regular constituent of both plants and animals.

**CARBONATES** (kär'bön-äts), the compounds in which carbonic acid is the base, such as carbonate of lime and some forms of lead

ore. The former, in its purest natural form, is the mineral calcareous spar. Carbonate of chalk is the principal ingredient in the marbles and limestone. Other carbonates are those of soda, potassa, and ammonia. They comprise a class of salts that are used extensively in the arts and in medicine, and are very numerous, although carbonic acid itself is feeble and can be expelled easily from nearly all the carbonates by red heat.

**CARBONDALE** (kâr'bôn-dâl), a city of Lackawanna County, Pennsylvania, on the Lackawanna River, sixteen miles northeast of Scranton. It possesses large iron foundries, flouring mills, and other manufactories. The coal mines near it yield about 900,000 tons annually. There are excellent railroad facilities, electric street railways, electric lights, paved streets, good schools, and other public institutions. Population, 1900 13,536.

**CARBONIC ACID** (kâr-bôn'ik), or **Carbon Dioxide**, a substance occurring free as a gas in the atmosphere, forming about  $\frac{1}{2500}$  of the air. It is made up of twelve parts by weight of carbon and thirty-two of oxygen. Carbonic acid is twenty-two times as heavy as hydrogen, has no distinct smell or color, and has the property of turning blue litmus slightly red. It acts as a narcotic poison when present in the air to the extent of four or five per cent., and is incapable of supporting combustion or animal life. It is brought into the air by the breathing of animals, the burning of fuel, the decomposition of animal and vegetable substances, and the fermentation of liquors, and evolves from fissures of the earth. In coal mines it constitutes *choke damp*.

As carbonic acid is a dense gas, heavier than air, it has a tendency to sink into vaults, wells, and low places, often rendering valleys and caves uninhabitable. It is pleasant to the taste and forms a small per cent. of aërated beverages, such as carbonated mineral waters, champagne, and beer. Though poisonous to the lungs, it is agreeable and pleasant when taken into the stomach. It is found in large quantities in all marbles and limestones, is evolved from the colored parts of the flowers of plants both during the day and night, and from the green of plants during the night. Plants absorb it from the atmosphere during the day, and it forms an important part in their nourishment. It constitutes the largest ingredient in the food of vegetables.

The carbonic acid evolved from the fissures of the Upas valley in Java is very dense and rises to a height of about eighteen feet above the surface. The valley is nearly a mile in

circumference and entirely devoid of animal or plant life. Birds attempting to fly across it drop dead, while a dog is killed by its influence in about fifteen seconds. Carbonic acid, when present in large quantities, extinguishes a lighted lamp or burning of any kind. The condition of the air in mines is tested by lowering a lighted lamp. Carelessness in entering mines without testing the air has caused the loss of many lives, as carbonic gas, if breathed freely, causes death by asphyxia. The presence of large quantities in poorly ventilated rooms, given off by the breathing of many persons, is the source of headache and depression, and causes the loss of health if long continued. Its presence in the air may be recognized by exposing a vessel containing lime water, as it causes a white film of carbonate of chalk or lime to form on the surface of the liquid, if present in large quantities.

**CARBONIC OXIDE** (öks'id), a colorless gas containing one equivalent less of oxygen than carbonic acid, being a combination of about forty-three per cent. of carbon and fifty-seven per cent. of oxygen. It is generated in close furnaces as a product of imperfect combustion, mixed with carbonic acid and other gases. It is without smell and taste, burns with a blue flame, and is more poisonous than carbonic acid. When breathed as it issues from furnaces in factories, it sometimes causes asphyxia to the workmen.

**CARBONIFEROUS AGE** (kâr-bôn-îf'ēr-üs), the period of time preceded by the Devonian age, and classed in the latter part of the Palaeozoic era. It is so named from the mineral coal and other carbonaceous matter found in the deposits, which include many fossils of plants and animals. Among the remains and traces of plants are chiefly ferns, rushes, conifers, and lepidodendrons. These plants differed greatly from those of the present time, and all of the species seem to have been very large. The mosses grew thickly matted and the ferns resembled trees with stems twenty feet in height. Among the animal life were the corals and crinoids, the gastropods, the cephalopods, crustaceans, scorpions, dragon flies, spiders, fishes, and numerous large reptiles. It is reasonably certain that more than 2,000 species of plants and almost that number of animals existed.

The carboniferous system lies between the Devonian and Permian systems of the Palaeozoic period. It is estimated that this system includes about 400,000 square miles of productive coal fields, but the area is undoubtedly much larger. These coal measures are widely

distributed in all the continents, but the larger portion of commercial coal deposits are made up of bituminous and lignite coal, with fields of anthracite in the United States, Canada, and other regions, though the area of these fields is not extensive. Associated with the coal seams are deposits of fire clay, iron ores, limestone, potter's clay, and stone valuable in building. In some localities salt is obtained from the lower strata. See **Geology**.

**CARBORUNDUM** (kär-bō-rūn'dūm), a manufactured material made by combining carbon and silicon, two of the hardest known elements. In making this product, coke is crushed and ground to a fine powder and mixed in proper proportions with common glass sand. Salt and sawdust of determined quantities are added to this mixture for mechanical purposes. The mixture of coke, sand, sawdust, and salt is then placed in an electric furnace, and for thirty-six continuous hours an electric current of 1,000 horse power of energy is passed through the furnace, subjecting the mixture to a heat of approximately 7,000° Fahr. When the furnace is cool, the mixture is found converted into large masses of beautiful colored crystals of exceedingly brilliant luster. After the carborundum crystals have been removed from the furnace, they are crushed to separate the mass of crystals apart, then thoroughly washed, dried, and screened to separate the different sizes.

Carborundum is the hardest artificially made product, and in degree of hardness is exceeded only by the diamond. It is used extensively as an abrasive. For dentistry alone there are 205 separate and distinct devices in the form of wheels, points, and others that employ carborundum. This material enters into minute forms scarcely large enough to be picked up by the finger, and on the other hand the same material is used in wheels weighing 1,000 pounds. The largest factory for manufacturing this product in America is at Niagara Falls, where it is prepared for use in instruments and machinery, and for lining furnaces as a protection against great heat.

**CARBUNCLE** (kär'būn-k'l), a painful inflammation of the connective tissue beneath the skin, most frequently on the back. It resembles a boil, but is much larger and more painful, and its origin seems to be constitutional. In the beginning it is characterized by swelling and a severe burning pain, frequently accompanied by chills and fever, and in its later stages small blisters open and discharge a thin pus. Both surgical and medical treatment is sometimes required. The name *carbuncle* is

applied to a variety of garnet obtained in Southern Asia and many sections of North America. It has a deep red color and is used in jewelry.

**CARDENAS** (kär'dā-nās), a seaport on the northern coast of Cuba, in the province of Matanzas, 103 miles east of Havana. It is one of the principal seaports of the island, has good railroad connections, and exports large quantities of fruits, tobacco, coffee, molasses, and sugar. Since the Spanish War of 1898 it has grown steadily in commercial importance. The manufactures include cigars, sugar, clothing, and utensils. It has several schools and convents, electric lights, and a system of waterworks. In 1898 it was the scene of an engagement between the United States blockading vessels and the Spanish batteries, in which Worth Bagley was killed, the first American to lose his life. Population, 1899, 21,940.

**CARDIFF** (kär'dīf), a village of Onondaga County, New York, eleven miles north of Syracuse. It is situated in the center of a fine country. The village is notable for the pretended discovery of the Cardiff Giant, a statue carved from Iowa gypsum, made in Chicago, and buried at Cardiff. It was exhibited as a petrified giant at various times.

**CARDIFF**, an important seaport of Glamorgan County, Wales, at the mouth of the Taff River, on the estuary of the Severn. It has extensive docks and large exports of minerals; mostly iron and coal. The manufactures include machinery, clothing, implements, steamboats, and ironware. It formerly contained a castle of great strength, in which Henry I. imprisoned Duke Robert for twenty-six years. The city has modern facilities, a number of colleges and higher schools, many costly churches, and several libraries and public parks. Rapid transit connections are maintained with several suburban districts. Cromwell captured Cardiff in 1648, after a bombardment that lasted three days. Its modern growth dates from 1839, when the first great dock was opened. Population, 1907, 187,620.

**CARDINAL** (kär'dī-nal), the highest dignitary in the Roman Catholic Church under the Pope. The cardinals are classified in three divisions, which include the orders of cardinal bishops, cardinal priests, and cardinal deacons, the total numbering seventy, in allusion to the seventy disciples sent out by Christ. They are chosen by the Pope, the cardinal bishops numbering six; cardinal priests, fifty; and cardinal deacons, fourteen, who constitute the sacred college in which the election of the Pope is vested. The Roman pontiffs, before the reign

of Nicholas II., were elected by the whole clergy of the city of Rome and by the prominent laity, and at one time even by the body of citizens. However, Nicholas II. transferred the election of the pontiffs to the cardinals, with the assent of the other parties, and Alexander III. in 1179 limited the election to the cardinals, a two-thirds vote being necessary to constitute the election. This method still prevails in the election of pontiffs. Among the list of privileges enjoyed by the cardinals is the precedence over bishops, archbishops, primates, and patriarchs. They have exclusive right to the titles "Eminence" and "The Most Eminent," and rank with royal princes.

**CARDINAL FLOWER**, the name of several species of the *lobelias*, native to the swampy places in temperate climates, and cultivated extensively as garden flowers. The stem is tall and simple and has alternate leaves, and the flowers are of a variety of colors, ranging from white to deep red. They are cultivated as ornamental plants in many flower gardens of Canada and the United States.

**CARDINAL VIRTUES**, the moral virtues which are regarded as the basis of all right action, so named from *Cardo*, a hinge, denoting the fundamental point on which all things turn. These virtues are four in number, embracing justice, prudence, temperance, and fortitude. Socrates and other ancient writers divided the virtues in this way, but modern ethics looks upon personal acts as virtues only so far as they respect and are respected by social relations.

**CARDS**, a kind of cards printed on pasteboard, having pictures and symbols, and used in playing a number of games. The *deck* or *pack*, as a set is called, consists of fifty-two cards, of four classes or suites, known as *clubs*, *diamonds*, *hearts*, and *spades*. The suites are distinguished by colors, the clubs and spades being black and the diamonds and hearts red, and the individual cards are known by the spots and faces. Thirteen cards make up each of the four suites, each of which includes spot cards from one to ten and three face cards, known as *king*, *queen*, and *jack* or *knave*. Among the games played are *cassino*, *cribbage*, *draw poker*, *euchre*, *solitaire*, *whist*, etc. Though used more extensively in playing games of chance than any other cards, they are proscribed by many Christian and other societies, chiefly because the games in which they are used either take up much time or are popular among those who play for money or other valuable considerations.

**CARIB** (kär'ib), a tribe of Indians who for-

merly inhabited the northern coast of South America, from the Orinoco to the Amazon. They came in contact with the Spanish explorers in many islands of the West Indies. It is thought that they expelled the Arawakan tribe from the Lesser Antilles. These Indians practiced cannibalism and were warlike when first discovered, and the Spaniards subjected them as slaves. At present the descendants, mixed largely with the Negroes, are known as Black Caribs and number several thousand. They inhabit the coast of Central and South America.

**CARIBBEAN SEA** (kär-ib-bē'an), the largest inlet of the Western Hemisphere, extending inland from the Atlantic Ocean. It is bounded on the south by Venezuela and Colombia, on the west by Central America, and on the north by Yucatan and the Greater Antilles. It is connected by Yucatan Channel with the Gulf of Mexico, whose waters unite with those of the inflowing currents to form the Gulf Stream. Among the principal arms are the Mosquito Gulf and the Gulf of Honduras, on the west, and the gulfs of Darien, Paria, and Venezuela, on the south. The length from east to west is 1,700 miles, and the extreme depth, south of Cuba, is 16,000 feet.

**CARIBOU** (kär'ī-bōō), the American woodland deer, employed by the natives to draw their sledges. Formerly it ranged south as far as Ohio and Colorado, but it is now confined chiefly to Canada. It has large hoofs, prominent antlers, and long hairs about the neck and feet. See **Deer**.

**CARICATURE** (kär'ī-kà-tūr), a picture or drawing of a person in which certain points are so exaggerated as to give the whole a ludicrous effect. The art of caricaturing dates from the early Egyptians, and was employed more or less in all times. At present it forms a distinct feature of comic journals, such as *Puck* and *Judge*, in the United States; *Fliegende Blätter*, in Germany; *Charivari*, in France; and *Punch*, in England. Among the leading caricaturists are Nast, Opper, and McCutcheon, in the United States; Wilhelm Scholz, in Germany; Wilhelm Busch, in Austria; Honoré Daumier, in France; and George Cruikshank and John Doyle, in England.

**CARLISLE** (kär-lil'), a city of England, capital of Cumberland County, fifty miles west of Newcastle. It is located at the confluence of the Eden and Caldew rivers and several important railroads, and has communication with Liverpool by steamboats. Among the chief buildings is a cathedral founded by William Rufus. A castle, in which Mary, Queen of Scots, was confined after the Battle of Langside,

founded in 1092, stands near the city and is now used as a barrack. The manufactures include cotton and woolen textiles, clothing, and ironware. It has a large trade in produce and manufactures. Carlisle dates from an early time in the history of England and was destroyed by the Danes in 900. Population, 1907, 46,580.

**CARLISLE**, county seat of Cumberland County, Pennsylvania, about eighteen miles west of Harrisburg, on the Cumberland Valley and the Gettysburg and Harrisburg railroads. It is platted on a regular plan and has waterworks, electric lights, and other municipal facilities. The manufactures include railroad cars, ironware, carpets, and machinery. It is the seat of Dickinson College and the Carlisle Indian School, founded by the government in 1879. This college is supported by the government for the education of Indian pupils, and has been attended by three thousand students, of whom several hundred have been graduated. The pupils publish a number of periodicals, make their own uniforms, and many of them rise to high educational attainments. Near the city is Mount Holly Springs, a popular summer resort. Carlisle was settled in 1751. At the time of the Civil War, in 1863, it was bombarded by the Confederates. Population, 1900, 9,626.

**CARLOVINGIAN** (kär-lō-vīn'jī-an), the name of a historical royal family which furnished a number of sovereigns for Germany, France, and Italy in the 8th, 9th, and 10th centuries. The family origin dates back to the early part of the 7th century, but derived its name from Charles Martel. The latter reigned in France from 715 to 741. He was succeeded by his son Pepin, who reigned from 741 till 768, and he was succeeded in the government by Charlemagne and Carloman, who reigned conjointly from 768 to 771. In 771 Charlemagne became sole king, was crowned emperor by the people of the western world in 800, and was succeeded by his son Louis le Debonnaire in 814. The latter divided his empire among his sons and in 840 Charles the Bold became King of France. He was succeeded by a number of weak princes in 877, and the dynasty came to its end with Louis V. in 987. The most important division of the empire of Charlemagne consisted of Germany, France, and Italy, beginning in 887. A branch of the family ruled in Germany until the rise of the houses of Franconia and Saxony, and in Italy until the rise of Otho the Great, when the country became united to the German empire.

**CARLSBAD** (kärls'bät), or **Karlsbad**, meaning Charles's Bath, a city in Bohemia,

seventy miles northwest of Prague, on the Tepl River. It is so named because its mineral springs were first utilized by Charles IV. (1316-78), Emperor of Germany, for their healing qualities. It is the most aristocratic place and health resort in Europe. Visitors crowd it from June to September, the visiting delegations often numbering 25,000. It has cold and thermal springs, the latter reaching a temperature of from 80° to 165° Fahr. The city has ample accommodations for guests, such as parks and hotels and is in every way fitted for the entertainment and accommodation of guests. In the market place is a beautiful statue of Charles IV. The manufactures include carpets, needles, scissors, knives, woodwork, and articles of glass, which are sold largely to visitors. Among the municipal utilities are gas and electric lighting, a public library, and steam and electric railways. Population, 1906, 15,375.

**CARLSRUHE** (kär's'rōō-e), or **Karlsruhe**, meaning Charles's Rest, a city in Germany, capital of the grand duchy of Baden, thirty-eight miles northwest of Stuttgart. It was founded in 1715 by Markgraf Charles William, whose remains are interred below a statue in the market place. The city is built on a beautiful plan, and has several fine edifices, including castles and palaces. The court library contains 100,000 volumes and the public library is somewhat larger. Its museums have rare collections of antiquity and natural history. The city possesses fine botanical gardens, a large market place, several public squares, and a number of monuments. It has manufactures of railroad cars, carriages, jewelry, locomotives, carpets, textiles and chemical products. The streets are paved with stone and asphalt and traversed by lines of electric railways. Population, 1905, 111,249.

**CARMEL** (kär'měl), the name of a range of hills in Palestine, extending from the Mediterranean to the plain of Esdraelon. The length of the range is about twenty-six miles, extending from the plain of Dothan in a northwesterly direction, and the highest altitude is 1,810 feet. Mount Carmel, an eminence near the sea, is about 1,500 feet high and is the seat of a monastery, the monks being called Carmelites. These mountains were a favorite retreat of the prophets Elijah and Elisha, and here were enacted many noted scenes in Bible history.

**CARMELITES** (kär'měl-its), a monastic order of the Roman Catholic Church, known officially as the Order of Our Lady of Mount Carmel. Those who belong to the organization claim that it was instituted by Elijah,

the prophet, but it dates from 1156, when Count Bertrand, one of the crusaders, came from Calabria and established the monastery on Mount Carmel, in Palestine. The Saracens compelled them to wear striped dresses, but later they changed to a habit of brown with a white cloak and scapular, from which they came to be known as white friars. The Carmelite nuns date from 1452, and both they and the friars were reorganized by Saint Theresa in the 16th century, when they became known as barefooted Carmelites. At present they are found in all the countries where the Catholic Church has a considerable membership. They are austere in their habits of life.

**CARMINE** (kär'mīn), a pigment of a brilliant scarlet color, obtained from cochineal. Several processes are employed in obtaining this product, one of which is as follows: Put one pound of cochineal in three gallons of water, after fifteen minutes add one ounce of cream of tartar, heat gently for ten minutes, add half an ounce of alum, boil about three minutes, and draw the liquid into clean glass pans, in which the carmine will settle at the bottom, when the water will be drawn off and the product dried. Carmine is used as rouge for imitating the soft blush upon the cheeks, and in coloring confectionery and artificial flowers. Carmine lake, a product obtained from the residues of cochineal in manufacturing carmine, is used in printing and painting.

**CARNATION** (kär-nā'shūn), the name of the double-flowering variety of the clove pink. The highly cultivated carnation is noted for its beautiful colors and sweet scent. It is propagated by layers or cuttings of shoots in the summer season. The plants are taken up late in the fall and set in the greenhouse, where they bloom nearly the entire winter. Under cultivation the carnation has assumed a large variety of tints and forms. It is grown very extensively for the market.

**CARNEGIE** (kär-nēg'ī), a borough of Allegheny County, Pennsylvania, six miles southwest of Pittsburg, on the Pittsburg, Cincinnati, Chicago and Saint Louis and other railroads. It occupies a fine site on Chartier's Creek and has a large jobbing trade. The manufactures include iron and steel products, machinery, and implements. Its name was changed from Mansfield Valley to Carnegie in 1894. Natural gas, coal, and oil abound in the vicinity. Population, 1900, 7,330; in 1910, 10,009.

**CARNEGIE INSTITUTION**, an educational institution founded at Washington, D. C., by Andrew Carnegie, and incorporated Jan. 4, 1902. Its object is to promote higher study

and original research in any department of science, art, or literature, for which purpose it is designed to cooperate with learned societies, colleges, technical schools, governments, and universities. The founder donated \$10,000,000 to establish this institution, which is designed on a plan similar to that of the Smithsonian Institution. In 1907 he made an additional gift of \$2,000,000.

A board of trustees and ex-officio members of such a board were named for the Carnegie Institution by its founder. The ex-officio members are: The President of the United States, the president of the Senate, the speaker of the House of Representatives, the secretary of the Smithsonian Institution, and the president of the National Academy of Sciences. The trustees named originally were: John S. Billings, New York; Grover Cleveland, New Jersey; William H. Frew, Pennsylvania; Lyman J. Gage, Illinois; Daniel C. Gilman, Maryland; John Hay, District of Columbia; Abram S. Hewitt, New York; Henry L. Higginson, Massachusetts; Henry Hitchcock, Missouri; Charles L. Hutchinson, Illinois; William Lindsay, Kentucky; Seth Low, New York; Wayne MacVeagh, Pennsylvania; D. O. Mills, New York; S. Weir Mitchell, Pennsylvania; William W. Morrow, California; Elihu Root, New York; John C. Spooner, Wisconsin; Andrew D. White, New York; Edward D. White, Louisiana; Charles D. Walcott, District of Columbia; and Carroll D. Wright, District of Columbia. Jan. 29, 1902, the institution was duly organized, when Daniel C. Gilman was chosen chairman of the board of trustees and John S. Billings was named as secretary.

The object and administration of the Carnegie Institution are best set forth in the deed of gift, which contains the following:

First—To promote original research, paying great attention thereto as one of the most important of all departments.

Second—To discover the exceptional man in every department of study whenever and wherever found, inside or outside of schools, and enable him to make the work for which he seems specially designed his life work.

Third—To increase facilities for higher education.

Fourth—To increase the efficiency of universities and other institutions of learning throughout the country, by utilizing and adding to their existing facilities and aiding teachers in the various institutions for experimental and other work in these institutions as far as advisable.

Fifth—To enable such students as may find Washington the best point for their special

studies to enjoy the advantages of the museums, libraries, laboratories, observatory, meteorological, piscicultural, and forestry schools and kindred institutions of the several departments of the government.

Sixth—To insure the prompt publication and distribution of the results of scientific investigation, a field considered highly important.

**CARNELIAN** (kär-něl'yan), or **Cornelian**, a mineral of the chalcedony variety. It is found in various colors, usually reddish, but sometimes yellow, brown, or white. This mineral is widely distributed, especially in the region of Lake Superior, but the finest specimens are brought from India, where it is obtained chiefly in the vicinity of Cambay. It is used largely for ornaments and beautiful seals are engraved on it.

**CARNIVAL** (kär'nī-val), the festival week before the beginning of Lent. It is celebrated in Roman Catholic countries with much freedom and mirth, especially at Naples and Rome. In some of the American cities it is celebrated under the name of *Mardi Gras*. The cities of New Orleans and Mobile are especially enthusiastic in its observance.

**CARNIVORA** (kär-nīv'ō-rà), the name applied to animals which have teeth fitted for the mastication of animal matter and prey upon other animals. They possess short jaws, large jaw muscles, and teeth especially fitted for cutting and mincing flesh. The body is slender, thus giving advantage in securing prey, while the jaws differ greatly from the long jaws of herbivorous animals like the horse and ox, which require time to grind their less nutritious food. The stomach is simple and the alimentary canal is short, and the latter has only about three times the length of the body, while in herb-eating animals the alimentary canal is often from ten to thirty times the length of the body. The most important carnivorous animals include the lion, tiger, tapir, wolf, bear, leopard, skunk, coati, panther, puma, jaguar, raccoon, and walrus.

The carnivorous animals are well distributed in all the continents except Australia, where they are limited to the flesh-eating marsupials. They vary in size from the small and slender ermine to the large polar bear, which may weigh 2,000 pounds. The species native to tropical countries are the most numerous and carry on a constant warfare against man as well as the lower animals. The dog and the cat, though among the fiercest of this class, have been domesticated as pets.

**CARNIVOROUS PLANTS**, a class of plants which feed or subsist on small animals, especially insects. Many species are included in

this group and most of them occur in swamps where nitrogenous matter is scant, hence the advantage of feeding upon animal life. The Venus's flytrap, common to North Carolina, is a notable example. It has leaves divided into halves which close instantly, much like a trap, when minute hairs upon their surface are touched, and the entrapped insect is held until the digestible parts are assimilated, when the leaves open again. The pitcher plant (q. v.) is another notable example, and its numerous species are more or less widely distributed. It has hollow leaves in which water, made up partly of a secretion of the plant itself, comprises the trap, while a honeylike exudation lures the insects, and small hairs strike downward when touched and cause the insect to fall into the basin. The butterwort of Canada and the northern parts of the United States belongs to the carnivorous plant. Other familiar species are the sundews, and such plants as the petunia and tomato, whose leaves are frequently covered with insects, from which the plant is supposed to derive some nourishment.

**CAROB** (kär'ōb), or **Locust**, a tree native to the countries adjacent to the Mediterranean Sea. In size and appearance it resembles the apple tree, but is evergreen, with oval leaflets, and bears hornlike pods filled with a mealy pulp of agreeable taste and odor. The pulp is valuable as stock food, and is used to some extent as human food by the poorer classes. Carobs are often called *Saint John's bread* from the tradition that they are the locusts eaten by John the Baptist while he was in the wilderness. It is probable that they are the husks alluded to by Christ in the parable of the prodigal son. The tree is exceedingly productive, often yielding from 700 to 900 pounds in a season. The wood is useful in tanning, while the roots contain medical properties. It is not allied to the American locust. The Moors and Arabs cultivate it extensively. It is gaining a foothold in India, where it serves a useful purpose as a food article.

**CAROLINE ISLANDS**, a group of islands in the Pacific Ocean, lying north of New Guinea and east of the Philippines. The area is 570 square miles, and, including the Pelew group, 860 square miles. The archipelago consists of thirty-six groups of islands, the principal ones being the Pelew, Yap, Ponape, and a number of other island groups. About 525 islands are included in the archipelago. Of this number about 200 are in the Pelew group, of which Babel-Thaob is the largest, containing an area about as large as all the other groups

put together. Commercially, the most important of the entire group is Ponape, containing an area of 134 square miles. Most of the surface is fertile. The products include fruits, cereals, and coconuts, while excellent pasturage for horses and cattle abounds. Several of the islands are volcanic and rich in minerals, including quartz and limestone. However, the larger number are of coral formation. The natives belong to the Polynesian group, while the Europeans consist mostly of Germans, who control the trade and manufactures. Agriculture, stock raising, mining, and commerce are the chief occupations. The forests yield timber for cabinet work and various fruits used in making varnish.

The Caroline Islands were discovered by the Portuguese in 1527 and were annexed to Spain in 1686. A dispute arose over the commercial relations between Germany and Spain in 1885, which was adjusted by the Pope under a joint agreement of the two nations; by which Spain retained control and Germany secured special trade advantages. The American representatives at the Paris convention, following the Spanish-American War, vainly endeavored to induce Spain to cede them to the United States. In 1899 Germany bought the islands from Spain for about \$4,000,000. They are now a German possession, with a local governor appointed by the emperor. Religious liberties are conceded to all inhabitants. Ponapé is the seat of government in the Eastern Carolines and Yap, in the Western Carolines. Population, 1907, 55,466.

**CAROLINGIANS** (kär-ô-lîn'jê-änz), the second dynasty of Frankish kings, so named from Charles Martel. This dynasty succeeded the Merovingians in 751, when Pepin the Short became king. He was a son of Charles Martel, who was mayor of the palace in the Frankish kingdom, and was succeeded by his sons, Carloman and Charlemagne, but the latter soon became sole ruler, in 771, and was succeeded by his son, Louis the Pious. The latter divided his empire into departments, each of which was presided over by one of his sons, and after his death, in 840, the great empire was divided. Charles the Bold, son of Louis the Pious, became king of the portion of the territory corresponding to modern France and is the founder of the French dynasty. He died in 877 and was succeeded by a number of princes until in 987, when Hugh Capet, founder of the Capetian dynasty, became King of France.

**CAROTID ARTERIES** (kâ-rôt'id), the name of two great arteries that serve to convey the blood from the aorta to the head and brain.

The common carotids are two arteries, one on each side of the neck. Each divides into an external and internal branch. The internal carotid supplies the eye and brain with blood, while the external carotid supplies the neck, face, and upper parts of the head.

**CARP** (kärp), a fish native to the fresh-water lakes and streams of Central Europe and corresponding latitudes in Asia. Owing to its

COMMON CARP.

value as an article of food, it has been extensively naturalized in many countries, and is cultivated in many parts of Canada and the United States. It has been transferred more extensively than any other fish, except, perhaps, the gold fish, and can subsist out of water longer than any other. Under careful feeding it attains a weight of three pounds when six years old, and often reaches a weight of eighteen pounds at maturity, while in Europe it has been known to weigh forty pounds. The fins are dark brown, and the body is yellowish beneath and olive brown above. Its food consists chiefly of aquatic plants, but it is fond of insects and worms. The carp is not a favorite game fish, as it is not a free biter, and is quite cunning in evading a net. Among the species are the *German*, *leather*, *golden*, and *crucian* carp. The leather carp has no scales.

**CARPATHIAN MOUNTAINS** (kär-pä'thī-an), a mountain range of Central Europe, extending a distance of about 875 miles from Pressburg on the Danube to Alt Orsova on the Rumanian frontier. They form two great masses, one in Hungary and one in Transylvania, the group lying almost entirely within Austria and Rumania. The culminating peak, Gerlsdorferspitze, has an altitude of 8,737 feet above sea level. These highlands consist of various chains and groups, including the Carpathians proper, the Little Carpathians, and the Transylvanian Alps. They are timbered to a height of nearly 5,000 feet, the lower portions with valuable walnut groves, and the higher with beech, cherry, and pine. The groups within Hungary are exceedingly rich in various minerals, especially limestone and iron. Many valleys

which produce fruits and cereals lie in different portions, while some parts are rocky, barren, and exceedingly precipitous. The only glacier within the region is on the northern declivity of Eisthal Peak.

**CARPEL** (kär'pěl), in botany, the name of the leaf forming the pistil, or one of the several parts of a compound pistil. See **Flower**.

**CARPENTARIA** (kär-pěn-târ'ĩ-à), **Gulf of**, an extensive indentation of the northern coast of Australia. It extends from Cape York to Cape Arnhem, is about 500 miles long, and incloses numerous islands. The shores are generally low. It was so named from Peter Carpenter, a Dutch navigator, who explored it in 1627.

**CARPENTER BEE**, an insect of the bee family, so called from its great skill in working wood. The insects of this class include some of the true bees, and most of them inhabit countries that have a warm climate. Several species are common to America and Europe, some of which are as large as the bumblebee. These insects cut a longitudinal hole or tunnel, about a foot long and a third of an inch wide, usually in dry trees, and in these they lay their eggs and store honey.

**CARPENTRY**, the art or calling of framing timber for architectural and other purposes. The term is properly applied to framing heavy work, such as sills, flooring, roofs, and partitions. The art of doing the ornamental work is called *joining*, but commonly the workman in either line is called a carpenter. The tools of a carpenter include saws, planes, gouges, mortise chisels, squares, bevels, augers, brad awls, and many others. Carpentry has been greatly changed by the introduction of labor-saving machinery. Much of the material for building is now bought in a prepared form at planing mills and at blind, sash, and other factories. Doors, stair railings, windows, ornamental trimmings, and many other parts are secured in complete form, instead of being made by hand as formerly. This is the natural result of employing improved machinery in cutting timber, which has likewise caused a saving in the cost of transportation to long distances from the sawmills located in forests or at points reached by rafting logs in streams. Formerly the carpenter cut the shingles with a hatchet from the block, now mills cut them by the thousands, or the wooden forms have been displaced by stone, slate, or metallic products. Paper is now used to a large extent in walls and asbestos is employed for deadening sound, while steel and iron are displacing the wooden and brick frames of former times. The general diversity of orna-

mentation has caused the invention of a large variety of machines, which have simplified the work in some lines, but, on the other hand, require greater skill in others.

**CARPET** (kär'pět), the name of a kind of felted or woven fabric, generally made of wool, used as a covering for floors and chambers, or for spreading on staircases and on the ground. The use of rugs was common in ancient Babylon, Egypt, China, and India. Carpet making has been an important industry in Persia, Turkey, India, and many portions of Eurasia for centuries, and many laborers are engaged at present in its production. The use of carpets was introduced into Western Europe at the time of the Crusades, but, even in the time of Queen Elizabeth, the floors of palaces and residences were strewn with rushes. The practice of decorating walls with tapestry and cloth is much older than the carpeting of floors. For several centuries, particularly in the time of Thomas Wolsey, the walls were covered with tapestry while the floors were bare. The manufacture of carpets was introduced in Germany and France about 1606, and in England by the French in 1750. Wool is the principal article used in the manufacture, though hemp and vegetable matting are employed extensively.

Among the different grades of carpet are the varieties known as *Brussels*, *Venetian*, *Dutch*, *Wilton*, *Axminster*, *Chinese*, and *tapestry*. Axminster carpet is on the style of the Turkish, in one piece, the patterns consisting mostly of curved and angular strips, containing tufts of colored worsted designs and decorations in various colors. Brussels carpet was first made at Brussels, Belgium, but is now manufactured extensively in all countries. It is woven on a loom carrying a shuttle which raises portions of colored yarn to the surface, and the linen basis is concealed by the worsted, which is drawn through the reticulation and looped over wires, which are afterward withdrawn, thus giving the surface a ribbed appearance. The machinery used in manufacturing Brussels carpet is very complex. Wilton carpet is made similarly to the Brussels, but, instead of being drawn out, the loops are liberated by passing a sharp knife into the grooves, thus producing a velvet pile surface instead of looped threads.

Felt carpet is made by printing colors on felt. Hemp carpet is used in the more inferior buildings and stairways. Many offices and chambers are now furnished with a carpet made of matting in which a vegetable growth from the South Seas is utilized, while others are decorated with a class of oilcloth. Philadelphia is one of the most extensive carpet producing cities in the

world. The largest output of carpets in the United States is in the east central states, while the finest rugs are made in Western Asia. As a whole, the United States takes the first rank in the production of carpets; Canada, second; Germany, third; and France, fourth.

**CARPETBAGGERS** (-bäg-gērz), the name applied to a class of northern people who settled in the Southern States after the close of the Civil War with the view of controlling the political affairs in that section of the United States. It was first used in reference to the northern politicians who had an ambition to become members of Congress, hence these men removed to the Southern States. They were called carpetbaggers from the circumstance that many of them brought only their wearing apparel in baggage. The term is now applied to all of the northern adventurers who sought political influence during the reconstruction period, from 1865 until 1876. At that time many of the leading white citizens were not permitted to vote, and the county, district, and State politics were controlled by carpetbaggers, who were assisted by the Negroes. This régime, known as *carpetbag government*, was extravagant and plunged many of the states into debt.

**CARPET BEETLE**, a small bug or moth which infests houses and preys upon carpets and other cotton and woolen fabrics. It was not known in America until 1872, when it was first noticed in New York and in Southern Canada, and since it has become widely distributed. The adult is about one-seventh of an inch long, has scales of red and black, and is marked with white spots. The larvae are hairy grubs and attack the edges of carpets, especially at the seams and where furniture is placed, while the adults feed on the pollen of flowers and other parts of plants. Naphtha balls, fumes of carbon bisulphide, and kerosene are protection against these pests in their early stages.

**CARRARA** (kä-rä'ra), a city of Italy, in the province of Massa e Carrara, sixty miles southwest of Modena. It is located on the Avenza River, three miles from the Mediterranean, and is surrounded by hills famed for their white marble. The chief buildings include the churches of the Madonna and of Saint Andrea, and in the city are fine statues of Rossi, Mazzini, and Garibaldi. It has a fine museum and an academy of sculpture founded by Napoleon. The Carrara quarries have been worked since an early period in Roman history, and at present there are more than 600 quarries in the vicinity of the city. Most of the product is transported via Avenza, a small port on the

Mediterranean, but many sculptors come here to save expense in transporting the marble. Population, 1906, 21,560.

**CARRIAGE** (kär'rij), a name generally applied to all structures employed to transport merchandise and passengers. In the United States the name refers particularly to wheeled vehicles for carrying persons to distinguish them from those used for transporting goods. It is especially applied to an elegant conveyance, partly or wholly enclosed, with seats for two or more persons and drawn by one or more horses. The term is loosely applied to such vehicles as top buggies, broughams, and phaetons. In Great Britain the term is applied to railway cars and often preceded by the name designating the class, as first-class or second-class carriage.

The most ancient conveniences for transportation were, no doubt, by riding animals, as camels, elephants, and horses. We learn that Pharaoh gave Joseph second place in Egypt and "he made him ride in the second chariot which he had," and later wagons were sent to convey Jacob and his family to Egypt. Chariots were generally used by rulers and warlike leaders in Egypt, while in Rome they were employed for general use. The Roman carriages were richly ornamented, some drawn by two and others by four horses. In the Olympic games of Greece the chariot was a necessary supply. The condition of the roads had a material modification on early vehicles. The celebrated Appian Way, constructed in Rome in 331 B. C., and many other thoroughfares, were especially fitted for the use of chariots. Covered carriages came into use in the 16th century, at first among the nobles, but later were generally adopted as conveyances by all classes of citizens. Their use was greatly opposed by the owners of boats and the carriers of sedan chairs. In some cases the sovereigns were induced to forbid their employment by the citizens and their wives, of which the ordinance of Philip the Fair, in 1294, is a notable instance. In 1550 there were only three carriages in Paris, the noblemen and citizens riding mostly on horseback. They came into general use in Germany as early as 1613. Hackney coaches were introduced in London in 1625.

The early vehicles were extremely rude, particularly the heavy wagons used for transports. Many had rude axles with wooden wheels cut from large logs, and in this respect were similar to those now rarely used in Mexico. At the beginning of the 18th century the body of carriages was suspended by leather straps. In 1804 an Englishman, Obadiah Elliott, invented the oval springs which are in common use at

present. The general forms of carriages now used in Western Europe are similar to those seen in Canada and the United States, but many have been modified or improved. The *buckboard*, *sulky*, *rockaway*, and *buggy* are distinctly American vehicles. The *jinrikisha* is a two-wheeled cart pulled by a man, and is commonly used in Japan and Eastern Asia. Among the newer means of conveyance are the bicycle and automobile, which are extensively used in many countries. See **Automobile**, **Bicycle**, etc.

**CARRIER** (kă'rĭ-ēr), a person or company that undertakes to carry or makes a business of carrying persons or goods for a consideration. Two classes of carriers are recognized—*private carriers* and *common carriers*. Private carriers are persons who undertake to transport the goods of others who may choose to employ them, yet they do not enter into the employ of the public generally. A private carrier incurs no responsibility beyond that of ordinary diligence. Common carriers are persons or companies who engage to carry goods for the general public in consideration of a suitable compensation. They are required to provide safe and suitable conveyance, and are not exempt from responsibility, even if interfered with by ice, snow, fire, or other natural causes. They are responsible for all losses, except from the act of an enemy in times of war or the default of shippers.

In many cases the responsibility of common carriers is limited or modified by special contract, but under the general law they cannot free themselves wholly nor escape the duty of reasonable diligence. The common carrier is responsible for the acts of all his agents, must deliver commodities in as good condition as received, may refuse to accept goods not properly prepared for shipment, and may demand transportation charges in advance. In cases where charges are payable at the end of the route, the goods may be held until payment is made, and, if entirely neglected, the goods may be sold to cover a part or all of the transportation charges and storage. In making shipments the sender need not disclose the contents of his package unless requested to do so by the carrier. If the sender misrepresents the value or character of the goods, the carrier is not liable in case they are stolen. Railroad, hack, steamboat, and street railway companies are common carriers.

**CARRIER PIGEON**, a name applied to a species of pigeon used for conveying letters from any place to their home, now generally called *homing pigeon*. The common carrier pigeon is a large bird with naked skin at the

base of the beak and long wings, and has a circle of naked skin around the eyes. It is thought that the Chinese were the first to make use of pigeons in this way, but the oldest instance on record is that of the 16th century B. C., when Joshua invaded Palestine and employed this mode of communication between the camps on different sides of the Jordan. The Greek lyric poet Anacreon mentioned the use of carrier pigeons in the year 500 B. C. Pliny the Elder called attention to the value of homing pigeons in several sieges conducted by the Roman army. In the siege of Paris by the German army, in 1870-71, fully 150,000 official messages were carried into the city by means of pigeons. Various uses of trained carrier pigeons constitute a national game in Belgium and Holland, and they are kept for pleasure and military purposes in many European countries.

CARRIER PIGEON.

A pigeon flies about thirty miles an hour under favorable circumstances, and is successfully used for distances from 200 to 500 miles, though there are cases on record in which they have been used for more than 1,000 miles. The homing faculty or instinct enables them to find their way home from surprising distances, and upon this virtue depends the value of these birds. Pigeons are trained for service by taking them a short distance from home and setting them free, gradually increasing the distance from time to time. By successive experiments the tendency to seek their former place of habitation is gradually developed, until finally they can be depended on to return from long distances. One of the best records ever made was by an American homing pigeon, which flew 1,040 miles without stopping. In the East, where the custom is general, the birds' feet are washed in vinegar to induce them not to alight in quest

of water and to keep them cool. The message sent is microscopic. It is rolled in a goose quill, which is tied to a wing feather or a leg, though long-hand writing is frequently used for short distances.

**CARROT** (kär'rüt), a plant cultivated for its root, belonging to the parsley family. It is a biennial plant. In the wild state the root is white, while the domesticated carrot is of a yellow or reddish color. The root differs somewhat in the numerous species, but is generally long and tapering and matures on the approach of cool weather. The seed is sown in beds early in the spring, usually in rows about one foot apart, and the plants are afterward thinned. Carrots are used chiefly in soups and stews, especially in America, and in many European countries they are cultivated as feed for cows. They yield at the rate of 500 to 1,200 bushels per acre, and produce an excellent quality of butter with a bright color. The carrot is used in Canada and the United States for adulterating coffee, and in America and Europe more or less extensively as an article of food.

**CARSON CITY**, the capital of Nevada, county seat of Ormsby County, thirty miles south of Reno, on the Virginia and Truckee Railroad. It is located near the base of the Sierra Nevada Mountains, in a district which is rich in gold and silver deposits, about twelve miles from Lake Tahoe. The chief buildings include the capitol, the county courthouse, the United States mint, and the Federal building. It has extensive railroad shops, lumbering interests, and grain elevators. The city was founded in 1858 and became the capital of Nevada in 1861. It was incorporated in 1875. Population, 1900, 2,100; in 1910, 2,466.

**CARSON RIVER**, a stream in Nevada, rises in the Sierra Nevada Mountains, and after a course of about 150 miles flows into Carson Lake. Its general direction is toward the northeast, passing a short distance south of Carson City, and a branch of it in the lower course flows into Carson Sink. Carson Lake has no visible outlet. The water from this stream is used in the Truckee-Carson irrigation system. See **Irrigation**.

**CART**, a vehicle with two wheels, usually without a top, and fitted to be drawn by one horse. Heavy carts have no springs and are employed in hauling heavy freight or rocks, while vehicles of light construction are used in driving. The latter are supplied with springs and frequently with a top or canopy. The one-horse cart is employed extensively in Europe for draying, usually in the form of a dump cart, from which the load may be removed by

tilting the body of the vehicle. A dogcart is constructed so the frame may be adjusted to balance the load, and a trotting sulky is used in horse racing. The gig is a two-wheeled cart with a single seat. In the calash, used more or less in Canada, the driver has a low seat in the front. Carts with wheels made of cuts from logs are used extensively in Central America and the West Indies.

**CARTAGENA** (kär-tä-jě'nà), or **Carthage**, a city of Colombia, on the Caribbean Sea, capital of the state of Bolivar. It is located on a peninsula and has a fine harbor, but the low coast makes it unhealthful to Europeans. The chief buildings include those of the government, a college, a cathedral, a seminary, and several churches. Among the manufactures are candles, clothing, and chocolate. It has a large export trade in tobacco, cattle, coffee, rubber, and precious stones, and imports merchandise and machinery. The city was founded in 1533 and was captured by Spain in the revolution of 1815. Population, 1906, 19,380.

**CARTAGENA**, a seaport in Spain, on the Mediterranean Sea, about twenty-eight miles southeast of Murcia. It is an important naval and military station, and its harbor is one of the safest and largest on the Spanish seacoast. It has manufactures of glass, cordage, wine, and machinery, and exports of iron ore, lead, esparto grass, and fruits. The chief features are the arsenal, the Presidio, the Hospital Militar, a Gothic cathedral, several hospitals, and a number of schools. It has steam and electric railways, waterworks, stone pavements, and systems of gas and electric lighting. Cartagena was founded by Hasdrubal about 243 B. C. and was named New Carthage. In 210 B. C. it was conquered by Scipio Africanus and made an important Roman city. The Goths ruined it, but in the time of Philip II. its importance was revived. Population, 1905, 106,150.

**CARTAGO** (kär-tä'gõ), a town of Costa Rica, capital of a province of the same name, fourteen miles southeast of San José. It has railroad connections with the principal cities of Central America and a brisk trade in coffee and fruit. An earthquake destroyed many of its buildings in the latter part of the 19th century and civil wars caused it to decline. Population, 1906, 5,502.

**CARTHAGE** (kär'thâj), a city in Missouri, county seat of Jasper County, on Spring River, fifty-eight miles west of Springfield. It is on the Saint Louis and San Francisco, the Missouri Pacific, and other railroads, and is surrounded by a coal, lead, zinc, and cobalt producing region. The chief buildings include the

county courthouse, the public library, and Carthage College. It has manufactures of plows, windmills, furniture, artificial ice, clothing, and machinery. Among the municipal improvements are sewerage, waterworks, pavements, and gas and electric lighting. On July 5, 1861, it was the scene of a battle between the Union army under General Sigel with 1,500 and the Confederates under General Price and Governor Jackson with 3,500 men. The battle resulted in a retreat of Sigel's army. Carthage was settled in 1833 and was incorporated in 1873. Population, 1910, 9,483.

**CARTHAGE** (kär'thīj), the most celebrated Phoenician colony, founded by Queen Dido about 880 B. C., who came thither with a body of aristocrats, fleeing from the democratic party of Tyre. It was located in Africa, occupying a portion of the region now included in Tunis. Queen Dido fled from Tyre after the murder of her husband. She built up a colony around which great commercial interests centered, and the city of Carthage rose to vast importance among the ancient cities in Northern Africa. The population of the city before the time of its destruction was about 700,000. It was built on a peninsula about three miles wide, across which was constructed a triple wall with lofty towers. Every side of the city was defended by a wall. The Punic traders brought immense wealth, thus resulting in the construction of massive buildings and in lavishing them with magnificent adornments. A double harbor served for merchants' ships and for the navy. The admiral's palace occupied a lofty island in the center of the inner harbor. At the time of its greatest prosperity Carthage occupied a site twenty-three miles in circumference, with a population probably greater than that of ancient Rome. Its navy was the largest in the world; at the time Regulus made his famous attack on Carthage it consisted of 350 vessels and 150,000 men.

The Carthaginians conquered Sardinia in the 6th century B. C. and entered upon a war for the possession of Sicily. They founded colonies on the western coast of Africa, contended for the possession of the Strait of Gibraltar, and invaded Spain and Gaul. The history of this powerful nation is divided into three epochs for convenience in study. The first extends from its foundation to 410 B. C., and includes the rise and development of national power. The second extends from 410 to 265 B. C., and embraces the period of wars with Greece and Sicily. The third epoch embraces the period from 265 to 146 B. C., and includes the wars with Rome, ending with its fall and destruction. In the

first period colonization was widely extended and treaties were made with other powers. Among the most famous were those concluded with Rome in 509 B. C., in 348, and in 306. Its people were noted for their interests in commercial enterprises and the early wars were but the natural result of an extending commerce and colonization. The first Punic War extended over twenty-three years, from 264 to 241. It was a period of contention for the occupation of Sicily and resulted in the expulsion of the Carthaginians from the island. What Carthage lost in Sicily was more than regained, by the conquest of Spain under the skillful military achievements of General Hamilcar and his son-in-law, Hasdrubal.

After the death of these two distinguished generals, Hannibal, the son of Hamilcar, took charge of the army and rose to eminence, establishing for himself a place among the most noted generals of the world. He organized the forces of Carthage in Spain and entered upon the second Punic War in the year 218 B. C., when he crossed the Alps with a powerful army and proceeded into Italy. His successes astounded the world, routing the best soldiers of Rome and gaining victories at Lake Trasimeno, Trebbia, and Cannae. For seventeen years he harassed Rome and brought it to the verge of ruin. After the Battle of Cannae, he sent a bushel of gold rings to Carthage, the ornaments of Roman knights. One-fifth of the Roman populace able to bear arms had fallen within eighteen months, while Capua, the second city of importance, joined Hannibal. In the hour of peril the Roman spirit rose and Hannibal's victories began to ebb. He was recalled to defend his own city, where he was defeated by Scipio in the Battle of Zama in 202 B. C.

Peace was concluded between the two nations, but the power of Carthage was broken, never again to rise to its former height. Although the nation began to recover its importance in commerce, a party at Rome was bent upon its destruction. The third Punic War began in 150 and ended in 146 B. C., in which Rome was the aggressor. The Carthaginians surrendered their arms, but when bidden to leave the city to be razed they were driven to desperation. They melted their gold and silver vases and their metallic statues to forge them into new weapons. The long hair of the women was made into bowstrings, and all available material was used to contest every inch of the city against the Romans. The younger Scipio led the siege and after a desperate struggle captured Carthage. Though the city had flourished

more than 700 years, it was utterly razed to the ground. The territory was turned into a Roman province and became one of the chief possessions of the Roman Empire. The Vandal kings of Africa made it their capital in the 5th century A. D. and at the end of the 7th century it was destroyed by the Arabs.

Very little is known of the laws, life, and customs of the people of Carthage. Both its constitution and history are obscure in many respects. It is known that no ancient people rivaled it in colonization and competition for trade. There is no fragment of a Punic orator, historian, philosopher, or poet to make known the events that characterized this wonderful people. Carthage is better understood from its wars than from the achievements in education, art, and industry. It is known that the Carthaginians descended from Phoenician ancestors and, like them, worshiped Moloch and Baal, to whom human sacrifices were offered. The sun was the highest natural manifestation of this deity, but they also worshiped the Tyrian Hercules and a variety of heroes, heroines, and spirits, such as the goddess of the elements and the genius of death. The language was similar to that spoken by the Asiatic Phoenicians, from whom they were descendants.

**CARTHUSIANS** (kär-thū'zhanz), a monastic order of the Catholic Church, founded by Saint Bruno of Cologne in 1084. It was so named from La Chartreuse, France, where the first hermitages were built. The order was approved by the Pope in 1170, and the name was corrupted into Charter Houses in England, where the first monasteries of this order were built in 1180. The rules of living are very austere, and the members are divided into monks and lay brothers. They abstain from eating flesh, are required to perform manual labor, wear coarse clothing, and take a vow of continual silence. The wine known as *chartreuse* was originated by them and from its manufacture they derive some revenue. Formerly this order had a large membership in Central Europe, but their austerity caused them to decline, and at present there is only one monastery in England, the one located near Brighton.

**CARTILAGE** (kär'tī-lāj), or **Gristle**, an elastic substance or texture occurring in vertebrate animals. There are two forms, the *temporary* and the *permanent*. The former is present in place of bone in very early life and later changes to bone by ossification; the permanent cartilage retains its cartilaginous character. Temporary cartilage is found at the ends of bones, where they enter into the formation of joints. The permanent cartilage consists of

the *articular* and the *membraniform*. The former is found at the joints and the latter in the walls of cavities, as the nose, external ear, and larynx.

**CARTOON** (kär-tōon'), a term now generally applied to pictorial sketches published in newspapers and magazines. They are intended to convey a vivid or exaggerated view of some important event or notable character. The term is applied in painting to designs drawn on paper, intended for models in transferring the figures to the fresh plaster of a wall. The most celebrated cartoons were painted by Raphael for the tapestries of the Vatican. Originally there were twenty-five of these famous paintings, but only seven are now extant. They are in the South Kensington Museum, London, and include representations of "The Death of Ananias," "Paul Preaching at Athens," and "The Miraculous Draught of Fishes."

**CARTRIDGE** (kär'trij), a case of metal, flannel, paper, or parchment containing an exact charge of powder and bullet, and fitting the bore of a gun. A *blank cartridge* contains only the powder. A cartridge filled with dynamite or other explosive is used in blasting. In breech-loading guns the cartridge case is metallic, or contains a metallic rim. A percussion cap is in the center base, or on the inner rim. Solid brass cartridges can be reloaded and used an indefinite number of times.

**CARVING** (kärv'ing), a kind of sculpture, usually done by cutting on ivory or wood. This art was practiced by the Assyrians and Babylonians, who carved in ivory and associated with it the practice of engraving in gems. Ivory was used largely for carving among the Grecians, especially in making the statues of the gods, in which the solid material was overlaid with plates of ivory. The art of wood carving came into extensive use during the early Christian period, and it was long a popular form of decorating the churches of Central Europe, especially in Germany. Among the famous carvers may be mentioned Albert Dürer, Hans Bruggemann, and Hans Schwartz of Augsburg. The churches in which famous carvings are well preserved include those of Nuremberg, Altenberg, and Erfurt. The carvings in some of the Lutheran churches are very elaborate, including scenes in the lives of Christ and the saints.

**CASCADE MOUNTAINS** (käs-kād'), a range of western highlands, forming the northern extension of the Sierra Nevada of California, and trending through Oregon, Washington, and British Columbia. Their direction

is nearly north and south, and the distance from the Pacific coast averages about one hundred miles. The Cascades are of volcanic origin, though they are more recent than the Rocky Mountains. They are covered with fine forests of valuable timber. The lava cast up by volcanic action through the fissures and craters is deposited over an area of about 200,000 square miles, and in many places it forms a coat fully 2,000 feet thick. The surface is formed largely of decomposing lava, but it is very fertile and whitish in color, and furnishes good soil for grazing and agriculture. There are productive deposits of coal, copper, nickel, and platinum, and small quantities of silver and gold. West of these mountains, in the State of Oregon, is the fertile valley of the Willamette, and in Washington is a corresponding valley drained by the Chehalis and Cowlitz rivers. Among the most noted peaks are Pitt, elevation 9,820 feet; Jefferson, 10,200 feet; Hood, 11,225 feet; Baker, 10,700 feet; Saint Helen's, 12,000 feet; and Rainier (Tacoma), 14,450 feet.

**CASCADE TUNNEL**, an excavation through the Cascade Mountains, in Montana, constructed by the Great Northern Railway Company. It is sixteen feet wide, twenty-two feet high, and 13,413 feet long, about two and one-half miles. The excavations were difficult on account of much water and large boulders being in its course. It is lined almost exclusively with solid work of concrete, and comprises one of the notable engineering works of America.

**CASCARILLA** (kās-kā-rī'lā), the bark of a small tree or shrub native to the West Indies and the Bahama Islands. It has a spicy, bitter taste, and is used in medicine as a tonic to aid digestion. *Cascarillin* is an essential oil obtained from the bark, which also yields a resinous product used in medicine.

**CASCO BAY** (kās'kō), an inlet of the coast of Maine, between Cape Small Point and Cape Elizabeth. The shore is about twenty miles long, and at the western extremity is the city of Portland. Within the bay are about 300 small islands, most of which are fertile and are occupied by fishermen and summer residents.

**CASE**, in grammar, that form or use of a noun or pronoun by which its relation to other words in a sentence is denoted. Formerly the English language possessed inflections to indicate five different cases. At present the language contains only three cases, the *nominative*, *possessive*, and *objective*, though some writers include the *absolute*. The possessive form of nouns is the only case that is marked by inflections. In French, Spanish, Portuguese, and

Italian the nouns have no inflections. The *nominative*, *dative*, *genitive*, and *accusative* are the cases in German grammar, while the Sanskrit has eight cases.

**CASEIN** (kā'sē-īn), the principal nitrogenous portion of milk. It is soluble in alkali, coagulates by animal membranes, and dries in a yellow mass. Casein is the principal constituent of cheese. Vegetable casein or *legumin* is a similar substance occurring in peas, beans, and the seeds of several other vegetables. Casein consists essentially of 0.8 parts of sulphur; 7.1 of hydrogen; 15.7 of nitrogen; 22.5 of oxygen; and 53.9 of carbon.

**CASHEW** (kā-shōō'), a tree native to the West Indies, related to the sumach and poison ivy. It is about sixteen feet high, has evergreen leaves, and bears kidney-shaped fruit, the cashew nuts of commerce. These nuts yield a sweet oil resembling olive oil, which is used to flavor wine and other liquids. The nuts are borne upon fleshy stalks, sometimes called the cashew apple, and these stalks are free from acidity. They are edible and have a pleasant, acid flavor.

**CASHMERE** (kāsh-mēr'), or Kashmir, an extensive principality in the northwestern part of Hindustan, governed by a Sikh ruler, but politically subject to British India, of which it forms a part. The districts included in it are Baltistan, Jammu, Ladakh, Cashmere, and a number of other minor divisions. It has an area of 80,500 square miles. The district including Cashmere proper is inclosed by the Hindu-Kush and Himalaya mountains and is drained by the Jhelum River. It is celebrated in history and literature for its excellent climate and beautiful scenery. The mountains surrounding it attain a height of 7,000 to 12,000 feet, among which are many fertile valleys, and the lower regions are covered with beautiful and valuable forests. The soil produces cereals and fruits, while the mountains yield iron, plumbago, sulphur, limestone, and cobalt. In many places both thermal and mineral springs abound. The wolf, ibex, bear, leopard, and chamois are among the animals inhabiting the district.

The inhabitants belong chiefly to the Mohammedan religion, but include a considerable number of Brahmans. They engage largely in agriculture and the manufacture of ironware, baskets, furniture, and cashmere shawls. These shawls are made of the down common to the animals of the region, which surpasses in fineness and length the merino wool, and is obtained from the wild sheep, yak, and cashmere goat. The manufacture of a shawl of the best

grade requires several weeks. This work is done mostly by women and girls. A number of different dialects are spoken. The people are strongly developed physically and are among the most intelligent and progressive of the Hindu races. Srinagar, or Cashmere, is the capital and largest town and the summer residence of the Maharajah. Population, 1906, 2,928,620.

**CASHMERE GOAT**, a kind of goat native to Asia, valuable for its long, silky hair. The best grade of this animal is obtained in Tibet and Cashmere, and it has been acclimated and is reared in all of the continents. It has nutritious flesh and gives rich milk, but is grown chiefly for its fleece. The hair is longer than that of the Angora goat, about eighteen inches in length, and a single goat does not yield more than seven or eight ounces of the down, beyond which extend the long hairs. It requires the fleeces of about ten goats to manufacture a shawl a yard and a half square. The male of the cashmere goat has large horns.

**CASH REGISTER**, a mechanical device used in stores and shops to record the cash received for goods sold. It is in general use in retail stores and in some of the larger shops and bazaars. This machine consists of a metallic box, supplied with a keyboard similar to that of a typewriter, each key being attached to a bar which registers the amount of the purchase and exhibits a tablet, showing the amount of the sale both to the customer and to the salesman. Amounts larger than those that can be shown by the machine are registered by pressing two or more keys in succession. A roll of paper within the machine is moved continuously by a system of wheels, and at the close of the day the various amounts recorded can be added to determine the total sales made at the store or in a certain department. The salesmen place the cash received in a drawer, and the total must agree with the sum of all the sales as recorded on the roll of paper, which is secured by a lock and key.

**CASPIAN SEA** (käs'pī-an), an inland sea or lake in Eurasia, the largest in the world, having a breadth of 200 miles and a length from north to south of about 700 miles, with an estimated surface of 170,000 square miles. It is located on the boundary between Europe and Asia. On the eastern coast are a number of large bays. The western coast is more or less modified by the Caucasus Mountains; the southern, by the Elburz Mountains, and the northern and eastern, by the Kirghiz Steppe. A portion of the land north of the Caspian is below sea level, while the surface of the sea itself is

97 feet below the Black Sea and 250 feet below the surface of the Aral Sea. It is thought that the three lakes were once a common sea, which is demonstrated, apparently, by the fact that the water is still diminishing, and appears formerly to have covered a large portion of the adjacent steppes.

The Caspian Sea has no visible outlet to the sea. Its water is salty, though not as salty as that of the ocean. Among the rivers that flow into it are the Ural, the Terek, the Emba, and the Volga, the last mentioned being the largest river in Europe. Through the middle of the sea is a submarine ridge formed by a continuation of the Caucasus Mountains, which divides it into north and south basins. The greatest depth of the northern basin is 2,525 feet and of the southern, 3,250 feet, though both contain shallows that render navigation dangerous. It has salmon, sturgeon, and other valuable fisheries. It is the seat of a vast commerce. The most important ports on its coast are Astrakhan, Baku, Petrovsk, Derbend, and Krasnovodsk. A large number of railroads extend from it in all directions, and it is connected with many navigable rivers and canals. Among the important canals are those connecting the headwaters of the Volga with the Schlina and Tvertza rivers, by which the Baltic Sea is united with the Caspian. Russia has a number of fortifications on its coast and maintains a strong fleet and steamship lines for trading purposes. The sea is not affected by ebb or flood tides.

**CASSEL** (käs'sel), or **Kassel**, a city of Germany, capital of Hesse-Nassau, ninety miles northeast of Frankfort-on-the-Main. It is pleasantly situated on both sides of the Fulda River, has important railway and electric line connections, and is the seat of extensive manufactures of ironware, locomotives, machinery, and scientific instruments. The public institutions include two gymnasia, several high schools, and a number of hospitals and charitable institutions. It has a large trade in merchandise and manufactured products. The city operates and owns the gas works, a slaughterhouse, and an electric-light plant. A short distance west of the city is the Palace of Wilhelmshöhe, erected in the 18th century, in which Napoleon III. was imprisoned at the close of the Franco-Prussian War.

Königsstrasse is the principal street, which is beautifully paved, and near the center is the famous Königsplatz. Friedrichsplatz, one of the largest squares in Germany, is in the center of a large number of famous buildings, including the Electoral Palace and the Museum Frid-

ericanum. The latter contains the provincial library of 170,000 volumes, of which the Grimm brothers were librarians from 1814 to 1830. In this library is the valuable poetic production known as *Hildebrandslied*, dating from the 9th century. The art gallery, constructed of red sandstone, is one of the finest buildings in the city, and contains a collection of paintings gathered by Langrave William VIII. The city was anciently known as Chassala. In the Seven Years' War it was captured by the French, and became the capital of the kingdom of Westphalia in 1807. It was occupied by the Prussian troops in 1866 and made a part of the kingdom of Prussia. Its modern prosperity is due largely to its material development in manufacturing and wholesaling. Population, 1905, 120,467.

**CASSIA** (kăsh'ă), a genus of plants of the pea family, including herbs, shrubs, and trees. Several species are known for their leaves, which, when dried, constitute the drug called *senna*. These plants are native to Africa and Asia, but an American species quite similar has the cathartic properties of *senna* in a mild form. The *cassia fistula*, a tree native to Egypt and India, yields the purging cassia, which contains considerable sugar and is used in making laxative conserves. The familiar *cassia bark*, or *cassia wood*, is derived from a tree of the laurel family, and is sold in the market as a cheap grade of cinnamon. It is obtained in large quantities from China. The fragrant bark mentioned in the Bible is supposed to be the cassia bark.

**CASSIMERE** (kăs'si-mēr), a word derived from the cashmere manufactured in the Himalayas from the fine wool of the cashmere goat. It is applied to a dress fabric made of soft, fine wool. Cashmere is made into shawls, but the cassimere of European and American manufacture is used largely for men's wear.

**CASSINO** (kăs-sē'nō), a game played with a full pack of cards, by two or more persons. Each of the players receives four cards, dealt in succession, and four are laid on the center of the table with the face turned up. To secure a full understanding of the game, it is necessary to consult the rules. In one variation of *cassino*, the jack, queen, and king are treated as pit cards, that is as if they had eleven, twelve, and thirteen spots. The game consists of scoring the highest number of points, usually twenty-one, hence several deals are required for one game. The points that count one each are: each ace, the two of spades, the greatest number of spades held by an individual player, and a *sweep* (which signifies that a player can

take all the cards from the table except in the last hand); the ten of diamonds counts two; and the greatest number of cards held by an individual player counts three, making a total of twelve points to each deal. The two-spot of spades is known as *Little Cassino* and the ten-spot of diamonds is called *Big Cassino*.

**CASSIQUIARI** (kăs-sē-kē-ä'rē), a river of southern Venezuela, which unites the Orinoco with the Rio Negro. At the point where it issues from the Orinoco it is 300 yards wide, and it gradually increases in breadth until it reaches the Rio Negro, where it has a width of 600 yards. This remarkable river connects the Amazon River with the Orinoco and furnishes a passage for vessels between the two great river systems.

**CASSOWARY** (kăs'sō-wā-rÿ), a bird allied to the ostrich and the emu. It differs from the ostrich in having shorter wings, a bony crest,

CASSOWARY.

and wattles on the naked neck. It is native to New Guinea, the Moluccas, and many other Asiatic islands. The cassowary is distinguished from the emu by various characteristics, and possesses points of similarity with the moa and other extinct birds. Its wings are unfitted for flight, owing to their shortness, while its legs are powerful and well designed for swiftness. The feathers resemble pendant hair, the color is brownish-black, and the neck is naked, with the upper parts of a bluish color. The eggs are laid on the sand, where they are hatched by the sun. The flesh is juiceless, tough, and black. It is rarely eaten, except by the natives. Its food consists of leaves, seeds, and fruits.

**CAST**, an impression made by pouring a duc-

tile substance like plaster of Paris into a mold. The substance hardens on cooling and when taken out retains the form of the mold. Casts are of value in studying art, especially since the works of great masters cannot be seen by all. Many of the finest figures of antique art have been cast. These casts constitute the larger part of many museums.

**CASTALIA** (kās-tā'li-à), a fountain famous in the history of ancient Greece. It is located at the foot of Mount Parnassus, near the temple of Apollo, sacred to Apollo and the muses. The Pythia used to bathe in its waters before delivering the oracles of the gods. It was regarded as a source of inspiration for the poets and was so named from Castalia, the daughter of Achelous. It is now called the fountain of Saint John.

**CASTE** (kást), the artificial division of society on the basis of wealth, heredity, and other conditions. The caste system reaches its culmination in India, where society is divided into many classes. The principal castes include the *Brahmans*, *Kshatruyas*, *Vaisyas*, and *Sudras*, besides the *Pariahs*, or *outcasts*, who are regarded as of no caste. These castes are again divided into subcastes, the object being to make position or employment hereditary. See **India**, **Buddhism**, **Brahmanism**, etc.

**CASTELLAMARE** (kās-těl-là-mä'rà), a city and seaport of Italy, in the province of Naples, sixteen miles southeast of Naples. It is important as a railway and commercial center, and the surrounding country is noted for its beautiful springs and healthful climate. A fine cathedral, a royal palace, a military hospital, and several convents are among the chief buildings. The manufactures include clothing, machinery, and silk and cotton textiles. It has considerable trade, both export and import, and its fisheries are important. The city was anciently known as Stabiae. It was captured by Sulla in the Social War, and was destroyed by lava from Pompeii in 79 A. D. The castle was erected by Frederick II. in the 13th century. Population, 1906, 33,250.

**CASTELLAMARE DEL GOLFO** (-děl gòl'fò), a seaport of Sicily, on the Gulf of Castellamare, forty-five miles west of Palermo. It is situated near the mouth of the San Bartolomeo River. It occupies the site of the ancient Segesta. The commerce consists chiefly in grain, oil, fruit, wine, and fish. It is the seat of several fine schools and has a cathedral. Population, 1906, 20,175.

**CASTILE** (kās-těl'), a region extending southward from the Bay of Biscay, and forming the center of the Spanish monarchy. It is

divided into Old Castile and New Castile, both from the standpoint of geography and politics. Old Castile forms an elevated plateau from 2,500 to 3,000 feet high, surrounded on all sides by mountains, watersheds, and other natural demarkations. It has an area of 25,810 square miles, is divided into several provinces, and has a population of 1,785,325. New Castile is similarly inclosed by elevations. It has an area of 44,720 square miles and is divided into five provinces. Population, 1,876,350.

**CASTING**, the art of forming metal in a mold. It is thought that the art of shaping metal by means of hammer and chisel is much older than that of casting. However, casting is of great antiquity, which is evidenced by a number of historical accounts, among them the incidents connected with the golden calf and the brass vessels cast for Solomon's temple. John Thomas in 1709 introduced into Scotland an effective method of casting iron and carried out the art successfully, but kept it a secret for many years. It is now one of the principal industries.

**CAST IRON**, the crudest form of iron, obtained from the blast furnace by running melted metal into molds. The cast bars are from three to four feet long and from three to four inches wide. The molds are long, narrow channels. After the metal has solidified, the bars are taken out and placed in a storage room. Iron cast in this form is called pig.

**CASTLE** (kās'l), a fortified building used as a residence and as a place of defense, usually belonging to a nobleman or a prince. Castles were especially numerous in feudal times.

Many ruins of these buildings are preserved in Europe, especially in Austria, England, France, and Germany. They were built chiefly of stone so as to make them proof against fire and the attacks of enemies. The entrance was defended by a *barbican*, which was often large and strong, and the *portcullis* or *iron grating* was hung by chains and weights. The larger castles had many rooms and compartments, the stronger of which was known as the *donjon* or *dungeon*. It was the last resort in case of great danger.

**CASTLE GARDEN**, the name originally given to a fort built on an island off New York. New York harbor was fortified after the War of 1812, which rendered Fort Clinton, the name applied to it, unnecessary. In 1822 it was deeded to the State and later leased and made into a pleasure garden. P. T. Barnum had control of it during the first appearance of Jenny Lind in America. It was used by the State board of immigration as an immigrant sta-

tion until 1891. At that time the Government took charge of immigrants and transferred the station to Ellis Island, since which time Castle Garden has been transformed into an aquarium.

**CASTOR AND POLLUX** (kās'tōr ānd pōl'lūks), the chief stars of the constellation known as Gemini, the Twins. The former is of the first magnitude and the latter of the second. Longitude is reckoned from the latter, as outlined in the *Nautical Almanac*, a publication issued by the Government. In the mythology of Greece the two were noted as the twin deities, sons of Zeus. Immortality was assigned to Pollux, but Castor was regarded as mortal, while both were famous as the patron deities of the mariner. They accompanied Jason on the Argonautic expedition. When a storm had arisen on the voyage, Orpheus played on his wonderful lyre and prayed to the gods that the tempest might be stilled, when starlike flames shone over the heads of the twin brothers. When Castor was slain, Pollux could not be reconciled until Jupiter gave him immortality with his brother. In order to fill the mission assigned to both, they passed alternately one day under the earth and the next on the Elysian Fields. The soldiers of antiquity not only believed them guardians of navigation, but thought they were mounted on snow-white steeds, clad in rare armor, and that they took part in many battles of the Greeks and Romans.

**CASTOR OIL PLANT**, a plant native to the East Indies, but now generally distributed

CASTOR OIL PLANT.

throughout the tropical and temperate zones. Its seeds are of light ash color, oval in shape, and about the size of a small bean. The castor

oil sold in the markets is obtained from the seed of this plant by crushing and pressing. It is used largely in medicine as a purgative, and is a remedy for dysentery and irritation of the stomach. Castor oil is valuable as a lubricating oil in the higher classes of machinery. Most of the castor oil consumed in America is imported. The plant is grown extensively in gardens and parks for ornamental purposes.

**CAT**, the name applied to a genus of quadrupeds, including the domestic cat, the wild cat, and other animals, such as the jaguar, puma, tiger, leopard, and cougar. The domestic cat is well known and has been a favorite animal for many years. It is thought that the cat was kept as a domestic animal in ancient Egypt, and that the country adjacent to the Nile is its nativity. The wild cat has been found more or less distributed in Eurasia, but is not thought to be the origin of the domestic kind, for the reason that the latter has no tendency to return to the type of a wild cat, even after being isolated from settlements for some time. Besides, there are no evidences that the wild kind has ever been domesticated, and cats now found in a wild state still retain the identical features of those met with many centuries ago. In 938 the cat became a general favorite in Europe, and, on account of its rarity, laws were passed in several countries punishing those who stole or killed the animal.

The habits of the cat are quite well known and need very little description. Its ability as a hunter, both during the day and night, renders it valuable, while its characteristic mewing, purring; and cruelty in fighting are well understood. It is quite certain that a cat forms no real affection for mankind. Its attachment is rather to place and condition, where it may receive food and shelter. Its delight in tormenting a mouse before killing it has been mentioned as a trait of sympathy, but it is known that birds are generally inflicted with a fatal wound upon being captured, which is evidence that fear of escape causes the immediate death of the one, and the delight in torment of the other. The desire to return home is a peculiar characteristic, since it has the ability to find its way back at great distances, even when carried in an inclosure, but this trait is more distinctly marked in the older of the family.

The food of cats consists largely of meat and small quadrupeds, but in the absence of these it subsists on starchy food and even vegetables. Its cunning disposition is often manifest by an inclination to lay traps for mice and birds. Several incidents are on record where

cats shelled grains of corn from the cob and placed them a short distance from the entrance to the hiding places of mice, in order that they might decoy their prey when coming for the morsels of food. There are several accounts of cats scattering crumbs in the winter time to attract birds that they might fall upon them. The peculiar construction of their eyes enables them to see quite as well in the dusk of the evening as in the daytime, which renders them

WILD CAT.

peculiarly fitted to entrap the prey at the time when small quadrupeds are in the habit of coming out of their places of hiding for food. Nature seems not to have intended them to enter the water, as the absence of oily substances in the hair causes them to shun wet and moist places.

The skins of cats are valuable for rugs and sleigh robes. Electrical machines have been rendered more serviceable by the use of rub-

ANGORA CAT.

bers made of cats' skins. In former times illy informed people were superstitious regarding the conduct of cats. In Egypt they were held in reverence, and were honored by devotion and the construction of temples. Many people still prophesy visitors when a cat washes its face, or a death in the family when a catcall is heard from the top of a house. The foolish notion that cats have nine lives has led to the death of many of these very useful and agreeable animals. Among the various kinds of cats kept

for domestic purposes are the *tailless cat* of the Isle of Man, the *Angora cat* of Asia Minor, the *Persian*, and the *blue* or *Carthusian*. The *Chinese cat* has long, silky ears that hang downward, the *tortoise-shell* variety is quite elegant and delicate in form, and the *Maltese* is a bluish-gray and a general favorite for store and house use. The Arabians are among the greatest lovers of cats and keep them as pets. Cats are more or less widely distributed and are either kept as pets or as a protection against pests.

**CATACOMBS** (kät'ä-kömz), the underground cavities used for the burial of the dead. This peculiar mode of caring for dead bodies was practiced by people of great antiquity. While the existence of vast catacombs has long been known, they were apparently forgotten by the great mass of writers until Father Bosio spent thirty years in exploring them. A descriptive account of his investigations was first published in 1632. Attention was again attracted to them by the celebrated work of De' Rossi in 1864-67. Among the celebrated catacombs are those of Egypt, Syria, Persia, Asia Minor, Palermo, and Syracuse. Many catacombs are of wonderful extent and still in a good state of preservation. In many of them are frescoes and paintings still as fresh and beautiful as if recently touched by the brush of the artist. At Milo a hill is fairly honeycombed with vaulted labyrinths in which thousands of bodies are stored. In the catacombs of Peru, South America, many remarkable relics have been found dating long prior to the Christian era. In Paris are similar burying places, but these have been used mainly as charnal houses for criminals and victims of pestilence and insurrections.

The most important catacombs are located near Rome, especially in the vicinity of the Appian Way. These crypts are believed to have been the places of worship of the early Christians at the time when the new worship was forbidden and the followers of Christ were generally persecuted. The earliest of these belong to the year 111 A. D., and the newest date from the time immediately previous to the period when Constantine began his reign. In these subterranean burial places are about 6,000,000 tombs. They are constructed in the form of galleries five feet wide and eight feet high, from which branches lead in all directions. Galleries lie above galleries, forming several stories and constituting a perfect honeycomb of rooms and departments. A vast number of them contain slabs on which Christian inscriptions and symbols are found, among them such

as an anchor, a palm branch, or a dove. It is quite certain that these tombs were constructed by the Christians, principally by those possessing riches, and that they remained for some time under the control of the church. Later they passed to the ownership of church communities, but with the beginning of Constantine's reign they ceased to be used for burying purposes. The Goths and Lombards ravished divers of these tombs in the 6th and 8th centuries, and later the popes removed the remains of many saints and martyrs to the churches for burial.

**CATALEPSY** (kăt-ă-lěp'sŷ), a disorder generally connected with hysteria, in which the person afflicted falls into a state of real or apparent unconsciousness. Those afflicted remain in a rigid, fixed state from several minutes to several hours or even days, and very suddenly recover consciousness as if aroused from a deep sleep. It mostly affects people who are hysterical, and as a rule is followed by no bad consequences. Cases have not been infrequent in which persons affected by this disease were buried alive.

**CATALPA** (kă-tăl'pa), a class of trees found in the southern part of the United States, where they are native. The genus includes four or five species. They have large leaves, beautiful trumpet-shaped flowers, and long pods with winged seeds. The wood is soft and light, and its durability makes it valuable for railroad sleepers, furniture, and construction purposes. Several species common to the West Indies attain a height of forty feet and yield timber known as the French oak, while the bark is a source of tannin. The Asiatic species are much smaller and quite unimportant.

**CATAMARAN** (kăt-ă-mă-răn'), the name given to a kind of vessel or boat made of three logs lashed together. The center log is much the largest and serves as a keel, while the others correspond to the sides of a boat. This class of boats is either rigged with a sail or propelled wholly by paddles. The length is from twenty to twenty-five feet. They are used by the Hindus of Madras, the Ceylon Islanders, and on the coast of South America. In the monsoons and stormy seasons the catamaran is much safer than a boat of ordinary construction.

**CATANIA** (kă-tă'ně-ă), a seaport city of Sicily, on the northeastern coast, near Mount Aetna, thirty miles northwest of Syracuse. It is the capital of the province of Catania. Being surrounded by a fertile plain, it is frequently mentioned as the granary of Sicily. In

1693 it was visited by earthquakes which occurred at the time of an eruption of the great volcano, but it has since endured successive damages of this kind, and is the finest and most prosperous city on the island. It has a safe and commodious harbor, an excellent cathedral, and numerous public buildings. Among the most noted are the Church of San Nicolo, the Benedictine Convent, the town hall, and the university founded in 1445. The manufactures include linen goods, articles of wood, clothing, wine, machinery, and silk. It has stone and macadam pavements, waterworks, gas and electric lighting, and steam and electric railway service. The public library contains 92,500 books. It has several fine schools, a museum, and attractive gardens and parks. The city was founded as early as the 8th century B. C. by the Greeks, and attained its highest prosperity in the 5th century B. C. It was desolated by Dionysius, but later became the seat of a Roman colony, which caused it to attain its former commercial importance. The Goths inflicted severe damage, but it again rose to become the principal city of the island under the Byzantine Empire. Population, 1906, 149,295.

**CATAPLASM** (kăt'ă-plăz'm), a preparation applied to diseased or painful parts for soothing or stimulating the skin. The most common preparations of this kind have linseed meal as a basis, or are made up of yeast or mustard, in which form they are applied as a poultice.

**CATAPULT** (kăt'ă-pŭlt), an ancient military engine invented by Dionysius, tyrant of Syracuse, in 399 B. C. It was used for throwing darts, arrows, or stones with great force. Its construction was of wood. The framework supported a bow, which was bent by a windlass and the cord was released by a spring, thus causing the missile to be propelled with considerable force.

**CATARACT** (kăt'ă-răkt). See **Waterfall**.

**CATARACT**, an affection of the eye, in which opaque matter more or less penetrates the crystalline lens, causing vision to be either wholly or partially obstructed. A loss of the natural color of the pupil marks its earliest approach, and, when developed, the pupil has a milk-white color. There are two kinds of cataracts, the hard and the soft. Elderly people are affected most commonly with the hard cataract, while the soft cataract occurs at any age, but is most frequent among children. Children born with this condition, which often occurs, are said to be affected by *congenital cataract*. The form that results from a wound of the lens is called *traumatic*. The disease is

quite painless and is treated by surgical operations, in which the diseased lens is removed from its location opposite the transparent cornea.

**CATARRH** (kă-tăr'), a discharge or running which occurs under certain circumstances from the various outlets of the body. It is due to a number of causes, such as overheating, sudden checking of perspiration, constipation, or breathing foul air. In the eyes and nose it is usually called a cold in the head, in the back of the mouth and throat it is known as post-nasal catarrh, and in the windpipe and bronchial tubes it is designated laryngeal and bronchial catarrh. The form of catarrh that affects the stomach and alimentary canal is known as gastric and intestinal catarrh, while that affecting the bladder is called vesical catarrh.

**CATAWBA** (kă-tă'βά), a river of North Carolina, rises in McDowell County and courses 250 miles, entering South Carolina, after which it is known as the Wateree River. The name has been given to a wine made from the Catawba grapes, discovered near the river in 1801. It is now produced in large quantities in Ohio and other states, and is one of the wines most largely consumed.
